Abstract

Many e-book applications have been available on the mobile devices in the recent decade. People read the electronic contents on their mobile devices. Meanwhile, a variety of mobile device platforms have emerged in the market. To make the e-book content compatible on different mobile device platforms, the layout or e-book application design needs to be adjusted based on the display resolution. However, different resolution settings are available in the mobile devices. For example, Android can runs on a variety of devices that offer different screen sizes. Android also can support different resolutions from 320*240 to 1280*720. Hence, the resolution becomes a critical problem for e-book content provider. Besides, image scaling is another problem for e-book applications. If the e-book application load bitmap images as its contents, the bitmap contents may be distorted when user scales up the size of contents or images. Therefore, the different resolutions and image scaling are two important issues in the design of e-book application. Vector graphic library can solve the above problems. However, vector graphic has bad performance in mobile devices and just few e-book contents are available in vector graphic format. Hence, file format conversion is another high-cost task in e-book with vector graphic. This paper proposes a cloud system integrating an e-book reader with vector graphic technology, called CloudVG. CloudVG optimizes the vector graphic library through a Renderscript method and offloads the conversion of bitmap to vector format on cloud platform. The experiment results show CloudVG can achieve 250% performance improvement over the original library and the procedure of file format conversion can achieve a near-linear speedup on cloud computing platforms.

Keywords: Vector graphic; e-book; cloud computing; android apps; renderscript

1. Introduction

Smart mobile devices become the center of our daily lives. Hence, many system manufacturers produce a variety of mobile devices in the market. In the IDC report, Android system occupies a considerable market share of smart handheld device. Android is a Linux-based operating system and is maintained as an open source project by Google. Many programmers and manufacturers have joined the system development due to open source. Hence, there are many applications and hardware devices which are developed based on the Android operating system.

Today's advanced mobile devices are well integrated with the Internet and have far more functionality than mobile phones of the past. Some peoples use handheld devices to be personal multimedia de-

IETC 2014

vice for playing music and movie through Internet. Some other people read books on mobile device. Hence, many software developers design applications of multimedia player and E-Book reader.

E-book application has been widely studied by research group and industry manufacture in recent years. However, so far, the e-book applications are not widely used in the mobile device because e-book applications have following weakness for mobile devices.

- Image distortion: The contents and image of e-books may be distorted when user scales up the size of contents or images. Because the image's format of e- book is the bitmap type.

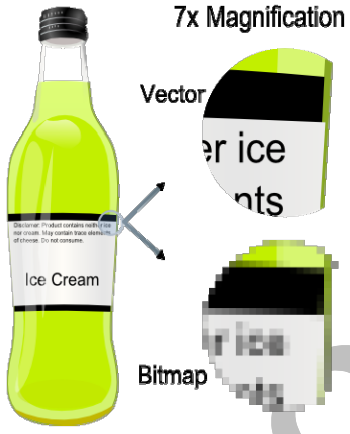

Fig. 1. Bitmap and vector graphic comparsion

- Performance efficiency: E-Book applications spend a lot of time to process path calculation and drawing when E-Book application is developed based on vector graphic library. Vector graphic library has a major strength for E-Book application. Vector graphic library avoid image distortion when user scales up the size of contents or images on E-Book application.

- Resource limitation: Users usually have many e-book contents and electronic comic books in their mobile devices. It is very inconvenient for user to manage their e-book content in small storage device. It occupies a large part of storage space in their device. Besides of storage limitation, processing image transformation is also a heavy load work on mobile device. Due to battery life, mobile devices try not to do a task with long processing time. Therefore, cloud platform help E-Book applications to solve the resource limitation problem.

In this paper, we develop CloudVG to solve the above problems. CloudVG integrates the e-book software with vector graphic technology to cloud platforms. Cloud platform can help e-book software to offload the procedure of file format conversion and it also provides large storage resource for mobile device to store the e-book contents. The performance of CloudVG for displaying contents is also optimized by GPGPU in mobile devices through Rederscript function.

The rest of this paper is organized as follows. Section 2 shows the related works which include E-Book applications, vector graphic library, Android Renderscript and cloud image file conversion processing. Section 3 presents our system architecture in the cloud service. In Section 4, we present our system execution results and benchmarks. The brief conclusion is presented in Section 5.

2. Related work

E-book application has been widely studied by industries and academia. Some previous studies probe E-Book's applications [1, 2], security [3, 4], platform and standardization [5]. According to [5], we

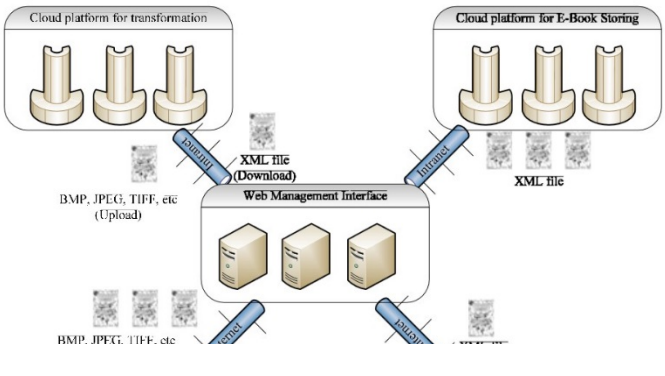
IETC 2014

know that there are many different e-book file formats and each file format is not compatible with another e-book file format. Therefore, file format compatibility is an important issue for e-book application. Vector drawings can enlarge to any size without any loss in quality. Then, vector graphic is a free file format and it is also readable on both handheld devices and computers. So that, we can convert e-book file to xml descriptor of vector graphic. There are many libraries to support vector graphic reader in embedded platform [6] [7]. We integrate OpenVG [6] library with Android system and we also optimize it on our embedded platform.

2.1. Overview of OpenVG

OpenVG is a standard vector graphic API, which is developed by Khronos Group, Inc, for hardware-accelerated 2D vector graphics. .OpenVG primary is implemented on smart phone, handheld devices and consumer electronic devices and it is composed of three basic components: path, paint and image. All images to be drawn are defined by single or multi paths grouping a sequence of commands. OpenVG provide a method to offload computationally intensive graphics processing from the CPU onto a GPU to save energy. However, the offloading solution needs to be implemented by hardware manufacturers. We propose a solution to increase the performance of OpenVG through Renderscript. Our solution can be designed for different OpenVG applications.

2.2. Renderscript



CloudVG use embedded GPGPU to increase the performance of application. The embedded GPGPU is based on ARM Mali architecture. The Mali series of graphics processing units (GPUs) are semiconductor intellectual property cores produced by ARM Holdings. Mali-T604 supports Android Renderscript library. Renderscript [11] is a low-level API for intensive computation using heterogeneous computing. It allows developers to maximize the performance of their applications at the cost of writing a greater amount of more complex code. Some researches use it to optimize 3D graphics library [12] and multimedia development [13]. In CloudVG, Renderscript is used to optimize the performance of vector graphic library in Android system.

2.3. File conversion

In [8], they proposed some algorithms for converting file to vector graph format. They only deploy client server architecture to execute their algorithm. However, converting file format produce a huge workload when user need to transfer large amount of files. Our solution is a parallel implementation of the Autotrace that uses multi-VM and it achieves near-linear speedup on cloud computing platform.

3. System architecture

Figure 2 shows CloudVG architecture. CloudVG is composed of three components: vector graphic library, cloud platform and cloud storage. The vector graphic library focuses on drawing the contents with vector graphic file format. The object of cloud platform is to process conversion of bitmap to vector graphic and the cloud storage stores user data after file format conversion.

IETC2014

Fig. 2. CloudVG system architecture

A. *Vector graphic library in mobile devices*

We modify the vector graphic library based on ShivaVG and port it on Android system. ShivaVG is a vector graphic library that follows OpenVG standard for library implementation. OpenVG separates the procedures of drawing vector graphic to seven steps. We use two-level optimized solution to increase the performance of vector graphic library. First-level is algorithm optimization and we optimize the vector graphic library in step four of OpenVG flow on Android system. We use GPGPU to optimize the vector graphic library through Renderscript API in second-level.

1) OpenVG algorithm optimization

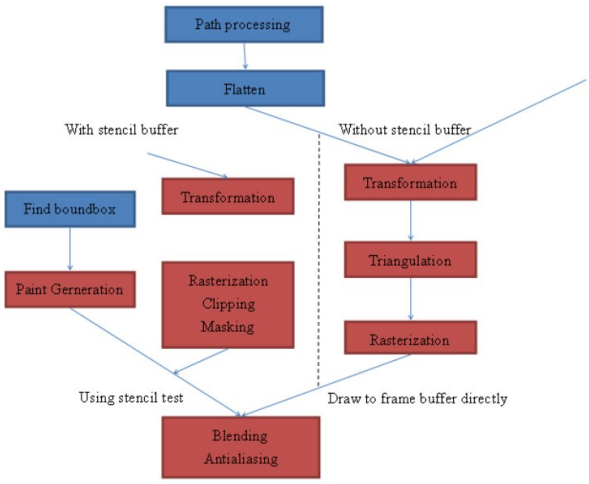


Fig. 3. Optimization algorithm flow

The step four of OpenVG is the rasterization. Rasterisation is the task of taking an image described in a vector graphics format and converting it into a raster image (pixels or dots) for output. Triangulation is the main process in rasterization step. The time complexity is $O(n^3)$ in original algorithm. We replace original triangulation algorithm with monotone triangulation and polygon partitioning. In the result, the time complexity of triangulation reduce from $O(n^3)$ to $O(n*\log n)$. The optimization flow is shown in Figure 3.

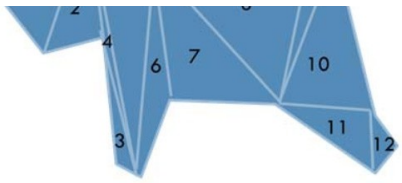

Fig. 4. Example of monotone triangulation

There are some problems in monotone triangulation. If the picture is not a monotone graphic, monotone triangulation will get error in execution. So, we deploy polygon partitioning before monotone triangulation. Polygon partitioning separates any graph shape into monotone graph.

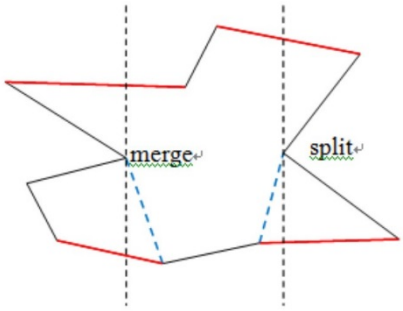

Fig. 5. Example of polygon partition

2) GPGPU optimization

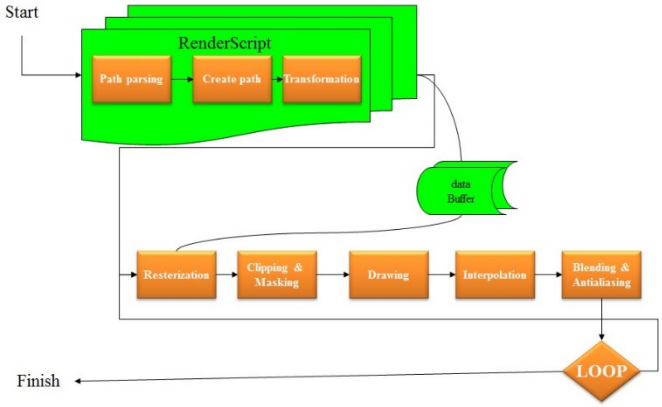

Fig. 6. Renderscript integration

OpenVG has three computing-intensive components: path parsing, path creating and transformation. So, we use Renderscript to rewrite the procedures of three components Renderscript provides some computational API to offload the computing function to GPU unit.

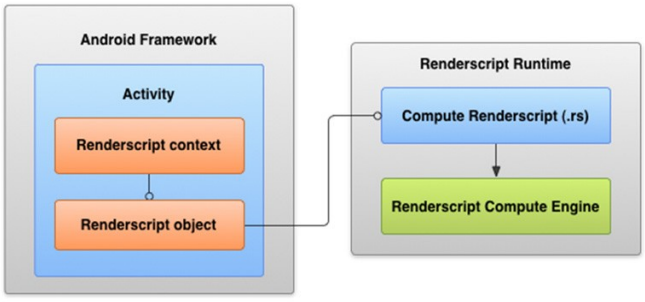

Fig. 7. Flow of Android to Renderscript

Figure 7 shows the flow to call Renderscript function. We use Android NDK to trigger Renderscript object and then pass the computational data to GPU memory through Renderscript object. After computing in Renderscript engine, CloudVG can receive the computed result from Renderscript object. In this subsection, we describe the optimization of CloudVG in mobile devices. The rest of this section shows optimization in cloud platform.

B. *CloudVG optimization in cloud platform*

This research work converts a variety of image format to vector graphic descriptor in order to support more and more file format. However, file transformation procedure is a heavy workload process in embedded platform. For that reason, our solution takes advantage of cloud computing in order to enhance our computing power.

We deploy the Autotrace [5] code in cloud. Autotrace is software of file transformation. And we build up a domination machine to dispatch converting task to back end cloud platform. We parallelize the file format conversion task in group of images method. Our solution splits all images which are in e-book file to different group and the system assigns these group tasks to different computing virtual machine in cloud. We present our cloud solution in figure 8. The parallel algorithm is shown in Table 1.1) OpenVG algorithm optimization

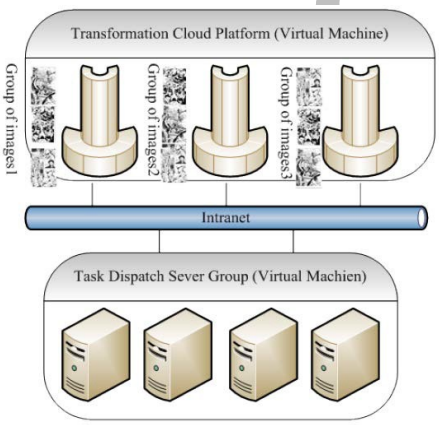

Fig. 8. Cloud parallel method

Table 1. GOP ALGORITHM IN CLOUD PLATFORM

Algorithm: GOP Conversion Algorithm
Input: A collection of bitmap B_m
Output: A book with vector graphic format B_{vg}
1. Receive B_m from user request.
2. Divide B_m into N groups
Dispatch N groups of pictures to computing node via Hadoop framework.
4. Merge N groups of pictures to B_{vg}

Users manage their contents through our web interface. Users can do some operation on management website, such as: uploading contents, downloading their contents and sharing their contents with copyright. We also put all contents which are uploaded by same user in single cloud storage. The placement method can increase data locality.

IET 2014

4. Experimental result

In this section, we present the result of experiments to scrutinize the correctness of CloudVG system. Futhermore, we use experiments to compare the effectiveness of CloudVG system with existing ones, in terms of time complexity and display latency.

A. Experimental environment

The experimental environment is described as follows: smart phone, pad and embedded development platform (PAC Duo platform), and ten Hinet Hicloud platforms. Figure 9 shows our experimental environment in cloud.

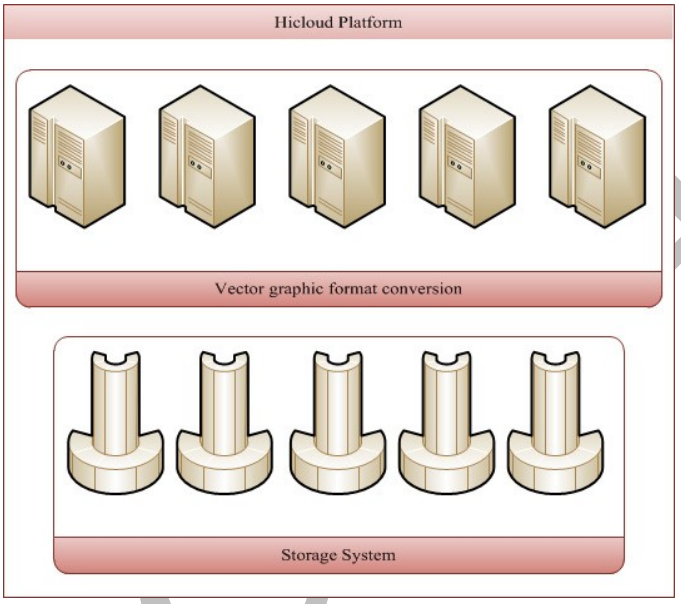

Fig. 9. Cloud machine arrangement

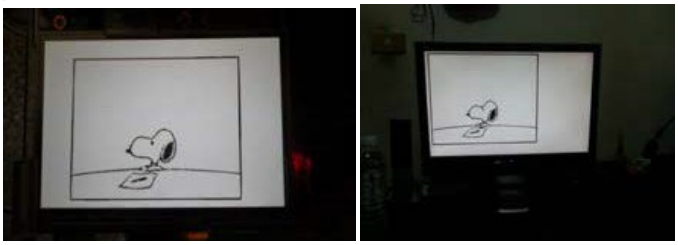
B. Vector graphic demonstration

In this sub-section, we use a mobile device to access the vector graphic file in cloud storage. Figure 10 shows the E- book with vector graphic library on PAC Duo platform and a smart TV.



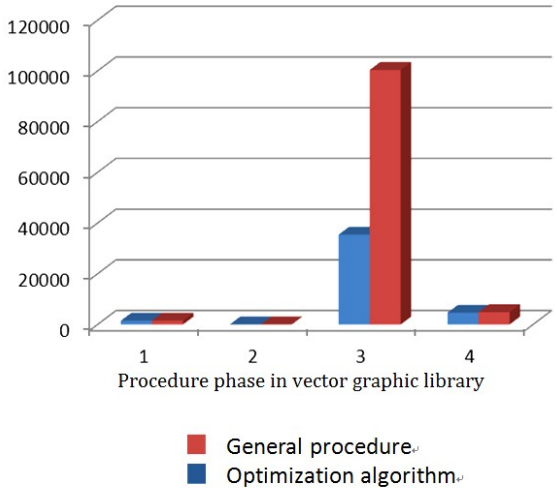


Fig. 10. Execution screnn on PAC Duo and smart TV

C. Analysis result of CloudVG in mobile device

We ran CloudVG on Google Nexus 10. Google Nexus 10 equipped a Mali-T604 which supports the Renderscript programing in Android system. Figure 11 shows the performance speedup by optimization algorithm and GPU offloading mechanism. We can see that optimization algorithm increase the performance 250% in phase III of OpenVG comparing to ShivaVG.

D. Analysis result of CloudVG in cloud platform

Figure 8 presents our performance speedup. CloudVG uses multiple virtual machines to convert the bitmap to vector graphic format and achieves near-linear speedup on cloud computing platforms.

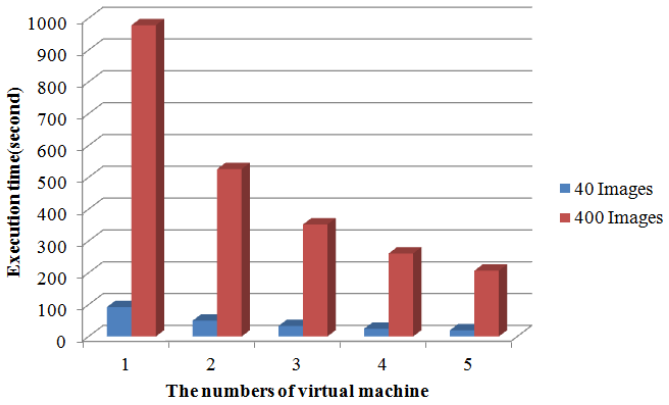

Fig. 12. Performance of file transformation in Cloud

5. Conclusion

In this paper, we present an E-Book software with vector graphic technology on Cloud Platform, called CloudVG, which consider three factors affecting the user experience of image distortion, perfor-

mance and resource limitation. The basic development tool of CloudVG is the vector graphic library and we optimize the vector graphic library by replacing original triangulation algorithm with monotone triangulation and polygon partitioning. We also integrate Renderscript programming model into CloudVG. In addition, CloudVG also achieves a near-linear speedup by parallelizing the process of file transformation on the cloud platform.

Integration of multiple learning methods in modern college education

Yanhang Zhang62, Xiaohong Su, Hongli Zhang
School of computer science and technology, Harbin institute of technology, Harbin 150001,China

Abstract

Compared to leaning approach of traditional teaching, autonomous, cooperative and exploratory learning are three useful learning methods in college education. Only mastering one learning method for a college student is not enough. In order to improve students' abilities such as innovation and cooperation, an integration of multiple learning methods in teaching system is proposed in this paper. Firstly, we introduce characteristics of three learning methods. And then features of modern knowledge are pointed out. We discussed relationships among autonomous, cooperative and exploratory learning further. Finally, we illustrated how to integrate the above three learning methods in college education.

Keywords: Automous learning; cooperatiive learning; exploratory learning; collage education

IETC 2014

1. Introduction

The rapid advances in economy and technology have changed the way of students study today. In current years, research of effective learning methods in college education has been aroused extensive attention (Raymond, 2012; Riek, 2013). On the one hand, most people think cooperative learning is a useful skill that should be mastered by a university student (Steve, Emma, Liz & Andrew, 2012). On the other hand, autonomous learning is highlighted by some researchers (Gwen, Amber, Katerina & Wim, 2014; Douglas Elliot, 2013). Moreover, some people argue that exploratory learning should be paid more attention to by the students(Foote Stephanie, Harrison David, Ritchie & Dyer, 2012; Seri & Gal, 2014). In fact, autonomous, cooperative and exploratory learning are three effective learning methods which are different from each other, but have correlative dependence.Only applying one of them is not enough in undergraduate phase. For that reason, it's necessary to explore difference and relationship among themselves. To meet the specific learning needs of students, how to integrate the three learning methods effectively in college education is very important, especially for improving the undergraduate learning efficiency.

2. Characteristics of three learning methods

* Corresponding author. Tel.: +0-86-451-86412824.
E-mail address: zhangyanhang@hit.edu.cn

2.1. Autonomous learning

Autonomous learning is a type of highly self-conscious, self-directed and personalized learning. Autonomous learning is flexible. An investigation shows that most excellent students master the skill of learning knowledge autonomously. During the study process, they usually have clear aim and choose their learning content with a suitable learning method. They excel in solving problem and overcoming difficulties.

Autonomous learning is the core competence required in lifelong learning, it is not only important for the students' academic achievements, but also benefits improving their learning motivations. Particularly important is autonomous learning increases individual autonomy.

2.2. Cooperative learning

Cooperative learning is a form of autonomous learning (AL) in which small groups of students work together on an issue. This method provides opportunities to develop social and communication skills and group thinking. The aim of cooperative learning is to achieve higher levels of cognitive learning using personal knowledge within a collaborative team.

2.3. Exploratory learning

Exploratory learning, proposed by the scientist of university of Chicago, is the production of education modernization of USA in 50's of last century. For the students, learning process is similar to the explore work of scientist. This kind of learning is open, and not limited to class hour and classroom practice. What the students study are not fixed at text books or subjects. Raising questions and solving the problems are very important in exploratory learning. So openness and critical thinking are the main characters of exploratory learning.

3. Characteristics of three learning methods

In modern society, the knowledge has characteristics of constructiveness, situatedness, complexity and tacitness.

- Constructiveness
  Knowledge building includes individual knowledge building and collaborative knowledge building, which was proposed by Carl Bereiter and Marlene Scardamalia. Task of knowledge building is to create or modify public knowledge. The built knowledge can be used by the people.
- Sociality
  Knowledge not only exists in the individual, but also consists in a team or a community.
- Situatedness
  What the students learn in the university should be similar to the situations that they will meet probably off campus in the future.
- Complexity.

IETC 2014

The knowledge structure has the characteristic of openness. We can't master the knowledge with an isolated way.

- Tacitness

  Concept of tacit knowledge was proposed by Polanyi in 1958. He pointed out that there are two types of knowledge contained in a brain: explicit knowledge and tacit knowledge. As explicit knowledge, which can be expressed as information, is codified and formally stored in specific media. While tacit knowledge is that which cannot or has not yet been expressed as information. Knowledge could exist in both explicit and tacit forms, but tacit knowledge is the larger and more important of the two (Chilton & Bloodgood, 2008).

4. Relationships among the three learning methods

It was pointed out that modern learning includes three aspects, namely content, motivation and interaction (Illeris Knud, 2010).The content means what knowledge should be studied. The motivation is the power source of learning, and it plays an important and necessary role in learning process. The motivation affects persistence and effectiveness of learning also. The study usually happens in a social situation, it needs interpersonal communication. Therefore, Autonomous learning, exploratory learning and cooperative learning correspond to content, motivation and interaction.

Group work has been recognized as an effective way of improving students' learning experiences. Cooperative learning helps to promote work-related skills, develop deeper level of understanding of complex tasks and manage time-consuming tasks. However, cooperative learning is based on the autonomous learning. As any individual of a group, if he wants to contribute to a rise in knowledge of the team, he must learn more and more knowledge autonomously as he obtained knowledge from his group member. The more knowledge he learns autonomously, the more chances he will have to exchange information and cooperate with others, which will promote autonomous learning further.

Exploratory learning is based on the autonomous learning also. But different from cooperative learning, interest is highlighted in exploratory learning. Long time in-depth autonomous learning may change to exploratory learning. So exploratory learning is a higher level of study. When exploratory learning is extended to a certain degree, an effective learning approach that is called cooperative exploratory learning is need. In process of cooperative exploratory learning, every member executes a sub-exploratory task, and they cooperate with each other to finish a complete complex exploratory task in a group. Cooperative exploratory learning integrates the features of cooperative learning, exploratory learning and autonomous learning.

5. Integration of learning methods in college education

College education comprehends the training of many kinds of ability. In undergraduate phase, only master one learning approach for a student is not enough. They should obtain new knowledge through various channels and improve their abilities such as innovation, cooperation and so on.

IETC 2014

Therefore, integration of multiple learning methods in modern college is proposed which is shown as figure 1. The teaching activities include theory and practice. And these activities are executed in class or outside class. For the in-class activities, anywhere cooperative discussion and cooperative project belong to cooperative learning training, which will provide the student ability of Knowledge fusion and interpersonal communication. The other two in-class activities are lecture teaching and lab work, which are traditional teaching methods and implanted in fixed room.

Anywhere outclass reading is a useful theory learning approach, and it can widen student's thoughts. This reading work can be done outside class. In order to increase the student's ability of exploring unknown world without limits, anywhere exploratory experiment is essential. This type of experiment is based on the interest of the student. Any fantastic idea is reasonable and encouraged.

There is no doubt that the proposed integration enables teachers to enrich their language courses. The multiple learning methods training provide students with experience that is reflected upon, which will be translated into useful knowledge for their career in the future.

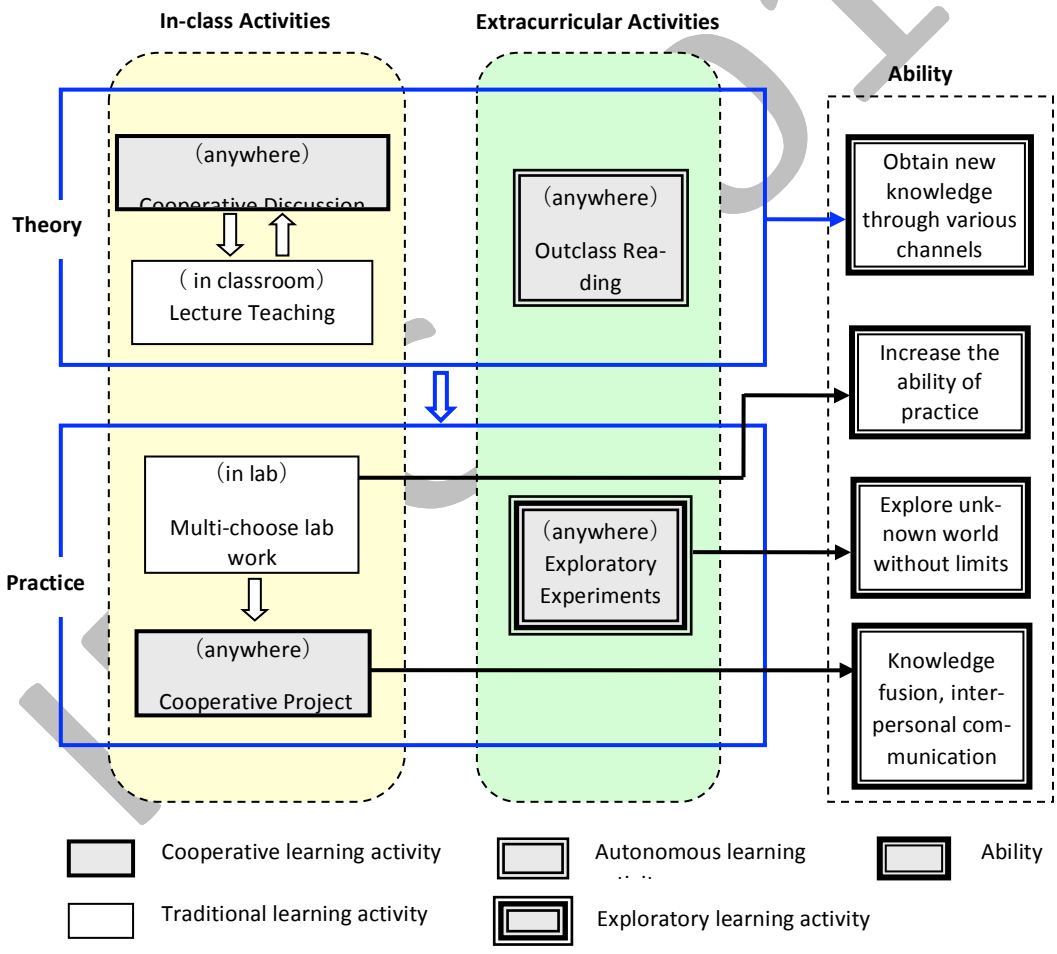

Fig. 1. Active, cooperative and exploratory learning in modern college education

6. Conclusions

In today's higher education institutions, students should not to be passive recipients of knowledge from the lectern. Therefore educators should integrate multiple learning methods training in the teaching activities, and create opportunities for students to master various learning methods. Autonomous, cooperative and exploratory learning are three useful learning methods for college students. Relationships among the three methods are mutual independence but complementary each other.

Integration of Web 2.0 Tools in to Non-formal Learning Practices: A Case Study of IBM

Ayse Kok
Lecturer, Bogazici University, Bebek Istanbul, 34340, Turkey

Abstract

This research identified the specific benefits of online collaboration tools, and explored how their usage has been appropriated by employee volunteers for their practice of volunteering and how they influenced the process of their meaning-making. By doing so, it raised an awareness of the digital tools that provide collections of traits through which individuals can get involved in non-formal learning practices by having digital interactions with others.

Keywords: digital learning, IBM, volunteering, Web 2.0, e-collaboration, blog, wiki

IETC 2014

1. Introduction

This study provides an insight into how online engagement enabled the continuation of non-formal workplace learning practices such as volunteering and opened up possibilities for new ways to contribute to the learning process of employees. Today's workplace settings are in constant need of recurrent learning processes interwoven with daily tasks on digital spaces. However, these digital spaces are not devoid of any issues and hence suggest the need for employees to be conscious of the emerging issues. As every knowledge-intensive entity needs to support their employees' development in non-classroom and non-instructional type of learning the crucial aspect of digital applications in terms of contributing to related processes of knowledge creation by fostering collaboration needs an emphasis. While doing this I reflect upon the strategies adopted in alignment with the umbrella term of "Web 2.0".

This research study explores how online communities are created by employee volunteers and also provides an understanding of non-formal learning practices within such fluid settings; important issues for organizations interested in non-formal learning practices of their employees are also being raised.

The study conveys a context-driven collaboration model focusing on learning through collaboration throughout a volunteering programme. This volunteering program matches communities' needs in the developing world to IBM employees' learning processes in a collaborative and integrated manner. This volunteering model involves a decentralized, employee-generated learning process that is driven by collaboration with colleagues, online resources and experts within the organizational setting in IBM. I identify the affordances of various digital tools from the perspective employee volunteering, and how these affordances can be leveraged to support employee choice and autonomy. The volunteers made a decision for using these online collaboration tools on their own without being under the influence of any

institution, and based on their own needs and ideas they utilized these tools. In addition to being a generic space for sharing documents, the digital environment serves as a joint place populated and created by the volunteers to navigate through information, find personal routes and pathways. This set of tools provides contextual information in a seamless manner based on the learning needs of the IBM employees. My inquiry in this thesis related to different volunteering cases that deal with the changing usage patterns. I delve into the collaborative processes facilitated by the use of digital tools within their volunteering context, in other words, whether and how volunteers were supported by the content conveyed to them via means of relevant digital assets and tools. The volunteering setting embeds aspects of both virtual and physical parts of workplace learning.

2. Literature Review and Conceptual Work

The last decade has been witness to a shift from the individual to the constructive and social aspect of knowledge in the existing epistemologies (Easterby-Smith & Lyles, 2003). Such a direct shift of focus onto the social nature of meaning and practice can result in the redefinition of the organisation itself as a community of practice (CoP), with organisational dimensions that convey meaning to these practices meaning.

The prominent scholars Lave and Wenger who firstly made a definition of CoP in their famous book with the title *"Situated Learning: Legitimate Peripheral Participation"* studied how situated learning takes place as a result of the relationships built by "master practitioners" and "newcomers". CoP 's can also refer to places in which which "communicative action" occurs (Polanyi, 2002). The mutual creation of knowledge mediates these actions (Wenger, 2004). While CoP's function as a ground for knowledge creation and transfer (Lesser & Prusak, 2000; Wenger, 2004; Wenger & Snyder, 2000) they exist at the crossroads of intellectual and social capital. Within the current body of literature it is a common belief among scholars that CoP's support the basis of social capital, which is mandatory for creating knowledge and its dissemination (Lesser & Prusak, 2000, p. 124).

According to Wenger (1999), CoP framework can be implemented within both "intra" and "inter" dimensions of organizational settings due to being "an integral part of our daily lives" (Wenger, 1999, p. 6, 7). Building further upon the concept of CoP, Wenger utilized it to establish a comprehensive theory of how individuals within collective settings such as organizations work together (1999; 2000; 2004). In his book, *Communities of Practice: Learning, Meaning, and Identity*, Wenger (1999) states that organizations can be considered as assemblies of CoP which can reach even beyond their confines and be situated either within or between formal networks (1998, p. 30). In addition, some scholars utilized the concept of CoP to put cross-sector collaborations under scrutiny (Lathlean & le May, 2002; Dewhurst & Navarro, 2004). These scholars have also contributed to my motivation for approaching the CSC Program from the perspective of CoP. These studies suggest that organizational initiatives provide a fruitful ground to implement the CoP theory.

The term "joint enterprise," referred to as the shared purpose of practitioners in a particular field is used as one of the main characteristics of a CoP (Wenger & Synder, 2000). Similarly, according to O'Donnell *et* al (2003) CoP's are formed around a common interest established upon the values of their members. These shared interests are set into a negotiation on a communal basis (Wenger, 1998, p. 78) around a common purpose. Wenger (1998) describes a "practice as a process by which meaning is provided for one's engagement within the world" (p. 51). According to Wenger (1998), "mutual accountability" (p. 81), which refers to the degree of reciprocal relationship among its members, acts as a glue in terms of holding

IETC2014

these joint enterprises together. The "shared repertoire" is another feature underpinning CoP (Wenger, 1999, p. 82) and this "shared repertoire" includes the tools and techniques in order for negotiating the meaning and making learning happen (Wenger, 1999). Possible forms for this repertoire range from an informal discussion during a coffee break to a structured meeting based on some decision-making criteria. According to Wenger & Synder (2000), as CoP's often have connotations to business units or teams; additional effort is required to integrate them into organizational settings in order for their power to be realized (Wenger & Snyder, 2000).

IBM's CSC employees can be considered as communities of voluntary practitioners and their means of communication should also be taken into account. These means of communication range from face-to-face interactions to the use of various digital tools. In other words, it is not sufficient to focus only on the individual elements of the CSC Programme such as the volunteers or online collaboration tools, but in particular on their mutual interplay. Crossan *et* al. (1999) states that one of the main barriers against theory development with regard to any organizational practice is whether the unit of analysis should be individual, group, organizational and/or interorganizational. Furthermore, some theorists assert that an organizational practice would not be complete without the sharing of information and the development of common meaning (Daft & Weick, 1966; Huber, 1991; Stata, 1989). Consequently, as an organizational practice must be shared and integrated with the learning done by others (Brown, 1993; Daft & Huber, 1987; Daft & Weick, 1966) the unit of analysis should be the group. Other scholars assert that the unit of analysis should be the organization itself as much needs to be done by organizations themselves due to the fact that the activity is stored with organizational structures, procedures or systems (Duncan & Weiss, 1979; Hedberg, 1981; Shrivastava, 1983; Fiol & Lyles, 1985; Levitt & March, 1988; Stata, 1989; Huber, 1991; Chi-Sum *et* al., 2008). By taking into account these theoretical perspectives, the unit of analysis of this study will be the group as it focuses on the different CSC groups made up of IBM employee volunteers.

2.1. Literature about CSCL

Any academic discussion of online collaboration involves the practice and theory of CSCL (computer-supported collaborative learning). While the focus of much current CSCL work with regard to workplace learning is rooted in workplace interaction, we should keep in mind that contrary to popular belief, CSCL could especially make a difference when it comes to learning outside the boundaries of organizational settings. So, apart from the daily work practices of individuals, the social "situatedness" of learning (Winograd & Flores, 1986) should also become the focus of these discussions (Lave, 1988). Due to the adoption of such an alternative approach "outside-class" activities are considered as a crucial aspect of the social background with regard to the process of learning (Cole & Griffin, 1987).

From the theoretical perspectives of CSCL, learning should be assessed on the group level while technology can support the group processes: According to Scardamalia and Bereiter (1996), the community learns as a whole in a computer-supported learning community while the term "community" itself needs a re-conceptualization taking into account the definition provided by Lave and Wenger (1991). Engeström (1999) took a wider learning approach and studied how learning occurs during the interaction of multiple groups among each other. Stahl (2001) claims that these theoreticians (e.g: Lave, 1996; Engeström, 1999) derive their social theories based on Hegel (1967), Marx (1976) and Vygotsky (1978) and that these CSCL theories are disputative due to the increasing complexity of the history of philosophy and theory since the times of Descartes. According to Kant (1787), our conceptualization of the outer world was represented by the human mind, which involves a basic structure rather than being simply given by the material world. Hegel (1807) adopted a developmental view and grounded the process of representation in changes throughout the history. According to Marx (1867/1976), these changes are grounded within socio-economic phenomena. Later on, another famous scholar, namely Heidegger (1927), suggested another perspective in which the human being is more firmly situated in the world than Descartes' approach. Figure 1 shows a graphical representation with regard to the different social and individual theories of learning.

IECT 2014

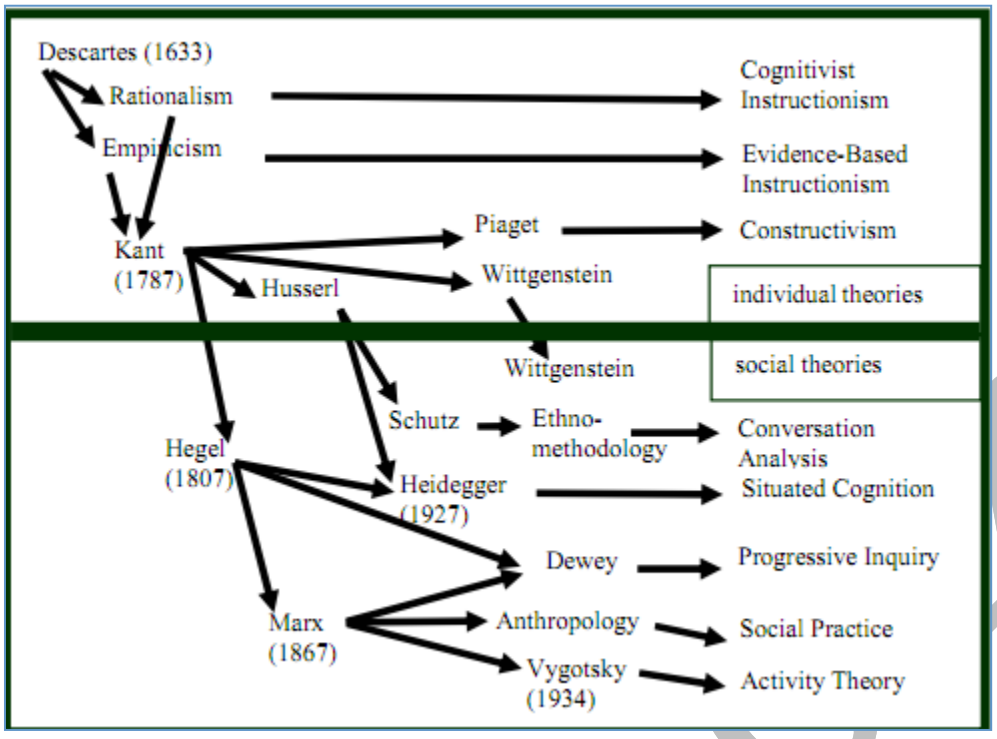

Fig 1. Graphic representation of individual and social theories of learning (Stahl, 2001)

Taking into account these individual and social theories of learning there are two main approaches of defining CSCL:

According to the first perspective, CSCL can be seen as an "umbrella term" which provides a fertile ground with regard to the development of multi-faceted perspectives on related topics. In fact, this approach provides a further ground for the creation of many new research areas such as Computer Supported Cooperative Work (CSCW) (Bannon et al., 1988, Bannon & Schmidt, 1992).

The second perspective is related to understanding the related problems and concerns in detail and establishing a shared understanding on the object of study which would further contribute to the development of the field. As there is no unified definition for CSCL, a compositional perspective might be taken in which the meaning of the term is built from its components. So, possible questions that can be asked include what do people mean by collaboration or learning and by CSCL. Rather than imposing an exclusive interpretation on the meaning of CSCL, the focus of research can shift to workplace learning, in this case to the specific initiative of employee volunteering, and how it might be supported by the online collaboration tools.

Table 1 provides the differences between traditional and collaborative learning as explained by Mandl & Krause (2001). A constructivist learning theory underpins the concept of CSCL. According to this theoretical approach, learning involves a process guided on one's own which requires a conscious knowledge creation and hence the previous experiences, skill set and mindset of the individual influence this process (Mandl & Krause, 2001). Additionally, there is a second constructivist approach with regard to knowledge-sharing: "to solve problems in a self-organized way" (Arnold & Schussler, 1998, p. 78). Within this regard it is crucial for organizational stakeholders that different types of learning are facilitated by supporting learner-oriented, social and situative learning (Mandl & Krause, 2001).

Table 1. Differences between the traditional and collaborative e-learning model (Mandl & Krause, 2001)

	Traditional Approach	Collaborative Approach
The objective of learning	Being qualified for expertise	Skill
Know-how	In progress, memorized	Construed
Paradigm	Solving a problem, gaining an understanding	To enhance related experiences and practices
Technology use	Dissemination	Communication, learning in collaboration The metaphor of participation
The mode of involvement for learner	The metaphor of acquisition metaphor	Dynamic and complex model
Interaction type	Delivery model	

Timothy Koschmann, one of the prominent scholars in this field asserted that this shift in pedagogical models due to the use of technology represents the start of a new paradigm according to the Kuhnian perspective (Koschmann, 1996). Koschmann (1996) further stated that with CSCL the emphasis shifts from the personal development onto the group cognition and due to the incompatibility of this perspective with the conventional view which is more individualistic, it meets the requirements of a new paradigm as determined by Kuhn (1962).

In my view, rather than trying to come up with a unified approach for empirical research in CSCL researchers should focus on how individuals collaborate with digital tools which might also be relevant for the CSC Programme. In my point of view, the aim should be to elaborate on the ways of using these tools in an effective way in order to obtain the commonly shared goals which is one of the underlying features of collaboration.

3. Research Methodology

This section discusses the key research questions, the overall methodological approach, the design of the study and research methods and strategies as well as ethical issues, and a short precursory description of data analysis planned including a pilot study.

IETC 2014

3.1. Research Questions

The study aims to answer the following research questions:

- How are collaborative learning tools used for the volunteering practice of knowledge workers?
- What are their assumptions about the benefits and challenges in using these tools for such a practice?

In conceptualising the participatory nature of this research study, I have derived my approach from the framework offered by Fajerman and Treseder (2000) that specifies six different ways for involving participants ranging from no involvement at all to the involvement of the participant initiated on his own or based on decisions shared with the researcher. The methodology used in this study belongs to the group of "consulted and informed" as defined by Fajerman and Treseder (2000), in other words I as a researcher designed the study while the participants' opinions are taken seriously. Needless to say, the participants are informed of the complete research process (See Figure 2).

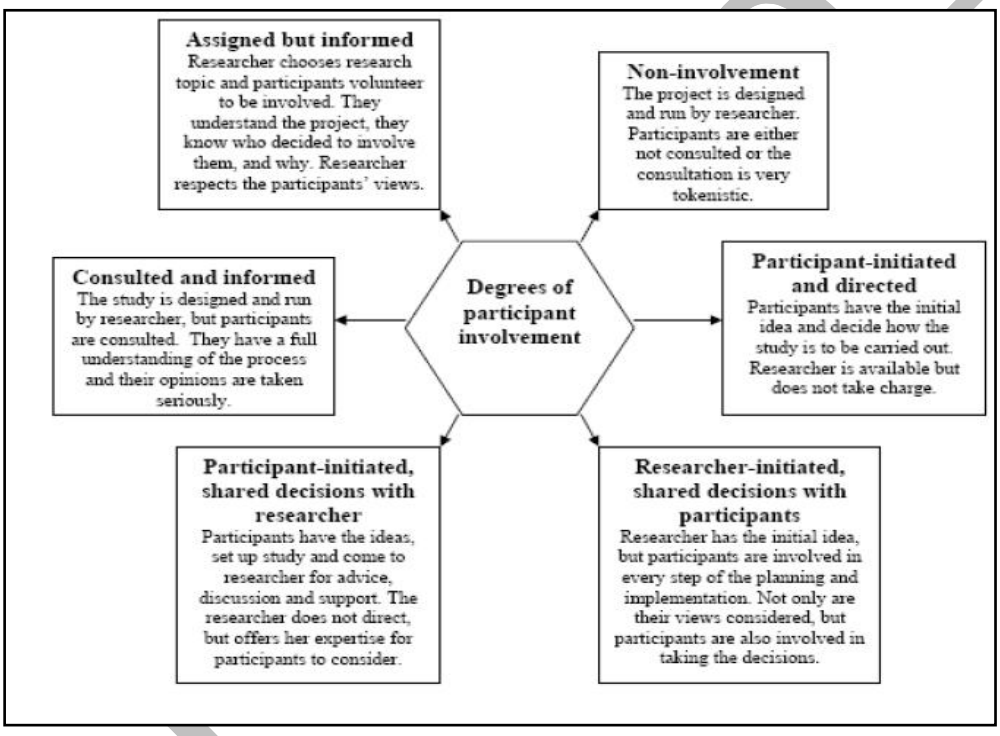

Fig 2. Fajerman and Treseder (2000)'s model for levels of participant involvement

3.2. Data Collection

Data collection has the following main sources:

- information based on the online survey,
- digital artefacts such as blogs and wikis and
- transcripts from the interviews.

The data collection methods of this research study include an interview an online); and review of digital artefacts all of which have been utilized in both participatory design and related participatory research. A cross table in order to match the online survey and interview details was developed. Table 2 provides the data collection methods based on each stage.

Table 2. Breakdown of data collected

Stage One- context	Stage Two- case studies	
Survey	Interviews	Digital artefacts
12	17	30

3.3. Data Analysis

To conduct the quantitative data analysis, SPSS was used while for qualitative analysis Excel was used by separating content into appropriate sections and manipulating it. Open comments provided about the answers were put into an additional column in the Excel file. In order to see whether some general patterns emerge an overall descriptive analysis was conducted based on the available dataset. A further analysis of these patterns showed whether there were differences among the volunteers. Based on the emerging patterns I coded the qualitative data and ranked the results or directly quoted to support the quantitative findings.

After data collection at the level of individual participants, I tried to put each case study into analysis individually followed by an overarching study across the cases (study of cases). The main purpose of the qualitative data analysis was to extract and abstract from the complex data any evidence with regard to the activities and experiences with online collaboration tools to convey responses to the research questions. I transcribe relevant extracts from the interviews to supplement the results of the survey. I used this analysis to convey more detailed information about the approaches that the participants put into use and in which ways the tools had an impact on both their approach to collaboration and their knowledge-sharing activities.

For further analysis, all verbatim transcripts of the online interviews with the interviewees were imported into NVivo. Table 3 provides an overview of the alignment of suggested coding categories with research questions and interview questions. Digital artefacts such as entries into the CSC Programme wiki, blog or Lotus Notes tools served as supporting sources. The themes and the categories to which they belong have been changed in case of any differences until a common agreement has been reached among the participants.

Table 3. Overview of the alignment of the suggested interview coding categories with research questions and interview questions

Research Questions	**Mapping with Interview Questions**	**Mapping with an Interview Coding Framework**
How are collaborative learning tools used for the volunteering practice of knowledge workers?	1. How does your organization make an effort to contribute to the usage of online collaboration tools during the CSC Programme? 3. How many times in a day do you use any of the online collaboration	DESCRIPTIONS OF USAGE (i.e. where participants describe how they use online collaboration tools thro-

	8. What are the factors that can contribute to your engagement with online collaboration tools?	online collaboration tools throughout the CSC Programme
	10. Is there anything else about your use of online collaboration tools that I could have asked you? Or anything else you would like to add?	
What are their assumptions about the benefits and challenges in using these tools for such a practice?	2. What are the main factors that allow/limit your organization to facilitate the use of the use of online collaboration tools within this context?	FEELINGS ABOUT USAGE (confidence, difficulties, concerns)
	4. What are the main factors that allow/limit your organization to facilitate the use of the use of online collaboration tools within this context?	SUPPORT- SOURCES (who provides the support; influential people)
	5. Are there any downsides to using online collaboration tools for professional knowledge-building and sharing? For example?	SUPPORT- NATURE (what kind of support)
	6. Do you think using technology – specifically for collaboration in this CSC Programme can be improved? Please give specific examples.	SUPPORT- EVALUATION (how useful or effective was the
	7. What are your key concerns of the use of online collaboration tools in relation to knowledge-sharing?	support perceived to be)
	8. What are the factors that can contribute to your engagement with online collaboration tools?	

4. Results

In line with the approaches above the CSC participants devise and adopt a variety of approaches when using technology to support their volunteering process. The most common types of approach adopted by participants seem to be related to sharing of experiences, knowledge and best practice which can establish the ground for encouraging the use of online collaboration tools. These are outlined in Table 4.

Table 4. Overview of the types of approaches used by CSC volunteers

Volunteers' Approaches	**Examples**
Having co-presence/ Sharing experience, knowledge and best practice	Using Instant messaging; participating in discussion forums; or uploading videos or photos onto the Internet

Meeting new colleagues and experience parts of the world	Having discussions through Lotus Notes communities and tracking the experience of the participants
Navigating through information, find personal routes and pathways	Using internal Lotus Notes platform
Increasing one's knowledge on CSC Programme	Using Edvisor especially before leaving for fieldwork
Reflecting on one's experiences	Blogging
Accessing, creating, sharing and continually improving ideas	Participating in exchange of ideas via blogs and wikis
Participating in networks of distributed volunteers engaging in activities	Using popular Web 2.0 tools such as Ning, FaceBook
Facilitating ongoing communication, dialogue and shared activity	Creating digital artefacts
Supporting one's learning process	Attending online trainings on culture, security and literature reading on social responsibility projects online
Receiving informal support	Using Skype or MSN to communicate with others
Aiming toward a common goal of knowledge creation	Participating in exchange of ideas via Lotus Notes communities, e-mail and wiki
Participating in a team evolution process	Observing others' online behavioural pattern on discussion forums or the wiki
Supporting online communities and relationships between people	Participating in Lotus Notes communities
Having a more authentic collaboration through the creation of digital artefacts	Posting mainly on blogs or contributing to wikis
Recombining the information shared by others to create new concepts, ideas, and services	Utilizing Web 2.0 tools (mostly blogs and wikis)

At the heart of the CSC Programme lies the process of project-based learning that enables the individuals to gain a shared understanding and construe a common basis for knowledge creation. This does not necessarily leave aside individual contributions and perspectives, yet volunteers are not required to segregate their work into discrete tasks to be completed individually and bring them together later on. Rather, they are required to make contributions to the point of views of their team mates for the mutual negotiation of meaning and the joint construction of a project by using online collaboration tools (Roschelle & Teasely, 1995). Coordination is a necessary element only when putting together the partial results of the discrete tasks of the related project (Roschelle & Teasely, 1995). On the other hand, the construction of a joint project through genuine collaboration necessitates a coordinated effort for a joint problem-solving (Roschelle & Teasely, 1995). It involves an interactive process that requires the participation of all group members for mutual negotiation and sharing of ideas (Roschelle & Teasely, 1995).

All these factors displayed in Table 5.0 lead to the emergence of a new volunteering practice that I call as 'distributed' or 'technology-enhanced' volunteering. It is the amalgamation of the social affordances of digital tools, with new informal learning goals and priorities that provide an opportunity for metamorphical shifts in employee volunteering practices.

Table 5 Mapping between research questions and the findings

Research question	**Findings**	**Sub-themes**

	While connection is about enabling a space for activities co-presence is about requiring that everybody participate in these activities.	Usage & Approaches Strategies/Choices Feelings
	Informal and formal distributed cognition are apparent throughout the CSC project.	Usage & Approaches Strategies/Choices
How are collaborative learning tools used for the volunteering practice of knowledge workers?	Through participation in these forms of discussion and interaction, volunteers are provided with the ability to construct their own informal learning trajectories as well as shaping proactively those of others. This observed distributed cognition among CSC volunteers as supported by online collaboration tools directly leads to the temporary construction of one or more group minds.	
	Intersubjectivity is obtained when there is a shared ownership of the activity and a common conceptualization about the objective as a result of the collaborative redefinition of that activity. So, perspectives are negotiated on an ongoing basis.	Usage & Approaches
	The perceived benefits of online collaboration tools can also engender epistemic fluency (Goodyear & Zenios, 2007) which allows volunteers not to underestimate the complexity of existing ideas, norms and practices.	Usage & Approaches Feelings

Evidence of both interdependent use (using the tools for the purpose of collaboration), independent use (e.g: independent use of tools for other purposes than collaboration) are evident throughout the study. Such practices do not often conform with the norms and practices of the conventional volunteering practice. Individual traits such as personal values act as a mediator for the methods of collaboration and learning in social contexts, such as digital environments.	Usage & Approaches Choices
Interrelations among the values of the participants and the digital actions give form to the individual engagement within the collaborative practice of volunteering.	
Volunteers' participation in digital collaboration should not be assumed as being certain. Meaning and value are important for what is afforded for them to participate in online conversations and learn. So, there are different kinds of invitational qualities required such as the ability to make reluctant participants get involved in conversation and support them for finding a meaning through their participation in ways that enable the transformation of existing values and practices.	
Given the situatedness within the context of relations and distributed volunteering networks, the volunteering experience requires a certain amount of commonality in order for collaboration to take place.	Usage
The main challenges were how to find meaningful insights, to decide for the individual roles and responsibilities as well as the delicate balance of internal and external capabilities.	Feelings

What are their beliefs about the benefits and challenges in using these tools for such a practice?	Two individual aspects that appeared to influence participants' decisions about technology use are: • A tendency to participate in a shared endeavour; • A feeling of co-presence	Choices Use & Feelings
	Retention of the co-presence and eventedness, involve to some degree retaining the volunteer's perspective.	Usage & Feelings
	One of the key affordances of various tools used throughout the CSC Programme is its collaborative affordance. That is, the tools have properties that allow them to be used to collaborate.	Usage & Approaches Choices
	Although the tools were not mainly designed for the purpose of learning, volunteers perceived its potential to support learning.	
	The tools cannot be used for arriving at a precise decision.	Critical moment Feelings & Assumptions
	The clarification of mutual roles and responsibilities is essential to effective utilization.	Feelings & Assumptions
	Some participants mentioned that receiving informal peer support is an important alternative to receiving timely formal support.	Support
	Participants equipped with various levels of expertise and areas of interests nourish the volunteering environment with ideas and knowledge that are befitted by volunteers based on their needs. Expertise is therefore distributed amongst all volunteers. Given the 'transformative' nature of such interactions (Pea, 1994), individuals acquire more expertise as the dialogue unfolds and they co-construct knowledge.	Choices Usage & Feelings

There is also the opportunity provided by the online collaboration tools to go through a team evolution process and recognize common patterns in communication styles of group members.	
Some participants expressed some issues of concern such as privacy. Still some of the participants indicated they would collaborate without technology, but they would prefer not to.	Choices Usage & Feelings
Commitment to joint work comes from those we know well and trust -- our strong ties in social network terms. Thus, according to Haythornthwaite (2008) e-learning settings also need to support strong tie formation in order to get work done.	
The different tools enabled the volunteers to navigate through information, find personal routes and pathways.	Usage Choices Skills
The volunteers are also endowed with a flexibility that enables 'collaborative remixability' (Boyd, 2007) – a transformative process which denotes the state of the information which can be recombined to further develop new concepts, ideas, and services.	Usage & Approaches Choices Skills
As the tools can offer individuals access to crucial components of knowledge related to their volunteering projects, it is important that these tools are highly invitational.	
A more liberated definition of community occurred derived from the notion of social networks with an emphasis on social ties rather than geographic location. These virtual communities are place independent, liberated from geography and dependent on technology.	
In CSC Programme, online interaction support offline geographically dependent communities whereas online interaction and engagement go hand-in-hand with overall civic engagement. Also, by using information and communication technologies to improve communities community informatics becomes more important.	

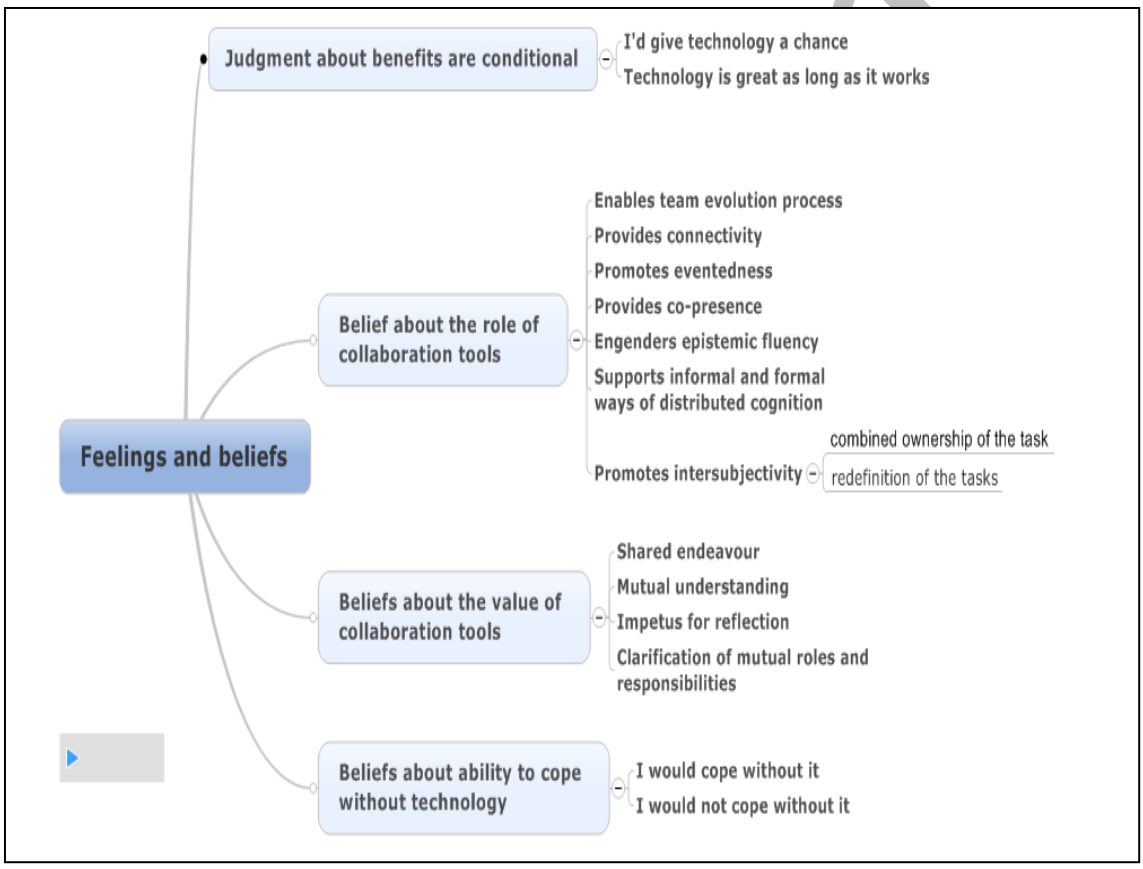

Fig 3. Samples of answers to interview questions

According to Selwyn (2006), who came up firstly with the term "digital decisions", when individuals make empowered decisions to use or not to use technology, they exercise a genuine choice by taking into account its relevance, usefulness or even happiness caused by its usage throughout their everyday lives (Selwyn, 2006).

The choice for not using the technology is also evident in the CSC data. One of the underlying reasons for not using the technology was no being able to "get on with them". It is also evident from the data that several CSC volunteers think that it is up to them to take refined and complicated decisions for the usage of digital tools to aid their volunteering practice. The affordances and features of digital tools mainly underlie this decision-making process in addition to other factors.

The results from the study suggest that the opportunity of both being provided with a feeling of co-presence and eventedness are reasons why participants liked using online collaboration tools mostly CSC participants mentioned that the feeling of belonging to a networked community of colleagues sharing resources and asking for support the value of peer support is also an influential factor

Finally, if there were a particular amount of dependence on collaboration tools due to the assumption that it facilitates an easier collaboration; CSC participants preferred to refer to specific aspects and stated their views in a confident manner, rather than just being in favour of a particular tool or using it.

5. Conclusion

Technologies can provide many possibilities, but they cannot "fix" meanings (Suthers, 2005). Based on this fact, this research identified the specific benefits of online collaboration tools, and explored how their usage has been appropriated by employee volunteers for their practice of volunteering and how they influenced the process of their meaning-making. By doing so, it raised an awareness of the digital tools that provide collections of traits through which individuals can get involved in non-formal learning practices by having digital interactions with others.

It would be disingenuous and naïve of me to promise that the research study will by itself transform the online collaboration experiences of all users. I do however argue that the finding of this research study would increase an awareness amongst institutional stakeholders interested in the practice of employee volunteering to take further action and to provide direct responses to what the participants have said and done.

Furthermore, the concept that the process of employee volunteering should make a shift from the conventional model that has been depicted through this research study and elaborates that participants have created a variety of refined and customized strategies for putting the digital tools into practice to aid their process of collaboration. I assert that the most pragmatic way to view online collaboration tools with respect to supporting employee volunteering or other non-formal learning practices is to consider it an enabling medium through which the individuals can structure and complete their activities. The possibility of making use of the tools to reach beyond the individual volunteering activity and facilitate access to other contexts of activity which can be reciprocally supportive breaks down some of the employee volunteering stereotypes that have been moved back and forth for such a long time.

One of the main challenges faced during technology-enhanced volunteering programs will be the composition of the available digital tools and activities so that each tool can be utilized for its affordance. Despite the fact that this study has taken a step in that direction, there is certainly a need for more studies about what works and what does not in a project-based learning environment. The alignment all the affordances in such a way that volunteers gain an understanding of them and make use of the many affordances can be difficult. So, online collaboration tools should better be distributed within the network of volunteers and embodies within their practice of volunteering so that volunteers have more opportunities to realize and

IECT 2014

take benefit from the affordances of the digital tools. For this purpose, a thorough structuration of the complete environment and the various actors within that context are required: volunteers, digital tools, digital resources and other project stakeholders such as managers.

In the final analysis, the incorporation of online collaboration tools into the CSC Programme is about change in the way the volunteers collaborate with each other, not about technology. This collaborative phenomenon raises the point about socio-technical systems thinking, which stipulates that technology in itself has little meaning. Within the context of employee volunteering, technology gains its value with regard to the collaborative interactions of the volunteers. It's about people and their behavior, not computers. It is about inventing new visions of employee volunteering in the context of a digital world. While the lack of online collaboration tools is a barrier to change, the presence of these tools does not guarantee change.

[b]*Northern Border University, Arar,91481,Kingdom of Saudi Arabia*

Abstract

In todays' economically viable worldview scenario, everyone wants to earn sufficient money which can be spent to maintain better lifestyle. There are many factors such as people living in the remote areas without appropriate communication systems or the physically challenged people et al who are not able to attend the traditional college system hence they seek an alternative option to gain education. E-Learning is a best alternative that provides suitable opportunity to all such individuals to obtain the desired qualifications or degrees as quality education even without attending any face to face college system in the educational institutions. The most positive point in E-Learning is that students find opportunity for access to the course materials anytime and anywhere whenever they find time through the use and application of electronic gadgets. Today, every reputed educational institution especially universities worldwide run their distance learning courses under the E-Learning system. Most powerful feature of E-Learning is that it remains an extremely interactive experience. Too many applications and tools are already available abundantly in the market today to promote E-learning in multiple ways. Take for example Moodle, Blackboard, LectureCast, Classroom 2.0, ELE (E-learning Environments) and E-Learning 2.0 amongst others. In this paper, we have focussed on the Second Life by Linden Lab (USA) for educational trainings. It has special instructiveness as we compare to rest E-Learning training methodologies available before us nowadays. It gives an opportunity to the students to attend virtual classrooms and attend lectures. The good thing is that Second Life develops a sense of presence in the students who feel as if they are physically present in the university campuses and spend time with their faculty members or peers. There are several other impeccable and strong features in Second Life. We have focused on Second Life education project to connect with Blackboard which we have already started to use in our university.

Keywords: Second Life, E-Learning, 3D Virtual World, Blackboard, Moodle

IETC 2014

1. Introduction

E-Learning is mushrooming in most universities and Institutions of Higher Learning worldwide where it is used as an alternative education system today. Mainly there are two types of e-Learning concepts namely Synchronous and Asynchronous. Synchronous environment is more interactive than Asynchronous environment because in Synchronous environment users are empowered to exchange all sorts of information during the same time frame. There is no dearth of applications when it comes to supporting e-Learning nowadays. Such applications are easily available in the market and are especially meant to make e-Learning a hassle-free experience through all possible supports required. Some popular applications, widely practiced in every nook and corner of the world, include Blackboard, Moodle, OpenSim (Linden_Labs, Second Life 2009) and Second Life (The_Open_Simulator_Project, 2009) Today, Second Life (SL) has emerged into one of the most popular 3D multiuser virtual environment applications with its practises increasing each passing of the day. Many leading universities in the world prefer using SL for teaching and

* Corresponding author: Dr. Ahmed Maajoon. Alenezi
Tel.: +966505279551; fax: +9660146644949.
E-mail address: Ahmed.Alenezi@nbu.edu.sa

learning purposes. Approximately 500 universities and colleges around the world have preferred SL (http://secondlife.com/; M., Fominykh, E., Prasolova-Førland, M., Morozov, and A., Gerasimov, (2008). The advantages of SL are variegated in nature so most users have options to build their own knowledge bases through the help of the tools present in SL. This paper describes the main features of SL like how it is useful for educational purpose and what are the challenges which one might face during its usage? An important idea which has summed up through connecting SL with Blackboard is to explore the avenues which bring more attractiveness and user friendliness environment for students and faculty members alike. This concept though also carries many disadvantages (C., Allison, A., Miller, T., Sturgeon, J., Nicoll, and I., Perera, (2010) which mainly relates to the restricted programming, backup problems & network conditions besides other issues such as server loads. Such aspects prevail due to it being centralised in nature and concept (C., Allison, A., Miller, T., Sturgeon, I., Perera, and J., McCaffrey, 2011). According to a research done recently, by the end of 2012 approximately 70% organizations have already started using virtual world tools through setting up their own Lands and experiential spaces (Hew, K.F., & Cheung, W.S., (2010) & so was the prediction for 80% Internet users to use Virtual Avatars which seemed coming true (Chang, V., Gütl, C., Kopeinik, S., & Williams, R., (2009).In this paper, we have described our new experiment, "how to get the benefits of two e-Learning technologies with the combination of their services and facilities (Blackboard and Second Life). First tool lacks some features and the other fulfilling such things and vice versa. The methodology of this paper clearly describes how and why this decision has worth.

1.1 History of second life

Second Life was launched by Linden Lab in 2003 for the public use. It though gained ample popularity during 2005-06 with drastic increase of its users. Nowadays, it has already attained 36 million registrations. Linden Lab was founded by Philip Rosedale in the year 1999. Earlier, Linden Lab's motive was to develop hardware for the Virtual world. The product name given was **The Rig** but after sometime they began working on SL to support the Virtual world. Learners can now create objects and textures in SL through the help of its variety of built-in tools which are already made available in SL. Linden Lab developed a scripting language named Linden Scripting Language. Residents (Avatars) can use other's scripts as well. Residents have good scope to communicate with each other through the Avatars (Y., Zhao and L., Wu, (2009). Learners can import the objects, textures and animations through the support of external software available in SL which provides a Virtual market to sell and buy products.

1.2 Benefits of second life in education systems

It might look strange but the fact is undeniable that you may visit to other countries without leaving your classroom while using SL. Of course, you feel at home while use SL especially once learn about other's cultures besides acquiring newer skills, engaging yourself in the entirely new forms of communication to interact with others and so do you increase 'people's skills' further. You have an entirely new way to solve the problems that might not been possible to perform in the 'real world' scenario. Other advantages include connecting to other online communities, forging new links and friendships and last but not the least finding new opportunities to collaborate and go for social interactions while you are at self-paced learning route to suit all possible learning styles. You have best opportunities to create, comment and share contents with other users through SL and in the meanwhile there is an opportunity to integrate within the blended learning system to avail maximum benefits. SL therefore offers range of opportunities for researchers because of collaboration and connection between the users. You are exposed to whole range of possibilities which you might not have utilized on the previous occasions.

1.2.1 Changing the trend of existing traditional system

In SL, users have privilege of creating Objects and Avatars as per one's wish or preferences. Users can also exchange information and so do they publish their work on SL.

IETC 2014

1.2.2 Availability to remote area

Students can use SL who live in the remote areas. It therefore saves time and energy of those students staying at any far off distant regions from the universities or colleges they have enrolled. It provides them real scenario through the 3D presence.

1.2.3 Interactive

Students feel as if they are present in the institutions in real terms through the help of Avatars. It is equipped with voice and chatting facilities for exchange of information between the users. They can definitely share their knowledge and experience through literally living in a second life while they use SL.

1.2.4 Collaborations & connectivity with other e-learning applications

Students and instructors can create their own groups and connect with the other Educational Groups or Organizations to share knowledge without even having any physical presence. There is no need to be present physically at any Institution from which any group wants to share desired information. It ultimately reduces the cost of education which is one of the added benefits. It can be linked with 2D Web, Blackboard, & Moodle with the help of Sloodle (Sloodle, http://www.sloodle.org/moodle/) Moodle is used to create online learning sites (Moodle, http://moodle.org/). It is an open source application for e-Learning.

1.3 Business opportunities

It is unique and interesting fact that SL runs its own currency which has been named Linden dollars. Near about sixty thousands of SL users do exchange their real currencies with Linden dollars to go with the business opportunities of one kind or another. Most users do earn sufficient money through buying and selling lands, involvement in advertising activities, stores, scripting & several other roles which are professionally impeccable. It is worth noticing to see hundreds of thousands of companies already existing in SL who often involve the users to work on the roles like 2D and 3D animation etc., for their active involvements. Good number of World Tour Agencies operate through SL. If it is in the field of Education then users have opportunity to set up their own institution for specific training options to explore (http://secondlife.com/destinations/business; http://secondlife.wikia.com/wiki/Business.). Those willing to attend such classes are charged certain fees to attend the classes. In some cases such classes are also offered free of cost depending upon the educational world and the nature of trainings given. One of the recent examples can be witnessed in Egypt where SL became a medium of training for the annual "HAJ."

1.4 Issues and challenges in second life

1.4.1 It takes a lot of time

It requires a lot of time to obtain skills to create objects and Avatars in SL such as in a case students and faculty members plan to create some project in SL, they require sufficient time to create the projects. You

IETC 2014

have to first learn how to create the objects like wall, chair etc., and Avatars which students or faculty members or both want to use.

1.4.2 Internet availability

SL requires high speed internet connection and computer devices. It should be noted that operation might become difficult in the developing & poor countries where lack of infrastructure and high speed broad-band services are not easily available so bunch of problems welcome users. Furthermore, the next issue is factors related to the economic conditions of such countries. All learners willing to utilise SL must spend sufficient money for computer devices & high speed broadband services to avail such benefits.

1.4.3 Privacy issues

(i) All Avatars present in a particular area can see other's names and an Avatar can't change his SL name.
(ii) Residents can interfere in the conversation between other residents through the help of scripts. \

2. Literature survey

Case studies and surveys done ever and those evaluated by previous researches shows that Virtual 3D e-Learning environment boost distance education sector. It is highly beneficial for students which can increase students' engagements and experiences (Brown, J.S., and Adler, R.P., 2008; Carr, D., 2008). Martino (Martino, J., (2007) & Van den Brekel (Van den Brekel, A.J.P., (2007) found that Virtual environments are best substitutes for those students unable to attend traditional face to face teaching systems. According to A., Jamaluddin, Virtual experiments give great environment for Teaching & Learning (A., Jamaludin *et al*., (2009). According to Kemp, J., and Livingston, D., SL can be used to create 3D experiential based the projects for e-Learning (Second Life, Last accessed 7th April 2008 From:http://www.secondlife.com; Kemp, J., and Livingstone, D., 2006). SL was not designed especially for the education sector but it is widely used in the education field nowadays. There are many other virtual worlds available in the market today from Open Sim, ThereWorlds and et al. But SL is best among such Virtual world tools. SL provides communication, group discussions and collaboration of groups and communication between group members (M., Hobb *et al*., (2006)). Several researchers agree that SL has great impact due to its effectiveness on both either hybrid or fully online courses (Jarmon, Keating, & Toprac, 2008; Jarmon & Sanchez, 2008; Nicosia, 2008). According to an estimation more than two hundred educational institutions and universities use SL presently to deliver their online lectures. An Educators listserv (SLED) helps and promotes best practices in education. It provides important materials for the instructors willing to use it in the classroom. Another Listserv, Second Life Research listserv (SLRL) deals with the current applications in SL, new methodologies, measurement, assessment & virtual conferences. More than eighty per cent universities in the UK are associated with SL. Over one hundred and fifty universities in the United States of America (USA) own their islands in SL. It gives classroom feeling with fun learning experiences. SL needs technical experts in the fields of multimedia and programming to create their educational projects. It also needs full training to use SL for instructors. If we compare SL from rest traditional e-Learning techniques such as LMS (Learning Management System) for example Moodle, Blackboard etc., it is clearly an indicative that it is tough to use SL (Virtual Learning Techniques).

IETC 2014

3. Methodology

Northern Border University (NBU) in Saudi Arabia has already started using Blackboard to promote e-Learning in its various colleges. Although Blackboard is an excellent e-Learning tool but the concept of virtual reality facility is still not available in it. Blackboard definitely gives facility to integrate with Second Life. Keeping in view the use of SL in our university we conducted a survey for that purpose. It started with providing platform to university's coordinators and faculty members for thorough discussion with all those parties involved in the e-Learning concept as a team representing different departments of NBU. The initial steps were through showing demos and short trainings on Second Life from its application to use amongst others.

We selected the variables for a survey which are listed below, and their description is mentioned in the table. We compared these two applications according to the facilities they offer and according to our needs in NBU at present. These are key factors which we have taken for comparative study. The table below shows comprehensive comparison between SL and Blackboard.

The Key factors (variables) on which we have taken the decision is:

(i) Application

(ii) Environment

(iii) Tools

(iv) User Friendliness

Table 1. Comparison between Second Life & Blackboard

Parameters Used	Second Life	Blackboard
Applications	It can be used for educational business, and religious or anything which any user wants to create.	It is only for Educational purpose.
Environment	3D Virtual Environment helps the Participants to Represent it through the help of Avatars.	Interactive Websites, No concept of Avatars.
Tools	Fully User Created Ideas are Implemented via Videos, Audios and Chats etc.	Predefined learning tools are available like courses, tasks and questionnaires.

IETC 2014

User Friendliness led	Required Highly Skilled People to Use	Not required high skil-
and Create Contents.	People as it is easy to use.	

Results:

We selected few Questions (Multiple choice) which are based on the variables selected that we have selected according to our needs. For example-

Q. On which e-Learning application you can represent yourself virtually (Imagine your cybernetic **(means your Virtual Image)** will be there during class time (It is called 3D Virtual Learning) and can talk with the students & vice versa.

Options were:

a. Face to Face (Traditional) Learning

b. Online Learning

c. 3 D Virtual Learning

d. Blended Learning

Figure1: First Data is collected for Second Life

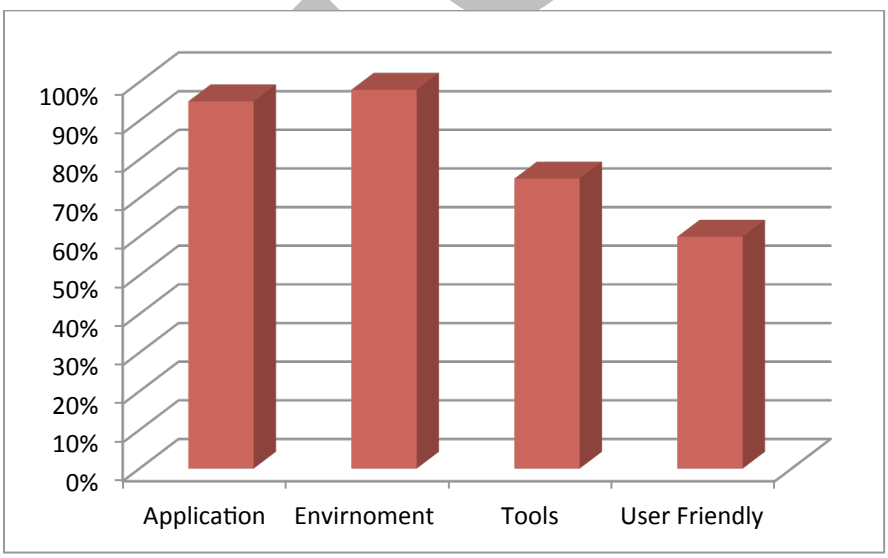

Figure 2: Second Data is Collected for Blackboard

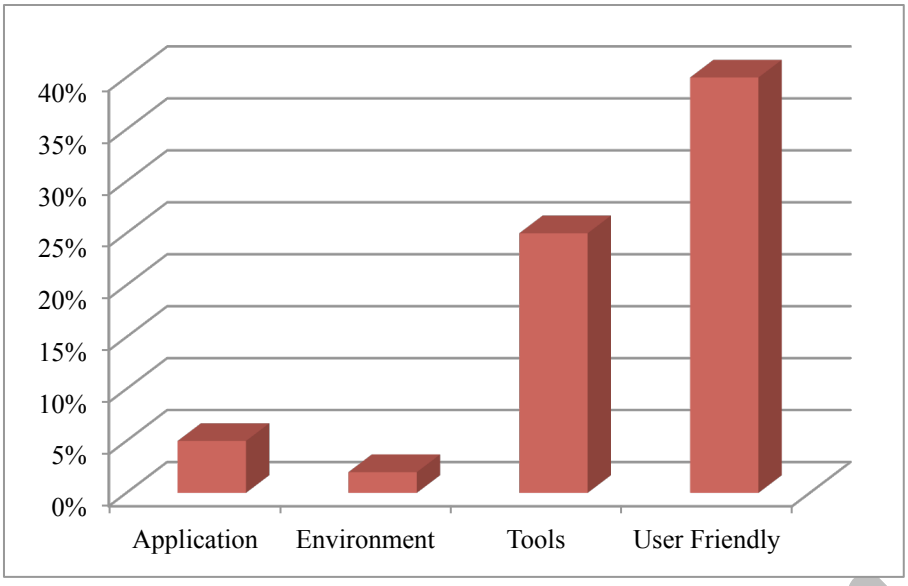

Figure 3: Compare Graph between Second Life & Blackboar Data

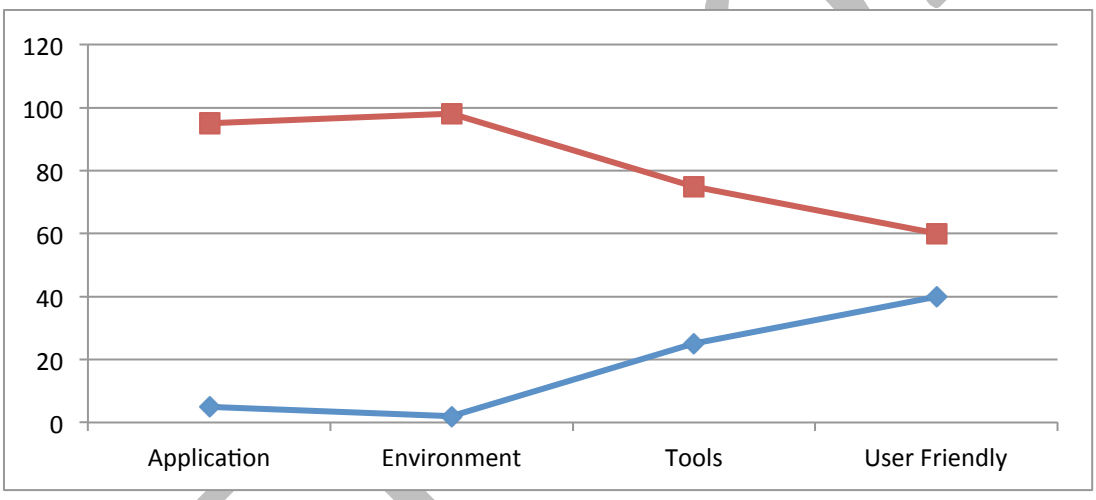

Table 2: The Compare Table Percerntage is:

Compare Percentage	Second Life	Blackboard
Applications	95%	5%
Environment	98%	2%
Tools	75%	25%
User Friendliness	60%	40%

After the completion of our survey, we found that 95% people like application part of SL while 98% liked environments of SL but it is not easy to use and prepare materials on SL with the percentage going down to 75% and 25% respectively. If we look at Blackboard part then people voted for the tools are 25% while for the user friendliness it was 40%.

People who voted in this survey represented technical background. It is noticeable that with such backgrounds their suggestions were approximately 25% for tools use and for the user-friendliness it was 40% then it remains a tedious idea that persons from rest departments would have maximum usability.

We concluded that the need is to combine Second Life & Blackboard in the current scenario in NBU for effective promotion of e-Learning tools. Combined benefits like Blackboard offering best of prepaid materials and Second Life providing easy networking tools with its features of virtual reality will pave the way for a newer perspective.

Blackboard gives facility to integrate it with SL. One of the most important factors to use both is that we still don't have technically sound members in all departments in our university but they are gearing up to adopt the new technologies. From combination of these two applications we will definitely have unlimited benefits and advantages.

4. Conclusion

Virtual world will be the most effective arm for universities in the near future to support all sorts of distance learning systems. It is a latest technology 3D (MUVE) which supports education system in an attractive manner. Right now, SL fulfils most of the facilities and function which educational institutions require to make best use of their e-Learning applications on the basis of several comparative studies. Various types of 3D (MUEVs) are present in the market these days but SL dominates in almost all leading universities worldwide due to its unique features and functions. Ultimately, if we connect to Second Life alongside Blackboard it would be a great combination of services towards e-Learning because there are many prepaid formats to assist both faculty and students in Blackboard from Syllabus to Content to Texts and Videos et al. Blackboard gives a very easy method to make such things and beside this SL offers a virtual platform to create the virtual classes for an experience of real classes to attract the students. For our university we have started work on SL project after the decision of survey, and in near future we will deliver our trainings through virtual world. We are planning to implement this for conferences and want to create research and development in Science, Engineering and Medical fields. We will connect our teams with other research groups that are now present in Virtual world. It will save time and cut the travelling expenses.

IECT 2014

5. Future work

Although there are many drawbacks in SL but its benefits make it at par and attractive. In the current scenario, SL can't replace traditional online e-Learning systems completely. Linden Lab has to focus on the privacy issues mainly to maintain thorough discipline in the teaching environments. There should be a strong system to resolve the matters related to offences or violence without any delay. Linden Lab has to create some easy tools which must be user-friendly and least complex in the processing. Make the processes easier as much as possible so that it doesn't require any special training to use SL unlike in the current scenario when it requires certain amount of desired skills for complete operation.

6. Acknowledgements

The researchers would like to thank all participants whom we had involved in this survey for our research outcomes; and so do we extend our thanks to the Ministry of Higher Education in the Kingdom of Saudi Arabia, for funding this Research Project conducted under the supervision of Deanship of e-Learning & Distance Learning at Northern Border University. The motivation we had from the Ministry of Higher Education and University Leadership is highly admiring for boosting our morale to conduct such timely and valuable researches.

Abstract

This paper aimed at describing how mobile learning (mLearning) could be incorporated in formal setting exemplified through developing an mLearning implementation model for English Language skills course among undergraduates. Based on Moore's transactional distance theory and Park's Pedagogical framework for mobile learning, the study adopted a hybrid NGT-ISM technique in developing the model via experts' views. Mapping against the theories adopted, the model was further elaborated on how mLearning is implemented through language activities. The findings of the study could impact technology mediated education specifically on the implementation of mLearning as learners' performance support in formal language learning at university undergraduate level.

Keywords: mLearning; informal learning; Interpretive Structural Modeling; transactional distance theory

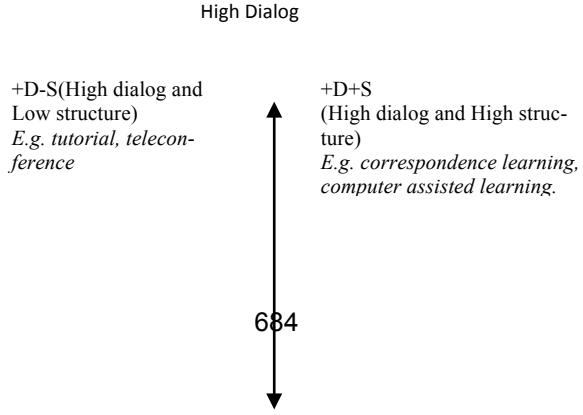
IETC 2014

1. Introduction

In the instruction of language subject, it is often an uphill task for lecturers in providing adequate time and space for meaningful language exposure in the classroom for every student to develop their fluency due to large numbers of students with limited time allotted for formal language classes. To add to the odds, most formal language instructions are still based on drill and exercise principles. MobileLearning (mLearning) or learning mediated through mobile devices and technology coupled with robust mobile interaction environment could aid students to fulfill their language learning needs. Past researches have evidently stressed on the positive effect of mLearning on students' learning. For example, a mobile learning tool (MOLT) developed by Cavus and Ibrahim (2009) showed that undergraduate students enjoyed learning new vocabulary using Short Message Service (SMS) text messaging through their mobile phones. In another study, mobile phones are more effective as a vocabulary learning tool compared to traditional vocabulary tool (Basoglu & Akdemir, 2010). Through mLearning as complement to formal classroom learning, students could facilitate own learning (learner's autonomy) and indirectly allowing a sense of ownership (Truby, 2010; Dlodlo, Tolmay, & Mvelase, 2012). In this study, employing mLearning not only could be regarded as a complement to formal classroom learning but also to augment classroom learning (Quinn, 2011; Terras and Ramsay, 2012). Learning activities which are engaged in the classroom could be continued and developed through mobile interaction beyond classroom walls and time, facilitating more students to fulfil course learning outcomes despite of students' individual different learning needs

* Muhammad Ridhuan Tony Lim Abdullah. Tel.: +6015844964; fax: +6053656280
*E-mail address:*ridhuan_tony@petronas.com.my

(Muhammad Ridhuan & Saedah Siraj, 2010). As a solution, mLearning could help more students especially the low achievers to improve their language competence and communication skills. However, how mLearning is viable as a solution would depend on how it should be implemented (Abdullah & Siraj, 2011). Thus in this study, this paper seek to illustrate an example how a sustainable mLearning initiative could be employed through the development of an mLearning implementation model for an English Language communication course. Here, mLearning is incorporated in the formal classroom learning as a solution to fulfill learners' language learning needs especially the low achievers at the undergraduate level.



2. Theoretical framework

This section discusses the theoretical framework in framing the development of the mLearning implementation model for undergraduate English Language learning.

2.1. Transactional distance theory

Transactional distance theory proposed by Moore (1997) falls under educational theory to define the concept of distance learning. His theory capitalizes on the cognitive distance which is pedagogical in nature between instructors (lecturer or teacher) and learners in educational setting especially in the field of distance education. The distance is seen to affect the teaching and learning strategies and techniques employed by the instructors. The strategies and techniques should aim at minimizing transactional distance to maximize learners' learning outcomes. In shortening the transactional distance, Moore introduced three key interactive variables, which have to work together to provide an effective and meaningful learning experience namely dialog, structure, and learner's autonomy (Moore, 2007, p. 89-105). On the basis of the presence or absence of dialogue (D) and structure (S), Moore (1997) presented four types of transactional distance ranging from low dialog and low structure (–D–S), low dialog and high structure (–D+S), high dialog and high structure (+D+S), to high dialog and low structure (+D–S) which could generate endless types of teaching and learning (Park, 2011). The four types of types of transactional distance here could be illustrated as in Figure 1.

IETC2014

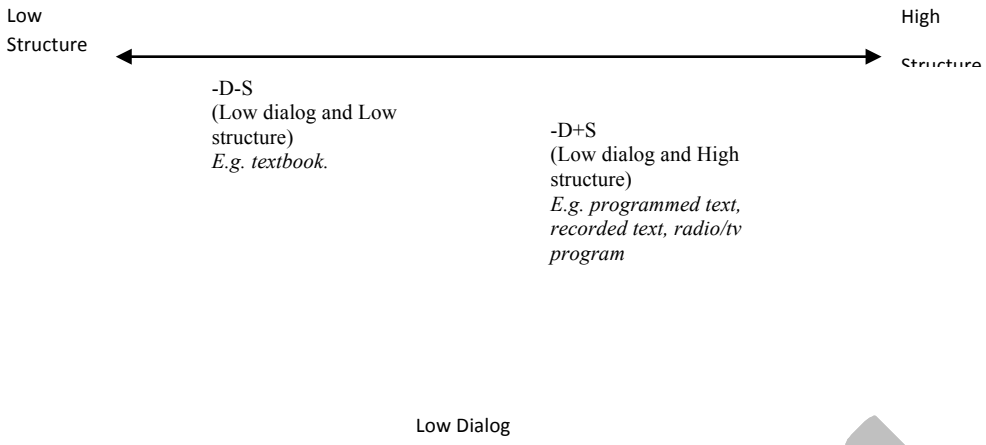


Figure 1. Types of transactional distance (Moore, 1997). Adapted from *Theory of Transactional Distance*, by M.G. Moore, 1997, in Theoretical Principles of distance education (pp. 22-38) by D. Keegan (Ed.), NY: Routlege Studies in Distance Education.

Since mLearning is categorized under distance education, the theory could describe the types of learning activities involved in the development of the mLearning model in this study where pedagogical spaces exist between the learners and the instructors mediated through mobile devices. Based on the types of transactional distance introduced in the theory, the types of language learning activities could be theorize according to interactions among dialog, structure, and learners' autonomy. For instance, in the introduction of a learning topic, structure could be high and the amount of dialog could instead be low to allow students an overview on what they have to learn. As the learning progresses to practical session, structure would be loose allowing more interaction (dialog) among learners and instructors to develop learners' language skills.

2.2. Park's pedagogical framework for mlearning

In the context of this study, we adopt Park's pedagogical framework for mobile learning (Park, 2011) to conceptualize the implementation of mLearning in this study. The pedagogical framework is a modification of transactional distance theory (Moore, 1997; 2007) to serve as a theoretical framework for the implementation of mLearning. This framework could further elaborate the types of mLearning activities based on learners' interaction in effective implementation of mLearning. Park (2011) designed the framework (Figure 2) as reference to instructional designers to effectively design and implement mLearning. In this framework, Park focused on the social aspect of learning with mobile devices as mediating artifacts. Park's pedagogical framework is comparable to the purpose of the study in the context of learning through social interaction among learners, instructors, devices, content and learning context mediated by mobile devices; hence the adoption of the framework. In his framework, Park (2011) proposes four types of mobile learning activities generated in the context of distance education as the following:

(1) High transactional distance socialized mLearning (HS)
(2) High transactional distance individualized mLearning (HI)
(3) Low transactional distance socialized mLearning (LS), and
(4) Low transactional distance individualized mLearning (LI)

IECT 2014

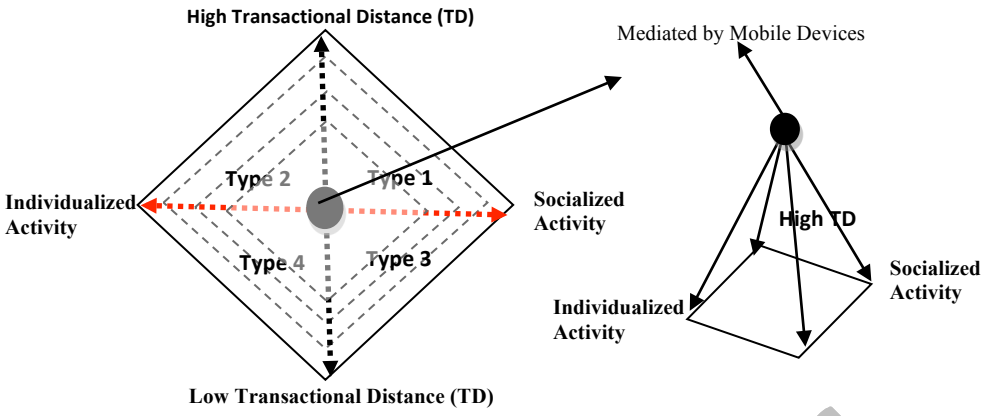

Figure 2. Four types of mobile learning: A pedagogical framework. Adapted from "A Pedagogical Framework for Mobile Learning: Categorizing educational applications of mobile technologies into four types," by Y. Park, 2011, The International Review of Research in Open and Distance Learning, 12(2), p. 89.

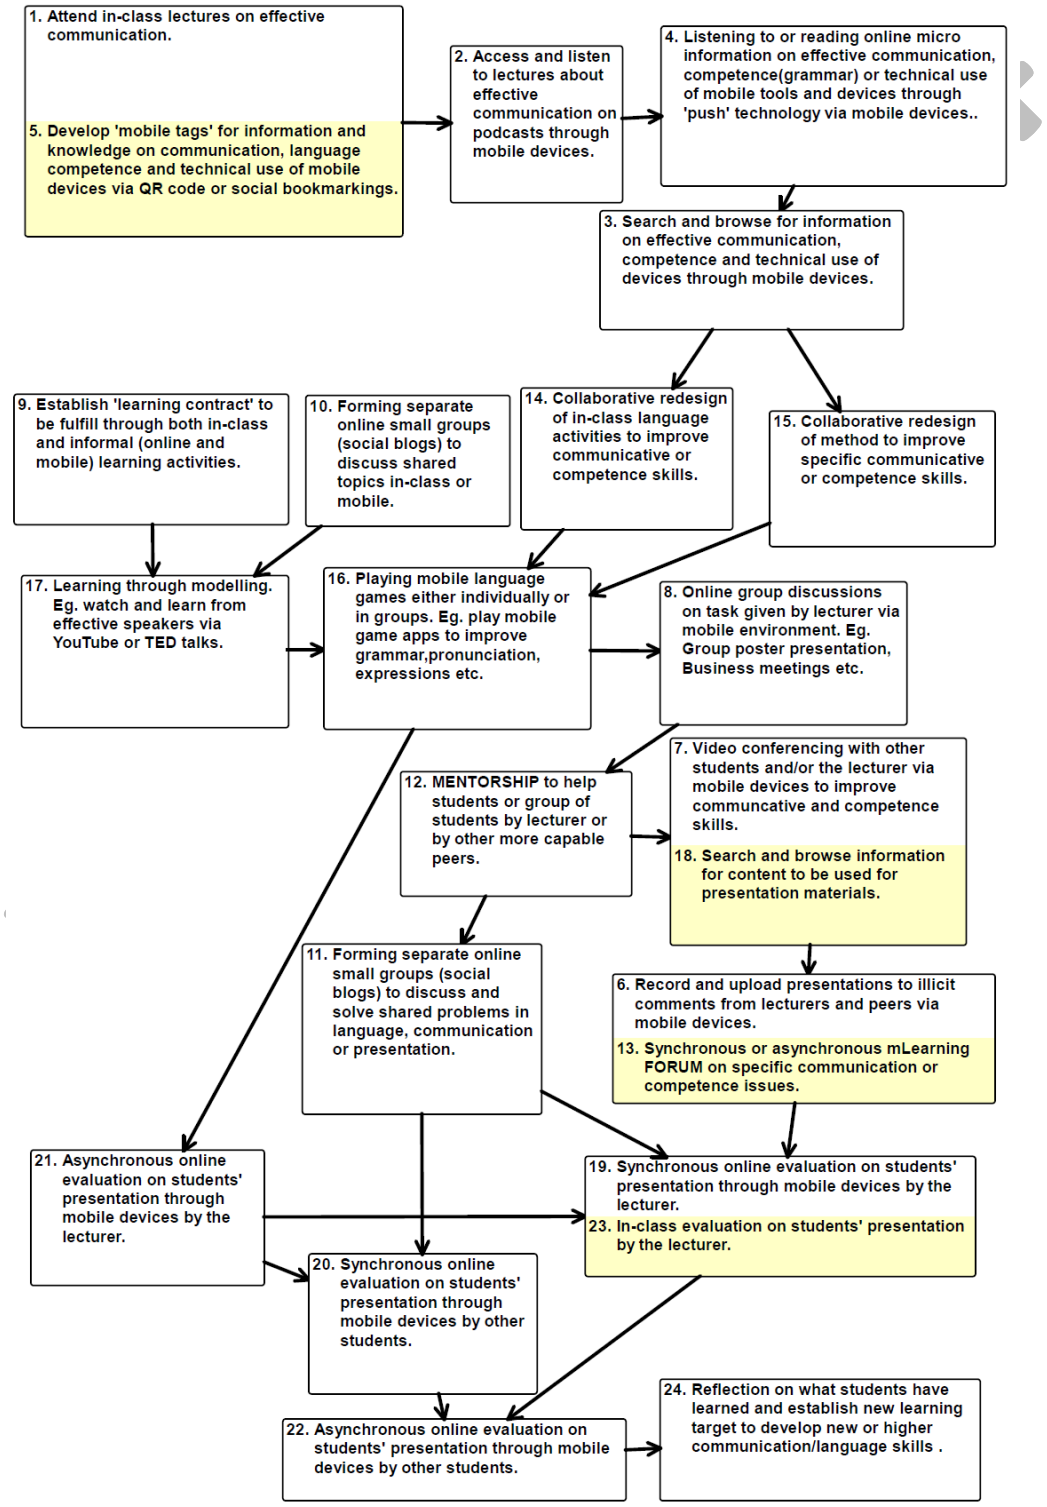
3. Objectives of the study

This study seeks to develop an mLearning implementation model to overcome language learning needs in an English communication course among undergraduates using experts' opinion. The implementation model consist of a network of language learning activities connecting both mobile language learning activities and formal classroom activities. Thus, the elaborated objectives of this study are:

- to identify the appropriate network of language learning activities in mLearning implementation model to aid learners to be competent in communication skills in professional settings;
- to propose a structural model of activity-based implementation of mLearning for language learning.
- to map the proposed model to Transactional Distance Theory and Park's Pedagogical Framework to interpret the model to guide in the undergraduate language learning using mLearning.

4. Method



Based on the objectives of the study, Interpretive Structural modeling (ISM) (Warfield, 1976) was employed because not only it could facilitate investigation into the relationships among the learning activities but an overall structural model could be extracted based on the relationships. The various steps involved in the ISM technique are as the following: (1). Identifying elements which are relevant to the problem or issues. In this study, the authors employed a Nominal Group Technique (NGT) (Delbecq, 1971) to identify the elements. In the scope of this study, the authors chose to develop it for 'Professional Communication Skills (PCS)' course, an undergraduate English Language course offered by a private Malaysian university. It is a compulsory subject to be taken in fulfillment of a four year undergraduate study among engineering students. The NGT involves selected experts from the university as well as from other institutions. The experts consist of four (4) Content Experts, who are course instructors of PCS from the private institution, two (2) Information Technology or mLearning experts, one policy stakeholder of the institution and one curriculum expert; (2). Determine the contextual relationship and relation phrase with respect to how the learning activities (elements) should be connected with each other; (3). Generate the ISM model. This was done by the software after the pairings of elements was successfully conducted. The software derives the model based on the concept of pair wise comparison as and transitive logic; (4). The model was then being

IETC 2014

reviewed by the experts to check for conceptual inconsistency and making the necessary modifications; (5) The final model was then presented after the necessary modifications were made.

5. Findings

The findings from the modified nominal group technique (NGT) and the ISM session resulted in the development of the mLearning implementation model for undergraduate English Language Learning as shown in Figure 3.

6. Discussion

Tying to Moore's transactional distance theory (Moore, 1997), the language activities from the model (Figure 3) support the description of the pedagogical distance concept as proposed in the theory. For example, the mentorship activity (activity 12) through mLearning exemplified a type of learning activity, which has low structure and allows high dialog between the instructor and learners yet promotes high learner's autonomy as part of their language learning process. The activity has low structure as it focuses more on learners' input (questions, comments, evaluation, and reflections) which requires more dialogs in fulfilling learners' language learning needs. This is consistent to Moore's argument that low structured

educational activities could promote high dialog, which offer more dynamic learning experiences for the learners (Moore, 1997, p. 27). This type of activity (activity 12) also supports type 3 mLearning activity (Low Transactional Distance Socialized mLearning) of Park's pedagogical framework (2011) where the activity has loose structure but involves frequent interaction among learners (refer to Table 1). However, activity 17 (learning through modeling) has high structure as it is in the form of recorded presentations where learners as individuals or in groups could learn through examples. This type of activity supports type 1 mLearning activity (High Transactional Distance Socialized mLearning) or type 2 mLearning activity (High Transactional Distance and Individualized Mobile Learning Activity) of Park's pedagogical framework as learners have more psychological and communication space with the instructor due to the structure of the learning content. High interactions could mainly occur among learners when they discuss among themselves about the quality of a speaker's recorded presentations (Type 1 mLearning) or the learners as individuals could interact only with the recorded presentation (Type 2 mLearning) to learn best presentation practice on their own. Thus, learners could have more options on the types of learning which suit their preferences. As a summary in relating the language activities to transactional distance theory, Table 3 aimed at proposing how the activities could be categorized according to Moore's types of educational activities (refer to Figure 1) that are based on the presence or absence of dialog (D) and structure (S). In comparison, Table 4 shows the summary on how the language activities could be categorized based on Park's mLearning types of activities.

Table 3

Category of mLearning Language Activities Based on Moore's Types of Educational Activities (based on presence/absence of dialog (D) and structure (S))

Moore's Types of Educational activities	**Learning Activities of mLearning Implementation Model**	
–D–S (Low dialog and low structure) *Note: High transactional distance between the instructor and learners.*	5.	Develop 'mobile tags' via QR code or social bookmarking.
	10.	Forming separate online small groups (social blogs) to discuss shared topics in- class or mobile.
	11.	Forming separate online small groups (social blogs) to discuss and solve shared problems in language, communication or presentation.
	14.	Collaborative redesign of in-class language activities to improve communicative or competence skills.
	15	Collaborative redesign of method to improve specific communicative or competence skills.
	18.	Search and browse information for presentation materials.
	24	Reflection on what students have learned and establish new learning target to develop new or higher communication/language skills.
–D+S (Low dialog and high structure) *Note : High transactional distance between the instructor and learners.*	2.	Access and listen to lectures through mobile devices.
	3.	Search and browse for information through mobile devices.
	4.	Listening to or reading online micro information through 'push' technology via mobile devices.
	8.	Online group discussions on task given by lecturer via mobile environment. Playing mobile language games
	16.	Learning through modeling.
	17	Synchronous online evaluation on students' presentation through mobile devices by other students.
	22	Asynchronous online evaluation on students' presentation through mobile devices by other students.
+D+S (high dialog and high structure) *Note: low transactional distance between the instructor and learners.*	9.	Establish 'learning contract'
	19.	Synchronous online evaluation on students' presentation through mobile devices by the lecturer.
	21.	Asynchronous online evaluation on students' presentation through mobile devices by the lecturer.

IETC 2014

According to Moore (1997) in his theory, the aim of an effective distance education is to minimize the transactional distance between the instructor and the learners. However, aligned with Park' pedagogical framework for mLearning, both Tables 3 and 4 show the types of activities which could demonstrate how low or high transactional distance could be exploited or integrated to support learners to achieve their learning targets. In short, the findings here could implicate Moore's theory of transactional distance. For example, activities 12 and 17 as discussed earlier could serve as examples on how the different gaps in transactional distance between the instructor and the learners for each activity could be exploited based on the structure of the learning activity and learners' autonomy in aiding students' learning process. However, it is the integration among language activities instead of the application of language activities in isolation, which support the learner's language needs. Further discussion on the integration of these activities focusing on how mLearning could support learners' language learning is presented in the following section.

7. Conclusion

This study was conducted to describe how mLearning as new technology tool of learning could be used as a guidepost in aiding learners to achieve their learning goals. As a result, an interpretive structural implementation model was developed to guide how mLearning could augment formal classroom learning in catering the learning needs of undergraduate students especially the low to intermediate level achievers. The model as discussed in this paper not only shows how mLearning could be implemented but further describes how formal and informal learning could be bridged as a solution to cater the students' learning needs. In the process, the model redefines what mLearning as a tool to augment learning and as performance support (Quinn, 2011; Terras and Ramsay, 2012) rather merely as a system to deliver a course. In the implementation of mLearning as learning support, the discussion of the model also demonstrated how transactional distance theory (Moore, 1972, 1993, 1997) and Park's pedagogical framework for mLearning (Park, 2011) described the mLearning concept and practice as learning support in formal learning which capitalized on the interactions among students, course instructors, learning content, mobile devices, and learning course outcomes. Through the theory and framework, the model showed that several types of mLearning could be necessarily involved in stages of the learning process based on the interactions and students' autonomy. Based on the framework, learning activities which are selected should describe how students could interact and collaborate with each other to learn and how they could be aided to achieve their learning goals with the help of others. Although the pedagogical framework guides how mLearning could be implemented specifically for language learning among undergraduates, the study could contribute as a proposal on how mLearning implementation models could be developed for other areas of learning disciplines for other types of learners learning using mobile technology-one which is sustainable.

Investigating the relationship between foreign language learning and call attitudes among EFL freshman students

Hüseyin Öz[a]65
[a]*Faculty of Education, Hacettepe University, Ankara 06800, Turkey*

Abstract

Over the last two decades rapid developments in computer sciences and technology have established the persistent role of technology-based learning in all walks of education, more specifically in second or foreign language learning. Thus, the current study was an attempt to investigate the relationship between attitudes towards foreign language learning and computer-assisted language learning. A total of 128 university students majoring in English as foreign language from a major state university were randomly selected for the study. Data were collected using the Attitudes towards Foreign Language Learning (A-FLL) and Attitudes towards Computer-Assisted Language Learning (A-CALL) scales. Findings revealed that there are statistically positive correlations between attitudes towards foreign language learning (A-FLL) and attitudes towards computer-assisted language learning, suggesting that the bidirectional relationship between computer technology and human interface greatly influences learning a L2. Moreover, some of the subcomponents of A-FLL including teacher influence, tolerance of ambiguity and extrinsic motivation greatly contributed to the prediction of the participants' attitudes towards computer-assisted language learning. Gender and age differences were also found to potentially affect some aspects of human interface, and the participants' years of language learning experience and their academic achievement also correlated positively with degree of inhibition component of CALL. It is concluded that inquiry into language learners' attitudes towards technology-based L2 learning will greatly constitute a viable and secure avenue towards the betterment of L2 learning programs and quality language learning.

Keywords: Foreign language learning; computer-assisted language learning (CALL); attitudes; Turkish students; English as a foreign language

IETC 2014

1. Introduction

Over the past few decades there has been a growing interest in researching numerous variables which affect achievement in learning a second or foreign language (L2) in an effort to give the most comprehensive account of language proficiency as well as successful L2 use. A myriad of variables such as cognitive, affective disposition, personality, attitudes, values, mood, motivation, intelligence (Dörnyei, 2005, 2009, 2014) have been found to account for a significant proportion of the variance in L2 learners' performance. Gardner's (1985, 2001) socio-educational model of motivation claims that various individual differences, more specifically integrativeness, i.e. attitudes towards the target language community, attitudes towards learning situation, and instrumental motivation greatly contribute to the establishment of language learners' level of motivation referred to as integrative motivation. Dörnyei (2005), however, asserts that the concept of individual differences is "rather loose" by definition since it contains a myriad of "certain core variables and many optional ones" (p. 7). Thus, he opts for *personality*, *ability/aptitude*, and *motivation* (encompassing Gardner's integrative motivation and plus (Dörnyei, 2005, 2009)) as principal learner variables which have the potential to account for a significant proportion of the variance in one's achievement in learning an L2.

E-mail address: hoz@hacettepe.edu.tr

The integration of technology and computer-assisted tools into education during the past few decades has also provided the necessary impetus to explore the role of technological developments in L2 teaching and learning. Researchers have attempted to investigate the issue from a variety of perspectives. The main objective has often focused on an attempt to find out the relationship between language learning capacity or aptitude and ability to use technology, especially computers, for language learning purposes. In other words, investigating the role of technology-based instruction and pedagogically-oriented implementation of technological and pedagogical developments in L2 learning and teaching have gained more momentum during recent decades. According to Chapelle (2001), a great majority of research on computer-assisted language learning (CALL) has been revolving around issues such as software developed for language learning purposes and designing language learning tasks. However, the potential role of language learners in how to use computers and technology for successful language learning, i.e. the human interface and computer use aspect of CALL (Rahimi & Yadollahi, 2011), has not been given much attention in CALL studies. Put another way, language learners' interaction with computers and individual differences such as their capacity and attitudes towards using CALL, or " human ware" (Warschauer, 2002), for foreign language learning (FLL) and success in learning an L2 have not been taken into account appropriately (Vandewaetere & Desmet, 2009; Tunçok, 2010).

The strength of research on CALL with emphasis on L2 learners' attitudes towards CALL is that "learners can be ensured against failure and a more adaptive way of CALL becomes possible" (Vandewaetere & Desmet, 2009, p. 350). However, relatively little research has been done to examine the relationship between attitudes towards foreign language learning and CALL, especially in the Turkish context. To address the lack, this study aims to investigate the relationship between attitudes towards FLL and CALL, and determine to what extent attitudes towards FLL contribute to the prediction of attitudes towards CALL, in the hope of shedding some light on the betterment of CALL-based instruction in Turkey.

2. Literature review

The history of the thriving area of L2 motivation and attitudes towards language learning situation as well as target language community dates back to the studies in social psychology pioneered by Wallace Lambert and Robert Gardner in Canadian context during the 1970s, and Gardner's (1985) socio-educational model of L2 learning. This model integrates aspects of traditional motivational research on L2 learning, which puts emphasis entirely on individual and social psychological insights addressing the relationship between L1 and L2 communities (Dörnyei, 2005). Gardner (1985) asserts that students' attitudes towards specific language community will certainly influence the degree of success in incorporating aspects of that language. This assertion highlights the significance of learners' attitudes as one of the most important motivational factors that have impact on learning an L2. Indeed, the socio-educational model highlights integrative motivation as the cornerstone. Later, Tremblay and Gardner (1995) broadened the scope of Gardner's social psychological model of L2 motivation only to integrate socially oriented construct with new elements from other cognitive motivational and goal-oriented theories. Based on the new extended model, the construct of language attitudes included attitudes towards L2 speakers, integrative orientation, interest in foreign language, attitudes towards L2 course, attitudes towards L2 teacher, and instrumental orientation.

Information and Communication Technologies (ICT) have become an integral part of our lives, affecting all walks of human life and endeavor. Through widespread availability and practicality, computers in particular have made their way into education, attracting teachers' and students' attention. Over the past decade, computers have been widely used for educational purposes, and more specifically for second or foreign language learning in a way that computer assisted language learning (CALL) has become an indispensable part of language learning process in the third millennium. However, no single well-defined definition of CALL-related attitude has been offered so far. The construct of CALL is often defined as incorporation of computers into language learning process for presenting language learning materials, or "any process in which a learner uses a computer and, as a result, improves his or her language" (Beatty, 2003, p. 7).

IECT 2014

Research has shown that affective variables such as personal attitudes are important factors to affect an individual's language learning and use (Baker & Macintyre, 2000; Gardner, 2001; Gardner & MacIntyre 1993; Gardner et al., 2004; Karahan, 2007; MacIntyre, MacMaster, & Baker, 2001). The core content of attitude/motivational studies in foreign language learning (FLL) and second language acquisition (SLA) is the contention that positive attitudes towards language learning motivates learners and contributes greatly to achievement in different domains. Conversely, negative attitude serves a psychological barrier against successful L2 learning (Dörnyei & Csizér, 2002). Recent developments in SLA research have established the fact that the degree of desire to be identified with international community or international posture (Yashima, 2002, 2009), intercultural communicative competence (Byram, 1997; Mirzaei & Forouzandeh, 2013), and international citizenship (Byram, 2013) play a crucial role in motivating L2 learners to successfully learn and use an L2.

Similarly, positive attitudes towards the effectiveness of CALL applications in language learning can raise learners' behavioral intention of using it (Akbulut, 2008; Ayres, 2002; Başöz & Çubukçu, 2014; Desmet, 2007; Fatemi Jahromi & Salimi, 2013; Felix, 2005, 2008; Liaw et al., 2007; Rahimi & Yadollahi, 2011; Tunçok, 2010; Vandewaetere & Desmet, 2009). It is concluded, therefore, that understanding language learners' attitudes towards foreign language learning and application of ITC for language learning purposes facilitate the use of appropriate CALL, paving the way for the implementation of CALL-based pedagogy and the use of CALL applications for teaching and learning languages. Akbulut (2008), for instance, investigated attitudes of Turkish university students (N = 155) towards effectiveness of CALL. The students all had high levels of proficiency in English. The findings revealed that the participants had positive attitudes towards CALL since computers were found to be helpful in sustaining "independence, learning, collaboration, instrumental benefits, empowerment, comfort and communication" (p. 1).

Most studies have shown that the attitudes towards FLL and CALL can be decomposed into a tripartite model, consisting of a *cognitive* component which entails beliefs about attitude-related situations, an *affective/evaluative* component expressing feelings arising about cognitive element and appraisal of these feelings, and a *behavioral* component which includes particular learning behaviors adopted by the learners (Vandewaetere & Desmet, 2009, p. 351). These attitudes towards foreign language learning and CALL are interrelated. The close association between these two constructs is central to the successful application of CALL in FLL (Liu & Reed, 1995; Masgoret & Gardner, 2003). In line with this, the present study aimed at exploring the viable relationship between attitudes towards FLL and CALL, in the hope of shedding more light on the relationship between "hardware", "software", and "human ware" in the application of CALL in language learning process. For this purpose, the following research questions were formulated to guide the study.

1. What are Turkish freshmen EFL students' attitudes towards FLL and CALL?
2. Is there any relationship between attitudes towards FLL and CALL?
3. How well can the variance in attitudes towards CALL be predicted by attitudes towards FLL?
4. Do demographic factors such as gender, age and GPA moderate on attitudes towards FLL and CALL?

3. Method

3.1. Research design

This study was carried out with a quantitative research design using survey methodology to collect data about participants' attitudes towards foreign language learning (A-FLL) and attitudes towards computer-assisted language learning (A-CALL). As a cross-sectional study conducted at one point in time, this design is useful to employ when researchers try to gather information quickly and economically (Creswell, 2012). Further quantitative data were also gathered from the participants' course grades and cumulative grade point average (GPA) scores.

IETC 2014

3.2. Setting and participants

This study was conducted in an English as a foreign language (EFL) teacher education program at a major state university in Ankara, Turkey. Convenience sampling was used to select the participants of the study. A total of 128 undergraduate freshman students (females: 75% and males: 25%) enrolled in the department voluntarily participated in the study, responding to the statements on a 7-point Likert scale. Their mean age was 19.08 years (*SD* = .88, range 18~22). Without any consultation among themselves they completed the anonymous survey during the regular class hours and also gave consent for data collection.

3.3. Research instruments

3.3.1. Attitudes towards foreign language learning (A-FLL)

Attitudes towards foreign language learning were measured by the English version of Attitudes towards Foreign Language Learning (A-FLL) Scale (Vandewaetere & Desmet, 2009). The A-FLL consists of 31 statements which participants rate on a 7-point (ranging from *1. totally disagree* to *7. totally agree*) Likert scale. It has three major components: *cognitive* component, *affective/evaluative* component with three sub-scales of *extrinsic, intrinsic*, and *teacher influence,* and *behavioral* component with four subscales of *exhibition, inhibition, tolerance of ambiguity,* and *learning effort*. The scores for factors are calculated by adding the scores on statements related to each factor. Higher scores represent more positive attitudes towards FLL. The internal consistency of A-FLL in this study was α=.83 for the entire scale.

3.3.2. Attitudes towards computer-assisted language learning (A-CALL)

Attitudes towards CALL were measured by the English version of Attitudes towards Computer-Assisted Language Learning (CALL) Scale (Vandewaetere & Desmet, 2009). The A-CALL consists of 20 statements which participants rate on a 7-point (ranging from *1. totally disagree* to *7. totally agree*) Likert scale. It has four major components: *effectiveness of CALL vs. non-CALL, surplus value of CALL, teacher influence,* and *degree of exhibition.* The scores for factors are calculated by adding the scores on statements related to each factor. Higher scores represent more positive attitudes towards CALL. The internal consistency of A-CALL in this study was α = .83 for the entire scale, ranging between .69 and .89 for the subscales. The instrument employed in the study was also used to gather demographic and background information with regard to participants' grade point average (GPA), gender, and age.

3.3.3. Procedures for data collection and analysis

This study was conducted in an undergraduate EFL teacher training program at a major state university in Ankara in May 2014. It took participants around fifteen minutes on average to complete the survey. Data analysis was carried out in order to address the research questions formulated for the present study. The statistical analyses were performed using IBM SPSS Statistics 21, a comprehensive computer program used to help researchers perform statistical analysis quickly and accurately.

In order to characterize the scores of the participants' attitudes and for the ease of interpretation of results, the perfect scores were computed and mean values were obtained. Descriptive analyses such as frequency and mean were obtained to characterize the collected data. Other statistical analysis tests conducted for the study consisted of the Pearson product-moment correlation test, the independent-samples t-test, the one-way analysis of variance (one-way ANOVA), and regression analysis. Statistical tests conducted for this study were assessed at the 0.01 and 0.05 levels of significance.

IETC 2014

4. Results

4.1. Descriptive statistics for EFL students' attitudes towards FLL and CALL

When the participants were asked to rate their attitudes towards foreign language learning, 75% of the participants agreed with cognitive component, 79% with affective/ evaluate component and 64% with behavioral component of A-FLL. Understandably, 73% of them expressed positive attitudes towards foreign language learning with higher mean score (M = 71.62, SD = 11.11) ascribed to affective/evaluative component. Furthermore, the highest mean score (M = 38.42, SD =6.48) was observed in intrinsic motivation subcomponent of affective /evaluate component, while the highest mean score (M = 17.94, SD =3.13) was ascribed to exhibition subcomponent of behavioral component.

With regard to the importance of CALL in second or foreign language learning, the ratings also indicated positive attitudes (Table 1). Specifically, 60% of participants expressed positive attitudes towards the overall impact of CALL on language learning with higher mean score observed in *surplus value of CALL* (M = 41.55, SD = 8.66). It was also found that 58% of the participants expressed positive attitudes towards the effectiveness of CALL, 66% for surplus value of CALL, 65% for teacher influence, and 54% for the degree of exhibition to CALL.

Table 1. Descriptive statistics for components of A-FLL and A-CALL

Components of A_FLL	Subcomponents	N	Mean	SD	%
Cognitive	-	128	26.28	5.77	75
Affective/Evaluative	Extrinsic	128	16.25	4.37	78
	Intrinsic	128	38.42	6.48	79
	Teacher Influence	128	16.93	3.60	81
Total		128	71.62	11.11	79
Behavioral	Inhibition	128	7.50	2.67	54
	Exhibition	128	17.94	3.13	86
	Tolerance of ambiguity	128	14.93	3.25	72
	Learning Effort	128	17.19	5.12	50
Total		128	57.58	8.63	64
Components of CALL					
Effectiveness of CALL	-	128	16.25	4.72	58
Surplus Value of CALL	-	128	41.55	8.66	66
Teacher Influence	-	128	13.56	3.59	65
Degree Of exhibition	-	128	11.34	2.17	54
Total		128	82.71	12.58	60

4.2. Relationship between attitudes towards FLL and CALL

The Pearson correlation coefficients revealed a statistically slight positive correlation between three components of A-FLL and CALL, $r(128) = .29$, $p < .01$ for *cognitive component*, $r(128) = .26$, $p < .01$ for *affective/evaluative component*, and $r(128) = .19$, $p < .01$ for *behavioral component*. Moreover, there was

IETC 2014

statistically a moderate significant correlation between overall A-FLL and overall A-CALL, $r(128) = .51$, $p < .01$. Significant correlations were also found between some sub-scales of A-FLL and A-CALL. These are presented in Table 2 below.

Table 2. Correlation between A-FLL and components of A-CALL

Components of A-FLL	Subcomponents of A-FLL	Effectiveness of CALL	Surplus value of CALL	Teacher influence	Degree of exhibition	Overall CALL
Cognitive	-	-.12	.36*	.27**	.03	.29**
Affective/ Evaluative	Extrinsic motivation	.16	06	.06	.09	.26**
	Intrinsic motivation	.11	.36*	.23*	-.06	
	Teacher influence	-.06	.19*	.41**	-.10	
Behavioral	Inhibition	.19*	-.06	-.15	.34**	.19*
	Exhibition	-.08	.38**	.32**	-.03	
	Tolerance of Ambiguity	-.16	.27**	.19*	.11	
	Learning effort	-.20*	-.17	.-.20*	.27**	
Overall FLL	-	.11	.31**	.21*	.13	.51**

* Significant at .05 level.

** Significant at .01 level.

4.3. Attitudes towards FLL as predictors of attitudes towards CALL

Multiple regression analysis was conducted to test if Attitudes towards Foreign Language Learning (A-FLL) significantly predicted the participants' ratings of Attitudes towards Computer-Assisted Language Learning (A-CALL). Cognitive component of A-FLL explained 13% of the variance in surplus value of CALL ($R2 = .13$, $F(1,126) = 17.86$, $p < .01$) with ($\beta = .36$, $p < .01$) power of prediction and 7% in teacher influence ($R2 = .7$, $F(1,126) = 9.19$, $p < .05$) with ($\beta = .26$, $p < .01$) power of prediction.

The results of the regression analysis indicated that the three subcomponents of affective/evaluative component of A-FLL, namely extrinsic and intrinsic motivation along with teacher influence, as predictor variables explained 18% of the variance in teacher influence component of CALL($R2 = .18$, $F(3,124) = 8.80$, $p < .01$), 13% in surplus value of CALL ($R2 = .13$, $F(1,126) = 18.40$, $p < .01$). It was also found that teacher influence subcomponent of A-FLL significantly predicted teacher influence in CALL ($\beta = .41$, $p < .01$) while intrinsic motivation significantly contributed to the prediction of surplus value of CALL ($\beta = .36$, $p < .01$).

Concerning behavioral component, the results of multiple regression analysis revealed that the four subcomponents accounted for 11% of the variance in effectiveness of CALL ($R2 = .11$, $F(4,123) = 3.77$, $p < .01$), 20% in surplus value of CALL ($R2 = .23$, $F(4,123) = 8.95$, $p < .01$), 15% in teacher influence ($R2 = .15$, $F(4,123) = 5.45$, $p < .01$), and 14% in degree of exhibition to CALL($R2 = .14$, $F(4,123) = 4.83$, $p < .01$). The findings also indicated that learning effect significantly predicted effectiveness of CALL ($\beta = .23$, $p < .05$), exhibition significantly predicted surplus value of CALL ($\beta = .33$, $p < .01$) as did tolerance of ambiguity ($\beta = .24$, $p < .05$). Likewise, exhibition ($\beta = .30$, $p < .01$) and learning effort ($\beta = -.18$, $p < .05$) greatly contributed to the prediction of teacher influence component of CALL, while inhibition significantly predicted degree of exhibition to CALL ($\beta = .26$, $p < .05$). Finally, the overall attitudes towards FLL explained 26% of the variance in A-CALL.

4.4. Demographic factors and attitudes towards FLL and CALL

IETC 2014

Gender differences were also found, to some extent, to moderate on the participants' attitudes towards FLL and CALL. The results indicated a statistically significant difference, $t(126) = 2.02$, $p < .05$, between males ($M = 15.65$, $SD = 4.61$) and females ($M = 17.70$, $SD = 5.20$) only in learning effort subcomponent of A-FLL. Regarding attitudes towards CALL, the findings also revealed statistically significant differences between groups in relation to their perceptions of *effectiveness of CALL*, $t(126) = 2.38$, $p < .05$, with females scoring higher ($M = 16.82$, $SD = 4.25$) than males ($M = 14.56$, $SD = 5.67$) and *surplus value of CALL,* $t(126) = -2.23$, $p < .05$. Unlike effectiveness component, males had higher mean score ($M = 9.37$, $SD = 1.65$) in *surplus value of CALL* than females ($M = 8.23$, $SD = .84$) did. Moreover, 'Effect Size' statistic based on the 'Eta Square' value (η^2) of Cohen (1988) indicated a slight significant difference between groups ($\eta^2 < 0.059$) in all significant variables.

The results of one-way ANOVA showed a statistically significant difference in the participants' attitudes towards CALL regarding their academic achievement only in *degree of exhibition component, F* (62, 65) = 1.67, $p < .05$, with a moderate effect size, $\eta^2 = .06$ ($\eta^2 < 0.14$). Likewise, the participants differed significantly in their attitudes towards CALL, $F(9,118) = 2, 77$, $p < .05$, with a large effect size, $\eta^2 = .17$ ($\eta^2 > 0.14$), in relation to their years of experience in learning EFL. Regarding age differences in the attitudes towards FLL, the results indicated statistically significant differences between age groups of 18 and 20 in exhibition subcomponent of behavioral component, $F(4,123) = 2.56$, $p < .05$, with a moderate effect size, $\eta^2 = .08$ ($\eta^2 < 0.14$). Moreover, there was a statistically significant difference among age groups of 18, 19, 20 and 22 regarding their attitudes towards CALL only in degree of exhibition to CALL, $F(4,123) = 4.20$ $p < .05$, with a moderate effect size, $\eta^2 = .12$ ($\eta^2 < 0.14$).

5. Discussion and conclusions

The main goal of the current study was to explore the relationship between language learners' attitudes towards foreign language learning (FLL) and computer-assisted language learning (CALL) in the Turkish context. The findings yielded important insights into attitudinal/motivational factors influencing attitudes towards the two interrelated constructs. The findings indicated that Turkish EFL students have positive attitudes towards FLL and integrating CALL-applications into language learning process. Other studies (Akbulut, 2008; Ayres, 2002; Mahfouz & Ihmeideh, 2009; Rahimi & Yadollahi, 2011) have also reported positive attitudes towards the effectiveness of CALL in learning an L2. Mahfouz & Ihmeideh (2009), for instance, found that university students' attitudes towards using video and text chat with anonymous English native speakers for improving their English language skills were higher regarding speaking skills, followed by listening, reading, and writing skills. Similar results were reported by Rahimi and Yadollahi (2011) who found that Iranian students expressed positive attitudes towards CALL and FLL.

The findings also showed a positive strong correlation between attitudes towards FLL and CALL. This indicates that overall attitudes towards CALL can be predicted by students' attitudes towards FLL since these two constructs are interrelated. As shown in the results section, the participants' overall attitudes towards FLL account for 26% of the variance in their attitudes towards CALL. This suggests that students' positive attitudes towards FLL and CALL applications will greatly enhance their performance both in the subject matter, i.e. learning an L2, and using information and communication technology (ICT). Obviously, this will, in turn, lower computer resistance among language users in a CALL-based curriculum (Brosnan, 1998; Nævdal, 2007).

The findings of the present study also revealed that male and female students have positive attitudes towards FLL and CALL except for differences in the *learning effort* sub-scale of A-FLL, with females having higher mean scores than males. This suggests that female students believe that language learning becomes more enjoyable when the learning effort decreases. Similarly, gender differences were found to moderate on the students' attitudes towards CALL in *effectiveness* and *surplus value of CALL*. This indicates that female students believe that language learning, assisted by computers, is better than learning by oral practice, more adequate than traditional language learning, and enhances language proficiency in comparison with non-CALL instruction. On the other hand, male students believe in the *surplus value of CALL* and that computer-assisted language learning is a valuable extension of the traditional learning methods. These findings are congruent with those of Fatemi Jahromi and Salimi (2013) who also found that gender differ-

IECT 2014

ences potentially affect attitudes towards CALL. However, these findings are inconsistent with Akbulut's (2008) study which reported that there was no relationship between gender and attitudes towards CALL.

The participants' academic achievement (their grade point averages), years of learning experience, and age were also found to influence their attitudes towards FLL and CALL. Concerning academic achievement and learning experience, the participants only differed in their attitudes towards *degree of exhibition to CALL*. That is, great performance and having more language learning experience make students feel less inhibited when communicating in the foreign language via computer (chat) than in a face-to-face situation. Moreover, the participants differed in their attitudes towards *exhibition subscale* in FLL and *degree of exhibition* to CALL. In other words, the degree of exhibition to both FLL and CALL was found to be crucial in integrating CALL to foreign language learning process. This suggests that the degree of feeling confidence and controlling anxiety in a face-to-face learning situation (classroom) vary across age groups both in A-FLL and A-CALL. Put differently, the threshold to start a face-to-face conversation may be bigger to some students than starting a virtual (computer-assisted) conversation and vice versa. This study has also confirmed the findings of Tunçok's (2010) study which found that A-FLL and A-CALL are interrelated and that most of the students have positive attitudes towards CALL and foreign language learning. Moreover, other factors such as age, grade, gender, years of studying English and prior CALL experience affect students' attitudes. These findings enhance our understanding of students' attitudes towards FLL and CALL.

As the need for classroom CALL as a part of online courses, CALL-based materials assessment, participation in institution-wide and inter-institution partnerships, and, more specifically, the need for using or administering multimedia language laboratories are inevitable in CALL in the third millennium (Fotos & Browne, 2004; Walker & White, 2013), it seems necessary that teachers, instructors, and curricula should be equipped adequately with new technological tools that address both teaching practices and curriculum evaluation. It is actually obvious that these objectives can be met, in part, if we take the attitudes of both teachers and students toward foreign language teaching and learning into account within a CALL-based pedagogical framework. The teaching practices of teachers, their approaches toward both teaching and assessment are to be given due attention when CALL-based curriculum is designed. Thus, a multi-disciplinary research is needed to make the most of a CALL-based pedagogy.

The primary objective of the present study was to investigate the relationship between Turkish freshman EFL students' attitudes to FLL and CALL in an English as a foreign language classroom. The results indicated that A-FLL and other demographic factors such as gender, age, academic achievement, and years of language learning experience have the potential to exert influence on language learners' attitudes towards CALL, thereby, enhance or deter their ultimate achievement in a CALL-based language learning context. However, other studies found that students' attitudes towards CALL may be shaped by their accessibility, and their ability to sustain autonomous learning, language achievement, and instrumental benefits (Akbulut, 2008) as well as faculty and seniority of university, i.e. freshman, sophomore, junior, and senior students, (Mahfouz & Ihmeideh, 2009). Therefore, further research is needed to investigate the issue from various aspects of CALL-supported language instruction including conducting attitudinal studies on online chat with native speakers, and other important factors such as computer ownership and use which are potentially liable to affect CALL-application in language learning process in different learning environments.

Investigation of pre-service teachers' intentions to use of social media in teaching activities within the framework of technology acceptance model

Dilek Sultan ACARLI[a]66, Yasemin SAĞLAM[b]
[a,b]*Hacettepe University, Secondary Science and Mathematics Education, Beytepe, Ankara, 06800, Turkey*

Abstract

In recent years, social media is used frequently in daily life, as a result of this; it affects different fields in our lives. Intensive use of technology in teaching activities causes the social media to enter in this filed too. In this context, teachers and students started to use social media in terms of teaching and learning activities such as information sharing, web based learning, creating discussion groups etc. The aim of the study is to investigate pre-service teachers' intentions to use of social media in teaching activities which becomes indispensible in technologic environments. In accordance with this purpose a survey was prepared within in the framework of Technology Acceptance Model (TAM) which was developed by Davis (1986) and extended by Venkatesh and Davis (2000). The survey was implemented to pre-service teachers who are studying at a university in the faculty of education. Reliability, validity and factor analysis for the scales in the survey were performed. For each items in the scales, frequency distribution, percentages, means and standard deviation were calculated

*Keywords:*Technology Acceptance Model, social media, pre-service teachers

IETC 2014

1. Introduction

Social networks which are used by a group of people and defined as a total of a number of activities that are made possible by social technologies (Hamid, Chang, & Kurnia, 2009), have been covering an overwhelming part of our daily lives in recent years with the variety and usage rates. According to comScore's, a research company's research while Turkey stands as the fifth most time spending country in social networks (Kural, 2012), and %94 percent of the online population of Turkey is also registered user of Facebook, a social network company (Kaymaz, 2014). Leaving aside the negative sides of this percentage of usage, the fact that a common area used in this scale will also be used by educators in activities of education is an inevitable outcome. In this respect, now, social networks are used in areas of information, education, learning and teaching, apart from communication and social goals. As the user interfaces are quite easy, social network sites are beneficial to academicians in many ways and they provide practical solutions for students and researchers in terms of forming groups, sharing within these groups and communication and feedbacks (Gülbahar, Kalelioğlu, & Madran, 2010).

In recent years, there has been an important progress in terms of professional utilization of communication technologies and the admission and prediction of the acceptance of these technologies by the users (Vankatesh & Davis, 2000). One of these studies is Davis's (1989) Technology Acceptance Model (TAM), which was developed later by Venkatesh and Davis (2000) as Technology Acceptance Model 2 (TAM2, Fig.

1). According to TAM2, individuals' intentions of using a system are affected by two variables: First, "perceived usefulness" which comes from the belief that the work performance of the individual will improve when a system is used, and the second, "perceived ease of use" which covers the belief that there is no need to try hard to learn this system (Vankatesh & Davis, 2000). These two variables are also affected by two concepts as processes of social effect (subjective norm, voluntariness and image) and cognitive instrumental processes (job relevance, results demonstrability and perceived ease of use) (Vankatesh & Davis, 2000).

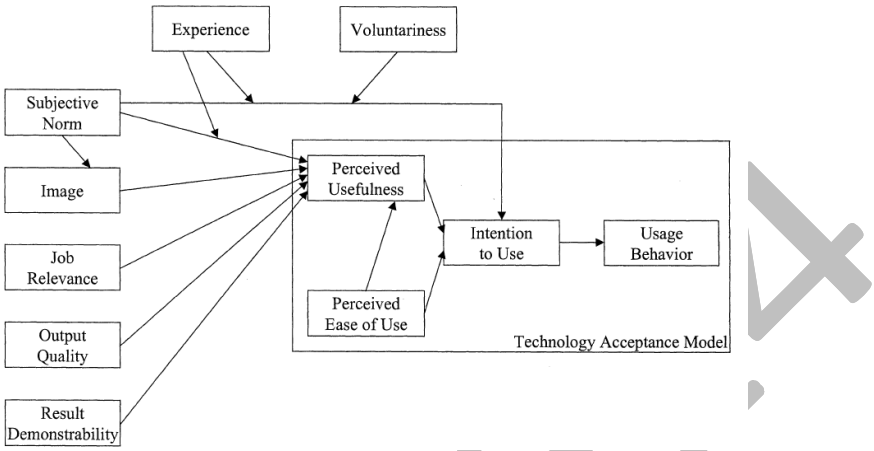

Figure 1- TAM2 (Vankatesh & Davis, 2000).

The purpose of this study is to develop a measuring tool to determine the tendencies towards the usage of the social media, which has become an indispensable part of electronic mediums, in teaching process by the candidates of teaching as a profession. In this respect, a scale has been prepared by using Technology Acceptance Model 2 (TAM2) and the resulting data has been presented.

2. Methodology of research

This is a quantitative research. Data were collected by using a questionnaire, developed by the researchers by using the Technology Acceptance Model 2 (TAM2; Venkatesh & Davis, 2000).

2.1. Sample

The research has been carried out with 322 teacher candidates who are students in different teaching programs in the city of Ankara. %82.3 of these candidates was females and %17.7 of them was males. %82.9 of the candidates has stated that they use social media every day. The most commonly used social media were Facebook (305 people), Twitter (205 people) and Instagram (148 people). The most common purposes of using social media were communication and online chat (277 people), spending spare time (211 people), sharing videos, photos and status and profile updates (201 people) and educational purposes (183 people).

2.2. Data collection and instrument

In this research, in collecting the data, the scale that was developed within the framework of Technology Acceptance Model (Venkatesh & Davis, 2000) was used. The items in the scale were graded according to Likert 5 type as; "totally agree = 5", "agree = 4", "partly agree = 3", "do not agree = 2", "absolutely do not agree = 1", and listed from 1 to 5 in accordance with these choices. In this study, first of all, a first level

confirmatory factor analysis was made for eight lantent variables (intention, subjective norm, perceived ease of use, perceived usefulness, image, job relevance, result demonstrability and voluntariness) that constitute the main dimensions of Technology Acceptance Model 2(Venkatesh & Davis, 2000), along with the model constructed with 33 observed variables. The output quality, which is the 9th variable, was not included in this study as the samples were teacher candidates and did not have any professional experiences yet.

2.3. Data analysis

Confirmatory factor analysis was made for the dimensions in the developed scale by using AMOS18 program. While less than 3 was considered as a good Klem (2000), X2 / df value for the model compatibility tests, any value under 5 was considered as acceptable. In the study, this information was taken into consideration for the X2 /df value. Schermelleh – Engel et al. (2003), have stated that in the model compatibility tests, .any values less than .08 in the Root Mean Square Error Approximation (RMSEA), .10 in the Standardized Root Mean Square Residual (SRMR), and higher than .9 in the Comparative Fit Index (CFI) were acceptable compatibility standards. Moreover, any value higher than .9 in Non-normed Fit Index (NNFI), also named as Tucker-Lewis Index (TLI) is considered as acceptable (Tucker & Lewis, 1973). In this research, the compatibility of these values in constructing models for confirming factor analysis was tested.

3. Results of research

The modification indexes that were proposed by the results of the first analysis were analyzed and clauses in which the answers could have affected each other, the clauses that were explained by the same dimension were determined and after the required modifications were made, they were analyzed by restarting the program. The value of voluntariness which had bad values was entirely dismissed from the model by a modification. The results of the analysis showed that the compatibility indexes had acceptable and/ or over acceptable values ($\chi 2/df=2.346$, p=.000, RMSEA=.06, SRMR= .03, GFI=.90, CFI=.96, TLI=.96).

The factor load values, averages and reliability of the developed model that is realized by the confirmatory factor analysis are summarized in Table1. Cronbach Alpha (α) or, for the dimensions with two clauses, considering they have a normal distribution, Pearson correlation parameter (r) was calculated in reliability calculations.

Table - 1. Results of factor analysis

Scale items	**Factor load**	**Mean**	**Reliability**
Intention to use			
1. I am planning to use social media in my teaching activities.	.77	3.84	r=.70
2. During my professional life as a teacher, I am thinking of using social media for teaching activities.	.91	3.79	
Subjective Norm			
1. The people whose opinions I value expect me to use social media effectively during my teaching activities.	.75	3.55	α=.85
2. The people whose opinions I value encourage me to use social media during my teaching activities.	.83	3.47	
3. The people who are important for me support me to use social media	.83	3.55	

IETC 2014

during my teaching activities			
Perceived ease of use			
1. It is easy for me to carry out teaching activities on social media.	.78	3.66	α=.83
2. For me, social media is suitable to carry out teaching activities.	.79	3.63	
3. I can do the things I want, in terms of teaching activities, on social media	.82	3.74	
Perceived usefulness			
1. Using social media will improve my performance in teaching as a profession.	.81	3.69	α=.90
2. Using social media will improve my productivity in my profession.	.79	3.69	
3. Using social media will improve my efficiency in my profession.	.84	3.65	
4. I think that using social media in my teaching activities will be beneficial for me in terms of my profession	.84	3.73	
Image			
1. The teachers who use social media in their teaching activities will be more prestigious than those who do not.	.86	3.42	r=.61
2. The teachers who use social media in their teaching activities will be more popular.	.71	3.43	
Job relevance			
1. Using social media is important for my profession.	.78	3.74	α=.84
2. Using social media is related to my profession.	.82	3.48	
3. Using social media serves the purpose of my profession	.80	3.46	
Results demonstrability			
1. I don't think that I will have any difficulty in explaining advantages/ disadvantages of using social media.	.63	3.79	α=.75
2. I believe that I can get in touch with my colleagues about the results of using social media.	.73	3.78	
3. I think that I will be able to see the results of using social media clearly.	.77	3.70	

IETC 2014

4. Conclusions

The data acquired by the scale that is developed by the results of the study in question, is presented in the outcomes section. In evaluating the factor analysis results, the information that the factor load values of the clauses that are in the scale should be equal to or higher than .45 was taken into consideration (Tabachnick & Fidell, 1989). In the analysis within the study, the factor loads of the scale were found to be changing between .63 and .91. In the reliability calculations of the scale, it was taken into consideration

that the reliability parameter for each dimension should be (cronbach alpha) .70 or higher (Büyüköztürk, 2006). Cronbach alpha values are changing between .75 and .90 for this study. As for the correlation values that are calculated for dimensions with two clauses, they were of avarage values (r=.70 ve r= .61). When these statistical values are examined, it can be concluded that the scale is suitable for determining the tendencies of teacher candidates' in terms of usage of the social media in their professional lives. When the average values of the answers of the candidates are considered, one can conclude that they are eager to use social media in their professional lives. However, in order to have a more sound result, the developed scale should be applied to wider groups. Moreover, the subject can be examined in a more detailed way by applying a comprehensive statistical technique which takes the relationships between the dimensions of the scale into consideration, and by the analysis of different demographic variables.

İşbirliğine dayalı öğretim tasarımında senaryo temelli öğrenmenin kullanılması: amaçlı senaryo tasarımı

Derya Kıcı[a]67
[a]*Toronto Üniversitesi, Ontario Eğitim Çalışmaları Enstitüsü, 252 Bloor St.W Toronto, M5S 1V6, ON, Kanada*

Abstract

Bu araştırma, Schank (1994) tarafından senaryo temelli öğrenme başlığı altında geliştirilmiş olan amaçlı senaryoların işbirlikli öğrenmeye entegre edilmesi amacıyla örnek bir öğrenme materyali tasarımını ve uygulanmasını içeren deneysel bir çalışmadır. Amaçlı senaryolar belirli kısıtlar dahilinde öğretilecek materyali, öğrencinin ulaşması beklenen hedefleri, öğrencinin çalışacağı öğrenme ortamını, öğrencinin yerine getirmesi beklenen görevleri, ve öğrenciye sunulacak kaynakları içeren bir çeşit yaparak öğrenme ortamı olarak tanımlanmaktadır (Schank, 1994). Bu çalışma kapsamında amaçlı senaryo tasarımı ilkelerine yer verilmiş ve yetişkin eğitiminde problem çözme becerilerini geliştirmek hedefi ile takım çalışmasına ve işbirliğine dayalı bir öğrenme materyali tasarlanmıştır. Tasarlanan öğrenme materyali dörder katılımcıdan oluşan gruplar halinde toplamda 100 katılımcı ile test edilmiştir.

Keywords: İşbirlikli öğrenme; amaçlı senaryo; problem çözme.

IETC 2014

1. Giriş

Senaryo temelli öğrenme bir amacı gerçekleştirmek üzerinde kurulmuş gerçek bir durum doğrultusunda bir dizi başarılı ve başarısız yol takip edilerek gerçekleşir. Schank (1982) etkili bir öğrenmenin, gerçekçi problemler ve ayrıntılı olarak tanımlanmış roller içeren senaryolar üzerinden yapılabileceğini ve senaryolarda yer alan problemi çözerken öğrencinin motivasyonunun artacağını, böylelikle kazanılan deneyimler ile gerçek yaşam sorunlarının da çözülebileceğini belirtmektedir. Burada iki temel yenilik, pedagojik açıdan öğrencinin aklını vererek, yaparak öğrenmesi; teknik olarak da bu tür öğrenmeleri sağlayacak olan ortamların sistematik olarak hazırlanması, malzemelerin endekslenerek sistemce otomatik ve dinamik olarak sağlanmasıdır (Schank & Clearly, 1995).

Okul dışında insanlar, tipik olarak istedikleri amaçlarına ulaşmaya çalışırken edindikleri deneyimlerinden öğrenirler. Amaçlı senaryo (Goal Based Scenerio) ara yüzü bu basit gerçeği kullanan bilgisayar temelli öğrenme ortamlarını tanımlamaktadır (Schank, Fano, Bell ve Jona, 1993/1994). Amaçlı senaryolarda esas fikir, tasarlanan ortama giren öğrencinin kendi ilgi ve merakı doğrultusunda, ustalık kazanması amaçlanan alanda, kendi üzerine alacağı bir rol üzerinden, ustalık gerektiren tecrübeleri bizzat yaşaması ve eylemlerinin sonuçlarını görmesi olarak ifade edilebilir (Schank, 2005). Bir başka deyişle amaçlı senaryolar öğrencilerin tanımlanmış amaçlar ve bu amaçları gerçekleştirmek için destek sunan ilgileri etkisinde olan problemlerdir. Amaçlı senaryo öğretilecek materyalin seçildiği, öğrencinin çalışabileceği bir ortamın olduğu, öğrencinin yapacağı görevlerin yer aldığı ve kaynakların öğrencinin erişimine sunulduğu belirli bir şekilde yapılandırılmış bir yaparak öğrenme seklidir. Örnek olarak bir müzik parçası besteleme, bir araç tasarımı, ya da bir şirket kurma ve yönetme gibi görevler verilebilir (Schank, Fano, Bell, & Jona,

* Derya Kıcı. Araştırma Görevlisi
E-mail address: derya.kici@mail.utoronto.ca

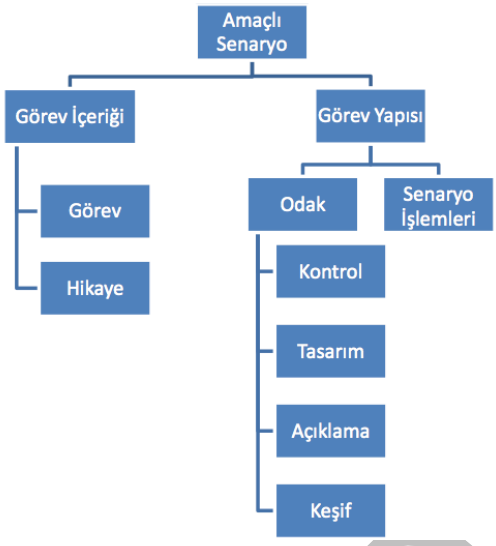
1993/1994). Schank ve çalışma arkadaşları (1993/1994) amaçlı senaryoların öğrencinin öğrenebileceği beceriler üzerine geliştirilmesi gereğinin üzerinde durmaktadır. Bu fikir doğrultusunda öğrenciler, pratik bir rasyonalite içinde, hâlihazırda bildikleri ve ihtiyaçları doğrultusunda kendileri için en iyi olan ne ise onu yapmak isteyen ve bu amaç uğruna bir strateji belirleyip uygulayan kişiler olarak kabul edilmektedir. Sonuç itibariyle öğretim tasarımcısının öğrenme kazanımlarını öğrencinin meşgul olacağı konular olarak değil, öğrencinin uzmanlaşabileceği beceriler şeklinde ifade etmesi gerekir. Amaçlı senaryolar açık ve somut bir amacı, bu amaca ulaşmak için öğrenilmesi ve deneyimlenmesi gereken hedef beceriler kümesini, ve bu işi yapacağı bir faaliyet ortamını içerir. Araştırmacılar buradaki "amaç" kavramını tanımlamak için öğrenciye verilen bir "misyon/görev" metaforunu kullanmışlardır.

Amaçlı senaryolar bir eğitim yazılımı türü olmaktan öte bir öğrenme yaklaşımıdır ve bilgisayar ortamında sunulmak zorunda değildir. Buna rağmen bilgisayar ortamları amaçlı senaryoların uygulanması için sınıf ortamında sağlanması zor ön koşulları sağladığı için tercih edilebilir (Schank, Fano, Bell, & Jona, 1993/1994).

Bu çalışmada Schank (1994)'in önerdiği amaçlı senaryo tasarımına ek olarak işbirlikli öğrenme yaklaşımı eklenerek çok kullanıcılı bir amaçlı senaryo tasarlanmıştır. İşbirliği kişisel bağımsızlık, üreticilik, yansıma, etkin katılım, kişisel uyumluluk ve çoğulculuğa dayanmalıdır. Açıkgöz(1992) işbirlikli öğrenmenin en önemli özelliği olarak, öğrencilerin bir amaç doğrultusunda küçük gruplar halinde birbirinin öğrenmesine yardım ederek çalışmalarından bahsetmektedir. İşbirlikli öğrenmenin diğer grup çalışmalarından farkı, grup üyelerinden hem kendilerinin hem de diğerlerinin öğrenmesini en üst düzeye çıkarmaya çalışmalarının beklenmesidir. İşbirlikli öğrenme gruptaki her üyenin, gruptaki diğer üyeler başarmadan kendisinin de başaramayacağını bilmesi ve bu nedenle arkadaşlarının öğrenmesine yardımcı olmasını sağlayacak şekilde düzenlenmelidir. İşbirlikli öğrenme sonunda elde edilen başarı, tek tek bireylerin katkısıyla elde edilmiş grup başarısı olmalıdır. Bir gruptaki bireylerin birbirinden bağımsız olarak işin bir kısmını yapmaları işbirlikli öğrenmenin gerçekleşebilmesi için yeterli değildir. İşbirliğinde esas olan öğrencilerin birbirleriyle etkileşerek birbirine yardımcı olmaları ve ortak bir ürün ortaya koymalarıdır (Açıkgöz, 1992).

2. Amaçlı senaryo tasarımı

"Hırsız Kim?" adlı bu amaçlı senaryo ile çalıştıktan sonra öğrencilerin sahip olması hedeflenen iki temel beceri vardır. Birincisi; problem çözme becerisini geliştirir, ikincisi ise; arkadaşları ile işbirliği içerisinde çalışır.



Amaçlı senaryoların nasıl tasarlandığını anlamak için, onu ortaya çıkaran farklı bölümleri, bütün yapıda rol oynayan her bir parçanın rolünü ve bölümlerin birbirleri ile nasıl ilişkili olduğunu tanımlamak oldukça önemlidir. Bir amaçlı senaryo her biri kendi içinde alt bölümlere ayrılan iki ana bölümden oluşur: Görev içeriği ve görev yapısı. Amaçlı senaryoların organizasyon yapısı Şekil 1'de gösterilmektedir (Schank ve diğ., 1993/1994).

2.1. Görev içeriği

Görev içeriği özellikle tematik açıdan amaçlı senaryoların geliştirilmesi ile ilgilidir. Bu başlığın altında görev ve hikaye olmak üzere iki alt başlık yer almaktadır. Görev amaçlı senaryonun bütününde yer alan amaçtır. Örneğin bir ayakkabı fabrikası kurmak ve üretimi sağlamak amaçlı senaryo yaklaşımı için uygun bir görevdir. Hikâye ise görevin altında yatan takip edilecek öncül görevdir. Ayakkabı fabrikasının özellik-

IETC 2014

leri ortaya konulmalı, üretilecek ürünler tasarlanmalı, rakipler ve müşteriler hesaba katılmalı ve sonra ayakkabı fabrikası kurma görevi için hikâye oluşturulmalıdır.

Şekil. 1. Amaçlı senaryoların organizasyon yapısı

2.1.1. Görev

Amaçlı senaryoda öğrencinin tamamlamaya çalıştığı amacı belirleyen görev**,** amaçlı senaryonun öncelikli bileşenidir. Amaçlı senaryodaki pedagojik amacı karşılayan bir görev seçildikten sonra tasarımın kalanı daha açık odaklı olmaya başlar. Diğer taraftan amaçlı senaryo, hikâye ve senaryo işlemlerini oluşturan bileşenler ile yakından ilişkili olmalıdır. Öğrenci görevi çeşitli yollardan tamamlayabilir. Bu nedenle nasıl devam ettiği değil, neyi başardığı daha ön planda tutulmalıdır.

Görev gerçek ve hikâye içerisinde anlamlı olmalıdır. görevi tanımı belirsiz nitelik ve etkinlikler içermemelidir. Örneğin, "görevin dürüst olmak" ya da "sorumluluk duygusu ile hareket et!" gibi ifadeler yeterince açık değildir. Verilen görevlerin bütün öğrencilerin hayal gücünü kapsaması mümkün değildir. Homojen bir şekilde bütün öğrencilerin ilgisini çekme girişimi, kimsenin heyecan duymaması ile sonuçlanabilir. Bu nedenle küçük bir hedef kitlenin gerçekten ilgisini çekebilen bir amaçlı senaryonun hedef kitlesini arttırmaya çalışmaktan kaçınılmalıdır.

Görevin gerçek bir amaç içermesi gereğinin yanı sıra hikâye bağlamında takip etmek için makul bir amaç belirlenmelidir. Öğrenci senaryonun içeriğinden görevinin ne olduğunu çıkarabilmelidir. Ayni şekilde görevi duyduğunda da hikâyeyi tahmin edebilmelidir. Örneğin, öğrencinin bir şirketin yöneticisi olarak rol aldığı bir hikayede, şirket bir takım problemler ile karşı karşıya kaldığında, görev muhtemelen gerçek bir yöneticinin yapabileceği eylemler ile bu problemleri çözmek ya da bu problemler hakkında bir rapor yazmak olduğu tahmin edilebilir olmalıdır. Eğer görev ve hikâye tutarlılık içerisinde değilse bu öğrenci için bir motivasyon problemi oluşturabilir. Öte yandan, görevin mükemmel bir amaç içerdiği bir amaçlı senaryoda uygun olmayan bir hikâye görevin anlamlı şekilde ilerlemesine müsaade etmez. Benzer bir şekilde, büyüleyici bir hikâyenin öğrenciyi önemli bir görevi başarmak için işe koşmadığı da görülebilir.

Amaçlı senaryoda görev tasarlanırken göz önünde bulundurulması gereken en önemli nokta öğrencinin motive olması için öğrendiklerinin kullanışlı, alakalı ve heyecanlandırıcı olmasıdır. Amaçlı senaryo ile

IETC 2014

ilgilenmesi için birçok öğrencinin motivasyonu özellikle başlarda, görevi tamamlama isteğinden gelir. Görevin uygun şekilde motive etmesini sağlamaya yardımcı olacak bazı öneriler şöyledir:

- Görev, mümkün olan her zaman, öğrencinin hali hazırda sahip olduğu ya da öğrencinin benimsemek için gönüllü olduğu amaçlar içermelidir. Bazen öğrenciyi motive etmek için halihazırda sahip olduğu bir amacı gerçekleştirmek için bir fırsat sunulduğunda dahi öğrenci bu amacı benimsemez. Bu durumda öğrencinin amacı neden benimsemediği dikkatlice düşünmelidir. Bunun nedeni örneğin, verilen amacı gerçekleştirmenin mümkün olmadığını düşünmesi olabilir. Astronomi konusuna ilgi duyan bir öğrenci başka bir galaksiye gitme konusunda çok istekli olabilir fakat bu hali hazırda mümkün olmadığı için muhtemelen öğrenci için aktif bir amaç olmayacaktır.

- Görev çeşitli etkinlikleri kapsayacak yeterlilikte olmalıdır. Kapsamı çok dar olan görevler, bu göreve dâhil olan farklı ilgi alanları olan öğrencilerin dikkatini çekmeme riski taşır. Görevi başarmak için ulaşılabilir çeşitli yollar barındıran geniş kapsamlı bir görev birçok kişinin ilgi alanına hitap eder

- Öğretilmek istenen hedef becerilere ulaşmak için görevin tamamlanması çok önemlidir. Bir görevin tasarımında, amaçlı senaryo tasarımcısı sonuçta öncelikli hedef becerinin edinimine ulaşılması gerektiğini unutmamalıdır. Görev söz konusu hedef becerilere bağlı olmaksızın motive edici olabilir ve farklı amaçlar içerebilir. Tasarımcı görevi belirlerken, hedef becerilerin görevi başarmada yardımcı olabileceği durumları aklında bulundurulmalıdır. Bunun için sorması gereken sorular şunlardır: Bu durumlar makul mü? Birbirlerine tutarlı bir hikaye ile bağlanılabilirler mi? Hedef beceriler bu hikayeye dahil edilmek için zorlanıyor mu yoksa kendiliğinden dahil oluyor mu?

- Motivasyon etkisinin yanı sıra, hedef becerilerin gerçek bir senaryo içerisine gömülmesindeki temel neden öğretilen bilgiyi konumlandırmaktır. Hedef beceriler öğrenci için sadece öğrenci onunla ne yapacağını bildiği zaman kullanışlı olur. Buna rağmen hedef becerileri basitçe uygulayabilir olmak yeterli değildir. Öğrenci görevi başarıyla tamamlamanın esasında amaçlı senaryo dışında bir takım genel amaçları gerçekleştirmek olduğunun farkında olmalıdır. Bu vurgu hedef becerilerin yararının açığa çıkarılmasına yardımcı olur. Görev öğrenciye "Eğer ben bunu yapabilirsem, diğer her şeyi de yapabilirim" dedirtebileceği gibi tam tersi "Tamam, bunu yaptım ve eğlenceliydi, peki ama şimdi ne oldu?" da dedirtebilir. Örneğin kurye rolünde trafiği yoğun bir bölgede motosiklet sürmeyi öğrenmek öğrenciye eğer burada motosiklet sürebiliyorsa, her yerde bunu yapabileceğini düşündürtebilir. Ancak trafikten uzak bir park etrafında motosiklet sürmek, aynı becerileri içermesine rağmen, öğrenciyi bu becerilerin aynı yolla kullanımı ve sağlamlığı konusunda ikna etmez

- Görev farklı yaklaşımlar doğrultusunda başarılabilir olmalıdır. Bir yöntem ya da yaklaşım kullanarak görevi başarmayı deneyimleyen öğrenciler geri gidebilmeli ve tekrar deneyebilmelidir. Görev öğrenci kontrolünü ve böylece amaçlı senaryo oturumunun sahipliğini azami boyuta çıkarmak için, öğrenciye nasıl mücadele vereceğinin kararını verme konusunda serbestlik tanır. Bazı öğrenciler doğrudan bir çözüm oluşturmak için girişimde bulunmak isterken diğerleri ipuçları toplamak ister, tavsiye alır ve sonra devam eder. Görev çözüme götüren basitçe tanımlanmış doğru yolu, karmaşık hale getirmekten kaçınmalıdır. Amaçlı senaryo tasarlanırken öğrenci için tuzaklar kurulmamalıdır (Schank ve diğ., 1993/1994).

2.1.2. Hikaye

Bu bileşen amaçlı senaryonun öğrencinin aklında tutarlı olması bakımından oldukça önemlidir. Hikâye görev ile birlikte amaçlı senaryonun içeriğini oluşturur. Hikâye öğrencinin rolünü, eylemde bulunacağı sahneleri ve diğer amaçlı senaryodaki ayrıntıları tanımlar ve öğrenci için daha makul ve cezbedici hale getirir. Motive edici bir hikaye oluşturmak için insanların yapmayı sevdiği ya da ilgi duyabilecekleri bir şeyi ya da insanların gerçek hayatta korktukları bir şeyi seçmek gerekir. Böylece öğrenci hikâye için daha güçlü duygulara sahip olur ve kendisine verilen rolü benimser. Hikâyede öğrenciye başta verilen görev çok önemlidir. Sıkıcı bir hikâyede öğrenci, tıpkı başlangıçta okuması zevkli gelmeyen bir romanda olduğu gibi amaçlı senaryonun bütününde kaybolur. Devamında ilgi çekici olacağını düşünmediği bir hikaye içerisinde devam etmesi pek olası değildir. Hikayeler üç temel bileşenden oluşur; rol, kurgu ve sahneler.

IETC2014

Rol: Rol, öğrencinin hikaye içerisinde oynayacağı rolü tanımlar. Rolün doğası öğrencinin görevi nasıl gerçekleştireceğini etkiler. Rol genellikle bir meslek alanı tarafından tanımlansa da rolü tanımlamak için mesleki deneyim, refah, ideoloji ve sosyal durumlar gibi çeşitli faktörler göz önünde bulundurulabilir. Örneğin, borsa öğretmeyi amaçlayan bir amaçlı senaryoda, çevre dostu şirketleri desteklemek isteyen bir yatırımcı belirlemek iyi bir fikirdir.

Kurgu: Kurgu görevin neden önemli olduğunu ve öğrencinin kimlerle birlikte çalışacağı gibi senaryo ile ilgili detayları içerir. Öğrencinin hangi araçları ne için kullanabileceğinin, nerede faaliyet göstereceğinin, karşılaşacağı güçlüklerin ve alacağı ödüllerin neler olduğunun belirlenmesi gereklidir. Görev öğrenci faaliyet gösterdikçe artan bir beklenti ile devam ederken kurgu da bu beklentilerin nasıl karşılanacağına dair somut bir fikir vermelidir.

Sahneler: Hikâye, akış içerisinde tutarlı öğeler ile birlikte birden fazla mekânda ve sahnede geçebilir. Böylece, bir sahne öğrenciye senaryodaki işlemler ile meşgul olması için fırsat sağlayan ve bazı mantıksal bağlantılar sunan belirli fiziksel ayarlardan oluşur. Örneğin bir sahne fabrikada üretim bandını ya da ürünlerin gemilere yüklendiği bir iskeleyi içerebilir.

2.2. Görev yapısı

Görevi takip edecek öğrenci için bir araç olan ve bir çok şekilde geliştirilebilen görev yapısı, hikâyeyi desteklemek için geliştirilmesi gereken planları belirtmelidir. Burada tasarlanan görevler, amaçlı senaryo ile öğretilmek istenilen becerilerin işe koşulmasında gereken alt planları desteklemek için tasarlanır. Örneğin, bir ayakkabı fabrikası tasarımında, öğrenci ayakkabı fabrikasının hangi birimlerden oluştuğu üzerine düşünebilir, çizim ve tasarım yapabilir, ürünlerini çeşitlendirebilir, rakip şirketleri araştırabilir ya da ürünlerin satışında ve üretim yönetiminde önemli noktaları tespit edebilir. Bütün bu eylemler ayakkabı fabrikası tasarımını içeren bir senaryonun görev yapısında bulunabilecek eylem noktalarıdır.

Görev yapısı içerisinde göz önünde bulundurulması gereken bir diğer durum ise öğrencinin yapacağı eylemlerin gerçekçi eylemler olması gereğidir. Örneğin öğrencilerin yazı mi yazacağı, çizim mi yapacağı ya da birbirleriyle sözel iletişim mi kuracağı belirlenir. Öğrencilerin yapabilecekleri bu eylemler senaryo işlemleri olarak tanımlanır. Dikkatle seçilmesi gereken bu işlemleri kullanarak öğrencilerin hedef becerileri öğrenmeleri amaçlanmaktadır.

Görev yapısı öncelikle, uygulanacak etkinliklerin tarzı göz önünde bulundurularak oluşturulur. Bu görev odağının seçimi problemidir. Görev odağı; tasarım, açıklama, keşif ve kontrol gibi yaklaşımların kombinasyonunu içerir. Bu ana odaklardan birini seçmek şart olmamakla birlikte amaçlı senaryodaki görev odakları kümesini tanımlamak tasarım esnasında kullanışlı bir yöntemdir (Schank ve diğ., 1993/1994).

2.2.1. Odak

IETC 2014

Görev seçildikten sonra amaçlı senaryonun ikinci bileşeni görevin neye odaklanacağının belirlenmesidir. Görev odağı amaçlı senaryonun kalanı etrafında ara yüzün tamamının yapılandırılmasını sağlar. Amaçlı senaryo alanının birtakım kısıtları vardır. Örneğin bir program demiryolu istasyonu inşa etmek için bir görev sunarken diğer taraftan bir başkası öğrenciden tehlike altındaki türlerin korunması için devlet toprakları üzerinde bir bölge oluşturmasını isteyebilir. Fakat hikâye ve görev gibi açık özelliklerin ötesinde, bir amaçlı senaryoda birbirinden farklılık gösteren derin anlamlar bulunabilir. Bu farklılık esas etkinliklerin genel anlamda türü ve odağı ile ilişkilidir. Odak öğrencinin yapması beklenen etkinliklerin organizasyonunda temel niteliktedir. Aşağıdaki tabloda tanımlanan dört tür görev odağının özeti sunulmuştur:

Table 1. Dört çeşit görev odağı

Görev Odağı	Tanım
Açıklama	Öğrencinin odağının olguların değerlendirilmesi, sistemlerin teşhisi ve çıktıların tahmini üzerinde olan senaryoları içerir.
Kontrol	Öğrencinin bir organizason yürüttüğü, system işlettiği vb. senaryoları içerir.
Keşif	Öğrencinin içerisinde kanunları uyguladığı, etkinliklere katılım için fırsatların varkına vardığı bir mikro dünya sunan senaryoları içerir.
Tasarım	Öğrencinin temel faaliyetlerinin yeni ürünler oluşturmak, bir sistemin nasıl organize edileceğini belirlemek vb. olduğu senaryoları içerir.

2.2.2. Senaryo İşlemleri

Amaçlı senaryonun son bileşeni öğrencinin amaçlı senaryo ile meşgul olduğu sürece yapacağı asıl etkinlikleri belirleyen senaryo işlemleridir. Senaryo işlemlerinin doğası, pedagojik amaçların nihai gelişimi üzerindeki önemli etkisidir. Eğer eylemlerin gerekleri ilgisiz, tutarsız, anlamsız ve çok karmaşık ise öğrencinin motivasyonu ve ilgisi azalacak ve istenen beceriler öğrenilemeyecektir. Senaryo işlemleri terimi bir parametre ile ayar yapma, bir simülasyonda direktif verme, soruları cevaplama, bir ürünü şekillendirmek için bir araç kullanma, bilgi arama ve seçenekler arasında karar verme gibi etkinliklerden bahsetmektedir.

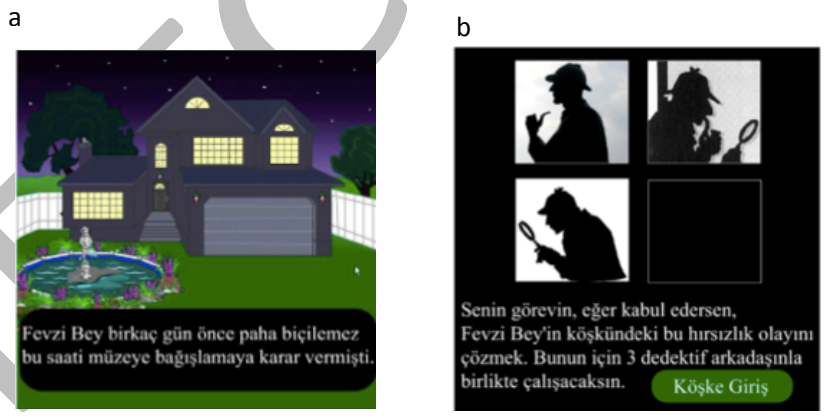
2.3. Hikaye temelli öğrenme / uzman videoları

Amaçlı senaryo öğrenme ortamlarında, bilgi zenginleştirme ve bağlam dayalı ilişkilendirme içerisinde öğütler verilerek desteklenir. Otomatik olguya dayalı ilişkilendirme analizi öğretim tasarımı için aranan problem durumlarının çeşitlerini gösteren öğretim durumlarını tanımlar. Öğrenme ortamı içerisinde öğrenenlere sunulacak aday olgular şu özelliklere sahiptir (Jonassen & Hernandez-Serrano, 2002):

- Belirli bir bilgiyi, bir bağlam içerisinde sunar.
- Geniş ya da dar zaman öbekleri sunabilir.
- Videolarda bahsedilen deneyimler beklenenden farklıdır.
- Problem çözenler için bazı amaçlara ulaşmada yardımcı olacak ya da olası başarısızlıklar konusunda uyaracak derslere sahiptir.

IETC 2014

3. "Hırsız Kim?"



Bu bölümde amaçlı senaryoların tasarım ilkelerine dayanarak tasarlanan "Hırsız Kim?" uygulamasının detaylarına yer verilmistir. Tasarlanan bu amaçlı senaryoda görev içeriği şöyledir:

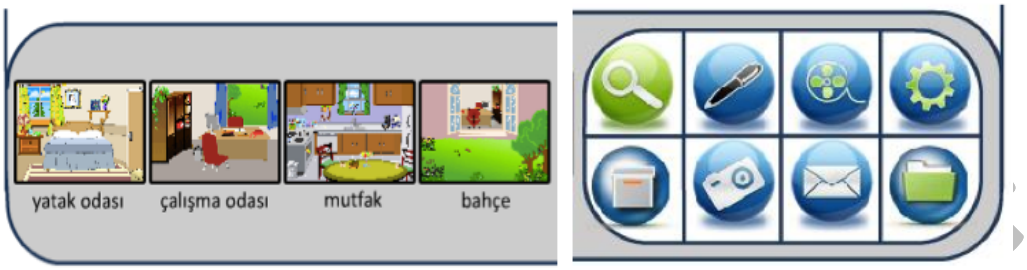
Hikaye: Bu amaçlı senaryoda sunulan hikâyeye göre Fevzi Bey'in köşkünde bir hırsızlık olayı gerçekleşmiştir. Fevzi Bey'in bir kaç gün önce müzeye bağışlamaya karar verdiği antika saat çalınmıştır. Fevzi Bey, yaşlı ama gösterişli bir köşkte Mukaddes Hanım ile birlikte yaşamaktadır. Köşkte ayrıca bir kalfa ve Fevzi Bey'in hemşiresi yatılı olarak çalışmaktadır. Olayın gerçekleştiği sırada köşk sakinleri dışında iki kişi daha evde bulunmaktadır. Bunlardan birincisi Fevzi Bey'in yıllar evvel ilk eşi ile birlikte evlat edindikleri Sadık ve Fevzi Bey'in abisinin oğlu olan yeğeni Selim. Hikâye kullanıcıya olayın anlatılması ve görevin belirlenmesi ile başlamaktadır.

Rol: Öğrenci bu amaçlı senaryo içerisinde "özel dedektif" rolüne sahiptir.

Görev: Öğrencinin görevi dedektif rolü içerisinde üç arkadaşı ile birlikte takım çalışması yaparak, hikâyede sunulan şüpheliler arasından suçluyu tespit etmektir.

Kurgu: Uygulama içerisinde öğrenciler şüphelileri inceleyebilir, şüphelilerin ifadelerini okuyabilir ve olayın gerçekleştiği köşkte, dört farklı mekânda araştırma yaparak ipucu toplayabilir. Bu sırada kullanabileceği büyüteç, fotoğraf makinesi, not defteri ve topladığı delillerin bulunduğu kanıt kutusu gibi araçlar mevcuttur. Ayrıca, uygulama içerisinde kullanıcıların dedektif arkadaşları ile işbirliği yapabilmeleri için bir mesajlaşma sistemi, topladığı delilleri, çektiği fotoğrafları ve aldığı notları arkadaşları ile paylaşabileceği bir panel ve arkadaşları ile çevrimiçi olarak iletişim kurabileceği bir anlık mesajlaşma penceresi bulunmaktadır.

Şekil. 2. (a) hikaye ekranı; (b) görev ekranı



Sahneler: Öğrencilerin yukarıda bahsedilen görev ve hikaye içerisinde iş yapabilecekleri, yani bu amaçlı senaryo konseptinde araştırma yapabilecekleri dört farklı mekan bulunmaktadır. Bu mekanlar Fevzi Bey'in köşküne ait mutfak, yatak odası, çalışma odası ve çalışma odasının penceresinin baktığı arka bahçedir.

Odak: Bu çalışma için geliştirilen Hırsız Kim? adlı amaçlı senaryonun görev odağı karar vermedir. Bu odak yukarıda bahsi geçen dört odak türünden "Açıklama" altında yer alabilir. Kullanıcılardan beklenen

IECT 2014

hikâye içerisindeki olguları değerlendirmesi, sebep sonuç ilişkisi kurması ve mevcut durum ile ilgili çıktıların tahmini üzerine bir teşhis koyması ve buna göre muhakeme yaparak bir karara varmasıdır. Öğrenciden hikâyenin kendisine sunduğu ipuçları doğrultusunda hırsızın kim olduğuna dair bir tespit yapması ve bu tespitini takım arkadaşları ile paylaşarak ortak bir karara varması beklenmektedir.

a b

Şekil. 3. (a) mekanlar; (b) araç kutusu

Senaryo İşlemleri: Öğrencinin hedef beceri olan problem çözme basamaklarını amaçlı senaryo dâhilinde tamamlaması ve arkadaşları ile işbirliği içerisinde görevi tamamlaması için yapması gereken etkinlikler ve bu etkinliklere ait ekranlar aşağıdaki gibidir.

Görev: Öğrencilerin uygulama üzerinde çalışmaları sırasında istedikleri her zaman kendilerine verilen görevi [illegible] esinin yeniden izlenmesine olanak veren biçimde görevini hatırlatmak amacı ile tasarlanmıştır.

Şüpheliler: Bu ekranda olay esnasında köşkte bulunan altı şüpheliye ait kısa bilgiler sunulmaktadır. Öğrenciden olay sırasında köşkte bulunan kişilerin kim olduğu, Fevzi Bey ile yakınlığının ne olduğu, köşkte bulunma sebebi ve benzeri konularda fikir edinmek amacıyla bu bilgilere göz atmaları beklenmektedir.

İfadeler: Bu ekranda olay esnasında köşkte bulunan altı şüpheliye ait ifadeler bulunmaktadır. Her şüpheliye dört soru sorulmuştur. Bu sorular şöyledir: 1-Ne kadar zamandır köşktesiniz? 2-Dün aksam neredeydiniz? 3-Dikkatinizi çeken olağandışı bir şey oldu mu? 4-Size [illegible] bir? Öğrenciden beklenen bu şüphelilerin ifadelerini okumaları ve bunlarla ilgili notlar almalarıdır.

Mekânlar (Sahneler): Öğrenciler köşkte bulunan dört mekânda inceleme yapabilirler. Bu mekânlar çalışma odası, yatak odası, mutfak ve bahçeden oluşmaktadır. Kullanıcıların bu mekânlarda arama yapmaları ve delil olabileceğini düşündükleri nesneleri kanıt kutusunda toplamaları gerekmektedir. Ayrıca bu delillerin kime ait olduğu konusundaki tahminlerini de not almaları ve arkadaşları ile paylaşmaları beklenmektedir.

Araçlar: Bu bölümde bir dedektifin araştırma esnasında ihtiyaç duyabileceği bazı araçlar öğrencilerin kullanımına sunulmuştur. Bu araçlar büyüteç, fotoğraf makinesi, not defteri ve kanıt kutusundan oluşmaktadır. Öğrencilerden uygulama esnasında bu araçları etkin biçimde kullanmaları beklenmektedir.

İşbirliği Araçları: Öğrencilere diğer üç arkadaşı ile işbirliği yapabilmesi için birtakım araçlar sunulmaktadır. [illegible]

mesaj kutusu yer almaktadır. Kullanıcılardan beklenen yaptığı araştırmalar sırasında bulduğu delilleri ve aldığı notları diğer arkadaşları ile paylaşması, arkadaşlarından gelen paylaşımları dikkate alması, arkadaşları ile fikir alışverişinde bulunması ve ihtiyaç duyduğu zamanlarda arkadaşlarına çevrimdışı mesaj göndermesidir.

Yardım: Bir amaçlı senaryoda öğrenci istediği her zaman, hem içerik hakkında hem de uygulamanın kullanımı hakkında destek alabilmelidir. Bu kısım uygulamanın nasıl kullanılacağına ilişkin yardım ekranlarından oluşmaktadır.

Karar: Bu ekran kullanıcıların problemi çözdüğü ve suçlunun kim olduğunu belirlediği etkinliği gerçekleştirilmeleri üzerine tasarlanmıştır. Bu etkinlikte öğrencilerden bir tanesi altı şüpheliden birisini suçlu olarak önerir. Bu önerinin üzerine diğer üç kullanıcının yanıtları beklenir. Önerilen şüphelinin suçlu olup olmadığının sistem tarafından değerlendirilebilmesi için tüm öğrencilerin bu şüphelinin suçlu olduğu konusunda hem fikir olması gerekmektedir. Öğrencilerden herhangi birisi ret oyu kullandığı takdirde kullanıcılardan hem fikir olana kadar birlikte çalışmaya devam etmeleri beklenmektedir. Böyle bir durumda anlık mesajlaşma penceresini kullanarak durumu değerlendirebilir ya da araştırma yapmaya devam edebilirler. Bütün kullanıcıların aynı şüphelinin suçlu olduğu konusunda hem fikir olduğu durumda sistem takımı oluşturan öğrencilerin her biri için hesaplanan amaçlı senaryo puanlarının ortalamasına bakılır. Bu puan yeterli ise öğrencilere suçlu tarafı kazandıklarına dair bir mesaj gösterilir ve öğrenci arayüzü kapanır. Bu durumda sistem takımı oluşturan öğrencilerin her biri için hesaplanan amaçlı senaryo puanlarının ortalamasına bakılır. Bu puan yeterli ise sistem suçlu tarafı kazandıklarına dair bir mesaj göster

Uzman Videoları: Hikâyelerde [illegible] m-
dedaha önce benzer konularda çözüm bulunduğu gibi konularda fikir edinebilir. Bu videolar öğrencinin bu amaçlı senaryoda yerine getirmesi beklenen görevin nasıl tamamlanacağından bahsetmez. Tümüyle söz konusu videodaki uzmanın deneyimlerini aktardığı ve öğrencinin buradan kendi adına bir çıkarım yapmasının beklendiği bölümdür. Bu uygulamada görüşlerine yer verilen uzmanlar, Sir Arthur Conan Doyle tarafından oluşturulan hayalî dedektif kahraman Sherlock Holmes, Agatha Cristie'nin hikâyelerinin ve romanlarının ünlü dedektifi Her-
[illegible] n-
maktadır. Bunlardan ilki Müfettiş Gadget tarafından problemin belirlenmesi ve anlaşılması ile ilgili bir takım deneyimlerin aktarıldığı videodur. Sonraki iki video Hercule Poirot'un problem çözmenin aşamaları ile ilgili "Ölüden Mektup Var" adlı hikayeyi ve hipotezlerin oluşturulması, test edilmesi, en uygun hipotezin seçilmesi hakkında olan "Acı Kahve" adlı hikayeleri içermektedir. Dördüncü hikaye, Sherlock Holmes'un "Sussex Vampirinin Maceraları" adlı hikayesi ile genel bir sonuca varma konusundaki deneyimlerini içerir. Son video ise yine Sherlock Holmes'un bilgi toplama aşaması ile ilgili deneyimlerini aktarmak amacı ile Sherlock Holmes'un kadim dostu ve yardımcısı Dr. Watson tarafından anlatılan "Mavi Yakut" hikâyesi yer almaktadır.

4. Sonuç

Bilişim çağının gerektirdiği insan profilinin belirlemesinde, yalnızca oluşan bireysel ve toplumsal ihtiyaçlar değil, ayrıca teknolojik ve bilimsel gelişim de önemli bir katkıya sahiptir. Buradan hareketle, çeşitli kurumlar ve dernekler (21st century skills (P21); Assessment and Teaching of 21st Century Skills (ATCS)), 21. yy. İnsanının sahip olması gereken özellikleri belirlemek için çalışmalar yapmaktadır. Bazı küçük farklılıklar göstermesine rağmen büyük oranda benzerlik gösteren bu özellikler aşağıdaki şekilde sıralanabilir (Bates, 2000; akt. Yıldırım, 2001): Etkili iletişim becerileri (okuma, yazma, konuşma, dinleme); kendi başına öğrenebilme yeteneği; sosyal beceriler (sorumluluk, olumlu yaklaşım, etik); takım çalışması becerileri; etkin ve verimli düşünme becerileri (problem çözme, kritik düşünme); bilgi ustalığı (bilgiye ulaşabilme, kullanabilme ve yeni bilgi üretebilme); yaşam boyu öğrenme becerileri. Kısaca günümüzde eğitimin kurumlarının toplumun taleplerine uyan, birtakım temel becerilerde yetkin olan, yeni konularda öğrenmeye hazır, güncel problemlerin çözümü için işbirliği yapabilecek ve henüz var olmayan alanlarda dahi yenilikler yapabilecek bireyler yetiştirecek şekilde düzenlenmesi gerekmektedir.

Bu çalışmada, amaçlı senaryoların işbirlikli öğrenme yöntemlerine dahil edilmesi için takım çalışmasına uygun şekilde tasarlanması önerilmiş ve bu tasarıma örnek teşkil etmesi amacıyla bir örnek öğrenme materyali hazırlanmıştır. Bu çalışma dahilinde tasarlanan Hırsız Kim? adlı amaçlı senaryo tasarımı yaşam boyu öğrenme kapsamında işbirlikli öğrenme ve problem çözme gibi 21.yy. öğrenme ihtiyaçlarını karşılaması bakımından önem taşımaktadır.

Bu tasarım daha sonra bir Facebook uygulaması olarak geliştirilmiş ve etkinliği test edilmek için 100 yetişkin katılımcı ile deneysel bir çalışma yapılmıştır. Söz konusu çalışmanın detayları ve bulgularından başka bir makalede (Kıcı & Dilmen, 2014) ayrıntılı olarak bahsedilmektedir.

Abstract

The aim of this paper is to describe the attitudes of principals toward the integration of Information and Communication Technology (ICT) in public primary schools in the city of Veracruz, Mexico. This is a quantitative research through a survey. It was used a representative probability sample of 46 public primary schools in the municipality with a probability of occurrence of 90% and a standard error of 5%. The results indicate that the respondents believe that ICT apply to their work activities for both routine management tasks as for insertion into educational didactics in spite of the computer equipment insufficient.

Keywords: Attitude; Use of ICT; Teachers; Public Primary Education, Mexico

IETC 2014

1. Introduction

The incorporation of ICT has been modifying many ways in daily life and each day is affecting new people around the world. Fernandez-Tilve (2007) affirm that these technologies could help to the teaching process because there are so many different tools and pedagogical ways to work in teams and provide solutions to the users.

However, the inclusion of ICT in education is still a big challenge to the concepts of traditional learning and teaching (López de la Madrid & Chávez, 2013) without take in consideration the educational level. The application of these technologies into the classroom redefines the ways how the knowledge is being built, their value has been recognized by the literature but their full potential has not been consolidated.

Previous studies performed by Ana-Moreira, Cepeda-Romero, González-Salamanca & Sanabria-Mesa (2010) pointed that in spite of the increase of technological resources availability in the schools, the pedagogical practice in teachers do not reveal a significant modification in the traditional teaching model. In the case of Mexico, we have lived this situation with the technological provisioning executed by the national program of Enciclomedia with few positive results.

Meanwhile others authors [Fernández, Rodríguez & Vidal (2007); Fernández, Hinojo & Aznar (2002); Tejedor & García-Valcárcel (2006)] consider that attitudes of teachers towards ICT is one of the element that can explain the problems that affects their incorporation. They believe that having this knowledge it can be built specific programs to promote the effective use of ICT by the teachers in their initial and continuous training.

As usual, the teachers play a relevant roll in the results of any educational reform, so the reform that involves in the incorporation of ICT it is not the exception. The teachers must have a series of competencies and attitudes that allow that specific reforms help them to modify their practices. Thus, is about the understanding about what is happening in the classroom about the incorporation of ICT how we can glimpse the way for a right implementation of these technological tools, and is precisely the study of the attitudes of teachers one of the key elements to take in consideration in these integration process.

2. Methodology

In order to know about the attitudes of principals towards ICT in public basic schools of Veracruz City was chosen the quantitative method. The population was of 214 principals of public basic schools. It was used a representative statistical sample of 41 principals.

The survey used has a Likert scale to measure attitudes developed by Sigalés, Mominó, Meneses and Badia (2009). This instrument was composed by 31 questions or items with one possibility of answer between 1 and 5 (1: Totally agree; 2: Agree; 3: Neutral; 4: Disagree; 5: Strongly Disagree).

The reliability of the instrument was corroborated by Cronbach alpha coefficient getting an acceptable value of 0.891. The application of the instrument was face to face in a printed format sheet. In order to analyze the results of this survey SPSS software was used.

3. Conditions of the schools and their principals

It was possible to get information from 46 principals of the 55 public primary schools visited. The sample was composed by 36 women (78.3%) and 10 men (21.7%). The average age of the sample was 48 years old, with a minimum of 38 and a maximum of 63. Regarding to the formal education, at least 50% of the principals have a bachelor´s degree and 10.9% have a master degree. Meanwhile 15.2% studied basic specific training for primary teacher and 19.6% expressed have finished the full formal specific training for primary teacher. Finally, 4.3% have a special education studies after the full formal specific training for primary teacher.

Referring to the years of experience as principal in the same school or in any other school, 8.7% has less than a year. The most prolific group was found between 1 and 5 years working in the same position (32.6%), follow with the gays with 6 and 10 years old working as principals (23. 9%). While most of the lowest percentages are distributed among those with more time in that position (8.7% between 11 and 15 years; 4.3% between 16 and 20 years; and 4.3 between 21 and 25 years). A final group is represented by the principals who have more than 26 years working in that position (17.4%).

IETC 2014

In terms of the technological infrastructure of the principals, 97.8% said to have at least one computer in their house and 95.7% of the principals noted that have Internet in their home. On the other hand, most of the principals expressed that they have computers in their schools (80.4%), but unfortunately 71.7% said that their schools do not have media classroom.

However, concerning the status of the computer equipment available to the school 47.8% of the principals expressed that they do not have any broken computer or out of service computer. Meanwhile, 41.2% said that they have between 1 and 5 computers broken or out of service. On the other hand, 10.9% said as out of service between 7 and 20 personal computers. It is relevant to mention that in most schools with computer equipment which feature is in use, it means those schools do not have backup equipment.

In relation to the total personal computers in the school, at least 15.2% of the principals said that they didn´t have any personal computer. Meanwhile, 41.3% expressed to have between 1 to 5 personal computers. While 17.4% of the principals stated to have between 6 to 10 personal computers. Also 15.3% said that have between 11 to 15 personal computers in their facilities. Only 6.6% of the schools have between 26 to 30 personal computers. Finally, one school reported 27 personal computers (2.2%), other school stated 28 personal computers, one school with 36 and other schools said 45 personal computers.

Reviewing the existence personal computers in operation in these public primary schools that are been used with educational purposes, we found that 43.5% of the principals expressed that none of these personal computers is been used for this purpose. However, 37% of the schools dedicate between 1 to 5 personal computers for educational purposes. In the range from 6 to 10 personal computers we could found just 2 schools (4.4%). Meanwhile, 10.8% of the schools dedicate between 11 to 15 personal computers for educational matters. Only two principals said dedicate more computers to education (25 and 34 personal computers).

About the members of the community that use personal computers in the school is in this way: 73.9% for principals; 60.9% for teachers; 8.7% for staff personnel; and 37% of the students in the schools.

The digital presence of the school in Internet was expressed by the principals in this way: 78.3% schools have e-mail address. Just 2.2% of the schools have their own web page. And 6.5% of the schools have at least one Blog. These indicators show a minimum presence in Internet.

4. The roll of principals in the process incorporation of ICT

In the case of Mexico, there have been implemented several strategies to facilitate the incorporation of ICT in the education. We could say that at least there are five documents involved in the educational national policy: the third article of the constitution, the General Law of Education, the National Development Plan, the Regional Educational Program and the Alliance for Quality Education (Torres, Angulo, Valdés & García, 2013).

The Mexican Government recognize that there are relevant lags in the National Education System in order to get a quality education (Torres, Aviles & Romero, 2012), so the way to increase the quality for primary education, it was adopted to strengthen the teachers training and to modify the educational programs that allow to use ICT in learning. In this sense the roll of the principals is quite relevant because they know how effective are the teachers in their school, they can identify very easy the weaknesses and help to do something about it.

IETC 2014

In the other hand, the Mexican Federal Government and the National Union of Education Workers (SNTE), in the Alliance for Quality Education agreed to modernize schools with the necessary infrastructure (computer equipment, Internet connectivity, availability of computer use in a classroom). Also, they promised to provide personal computers to teachers that get the certification of digital competencies (Arras, Torres & Fierro, 2012). All these matters must be take in consideration in each School Development Program, for that reason the roll of the principals is crucial to get succes in the achievements of the teachers and students.

5. Results

In Table 1 is presented in condensed form the results on the attitudes of principals towards the use of Information and Communication Technology (ICT) showing the dimensions of attitude towards ICT from the beliefs, appreciations and perceptions of respondents considering aspects of their technological skills, teaching skills, possible pedagogical application, ease of use, interference with learning support, emotional considerations, professional application, role in communication and interaction, state of the technological infrastructure and possibilities of access to computing and the Internet.

The questions associated to the dimension of beliefs about technological skills of the principals were related with the roll and necessity to receive technological training and also with the degree of confidence that the director has in terms of self-learning.

Meanwhile the questions associated to the dimension of beliefs about teaching skills were related with the roll of ICT in pedagogical matters about the design of activities, form of organization of the learning and evaluation mechanisms.

On the other hand, the questions associated to the dimension of appreciation about possible pedagogical application were related with how ICT can support the student in finding information and content management.

For the dimension of perception about ease of use of ICT, the questions were related with the degree of usability of technology tools in areas of cooperation and collaboration between teachers or between teachers and their students.

Referring to the dimension of beliefs about interference with learning support relates to the perspective of principals about the facilities that provide ICT in conducting learning activities and teamwork.

Finally, the questions associated to the dimension of affective appreciation address the sense of comfort that the principals have over the use of ICT for both administrative and educational work perspective and also considerer how they think students feel in this regard.

Table 1. Dimensions of study on the attitudes toward ICT of the principals

Beliefs about technological skills	Mean	σ	Std. M
I consider relevant the training in ICT	1.43	.583	.086
I believe that ICT training courses should increase	1.24	.431	.064
I learn to use software easily following the instructions in the manual	1.07	.250	.037
Beliefs about teaching skills	**Mean**	**σ**	**Std. M**
ICT help you to make evaluations	1.09	.285	.042
ICT help you to set up lessons for teaching	1.13	.341	.050
ICT help you in the design of teaching activities	1.26	.491	.072
ICT help you for the feedback of evaluations	1.48	.691	.102
Appreciation about possible pedagogical application	**Mean**	**σ**	**Std. M**
ICT facilitate students to get information	1.28	.455	.067
I think that ICT helps to get scientific information	1.26	.444	.065

IETC 2014

I consider appropriate to use ICT to present content	1.61	.856	.126
ICT promote student motivation for learning	1.48	.691	.102
Perception about ease of use	Mean	σ	Std. M
It is easy to access educational virtual platforms	1.35	.526	.078
ICT facilitate the creation of workspaces with students	1.48	.658	.097
ICT facilitate the creation of workspaces with other teachers	1.80	.910	.134
Beliefs about interference with learning support	Mean	σ	Std. M
ICT facilitate students to perform learning activities	2.3	.986	.145
ICT facilitate students the cooperative learning	1.43	.655	.097
Affective appreciation	Mean	σ	Std. M
I like to use the computer	1.78	.841	.124
I feel that students learn best when they use ICT	1.61	.747	.110
ICT make more comfortable the administrative tasks	1.54	.585	0.86

6. Conclusions

The integration process of ICT in the public primary schools in Veracruz City is a pending task to be resolved. The data show a positive attitude by the most of the principals and we could say that they can manage these technologies with certain ease, buy mainly to perform their management job. They recognized the current weakness in terms of technological infrastructure, training and in the design of educational programs supported by ICT.

So is imperative to take actions against these weakness as soon as possible in order to propitiate the full incorporation of all schools in Veracruz city, but also in Veracruz State and of course in all Mexico.

The Mexican Government have made efforts in national program that tried to provide technological resources in several occasions. However, previous failed experiences show that each national program should be integrated with a national technological change plan that take in consideration that Mexico is a huge, different and complex country. So, differential and specific strategies should be used according to the region and their characteristics.

It is relevant that these national efforts include: (1) Provisioning of telecommunications infrastructure in order to provide free, fast and stable Internet to all the schools in the country; (2) Provide a continuous schema for induction, training and monitoring about the use of ICT with educational purposes; (3) Design national policies in the educational system in order to provide equitable and fair reforms focus in promote the development and evaluation of teaching career.

So, in these educational reforms it is imperative to ensure a higher presence of ICT in educational activities, a higher level of informational competencies in principals, teachers and students, and a mayor contribution of these technologies to improve the quality of learning.

Learning styles and visual literacy for learning and performance

Riad S. Aisami

Faculty of Instructional Technology, Troy University, Troy, Alabama, USA, raisami@troy.edu

Abstract

Identifying students' learning styles has been found to be a significant factor for planning effective instruction. Also, visuals have been proven to be a learning enhancer if it is connected to the learning styles. The aim of this paper is to address some of the fundamental questions about learning styles and visual literacy for learning and performance. Questions including how people learn; what are the learning styles, and how it is determined. It also focuses on how visuals can be connected to the learning styles including multiple intelligences of individuals with learning disabilities such as agenesis of the corpus callosum. It also differentiates between visuals for learning and performance. Some of the visual and learning theories, along with instructional and graphic design models will also be introduced and discussed.

Keywords: Learning styles; agenesis of the corpus callosum; multiple intelligences; information processing; visual literacy

IETC 2014

1. Introduction

The most essential question in education today is: how can teachers and instructors provide their students with effective instruction? The effectiveness of instruction is usually measured by the instruction's capability in enabling the target learners achieve the instruction's intended learning outcomes. Thus, in order for teachers and instructors to plan the instruction that meets their students' need, they ought to know how the students learn better based on their learning styles. The type of learning style mainly depends on the side of the brain, left and right, that a student uses the most. Therefore, teachers and instructors need also to know how the human brain functions in order to assess the learning styles of their students properly and so develop matching instructional strategies. However, the common belief among teachers in general, higher education instructors in particular, is that students learn by various learning styles. Hence, the instructional contents must be delivered to students in different ways, and multiple instructional methods should be utilized. However, visuals in particular have been found to be a strong learning enhancer in various learning settings and for students of varied learning styles. Research suggests that using visuals in teaching results in a more effective learning and, therefore, the need to utilize it in teaching is rationalized. The presence of visual elements in today's teaching and learning is increasing as the integration of images and visual presentations with text in textbooks, instructional manuals, classroom presentations, and computer interfaces broadens (Benson, 1997; Branton, 1999; Dwyer as cited in Kleinman & Dwyer, 1999 and Stokes, 2001).

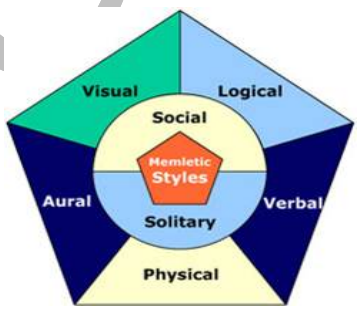
Using visuals in teaching, however, is not entirely new. Over the years, teachers often used different visuals to illustrate certain learning concepts for their students. They first used colored chalk with blackboards, and then colored markers with white boards and flip charts. They also used Crayons and

construction papers for children. Still pictures, posters, storyboards, charts, etc. were also among the visuals used in early teaching. Later, slides and transparency presentations were also used. However with today's advanced technology, digital visuals are being used as a viable learning enhancer due to its capability in conveying the desired instructional message instantly and universally. Therefore, visual literacy has become a required competency for teachers and instructors of all levels as well as for students in many formal educational settings.**Visual Literacy** is defined as the ability to understand, use, and create with images effectively (Braden, 1996 as cited in Lohr, 2008).

This paper aims to address some of the fundamental questions about learning styles and visual literacy for both learning and performance. Questions including how people learn; what are the learning styles, and how it is determined. It also focuses on how visuals can be connected to the learning styles to enhance learning (connection and action), and differentiates between visuals for learning and performance. Some of the visual and learning theories like the information processing theory and the cognitive theory of multimedia will be referenced. Also, related graphic and instructional design models like the ISD (instructional system design) approach and ACE (analyze, create, and evaluate) will also be introduced and discussed.

2. Learning styles and the human brain

While some people learn by hearing or reading words, others prefer seeing pictures, and or learn by doing (hands-on). Also, there are some people who learn better by analyzing or socializing, or some people like to learn individually, while others like to learn in groups. These different preferences of learning are referred to as the **learning styles**. Figure 1 presents learning styles overview that includes seven-learning styles: (1) visual (special), (2) verbal (linguistic), (3) aural (auditory), (4) logical (mathematical), (5) physical (kinesthetic), (6) Social (interpersonal), and Solitary (intrapersonal). This overview is based on (Learning-styles-online.com, 2014)



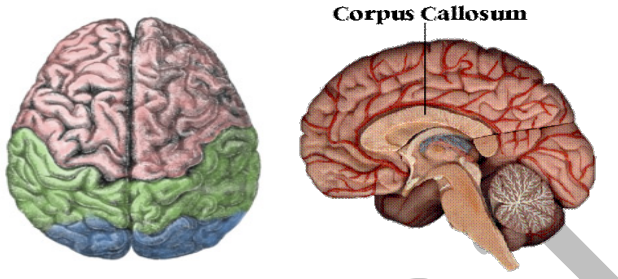


Figure 1: Learning styles overview

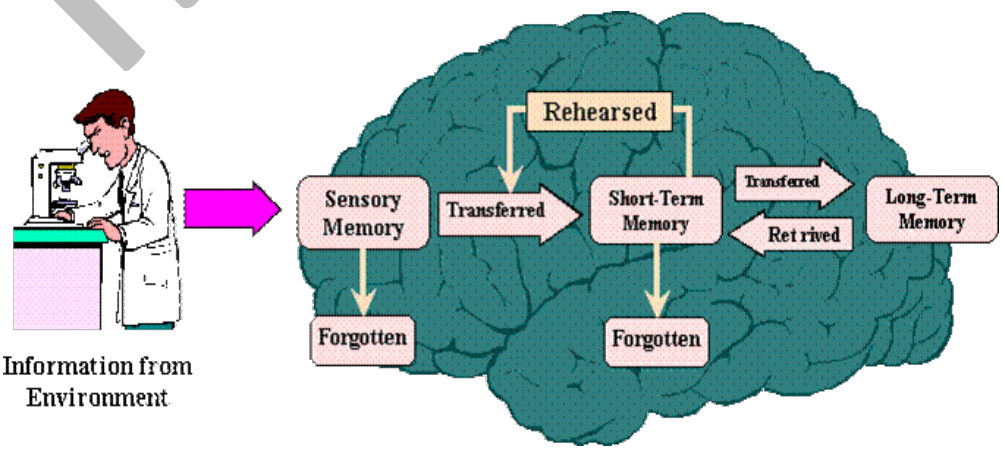
Also, students can have a combination of two styles such as visual-verbal, visual-nonverbal, auditory-verbal, or physical-kinesthetic, or can have a mix of multiple learning styles. Evidently, students with multiple learning styles can benefit from multiple instructional strategies. However, the research does not provide evidence of the superiority of a particular combination or mix of multiple learning styles over another. Hattie (2011) states that there is no scientific evidence, as of yet, that shows that people have specific, fixed learning styles or discrete intelligences, nor that students benefit when teachers target instruction to a specific learning style or intelligence. However, providing students with multiple ways to learn content has been shown to improve students learning (as cited in Edutopia, editor's notes, 2013).

In order for us to understand the origination of the learning styles, it is imperative that we understand how the human brain functions in general and how learning actually takes place. The cerebral cortex of the brain that houses the rational functions is divided into two-**brain hemispheres** connected by a

IETC 2014

thick band of nerve fibers (the corpus callosum) which sends messages back and forth between the two hemispheres of the brain. Figure 2 shows images of the two hemispheres of the brain and the corpus Callosum. While brain research confirms that both sides of the brain are involved in nearly every human activity, we do know that the left side of the brain is the seat of language and processes in a logical and sequential order. The right side is more visual and processes intuitively, holistically, and randomly. Most people seem to have a dominant side. The key word is that our dominance is a *preference*, not an absolute (Monroe Institute, 2014). Hence, people can and should develop both sides of their brain. However, knowing and understanding our multiple learning styles can help us learn more effectively by capitalizing on our strengths. Such determination has been found to make a difference for people with learning disabilities because of their multiple intelligences and different ways of learning.



(a) Brain Hemispheres **(b) Corpus Callosum**

Figure 2: Images of the brain hemispheres and corpus callosum

3. Information processing theory

The **information processing** theory describes how information travels through memory. In 1968, Atkinson and Shiffrin propose a model of information processing based on two types of memory: (1) short-term memory (including sensory and working memory) and (2) long-term memory. This model shows that the short-term memory is limited to seconds and explains why it's hard for people to remember things for a long period or perform simple tasks. In this model, the working memory of the short-term memory works in a system in which has an executive capacity that manages information. In a way, it plays the role of the Gate Keeper. It filters the information and decides on what type of information is insignificant that needs to stay in the sensory memory where it gets forgotten in seconds; and what is significant and must be advanced to the long-term memory where it gets stored, retained, and later recalled. "Learning is attributed to the successful transfer of information from one type of memory to the next (Lohr, 2008, p.54). Figure 3 shows how the information travels through the memory.

IETC 2014

Figure 3: Movement of the information through the memory

4. Mayer's cognitive theory of multimedia

In (2001), Mayer identifies some strategies for extending the memory for learning by using instructional multimedia principles and explains how visual and verbal memories can interact. Mayer builds his theory based on Atkinson and Shiffrin's information processing theory and identifies three cognitive processes of **selection, organization** and **integration** to increase **retention** of information and **enhance learning**. While the information learning theory focuses on the structure of these same three principles in enhancing the information processing and storage in the memory, Mayer's cognitive multimedia theory focuses on the facilitation of these principles in retaining the information in which it can be utilized in a meaningful way. Mayer's theory emphasizes that the retention of the information starts at the organization stage in which significant information needs to be organized and visualized in order to be moved from the short-term memory to the long-term memory where it can be stored. Lohr (2008) offers an interpretation to Mayer's organization principle of the multimedia theory. She states, for the instructional designers, that: "learners are more likely to think about your visuals the way you want them to if you organize or present information, in a way that the mind is predisposed to grasp (Lohr, p.62). Figure 4 shows how pictures get processed in the memory based on Mayer's cognitive theory of multimedia.

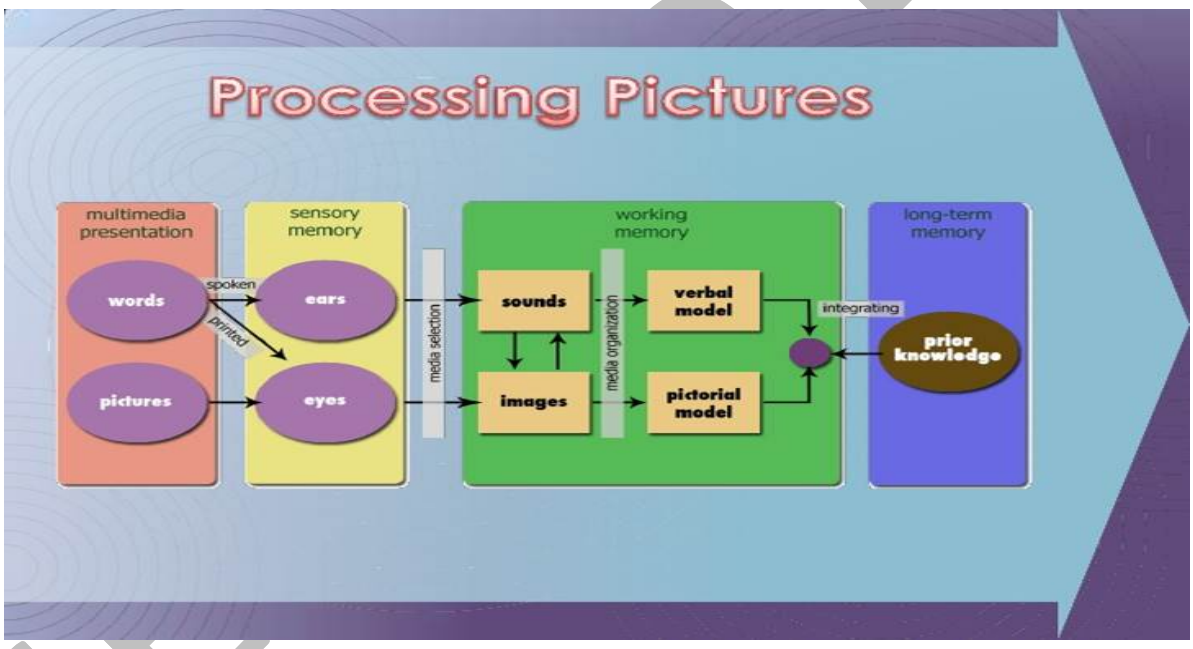


Figure 4: Processing pictures in the memory

5. Visuals for learning

The principle question here is how teachers and designers can organize and utilize visuals to help students learn and retain information in order to be recalled later for a meaningful use. **Visual** is a form of communication that is not verbal. It can be a picture or another form of illustration that appeals to the sense of sight. Figure 5 illustrates how the visual appeals to the sense of sight. In general, visuals can include but are not limited to: pictures, symbols, signs, maps, charts, graphs, diagrams, photographs, and models. Braden (1996) identifies five categories of visuals that have been studied by educational researchers. According to Barden, these visual categories are: (1) semiotics and film-video conventions, (2) signs, (3) symbols and icons, images and illustrations, (4) multi-images, and (5) graphic presentations (Braden, 1996 as cited in Lohr, 2008, p.13).

Figure 5: An illustration of how the visual image appeals to the sense of sight

A large body of research indicates that visual cues help us to retrieve better and remember information. The research outcomes on visual learning make complete sense when we consider that our brain is mainly an image processor (much of our sensory cortex is devoted to vision), not a word processor. In fact, the part of the brain used to process words is quite small in comparison to the part that processes visual images. Words are abstract and rather difficult for the brain to retain, whereas visuals are concrete and, as such, more easily remembered.There is countless studies that have confirmed the power of visual imagery in learning. One study asked students to remember many groups of three words each, such as dog, bike, and street. Students who tried to remember the words by repeating them over and again did poorly on recall. In comparison, students who made the effort to make visual associations with the three words, such as imagining a dog riding a bike down the street had better recall significantly (Kouyoumdjian, 2012, as stated in Psychology Today, 2014). In fact, just about every specialized study conducted for visuals and learning has emphasized the positive impact that visuals have on the students' memory, motivation, and performance. Visuals have been proven to engage students in the learning process, and images stimulate their critical and creative thinking. Also, visual thinking is conceived to be a learning style by which students learn better and retain more information when abstract words are associated with images. Teachers and instructors often hear statements from their students like these: I am a visual learner. I need to see it. Can you show me? Such demand is even stronger by online students who often struggle in an isolated learning environment where visuals and interactive multimedia can, to a degree, compensate for the social interaction of a traditional classroom.

6. Agenesis of the corpus callosum and visualized learning

As stated in the learning styles and brain hemispheric preferences sections, the learning styles are determined based on the two sides of the brain and learning requires movement of the information from one side to another through the corpus callosum. It was also concluded that identifying **multiple learning intelligences** for students with learning disabilities can help in capitalizing on the students' intelligence strengths, and teach them accordingly. However, how about individuals who were born without a corpus callosum and their learning disability is the lack of connectivity between the two sides of the brain that medically known as the agenesis of corpus callosum. How do these individuals learn, and how does their brain process information? While ADHD (attention deficit hyperactivity disorder) and other learning disabilities like non-verbal learning disability and autism are all widely known and have been reasonably addressed, ACC (agenesis or the corpus callosum) is not as known and relevant research is still limited. **Agenesis of the corpus callosum** is defined as a congenital (lifelong) brain abnormality that occurs when the corpus callosum does not develop as it should during the early prenatal period. It can occur as an isolated condition or in association with other brain abnormalities or physical or medical conditions. The corpus callosum is important for processing and integrating sensory, motor, and cognitive information. When the corpus callosum is missing or malformed, these functions may be affected (University of Main, 2008). Figure 6 shows an image of the brain with agenesis of the corpus callosum.

IECT 2014

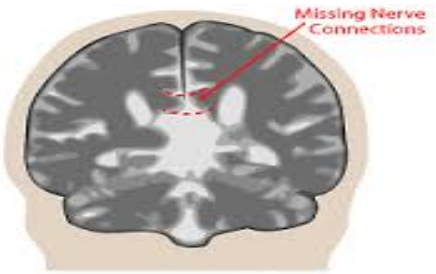

Figure 6:

Professionals in the field are still trying to have a better understanding of the impact of these types of disorders and the similarities and differences among and between them. Therefore, the question of how people with ACC exactly learn without a "connecter" between the two sides of the brain to send the information back and forth between the two-brain hemispheres is a question that is yet to be adequately researched. However, based on our personal experience for ten years with a child who has complete agenesis of the corpus callosum, we have found her to have multiple learning styles with visual-spatial is dominant. Auditory-verbal is also a favorable learning style for her. By which, she learns better by listening to a person reading a book or story than reading it herself. She also seems to benefit from the physical-kinesthetic learning style and the multiple learning intelligences by which she has learned to play the piano articulately, and had no difficulties learning to play other kind of musical instruments like clarinet and trombone. Also, stimulating her brain with visuals and provoking her to think visually has been found to be an effective learning technique for her. For instance, having her chunk long combined telephone numbers and associate each chunk with a special memorable event such as her birthday along with the motivation like calling grandparents overseas has enabled her to learn and retain up to 22-digit number. Evidently, Math is her hardest subject because it requires instant movement of the information back and forth between the two sides of the brain. Thus, it was hard for her to even remember, for instance, that 8 x 8 is 64. However, she was able to retain and recall the answer handily when she heard it as a song: 8 and 8 went to the store to buy game 64. And to reinforce her understanding of the concept, we also asked her to imagine always that 8 and 8 as twin sisters who are holding hands and walking in the Mall down to the game store to buy game number 64. Undoubtedly, visualization and rhyming were what enhanced the information and made it move to her long-term memory where it was retained and recalled later while she was working with more advanced Math that requires such multiplication. Also since the absence of the corpus callosum prevents her from seeing straight lines vividly in its actual places, she had a hard time performing relevant tasks precisely such as cutting along the line or placing a cup near a lined-edge of a dining table or kitchen countertop. Therefore, we trained her to disregard the line when she sees it and visualize the area where she can perform the required task instead. For instance, visualizing an area above or below the line where she can cut straight next to the line without crossing over it; or an area between the edge of the table and a plate on it where she can place the cup. Such visualization has helped her not only performs these tasks more precisely, but also promoted her comprehension of the concepts being learned. Also, the same technique of visualization and the motivation to be in control of the steering wheel has enabled her to drive a golf cart comfortably in streets with no lines in the middle, when driving for individuals with this learning disability is still altogether an area beyond the research scope. Based on our experience, we have found that our daughter can learn better with the utilization of various visuals to illustrate certain learning concepts, and can think and create critically by visualizing and performing cognitive and motor tasks. In conclusion, visualization coupled with motivation has been an effective learning approach that made learning less agonizing and an achievable task for her that would have been more difficult otherwise. However, this is only one case of teaching an individual student with an isolated condition of ACC (no other medical or mental complications). Therefore, our findings do not by any means offer a scientific breakthrough nor does it yield a generalization of our conclusion. It may, however, offer an approach to be tried and tested further in a larger and more inclusive research context.

7. Visual Literacy

What does visual literacy entail, and what exactly visual literates are capable of doing? Visual literacy is a group of acquired competencies for interpreting and composing visible messages. A visually literate person can: (a) discriminate and make sense of visible objects as part of the visual acuity; (b) create static and dynamic visible objects effectively in a defined space; (c) comprehend and appreciate the visual testaments of others; and (d) conjure objects in the mind's eye (Brill, Kim, and Branch, 2001as cited in Lohr, 2008, p. 5).

7.1 Visual literacies and utilization of visuals for performance: Visual literacy for performance can be defined as the ability to create and utilize visuals to support the human performance of achieving specific tasks. For instance, the ability to prepare visualized instructional steps to help people in performing some life tasks such as pumping gas in a self-service gas station or completing a bank transaction using an automated teller machine. Or the ability to develop instructional manuals to help people perform even more difficult tasks like operating a newly purchased electronic device like an iPad or assembling a computer desk. Also, there are some other professionals who use visuals for more planned performance. These may include someone as James, the instructional designer, who works for a company who demands excitement in the training; or Maria, a graphic designer, who wants to design an impressive logo for a client company. Visuals have been also found to be very powerful in conveying marketing and advertising messages. Imagine how memorable the visual graphics of some of the corporations' logos by which we recognize a company by merely seeing its visual graphic. To name few of the many companies who have impressive logos, these may include McDonalds, Apple, Nike, and Starbucks. In fact, Starbucks has simplified its logo by dropping the printed name and keeping only the graphic image. Without a doubt, the graphic designers of these corporations know precisely how the human brain functions and how visual graphics impact the memory.

7.2 Visual literacies for learning: It is the utilization of visuals in education for the purpose of helping students learn better wherever learning takes place, in schools, colleges, universities, in class, or online. As indicated previously, visual literacy is now a required competency in education that requires teachers and instructors to be able to organize, manipulate, and utilize graphics for the purpose of learning. By using their visual competency, they can enhance their students' learning and help them achieve academic success. For instance, being visually literate, Sue a 7th- grade science teacher can create highly visualized and attractive instruction for her science class and Robert, a community college instructor can develop an effective PowerPoint presentation or a computer-based instruction for his web-based class.

8. Graphic and instructional design models

Evidently, visuals can play a major role for both learning and performance. However, visuals have to be planned keenly and used purposefully in order to communicate the intended message. Just as professionals for performance are knowledgeable and skillful in graphic design, teachers and instructors ought to be able to create, manipulate and integrate visuals into curriculum. They also need to be able to work with and manage electronic files for digital images like GIF and JPEG, and draw graphics like shapes and or import pictures, clip arts, charts, tables, shapes, smart art, and animation to an instructional document. Also, teachers and instructors need to be able to use some graphic editing programs and software such as the Adobe Photoshop to work with a graphic design principles and tools for learning. In her book *Creating Graphics for Learning and Performance*, Lohr (2008) presents the **ACE** (analyze, create, and evaluate) model as a graphic design approach for learning and performance. The ACE model is directly tied to the two-learning theories introduced previously, the information processing theory and Mayer's cognitive theory of multimedia. She presents the ACE model as a micro design process in the larger context of the **ISD (**instructional system design**)** approach that is based on the **ADDIE** (analyze, design, develop, implement, and evaluate) macro instructional design process. Within the creating cycle of the ACE model, Lohr uses the **PAT** (principles, action, and tools) as a process to create graphics for instruction that cater to the learners' need and enhance certain learning events as part of a larger context of achieving a pre-planned instruction with specific learning outcomes. Also within the creating cycle of the ACE model, Lohr utilizes principles such as selection, organization, and integration that were discussed in both the information

IETC 2014

processing and Mayer's cognitive multimedia theories as learning enhancers. Lohr also presents a set of **Actions** and **Tools** to create these graphic design principles. The actions include the **CARP** (contrast, alignment, repetition, and proximity), and the tools include the type, shape, color, depth, and space (Lohr, pp.71-94). Figure 7 shows CARP and tools sample images.

(a) Example of CARP **(b) Example of type, color, shape, depth**

Figure 7: Examples of the CARP graphic principles and tools

9. Conclusion

Visuals have been found to be a powerful tool for both learning and performance. It enables people at the time of the need to perform specific tasks efficiently, and also helps students learn better based on their learning preferences. Visuals have been also found to be greatly effective for learning if it's connected properly to the students' learning styles and planned around the desired learning outcomes. In fact, utilizing visuals in light of the instructional system design (ISD) approach has been proven to increase the target learners' retention and optimize learning. Also, visualization of the learning concepts along with the motivation to learn it has been found to help students learn the concepts more forcefully and foster their critical and creative thinking. This approach has also been found to be greatly effective for individuals with learning disabilities, including agenesis of the corpus callosum. However, research tells us that the effectiveness of visuals can only be optimized if it's used in conjunction with other forms of learning tools such as auditory and tactile experiences. Also, the efficiency of teachers and instructors in using visuals for learning can make a difference in the students' success. In today's massive information age, the need for visual competencies and technology-related skills is increasingly high for a high-quality matching performance.

MARKETING COURSE AT THE FACULTY OF MANAGEMENT SCIENCE AND INFORMATICS

Jakub Soviar[a]69, Michal Varmus[a], Milan Kubina[a]
[a]*University of Žilina, Faculty of management science and informatics, Univerzitná 8215/1, 010 26 Žilina, Slovak Republic*

Abstract

This paper deals with our concept of teaching marketing at the University of Zilina – Faculty of management science and informatics. Our main educational goal toward the students is to teach them marketing approach and marketing way of thinking. The students work with real existing products. With study of market reality they try to understand strategic approaches. They work in teams. Single study groups deals with single products, which are direct competitors (e.g. Sony´s PS4 and Microsoft´s XBOX One...). At the end of the course students presents specific information and findings at a joint meeting. The results are also under discussion, which is necessary for a more comprehensive understanding of the market. Discussion results are generalized and confronted with theoretical knowledge. In our concept are crucial two factors: teamwork and the use of information-communication technologies that allow students to work better together. Our paper describes the concept of teaching the marketing course and its main meaning. Subsequently, we discuss a method of teamwork among students.

Keywords: marketing; marketing course; teamwork; marketing teaching; cooperation; collaboration, cooperation management

IETC 2014

1. Introduction

Our topic is considering course of marketing at the University of Žilina, but is close related to our research project called cooperation management (Slovak republic scientific grant 1/0992/11Cooperative management – effective approaches for gaining the competitive advantage 2011-2013 and 1/0621/14 Marketing management in cooperative environment - Proposal of strategic cooperation management implementation model - from 2014).

The term of cooperation management is covered of variety of interpretations. Lafleur (2005) understands cooperation management as a way of managing and developing collaboration in a competitive environment. According to Ray (2002), cooperation management represents a term for integrated management of company networks. Staatz (1983) sees cooperation management as cooperative decision making within heterogeneous preferences. He highlights the need for a model of cooperation based on a defined group choice. Zhang (2011) believes that cooperation management represents a basis for solving all managerial problems. According to him, cooperation management provides conditions for creating a system of cooperation based on effective use of resources and technologies. Veerakumaran (2006) summarized the most important characteristics of cooperation management into the following points:

* Corresponding author. Tel.: +421 41 513 4462
E-mail address: jakub.soviar@fri.uniza.sk

- Cooperation management is a complex decision making process and the decisions are made on all managerial levels.
- Primary goal of cooperation management is to satisfy the needs of the members of cooperation.
- All activities need to occur according to the agreed principles of management and cooperation.
- Suitable balance needs to be established between the efforts for commercial success and maintaining goals of the cooperating parties.
- Management focused on reaching a goal via effective use of resources.

Considering literature review and our own research in the area we have postulate our own definition of cooperation management: Cooperation management is effective and efficient management of relationships in a cooperation between separate and relatively independent organizations or individuals, with the goal of improving their competitiveness. (Soviar, et. al. 2013)

According to above mentioned topic we have tried to bring cooperation management processes into the education process.

2. Student´s cooperation at the marketing course

When we take responsibility for the marketing course our first problem was to realize our main educational goals:

- students must work with real products on real market;
- they will use only real and relevant data;
- the case on the market will be analyzed in detail;
- discussion will be just after proper analysis;
- there in the discussion the students will prioritize their strategic point of view.

Besides these main goals we also include theoretical knowledge about standard marketing topics (e.g. according to Kotler, P. – Keller, K. L. et. al. 2012 and Kotler, P. – Armstrong, G. et. al. 2013). Marketing course is required to be successfully ended in the undergraduate program (field of study – management) and it is also a requirement for continuing in postgraduate program (field of study – information management). For other fields of study in our faculty (informatics and computer engineering) is marketing course optional. Marketing course has an important thematic follow up in the course of marketing communication (which is optional for all fields of study). Marketing is obligatory subject in second year of undergraduate study program (bachelor study). The course is divided into 13 weeks. In every week are presentations and lectures (seminars). There are 65 students average in every year and 4 study groups (average). Every study group has single lectures. Presentations are open for all.

We have brought above mentioned educational goals into praxis in academic year 2011/2012. Students worked in teams inside single study groups. There are 5 major cases to work out during the semester (following the concept in Soviar, 2011). Every week the students worked on other case. Single cases are closely related to each other. Majority of time in the lectures was devoted to discussion about main findings, comparison of information between single teams and lecturer´s recommendations. Complete cases must be submitted in precise time and form via e-learning system (five times). The lecturers must review the submitted papers and evaluate them. Final cases are devoted to the work with obtained information and to determine the strategic approaches as well as to discussion. For brief familiarization with the topic and work during the semester all study groups representatives presented the main conclusions on the final presentation. This led to final discussion and to pointing out of the main themes, issues and further possibilities by lectures.

IETC 2014

In terms of strengthen the cooperation between the students on one hand and also of "healthy rivalry" on other hand we have decide to bring new rules of forming teams within the study groups into praxis (in academic year 2011/2012). The custom was that the students are allowed to from their teams by themselves. New rule was that the teams will be created by the lecturers.

Students fill up a brief questionnaire on the first lecture, which is in fact a self-evaluation. Following the self-evaluation results there were created teams to work on the first major case. Every team has 4 members minimum. Member of teams depends on the number of students in every study group. This questionnaire "ex-ante" holds 5 questions. Student evaluates him or herself on 5 point scale, where 1 is minimum and 5 maximum. The questions are:

- Am I a "team player"?
- How good am I in ICT and with the work with software (MS Office, Word, Excel, PowerPoint ...)?
- Can I analytically process information?
- How well can I point out the important issues from the big amount of information?
- When I have sufficient amount of relevant information, can I use them to build strategic processes?

According the "ex-ante" results the students are divided into groups as following:

- 20-25 points - self-evaluation level "Top"
- 12-19 points - self-evaluation level "Middle"
- 11 and less - self-evaluation level "Low"

If students evaluated themselves relatively identically we consider even minor gaps in results and divided them into three groups also. If possible - every group has at least one student, which evaluated his/herself as "Top" and at least one evaluated as "Low". Further work during semester will objectify these self-evaluation "ex-ante". Major cases are submitted for evaluation every two weeks. After submission single team members evaluate each other and there is also self-evaluation present. Submitted cases (papers) are evaluated by lecturers. Evaluation after submission by students is following:

- "Team member name" – Is he or she worked diligently and responsibly? (scale from 1 to 5)
- "Team member name" – To what extent was his or hers contribution creative and relevant? (scale from 1 to 5)
- "Team member name" – Was cooperation with him or her easy or difficult? (scale from 1 to 5)
- How was my contribution to the teamwork? (scale 1-5)
- Who was most beneficial for the team? (name/nobody)
- Who causes biggest problems in team? (name/nobody)
- Notes, suggestions… (open question)

Results from these evaluations are strictly confidential. According to that we provide no student´s names. After evaluation the students knows just statistically processed results (averages, etc.). Every student has access only to his or hers results (also just numbers, no names of evaluators). There is no way that anybody could see evaluation of some other student.

For every main case there were created new teams as following:

- First case: Teams are created as evenly as possible. In each team should be relatively equal representation of all categories of self-evaluation „ex ante" (Top, Middle, Low).Teams are created by lecturers.
- Second case: Teams are created according to the amount of points in self-evaluation „ex ante". That means to rank students according to the results of their self- evaluation from the highest to the lowest, and then inserted into teams according to the number of points. In each team will by students who rated themselves relatively the same.
- Third case: Teams are created as in first case.
- Fourth case: Teams are created randomly (with the use of random numbers generator at random.org).
- Fifth case: Teams are created by students (with no intervention of lecturers).

IECT 2014

3. Results

When Cluster analysis was made from data taken from evaluation of students this result was observed. More than 85% students that were evaluated themselves by mark 4,3 got average mark 4,5 from team. Only 15% students evaluate themselves by mark 3,19 got average mark 4,2 from team. It can be understood that 85% students guessed own abilities well or team evaluated members very benevolent.

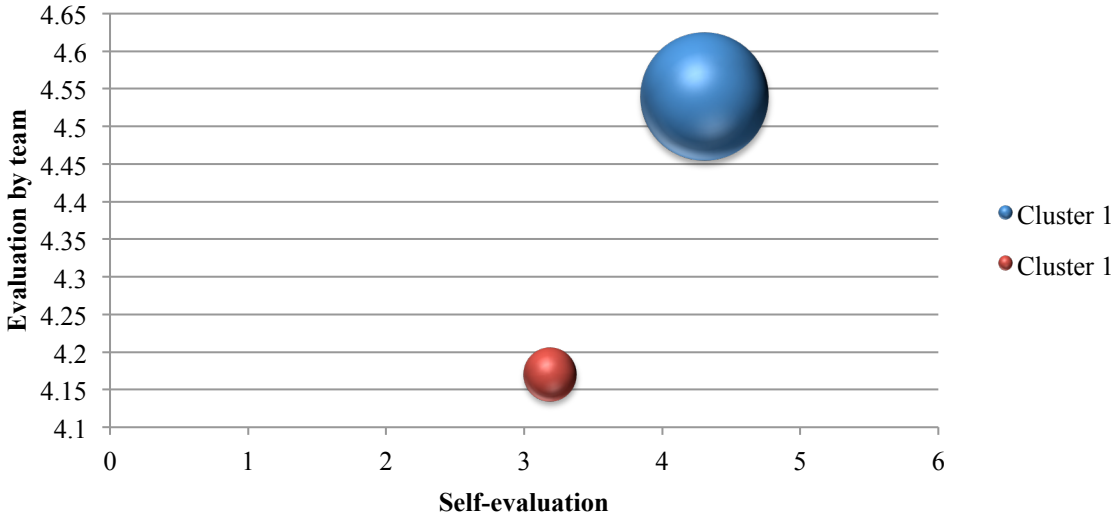

Figure 1 Cluster analysis of Self-evaluations vs. Evaluation by team (Academic year 2011/2012)

The final marks that students got during observed years are shown in following tables. In Academic year 2011/2012 (Table 3.1) most of the students (26) got final mark C. To get this mark they needed by average almost 41 points from semester and 37 points from final exam.

3.1. Academic year 2011/12

Marks	**A**	**B**	**C**	**D**	**E**	**Fx**
Count	2	15	26	22	4	1
Semester Points - mean	45,50	42,27	40,96	39,16	35,13	28,00
Exam Points - mean	45,50	41,87	37,35	32,34	30,75	0,00

In Academic year 2012/2013 (Table 3.2) most of the students (31) got final mark C as well. To get this mark they needed by average almost 38 points from semester and 37 points from final exam. It means that most of them were close to final mark D.

3.2. Academic year 2012/13

Marks	**A**	**B**	**C**	**D**	**E**	**Fx**
Count	3	14	31	14	2	1
Semester Points - mean	37,50	39,86	38,21	35,75	36,25	37,00

IETC'14

Exam Points - mean	45,00	43,00	36,98	32,86	30,00	0,00

In Academic year 2013/2014 (Table 3.3) most of the students (30) got final mark D. To get this mark they needed by average almost 39 points from semester and 34 points from final exam. This confirmed the tendency of the last period. The question is whether this is due to the increasing demands of study, or declining quality of achieved results.

3.3. Academic year 2013/14

Marks	**A**	**B**	**C**	**D**	**E**	**Fx**
Count	1	9	21	30	5	2
Semester Points - mean	47,00	44,33	42,64	38,97	33,90	15,25
Exam Points - mean	46,00	43,22	38,90	34,17	30,80	0,00

For a better view of the trend are marks shown in the following Figure 2. There is possible to see normal distribution for each reference year, but his tendency is shifting as well.

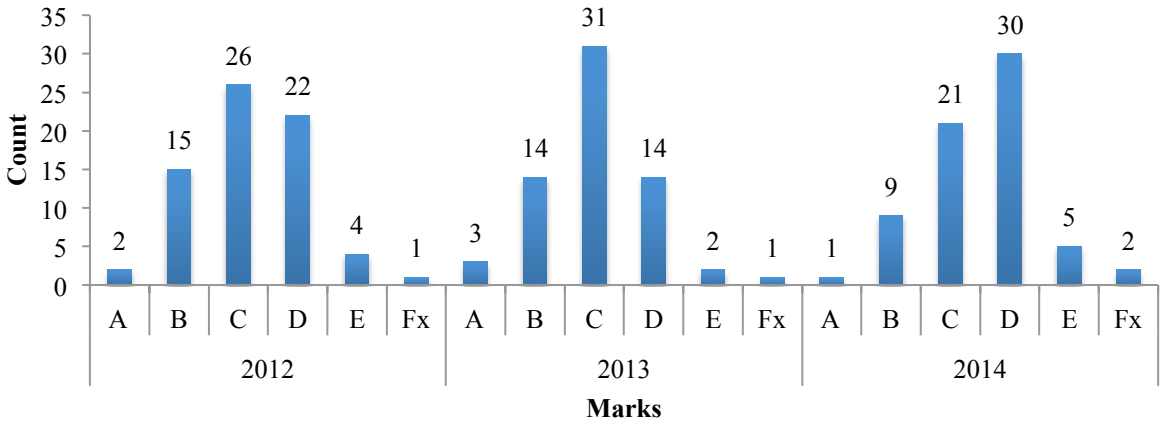

Figure 2 Given marks by years

4. Conclusion

On base the received data can be confirmed that is tendency to get worse final marks. During academic years 2011/2012 and 2012/2013 were teams built by teacher and randomly change for each case. The last year 2013/2014 students built the teams and they stayed for all cases. It was discovered that most of low teams stayed low and also they lost motivation to be better. On the other hand very good team lost rivalry. The result was that fewer students got enough points from semester. It is necessary to confirm that very good mark was not a gift and it was fair. As was mentioned in papers from Lendel, Varmus (2013) and Lendel (2013) every university teacher uses feedback in a different range and by different way and only future research will show if our model is correct.

Math, English and netbooks at the university. Learning across contexts?

Georgina Rodríguez70, Alejandro Spiegel, Melina Salviolo and Alicia Peña
Grupo TecMovAE - Facultad Regional San Nicolás – Universidad Tecnológica Nacional
Colón 332 (2900) San Nicolás, Argentina

Abstract

Nowadays, teachers and students at public universities in Argentina have mobile technologies. Mathematics and English are two areas that traditionally include diverse technologies in education, both at secondary school and at university. Taking into account the outcomes of our research project, the aim of this article is to show the analysis of the experience on the uses of mobile technologies –made and assigned– at the university particularly in these subjects, analysing the use of these technologies both in the classroom and through the different contexts that students cross in their lives.

*Keywords:*University, Mobile Technologies, Mathematics, English, Aprenticeship

IETC 2014

1. Introduction

Nowadays, students that begin engineering careers at Facultad Regional San Nicolás, Universidad Tecnológica Nacional, in Argentina, are part of a change as regards the technology they have available for studying. In general, all of them have mobile technological equipment, partly due to the Conectar Igualdad Program (www.conectarigualdad.gob.ar) which has delivered more than 4.300.000 netbooks at state secondary schools, and also because of the proliferation of mobile technologies (MT). Mobile devices are present in different ways in everyday life. This increase in technological equipment together with the advances in connectivity would enhance the learning processes, not only in the classroom, but also during students' transit across their daily contexts. Nevertheless, we ask ourselves to what extent this increase in MT, coupled with the growing connectivity, could really empower learning, in the classroom and through contexts.

This potential contribution of MT makes authors like Traxler (2009) and Kukulska-Hulme (2013), define "Learning across Contexts" as the learning that is developed through the use of these technologies at any place and any time of the students' daily lives.

In other words, these learning processes take place when teachers or students are aware of the differential advantage (Spiegel, 2010) of MT, meaning that the potential of the portability of the devices included in MT are significantly used. At this point, we wonder whether university teachers require their students to use MT and what kind of activities related to academic life are performed with these devices inside and

* Corresponding author. Tel.: +54-336-4425266; fax: +54-336-4420830.
E-mail address: tecmovae@frsn.utn.edu.ar

outside the classroom. To answer these questions we will address general data and we will focus on the case of Mathematics and English, two of the subjects that traditionally make an intensive use of technologies.

The ongoing research project of the "Mobile Technologies Applied to Education" Group (TecMovAE), «Mobile Technologies at University. Social practices, challenges and opportunities at first year of University» identified as UTN1612, investigates about social practices, challenges and opportunities of mobile learning at university. Within the project, information was collected during 2012 and 2013. Data was constructed from:

- Surveys conducted to students of engineering careers, both at the beginning and at the end of their first year at university:

  - The first survey gathered information about the expectations on the use of MT at the university, and about the social practices that students developed with MT in their daily lives. Students were also asked about their experience at secondary school using MT, as most of them received netbooks from the Conectar Igualdad Program.
  - On the second survey experiences on the use of MT at the university, and their opinions, were gathered.

- Surveys conducted to teachers of first year of engineering careers at the university.
- Semi-structured interviews made to teachers and students.

Some results are shown here, together with some reflexions, analysis and conclusions.

2. Theoretical approaches

2.1 Mobile learning, learning across contexts

As Gaudreau Miranda, & Gareau (2014) say, smartphones tablets (and netbooks in Argentina, due to Conectar Igualdad program) have rapidly grown in popularity among undergraduate students. Mobile phones which used to enable only telephone conversations and minimal texting, now allow students to do the same as they could do with laptops, empowered by the improvement of broadband technologies. Students always carry with them this type of MT, and fortunately the access to broadband is becoming better in our country. Meanwhile, mobility, as Traxler (2009) points out, should be regarded not only in terms of spatial movement, but also by the ways in which mobility can allow temporary movement and boundary crossing.

Taking into account the definition of context that Spiegel (2013) adapts from Shuster (1995), society is conceived as a context within which the digital context is also included. Educational institutions may also be considered as contexts, with porous or shielded boundaries, to allow or to hinder seamless learning. Kukulska-Hulme, Sharples, Milrad, et al (2009) emphasizes an understanding of context as a general concept that covers interrelated aspects of mobility. In this sense, defines physical, technological, conceptual, social and temporal contexts of learning. The attractive aspect of this definition is that it covers a broad spectrum of issues relevant to characterize mobile learning. Thus, an extended notion of mobility and context would include physical, conceptual and temporal spaces.

IETC 2014

Kukulska-Hulme (2009) says that student's mobility creates a learning environment in constant change. The interactions mediated by technologies are intertwined with the direct interactions with people. Therefore, the interactions with mobile technologies within the frame of pedagogical interactions that take place around them, become the centre of attention. So it can be said that mobile learning is all learning that happens when the student takes advantage of learning opportunities offered by mobile technologies (O'Malley, Vavoula, Glew, Taylor, Sharples & Lefrere, 2003).

Goodyear (2011) points out that we are facing two perceptible changes in the field of educational research. The first one is a change in the sense of spaces and contexts in which education takes place, since different learning activities are becoming more commonly distributed through a variety of contexts. The second change relates to a broader understanding about the conception of educational practice. In this respect, a growing importance of design, in our case, the didactic design –to develop, to implement, evaluate and better the learning activities related to learning processes– to create and evaluate technologies to guide the learning activities.

The challenge, according to Pachler, Bachmair & Cook (2010), is to recognize the activities that students perform every day with their mobile devices, which take place in daily life, as skills that are relevant to academic learning and thus relate university with their daily lives in a significant way for everyone. The information in informal learning contexts can be combined with learning resources traditionally used in educational institutions. This could extend the learning activities, not only studying, but also experimentation and interaction among persons, beyond the classroom, library or laboratory.

Meanwhile, according to Fried (2008) and White & Martin (2014), mobile devices are seen as disruptive for the aims of learning in classroom contexts, because they are associated with informal use, like surfing the Internet, playing videogames, watching videos, listening to music, reading e-mails, etc. Fried (2008) goes further, expressing that educators have good reasons to be cautious about in-class laptop use.

We refer, then, also to a situated learning (Lave and Wenger, 1991) that promotes learning as social interaction. In this respect, the achievements are reached by means of communication among students in the construction and completion of the activities, and the collaboration to build and to understand.

Time and space converge also to create the right conditions for learning, and the available technologies guarantee the ready access to remote resources, as well as the use of the information and the potential available contacts in a particular place.

Despite the fact that mobile technologies can open new opportunities to situate learning in authentic contexts outside the classroom, there is still a huge mountain of challenges that needs to be dealt with before we can meaningfully realise the actual potentials of mobile learning. Even though mobile learning has recently been considered as a meaningful tool to support boundary –and context– crossing (Pachler et al., 2010), this has mostly been studied in terms of the role mobile technology can play in one context, usually in an outdoor environment, rather than studying the pedagogical value of crossing contexts as such. Still little is understood about how we can pedagogically orchestrate the utilization of different contexts to support learning. In fact, little is understood in general about how we can support learning in more dynamical contexts than the classroom environment, in terms of scaffolding learning processes (Nouri, 2012).

IETC 2014

2.2 Mathematics, English and mobile learning

Mobile technologies associated with decontextualized learning can support math learning. From a theoretical point of view, mobile learning can be motivated from different perspectives, such as situated learning (Nouri, J. 2011).

Examples of mobile learning apps for mathematics teaching can be seen in White & Martin (2014), and in Eliasson, Cerratto Pagman, Nouri, Spikol & Ramberg (2011). In these studies, they present projects that include mobile devices in environments beyond the classroom, for the learning of mathematical content such as the linear function and geometry, among others.

As regards teaching and learning of math, the inclusion of these technologies would enhance the design of the teaching sequences, as there are many applications that would be helpful to facilitate learning. In particular, the Conectar Igualdad netbooks have mathematical software like Euler Math, Toolbox, Geogebra, Graphmatica, Maxima, Modellus, etc.

In addition, there are a number of free apps, such as graphical software and sophisticated calculators, which can be downloaded to smartphones and tablets, and that would help both to the visualization and to the efficiency in obtaining results. Some examples of these applications are MyScript Calculator, Mathlab Calculator, Mathematics for Android and 3D Functions Plotter, among others. The advantages of using these software are well known, as visualization is a key tool in the process of concept formation in mathematics, and the time saved by not performing manual calculations can be used in the analysis of results.

Also, MT and wireless networks could provide flexible building schemes for learning a foreign language, both in time and space, allowing also alternative communication (synchronous and asynchronous, group and/or individual).

According to Kukulska-Hulme (2012), the learning processes that students can develop using MT are consistent with the spirit of constant inquiry about language-in-use, and with the frequent informal practice required when learning a foreign language. However, the question about how these should now be organized, by and for students, given the growth of new tools, services and resources, remains barely answered.

Searching beyond the "at anytime, anywhere" motto, faculty involved in foreign language teaching and in the teaching of mathematics need to examine how the learning of these subjects is changing in this new scenario, rich in mobile technologies, and under the influence of the students' new practices that come from their personal perspectives about the best utilization of the mobile technologies they carry with them every day as they move through contexts.

3. Findings and results

From the data gathered from the surveys conducted in 2012 and 2013 to students and teachers at the university, it was found that almost the 100% of university teachers and students have MT and Internet connectivity. In this sense, it is worth to be remarked that four out of ten students received netbooks from the Conectar Igualdad program. Both groups make similar uses of MT outside the classroom, in their daily lives, as it is shown on Table 1.

Table 1.Use of mobile device in the students and teachers' daily lives.

Some questions asked about the use of MT in daily lives	Students	Teachers
For communicating with family and friends	97%	100%
Download and listen to music	97%	90%
Search for information and get news about current events and politics online	100%	82%

In particular, it turned out that faculty also use their MT for preparing teaching materials such as notes and practical guides, and uploading them to Internet in educational platforms.

In the surveys conducted to faculty a question about the applications they used at university was included. The results on the most common programs are shown on table 2.

Table 2. Apps used by faculty.

Do you use weekly these software?	Teachers

IECT 2014

Word processor (Word, Notepad, etc.)	85%
Presentations Software (PowerPoint, etc.)	67%
SpreadSheets (Excel, etc.)	89%
Browsers (Google, Mozilla, etc.)	77%
Mathematical programs (Geogebra, Maple, etc.)	46%

When students were asked if their teachers had used MT for teaching, 48% said "sometimes". Taking into account the records of request about computer equipment, it appears that "mobile technology" may have been the projector and the teacher's netbook –or the one provided by the department– for example, for PowerPoint presentations (Spiegel, Rodríguez, Salviolo, Peña & Ferrarasi, 2013) or the use of pen-drives for the distribution of information, as the students pointed out in the interviews. In relation to faculty use of MT, students were asked also how teachers used MT for improving their classes, we show here some student expressions, which agrees with what was previously stated: *Showing us slides about topics dealt with in class…", "Projecting slides and videos…", "They used the projector…", "PowerPoint presentations…", "Showing us slides or videos…", "Through slide presentations…".*

Also, students were inquired about the use of mobile devices, for academic purposes, if it was by their own initiative or by requirement of teachers. Results are shown in table 3.

Table 3. Some questions about the use of MT at first year of university

Question	2012	2013
Have teachers asked you to use your computer outside the classroom?	36%	59%
Have you used your netbook or any computer outside the classroom for academic purposes?	42%	84%

It is interesting that, despite the lower percentage of 2012, by 2013 a small majority of students (59%) stated that their teachers asked them to use technological devices for learning purposes outside the classroom. From the data exposed, it can be seen that from one year to the other, teachers required their students an increasing use of MT.

Both in 2012 and 2013, the percentage of use of MT by students on their own initiative overcame the percentage of teachers' assignment. Even more, in 2012 it was overcome in a 6%, and in 2013 in a 25%.

Meanwhile, it arose from the interviews that as part of their academic tasks, an increasing number of students search and find in YouTube answers to many of the questions that arise in class. And they do so in their "dead time", for instance, when they are travelling, a frequent activity due to great distances between their workplaces or university and homes. In the same sense, some students listen to the lessons delivered at university that they have recorded for their own initiative; in fact, they expect their teachers to provide them with this type of material: audiovisual support portable on their MT that, according to the interviews carried out and some comments included in the surveys, is the way they choose to access knowledge.

Regarding the use of MT as a tool for communication between students and faculty, results are shown in Fig. 1. E-mail is a traditionally used tool, but here it can be seen that the use of Facebook has grown up since 2012.

IECT 2014

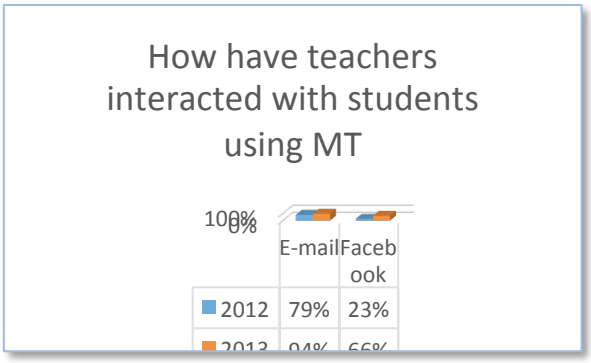

Fig. 1. The way that teachers interacted with students using MT.

While it was quite predictable that university teachers communicate with freshmen by e-mail, the increase turns out to be showy in the percentage of teachers who use Facebook to communicate with students between classes.

Dealing with English texts is a task that becomes a routine when studying engineering. This is the reason why English appears as a subject in every year of the curriculum. In Table 4, some opinions of the relevance of English at the university are presented. Also, some students expressions selected from the survey, about the relevance of the study of English, are shown here:

- *"...Because the most relevant information on the Internet is in English"*
- *"...Because many of the topics searched are shown in English, especially if they are worldwide known.*
- *"...Because English language is necessary to search information"*
- *"...Sometimes, there isn't enough information in Spanish, so we have to search in English. In other cases, I visit English pages because I know some that are better for the searching of certain information"*
- *"...English language competency is really helpful in our career because there are a lot of books that are in English"*

Table 4. The relevance of knowing English for academic activities at university

Question	Many	Some
English was important when you used MT for studying at university	42%	31%
English was important for searching information related to your career on the Internet.	34%	22%

More than 50% of students said they have found the information they need for their academic activities only in English. This fact becomes a trouble for many students that do not know this language. Therefore, we inquired about what students did in those situations. Results can be seen in Fig. 2.

IETC2014

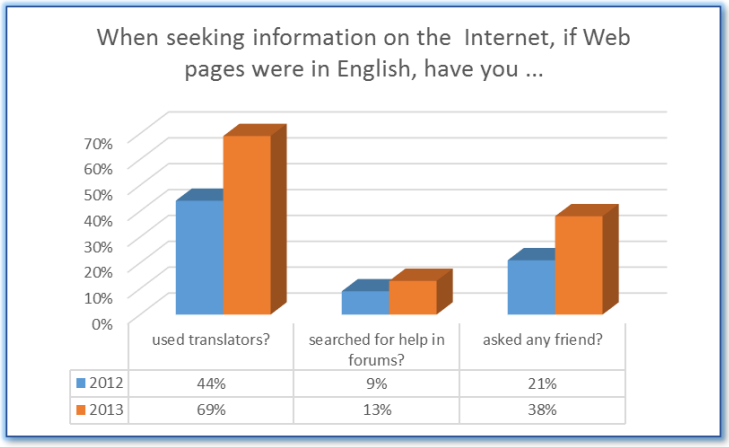

Fig. 2. Use of MT as a tool for English

Also students were asked about the use of engineering specific software. In particular, the engineering software used at first year of university are mathematical and cad software. Results are shown in table 5.

Table 5. Use of MT as a tool for Mathematics

	2012	2013
I have used engineering software, mostly for Mathematics	47%	59%

On the surveys, students expressed the purposes they had for using specific software with their MT, generally outside the classroom. We selected some remarkable ones: "*Math problems", "To verify results…", "Accomplishment of practical work…", "To draw complex functions, or for solving complicated equations,…", "Physics, Mathematics", "Analisys of mathematical graphics"*.

As we have seen, both in general terms and in particular in math and English, MT are present inside and outside the classrooms, as well, either by the teachers' indication or, much more for students' own initiative. Thus, MT accompany, but not completely yet, the students' academic activity through their own vital contexts.

4. Conclusions

As it can be seen from the data gathered, teachers at university are becoming aware of the possibilities offered by mobile technologies, which students have nowadays. On the other side, it seems that students make a more intensive use of their devices, and demand changes as regards the use of these devices to give better possibilities for learning in commuting time to and from university or work.

In this scenario, we can say that MT are already being used across different contexts. According to what we have deepened above, our data shows that there is a year-on-year increase on the use of MT, both from teachers' indication and for students' own initiative. These facts can also be seen from the communication that faculty and students keep, with the marked annual increase in the percentage of teachers who use Facebook to communicate with students between classes.

As regards MT for teaching at university, Math and English are widely known to be the two subjects that most include ICT in the teaching and learning processes. According to our investigation this is also true with respect to MT.

In our research we found that although MT are used across contexts, this use is still incipient and there is much remaining to take advantage of their potential. Learning across context could be an alternative to

IETC2014

make the most of them, and to play down the problems alluded by Fried (2008). We will continue our research on the use of MT within the rest of the courses at university, focusing on the utilization and production of resources of video.

Meanwhile we are going to transfer the results and concrete proposals to strengthen strategies for learning across contexts already existing in college.

Maximizing the effects of collaborative learning through ICT

Ezekoka, Gertrude K.(PhD)
Faculty of Education
Imo State University, Owerri
Imo State, Nigeria

Abstract

This study investigated the effects of ICT facilities on collaborative learning (CL) in Imo State University (IMSU), Owerri in Nigeria. It adopted a descriptive survey design with a researcher-made questionnaire as the instrument. Sixty (60) lecturers selected from across the faculties served as the sample. The data collected were analyzed using mean scores. The study revealed the ICT facilities used in IMSU to enhance CL; ICT facilities enhance CL by helping to increase the level of participation of students, etc. The study also revealed some problems encountered in the use of ICT in CL. Some recommendations were also made.

Peer-review under responsibility of the Sakarya University

1. Introduction

Collaborative learning (CL) is an umbrella term used for a variety of educational approaches involving joint intellectual efforts by students or students and teachers together. Usually students are made to work in groups of two or more, mutually searching for understanding, solutions or meanings or creating a product. According to Dillenbourg (1999) CL is defined as "a situation in which two or more people learn or attempt to learn something together". It can be seen as social interactions that are targeted towards deeper knowing. CL refers to an instruction method in which students are responsible for one another's learning as well as their own. Thus, the success of one student helps other students to be successful.

Proponents of CL claim that the active exchange of ideas within small groups not only increases interest among the participants but also promotes critical thinking. According to Johnson & Johnson (1986), there is persuasive evidence that cooperative teams achieve at higher levels of thought and retain information longer than students who work quietly as individuals. The shared learning gives students an opportunity to engage in discussion, take responsibility for their own learning and thus become critical thinkers.

CL is a variation of cooperative learning which exists when students work together in groups to achieve common goals. Collaborative learning differs from cooperative learning in that it gives students more freedom to work independently from the instructor, within their group while still adhering to the principles of cooperative learning. In this paper, both terms will be used interchangeably to mean a situation where students work in groups.

CL encompasses the following processes: firstly, students encounter a phenomenon or are presented a problem or task. This can be referred to as the triggering event. In trying to resolve the problem, students discuss and agree on the theme of inquiry or the identified problem. This initial discussion helps to cultivate a sense

IETC 2014

of ownership to the problem among the groups of students. With the activity jointly established, students could then proceed towards further discussion. This will undoubtedly lead to idea improvement and argumentative knowledge construction.

Lehtinen (2003) as cited by Wang (2008) gave some more features of collaborative study. He noted that successful collaborative study models are characterized by equality and mutuality. Collaborative study allows learners to be treated equally and requires that they mutually respect each other. Though this requirement cannot be enforced, but it must be facilitated. Learners in such an instructional environment are more willing to study because their gains and efforts are shared and the sharing provides a fearless environment that is rarely attained in conventional school settings. It dissolves the stress in relationship among students, teachers and administrators.

1.1 Use of information and communication technology (ICT)

The use of ICT in CL will make it easy for people to collaborate easily with someone far away as they would with someone in the same room. E-collaboration technologies allow people to bring diverse skills on collective ventures that eliminate the barriers of time, distance and resources (Bessagnet, Schlenker, & Aiken, 2005). ICT is not designed to replace face-to-face interaction; it is designed to supplement it by allowing people to communicate anytime and anywhere. ICT as a collaborative technology offers functionalities for coordination of group work, tools for recording progress and giving feedback, libraries of solutions and best practices as well as meta-information (that is date, author and sequence of contributions).

According to the Australian Government Report (nd) on the benefits of collaboration in teaching and learning, the following technology tools can be used to support collaborative learning in all sectors of education.

Wikis: Collections of linked web pages editable by anyone, allowing collaborative content creations. Wikipedia is a good example.

Microblogs: Brief updates posted by users on any chosen topic for other users to see. Twitter is a good example of microblogging service.

Social Networking Services: Web services that allow users to interact in various ways including sharing photos, messaging publicly and privately, and sharing information about themselves on their profiles. Facebook is the largest social networking site in the world.

Virtual Worlds: Software applications that provide users with the experience of being agents in online environments with their "self" represented by an avatar or online persona.

Online Games: Games played with and against other users over the internet.

According to Farren & Tweedy (2002) videoconferencing can be used to enhance collaborative learning. Videoconferencing is one application of ICT that involves using appropriate hardware and software to enable two or more people in different locations to see and hear each other at the same time, sometimes even sharing computer applications for collaboration. The standardization and increasing adoption of these techno-

IETC 2014

logies has vastly affected the way people choose to communicate, learn and work. The internet and online tutorials offer a more expansive world to explore compared to traditional lectures. This gives students the freedom and flexibility to learn at their own pace and they may find it easier to concentrate and learn than following a teacher's thought process during a lecture (Anderson, 2004).

In summary, Becta (2008) gave some benefits of using ICT to support CL thus:

- *Students' engagement and participation is increased, particularly for quieter students who can work collaboratively online without anxiety of raising questions in front of the class. Students can also express themselves through less traditional avenues such as video.*
- *Social networking can encourage online discussion amongst students outside school hours.*
- *Tolls can be available anytime and anywhere, which encourages some students to extend their learning through further investigation into topics that interest them.*
- *Students feel a sense of ownership and engagement when they publish their work online and this can encourage attention to detail and improved quality of work overall. Some teachers use the publication of work to encourage peer assessment.*

2. Methodology

A descriptive survey design was adopted for this study. The target population was all the academic staff in Imo State University, Owerri Nigeria which totaled to1200 spread out in eleven faculties. Sixty (60) lecturers were randomly selected from across the faculties. A researcher-made questionnaire was used to collect data. This questionnaire had two sections A & B. section A was on demographic information. Section B solicited information on the ICT facilities used to enhance CL, the ICT facilities utilized in Imo State University for CL, ways these facilities enhance CL and the problems encountered in the use of these facilities. The data collected were analyzed using means.

2.1 Statement of the problem

To improve the academic performance of students, teachers should look out for better and more innovative methods of teaching that will involve the learners. As the teachers' role has been changed to that of a facilitator of learning, it behooves him/her to help the learners discover knowledge themselves. Knowledge discovered by the learners tends to be retained longer and applied in life. CL will help learners in the groups to fully participate in knowledge acquisition. The researcher wants to find out how application of ICT to CL will be of benefit.

2.2 Purpose of the study

The study investigated the ways the effects of CL can be enhanced using ICT. Specifically this study sought to find out:

IETC 2014

- *ICT facilities that can be used to enhance collaborative learning.*
- *The ICT facilities utilized in Imo State University for CL.*
- *Ways these facilities can enhance CL and*
- *The problems encountered in the use of these facilities.*

2.3 Research questions

To guide this study, the following research questions were used;

- *What are the ICT facilities used in CL?*
- *What ICT facilities are utilized in Imo State University to enhance CL?*
- *In what ways do these facilities enhance CL?*
- *What are the problems encountered in the use of these ICT facilities?.*

3.0 Findings

3.1 Research question 1

What are the ICT facilities that can be used in collaborative learning?

1: Responses Table on the ICT facilities that can be used in CL.

S/N	*Item*	*SA*	*A*	*D*	*SD*	$\bar{X}$
1	*Social networking services e.g. Facebook,2-2go, Twitter*	*24*	*35*	*1*	*-*	*3.4*
2	*Virtual worlds (software applications that provide users with the experience of being agents in online environments with their "self" represented by an avatar or online persona)*	*12*	*15*	*31*	*-*	*28*
3	*E-mail*	*26*	*34*	*-*	*-*	*34*
4	*Online Games*	*20*	*36*	*4*	*-*	*3.3*
5	*Newsgroup/blogs/mircoblogs*	*22*	*09*	*29*	*-*	*2.9*
6	*Wikis*	*23*	*31*	*06*	*-*	*3.3*
7	*Web CT*	*24*	*34*	*02*	*-*	*3.4*
8	*Videoconferencing*	*28*	*32*	*-*	*-*	*3.5*
9	*Audio Conferencing*	*15*	*17*	*28*	*-*	*2.8*
10	*Use Of GSM Phones*	*16*	*16*	*28*	*-*	*2.8*
11	*World Wide Web*	*24*	*36*	*-*	*-*	*3.4*

From the table above, items 1-11 have mean scores 3.4, 2.8, 3.4, 3.3, 2.9, 3.3, 3.4, 3.5, 2.8, 2.8 and 3.4 respectively. Since these items have mean scores above 2.5, it simply means that the following ICT facilities can be used for collaborative learning: social networking services, virtual worlds, e-mail, online games, newsgroup/blogs/microblogs, wikis, web CT, videoconferencing, audio conferencing, use of GSM phones and World Wide Web.

IETC 2014

3.2 Research question 2

What ICT facilities are utilized to enhance collaborative learning in Imo State University?

Table 2: Responses on the ICT facilities lecturers use to enhance collaborative learning.

S/N	Item	Yes	% Yes	No	% No
1	Social networking services	34	57%	26	43%
2	Virtual worlds	24	40%	36	60%
3	E-mail	40	67%	20	33%
4	Online games	21	35%	39	65%
5	Newsgroup/blogs/mircoblogs	21	35%	39	65%
6	Wikis	23	38%	37	62%
7	Web CT or any other chat facility	34	57%	26	43%
8	Videoconferencing	34	57%	26	43%
9	Audio conferencing	36	60%	24	40%
10	Use of GSM phones	60	100%	-	-
11	World Wide Web	39	65%	21	35%

From the table above, only social networking services (57%), e-mail (67%), web CT (57%), videoconferencing (57%) audio conferencing (60%), GSM phones (100%) and World Wide Web (65%) are the ICT facilities that the lecturers in Imo State University use to enhance collaborative learning. Virtual worlds, online games, newsgroup/blog/microblogs and wikis are not used by lecturers for collaborative learning.

3.3 Research question 3

In what ways do these ICT facilities enhance collaborative learning?

Table 3: Table showing ways ICT facilities enhance collaborative learning.

S/N	Item	SA	A	D	SD	$\bar{X}$
1	ICT facilities increase the level of participation of students in collaborative learning	35	23	2	-	3.6
2	They encourage online discussion amongst students outside school	32	28	-	-	3.5
3	They give students the freedom and flexibility to Learn at their own pace and time	22	38	-	-	3.4
4	They encourage students to extend investigation into topics that are of interest.	22	38	-	-	3.4
5	They enable students get ideas from subject specialists all over the world.	35	25	-	-	3.6
6	With ICT, collaborative learning is not limited by time or distance	36	24 -		-	3.6

From the table above, items 1-6 have mean scores of 3.6, 3.5, 3.4, 3.4, 3.6 and 3.6 respectively showing that ICT facilities increase the level of participation of students; encourage online discussion amongst students outside school hours; give students the freedom and flexibility to learn at their own pace and time; encourage students to extend their learning through further investigation into topics that are of interest; and enable students get ideas from subject specialists all over the world. Also with ICT, collaborative learning is not limited by time or distance.

3.4 Research question 4

What problems are encountered in the use of these facilities?

Table 4: Showing the problems encountered in the use of ICT facilities.

S/N	Item	SA	A	D	SD	$\bar{X}$

IETC 2014

	Problems that hinder the use of ICT facilities in collaborative learning					
1	*Inadequate supply of electricity*	*37*	*23*	*-*	*-*	*3.6*
2	*Limited access/poor communication infrastructure*	*36*	*24*	*-*	*-*	*3.6*
3	*Inadequate ICT skills by students*	*34*	*13*	*13*	*-*	*3.4*
4	*Inadequate ICT skills by lecturers*	*24*	*33*	*3*	*-*	*3.4*
5	*Over population of students*	*30*	*20*	*5*	*5*	*3.3*
6	*ICT phobia (fear of technology)*	*02*	*24*	*13*	*21*	*2.1*
7	*Lack of funds*	*31*	*24*	*4*	*1*	*3.4*

From the table above, items 1-5 and 7 have been scores of 3.6, 3.6, 3.4, 3.4, 3.3, and 3.4 showing that the problems that hinder the use of ICT facilities are inadequate supply of electricity; limited access/poor communication infrastructure; inadequate ICT skills by students; inadequate skills by lecturers; over population of students and lack of funds. Item 6 with a mean score of 2.1 shows that ICT phobia is not a problem militating against the use of ICT facilities in collaborative learning.

4. Discussion

The study revealed that the following are ICT facilities that can be used for collaborative learning: social networking services (e.g. Facebook, 2go, Twitter), virtual worlds, e-mail, online games, newsgroup/blog/microblogs, wikis, Web CT or any other chat facility, videoconferencing, audio conferencing, GSM phones and World Wide Web. This finding is in line with the Australian Government Report (nd) which listed wikis, microblogs, social networking services, virtual worlds and online games as technology tools that support CL in all sectors of education. In Imo State University, Owerri, Nigeria, only social networking services, e-mail, web CT, videoconferencing, audio conferencing, GSM and World Wide Web are used for collaborative learning.

This study also revealed ways ICT facilities enhance collaborative learning as increasing the level of student participation in CL; encouraging online discussion amongst students outside school; giving students the freedom and flexibility to learn at their own pace and time; encouraging students to extend their learning through further investigation, enabling students get ideas from subject specialists all over the world; and CL is not limited by time or distance when ICT facilities are used. Supporting this finding Bessagnet, Schlenker & Aiken (2005) opined that e-collaboration technologies eliminate the barriers of time, distance and resources. In line with the above, Becta (2008) opined that using ICT facilities in CL helps to increase students' engagement and participation. Furthermore, the fact that these tools can be available anytime and anywhere encourages students to extend their learning into topics that interest them.

The study further showed the problems encountered in the use of ICT for CL as inadequate supply of electricity, limited access/poor communication infrastructure; inadequate ICT skills by students and lecturers; over population of students and lack of funds. Nigeria being a developing country is still grappling with electricity problems. The above listed problems are responsible for the lack of use of many ICT facilities in CL in Imo State University, Owerri. Ezekoka (2010) listed the following as barriers to the use of ICT in Nigeria: lack of ICT skills, lack of motivation and confidence in teachers using ICT, lack of pedagogical teacher training, the absence and poor quality of ICT infrastructure, limited access to ICT equipment, lack of ICT main streaming into school strategies and epileptic power supply.

IECT2014

5. Conclusion

This study has examined the benefits of using ICT facilities in CL. Any method of teaching that encourages students' engagement and participation as CL should be encouraged. When students are involved in finding knowledge or in problem solving they tend to retain any knowledge acquired for a longer period. The use of ICT in CL should be encouraged in schools. ICT enhances CL in many ways as it does not restrict learning to particular times or places. It also exposes the learners to subject specialists all over the world.

6. Recommendations

Based on the findings of this study, the following recommendations were made;

- *Lecturers should encourage the use of ICT for collaborative learning by giving assignments/projects that require ICT facilities.*
- *The government should provide online services in the institutions of higher learning and at cheap prices to encourage students to utilize them.*
- *Generators should be available to help power these online services as alternative source of power.*
- *Workshops and seminars should be organized from time to time for lecturers on the use of ICT facilities to enable them acquire the necessary ICT skills.*
- *Undergraduate students should be made to take their computer lessons in General studies very seriously. The instructors should make the lessons more practical to enable the students acquire the ICT skills needed for their studie*

IETC 2014

7. Acknowledgments

I am grateful to the academic staff of Imo State University, Owerri especially those that constituted the sample for sharing their ideas on collaborative learning and the use of ICT. I also thank all the authors whose works were cited in this study.

Measuring the level of algorithmic skills at the end of secondary education in Hungary

Piroska Biró[a71], Mária Csernoch[a], János Máth[b], Kálmán Abari[b]

Abstract

Students starting their tertiary studies in Informatics are found to have a low level of algorithmic skills and understanding of programming, which leads to the high number of drop out students and failed semesters during their studies. The students' low level of programming skills contrasts with their excellent results in the school leaving exams. To find out the reasons for this we have launched the TAaAS project (Testing Algorithmic and Application Skills), which focuses on the students' algorithmic skills and programming ability in traditional and non-traditional programming environments. Our analyses proved that school leaving exams are not able to measure these abilities of the students, and beyond that, are not able to distinguish between the different levels of the students. Students are accepted into the universities and start their studies based on the misleading results of the school leaving exams.

Keywords: level of digital thinking, algorithmic skills, school leaving exams in Informatics and Mathematics

IETC 2014

1. Introduction

As early as 1995 a new National Curriculum was introduced in Hungary including formal Computer Sciences/Informatics (CSI) education, which promised to deliver well-developed algorithmic skills. Since then digital competency and computational thinking is regarded as one of a child's key analytical abilities and is intended to be developed both in formal CSI studies and in traditional school subjects. To support this concept, the structure of the traditional subjects was changed, formal CSI studies were introduced, and the connections between this new subject and the others were clearly stated. In addition to these fundamental changes, in 2005 a new system of school leaving exams was launched with a double-purpose: serving both as the closing event of the primary and secondary studies and as the entrance exam to tertiary education.

Based on these changes in the education system in support of the development of computational thinking (Wing, 2006), the straightforward consequence would be that our students achieve a high level of algorithmic skills, especially those students who choose CSI as their major in tertiary education. However, the pattern is not this clear. Institutes in CSI tertiary studies are faced with the problem that the subjects and the level of the entrance exams are quite contradictory in terms of the requirements of CSI studies. The contradiction is further proved by the high number of drop out students and failed semesters.

To clear up this misunderstanding we have launched a project entitled Testing Algorithmic and Application Skills (TAaAS), which focuses on the students' algorithmic skills in comparison to their results in

[71] * Corresponding author. Tel.: +3652512900/75227
E-mail address: biro.piroska@inf.unideb.hu

the school leaving exams (Biró & Csernoch, 2013a, 2013b, 2013c, 2014; Biró et al, 2014a, 2014b; Csernoch & Biró, 2013a, 2013b, 2013c, 2014a, 2014b, 2014c; Csernoch et al, 2014).

2. Sample

2.1. Participating students

The TAaAS project was launched in the 2011/2012 academic year, at the Faculty of Informatics at the University of Debrecen, Hungary, and has been running since then. In the following year the testing was repeated with students newly arrived at our faculty, while in the 2013/2014 academic year the project was widened, and three more Hungarian institutes joined (Eötvös Loránd University (ELTE, Budapest), Eszterházy Károly College (EKF, Eger), and the College of Nyíregyháza (NYF, Nyíregyháza) (Biró et al, 2014a, 2014b; Csernoch & Biró, 2013).

In the following three years at the University of Debrecen (DE) three majors of Informatics were tested including a total of 950 students: Software Engineering (SOE), System Engineering (SYE), and Business Information Management (BIM) (Table 1)

.

Table 1. The number of students at the Faculty of Informatics at the University of Debrecen, Hungary participating in the TAaAS project

	SOE	SYE	BIM	Sum
2011/2012	115	86	109	310
2012/2013	108	111	101	320
2013/2014	115	115	90	320
Sum	338	312	300	950

2.2. The structure of the school leaving exams

The school leaving exams (School leaving exams, 2014) serve both as the closing event of the primary and secondary studies and as the entrance exam for tertiary studies, and run at intermediate and advanced levels. There are four compulsory subjects – Mathematics, Hungarian, History, and a foreign language –, and at least one more, which is chosen by the students. It is the students' choice at which level(s) they take the exams; however, tertiary education institutes indicate the required subjects and their levels. In order to start a tertiary course in CSI the result of the compulsory Mathematics school leaving exam must be taken into consideration. However, it is not compulsory to take the school leaving exam in Informatics, and this can be substituted with Physics in SOE and SYE, and with other subjects in Sciences in BIM. Furthermore, even the results of exams in Hungarian, History, and foreign languages are considered when calculating the results of the entrance exams for CSI studies. The Informatics school leaving exam runs at both levels, and they consist of a computational and an oral session. At intermediate level in the computational session only application problems have to be solved, while at advanced level there are more complex application tasks and one programming task.

The following question naturally arises in this context: how well is this system of school leaving exams able to measure the students' algorithmic skills, their level of computational thinking, and their correct

IETC 2014

usage of terminology in CSI, all of which are requirements for tertiary CSI institutes? In sum, we can ask how well students are prepared for higher level studies in CSI.

2.3. The tasks of the TAaAS project

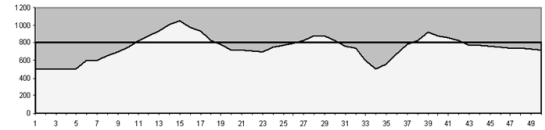
The TAaAS project was launched to test the students' algorithmic skills in traditional and non-traditional programming environments, to reveal how the students approach programming problems in the different environments, and how they would relate the computer related problems to algorithms (Soloway, 1993; Warren, 2004; Sestoft, 2010). We have selected three different environments to test the students' algorithmic skills, two of which are rather traditional (Tasks 1 and 2), while one is a new programming environment (Task 3).

2.3.1. Logical operators

Task 1 is a traditional program code of a multilevel IF structure to test the students' ability to recognize logical operators. The possible output of the program for the pairs of inputs is one of four whole numbers: 3, 2, 1 and 0. The source code is accompanied by a table of nine pairs of inputs and nine empty cells, where the selected output numbers have to be written. The presentation of the problem with the limited number of possible answers and the output table made the task quite easy (Fig. 1).

You draw two cards (X, Y) from two packs. In both packs you can find cards with the letter A, cards with the letter B and cards with the number zero. Give the points in the last column of the table according to the algorithm given below.

```
V:=X="A" or Y="A"
W:=X="B" or Y="B"
If V and W then Point:=3
else If V then Point:=2
else If W then Point:=1
else Point:=0
```



X	Y	Point
A	A	
A	B	
A	0	
B	A	
B	B	
B	0	
0	A	
0	B	
0	0	

Fig. 1. The text, the program code and the output table of Task 1.

2.3.2. Decoding pseudo codes

The other traditional programming task of the test (Task 2) contains three pseudo codes which the students have to decode, and the results should be presented in semantically correct natural language sentences. Compared to Task 1, these problems are a lot more demanding. However, we have to note here that both tasks are borrowed from the Nemes Tihamér Hungarian national programming contest for 5–8th graders (Nemes, 2013).

What do the following programs do? What is stored in variable DB and M?

N=50, measured values:
500,500,500,500,500,600,600,650,700,750,820,880,930,1010,1050,980,930,830,780,720,720,710,700,750,
770,790,820,880,880,820,760,740,600,500,560,670,770,770,760,750,740,740,730,720.

Task 2.1
```
DB:=0
Loop from i=1 to N
If X(i)>800 then DB:=DB+1
End loop
```
Task 2.2
```
DB:=0
Loop from i=2 to N−1
If X(i)<X(i−1) and X(i)<X(i+1) then DB:=DB+1
End loop
```
Task 2.3
```
M:=0
Loop from i=2 to N
If X(i)−X(i−1)>M then M:=X(i)−X(i-1)
End loop
```

IETC 2014

Fig. 2. The context and the pseudo codes of Task 2.

2.3.3. Programming in spreadsheet

Spreadsheet is not usually considered a programming environment, but a user-friendly interface which even computer illiterate end-users would be able to use. However, it has been proved that this is not so (Warren, 2004; Sestoft, 2010; Csernoch, 2012). The high number of spreadsheet documents carrying errors (Panko, 2010; Tort, Blondel & Bruillard, 2008) and the extremely long time required for the preparation of these documents (Van Deursen & Van Dijk, 2012) has proved that spreadsheet should be taken more seriously. Spreadsheet is a functional language, and this could serve as an introductory language due to its simplicity and the problems related to it. We chose these problems to reveal how students handle them, and beyond that they are closely related to the other two more traditional programming tasks, and so allow us to obtain comparable results. Tasks 3.1–3.3 should be answered with complete spreadsheet formulas. Task 3.4 is a decoding task with a double purpose: on the one hand, the results should be expressed in a natural language sentence, similar to Task 2; on the other hand, this complete formula would provide guidelines for solving Tasks 3.1–3.3. We wanted to see whether the students recognize the connection between these problems or not.

	A	B	C	D	E
1	**Country**	**Continent**	**Capital**	**Area**	**Population (thousand)**
2	Afghanistan	Asia	Kabul	647500	27756
3	Albania	Europe	Tirana	28748	3545
4	Algeria	Africa	Algiers	2381740	32278
5	American Samoa	Oceania	Pago Pago	199	69
6	Andorra	Europe	Andorra la Vella	468	68
7	Angola	Africa	Luanda	1246700	10593
8	Anguilla	America	The Valley	102	12
233	Yemen	Asia	Sanaa	527970	18701
234	Yugoslavia	Europe	Belgrade	102350	10657
235	Zambia	Africa	Lusaka	752614	9959
236	Zimbabwe	Africa	Harare	390580	11377

Task 3.1	How many African countries are in the table?
Task 3.2	What is the average population of those countries whose surface area is smaller than G1?
Task 3.3	How many countries have a surface area greater than G1?
Task 3.4	What is the result of the following formula? {=SUM(IF(B2:B236="Europe",IF(LEFT(A2:A236)="A",1))))}

Fig. 3. Presenting Task 3, with the context, the questions to answer with spreadsheet formulas, and the code for decoding.

2.4. The evaluation of the tasks of the TAaAS project

The correction of Task 1 was unambiguous; the number of the correct answers had to be counted. However, both Tasks 2 and 3 required more serious consideration. To find out how the students approach these tasks, and how their algorithmic skills are developed we adapted the categories of understanding of the SOLO taxonomy to both the traditional and the non-traditional programming tasks. Considering the special environment of the tasks and the preliminary corrections, the following five levels of understanding are included: Ignored (1), Prestructural (2), Unistructural (3), Multistructural (4), Relational (5) (Biggs & Collins, 1982; Lister et al, 2006, Clear et al, 2008, Sheard et al, 2008, Tan & Venables, 2010).

3. Hypotheses

H1: The students' selection of major indicates that their results are higher in the Informatics than in the Mathematics school leaving exams.

H2: There is a connection between the students' results in the test focusing on algorithmic skills and in their results in the school leaving exams.

4. Results

IECT 2014

4.1. The results of the school leaving exams

The comparison of the number of the participating students shows that most of the students take the Informatics school leaving exam, even though it is not compulsory (Table 2). The difference between the number of participating students and those who take the exam in Mathematics is due to students arriving from foreign countries and to uncompleted questionnaires (Table 1 and 2). However, the low number of the advanced level exams is remarkable, both in Mathematics and Informatics. The only exception is the SOE students' Informatics exam at advanced level.

Table 2. The number of students and their results in the school leaving exams in Informatics and Mathematics

	SOE	SYE	BIM	Average
school leaving exam (SLE) – intermediate level				
Informatics	84.1 (N=175)	82.2 (N=237)	80.8 (N=193)	82.3 (N=605)
Mathematics	74.1 (N=277)	71.4 (N=265)	74.4 (N=252)	73.3 (N=794)
school leaving exam (SLE) – advanced level				
Informatics	72.5 (N=127)	66.4 (N=37)	55.7 (N=16)	69.7 (N=180)
Mathematics	68.1 (N=22)	70.3 (N=17)	68.9 (N=24)	69.0 (N=63)

The comparison of the results of school leaving exams shows no significant differences between the majors, except in Informatics at advanced level. The comparisons of the pairs with the Kruskal-Wallis probes only found a difference between the results of the SOE and the BIM students in Informatics, at both levels. We can conclude that students start their tertiary CSI studies at the Faculty of Informatics with similar knowledge, both in Informatics and Mathematics, regardless of their majors.

The results of the school leaving exams at intermediate level in Informatics and Mathematics show significant differences (Wilcoxon signed rank test SOE, SYE, BIM: $V=1487$, $p<0.001$, $V=3386$, $p<0.001$, $V=3522$, $p<0.001$, respectively). Consequently, the results in Informatics are significantly higher than in Mathematics, which proves our H1 hypothesis. Based on the results of the school leaving exams only two clusters were distinguishable: C1SLE and C2SLE with 56.4% and 43.6% of the students, respectively. Their results in Informatics are 87.74% and 74.84%, in Mathematics 81.91% and 60.45%, respectively. Both the majors as categories and the clusters indicate that the school leaving exams are not able to distinguish between the students (Chi-square test: $\chi^2(2)=3.82$, $p=0.148$).

4.2. Knowledge-based clusters

Since the results of the school leaving exam do not show differences between the majors, we selected Task 1 to create knowledge-based clusters to see whether we could differentiate the students or not. With Task 1 we found four knowledge-based clusters: C1L–C4L, from the best group to the worst, respectively. With these clusters we can tell the students apart based on their results in the logical task (Fig. 4). The students who ignored or did not finish Task 1 belong to C4L, the best students to C1L, while C2L and C3L fall between these two. The question was how the clusters would differentiate between the students. The performance of C2L was found somewhat arbitrary; we could not find any characteristic feature for this cluster. However, C3L proved to have some limited knowledge. Those who belong to this cluster calculated the output almost as perfectly as those in C1L with A and B pairs of inputs; however, when one of the inputs was 0 they provided a 0 output, without considering the algorithm.

In Task 2 the high number of Level 1 results (Ignored) is remarkable; however there are significant differences between the clusters; with the increase in the number of the clusters the students' results are significantly lower (Jonckheere-Terpstra Test: $p<0.001$ in all the three codes). The Mann-Whitney test proved that in all the three pseudo codes the adjacent clusters differ significantly ($p<0.05$), with the exception of C2L and C3L in Task 2.1, but even in this case the direction of the difference is the same as with the other pairs. Further analyses of the clusters in Task 2 revealed a similar pattern as that found in Task 1. C4L achieved the lowest level; most of these students stop at Level 1. The most frequent result for C1L in

IETC 2014

Task 2.1 is Level 5. Even in this group, both in Task 2.2 and 2.3, the number of students ignoring the tasks is higher than in any of the other levels. However, in Task 2.2 the second most frequent level is 5, while in Task 2.3 it is 4. In C2L and C3L the second most frequent level is 3. However, in Tasks 2.1 and 2.2, which are the easier tasks, more C2L than C3L students reach Level 5, while in Task 2.3, which is the most difficult, the results of C2L decrease with the increasing level of understanding, and from Level 3 the frequency of C2L is below C3L. This result is a further proof of the limited knowledge of C2L.

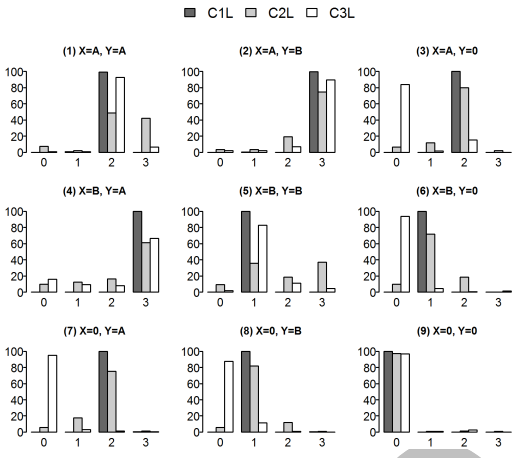


Fig. 4. The results of the clusters in Task 1.

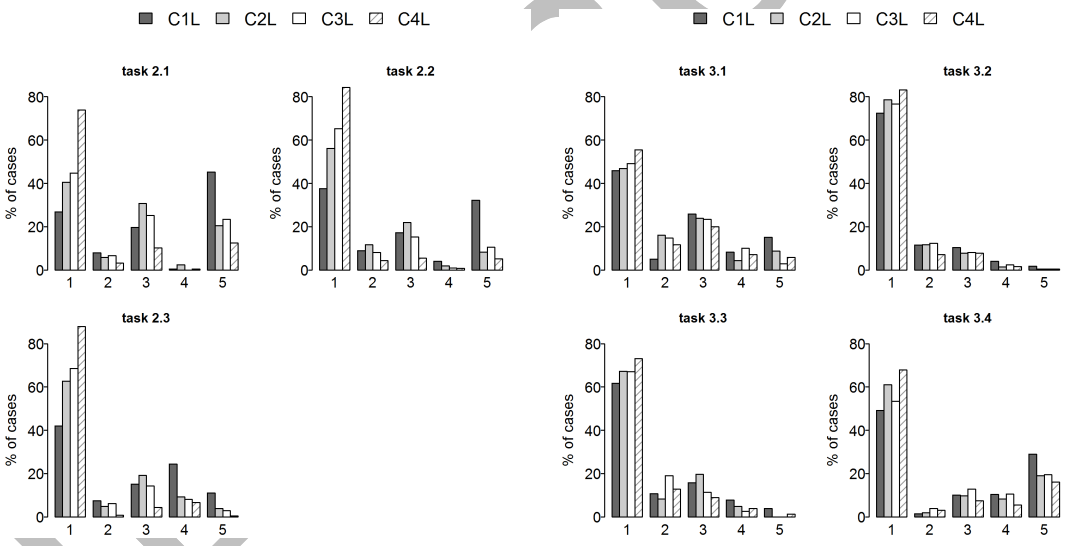

Fig. 5. The results of the clusters in Tasks 2 and 3.

In general, the result of Task 3 is the lowest among the three programming tasks. The high number of the ignored problems in this task is remarkable in all the clusters, especially for Tasks 3.2 and 3.3, which are the generalizations of Task 3.1. Significant differences between the clusters were only found in Tasks 3.1 and 3.4 (Kruskal-Wallis probes, Tasks 3.1, 3.2, 3.3 and 3.4: $\chi^2(3)=19.27$, $p<0.001$; $\chi^2(3)=8.67$, $p=0.034$; $\chi^2(3)=3.07$, $p=0.38$; $\chi^2(3)=25$, $p<0.001$). However, a comparison of the pairs show only differences in Task 3.1 between C1L and C3L-C4L, and in Task 3.4 between C1L and C4L. Level 5 is achieved with the highest frequency only in Task 3.4, which is the decoding problem. In this problem C1L performs better than the other clusters, while there are hardly any differences between the other clusters. In the other tasks the most frequent levels are 2 and 3, and C1L is slightly better in Task 3.1 than the others. We can conclude that even the knowledge based clusters which worked well in the traditional programming environment are not able to distinguish between the different weaknesses of the students in spreadsheet. Based on the comparison of the results in the school leaving exams and the test, we have found that while

our knowledge based clusters are able to distinguish the students' levels of algorithmic skills, the school leaving exams do not have this feature. Consequently, we have to reject our H2 hypothesis.

5. Conclusions

In the framework of the TAaAS (Testing Algorithmic and Application Skills) project we have tested the first year students of the Faculty of Informatics at the University of Debrecen, Hungary, focusing on the students' algorithmic skills, and their level of understanding in traditional and non-traditional programming environments. We have realized that the students arriving at our faculty do not match the requirements set by our majors, in spite of the students' high results in the school leaving exams. This contradiction leads to the high number of drop out students and failed semesters.

The present article focuses on a comparison of the first year students' results in the school leaving exams and in the TAaAS project. First of all, the low number of students taking the advanced level school leaving exams is remarkable (except with the SOE students in Informatics), consequently, we rely mainly on the results at intermediate level. The analysis proved that the results of the school leaving exams in Informatics are significantly higher than in Mathematics. This would explain the students' low results in the different subjects in Mathematics in tertiary CSI education. It was also found that the majors do not show significant differences in their results, either in Informatics or Mathematics. Consequently, based on the school leaving exams only two clusters are recognizable, i.e. the school leaving exams seem an unsatisfactory to distinguish between the different levels of the students. Furthermore, the good results in Informatics suggest that the students start their studies in tertiary education with a high level of computational thinking.

To find the sources of the contradiction between the entrance exam results of the students and their real performance in tertiary education we selected algorithm driven tasks in the TAaAS project. The students' results in these tasks revealed that they have a low level of algorithmic skills and understanding of programming.

The most successful task in the test, Task 1, was selected to create knowledge based clusters, and four well distinguishable clusters were recognizable; C1L–C4L, moving from the best to the worst. The best cluster is proved to be the best, while the worst is the worst in all the three tasks. Between them two clusters are also clearly distinguishable. C2L's results seem rather arbitrary, while C3L is found to have limited knowledge. The characteristic feature of this type of knowledge is that until they reach their limit they achieve similarly good results to C1L, while with more difficult tasks they perform at the lowest level of understanding.

Tasks focusing on the programming skills are able to distinguish the different levels of algorithmic skills and levels of understanding in programming. On the one hand, we can conclude that the system which relies heavily on the results of the school leaving exams when selecting students for Informatics courses does not serve its purpose. On the other hand, neither the Mathematics, and most unfortunately, nor the Informatics school leaving exam at intermediate level is able to measure the level of the students' algorithmic skills.

Metacognition and sensorimotor components underlying the process of handwriting and keyboarding and their impact on learning. An analysis from the perspective of embodied psychology.

María A. Pérez Alonso
University of Applied Sciences JOANNEUM, Werk VI-Strasse 46, Kapfenberg 8605, Austria

Abstract

Digital writing devices such as the computer or the personal digital assistant are inundating the higher education classrooms around the globe. They have developed to indispensable learning tools and consequently the use of longhand in the education context is in continual detriment.
From the perspective of cognitive science the processes of typing and handwriting differ considerably. This paper firstly analyzes the highly complex nature of handwriting, further highlights the psycho neurological mechanisms involved in acquiring and practising this skill and points out the differences to typewriting. Finally, the author deliberates about how the use of the two different writing techniques may affect the learning outcome of students.

Keywords: learning efficiency; cognitive effort; handwriting; keyboarding; note taking; working memory.

IETC 2014

1. Introduction

For the millennial generation as well as for the digital immigrants daily use of information technology devices is a matter of course which does not require further reflection. The confidence in electronic instruments to register and store information, to communicate and to handle daily business is so deeply rooted in everyday life that rarely an alternative modus operandi is considered.

The widespread maxim "the more digitalized a process or instrument is, the more reliable and professional is its output " meets the current zeitgeist. In the framework of education, this belief affects the behavior of our students in the classroom and the way they are taught and learn.

This paper, firstly, analyzes one of the aspects which has been deeply influenced by the introduction of new technologies in education: the nature of writing. Oatley & Djikic (2008) postulate in an article the idea of "writing as thinking"; following the statement of Richards (1925) "a book is a machine to think with" Oatley et al. (2008) go further and predicate that "a pen is machine to think". Miró Juliá (1999) while exposing his teaching methodology in higher education makes the observation that "handwriting is a tool to learn reasoning". Taking into account statements like the previous mentioned it is worth to consider the impact of the ever-increasingly adoption of keyboarding as writing alternative among the students community. The new Common Core State Standard, the standardized education benchmark for USA public schools adopted by 45 U.S. states, does not require school districts to teach cursive writing and it omits it as a graduate requirement. This implies that the state does not check schools on covering handwriting in their programs; keyboarding skills, on the other hand, are specifically required. However, the acquisition

of the cursive writing skill has always been considered as a milestone of child development and a big step toward the intellectual maturity of human beings.

Secondly, this work examines the concept of metacognition and the different cognitive processes involved in handwriting and keyboarding with special focus on the activity of notes taking in the classroom. Even from the perspective of a neophyte in the writing topic it can be attested that the two writing modalities imply different sensorimotor processes. The impact of both writing modalities in the learning outcome is analyzed taking into account the principles of the embodied psychology. Additionally, an insight in the neuropsychological processes activated while practicing writing and their role in memorizing and comprehending learning material is offered.

Finally, a reflection about the future role of longhand in the context of education is given. The author, conform to the proposal of Mueller & Oppenheimer (2014), advocates for a combination of writing techniques by taking into consideration that they support and strengthen different skills, necessary firstly for cognition development, secondly for learning efficiently and lastly for successful performing in a progressively more digitalized workplace.

2. The nature of writing

In order to understand the interconnection between writing and other cognitive processes the relation between handwriting and letter cognition will be exposed as prior development skill for acquiring reading proficiency.

In an early experiment conducted by Hulme (1979) visual recognition was studied by comparing the memorization of abstract graphics with children who had to learn the forms just by looking at them or by tracing them with the index finger. The tracing modality entails a higher memorization of the abstract items than the activity of looking at them. Hence, consequently, it is legitimated to suppose that visual and motor information are allied. The great body of research devoted to analyze the role of handwriting in the categorization of letters conducted by James in cooperation with other researches offers as well sufficient evidence of how the sensorimotor experience during the process of acquiring writing and reading proficiency has developed in a complex neural network. In a study undertaken by James & Engelhardt (2011) preliterate five years old children were instructed in the visual motor task of printing by hand, tracing and typing in a keyboard different letters. Posteriorly, children underwent a functional imaging session (fMIR) and were instructed in a task of letter recognition. Results show that after a self-generated letter printing letter perception recruits brain areas involved in letter processing and reading system, concretely in the visual areas involved in letter processing and the motor areas engaged in letter production, in a higher degree than doing other kind of sensorimotor activities. The motor task involved in tracing and free printing may appear the same, but the prior and posterior processes underlying the motoric performance differ considerably. When writing by hand, stroke after stroke, children learn the different variations of a letter and consequently deal with an ambiguous and demanding task of categorizing, the free creation of letters allows children to understand the perceptual properties and the variations on shape from the prototype; in the process of tracing they are not confronted with such a challenge. The highly demanding process of categorization recruits brain areas involved also in letter identification, concretely the fusiform gyrus which is responsible for within-category identification and, at the same time, for letter recognition. Children who had undergone the printing practice by hand show a neural activity more enhanced and "mature -like" than those who were instructed just in looking at the letters.

Studies conducted with adults corroborate as well how both processes are strongly interconnected. Longcamp, Anton, Roth & Velay (2003) explored to what extend motor-perceptual brain areas may be activated while reading; subjects underwent the task of looking at letters and letter-like stimuli, pseudo-letters, and then copying the characters. Brain imaging shows an activation of the left premotor cortex while looking at the letters as well as when writing them, when dealing with pseudo-letters the passive exposure to them did not activate the premotor context. The authors conclude that there must be a relation between the subjacent processes of reading and writing, being the ability to write a support for reading. James & Gauhtier (2006) corroborated with some studies the results of Longcamp et al. (2003). Fur-

IECT 2014

ther James & Atwood (2009) aimed to find out how the specialized response pattern seen during letter perception may be caused partially by the experience in writing letters. Participants were trained to recognize pseudo-letters by writing, typing, or visual practice. The aim was to investigate whether or not different types of experience with letter-like stimuli ("pseudo-letters") led to functional specialization similar to that which exists for letters. Results suggested that only after writing practice did neural activation patterns to pseudo-letters coincide with the patterns observed for letters. That is, neural activation in the left fusiform and dorsal precentral gyrus was higher when participants observed pseudo-letters than other similar stimuli, but only after writing experience. Neural activation also increased after typing practice in the right fusiform and left precentral gyrus, suggesting that in some areas any motor experience may change visual processing.

In a study of Longcamp, Boucard, Gilhodes, Anton,Roth, Nazarian, & Velay (2008) adults had to learn unfamiliar letters. The modalities were two: handwriting and keyboarding. The group learning by handwriting performed better than the experimental group which was learning the new characters via typing. Brain imagines acknowledge, once again, that the test persons who learned by hand recruited motor function areas of the brain. The mere physical act of shaping letters activates the motor memory in the sensorimotor zones of the brain and reinforces the learning process.

Thus, this body of studies leads to consider the facilitator role which the handwriting experience plays in acquiring reading proficiency and the neural interconnection between handwriting and letter recognition. Learning cursive is an important tool for cognitive development, which enhances the functional specialization of the brain. The results of these experiments indicate a strong interaction between perceptual and motor systems during pseudo-letter and letter perception. The decreasing commitment of parents and educators in instructing longhand in favour of other writing modalities may generate disadvantages in the children´s development process like for instance slowing down the reading proficiency. The substitution of longhand by typing needs further exploration in order to determine the impact this course may have in our education systems.

3. Writing modalities

J. Willis, in a plea for handwriting, declares: *"when writing is embedded throughout the curriculum, it promotes the brain´s attentive focus to class and homework, boosts long-term memory, illuminates patters, gives the brain time for reflection, and when well guided is a source of conceptual development and stimulus of the brain´s highest cognition"* (Willis, 2011).

The majority of psychological studies of writing focuses on mental processes but, as Mangen & Velay (2010) depict, scarce research has been done about the bodily experience of writing, and writing by nature is a physical experience. Writing means using a technology to create a text, by switching technologies the bodily experience, and subsequently its interconnected cognitive processes, must necessarily suffer alterations. Hence, it is of capital importance to scrutinize how the changeover to a new writing technology may impact the embodied cognition experience.

3.1. Differences between handwriting and keyboarding from the perspective of embodied cognition

Based on the article published in advances in haptics "reflections on the haptics of writing" of Mangen et al. (2010), the first and more obvious aspect which differentiates between handwriting and the use of digitalized devices is the tool. While by longhand the pen, hand (as haptic input) and the written result (as output) are in the same visual field; in keyboarding the visual effort has to be divided between two physically separated fields: keypad and screen. This fact may diminish the quality/quantity of devoted attention.

Another evident difference is the involvement of hands. Whereas longhand implies the use of a single hand, keyboarding is bimanual. This fact carries several implications. The use of only one hand slows

IETC 2014

down the process of writing compared to keyboarding and hence has consequences in the information processing. Handwriting enables more time for reflection and gives the memory a greater chance to store the information which is writing down. Contrariwise, writing down information via keyboarding goes so rapidly that the required retention is minimal. Writing stimulates the reticular activating system (RAS) in the brain. The RAS operates as a filter for what should be processed; this may explain why the retention is higher by handwriting.

Research headed by Berninger (Berninger, Augsburger, & García, 2009) underlines the previous statement. Berninger and her team conducted a study to analyze children´s ability to write the alphabet, sentences and essays using the pen or the keyboard in the second, fourth and six school grades. While writing the alphabet, the keyboard went faster than the pen. On the other hand, children writing by hand wrote more and faster essays. With reference to sentences the results were ambiguous, although fourth and six graders wrote more complete sentences when using the pen. The aim of the study was to compare methods of transcription (cognitive process which allows translating thoughts into written language).The sequential character of finger movements activates regions involved in thinking, language and working memory; subsequently, it reinforces the short and long term memory. In this study even children with disabilities performed better with a pen. Nevertheless, a part of the scientific community dedicated to the study of cerebral lateralization supports the advantages which the bimanual nature of keyboarding may have in the neurological development (Gómez Guardado, 2013).

A further different aspect, according to Mangen et al. (2010), between writing technologies is linked to the production of characters. In handwriting each letter has to be graphomotorically formed, in typewriting there is not such a graphomotor component, the computer keys offer already formed letters and the writing action consists of deciding which key to press; evidently, the writing pace cannot be the same. Related to this idea, the inner voice in writing (subvocal articulatory rehearsal process) and its implications in the working memory differ in both modalities. Since handwriting is slower, pace of the inner voice allows more time for rehearsal and facilitates in a greater scale the retention (Chenoweth & Hayes, 2003).

The National Association of State Boards of Education in the USA (NASBE), which recently compiled evidence about the benefits of instruction in handwriting, listed the following facets stimulated by handwriting (Kysilko, 2012):

- Cognitive and motor skills development
- Literacy development
- Memory
- Written expression
- Learning disabilities improvement t point

The implications of the switchover, from book to image, from pen to keypad, have for some contemporary thinkers consequences far beyond the above exposed, but which exceed the boundaries of this paper. In terms of Kress (Kress, 2003) this phenomenon will have an impact not only in the cognition process, the education and the communication, but also in widest areas, from socio-cultural paradigm changes to shifts in term of power.

3.2. Note taking. Implications on learning

Even those who can afford greatly relying on memory may catch themselves taking notes with the most different purposes. From the banal act of writing the shopping-list to crucial issues, we need to remember, we use notes. Taking notes, apart from ensuring the possibility to remember information, allows us to concentrate, comprehend and reconsider information as well as to reorganize intentions and plans. Generally speaking, note taking is a complex activity which requires an effort; this effort, however, pays off in form of efficiency.

The process of note taking demands auditive, sensorimotor, visual and cognitive perceptive tasks (Piolat, Olive, & Kellogg, 2005) which additionally must be performed simultaneously and under time pressure. Piolat et al. (2005) argued that the act of selecting the relevant information from the incoming continuous flow (which implicates a process of decision making), retaining the information in the working

IETC 2014

memory long enough to be processed and comprehend it while interacting with already stored knowledge for finally transcription taxes the sensorimotor and cognitive capacity fairly high. In other words, it requires the principle proclaimed by the embodied cognition of learning since it implies comprehension (van Dijk & Klintsch, 1983) and written production (Daneman & Merikler,1996).

Empirical studies confirm the use of note taking as a highly effective way of learning in the educational context, and therefore it is important to consider if the switch of writing modalities may affect the learning process while note taking. Students take notes in order to record information they should posteriorly read and learn, however, the benefit goes beyond the initial intention; taking notes is per se and act of memorization which leads to the creation of an "internal" storage (Kiewra,1987), the act of taking notes intrinsically fosters learning. Note taking is a fundamental skill for exam performance, accounting higher than other predictors as verbal ability (Kiewra, Dubois, Christian, McShane, Meyerhoffer, & Roskelley, 1991). *"Taking notes involves active listening, as well as connecting and relating information to already available knowledge. It also involves seeking answers to questions that arise from the material "*(O'Hara, 2005). Moreover, the capabilities of the note taker, the student, influence decisively the learning achievement; aspects like the mastery of the language, the body of previous knowledge related to the subjects as well as the transcription speed affect the quality of the notes and consequently the learning efficiency (Peverly, 2006).

In a study carried out by Makany, Kemp, & Dror, (2008), the authors conducted a comparative analysis of two different note taking modalities: traditional linear and non-linear SmartWisdom; after the exposition to a lecture or a conference discussion, participants were measured in the following cognitive processes:

- Comprehension
- Accuracy
- Complexity
- Metacognition
- Memory

Students taking non-linear notes statistically outperformed in comprehension and metacognition. Although the central executive functions of the working memory are highly demanded by note taking and while some studies reported a correlation with learning efficiency, some experts, like the exposed above, plead that the academic excellence behind note taking is rather generated from an advance information management technique (restructuration of the information), able to deal with the continuous flow of information, than on the prominent short memory skills (Makany et al., 2008).

The quality of notes taken depends on the cognitive load which the students can handle in the process (Baddeley, Chincotta, & Adlam, 2001); following Titsworth (Titsworth, 2004) students record more details and organizational points when listening to lectures with strong organizational cues, therefore note taking techniques which stimulate the creation of organizational cues may as well reinforce academic performance by reducing the cognitive demand. However, future studies should analyze to what extent short memory skills are a fundamental prerequisite to manage the information and if it possible to outstandingly manage information without a firstly high performance of the working memory.

Metacognitive knowledge is often regarded as a strategy for efficient self- regulated learning (Sperling, Howard, Staley, & DuBois, 2004) and consequently as a key factor in academic performance (Hacker, Dunlosky, & Graesser, 1998);note takers need to be reflective and aware of their own abilities to registering and comprehending the written information. Besides, while taking notes students become firstly conscious of what they are learning, monitor the efficiency of their own taking notes competence and estimate their understanding by having to transcript thoughts into written words, "*learning to monitor the quality of one's thought and the products of one's effort is the hallmark of what is mean by cognition*"(White & Frederiksen,1998).

Once accepted the great benefits of note taking for students it seems worthwhile to consider how the replacement of paper and pen by digital devices may affect the sensorimotor and cognitive processes and the learning benefits underlying note taking.

IETC 2014

The findings of a set of research studies conducted by Mueller and at. (2014) evidence that note taking via laptop generates nearly verbatim records of the teaching material while longhand note takers record less information. 65 students were exposed to a lecture about an interesting but not common knowledge topic. Part of the students was asked to take notes by hand, part by laptop. One and a half hour after the presentation students were tested on the teaching material in factual records and in higher order conceptual learning. In factual records students scored very similar while in conceptual and inferences learning students taking notes with the computer performed poorer. In a further study students went under the same kind of probe, but were additionally tested one week later. Interestingly students who took notes handwriting performed significantly better in factual as well as in comprehension questions.

One of the plausible explanations for this result may be caused by the nature of writing. Students using keyboard registered a much higher verbatim overlap with the lecture, this modality of writing allows a higher speed production and therefore leads to "mindless transcription". The high amount of registered information inhibits its management by overloading the cognitive processes. On the other hand, students writing are using a slow and arduous method and are forced to select thoroughly the information to be recorded; consequently they become deeper engaged with the material, which enables additionally the storage of the new learning material in a deeper and more interconnected way with existing knowledge.

In consonance with the findings of Makany et al. (2008) it is tempting to explain the lower performance of keyboarding note taking in the study of Mueller et al. (2014) as an extreme form of a linear note taking technique; considering a continuum from the most efficient learning form of note taking to the poorest one which implicates just the ability to record the maximum amount of words , keyboarding will be positioned in the opposite extreme of non-linear techniques, concretely in the one which less enhance academic performance.

According to the revised taxonomy of Bloom (Anderson, Krathwohl, & Airasian, 2001) the necessary information filter given by the nature of handwriting involves a higher level in the Bloom' s proposed learning hierarchy, namely the levels of understanding , analyzing and evaluating the given information which facilitate a deep learning. Parallel, from the perspective of information sciences and the data-wisdom chain model, it can be assumed that note taking by keyboarding can be located in the scale of generation of information while handwriting implies a process and reframing of information which results in knowledge.

4. Conclusion

The dissimilar learning output of the two taking notes modalities should not conduct us to dismiss one in favor of the other. Even explaining to our students the benefit of handwriting is not likely they will refuse to use digital devices as a learning instrument. The amount of students making use of a laptop in the classroom is increasing and the trend is irreversible. According to Mueller at al. (2014), it is recommendable to try to combine both methods and to make students aware of the benefits of handwriting; for many, a quite unfashionable writing way.

The combination of methods could be the key to optimize academic performance while taking notes. Technology advances speedily and it may come the day when digital writing can include more of the idiosyncracy of longhand, including so many of the cognitive benefits implicated in it.

Trying to strengthen first the longhand practice in the higher education context will result in a lost cause. It is much earlier, in the elementary school, when children should be enhanced in handwriting proficiency and in the awareness of the importance to write and to have a personal and legible calligraphy and a good orthography.

There is an inherent joy in the human nature to create and to have an individual hallmark difficult to imitate. Handwriting implies a creative process and leaves a unique personal seal on paper. Children in the school are most eager to accept the challenge to learn to write dually and it is the environment, par-

IECT 2014

ents and school community, who may support children to develop the necessary skills for outstanding proficiency in both techniques without forcing them to prioritize or to choose one of the two methods.

Methodology of theoretical physics in economics: examining price jerk

Tomáš R. Zeithamer72

University of Economics, Faculty of Informatics and Statistics, Department of Mathematics, Ekonomická 957, 148 00 Prague 4, Czech Republic

Abstract

The introductory part of the work takes a look at methodologies of experimental and theoretical physics in relation to basic economic research. Factual research in bibliographic databases shows that representatives of the Czech School of Economics have taken a leading role in the methodological use of applied and theoretical physics in basic economic research, particularly in the latter half of the twentieth century. In the second part of the work, methodological approaches of theoretical physics are used to derive a linear deterministic motion equation for instantaneous commodity price without an inflexion point. The third part of the work uses the methodology of theoretical physics to derive a price jerk equation, which results from a non-linear motion equation for instantaneous commodity price.

Keywords: Depreciation; differential equation; econophysics; equation of motion; training appraisers.

IETC 2014

1. Introduction

The results of applying statistical mechanics in microeconomics suggest that the time is ripe for using the experimental, theoretical and mathematical methodologies of physics to model economic systems beyond the framework of traditional economic modeling. The question remains whether the import of concepts from physics to economics is merely an applied metaphor, or actually a modification of the analytical structure of economics. There are persuasive arguments that this involves more than applied metaphors (Wilson, 1998; Salzano & Kirman, 2005; Arecchi, 2005; Brock & Colander, 2005). If we are to find at least a partial answer to this question, we must compare the linear and non-linear analytical structure of physics with the analytical structure of economics. To enable such a comparison, work has begun on a principle of correspondence between economic variables and the physical variables used in one of the most highly developed disciplines of classical physics, classical non-relativistic mechanics. The final form of this principle of correspondence will to a certain degree be reflected in the methodological foundations used to teach economics itself, for example, in the training of appraisers at the university level.

The late nineteenth century is a period in which there was a synthesis of economic laws formulated by the previous generation of economists, and increased attempts to describe these laws using the language of physics and mathematics. Economic phenomena and processes at that time were described and analyzed using analogies between the evolution of physical systems and the evolution of economic systems. Biographical research has shown that one of the reasons for the successful application of theoretical physics in economics is that many economists had initially studied physical and mathematical sciences, or fields related to the physical or mathematical sciences (Zeithamer, 2012 a, 2012 b, 2013).The first half of the twentieth century witnessed a deepening integration of economics, mathematics and physics. The

E-mail address: zeith@vse.cz

gradual spread of methods taken from experimental and theoretical physics and applied to economics during the 19th and especially the 20th century eventually led to the beginning of basic research, which in the 21st century consists of the systematically targeted application of experimental, theoretical and mathematical physics to economics (Zeithamer, 2012 a, 2013). A part of this basic research in economics has become known as econophysics.

At the Czech School of Economics during the 19th century, no reliable sources have yet been found indicating such an interdisciplinary approach or related original work. In the second half of the twentieth century however, we do find economists at the Czech School of Economics whose works represent applications of physics in economics, i.e. in econophysics in broader sense. Einstein's special theory of relativity was applied by professor Pavel Hrubý (*5. 5. 1914 - †25. 6. 1994) in order to use economic spacetime for more precise economic analysis and prognosis (Hrubý & Kálal, 1974). Another Czech economist, who represents the Czech School of Economics in econophysics in broader sense, is professor František Drozen (*30. 5. 1949), whose results were inspired by the work of German railway engineer August Wöhler (*22. 6. 1819 – †21. 3. 1914). František Drozen constructed an analogy between the process of fatigue crack growth in axles of railway wagons and the process of price reduction for goods. This approach to modeling the process of falling prices for goods can be found in its final form in several of Drozen´s works (Drozen, 2003, 2008).

The methodology of qualitative and quantitative physical research of any system strives to achieve one basic goal, namely that the signal to noise ratio be much greater than one. If it is possible to deliberately increase the output signal from an inanimate system above the background noise, this brings to the forefront the natural relations which are common to different systems investigated (Roehner, 2002, 2007; Štroner & Pospíšil, 2011). Of course there are other systems which do not permit the researcher to amplify the level of output. In such case, there is another way to increase the signal to noise ratio. Here, it is necessary to continually decrease the background noise to the lowest possible level. A classic current example requiring such noise reduction is the detection of gravitational waves, the existence of which was predicted by prof. A. Einstein in his work from 1916 (Einstein, 1916). Outside the solar system, the theory predicts a number of "stellar" sources of gravitational waves, which could be detected in the event they reached Earth. For the Sun, a typical class G main-spectrum star, it has not yet been possible to theoretically determine such mechanisms which would be responsible for detectable levels of gravitational radiation (Weinberg, 1972; Papini & Valluri, 1976; Křivský & Zeithamer, 1982; Karmakar & Borah, 2013). A situation similar to the physical research of inanimate systems arises in the physical research of economic systems. Efforts similar to the detection of gravitational waves can be seen in numerous other multidisciplinary fields, explored in publications such as: Physics of the Earth´s Magnetosphere (Zeithamer, 1986 a, b, 1987 a, b, c, 1988, 1989, 1990; Vörös, 1991; Kan, Potemra, Kokubun, & Iijima, 1991; Otto, 2005; Vasyliunas, 2012), Heliometeorology and Helioclimatology (Sulman, 1982 a, b; Baker, 2005; Pérez – Peraza & Libin, 2012), Biophysics of the Sun – Earth Relations (Tromp, 1980; Sulman 1982 a, b; Kiefer, 2005).

In economic systems, one of the main reasons that the signal to noise ratio is close to one is the high degree of self-organization and self-improvement.

Finding causal mechanisms which explain observed socio-physical phenomena on a gravitational, electromagnetic or nuclear level is a very difficult, long and costly task. The same applies to the behavior of experts in commodity price theory, thoroughly based on the knowledge of basic physical force interactions. The theoretical constructions presented in this work are intended to facilitate solving both tasks mentioned in a future modern commodity price theory. Specifically, there are linear and non-linear elementary kinematic equations which do not explain the phenomena observed in the socio-physical system with interactions of force, but merely describe the developing state of the socio-physical system. While not easy to solve, these kinematic equations lead to quantifiable mechanisms which explain observed developments in the state of the socio-physical system using analytical dynamics, i.e. force interactions. The analytical dynamics of socio-physical systems is not the subject of this work, however, it is one of the subjects of basic and applied economic and physical research conducted by the author of this article.

2. Linear motion equation of commodity state without inflexion

In this paper it is assumed that the market value of a commodity is quantifiably determined only by the market price *n* of the commodity. We now make the generalizing assumption that the instantaneous acceleration of reduction of the market value is directly proportional to the instantaneous rate of reduction of the market value (Zeithamer, 2010). Then the deterministic differential equation of price which expresses this model is

$$\frac{d^2n}{dt^2}(t) = -\mathrm{A}\frac{dn}{dt}(t), \tag{1}$$

where $A > 0$ is the proportionality constant, and a negative sign is used to indicate that ***n***, the market value of goods, i.e. a price, is decreasing and the acceleration of reduction of the market value increases over time. The initial conditions now are that over time $t = 0$ the market value is $n(0) = n_0$ and $\frac{dn}{dt}(0) = r_0 < 0$, where $[A] = s^{-1}$; s – designates the basic time unit, seconds.

3. Non-linear motion equation of commodity state with inflexion and jerk of price

In this section of our work, we again presume the following conditions to be met: (1) the commodity is on one of the markets of a model of market structure with perfect competition at initial time t_0; (2) at time t_0 the commodity is found in its initial state, which is uniquely determined by the magnitude of instantaneous commodity depreciation $w(t_0) = w_0$.

Let the acceleration of $\frac{d^2n}{dt^2}$ of the instantaneous commodity price be the sum of two components, i.e.

$$\frac{d^2n}{dt^2} = \left(\frac{d^2n}{dt^2}\right)_1 + \left(\frac{d^2n}{dt^2}\right)_2. \tag{2}$$

The first component of acceleration is a consequence of physical and chemical processes, which cause the first component of the instantaneous acceleration to increase in direct proportion to the magnitudes of rate of change of the instantaneous commodity price *n*, i.e.

$$\left(\frac{d^2n}{dt^2}(t)\right)_1 = B\frac{dn}{dt}(t), \tag{3}$$

where B is the proportionality constant, $B > 0$ and $t \in \langle t_0, +\infty)$. The second component of acceleration results from socio-psychological processes, which cause the second component of the instantaneous price acceleration to be directly proportional to the product of the magnitude of rate of change of the instantaneous price $\frac{dn}{dt}(t)$ and the magnitude of instantaneous price $n(t)$, while the proportionality constant is negative, thus

IETC 2014

$$\left(\frac{d^2n}{dt^2}(t)\right)_2 = -A\frac{dn}{dt}(t)\cdot n(t), \tag{4}$$

where $(-A)$ is the proportionality constant, $A>0$, $t\in\langle t_0,+\infty)$.

By substituting relations (3) and (4) into equation (2), we obtain the following motion equation for the acceleration of instantaneous commodity price *n*

$$\frac{d^2n}{dt^2}(t) = B\frac{dn}{dt}(t) - A\frac{dn}{dt}(t)\cdot n(t), \tag{5}$$

where $A>0$, $B>0$, $t\in\langle t_0,+\infty)$. A similar equation holds for commodity relative depreciation *RD* (Zeithamer, 2012 b, 2013)

$$\frac{d^2RD}{dt^2}(t) = B\frac{dRD}{dt}(t) - A\frac{dRD}{dt}(t)\cdot RD(t), \tag{6}$$

where $A>0$, $B>0$, $t\in\langle t_0,+\infty)$.

For the motion of a solid body through space in which the magnitude of the force *F* of resistance in that space against the movement of the body is directly proportional to the velocity v of the body, i.e. $F=-kv$ ($k>0$ is the constant of proportionality), the magnitude of jerk *j* is expressed by the following equation (Pospíšil, 2013),

$$j = \frac{d^3s}{dt^3}(t) = -\frac{k}{m}\frac{d^2s}{dt^2}(t), \tag{7}$$

where *s* is the path traveled by the body, *m* is the mass of the body, *t* is time, and *j* is the magnitude of jerk in units m/s^3. From the equation of motion for instantaneous price (Eq. 1) we get the following equation for the magnitude of price jerk j_p, e.g. in units of USD/s^3,

$$j_p = \frac{d^3n}{dt^3}(t) = -A\frac{d^2n}{dt^2}(t), \tag{8}$$

where $n(t)$ is the instantaneous price of the commodity and *t* is the physical time. Equations (7) and (8) are the first step in constructing a principle of correspondence between economic variables and physical variables of classical non-relativistic mechanics: the path *s* traveled by a solid body through space with a force of resistance against this movement is directly proportional to the velocity, which corresponds $(\leftrightarrow)$ to the instantaneous price *n* of a commodity in a market structure with perfect competition i.e. $s \leftrightarrow n$. Equations (7) and (8) are also a second step in deriving a complete principle of correspondence between economic variables and physical variables: for the motion of a solid body through space, where the force of resistance against this movement is directly proportional to the velocity v, jerk *j* corresponds $(\leftrightarrow)$ to price jerk j_p for a commodity in a market structure with perfect competition, i.e. $j \leftrightarrow j_p$.

The price jerk function $j_p(t)$ for a non-linear motion equation of commodity state with inflexion (5) may be derived in the following manner. By taking the derivative of equation (5) with time t and substituting

IETC 2014

into the right side of the resulting equation for $\frac{d^2n}{dt^2}(t)$ from equation (5), we get the price jerk equation in the form

$$\frac{d^3n}{dt^3}(t) = \left(A\, n(t) - B\right)^2 \frac{dn}{dt}(t) - A\left(\frac{dn}{dt}(t)\right)^2. \qquad (9)$$

The price jerk function $j_P(t)$ on the right side of equation (9) may be expressed by a derivative or function $G(t)$ with respect to time t in the form

$$j_P(t) = \left(A\, n(t) - B\right)^2 \frac{dn}{dt}(t) - A\left(\frac{dn}{dt}(t)\right)^2 = \frac{dG}{dt}(t), \qquad (10)$$

where

$$G(t) = \frac{1}{3A}(A\, n(t) - B)^3 + A\int_0^t \left(\frac{dn}{dt}(u)\right)^2 du + const., \qquad (11)$$

while constants of proportionality A and B from equation (5) are expressed in the following units $[A] = (c.u.)^{-1}\ s^{-1}$, $B = s^{-1}$; $c.u.$ – designates the basic currency unit, s – designates the basic time unit, seconds. Then the price jerk equation (9) acquires the form

$$\frac{d^3n}{dt^3}(t) = \frac{dG}{dt}(t). \qquad (12)$$

Equation (12) corresponds to the non-relativistic equation for mechanical jerk, following from Newton's second law of motion.

IETC 2014

4. Conclusion

Assuming that the market value of the commodity at time *t* is fully determined exclusively by the value of the instantaneous commodity price $n(t)$, methodological procedures taken from theoretical physics are used to construct motion equations for a commodity's instantaneous price $n(t)$ and instantaneous relative depreciation $RD(t)$. Motion equation (5) for instantaneous commodity price with inflexion is a non-linear differential equation of the second order with constant coefficients. This motion equation was derived for a sequence of markets with perfect competition. The conclusion of the work presents the first step for constructing a principle of correspondence between economic variables and kinematic variables of classical non-relativistic mechanics.

Acknowledgment

The author is grateful to Mrs. Pavla Jará and the National Technical Library for their great effort and excellent work, which was indispensable in the completion of a large portion of this work. M-learning in education: Omani Undergraduate students perspective

Mohamed Sarrab73
Communication and Information Research center, Sultan Qaboos University, Oman

Abstract

The purpose of this research is to analyze and evaluate students' knowledge and awareness about M-learning. This empirical study includes 56 university students from computer engineering and science departments in University of Sultan Qaboos. This study consists of two parts. The first part involved study overview presentation and students' discussion about M-learning. The second part included survey study that consists of three phases: General information, M-learning knowledge and M-learning perception. Based on the study survey questions regarding the knowledge, acceptance and use of M-learning, the students respond are analyzed and evaluated. The study initial findings indicated good M-learning awareness and acceptance level and show students positive attitude that reflect students interesting in the use of mobile devices as learning tools.

Keywords: Learning; E-learning; Mobile learning; M-learning ;

IETC 2014

1. Introduction

The traditional learning in short T-learning and education systems are normally made in the classrooms in which teachers are responsible for providing students with their study materials. The T-learning has three main components learners, teachers and study materials where all of them must be physically represented in the learning place. The T-learning has many drawbacks such as learning in specific location and the availability of learning material. Generally, T-learning is not suitable for different learning and education style such as online exams, discussion ports, collaboration, animation, video, listening and knowledge searching (Georgiev, & Smrikarov, 2004, Cavus, & Ibrahim, 2008). These T-learning drawbacks and limitations have led to find new educational and learning methods. The ICT and the use of electronic media in education have introduced the ***E-learning*** which allows the educators to learn at any time and in different locations. The E-learning refers to the use of technology in different learning activities and to help people to learn remotely. The E-learning concept covers different models such as web-based learning, virtual classrooms, computer-assisted learning and digital communication (Sarrab, Alalwan, Alzahrani, Elgamel, 2013).

Currently, most of education systems prohibit students using their mobile devices during school work and, students are very rarely allowed to use mobile devices web browser to find information during lessens or exercises. Other students may allow using their mobile devices as bilingual dictionary or using their mobile cameras to capture photograph of PowerPoint presentation (Sarrab, Elgamel, & Aldabbas, 2012). In fact, that realize of M-learning is impossible without the use of mobile devices. The very important and common abilities are their mobility, availability and easily wireless connecting. Using modern mobile technology integrated in M-learning, changes the way our students learn and educate to be more interest-

* Corresponding author. Tel.: +96824143698; fax: +96824414336.
E-mail address: sarrab@squ.edu.om

ing, interactive, flexible and widely available and. M-learning is cost efficient technique that encourage students to learn and get knowledge without traditional education system restrictions (Douglas, Matt, & Michael, 2008, Alalwan, Alzahrani, & Sarrab, 2013). The reset of the paper is organized as follows the next four section 2 briefly introduce M-learning. Then, section 6 discusses the literature review and the next two sections present the study and its methodology. Thereafter study results and discussion are provided with a number of findings and implications. Finally, conclusion and limitation of this study and implication for future studies are discussed.

2. M-learning

M-Learning can be defined as E-learning using mobile devices (Uhlig, Neiger, Rodgers, Kagi, Leung, & Smith, 2005). In 2001 a Norwegian research group defined this new form of learning as a learning technique using mobile technologies because of the growing demand for flexible learning process and geographic spatial mobility (Perez, Doom, Sailer, IBM, & Watson, 2008). Chabra and Figueiredo in 2002 offered a new definition of M-Learning as learning or education process using a specific device, in anyplace and at any time (Subramanian, 2009). The concept of M-learning combines the advantage of network wireless technologies and mobility to be used in the education and learning processes (Farooq, Schafer, Rosson, & Caroll, 2002). Considering the learning availability anytime and anywhere lead to M-learning as a new model of learning technology.

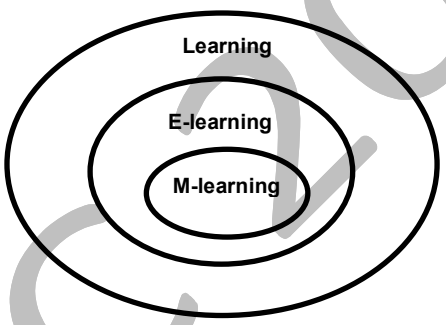

Fig. 1. M-learning as a subset of E-learning

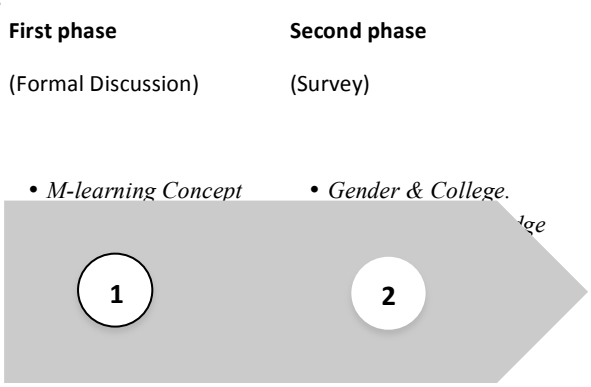
In fact the use of M-learning is still not very popular. However, mobile devices technologies are becoming more capable of supporting communication services and managing learning contents. Thus, M-learning has the potential to become main stream in the foreseeable future (Tana, & Aib, 2011, Alzahrani, Alalwan, Sarrab, 2014).

3. Literature review

With the fast development of the wireless technology, students are exposed to a new educational and learning experience that is led to M-learning. Despite, long history and large amount of mobile technology development, still there is not comparable development with what can be seen in D-learning, E-learning and in internet innovations overall. Several researches and developments have been carried out on M-

IETC2014



learning including requirements analyse (Oulasvirta, Wahlström, & Anders, 2011), architecture design (Haag, 2011), proposed models (David, Gary, Roure, & Victor, 2010), current and future trends (Minutoli, Fazio, Paone, & Puliafito, 2010). There are many M-learning applications in market today such as, Alykko which is an intelligent mobile tutoring application for instructors to manage their tutorial material using mobile and web technologies (Hofmann, Labs, & Woods, 2010). Active campus is another type of M-learning application used as a context-aware organizer to manage and support some learning activities (Mallikharjuna, Sasidhar, & Satyendra, 2010). MOODLE (Kasi, Kusuma, & Kumar, 2012). is a learning management system and POODLE (Uhlig, Neiger, Rodgers, Kagi, Leung, & Smith, 2005) is a form of MOODLE after redesigning to be compatible with wireless networks and suitable for hand-held devices. A group of Malaysian researchers proposed M-learning approach that uses mobile graph to trace students' performance and progress (Wasserman, 2010). Their proposed system is to complement and improve the Malaysian learning process. The M-learning is still in its infant age, thus, it has not standard developed similar to desktop or PC application development (Arno, 2011).

4. The study

Most of the M-learning mechanisms are concentrating on students of different higher education providers. The article reports an empirical research study about student's' M-learning knowledge that was conducted with the purpose of defining the meaning of M-learning and evaluates the student's acceptance of M-learning within university undergraduate students. This research study was conducted on undergraduate students in departments of computer engineering and computer science at Sultan Qaboos University, Oman. The main contribution of this article is the discussion of M-leaning concept, providing some examples of M-learning and empirically studying students' knowledge and perspective of M-learning and how students see Mobile tools incorporate into their study classes as M-learning tools.

5. Methodology

In order to accurately analyse and evaluate student's knowledge and perspective about mobile device as M-learning tools in the learning process this research was designed depending on the students' action (Brydon-Miller, Greenwood, & Maguire, 2003). The study methodology is consisting of two phases:

IETC 2014

Fig. 2. Exploratory Study steps

The first phase includes three parts, the first part involved introduction of M-learning and discussed this research study purposes and steps. On the time of this research study there were 29 female and 27 male students with the age range between 18 to 26 participated. The second part introduced the target of the study and showed the importance of this empirical experiment study. The third part is about the study procedure, in which, a set of methodology steps are explained to the participated students. The second phase is the survey study which includes five parts. The first part is the general information part. The second part is E-learning knowledge part. The third part is about E-learning perception and the fourth part is about student's' M-learning knowledge. Finally the fifth part is about M-learning perception.

6. Discussion

This research study discusses in details the student's knowledge and ability to move from D-learning and E-learning into M-learning by empirically study and evaluate the students level of knowledge about different learning processes and facilities. The following sections cover the discussion parts:

- M-learning knowledge

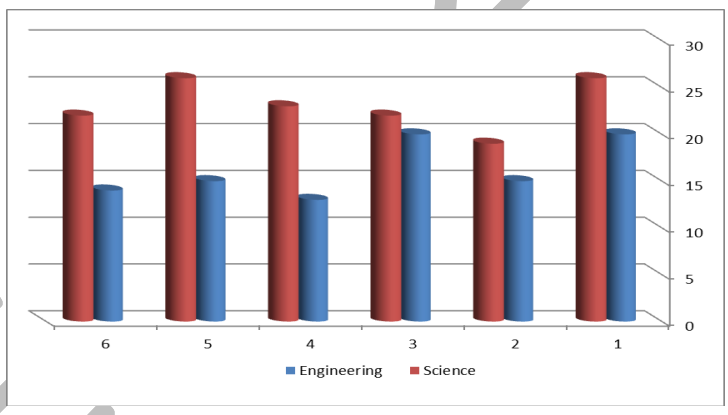


Fig. 3. M-learning Knowledge Students Response

As indicated in Figure 3 that, number 1 indicates the use of mobile device to access internet, 2 indicates the students ability to download mobile applications, 3 indicates the use mobile devices to send and receive emails, 4 reflects the use mobile device to translate sentences. 5 indicates the use of mobile devices to search word meaning and 6 the use of mobile device to access social networks. The majority of responded students use different mobile tools to access the Internet in different purposes. Moreover, 42 students claimed that they use different mobile tools for sending and receiving emails. However, a small number of engineering students answered that they use their mobile devices as translator tool to translate words and search for their meanings on the Internet. In addition to that, only 15 engineering students responded that they can download the needed mobile applications. In fact, in the all options of M-learning knowledge science students are much better than engineering students.

- M-learning perception

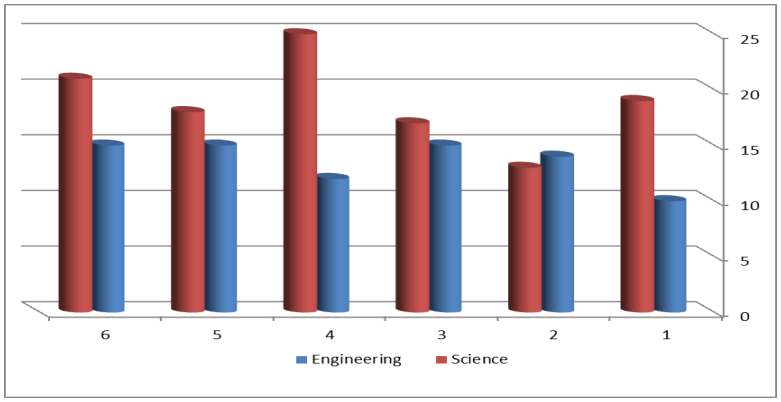

Fig. 4 M-learning Perception . Students Response

As shown in Figure 4 that, number 1 represents the students ability to text friends or classmates during class. number 2 indicates the students participation in discussion forums, 3 is the use of mobile devices to read an article or submit an assignment, 4 represents the use of mobile devices to take photos or record videos of the class slides or whiteboard, 5 indicate the student ability to access university LMS using mobile device and 6 represents the use of mobile devices to write note and set alarm as an assignment reminder. Whereas, more than 30 out of 56 students can read an article and submit their assignment using mobile device as learning tool, use mobile device to photograph or record their class presentation slides, Accessing the university learning management system using their mobile device and set alarm or write note as an assignment reminder on their mobile devices. However, less than 30 students were agree that they use their mobile devices to text a friend during class and participate in discussion forums.

7. Conclusion and future work

From this 6 months research study it can be concluded that M-learning can be used to solve the T-learning issues and difficulties and both learners or students and instructors or staff members require a proper M-learning system to facilitate and improve their learning process. The M-learning different mechanisms are not designed to replace T-learning different approaches but M-learning mechanisms can be used to overcome the limitations in the learning process of different learning providers. Although most of the participated students are interesting and familiar with the use of M-learning. The participators were claiming that the study policy of the higher education providers should encourage different M-learning intuitive to provide more interactive and flexible learning process. For future research, more empirical in depth research study needs to be conducted in all aspects of M-learning in Oman. The initial results of this M-learning research study encourage the researchers for more comprehensive study about the acceptance and adoption of M-learning including students from different departments, colleges and universities.

New concept in e-learning materials based on practical projects

"Eduard Müller, Miroslav Grach, Jitka Bezděková" 74
"Univerzitni 22, 306 14 Pilsen, Czech Republic"

Abstract

The paper focuses on the application of new e-learning materials at the University of West Bohemia in Pilsen at the Faculty of Mechanical Engineering in the Department of Machine Design. These study materials are based on projects which were previously applied in practice and thus help students to master and become familiar with engineering issues from a practical viewpoint. E-learning materials are written in a structured and unified form in this sequence: introduction, active two-colour 3D models coloured according to function and machining technology, and overall drawing documentation.

Keywords: e-learning materials; 3DPDF, CAD models, Machine design

1. Introduction

The number of students graduating in engineering field has been declining in the Czech Republic for the last two decades. It has resulted in the insufficient number of engineering graduates in the labour market of the industrial branch in the Czech Republic.

Although industry is generally satisfied with the current quality of graduate engineers it regards the ability to apply theoretical knowledge to real industrial problems as the single most desirable attribute in new recruits (The Royal Academy of Engineering, 2007). Nowadays the employer has high demand of fresh graduates. He requires language knowledge, technical expertise and basic knowledge of CAD programs. Most of students deal only with the theory at school and they are not able to use their knowledge in practise at their first job so the employer has to spend considerable financial and time resources on the training of the new staff. This situation can cause financial problems to small and medium-sized companies and influence their competitiveness, too. Many authors have discussed how changes in the professional context of engineering have influenced demands of engineers and engineering education (Male, 2010). This problem is also described in the article (Vavrečková, 2009), which deals with the problem of educated specialists and their economic impact on the development of the state and describes the transition of developed countries into "The economy of knowledge type." (Vavrečková, 2009).

E-mail address: emuller@kks.zcu.cz

IETC 2014

For the future it is necessary to keep and deepen relationship between universities and industrial companies. This cooperation cannot be ignored, even if this activity is time-consuming and financially demanding in the short perspective of time and do not show benefits to both parties immediately. Managers see the greatest benefit of cooperation with universities as contact with potential employees (Bodmer, C., Leu, A., Mira, L. and Rütter, H., 2002). In the case of inactivity of mutual cooperation, the number of students involved in the practical projects could be reduced and students would not be able to gain valuable experience for their future practice. This issue is highlighted by the authors of the article „A makeover for engineering education"(Wulf, Fisher, 2002).

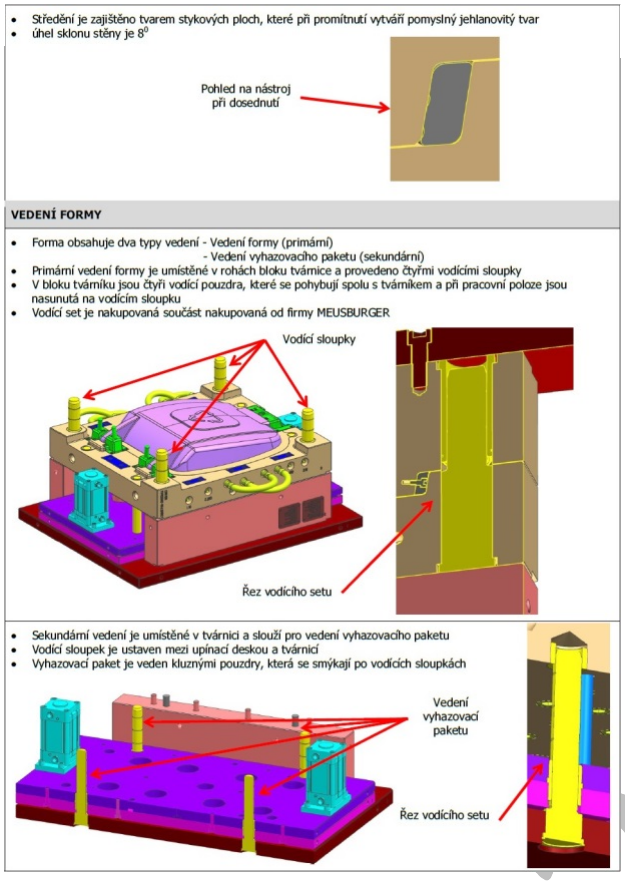
Working on real projects allows students to explore issues arising from practice. This increases the quality of graduates and their employability. The literature (Gibarti, 2006) talks about „Investice do lidského kapitálu jsou investice do vědy a vzdělání".

Over the last ten years the automotive industry has been on the increase in the Czech Republic. It caused the higher demand of the people with the machinery education especially those focused on the transportation technology. Many subcontractors, who produce a wide range of components for cars are dependent on the automotive industry. One of these branches is the manufacture and design of plastic injection moulds. Injection moulds produce decor, carrier, insulation and trim parts. It is a very extensive and sophisticated range of design and graduates have lack of experience in the issue. Based on the demand of graduates with broader experience which is still increasing at our Department of Machine design we decided to create a database of complex projects from the practice dealing with the design of injection moulds. It will help to improve the quality of teaching, which would systematically increase the level of practical knowledge of graduates at University of West Bohemia in Pilsen at Faculty of Mechanical Engineering, the Department of Machine design. The projects from the database will serve for studying and solving similar projects within Semester, Bachelor or Master Theses. This paper presents the new e-learning materials dealing with the design of injection moulds.

2. Description of the structure the study materials

For the new study materials the tool which is used for the production of the lid of the bin has been chosen as the example. This sample includes the description of the injection mould and its function. Next it describes the General Safety Rules with service, draft direction, 3D models in PDF format, drawings and datasheets of the produced components.

IETC 2014



2.1 Information of mould and general safety rules with service

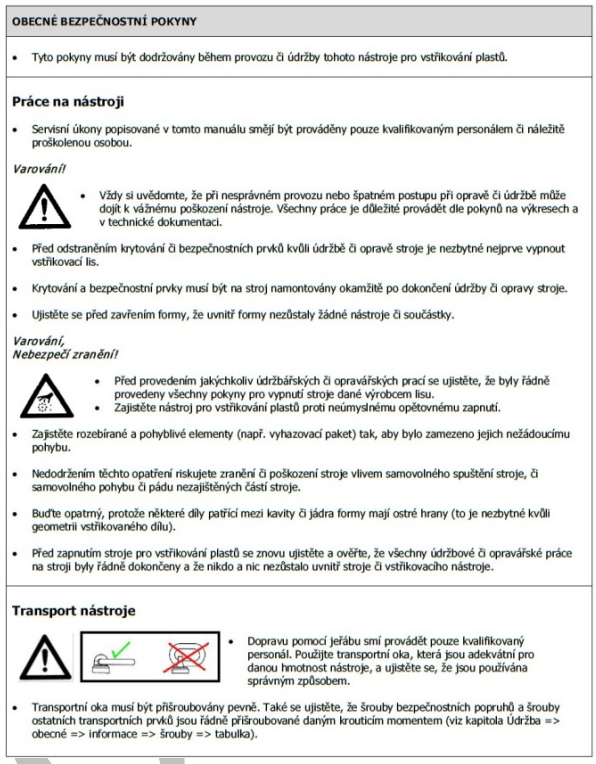
There has been a great emphasis on the logical order of the individual chapters. The first chapter begins with the basic description of the mould. The next chapters describe in details main components of assembly and subassembly. The upper part of Figure 1 (a) shows the main guide of the mould including the guide pillars, guide bushes and its function. This part is for better illustration provided with the picture where the guide pillars are marked with the red arrow. For better understanding one part of the machine has been shown in the working position where there is possible to see the whole guiding set. At the bottom part the leading of the guiding ejection system is described. The structure of the description is similar.

The picture (b) shows another part of the e-learning materials where General Safety Rules are listed. In case of the machine operation or shutdown the operator has to follow these rules. It contains the rules during the manipulation with lubricants or disassembly and transportation of the mould. This part also includes general maintenance of injection machine and its each component.

IETC 2014

a

b



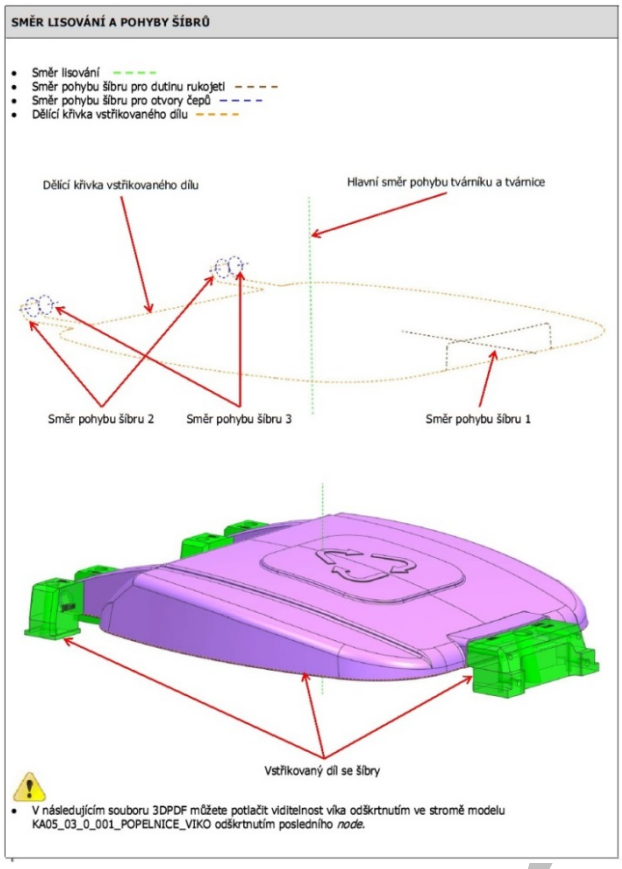


Fig. 15 (a) Description of mould (b) Safety rules

2.2 *Draft direction*

The next part of the study material deals with the draft direction and so called reference curve of the moulded part. It Is the first step when the design of the injection mould is made. First students become familiar with the different movements of the components that occur during the production process. Using pictures and simple explanations students can view what direction the components will move. In Figure 3 picture (a) you can see the main draft mould and moving of slides which allow the production of any undercuts. The main part is so called reference curve, which divides moulded part into the stationary and movable mould. For better illustration each trajectory is marked by different colours and arrows. The picture (b) allows viewing of the draft direction at interactive 3D Pdf file (see next chapter) view where each component is possible to see and suppressed. Students can also analyse all the components at various perspectives and distances

IETC 2014

a

b

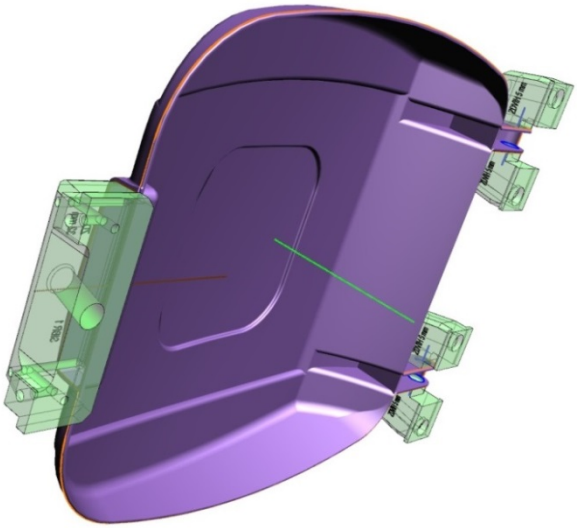

Fig. 16 (a) Description of draft direction, reference curve and slides move (b) 3D Pdf

2.3 CAD models

CAD models, which are the basis of the whole project, are a great source of knowledge for students of machine design. CAD models are created in various CAD programs for example Catia, Pro-Engineer, Siemens NX etc. It is not possible for students to own these softwares which are very expensive. For this reason all data from various CAD programs have been converted into 3D Pdf file. The biggest advantage is the ability to view the learning materials in PCs, laptops, tablets, etc. The only condition is to have software which is able to read Pdf files. It allows the program called Adobe reader, which is available with a freeware license.

In this file, students can interactively browse the selected parts based on the tools. CAD models are possible to turn around, zoom in, zoom out, create Sections and the parts can be suppressed or activated. Viewing the interactive CAD models at Pdf file is better than using the drawings because it is more effective and faster for the orientation. Especially beginner students who have little experience can get better overview of the study tools compared to problems they could have with the orientation of drawings.

IETC 20-

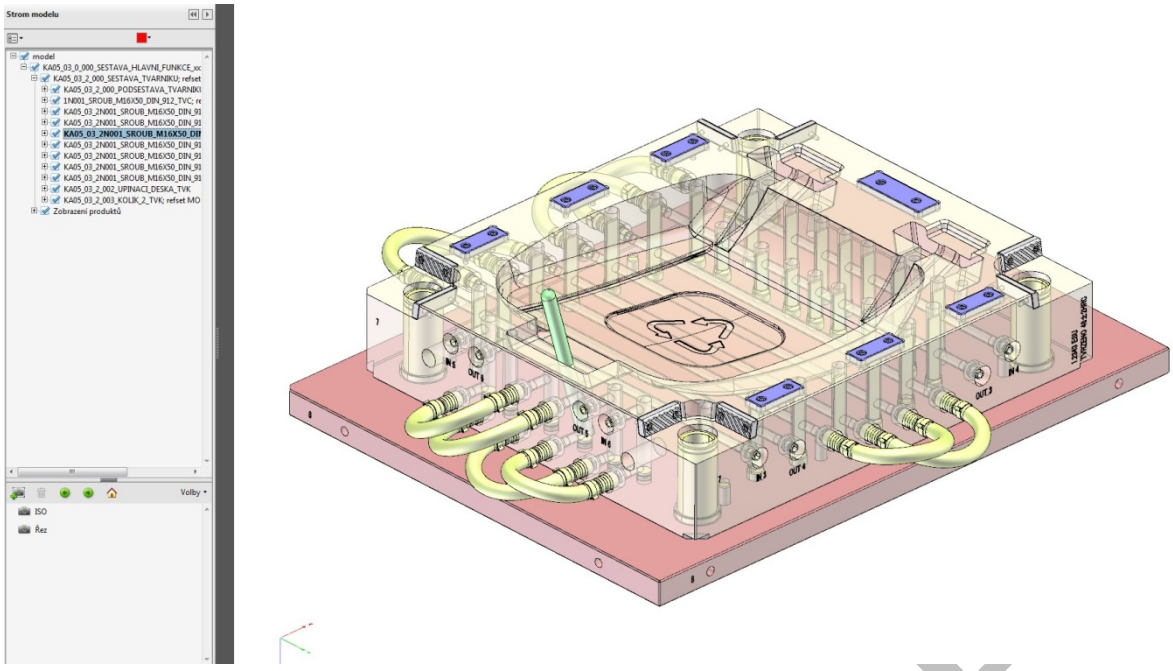

Fig. 17 Active subassembly in 3D Pdf file

2.4 *Colours of CAD models,*

CAD models are divided by colours into two groups. The first group is coloured according to the methods of the function parts and the second one according to the technology of manufacturing. The benefit is the simplified and faster detection of the function of each part. The first defined range of colours indicates the parts with the same function for example transporting, stopping or measuring elements. The second range of colours identifies the manufacturing technology. Each face is assigned by the colour that corresponds to the manufacturing technology for example drilling, milling, or cutting the parts etc.

Figure 4 shows the colours of the parts according to the machining technology. On the left side the technological operations on each part are described. In the right part of the figure the table with the labelled legends is illustrated. The table is divided into four columns. The first column displays the list of colours used in the work. The middle column defines colours according to the RGB colour model. The third column describes the function of the given colours. Thus students are able to recognize the manufacturing technology of the face or produced parts quickly and easy.

IETC 2014

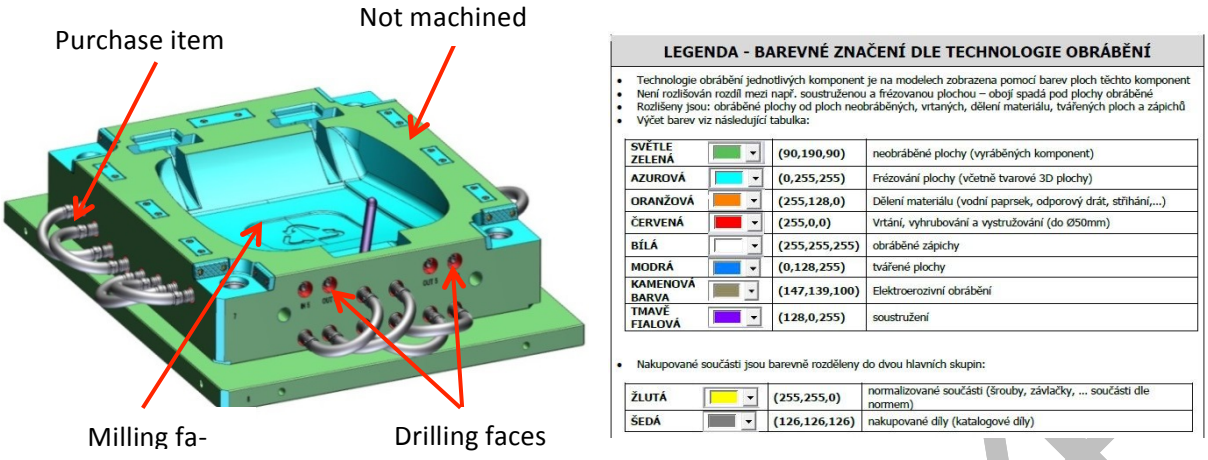

Fig. 18 Colour legend of the manufacturing technology

3. Contribution to students and academics

The main benefit of these new e-learning materials is the teaching innovation at FME at UWB. The e-learning materials provide the know-how of injection machine design and help to improve the quality of teaching. The main part of the study material is CAD models which help students to understand the problems of the study field faster and easier. Students can explore each CAD model in terms of relationships, its parts and technological operations. Thus students can use the e-learning materials for S emester, Bachelor and Diploma Theses.

Technical specifications of each design project can be easily modified. Students can explore the original design of a project and make modifications according to the new instructions. Then they create their own projects and designs and gain new experience in the field. Their designs approximate to real engineering projects in the practice.

The new e-learning materials will serve as a database of real design projects that will be available to all students and academics at FME at UWB. These design projects can be used in the framework of the teaching subjects. The teaching subjects will be enriched by the valuable know-how and academics will be able to explain the theoretical foundations on the projects in practice. Therefore they will be able to provide students with the importance and sense of the stated information.

4. Conclusion

IETC 2014

This article is focused on the new concept of e-learning materials that deal with the design of plastic injection moulds. These e-learning materials have been designed to help students to become familiar with common design issues. Students will gain valuable design experience during their studies, because the materials are based on real projects solved in practice. Especially they are drawings and designs of injection moulds. This way Faculty of Mechanical Engineering at UWB upgrades and expands the database of the study materials. These new e-learning materials are gradually introduced into individual subjects. The main goal of this article is to present this new concept. The study materials are made in the form of structured Pdf that contains basic information about injection moulds with CAD models, General Safety Rules, service and complete drawings. CAD models based on the specific formats of CAD software had to be converted into 3D Pdf file. This format allows students to browse the data without the installed CAD software where the mould was created. The file Pdf is readable with Adobe reader which is freeware for most PCs, tablets, smartphones etc.

These study materials will be included into the system of the quality teaching at the UWB. We are convinced that these study materials will be helpful for students and bring up more competent and capable engineers, who have their first contact with the practice during the period of their studies, and not until after the access to employment.

Nigerian Undergraduate Students' Attitude to the Use and Integration of Interactive Whiteboard for Instruction

Peter Ayoola AJELABI, Ph.D
ayoajelabi@yahoo.com

Faculty of Education, Northwest University, Kano, Nigeria

Abstract

In most advanced countries classrooms, the interactive whiteboards have replaced the traditional whiteboards. However, the developing nations' classrooms across all levels are also catching up with this trend.

This study investigated undergraduate students' attitude to the use and integration of interactive whiteboard for teaching and learning , after a thirteen weeks exposure to a 200 level faculty based compulsory, two-unit course. One hundred and ninety nine (199) out of three hundred and twenty two (322) students who registered for the course at Northwest University, Kano, Nigeria were randomly selected for the study. In addition, two null hypotheses were formulated and tested for this study.The findings showed that there was no significant difference in male and female students' attitude, while a statistically significant difference was recorded for those that are young and the elderly. Young students developed more favourable positive attitude to the use and integration of interactive whiteboard for learning. Recommendations were made accordingly based on the findings.

Keywords: Attitude, Integration, interactive whiteboard, instruction

Introduction

"Necessity is the mother of invention". This maxim explains the dynamics of change in every area of life , including education. The globe is experiencing the advancement of technology, and its application in all spheres of life. Technology has made the whole world to be a global village.

Jukes (2008) pointed out that right from the early 1990s to early 2000s, the entire globe started experiencing a digital revolution which includes the pervasive use of the internet, cell phones , e-mail, video games and social networking tools. Consequently, the world became technologically super charged until this day.

The field of education, and instruction in particular had been having a great feel of these technologies. Some of the above mentioned technologies were aptly applied into instruction. Also, researches had been conducted , and is still being conducted on the effects of these technologies on teaching and learning. Educationists are greatly concerned on how these technologies could help in improving the teaching-learning process across the various levels of the educational system.

The problem

IETC 2014

In the higher institutions of learning, the lecture method is probably the oldest, well known and widely used method of imparting knowledge. The lecturer dominates the exercise with or without the learners' involvement (Ajelabi,2005). This method makes teaching to be teacher centred .As a result, students are usually passive, bored and probably, not motivated to learn. Students' commitment to learning is doubtful. Interactions with lecturer and peers are minimal. At times, these disengaged learners exhibit off task behaviours such as distracting other students, playing with their mobile phones, i-pads, tablets or even chatting with their peers. Consequently, this affects their attitude to learning, and this in turn automatically affects their academic achievement**.**

Need for the study

Since it has been discovered that lecturing makes students passive learners, and not engaged for a meaningful learning, there is a need to examine how we can modify the lecture method in higher institutions of learning with the application of modern technological devices, using the interactive board . This study is carried out to investigate how the use of technologies (interactive whiteboard) can help learners in tertiary institutions engage in a classroom lesson, receive significant attention ,commitment, as well as interact more with their lecturers, in spite of the teaching methodology, adopted by the lecturer.

There is a need to state at this juncture that though 'the first electronic interactive whiteboard was introduced in America in 1991' (Lopez and Diogo,2011), the higher institutions in Nigeria did not experience its installation into the lecture rooms until about 2005 and beyond. Northwest University in Nigeria commenced teaching activities in 2013 , and the lecture rooms were fitted with the interactive whiteboards same year, but ,they were under utilised. Since the researcher is trained on, and efficient with its utilisation , it was deemed fit to use it effectively in the delivery of a course during the semester.

This study therefore is carried out to examine the attitude of the students to the use and integration of the interactive whiteboard for teaching and learning at the end of a course of study.

Literature Review

Smart Technologies (2003) refers to interactive white boards or smart boards as 'a brand of interactive white boards (IWB) that displays image(s) from the computer monitor with the surface operating as a giant touch screen....and can be mobile or wall mounted.' For its operation, one may decide to control the computer from the board or, by touching the interactive board screen either directly with the finger or one of the incorporated electronic pens.

The interactive board performs a range of tasks much more than the chalkboard. The teacher can 'write on the interactive white board's large touch-sensitive surface with the electronic pen, drag and drop images or text, interact in many ways such as pressing icons to hear pre-recorded sounds ... engage with multi-media educational activities , watch simulations and view graphics , capture texts or areas of screen and annotate with the pen as well as save notes, drawings or annotations for future use' (Smart Technologies, 2004).

IETC 2014

Various individuals and groups in some advanced countries had carried out some researches on the application of the interactive white board for instruction. There is a need to mention that most of the researches were basically concerned with the utilisation of the equipment in teaching kindergarten, elementary and secondary school pupils. In addition, most of these works were interested in achievement , and not the attitude of learners to the technology. Also, there is a limited research carried out with the adult learners serving as subjects.

Oleksiw (2007) studied the effects of the introduction of an Interactive whiteboard on raising State test scores by enhancing motivation, attentiveness and comprehension in a grade three mathematics class. His findings were that there was statistically significant interactions between whiteboard use and grade levels. Also, the interactive board proved to be an effective tool that amplified motivation, stimulation and understanding in mathematics. Research on the use of interactive board is also extended to students with special needs. Zirkle (2003) carried out a study on the effects of the smartboard on high school students with special needs in a functional mathematics class. His key finding was that the interactive whiteboard was a positive tool for assisting in the maths achievement of special needs students in a functional math class.

Furthermore, Min and Siegel (2011) reported a study exploring the influence of interactive whiteboard on students engagement and perception of classroom activities. Students perception were measured via questionnaire. Observation results revealed that effective teaching without technology, can promote above average levels of students engagement.

Hypotheseses

Two null hypotheses were postulated for this study:

(a)There will be no statistical significant difference in the attitude of male and female students on the use and integration of the interactive whiteboard for instruction

(b) There will be no statistical significant difference in the attitude of the young and the elderly students on the use and integration of the interactive whiteboard for instruction.

Research Methodology

Subject

IETC 2014

This study was conducted in Northwest University, Kano. It is one of the newly established state owned universities in Northern part of Nigeria. The students' population was made up mostly of Northerners (North west geo-political zone) , and few from other parts of the country. All the level 200 students with a total population of three hundred and twenty two (174 males and 148 females) with ages ranging between seventeen and forty five years constituted the study. Out of this number, a total of one hundred and ninety nine students (110 males and 89 females) whose age range between eighteen and forty two , and, who enrolled for the 2-unit, level 200 compulsory faculty course titled Media and Methods constituted the sample for the study .The subjects were randomly selected.

Instrument

The major instrument constructed by the researcher, and which was used in this study for data collection was a questionnaire titled 'Students Attitude Towards the Use of Interactive whiteboard for Learning (SATIWB)' scale .It is made up of an 18- item likert type attitude questionnaire which varies from strongly agree to strongly disagree. Nine of the items connote positive attitudes, while the rest connote negative attitudes towards the use of the interactive board for learning the course EDU 2202 : Media and methods. The instrument was content validated. The reliability co-efficient was found to be 0.86.

Procedure

Prior to the resumption for the 2013/2014 academic session, the researcher organised a one-day intensive training on the use of the interactive whiteboard for all the thirty two academic members of staff. Furthermore, when it was few days to the commencement of lectures, the researcher met with four junior academic members of staff (who I do mentor) and carried out further intensive training on the use of the interactive whiteboard. After this training, the course outline of EDU212 was discussed with the rest of the team. All of them were briefed on the methodology of lesson delivery. The method adopted was basically learner-centered (a total departure from the conventional method, which was lecturing) .

The students were taught the course named above for a period of 13 weeks. The researcher and four other lecturers always meet few days before the week's lecture to harmonise the lesson delivery. Thereafter, the students were met once in a week for two hours interaction. The 322 students (average of 65 in a class) were distributed into five groups, with each lecturer rotated to teach across the groups. This was done in consideration of the mode of lesson delivery. The lectures were presented via the interactive white board, and the students were kept busy with different and varying activities, based on the content of each lesson. Some of the activities included quizzes, writing and/or typing of answers on the board,selecting pictures, drawings etc from the gallery, searching into lesson activity toolkit for enhancement of lessons, solving problems , watching videos and discussing them etc.

At the end of the 13- week lectures, the questionnaire was personally administered to the randomly selected subjects by the researcher with support from two members of the team.

IETC 2014

Results

The results regarding the first hypothesis which states that 'there will be no statistical significant difference in the attitude of male and female students on the use and integration of the interactive whiteboard for instruction', showed that there was no significant difference as shown in table 1

Table 1 : Means, Standard deviation and t-test analysis on male and female students' attitude on the use of interactive whiteboard for instruction

Students	N	X	S.D	T - value
Male	110	60	1.3	1.23
Female	89	59.4	1.5	

Df = 197 , t-calculated = 1.23 t critical at 0.05= 1.66

Since t calculated (1.23) is less than the t critical score (1.66) i.e 1.23< 1.66 , we conclude that there is no significant difference. Hence, the first null hypothesis is accepted.

Regarding the second null hypothesis which states that "there will be no statistical significant difference in the attitude of the young and the elderly students on the use and integration of the interactive whiteboard for instruction ", the results showed that a significant difference was recorded as shown in table 2.

Table 2 : Means, Standard deviation and t-test analysis on young and elderly students' attitude on the use of interactive whiteboard for instruction.

Students	N	X	S.D	T – value
Young	119	63.4	2.14	7.32
Elderly	80	52.1	2.06	

Df = 197 , t-calculated = 7.32 t critical at 0.05= 1.66

Since t- calculated (7.32) is greater than t-critical (1.66), it shows that there is a significant difference . Therefore, null hypothesis 2 is rejected.

Discussion

From the findings, we can see that there was no significant difference in the attitude of male and female students to the use of the interactive whiteboard for learning. This was revealed in table 1. The students developed lots of interest in using the interactive whiteboard for learning. They were quite happy to learn this course with the use of the interactive whiteboard. This was because during their first year of study, they were taught all courses by different lecturers who adopted lecture method, without the use of any form of technology. Also, this method of learning is rarely implemented in any of the courses that they were exposed to, even at level 200. The researcher observed that the students were always excited during lessons, and always look forward to subsequent classes. Consequently, 98% of the students responded positively to the item seeking their response on "I would like to receive all my lectures from lecturers who makes effective use of the interactive whiteboard". Another factor which must have made them to develop favourable attitude was the fact that they were always busy with different activities, interacted with

IETC 2014

the lecturer and their peers as well as the advantage of having opportunities to air their views and opinions on the topic being taught. This supported the view of Preston and Mowbray (2008) who said that the interactive board provides teachers and students with a whole new interactive learning environment to share ideas, information, images, animation and videos.

On the other hand, table 2 revealed a statistical significant difference in the attitude of the young and the elderly in the use of interactive whiteboard for learning. The younger students (18 – 29 years) showed more favourable positive attitude to learning via the use of the interactive whiteboard more than the elderly (30 – 42years). What must have been responsible for this? One of the main reasons responsible for this is that some elderly students have phobia for technologies , and are finding it difficult to embrace a technological revolution change. Also, few of this elderly students are teaching in primary schools, and they are used to utilising the chalkboard. In addition, some of them are just learning how to effectively use other modern technologies like the i-pad, i-phone, laptops and other gadgets. The researcher did observe that whenever few of these elderly students are called upon to come and do one activity or the other on the interactive whiteboard, they were always reluctant to do so. As a result, the researcher had to motivate and give them more support in this area. The younger ones exhibited a more positive attitude because we can refer to them as "the net generation" which started between early 1990s and 2000s, coinciding with when some of them were born and growing up. Small and Vorgan (2008) refers to them as 'digital natives', and the elderly as 'digital immigrants'. Right from a tender age, the younger ones had integrated technology into various aspects of their lives. Consequently, they tend to process information faster than the elderly.

Conclusion

This study examined the attitude of undergraduate students to the use of interactive whiteboard for instruction. The researcher analytically discuss the perception of the students. From the discussion, one can deduce that the students (male, female, young and elderly) do develop a much favourable positive attitude to learning one of their compulsory faculty based courses with the adoption of the interactive whiteboard.

The above notwithstanding, one needs to point out that this equipment is available in some lecture rooms in Nigeria, but it is not adequately and judiciously utilised based on some of these reasons : inadequate and lack of energy supply, lack of trained manpower to use it , laziness on the part of some lectures to prepare a quality, interactive lesson as well as lack of maintenance. Although, some Universities are yet to purchase it, some that had purchased it had turned them to whiteboard where they write on it, using permanent board markers, thereby destroying the surface.

Recommendations

Since this research had proved that Nigerian undergraduate students are keen on their lecturers utilisation of the interactive whiteboard for instruction , based on the students' favourable attitude, it is hereby recommended that lecturers should adopt the use of interactive whiteboards in the delivery of their lessons. Considering the advantages which are over and above the conventional method of lecturing, it would be of great benefit to our students if all lecturers adopt and incorporate its proper usage, as it would enhance teaching and learning. Probably, it would reduce the rate of failure in most courses.

IETC 2014

There is a need for change in the method of instruction , thereby breaking the monotony of lesson delivery. Since the students had indicated their willingness and interest to learn through the use of interactive whiteboard, lecturers and administrators should help to bring out the potentials in our students so as to fully maximise today's technologies

Ninth Grade Student' Self-assessment in Science: A Rasch Analysis Approach

Wen-Wei CHIANG75

[*] *Graduate Institute of Science Education and Environmental Education, National Kaohsiung Normal University, No.62, Shenzhong Rd., Yanchao Dist., Kaohsiung City 82444, Taiwan (R.O.C.)*

Abstract

Based on the competency indicators of the nine-year compulsory curriculum in Taiwan, this study constructed a self-assessment scale suitable for use by junior high school students to evaluate their comprehension of science-related concepts. Using random strata sampling this study surveyed ninth grade students in Taiwan in 2012. A total of 1,326 questionnaires were distributed and 1,005 valid questionnaires were recovered. The Rasch model was employed to study the self-assessment results and analyze difficulties in learning science-related concepts as well as discrimination, reliability, validity, suitability, and data error detection. The three conclusions of this study are as follows: 1) Diagnostic tests for teaching evaluation should be based on Rasch measurement results. 2) A structure for diagnosing the item response of students should be constructed to replace conventional test analysis and to build a framework for diagnosing the response of students to test items. 3) The actual capabilities of students must be considered in the development and selection of teaching activities.

Keywords: self-assessment; Rasch; science concepts

IETC 2014

1. Introduction

Many nations have introduced successful educational reform programs in response to the tide of globalized education reforms and the demands of social and cultural change. The success of implementing new curriculum is strongly influenced by how schoolteachers explain and interpret these concepts (DeBoer, 2011). Previous experience in curriculum reform, such as the standards-based curriculum launched by the U.S, the attainment targets in the UK, the key competencies promoted in Australia, and the achievement objectives in New Zealand, has shown that competencies or standards that have not been examined and reviewed cannot be understood or identified by schoolteachers, much less implemented within a teaching environment (Burgess & Lowe, 2002; Petrosky & Delandshere, 2001). In Taiwan, the development of science curricula has largely been modeled after the experience of western nations, which emphasize a student-focused approach and an understanding of the nature of science (Tang, 2003). Since the "Nine-Year Compulsory Curriculum Outline" was published in 1998 by the Ministry of Education and implemented in 2001, the science curriculum has undergone multiple reforms. Currently, this reform process is set to enter its 12th year. This study examines whether the concept of reforming science education has been truly implemented in science instruction.

Many countries use transnational assessment tests such as Trends for International Mathematics and Science Study (TIMSS) and The Program for International Student Assessment (PISA) to understand the competitiveness of their populace (Chiu & Duit, 2011). Modern test theory has replaced classic test theory (CTT) with regard to the items on these tests. Item response theory (IRT) operates in accordance with the reaction of test takers to questions and has the characteristics of sample and item independence. IRT employs the maximum probability method and the Bayesian method to estimate parameters for test takers or test items to obtain the logit score (Wright & Linacrc, 1992). Rasch analysis is a type of one-

* Corresponding author. Tel.: +886930891031
E-mail address: STEM2061@gmail.com

parameter IRT logistic model that converts ordinal data into interval data to resolve sample dependence and non-equidistance limitations encountered in CTT (Rasch, 1960). Each latent trait is estimated using the linear probability relationship between test-taker competency and item difficulty for each item. From the distribution graph of test takers and test item coordinates on the same continuous band, any response abnormalities are analyzed using the distance relationships between test takers and test items (Fischer, 1987). The Rasch model represents the difficulty of IRT in an objective and equidistant manner. It is capable of proving content validity, structural validity, generalized validity, essential validity, interpretive validity and external validity. The Rasch model can also be used to replace the factor analysis of CTT and test for unidimensionality in the test paper. Because it is an equidistant and objective assessment, the Rasch model can improve on the insufficiencies of CTT (Rasch, 1960), such that testing truly fulfills the functions of scientific prediction and inference. The data provided by Rasch analysis on the response pattern of test takers can confirm whether the test takers are the optimal target population and assist in building an item bank and developing computerized adaptive testing.

Research on self-assessment scales has flourished with the autonomy and interactivity of learners emphasized in student-centered learning (Ross & Starling, 2005). The more closely self-assessment scales match teaching objectives, teaching materials and test content, the more effectively the scale results can predict the learning situation of students. Research has shown that by teaching students how to accurately conduct self-assessment and understand its purpose in the educational environment, teachers can enhance consistency between self-assessment and teacher assessment (Ross, Rolheiser, & Hogaboam-Gray, 1999; Sung, Chang, Chiou, & Hou, 2005). With regard to the differences between teacher assessment and student self-assessment, teachers can gain an understanding of the needs of students through dialogue in order to design suitable classroom activities.

This study explored the challenges encountered in the macroscopic context of globalized science curriculum reform. Conducting a questionnaire survey, we employed the Rasch model to analyze the learning situation of junior high school students with regard to scientific concepts and employed data processing to identify basic shared concepts.

2. Literature Review

2.1. International comparison of educational testing

The understanding of scientific concepts is extremely important to the learning of science. Since the 1970's, western countries have been conducting studies on the learning and understanding of specific science-related concepts. Since 1980, identifying the science-related concepts that students understand and determining how students comprehend scientific phenomena has become an important area in science education research. This work promoted a better understanding of how students learn and deeply influenced the progress of science education.

The most representative international science education tests are TIMSS and PISA. The TIMSS was first conducted in 1970 with a total of 19 participating nations. By the time the second TIMSS was proposed in 1980, the number of participating nations had increased to 24. In 1990 the International Association for the Evaluation of Education Achievement, (IEA) launched the third TIMSS with more than 40 participating nations (NTNU, 2013). Taiwan applied to join the IEA in 1992 and participated in the TIMSS REPEAT (TIMSS-R) launched by the IEA in 1999. The survey subjects were 8th grader students (13 year old age group). A total of 38 nations participated in TIMSS-R. In view of the emphasis placed on math and science education as well as the learning achievements of students, TIMSS was changed to an international test conducted once every four years. The subjects of TIMSS 2003, which surveyed knowledge, application, and inference with regard to math and science, comprised 4th grade students and 8th grade students. To expand the above cognitive domain, TIMSS 2007 integrated additional key content areas. The content of 4th grade science includes life sciences, natural sciences, and earth sciences, while 8th grade science comprises biology, chemistry, physics, and earth sciences.

Hosted by the Organization for Economic Cooperation and Development (OECD), PISA is a global student assessment program that compares the learning effectiveness of 15 year olds in relation to life skills and knowledge, analyzes the effectiveness of education in each nation, and defines national literacy from these results. The program also examines how school structure influences educational quality and equality, explores educational equality through variation ratios that can be explained through socioeconomic factors, and analyzes whether educational opportunities are equal and whether educational quality is consistent between public and private schools, urban and rural areas, and different ethnic groups. The design of PISA items focuses on application and situational mimicry rather than being restricted to curriculum content. Students taking the assessment must first comprehend the information and actively use their ability to process, evaluate and contemplate data in the formation of answers to the problem scenarios. The central point of the assessment is determining whether young people can apply the knowledge and skills they have acquired to real world problems, rather than simply mastering the school curriculum. The assessment covers the degree of competency in reading, math, and science. Conducted once every three years, the international assessment combines innovative literacy concepts with the principle of lifelong learning focusing on the key knowledge and skills required in adult life. The assessment outcomes provide food for thought as well as a basis for evaluating and monitoring performance in education sectors worldwide. Each assessment primarily tests one academic discipline, while conducting supplementary testing of two other disciplines. For example, in 2006, science was the main subject tested, supplemented by reading and math. In 2009, reading was the main subject tested, supplemented by science and math.

In 2001, Taiwan implemented the nine-year compulsory curriculum, and in 2002 hosted the first national science education conference. The conference concluded by emphasizing the goals of properly instructing each student, promoting lifelong learning, and achieving a consensus on popular science education. To provide more systemized information about science learning, the National Science Council of Taiwan has sponsored a task-oriented integrated research project, which commenced in 2000 and is conducted by a group of researchers in science education. The long term objectives are to enable the systemic research of student understanding of key science-related concepts, identify the factors that influence misconceptions, and develop teaching strategies to promote better understanding of science-related concepts. The study conducted cross-sectional sampling of 6^{th}, 8^{th}, 9^{th} and 11^{th} grader students with the aim of determining how well students comprehend concepts related to physics, chemistry, and biology. The research concepts related to physics include motion, force, torque, heat, light, sound, atmospheric pressure, earth movement, magnetism, and electricity. The concepts related to biology include taxonomy, reproduction, ecology, animals and plants, respiration, plant growth, evolution, genes, the nervous system, and the use of microscopes. The concepts related to chemistry include current, electrons, redox reaction, particle models, chemical equilibrium, acidity and alkalinity, classification of chemical elements, materials science, and organic compounds. The science education research team worked together through group meetings, workshops, discussions, and reports. Using concept maps and propositional statements, researchers sought to determine (through interviews) how well students comprehend science-related concepts. The alternative conceptions of students were compiled through interviews and these results were used to develop a two-stage diagnostic test. The first stage was designed to test the real knowledge of students, while the second stage confirmed the interpretation and reasoning of students. Test questions were developed from the pilot experimental results of each sub-study and the results were used to analyze and select the items more suitable for investigating the misconceptions of students (Treagust, 1988). Subsequently 10-15 questions were selected for each subject and further examined, discussed and filtered by domain experts. After pre-testing, analysis and modification, questions of higher quality were produced as a written test. From 2000 to 2004 the two-stage diagnostic test was used to assess the alternative conceptions of students. This not only provided science teachers with a reference for the improvement of teaching practices and the preparation of textbooks, but also served as an important foundation for research on science education.

2.2. Test theory

The development of classic test theory (CTT) has allowed psychological testing to more closely approach scientific assessment. Classic test theory is used to establish norms through stringent, standard-

ized control of test procedures, to eliminate subjectivity from psychological testing. This has contributed immensely to preserving the scientific basis of social sciences (Andersen, 1995).

The theoretical basis of the IRT (Item Response Theory) model assumes that the ability to be tested is a fixed potential property θ, therefore the ability of the nth test-taker is θ_n. Each item designed in the test must also be provided an objectively standardized difficulty, and the difficulty of item i is assumed to be b_i. The overall performance of test takers in this test has a fixed upper level d, which reflects the upper limit of the score obtainable by test takers. This variable can also be interpreted as the percentage of the total test score accounted for by the maximum score obtained after deducting for careless mistakes. There is also an upper level limit for the overall performance of test takers c, a value which reflects the lower limit of the score obtainable by test takers. This can also be seen the percentage as the total test score accounted for by the minimum test score obtainable from making correct guesses (Custer, Omar, & Pomplun, 2006). In this model, a_i is the discrimination level of the ith item, used to demonstrate the cumulative probability gap between different test items. Based on the theoretical assumptions described above, the theoretical model of CTT can be expressed as follows:

$$\boldsymbol{P}(\theta_{ni}) = c + \frac{d - c}{1 + e^{-a_i(\theta - b_i)}}$$

where the probability that the nth student answers the ith item correctly is $\boldsymbol{P}(\theta_{ni})$，. In addition to being affected by test-taker ability θ_n and item difficulty b_i, this probability value is also influenced by item discrimination a_i and the upper limit d and lower limit c of ability. The IRT is widely used in competency tests and computer adaptability tests. However, because the model explores a range of factors, most educational or psychological assessments employ a simplified IRT model, of which the Rasch model is the most popular. Danish mathematician G. Rasch (1901-1980) proposed a new measurement model to solve the issue of whether the original scores are intervals and whether they are scientifically objective. Later researchers have used this to build a completely new set of test theories that have lifted psychological testing to a truly scientific level.

By analyzing the item responses of test takers, the Rasch model (1960, 1980) places the estimated values for the ability of test takers and item difficulty into the same interval, represented in units of logit. The parameter of item difficulty is usually standardized to a mean of. In the common two- or three-parameter IRT models, the ability scale of test takers is usually standardized to score scale with a mean of 0 and a standard deviation of 1. Like other IRT models, through shared items the Rasch model can vertically scale the items designed in response to differences in ability among test takers of different ages. Test-taker competency and item difficulty are placed within the same scale which assists in long-term monitoring of the growth of capability.

The Rasch model is suitable for analyzing binary scored data. Logit conversion of test-taker ability （θ）and item difficulty（b）is used to obtain a mathematical formula for win (P) (the probability that the test-taker will answer the item correctly) to solve for the relationship between the two variables. The equation is shown below (Rasch, 1960).

IECT 2014

$$P_{ij} = \frac{e^{(\theta_j - b_i)}}{1 + e^{(\theta_j - b_i)}}$$

where θ_j indicates the ability of test-taker *j*, b_i is the difficulty of item *i*, and P_{ij} is the probability that the test-taker will answer an item correctly. In the Rasch model, all items are required to have a high degree of discrimination（a=1.0）and zero rate of guessing correct answers c= . The most important feature of this model is its strict requirements regarding item characteristics and the response of test takers. If these requirements are met, the computed ability will accurately reflect the actual competency of the test taker.

Regular IRT models are divided according to the different use of parameters, as follows: one-parameter logistic model, two-parameter logistic model, and three-parameter logistic model, as shown in Table 1.

Table 1. Comparison of different parameter models and corresponding mathematical equations

Model	Mathematical equation
One-parameter logistic model	$P_i(\grave{e}) = \frac{e^{D(\theta - b_i)}}{1 + e^{D(\theta - b_i)}}$
Two-parameter logistic model	$P_i(\grave{e}) = \frac{e^{D_{ai}(\theta - b_i)}}{1 + e^{D_{ai}(\theta - b_i)}}$
Three-parameter logistic model	$P_i(\grave{e}) = c_i + (1 - c_i)\frac{e^{D_{ai}(\theta - b_i)}}{1 + e^{D_{ai}(\theta - b_i)}}$

Data source: Hambleton & Swaminathan (1985, p. 49)
Note: In these equations, θ is the estimated potential ability of test takers and P_i（θ）is the probability that test takers with ability θ will correctly answer item *i*.

The properties of the Rasch model in scenarios with a binary scoring format (right or wrong) have been extensively researched. One additional feature of the Rasch model is that testing must be unidirectional. This is how the estimates of test-taker ability and item difficulty can be placed within the same potential property and their relative positions determined. Multi-directional test scores would render the comparison of test scores meaningless and apply the final inferences into question (Smith & Miao, 1994; Wright & Mok, 2004). Essentially, the ability to add and subtract test scores implies that the items are measuring the same entity and satisfies the requirement of unidirectionality. To verify unidirectionality requires the passing of specific tests, which can be accomplished using the Rasch model. The Rasch model also converts ordinal data into interval data, thereby solving the problems of test dependency, sample dependency, and non-interval original scores, which are commonly encountered in CTT. The Rasch model is based on a theory-oriented analysis method capable of examining the structure of test concepts to ensure that it complies with theoretical expectations. This approach should be able to prevent the problem of inconsistency among factors, which plagues exploratory factor analysis.

2.3. Self-assessment

Self-assessment refers to evaluating and determining the quality of one's own performance as well as identifying strengths and weaknesses in order to improve learning results (Klenowski (1995)). Through self-assessment, learners can examine their personal strengths and weaknesses in a particular subject. Based on the objectives, self-assessment can divided as follows: 1)Achievement-oriented self-assessment, in which assessment results are related to selection, identification, achievement, and diagnosis; and 2)Development-oriented self-assessment, which assesses the management of self-learning and the learning process (Bachman, 2000; Oscarson, 1989). Self-assessment is seen as an effective tool to help students gain a better understanding of assessment objectives and indicators (Orsmond, Merry, & Reiling,

IECT 2014

2000), which positively contributes to learning. Self-assessment can also aid students with poor grades to understand the cause of their struggles and reveal the source of their frustration (Taras, 2002). McDonald and Boud (2003) found that in many academic subjects, self-assessment positively influences the learning achievements of students. Evidence from most of the above studies shows that self-assessment can increase the motivation of students to achieve, thereby effectively improve their learning behavior. Nonetheless, the accuracy of self-assessment has often been questioned. Sullivan and Hall (1997) found that nearly 40% of students overestimate their performance, indicating that the subjective judgment of individuals can easily detract from the reliability and validity of self-assessment results. The stability of assessment validity is also influenced by differences in the individuals being assessed. Related studies have found that self-assessment results usually exceed the results of teacher assessment and the consistency of self-peer assessment is usually higher than that of self-teacher assessment (Bergee, 1997; Ross et al., 1999). Boud and Falchikov (1989) found that when self-assessment affects ranking within overall classroom scores, students tend to overestimate their abilities.

This study used the Rasch model in the self-assessment of students with regard to science related concepts. In contrast to CTT, the Rasch model considers both competency and item difficulty when testing comprehension. The Rasch model interprets two main types of outcomes based on the concept of ANOVA; therefore, the value of the competency parameter is unrelated to the value of the difficulty parameter and vice versa. The only area that the two parameters mutually influence is the rate of correct-incorrect answers on the left side of the equation. The above scenario indicates that when the Rasch ability value replaces the original score as the reported score, this value is entirely unrelated to the difficulty value and is not influenced by the test instrument. Put simply, the Rasch approach is an objective form of measurement.

3. Research Method

Taiwanese students in the ninth grade have undergone six years of elementary school and three years of junior high school in order to complete the nine-year compulsory curriculum. In order to understand the learning progress of students, this study used the BILOG-MG computer program to apply the Rasch 2PL model for analysis. This model was used for the self-assessment of ninth grade students with regard to science-related concepts in order to accurately estimate the competency of test takers in science.

The population for the questionnaire survey in this study comprised students currently employed in public junior high schools in the southern part of Taiwan, excluding special education students. Strata sampling was used to select test subjects. Kaohsiung City and Pingtung County were selected in the southern part of Taiwan as the first stratum according to the ratio of students, while the second stratum included schools categorized by size. The number of schools was summed and a fixed ratio was used to determine the number of schools for sampling.

A pilot sample was drawn from public junior high schools on the mainland of Taiwan. Five schools were sampled from ten junior high schools. The schools in the pilot sample were not categorized on the basis of size. Ten questionnaires were distributed in each school and 100 ninth grader students were selected as participants in the pilot test. The population of the official questionnaire survey was ninth grade students in public junior high schools in Taiwan. In accordance with the ratio of school size and number of students in each region, we used random strata sampling to select a total of 145 public junior high schools from which 1,326 students were sampled (approximately 1% of the total population of ninth grade students in Taiwan public junior high schools). The first stratum was based on the number of ninth grade students. Questionnaires were distributed to 1,326 students in 145 public junior high schools. The number of questionnaires recovered was 1,155, making an overall recovery rate of 87%. After eliminating those with incomplete personal data, omissions, and fixed responses, there remained 1,005 valid questionnaires, resulting in an approximate usability rate of 76%.

IETC 2014

4. Results

This study applied IRT to the learning of natural and life sciences, for the purpose of constructing a self-assessment scale capable of evaluating the comprehension of ninth grade students with regard to science-related concepts. Random strata sampling was used to sample ninth grade students in the southern of Taiwan. BILOG-MG computer programming was utilized for estimation and Rasch two-parameter logistic model (2PL) analysis was used to determine how well ninth grade students comprehended science-related concepts.

4.1. Parameter estimation of science concept items

This study used IRT parameter estimation software (BILOG-MG), to test the 219 test items and employed Rasch 2PL to analyze difficulty and discrimination. The first time that this study conducted parameter estimation, we were unable to estimate parameter values for Item 14 ("Is the Milky Way the only galaxy in the universe?"), Item 28 ("An iron cooking pot has become rusty, is this classified as a chemical change?"), Item 33 ("Are all organisms multi-cell?") and Item 42 ("Is the urinary system the only excretory system in the human body?"). This may be due to the low variance in the response patterns among test takers in answering these test questions. This study defined the four items above as unsuitable and re-estimated the results of the remaining 215 items. Based on the results estimated from each item, we conducted wide-ranging discussions on the concepts corresponding to the questions and used descriptive statistics to conduct situational analysis. The analysis results are as follows:

1). The degree of discrimination as estimated from the 215 items ranged between .31 and 2.34 (mean discrimination: 1.27). The mean discrimination level of concepts ranged from .68 to 1.78. Wang (1995) claimed that a regular degree of discrimination ranges from 0 to 2, such that items with a score of .8-1.25 are considered to have good discrimination. Of the questions designed in this study, 67 fell within the range of good discrimination and the remaining 115 had discrimination higher than 1.25. Among the 44 concepts, 16 fell within the range of good discrimination and 24 had levels of discrimination higher than 1.25, indicating that the questionnaire in this study is considered to be highly discriminative (as shown in Table2).

2). The difficulty values estimated for the 215 items ranged between -2.46 and 2.30（mean difficulty value: - .95）. The difficulty value of concepts ranged from -1.87 to - .07, indicating that the test questions designed in this study are moderately easy. The 15 items with higher difficulty are listed in order as follows: "materials", "creativity, design and manufacturing", "life diversity", "information and communications", "organic compounds", "food and biotechnology", "scientific ethics", "combustion, oxidation and reduction of substances", "transport", "reproduction, genetics and evolution", "development and utilization of energy", "conservation and utilization of resources", "relationship between man and nature", "acidity, alkali, salt" and "electrical and mechanical applications". Students performed more poorly on these 15 concepts, compared to other concepts.

Table 2. Overview of difficulty and discrimination parameters of science test questions

Subject	Concept	Discrimination					Difficulty				
		Question Numbers	Mini value	Max value	Mean	S. D.	Question Numbers	Mini value	Max value	Mean	S. D.
Physics	Temperature and heat	4	1.21	2.24	1.67	.45	4	-1.33	- .88	-1.13	.20

5. Conclusions

Taiwan referred to the curriculum reform in other advanced nations in the reform its nine-year compulsory curriculum. After identifying the orientation of a competency-based curriculum, Taiwan identified ten basic competencies and then proceeded to develop ability indicators for each field based on these competencies. Competency-oriented education is the current trend in curriculum reform in the U.S., UK, Australia, and New Zealand. The quality of competency indicators and teachers' understanding of these criteria are essential to implementing competency-oriented curricula.

5.1. Diagnostic tests for teaching evaluation should be based on Rasch measurement results

This study used the Rasch model to analyze the discrimination and difficulty levels of science-related concepts and basic science competencies in test questions. Our results indicate that the results of self-assessment and informal testing would be more valuable as reference data if they more accurately represented the scores of learners - in other words, if they had more predictive validity. Therefore, self-assessment tools for students must be empirically proven in order to build reliability, content validity and predictive validity. Only in this way can we facilitate more accurate diagnosis of learner capability.

5.2. A structure for diagnosing the item response of students should be constructed to replace conventional test analysis and to build a framework for diagnosing the response of students to test items

This study demonstrated that the first task in diagnostically interpreting test data is building a reference framework for diagnosing the response of students to test items. The strengths and weaknesses of this framework are determined by the quality of competency variables. The development of competency variables must be based on the theoretical basis of cognitive psychology. Effective diagnostic analysis can be achieved only by interpreting in the manner and extent to which students understand specific concepts when based on a theoretical framework. This study demonstrated that replacing conventional item analysis approach with Rasch analysis can overcome the problems of CTT to develop exams of superior quality. The capability afforded by the Rasch analysis method should be exploited to build a new set of theories for item analysis.

5.3. The actual capabilities of students must be considered in the development and selection of teaching activities

When designing teaching activities, teachers must use competency indicators as benchmarks and integrate them with teaching materials in order to convert them into lesson content. The vehicle of teacher presentation and classroom activities can then be used to achieve predetermined teaching objectives. However, after developing teaching activities, there is an even greater need for teaching evaluation capable of identifying the progress of students and determining whether students have acquired the basic competencies in each stage of learning. This could assist students to grasp their own strengths and weaknesses in learning and guide them in self-reflection and learning improvement.

Novel educational assessment for building structures: Automatic evaluation of on-line graphics

Antonio Aznar[a] & José I. Hernando[b]
[a]*ETSICCyP. Department of Material Science. Technical University of Madrid.*

[b]*ETSAM. Department of Building Structures. Technical University of Madrid.*

Abstract

This article presents a new automatic evaluation for on-line graphics, its application and the numerous advantages achieved applying this developed correcting method. The software application developed by the Innovation in Education Group "E4", from the Technical University of Madrid, is oriented for the online self-assessment of the graphic drawings that students carry out as continuous training. The adaptation to the European Higher Educational Area is an important opportunity to research about the possibilities of on-line education assessment. In this way, a new software tool has been developed for continuous self-testing by undergraduates. Using this software it is possible to evaluate the graphical answer of the students. Thus, the drawings made on-line by students are automatically corrected according to the geometry (straight lines, sloping lines or second order curves) and by sizes (depending on the specific values which define the graphics).

IETC 2014

1. Introduction

The educational experience and the computer application developed described in this work were made in the subject of Structural Analysis (SA) of the Architecture Technical University of Madrid (UPM). Structural Analysis is a discipline with a large scientific and technical tradition. Its study comprises an evident technical component based on rational mechanic laws, and a second technical component equally important, because of the big economical and social responsibility that comes with its application to construction: not only a conceptual, but also a numerical error can be unacceptable due to the gross economical losses that can derive from it, but mainly because it could threaten people's life (West & Geschwindner, 2002).

SA needs of numerical precision. In this regard, the combination of practice with the theoretical part of the subject make the Information and Communications Technologies (ICT) a suitable complement for the traditional face-to-face teaching. In traditional education the monitoring of each member of a medium/big size student group with the level of detail allowed by the ICT, would take a huge amount of professor's time. This time limitation usually turns into a final desertion of the continuous assessment techniques.

Years ago, the continued work of the student was encouraged through weekly voluntary practices in SA subject. Those practices were made at the classroom after the theoretical explanation, as immediate application. During this second part of the class, in a distended atmosphere, both the teacher-student commu-

nication and communication between students were favored in order to solve the different possible doubts that could show up in the practical application of the previously exposed theoretical concepts. In the typical medium and big size students groups in SA subject, the later review of the students exercises by the professor had to be reduced to a limited number of students or to a limited number of answers from all students. In any case, the ratio between the time the professor spent on those evaluation tasks, and the benefits obtained were, at most, scant.

With the arrival of ICT the previously mentioned second part of the class was complemented with the virtual learning technique (e-learning), which encouraged both the continuous assessment and the individual monitoring of the student. Thus a blended learning method (b-learning) was implemented in SA, through which the virtues of the traditional education were potentiated with those of the e-learning tools in benefit of the learning process.

To incorporate the b-learning techniques to the educational system it was necessary to obtain a computer tool which could transmute the daily practice made in the classroom into electronic practices that could be remotely developed and self-assessed. It was necessary a tool that could incorporate the following capabilities:

- Auto-correction: it should allow the students to correct their all-year exercises.
- Automatic correction: the tool should automate the correction process given the large number of students and practices to be accomplished.
- Continual assessment: the tool should have the capability to include a very large number of practices due to the daily tests that the student has to complete.

There are many computer applications that satisfy those requirements. The implantation at an institutional level by the Technical University of Madrid of the Moodle platform eases its election between the different possible options.

As Moodle is an open platform it was possible to develop applications to improve its performance and to adapt it to the needs and particularities of the SA. First, an application that allowed the customization of each exercise, assigning different values to its variables, was developed. However it was not possible to use the generic Moodle techniques for that personalization as exercises of SA have an important graphic component, which was necessary to customize with the rest of data for each exercise. The purpose of personalization was focused to minimize the possible student scam that could be originated by the on-line resolution of a single exercise, and, at the same time, to compare the different results obtained by some students in the face-to-face lessons to provide some valuable knowledge about the variation of the final result in relation with the initial values of the problem. In order to acquire this last knowledge the rank value should be carefully calibrated, so that the values do not deviate from the real possible cases extracted from its technical approach and/or of the previous experience of the building structures construction.

From the first semester once the system was implemented, it was positively received by the students and a measurable improvement in the results of SA teaching was observed.

The great acceptance of the system turned into an extra motivation of the students, who, stimulated by the immediate answer of the system, increased considerably the time spent on the subject. A proof of this is the considerable number of attempts in solving the exercises that were made by the students. While some students just needed a few tries to solve correctly the exercise, others needed a large amount of them. A detailed explanation of this first experience can be found in (Aznar & Hernando, 2011) and (Aznar et al, 2012).

Once the success of the developed system and the adequacy of the e-leaning tools for evaluation were verified, we thought about the possible risk of losing the perspective of the whole picture of the structural behavior. In the Structural Analysis classic treatises the study of the graph of internal forces was imperative allowing the study of the behavior of the structure as a whole, opposite to the local and detailed description that is achieved by a pure numerical description. To take advantage of all benefits of the b-learning method it was necessary the evaluation and verification of the graphs geometry that represent the structure internal forces, and not just some (or many) numerical values. Unfortunately, as Moodle platform did not included such possibility, we had to develop the application described below.

IETC 2014

2. Development

In order to achieve the previous mentioned targets it was necessary to find again an e-learning platform where we could develop them. The choice of Moodle was the most suitable. The main reasons that made us opt for it was the more than two experience years we had with it, and the request of not losing the targets already achieved. Among others: a) the possibility of an automatic correction; b) the option of an immediate answer to the students; c) the possibility of answering the same question many times in case the answer is not correct; d) the freedom of schedules; e) the proven Moodle's capability of storing in an efficient way the huge amount of data necessary to elaborate SA practices. This subject involves a complexity technical part, including bibliography, regulations and technical documentation, and, mainly, graphical documentation (architectural plans, structure plans, structure detail plans, structural models, forces schemes, etc.), without which there is the risk of reducing the Structural Analysis to a simple academic entertainment. On the other hand it was neither found the wanted tool in any other computer application.

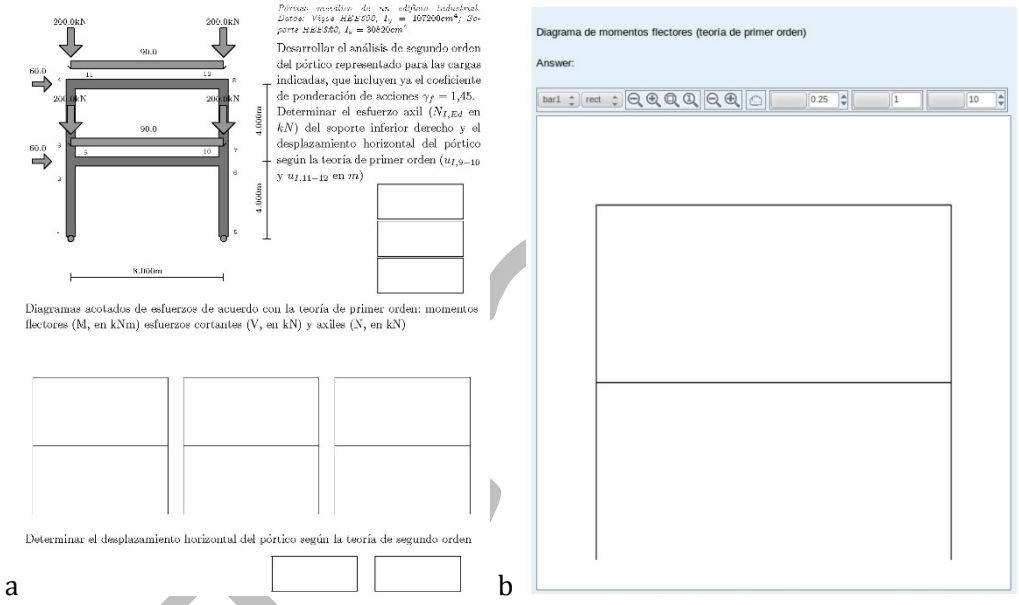

Figure 1. (a) Partial view of a SA practice. (b) Example of the developed question type.

Once the Moodle platform was selected, a study of its performance was made in order to find the most efficient way of achieving the pursued targets. It was decided to develop a new "question type", to be added to the ones already offered by Moodle. This new question type was named "graph of internal forces", "diagrams" in its short version.

Fig. 1 shows an example of the developed question type. In this example the students has to draw the graph of internal forces on the structural model.

It was sought that the professor, relying on Moodle capabilities, would be able to introduce question of the type "diagrams" in the course exercises in a quick and easy way. Likewise, the students should be able to answer, graphically, as any other question of the test. To develop "diagrams" and make it compatible with the platform and its usual use, a study of several standard Moodle question types was made.

3. Operation

In order to develop the new question type several basics requirements were specified:

3.1. Definition of the question wording

The questionnaires development should be quick and easy. It must be ease to the professor the introduction of the question formulation data, its solution, as well as the allowed error margins and other specific parameters of "diagrams", such as scale factors or sign criteria.

3.2. Student's answer.

The students should be able to answer in an easy and enjoyable way, and essentially by graphic means: drawing straight lines, parabolas or combinations of them.

3.3. Bidirectional communication with the database.

Moodle stores all the information about the questions, such as values, solution, error margins and other parameters from the question formulation, as all the answers (attempts) provide by the student, in a relational database. All Moodle question types allow a bidirectional communication with the database to implement the yearned automatic and continuous correction. It was obvious that "diagrams" should also have this property.

3.4. Feedback.

With data introduced by the professor in the definition of the question and answer given by the student, Moodle should be able to validate the student's answer. At the same time, attending to the parameters established by the professor, it should show the student the mark of its answer, its graphical correct answer, or to allow the student to continue searching for the right answer if he has not yet reached the highest mark, etc. All Moodle standard questions had these properties, and thus "diagrams" should inherit them.

3.5. Flexibility.

Because of the large tradition of the Structural Analysis, plenty of approximations coexists. Thus, flexibility was an imperative premise in "diagrams" as we would not want to limit its use just to SA and even, just to the particular vision of a SA professor.

4. Implementation

In order to experiment without the risk of causing collateral damages, a local version of Moodle 2.4 was installed in a network isolated computer. Once defined the basic requirements, pointed out in the previous

IETC 2014

section, and with the "safe" Moodle version available the development of the new Moodle question type was initiated.

The code for “diagrams” was written in *php* language, as it is the standard code for all the Moodle question types. Attending to the indications in the Moodle manual we started from the basic structure of the "short answer" standard question, which we modified up to transforming it into "diagrams". A portion of this code is represented in Fig. 2.

```
 * The diagrams answer question type.
 *
 * @copyright  2013 Jose Ignacio Hernando García, Miguel Martínez Pañeda
 * @license    http://www.gnu.org/copyleft/gpl.html GNU GPL v3 or later
 */
class qtype_diagrams extends question_type {
    public function extra_question_fields() {
      return array('question_diagrams', 'answers', 'topology', 'graphofinternalforces', 'width'
    }

    public function questionid_column_name() {
        return 'question';
    }

    public function move_files($questionid, $oldcontextid, $newcontextid) {
        parent::move_files($questionid, $oldcontextid, $newcontextid);
        $this->move_files_in_answers($questionid, $oldcontextid, $newcontextid);
        $this->move_files_in_hints($questionid, $oldcontextid, $newcontextid);
    }

    protected function delete_files($questionid, $contextid) {
        parent::delete_files($questionid, $contextid);
        $this->delete_files_in_answers($questionid, $contextid);
        $this->delete_files_in_hints($questionid, $contextid);
    }

    public function save_question_options($question) {
        global $DB;
        $result = new stdClass();

        $context = $question->context;

        $oldanswers = $DB->get_records('question_answers',
                array('question' => $question->id), 'id ASC');
```

Figure 2. Portion of the code of “diagrams” question type

Even though writing the code of the different *php* files (which form the structure of the question and their interaction with the database) had its difficulties, the biggest hurdle was encountered when creating the application that would allow the students to draw the answer. A *javascript* application was designed that accompanied the *php* files, and to which they refer. In the designed application the students can, through a command panel with different options, draw in a canvas the structural answer of the internal forces graph of the set out structure.

After many verifications the question type was finally installed in the Moodle of the Technical University of Madrid. After three semesters of an intensive use of "diagrams", in which it has been subjected to limit situations that had forced to improve some of its aspects, it is confirmed that the question type is fully operational.

5. Performance

The premise of making the new question type as simple as possible was adopted to develop the data entry by the professor and the introduction of the results by the student.

Fig. 3 shows an example of the professor form has to complete to elaborate one of these new question types.

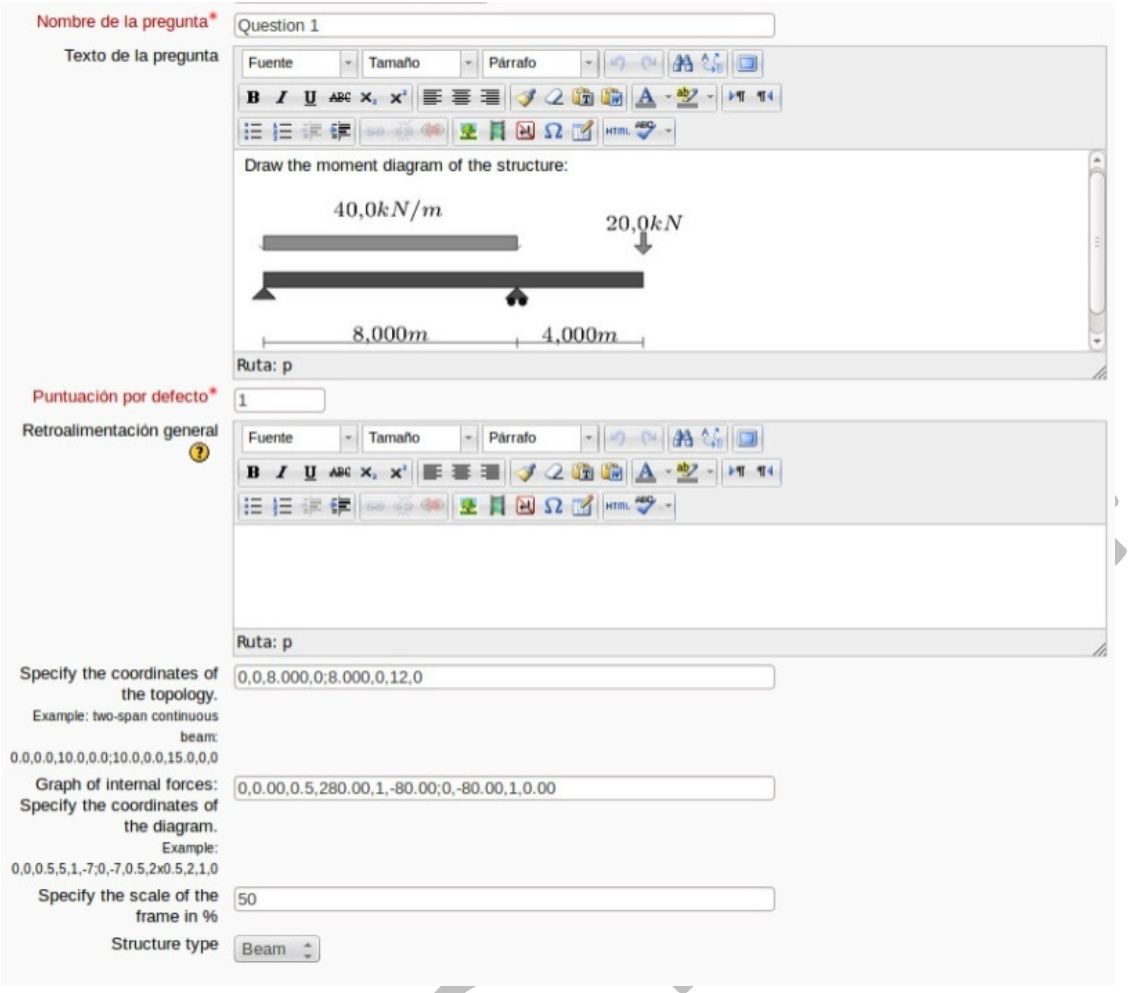

Figure 3.View of the professor´s form to complete a "diagrams" question type

Once installed the Moodle question type "diagrams"4 the professor can select it directly from the question type list that shows up when a new question is created in the "question bank". To the standard options that are shown to the professor when writing a new question like "name of the question", "text of the question", etc. the specific ones for "diagrams" are added. From the particular options of "diagrams" stand out, first, the input in which the geometry and the topology of the structural model must be defined, and on second place the input where the diagram of internal forces of each bar which form the structure is defined. The geometry and the topology is defined through the coordinates of the structural model bar ends, in a similar way as in any designing structural commercial program, so therefore it is supposed to be familiar for a SA professor. The definition of the diagram of internal forces is not difficult either, as, for the usual forces in buildings the diagram is formed by straight lines or quadratic polynomials. In the case of straight lines the professor has to define the value of the diagram in two points, in the second case he has to introduce the value of three random points. The diagram of a bar could be formed for several stretches (formed by straight lines and/or second order curves). The professor should define each of this different stretches separately as in the previous cases. Other offered parameters can be seen at Fig. 3.

Once concluded the data input, the professor can see the formulation of the question and the diagram of internal forces as shown in Fig. 4.

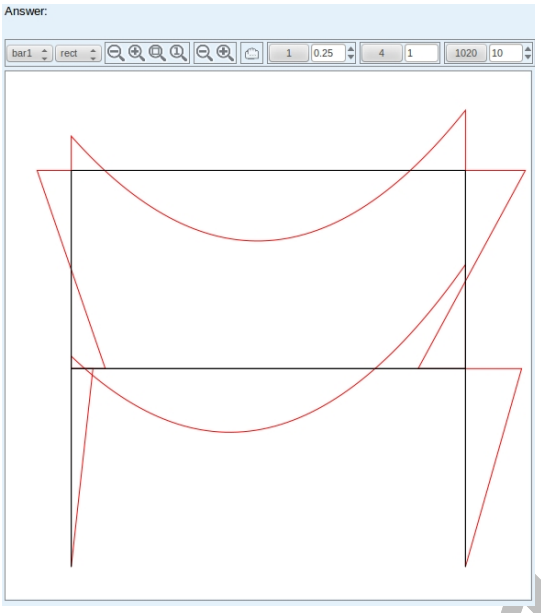

Figure 4. Preview of the question, just available to the professor

The "diagrams" question is shown to the student as another typical question inside the Moodle form. Next to the formulation of the question (that could include graphics, as any other Moodle question) it is displayed a small tool bar and a canvas where the drawing of the diagram of internal forces of the structure can be made just with the mouse. Its working is similar to a CAD application, so it does not suppose any difficulty for any student of architecture of the 21st century (Fig. 5).

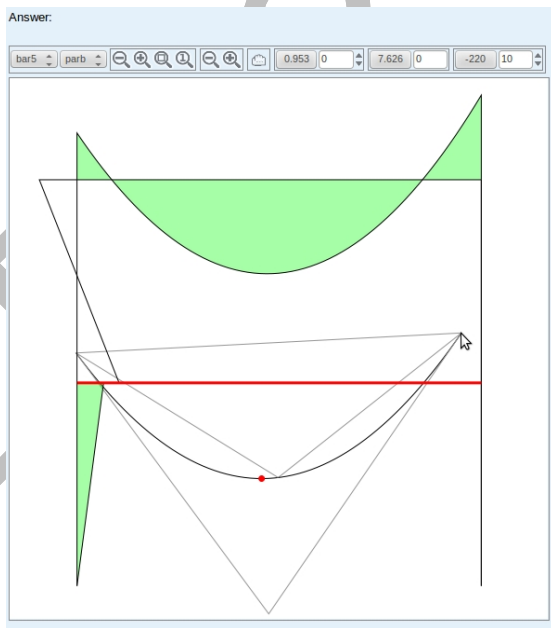

Figure 5. Student's answer snapshot.

Figure 5 shows the internal forces diagrams of bars already answered and validated by the application on green and diagrams already answered but not validated by the application on black. Also, the diagram that was being answered at the time the snapshot was taken is shown next to the cursor.

6. Results

IET 2014

This work includes the methods developed for the incorporation of a new type of question in the Moodle platform. This new question type, which enriches the use of ICT, has been fully operational amongst the standard Moodle question types for three semesters in the network of the Technical University of Madrid. Since its implementation it has been used by the students of several structural subjects of the University of Architecture.

The operation of this new question type (figure 5) has not brought about any problem since its installation. It has been excellently welcomed by students, overflowing the most optimistic previsions, reaching almost an addictive use.

Thanks to this new application the drawing of the graph of internal forces of a structure is covered through the ITC, one of the targets of the SA subject, overcoming the limitations that the Moodle platform offered a priori. The benefits for the students are manifest, according to the enquiries made to the SA professors and to the success evidenced in the final tests results. These tests have proven a much more complete learning than before the implementation, with an evident settlement of concepts.

7. Conclusions

Students profit of all the benefits of the b-learning method through the developed computer application system of continuous automatic correction and an automatic evaluation system for the diagrams of internal forces. The development of this informatic questionnaire type offers new tools in contrast with the traditional student qualification characterized by very subjective component. Using this tool objective qualification of a major part of the subject, the diagrams of internal forces, is achieved together with other advantages as the professor is released from mechanical duties.

Thanks to it, this self-correcting application has improved considerably the learning of SA between the students proved in the evaluation results. Student motivation has also been increased, due to the graphic input of results and the quickness of the system feedback. This high motivation has resulted in an unattainable level of comprehension through other techniques. The tool makes also viable the correction of the daily practices in a time impossible without the ICT, which allows the professors to focus their efforts on others tasks as the direct attention to the students reflected in a much better exploitation of the learning process. The professors also turn out benefited as the work of evaluation and monitoring of students is considerably improved, with the additional advantage of having a number of qualifications formerly impossible at any time.

On the problem of categorizing students based on their cognitive styles and teaching strategies

Michaela Kykalová[a], Elena Anatolievna Vasilyeva[b76]
[a,b]*University of Hradec Králové, Rokitanského 62, Hradec Králové 3, 500 03, Czech Republic*

Abstract

The research determines different types of students according to their dominant cognitive learning styles. We are focused on the students of Russian language at high school, acquiring statistical representation of various typological groups we cluster the students into to verify whether the development of metacognitive skills does improve the efficiency of learning foreign languages.

The research includes a survey based on the works by Howard Gardner and others. We categorize students according to their dominant cognitive learning styles and corresponding teaching strategies. Two hundred respondents were included in the survey. The paper also provides a historical background of the subject.

Keywords:Howard Gardner; Multiple Intelligences; teaching strategies; cognitive learning styles

1. Introduction

Compulsory teaching of a second foreign language no later than from the 8th grade of school was introduced in the academic year 2013/2014. This step is a reflection of the EU policy of multilingualism and multiculturalism. In connection with this, an increase has been recorded in the number of schools that offer Russian as well as an increase in the number of students who choose this language apart from English language. In the center of our interest lies the classification of types of students who chose Russian as the second foreign language. If we take into account the fact that one of the basic approaches of modern pedagogy is paedocentrism, we can see possibilities of improving the efficiency of teaching the first foreign language as well as the second foreign language in the classification of students according to the type of learning (type of intellect) and subsequent individualization of teaching with regard to each of the types. In conducting our research, we depart from H. Gardner's theory.

IETC 2014

In the 1970s in the USA, psychiatrists John Grinder and Richard Bandler dealt with the issue of neurolinguistic programming. The scholars examined the behavior of very successful people and attempted to define basic elements in their communication and behavior that positively affect their success. This is the basis of the theory of multiple intelligences, a method which gives rise to numerous debates among scholars but which has found application in the curricula of many American educational institutions. This theory is based on the philosophy of language teaching according to which the intellect of man is composed of many different equivalent intellects, which we must first uncover, and only then it is possible to develop them in the process of teaching. This theory was developed by the American scholar Howard Gardner as a counterpoint to the classic IQ test, based on the idea of a compact innate and unchangeable human intellect. In Gardner's view, IQ tests only measure the linguistic and logical skills of a person, but teaching practice shows that people gain knowledge in different ways. The scholar further contends that language is not connected only with the linguistic abilities of an individual, but with all parts of human intellect. Besides, this theory also had its predecessors. As early as in 1904, the French scholar and psychologist Alfred Binet dealt, in a sense, with a variety of intelligence when he and Theodor Simon created, on the basis of their long-term examination of children in their natural environment, a so-called Binet–Simon scale, which was a scale of various skills, broken down by age of children, which was, according to the authors, typical for the mastery of these skills. This finding was the core of Binet's claim that it is not possible to generalize intelligence, that it is diverse; he also examined the approach of mentally disabled children to the mastery of these skills (Lojová & Vlčková, 2011; Gardner, 1993; Binet, 1907).

A pioneer in the field of examination of children in terms of their preferred intelligence was, without a doubt, Maria Montessori. In her profession as director of the school Casa dei Bambini (*Children's House*), she was fully aware of the peculiarities and differences of individual children, and therefore also promoted individual work with each child or their division into smaller groups according to the predominant style of learning.

In the 1970s, phenomenological psychology appeared, examining subjective human experience, on the basis of which the Swedish scholar and psychologist FerenceMarton, together with his British colleague Noel Entwistl, later introduced a qualitative research method, phenomenography (Lojová & Vlčková, 2011; Mareš, 1998).

In 1984, American theorist David Kolb focused on the natural preference of learning styles and, based on his so-called experiential learning psychology, defined four types of students: 1. diverging (sensitive students, able to look at a problem from different angles, they like observing), 2. assimilating (students requiring a clear logical explanation), 3. converging (students preferring practical experience over theory, they like solving problems), and 4. accommodating (students who like experimenting, during which they involve their excellent intuition and instincts) (Osland & Kolb & Rubin, 2006).

3. Theory of multiple intelligences

The theory of multiple intelligences was comprehensively described for the first time in Gardner's 1983 publication *"Frames of Mind: The Theory of Multiple Intelligences"*. Gardner sees intelligence as the ability to solve problems and to participate in the results that are important for a particular culture or community. In his book, the author formulates a number of criteria that define intelligence as a prerequisite of the ability to solve problems or difficulties fitted into cultural context and create one's judgment. The author defines the following eight types of intellect:

- Verbal or linguistic intelligence (*so-called "wordsmart" or "booksmart"*)
- Logical-mathematical intelligence (*so-called "numbersmart" or "reasoningsmart"*)

IETC 2014

- Visual-spatial intelligence (*so-called "picturesmart" or "art smart"*)
- Bodily-kinesthetic intelligence (*so-called "body smart" or "movementsmart"*)
- Musical or aural intelligence (*so-called "music smart" or "soundsmart"*)
- Interpersonal intelligence (*so-called "peoplesmart" or "groupsmart"*)
- Intra-personal intelligence (*so-called "selfsmart" or "introspectionsmart"*)
- Natural or naturalist intelligence (*so-called "naturesmart" or "environmentsmart"*)

The first two types of intelligence (verbal and logical-mathematical) are most apparent mainly in the process of education in schools, the other three (visual-spatial, bodily-kinesthetic and musical) are associated with artistic movements, and the remaining three types (interpersonal, intra-personal and natural) were described by Gardner as "personal intelligence" (Gardner, 1993). However, all types are interconnected, complementary, and rarely work alone. The basis of the theory of multiple intelligence is the fact that every individual has a unique set of intelligences that interconnect and cooperate in solving problems, which is the essence of the uniqueness of each individual (Lojová & Vlčková, 2011).

Academic psychologists viewed Gardner's theory of multiple intelligence with skepticism. By contrast, it was accepted by teachers very positively. Teachers and theorists of education did not hesitate to apply this theory in practice. One of the reasons of the positive acceptance of the theory in the school environment is the fact that it provides a conceptual framework for the organization of the educational process, for the building of a new approach to the arrangement of the lessons and the classrooms themselves, and it is focused on the specific needs of different types of students (Kornhaber &Fierros &Veenema, 2004).

Mindy Kornhaber, together with her colleagues from Harvard University, in the framework of the group's project "Project Zero", which has been carrying out its research since 1967, tested 41 educational institutions in the USA that use the theory of multiple intelligences in practice by using globally standardized entrance tests for U.S. universities – SAT (Scholastic Assessment Test). The research showed that the progress of students of these schools in three years of study was really substantial; one of the findings also was a decrease in the number of missed classes and an increase in the participation in leisure activities organized by the educational establishments (Gardner, 1993; Kornhaber &Fierros &Veenema, 2004).

4. Research and results

To conduct our psycho-didactic research, the method selected was a questionnaire drawn up on the basis of the literature studied and focused on five types of students according to their predominant intelligence. All items of the questionnaire were created in accordance with the characteristics of the individual, most commonly occurring, learning styles, with the manner of receiving information by students, their typical needs, behaviors, and prevailing intelligence.

In addition to H. Gardner's theory, in compiling the questionnaire, another theory taken into account was that of the prominent Czech scholar M. Sovák, who, in his publication "*Learning need not be torture*" (*Učení nemusí být mučení*), defined four basic types of students according to their most frequent needs in the learning process. These are: 1. aural-speech, 2. visual, 3. tactile and motional, and 4. verbally-conceptual (Sovák, 1990).

Furthermore, S.F.Reif's theory, working with seven types of intelligence, sometimes called learning styles, was taken into account. The author bases her classification of students on the type of intelligence the individual uses the most. The types of intelligence are: 1. verbal, 2. logical-mathematical, 3. spatial, 4. musical, 5. bodily-kinesthetical, 6. interpersonal and 7. intra-personal (Reifová, 2007).

IETC 2014

On the basis of the above theories, all respondents were, after the evaluation of the questionnaires, divided into five categories, which are further explored and analyzed in this paper. The types of students are: 1. aural-speech, 2. visual, 3. bodily-kinesthetic, 4. logical-mathematical, 5. verbal. The reason of the choice of these five categories was the mutual similarity and permeability of individual theories and types of classification of students according to the senses which the individual uses most frequently as well as according to the intelligence which is developed to the greatest extent in them. (See Gardner's and Rief's bodily-kinesthetic type and Sovák's tactile and motional one, logical-mathematical type by both Gardner and Rief and the verbally conceptual type by Sovák, musical and aural-speech one; and last but not least Sovák's visual type of a student, which corresponds with Rief's spatial intelligence and visually-spatial intelligence by Gardner, when a student has a high perception of drawings and sketches).

It can be easily proved using the above classification that every student has different ways of learning, different interests and motivation, and therefore different teaching activities are suitable for them. The teacher's task is thus to actively engage students in learning activities and stimulate the development of different types of intelligence and the various senses of the students.

A total of 200 students of the Russian language of different age groups from schools in the Hradec Králové region, the Pardubice region, and the Vysočina region were tested. The selection of educational institutions was significantly restricted by teaching of Russian, which unfortunately is not yet in place in all types of schools. Research was conducted in five secondary schools, and, for comparison a small sample of students of the University of Hradec Králové participated in the test too (these were students of the follow-up Master's program Teaching of Russian in lower and upper secondary school). The comparison of learning style preferences was crucial as they are changing with age because, from the perspective of ontogeny, time is an important factor influencing the development of human intelligence.

The respondents were subsequently divided into groups according to age in order to obtain an overview of their development over time (respondents aged 15 – 16 years; 17 years; 18 years; 20 – 22 years; 23 – 24 years).

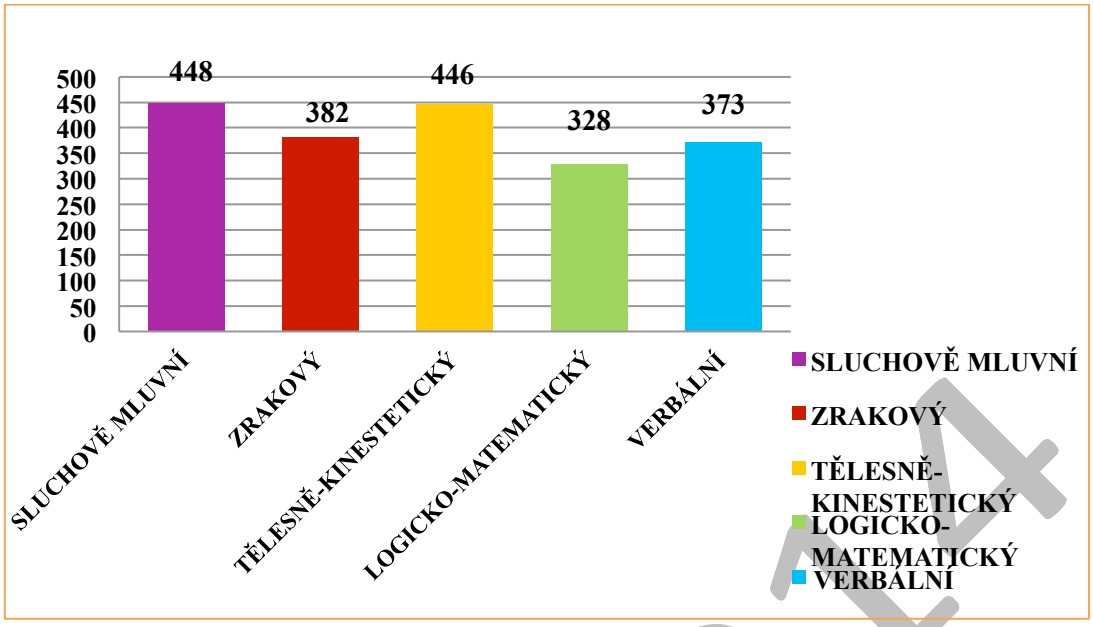
In the questionnaire presented, the respondents gave their opinions on a total of 35 statements; always 7 statements were focused on each learning style of the student, his/her predominant senses and intelligence. The respondents were asked to assign a point value to each statement according to the following scale (0 = I don't agree with this statement at all, 1 = this statement describes me partially, 2 = I completely agree with this statement). Statements representing each type were not presented in blocks but were randomly mixed. In the evaluation of the questionnaires, the total number of points for each of the five types of intelligence was added up, which was subsequently verified by the sum of the number of zeros, one's and two's. The highest number of points obtained represented the biggest agreement of students with statements representing a specific type of intelligence, and therefore the greatest preference by students of this type. Summary results were recorded in charts according to the different age groups of respondents. A total of six charts were created in this research, the last of which, the sixth, is the final overview of the complex scoring of all of the surveyed respondents.

In the paper, we will only present the results and conclusions of the research conducted.

4.1. The group of students aged 15 to 16 years

The group of students aged 15 to 16 years contains a total of 58 respondents, whose score is shown in Fig. 1. In this group of respondents, two types of students are predominant: aural-speech (22.7%) and bodily-kinesthetic (22.5%). The visual (19.3%) and verbal (18.9%) types are very balanced and the logical-mathematical type has significantly fewer points (16.6%), which is generally repeated in all the surveyed groups, which also confirms the hypothesis of M. Sovák that the group of students of the logical-mathematical type is generally the least represented one.

IECT 2014



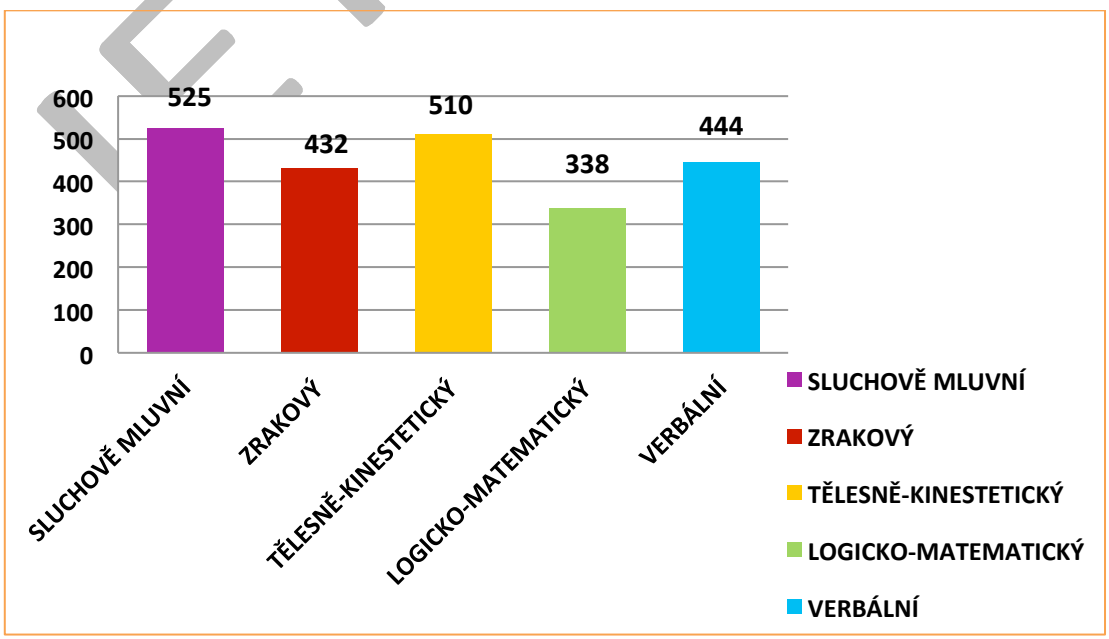


Fig. 1. Points scored – students aged 15 to 16 years.

4.2. The group of students at the age of 17 years

The group of students at the age of 17 years old had a total of 59 respondents (see Fig. 2.). Also in this sample, the aural-speech type of students is most represented (23.4%), followed by the bodily-kinesthetic type (22.7%). The third largest group of respondents in this sample are representatives of the verbal type of learning (19.7%), followed by representatives of the visual type (19.2%) and the logical-mathematical one (15%).

IETC 2014

Fig. 2. Points scored – students aged 17 years.

4.3.The group of students at the age of 18 years

Fig. 3.shows the distribution of students in a 12-member group of 18-year-olds. The dominant type is the aural-speech one (24.7%), followed by the bodily-kinesthetic type (21.5%) and the visual type (20.5%). 19.1% of students belong to the verbal type, and the least frequent is the logical-mathematical type (14.2%). These results basically copy the previous ones without a significant change in the positions of the individual types.

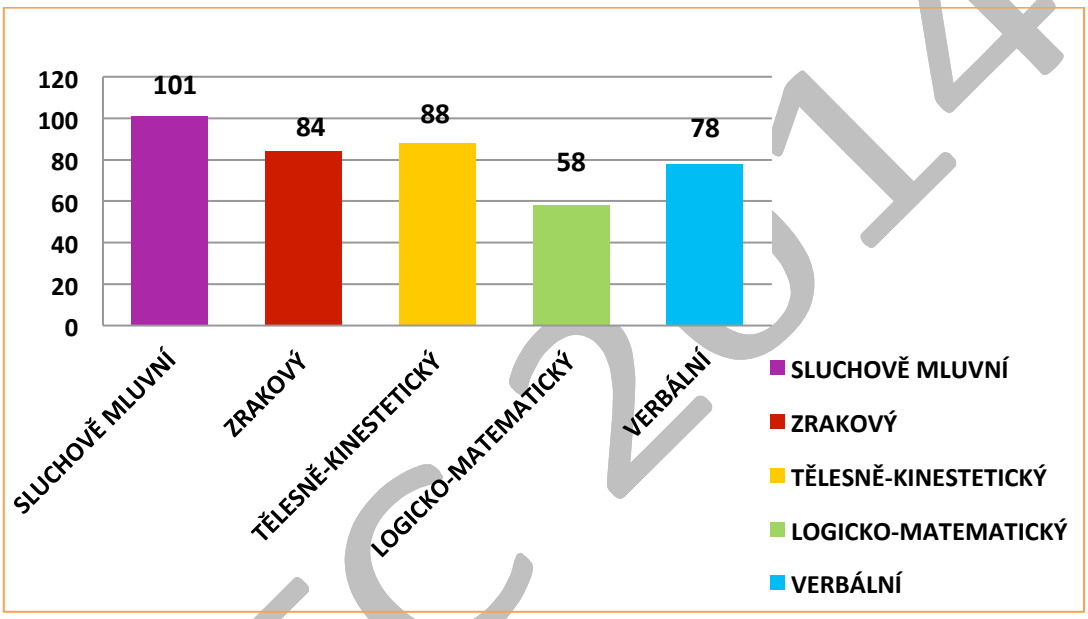

Fig. 3. Points scored – students aged 18 years.

4.4. The group of students aged 20 to 22 years

Fig. 4.shows answers of a total of 20 students aged 20 to 22 years. The sample of respondents is composed of individuals older than in the previous three groups. The fact that every year plays an important role in adolescence and forming of personality is also demonstrated by the results obtained – although the most represented type is the aural-speech one (22.9%) and the second largest group consists of representatives of the visual type (21.8%), which did not happen in any of the previous groups. The results obtained can be interpreted that at this age, students need, in addition to the teacher's verbal description also visual material. In foreign language teaching, it is therefore most suitable to include elements of audiovisual methods.

IETC 2014

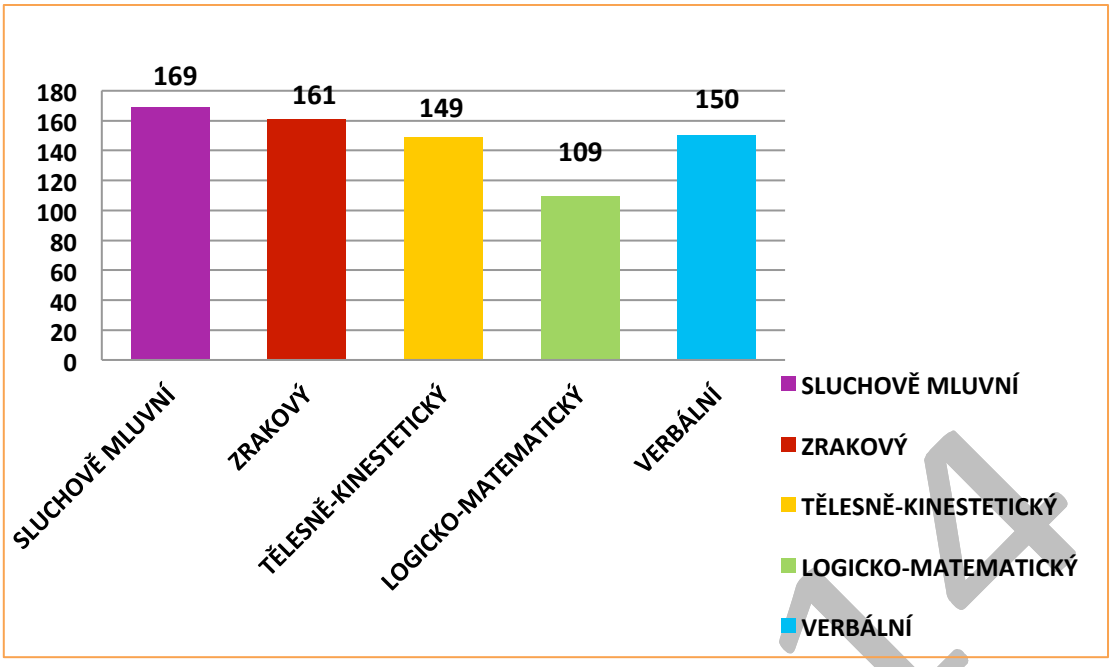

Fig. 4. Points scored – students aged 20 to 22 years.

4.5.The group of university students aged 23 to 24 years

The fifth chart presents the research results in a group of 13 respondents – university students aged 23 to 24 years (see Fig. 5.). The most numerous group in this sample are representatives of the verbal type of students (22.6%), followed by the bodily-kinesthetic type (22.4%) and the aural-speech type (20%). On the basis of the results one can conclude that the representatives of this age group are no longer dependent on the verbal description of the teacher and, on the contrary, prefer their own discussion with suggestions for solutions to problems or their own projects and their public presentation, which fully corresponds to the reality. The number of representatives of the visual type (17.4%) and the logical-mathematical type (17.6%) reflects the assumption that for older students there is usually no need for support in the form of visual images, diagrams or photos.

IECT 2014

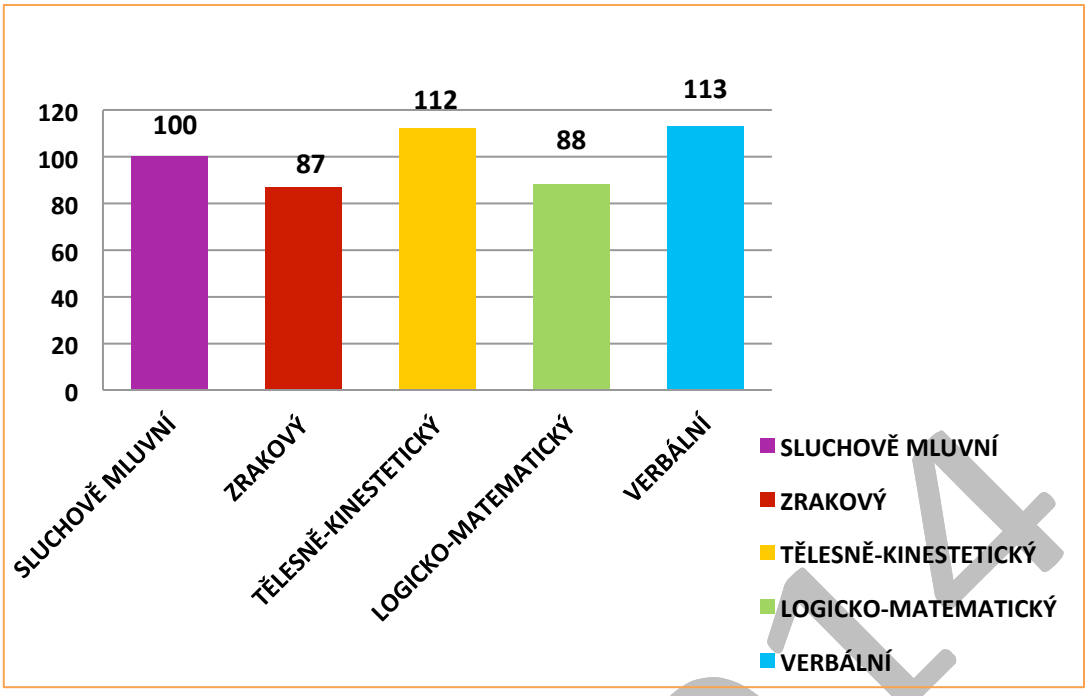

Fig. 5. Points scored – university students aged 23 to 24 years.

4.6. Summary

Last two charts present summary results of the research (see Fig. 6. and Fig. 7.). When sorting preferences of individual intelligence types in ascending order, the least frequent type of students is the logical-mathematical type (15.8%), which is confirmed by the partial results of our research as well as M. Sovák's claims.

The second least numerous group consists of representatives of the visual type (19.2%). At the beginning of the research, a hypothesis was formulated that due to the intense influence of mass media on shaping the personality of a child, the visual type of intellect will be predominant in the group of students. The results of the research did not confirm this assumption, on the contrary, it turned out that this type of students is among the least represented ones in the sample.

In third place is the verbal type of students (19.9%). All of the respondents were students of generally-oriented fields of studies or humanities disciplines; it can be noted that the result confirms the theory of H. Gardner, who claims that verbal types are mostly students of humanities, who like discussing problems.

The bodily-kinesthetic type of students (21.9%) is represented mainly by active students, who need motion and constant switching of activities in the course of one teaching unit. At the beginning of the research, we expected that the bodily-kinesthetic type of intellect would be represented in the research sample by only a small number of respondents, which would correspond to the decline in physical activity of children in contemporary society. Quite surprisingly, however, this type was in second place in the summary overview as to the number of points obtained, and it was significantly represented in all age categories.

IETC 2014

The absolutely most widespread type of student in general seems to be the aural-speech type (23.2%). These individuals prefer aural memory; in teaching, work with recordings and other audio materials should prevail, and the teacher must be prepared for the fact that their speech will be a model for the students, who will imitate them. For this reason, it should not be deformed by accents or defects.

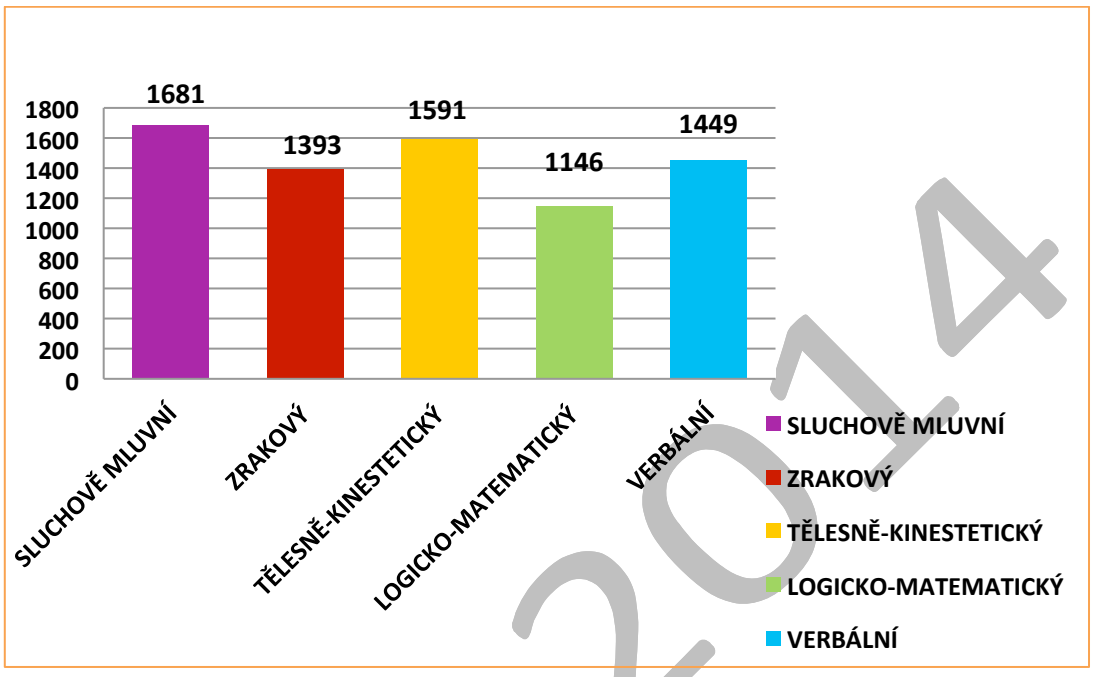

Fig. 6.Total points for different types of students.

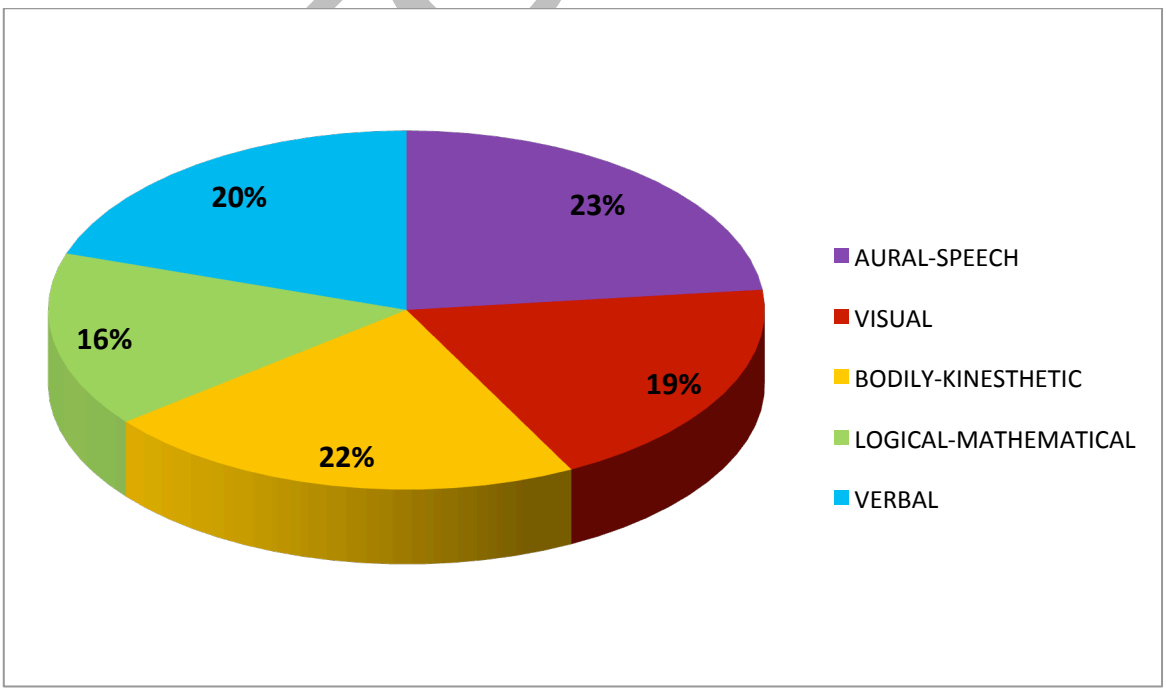

Fig. 7.Preferred intelligence type percentage of respondents.

5. Conclusion

This paper attempts to show that even though the children play videogames, watch TV and browse the internet in their free time nowadays, they still need to hear a new piece of information and to change activities during the lesson. In view of the fact that visual type of student is surprisingly not dominant as the questionnaire proved.

The charts also demonstrate that preferences of individual intelligence types change with age of students.

In conclusion, we express our agreement with the claim of J. Mareš that every child is a specific personality with individual learning styles that develop, and over time they permeate and change. It is then up to the teacher to respect students and try to understand their specificities at least to a certain extent. (Mareš, 1998).

Optimising the Digital Age Health-wise: Utilisation of New/Social Media by Nigerian Teaching Hospitals

Herbert E. Batta[a]77, Nicholas S. Iwokwagh[b]

[a]*Department of Communication Arts University of Uyo, 520001, Nigeria*

[b] *Department of Information and Media Technology Federal University of Technology Minna, 9000021 , Nigeria*

Abstract

The nature of health communication is changing globally as more people are relying on the Internet for health information (Gallant, Irizarry, Boone & Kreps, 2011). These authors argue that web-based communication tool development that engages e-patients can better guide effective healthcare strategies and intervention and promote participatory medicine. However, In Nigeria, health communication is only evolving and it is not clear the extent to which it can be argued that hospitals are taking advantage of the Internet and its related platforms (e.g. Social Media) to influence health outcomes or impact on health promotion, disease prevention or health literacy generally. Paucity of information in this field of study would anchor largely on the fact that health communication researches in Nigeria seem not to have given some attention. This article therefore explores the ways in which Nigerian Teaching hospitals utilise the new and social media. Specifically, it investigates whether the new and social media are used as public relations tools (for enhancing their visibility, promoting their services and corporate image), educational tools (to provide health information, enlightenment and education for the purpose of preventing disease and promoting health), social tools (to deepen interactions and exchanges between healthcare providers and healthcare recipients). The study anchors on three theories: Social Relationships Theory, Social Exchange Theory, and the Extended Parallel Process Model. Inductive content analysis was used to examine the websites of twenty Nigerian teaching and specialist hospitals. Findings showed that the major uses to which Nigerian teaching hospitals put the new and social media are to get feedback from clients (100%), present their vision and mission statements (65%), post administrative and personnel structure information (65%), and give details of contracts (60%). These media are little used for health promotion (25%), financial transactions (10%) and interactive engagement with clients (0%). The content of Nigerian teaching hospital web pages can be categorised into three as follows: employee/public relations content (100%); in-patient and out-patient–specific content (30%), and public health promotion and education content (25%). It concludes that Nigerian teaching hospitals' recourse to the new and social media is for the purposes of publicity and propagation of self image (public relations). To change this trend, it was recommended among others that: teaching hospitals should increasingly use the new and social media to provide avenues for patients and relatives to tell their stories, and for health professionals to offer informed opinions on medical and health matters.

Keywords: Digital Age, New Media, Social Media, Nigeria, Teaching Hospitals

IETC 2014

1. Introduction

In the past, the predominant means of contact with a medical institution or health facility was face to face, reading from a book, magazine, or newspaper or through the electronic media such as a report on the

* Corresponding author. Tel.: +2348023444791
*E-mail address:*heribertobat@yahoo.com

radio or footage in film. Today, by means of new information and communication technology, we can learn a lot about health matters, health professionals, and health institutions. Indeed, in contemporary times, we hear of e-patients, telehealth, virtual surgery, and so on. All these have come to extend the meaning of living in the digital age.

Our interest in this article is to explore the ways in which hospitals utilise the new and social media to influence health outcomes or impact on health promotion, disease prevention or health literacy generally. However, the focus is on how and why new and social media are used by Nigerian teaching hospitals. Are they used for enhancing their visibility, promoting their services and corporate image – a public relations tool? Are they used to provide health information, enlightenment and education for the purpose of preventing disease and promoting health – an educational tool? Or are they used to deepen interactions and exchanges between healthcare providers and healthcare recipients – a social tool? In any case, a hospital can and should use all three tools. The question is: to what extent is each tool used or is one used at the detriment of the other? Health communication researches in Nigeria seem not to have given some attention. In any case, health communication is still developing in the country.

1.2 Objectives of the Study

a) To explore the concepts of digital citizenship, social media and new media.

b) Examine the theoretical framework which underpins the discourse on social networks, social support, social exchanges and use of social media for health promotion and disease prevention.

c) Evaluate a sample of web sites hosted by teaching hospitals in Nigeria for their use of social media to promote health and prevent disease.

d) Elaborate on ways in which the social media could be harnessed to promote health and prevent diseases in Nigeria as obtainable in other countries.

1.3 Research Questions

This study was based on the following research questions:

(1) What do the concepts of digital citizenship, social media, and new media mean?

(2) To what extent are the theories of social networks, social support, social exchanges relevant to the application of new and social media to health promotion and diseases prevention?

(3) How do teaching hospitals in Nigeria use the new and social media to promote health and prevent diseases among the public?

(4) In what ways may the new and social media be harnessed for the promotion of health and the prevention of diseases in Nigeria?

1.4 Statement of the Problem

There is no doubting the fact that the power of the media stems from the ubiquity of the media, the cumulation of media messages and the consonance among media practitioners (Dennis & Merrill, 1991). Not only are the media everywhere, with the development and increasing use of social media and the new media, human lives continue to be increasingly entangled with media technologies. Now, our lives appear inseparable from the new media and the social media. We use them to initiate conversation, friendship, dating, courtship, coitus. We use them to commiserate, mourn, or even honour ourselves. Furthermore, we use them to annoy, taunt, insult, abuse. These are in addition to the uses and gratifications that we are

IETC 2014

more familiar with – information, education, entertainment, advertising, ethicisation, integration, and narcotisation.

What these mean is that the social and new media do actually expand the scope of social networks, they extend the frontiers of social exchanges, they add depth to social interactions, transactions and relationships, and they redefine the character of the social support systems available to humans. It is true that as humans form networks, engage in interactions, exchange social ties, forge social bonds; certain social problems are bound to arise. Friends for instance, initiate and encourage those in their circle of friendship to form alcohol drinking habits. Peers also pressurise fellows to smoke tobacco or abuse narcotic drugs. As members of the opposite sex forge relationships, sexual activities may be engaged in unsafe ways. All these have health implications.

It is instructive to note that just as the new media and the social media are utilised to forge social relationships that sometimes lead to deleterious health consequences, they may equally be used to promote social relationships that pay significant attention to health promotion and disease prevention. However, it is also true that the new and social media may be used in ways that are damaging to the health of users.

One of the social institutions in society that preoccupies itself with the health of the citizenry is hospitals. Specifically, teaching hospitals are tertiary centres of learning and research. Apart from studying the social determinants of health, they concern themselves with the investigation and treatment of diseases. They likewise concentrate on efforts that promote health and prevent diseases. Gold *et al*. (2012) state as follows concerning developing health promotion intervention on social networking sites:

Very little has been published about how social networking sites might be exploited for health promotion interventions. A recent review of the use of social media for social marketing identified just four examples, none of which used the most common social networking sites listed earlier. Some health organisations have begun extending their presence into social networking sites; however, this has often been used as an additional form of marketing to promote services rather than for intervention delivery.

The questions which this study faces are therefore as follows: to what extent do Nigerian teaching hospitals use the social and new media to strengthen interactions between them and the population? In what ways have Nigerian teaching hospitals utilised the social and new media to promote health and prevent diseases? How best may Nigerian teaching hospitals harness the social and new media for health promotion and disease prevention?

2. Conceptual Framework

To fully understand the discourse at hand, the following concepts need definition and clarification:

Digital Age: When we say we live in a "digital age," or that we are "digital citizens" (netizens), what do we mean? This can be understood when reviewed from the point of view of Al Gore's 1994 speech as captured by Leslie (2012, p. 81).

IECT 2014

In order to preserve freedom and democracy, telecommunications development must be encouraged in every nation. In this way, citizens will think of themselves as members of the human family…interconnectness, will bring about robust and sustainable economic progress, strong democracies, better solutions to global and local environmental challenges, improve health care, and – ultimately – a greater sense of shared stewardship of our small planet.

So the essence of the digital age is to connect people, regardless of boundaries. And digital citizens according to Mossberger*et al.* (2011) are those who use the Internet regularly and effectively. Digital citizenship involves nine elements: digital access, digital commerce, digital communication, and digital literacy. Others include digital etiquette, digital law, digital rights and responsibilities, digital health and wellness, and digital security. In sum, the digital age allows the citizen to utilise the Internet via computers, mobile phones, and web-enabled tools to participate, engage, or get involved in society, politics, and government.

Social support: According to Cohen (2004, p. 679), social support, "refers to a social network's provision of psychological and material resources intended to benefit an individual's ability to cope with stress." There are three types of social support:

(a) Instrumental support such as material aid or financial assistance, or a helping hand.

(b) Informational support such as tips, advice, or guidance.

(c) Emotional support such as care, reassurance, trust, sympathy, empathy.

A fourth type is Appraisal support which involves making available information that is necessary for self evaluation purposes. This includes constructive feedback, affirmation, and social comparison. Social relationships have a great influence on health education and health behaviour. Significantly, the health components of social relationships include social integration, social network, and social support. Cohen (2004) explains social integration as participation in wide range of social relationships – a multi dimensional system with a behavioural aspect – active involvement in various social activities or relationships – and a cognitive aspect – one's ability to commune and identify ones social roles.

Apart from providing emotional, informational and material support, social networks as Cohen further states, regulate behaviour, and give room for social engagement. Besides and very importantly, social networks deliver means of contact to spread disease and the conditions for conflict, exploitation, stress transmission, misguided attempts to help and feelings of loss and loneliness.

These points must be noted because though Cohen is mostly referring to natural social support, networks, and integration, it is true that digital social networks often reinforce natural ones and we should increasingly seek ways of using our digital relationships to widen the network, offer social support, foster social integration and particularly promote health and prevent socially instigated problems such as tobacco, drug, and alcohol abuse and unsafe sex practices.

2.1 Social Media, New Media

Social media or new media according to Kita and Thesanvitz (2010) are Internet tools that permit users to participate and produce content. They are regarded as digital appendages of interpersonal means of promotion and the narrowing of broadcast type communication. They make co-operation, exchanges, interactions, transactions possible among different kinds of people irrespective of where they live. People use the Internet for a variety of purposes: Creation and retrieval of information, banking, payment of bills,

IETC2014

ticket broking, purchase of goods or services, voting, posting of comments and images, blogging and chatting.

Examples of social media include *Facebook, Orkut, YouTube, Myspace, Linkedln, Live Journal* and *Twitter*. Dube (2007) identifies five major characteristics of social media or networks as follows:

(a) Social media are user-based. Social media or online social networks are built on content generated and updated by users themselves. The contents are chats, discussions, pictures, movies, conceived and posted by users who get responses from other users and in that way the network expands and the content assumes a direction of its own. Without these contents the forums, applications and chat rooms would be devoid of messages.

(b) Social media are interactive. The social media allow people to connect with others and to engage in activities online in a give and take sort of way. The absence of linear modes of message transmission and the presence of transactional means of communication is a cardinal attraction of the social media.

(c) Social media are community–driven. The social media make it possible for people to form online communities based on shared interests such as sports, education, health, faith, sexual orientation, ethnicity, etc.

(d) Social media thrive on relationships. The social media are built on the basis of social networks which are hinged on relationship – friendship, family ties, ethnic ties, professional bonds, shared hobbies, etc. The larger the network, the greater the propensity of wider reach for content posted online.

(e) Social media are emotionally charged. Since social media are made up of network of people who are socially related, the emotional component of such relationships makes it possible to rely on members of the network for support in the form of love, sympathy, empathy, encouragement, solidarity, and to fight off feelings of rejection, loneliness, depression, etc.

Again, Kita and Thesanvitz (2010) emphasise that a network is made up of people, groups, organisations and relationships, flows, transaction that create connections online. It brings together people who bridge and bond by strengthening the social connection, usually through people who act as a connector, and very importantly, social networks are a great influence on behaviour. A few social media tools include:

i) RSS (Really Simple Syndication) – a newsfeed technology that allows subscribers to tell when a website has added new information.

ii) Social network websites (e.g. *Facebook, Linkedln, MySpace, Ning*) allow users to create a profile description, select other users as friends, contacts, and share their contacts' contacts as well.

iii) Wikis – a place where multiple people can collaborate.

iv) A forum – a website that centresaround discussion between users, organised by topic.

v) Video sharing (e.g. *You Tube, blip tv, qik.com*) services host and display files for others to watch, comment on, and share.

vi) Podcasts (mp3 or other audio formats) are audio files listened to on a computer or mobile music player (e.g. Ipod).

2.2 Theoretical Framework

IETC 2014

Man is a social being. Fiske (2010) states that the most striking feature of humans is their sociality and that social relationships permeate all facets of human life in the most extensive, complex and diverse of ways. To Fiske, social relationships occur where two or more persons transact with each other in such a manner that their behaviour, emotion, judgment, or thought complement each other. In other words, Fiske means that social relationships occur when someone, "acts under the implicit assumption that they are interacting with reference to imputably shared meanings" (p.1).

Furthermore, according to Fiske, people often employ four basic models to coordinate many features of sociality around the world. These models which have come to be known as the relational models theory are as follows:

(a) Communal Sharing: This is a relationship where persons in a group relationship take themselves as equivalent or undifferentiated within the social domain.

(b) Authority Ranking: In this relationship, people assume unequal postures where subordinates respect and obey while superiors give orders and offer care and protection.

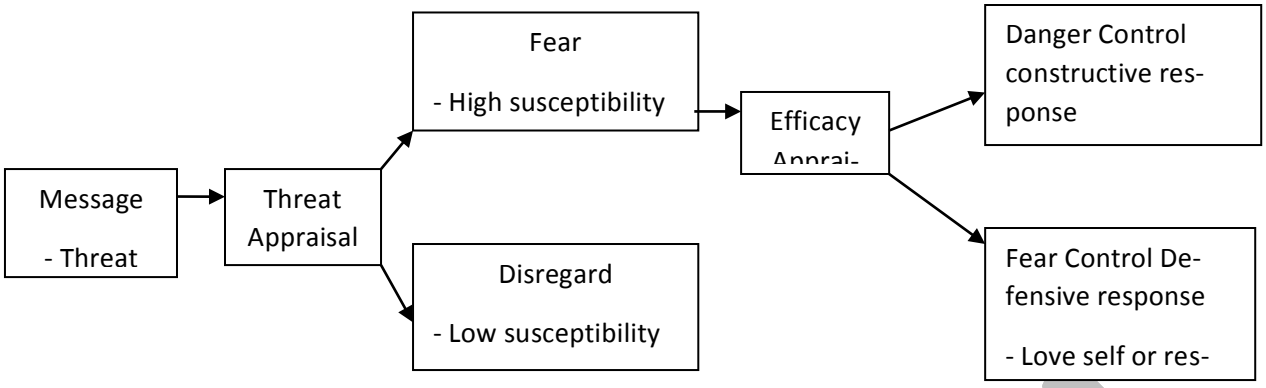
(c) Equality Matching: In this relationship, people strive not to upset the balance among participants and convey the notion of taking turns, equal share distribution, or one person-one-vote.

(d) Market pricing relationships which does not necessarily involve money describes a relationship that embraces socially meaningful ratios or rates namely salaries, rents, interests, etc.

It is good to keep in mind that as humans interact whether physically or digitally as occur over the social media or new media, these models are in the words of Fiske (2010, p . 2) used, "to construct, coordinate, and contest social action, as well as to interpret, plan, and remember."

Another key communication theory that situates well within our discourse is the social exchange theory. Explained and initiated by Thibault and Kelley (1952), the theory is hinged on the exchange of rewards and costs to quantify the values of outcomes from different situations for a person. What the theory means is that individuals work to reduce costs and increase benefits and use what they judge as possible rewards to decide or regulate their relationship with others.

The value of the social exchange theory is that it is based on the principle of reciprocity. When we communicate in the social setting, the message we send out is likely to be responded to in terms of what it is worth and what the receiver perceives as the gain or loss in the message. This principle works for face to face relationship as well as relationships over the social media or the new media. If health tips are communicated over the social or new media, what does the source stand to gain and what does the receiver stand to gain? If the receiver is required to take action or give up a behaviour, what is the value of the action or the cost of given up behaviour?



Lastly, the Extended Parallel Process Model (EPPM) is relevant to our discussion. Witte (1992) originated this theory and Hipper (2011) explains that, the theory is based on two main ingredients namely: threat and efficacy. Threat is said to comprise of susceptibility and severity whereas efficacy is made up of self efficacy and response efficacy. What this means is that if the desired response is to come from an audience, the message must have (a) Enough high levels of both threat and efficacy; and (b) Higher levels of efficacy. It is necessary to note that, messages with enough levels of susceptibility or severity are difficult to discountenance. Also, messages with some level of threat but low level of efficacy result in denial or avoidance as the audience manages to control the fear.

IETC 2014

Happily, messages with high threat and high efficacy levels stimulate the audience to switch into danger control by engaging in salutary behaviour to minimise the threat. This theory, adapted from Witte (1992) by Hipper is represented thus:

IETC 2014

Figure 1: Diagram of the Extended Parallels Process Model (EPPM)

Adapted from Witte (1992); Source: Hipper (2011) new media @ hhs.gov.

As we can see, using models and theories does help us understand health communication whether we are dealing with the traditional (mass) communication, the new media or social media. Hipper (2011) concludes that a theory such as this gives us the template for our message or intervention, telling us the features we need to know about our target audience and the variable that are prone to influencing their actions. It equally permits us to assess the efficacy of our intervention and thereafter repeat our success or better our poor performance, benefits that come when we employ social media.

2.3 Review of Related Studies

This review of very recent and related studies is based on the following three works:

(1) Gold, J. *et.al.* (2012). Developing Health Promotion Intervention on Social Networking Sites: Recommendations from the Facespace project. *Journal of Medical Internet Research*, 14 (1): e30.

This study was predicated on the fact that the Internet has significantly altered the way people obtain information and communicate. It noted that social networking sites permit people to maintain, develop, and view their social networks. They also offer additional functions such as public and private messaging and photo, video and other content sharing and that *Facebook, Twitter, Linkedln* and *Myspace* were the most popular social networking sites in the world with *Facebook* having in 2012, 500 million active users.

IETC 2014

The authors lamented the paucity of published works on the utilisation of the social media for health promotion interventions. This they say makes it difficult for others to reasonably consider if and how they might approach developing interventions in the spaces. Also, the absence of evidence for assessing such interventions makes it tough to say if health promotion interventions using social networking sites yield fruits.

This provided the rationale for the Facespace project in 2009 and 2010 – a novel health promotion intervention utilising social networking sites. The project involved the delivery of sexual health promotion through social networking sites to two main at–risk groups – youths of between 16 and 29 years and gay men. In the project, public health researchers, specialists in user interaction with information technologies, a creative production firm, and a community – based group were brought together.

The concept of the project involved using fictional characters to post video content and to interact on sites such as *Facebook, YouTube, Twitter* and *Flicker* with sexual health promotion messages embedded within some postings and interactions. On completion of the project, the report made the following observations/recommendations:

(a) Health interventions on social networking sites need extra multidisciplinary specialists in social media and knowledge of how end users interact and engage in online milieu.

(b) The new and challenging setting of social networking sites should be considered in project timeliness because applying and obtaining ethical, legal, and organisational permits may take a longer time.

(c) Since the online environment in suffused with copious content; being usually appealing is not enough to attract attention. An established base of end users when the site is opened and the use of online advertisements and photo tagging may help attract end users.

(d) To guard against the loss of participants over time within an online intervention, it pays to boost or maintain engagement by offering the intervention over a shorter period, zeroing in on one core message, making all posts as standalone messages as well as giving end users more room to generate and juggle content on their own.

(e) It is important to ensure that health interventions get to the target group. The high point occurs when sufficient members are largely interested in a post to share it with friends, who share it with their friends continually. To make this happen, it pays to structure the campaign appropriately, comply with ethics, and imbue the message with fun and imagination and make it accessible and involving. Another way is to get people with huge social connections to spread the message.

(f) The definition of a successful programme and the means of measuring it is critical.

The conclusion of the authors of this study is that, as the communications media continue to metamorphose, if health organisations do not embrace the social/new media they risk being isolated.

2. Gallant, L. M. *et. al.* (2011).Promoting Participatory Medicine with Social Media: New Media Applications on Hospital Websites that enhance Health Education and E-patients Voices.*Journal of participatory medicine*, 3:e49.

IETC 2014

In this study, Gallant *et. al.* note that the nature of health communication is changing as more people rely on the Internet for health information. They state that understanding web-based communication tool development that engages e-patients can better guide effective healthcare strategies and intervention and promote participatory medicine.

The problem that necessitated this study was that whereas hospitals are the pivot of public health information and health education, the extent to which hospital websites help in the achievement of those important health goals was unknown. The aim of the study was therefore to examine how hospitals utilise their websites to realise their healthcare mission using the various media and content delivery schemes.

The study made use of an inductive content analysis to examine the websites of 14 top-ranked United States hospitals. The authors identified different types of online media formats used by each hospital e.g. blogs, instant-messaging, audio clips, and video clips, etc. Thereafter, patient health information content such as disease information, symptom checkers, and health education was identified within each media format. The analysis conducted between January 5, 2011 and February 28, 2011 showed the following six categories of new media applications:

(i) Social media applications: social media allow one group of people to connect with another. In hospitals, they allow e-patients to receive health communication messages. A high number of hospitals analysed used *Facebook*, hospital-sponsored *YouTube* videos and *Twitter* to communicate with e-patients. Health information on the social media sites included patients' stories, medical expert opinion, details of procedures or tests, and health tips on diet, pediatric care, or cancer prevention.

(ii) Blogs: These are text-based web messages. The study showed that the hospital websites contained health communication messages scripted by medical experts as well testimonials from patients. However, the study observed very little additional engagement between e-patients and blogging health providers.

(iii) Web-based Broadcasting: The study found that the hospitals broadcast media formats include online videos, podcasts, and webinars directly on their websites instead of using *You Tube* and *Facebook* to present various forms of health information from the hospital for e-patients and in the case of webinars, medical and support staff training in half the cases.

iv) Web-enabled e-patient communication tools. These make it possible for care providers and e-patients to interact. The study identified tools such as email, online chat, text messaging, and online support groups.

(v) Mobile applications: These are utilised to support health information through wireless means available in smart phones, and ipad. The applications include walking exercises, symptom checkers and meditation exercises. Five of the hospitals had mobile applications.

(vi) Online health tools: These permit e-patients to learn and educate themselves about their individual health needs. Examples of these tools are health dictionaries, health topic guides, event calendars, body mass index calculators, etc. The study showed that 11 hospital websites had patient portals through personalised accounts involving administrative tasks, accessing personalised medical information and interacting with health professionals. E- Patients could use these portals to make appointments, request referrals and prescriptions refills, pay bills, update contact information or insurance information and pre-register and fill forms for appointments.

The conclusion of the study is that it provides insights into how hospitals and other health-based websites can employ online media for future health advocacy. The merits of using online media are that they boost e-patients' involvement in health information and reinforce the objectives of healthcare agencies in the provision of healthcare resources to better health results.

IETC 2014

3) Carroll, J. A. & Kirkpatrick, R. L. (2011). Impact of social media on adolescent behavioural health. Oakland, CA: California Adolescent Health Collaborative.

Carroll and Kirkpatrick observe that teenagers in the United States often use the Internet, cell phones, and video games to gather information and communicate with one other. The social media afford them this opportunity because of their special capacity to engender interaction and offer strong, fresh ways for youths to create and explore the social milieu. As youths' recourse to the social media, they are at the same time nurturing their identity, sexuality, physique and morality.

The study bears data to the effect that more than 70 percent of youths have cell phones and use them for text messaging. It also shows that more than 70 percent of teens have used social networking sites such as *Facebook* and *Myspace*. Also, it indicates that more than 60 percent of online teens watch online videos through online video sites such as *YouTube.com* and that 61 percent of online teens have commented on a blog.

For teens from California's urban, suburban, and rural communities, the following benefits of social media on adolescent health have been documented:

- Extensions of friendships developed earlier from school, religious organisations, sports and other local activities as well as experience of connectedness and avenues to learn from one another.
- Provision of a supportive environment to explore romance, friendship, and social status and opportunity to share and discuss taste in music, film, video, games and teen culture generally.
- Filling of void for support that is absent in traditional relationships especially for teens with different sexual orientation, the socially withdrawn or those who feel they are unattractive.
- A major source of information and advice particularly on health matters regarding diet, drug use, sexual health, and physical fitness.
- A feeling of independence and freedom that comes with staying in touch, communicating with others, and seeking out social support from parents, siblings, relatives, and friends.

Regarding the protective aspects of what teens do online, the study shows that:

Teens join an online community or a "group" on *Facebook* or *Myspace* in support of a cause (54%), They post creative writing or artwork (53%). Post or share video or music they have created (50%). They organise or invite others to an event using social media (45%). They volunteer for a campaign, nonprofit group or charity (34%), and participate in online study groups (26%).

On the negative side, they use of social media among teens also goes with some risks. These include negative effects on mental health (depression and negative self-views), cyber bulling, texting/sexting, dangers of sexual solicitation, and exposure to problematic and illegal content and privacy violations.

The study cites examples of social media use for improving adolescent health outcomes. Three of them are: **Hook up:** a statewide text messaging source which provides basic facts about reproductive health and relationships. **Teensource** is a website resource for youths who seek information on healthy and

IETC 2014

responsible sexual lifestyles while **Tune** is an interactive health and wellness programme that helps teens make positive choices and healthier lives through music. In its conclusion, the study held that a multi-pronged approach that employs several social media platforms, and in-person contact possess the capability to reach young people with correct health information, resources and support.

There are other studies which relate to the use of social media in healthcare. Posing the question for the United States audience, on who will drive the social media in healthcare, Rauscher (2011) carves out a big chunk of role for physicians, the pharmaceutical industry and the Federal Government. He sees the Health and Human Services as a social media champion, an authoritative source of health information that uses the social media to promote education, collaborate and engage patients and clinicians on a wide range of health issues.

Similarly, in a study of how US hospitals use social media, Thaker, Nowacki, and Mehta, Sandlin (2011) reports that only (21%) of hospitals use social media and these are large, urban, health-system-based, non profit, non-governmental organisation–run ones engaged in graduate medical training or in pediatric care. Very significantly, the hospitals were using the social media to target a general audience (97%), provide content about the hospital (93%) announce news and events, promote health and further public relations (89%).

However, Sandlin states that it is worrisome that the hospitals did not use the media in social ways because their mode of communication was linear not transactional. Rather than use the social media to send out one-way messages to the masses, they should give patients the opportunity to respond and engage.

To this end, Howard (2010) has suggested five ways in which social media help promote good health. These include online communities and connections, Twitter Telemedicine and Hello Health, socialising community health data, healthcare wikis, and open source and connecting health care communities.

Lastly, in Lumba's (2012), "Ten ways to use the social media to promote wellness," the ten tips for using social media to boost engagement include; getting early adopters involved, rewarding successes publicly, bringing people together, paying attention to small details, and making it fun. Others are, owning the conversation, integrating real experiences, starting open threads for learning, being generous with health tips and making it challenging.

3. Method

This study made use of inductive content analysis to examine the websites of twenty Nigerian teaching and specialist hospitals. According to Gallant, Irizarry, Boone and Kreps (2011), this method is now more employed to study Internet content and that the paucity of empirical work on hospital website content, the virtual lack of research on hospital websites and online multimedia formats make the use of inductive analysis appropriate.

The 20 hospitals which formed the population and sample of the study included: (1) University College Hospital, Ibadan. (2) Lagos University Teaching Hospital.(3) Lagos State University Teaching Hospital. (4) ObafemiAwolowo Teaching Hospital, Ile Ife. (5) OlabisiOnabanjo Teaching Hospital. (6) National Ortho-

IETC 2014

paedic Hospital, Lagos. (7) University of Illorin Teaching Hospital. (8) University of Benin Teaching Hospital. (9) University of Nigeria Teaching Hospital. (10) NnamdiAzikiwe University Teaching Hospital.(11) University of Calabar Teaching Hospital. (12) University of Uyo Teaching Hospital. (13) University of Abuja Teaching Hospital. (14) University of Jos Teaching Hospital. (15) University of Maiduguri Teaching Hospital. (16) Bayero University Kano Teaching Hospital.(17) Ahmadu Bello University Teaching Hospital, Zaria.(18) Othman Dan Fodio University Teaching Hospital, Sokoto.(19) University of Port Harcourt Teaching Hospital. (20) National Hospital, Abuja.

These hospitals were elected for study because they are research centres, referral hospitals and are referred to as centres of excellence in training, personnel, technology, and innovation. If any health institutions are to utilise the new and social media for health purposes, then these should be teaching and specialist hospitals.

The content categories examined were: public health/education and promotion content, employee and public relations content and in-patient/out-patient-specific content. The unit of analysis was made up of text, images, menus contained in the hospital web pages. A total of 160 web pages were analysed with each hospital having an average of eight pages. This study was carried out between September 10 and October 14, 2012.

4. Findings and Discussion

The results of the study are presented as follows:

Table I: Utilisation of New/Social Media

Type of Media	Number of Hospitals	Percentages
Website	13	65
Linkedln	5	25
You Tube	0	0
Twitter	2	10
Facebook	15	75

Table 1 above shows that of the twenty hospitals studied, 13 (65%) had their own websites. Moreover, five hospitals (25%) were also on *Linkedln*, none (0%) on *YouTube*, 2 (10%) on *Twitter* and 15 (75%) on *Facebook* social media channels. The Lagos University Teaching Hospital had the strongest social media presence. Besides hosting its website, it was also on *Linkedln, Twitter* and *Facebook*. Similarily, the University of Ilorin Teaching Hospital is on all three social media. However, teaching hospitals in Uyo, Jos, Kano, Maiduguri, Sokoto, Nnewi, and Lagos State had no websites. The study shows that while the majority (65%) of the hospitals hosts a website, more of them (75%) were on *Facebook*. It was observed that the hospitals use of *Linkedln* was particularly to post the profiles of the medical personnel, their specialties and careers. On the other hand, their *Facebook* pages mainly contained postings of satisfied patients or their relatives. Health and medical questions and issues were not raised there.

IETC 2014

Table 2: Purposes of Utilising New/Social Media

Purposes of Media use	Number of Hospitals	Percentages
Presentation of vision/mission	13	65
Provision of content for clients	12	60
Posting of admin/personnel information	13	65
For recruitment, contacts, tenders	12	60
Public health/medical information	5	25
Receiving feedback from patients	20	100
For financial information/bill settlement	2	10
Interaction/engagement with patients	0	0

Data in Table 2 indicate that the teaching hospitals in Nigeria use the new and social media for a variety of reasons. Going by the analysis of their websites and web pages, the chief purpose is that of receiving feedback from people (100%). Other reasons were to present their vision and mission statements (65%), and provide details through which they can be contacted through telephone numbers, email address, web mails, street address or the social media channels (60%). The hospitals also use the new media to give information about their administrative structures and personnel (65%) and about recruitments, deployment, tenders, and contacts (60%).

However, the table also shows that only (10%) of the hospitals use the new media for financial dealings with their clients. That means, little provision is made for online payments and electronic booking or referral of patients. Very significantly, the data show that the hospitals are using the new social media to offer the public health and medical information only at the level of 25 percent and not at all (0%) to engage the public (patients and relatives) in a two-way communication.

Table 3: Content of hospital web pages

Content	Number of Hospitals	Percentages
Public health and education content	5	25
Employee and public relations content	20	100
In-patient/out-patient-specific content	6	30

Table 3 shows that five or 25 percent of the hospitals use the new and social media to post health and medical information which could be of use to the public. However, all 20 hospitals whose websites were anlaysed used the new media and social media for content that could be described as serving public, community, or employee relations. These include information on employment opportunities, posting of staff, bidding for contacts, etc. Also, the data indicate that only six of the hospitals or 30 percent have content that are specific to or generated by in-patients, out-patients, or their relatives. Such information borders on online booking, bill settlement and referrals.

IETC 2014

The findings of this study can be summarised as follows:

(a) Sixty-five percent of Nigerian teaching hospitals have websites while (75%) are on *Facebook*. Teaching hospitals presence on *Linkedln* and *Twitter* is between 10 and 25 percent. There is no presence on *YouTube*. While seven hospitals have no websites, two of the hospitals are on three social media channels.

(b) The major uses to which Nigerian teaching hospitals put the new and social media are to get feedback from clients (100%), present their vision and mission statements (65%), post administrative and personnel structure information (65%), and give details of contracts (60%). These media are little used for health promotion (25%), financial transactions (10%) and interactive engagement with clients (0%).

(c) The content of Nigerian teaching hospital web pages can be categorised into three as follows: employee/public relations content (100%); in-patient and out-patient–specific content (30%), and public health promotion and education content (25%).

The implications which findings from this study have for theory and practice are as follows:

(i) Fiske's theory of relationships which holds that human behaviour affects and is affected by others, and suggests that relationships are very important in health and disease situations; infers that teaching hospitals and indeed hospitals in Nigeria are not taking enough advantage of 'relationships' by not engaging more with the public on an interactive basis or by not offering enough health promotion and disease prevention messages to people who can further influence others. Also, by taking advantage of the extended parallel process model, care would be taken to design effective messages.

(ii) By not using the new and social media to engage more with the public in significantly interactive ways, teaching and specialist hospitals in Nigeria are failing to exploit the merits of social exchanges to influence health outcomes.

5. Conclusion

Social and new media have gained prominence in human affairs. They are also becoming increasingly significant in health and medical matters. In this study, we have shown that Nigerian teaching hospitals are only beginning to harness the power of the new media for health purposes. The conclusion of this study is that the Nigerian teaching hospitals' recourse to the new and social media is for the purposes of publicity and propagation of self image. To change this we make the following suggestions:

6. Recommendations

IETC 2014

(1) Since teaching hospitals are centres of research and innovation, their websites should be powered to contribute to health literacy among the public. People who visit hospital websites should receive health tips, education and explanations of medical and surgical procedures. These may help them prevent disease and promote health.

(2) In this era of participatory medicine, teaching hospitals should increasingly use the new and social media to provide avenues for patients and relatives to tell their stories, and for health professionals to offer informed opinions on medical and health matters.

(3) Health professionals should establish blogs where they comment on health issues to which patients and relatives contribute to expand health care givers/client transaction.

(4) To help build a community of e-patient, hospitals should host online videos, podcasts and websites for the presentation of various bits of health information if their budget permits them to do so.

(5) Establishing patient portals on hospital websites can also make things easy for e-patients. With this, they can arrange for appointments, request for referrals, pay hospital bills, and update their records.

(6) As centres of innovation, teaching hospitals should invest in online health tools such as body mass index (BMI), health indices calculators, and health dictionaries as features of their websites to capture young, upwardly mobile ICT users as a way of gingering their interest in health matters.

As Kita and Thesenvitz (2010) have noted, social media can educate, entertain, empower and provide information, education, inspiration and innovation, as well as stimulate knowledge transfer to many by many, it is hoped that if these suggestions are taken, Nigerian teaching hospitals would contribute more effectively to the utilisation of new and social media to promote health.

"Will the internet ever replace colleges and universities as we know it today?" An Internet discussion about the future of higher education.

Douglas S. Franklin*, Ph.D. Ohio University, Athens, OH, 45701 USA78*

Abstract

This paper explores a nearly 400-comment online discussion regarding higher education and the impact technology and the Internet has or will likely have on its future. From "I predict only 200 research brick and mortar universities will be alive and provide online programs" to "online education is growing, but the early research shows that blended learning is the best for students", the diversity of comments provides a varied spectrum of thought concerning the future of higher education. The results of the discussion of over 50 professionals on a Linkedin discussion group of higher education professionals suggests that technology will play a major in higher education role but traditional institutions will continue to be around for the foreseeable future.

Keywords: Type your keywords here, separated by semicolons ; American Higher Education; Technology; Policy; Issues; Internet; MOOC

IETC 2014

Introduction

Matt Saccaro's blog, "*When will the Internet replace college?"* recently spawned an online discussion of a Linkedin group interested in higher education. The nearly 400-comment online discussion covered a two-month period and raised many of the same issues facing higher education scholars, administrators and faculty. In his blog, Saccaro (2014) addresses issues facing American colleges and universities as well as graduates from those institutions including: high student debt and delinquency rates; poor job market and high unemployment facing recent graduates, poor student performance and students academically adrift, employer claims mediocre job of performance by recent college graduates; and concerns about removing less profitable academic departments. He suggests that overall, the "American post-secondary system is in the toilet" but suggests that while "the Internet has not bested the post-secondary education system, … there is hope."

Of course Saccaro is not alone in his criticism of American higher education. Richard Vedder, Director for the Center of College Affordability & Productivity (2014) and author of *Going broke by degrees* (2004), an emeritus economics professor from Ohio University is a regular critic of the rising costs of higher education, student financial aid policy, educational inefficiencies, and the resulting impact on student debt. In *Academically adrift*, Arum and Roksa (2011) discuss the limited learning that occurs on college campuses, the lack of academic rigor and the uneasy agreement between faculty and students that allows both parties to pursue their own interests. Sperber (2000) suggests big-time sports and college drinking have 'crippled' undergraduate education. Archibald and Feldman (2011), cite the perception of a dysfunctional system of higher education caused by "prestige games and gold plating" (p. 93), eventually leading

* Corresponding author. Tel.: +0-000-000-0000 ; fax: +0-000-000-0000 .
E-mail address: author@institute.xxx

to higher costs which lead to higher tuition. Taylor (2010) suggests, "The quality of higher education is declining: colleges and universities are not adequately preparing students for life in a rapidly changing and increasingly competitive world" (p. 3).

College presidents seem to understand the issues although there is limited evidence they will take steps to address the issue. In a recent study conducted by the *Chronicle of Higher Education* (2014) and sponsored by the learning management system (LMS) company Blackboard®, 68% of college presidents surveyed disagreed that higher education would be similar to the way it is today in 10 years, however, 60% felt that U.S. higher education was moving in the "right direction" to address these changes (Selingo, 2014). .

Two recent documentaries, *Declining by degrees* (Merrow, 2005) and *Ivory tower* (Rossi, 2014) address the issue. Through a series of interviews and video clips, *Declining by Degrees* suggests some of the problems with higher education include low retention and graduation rates, students drifting through school, and the fact that too many students do not have the skills to be productive employees. Merrow (2005) suggests some possible causes for poor college performance include high rates of student drinking, excessive work loads for some students, high incidence of part-time teachers, classes that are too large, underprepared students for college work. He suggests that grade inflation is a result of the desire to mitigate poor retention rates and provide an inaccurate picture of student performance. The result is that college produces students without the skills necessary to produce productive employees. Almost 10 years later, *Ivory Tower* (Rossi, 2014) reiterates similar themes and presents a radical view of the result of inaction is a 'time bomb of student debt and suggesting the value of higher education may not be worth the investment.

The purpose of this study was to investigate the perspectives of the participants involved in an online discussion about higher education and the impact technology and the Internet has or will likely have on its future. Many participants addressed the aforementioned issues in their comments either directly or indirectly.

IETC 2014

Methods

The primary data for this study were generated from comments collected over a two-month period of an online discussion in a Linkedin Group focused on higher education. The study used naturalistic inquiry, a qualitative research technique that "takes place in real-world settings …and the phenomenon of interest unfolds naturally in that it has no predetermined course established by and for the researcher" (p. 32) and empathic neutrality and mindfulness a technique that sees the researcher as someone who "seeks vicarious understanding without judgment (neutrality) by showing openness, sensitivity, respect, awareness, and responsiveness (mindfulness)" (Patton, 2001; p. 40). Demographic data and themes were generated from thematic analysis of the comments made during the online discussion period. Thematic analysis, the "encoding qualitative information" (p. vii.) by developing 'codes' that serve as data labels for sections of data (Boyatzis (1998), was conducted by generating a spreadsheet using the topics of author, type of work, themes, location or origin of the comment, and author's credentials.

Care was taken to ensure participant anonymity. With the exception of those made by the author, comments taken from the discussion were not attributed to any individual, organization or group. The intent to collect, analyze and publish the data was made evident through a comment made by the author

and posted on the discussion. The comment received one "like" from one participant. No other comments were made suggesting approval or disapproval of the intent to publish.

Limitations of the Study and Discussion

This study was intended to record the observations of an online discussion of members of a Linkedin group to determine what themes might inform research associated with technology use in higher education and to explore the views of participants as to whether technology would replace colleges as we know them today. The results should not be considered generalizable and should be viewed in the context of an informal online discussion. Other than a personalized "handle" there was no way to determine credentials or experience of participants engaging in the conversation. An attempt was made to differentiate participants based on the limited information provided and the results were used in the demographic section and in grouping based on perspectives.

Two primary contextual limitations of the study became evident during the analysis of the data. The first was the lack of a common view of the purpose of college specifically or higher education as a whole. The second was the lack of a common definition of college enrollment and the differing needs of traditional and nontraditional students. These limitations will be addressed in the discussion section of the paper.

Findings

The question *Will the Internet ever replace colleges and universities as we know the today?,* generated 376 comments from 53 participants working or engaging with both academic and non-academic organizations Forty (n=40; 75%) participants identified themselves as a tenured or contingent faculty member, including twenty (n=20) international, thirteen (n=13) US and seven (n=7) faculty from an unknown origin. Eleven (n=11) participants were identified as working in businesses as a consultant and/or entrepreneur. It was not possible to project the work status of two (n=2) participants. The majority (n=31; 58.5%) of participants made one or two comments while the majority of the conversation was generated by a minority of participants (n=7; 13.2%) who produced a majority (n=249; 66.2%) of the comments. One participant, an international business entrepreneur made 21.5% (n=81) of the comments. The next most active participant was a U.S. adjunct professor in higher education and the author who made 13% (n=49) of the comments.

The conversation covered more than the present or future impact technology has or will have on higher education. The broad based discussion included topics including teaching and learning, institutional quality, organizational efficiency and effectiveness, educational quality, globalization in higher education, the declining economy and its impact on hiring students, diploma mills, and issues relating to overbuilding on campus, student drinking and athletics.

In general, the tone of the comments was respectful but difficult for some participants. There was a good use of data to support positions but the discussion suffered from an overuse of unsupported views, hyperbole and an overreliance on personal experience. One participant conducted an early analysis of

IECT 2014

comments stating, "Lot's of people, from many different places (including different countries) participated; for the most part, all participants were respectful of each other's point of view; participants often presented data or links to data published in reputable (but not necessarily scientific) sources; everyone had the choice to be active participants. Some were more active than others, but no one seemed to be keeping score; all comments were recorded and you could go back to re-read what others had said; participants were free to leave the conversation at any time and re-enter at any time; some people were better (or had more time) at this; participants seemed more relaxed; some participants in this discussion are engaged in other discussions as well; you can reply to a comment in public or only for the commenter. I have never had a better faculty discussion, since I started teaching in 1969" (Unnamed participant).

The analysis of the discussion comments revealed the majority (n=37; 69.8%) of the participants did not feel that technology would replace higher education, as we know it today. The remainder of opinion ranged from a definite yes (n=6; 11.3%) to maybe (n=3; 5.6%). Several participants (n=7; 13.2%) discussed the topic without offering an opinion on the original question. A common theme for participants indicating that technology would not replace traditional colleges in the near future was that technology can help students with a diverse learning styles but that it should be used as a tool in a balanced and blended approach to education. Other views suggested the need for extracurricular or co-curricular engagement to support learning indicating the student experience could not be replaced by technology. Others indicated the need for deeper interpersonal connection between faculty and students. Some comments reflected a concern for the potential for barriers to education through technology including the difficulty with interpersonal communication. Finally, several comments suggested that technology did not address the varying purposes of college and was limited to knowledge collection and transmission. One comment reflected the thoughts of the majority opinion of the group in saying "online (learning) will earn more space in higher education worldwide, but (will) always will be supplemented with classroom or lab education for the development of experimental work and research." In addressing the need for interpersonal connection one participant offered, ""the interaction, and participation with humankind are very important."

Participants indicating technology has or will replace higher education in the near future cited the existence and growth of online courses, the development of Massive Open Online Courses (MOOCs), worldwide open universities, and disruptive innovations will result in change. The most radical point of view saw the closure of thousands of institutions suggesting. "I predict only 200 research brick and mortar universities will be alive and provide online programs." Another summarized this view with, " all new innovations disrupt something already being used. Electrical car disrupts the profits of gas companies. Therefore it has been stopped for many years, and… is still being blocked. (Similarly), excellent online degree programs from elite universities will be blocked by existing beneficiaries, those…existing colleges and faculties" (which are privileged by the status quo.) A caveat of sorts by some participants with this view was the need to ensure quality of the online product. One comment, obviously emphatic about his view, indicated, "(the) important point is WHO IS DELIVERING THE KNOWLEDGE IS IT A VALUABLE KNOWLEDGE…MIT, Harvard and elite universities (have now) come to picture. … If they provide degrees and charge only $ 100-200 per course WHO do you think … would go to other schools… (The) QUALITY OF THE KNOWLEDGE MATTERS. ELITE UNIVERSITIES HAVE PROVED THEMSELVES GOOD FOR CENTURİES TO BE GOOD. One participant was very simplistic in his answer indicating, "it (technology) already has" (replaced colleges and universities). Another participant suggested taking a more long-term view with " I do not see the Internet replacing universities or colleges any time soon, but continued changes enabled by the dynamism of the technology are imminent.

Discussion

IETC 2014

The findings of the discussion seem straight forward and to the point. The majority of the participants felt technology had a place in higher education but would not replace colleges and universities, as they are known today. In reflecting on the discussion one wonders can the question, '*will the Internet ever replace colleges and universities as we know it today?*' be answered without an understanding the role and function of both the Internet and of college? In order to reinforce the views of the participants, clarification of the role and function of both technology and higher education is undertaken.

It seems appropriate to use resources developed from the Internet to help us define the Internet. Wikipedia, The Free Encyclopedia, an editable, online encyclopedia indicates "the internet is a global system of interconnected computer networks that use the standard internet protocol suite (TCP/IP) to link several billion devices world wide. Webopedia (2014) an online tech dictionary for IT professional indicates, "The Internet is a massive network of networks, a networking infrastructure. It connects millions of computers together globally, forming a network in which any computer can communicate with any other computer as long as they are both connected to the Internet. Webopedia differentiates between the Internet and World Wide Web (WWW) suggesting the "Web is a way of accessing information over the medium of the Internet. It is an information-sharing model that is built on top of the Internet. In short, the Internet is a relatively young system of networks that support the World Wide Web and other tools in the transfer of knowledge.

Defining American colleges and universities is a bit more cumbersome than the simplistic definition of the Internet or the World Wide Web. Since the founding of Harvard College in 1634, American higher education has evolved to become, according to many, the world's 'global gold standard' and envy of the world. The complexity of American higher education is obvious when reviewing the Carnegie Foundation for the Advancement of Teaching classification of institutions (Carnegie Foundation, 2010). Using a highly complex series of flow charts, the Carnegie Foundation clarifies role and function of America's (n=4,633) degree granting institutions of higher education in a variety of ways. The first divides the institutions by undergraduate and graduate experience. Within the undergraduate instructional program schools (n=3601), there are those institutions that are associates (n=1714), associates dominant (n=240), and baccalaureate dominant (n=1647). When divided to produce an undergraduate profile institutions with undergraduates increases (n=3741 and is divided by four-year institutions (n=1920) and two-year institutions (n=1821). Within the graduate instructional programs (n=1361), there are institutions that are post-baccalaureate (non-doctorate institutions) (n=912) and doctoral institutions (n=449). Carnegie goes on to offer a basic classification for all four-year institutions (n=2713) as doctorate granting institutions (n=294), masters' institutions (n=728), baccalaureate institutions (n=808), special focus institutions (n=851) and tribal colleges (n=32).

The United States Department of Education identifies postsecondary institutions as public (n=2008) and private (n=5,389), and nonprofit (n=1,892) and for-profit (n=3,497). The total institutions (n=7,236) identified the National Center for Education Statistics, the research arm of the Department of Education includes institutions (n=2,045) offering programs that do not offer degree programs (Ginder et al., 2014).

Enrollment in these institutions reflects the diversity of population and the differing reasons for attending colleges. The total enrollment for American higher education (n=28,305,025 includes institutions with undergraduate and diploma programs ((n=24,524,988; 77%) and graduates ((n=3,780,037; 13%), (Ginder et al., 2014). Degree seeking undergraduate enrollment in the United States has increased 48% since 1990 and is expected to hit 20.2 million students by 2023 (NCES, 2014). Student enrollment is heavily weighted towards women in both undergraduates (n=16,179,594; 57%) and graduate students (n=2,262,755; n=59%). The majority of aforementioned growth in enrollments is expected to be with women students, 18% vice 8% for males (NCES, 2014).

IETC 2014

Many of the flaws associated with American higher education such as heavy student drinking and excessive partying, floating through school and academically adrift (Arum et al., 2011), poor post graduate employment rates, and dissatisfaction with employment preparedness present a picture of traditional age college students, those young adults entering post-secondary education right after high school, at roughly 18-19 years old (NCES, 2014). While traditional age college students make up the majority of full-time undergraduates at public (88%), private nonprofit (86%) and public 2-year (71%) schools, the majority of full-time students at 4-year private for-profit (71%) and 2-year private for-profit (52%) were over the age of 25 and are considered nontraditional students. Nontraditional students are 24 or older and have usually taken time away from school to work, serve in the military or engage in some other life experience. The impact of nontraditional students on enrollments is even more pronounced for part-time students. Other than at the 4-year (50%) and 2-year (52%) public institutions, the majority of part-time students at all other institutional types were nontraditional students over the age of 25. Nontraditional students make up the majority (60.3%) of all part-time students. A significant percentage of these students (47.5%) were 35 and older (NCES, 2014).

In addition to the complexity suggested by the Carnegie Foundation and the U.S. Department of Education, institutional diversity of purpose clouds the understanding of American higher education. In *Higher Education in America* (2013), Derek Bok suggests, "American colleges and universities do not have a single goal…(and) have not had a single unifying purpose for well over one hundred years (p. 28).

"The American college was conceived of as a social investment" (Thelin, 2004 p. 58) but as evolved over time. Clearly, early federal legislation such as the Morrill Land-grant acts of the mid 19th century, and 20th century laws associated with educating returning veterans from World War II, the National Education Defense Act of 1958, and the Higher Education Act of 1965 and its subsequent reauthorizations speak to the importance of higher education as a the need to support societal interests.

In *Uses of the University* (2001), Kerr wrote "the basic reality, for the university, is the widespread recognition that new knowledge is the most important factor in economic and social growth. We are just now perceiving that the university's invisible product, knowledge, may be the most powerful single element in our culture, affecting the rise and fall of professions and even social classes, of regions and even nations" (pg. xii). Kerr suggests the modern "multiversity" is a confluence of the purposes of universities of the past. From Cardinal Newman, the 19th century founder of the University of Dublin, the purpose of the university is "the high protecting power of all knowledge and science, of fact and principle of inquiry and discovery, of experiment and speculation; it maps out the territory of the intellect and sees that…there is neither encroachment nor surrender on any side" (pg. 1). Newman's view of 'liberal knowledge', which is related to all walks of life, lay in stark contrast to other scholars of his day who sought to limit the purpose of a university to only scientific related knowledge. "University training, said Newman, 'aims at raising the intellectual tone of society, at cultivating the public mind, at purifying the national taste, at supplying true principles to popular enthusiasm and fixed aims to popular aspirations, at giving enlargement and sobriety to the ideas of the age, at facilitating the exercise of political powers, and refining the intercourse of private life" (Kerr, 2001; p.2).

In, *Our under achieving colleges* (2006), Bok, raises the issues of "how much students learn" and suggests the discussion of performance must begin with a shared understanding of the role and purpose of higher education. He indicates the key outcomes of a college education should include "the ability to communicate, critical thinking, moral reasoning, preparing citizens, living with diversity, living in a more global society, possessing a 'breadth of interests' and preparing for work. This litany of purposes is not universal and there are a number of critics suggesting one or more of these ideals has little or no place in higher education. Hacker and Dreifus support the view of preparing students for work, particularly in the high-tech world is important but suggest, "that the purpose of college is not to make students into better citizens" (p. 5).

IECT 2014

In discussing the *Great American University*, Cole (2009) suggests several things make a modern American university excellent including: faculty research productivity; quality and impact of research; grant and contract support; honorific awards; access to highly qualified students; excellence in teaching; physical facilities and advanced information technologies; large endowments and plentiful resources; large academic departments; free inquiry and academic freedom; location; contributions to the public good and excellent leadership. The paradox facing the American colleges and universities is that some of the things that make a great institution are the very things that create some of the issues reflected in *Will the internet ever replace colleges and universities as we know it today?* and within the comments made during the discussion.

Online education, in its many forms has been part of higher education on increasing levels since the development of the Internet (ARPANET) by the United States Department of Defense in 1969. The use of learning management systems (LMS), the ubiquitous presence and engagement of online and blended courses, and the digitization and mass distribution of library resources provide evidence that technology has changed forever how higher education distributes knowledge to its students. William Bowen (2013), President emeritus of the Andrew W. Melton Foundation and Princeton University, suggests "far greater access to the internet, improvements in internet speed, reductions in storage costs, the proliferation of increasingly sophisticated mobile devices, and other advances have combined with changing mindsets to suggest that online learning, in many of its manifestations can lead to at least comparable learning outcomes relative to face-to-face instruction at a lower cost" (p. 45).

There is some thought that online education in any form should be considered a disruptive innovation, "a process by which a product or service takes root initially in simple applications at a the bottom of a market and then relentlessly moves up market, eventually displacing established competitors (Christiansen, 2014). In a cautionary statement Christiansen and Eyring offer, "The downfall of many successful and seemingly invincible companies has been precipitated by a disruptive innovation-that is, an innovation that makes a complicated and expensive product simpler and cheaper, and therefore attracts a new set of customers" (Christensen, and Eyring, 2011, p. 47). Adoption of a total technology solution suggests that higher education move from a position focused on the education of students by developing them holistically, towards the view of students solely as customers, which may be at odds with the many of the aforementioned purposes.

Conclusion

"Education is not the learning of facts, but the training of the mind to think." Albert Einstein.

The purpose of this study was to investigate the perspectives of the participants involved in an online discussion about higher education and the impact technology and the Internet has or will likely have on its future. In reviewing and disaggregating the 376 comments to develop themes used in the analysis it became clear there was no consensus for a clear definition of what a college education was, who the students were, and what role technology plays, or could play in the educational process. This lack of understanding was compounded by the personal, and often limited views of the participants. Other than the author, there were no self-declared higher education scholars or researchers in the group, although faculty and administrators working in higher education made many of the comments. Many of the comments made by faculty and administrators reflected upon practices limited to experiences with online courses and massive open online courses (MOOCs) and not the diversity of role and function of higher education.

IETC2014

The aforementioned data suggest the importance of understanding the different types of students, traditional and non-traditional, and the diversity of needs and pressures these students place on the higher education system. Student needs, including those associated with remediation due to lack of preparation, knowledge and skill development for work and life in society, work-force retraining for displaced workers and veterans should be investigated in a holistic way before replacing an existing system of higher education with a technological solution.

Although the lack of understanding of the complexities facing American higher education was a limiting factor, a majority of the participants (n=37; 69.8%) felt that technology would not replace colleges and universities, as we know them today. In a recent interview with *Inside Higher Education*, Hilary Clinton, former U.S. Senator and U.S. Secretary of State, offers a prospective that would likely be accepted by the majority of participants in this discussion; "Online education can 'open doors' for many students, and may offer as high quality an education as anything in some fields or for some students. But technology is a tool, not a teacher. It cannot replace laboratory-based experiments" (Jaschik, 2014).

The discussion raises the need for more research associated with the various aspects of and problems facing higher education. More research is needed to address issues related to the rising costs of higher education and the subsequent impact on student debt known collectively as college affordability. Additional research should focus on the role technology can play in addressing institutional efficiency and effectiveness in delivering education to all of America's higher education students. Finally, understanding the different roles and functions of colleges and universities as well as the diversity of student needs and how technology could be used to support the educational process and transform American higher education should be explored.

"Will the internet ever replace colleges and universities as we know it today?" An Internet discussion about the future of higher education.

Douglas S. Franklin*, Ph.D. Ohio University, Athens, OH, 45701 USA79*

Abstract

This paper explores a nearly 400-comment online discussion regarding higher education and the impact technology and the Internet has or will likely have on its future. From "I predict only 200 research brick and mortar universities will be alive and provide online programs" to "online education is growing, but the early research shows that blended learning is the best for students", the diversity of comments provides a varied spectrum of thought concerning the future of higher education. The results of the discussion of over 50 professionals on a Linkedin discussion group of higher education professionals suggests that technology will play a major in higher education role but traditional institutions will continue to be around for the foreseeable future.

Keywords: Type your keywords here, separated by semicolons ; American Higher Education; Technology; Policy; Issues; Internet; MOOC

IETC 2014

Introduction

Matt Saccaro's blog, "*When will the Internet replace college?*" recently spawned an online discussion of a Linkedin group interested in higher education. The nearly 400-comment online discussion covered a two-month period and raised many of the same issues facing higher education scholars, administrators and faculty. In his blog, Saccaro (2014) addresses issues facing American colleges and universities as well as graduates from those institutions including: high student debt and delinquency rates; poor job market and high unemployment facing recent graduates, poor student performance and students academically adrift, employer claims mediocre job of performance by recent college graduates; and concerns about removing less profitable academic departments. He suggests that overall, the "American post-secondary system is in the toilet" but suggests that while "the Internet has not bested the post-secondary education system, … there is hope."

Of course Saccaro is not alone in his criticism of American higher education. Richard Vedder, Director for the Center of College Affordability & Productivity (2014) and author of *Going broke by degrees* (2004), an emeritus economics professor from Ohio University is a regular critic of the rising costs of higher education, student financial aid policy, educational inefficiencies, and the resulting impact on student debt. In *Academically adrift*, Arum and Roksa (2011) discuss the limited learning that occurs on college campuses, the lack of academic rigor and the uneasy agreement between faculty and students that allows both parties to pursue their own interests. Sperber (2000) suggests big-time sports and college drinking have 'crippled' undergraduate education. Archibald and Feldman (2011), cite the perception of a dysfunctional system of higher education caused by "prestige games and gold plating" (p. 93), eventually leading

* Corresponding author. Tel.: +0-000-000-0000 ; fax: +0-000-000-0000 .
E-mail address: author@institute.xxx

to higher costs which lead to higher tuition. Taylor (2010) suggests, "The quality of higher education is declining: colleges and universities are not adequately preparing students for life in a rapidly changing and increasingly competitive world" (p. 3).

College presidents seem to understand the issues although there is limited evidence they will take steps to address the issue. In a recent study conducted by the *Chronicle of Higher Education* (2014) and sponsored by the learning management system (LMS) company Blackboard®, 68% of college presidents surveyed disagreed that higher education would be similar to the way it is today in 10 years, however, 60% felt that U.S. higher education was moving in the "right direction" to address these changes (Selingo, 2014). .

Two recent documentaries, *Declining by degrees* (Merrow, 2005) and *Ivory tower* (Rossi, 2014) address the issue. Through a series of interviews and video clips, *Declining by Degrees* suggests some of the problems with higher education include low retention and graduation rates, students drifting through school, and the fact that too many students do not have the skills to be productive employees. Merrow (2005) suggests some possible causes for poor college performance include high rates of student drinking, excessive work loads for some students, high incidence of part-time teachers, classes that are too large, underprepared students for college work. He suggests that grade inflation is a result of the desire to mitigate poor retention rates and provide an inaccurate picture of student performance. The result is that college produces students without the skills necessary to produce productive employees. Almost 10 years later, *Ivory Tower* (Rossi, 2014) reiterates similar themes and presents a radical view of the result of inaction is a 'time bomb of student debt and suggesting the value of higher education may not be worth the investment.

The purpose of this study was to investigate the perspectives of the participants involved in an online discussion about higher education and the impact technology and the Internet has or will likely have on its future. Many participants addressed the aforementioned issues in their comments either directly or indirectly.

Methods

The primary data for this study were generated from comments collected over a two-month period of an online discussion in a Linkedin Group focused on higher education. The study used naturalistic inquiry, a qualitative research technique that "takes place in real-world settings …and the phenomenon of interest unfolds naturally in that it has no predetermined course established by and for the researcher" (p. 32) and empathic neutrality and mindfulness a technique that sees the researcher as someone who "seeks vicarious understanding without judgment (neutrality) by showing openness, sensitivity, respect, awareness, and responsiveness (mindfulness)" (Patton, 2001; p. 40). Demographic data and themes were generated from thematic analysis of the comments made during the online discussion period. Thematic analysis, the "encoding qualitative information" (p. vii.) by developing 'codes' that serve as data labels for sections of data (Boyatzis (1998), was conducted by generating a spreadsheet using the topics of author, type of work, themes, location or origin of the comment, and author's credentials.

Care was taken to ensure participant anonymity. With the exception of those made by the author, comments taken from the discussion were not attributed to any individual, organization or group. The intent to collect, analyze and publish the data was made evident through a comment made by the author and posted on the discussion. The comment received one "like" from one participant. No other comments were made suggesting approval or disapproval of the intent to publish.

IETC 2014

Limitations of the Study and Discussion

This study was intended to record the observations of an online discussion of members of a Linkedin group to determine what themes might inform research associated with technology use in higher education and to explore the views of participants as to whether technology would replace colleges as we know them today. The results should not be considered generalizable and should be viewed in the context of an informal online discussion. Other than a personalized "handle" there was no way to determine credentials or experience of participants engaging in the conversation. An attempt was made to differentiate participants based on the limited information provided and the results were used in the demographic section and in grouping based on perspectives.

Two primary contextual limitations of the study became evident during the analysis of the data. The first was the lack of a common view of the purpose of college specifically or higher education as a whole. The second was the lack of a common definition of college enrollment and the differing needs of traditional and nontraditional students. These limitations will be addressed in the discussion section of the paper.

Findings

The question *Will the Internet ever replace colleges and universities as we know the today?,* generated 376 comments from 53 participants working or engaging with both academic and non-academic organizations Forty (n=40; 75%) participants identified themselves as a tenured or contingent faculty member, including twenty (n=20) international, thirteen (n=13) US and seven (n=7) faculty from an unknown origin. Eleven (n=11) participants were identified as working in businesses as a consultant and/or entrepreneur. It was not possible to project the work status of two (n=2) participants. The majority (n=31; 58.5%) of participants made one or two comments while the majority of the conversation was generated by a minority of participants (n=7; 13.2%) who produced a majority (n=249; 66.2%) of the comments. One participant, an international business entrepreneur made 21.5% (n=81) of the comments. The next most active participant was a U.S. adjunct professor in higher education and the author who made 13% (n=49) of the comments.

The conversation covered more than the present or future impact technology has or will have on higher education. The broad based discussion included topics including teaching and learning, institutional quality, organizational efficiency and effectiveness, educational quality, globalization in higher education, the declining economy and its impact on hiring students, diploma mills, and issues relating to overbuilding on campus, student drinking and athletics.

In general, the tone of the comments was respectful but difficult for some participants. There was a good use of data to support positions but the discussion suffered from an overuse of unsupported views, hyperbole and an overreliance on personal experience. One participant conducted an early analysis of comments stating, "Lot's of people, from many different places (including different countries) participated; for the most part, all participants were respectful of each other's point of view; participants often presented data or links to data published in reputable (but not necessarily scientific) sources; everyone had the choice to be active participants. Some were more active than others, but no one seemed to be kee-

IECT 2014

ping score; all comments were recorded and you could go back to re-read what others had said; participants were free to leave the conversation at any time and re-enter at any time; some people were better (or had more time) at this; participants seemed more relaxed; some participants in this discussion are engaged in other discussions as well; you can reply to a comment in public or only for the commenter. I have never had a better faculty discussion, since I started teaching in 1969" (Unnamed participant).

The analysis of the discussion comments revealed the majority (n=37; 69.8%) of the participants did not feel that technology would replace higher education, as we know it today. The remainder of opinion ranged from a definite yes (n=6; 11.3%) to maybe (n=3; 5.6%). Several participants (n=7; 13.2%) discussed the topic without offering an opinion on the original question. A common theme for participants indicating that technology would not replace traditional colleges in the near future was that technology can help students with a diverse learning styles but that it should be used as a tool in a balanced and blended approach to education. Other views suggested the need for extracurricular or co-curricular engagement to support learning indicating the student experience could not be replaced by technology. Others indicated the need for deeper interpersonal connection between faculty and students. Some comments reflected a concern for the potential for barriers to education through technology including the difficulty with interpersonal communication. Finally, several comments suggested that technology did not address the varying purposes of college and was limited to knowledge collection and transmission. One comment reflected the thoughts of the majority opinion of the group in saying "online (learning) will earn more space in higher education worldwide, but (will) always will be supplemented with classroom or lab education for the development of experimental work and research." In addressing the need for interpersonal connection one participant offered, ""the interaction, and participation with humankind are very important."

Participants indicating technology has or will replace higher education in the near future cited the existence and growth of online courses, the development of Massive Open Online Courses (MOOCs), worldwide open universities, and disruptive innovations will result in change. The most radical point of view saw the closure of thousands of institutions suggesting. "I predict only 200 research brick and mortar universities will be alive and provide online programs." Another summarized this view with, " all new innovations disrupt something already being used. Electrical car disrupts the profits of gas companies. Therefore it has been stopped for many years, and… is still being blocked. (Similarly), excellent online degree programs from elite universities will be blocked by existing beneficiaries, those…existing colleges and faculties" (which are privileged by the status quo.) A caveat of sorts by some participants with this view was the need to ensure quality of the online product. One comment, obviously emphatic about his view, indicated, "(the) important point is WHO IS DELIVERING THE KNOWLEDGE IS IT A VALUABLE KNOWLEDGE…MIT, Harvard and elite universities (have now) come to picture. … If they provide degrees and charge only $ 100-200 per course WHO do you think … would go to other schools… (The) QUALITY OF THE KNOWLEDGE MATTERS. ELITE UNIVERSITIES HAVE PROVED THEMSELVES GOOD FOR CENTURİES TO BE GOOD. One participant was very simplistic in his answer indicating, "it (technology) already has" (replaced colleges and universities). Another participant suggested taking a more long-term view with " I do not see the Internet replacing universities or colleges any time soon, but continued changes enabled by the dynamism of the technology are imminent.

Discussion

The findings of the discussion seem straight forward and to the point. The majority of the participants felt technology had a place in higher education but would not replace colleges and universities, as they are known today. In reflecting on the discussion one wonders can the question, '*will the Internet ever replace colleges and universities as we know it today?*' be answered without an understanding the role and

function of both the Internet and of college? In order to reinforce the views of the participants, clarification of the role and function of both technology and higher education is undertaken.

It seems appropriate to use resources developed from the Internet to help us define the Internet. Wikipedia, The Free Encyclopedia, an editable, online encyclopedia indicates "the internet is a global system of interconnected computer networks that use the standard internet protocol suite (TCP/IP) to link several billion devices world wide. Webopedia (2014) an online tech dictionary for IT professional indicates, "The Internet is a massive network of networks, a networking infrastructure. It connects millions of computers together globally, forming a network in which any computer can communicate with any other computer as long as they are both connected to the Internet. Webopedia differentiates between the Internet and World Wide Web (WWW) suggesting the "Web is a way of accessing information over the medium of the Internet. It is an information-sharing model that is built on top of the Internet. In short, the Internet is a relatively young system of networks that support the World Wide Web and other tools in the transfer of knowledge.

Defining American colleges and universities is a bit more cumbersome than the simplistic definition of the Internet or the World Wide Web. Since the founding of Harvard College in 1634, American higher education has evolved to become, according to many, the world's 'global gold standard' and envy of the world. The complexity of American higher education is obvious when reviewing the Carnegie Foundation for the Advancement of Teaching classification of institutions (Carnegie Foundation, 2010). Using a highly complex series of flow charts, the Carnegie Foundation clarifies role and function of America's (n=4,633) degree granting institutions of higher education in a variety of ways. The first divides the institutions by undergraduate and graduate experience. Within the undergraduate instructional program schools (n=3601), there are those institutions that are associates (n=1714), associates dominant (n=240), and baccalaureate dominant (n=1647). When divided to produce an undergraduate profile institutions with undergraduates increases (n=3741 and is divided by four-year institutions (n=1920) and two-year institutions (n=1821). Within the graduate instructional programs (n=1361), there are institutions that are post-baccalaureate (non-doctorate institutions) (n=912) and doctoral institutions (n=449). Carnegie goes on to offer a basic classification for all four-year institutions (n=2713) as doctorate granting institutions (n=294), masters' institutions (n=728), baccalaureate institutions (n=808), special focus institutions (n=851) and tribal colleges (n=32).

The United States Department of Education identifies postsecondary institutions as public (n=2008) and private (n=5,389), and nonprofit (n=1,892) and for-profit (n=3,497). The total institutions (n=7,236) identified the National Center for Education Statistics, the research arm of the Department of Education includes institutions (n=2,045) offering programs that do not offer degree programs (Ginder et al., 2014).

Enrollment in these institutions reflects the diversity of population and the differing reasons for attending colleges. The total enrollment for American higher education (n=28,305,025 includes institutions with undergraduate and diploma programs ((n=24,524,988; 77%) and graduates ((n=3,780,037; 13%), (Ginder et al., 2014). Degree seeking undergraduate enrollment in the United States has increased 48% since 1990 and is expected to hit 20.2 million students by 2023 (NCES, 2014). Student enrollment is heavily weighted towards women in both undergraduates (n=16,179,594; 57%) and graduate students (n=2,262,755; n=59%). The majority of aforementioned growth in enrollments is expected to be with women students, 18% vice 8% for males (NCES, 2014).

Many of the flaws associated with American higher education such as heavy student drinking and excessive partying, floating through school and academically adrift (Arum et al., 2011), poor post graduate employment rates, and dissatisfaction with employment preparedness present a picture of traditional age college students, those young adults entering post-secondary education right after high school, at roughly 18-19 years old (NCES, 2014). While traditional age college students make up the majority of full-time

IETC 2014

undergraduates at public (88%), private nonprofit (86%) and public 2-year (71%) schools, the majority of full-time students at 4-year private for-profit (71%) and 2-year private for-profit (52%) were over the age of 25 and are considered nontraditional students. Nontraditional students are 24 or older and have usually taken time away from school to work, serve in the military or engage in some other life experience. The impact of nontraditional students on enrollments is even more pronounced for part-time students. Other than at the 4-year (50%) and 2-year (52%) public institutions, the majority of part-time students at all other institutional types were nontraditional students over the age of 25. Nontraditional students make up the majority (60.3%) of all part-time students. A significant percentage of these students (47.5%) were 35 and older (NCES, 2014).

In addition to the complexity suggested by the Carnegie Foundation and the U.S. Department of Education, institutional diversity of purpose clouds the understanding of American higher education. In *Higher Education in America* (2013), Derek Bok suggests, "American colleges and universities do not have a single goal…(and) have not had a single unifying purpose for well over one hundred years (p. 28).

"The American college was conceived of as a social investment" (Thelin, 2004 p. 58) but as evolved over time. Clearly, early federal legislation such as the Morrill Land-grant acts of the mid 19th century, and 20th century laws associated with educating returning veterans from World War II, the National Education Defense Act of 1958, and the Higher Education Act of 1965 and its subsequent reauthorizations speak to the importance of higher education as a the need to support societal interests.

In *Uses of the University* (2001), Kerr wrote "the basic reality, for the university, is the widespread recognition that new knowledge is the most important factor in economic and social growth. We are just now perceiving that the university's invisible product, knowledge, may be the most powerful single element in our culture, affecting the rise and fall of professions and even social classes, of regions and even nations" (pg. xii). Kerr suggests the modern "multiversity" is a confluence of the purposes of universities of the past. From Cardinal Newman, the 19th century founder of the University of Dublin, the purpose of the university is "the high protecting power of all knowledge and science, of fact and principle of inquiry and discovery, of experiment and speculation; it maps out the territory of the intellect and sees that…there is neither encroachment nor surrender on any side" (pg. 1). Newman's view of 'liberal knowledge', which is related to all walks of life, lay in stark contrast to other scholars of his day who sought to limit the purpose of a university to only scientific related knowledge. "University training, said Newman, 'aims at raising the intellectual tone of society, at cultivating the public mind, at purifying the national taste, at supplying true principles to popular enthusiasm and fixed aims to popular aspirations, at giving enlargement and sobriety to the ideas of the age, at facilitating the exercise of political powers, and refining the intercourse of private life" (Kerr, 2001; p.2).

In, *Our under achieving colleges* (2006), Bok, raises the issues of "how much students learn" and suggests the discussion of performance must begin with a shared understanding of the role and purpose of higher education. He indicates the key outcomes of a college education should include "the ability to communicate, critical thinking, moral reasoning, preparing citizens, living with diversity, living in a more global society, possessing a 'breadth of interests' and preparing for work. This litany of purposes is not universal and there are a number of critics suggesting one or more of these ideals has little or no place in higher education. Hacker and Dreifus support the view of preparing students for work, particularly in the high-tech world is important but suggest, "that the purpose of college is not to make students into better citizens" (p. 5).

In discussing the *Great American University*, Cole (2009) suggests several things make a modern American university excellent including: faculty research productivity; quality and impact of research; grant and contract support; honorific awards; access to highly qualified students; excellence in teaching; physical facilities and advanced information technologies; large endowments and plentiful resources; large academic departments; free inquiry and academic freedom; location; contributions to the public good and

IETC 2014

excellent leadership. The paradox facing the American colleges and universities is that some of the things that make a great institution are the very things that create some of the issues reflected in *Will the internet ever replace colleges and universities as we know it today?* and within the comments made during the discussion.

Online education, in its many forms has been part of higher education on increasing levels since the development of the Internet (ARPANET) by the United States Department of Defense in 1969. The use of learning management systems (LMS), the ubiquitous presence and engagement of online and blended courses, and the digitization and mass distribution of library resources provide evidence that technology has changed forever how higher education distributes knowledge to its students. William Bowen (2013), President emeritus of the Andrew W. Melton Foundation and Princeton University, suggests "far greater access to the internet, improvements in internet speed, reductions in storage costs, the proliferation of increasingly sophisticated mobile devices, and other advances have combined with changing mindsets to suggest that online learning, in many of its manifestations can lead to at least comparable learning outcomes relative to face-to-face instruction at a lower cost" (p. 45).

There is some thought that online education in any form should be considered a disruptive innovation, "a process by which a product or service takes root initially in simple applications at a the bottom of a market and then relentlessly moves up market, eventually displacing established competitors (Christiansen, 2014). In a cautionary statement Christiansen and Eyring offer, "The downfall of many successful and seemingly invincible companies has been precipitated by a disruptive innovation-that is, an innovation that makes a complicated and expensive product simpler and cheaper, and therefore attracts a new set of customers" (Christensen, and Eyring, 2011, p. 47). Adoption of a total technology solution suggests that higher education move from a position focused on the education of students by developing them holistically, towards the view of students solely as customers, which may be at odds with the many of the aforementioned purposes.

Conclusion

"Education is not the learning of facts, but the training of the mind to think." Albert Einstein.

The purpose of this study was to investigate the perspectives of the participants involved in an online discussion about higher education and the impact technology and the Internet has or will likely have on its future. In reviewing and disaggregating the 376 comments to develop themes used in the analysis it became clear there was no consensus for a clear definition of what a college education was, who the students were, and what role technology plays, or could play in the educational process. This lack of understanding was compounded by the personal, and often limited views of the participants. Other than the author, there were no self-declared higher education scholars or researchers in the group, although faculty and administrators working in higher education made many of the comments. Many of the comments made by faculty and administrators reflected upon practices limited to experiences with online courses and massive open online courses (MOOCs) and not the diversity of role and function of higher education.

The aforementioned data suggest the importance of understanding the different types of students, traditional and non-traditional, and the diversity of needs and pressures these students place on the higher education system. Student needs, including those associated with remediation due to lack of preparation, knowledge and skill development for work and life in society, work-force retraining for displa-

IETC 2014

ced workers and veterans should be investigated in a holistic way before replacing an existing system of higher education with a technological solution.

Although the lack of understanding of the complexities facing American higher education was a limiting factor, a majority of the participants (n=37; 69.8%) felt that technology would not replace colleges and universities, as we know them today. In a recent interview with *Inside Higher Education*, Hilary Clinton, former U.S. Senator and U.S. Secretary of State, offers a prospective that would likely be accepted by the majority of participants in this discussion; "Online education can 'open doors' for many students, and may offer as high quality an education as anything in some fields or for some students. But technology is a tool, not a teacher. It cannot replace laboratory-based experiments" (Jaschik, 2014).

The discussion raises the need for more research associated with the various aspects of and problems facing higher education. More research is needed to address issues related to the rising costs of higher education and the subsequent impact on student debt known collectively as college affordability. Additional research should focus on the role technology can play in addressing institutional efficiency and effectiveness in delivering education to all of America's higher education students. Finally, understanding the different roles and functions of colleges and universities as well as the diversity of student needs and how technology could be used to support the educational process and transform American higher education should be explored.

"Will the internet ever replace colleges and universities as we know it today?" An Internet discussion about the future of higher education.

Douglas S. Franklin*, Ph.D. Ohio University, Athens, OH, 45701 USA80*

Abstract

This paper explores a nearly 400-comment online discussion regarding higher education and the impact technology and the Internet has or will likely have on its future. From "I predict only 200 research brick and mortar universities will be alive and provide online programs" to "online education is growing, but the early research shows that blended learning is the best for students", the diversity of comments provides a varied spectrum of thought concerning the future of higher education. The results of the discussion of over 50 professionals on a Linkedin discussion group of higher education professionals suggests that technology will play a major in higher education role but traditional institutions will continue to be around for the foreseeable future.

Keywords: Type your keywords here, separated by semicolons ; American Higher Education; Technology; Policy; Issues; Internet; MOOC

IETC 2014

Introduction

Matt Saccaro's blog, *"When will the Internet replace college?"* recently spawned an online discussion of a Linkedin group interested in higher education. The nearly 400-comment online discussion covered a two-month period and raised many of the same issues facing higher education scholars, administrators and faculty. In his blog, Saccaro (2014) addresses issues facing American colleges and universities as well as graduates from those institutions including: high student debt and delinquency rates; poor job market and high unemployment facing recent graduates, poor student performance and students academically adrift, employer claims mediocre job of performance by recent college graduates; and concerns about removing less profitable academic departments. He suggests that overall, the "American post-secondary system is in the toilet" but suggests that while "the Internet has not bested the post-secondary education system, … there is hope."

Of course Saccaro is not alone in his criticism of American higher education. Richard Vedder, Director for the Center of College Affordability & Productivity (2014) and author of *Going broke by degrees* (2004), an emeritus economics professor from Ohio University is a regular critic of the rising costs of higher education, student financial aid policy, educational inefficiencies, and the resulting impact on student debt. In *Academically adrift*, Arum and Roksa (2011) discuss the limited learning that occurs on college campuses, the lack of academic rigor and the uneasy agreement between faculty and students that allows both parties to pursue their own interests. Sperber (2000) suggests big-time sports and college drinking have 'crippled' undergraduate education. Archibald and Feldman (2011), cite the perception of a dysfunctional system of higher education caused by "prestige games and gold plating" (p. 93), eventually leading to higher costs which lead to higher tuition. Taylor (2010) suggests, "The quality of higher education is

* Corresponding author. Tel.: +0-000-000-0000 ; fax: +0-000-000-0000 .
E-mail address: author@institute.xxx

declining: colleges and universities are not adequately preparing students for life in a rapidly changing and increasingly competitive world" (p. 3).

College presidents seem to understand the issues although there is limited evidence they will take steps to address the issue. In a recent study conducted by the *Chronicle of Higher Education* (2014) and sponsored by the learning management system (LMS) company Blackboard®, 68% of college presidents surveyed disagreed that higher education would be similar to the way it is today in 10 years, however, 60% felt that U.S. higher education was moving in the "right direction" to address these changes (Selingo, 2014). .

Two recent documentaries, *Declining by degrees* (Merrow, 2005) and *Ivory tower* (Rossi, 2014) address the issue. Through a series of interviews and video clips, *Declining by Degrees* suggests some of the problems with higher education include low retention and graduation rates, students drifting through school, and the fact that too many students do not have the skills to be productive employees. Merrow (2005) suggests some possible causes for poor college performance include high rates of student drinking, excessive work loads for some students, high incidence of part-time teachers, classes that are too large, underprepared students for college work. He suggests that grade inflation is a result of the desire to mitigate poor retention rates and provide an inaccurate picture of student performance. The result is that college produces students without the skills necessary to produce productive employees. Almost 10 years later, *Ivory Tower* (Rossi, 2014) reiterates similar themes and presents a radical view of the result of inaction is a 'time bomb of student debt and suggesting the value of higher education may not be worth the investment.

The purpose of this study was to investigate the perspectives of the participants involved in an online discussion about higher education and the impact technology and the Internet has or will likely have on its future. Many participants addressed the aforementioned issues in their comments either directly or indirectly.

Methods

The primary data for this study were generated from comments collected over a two-month period of an online discussion in a Linkedin Group focused on higher education. The study used naturalistic inquiry, a qualitative research technique that "takes place in real-world settings …and the phenomenon of interest unfolds naturally in that it has no predetermined course established by and for the researcher" (p. 32) and empathic neutrality and mindfulness a technique that sees the researcher as someone who "seeks vicarious understanding without judgment (neutrality) by showing openness, sensitivity, respect, awareness, and responsiveness (mindfulness)" (Patton, 2001; p. 40). Demographic data and themes were generated from thematic analysis of the comments made during the online discussion period. Thematic analysis, the "encoding qualitative information" (p. vii.) by developing 'codes' that serve as data labels for sections of data (Boyatzis (1998), was conducted by generating a spreadsheet using the topics of author, type of work, themes, location or origin of the comment, and author's credentials.

Care was taken to ensure participant anonymity. With the exception of those made by the author, comments taken from the discussion were not attributed to any individual, organization or group. The intent to collect, analyze and publish the data was made evident through a comment made by the author and posted on the discussion. The comment received one "like" from one participant. No other comments were made suggesting approval or disapproval of the intent to publish.

IETC 2014

Limitations of the Study and Discussion

This study was intended to record the observations of an online discussion of members of a Linkedin group to determine what themes might inform research associated with technology use in higher education and to explore the views of participants as to whether technology would replace colleges as we know them today. The results should not be considered generalizable and should be viewed in the context of an informal online discussion. Other than a personalized "handle" there was no way to determine credentials or experience of participants engaging in the conversation. An attempt was made to differentiate participants based on the limited information provided and the results were used in the demographic section and in grouping based on perspectives.

Two primary contextual limitations of the study became evident during the analysis of the data. The first was the lack of a common view of the purpose of college specifically or higher education as a whole. The second was the lack of a common definition of college enrollment and the differing needs of traditional and nontraditional students. These limitations will be addressed in the discussion section of the paper.

Findings

The question *Will the Internet ever replace colleges and universities as we know the today?,* generated 376 comments from 53 participants working or engaging with both academic and non-academic organizations Forty (n=40; 75%) participants identified themselves as a tenured or contingent faculty member, including twenty (n=20) international, thirteen (n=13) US and seven (n=7) faculty from an unknown origin. Eleven (n=11) participants were identified as working in businesses as a consultant and/or entrepreneur. It was not possible to project the work status of two (n=2) participants. The majority (n=31; 58.5%) of participants made one or two comments while the majority of the conversation was generated by a minority of participants (n=7; 13.2%) who produced a majority (n=249; 66.2%) of the comments. One participant, an international business entrepreneur made 21.5% (n=81) of the comments. The next most active participant was a U.S. adjunct professor in higher education and the author who made 13% (n=49) of the comments.

The conversation covered more than the present or future impact technology has or will have on higher education. The broad based discussion included topics including teaching and learning, institutional quality, organizational efficiency and effectiveness, educational quality, globalization in higher education, the declining economy and its impact on hiring students, diploma mills, and issues relating to overbuilding on campus, student drinking and athletics.

In general, the tone of the comments was respectful but difficult for some participants. There was a good use of data to support positions but the discussion suffered from an overuse of unsupported views, hyperbole and an overreliance on personal experience. One participant conducted an early analysis of comments stating, "Lot's of people, from many different places (including different countries) participated; for the most part, all participants were respectful of each other's point of view; participants often presented data or links to data published in reputable (but not necessarily scientific) sources; everyone

IECT 2014

had the choice to be active participants. Some were more active than others, but no one seemed to be keeping score; all comments were recorded and you could go back to re-read what others had said; participants were free to leave the conversation at any time and re-enter at any time; some people were better (or had more time) at this; participants seemed more relaxed; some participants in this discussion are engaged in other discussions as well; you can reply to a comment in public or only for the commenter. I have never had a better faculty discussion, since I started teaching in 1969" (Unnamed participant).

The analysis of the discussion comments revealed the majority (n=37; 69.8%) of the participants did not feel that technology would replace higher education, as we know it today. The remainder of opinion ranged from a definite yes (n=6; 11.3%) to maybe (n=3; 5.6%). Several participants (n=7; 13.2%) discussed the topic without offering an opinion on the original question. A common theme for participants indicating that technology would not replace traditional colleges in the near future was that technology can help students with a diverse learning styles but that it should be used as a tool in a balanced and blended approach to education. Other views suggested the need for extracurricular or co-curricular engagement to support learning indicating the student experience could not be replaced by technology. Others indicated the need for deeper interpersonal connection between faculty and students. Some comments reflected a concern for the potential for barriers to education through technology including the difficulty with interpersonal communication. Finally, several comments suggested that technology did not address the varying purposes of college and was limited to knowledge collection and transmission. One comment reflected the thoughts of the majority opinion of the group in saying "online (learning) will earn more space in higher education worldwide, but (will) always will be supplemented with classroom or lab education for the development of experimental work and research." In addressing the need for interpersonal connection one participant offered, ""the interaction, and participation with humankind are very important."

Participants indicating technology has or will replace higher education in the near future cited the existence and growth of online courses, the development of Massive Open Online Courses (MOOCs), worldwide open universities, and disruptive innovations will result in change. The most radical point of view saw the closure of thousands of institutions suggesting. "I predict only 200 research brick and mortar universities will be alive and provide online programs." Another summarized this view with, " all new innovations disrupt something already being used. Electrical car disrupts the profits of gas companies. Therefore it has been stopped for many years, and… is still being blocked. (Similarly), excellent online degree programs from elite universities will be blocked by existing beneficiaries, those…existing colleges and faculties" (which are privileged by the status quo.) A caveat of sorts by some participants with this view was the need to ensure quality of the online product. One comment, obviously emphatic about his view, indicated, "(the) important point is WHO IS DELIVERING THE KNOWLEDGE IS IT A VALUABLE KNOWLEDGE…MIT, Harvard and elite universities (have now) come to picture. … If they provide degrees and charge only $ 100-200 per course WHO do you think … would go to other schools… (The) QUALITY OF THE KNOWLEDGE MATTERS. ELITE UNIVERSITIES HAVE PROVED THEMSELVES GOOD FOR CENTURİES TO BE GOOD. One participant was very simplistic in his answer indicating, "it (technology) already has" (replaced colleges and universities). Another participant suggested taking a more long-term view with " I do not see the Internet replacing universities or colleges any time soon, but continued changes enabled by the dynamism of the technology are imminent.

Discussion

The findings of the discussion seem straight forward and to the point. The majority of the participants felt technology had a place in higher education but would not replace colleges and universities, as they are known today. In reflecting on the discussion one wonders can the question, '*will the Internet ever replace colleges and universities as we know it today?*' be answered without an understanding the role and

IECT 2014

function of both the Internet and of college? In order to reinforce the views of the participants, clarification of the role and function of both technology and higher education is undertaken.

It seems appropriate to use resources developed from the Internet to help us define the Internet. Wikipedia, The Free Encyclopedia, an editable, online encyclopedia indicates "the internet is a global system of interconnected computer networks that use the standard internet protocol suite (TCP/IP) to link several billion devices world wide. Webopedia (2014) an online tech dictionary for IT professional indicates, "The Internet is a massive network of networks, a networking infrastructure. It connects millions of computers together globally, forming a network in which any computer can communicate with any other computer as long as they are both connected to the Internet. Webopedia differentiates between the Internet and World Wide Web (WWW) suggesting the "Web is a way of accessing information over the medium of the Internet. It is an information-sharing model that is built on top of the Internet. In short, the Internet is a relatively young system of networks that support the World Wide Web and other tools in the transfer of knowledge.

Defining American colleges and universities is a bit more cumbersome than the simplistic definition of the Internet or the World Wide Web. Since the founding of Harvard College in 1634, American higher education has evolved to become, according to many, the world's 'global gold standard' and envy of the world. The complexity of American higher education is obvious when reviewing the Carnegie Foundation for the Advancement of Teaching classification of institutions (Carnegie Foundation, 2010). Using a highly complex series of flow charts, the Carnegie Foundation clarifies role and function of America's (n=4,633) degree granting institutions of higher education in a variety of ways. The first divides the institutions by undergraduate and graduate experience. Within the undergraduate instructional program schools (n=3601), there are those institutions that are associates (n=1714), associates dominant (n=240), and baccalaureate dominant (n=1647). When divided to produce an undergraduate profile institutions with undergraduates increases (n=3741 and is divided by four-year institutions (n=1920) and two-year institutions (n=1821). Within the graduate instructional programs (n=1361), there are institutions that are post-baccalaureate (non-doctorate institutions) (n=912) and doctoral institutions (n=449). Carnegie goes on to offer a basic classification for all four-year institutions (n=2713) as doctorate granting institutions (n=294), masters' institutions (n=728), baccalaureate institutions (n=808), special focus institutions (n=851) and tribal colleges (n=32).

The United States Department of Education identifies postsecondary institutions as public (n=2008) and private (n=5,389), and nonprofit (n=1,892) and for-profit (n=3,497). The total institutions (n=7,236) identified the National Center for Education Statistics, the research arm of the Department of Education includes institutions (n=2,045) offering programs that do not offer degree programs (Ginder et al., 2014).

Enrollment in these institutions reflects the diversity of population and the differing reasons for attending colleges. The total enrollment for American higher education (n=28,305,025 includes institutions with undergraduate and diploma programs ((n=24,524,988; 77%) and graduates ((n=3,780,037; 13%), (Ginder et al., 2014). Degree seeking undergraduate enrollment in the United States has increased 48% since 1990 and is expected to hit 20.2 million students by 2023 (NCES, 2014). Student enrollment is heavily weighted towards women in both undergraduates (n=16,179,594; 57%) and graduate students (n=2,262,755; n=59%). The majority of aforementioned growth in enrollments is expected to be with women students, 18% vice 8% for males (NCES, 2014).

Many of the flaws associated with American higher education such as heavy student drinking and excessive partying, floating through school and academically adrift (Arum et al., 2011), poor post graduate employment rates, and dissatisfaction with employment preparedness present a picture of traditional age college students, those young adults entering post-secondary education right after high school, at roughly 18-19 years old (NCES, 2014). While traditional age college students make up the majority of full-time

IETC 2014

undergraduates at public (88%), private nonprofit (86%) and public 2-year (71%) schools, the majority of full-time students at 4-year private for-profit (71%) and 2-year private for-profit (52%) were over the age of 25 and are considered nontraditional students. Nontraditional students are 24 or older and have usually taken time away from school to work, serve in the military or engage in some other life experience. The impact of nontraditional students on enrollments is even more pronounced for part-time students. Other than at the 4-year (50%) and 2-year (52%) public institutions, the majority of part-time students at all other institutional types were nontraditional students over the age of 25. Nontraditional students make up the majority (60.3%) of all part-time students. A significant percentage of these students (47.5%) were 35 and older (NCES, 2014).

In addition to the complexity suggested by the Carnegie Foundation and the U.S. Department of Education, institutional diversity of purpose clouds the understanding of American higher education. In *Higher Education in America* (2013), Derek Bok suggests, "American colleges and universities do not have a single goal…(and) have not had a single unifying purpose for well over one hundred years (p. 28).

"The American college was conceived of as a social investment" (Thelin, 2004 p. 58) but as evolved over time. Clearly, early federal legislation such as the Morrill Land-grant acts of the mid 19th century, and 20th century laws associated with educating returning veterans from World War II, the National Education Defense Act of 1958, and the Higher Education Act of 1965 and its subsequent reauthorizations speak to the importance of higher education as a the need to support societal interests.

In *Uses of the University* (2001), Kerr wrote "the basic reality, for the university, is the widespread recognition that new knowledge is the most important factor in economic and social growth. We are just now perceiving that the university's invisible product, knowledge, may be the most powerful single element in our culture, affecting the rise and fall of professions and even social classes, of regions and even nations" (pg. xii). Kerr suggests the modern "multiversity" is a confluence of the purposes of universities of the past. From Cardinal Newman, the 19th century founder of the University of Dublin, the purpose of the university is "the high protecting power of all knowledge and science, of fact and principle of inquiry and discovery, of experiment and speculation; it maps out the territory of the intellect and sees that…there is neither encroachment nor surrender on any side" (pg. 1). Newman's view of 'liberal knowledge', which is related to all walks of life, lay in stark contrast to other scholars of his day who sought to limit the purpose of a university to only scientific related knowledge. "University training, said Newman, 'aims at raising the intellectual tone of society, at cultivating the public mind, at purifying the national taste, at supplying true principles to popular enthusiasm and fixed aims to popular aspirations, at giving enlargement and sobriety to the ideas of the age, at facilitating the exercise of political powers, and refining the intercourse of private life" (Kerr, 2001; p.2).

In, *Our under achieving colleges* (2006), Bok, raises the issues of "how much students learn" and suggests the discussion of performance must begin with a shared understanding of the role and purpose of higher education. He indicates the key outcomes of a college education should include "the ability to communicate, critical thinking, moral reasoning, preparing citizens, living with diversity, living in a more global society, possessing a 'breadth of interests' and preparing for work. This litany of purposes is not universal and there are a number of critics suggesting one or more of these ideals has little or no place in higher education. Hacker and Dreifus support the view of preparing students for work, particularly in the high-tech world is important but suggest, "that the purpose of college is not to make students into better citizens" (p. 5).

In discussing the *Great American University*, Cole (2009) suggests several things make a modern American university excellent including: faculty research productivity; quality and impact of research; grant and contract support; honorific awards; access to highly qualified students; excellence in teaching; physical facilities and advanced information technologies; large endowments and plentiful resources; large academic departments; free inquiry and academic freedom; location; contributions to the public good and

IETC 2014

excellent leadership. The paradox facing the American colleges and universities is that some of the things that make a great institution are the very things that create some of the issues reflected in *Will the internet ever replace colleges and universities as we know it today?* and within the comments made during the discussion.

Online education, in its many forms has been part of higher education on increasing levels since the development of the Internet (ARPANET) by the United States Department of Defense in 1969. The use of learning management systems (LMS), the ubiquitous presence and engagement of online and blended courses, and the digitization and mass distribution of library resources provide evidence that technology has changed forever how higher education distributes knowledge to its students. William Bowen (2013), President emeritus of the Andrew W. Melton Foundation and Princeton University, suggests "far greater access to the internet, improvements in internet speed, reductions in storage costs, the proliferation of increasingly sophisticated mobile devices, and other advances have combined with changing mindsets to suggest that online learning, in many of its manifestations can lead to at least comparable learning outcomes relative to face-to-face instruction at a lower cost" (p. 45).

There is some thought that online education in any form should be considered a disruptive innovation, "a process by which a product or service takes root initially in simple applications at a the bottom of a market and then relentlessly moves up market, eventually displacing established competitors (Christiansen, 2014). In a cautionary statement Christiansen and Eyring offer, "The downfall of many successful and seemingly invincible companies has been precipitated by a disruptive innovation-that is, an innovation that makes a complicated and expensive product simpler and cheaper, and therefore attracts a new set of customers" (Christensen, and Eyring, 2011, p. 47). Adoption of a total technology solution suggests that higher education move from a position focused on the education of students by developing them holistically, towards the view of students solely as customers, which may be at odds with the many of the aforementioned purposes.

Conclusion

"Education is not the learning of facts, but the training of the mind to think." Albert Einstein.

The purpose of this study was to investigate the perspectives of the participants involved in an online discussion about higher education and the impact technology and the Internet has or will likely have on its future. In reviewing and disaggregating the 376 comments to develop themes used in the analysis it became clear there was no consensus for a clear definition of what a college education was, who the students were, and what role technology plays, or could play in the educational process. This lack of understanding was compounded by the personal, and often limited views of the participants. Other than the author, there were no self-declared higher education scholars or researchers in the group, although faculty and administrators working in higher education made many of the comments. Many of the comments made by faculty and administrators reflected upon practices limited to experiences with online courses and massive open online courses (MOOCs) and not the diversity of role and function of higher education.

The aforementioned data suggest the importance of understanding the different types of students, traditional and non-traditional, and the diversity of needs and pressures these students place on the higher education system. Student needs, including those associated with remediation due to lack of preparation, knowledge and skill development for work and life in society, work-force retraining for displa-

IETC 2014

ced workers and veterans should be investigated in a holistic way before replacing an existing system of higher education with a technological solution.

Although the lack of understanding of the complexities facing American higher education was a limiting factor, a majority of the participants (n=37; 69.8%) felt that technology would not replace colleges and universities, as we know them today. In a recent interview with *Inside Higher Education*, Hilary Clinton, former U.S. Senator and U.S. Secretary of State, offers a prospective that would likely be accepted by the majority of participants in this discussion; "Online education can 'open doors' for many students, and may offer as high quality an education as anything in some fields or for some students. But technology is a tool, not a teacher. It cannot replace laboratory-based experiments" (Jaschik, 2014).

The discussion raises the need for more research associated with the various aspects of and problems facing higher education. More research is needed to address issues related to the rising costs of higher education and the subsequent impact on student debt known collectively as college affordability. Additional research should focus on the role technology can play in addressing institutional efficiency and effectiveness in delivering education to all of America's higher education students. Finally, understanding the different roles and functions of colleges and universities as well as the diversity of student needs and how technology could be used to support the educational process and transform American higher education should be explored.

Özel Gereksinimli Çocuk Ailelerinin Bilişim Okuryazarlığı ve e-abdep kullanımları*

Atilla Cavkaytar, Esra Ceyhan, Oktay C. Adiguzel

Anadolu Üniversitesi, Eğitim Fakültesi, Eskişehir, 26470, Türkiye

ÖZET

e-abdep, zihin yetersizliği olan çocuğa sahip anne babalara yönelik hazırlanmış, çevrimiçi aile bilgi ve destek eğitim programıdır. Ailelerin e-abdep kullanımı öncesindeki bilişim okuryazarlığı durumları bilişim okuryazarlığı anketiyle; katılımcıların e-abdep'i tamamladıktan sonraki e-abdep kullanımına ilişkin görüşleri ise "Katılımcıların E-ABDEP eğitim ortamının kullanımına ilişkin görüşleri anketi" aracılığıyla toplanmıştır. Sonuçlar zihin yetersizliği olan çocuğa sahip ebeveynlerin de bilgisayar ve internet teknolojileri kullanarak bilgiye erişebileceklerini göstermiştir. Ayrıca Katılımcılar ile yapılan görüşmelerde katılımcıların tümü programa yönelik olumlu ve memnuniyet içeren görüşler bildirmiştir. Katılımcılar olumlu görüşlerinin yanı sıra E-ABDEP'in daha da iyi olabilmesi yönünde öneri odaklı görüşlerini de bildirmişlerdir.

***Anahtar Sözcükler**: Özel gereksinimi olan çocuklar, aile eğitimi, e-öğrenme*

The Computer Literacy of The Families with The Children With Special Needsand Their Use of e-FISEP*

e-FISEP is an online family information and support education program that prepared for the parents who have children with intellectual disability. The computer literacy of the families before their use of e-FISEP was identified with Computer Literacy Questionnaire. The families' views about the use of e-FISEP were identified with "The Questionnaire of Participants' Views About Use of e-FISEP Learning Environment" after they completed e-FISEP. Results showed that the families with children with intellectual disability could reach the information by using computer and Internet technologies. Participants presented positive opinions about the program in the interviews. Besides, they also gave suggestions for that e-FISEP could be better.

Participatory framework for Bologna process in Slovak Universities

Koloman Ivanicka [a], Juraj Tomlain [b 81]

[a] *prof. dr., Management Institute of the Slovak University of Technology, Vazovova 5, 81243 Bratislava, Slovakia*
[b] *dr., Management Institute of the Slovak University of Technology, Vazovova 5, 81243 Bratislava, Slovakia*

Abstract

Higher education institutions (HEI) in Slovakia have undergone the serious transformation (the adaptation to free market economy, Bologna process, etc.); however the participation of broad academic and student community on the transformation was not always assured. One of the promising approaches to change the existing situation was to introduce participatory electronic framework in the selected Universities for discussing the problems of educational policies in HEI in the framework of Bologna processes, which may have the potential impact on HEI, as well as, on broader society. Although e-participation methods have showed the promising potential for acceleration of changes related to solving educational problems and Bologna processes by better use of intellectual potential of universities, they also revealed the new problems that are briefly discussed.

Keywords: e-participation, e-demokracy, Bologna process, higher education institutions;

IETC 2014

1. Introduction

The economic transformation of Slovak economy was based on market principles since 1989. Supply, demand, public transparent competition is increasingly applied to education and research as well. While the business transformation was largely successful, the education and research suffered from the lack of financial resources, higher age structure of the academics, and often from complex legislation. This has hampered the organization learning at the Universities. It is thus believed that further strengthening the participation of all HEI stakeholders may help to accelerate the learning process and may also enable to attain better quality of results from on-going Bologna process.

The Slovak Republic is the only EU country that spends less on education than four per cent of GDP. The best results reported in this criterion Denmark (7.83 percent), Cyprus (6.93 percent) and Sweden (6.69 percent), "said Andrej Kralik of the European Commission Representation in Slovakia. Also, Commissioner for Education, Culture, Multilingualism and youth Androulla Vassiliou urged Member States not to cut appropriations for education, in spite of the difficult situation, in which they find themselves in crisis.

In spite of these difficulties Slovakia is one of the signatories of a unified system of higher education - the Bologna Declaration. The Bologna Declaration committed its signatories (at present 47 countries) to meet six primary objectives:

1. adoption of the system easily understandable and comparable diplomas,
2. adoption of a system based on two cycles of study (currently has a three-stage)
3. adoption of the credit system (ECTS),

81 Corresponding author name.
E-mail address: juraj.tomlain@stuba.sk

4. improvement of the mobility,
5. improvement of European cooperation in quality assurance and
6. strengthening the European dimension in higher education

2. Theoretical facts – purpose of study

One of the key aspects towards the success of the Bologna Process is the close cooperation and interaction between governments, higher education institutions, students, staff, employers and quality assurance agencies. Our team addresses this problem though e-participation platform developed in the framework of MyUniversity project

"MyUniversity" is a project conceived by the European Commission, whose aim is to bring together in close cooperation all university members (students, staff etc.) and university stakeholders, by the means of a transparent and user friendly e-participation (and e-democracy as well) platform. Through the use of this platform, the participating universities will be able to engage their members and stakeholders on multiple issues, to get their feedback in both local and European level.

The concept of e-democracy represents the support of democracy by ICT (information and communication technologies). It includes any electronic communication tools, enabling /empowering citizens in their efforts to establish the responsibility of ruling politicians for their works in public affairs. (Peart, 2007)

For the purposes of this study we will use definition of e-Participation by Macintosh, who describes tools for it as the use of information and communication technologies in order to support "information retrieval, top-down engagement or bottom-up empowerment". Suggested tools for these activities are often exemplified by webcasts, blogs, chat interviews, discussion boards, quick polls, surveys and petitions; in some cases also decision-making games. (Macintosh, 2004)

Although the information about Bologna process is widespread on websites, however the detailed knowledge necessary for the effective e-participation in this process is not common among the stakeholders. The information on Bologna, process is provided in many official documents, that are not very interesting for reading, and sometimes written by high level language.

As an example of reality can give a short survey (obtained through the discussion module MyUniversity portal) among the ordinary students of the University of Presov, where the question: "What associations do you have when hearing the word "BOLOGNA? The most common answers were:

a) „The first thing my mind is spaghetti and Italy. And it is also the last"
b) „Firstly football team in this city, but spaghetti too and the old university"
c) „Nothing"
...

Analysis of the information available from other European countries, reveal the certain administrative and implementation problems when applying the Bologna principles into national education systems.

Such is for instance the Portuguese experience, where the policy implementation of Bologna process tends to present favorable progress and convergence of results, yet in spite of favorable picture of policy outcomes, the reform is far from being achieved in substance. So far, not all the constituencies of HEIs (e.g. academics) are involved and share the same guiding principles. (Veiga et al. 2008)

Often the Bologna process is oriented on new degree courses and the principal innovations (credits, modules, new types of dissertations) supervised by the "political" heads (deans of faculty) and by the few collaborators (Moscati, 2006). Thus much broader participation (including the e-participation) of academics and students may help to overcome this problem not only in South Europe, but also in other countries where the problems are often quite similar.

IECT 2014

While there is the growing volume of literature concerning the theory and practice citizen e-participation and e-democracy, the literature on e-participation of the university stakeholders is practically absent, and the experience in this field is most probably absent or quite rare.

3. Methods

MyUniversity project equips the universities with a cutting edge e-Participation platform, which provides them the means to reach out all their members and stakeholders, informing them of the issues under debate and providing them with innovative interactive tools so they can actively participate in the process. Thus providing the higher education decision making process with valuable input towards future polices and legislation.

MyUniversity is the European Union Seventh framework project which is being tested by universities in Bulgaria, Lithuania, Spain, Slovakia and Sweden. Potentially the project has 400,000 users at these universities, although only the small fraction uses the platform at this moment.

The project engages the university members and stakeholders in the higher education decision making process and gathers their opinions on specific policy issues, action plans, strategies, student mobilization and university life in general.

MyUniversity platform has been developed on Gov2DemOSS - the open source, informative and collaborative civic engagement platform that provides an efficient channel for governments and, alternately community groups, to keep their constituents informed, manage their information repositories, enable transactions and gauge public opinion. In addition, it is also important to mention that MyUniversity platform is an open source solution, offered under a GPL/GNU license.

These participation methods (modules) are implemented in MyUniversity platform and have been used for attaining the results of this research.

ePetitions allow users to address a petition signed by multiple citizens (i.e., website users) to a local official. This module provides valuable input for the decision making processes as it helps to identify the issues that are important to their citizens (students, academics).

Forums are very powerful tools in a participation environment, if used correctly. It allows the user to engage the students, academics, teachers on issues that are important to them and receive a wide range of opinions that can be taken into account when deciding on local – university policies.

Newsletter – The platform allows sending newsletters to all registered users on their e-mail address. Additionally, these newsletters can also available on MyUniversity websites for the broad public.

Processes – A Participation process is in fact a pseudo-module as it combines a variety of other module's functionalities (e.g., surveys, online documents, forums…) in order to allow the students, academics, teachers to interact with each other and carry out on-line participation processes related to local - university issues. In the consultant's experience, these on-line participation processes can either run alongside traditional participation, as an additional channel, to reach more users or purely on their own, with the same effectiveness.

IETC 2014

4. Discussion of the results

The applied methods enabled the authors to test the participatory electronic framework for discussing the problems of educational policies in HEI in the framework of Bologna processes, which may have the potential impact on HEI, as well as, on broader society. The illustrative scheme (mechanism) is shown on the figure 1.

Figure 1. Scheme of the MyUniversity e-participation mechanism

The e-participation discussions related to Bologna process have not been so far very fruitful. Probable reason for that is the fact that predominant approach to implementation of Bologna process was top-down. Slovak Ministry of education and Accreditation committee has defined the guidelines that have to be followed by the universities, providing them the limited time for their implementation. Usually the management of the faculties demanded the staff to quickly implement partial solution, while they often have not been aware of the "full picture", which rather the domain of members of the narrow expert groups and few managers. Naturally such approach provided the limited space for the broad participation of the stakeholders.

Norwegian researchers correctly point out that the Internet (and e-participation methods) largely serves to activate people who are already politically active. (Saglie, J , Signy, I. 2009) It is thus quite difficult to activate the academics and students that did not actively participate in Bologna process discussions before. The problem of our so far realized research was that we have concentrated our effort on the use of „ready to go techniques", and only later we realized the complexity and broad scope of the activities that are going on in HEI. Furthermore the e-participation in Bologna process may be more successful when we will better understand the real needs and preferences of the participants and the stakeholders. According to (Øystein S. et al., 2011) the stakeholders are often treated as the homogenous entities often resulting in oversight of key interests. There is also the question of activation of the student parliaments

Serious problem of the Slovak Universities are the low wages of the University teachers. Although the living costs are not very different from the Western Europe, the wage of full time professor is around € 1000 net. As a result of it in the majority in the University staff prevail the older conservative teachers that in addition have additional jobs, in order to be able to pay the pay their family expenses. The uncompetitive wages make it difficult to retain the younger staff. The existing staff tends to keep the high level of their expertise, however they have less time to take care of quality of pedagogy, the participation aspects of the decision making process, etc. The innovation in the orientation of the Universities toward Bologna process is mostly top-down driven by obligatory guidelines, which however do not enable to understand the Bologna process as the whole, but they are rather oriented on the technical aspects of its implementation. The administrative university staff is even less paid, and less motivated and slimmed down. That means that some administrative more complex tasks have to be done by the university educators, which reduces their available time for other tasks. Moreover the administrative staff is often unable to effectively help the students with the mobilities to other countries. Role of the universities in Slovakia for the development of the society is verbally praised, but de facto neglected.

5. Conclusions:

When designing e-participation structure with the goal of discussing the problematic issues of the implementation of Bologna process in Slovak Universities. First of all it is necessary to provide the participants clear and "digestible" information about the Bologna process. Although there are many web pages that inform about it, their reading is not always easy, and they often do not address the needs of readers. Only informed and motivated participants would be able to discuss the implementation problems of Bologna process at the universities and propose the solutions, so that the results of the discussion may help the decision makers at the University level (already overburdened by the variety of other administrative tasks), or may provide the interesting insights for the National Bologna group. E-participation should be understood in the broader framework of the participation of the students and teachers in the University life. At present both categories have the representation in the faculty and University senates, however the discussion Bologna process is not the priority there. In order to achieve higher participation of the students, we think that, they should be provided by the additional training that would enable them to understand the complexities of the Bologna process, which are at present not understood by many teachers as well.

Moreover there is the problem. MyUniversity is just one portal among others, where the people can discuss the problems. There is the strong competitions from social media, such as the e.g. Facebook, where the student feel more at ease to explain their views. We think that the questions of the computer literacy nowadays represent the smaller problem. There is another problem for the e-participation, however, that is usually not reflected in the literature. It seems to us that there is the growing number of professionals, who spend a long hours writing the mails and papers, and they are not willing to take the active part at e-participation initiatives, social media etc., since they are already overburdened by the cyberspace.

Thus in the last year of the MyUniversity project we will have to focus much stronger attention especially on solution of these issues.

Perception of undergraduates on the adoption of mobile technologies for learning in selected universities in Kwara state, Nigeria

Mosiforeba Victoria Adegbija&Olaniyi Oladimeji Bola
Email: mosivic@gmail.com&austinbolas@yahoo.com
Department of Educational Technology, University of Ilorin, Ilorin, Nigeria

Abstract

This study investigated the perception of undergraduates on the adoption of mobile technologies for learning. The respondents included 182 randomly selected undergraduates from three universities in Kwara State. The data collected through a researcher-designed questionnaire were analyzed using percentages, means, standard deviation and the t-test statistics. The results revealed among others that no significant difference existed in the undergraduates' perception on the adoption of mobile technologies for learning based on gender. It was recommended that stakeholders in the education sector should encourage undergraduates by procuring, providing or subsidizing mobile technologies that can be adopted for learning.

*Keywords:*Mobile Technologies, Adoption, Perception, Learning, Kwara State, Nigeria

IETC 2014

1. Introduction

Learning with mobile technology is an emerging educational phenomenon resulting from the integration of electronic learning and mobile technologies. Mobile learning has transitioned from a subordinate method of electronic learning into its own educational area and it has become a new field of research globally (Pollara & Broussard, 2011). The increasing use of mobile technology for learning is creating a paradigm shift for electronic learning. Mobile learning provides significant learning prospects for students who regularly use mobile devices like personal digital assistance, android, smart phones, and so on (Gedik, Hanci-Karademirci, Kursun & Caglitay, 2012).

Mobile technology is defined as handheld information technology devices or artifacts that encompass hardware (devices), software (interface and applications), and communication (network services) (Pamela, 2011). Hashemi, Azizinezhad, Najafi and Nesari (2011) defined mobile learning as the use of technological devices or technologies, which include mobile phones, androids, smart phones, iPad, and so on, to extend the reach of teaching and learning to occur across multiple locations. Mobile learning is the wireless delivery of learning content to students through handheld mobile technologies anytime and anywhere (Pamela, 2011).

The prevalence of these technologies among students is transforming the educational system in Nigeria which is regarded as one of the third world countries. The continued growth of mobile technology as an educational tool is as a result of its flexibility and pervasiveness (Iqbal & Qureshi, 2012). The ease of use, portability and relatively cheap procurement make the mobile technologies ready tools that can be used by students generally.

El-Hussein and Cronje (2010) opined that the use of mobile devices for learning can enlarge the scope of tertiary education and allow it to better reach students. The use of these technologies for learning is equally capable of providing a more interactive and effective type of learning to meet individuals' learners needs. Mobile technology can be beneficial for higher education due to its ubiquitous nature and ability to shape information processes (Schepman, Rodway, Beattie & Lambert, 2012). Mobile technology offers the ability to engage in learning activities such as communication and content material sharing between students and lecturers, students and subject experts, and among students and their environments.

In addition, mobile technologies have the ability to bridge pedagogically designed learning contexts, facilitate learners' generated contexts and content (both personal and collaborative) while providing personalization and ubiquitous social connectedness which makes it to be different from the traditional learning environment (Cochrane & Bateman, 2009). This is why mobile technology can be referred to as social technology which provides social learning environment for learners.

In the general computer literature, there is evidence that students, who are competent computer users, are more likely to perceive new technology positively and is more ready to adopt new technology (Shih, Munoz & Sanchez, 2006). Lu and Viehland (2008) found no support for the notion that past e-learning experience influenced mobile learning adoption. Research on the adoption of technology among educators and students may reveal some of the factors that may be paramount in the introduction of mobile learning and this insight may be too general to be useful to institutional decision-makers considering learning with mobile devices.

Meanwhile, pilots and small scale trials have been undertaken on mobile learning adoption (Uzunboylu & Ozdamli, 2011; Williams, 2009; Akour, 2009). The small scale and pilot studies lack the broadness to give substantial confidence in the results. Also, there are no conclusive studies on the influence of gender in the adoption of technological devices (Adegbija & Bola, 2013).

Therefore this study investigated the perception of undergraduates on the adoption of mobile technologies for learning in selected universities in Kwara State, Nigeria. This is very necessary because of the ailing educational sector in Nigeria. The use of mobile technologies in learning could contribute to the effectiveness of instruction and increase availability of education to the thousands of the youths waiting and yarning for global information or knowledge lacking in higher institutions in Nigeria.

2. Purpose of the study

The main purpose of the study was to investigate the perception of undergraduates on the adoption of mobile technologies for learning in selected Universities in Ilorin, Kwara State, Nigeria. Specifically the study investigated the:

5. Perception of undergraduates on the availability of mobile technologies that can be adopted for learning in Universities in Kwara State, Nigeria
6. Perception of undergraduates on the adoption of mobile technologies for learning in selected Universities in Kwara State, Nigeria
7. Influence of gender on undergraduates' perception on the adoption of mobile technologies for learning in selected Universities in Kwara State, Nigeria.

Hypothesis: The hypothesis tested was:

There is no significant difference in the undergraduates' perception on the adoption of mobile technologies for learning in selected Universities in Kwara State, Nigeria.

IETC 2014

3. Methodology

This research is a descriptive research of the survey type. The survey involved the use of a researcher-designed questionnaire used to collect data from randomly selected undergraduates from the three purposively selected Universities (University of Ilorin, Kwara State University and Al-Hikmah University) in Kwara State, Nigeria. A total of 182 undergraduates from the three Universities responded to the researcher-designed questionnaire. The instrument used to collect the data was validated by ten undergraduates and three lecturers from Kwara State College of Education, Ilorin, Nigeria.

The data obtained were subjected to both descriptive and inferential statistics. Frequency counts, percentages and mean score were used to answer the research questions. The data collected from the hypothesis generated were analyzed using the t-test statistics.

4. Data analysis and results

Research question 1: The question was asked in order to find out the perception of undergraduates on the availability of mobile technologies that can be adopted for learning in selected Universities in Kwara State, Nigeria.

Table 1: Perception of Undergraduates on the availability of mobile technologies that can be adopted for learning in selected Universities in Kwara State, Nigeria

S/N	Items	Personal Access	Access through the library	No access	Access through peers	Access through parents
1	Cell phone	162 (89%)	4 (2.2%)	7 (3.8%)	1 (0.5%)	8 (4.4%)
2	Android	132 (72.5%)	7 (3.8%)	21 (11.5%)	15 (8.2%)	7 (3.8%)
3	Smart phones	129 (70.9%)	9 (4.9%)	22 (12.1%)	17 (9.3%)	5 (2.7%)
4	Personal digital assistant	42 (23.1%)	32 (17.6%)	74 (40.7%)	19 (10.4%)	15 (8.2%)
5	Apple's iPad	56 (30.8%)	12 (6.6%)	54 (29.7%)	46 (25.3%)	14 (7.7%)
6	Mp3 players	105 (57.7%)	13 (7.1%)	23 (12.6%)	38 (20.9%)	3 (1.6%)
7	E-book reader	68 (37.4%)	54 (29.7%)	28 (15.4%)	23 (12.6%)	9 (4.9%)
8	Laptop	128 (70.3%)	9 (4.9%)	9 (4.9%)	18 (9.9%)	18 (9.9%)
9	Tablet PC	63 (34.6%)	9 (4.9%)	36 (19.8%)	38 (20.9%)	36 (19.8%)
10	iPod touch	53 (29.1%)	14 (7.7%)	54 (29.7%)	33 (18.1%)	8 (15.4%)

The results in table 1 suggest that out of 182 respondents, 162 (89%), 132 (72.5%), 129(70.9%), 105(57.7%), 128(70.3%) have personal access to cell phone, android, smart phones, Mp3 players and laptop respectively. Availability and accessibility of other devices by the respondents have low percentages on, access through the library, no access, access through peers, and access through parents.

Research question 2: The question was asked in order to find out the perception of undergraduates on the adoption of mobile technologies for learning in the selected Universities in Kwara State, Nigeria. Thus, the researchers analyzed the responses from the items on the questionnaire and the results are as shown in table 2.

IETC 2014

Table 2: Perception of undergraduates on the adoption of mobile technologies for learning in the selected Universities in Kwara State, Nigeria

S/N	Statements	Agree	Disagree	Mean	Rank
1	Mobile technologies will enhance learning better than other technologies when adopted	165(90.7)	17(9.3)	3.3802	2nd
2	I am interested in knowing what resources are available if mobile technologies are adopted	166(91.2)	16(8.8)	3.4011	1st
3	I am ready to adopt mobile technologies if introduced for learning	156(85.7)	26(14.3)	3.2323	6th
4	Adoption of mobile technologies for learning will reduce workload on students	152(83.6)	30(16.4)	3.1918	8th
5	I am interested in the adoption of mobile technologies for learning	155(85.2)	27(14.8)	3.2018	7th
6	I intend to adopt mobile technologies for learning in future	157(86.3)	25(13.7)	3.2663	5th
7	I intend to purchase mobile technology for learning because I do not have now	158(86.8)	24(13.2)	3.2737	4th
8	I intend to advise my colleagues to adopt mobile technologies to access internet for reading lecture notes online	159(87.4)	23(12.6)	3.2837	3rd
9	Adoption of mobile learning will reduce work load for lecturers	148(81.4)	34(18.6)	3.1429	9th

Note: Strongly agree and agree were merged to indicate agree, while disagree and strongly disagree were merged as disagree for convenience in this study.

Results in table 2 reveal that statement 2 was ranked first with a total number of 166 (91.2%) respondents which agreed to the statement that, I am interested in knowing what resources are available if mobile technologies are adopted; while a total number of 16 (8.8%) respondents disagreed. Ranked second was statement 1 with a total number of 165 (90.7%) respondents that agreed that mobile technologies will enhance learning better than other technologies when adopted while 16 (8.8%) respondents disagreed. Statement 4 was ranked 8th with a total number of 152 (83.6%) respondents that agreed to the statement that adoption of mobile technologies will reduce workload on students. Lastly, statement 9 was ranked 9th with a total number of 148 (81.4%) respondents which agreed that adoption of mobile learning will reduce work load for lecturers.

Table 3: Influence of gender on undergraduates' perception of the adoption of mobile technologies for learning in the three Universities in Kwara State, Nigeria

Sex	N	Mean	Std. Deviation	Df	t	Decision
Male	114	29.7544	3.35657			
				180	2.87	
Female	68	28.1912	3.86047			
Total	182					

From table 3, it can be deduced that the t-cal value of t(180), = 2.87 which is greater than 0.05 is not significant because the probability value 0.226 is higher than the alpha value of 0.05. This indicates that no significant difference exists in the extent to which male and female undergraduates perceived the adoption of mobile technologies for learning in the three universities in Kwara State.

Therefore, the hypothesis which states that there is no significant difference in the extent to which male and female undergraduates perceived the adoption of mobile technologies for learning in the three universities in Kwara State is accepted. This means that students' gender does not influence the perception of undergraduates in the adoption of mobile technologies for learning in the three universities in Kwara state, Nigeria.

5. Conclusion and recommendations

The findings of this study showed that the undergraduates have personal access to cell phone, Android, Smart phones, Mp3 players and laptops in the study area and they are favorably disposed to the adoption of mobile technologies for learning. The undergraduates also showed their willingness to procure their own mobile technology devices if they are introduced for learning. The findings of the study further showed that there is no significant difference in the extent to which male and female undergraduates perceived the adoption of mobile technologies for learning in the three Universities in Kwara State, Nigeria.

It is recommended based on the findings of this research that government should motivate and encourage both students and their lecturers to incorporate the use of mobile technologies for learning in Universities as a whole. Gender should not be considered in the adoption of mobile technology, instead both male and female undergraduates should be given equal exposure and opportunity in the use of mobile technologies when they are eventually adopted for learning.

[b]*Gazi University, Tourism Faculty, Golbasi Campus, Ankara 06830, Turkey*

Abstract

This study aims to analyze the strengths, weaknesses, opportunities and threats of thermal tourism through the opinions of tourism students. Students getting tourism education is the population of this study. A questionnaire was used as the data collection instrument, and 1135 students in various levels of tourism departments participated in this study. According to the results, students see the existence of a university as the strength and non-existence of an airport as the weakness of Afyonkarahisar. Besides, they think that thermal tourism's being done during the year is the opportunity and construction problems' negative effects on tourism are the threats.

Keywords: *Thermal tourism; tourism students, health tourism, SWOT analysis, Afyonkarahisar-Turkey*

IETC 2014

1. Introduction

Turkey is among the top six countries in terms of tourist destinations, and among the top twelve countries in tourism income. (UNWTO, 2013). This shows the importance of tourism as a sector in Turkey. The importance of tourism takes place in government policies and strategic plans related to tourism. Using tourism sources efficiently, getting more shares from tourism market and increasing the economic support of tourism are among the strategic targets of Turkey tourism. Another one of these targets is to improve alternative tourism opportunities. Thermal tourism is a type of tourism which can be improved as an alternative to sea-sun-sand tourism, the traditional Turkey tourism, and can be done during 365 days of the year. Providing the expected benefits from thermal tourism is only possible by making situation analysis, managing the current situation and planning the future of this sector carefully. One of the ways to achieve this is to conduct regional SWOT analysis which identifies the strengths, weaknesses, opportunities and threats regarding tourism (Emir, 2011). It can be said that SWOT analysis is a subjective evaluation achieved by listing the data that are helpful in understanding, discussing and decision making process in a logical order (Gürlek, 2002). SWOT, which is an important method used to analyze weak sides of the rivals and form defending strategies against their strengths, is also a type of analysis helping managements to evaluate inner and outsider environment by determining the strengths, weaknesses, opportuni-

ties and threats (Kotler et al., 1999; Cebecioğlu, 2006; Akgemici, 2007; Kreiner and Wall; Haines, 2009: 154).

When the literature is examined, it can be seen that there are numerous studies on thermal tourism. It can also be seen that these studies mainly focus on the reasons why the destination is visited by tourists or determining the tourists' satisfaction levels regarding the tourism services and touristic managements in the region. In their study which tried to determine the thermal tourism potential of Kızlıcahamam Sey thermals, Göyün and Akpınar (2003) focused on the fact that the socio-economic development of local people can be ensured by enhancing the current tourism facilities and promoting them. In their study investigating the determining features of destination image, İlban et. al. (2008) found that Gönen is a clean and modern destination with a high quality of life; transportation is convenient and prices are cheap there; recreation activities and information about them are enough; its people are kind and friendly; it has got some superior features in terms of dishes and handcraft compared to other regions. In the study conducted by Tunçsiper and Kaşlı (2008) on thermal tourism of Gönen, it was stated that tourism has a significant effect on transportation, entertainment, beverage retailers, dairies, petrol stations etc.. Besides, in their study which aimed to identify the factors influencing the improvement of tourism, İlban and Kaşlı (2009) determined that marketing, recreational facilities, entrepreneur of private sector, planning, tourism variety and educated work power are the factors that may prevent the improvement of tourism in Gönen. Another study to identify the image of thermal tourism was carried out by Emir and Durmaz (2009) in Afyonkarahisar. The results of their study showed that Afyonkarahisar was evaluated as a good destination and it was trendy to join thermal activities in the region. On the other hand, the participants stated that the region was not safe and marketing services were not enough. In the study conducted by Serpen et. al. (2009), it was emphasized that a big geothermal pipeline was being planned to carry hot water to the hotels in Afyonkarahisar and this city would have the most important balneology facilities of Central Anatolia.

Taş (2012) investigated how Afyonkarahisar developed in terms of thermal tourism and thermal sources of the city. Sandıkçı and Özgen (2013) conducted the tourism SWOT analysis of Afyonkarahisar through the opinions of staff working in hotels with tourism management document. According to this, the thermal tourism image of the region and the existence of rich natural sources regarding health tourism were found to be the strengths of Afyonkarahisar. However, the weaknesses of Afyonkarahisar were found to be as not benefiting from government incentives enough and travel agents' ineffectiveness in performing their duties. On the other hand, the results showed that the airport founded near the region and thermal tourism's being done during the whole year were found to be the opportunities, and customers' increasing bargain power and new thermal destination investments for this market were found to be the threats. In the study conducted by Çiçek et. al. (2013) to identify the places of inner Anatolian thermals waters and thermal services in Turkish health tourism, it was found that the hotels in the region were for domestic market but they were insufficient for foreign markets.

2. Method

In this part, there will be a brief mention on data collection, participants, data analysis and results.

2.1. Data collection

A questionnaire was used as the data collection method. The questionnaire developed by the researcher by examining previous studies (Crouch and Brent Ritchie 1999; Mueller and Kaufmann, 2000; Tabak, 2003; Gökçe, 2006; Durgun, 2006; Durgun, 2007; Çelik and Murat, 2008; İlban et. al., 2008; Çelik, 2009; Wickramashinghe and Takano, 2009; Subramoniam et al., 2010; Türksoy and Türksoy, 2010) on this topic has two parts. The first part has four questions including several demographic features of the participants. The second part consists of 60 items regarding the identification of strengths, weaknesses, opportunities

IETC 2014

and threats of Afyonkarahisar. According to this, there were 19 items regarding strengths, 20 items regarding weaknesses, 12 items for opportunities and 9 items for threats in the questionnaire. The items in the questionnaire were 5-point Likert scale ranging from "strongly disagree=1" to "strongly agree=5".

2.2. Participants

Students getting tourism education in Afyonkarahisar is the population of this study. Due to the big amount of population, time limitation, costs etc., sampling from 1453 students 350 from high schools, 759 from vocational schools, 344 bachelors was employed. After excluding the incomplete and erroneous questionnaires, 190 students from high schools, 682 from vocational schools and 263 from university department were included in the study.

2.3. Data analysis

The obtained data were analyzed through SPSS program and individual features of the participants are presented with percentages and frequencies. Besides, the opinions of the participants regarding the SWOT of Afyonkarahisar were given with the mean and standard deviation scores for each item and factor. In addition to this, independent sample t-test was used for the groups (gender, internship) having two variables, and one way ANOVA for the groups (age, school) with three or more variables. At the end of the variance analysis, Tukey test was used for the comparison of groups with significant differences.

2.4. Results

The t-test and ANOVA results regarding the comparison of students' evaluation of the SWOT analysis according to demographic features are presented in Tables 1 and 2. When Table 1 is examined, it is seen that the evaluation of students regarding the weaknesses and threats does not differ significantly according to the gender ($p>0.05$), whereas there is a significant difference between the evaluations regarding strengths and opportunities in terms of gender ($p<0.05$). According to the mean scores, it can be seen that female students have more negative evaluations regarding the strengths and opportunities of thermal tourism in Afyonkarahisar. It is also seen in Table 1 that the evaluations regarding strengths, weaknesses and opportunities differ significantly according to students having done internship or not. The mean scores show that students who haven't done an internship have more negative evaluations on the strengths and opportunities of thermal tourism in Afyonkarahisar while they have more positive opinions on weaknesses compared to the students who have done their internship.

Table 1

The Comparison of Students' Evaluation Regarding the SWOT Analysis in terms of Gender and Internship

Variables	Groups	STRENGTH		WEAKNESS		OPPORTUNITY		THREAT	
		Mean	Std. Dev.	Mean	Std. Dev.	Mean	Std. Dev.	Mean	Std. Dev.
Gender	Male	3,30	0,70	3,40	0,78	3,18	0,72	3,17	0,77
	Female	3,15	0,66	3,34	0,79	3,00	0,71	3,13	0,77
	p (sig.)	**0,000*****		0,244		**0,000*****		0,356	
Internship	Yes	3,31	0,65	3,42	0,75	3,17	0,71	3,20	0,72

IECT 2014

	No	3,17	0,72	3,32	0,82	3,04	0,73	3,11	0,82
	p (sig.)	**0,002****		**0,028***		**0,003****		**0,066**	

*p< 0,05; **p< 0,01; ***p< 0,001

According to the results of variance analysis in Table 2, there is a significant difference among the ages of students in terms of their evaluation regarding strengths, opportunities and threats of Afyonkarahisar in terms of thermal tourism. The mean scores of "19 and under" regarding the strengths of Afyonkarahisar are more significant than the ones belonging to the other groups. However, it is seen that their mean scores on opportunities are positive, and they had negative evaluations on threats. According to the results in Table 2, it is seen that students' opinions regarding the strengths, weaknesses, opportunities and threats do not change significantly according to their school of education. Based on this, it can be said that high school students' regarding the strengths and opportunities of Afyonkarahisar are more positive than other students. Briefly, it is clear that high school students paid more attention to the strengths and opportunities of Afyokarahisar. Besides, it was revealed that university students' opinions on the weaknesses and threats of thermal tourism in Afyonkarahisar were more negative than the opinions of high school and vocational school students. This finding shows that the perception levels of university students regarding the weaknesses and strengths of thermal tourism in Afyonkarahisar are very high.

Table 2

The Comparison of Students' Evaluation Regarding the SWOT Analysis in terms of Age and School of Education

Variables	**Groups**	**STRENGTH**		**WEAKNESS**		**OPPORTUNITY**		**THREAT**

3. Conclusions and discussions

IETC 2014

The most important feature of this study is that it makes the SWOT of thermal tourism in Afyonkarahisar through the opinions of students getting tourism education. It is a distinct advantage for Afyonkarahisar to have variety of schools (high, vocational, university) giving tourism education. Especially, the existence of a university in the city was stated the strongest side of Afyonkarahisar in providing the required qualified staff. This situation is an important opportunity in the development of the cooperation of universities and the sector. The development of university-sector cooperation and benefiting from health experts from universities in cure treatment was also emphasized in Sandıkçı et.al. (2013). Besides, it was highlighted in Akbulut (2010) that related departments at universities, non-governmental organizations and local administrations should increase their studies in thermal tourism. Especially the inclusion of tourism schools in the studies related to the tourism planning and marketing of the region will affect the decisions positively. According to the participants of the study, the increasing popularity of the city and Afyonkarahisar's natural sources for health tourism are the most important strengths of the city. In the SWOT analysis of thermal tourism in Afyonkarahisar conducted by Sandıkçı and Özgen (2013), rich natural sources of the city, the image of it and the increasing popularity of Afyonkarahisar were found as the strengths of the city. It is emphasized in Taş (2012) that the features and the abundance of thermal water sources is not enough for the development of tourism on their own. In addition to this, it was expressed that available transportation facilities, promotion and marketing of thermal areas efficiently and the existence recreation activities supporting thermal tourism are also necessary. In recent years, Afyonkarahisar has been an important market in the region with the public incentives provided for tourism investments. There has been considerable increase in the bed capacity of the city with these incentives. This situation attracted the attention of travel agencies to the region and increased the popularity of the city more. Besides, it is understood that strength of thermal tourism in Afyonkarahisar is the existence of rich natural sources appropriate for health tourism. The factors which were received the least scores by students in terms of the strengths were the rich cuisine of Afyonkarahisar, its being the junction point of Turkey in terms of transportation and Turkey's nomination of European Union. Afyonkarahisar's being a junction point in terms of tourism should be used more efficiently.

There is a significant difference between the gender of students in terms of their evaluation regarding the strengths and opportunities of thermal tourism in Afyonkarahisar. It is seen that female students had more negative opinions than males regarding the strengths and opportunities. In addition to this, it is revealed that students' opinions on strengths, weaknesses and opportunities differ significantly according to their internship. While students who haven't done their internship have more negative opinions on the strengths and opportunities of thermal tourism in Afyonkarahisar, the ones who have done an internship have more positive opinions on the weaknesses of the city. This situation can be explained through students' perception of tourism in their mind. It can be said that 3S (sea, sand, sun) is still effective in the minds of students. Besides, the inexperience of students without an internship in the field and the possibility that they may compare Afyonkarahisar with more popular destinations would be other reasons.

As the results and findings of this study suggest, the existence of schools giving tourism education in Afyonkarahisar is a distinct advantage for the city. It is possible to meet the any level of staff needed by hotel managements from these schools. In addition to this, since Afyonkarahisar is a junction point of Turkey, the completion of high-speed train projects will contribute to the attractiveness of the city. On the other hand, there is not an airport in Afyonkarahisar, Zafer airport, 60km to Afyonkarahisar, can be used more efficiently in transportation. Another important topic is that the current thermal sources should be used in a more balanced way which will not affect the life quality of future generations. Moreover, it would be beneficial tourism shareholders to form a mutual strategy for the promotion and marketing of the region. Especially, national mass media should be used, and public and private shareholders should benefit from social networks for the promotion marketing of the city. Recreational activities that would enrich thermal tourism services should be increased and especially cure treatments should be supported with diets. Although an average cure treatment lasts 21 days, it is seen that the staying period in the hotels of Afyonkarahisar is 2.2 days when the accommodation statistics are examined. The study conducted by Kervankıran and Özdemir (2013) shows that the staying periods of tourists in the hotels of Afyonkarahisar is below the standards of thermal centers. This situation may stem from the fact that the visitors of hotel managements in Afyonkarahisar include people who have less visiting periods with the purpose of relaxing, work or meeting but not cure treatment. For this reason, thermal hotel managements should

IETC 2014

develop their services on cure treatments and direct themselves to customers who need such treatments.

Preservice Teachers' Views about e-book and their Levels of Use of E-Books

Murat YALMAN[a] 83
[a]Computer Education and Instructional Technology Dicle University, Turkey

Abstract

The purpose of this study was to determine the views of preservice teacher about e-books and the level of their general knowledge about these kinds of technological tools. The subjects in this study consisted of 543 (310 females and 233 males) students. In line with the purpose of this study, both qualitative and quantitative methods were applied. The results demonstrated that the use of e-books increased in accordance with the students' levels. It was found out that the general knowledge levels of the social sciences students about e-books were lower when compared to the students from the departments of Science, Mathematics and Foreign Languages. It was seen that 19,15% of the students did not make any preference between e-books and conventional printed books while 54,88% of them preferred printed books and 25,97% them e-books.

Keywords: e-books, reading books, digital printing, e-book readers;

IETC 2014

1. Introduction

Widespread use of computers and the Internet has also given rise to software development. Parallel to this, transferring books into the digital environment resulted in the birth of e-books. However, so far, there have been various responses to such questions as what e-book is and what the elements of e-books are. In a study evaluating e–book and digital broadcasting throughout the world, Önder (2010) defined e-book "as a digitalized form of some or all printed books or as one produced completely in the digital environment, which can be viewed and accessed on any portable device like computers or specially designed e-book readers". Furthermore, it is a software-based electronic form with its rich text features (including bookmarker, highlighting, focusing and so on) that allow all the functions of conventional book reading. In a different definition, it is stated that e-books are a combination of software and hardware allowing texts to be designed in electronic environments or texts in the formats of doc, txt and pdf, which can be viewed with other devices besides computers (Morgan, 1999: 36; Cliff & Dearnley 2003; Vidana 2003; Lam & Ark., 2009). As the early e-books were beyond meeting the needs of e-book readers, current devices are now more user-friendly, which has led to the spread of these devices with the developments in technology. Companies interested in these products have integrated the features of e-book devices and those of computers and initiated the production of tablet computers. These kinds of initiations facilitated the use of e-books on portable devices like mobile phones, PDA and tablet computers (Wilson, 2003; Moore, 2009).

2.1. E-book Development and Its Advantages and Disadvantages

Books are defined as written texts used by humans for centuries (Bağtuş, 2007). These written texts first were carved on stones, then on animal leathers, later on paper made of wood, and now in digital environments. In this way, printing environments have developed in accordance with technological improvements. Technological improvements and an investigation of e-books and its future issues were first discussed by Alan Key's book "Dynabook" (Rukancı & Anameriç, 2003). In the following years, e-books created based on projects to maintain and preserve the books in libraries have increased its popularity since they are easily accessible and portable, which has also eliminated storage problems as well (Barnard, 1999; Morgen 1999). The first website to sell e-books on the internet was "BiblinBytes", which started to serve in 1993 (Anameriç & Rukancı, 2003). Parallel to these developments, the e-book titled "The Best Laid Plans" published by Publishing sold more than 6000 in 1999 (Hawkins, 2000: p.25). Despite this rapid development, it was seen that e-book readers were on the markets only after the year 1998. Many texts prepared in digital environment can be read on specially designed devices. Sony Company dominated the e-book reader market by producing its first reader "eInk" in 2006, later the "Kindle", and "Kindle 2" in 2009 (Yıldırım et.al., 2011).

This technology, which could change traditional reading habits radically, should be supported and improved. In the project supported by the Ministry of Education in Turkey, the goal is to make both students and teachers use this technology. Teachers' knowledge level and approach to e-book devices may influence transferring knowledge to their students regarding the use of e-books. Unfortunately, most teachers who experience difficulties and adaptation problems with technological devices get acquainted with them in the schools they are employed rather than during their school years at university (Yalman, 2013; Yalman ve Tunga, 2013). Therefore, it is important to determine the degree to which this technology is adopted and used by preservice teachers.

2. Method

Qualitative and quantitative research methods were applied in this study. To collect the qualitative data, the students were given a survey on e-books. In order to gather the quantitative data, the responses to the survey were evaluated, and the students were interviewed based on their responses.

3.1. Research Model

In order to determine the views of preservice teachers about e-books, a descriptive relational survey model was used in the study. The purpose of the present study was to determine students' level of knowledge about e-books, their preferences of traditional printed books and e-books and their views about e-books and to examine the related correlations based on the results with respect certain variables. After evaluating the survey results, in each part of the study, seven students who continued their education were interviewed, and their views were involved in the research results.

3.2. Sample

IETC 2014

This study was carried out with university students who attended different departments such as Science Teaching, Mathematics Teaching, Pre-school Teaching, English Language Teaching, French Language Teaching and Teaching Religious and Ethical Issues in the Fall and Spring Terms of the academic year of 2012-2013. In the study, the method of "Simple Random Sampling", one of probability sampling methods, was used. In simple random sampling method, each member of a group has an equal possibility to be selected. The research sample to be included in the study was selected on random basis from a list (Çepni, 2010: 46). The research sample consisted of 543 students from different departments of the education faculty. Table 1 below presents information about the departments, classes and genders of the preservice teachers who participated in this study and responded to the questions in the survey.

Table 1. Demographical Backgrounds of the Participants

Variable	Property	f	%
Sex	Female	310	57,09
	Male	233	42,91
Class	Freshmen	333	61,33
	Sophomore	150	27,62
	Junior	57	10,50
	Senior	3	0,55
Department	Primary School Teaching	170	31,31
	Science Teaching	92	16,95
	Pre-school Teaching	52	9,58
	French Language Teaching	32	5,89
	English Language Teaching	68	12,52
	Primary School Mathematics Teaching	73	13,44
	Teaching Religious and Ethical Issues	56	10,31
Total		543	100,0

As can be seen in Table 1, 57,09 % of the participants were female, and 42,91% of them were male. With respect to their class distribution, 333 participants were freshmen (61,33%), 150 were sophomore (27,62%), 57 were junior (10, 50%), and three of them were senior students (0,55%). The distribution of the students in terms of their department was as follows: 31,31% of the participants were from Primary School Teaching department; 16,95% from Science Teaching; 9,58% from Pre-school Teaching; 5,89% from French Language Teaching, 12,52% from English Language Teaching; 13,44% from Primary School Mathematics Teaching; and 10,31% from Teaching Religious and Ethical Issues.

3.3. Data Collection Tools

The demographical backgrounds and general knowledge levels of the students were determined via a survey. The survey was made up of two parts. In the first part, there were three items regarding their personal characteristics, and the second part included eight items questioning their views about e-book. The survey questions were prepared under the supervision of experts and piloted on 68 university students. The questions with an irrelevant and confusing content were excluded. After analyzing the data obtained, 49 students were interviewed in relation to their responses to the questions to determine their views about e-books. Different from scales, it is not possible at all to talk about a total score for surveys. Thus, from a technical point of view, it is not possible to discuss about the reliability and validity as in scales. Since the measurement tool used in the present study was a survey, reliability analysis was not performed.

IECT 2014

3.4. Data Analysis

After administering the survey, the data collected were transferred into computer software. Percentage (%) and frequency (f) techniques were used to describe the data obtained.

3. FINDINGS

The data obtained in this study, which aimed at determining the students' general knowledge and views about e-books at the education faculty, are illustrated in tables below. Table 2 presents the data regarding whether the students made use of e-books for their lessons with respect to the variable of class-grade.

Table 2. Percentage and frequency distribution of the preservice teachers' use of e-books via the internet

Class	E-book benefit		E-books do not benefit		Total
	f	%	F	%	
Freshmen	53	15,92	280	84,08	333
Sophomore	30	20,00	120	80,00	150
Junior	17	29,82	40	70,18	57
Senior	2	66,67	1	33,33	3

As can be seen in Table 2, 15,92 % of freshmen, 20% of sophomores, 29% of junior, and 66,67% of the senior students made use of e-books. The students' responses to the question of "What is e-book?" are given in Table 3 below with respect to their departments.

Table 3.Percentage and frequency distribution of the students' responses

to the question of "What is e-book?" with respect to their departments

Departments	Correct Answers		Wrong Answers	
	F	%	F	%
Primary School Teaching	89	20,51	81	74,31
Science Teaching	88	20,28	4	3,67
Pre-school Teaching	44	10,14	8	7,34
French Language Teaching	30	6,91	2	1,83
English Language Teaching	64	14,75	4	3,67
Primary School Mathematics Teaching	67	15,44	6	5,50
Teaching Religious and Ethical Issues	52	11,98	4	3,67
Total	434	100	109	100,0

As can be seen from Table 3 above, 434 students answered the question correctly, whereas 109 students gave wrong answers. With respect to the students' departments, their correct answers were as follows: 20, 51% (89 students) for Primary School Teaching; 20,28% (88 students) for Science Teaching; 10,14% (44 students) for Pre-school Teaching; 6,91 (30 students) for French Language Teaching; 14,75% (64 students) for English Language Teaching; 15,44% (67 students) for Primary School Mathematics Teaching; and 11,98% (52 Students) for Teaching Religious and Ethical Issues. Likewise, the distribution of the wrong answers in terms of the students' departments was as follows: 74,31% (81 students) for Primary School Teaching; 3,67% (4 students) for Science Teaching; 7,34% (8 students) for Pre-school

IETC 2014

Teaching; 1,83 (2 students) for French Language Teaching; 3,67% (4 students) for English Language Teaching; 5,50% (6 students) for Primary School Mathematics Teaching; and 3,67% (4 Students) for Teaching Religious and Ethical Issues.

Table 4. Frequency and Percentage Distribution of the students' responses to the question of "What is e-book?"

What is e-book?	n	%
I don't know	138	25,41
Electronic book	100	18,42
A book written and read on a computer	121	22,28
Virtual book	29	5,34
Books on the Internet	137	25,23
Touchscreen book	3	0,55
Technological, electronic tool	7	1,29
Portable device with screen	3	0,55
Devices for studying	5	0,92
TOTAL	543	100

The results obtained via the preservice teachers' responses analyzed in categories revealed that 25,41% of the students did not know what e-book is; 18,42% reported it to be a book written in an electronic environment; 22,28% considered it to be a book written and read on a computer; 5,43% regarded it as a virtual book; 25,23% said it is a book composed of texts on the Internet; 0,55% referred to it as a digitally designed book with touchscreen; 1,29% said it is a technological and electronic tool; 0,55% thought it is a portable tool with a screen; and 0,92% defined it as a tool for studying.

Table 5. Frequency and Percentage Distribution of the students' responses to the question of "Where can you buy e-book from?"

Where can you buy e-book from?	n	%
I don't know	213	39,23
Via the computer	19	3,50
Via the Internet and web stores	250	46,04
Technology Stores	21	3,87
Provided by Ministry of National Education and Government	21	3,87
Bookstores	7	1,29
Download Websites	9	1,66
Schools	3	0,55
TOTAL	543	100

As can be seen in Table 5 above, 39,23% of the students did not know where to buy e-books from; 3,50% think they could buy it via the computer; 46,04% said they could buy it via the internet and web stores; 3,87% reported that they could find it in technology stores; 3,87% stated that the Ministry of National Education provided e-books; 1,29% said e-books were available in bookstores; 1,66% stated they could reach e-books from download websites; and 0,55% said that school administration could provide e-books.

Table 6. Frequency and Percentage Distribution of the students' responses to the question of "What are the formats of e-books?"

What are the formats of e-books?	n	%

IETC 2014

I don't know	387	71,27
Pdf	84	15,47
doc, xls, ppt	57	10,50
Computer and webpages	6	1,10
html, mp3	3	0,55
Google and Mozilla	3	0,55
Facebook and Internet	3	0,55
TOTAL	543	100

The results obtained revealed that 71,27 % of the students did not know anything about e-book formats; 15,47% of them said pdf; 10,50 % said doc, xls, and ppt; 1,10 % of them said computer and webpage formats; 0,55% of them said html and mp3 formats; 0,55 % of them said Google and Mozilla file formats; and 0,55% of them said the file formats avilabile on Facebook and Internet.

Table 7. Frequency and Percentage Distribution of the Students' Preferences of Traditional Printed books and E-books

Preferences	F	%
E-Book	141	25,97
Traditional Printed Books	298	54,88
No preference	104	19,15
TOTAL	543	100

As can be seen in Table 7, 54,88% of the students preferred traditional printed books; 25,97% of them favored e-books; and 19,15% of them did not express any preference because of being indecisive. The results obtained via the data collected from the preservice teachers' reasons for their preferences are presented in Tables 8 and 9 below.

Table 8. Frequency and Percentage Distribution of the Students' Reasons for Their Preference of E-book

Why E-book?	n	%
I don't know; I never thought about it	35	24,82
Easy, practical and fast	18	12,77
Fast and rapid access	25	17,73
Technological and up-to-date	14	9,93
Detailed, more choices, and it includes summaries	18	12,77
User friendly, visual and touch-operated	18	12,77
Useful and no waste of paper	2	1,42
Easy to carry (portable)	10	7,09
Cheaper	1	0,71
TOTAL	141	100,00

The analysis of the students' responses regarding the reasons for their preference of e-book revealed that 24,82% of the students did not know the reason or think about it; 12,77% said it was practical and easy to use; 17,73% reported it was easy to access the desired e-book on the Internet; 9,93% expressed that it was a new technological tool and easy to update; 12,77% said it not only included summaries but also provided details various options; and 12,77% said that it was user-friendly and visually more attractive and that they liked its touchscreen feature. In addition, 9,09% of the students stated that it was easier

IETC 2014

to carry compared to printed books; 1,42% said it was more useful as it helps avoid paper consumption; and 0,71% preferred e-books because of its low cost.

Table 9. Frequency and Percentage Distribution of the responses to the question of whether to prefer e-books or printed books with respect to the variable of gender

	Females		Males	
	f	%	f	%
e-book	86	33,73	55	29,73
Printed books	169	66,27	130	70,27
TOTAL	255	100	185	100

Regarding the variable of gender, 33,73% of the female students preferred e-books, while 66,27% preferred printed books. Likewise, 29,73% of the male students chose e-books, and 70,27% preferred printed books. In this study, about 82,26% of the females and 79,40% of the males made a preference.

Table 10. Frequency and Percentage Distribution of the responses to the question of "What are the cost-ranges of e-book devices?"

Group	n	%
I don't know	152	27,99
Cheap	46	8,47
Reasonable	206	37,94
Expensive	110	20,26
Very expensive	29	5,34
TOTAL	543	100

The responses of the preservice teachers to the question related to prices of e-book devices revealed that 27,99% did not have any idea; 8,47% said they were cheap; 37,94% said the prices were reasonable; 20,26% stated that they were expensive; and 5,34% believed that e-book devices were very expensive.

4. Discussion

In this study, which aimed at determining the knowledge levels and views of preservice teachers about e-book technologies, 57,09% of the participants were female (310) and 42,91% of them were male (233). Similar responses to the survey were categorized. Thus, it was found out that 25,41% of the students did not have any idea about e-books. Regarding the categories generated depending on the responses, it was found out that the preservice teachers did not have a realistic and signicative idea/knowledge about e-books. After completing and analyzing the survey, the interviews held with students who defined e-books as books designed and written in an electronic environment revealed that the number of the students who defined electronic environment was not higher than ten and that they described all the written materials on the Internet as e-books.

It was also found out that use of e-books changed and increased depending on the class-grades of the students (Table 2). The interviews held with the students demonstrated that they downloaded e-books from the Internet and used them as supplementary materials for their lessons.

Table 3 below presents the results regarding the responses to the question of "What is e-book?" with respect to the departments of the participants. In general, the number of the students who answered the question correctly was 434, while 109 students neither made any comments nor gave answers. In general, the preservice teachers defined e-book as "a book which could be found on a virtual platform or on the

IETC 2014

Internet and which is designed and written in an electronic environment that could be read on a computer."

It was found out in the present study that the participants did not have a clear idea about where to buy e-books from. Also, it was revealed that 71,27% of the preservice teachers stated they did not have any opinion about e-book formats. However, the percentage of the students who gave acceptable responses like "pdf, doc, xls, and ppt," was 25,97%.

According to the responses regarding the students' preferences between e-books and printed books, it was found out that 25,97% of the students preferred e-books and that 54,88% of them preferred printed books. The rate of the students who did not want to express any preference was 19,15%. The interviews held with these students demonstrated that they did not have any idea about e-books and therefore they did not make any preference.

When the students were asked to state their reasons for choosing e-books, it was seen that 24,82% of them said they did not know the reason or thought about it and that the rest gave responses like "easy, practical and fast, easy to obtain, up-to-date and technological, detailed and offers more options and includes summaries." Of all the students, only 7,09% of them stated that it was portable and it allowed storing hundreds of books thanks to its high memory feature (Mallet, 2010). Besides, only two students reported that it prevented paper consumption (Marshall& Ruotolo, 2002). Depending on the responses of the students, it could be concluded that the students were not properly introduced to environments like e-books. Furthermore, it found out that none of the students mentioned the multi-language support (Nathaniel, 2010) feature of e-books in their responses.

According to the variable of gender, it was seen that the rates were almost equal between males and females in terms of their preference of e-books and printed books. It was found out that 66,27% of females and 70,27% of males preferred printed books rather than e-books. The students' views about the prices of e-book devices were examined with a single question in the survey. It was seen that 27,99% did not express any view about the prices of e-book devices; that 37,94% of the participants thought that the prices were reasonable; and that 25,60% of them believed that the prices were very high. During the interview, one of the participants who defined the Internet as an environment to purchase e-books from said "I, actually, don't know where to buy an e-book device. I came across with some e-books while I was searching for the books on the Internet I could find in bookstores. But, since they were written in a foreign language, they didn't attract my attention. I saw that the prices of these books are in dollars and high. I don't think that e-books have Turkish language support or I haven't come across one yet."

5. Results And Implications

It was seen in the present study that use of e-books among the participants did not go beyond using written digital materials and documents on the Internet. It was also found out that although the students knew that they were supposed to use e-books and related tools in future, they did not make any efforts to improve themselves or overcome their deficiencies. The students tended to use technological devices only when they had to and as much as they needed them. In addition, it was revealed that more than the half of the participants still preferred printed books. During the interviews held with the participants who did not make any preference and with those who chose printed books, it was found out that the reason for their choice was lack of knowledge about e-books.

Knowing about the deficiencies of students regarding the use of the Internet and computer, which provides great opportunities for seeking and processing information and knowledge, would be helpful to cope with related issues. Considering the fact that preservice teachers who will be employed in future at a school where they will have to use tablet computers and e-books, which is a project executed by the Ministry of education, it seems of great importance to determine their views as well as their levels of knowledge about this subject. Students' deficiencies determined could be overcome with lessons to be included in the curricula of university programs.

IETC 2014

In order to overcome the deficiencies of students, a project could be prepared in which students are required to obtain e-books and e-book devices. The use of e-books can be supported by establishing e-libraries at universities. In this way, students may have the opportunity to obtain and use multiple resources.

IETC 2014

Abstract

Education and technology are two basic elements in order to obtain skilled labor. Education provides a continuous improvement with willing and permanent changes in the abilities and behaviors of an individual. Technology is a discipline that provides the link between science and practice and occurs in a certain aim and order that are target - driven.

Modern education gives an education based on the practice that makes the students active by using new technologies. The productivity of improving the workforce based on the skilled and sectoral expectations also depends on this.

To use education technology provides a permanent education because the person first teaches and after he/she obtains the ability of practice in the effective and permanent learning. For this reason, to learn something by making and living is the most effective method. Infrastructure, lack of technological equipment, the level of instructors can cause to fall behind the technological development in the service and production sector of vocational and technical schools in Turkey.

Vocational and technical schools cannot achieve their education objectives based on the practice, because they cannot use the education technology properly. As a result of this, the loss of skilled labor that has the ability of using the information technologies that is important for the development of a country can occur.

Keywords: Vocational and technical schools, technological development, modern education;

1. Introduction

Information and communication technologies that have been developing rapidly in the current century cause obligatory and radical changes in educational field as well as every field. It is inevitable that developments in information and communication technologies has to be with technological equipment which will meet expectations of the sector together with progressing in coordination with educational programs

in order to not fall behind the contemporary education level. Computer forming the basis of these technologies has been started to use in education and teaching environments through internet and social network.

In our day, there is an intense competition in global market. It's gaining more and more importance to grow man power has the quality to meet expectations of business world in this competition. If education system will fail at growing qualified man power, the price for this failure shall be paid either by enterprises thereby training their available employees with a very high cost, or by society thereby standing for purchasing of goods and services of poor quality (Dahil, Karabulut, 2013).

Educational technology is evaluated as a whole systems that put data of different sciences into practice within large educational fields such as special purpose, method, instruments, measurement and evaluation, and ensure that manpower will be used in proper situations in the best way, problems of education will be solved, quality and productivity will be increased (Gürgün, 2014).

By means of information technologies, country borders have removed by globalizing and free circulation of qualified labor force has come into existence. As a result of this, institutions have had difficulty in graduating qualified individuals, who have proper knowledge, from academies which give vocational and technical education. Raising students who has these qualities in accordance with expectations of the sector depends on use new information and communication technologies efficiently and productively by the educational personnel in these institutions.

As is the case with every education field, it is very important to use computer and internet technologies in preparing students for life, according to today's conditions and technological development and with information and skills for expectations of the production sector, in academies that give professional and technical education. In the period where computer and internet technologies are used as learning and teaching instruments, demand and thoughts of students for using information technologies have an important place in evaluating reflections of technology on education.

Academies with vocational and technical education have undertaken a mission to raise qualified manpower for production sector that has served locomotive purpose in country improvement. However, there are many factors which hinder the current mission undertaken by these institutions. Expectations of the market are changed by the reasons related to technology and cultural life, employees seek to new things according to the origin of information source they are fed. Therefore, it has become difficult to say that an expectation that was applied in the past can be applied today. Education institutions have improved slowly in terms of understanding these new situations and at acting point.

Another important thing is business continuity. It is known that technological and global affects has threatened continuity in business life. When global affect is described in terms of country economy and employees, developmental level and geographical position of the country should be taken into consideration. As the members of OECD, Turkey has focused on liberalization of product markets, social security systems, policies of active labor market, and new developments in education system as primary structural reforms. This struggle has an additional importance in terms of ensuring that the problems related to education system will be solved, teenagers will be prepared for life and demands of labor markets in this new period (Tübitak, 2005). In spite of that, employment rate stays behind OECD countries. As one of the reasons for this, an important part of our country's population is formed by young people. Therefore, it is likely that teenagers, who has attended in several education activities but cannot be employed, will be pessimistic in terms of future expectations. In addition, it should be remembered that these teenagers will create a threat for country, in economic sense, because they cannot attend in a good life of individuals who are raised in social manner and invested. The reason is that working life creates confidence and respect feelings for individuals, and supports the feeling of belonging to a society (Dereli, Kabataş, 2009). Improvement in employment life of youngsters has a great importance in this respect.

IECT 2014

2. Periodical improvement of education technology

Objects supporting the education have been found according to current conditions as the education has become necessary in early periods of the life. In 1950's, education technology fell behind the industrial technology because important needs were met in that period (1st period). Afterwards, developments, innovations that were accompanied by 2nd World War made progress in comparison with the previous period (2nd period). In that period, dilemmas appeared in education, the 1st one is the traditional education that has come until today and the 2nd one is education conducted by technological instruments. Expenses of the 2nd education are high but its educational contribution is more. The 1st education doesn't meet the need due to developing technology (3rd period). As for this period, it can be said that it is a period ensuring efficient learning by combining two different teaching methods coming from 3 periods (4th period). As for this period, it is to place combined education technology in the educational content. In other words, purpose is to create a technological structure for education by an educational system in which not only a part of visual and auditory instruments but also whole instruments work (http://melek2552.wordpress.com). According in Table 1. shows to years of education technology the periodic changes.

Table 1. Development in Educational Technology (Information and Communication Technologies)

In terms of learning concept

Phase Name	Function	Product
1960-1970 Behaviorist Learning Concept	Algorithmic Regulating Of Information	Programmed Education
1970-1980 Cognitive Learning Concept	Restructuring Trying In Learning In Mental Process	Learning Process Design
1980-1990 Constructivist Leaning Concept	Unifying New Information With Previous One	Structuring The Meaning By Student

(http://kisi.deu.edu.tr)

3. Essential principles in educational technology

Educational technology, achieving goals application methods, in terms of content and functionality is based on certain basic principles. Main purpose in the application of educational technology, learning is the realization of a fully trained individuals. Adaptation of technology in education, provide development based on scientific principles is one of the basic principles. The target of the methods and techniques used in the application of science and technology, based on research involving holistic view has to do. For the success of the training program, increasing the effectiveness of teachers and students mutually technology supported in this activity is necessary to ensure continuity. Technological methods applied in training the individual level, the lack of success in the past and the future success of eliminating the negative impact on the success of the new applications that increase must be enabled in functional ways.

One of the most basic principles of teaching, the student has taken training as a result he desired to be given by the specified destination at a sufficient level of knowledge and skills are to be permanent. The most important way of making this happens, learning by doing and experiencing is the use of performing all possible senses. The material and information technologies used in the learning environment to student learning that learning can be made permanent will contribute very important when traditional educational applications based on information technology in student-centered educational applications taken

IETC 2014

a requirement have become inevitable. Effective learning and teaching in the context of educational technology is shown in Figure 1.

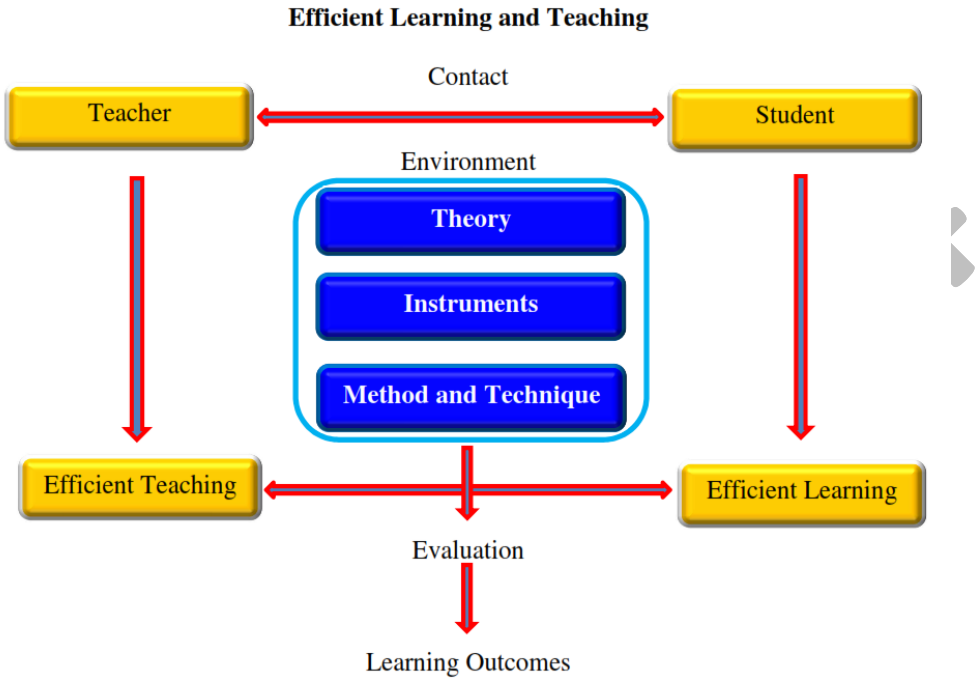

Fig.1. Scope of Educational Technology (It is collected from data of Higher Education Committee. April 2014)

4. Information technology for higher education

Economic, social and cultural changes have caused important changes in education all around the world (Downey et.al, 2005). To find skilled and qualified labor has become an important problem by increased globalizing. As for solution for this problem, it is possible by means of raising individuals with an efficient education system. Nowadays, knowledge workers are the individual who create essential value in economy, provide benefit, and trigger and maintain economic development (Turan, Çolakoğlu, 2008). Nowadays, countries don't think that education is an expense factor, rather treats as an important instrument in order to gain a competitive advantage. Success of a country depends on existence of educated and qualified labor, in an increasing way. An important result of globalizing is geographical borders have been removed; goods and services and also qualified labor can circulate more freely than the previous periods. This free movement of educated individuals has made international accreditation and validity of university diplomas a current issue (Akduman et.al, 2001). In European Union (EU) countries, there are decisions and initiatives in order to make traditional education and teaching environments flexible, compatible and integrated. Nowadays, traditional teaching methods should be more clear and flexible. In this way, education and teaching activities can be maintained in direction of individual need and choices in parallel with individual learning needs (Martinez-Torres et.al, 2006).

Use of information technologies in education and teaching lead to important results not only for students but also lead to significant results for instructors and other educators. Information and communication technologies increase productivity of instructors and educators and allow them to obtain more qualified output and result by making less effort in a shorter period (Turan, Çolakoğlu, 2008). Use of new technologies is not at the desired level in the higher education in Turkey.

Main reasons are that financial incapability, desired education and teaching level has been not reached in higher education, academicians working in the universities are lack of information and practice infrastructure, value of information technologies couldn't be understood completely by managers, academicians and students are not open to new ideas in cultural sense in our country, and also incapability with technical infrastructure (Gökdaş, 2005).

Table 2. Higher education, quantities of student (2013-2014 academic years)

Education Level	Primary Teaching	Secondary Education	Open Education	Distance Education	Total
Vocational	540.607	253.788	935.750	19.988	1.750.133
Undergraduate	1.344,492	400.371	1.609.528	16.297	3.370.688
Graduate	321.205	0	0	7.935	329.140
Total	2.206.304	654.159	2.545.278	44.220	5.449.961

(It is collected from data of Higher Education Committee. April 2014)

When we analyze distributions of current students according to different teaching methods and education levels, for the entire student, 41 percent studies in daytime education, 12 percent studies evening education, 47 percent studies in the Open University, and 1 percent studies in distance education. As for the students in two-year degree programs, 31 studies in daytime education, 15 percent studies evening education, 54 percent studies in the Open University, and 1,1 percent studies in distance education.

According to data dated April of 2014 from higher education Committee, quantities of students in the two-year degree programs has exceeded 1.750.000. 540.607 students study in daytime education, 253.788 students study evening education, 935.750 students study in the Open University, and 19.988 students study in distance education (Table 3).

Table 3. According to higher education type and teaching method total quantity of students in two-year education.

Education Level	Primary Teaching	Secondary Education	Open Education	Distance Education	Total
Public Universities	489.749	239.134	935.750	18.411	1.683.044
Private Universities	43.704	13.075	0	639	57.418
Foundation Vocational	7.154	1.579	0	938	9.671
Total	540.607	253.788	935.750	19.988	1.750.133

(It is collected from data of Higher Education Committee. April 2014)

5. Reasons obstacle use of educational technology

IETC 2014

Demonstrations for academies that give professional and technical education cannot be given according to today's conditions.

Vocational schools have insisted on an education approach based on distant theory rather than hands-on training which is the most important purpose they have had.

Investments are insufficient because of the influence of developing technology on the expenses.

Profile is too low in terms of student who gets professional and technical education.

There is open admission from vocational secondary education to vocational schools.

Technology investment requires a long-term and high-cost infrastructure.

Inspection is insufficient and not serious for foundation vocational schools.

Institutions that give vocational and technical education are far away from meeting expectations of the sector.

There aren't enough instructors with sufficient equipment in vocational schools.

Students, who will get vocational and technical education, haven't got numeral skills which are required for use of technology.

Vocational schools don't have a structure in order to raise their own instructors in a way they will be in accord with market and at an academic level.

Price policy that has been applied to instructors falls behind the market.

Foundation Universities have been working in an unaware, uncontrolled and unplanned way of the expectation of production sector.

Students, who have had vocational and technical education, are more interested in social networks than vocational field from information technologies.

Hands- on training periods are insufficient in terms of raising qualified manpower.

Students attending in vocational schools are children of the families with social-economic problems.

Students, who have had vocational and technical education, don't have sufficient knowledge for working life because their relations with sector are not strong.

IETC 2014

As there are no trainings apart from the vocational program in which education is given by flexible education models, it has become an obligatory to go towards certificate programs after graduation.

Negative effect of successful role models is high on individual in terms of gaining vocational roles supporting personal qualities in accordance with their interests and skills.

Hands-on training cannot be in parallel with advanced technology.

Student profiles that are self-confident and have had lifelong learning skills don't choose the vocational schools.

In formal and foundation vocational schools, theoretical education is given instead of hands-on training as there is no sufficient equipment and technological infrastructure.

Instructors, who will be implementer of technologic integration, have many severe difficulties in using technology because average of age of these instructors is high and they haven't sufficient equipment in academic field.

There is no lesson about technology integration according to branches in the schools that give vocational and technical.

Innovations in the education cannot be integrated to education programs instead of new ideas, changes.

In the institutions that give vocational and technical education, rate of the instructors who are interested in technologies and want to improve themselves is at a very low level such as 10%-15% according to statistics.

A large part for need of instructors cannot be met by the sector.

In order that computer technology can be used efficiently in education system, there are inconsistencies of the individuals in terms of perspectives on technology and attitudes against technological instruments.

Unemployment rate is more than, with a rate 9.4%, developed counties.

Districts and towns come into prominence by the amount of students in Vocational schools rather than raising strong vocational-technical instructors which our country needs mostly.

Businesses, where advanced technology is used, are far from the purpose to meet qualified labor.

There is an educational understanding that falls behind the use of technology which will realize community development.

IETC 2014

There are problems in order to reach qualified labor because demand of family and environmental factors are determiner for professional choices rather than abilities of individual.

There isn't any conscious professional guidance due to current exam system and lack of guidance service.

There is no compliance between education programs applied in the schools with vocational and technical education, skilled and technical labor reached by these programs, and needs of the market in terms of quality and quantity.

Profession standards cannot be determined in vocational education and there is traditional methods used in forming curriculum programs independently of working life.

Students with low profiles prefer vocational and technical schools.

To try to realize educational purposes by means of old technologies,

From the year of 2001, individuals without ability and tendency to use information technologies have to get vocational and technical education because of open admission from secondary school to vocational schools.

It is predicted that schools giving vocational and technical education should benefit from environmental foundations in accordance with law numbered 2809, but they remain incapable of this subject.

Candidates, who took very low points from YGS (the transition to higher education examination), choose the schools with vocational and technical education, and a student who want to get this education will most likely fail in an education in parallel with advanced technology.

Education conducted with lessons applied by 64 credits in vocational schools is quite insufficient in terms of following and applying new technologies.

In the schools with vocational and technical education, there are workplace apprenticeship applications in semester and summer holidays between 240 and 480 hours, hands-on training is conducted, and so these institutions have difficulty in meeting the expectation of sector.

There is no sufficient infrastructure education and application in the vocational and technical institutions which apply evening education.

In direction with cooperation of Industry-University, there is no regulation related to bring the experts, who have worked in industry, in the university.

There is a limitation in the salaries given to instructors for hands-on training.

IETC 2014

It hasn't been made a decision on which model will be applied in vocational and technical education system in our country. While vocational technical secondary schools apply Dual system which is applied in Germany, vocational schools carry out education – teaching according to American system.

According to European Qualifications Framework, Vocational Schools that give a 5th level education admit students by central placement instead of skill examination.

Instructors and student have no time and place freedom.

In the institutions with vocational and technical education, project assist is little if any.

6. Conclusion

Compliance between knowledge, skill and abilities of individual and properties required by the job is a serious factor that has influence on motivation of individual for job and the success in working life. Professional attitude will be correct if individual knows the qualities required by job by means of his interests and abilities. However, vocational schools have stayed behind in terms of raising individuals in accordance with technological developments in order to reach vocational and economic satisfaction on the basis of sector expectations in qualified labor market. After the reasons mentioned above, it isn't not likely to obtain an improvement depending on production sector in the country. Vocational schools in which there is misunderstanding both vocational and technical education policy and technical education based on technology and final an educational understanding that will meet the expectations of the sector, keep youngsters busy in daytime education for 2 years in the our country where we have a young population as 20 percent. Besides, amount of the student registered in open university is higher than those who attend in daytime education and rate of the student graduated from vocational schools has remained at 26, 2 percent level. These situations are important losses which should be solved immediately for production sector that has advanced technology integration based on practice. In addition, expectations of students of vocational school and instructors and product sector don't accord so it stays as an important problem in applying advanced technology to vocational and technical education.

As vocational and technical schools are without hands-on training based on physical infrastructure and renewable technological software which are necessary to use information technologies, an economy based on production, which is the most important principle, cannot be realized. Therefore, education and teaching efficiency cannot occur with increased participation, communication and interaction suggesting use of technology in education. When the influences of information technologies are analyzed more closely, it will be seen that instructors of higher education are lack of sufficient knowledge to give hands-on training and are unaware of abilities to follow technology closely and apply advanced technology.

Use of internet and other information technologies should be used in order to increase quality in education instead of accelerate the education. Vocational and technical education parallel with advanced technology should be planned and regulated according to purposes and goals. However, in today's vocational schools, there is theoretical education that doesn't force instructors and students instead of hands-on training that follows technology. As a result of this, graduated student is an unqualified intermediate staff for qualified labor market.

New technologies and computer-managed instruction have remained as a supplementary of traditional education and teaching methods.

Redesigning for collaborative learning environment: study on students' perception and interaction in web 2.0 tools

Fui-Theng LEOW[a]84, Mai NEO[b]

[a]*INTI International University, Persiaran Perdana BBN, Putra Nilai, 71800 Nilai, Negeri Sembilan, Malaysia*
[b]*Multimedia University, Jalan Multimedia, 63100 Cyberjaya, Selangor, Malaysia*

Abstract

In this study, Gagne's instructional events were incorporated into Jonassen's model for designing constructivist learning environment (CLE) to enable collaborative learning, which mediated by web 2.0 tools. By factor analysing the survey response from 182 students in previous study, 'peer interaction' component was identified, and therefore used as the coding category for the content analysis, to study students' comments and posts in web 2.0 tools. It was found that peer interaction can be further elaborated into different aspects, such as forming cross-checking and expressing personal thoughts. The next study will focus on other identified components in collaborative learning environment.

Keywords: Gagne's instructional events; Jonassen's model for designing CLE; web 2.0 tools; collaborative learning; peer interaction

IETC 2014

1. Introduction

In this digital age with modern technologies, studies show that learning approach should move away from merely producing correct outcomes or memorizing the facts for avoiding mistake. While the job market are seeking for 21st-centery-skills-ready fresh graduate, engaging university students in group learning and problem-solving project will bring the new role for the students to be active and responsible in collaborating and discussing the group work with their peers (Cecez-Kecmanovic & Webb, 2000; Chiong & Jovanovic, 2012). *"...in previous semester, my lecturer did not teach me about this, so I do not know how to do this..."* This is a typical example faced by the first author of students relying on the teacher to transmit the knowledge. By redesigning the learning environment for transforming students into independent learners, it can eventually reduce teacher dependency in students' learning process, especially when they gain new experience in meaningful learning process which relating to their prior knowledge, and building relevant new knowledge.

As determined by the situation, social interaction is the approach that makes learning more effective for overcoming the insufficiency in rote learning, and differentiates the constructivist learning from the traditional learning approach. On other hand, the advancement of ICTs has provided more opportunities for students to explore, interact, and work with the peers in process of making new meaning which serves the fundamental to constructivist learning approach (Vygotsky, 1978; McLoughlin & Lee, 2010). The literatures also show that collaborative learning is an instructional approach evolved from constructivist learning, however, with the technological support and network facilities, collaborative learning can be further diversified and enhanced to build students' skills in critical thinking, problem solving, and

* Corresponding author. Fui-Theng Leow
E-mail address: fuitheng.leow@newinti.edu.my

knowledge construction (Cecez-Kecmanovic & Webb, 2000; Chiong & Jovanovic, 2012). In this study, collaborative learning is employed as the main instructional approach to enable students gaining new learning experience in constructivist approach where the process was mediated by web 2.0 tools, so that student learning is neither restricted by limited class time nor just constraint to face-to-face interaction.

Web 2.0 was defined as the second generation of web, and the term was created in a conference brainstorming session in year 2004 by O'Reilly Media and MediaLive International. With its concept of 'web as platform', it changed the dynamics of content creation, and embracing user contributions (O'Reilly & Battelle, 2009). According to O'Reilly (2005), the software in web 2.0 era have some characteristics that firstly bring the fundamental changes in the business model. As inspired by these changes in transforming the business model, in this study, it described the changes brought by the same characteristics of web 2.0 era, to university classroom environment for enhancing collaborative learning in the constructivist approach. These changes include: shifting the focus from learning outcome to learning process, and treating students as co-contributors (see Table 1).

Table 1. Reflecting the changes into University learning environment based on the characteristics of web 2.0

Changes in University Learning Environment added by the Characteristics of Web 2.0
Shifting the focus from learning outcome to learning process, instead of just evaluating the outcome, engaging students in the project development and problem-solving, to emphasize on the learning process which require students to identify the scope, constantly update, respond to tasks at various stages. Therefore dynamically influencing the results, the quality of work, and student motivation.
Treating students as co-contributors, in the knowledge construction process, students are encouraged to contribute share experience, and conduct discussion in the learning environment. The instructor can monitor student performance, class situation and motivation level to adjust the learning activities and re-plan the strategies. Guidance can be provided to support students as part of the content-contributors.

1.1. Jonassen's (1999) model for designing constructivist learning environment (CLE)

According to Duffy & Jonassen (1991), 'all interpretations are not equal; it cannot be presumed that there is only one correct interpretation'. This explained that many perspectives can be used to address a concept based on different individual experiences. As knowledge cannot be transmitted in constructivism, Jonassen (1999) proposed a model for designing constructivist learning environments (CLE), for facilitating knowledge construction and meaning making. This model houses six essential components: 1-Problem / Project; 2-Related Case; 3-Information Resources; 4-Cognitive Tools; 5-Conversation / Collaboration Tools; 6-Social Contextual Support (see Fig. 1). This model was considered as a complementary design tool to enhance traditional teaching approach, and many studies had found that it can be applied in different contexts.

Jonassen (1991) also described that there are three stages of knowledge acquisition. Student learning usually begins at the stage of initial knowledge acquisition, which can be best supported by more objectivistic approaches, before transmitting to constructivist approach with ill-structured domain for acquiring more advanced knowledge (Jonassen, Mayes & McAleese, 1993).

1.2. Gagne's (1985) model of nine instructional events

Gagne described instructional design as 'analysing the desired learning outcomes in terms of their prerequisite skills', and believed that when the instruction is properly designed around the instructional events, student learning will have the most efficient and effective support. Hence, the model of nine instructional events was created for classifying types of learning and conditions for learning (Gagne et al., 1988; Wager, n.d). These instructional events include: 1-Gain Attention; 2-Inform Objectives; 3-Recall Prior Knowledge; 4-Present Content; 5-Provide Guidance 6-Elicit Performance; 7-Provide Feedback; 8-Assess Performance; 8-Enhance Retention and Transfer (see Fig. 1). Gagne's instructional events were

also considered as external events as it consists of well-organized instruction that facilitate the information processing and help students to learn (Gagne, 1985).

2. Research design

In this study, it mainly employed the content analysis on student's posts and comments in web 2.0 tools, to identify student perception and their interaction in web 2.0 tools. The results of this study serve as one of the important discussions in formulating the answer of the research question at the latter stage, 'How effective is the learning environment on student learning process?' The following sub-sections include the discussion on the study samples, design of learning activities, instruments used for data collection.

2.1. Samples

In this study, the research sample consists of 182 participating students who enrolled in IT classes which were taught by the researcher at INTI International University. The data collection started from year 2012 to year 2014, and spanned across five academic semesters. The class environment was set at the lecture classes at INTI International University, and student learning was centered at problem-solving project throughout the whole semester, to encourage student collaboration, social interaction, development of software skills. The student learning process was also mediated by multimedia contents and web 2.0 tools to enhance communication and students' understanding. Based on the demographics, these 182 participating students came from seven different IT courses. There were 74.2% of Malaysian students and 25.8% of international students; 79.7% of male students and 23.3% of female students.

2.2. Design of collaborative learning environment

In this study, as for providing objectivistic approaches to support the stage of initial knowledge acquisition, Gagne's instructional events were used and by dividing into three parts: engaging, enriching, and enhancing, to be incorporated into Jonassen's model to support the design of CLE, especially in the first stage in knowledge acquisition. As presented in Fig. 1, Jonassen's (1999) model and Gagne's (1985) were mapped into class environment for designing the collaborative learning, which mediated by multimedia contents and web 2.0 tools. In order to engage students, the event of gaining attention, informing objectives, and recalling prior knowledge were incorporated when introducing the project to the students and in the process of describing the related cases, so that they gain more interest and define the scope appropriately. As for enriching the student learning, the event of presenting content and providing guidance were embedded to encourage students to share and organize the resources, to build better understanding and stimulate their thoughts with cognitive tools, such as mind-map tool, wiki site or prototyping tool. Lastly, in enhancing student learning, the cognitive tool, conversation tool or collaboration tool can be used particularly in the event of giving feedback, eliciting and assessing performance, to encourage more discussion, enable more practice and development for strengthening the newly learned knowledge. In enhancing the retention, student learning can be continued with the contextual support, such as developing following courses or projects which require students to use their prior knowledge as the foundation for solving another complex problem, or for achieving more requirements in higher level of study.

IECT 2014

The breakdown structure below (see Fig. 2) presents the mapping of Gagne's (1985) model and Jonassen's (1999) model into class environment for collaborative learning.

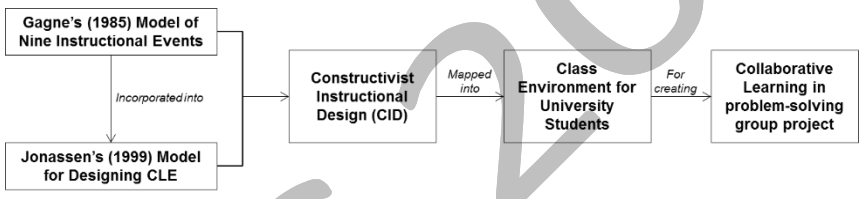

Fig.2. Breakdown structure for the design of collaborative learning environment

2.3. Instruments

As encouraged by the instructor, students can use the web 2.0 tools with their preference, for sharing resources, extending the discussion to online platform, exchanging opinions, and forming learner community. Content analysis is one of the main techniques for analysing qualitative data (Fraenkel, Wallen & Hyun, 2012), and in this study, it was used to investigate students' communications in web 2.0 tools, focusing on how they interact in posts and comments. Web 2.0 tools that used by those participating students were Facebook closed group; web-based or mobile-based chat apps, such as LINE app, Whatsapp, Facebook Messenger, WeChat app; cloud-based storage software, such as DropBox or Google Drive. Besides, open-ended questions were used to collect students' opinion from different perspectives, and support the analysis on students' posts and comments in web 2.0 tools.

4. Data analysis

In this section, the data analysis was based on the qualitative data collected from students' interaction in the posts and comments in the web 2.0 tools. The analysis method used was content analysis, and its coding categories were based on the components obtained from the factor analysis in previous study. However, in this paper, only one category was discussed, named 'Peer Interaction'. In addition, responses from open-ended questions were also used to further explain the students' posts and comments in web 2.0 tools. In analyzing students' peer interaction (see Fig. 3), some posts and comments in the web 2.0

IECT 2014

tools were extracted from different student groups. It can be noticed that in discussing the content for achieving an outcome, different groups of students interact and react differently with their group members.

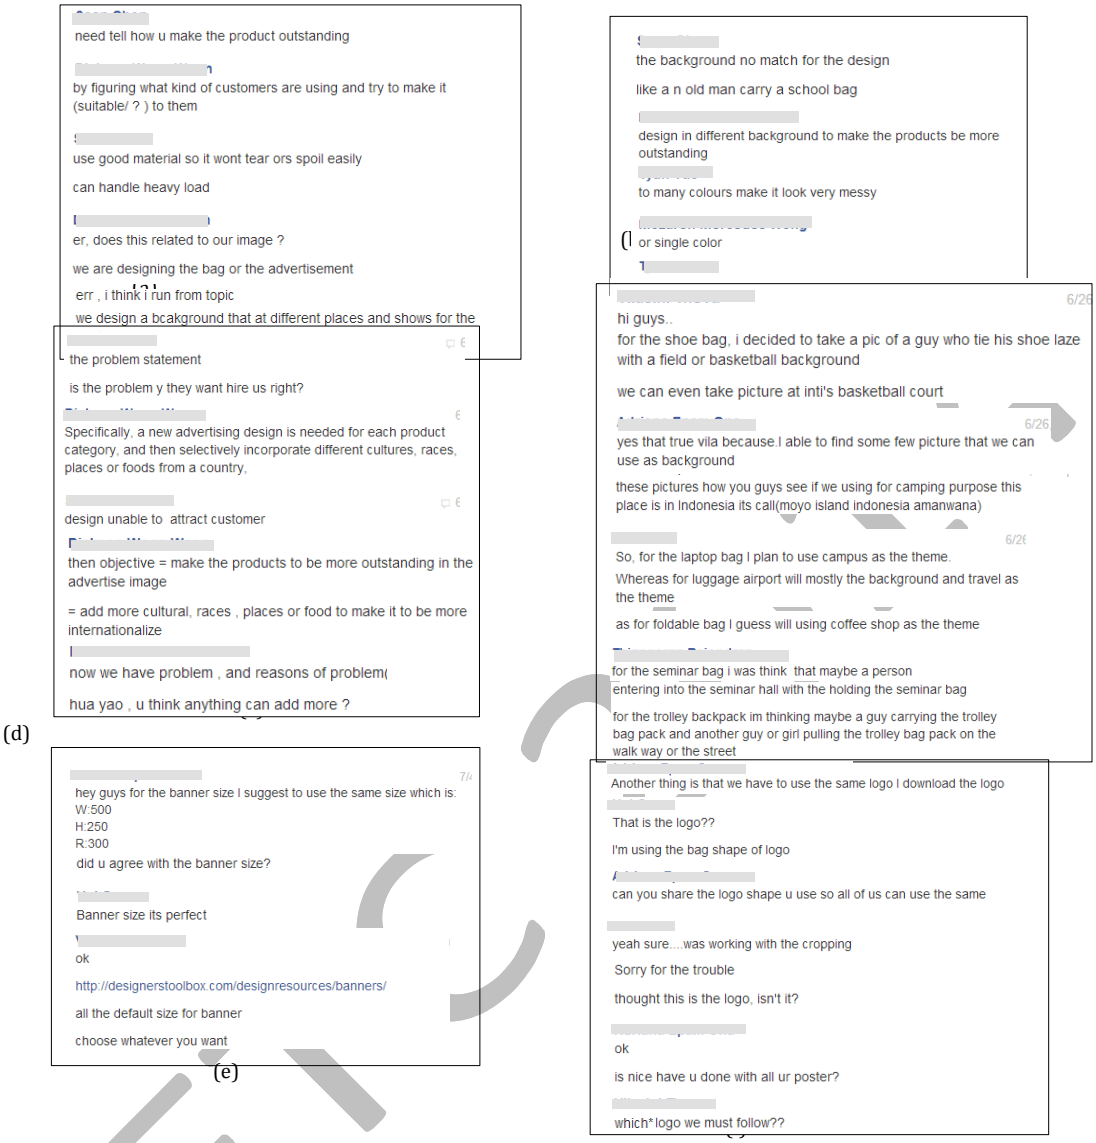

Fig.3. The collection of students' interaction and comments in web 2.0 tools

By referring to Fig. 3(a), during the discussion process, a member's misunderstanding was corrected immediately by another group member when he gave his own idea, so this discussion has helped him to avoid making further mistake, and by re-justifying the needs, it again highlighted the key points for keeping on the right track. Similarly, another student group managed to solve problem of standardizing the logo when two members used two different logos in a single project, another student was confused and ask *"which logo we must follow??"* (see Fig. 3(f)). At the end, they decided to use a more attractive logo which voted by all members. These can be considered as the important gains in peer interaction as students were exposed to possible conflicts, misunderstanding or mistakes in the project development process, therefore they learned to identify, quarantine, and fix them at the group level, before it leads to any worse situation where the main focus of development were shifted into a wrong direction or caused unnecessary waste of effort and time.

As seen in Fig. 3(b), students interacted by commenting about the artwork designed by a member with his personal opinion and impression *'like an old man carrying a school bag'*, which shows that he tried to explain why the design was not suitable and not matched. Hence, it stimulated another round of discussion with regards to the use of background images and color selection. This can be considered as an op-

portunity for students to learn to express their thoughts in a way that can be understood by others while not being offensive, as well as learning to accept the difference among the group members.

It can be noticed that students started to brainstorm at the beginning of the project development as they discussed about each of their understanding on the problem and tasks given (see Fig. 3(c)). By using the web 2.0 tools, students' interaction was at real-time when they brainstormed and exchanged understandings as well as constructed the project objectives with the peers without further delay, as one student told his group members "*now we have problem, and reasons for problem, u think anything can add more?*" It is believed that the students' retention and motivation can be increased as they get connected online for real-time communication and synchronization of their ideas and project works in a single shared web-based document. Furthermore, as each of the comments can be seen clearly in the chat box, students could take turn to provide suggestions and ideas to added onto the parts which has not been mentioned by other group members (see Fig. 3(d)). As filling the gap, it made the collaborative process more efficient and meaningful for students to realize that they were one of the contributors and play a role in enhancing the values of the project.

When students were encouraged to use web 2.0 tools to extend their communication and interaction, it was found that students learned to use the Internet resources conveniently to find more reference for expanding their existing knowledge, such as in Fig. 3(e), a student proposed some image resolutions as selecting a banner size was given as a task in the project work. Therefore, in supporting her suggestions, another group member pasted a web URL when introducing a webpage, and mentioned that '*all the default size for banner, choose whatever you want*'. Indirectly, it was found that by encouraging students to use web 2.0 tools, it has get students to stay closer to vast collection of resources on the Internet, and be flexible and anticipative in upgrading and updating their existing knowledge.

5. Discussion

As mentioned by Vygotsky (1978), no one can be detached from social life as human communication helps to construct the ideas and enable collaborative learning and skills development, which eventually form an individual's cognitive system (Chiong & Jovanovic, 2012; Tiantong & Siksen, 2013). In this paper, it presents one of the components, 'Peer Interaction' which was obtained from the factor analysis in previous study. Through the content analysis on students' posts and comments in web 2.0 tools, it elaborated and revealed more facts which were meaningful to students and related to the peer interaction process. Therefore, there were several points to be highlighted with pertaining to the peer interaction in collaborative learning environment:

1. **Peer interaction has formed cross-checking and peer evaluation in avoiding misunderstanding and reducing mistake** which might cause a waste of effort and time. As students commented in open-ended question: *'If there are any parts which doesn't look nice, others will change…'* '*We tend to make mistake and another one always corrected the things for us*', '*if not [1 member], we not understand about the requirement about the project, so we can't do what lecturer needed…*' '*it is essential to share the information to avoid misunderstanding*'. These feedbacks show that students appreciated and willing to interact with others as it can produce better quality of work compared to working alone and being isolated. It is consistent with other studies that when students were exposed to checking for mistake or fixing the misunderstanding, it nurtures their confidence and critical thinking skills which can improve students' understanding on the subject topics (Brindley, Walti, & Blaschke, 2009; Chiong & Jovanovic, 2012).

2. **Peer interaction has provided opportunities for students to express personal thoughts for suggestion and improvement**. The students mentioned that *'I feel happy as I get to voice my opinion…and satisfied when my group members accept my idea', '…search for information and then told other group member about what we found…', 'I'm not doing the animation part, but my group members will give me a best explanation on animation*'. It can be noticed that being able to share and contribute to the group project is important as it increases the student motivation in the learning process when they felt proud as one of the contributors and new ideas can be accepted by the group member. This is consistent with the study that students will gain the sense of enjoyment and new motivation when working collaboratively with differ-

ent perspectives which help them to achieve greater academic achievement (Chiong & Jovanovic, 2012).

3. **Peer interaction has indicated the need to accept difference among group members**. From student feedback, some comments reflected that '*many argument appeared due to bias on task allocation, in order to solve this, we hear the problem from another, and redistribute the works*…', '*a person keep scolding me about my part but he doesn't know how hard my part is, so we talk to him and he apologise because he was no experience*…'. This can be supported by the literature that, in acculturating students into a learning community, collaborative learning is an approach to accept and value diversity through negotiation and argument, so that different learning styles, cultures or conflicts can be solved or accommodated before establishing trust among themselves (Palloff & Pratt, 2005; Finegold & Cooke, 2006).

4. **Peer interaction has enabled students to perform brainstorm during real-time online discussion and work synchronization**. The student comments revealed that '…*we start with brainstorming, then construct our page layout, after that we compile everything in one time straight*…', '*we communicate with each other through Facebook… settle everything is on the spot, fast and efficient*', '*most of the time they respond actively…interact in Facebook…do meeting and complete in there*…'. This shows that with the use of web 2.0 tools has enabled online discussion and provided synchronized workplace for multiple users, to generate the outputs as each member takes turn to provide details, fill up the gap, and making final decisions. This is found to be consistent with the recent literature studies that with the availability of web technologies and students' IT literacy, the curricula in higher educational institutions can be re-designed to embrace collaboration in learning among the university students, from teacher-centered setting to discussion-based learning process, and from assessing individual achievement to the value of learning together (Chiong & Jovanovic, 2012; Pun, 2012).

5. **Peer interaction has stimulated students to actively use internet resources** as reference to expand, upgrade and update existing knowledge. When answering the open-ended questions, students said that '*we mostly found information from the Internet, also got a few photo sample from the Internet…*', '*we acquire information from the Internet such as About Us information that we would like to put in the project*…', '*we do some research on the Internet for the ideas of our product and the design of the application*…', '…*search for video tutorial and learn it*…'. These feedbacks show that using internet resources has been a very common and helpful practice among the students. As it can be noticed that Internet resources were used for many different purposes, such searching for ideas, work samples, guidance, or related information which were needed in different stages of the project development. This trend has reflected that the students who were raised in this information-rich generation are interested and capable to use digital media and Internet resources for learning, socializing, and working on tasks (Chisanu, Sumalee, Issara & Charuni, 2012). Hence, this pedagogical change has moved towards cultivating active learning to construct new knowledge with experiences of using different resources (McLoughlin & Lee, 2010; Chisanu et al, 2012).

6. Conclusion

As a conclusion, this study mainly focuses on incorporating Gagne's instructional events into Jonassen's model for designing CLE, in order to map into the class environment for collaborative learning in project group. It aims at enriching students' learning experience and knowledge construction process. In discussing the component of 'peer interaction' which were identified from the factor analysis in previous study, with the use of content analysis method in assessing students' feedback and their interaction in web 2.0 tools, several aspects on peer interaction were further elaborated and discussed. Therefore, this study has suggested that each of the components identified from this collaborative learning environment should be further studied and investigated with all forms of students' interaction in the web 2.0 tools. The next study will focus on different components of collaborative learning environment, including work organization and skills development.

Re-envisioning libraries for training and literacy development

Kurtis McDonald85
Kobe College, 4-1 Okadayama, Nishinomiya, Japan 662-8505

Abstract

As technology continues to develop at a rapid pace, libraries need to embrace a more engaged role in the active training of patrons to meet the diverse range of literacy requirements they are increasingly likely to face in their daily, academic, and professional lives. This paper contends that the promotion of educational opportunities should run throughout all aspects of libraries and embody the ethos of the librarians that work within them. If libraries are going to truly meet the needs of their patrons going forward, innovative information literacy training must be re-envisioned as a service priority in all library functions.

Keywords: literacy; libraries; computer literacy; technological fluency; information literacy

IETC 2014

1. Introduction

Libraries have long been considered primarily as places where books, journals, and other forms of paper-based sources of information are stored, indexed, and made available to meet the specific information needs of their patrons as they might arise. While the scope of these collections naturally varies within the different library contexts (public, school, academic, special) and even among the many subdivisions within each of these contexts, the notion that libraries are mainly for making paper-based reading materials accessible is one that has existed as long libraries have existed themselves. In recent decades, however, as technological capabilities have progressed dramatically, so has the capacity of libraries to incorporate an ever-increasing amount of text-based digital formats (electronic journals, magazines, newspapers, e-books) as well an array of multimedia formats (audio, audiobooks, video, video games) in their collections. Although the inclusion of such formats in library collections has served to greatly expand library access to a growing range of information and entertainment sources, it seems that in many ways the focus has managed to remain chiefly centered around that of providing access itself. Though this approach harkens back to the concept of libraries as information repositories carried over from the paper-based age, it is imperative to reconsider if this area of service is all that libraries can and should be concerned with.

In an age when access to information of all kinds is becoming increasingly easy due to the Internet, a library focused on providing access alone is clearly not meeting all of the varied needs of its patrons including a range of literacy needs. Indeed, along with the technological developments that have allowed libraries the opportunity to provide greater access to an expanding range of formats, the current skill set

* Corresponding author. Tel.: +81-0798-51-8614; fax: +81-0798-51-8593.
E-mail address: kurtis@mail.kobe-c.ac.jp

required of people in the 21st century seems to have changed as well. No longer is basic literacy, the ability to read and write, all that is required to thrive and succeed. Today, people must also increasingly be able to use technology effectively; they must have computer literacy. Even beyond basic and computer literacy, people must be able to conduct and manage their own information-seeking processes. Identifying information needs, exploring search options, and evaluating the sources that they do find are all now essential elements of information literacy required of many in the Internet-based, information-rich world of today. While the importance of these literacies has long been recognized within the field of library and information science and many, if not most, libraries do attend to them to some degree, this area of library service remains in a secondary role to that of providing access. If librarianship is going to truly meet the needs of patrons today, innovative information literacy training must be made a service priority in all library functions.

2. Literacies old and new

While the term literacy once referred almost exclusively to the basic ability to read and write, the concept of literacy today has come to mean a great deal more. *Basic literacy*, however, remains a critical first step that must be reached before computer and information literacy can be fully addressed. Fortunately, in many parts of the world, the development of functional basic literacy is almost taken for granted, as it is traditionally cultivated in required primary schooling. For those who may not have achieved basic literacy through schooling, both school and public libraries in the U.S. often still provide some degree of support (Brey-Casiano, 2006). In conjunction with other community-based organizations, these and other programs such as English as a Second Language (ESL) instruction remain small but important areas of service provided by libraries.

As technology has become a more and more ubiquitous part of daily life for many people, the ability to use computers effectively has become another critical skill in the 21st century. While the term *computer literacy* is often used to denote some degree of mastery of an overall set of computing skills or abilities in relation to the computer such as being able to use word processing or spreadsheet software, perhaps a more thorough and nuanced understanding is to think of this realm of literacy as *technological fluency* instead (Snyder et al., 1999). Indeed, the word fluency seems to better characterize both the range and fluid nature of technological abilities. While someone may be proficient at using the current version of Microsoft Word, that doesn't necessarily ensure that they would be able to effectively use other types of word processing software or even the next iteration of Word. Most notably promoted in the National Academy of Sciences' Committee on Information Technology Literacy's 1999 report, the concept of technological fluency not only takes into account the disparities in a computer user's skills between different applications, it also encapsulates the need "to plan to adapt to changes in the technology" (Snyder et al., 1999, p. 2), an aspect that is critically important given the rapid pace of technological change. Overall, the Committee noted that three kinds of knowledge were essential to technological fluency: contemporary skills (being able to use current applications effectively), foundational concepts (having an understanding of how the technology works), and intellectual capabilities (being able to reflect on and apply the use of technology to suit changing needs) (Snyder et al., 1999). While more and more people have now grown up accustomed to using computers in many different capacities, there regrettably remains a substantial 'digital divide' between people who have unfettered access to computers and the Internet in their home, school, and work environments and those that simply can not afford such access. For these people, much like those who may not have achieved basic literacy, public libraries may offer one of the only options available for improving this area of fluency (Celano & Neuman, 2010; Krebeck, 2010). By providing access to public use computers and training sessions geared around specific applications, libraries are now increasingly at the forefront of technological fluency development.

IETC 2014

While it is clear that libraries have some role to play in fostering both basic literacy and technological fluency, perhaps their greatest role should be seen in terms of supporting information literacy. *Information literacy*, probably most authoritatively defined by the American Library Association (ALA) in their 1989 report, is generally considered to be the set of abilities required "to recognize when information is needed and the ability to locate, evaluate, and use effectively the needed information" (para. 3). These abilities, therefore, can be thought of as taking people throughout the entirety of the research process: from the initial impetus which sparks a recognition of the need for information, to the search process itself and the evaluation of sources, all the way through to the proper and ethical use of any information found. While obviously of great importance in academia where the ability to conduct independent research and incorporate any relevant background information found is a hallmark of the educational endeavors typically undertaken by students, information literacy extends well beyond coursework and into the daily lives of all of us. Summarizing the widespread importance of information literacy, the ALA (1989) put it this way: "To promote economic independence and quality of existence, there is a lifelong need for being informed and up-to-date" (para. 2).

Although the ALA's 1989 overview of information literacy remains highly relevant and often cited, more recent literature has attempted to recalibrate information literacy to take into account new literacies that are still emerging, especially since many aspects of technological fluency have now become so intertwined with these latest skill sets. Some such as *digital literacy* simply seek to extend the central concepts of information literacy more specifically and directly to the vast number of new information and communication options now available online (Adeyemon, 2009; Borawski, 2009). Another concept gaining notoriety in the literature, *metaliteracy*, expands on the definition of information literacy somewhat by highlighting the growing degree of participatory opportunities now available, as Mackey & Jacobson (2011) note, "to actively produce and share content through social media and online communities" (p. 76). Finally, another conceptualization seen recently, *transliteracy*, focuses on the importance of the interaction now possible between all of the different types of text and multimedia formats, as they are increasingly likely to be used in conjunction with one another rather than in isolation (Ipri, 2010). While such novel frameworks have yet to be fully embraced by the library and information science community as broadly as information literacy has been, the distinctions they raise serve as excellent opportunities to reconsider the further blurring of the line between technological fluency and information literacy.

3. Rethinking the priorities of libraries

While it's clear that the importance given to information literacy in the field of library and information science has grown alongside greater access to information and heightened demand for technological fluency, both in the literature on the subject and in the parallel increase in instruction done in libraries in recent years (Grassian & Kaplowitz, 2009), it's even more clear that this function still remains subordinate to the traditional view of libraries as collections of materials (Jankowska & Marcum, 2010). Though some have called for a dramatic realignment of library priorities to place the central emphasis on instruction, particularly in academic contexts (see Loesch, 2010, and Palmer, 2011), these voices currently remain few and far between. While many have recognized the critical crossroads that libraries find themselves at today and have expressed a range of possible scenarios leading either more towards the margins or the mainstream (see Sennyey, Ross, & Mills, 2009), it seems that the library's potentially preeminent role as a provider of both information and the training required to utilize it effectively is often overlooked.

Given both the noted misalignment of libraries' current priorities retaining their focus foremost on providing access to a traditional collection and the demonstrated need for fostering information literacy skills outlined previously, it is my view that libraries must embrace a greater role for integrated training

IETC 2014

and instruction in concert with a more innovative approach to the materials they offer. However, beyond offering isolated information instruction sessions, re-envisioned libraries should build instructional opportunities into everything they do and the materials that they offer. Reference transactions should be thought of as training sessions in their own right and carried out as such as much as possible. Furthermore, the growing potential of digital convergence should be leveraged so that materials themselves can optionally serve as their own interactive training materials combining text with all kinds of multimedia formats. For instance, imagine the potential of downloadable e-books embedded with accompanying audio, video, interactive games, and social networking options. The unique possibilities offered by advanced cloud-based computing systems could also provide entire web-based and on-demand planned learning programs consisting of such multimedia-rich, electronic training materials. These programs could be set up to recognize users' knowledge states and previously viewed content and automatically tailor subsequent materials precisely to the level, interests, and identified needs of the users at that moment. Although the traditional focus of libraries was on ensuring access to carefully selected collections, the re-envisioned focus that I am proposing should be centered on ensuring access to engaging educational materials that foster information literacy and technological fluency in addition to mastery of the content itself.

While it is a liberating intellectual activity to completely re-envision libraries from the ground up, a more measured, incremental progression from a collection focus to a training focus would ultimately likely be required given the realities faced by most libraries. Budget concerns and their impact on limiting how many electronic subscription services could be brought online are obviously one of the largest obstacles to be addressed. An even more important initial concern is gauging the preferences and opinions of any library's user base before any major reprioritization of library goals is enacted. In the end, a library's primary mission must align with providing its constituency with the services that they desire and demonstrate a proclivity toward using. If interactive, electronic multimedia geared toward providing individualized content and training did not match well with the particular library and information needs and preferences of a given library community, such services, no matter how innovative, would likely not be used. Furthermore, as Godwin (2009) notes, the great majority of library faculty and staff are not currently prepared "to employ more engaging and active methods to reach their patrons" (p. 4), as would be required to meet the goals of the re-envisioned library outlined above.

4. Conclusion

Although the future of libraries remains uncertain, it is clear that a significant shift from the overarching priority given to collection of paper-based materials to include a much wider array of electronic formats and Internet resources is already well underway. While most of the field has been content to simply expand the focus on maintaining access to an indexed collection of both paper-based and electronic materials, this paper argues that a much more substantive reconsideration of the primary roles that libraries should be engaged in is required due to both the information and computer literacy needs increasingly required in the Information Age and the new affordances that technology can increasingly offer. Libraries today need to embrace a more engaged role in the active training of patrons to meet the requirements they are more and more likely to face in their daily, academic, and professional lives. The promotion of educational opportunities should run throughout all aspects of libraries and should embody the ethos of the librarians that work within them. While such a drastic realignment is sure to face challenges and resistance from those who do not believe such services can or should fall within the purview of libraries, the realities of the information needs of patrons today demands this type of innovation in strategic planning.

Abstract

The teaching of accounting sciences requires innovative alternative methodologies that allow a greater dynamism in students' learning processes, encouraging their autonomy in order to foster greater understanding and ownership of accounting topics covered in class. In that sense, the use of ICT for educational purposes has been positioned as a dynamic and interactive alternative that allows the application of knowledge and encourages the feedback in the learning process.
This paper aims to reflect on the use of ICT in accounting education as a strategy to improve teaching and learning processes in students of the Department of Finance of Metropolitan Institute of Technology of Medellin. It is proposed a teaching method with a learning virtual object through a virtual mediator of accounting formulations. It has a pedagogical purpose of providing students with a conceptual and practical tool to interpret and analyze accounting and financial topics at the enterprise level.
It is observed that the interaction between accounting graph logic and logic of dynamic perception facilitates the processes of teaching and learning in the disciplines of accounting and finance. It is reflected in greater motivation and understanding of mathematical equations in financial area that will carry out to experimentation of knowledge learned in the classroom.

Keywords: ICT; accounting sciences; teaching; learning

IETC 2014

1. Introduction

In the world and particularly in Colombia, there are different forms of communicative interaction between people with varied economic exchanges adapted from each epoch and every context of accounting development. Thus, humans have developed the tools to set the knowledge associated with modernity in the accounting area: dynamic variables, rules, resources, techniques and technologies. This has influenced the ways of thinking and practice of accounting education in the world. In a country as Colombia, it has a number of studies and knowledge associated with generating best practices of accounting education in university contexts.

Currently, the accounting discipline requires best practices in teaching and learning in various educational contexts, and in different processes and professional activities. There, it can use better perspectives and methodological approaches such as the social and educational constructivism, and philosophical and epistemological pragmatism of accounting. It can be implemented with accounting teachers to be better teachers and make significant teaching with the use other non-traditional forms of education.

* Corresponding author. Tel.: +0-57-301-4281455; fax: +0-574-440-5103
E-mail address: jhoanyvalencia@itm.edu.co

In the hands of currently society and the information and knowledge economy, accounting education and its teaching processes now have a key technological emphasis to the information and pedagogical economy based on technological and active guidance. These perspectives are based on key aspects of the information economy that works on networks and as a global economy (Castells, 2000). To ensure that accounting be part of the social and the economic in the world, it is required better and more effective methods of teaching and learning besides the only pragmatic accounting.

These aspects belong to different disciplines which seek to organize the academic training from the general to the particular knowledge. Future accountants put this knowledge at the service of society to solve problems and provide systems of information from public and private companies. Generally, accounting students in Colombia learn about areas such as accounting, finance, budgets and costs in a rote-linear manner without take into account their applicability. Students have greater cognitive clarity of understanding the financial, political and economic aspects when they know the applications of these areas. It allows them to be the architect of their own destiny and provide a proactive way to solve problems associated with the contexts in their country.

Knowing and practicing different forms, methods and techniques help to accounting teachers and their students to have a meaningful and fluid teaching-learning process. In this way, the aim of this paper is to investigate how teachers can be more innovative teaching accounting through technological resources. So the question that guides this discussion is: How do you teach accounting formulations through technological pedagogical mediator with Virtual Learning Objects and accounting analysis?

A teaching method with a Virtual Learning Object is proposed through a virtual mediator of accounting formulations with the pedagogical purpose to provide better teaching for students and a conceptual and practical tool to interpret and analyze corporate accounting and financial aspects. In this case, it gives an articulated vision between practicality and mathematical precision and between the equation and the financial problem. The teacher in the process of social, cognitive and academic training should define methods of teaching-learning where theory and practice are combined and accounting with other disciplines too.

2. Accounting education from a theoretical perspective of pedagogy

Pedagogy as a science of education has a fundamental influence on the practical learning process of specific variables and metrics to financial accounting. Pedagogy applied to the teaching of accounting education is considered from epistemological aspects according to the technical reason of for being social as a committed accountant with the society since practical aspects of how to use better methods, formulas and mathematical algorithms, and how to be more precise in making financial, economic and business decisions.

Accounting education is understood as the process of teaching and learning of "the accountant" which is self reflection of the activity of accounting in a society, economy and business. Education can approach the formulations of this knowledge and its impact on the social analysis as key aspects in the technique of financial process for all types of people in higher educational settings.

Currently, accounting education is a transmitter and disintegrated education with technological aspects. In this sense, it is proposed pedagogical mediations to improve part of this situation with a better analysis of the teaching process and alternatives based on technology and systemic understanding of financial process, using visualization, graphing and its analysis.

The instructional model seeks “to achieve learning by information transmission”. In this model of education, student learns by repetition, copying or imitating, because he learns mechanically as a receptor without creativity. Thus, it is necessary a new school based on the model of learning by practice, it means, learning occurs by "discovery" (De Zubiría, 1997).

IETC 2014

3. The importance of ICT on academic accounting programs

Information and Communication Technology (ICT) can be defined as a set of information, electronics and telematics technologies, using modern microelectronics, telecommunications and computing to develop all kinds of devices, techniques and processes that impact different areas of human life. So, ICTs can be based on computational and informatics tools that process, store, summarize, recover and provide information in order to transmit, share and socialize knowledge.

In businesses, financial and economic decisions are "a human construction and a form of culture that is characterized by the ability to understand, predict and control phenomena which surround the human being; technology is in culture" (Mejía, 2004).

The advance of new technologies and social changes that occur in the current accounting education requires ICT to support the student learning development. Therefore, it is necessary to stimulate new interdisciplinary tools that teachers and students understand in the accounting area with the implementation of ICT within the classroom and in their processes of accounting education. So as suggested by the IFAC (International Federation of Accountants) through IES 2, Content of Professional Accounting training programs (IFAC, 2008, pp. 39):

The component of information technology should include the following topics and competences: (a) general knowledge of information technology, (b) knowledge of the control of information technology; (c) competences of control information technology, (d) user competences of information technology; and (e) one or a mixture of the corresponding competences to managerial roles, evaluation and design of information systems.

In the dynamic scenario of accounting education from educational spaces of higher education, there are difficult aspects on its teaching (Strajman, 2013). For example: the lack of expertise, inadequate training received from teachers, unwanted changes in your own role and logistical problems associated with their integration into the classroom for the better and greater use of technology tools associated with the teaching-learning process.

It might mean that accounting education in Colombia with the inclusion of ICT should be part of pedagogical and didactic scenarios where expert teachers in these areas are required. Moreover, it shows the need for combining different disciplines as a support (computers, mathematics, graphic and audiovisual design, economy, communications, sociology, psychology, etc.) and new educational policies that enable an interaction of accounting education with ICT.

ICTs are a valid tool to improve the educational process to change the way in which students learn and teachers teach. Also, it helps to modify the instrumental character that should be secondary in the educational aspect. In the field of implementation of these technologies, the teacher cannot get them as a "fashion". He should know about them and be very clear about the purpose of their implementation. Furthermore, teaching-learning process of accountant must to preserve in his formation the social scientific training that aims to solve social problems by Virtual Learning Objects (VLO). They are educational mediators that have been intentionally designed for a learning purpose a technological nature which serves members of the process to explain-demonstrate some model or technique in a field of knowledge.

A VLO has content, learning activities, context elements and metadata. This metadata are data descriptors that are included in the document for easy storage, identification and recovery, which makes it different from a computing object (Ramirez, 2013). Its content its learning activities and its context elements should be designed by the teacher as an organized structure to guide a group of students in multiple paths to confront their ideas with a scientific and critical sense toward a virtual learning community. The student is interacting and solving multiple tasks in diverse situations that raise the understanding and practice of interactive objects. They are generally knowledge objects associated with a teaching-learning process in an active methodology.

IECT 2014

Applying a VLO in accounting is currently very important. It goes from own computing applications of accounting and technic process to graphics and financial variables for their models to decision-making and financial, legal and accounting responsibilities. However, the relation between accounting education and Virtual Learning Objects needs to be redefined. It is a new field in terms of methodology and research without a clear structure. Additionally there are several pragmatic clashes between people who are studying this research field and those who presume it still too registrar.

The purpose of working VLO is to build and demonstrate a logical proposal of interaction between accounting education and technological practice of a pedagogical virtual mediator, which increases the ability to display a proposal behind the financial problem in terms of a technological vision from a business perspective to the didactics of dynamic image and mathematical function analysis.

In this case, present a new method of accounting education is the key to the process of interaction between accounting education and understanding of the learner, who is a virtual mediator in the teaching-learning process from accounting formulas using a technological tool integrated by accounting and arithmetic. This method proposal as a VLO enables a visualization of integrated and holistic formulas, graphs and analysis through a complex and complete process to teaching financial variables that allows have greater precision and technical and technological objectivity.

Teaching accounting formulations through a virtual educational mediator type OVA is an accurate alternative to integrate current technology with a logical teaching-learning process, being didactic, comprehensive and oriented to image viewing with a sense of active and proposed construction of the financial learning process logic. This is achieved by the intrinsic motivation of the person, manifested by the precision of the formula through the algorithm and the attention of the dynamics of the image with the perception of the sense of financial problem.

In that time, it has been taken into account conceptual elements of understanding and reflective praxis such as the notion of cognitive interaction between the dynamic image and perception of understanding of the accounting procedure. They are correlated with a perspective of constructive interaction of teaching and accounting for development of the virtual mediator. Then for math graphing, it was proposed an improved theoretical perspective of financial mathematical calculus in one and several variables to improve the precision of the formulation and mathematical deduction. Finally, an objective application of the dynamic graphical of accounting formulations is accomplished in different scenarios and examples.

In this case, the interaction between the graphic and explicit discursive logic of a financial function promotes constructive interaction of learning from the questions and meanings of people interacting with the tool. This action facilitates the interaction between technology, pedagogy and accounting communication, which interacts in meaningful perception of people to approach the tool as a function of learning and simulation of the actual process they want to teach.

The virtual mediation facilitates the decision making process in the virtual learning mediation. It is conceived as a practical pedagogical application process of computer technology VLO in the teaching-learning process. In the traditional method, a problem-based learning is guided. However, the interactive part is not visible, and there is no dynamic ingredient where graphics changes and movements are made and the student observes, analyzes, and concludes. In the traditional method, but also it can guide a learning based on problems, the interactive part. The analysis done is synthesized in Table 1 through a comparison between traditional and VLO models.

Table 1. Comparison between traditional and VLO model.

	Traditional Model	VLO Model
Subject of learning	Reproductive Static (Chalk and board)	Productive Dynamic (Dynamic Software free)
Learning by	Slow understanding (observation data, data analysis, conclusion, data feedback and calculations)	Fast understanding (observation data and graphics, data analysis and graphics, conclusion, feedback introducing data

IETC 2014

		and dynamic graphics)
Evaluation	Summative, based on trial and error (written and rigid evaluation)	Formative, constructive comprehension levels (open evaluation with analysis of results according to the graph)
Teacher	Information provider or transmitter	Provider or transmitter of information that becomes in guide of learning, transfers control to the students through the simulation and interaction with the VLO
Student	Consumer/receiver information	Increasingly autonomous. Decision maker

4. Conclusions

In modern accounting education, in countries like Colombia, is essential to think and develop better and new teaching-learning methods of accounting. To that case, a method as virtual mediator in the teaching and learning of accounting formulas with free software tools technology was proposed. At present, the education needs pedagogy. Teaching requires to be clear about the purpose to which is wanted to arrive, the way students learn and grow, what kind of experiences are appropriate and effective, and what techniques and procedures are effective to perform the process.

Sometimes students are not interested in the learning process because they consider it monotonous and boring, have no motivating for the learning, are passive, no appropriate strategies, etc. That is the reason why is important the proposed model, which used ICT, something that is very close to the current generation. Furthermore, the use of software allows movement, change and in short time the student gets answer to his questions.

Model proposed is an appropriate strategy, with appropriate techniques where the student uses this tool for learning. It allows contextualize the analysis cases; perfect the use of memory in the applicability of knowledge-sharing strategies where he is more independent using active participation strategies which can test his creativity, and increases collaborative work in the classroom and the discussion of real problems by using these technologies.

The interaction between graphical accounting logic and dynamic perception logic facilitates the teaching and learning of accounting students, which is evident in the expressions of motivation and sustained understanding with analysis of the teacher interacting through the facility tool. Also, expected results with the accuracy of mathematical calculations make possible to focus on some financial mathematical equations to a most effective process in the projection of a scenario of teaching and learning to learn more, to better understand and visualize more effectively.

Remote access for education and control of mechatronics systems

Aydın GÜLLÜ87[a] Ozan AKI[b] Hilmi KUŞÇU[c]
[a,b]*Trakya University Ipsala Vocational School, EDIRNE 22400, Turkey*
[c]*Trakya University Faculty of Engineering,EDIRNE 22030 Turkey*

Abstract

Applied training is important in mechatronics engineering, a multidisciplinary science. Laboratory practice should be done theoretical training to be efficient. Expert trainers are required for mechatronics education which is a complex science. In this study, a network infrastructure is made for education and control of modular production system which is a mechatronics system. The structure was applied to mechatronics laboratory where is Trakya University İpsala Vocational School. In this way, an educator will provide the education of trainees, from any location with internet. Also, a modular production system can be controlled remotely.

Keywords: Mechatronics Systems Education, Remote Access for Education

IETC 2014

1. Introduction

Mechatronics is a design process that includes a combination of mechanical engineering, electrical engineering, telecommunications engineering, control engineering and computer engineering(Department, 2011; Faculty of Mechatronics, 2011). Mechatronics Systems Structure shown in Figure 1. Mechatronic systems consist of mechanical and electronic piece. These systems detects around with using sensors and with the software installed on controls the actuator(Auslander, 1996; Bishop, 2006; Bradley, Dawson, Burd, & Loader, 1991). With the advances in technology, these systems are continuously developed. The development of mechatronic systems can be software or hardware; such a programmable logic controllers (PLC), human machine interface(HMI) sensor or actuator.

* Corresponding author. Tel.: +90-505-783-6611; fax: +90-284-616-3534.
E-mail address: aydingullu@trakya.edu.tr

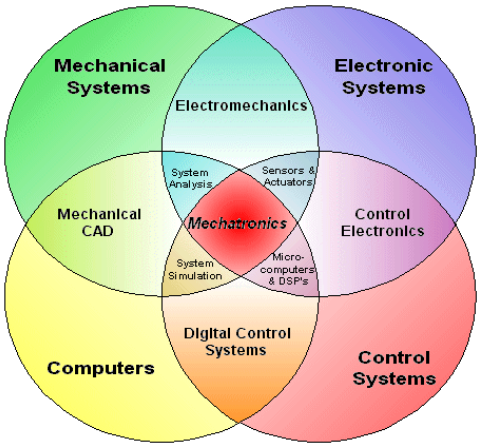

Fig. 1. Mechatronics Systems Structure

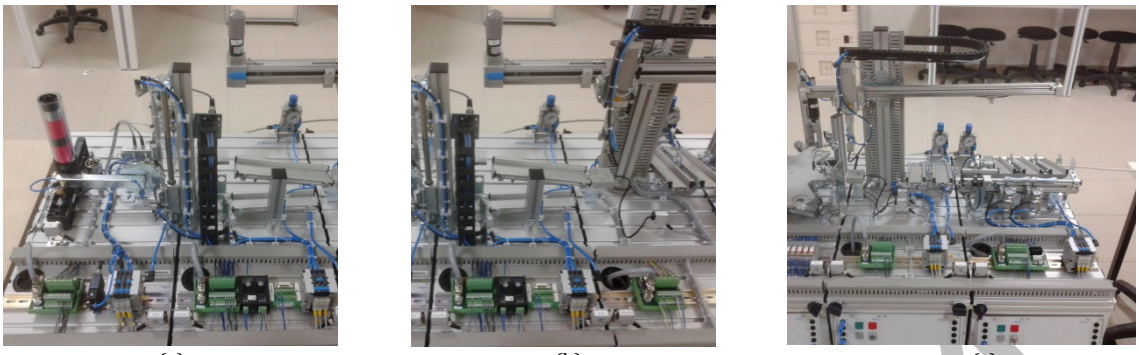
For the implementation of these changes to the system or to teach students, need to get support. Educators must be experts in the field for hardware and software training. In this study, an infrastructure has established to get help when needed from expert educators. With this infrastructure, over the internet from anywhere educators will be able to practical training in the laboratory. At the same time, control of the system in the laboratory can be done remotely, too. Educators will be able to tell lessons, visual and audible via projection, to students in the laboratory.



With the growth of internet in recent years, many studies are being conducted in the remote-access laboratory. Some of them; For phase-aided 3D microscopic imaging and metrology laboratory has been set up remote access(Wang et al., 2014). This study was made of the animation of laboratory equipment in remotely (Schulz, Chen, & Payne, 2014). In addition to remote access labs are carried out several studies on management and training (Maiti, Maxwell, & Kist, 2014; Pearson, 2014; Schauer et al., 2014). Remote accesses to the lab for different educational subjects are provided (Soares, Leão, Carvalho, Vasconcelos, & Costa, 2014).

In this study; from the training set used in laboratory is discussed in Chapter 2. Established network infrastructure in the laboratory is discussed in Chapter 3. Application notes are discussed in Chapter 4. In Chapter 5, results and evaluation are discussed.

2. Mechatronics systems

In this study, provided remote access and control of mechatronic systems, is located in Trakya University Ipsala Vocational School Mechatronic Laboratory. The system consists of six different stations. Stations respectively are distribution station, testing station, electrical handling station, processing station, pneumatic handling station and sorting station. The stations are shown in figure 2. All stations are a demonstration of the production system. The system is flexible and be programmed. Therefore it is called modular production system (MPS). Each station can operate independently of each other. The software can be designed to operate fully automatically. Each station has Siemens S7-1200 PLC. The transactions at stations are perceived by various sensors. Thereby data collected in the PLC, Output elements are controlled. Also there are five computers, six HMI and a projector in the laboratory. PLCs and HMIs communication protocol are Industrial Ethernet. All of the devices to communicate with each other and wi-fi access point switches are used. Established network is described in chapter 3. In this study, all six stations and HMIs can be accessed from a remote location with Internet. The students in the laboratory, practical software and station information, how it works, can be given by educators in remote locations.

IETC 2014

(a) (b) (c)

Fig. 2. (a)Distribution, Testing, (b)Electrical Handling, (c)Processing, Pneumatic Handling, Sorting Stations

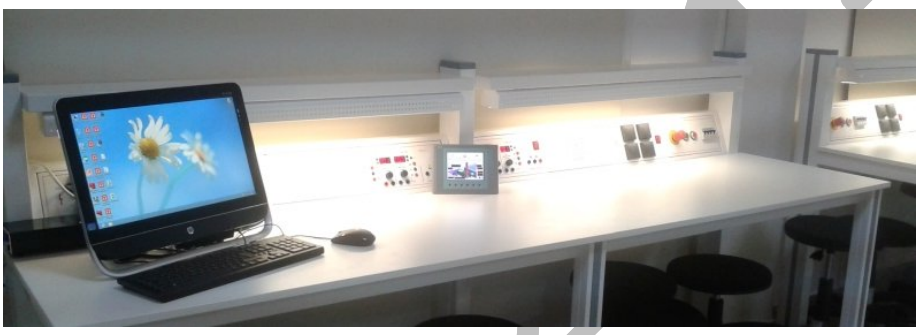


Fig. 3. Computer and HMI Station

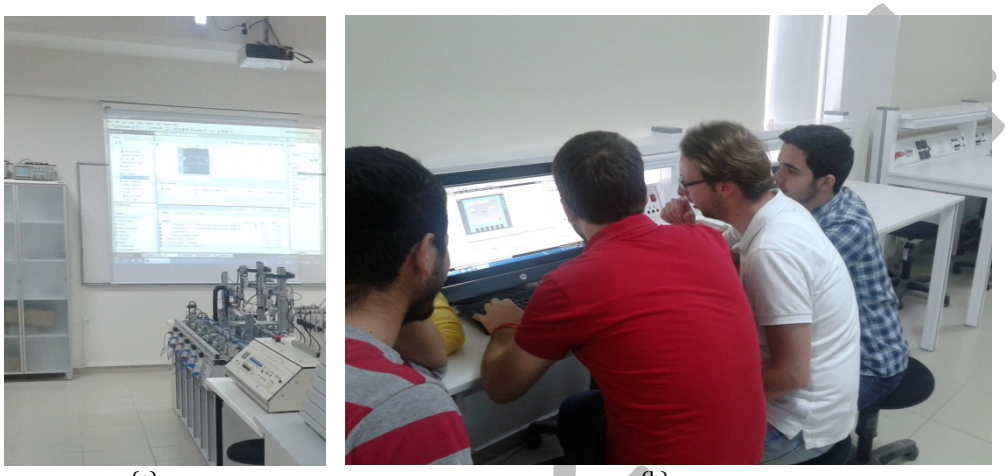

3. Remote access infrastructure

Industrial devices in the mechatronics laboratory are communicating via Industrial Ethernet protocol. Four of the computers can communicate with both Ethernet and wireless Wi-Fi. These computers are bridged Ethernet and WiFi connections. Last one computer can communicate via only Ethernet. Switches are used for cable communication. There are there four port switches in system. There is one access point, which has four ports, for Wi-Fi communication. The access point's WAN port is connected to the Trakya University network. The access point gives IP over DHCP to the devices in the laboratory. A fixed IP is given industrial devices to avoid IP conflicts. All other devices are given an IP address automatically. University and laboratory IP address is configured as different from each other. All network infrastructure diagrams are shown in Appendix 1.

4. Application

Remote access to all devices maintained in the laboratory is provided on the internet with the network connection established. Permitted persons can update the firmware of the device. In the laboratory, a computer that can connect remotely and online video lectures can be made. Images of training in the laboratory are shown in Figure 4.

In this study, two different distance education methods have been tried. The first of them; with the help of the Team Viewer program by making a remote connection is made lectures and station control. Team Viewer has set up a remote desktop connection to the computer in lab. Students with the help of the projector and speaker can follow the course. Education makes lectures over the internet thanks to Skype program. Students are able to follow the online course from their own computer or projector. Educators know the IP address of the station is able to remotely access and control hardware. Both methods were remotely practical lectures.

(a) (b)

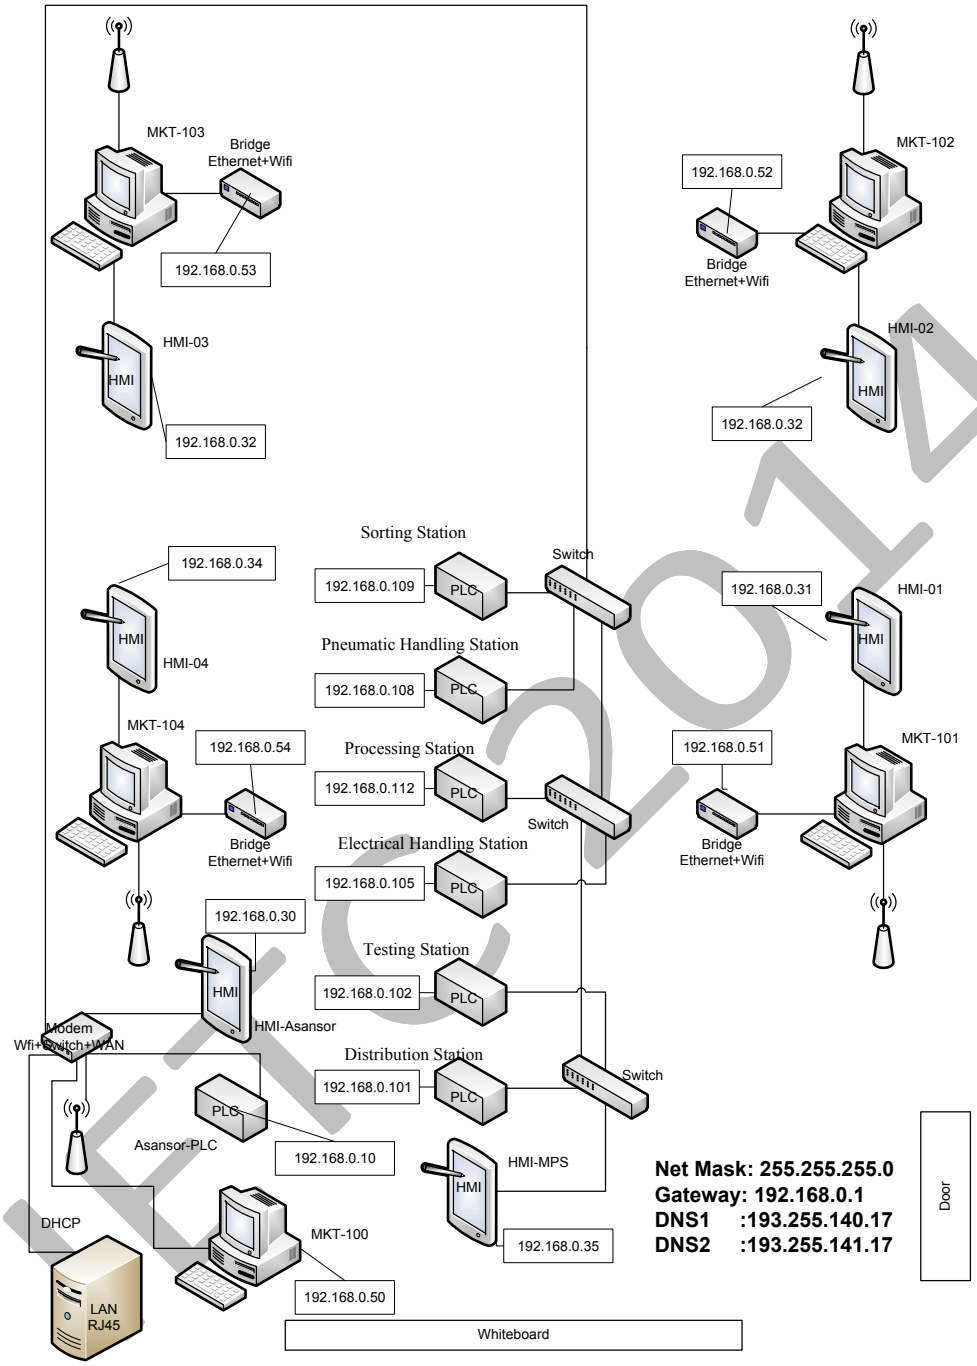

Fig. 2. (a) Stations and Projection Image (b) Students follow courses

5. Results and discussion

Mechatronic systems, known as of intelligent systems, are constantly evolving. Development can be hardware or software. The systems to perform the training, expert trainers are required. In this study, for remote education of mechatronic systems network infrastructure has been established. Remote access to the Trakya University Ipsala Vocational School Mechatronic Laboratory is provided with this infrastructure. Training and control can be done making connection to devices in laboratory with remote access. Training is provided in two different ways. One of them; video conference had established a remote desktop connection is made with the program. The second method; educators in remote locations to connect are provided with IP access to the laboratory. Either method, away from the laboratory via the Internet by connecting the educators gave practical training.

In this study, remote access infrastructure for mechatronics laboratory has been established. By designing a new interface, a link can be established more professional. At the same time, this infrastructure is the infrastructure of remote practical laboratory training.

Representation of women in computer game "prince of persia"

Derya Çetin88
Fırat University, Communication Faculty, 23119 Elazığ Turkey

Abstract

The stories of the popular video games include narrations like movies and other various media contents, and of course those contents are ideological. With this study, we are intending to, by making use of the feminist film theory, compare the 1989 and 2003 versions of Prince of Persia in the sense of representation of women. At the first version the story ends with the traditional patriarchal ends; however at the second version the Princess makes her own way. Within that scope it can be asserted that The Prince of Persia: The Sands of Time, despite being a popular text, includes a cracked-line that may be useful for oppositional readings.

Keywords: Computer games; women representation; feminist theory

IETC 2014

1. Introduction

Through the opportunities provided by the developing technologies, the stories of the video games are getting varied. Developments at the digital technology both made the stories more realistic in the audio – visual sense; and the videos that are shown at the beginning, end, and during the game started to take more and more place within the game. The stories of the popular video games include narrations like movies and other various media contents, and of course those contents are ideological. With this study, we are intending to, by making use of the feminist film theory, compare the 1989 and 2003 versions of Prince of Persia in the sense of representation of women. After the copyrights of the game were purchased by Ubisoft in 2003, it had been published as a trilogy, under the titles The Sands of Time (2003), Warrior Within (2004) and The Two Thrones (2005). In order to establish definite limits for the study, we have dealt with the first version of 1989 and The Sands of Time (2003), which had been improved with reference to the same story.

2. Feminist theory

* Corresponding author. Tel.: +905415980446
E-mail address: dryctn@yahoo.com

The history of feminist film theory begins in the 1970s and parallels the development of film theory itself as an academic discipline. It stems from the woman's movement of the 1960s and was influenced by germinal feminist works like Simone De Beauvoir's The Second Sex, Betty Friedan's The Feminine Mystique, and Kate Millett's Sexual Politics (Hollinger, 2012: 7). The male gaze theory, developed by Laura Mulvey with the assistance of psychoanalysis, had became one of the most commonly used paradigms in the feminist film theory (Smelik, 2008: 4). According to Mulvey, the pleasure obtained from the cinema is in relation with scopophilia, one of the motives that forms sexuality (Mulvey, 2010: 214). The impressive article of Mulvey, which had been published in 1975, not only puts psychoanalysis into the film theory, also examines the relation of the cinema with the patriarchal subluminal. This study, which enables the deepening of the film theory on the axis of the figuration and pleasure fictions with the questions that "how representations building the masculine and the feminine make themselves accepted by the means of the social myths and norms", and "how the social gender fictions make the social gender felt and how it effects the life styles", indicates that in the cinema audience had been placed as the subject of the masculine view and the body of the women had been placed as the subject of the sight; and thus the primary pleasures produced by the cinema are peeping and fetishism (Arslan, 2009: 18). Mulvey had examined the scopophilia at the classical cinema as a functional structure on the axis of effectiveness and passiveness, and had separated those two opposites into their genders. The narrative structure of the traditional cinema establishes the masculine character as effective and powerful: dramatic action opens around the actor and the view organizes with this. In that sense the cinema had previously idealized a visual mechanism being structured and organized according to the western art and westerns aesthetical criteria (Smelik, 2008: 4,5). According to Mulvey the cinema satisfies a primordial wish for pleasurable looking, but it also goes further, developing scopophilia in its narcissistic aspect. The conventions of mainstream film focus attention on the human form. Scale, space, stories are all anthropomorphic. Here, curiosity and the wish to look intermingle with a fascination with likeness and recognition: the human face, the human body, the relationship between the human form and its surroundings, the visible presence of the person in the world (Mulvey, 2010: 216). Mulvey had revealed narrative and cinematographic techniques that give the right to peep only to men. Within the narration of the movie, the masculine characters direct their sight towards the female character. The audience automatically, and mostly unconsciously unites with this masculine view. This is because the reason that the camera shoots not only from the optic, but also from the libidinal view of the masculine character. Thus, the cinematographic view has three levels that clarify the female character and turns it into something theatrical, which is the camera, character, and the audience). At the classic cinema peeping explains the women with their being charming (Cited by: Smelik, 2008: 5). Mulvey says that the mirror stage, which is particularly important for Lacan, in other words the moment that the child identifies his/her own image on the mirror is important for the establishing of the ego and for her theory. The mirror phase occurs at a time when children' physical ambitions outstrip their motor capacity, with the result that their recognition of themselves is joyous in that they imagine their mirror image to be complete, more perfect than they experience in their own body. Recognition is thus overlaid with misrecognition: the image recognised is conceived as the reflected body of self, but its misrecognition as superior projects this body outside itself as an ideal ego, the alienated subject which, reintrojected as an ego ideal, prepares the way for identification with other in future (Mulvey, 2010: 216). Because of that reason the forming of the ego is takes shape structurally with imaginary functions. Just like the cinema, even before the assertion of this analogy by Christian Metz at the articles on psychoanalysis and cinema, Mulvey had asserted that the cinematographic identification is structured at the border of gender differences. The figuration of the masculine character, which is more complete, stronger, and has a ideal ego, is a contradiction before the distorted passive and weak female character. Thus, the audiences are manipulated to identify itself with the masculine character rather than the female character (Smelik, 2008: 5,6). Woman then stands in patriarchal culture as a signifier for the male other, bound by a symbolic order in which man can live out his fantasies and obsessions through linguistic command by imposing them on the silent image of woman still tied to her place as bearer, not maker, of meaning (Mulvey, 2010: 212). Thus the visual pleasure has two dimensions that are transmitted by the means of gender difference: peeper – scopophilia view and narcissistic identification. Those two creative structures owe their importance to the clarified figuration of the female and the power of the masculine, holding the power. Furthermore, according to Mulvey, in the psychoanalytic sense the image of the women is already ambiguous; and the reason for that is its causing the fear of castration with its charm and seductive appearance. The female character that makes the masculine subject remind the lack of penis is rather the source of deep fears. The classic cinema overcomes the threat of castration by the means of the narrative structure or fetishism. In order to make the threat of castration imperceptible, the female character shall be found guilty. The confirmation of this crime is performed either by punishment or salvation. The reflection of this to the story of the movie is

realized by the means of two conventional ends, deemed proper for the women: the woman character either dies or marries at the end of the movie. In both cases catharsis is at the service of the male audience. (Smelik, 2008: 6)

3. Prince of persia

Prince of Persia is the general name given to the video game developed on by Jordan Mencher at 1989, and the other games derived from this game. The first game of the series had been published for Apple at 1989 first. The game had sold more than two million copies, and many versions adaption of it had been developed. In 2003, Ubisoft had bought the copyrights of Prince of Persia, and released the Sands of Time Trilogy, consisting of the games named The Sands of Time, Warrior Within and The Two Thrones. With this study, we are comparing the 1989 (Prince of Persia) and 2003 (The Sands of Time) versions of Prince of Persia in the sense of figuration of women.

3.1. Narrative structure and fetishism

The narration mainly consists of two parts, the story and the discourse. The story includes the plotline, the characters, and ambiance. On the other hand, discourse is the expression, the tool that transmits the discourse. The story is about "what" is being defined in the narration, and the discourse is about "how" it is defined. The story and the discourse are substantially important in the sense of the ideological construction of the narration, and they are articulated to each other in order to enable this (Abisel, 1994, s. 188-189). At the first version of the game, the story takes place in ancient Persia. The Persian King had gone to a war and left the throne to his Vizier Jaffar. Jaffar wants to marry the Princess, and take the throne. The Princess refuses her, and he locks her in a room, and tells her to accept his proposal, otherwise he will kill her. On the other hand, he also imprisoned the nameless stranger (the Prince), who was in love with the Princess. The game begins with the escape of the stranger from the prison. The stranger, who will be the Persian Prince at the end of the game, hurdles various barriers within the palace, and reaches the room of the Princess defeating his enemies. At the end the stranger kills Jaffar and marries the Princess. The game consists of 12 chapters. We see the Princess for 8 times in total, at the beginning while she refuses Jaffar and he locks her in a room, while she waits to be saved between the chapters, and at the end of the game, while being saved by the Prince. The only action of the Princess, other than waiting to be saved by the Prince, is at the beginning of the 8th chapter, giving the task of helping the Prince to a mouse. At the end of the 8th chapter, where the Prince cannot open the exit door, the mouse helps the Prince and enables him to pass to the 9th chapter. This is an exception for the Princess, because she waits for the Prince for salvation for the entire course of the game. Thus, as Smelik remarks, the Princess is given two opportunities at the beginning of the game, to die or to marry Jaffar. At the end of the game she is saved by the Prince, and marries the Prince; and catharsis is presented to the service of the male auditors. In the 2003 version of the game, released by Ubisoft in 2003, new characters had been added to the story, and the story had been improved. The story of the game can be summarized as; the Prince invaded a country and took magic sands from the country, enabling the control of the time. Then the Prince releases the sand, without guessing the results of his act, and then recollects the sands and put the clock back. Different from the first version, at this game the Prince does not receive the title "prince" at the end. At the very beginning of the game he is already a prince, as the son of Shahraman, the Persian Sultan. The Prince invades India, and the Princess is the daughter of the Indian Sultan Maharajah, Princess Farah. This time the Vizier is not the Vizier of the Persian, but Indian Sultan. At this version, the Princess has a more active role in the narration. At the beginning of the game, just like the first version, the Princess is captured, but then she escapes, and as being the wisest person at the game, tries to warn the Prince about the Vizier. The Vizier wants to get the blade of the Prince, and to become immortal by using the sands of time. It is only Princess Farah who knows the intention of the Vizier, and the evil side of the sands of time.

IECT 2014

At the beginning of the game she tries to prevent the Prince to unknowingly release the sands of time by using the blade, but she cannot succeed. Everyone turns into monsters, other than the Prince, the Vizier and Farah. The Prince defeats the monsters, passes various mechanical traps, solves riddles, and proceeds in the palace. At the 42nd minute of the game, which takes about 5 hours, Farah and the Prince meets, and they proceed together. At about three and a half hours of the five hours game, Farah takes active roles in the story with the Prince. She passes through narrow passages, opens the doors, and takes various tasks necessary to complete the game. In addition the uses an arrow, and physically fights shoulder to shoulder with the Prince, against the bad characters. Thus, Farah is no more a knick-knack for the story. She gets closer with the Prince as the game progresses, and when the Prince hesitates to place the blade in its place, she fights against him. The Prince loses her faith in Farah for a while, and hesitates to end the terror. Because of the hesitation of the Prince, Farah takes the blade, controlling the sands of time, from him, and, leaving the Prince, takes another way and decides to end the struggle all alone. The Prince moves alone for a while, and at the end of the game meet Farah, fighting the enemies. The Prince tries to help her, but he cannot succeed, and the Princess dies. At this point, the role assigned to Farah is consistent with the masculine roles imposed to the women; die or marry. As we mentioned before, in order to make the threat of castration imperceptible, the female character shall be found guilty. The confirmation of this crime is performed either by punishment or salvation. The reflection of this to the story of the movie is realized by the means of two conventional ends, deemed proper for the women: the woman character either dies or marries at the end of the movie. In both cases catharsis is at the service of the male audience. (Smelik, 2008: 6). Farah dies according to the principles of the conventional ends. Thus, Farah, who uses weapons like professional soldiers, fighting physically, and takes care of herself, is brought back to the point where she was located in the first version of the game. However, the narration does not end at that point. The Prince defeats his enemies, takes the blade back from Farah, and puts the blade in its place, takes the sands back. As he takes the sands he turn back the time, and the story return to the beginning, and thus Farah does not die. Since he held the blade, only the Prince remembers what had happened. Prince kills the Vizier, who did not take any actions yet, and the evil is stopped at the beginning. The Prince tells the story to Farah, but Farah, remembering nothing, does not believe in the Prince. The story ends as the Prince leaves her alone in her room, and move on. The game ends this way, and Farah neither dies, nor marries the Prince. In that sense the game has a cracked-line.

3.2. Subject positions

One of the main problems of the feminist criticism is the subject positions formed within the film watching as a result of the narration structure of the movie and it's dubbing methods. This is issue is discussed in connection with the issues like identification and peeping (Büker, 2010: 207). According to Mulvey, the pleasure of looking has been divided into two by the patriarchal system; the masculine - the effective, and the feminine – the passive. The determinist male view transfers its fantasy to the female figure, formed suitably. The women, in their conventional exhibitionist roles, with their appearance coded for a strong visual and erotic effect that gives the message "I am worth looking", are both the one being looked at and being exposed (Mulvey, 2010: 218). At the first version of the game, the Princess has long and frizzy hair, and in fancy dresses. On the other hand, the Princess is nothing more than a subject, waiting to be rescued, and only be seen between the chapters. However, at the version of 2003, Farah wears dresses, exposing her femininity, and assumes a role more than an object, with her tidy hair and bow. Farah, who had been captured at the beginning of the game, becomes the object of the looks of the audience and the Prince, while being carried on a couch, while her body is exhibited. However, rescuing within a short time, Farah becomes the subject by taking an active role at the struggle. At her book "The Acoustic Mirror" Kaja Silverman had moved the focus from the sight to the voice, and thus created the opportunity to approach to the female subject from a unique perspective within the framework of feminist film theory. Silverman asserts that the masculine subject is given the properties of being one and being complete in the cinema, not only by the image and the appearance, but also by the means of the recording and the usage of the voice (Cited by: Smelik, 2008: 15). There are no dialogues at the 1989 version of the game, and the story is told by three messages given at the beginning, middle, and end of the game, from which we learn that the Princess had refused the proposal of Jaffar, that she loves the Prince, and that she will wait for him to rescue her. At the end we are told that the Prince, who killed Jaffar, marries the Princess and becomes the Prince. At the 2003 version, Farah has been fictionalized as a powerful person,

IECT 2014

knowing the power of the sands even before the Prince, and trying to tell him what she knows. She tells the facts to the Prince, but the confused Prince does not believe her. At a great deal of the game Farah talks for a substantial time, and sometimes makes fun of the Prince. Different from the first version, Farah, resisting to objectification in the visual sense, strengthens her role as a subject with her voice, representing her will.

4. Conclusion

This study aims at, by making use of the feminist film theory, compare the 1989 and 2003 versions of the popular video game "Prince of Persia" in the sense of representation of women. It has been observed that at the 1989 version of the game the female character did not have an important role, just waited to be rescued as a passive character, and used as an object rather than a subject. On the other hand, regarding the 2003 version of the game, it has been observed that the female character holds a more important and central role within the narration. For the course of the game, she acts with the male character most of the time, accomplishes various missions, and takes active roles at fights by using weapons. According to Mulvey, the classic cinema overcomes the threat of castration by the means of the narrative structure or fetishism. In order to make the threat of castration imperceptible, the female character shall be found guilty. The confirmation of this crime is performed either by punishment or salvation. The reflection of this to the story of the movie is realized by the means of two conventional ends, deemed proper for the women: the woman character either dies or marries at the end of the movie. In both cases catharsis is at the service of the male audience. (Smelik, 2008: 6). At the first version the story ends by the marriage of the Princess, in compliance with the traditional patriarchal ends; however at the second version the Princess defeats the death, and refusing the love of the prince and makes her own way. According to Michael Ryan and Douglas Kellner's statement; conservative cultural or cinematic texts without exception includes a cracked line which overshadows seemingly successfull ideology of texts (Ryan&Kellner 1990: 112,113). Within that scope it can be asserted that The Prince of Persia: The Sands of Time, despite being a popular text, includes a cracked-line that may be useful for oppositional readings.

Abstract

Chemistry is a central science subject because it is required at Senior School Certificate level for entry into nearly all basic and applied science courses at the tertiary level of education in Nigeria. Nigerian students have, for many decades, performed very poorly in Chemistry at the Senior School Certificate Examination (SSCE). Students' persistent mass failure in SSCE Chemistry has been attributed to many factors among which are the many topics which research has identified to be difficult for students to learn. Nuclear Chemistry (NC) is one of these difficult topics. Considering the importance of NC in national development in terms of energy, medicine, research, armament etc, efforts are being made to determine why it is found difficult by students, and to resolve the difficulties for better students' learning achievement. This study was aimed at resolving identified Nigerian students' learning difficulties in NC using simulated computer animation teaching strategies. A sample of 63 SSIII (grade 12) students who have been identified as indicating widespread learning difficulties in NC were exposed to 4 weeks of instruction on NC concepts using computer simulation animation strategies. The sample (35 females and 28 males) were in 4 intact classes in 4 public secondary schools in Calabar Municipal Area Council, South - South zone of Nigeria. The instrument for data collection was a 30-item short-answer essay test called Nuclear Chemistry Learning Difficulties Diagnostic Test (NCLDDT). Data was analysed using frequency and percentage. It was found that the use of computer simulation animation teaching strategy reduced the widespread of the learning difficulties experienced by SSIII Chemistry students in Nuclear Chemistry. This teaching strategy was therefore recommended for teaching NC concepts and other difficult concepts in Chemistry at SSCE level.

Keywords: Learning Difficulties, Nuclear chemistry concepts, Resolve, Computer animation teaching strategies

1.0 Introduction

Chemistry is a central science subject as credit score in it is required at senior school certificate level for entry into nearly all basic and applied science courses at the tertiary level of education. Nigerian students have, for many decades, performed very poorly in Chemistry at the Senior School Certificate Examination (SSCE) level (Njoku 2004, Nwagbo 2002). This persistent poor achievement in Chemistry has effectively undermined the attainment of a national policy that 60% of enrolment in tertiary education would be students in science and science – based courses, while 40% would be students in Arts and Humanities. Student enrolment statistics in Nigeria's tertiary educational institutions indicate that overwhelming proportions are in arts and humanities, rather than science and science-based courses (Njoku 1997). Students' persistent mass failure in SSCE Chemistry has been attributed to many factors among which are the many Chemistry topics which research has identified to be difficult for students to learn. Some of the topics which have persistently proved to be difficult at secondary school level include Nuclear Chemistry (NC), equilibrium reactions, chemical energetic/thermodynamics, chemical kinetics, electrochemistry, chemical equations, the mole concept, solubility of substances, electrochemistry, among others (Okebuko-

IETC 2014

la, 2005, Echekwube, 2009 Chief Examiner's Reports, West African Examinations Council (WAEC), 2010, 2011, 2012, & 2013).

One of the main reasons students find many Chemistry concepts difficult is the high level of abstraction of these concepts, and the teachers often do not have the necessary resources to make them more concrete through laboratory demonstration and experimentation. According to Johnstone (1980), the higher a concept is in the hierarchy of theoretical concepts, the more the difficulty such pose to learners. This is because the theoretical concepts lower in the hierarchy would have to be learnt first in order to develop a strong enough background for learning the higher concepts. It is therefore the case that the position of the concepts in the hierarchy of theoretical Chemistry concepts strongly influences the level of difficulty which learners experience. NC is one of such concepts that are very high in the hierarchy of theoretical concepts which students have to learn. Thus to successfully learn NC concepts students would have successfully learnt the prerequisite theoretical concepts under the theme, 'particulate nature of matter' namely: elements and symbols, names of atoms, atomic structure, composition of the atom and subatomic particles. These are all highly theoretical in nature, and difficult to concretise by the teacher experiments and demonstrations during Chemistry lessons.

Another source of difficulty in the learning of chemistry is learners' inability to understand and manoeuvre the three levels of representing chemical phenomena (Onwu & Randall, 2006). These levels are the macroscopic, the sub-microscopic and the symbolic levels. The macroscopic level is real and concrete; it may take the form of Chemistry activities like experiments which are visible, and the learners can see changes taking place as well as the products of the changes. The sub-microscopic level involves invisible particles which are real. These may include atoms, molecules, ions, electrons, protons and neutrons. The presence of these particles can only be imagined by learners; their presence can also be demonstrated instrumentally, but imagination is the basis of learning about them. Finally, the symbolic level of representation of chemical phenomena is the chemical language expressed as symbols, formulae, equations, pictorial representations, graphs and mathematical representations (Johnstone, 1993; Sirhan, 2007). These levels of chemical representation constitute chemistry thinking. It is the chemistry community that understands their professional language. Onwu & Randall, (2006) maintained that the experienced chemist is comfortable on all three levels of communicating chemical concepts and phenomena, and they can easily move from one level to the other. But the novice Chemistry learner is comfortable in none of these levels and has difficulty relating one level to the other. Devetak, Urbancic, Wissiak, Krnel & Glaser, (2004) attributed the complexity of chemistry teaching and learning to the relationship among these three levels of representing chemical phenomena, as learners have difficulties transferring knowledge from one level to the other. Studies by Johnson,(1998) and Gabel, (1999) showed that learners find it easier and more fun to deal with observable chemical phenomena which they handle as activities/experiments or demonstrations (macroscopic level), rather than handling theoretical and highly abstract concepts which require conceptual understanding (sub-microscopic and symbolic levels).

The traditional way of learning of NC concepts depends almost exclusively on the sub-microscopic and symbolic levels of representation of chemical phenomena, and it brings no fun to the learners; hence the learners experience widespread difficulties in their effort to understand the high level theoretical concepts involved in the study of NC. It is therefore appropriate to believe that teaching NC concepts using more concrete approaches would reduce students' learning difficulties, and improve the learning outcomes. This may be achieved by using animated computer simulations in teaching to reduce the level of abstraction of the concepts and increase their concretisation and hence the capacity of the students to understand the NC concepts.

The annual reports of the Chief Examiner, West African Examinations Council (WAEC) as well as National Examinations Council (NECO) have perennially indicated that candidates most often fail to attempt questions on NC concepts, or that they fail the questions when they attempt them. This is indicative of the high level and widespread nature of the difficulties experienced by students with the learning of NC.

IECT 2014

Effective learning of concepts in NC is very important especially considering the various applications of nuclear sciences to society and national development. As a nation Nigeria's pace of economic development has continued to be retarded by very low electrical energy generation and distribution. Nuclear energy is a cheap non-fossil source of energy which can be harnessed to increase the national energy mix and quantity for distribution. There is the need to find ways of helping secondary school students learn NC concepts more effectively and fruitfully. This study is an attempt to find out the extent the widespread learning difficulties of students in Nuclear Chemistry can be remediated or reduced using computer animation instructional technology.

2.0. Research questions

Two research questions guided the study. These include:

1. What difficulties do chemistry students experience in learning Nuclear Chemistry (NC) concepts?
2. To what extent has the Computer Animation Instructional Strategies (CAIS) remedied/reduced the identified students' learning difficulties in nuclear chemistry concepts?

3.0. Research design, sample and sampling technique

The design of this study is Research and Development design. The sample for the study comprised 187 SSIII (Grade 12) Chemistry students during learning difficulties diagnosis stage of the study, and 63 SSIII students, (35 females and 28 males) during the remediation stages of the study. The students were from four intact classes of four public secondary schools in Calabar Municipal Area Council, Nigeria.

4.0. Instrument for data collection

The instrument for data collection was called Nuclear Chemistry Learning Difficulties Diagnostic Test (NCLDDT), developed by the researchers. It is a 30-item short answer essay test which had been drawn from all the major concepts of NC which were covered during the teaching sessions, namely: atomic structure and subatomic particles, basic concepts of radioactivity, nuclear equations and nuclear reactions, rate of nuclear decay and effects and applications of radioactivity. The test items targeted the understanding of NC concepts and sub-concepts required at the SSCE level. The items were assessed for face validity by the researchers and were adjudged good enough to diagnose students learning difficulties in NC. Only one of the researchers scored the students test so as to consistently identify the learning difficulties.

5.0. Procedure

The study was carried out in three stages. First stage involved (i) thorough teaching of all the contents in NC at SSCE level using traditional approaches (Lecture and discussion methods), (ii) administration of NCLDDT to the students after teaching, (iii) identification of students' learning difficulties and the widespread nature of the learning difficulties through analysis of students' errors in the test, and (iv) elucidation of the root causes of the learning difficulties through in-depth interview of a sample of the students so as to understand their perspectives on the identified problems.

IETC 2014

The second stage involved the selection of a remediation teaching programme based on the lessons learnt from analysis of students' errors in solving NCLDDT and the root causes of difficulties from students' interviews. It was decided that most of the observed difficulties were rooted in the abstract nature of the concepts and sub-concepts, and students' general weak mathematical background. The proportion of students who indicated learning difficulties after the teaching session using traditional approaches served as the pre-remediation status of the students on Nuclear Chemistry Learning Difficulties Diagnostic Test (NCLDDT).

The third stage involved the selection and development of Computer Animation Instructional Programme (CAIP) for remediation of the identified learning difficulties as this would reduce abstraction of the concepts. This programme was used to re-teach the entire contents of SSCE level nuclear chemistry by the researchers for four weeks after six weeks of diagnosing the learning difficulties. Only a subsample of the students who had widespread learning difficulties was accessible for the re-teaching/remediation programme. At the end of the teaching with CAIP, (this was 10 weeks after the initial diagnosis) NCLDDT was administered to the students as a post remediation test. This was to determine the effect of the remediation programme on the widespread nature of the learning difficulties.

6.0. Data analysis

The collected data were analyzed using percentage. It was decided at the out-set that any item in the diagnostic test in which 50% or more of the students committed errors (an indication of learning difficulty), would be regarded as posing widespread difficulty to the students. On the other hand, any item in which less than 50% of the research subjects committed errors would be regarded as not posing widespread difficulty to the students. The percentage difference between the proportion of the subjects experiencing learning difficulties before and after remediation indicates the extent to which the remediation programme has resolved the learning difficulties of students in Nuclear Chemistry.

7.0. Results

Table 1: Nature of Learning Difficulties in Nuclear Chemistry and the proportions of students Experiencing the Difficulties, Before and After Remediation Treatment

S/N	**Nuclear Chemistry Concepts and Nature of learning difficulties**	Number and % ofstudents Experiencing leaning difficulties **Before remediation** N=187	Number & % ofstudents Experiencing learning difficulties **After remediation** N=63	**% Difference, before and after**
1	Inability to label parts of the atom	85 (46.4%)*	16 (24.7%)	**21.7**

IETC2014

2.	Inability to identify nuclear particles, their masses, charges, symbols and the particle that takes part in nuclear reaction	126 (68.4)**	14 (23.0)	**45.4**
3.	Inability to identify numbers of electrons, protons, neutrons; or define mass number or atomic number	90 (45.8)	11(17.1)	**28.7**
4.	Inability to identify isotopes and explain meaning of isotopy	151(81.7)	32 (51.4)***	**30.3**
5.	Inability to calculate mass number from atomic number, number of neutrons and number of electrons	151(81.7)	32 (51.4)***	**30.3**
6	Inability to Conceptualize radioactivity, types of radiations, nature of radiations, changes masses due to radiation of alpha, beta particles, proton, neutron and positron	120 (64.7)	20 (32.5)	**32.2**
7	Inability to write nuclear symbols of α, β, proton, neutron and positron.	160 (85.4)	32 (50.7)***	**34.7**
8	Inability to calculate number of protons, neutrons and electrons from nuclear equations	144 (77.4)	26 (42.2)	**35.2**
9	Inability to write alpha decay equations, Beta decay equations and atomic fusion of hydrogen nuclei to form helium nucleus	148 (79.9)	18 (44.1)	**35.8**
10	Inability to balance given nuclear equations and identify α and β particles from balanced equation	95 (50.1)	10 (17.2)	**32.9**
11	Inability to determine values of atomic and mass number in nuclear equations	145 (77.6)	37 (59.3)***	**18.3**
12	Inability to write and balance nuclear equations from statements	178 (95.5)	43 (68.6)***	**26.9**
13	Inability to write and balance equations for nuclear fission, fusion and differentiate between them	170 (91.0)	29 (46.5)	**44.5**
14	Inability to balance nuclear equations from statements	164 (88.2)	37 (59.7)***	**28.5**
15	Inability to relate alpha emission to position of element in Periodic Table	163 (91.2)	38 (60.8)***	**30.4**
17	Inability to differentiate natural radioactivity from artificial radioactivity, through their equations.	170 (91.6)	27 (43.2)	**48.4**
18	Poor conceptual understanding of half life of nuclei, & give a name to the phenomenon	137 (74.1)	20 (31.4)	**42.7**
19	Inability to compare stability of elements based on their half lives, on their proton/neutron ratio	125 (68.1)	3 (4.7)	**63.4**
20	Inability to calculate time taken for complete nuclear decay	167 (89.4)	35 (55.4)***	**34.0**

29	Inability to estimate the penetrating power of radiations	45 (24.9)	10 (17.2)	**7.7**
30	Inability to identify the deflection of α, β, γ rays in electrostatic field, justify the directions of deflections and identify component stopped by metal foil	105 (61.7)	21 (34.6)	**27.1**

Figures in brackets are percentages (%)

* All % less than 50 indicate not difficult

** All % 50 and above indicate widespread Difficulty

*** Difficulty was still widespread after remediation, though there are considerable reductions

Research Question 1: This question sought to determine what difficulties chemistry students experience in the learning of Nuclear Chemistry (NC) concepts. Table 1 shows the various aspects of the concepts in Nuclear Chemistry in which students experience learning difficulties as indicated by the number and types of errors they committed while tackling questions on the concepts. The percentages (figures in brackets) indicate the proportion of students experiencing the difficulties (wide spread nature of the difficulties among the students). It can be observed from the Table that before remediation programme was applied, out of the 30 concepts and sub-concepts identified in NC, students experienced widespread learning difficulties in 25. Thus most of the concepts and sub-concepts are difficult to overwhelming majority of the students. Some of the concepts that posed most widespread difficulties include:

- Stating the uses of specific radio-isotopes (97.0%),
- Relating energy in nuclear fusion to Einstein's Equation ($E = MC^2$) (95.8%)
- Writing of nuclear equations (95.5%)
- Differentiating natural from artificial radioactivity (91.6%)
- Relating alpha emission to position of elements in the Periodic Table (91.2%)
- Calculating period of complete nuclear decay based on Half Life of decay of elements (89.4%)
- Giving correct reasons why solid radioactive wastes are not disposed of by composting (88.9%)

Interview of the students on the reasons they found the concepts difficult indicated that the roots of the difficulties was mainly due to high level of abstraction of concepts, weak entry behaviour of the learners on such topics as writing and balancing of chemical equations and atomic structure, and misconceptions that chemical changes can only involve orbital electrons in the atoms and atoms can neither be created nor destroyed.

Research Question 2: This question sought to determine the extent simulated computer animation teaching strategies remedied the observed learning difficulties among grade 12 students. Table 1 shows the frequencies and proportions of research subjects and the type of learning difficulties they experienced after application of remediation programme. It can be observed that the students experienced widespread difficulties in only 12concepts/sub-concepts, (reducing from 25 concepts before remediation). There is a general reduction of the proportion of students experiencing each identified learning difficulty. Percenta-

IECT 2014

ge reduction in the widespread of the difficulties for various difficult concepts ranged from **7.7% to 63.4%.** Majority of the concepts had their widespread difficulty reduced by over 30%. The mean percentage reduction in the widespread of the difficulties was **32.64%,** showing that on the average, the difficulties experienced by students in the learning of nuclear chemistry concepts reduced by 32.6% through the use of simulated computer animation teaching strategies. Certain NC concepts continued to indicate widespread difficulties among students in spite of the application of the remediation strategies. Some of the 12 concepts that remained difficult include:

- Relating energy in fusion reaction to Einstein's equation (73.9%)
- Writing and balancing of nuclear equations from statements (68.6%)
- Relating alpha emission to position of elements in Periodic Table (60.8%)
- Giving correct reasons why solid radioactive wastes are not disposed of by composting (60.8%)
- Determining the values of atomic and mass numbers in nuclear equations (59.3%)

Although there were general reductions in the widespread of the difficulties in all the concepts (ie. the number of students experiencing learning difficulties reduced in all cases) the proportions of students with these difficulties remained high. This indicates that these concepts are really challenging to students. This is most probably because the concepts are very high in the hierarchy of theoretical concepts which Chemistry students have to learn. There are many theoretical concepts and sub-concepts which must be mastered before students are able to effectively grapple with these highly abstract theoretical concepts that are on top of the hierarchy.

8.0. Discussion

The **52%** reduction in the number of difficult NC concepts (from 25 to 12) indicates the efficacy of simulated computer animation teaching strategies in clarifying to students the content elements that made the NC concepts difficult to learn. The simulated computer animation strategies appear to reduce concept abstraction, concretizing them, making it possible for the students to effectively visualise nuclear particles in the atomic nuclei, their interactions, transformations and the changes that accompany these properties/behaviours. Thus students become more able to learn the NC concepts and sub-concepts in more realistic and fruitful manner, thereby improving their conceptual understanding of the NC contents of the curriculum.

9.0. Recommendations

1. In view of the results above, there is need to build Chemistry teachers' capacity in the preparation and effective use of simulated computer animation strategies in teaching the concepts in NC and other very abstract concepts in Chemistry.
2. Chemistry teachers should be provided with the facilities such as computers, storage devices and projectors which they need for preparing and teaching their lessons using simulated computer animation strategies.

Results and outlooks of robot education in republic of Korea

Juyoung Yoo89
Department of International, Hankuk Academy of Foreign Studies, Yongin-si 449-791, Republic of Korea

Abstract

Approximately one century has passed since a Czech dramatist Capek Karel used a word "robot" for the first time in his satirical work "Rosumovi Univerzální Roboti (Rossum's Universal Robots)" in 1921. Indeed, the existence of a robot started with a literary imagination, when the word was used for the first time about one century ago, but the rot becomes an entity inseparable from human life, including housework and even nursing, in the contemporary society. Today, we have come to see intelligent robots going so far as not only to think and move of their own accord, but also revealing their feelings on their faces. That kind of robots is represented by ASIMO developed in 1980 by Honda in Japan, KISMET developed in the late 1990s by MIT in America, and HUBO developed in 2004 by KAIST in South Korea. Like this, robot research is currently led by Japan, the United States and the Republic of Korea. This presentation is about the robot education system currently implemented from elementary through high schools, the education results and the future prospects in South Korea. On the whole, robot education begins at college levels in America and Japan, but it is made in a systematic way after regular curricular activities at elementary schools in the Republic of Korea. In addition, more than 1000 private institutes for robot education are driving a booming trade and numerous robot competitions, including the International Robot Olympiad (IRO), are held in South Korea. Therefore, not only is the Republic of Korea expected to take the advantageous position first in the future robot education market, but the current robot education system in South Korea will be able to be a good guide for that which will be carried out throughout the world in a few years in the future.

1. Introduction

Approximately one century has passed since a Czech dramatist Capek Karel used a word "robot" for the first time in his satirical work "Rosumovi Univerzální Roboti (Rossum's Universal Robots)" in 1921. When the word "robot" was used for the first time at that time, the existence of robot was still nothing but a product of literary imagination. However, robots currently play an important role that is not inseparable any more from human life, including housework, surgery and war. These days, we have come to see intelligent robots going so far as to think and move on their own. They are represented by ASIMO developed in 1980 by Honda in Japan, KISMET developed in the late 1990s by MIT in America, and HUBO developed in 2004 by KAIST in South Korea. Moreover, even the robots are emerging one after another that can understand human feelings and talk with humans, as shown by "Pepper" developed by SoftBank in Japan. The Pepper lets the external server connected by Internet perform numerous arithmetic operation and data processing instead of the robot's head by introducing the method of "cloud". This makes it possible to learn and share the experiences of other robots connected with the same server. Doing so leads to a kind

E-mail address: juyoung274@naver.com

of collective intellect, as in the world of ants. After all, a computer draws near to humans by its own evolution.

Around the world, robotic research is led not only by America, Europe and Japan, which led a robot industry from the beginning, but by South Korea and China which recently spare no pains to invest in the industry under the recognition that it is a next-generation growth engine. The United States virtually dominated the robot industry in the 1960s at the dawn of industrial robots. The Unimation, Inc. installed an industrial robot for the first time at GM's automobile parts factory in 1962. Thereafter, Yaskawa, Nachi-Fujikoshi, Fanuk etc. in Japan rushed into robot business one after the other, making every effort possible to catch up with the US level of robot industry. Europe also began to spur the development of independent robots with the advent of the 1970s. Based on solid technical ability in the field of refined machinery, West European countries built industrial robots superior to US-made ones. But with the advent of the 21st century, South Korea and China see robot industry as a future major industry and step up their investment with the acceleration of economic growth in Asia. In particular, South Korea makes great efforts to help the students of elementary, middle school, high school and college students learn robot expertise, as seen in the every-year opening of robot-related world competitions, including the World Robot Olympiad (WRO). As a result, robot learning is creating a huge boom among students in the Republic of Korea.

Based on such circumstances, this presentation aims to present the robot education system currently implemented from elementary through high schools, the education results and the future prospects in South Korea. On the whole, robot education begins at colleges in America and Japan, but systematically after regular curricular activities at elementary schools in the Republic of Korea. In addition, more than 1000 private institutes for robot education are driving a booming trade and numerous robot competitions, including the International Robot Olympiad (IRO), are held in South Korea. Therefore, not only is the Republic of Korea expected to take the advantageous position first in the future robot education market, but the current robot education system in South Korea will be able to be a good guide for that which will be carried out throughout the world in a few years in the future.

2. Robot industry in South Korea

Robot research began very late in South Korea, compared to America, Europe and Japan. As mentioned above, robot industry was dominated by the United States in the 1960s, greatly developed by Europe in the 1970s, and led by Japan in 1980s. Unlike these countries, South Korea was quite late in robot industry investment and robot education.

The Republic of Korea was burned to ashes after the Korean War (1950-1953). South Korea, whose per capita national income was no more than 65 USD directly after the Korean War, was one of the world's poorest countries that received aid even from Ethiopia and Bangladesh. In such poor conditions, a cutting-edge industry like robot industry had nothing to do with South Korea. However, ROK economy developed remarkably, as five-year economic development plan was carried out successfully four times from 1962 on. According to the IMF, South Korea recorded a per capita GDP of 24,000 USD and a foreign exchange reserve of 366 billion USD (6th ranking in the world) as of 2003. Such a remarkable economic development was greatly credited to the conglomerate (chaebol)-led growth policy of the ROK government. The ROK economy was expanded to a global level with the accelerating growth of the chaebols, such as Samsung, Daewoo, LG and Hyundai, supported by the government. However, the globalized chaebols were entangled in severe labor-management disputes from the 1980s on. They selected an automated system using robots as an alternative to overcome them. Samsung also built a robot television production line in 1992 as the first among ROK enterprises. Thereafter, other enterprises vied for introducing robot production lines as well. The result is that South Korea is rated the third best country (US and Japan: first and second, respectively) in the world in the overall level of robot industry. South Korea also ranks fourth or so in the world in the level of learning based on the papers presented at international robot-related academic conferences. Like this, the Republic of Korea has joined a leading group of robot industry in a period as short as some 30 years since its investment.

However, the ROK's robot industry has not experienced a continuous development alone. Automobile

and semi-conductor industries, which belong to South Korea's key industries, were thriving across the world in the 1980s. In this boom period, the ROK's robot industry also made rapid progress in terms of quantity. However, most chaebols closed robot business divisions in the 1990s, since there was no continuous investment or research in robot industry. As a consequence, the ROK considerably fell behind in robot industry, compared to the US and Japan. Recognizing the seriousness of the situation, the ROK's government invested in robot industry on a large scale by letting the Ministry of Science and Technology, the Ministry of Information and Communication, the Ministry of Commerce, Industry and Energy, etc. implement large robot-related projects. Especially, the field of intelligent robots has been designated as a next-generation growth engine industry and continuously invested in by the ROK government. The Mecca Center of Samsung Electronics counts as a representative chaebol manufacturer of robots, and Rotem and multiple defense industry members develop military robots. Eugene etc. are small and medium enterprises that distinguish themselves in manufacturing robots.

3. Robot education in South Korea

The intelligent robot industry is one of the ROK's ten next-generation growth engine industries. Based on excellent IT technology, the ROK's artificial intelligence robot industry is very likely to grow into a future industry. Intelligent robots are classified into the humanoid robots with artificial intelligence and the ubiquitous robotic companions (URCs) based on networking. America, the second robot producer in the world, focuses on developing humanoid robots, while South Korea and Japan focuses on developing URCs. South Korea, a holder of 384 (31.1%) URC patents, fiercely competes for the lead with Japan, a holder of 514 (41.6%) URC patents. Having rushed into robot industry much later than the US and Japan, the ROK has gone so far as to fiercely compete for the lead with Japan, the US and Europe thanks to the heated robot education from the 2000s as well as the active investment of the government and enterprises.

On the whole, robot education begins at colleges in America and Japan, but systematically after regular curricular activities at elementary schools in the Republic of Korea. This is because the ROK's parents judge that robot industry will play a pivot role in national economy in the future. The ROK's robot education is also characterized by being performed at more than 1000 private institutes across the country. Robot education comprises the various steps of definition, operating principles, manufacturing and programming. In South Korea, diverse robotic campaigns are carried out to find and foster robotic prodigies through such education and to exchange robotic research results. International robot competitions are held as part of such campaigns. The ROK organizes international robot competitions, such as ROBOT CUP and International Robot Olympiad (IRO) which began to be held in 1995 and 1999, respectively. In particular, the IRO draws so much attention that it is attended by more than 3000 persons from all over the country. The Olympiad consists of elementary, middle and high school divisions, each of which has the games of transformer, robot gathering, robot biathlon, traverse and hurdle. Held every year, the competition was held in the Republic of Korea, Hong Kong, China, Australia, Singapore, Malaysia, Indonesia, the United States, etc. In addition to the IRO, there are a variety of competitions in the ROK:

Korea International Robot Olympiad (organized by Korea Robot Soccer Association (KRSA));
Robofest Korea (organized by Robot Education Contents Association);
Robofest Asia-Pacific (organized by Robot Education Contents Association);
World Robofest (organized by Robofest Committee);
Korea Intelligent Robot Contest (organized by Korea Intelligent Robot Association);
World Robot Olympiad (organized by World Robot Olympiad Committee);
National Youth Robot Contest (organized by Government Youth Commission (GYC));
National Student Robot Contest (organized by Korea Association of Robot Education Advancement (KAREA));
SeoulTech Robot Festival (organized by SeoulTech);
Korea Robot Game Festival (organized by Incheon Information Service (INIS)).

In South Korea, robots attract such much concern from elementary, middle and high school students for three reasons: first, the ROK has attained a remarkable economic development in a short span of time after the Korean War, but is considered to have reached the limitations of development. The reason lies in that its economic growth is based on imitation by low labor costs and diligence rather than originality.

IECT 2014

Now, it forms a social consensus among Koreans that the ROK will not survive in intense international competition without originality. They consider robot education one of representative educations to improve the needed originality. Second, the prospect for robot industry is considered to be bright, as the ROK government designates robot industry as its next-generation growth engine industry. Accordingly, it appears favorable for finding jobs to have robot expertise and major in robotics in the difficult job-seeking conditions of the ROK society. Third, South Korea is world-famous for high competitive rates for college entrance exams. Therefore, it is not easy to enter prestigious universities. In such situation, students can expect to get additional points from their award-winning records at international robot contests.

4. Future prospects

Robot industry is a next-generation high value-added industry that has experienced a high growth of 10% per year from 2000 on. Given the trend, its market is expected to amount to 1 trillion and 400 billion USD and thus exceed the BT market. The robot industry centered on personal robots is expanded by the life extension and human isolation by the development of IT and BT. South Korea should compete with advanced countries using a strategy of mass-producing low-priced personal robots by combining its world's fourth industrial robot technology with the vitality of IT enterprises and the knowhow of manufacturers. However, the reality is that industrial robots considerably lag behind in distribution rate, compared to Japan and the US. Japan tries to develop various kinds of robots, such as pet robots, including Sony's IBO, errand robots, education robots and public welfare robots, but South Korea shows a huge technical gap with Japan, though its technical development ranks the forth in the world.

However, robot education is actively implemented at schools as well as more than 1000 private institutes, as investment and interest in robot industry increased in the ROK around 2000. Robotics-related departments are established at many universities, including KAIST and Kwangwoon University, which makes the outlook for the ROK's robot industry bright. Especially, various international robot competitions, including IRO, contribute to the cultivation of robotic prodigies. Such investment in robot industry will be surely a big asset fir the development of robot industry in South Korea.

In the future, the ROK's robot industry seems to be competitive in the field of the ubiquitous robotic companions (URCs) based on networking. As for humanoid robots, South Korea is considered to have great difficulty in keeping up with advanced countries, including the US due to huge technical gaps. But as far as the URC field is concerned, the ROK has already reached the world's highest level in the IT field and will have a high competitive edge, if the country applies its IT technology to robot industry successfully. As South Korea is also advanced in automobile industry, it will create a great synergy effect to combine automobile industry with IT technology and robot industry. Therefore, it will be desirable for the ROK's robot education to connect IT technology with automobile one instead of focusing on robotics alone.

Results of enhanced learning with the edutainment format

Tiamyod Pasawano90

Rajamangala University of Technology Thanyaburi, Faculty of Technical Education, Department of Educational Technology and Communications, 39 Moo 1 Rangsit-Nakhon Nayok road, Thanyaburi, Pathum Thani 12110 Thailand

Abstract

The purposes of this research were to 1) study notions of teaching and learning by utilizing the Edutainment format in both local and foreign countries, 2) develop the Edutainment format to enhance learning of bachelor's degree students, and 3) study the effect of Edutainment format on learning by bachelor's degree students. The samples of this study consisted of printed documents, textbooks, academic journals, and electronic documents, of which 22 formats were selected from foreign countries and other 20 formats locally. Fifteen specialists were selected to evaluate and approve the formats. The 80 undergraduate student participants were selected by simple random sampling method from the Department of educational technology and communications. Purposive sampling was also applied to select 20 teachers from the Faculty of Technical Education, Rajamangala University of Technology Thanyaburi. The instruments adopted for this research were comprised of analyses derived form of Edutainment format; the approval form for specialists to approve said formats; questionnaires regarding students and teachers' needs to be used with the Edutainment format; opinion assessment forms for students and teachers to complete after using the Edutainment format; and an achievement test. The data were analysed by content analysis and descriptive statistics. The major findings were as follows:

1) The ideas of the Edutainment format from educators in both local and foreign countries indicated that technology and innovation used to enhance the Edutainment format included robotics, internet, games, movies, music, and television programs. The environmental factors included play activity, classroom designing, and campus facilities,

2) The Edutainment format to enhance undergraduate learning consisted of technology components including learning through Ubiquitous high-speed internet access, studio usage, light and sound, robotics, internet, games, movies, music and television programs. The environmental management, included performance stage, movie theatres, game rooms, wireless high-speed internet rooms, and activities to enhance creative thinking. The management of teaching and learning comprised activity based curriculum development, supporting learning emphasizing "Learning by Doing" approach, and tourism for entertainment.

3) After implementing the Edutainment format, the results revealed that all issues were rated at high levels. Concerning the opinions toward the Edutainment format implementation, the results in each area and at all items were rated at very appropriate level as well as most-appropriate level.

IETC 2014

1. Introduction

Learning in Edutainment is taught to blend many things together are Media, the classroom environment and a variety of activities were the aim to make happiness in play & learn. Change the classroom atmosphere follows the idea that Entertainment can create interest over the normal class. Have the advance planning of activity for learners do, and then they are fun, so they want to do it again, this is the heart of Edutainment. The taught previously, teachers attempt to help the learners remember in various ways such as recitation, doing exercises, etc. But now that thinking is not enough to manage efficiency learning. Because appearing the empirical data does not help the learners to learn by requirement. And the academ-

* Corresponding author. Tel.: 668 1544 5575; fax: 662 549 3216
E-mail address: tiamyod@yahoo.com

ic progress discovers the new innovative can help learning better. Emotion has a direct influence on remembering. Moreover emotional pleasure is part of a learning to build an environment where learners want to know, to see, to play and to sample. Teacher need to teach in the same learning styles of learners to avoid boredom, angry or fear, but try to create a happy class. Therefore the power of life that everybody should have understood in the emotional process to achieve the learning efficiency. Making a good environment, instruct, and good support can change thinking are affected to IQ (40 – 70%) and heredity effect on IQ (30 – 60%). So the environment in learning should be happy, funny and also get the new things. (Oshima et al., 2004) So teachers will build the knowledge, not only the act of passing on knowledge, urge and encourage learners to learn by themselves, including to finding the experience of learning in both informal and formal (Education Act of section 24 (5)) Learners learn under the atmosphere of Education and Entertainment = Edutainment, They can reach knowledge and clearly understand to can solve their problems and the public responded the Thailand Government Policy which requires learners to learn well and happy. A fun game and acquiring knowledge at the same time was integrated between the educational theories psychology and computer science in the research found that playing this game with collaborative can improve efficiently learning and is free to choose according to their interests. (Michelle, 2004: 2) From the foregoing should that Instructional media and technology have important roles in supporting learning. Especially when bring the entertainment media enhanced in the class. Thus, this is a good idea to manage Edutainment in Rajamangala University of Technology Thanyaburi where focus on teaching learners to be specialists in using of specialized tools, had the ability in communication that match with the target group and objectives, support intellect or genius learners (IQ) to show their capabilities. In addition support in EQ, can systematically think, analyze and resolve appropriately problems with a modern technology. From the importance and the source of such problems, researcher found that Edutainment can be applied to use in order to completely contribute vocational graduates both IQ and EQ. The results from this research will be for intervening in new techniques for learning in the future.

2. Purpose of the study

The purposes of this study were:

2.1 To study notions of teaching and learning by utilizing the Edutainment format in both local and foreign countries.

2.2 To develop the Edutainment format to enhance learning of bachelor's degree students.

2.3 To study the effect of Edutainment format for learning by bachelor's degree students

3. Scope of the study

3.1 Edutainment is a method of learning that focuses on funny in the lessons by interpolation techniques of teaching, multimedia and Play and Learn activities.

3.2 The enhanced learning is bringing out Play and Learn to apply in the classroom to get both academic learning and entertainment.

3.3 The Development of Edutainment will study from both printed document and electronic document to analyze the principles relate to education form, which provide the knowledge with entertainment. The boundaries were:

3.3.1 Study idea of Edutainment both local and foreign countries.

3.3.2 Analysis and synthesis the Edutainment Concepts and inquire opinions from specialists of entertainment. It will be a frame to specify the scope, direction and guidance to conform the development and the implementation are integrated with philosophy, principles, missions, policies, goals and objectives of Rajamangala University of Technology Thanyaburi.

4. Conceptual framework

This research used the principles and the concepts of TREND to apply; TREND is the new word from combining 4 characters: Technology (T), Relax (R), Enjoy (E), Need (N) and Design (D) those origins and meaning are:

4.1 Technology (T) apply various technologies (variety) used to enhance learning, such as computer hardware, software, network, internet, intranet, LAN, multimedia, forums, etc.
4.2 Relax (R) refer to the relaxation increased meditation and wisdom to help study happily.
4.3 Enjoy (E) is to provide (learn + do + pleasure) under free learning by incorporating the information and the knowledge in various with Entertainment. The purpose is for learners to gain the knowledge.
4.4 Need (N) is teaching management by focusing on the needs of the learners. By catering in variety following:
4.4.1 Visual learning which include using visual to reading and studying diagrams, charts, and other media. 4.4.2 Auditory learning (learning by listening) refers to tasks that involve listening.
4.4.3 Kinesthetic learning (learning by behaving in different situations) refers to learning from behaving in the Simulation such as role-play and also the experiential learning and total physical involvement in the learning as well.
4.4.4 Tactile learning (learning by doing) are learning by doing in various actions (hands-on) such as building a model, the experiments in the laboratory and studying of tangible objects.
4.4.5 Individual learning (self-learning) means learners learn by themselves both in the classroom and outside.
4.4.6 Group learning (learning by working together as a group) refers to situations which learners work with friends.
5. Design (D) is a variety of environments designed, not boredom, such as the placement of tables and chairs, the positioning of the light. (Phanchalee Wassanasomsit, 1999)

5. Methodology

5.1 The first phase

5.1.1 To study concepts of Edutainment both local and foreign countries. Selected data that was printed document by analyzing of a database and searching from learning resources and a library of departments and universities, both public and private. The document electronic, the researchers search keyword on the program (Search Engine) via the internet. When it is collected and then recorded all in the analysis form of the Edutainment documentary that researcher developed.

1. Questioning notions of Edutainment format from specialists, professors and learners by the analyze form of Edutainment documentary both local and foreign countries, and then sends queries to analyze the data.
2. Making the learning achievement test that covered course description of the television production subject. Study of chapter 2-4 consisted of shot size, camera angle shot and camera movement to use as a pre-test and post-test.

5.1.2 To develop edutainment format.

1. Creating Edutainment format by data collection of the content analysis from printed document and Electronic document and inquiries from specialists by using the principle of TREND Edutainment.
2. The Edutainment assessment, collected data from the evaluation of Edutainment from the principle of TREND Edutainment with the evaluation of rating scale 5 levels by estimating of specialists of Edutainment form 5 persons and evaluated in this assessment. After that, analyze the results, and update Edutainment under the guidance of specialists.
3. The Opinions assessment of teachers and learners about problems and needs of using Edutainment format with the evaluation of rating scale 5 levels to analyze the results to develop perfectly Edutainment.

5.2 The second phase

The study of using Edutainment Form to support undergraduate learning. The researcher collected data following:

5.2.1 The Experimental use of TREND Edutainment to test on 80 undergraduate learners, year 3 who enrolled in The Educational Television Production subject. The researcher was a teacher who compiled data on the classroom environment. Created a learning situation in Edutainment was developed. After that, learners do the learning achievement test and evaluation forms of Edutainment by using the evaluation of rating scale 5 levels to analyze the data.

5.2.2 The evaluation of Edutainment (TREND Edutainment), the management of learning environment in 3.1 compiled the data from specialists joined to observe in the class. Consider conclusive TREND Edutainment and estimated opinion from the evaluation forms to analyze the data.

5.2.3 The certification of Edutainment to promote the undergraduate learning. Conducted the data by 15 specialists to consider the suitability of TREND Edutainment and collected information from the evaluation to certify to analyze the data.

6. Result

The results were by the synthesis, the idea and the principle. The specialists gave opinions and suggestion were to

6.1 The physical characteristics of the classroom for example colors of desks, chairs, lighting, air-conditioning and creating various recreation zones. The specialists suggested to ask for budget to improve formerly each part, then adjust to the needs of most learners. Might have to go a step of research when was on the point of full development to be a beautiful campus. Every building should have the recreation zones. And provide internet rooms for 24 hours, theatres, stage for various forms.

6.2 The strategic adjustment in the course from teacher's performance is in a bright character to adjusting the attitude of learners to be positive. Then teacher rewarded learners who had the best behaved. Trying to invite celebrity specialists to educate and share ideas. Build the classroom atmosphere likes a game show. Teachers would be the host who draws all eyes to catch them all the time.

6.3 The Technologies of instructional media such as multimedia, 3D game, theater, high internet access computer, etc. There are suggestions that should provide enough free Wi-Fi refer to the speed of download and view information. And can be reached anywhere and anytime as well (especially on campus). The entertainment media should have to play the game both online and DVD with the touch screen to watch TV in live, real-time and rerun. Have a good audio and high quality microphone to use for recording the songs for the different occasions.

6.4 On the question which course suit to bring for TREND Edutainment (both required subjects and elective subjects). The answers were the writing for radio and television education subject, the Production Sound subject, the Computer Multimedia subject, and the production of the television education program subject.

6.5 The suitable application of the tourism, this learning outside the classroom was a great idea to build experience. It should be slow travel to absorb fully knowledge in the real atmosphere and should be provided every semester.

During the development of TREND Edutainment Format was to bring the concept to use by exploring ideas and needs, from giving information of learners and professors. The results of the data analysis showed in the table 1.

No.	List of estimation	$\overline{X}$	(S.D.)	level
1.1	Have movies from the Blue Ray Disc.	3.41	0.59	high
1.2	Watch TV in real-time and rerun.	3.38	0.62	most
1.3	Have the various types of music to listen Storage.	3.50	0.50	high
1.4	Have the amplifier, microphones, audio recording systems	3.50	0.55	high
1.5	Have online games and play from disc.	3.63	0.51	high
1.6	Have High speed internet Wi-Max, Wi-Fi, 3G, 4G	3.53	0.51	high

1.7	Learn wirelessly anytime (Ubiquitous)	3.59	0.56	most
2.1	Have theatres And mini cinemas	3.35	0.46	high
2.2	Have stage performances such as bands, musicals.	3.33	0.55	high
2.3	Have Wi-Fi rooms for 24.	3.48	0.59	most
2.4	Have air Conditioners	3.47	0.49	high
2.5	Decorate fully studios both light and sound.	3.70	0.45	high
2.6	Place tables and chairs in the classroom by unique format.	3.43	0.53	high
2.7	Add colors of the furniture in the classroom	3.53	0.5	most
2.8	Have comfortable lounges, dining rooms and bathrooms	3.35	0.45	high
2.9	Decorate mini gardens with variety trees	3.63	0.59	most
3.1	Provide a stage for Creative expression	3.65	0.51	most
3.2	Invite specialists to exchange lectures	3.60	0.45	high
3.3	Contest projects and reward	3.80	0.54	most
3.4	Create the learning environment like a game show	3.65	0.50	high
3.5	Excursions outside the classroom at learning resources.	3.75	0.60	most
4.1	Insert to play mixed in all subjects	3.65	0.51	most
4.2	Emphasis on the practical rather than the theoretical	3.60	0.49	high
4.3	Teachers have humor and Insert gags all the time	3.60	0.49	high
4.4	Divide small groups and large groups for cooperative learning.	3.50	0.47	high

Table 1 Results of a survey from learners who want to study in TREND Edutainment.

7. Conclusion

The research was combined with the TREND Edutainment model covered various issues such as the personality of teacher, preparing the courses that could be inserted play and learn. The activities which help completely TREND Edutainment such as a perfect short film contest, simple video editing, shootings, etc. and mixed with slow travel to absorb fully knowledge. The TREND Edutainment, researcher have introduced the latest technology to manage the data files, such as large CPUs to store television shows, games and DVD movies that popular or latest movies to service via the internet access through a variety of communication. The prepared content was used to test the performance in the course. The Television Education Production chooses the specific chapters or relational units to role-play. The personality of the teacher was changed to follow the contents in the chapters to achieve a variety of teachings. If the narrative comes to various programs, so teachers choose related DVD to project. And also had been categorized by a group of academic vocabulary such as picture size (shot size) 7 formats, camera (camera angle shot) 4 formats, camera movements (camera movement) 9 formats, and editing sequences Photo (editing) 11 formats. And then, imported those items blend with the teaching method in comedy style, such as the teaching of sign language. Teachers would write lesson plans or teaching methods for example, smiles while gesturing, etc. so that the various dimensions of teaching, the bright teacher change the classroom atmosphere is friendly to everyone. The learners have the positive attitude, wanted to study. And finally, help to increase the learning achievement.

Science and nature perception in the images and pictures of the children

[a]Fatih YILMAZ91 [b]Ayşe Derya KAHRAMAN
[a]*Dicle University, Diyarbakır21280, Turkey*
[b]*KTO Karatay University, Konya, Turkey*

Abstract

The aim of this research is to search the perception of elementary school fourth grade students related to science and nature concept in artistic statements based on written descriptions related to their pictures and only pictures. The pictural and literal statements of the students related to science and nature have been examined based on this aim. The research has been realized at Diyarbakır, Kayapınar province Hantepe Eğitim Şehitleri Elementary School and Ankara, Çankaya Province Sokullu Mehmet Paşa Elementary School in 2013-2014 semestr of educational period. 32 of students are having education in Diyarbakır, 28 of students are having education in Ankara. The data of the research which has been figured by qualitative research method has been collected in the from of written ideas related to the pictures and the ones explained in the pictures, the taken findings have been commented by analyzing them with descriptive analysis. The research has been realized by using phenomonologic research figure from qualitative research figures. At the end of the research, whereas the students describe science concept with "population, research environment, invention and life field" concepts, they stated nature concept with "environment, living area and environmental change" concepts.

Keywords: Science and nature, child pictures, perception

IETC 2014

1. Introduction

Elementary education includes a period when emotional, cognitive and psychomotor attainments are achieved and the child expresses himself democratically and explains his thoughts and emotions without feeling any pressure on him. The figurative situations can be more realistic and reflect the emotional world of the child. Because of this reason, examination of the figurative pictures and reflecting realistic situation of the students related to their emotional world can be accepted as very important.

Arts have an important place in mental development and richness of the figures of the children. Arts is a pyshological action born out of the aim of stating their emotions and ideas of the people against the nature with an individualistic point of view in a beautiful and effective style with the instruments such as line, color, shape, word and rhythm (Artut, 2002). The painting has an important place in the perception and description of the objects in the nature by the person and describing himself. Painting and child has been a continuously changing fact which complete each other and take place in the most important and effective elements of communication(Artut, 2007).

* Corresponding author. Tel.: +905079843020.
E-mail address: fatih.yilmaz@dicle.edu.tr

The paintings shed light on the inner world of the children, provide opportfunity discussing their ideas and emotions of them with a different point of view. Their paintings have the duty of a window in reflecting their ideas and emotions reflect their dreams freely(Crook, 1985, Thomas & Silk, 1990, Faroki & Hashemi, 2011). It can be understood by the way of drawings how the children have emotions related to the people or objects (Burkitt, 2004).

The painting process requires the child to arrange and choose colors, shapes and lines by analyzing many components such as content, style, shape and composition to transfer an idea, emotion, event or observation (Malchiodi, 2005). The children hate answering the questions which have been directly asked to them. They state their emotions more easily, enjoyable and quickly with drawings (Lewis ve Greene, 1983). Because of this reason, as painting has been accepted as an indicatior of the child's perception of outer world, it helps to communicate with the child and helps adults to solve the problems they met with the children (Artut, 2002). Also, critical thinking and understanding of the children can be increased by painting and developing the required skills opportunity can be presented to them to include those individual conversations and commenting the images (Uysal, 2011).

Another way to increase the students' understanding of what pictural statements mean is to listen their speech on the paintings (Malchiodi, 2005). Because the children have a tendency to draw "what they know" more than "what they see"(Toomela, 2006). In this context, the best way to understand the message in the children's picture is to speak about their paintings or images.

Science and technology education is existent in close environment of the student. All colors, lights, taste attract the child, because of this reason the child is interested with the world. Science and technology education is the education of this amusing and attractive richness and it tries to transform abstract information which the child needs to learn to concrete information (Soysal ve Afacan, 2012). Especially its close relationship with the nature makes this information more important. In this context, nature perception of the individual is related with how he he defines man-nature relationship and perceived beliefs, environment and ideas (Kutru ve Soran, 2012). This perception effects attitudes and beliefs related to many views such as accepting style of nature, sensitivity to nature and having environmental consciousness. Detailed information related to the nature is given in Science courses. Especially formation of perceptions related to science and nature on the children is provided by the way of Science courses.

When the literature on this field is examined , it can be observed that there are many paintings and image studies related to science and science man concept (Buldu, 2006; Oğuz, 2007; Rodari, 2007; Türkmen, 2008;, Ünver, 2010; Benli, Dökme & Kaya; 2011, Samaras, Bonoti & Christidou, 2012; Oktay & Eryurt, 2012; Çokadar & Demirtel, 2012; Ruiz-Mallen and Escales, 2012; Özel, 2012; Erdoğan, 2013a; Erdoğan, 2013b). In addition to this, studies such as god concept perception (Yıldız, 2013), class environment perception (Ülker & diğerleri, 2013), learning and teaching process perception (Aykaç, 2012), internet concept perception (Ersoy & Türkkan, 2009), popular culture concept perception (Erişti, 2010), school garden concept perception (Coronin-Jones, 2005), defining the family perception (Doğru & diğerleri, 2006) are the subjects about the children paintings. It can be told that limited studies which have been made by Yılmaz, Kobiatko and Topal (2012) with Ülker (2012) on nature perception take place. It can be stated that there are not studies related to science and nature directly.

In general meaning, the studies which the pictorial perceptions of the students are being determined are based on the adaptation of "draw a science person test" developed by Chambers(1983). This situation is thought to bring a limitation in determining the point of views to perceptions and concepts with different methods. Statistical analysis is being made in these studies; it can be told that entering the children's World directly seems to be limited.

In this research, it is aimed at determining the science and nature perceptions of the children by the way of pictures and literal statements. The questions below have ben tried to reply related to this aim:

- How do the elementary school students reflect their science and nature perceptions in pictures and images?

IECT 2014

- What are the similarities and differences between the elementary school students' science and nature perception and written ideas in their pictures and images?

2. Method

The research has been realized by the way of Phenomenology image from qualitative research images. In this image, it is aimed at commenting and stating individualistic perceptions or point of views related to a fact (Yıldırım & Şimsek, 2005). In the examination of children pictures in phenomenology image, different meanings, connecting to different meanings and world view of the one who is making the picture is emphasized(Malchiodi, 2005). In the research, science and nature perception of the students, the pictures which the students will make on science and nature and their written ideas on these pictures have been examined.

2.2 Collection of data and Application

The research data has been collected in 2013-2014 semester autumn period by document analysis which has been a qualitative research data collection method. The research data has been collected Diyarbakır Center Kayapınar Province Hantepe Eğitim Şehitleri Elementary School and Ankara center Çankaya province Sokullu Mehmet paşa Elementary School. The research includes 60 students from these two schools. 32 of them have been in Diyarbakır, 28 of them have been in Ankara. All the students participating in the research are in the fourth grade. The application of the research has been realized separately by the researchers. After the required permission has been taken related to researchers from the headmaster and the teachers, the researchers went to the school and gave drawing papers to the students and requested from them to take their pencils and drawing pencils. The students have been requested to divide the paper into two and draw what they understand when they are told the picture of nature one side and picture of science on the other side of the paper. The application has been realized in nearly one course period, 40 minutes.

After the picturing had been finished, the question of "what did you want to explain in this picture?" has been asked to the students by interviewing them again at the result of the analysis made by the researchers. The students have been requested to write the answers on the pictures they made by handwriting. The written things have been read by the researchers and have been analyzed by them.

2.2 Data collection environment

The research data have been realized in the classrooms of the students of Diyarbakır and Ankara Center schools in Arts course. The classroom where the research has been made was in three desks. The desks have been arranged freely for every student. The drawing papers for the students had been provided by the researchers in the application process, the students brought the pencils and drawing pencils by themselves. The students have been given 40 minutes, one course period, for the application, the application has been made under the supervision of researchers and teachers.

2.3 Analyzing and commenting of the data

IETC 2014

The pictorial explanations and literal statements have been examined by the way of document examination from the data taken from pictural explanations and written statements of the children, they have been analyzed by descriptive analysis method. The pictures made by the students and their replies to the written questions have been analyzed by the researchers in the analysis of the data process, and they have been presented to the idea of field experts related to which main themes belong to science and which ones belong to nature. The themes in the students' pictural explanations and written statements based on pictorial explanations have been determined in the results of the analysis. 4 themes have been determined as "environment, research center, invention and living area" related to science element, 3 themes have been determined as "environment, living area and environmental change" related to nature element. The items in which different opinions and consensus between the experts have been determined at the result of the analysis. 4 themes as "Population, research center, invention and living field" have been determined related to science element. 3 themes as"environment, living field and environmental change" existed related to nature element. The items with divergence and consensus have been determined at the result of analysis of expert. Reliability=Consensus/ (consensus+divergence)*100 formula has been used in reliability calculation of Miles and Huberman (1994, p.64) between researchers and field experts. The reliability value is 97.2%. Pictural drawings and written statements which do not have science and nature elements has been taken by taking ideas of the expert.

3. Findings

The findings taken in the research hve been collected with the main team as "Science and nature in the picture of students". The themes which have been determined by the analysis of studentstudies have been collected under 2 themes.

3.1. Findings related to science perception in pictual and literal descriptions of the students.

The perceptions of the students related to literal and pictural descriptions have been given in Table 1. When table 1 is examined, pictural and literal perceptions of the students related to "science" concept has been collected under the themes of "environment, research center, invention and living area". It can be stated that the students assimilated science with these 4 basic concepts. In addition to this, it can be seen that they describe these 4 concepts with subconcepts in themselves. When it is examined in general, it can be told that the students mostly assimilated science with the research based environments.

Table 1. Science themes stated in pictural descriptions and lieral statements of the students

Themes	
Population	
	World
	Alives
	Animal world
	Plant kingdom
Reseach Center Figure	
	Labortuar Environment
	Making experiment
	Cell and DNA chain
	Skeleton and muscle structure
	Evaporation
	Leverage and buoyancy of water
	Internal organs
	Solid, Liquid and Gas
Invention	
	Scientist
	Astronaut
Living environment	
	Environmental insensitivity
	Food with GMO

Population

It is observed that the students assimilated science concept with "world, living creatures, animals and plants world" subtheme in population theme. It can be told that they draw living world as animals' world and plants world, in two styles. In addition to this, it is seen that they drew science alone by assimilating it

IETC 2014

with the world. For example, Onur, a student drew science by assimilating it with the world. He used his description related to his drawing that" because science explains our world, moon, planets and the sun". Durmuş assimilated science and living creatures' world with "there are bees in science. Bees create a differentiation. Unless the bees are existent, there will not be living creatures. Also, the bees produce food for us." Examples from the students' drawing have been given in picture 1. When it is generally observed, we can say that the students see science as a part of population both in their drawings and written statements. However, they mentioned that they did not take the population as total; there are living creatures all in the world.

a b

Picture. 1. (a) Onur's picture; (b) Durmuş's picture.

Research Center Figure

When the students' drawing related to science have been examined, "Laboatory Environment, Making experiment, Cell and DNA chain, Skeleton and muscle structure, Evaporation, Leverage and buoyancy of water, Solid, Liquid and Gas" under the title of research concept have been stated as sub-themes. It is observed that the drawings which have been made by the students by assimilating science with research environment coincided with the principle of individuals who search question, criticize, analyze and synthesize as expected for science students and relevant to science nature. It is known that learning with making in laboratory environment provides permanent learning. In this context NS states while describing science in his picture "I thought melting of ice. Freezing, melting, evaporation is the best subjects in science which I can understand. Because of this reason, I drew this picture." He assimilated science with research environment.

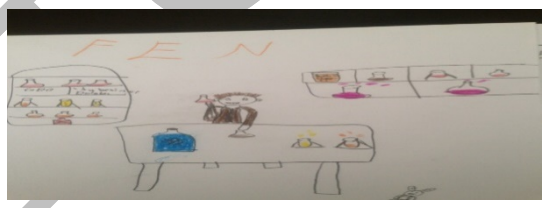
a b

Picture. 2. (a) Arda's picture; (b) Zeynep's picture

Invention

It is observed that the students describe "scientist and astronaut" concepts related to invention in their drawings related to science. It can be told that there is a situation that they assimilate science with scien-

tist concept. The research dimension of science can be explained with this situation. Astronaut can be stated as another dimension of scientist. A student called as Gökay assimilated science and scientists as "scientists make research for us. They are always working for us in the laboratories" related to scientist figure by his statement. In the same way, Başak drew science as astronaut and told that "There are always astranouts in the science books". She explained this situation as "Because of this reason, I drew astranout". The students' assimilating scientists and astranouts with science can be explained coding them as working people to find something or as a researcher. The drawings of the students related to this subject have been given in Picture 3.



a b

Picture.3. (a) Gökay's picture; (b) Başak's picture

Living environment

It is observed that the students assimilate science concept with the living environment in their literal and pictoral descriptions. It can be told that they give importance to environmental sensitiveness while doing this. Because, they explained our living environment with the concepts of "environmental sensitivity and food with GMO". When it is asked the reason of this to Ayşe, it is seen that Ayşe told that "I hear that there is too much GMO in our food in the last days." This situation can be explained as this subject took attention of the students by the way of visual and written media in science courses.

Picture.4. Ayşe's picture

As a result, it is observed that the students see science in their drawings and written statements as a piece of population and assimilate it with research centers. At the same time, they stated them as invention and living field. In this context, it is seenthat the students reflect science concept in their pictural images and written statements relevant to the content of science courses.

3.2. Findings related to nature perceptions of the students in their pictural and literal explanations

IETC 2014

Nature perceptions of the students in their pictural and literal explanations have been given in Table 2. When Table 2 is examined, the students' pictural and literal perceptions related to nature have been collected under the themes of "environment, living environment and environmental change". It can be told that the students can perceive nature concept as environment based. The students' assimilating nature with environment concept show that they have true concepts related to nature. Because they stated nature common concepts with such as green fields, forests, mountains, valleys, living creatures' houses in green fields in their pictures and written statements.

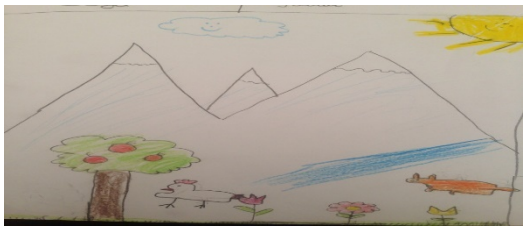
Table 2. "Nature" themes in pictural and written descriptinos of the students

Themes
Environment figure
Natural environment
Forests
Mountains and rivers
Sea
Sky, sun and clouds
Living environment
Livings (butterfly, insect,bee, flower etc.)
Picnic areas
Houses and people
Enviromental change
Season changes

Environment figure

It is seen that the students conceptualize nature and environment in their pictural and literal explanations. "natural environment, green field, forests, mountains and rivers, seas, sky, sun and clouds" are being located by the students in this concept. Green field and natural environment concepts take as common concepts in students' pictural drawings. The same situation can be told as the same for forests, mountains, rivers. This situation means that the nature concept take place in the minds of the students in a correct style. The student named as Hayrettin used the statement for mountains, trees and sky in his drawing as "I think that flowers, trees and animals live in the nature. Because of this reason I drew ühis picture." Enes mentioned his perception related to nature with his statement in a similar picture that "I drew human beings, animals and plants in nature picture. All of these live together." Gökçe mentioned her perception related to nature with her statement that "There are many living creatures in the nature, human beings, animals and plants live together." The drawings of the students related to this situation have been given in Picture 5.

a b



n's pictur

Living environment

It is observed that the students state nature by assimilating it with the environment we live in in their pictural and literal explanations. The living environment is stated as "living creatures, picnic areas and houses and human beings" in their pictural and literal explanations. It can be told that the students observe the living environment they have been in and they make evaluations according to this in their explanations about the living environment with nature concept. The students' description of nature perception as green areas and an alone house means that they perceive it as quiet environment faraway from city and they drew in this way. Their stating nature as insects, bees, butterflies and flowers living in natural environment show that they perceive and code nature in a true way. For example, Durmuş related to this theme had an explanation as " I drew by thinking birds, trees, lakes, rivers in the world.". The drawings of the students related to this situation have been given in Picture 6.

IECT 2014

Picture. 6. Durmuş's picture

Enviromental changes

The students stated that they see nature as environmental changes in their pictural and literal explanations. The environmental changes mean "seasonal changes". Every kind of change realizing in every season change such as dropping the leaves in autumn, opening of leaves in spring or greening of environment can be described as seasonal changes. It has been perceived by the students that the seasonal changes are situations which realize in itself and accepted this in this way." Şule stated her perception by telling that "As the season changes environment changes. This means the awakening of nature." The drawings of the students related to this situation have been given in Picture 7.

Picture. 7. Şule's picture

As a result, it has been observed that the nature concept is shaped according to a pattern in pictural and literal explanations of the students. The students assimilated nature with green fields. It can be told there is a natural environment, it has not been deformed by the people and they are perceived as virgin areas. It has been seen that there is a perception that there is green field where the living creatures live in, there is a lot of green field and people sometimes go to these places and have picnics and enjoy there.

4. Result and discussion

The elementary school students explained science with "population, research environment, invention and living environment" concepts in their pictural and literal statements in this research. They mentioned nature concept with "environment, living field and enviromental change" concepts.

IETC 2014

The findings in this research which "science and nature" perceptions of elementary school fourth grade students are being tried to be detemined in their pictural and literal statements show that general judgments have been created related to nature and science concept. Because it is observed that they meet at common points in science and nature concepts, it is seen that for example science is stated with generally laboratory environment and inventions, nature is explained with clean environment, green field, mountains and rivers.

Thu students assimilated science with population in general meaning. They see science as a piece of population, and related to this it has been observed that they perceive living world as a piece of whole. While explaining science with living creatures, it has been resulted that they perceived this as animal and plant world as in two dimensions. But they exclude human being from these categories. Because human beings are drawn as differenet figures in their pictures. This situation can be explained with the perception level of the students, meeting science firstly in fourth grade and not making a deep research. It has also been observed that the students assimilated science with research concept in their pictural drawings and literal explanations. Laboratory environment, science man, making experiment can be shown as an example. Especially it shows a similarity with many researches on making science man figure (Çokadar ve Demirtel, 2012; Ruiz-Mallen ve Escales, 2012). This situation can be explained as the perception of science and research together has been located in students and the first figure they remember when talked about science is scientist.

It is evident that the students have close ideas on nature concept in their in their pictural drawings and literal explanations. It can be told that they have a clear perception on nature subject. It has been seen that there is green field, water resources, mountains and sun in most of their drawings. For example, there are not any figures in their pictures showing people, houses, traffic and city life. Houses take place in some pictures but these houses are in the form of a country house and faraway from the city life. It has been observed that they drew nature a place to be relaxed and they did not talk about enviromental pollution in their pictures. Especially not talking about enviromental pollution can be explained as the students perceive nature as a place where people did not touch, and far and natural places.

The similarity between the drawings of student and their written statements in the research is seen as an important point. For example it is observed that they assimilate science with laboratory and research in their pictural drawings and literal explanations. Especially pictural and literal explanation related to nature perception show great similarities. When nature is talked about, the students state it with the same concepts When the drawings related to nature have been observed, natural environment, monutains, green gields, rivers, mouintains, lakes, sun and living creatures have been on the front size. Similar findings have been seen in the studies of Zuhal, Kuniatko and Topal (2012) and Ülker (2012). When it is thought that the study of Zuhal, Kuniatko and Topal (2012) has been realized with Czech students, the perceptions related to the nature heve been global common values.

One of the most important results of the research is that the students living in different social, cultural and economic regions perceive science and nature with common concepts. Because cultural and social environment effect the individuals' fact and situation and provide the formation of judgment. But it is seen that similar situations which effect the students' perceptions realize in the research. This situation is related with course boks, content of the program, teachers' point of view, audio and visual mass media which form a common perception.

When pictural development stages and literal statement skills of the fourth grade elementary students are taken into account, it is observed that their pictural and literal statements complete each other. Whereas pictural statements have been more complex, literal statements include statements explaining this situation. This situation can be explained that the children feel themselves more free in their pictural drawings, they find the opportunity of expressing themselves in the pictures, and related to this they have transferring their perceptions and observations more and deeper.

IECT-2014

As a result, it can be told that the perceptions of the students on science have been at an expected level. Especially, it is seen that their perceptions related to nature concept include judgments. For example, natural pollution has not been perceived as nature concept and has not been drawn and stated by the students. The students should be provided about enviromental sensitivity and importance of enviromental pollution and the nature cannot be clean forever.

Scientific visualizations based on integrated model of text and picture comprehension via eye-tracking

Azam Majooni[a], Mona Masood[a]92, Amir Akhavan[b]
[a]*Centre for Instructional Technology and Multimedia, Universiti Sains Malaysia*, Malaysia
[b]*School of Computer Sciences, Universiti Sains Malaysia*, Malaysia

Abstract

This study investigates the "*color combination effect"* and the "*sequence of pictures and text effect"* in the "Integrated Model of Text and Picture Comprehension" (ITPC) on the formation of the mental model and cognitive load in both desktop and mobile devices. These effects are studied using an experiment including scientific contexts with specific color combinations and different picture and text sequences. The participants of this experiment are graduate students from different fields of science in Universiti Sains Malaysia. Four tasks are assigned for each participant in each phase and every task includes a scientific context accompanied with visualization. After each task the participant is asked to answer a set of questions related to the context. Eye-tracking methods are adopted to record gaze data of the participants while reading each context. Analysis of the gaze data and the percentage of the correct answers to the questions indicate that the sequence of picture and text and use of color in the visualizations results in reduction of the cognitive load of the participants.

Selection and peer-review under responsibility of The Association of Science, Education and Technology-TASET, Sakarya University, Turkey.

Keywords: eye tracking; picture-text sequence; visualization; cognitive load

IETC 2014

1. Introduction

The main intention of information visualization is to provide insight about the information in order to solve some prominent problems such as information overload and misinterpretation of data. Several empirical studies have shown the superiority of the visual representations versus the sequences of verbal representations in different tasks such as trend recognition and relation illustration. In the Integrated Model of Text and Picture Comprehension (ITPC), developed by Schnotz, it is claimed that formation of the comprehension of text and visuals are considered as active processes of "*coherence formation*", but at the same time it mentions that combination of textual and visual data should be implemented carefully, as it might cause interference in the learning of the users because of inappropriate graphics (Schnotz & Kürschner, 2007). In the scientific domains, information visualization is used extensively to provide better representation for the verbal contents (Börner, Chen, & Boyack, 2005; Ware, 2012). The terms, "better representation" is not a precise explanation and there exist a demand for a more explicit comparison parameter to describe the quality and effectiveness of the visualization (Few, n.d. pp.24-26). In order to achieve a general instruction in this study, effect of the parameters, color and the sequence of pictures and text in the formation of the mental model is studied. To provide a comparison between desktop and mobile devices the experiment is conducted on both mediums as nowadays, millions of people use mobile devices for different tasks such as browsing the Internet, reading email, books, blogs and even scientific papers

(Maurer, Hausen, De Luca, & Hussmann, 2010). The participants of this experiment are graduate students from different fields of science at Universiti Sains Malaysia. The first phase of the experiment studies the "Picture-text sequencing effect" and "Color combination effect" in scientific contexts containing visualizations on the desktop computer. At the same time the participants are asked to read four short scientific contexts and their gaze data is collected using the eye-tracking devices. Also participant's comprehension from the context is evaluated using a set of questions at the end of each context. The second phase of the experiment aims to study the "Picture-text sequencing effect" and "Color combination effect" on the mobile devices of small and medium-sized screen. In the second phase, the steps of the first phase are repeated on the mobile devices and likewise the gaze data and the answers to the questions are collected and analyzed. In the final phase the participants are asked to complete the Felder-Silverman learning style model test in order to identify preferred learning style of the participants.

1.1. Related work

In the past decades, a great amount of research has shown that the combination of text and picture provides better learning compared to text only and picture only situations (Anglin, 2004; Fletcher & Tobias, 2005). Several research also is conducted to answer this question that if the text and picture appear in sequence, which model would be more effective. Some of these studies have provided experiments, to study the effect of picture and text sequencing (Canham & Hegarty, 2010; Eitel, Scheiter, Schüler, Nyström, & Holmqvist, 2013; McCrudden, Magliano, & Schraw, 2011; Shaw, Nihalani, Mayrath, & Robinson, 2012). The results of the conducted experiments varies for each study, meaning that some of the experiments concluded in the effectiveness of picture before text sequence (Borges & Robins, 1980; Dean & Enemoh, 1983; McCrudden et al., 2011; McCrudden, Schraw, & Lehman, 2007; Salmerón, Baccino, Cañas, Madrid, & Fajardo, 2009; Ullrich, 2007), and also almost equally a big body of research have achieved positive results on behalf of the text before picture or text only model (Bransford & Bransford, 1972; Canham & Hegarty, 2010; O'Keefe & Solman, 1987; Robinson, Katayama, Dubois, & Devaney, 1998; Robinson & Kiewra, 1995; Simmons, Griffin, & Kameenui, 1988). The Picture-text sequencing effect mentioned in the ITPC model, claims that the presentation of the picture before text, provides the mind preliminary visual information that helps with the creation of the mental model (Schnotz & Kürschner, 2007).

1.2. Picture and text sequencing effect on desktop and mobile devices

This study is important because, it investigates effect of picture and text sequencing on both the desktop and mobile devices side by side, while examining the influence of color on it. The effect of picture and text sequencing on mobile devices can be of more importance, as the screen size of the mobile devices are generally smaller than the desktop computers; which in this case when the picture is accompanied by text (or vice versa), the content producer is limited in the display size, thus there is no other way but to present picture and text in a sequential format.

2. Experiment

This study aims to determine the effect of color combination and image/text sequencing on the understanding and cognitive load of postgraduate students while reading scientific contexts on desktop and mobiles devices. In order to investigate the effect of these variables, an experiment is designed with two parts including four tasks to examine the cognitive load of the students using the desktop monitor and a mobile device.

IETC 2014

2.1. Participants

Participants of this study are 10 third year Universiti Sains Malaysia postgraduates with a science background aged between 29 to 35 years old. The participants are assured that their test results would be anonymous and their score will not be disclosed. The participants are divided into 2 groups, each group with eight similar texts but different sequence of picture and text.

2.2. Apparatus

In this experiment, the main goal was to investigate the cognitive load, of the participant in the picture first, followed by text and then text first followed by picture, on both desktop and mobile devices. In order to achieve this goal, Gaze data was collected using SMI Red, remote eye-tracking device in the desktop based tasks and SMI eye-tracking glasses (ETG) for the mobile device based tasks. The calibration of the devices are renewed after each task and the participants are asked to answer a set of questions related to the tasks.

After completing the tasks the participants are given the Felder-Silverman learning style questionnaire, to determine if they are visual or verbal learners.

2.3. Materials

Material used in this experiment, are eight simple passages which provides description on the results of the survey conducted on the academic databases. The length of each passage is between 150 to 210 words and the readability score for each of the passages is calculated using the readability formula (Kincaid, Fishburne Jr, Rogers, & Chissom, 1975) and the mean of the readability score is 14.2 with below 10% standard deviation. The material is accompanied with diagrams related to the context.

2.4. Procedure

The participants, initially are informed that they would read four tasks which include a short passage with a picture before or after the passage, on desktop computer and four tasks on mobile device and after each task they will answer a few questions related to each task.

The experiment includes three major sections:

(a) Reading tasks with questions on the desktop with remote eye-tracking device (RED):

Four reading tasks are assigned for each participant and after each task participants are asked to answer a set of questions about the context and their gaze data are recorded using the remote eye-tracking devices.

(b) Reading tasks with questions on the mobile devices with eye-tracking glasses (ETG):

The same procedures in step (a) are implemented, except this time the tasks and the questions are provided using small and medium-size screen devices and their gaze data are recorded using eye-tracking glasses.

(c) Felder-Silverman learning style model test:

In the final step, the participants are asked to answer 44 questions of the "Felder-Silverman learning style model" to identify their Learning Style Index (LSI) for further analysis. Fig. 1 demonstrates the schematic process of the experiment.

IECT 2014

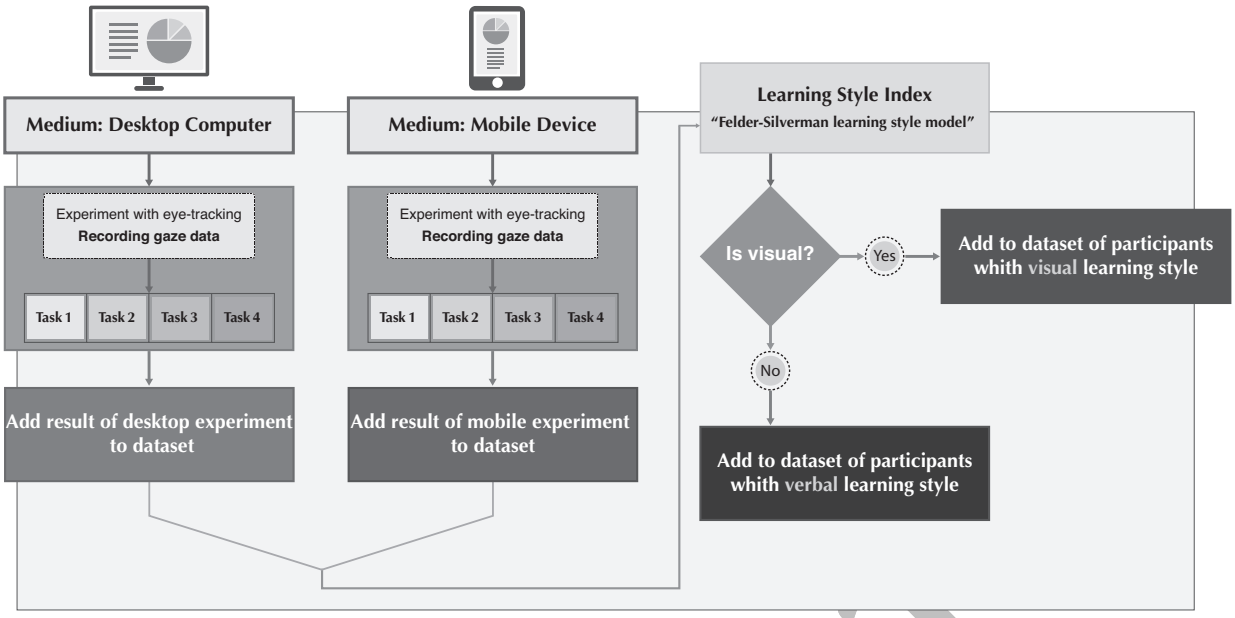

Fig 1. Schematic process of the experiment

3. Results

The collected information from the experiment can be divided into four categories:

- Scores of the questions about the context on the desktop and mobile device
- Eye-tracking results of the experiment on the context on the desktop
- Eye-tracking results of the experiment on the context on the mobile device
- Results of the Learning Style Index test

The analysis of the collected information is completed in three steps, firstly, the learning style of the participants is identified and the attributes of the *visual*/*verbal* learner are added to the database of the collected information. In the second phase, the mean score of the questions for all the participants for each test is calculated. Later the mean results for each group of *visual* and *verbal* learners are also calculated separately. Then the gaze data are plotted using the heat map and the scan path visualization methods to investigate the fixations and movement sequence of the eyes collected by the eye-tracking devices.

3.1. Gaze data

For further analysis, the scores and gaze data collected from the desktop and mobile devices are clustered and the results are analysed using classification method. The eye-tracking data provides information about the time needed for the participant to read and recognize each part of the context. It can also help estimate the cognitive load of the participant while going through the context. The collected eye tracking data are usually visualized either by heat map and scan path or by analysing the number and duration of the fixation on an Area of Interest (AOI) or POI. However the other eye tracking parameters such as blin-

king, pupil size variation and length of the saccades, ratio of fixations, are also very important parameters (Bixler & D'Mello, 2014). In this study, the parameters for each task and for each participant are put into a matrix of the eye tracking data, and 50% of all the features are recorded in this matrix are used for training the model using a supervised learning method. In the next step, the rest of the records are used for testing the hypothesis on the effectiveness of picture-text sequencing model.

3.2. Collected data on the experiment

The analysis of the results are completed using a method based on the records of the fixation, saccades, blinks and pupil size on two large AOIs. In order to investigate the relation of the cognitive load and gaze data in a quantitative manner, all the eye tracking data are summarized into 7 features and 2 matrices. This matrix of gaze data contains: (1) Time ratio of the Fixations, (2) Mean of the Fixations, (3) Number of Saccades, (4) Number of blinks, (5) Mean time between blinks, (6) Mean pupil diameter, and (7) Total length of eye movement. The results of the answers to the questions are used as the classifier attribute for the training step, and then this attribute is again used for testing the model. The ZeroR classifier in the WEKA data mining toolkit (Hall et al., 2009) is used for the training and testing. In this process, 50% of the participant's data (attribute matrices) are selected randomly for training purpose, 10% for validation and 40% for testing.

3.3. Normalization of the data

The data in the matrices for each participant are not all in one range, as each attribute represents one different feature, also physical characteristics (such as pupil diameter) vary for each participant, which leads to a bias in the modeling. In order to avoid this, the data inside the matrices are all normalized using a common method of normalization (in this case Hyperbolic Tangent function) therefore all the parameters will have values in the same range of 0 and 1. Fig. 2 is the matrix of the normalized features for participant one from group one.

The features matrix for participant one, after normaliztion	Tasks	Time ratio of the Fixations	Mean of the Fixations	Number of Saccades	Number of blinks	Mean time between blinks	Mean pupil diameter	Total length of eye movement
Desktop computer (RED)	1	0.386	0.7311	0.709	0.484	0.158	0.169	0.353
	2	0.377	0.8637	0.687	0.740	0.172	0.177	0.591
	3	0.396	0.6415	0.822	0.396	0.370	0.595	0.176
	4	0.395	0.5918	0.722	0.555	0.449	0.211	0.169
Mobile device (ETG)	1	0.431	0.6383	.8645	0.581	0.434	0.643	0.901
	2	0.395	0.4807	0.762	0.780	0.662	0.141	0.585
	3	0.379	0.6014	0.609	0.888	0.617	0.592	0.170
	4	0.432	0.6639	0.555	0.760	0.725	0.143	0.495

Fig 2. The features matrix for participant one after normalization for modelling

3.4. Results of the questions

The participants are asked to answer questions related to the context in each task, and the results of these questions are used as a measure of the understanding of the participants from the context. The mean of the results for all the participants is presented in Table 6 and Table 7. Although the number of participants was not too many, the results provide clues about the effectiveness of the use of color. Also, better results are achieved in the Picture first cases compared to the Text first cases, which supports the ITPC theory.

Table 6. Results of the questions on Mobile device (Mean results of Groups 1 and 2)

	Group 1		Group 2	
Context	Colored	Black and White	Colored	Black and White
Picture first	90%	80%	80%	80%
Text First	65%	70%	65%	60%

Table 7. Results of the questions on Desktop computer (Mean results of Groups 1 and 2)

	Group 1		Group 2	
	Colored	Black and White	Colored	Black and White
Picture first	90%	70%	85%	73%
Text First	67%	65%	75%	67%

3.5. Analysis of the pupillary response

According to Klingner, Kumar, and Hanrahan (2008), pupil diameter increases with the difficulty of the context. In this experiment, the pupil data for each of the participants, for each task on two main AOIs are collected and analyzed, the Fig 3 demonstrates changes of the pupil size while the participant is reading the context.

IETC 2014

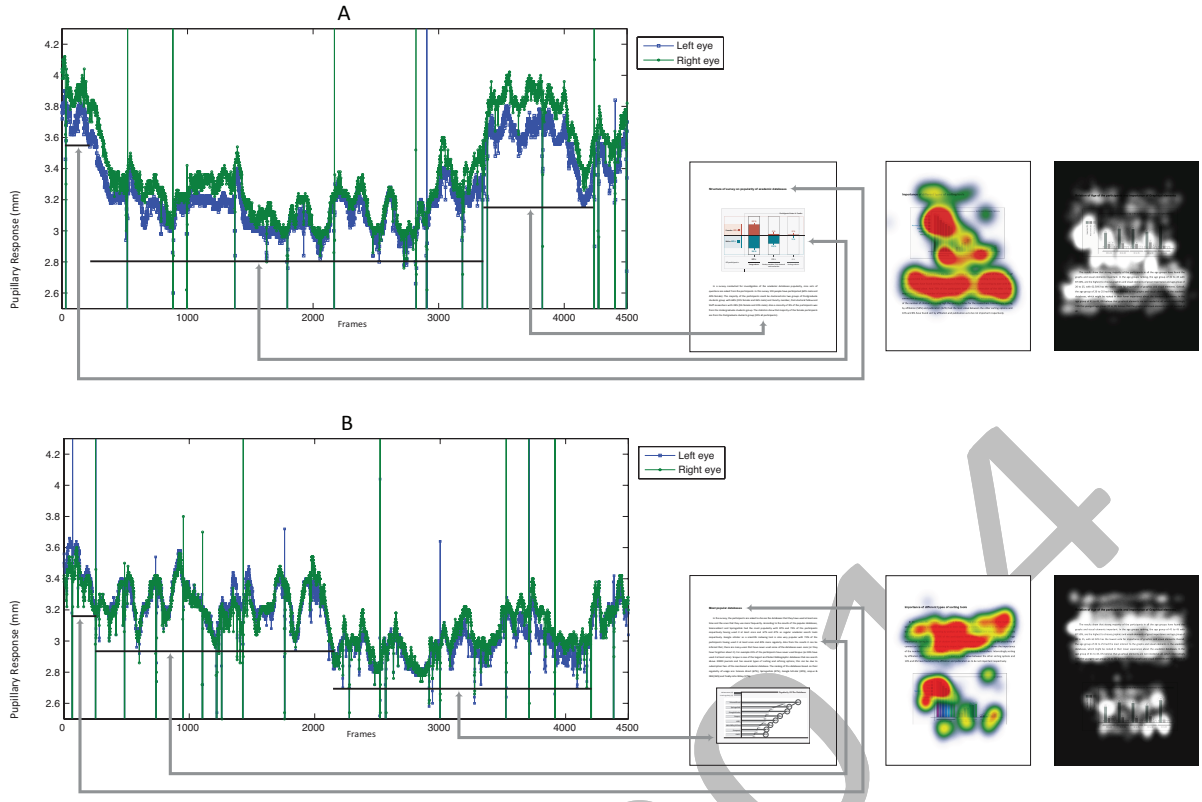

Fig 3. (a) the pupil diameter increases while reading the text and (b) during the process of reading pupil diameter is higher than while gazing at the figure

3.6. Analysis and classification

A parameter, representing the cognitive load is presented in this section which represents the cognitive load score (CLS). This parameter, is achieved by normalizing the maximum score of the parameters monitoring the cognitive load (number of blinking, size of pupil and fixation). In other words, values of the eye tracking features while watching a black space and while trying to read and understand a difficult section of the tasks is scored (between 0% and 100%). The mean value of the all features are tested using the model and the similarity factor is considered as the mean cognitive load for the tested tasks. Table 3 shows the results of the analysis.

The results of the cognitive load score, reflects the difficulty of the contexts for all the participants (Table 8), the scores suggests that, sequence of picture before text, can reduce the mean of the cognitive load. Also the mean of CLS in the contexts with colored figures is noticeably lower than the contexts with black and white figures.

Table 8. Mean cognitive load score from testing of the model trained by 50% of the participants

Device	Tasks	Cognitive load score	Tasks	Cognitive load score
Mobile device	Picture first, Colored	69%	Picture first, B/W	67%
	Text first, Colored figures	74%	Text first, B/W	81%
Desktop computer	Picture first, Colored	59%	Picture first, B/W	65%
	Text first, Colored figures	70%	Text first, B/W	78%

IECT 2014

4. Discussion

In this work, the effect of the color and the sequence of picture and text in the formation of the mental model and cognitive load is investigated for both the desktop and mobile device. The results support the Integrated Model of Text and Picture Comprehension on the effect of the sequence of the picture and text in both mobile devices and desktop computers. Also the results confirm the positive effect of color in the reduction of cognitive load in all the cases. Results of the Felder-Silverman test, provided that 75% of the participants were visual learners and 25% verbal learners. Nevertheless, in this experiment both verbal and visual participants had better scores on the *picture first* tasks.

5. Conclusion

The effect of sequence of pictures and text in the cognition load and the formation of the mental model in the scientific contexts in the Integrated Model of Text and Picture Comprehension is a rarely investigated issue and in this experiment, the authors try to conduct an analysis regarding this effect on both the desktop and mobile devices. The contribution of this study is both on the investigation of the theory and also technically analyzing the effect of using mobile devices versus desktop computers.

Self- motivation as a mediator for teachers' readiness in applying ICT in teaching and learning

Jimmi Copriady93*

Faculty of education, University of Riau, Indonesia

Abstract

The aim of this study is to examine teachers' motivation as a great mediator for teachers' readiness in applying ICT in their teaching and learning. Apart from that, this study was carried out to differentiate the effect of exogenous variables from the endogenous variables based on the academic fields (pure science and social science). This is a quantitative study using a survey method, involving a total of 874 high school teachers in Indonesia, including 446 science teachers and 428 social science teachers. Data was analyzed using path analysis (path analysis/ SEM) with AMOS software version 18. The results show that motivation is a significant variable as a mediator between the variables of readiness with ICT application in teaching and learning science and social science. Analysis of structural equation path model (SEM) shows that the data used in this study has a reasonable suitability for the proposed regression model. Thus, it is proved that the two independent variables are linked directly and indirectly to the dependent variable of the study which is the application of ICT in teaching and learning. The implication of this study is that the governments and ministry of educations take into account teachers attitudes and motivations in terms of ICT application and address this issue by providing sufficient infrastructure, equipments, facilities, and training for teachers to develop positive attitudes towards the ICT use in education.

Keywords: Motivation, Readiness, Mediator, ICT Aplication, SEM Analysis

IETC 2014

1. Introduction

The world is experiencing rapid changes which cause the explosion of ever-changing technologies. These changes are happening all over the globe, including developing countries like Indonesia. Therefore, it is inevitable that these changes should be embraced realistically so that the developing countries are not to be left behind in improving the quality of education as well as strengthening the implementation of classroom instructional process. The presence of various new means of information has changed the state of thoughts, ideologies and cultures. In addition, the world is now borderless; hence, various external elements are invading other countries without border controls. As such, this development of information technology is synonymous with the universal theme as the world without boundaries, which as Davis (2001) stated, one of human tendencies in the early 21st century is the information revolution. This means that information is obtained more rapidly, which put conventional methods, such as going to the library and printed materials are so out of styles.

Now, the education system has fully realised the potential of ICT as a valueable assisting tool in teaching and learning (Drier, 2001; Giannakos, 2014; Vajargah & Saadattlab, 2014). Students are now more interested in using ICT to access information, and having personal websites is a current trend where they can easily check their status via social networkings such as myspace, friendster, blogspot, facebook to

* Corresponding author. Tel.: +6281298209749; fax: +6276165804
E-mail address: jimmiputra30@gmail.com

name a few. This phenomenon has become a trend among school students (García-Santillán et al. 2014; Youssef et al., 2013; Zhao, et.al, 2002). This new type of students' interests and hobbies should be taken advantage of by teachers and parents to guide the students on the correct use of ICT (Badri et al., 2013; Öz, 2014). However, the most significant challenges faced by teachers are in handling a paradigm shift towards the ever-changing methods of teaching and learning and how to use computers and ICT as an alternative approach.

According to Baharuddin et al, (2000), for over the last thirty years, most classrooms in the European Countries have integrated ICT in the instructional process by learning how to use technology and ICT competencies also known as ICT literacy, which involve knowledge about the basic concept and operation, computer usage, word processing, spreadsheet, database, file management, documentation, presentation and communication of information. Technology can make our lives easier and simplify our daily tasks (Brooke, 2013; Holmes, 1999; Wang, 2014). In the context of teaching and learning, technology can facilitate tasks and improve teachers' performance in creating effective teaching and learning activities. According to Pisapa (1994), the integration of ICT in the instructional process refers to the use of learning technologies to promote, strengthen and enhance skills. Information technology should be used in combination with other teaching methods. Teachers need to integrate ICT to add value to the teaching and learning activities.

In the Indonesian context, ICT was first developed in 1983 at the University of Indonesia, in the form of University Network (UINet) by Dr.Joseph F.P Luhukay, who at the moment had just completed the Computer Knowledge doctorate program in the United States. The network was developed for over four years. In the same year, Luhukay initiated the establishement of the UlNet at the Department of Culture and Education which was a computer network covering a wider reach of the University of Indonesia, Bandung Institute of Technology, Bogor Institute of Agriculture, Gadjah Mada University, Surabaya Institute of Technology and HasanudinUniversity (Sutedjo, 2002). However, ICT is generally still an exclusive matter for the Indonesian people (Onno, 2003). Internet service in Indonesia is still a cost center and not yet a profit center. This is due to the significant facts of the minimum number of phones available, the uneven distribution of accessible networks (fiber optic cable), and the rental of internet line is still very expensive. In addition, Internet users in Indonesia are mostly among the upper middle social class and consumption patterns are more for educational purposes.

Naidu et al. (2006) stated that attitudes are beliefs, emotional reactions and behavioral tendencies toward an object that induce or inhibit a person to make a choice of action in an activity that is academic or informal. Skills could be considered as the ability or capacity to do something well. According to Wong (2002), information and communication technology skills can be viewed in two dimensions of ICT content skills and the skills of using ICT to complete tasks. ICT is a new means of technology to access information through an interactive spreadsheet that is more attractive through the integration of audio-visual and multimedia. Hubona and Whisenand (1995) viewed the use of ICT as a combination of traditional computer application and modern communication tools involving electronic mail and websites through communication networks and great access to information through search engines (Google & Mozilla). Correspondingly, Albirini (2006) highlights the importance of teacher's vision of technology itself, his/her experiences with it, as well as the cultural conditions under which ICT is introduced into schools in shaping teacher's attitudes toward technology and its subsequent diffusion in his/her educational practice.

IECT 2014

2. Problem statement

Indonesia is still lagging behind in terms of ICT provision as the usage of ICT in Indonesia is still limited and only available in the state of Java, and despondently the areas outside of Java are experiencing limited internet access. Prayitno (2007) stated that the use of internet as a whole is still relatively new to the Indonesian people and the number of users is still slightly lower than the total population and its accessibility is only in the big cities.

Siti Aishah et al. (2002) and Robiah et al. (2003) have found that teachers are comfortable with the conventional aids compared to the use of ICT. Their willingness to improve their knowledge and ICT skills is also very low, with their nonchalant attitude and disregard ICT as an urgent need to improve the quality and standards of their teaching and learning. The majority of teachers do not have good computer skills, which in this context referred to the basic knowledge of using Microsoft Word, Microsoft Excel and Microsoft PowerPoint. This is a clear evident that teachers do need helps. Apart from that, their skills in handling Microsoft Access and multimedia softwares such as Paint and Photoshop are still limited and their ability to use multimedia equipments such as scanners, digital cameras and digital video is very low. Teachers are also weak in electronic communications such as e-mail, chat, and exploring information from CD-ROMs and internet (Abdullah bin Md Yatim, 2002).

The common problem faced by the teachers is the lack of knowledge on how to use the internet to search and identify certain information. This dissuades them to apply it in their teaching and learning (Yunus & Wekke, 2009). They are disheartened with fear that their weaknesses will be known by students .This is consistent with a study by Laurillard (1994) which found that teachers were not competent in the use of technology, especially computers because of a lack of knowledge. For example, they took a long time searching for information via the internet; some were unable to search because they did not have the knowledge of internet search (Rye, 2009).

This study was designed to examine the readiness and self-motivation of high schools teachers in Indonesia in the use of ICT and ICT applications in teaching and learning in order to create a meaningful learning experience for students and to improve their teaching effectiveness. This study also identified factors which work as mediators on teachers' willingness to apply ICT in their teaching and learning and to support the optimal use of ICT in teaching and learning activities.

3. Literature review

3.1. ICT motivation

Motivation includes several factors which drive the selection, the persistence, as well as the engagement in particular activities to achieve an objective (Dweck & Elliott, 1983). Besides, motivation is refered to as the process in which goal-directed behaviour is prompted and sustained (Schunk, 1990). Therefore, motivational factors are regarded to be part of a person's goal structures and beliefs regarding what is significant (Ames, 1992). Accordingly, teachers' sufficient levels of motivation are seen to be associated with the innovative role of technology. Likewise, empirical study has effectively linked motivation to teacher's computer use (Sang et al., 2010)

3.2. Teacher readiness

IETC 2014

Teachers are considred as the main factor that generally determines educational development and innovation since they are the ones to employ the ICT investments for the pupose of educational development (Öz, 2014). It is argued that technology has no educational value in itself (Sang et al., 2010). However, their importance is highly recognized when being used by teachers in the process of teaching and learning (Chiu, 2014). While some people claim that the presence of technology in the classroom produces a pressure and requires efficient and effective use (Sang et al., 2011), study results display that these are also connected to teachers' attitudes and their levels of knowledge (Badri et al., 2013; Tezci, 2010). Teachers' positive views towards the applications of ICT or rejecting them all together are affected by their attitudes, (Albirini, 2006) as well as other significant factors such as their information about and experience with ICT (Badri et al,. 2013) their experiences in how to utilize these technologies in classroom environment (Keramati, 2011), information and experiences regarding the kinds of applications based on ICT, age, self-confidence (Molnár & Benedek 2013; Reading & Doyle, 2013).

The main issue in teachers' decision to utilize or not to use ICT is related to their attitudes. The results of a study by Badri et al. (2013) show that an individual's attitudes have a significant impact on his/her behaviors in ICT use. Teachers' attitudes (positive or negative) effect how they respond to and employ ICT. Therefore, information is needed about teachers' attitudes for planning about and future investment in ICT (Öz, 2014; Tezci, 2010). Likewise, Keramati et al. (2011) found that teacher's motivation and training play a substantial role in ICT application in education. Sang et al. 2011 has emphasized the strong relationships between computer-related attitudes and computer application in education. Attitudes towards computers affect teachers' acceptance of the usefulness of technology, and also affect whether teachers will integrate ICT into their classrooms.

Thus, Teachers' positive attitude can facilitate their use of more instructional technology tools in order to make learning more interesting as well as attractive for their students. However, teachers who have negative attitudes towards technology application in education cannot benefit in this area nor efficiently integrate technology into the education system. In Indonesia, as a developing country, the use of ICT in education by teachers is far from sufficient (Rye, 2009; Yunus & Wekke, 2009).However, very few studies have been reported in this area. Therefore, given the importance of teachers' attitutes and motivation in the application of ICT in education the relationship between motivation and ICT readiness, this area needs to be investigated.

4. Objectives of the study

The primary objective of this study was to identify self-motivation as a mediator on teachers' willingness to apply ICT in their teaching and learning. The other objective was to determine the effect of the independent variables (exogenous) on the dependent variables (endogenous) based on the academic fields (pure science and social science teachers).

5. Materials and methods

5.1. Instrument

This is a quantitative study using a survey method.

5.2. Population and sample group a

IETC 2014

The study sample was selected using purposive sampling and simple random techniques.A total of 874 high school teachers, including 446 science teachers and 428 social science teachers comprise the study sample.

5.3. Data analysis

Data was analyzed using path analysis (path analysis/ SEM) with AMOS software version 18.

5.4. Study procedure

The survey method was employed to collect data using questionnaires. A pilot study was conducted involving a total of 200 secondary school teachers for the purpose of determining the validity and reliability of the research instrument. The Cronbach's Alpha value for each aspect is as follow: teachers' attitudes towards ICT (0815), the use of ICT (0923), ICT facilities in schools (0888), ICT knowledge (0968), ICT skills (0.970) and the application of ICT in teaching and learning (0943). Every aspect has high reliability and fit to be used in the actual study for all of the instruments for readiness, motivation and application of ICT in teaching and learning. Respondents for the actual study were teachers from secondary schools in Indonesia. A total of 874 teachers were selected using purposive sampling and simple random techniques. Data was analysed by using Structural Equation Model (SEM) with AMOS 18.0 software to test the research hypotheses.

6. Results

Analysis of Structural Equation Model (SEM) with AMOS 18.0 software was used to test motivation as a mediator for teachers' readiness towards the application of ICT in teaching and learning. The results of the SEM analysis are as shown in Figure 1 below.

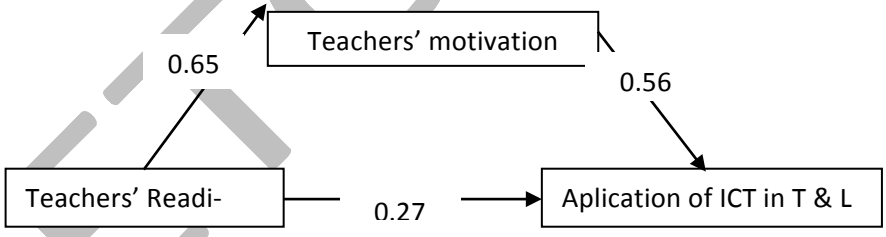

Fig 1. Motivation as a Mediator for Teachers' Readiness towards the Application of ICT in Teaching and Learning

SEM analysis of AMOS 18 software shows that teachers' motivation is a mediator towards teachers' readiness to apply ICT in teaching and learning. The results of the path analysis SEM equations model indicate SEM measurements as the following: Chi Square / df = 0.000, Root Mean Square Error Approximation (RMSEA) = 0:07, Goodness of Fit Index (GFI) = 1.000 and comparative fit index (CFI) = 1.000. All of the measures used show that the data used in this study proved to have reasonable compatibility with the model.

IECT 2014

Table1. Goo

dness of Fit Index (GFI) of the Respondents

Parameter	Coefficient /Index	
GFI	>0.9	1.000
NFI	>0.9	1.000
RMSEA	<0.08	0.069
CFI	>0.9	1.000
X^2/df	<0.3	0.000

Path analysis of the structural equation model (SEM) showed that the regression model proposed is compatible, where teachers' motivation is a significant predictor for the variable of readiness (motivation β = 0.65, p <0.000). Results of the analysis also indicate that variables in term of teachers' readiness and motivation are significant predictors for other variable which is the application of ICT in teaching and learning (readiness β = 0:56, p = 0.000; motivation β = 0:27, p <0.000).

In overall, the results of path analysis structural equation model (SEM) showed the variance in the endogenous variables, the application of ICT in teaching and learning as predicted by exogenous variables is 0.59. This shows that 59% of the variances of the application of ICT in teaching and learning is predicted by all the independent variables of the study. Thus, this means there is 0:41 or 41% of the variances in the variable of ICT application in teaching and learning can not be predicted by the regression model. Sobel test results show the impact value of motivation as a mediator for teachers readiness in applying ICT in their teaching and learning with the value of z = 19 576 and sig = 0.000 (p <0.05). This shows that motivation is a significant factor which plays as a mediator for the teachers to be ready in applying ICT in their teaching and learning process.

A model was designed and analyzed by using AMOS 18 to show a detailed look of the contribution of each aspect in teachers' motivation as mediator for teachers' readiness in applying ICT in their teaching and learning. The result is shown as in Figure 3 below.

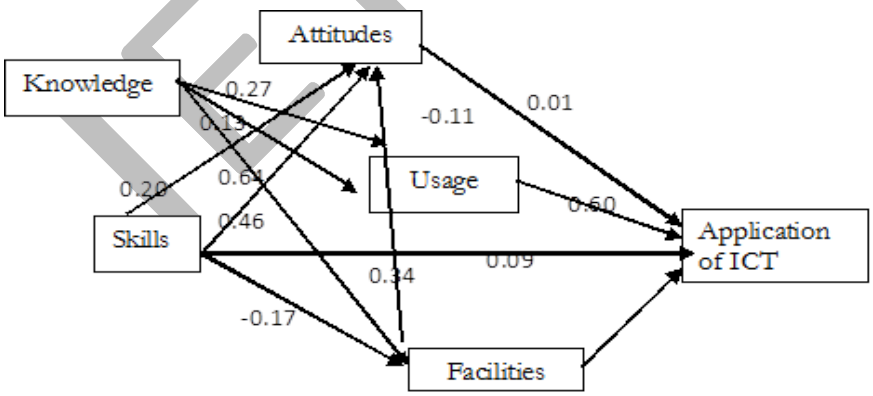

Fig 2. The aspects of motivation as mediator to each aspect of readiness towards the application of ICT in Teaching and Learning

SEM analysis of AMOS 18 software shows that the usage of ICT and ICT facilities are mediators for teachers in terms of ICT knowledge and ICT skills in the application of ICT in teaching and learning. Path analysis of the SEM equations model shows results that indicate the following: measurement of the Chi Square / df = 301 345, Root Mean Square Error Approximation (RMSEA) = 0.059, Goodness of Fit Index

(GFI) = 0.972 and comparative fit index (CFI) = 0.906. All of the measures used show that the data used in this study proved to have reasonable suitability for the proposed model.

Table 2. Goodness of Fit Index (GFI) of the respondents

Parameter	Coefficient /Index	
GFI	>0.9	0.972
NFI	>0.9	0.906
RMSEA	<0.08	0.059
CFI	>0.9	9.06
X^2/df	<0.3	0.000

The results of structural equation model (SEM) path analysis showed that the regression model is compatible as proposed, where ICT knowledge and ICT skills are significant predictor variables for the attitude variable (knowledge, β = 0:13, p <0.000; skills, β = 0.20, p = 0.000). The analysis also shows ICT knowledge and ICT skills of the teachers are significant predictor variables for the following variables: the use of ICT (knowledge, β = 0:27, p <0.000; skills, β = 0.246, p = 0.000), ICT knowledge and ICT skills are significant predictor variables for the variable of ICT facilities (knowledge, β = 0.64, p = 0.000; skills, β = -0.17, p = 0.000). The anaysis shows that the variables of ICT knowledge and ICT skills are significant predictor variables for the variables of ICT application in teaching and learning (knowledge β = -0.11, p <0.000; encouragement β = 0:34, p <0.000). As a result, this shows that the use of ICT is a significant mediator for the teachers to apply ICT in their teaching and learning (use β = 0.60, p <0.000). However, the attitude and ICT facilities are not mediators for the application of ICT (ICT attitude β = 0.01 and p> 0.001; facility β = 0:09, p <0.001).

Sobel test results, used to see the impact of every aspect of motivation as a mediator in the aspect of teachers support towards ICT applications, can be seen in Table 3 below.

Table 3. Sobel test on the effect of Motivation as mediator for teachers' readiness in applying ICT in teaching and learning

Mediated pathway	Z	P
Knowledge → Attitude → ICT Application	8.42	0.00
Skills → Attitude → ICT application	11.28	0.00
Knowledge → Usage → ICT application	19.04	0.00
Skills → Usage → ICT application	20.18	0.00
Knowledge → Facilities → ICT application	11.99	0.00
Skills → Facilities → ICT application	9.85	0.00

Table 3 shows that attitude, usage and facilities are significant mediators for knowledge and skills in the application of ICT (p <0.05). This clearly shows that the elements of teachers' motivation which consists of attitude, usage and facilities, effectively react as mediators for the teachers to be ready. In this context, readiness involves knowledge and skills to apply ICT in teaching and learning.

IETC 2014

7. Discussion

The results showed that motivation is a mediator that help teachers to be ready in applying ICT in their teaching and learning. These findings reaffirm a study by Abdul Wahab (2006) that there is a significant relationship between knowledge, skills and the usage of information and communication technology with the attitude towards information and communication technology. The study result is also consistant with the finding of a study by Aldunate and Nussbaum (2013) as they report that teachers who do not emply technology early in their teaching process and devote a small portion of their time to incorporating educational technology are less likely to adopt new echnology. Attitude is seen as a catalyst in determining whether teachers are willing to use ICT or otherwise. Normally, it is common for teachers to be positive in adapting with changes and accepting new technologies. Hence, their professional attitudes will help them in utilising the technologies as a way to improve the quality of their teaching and learning (Tezci, 2010).

Teachers are professionals who constantly experience changes and face development of new technologies in their lives. As professionals, they understand their roles and functions as a resource and catalyst for learning activities. According to Norton & Willburg (2003), teachers are always keen to have new technologies in the hope that technologies can help them in overcoming problems encountered in the context of teaching and learning. However, there are still teachers who do not realize the importance of ICT and multimedia as teaching and learning aids. Thus, according to Norhayati Abd Mukti (1995), teachers are still not fully ready to use computers in their teaching and learning and they rely more on their usual ways of teaching which normally include oral presentations and question and answer with the least emphasis on ICT development.

There are also teachers who do not fully utilize the advantages and capabilities of ICT in their schools, even if the government has supplied complete equipments and ICT facilities (Lim & Pannen, 2012). This occurs due to a number of factors that discourage the teachers in using ICT. Teachers are actually facing great challenges and problems in the use of ICT in their teaching and learning, especially their negative attitudes towards the use of ICT and their lack of the knowledge and skills in using ICT for teaching and learning process. This statement reinforces the study by Newby et al. (2000) which found that technical teachers do not use ICT in their teaching, even though they are given adequate facilities.

Face-to-face teaching is still relevant and seems a common practise. However, it is an added value if teachers are able to integrate ICT in their lesson. This in fact will enhance effectiveness in which teachers are still the most important players, as they are the ones who should know how to integrate ICT in the curriculum content (Konstantinos, Andreas, & Karakiza, 2013; Tezci, 2010). The lesson should be presented in such a way that learning would be fun, more attractive and effective through information management and integration with pedagogical competency and practice methodology. However, Dlodlo (2009) argues that information technology alone will not change anything without great operators and drivers (i.e., teachers) (Badri et al., 2013).

Teachers who regularly use the technologies will have extensive knowledge not only about the content of the subject but also on information and communication technology. Teaching with information and communication technology (ICT) such as the use of blogs, videos, websites, e-mail, etc. will reflect the maturity level of the educators, and level up students' appreciation as teachers are viewed as visionary, advanced and up to date (Owen et al., 2000; Sang et al., 2011). Teachers' competencies and their knowledge on how to access information via the Internet is also supported by the way they explore the applications through search engines. Lack of appropriate skills and knowledge will discourage teachers to use ICT and this will eventually cause desperate fall. Teachers need to get familiar with computers and keep on searching for information through the Internet multi resources. In the long run, they will naturally adapt with the latest technological developments through a variety of devices and networks. Siti Fatimah et al. (2005) argue that learning to apply ICT for data presentation such as a power point presentation, Prezi and graphics editor would be a form of improvements, as information is delivered in a more attractive and impressive mannner.

IECT2014

8. Contribution of the study

The primary finding of this study is that teachers' motivation is a mediator on their willingness to apply ICT in their teaching and learning. The study found that teachers' motivation is the most important factor in ICT readiness and there is a positive correlation between self-motivation and ICT readiness.In general, the result of the study can be used for developing and popularizing ICT usage at both school and higher education levels across diciplines. Findings of this study will also be valuable for both academics and practitioners of ICT in education. As technology readiness and adaptation process is positively correlated with the type of teacher's attitude and motivation towards new technology, hence, preparing and training teachers in this vein to embrace technology is of paramount importance which needs to be taken into account by stakholders. Furthermore, since the technology adoption process appreas to be qualitatively different for different technologies, in terms of complexity of application, hence, the stakholders and those in charge of ICT application in education need to take this issue into consideration.

As some related studies have been conducted in the other countries and have come up with almost similar results locally, for example, Iran (Keramati et al. 2011), the Emirats (Badri et al., 2013), and Greece (Konstantinos et al., 2013), it can be concluded that the issue is prevailing in developing countries. The solution for this issue is that the developing countries, which have the sufficient infrastructure and facilities to integrate ICT into the education system and curriculum, should take efforts to facilitate the introduction of ICT into the education system. To this end, they need to train and educate the teacher to be familiar with the benefits of ICT as well as learn how to employ it in the process of teaching and learning.

Furthermore, since teachers' attitudes and motivation play a key role in the willingness and readiness for ICT application, governments need to address this issue by facilitating the transition from traditional system of education to the modern system where ICT has a leadning part in education. More specifically, in addition to establishing the infrastructure and providing the necessary equipments, the governments should provide sufficient training for teachers. Thus, In addition to adding to the body of knowledge, this study lays the ground for longtitudinal study to delve into this area and unveil the issues and bariers of ICT usage in developing countries, since the issue of ICT readiness and adoption is a challenge specifically prevailing in the developing countries.

9. Implication, suggestion and conclusion

To effectively integrate technology into education, government should provide facilities to train teachers and advocate for technology's advantage to the teachers and students alike, and accordingly develope a positive attitude toward technology in the schools' teaching practices. In addition, feedback needs to be collected for the purpose of integrating technology continuously. Furthermore, the major problem is teacher's conception of ICT since teacher's attitude toward ICT is not appropriate. Therefore, it is important to first convince managers and second train teachers and elucidate and hihghlight benefits of this new paradigm for teachers.

As this study has demonstrated that teachers' motivation is a mediator on their willingness to apply ICT in their teaching and learning, this is very much associated with knowledge of ICT usage, so, teachers must be able to apply the knowledge to use ICT with their own information technology skills. Frequent use of the applications will in fact improve the skills and capability, which in the long run increase the application of ICT in teaching and learning. Sustainable efforts are required to improve the skills of using ICT. Therefore, the Ministry of Education needs to encourage all teachers especially by providing sufficient trainings and facilities for them to use ICT. Hence, such experiences can lead to more comfort, confidence, acceptance, and eventually development of a positive attitude toward ICT integration into curricula and teaching.

ABSTRACT
We designed a cross-disciplinary interdepartmental volunteer program, which involved student participation in "community care teams for the elderly living alone." Our aim was to enhance communication between students and the elderly. Students were expected to meet and learn to get along with the elderly, to develop listening and communication skills, and learn to cooperate with student participants in other services. Students were required to devote at least 14 hours per semester to this two-semester program. Between September 2008 and June 2009, 19 students (1st semester), 34 students (2nd semester), 7 students (both 1st and 2nd semesters), respectively, and 15 elderly participants became involved in the program. Students were divided into 15 groups (each with 2–4 students), and each group visited the assigned elderly person at least 6 times per semester. According to student accounts, these visits improved their interpersonal and communication skills and their ability to express concerns with self-confidence. Our analysis of students' reflections found that early exposure to such community experiences increases their capacity for self-reflection and teaches them how to show respect. The opportunity to develop empathic communication skills with the elderly and learn to cooperate with faculty and colleagues can be beneficial to students in their future medical practice and strengthen the quality of community care.

INTRODUCTION

Medical care reflects not only scientific knowledge, but also communications skills and desire to improve the quality of medical care. In clinical practice, doctors frequently miss opportunities to respond to patient emotions and to strengthen the patient-physician relationship (Avdi, Barson, & Rischin, 2008). Because of the brevity of doctor-patient interactions, it is difficult to establish trust (Rhodes et al., 2004; Klig, 2005).

Klig (2005) and Little (2002) both proposed that teaching medical humanism could improve the relationships between health care providers and patients and that health care providers could be trained to treat every patient humanely, and to be sensitive to patient values, culture, and ethnicity. Shapiro et al. (2009) suggested that periodic visits to members of the patient's family would increase a student's understanding of how the psychological, spiritual, or economic circumstances of patients impact the course of their diseases. Students would understand the true meaning of caring. Students would thus become more thoughtful medical professionals for the sake of their patients.

IETC 2014

The major goal of medical education should be improving the empathic communication skills of medical students (Avdi et al., 2008). In Afghani's study (Afghani, Besimanto, Amin, & Shapiro, 2011), 55% of responders (3rd and 4th year students) thought that empathy could be taught. Evans and colleagues reported that a consulting skills course could improve students' empathic behavior. In the study by Borges and Hartung (2007), 87% of students were inclined to volunteer their time to the indigent. Community service learning has been shown to increase communication skills. However, most previous studies on service learning were short term, and their findings were based on questionnaire surveys. One study revealed that 10-week service learning activities significantly increased medical and nursing students' overall knowledge of aging and their understanding of mental health needs in old age. However, the effect was not long-lasting (Leung et al., 2012). There has been little research on service learning over a longer period of time and using repeated exposure and feedback to sustain attitude change toward older adults.

Leung, Liu, Wang, and Chen (2007) commented that planned feedback as well as the opportunity to work with different people as a team are necessary for the program to succeed. Therefore, we developed a multidisciplinary service-learning program aiming to enhance the student caring experience through longer exposure to the community. In this program, students learned listening and communication skills during visits with elderly individuals living alone, and how to cooperate with students in other departments. This article describes the program's development and provides student feedback about this program.

THE STUDY

Fu-Dey Citizen House is located at the center of the capital Taipei. The residents were low-income, similarly aged elderly people who lived alone. Most were jobless and relied solely on low-income subsidies from the Taipei City Government. In addition, many residents were physically impaired, sick, handicapped, and facing the possibility of resettlement due to demolition of their homes. They were therefore afraid of leaving their familiar environment and uncertain of the future.

This community consisted of 3 three-story and 3 four-story buildings, and a house used as an activity center. Each household contained a bathroom, kitchen, and living room. The actual space available was very limited, accounting 216 square feet per room. The average age of residents was 80.4 ± 11.2 years for males and 67.8 ± 16.0 years for females.

Taipei Medical University is located in the municipal area of the capital city, and offers caring experience courses intended to preserve community health and teach students how to serve and communicate with the elderly. The service learning courses were given to first-year students of our university. Two semesters per year were offered as an optional non-credit course. The curriculum was free and open to all students, but at least 14 hours of service per semester were required to pass the course.

The course was tutored by two teachers (SHY, WPC) and two teaching assistants (CHL, HTP) with service experience. Between September 2008 and June 2009, a total of 26 and 41 students attending nine different schools were assigned to community care teams for the first and second semesters, respectively. Students were from departments of Medicine (1st semester, 4; 2nd semester, 10), Dentistry (2, 6), Pharmacy (2, 2), Medical Technology (2, 3), Health Care and Nutrition (3, 12), Public Health (3, 3), Hospital Management (6, 0), Nursing (1, 4), and Nursing & Health Care for the Elderly (3, 1). Of these participants, 7 students completed two semesters of the course.

Four social workers selected the family services provided to residents of the Fu-Dey Citizen House. Initially, the elderly of 384 households were screened based on their service needs, compliance with a set of criteria, and absence of mental illness. Finally, a total of 8 men and 7 women (15 households) were chosen to participate for 2 semesters.

On the first day of the 1st semester, the community health center staff held a one-day garden party to introduce students to all residents of the 384 households, increase their familiarity with one another, and allay feelings of strangeness and fear. In addition to the students enrolled in caring experience courses, 120 second-year medical students joined and participated the garden party day. Activities covered the basic health check, depression scales assessment, and health education to prevent falls and address nutrition concerns.

IECT 2014

After the garden party day, each group of students (2–4 people per group) was assigned one elderly person. At least 6 visits per semester to the same venue and regular scheduling of service were required to complete the course. The services selected were decided during the first home visit after the needs of the clients were determined. Needs were roughly divided into static and dynamic services. Static services included chess playing, newspaper reading, and information (current photos and data on the hometowns of the elderly) sharing. The dynamic services included assistance with climbing stairs, showering, and walking. In addition, students provided the elderly with the experience of warmth by giving cards and small gifts to them at certain festivals in particular. If the students could not visit the elderly regularly, they would mail their cards instead.

Students were accompanied by their teachers on the first and second home visits and were unaccompanied on follow-up visits. In addition to providing conversation, the students documented the life stories of the elderly after receiving their consents.

Before the first visit, the teacher briefed students on the basic characteristics of the community and clients to be served, to eliminate the tension and to familiarize students with the curriculum support system.

After the first home visit, each student (by completing the "Table of Learning Program Experiences") summarized the background data collected from the elderly subjects, the plans for future learning experiences, and the expected outcome of that experience.

On subsequent visits, students chatted with the elderly, so that they would have someone to talk to. Information gained from these visits was recorded in the "Learning Log", including the dates of each visit and the names of the families visited (Part I) and observations, feelings, reflections, changes, etc. (Part II).

The students met to share experiences after the end of the course, and express their opinion on the services offered the elderly during the semester. Furthermore, the students submitted final reports describing their impressions of the services they provided, the difficulties they encountered, the solutions to problems, event-related growth and change, service-related issues, ways to improve the course, and insights into future volunteer service.

The learning support system included contact links between teachers and students by phone and via online social networking. Teachers and students engaged in interactive discussions before, during, and after the courses, to ascertain the student's level of progress and need for help to deal with problems or difficulties.

Students' reflections were qualitatively analyzed. Representative feedback was quoted when we thought it was relevant to the goal of the project (Côté & Turgeon, 2005). A non-quantitative process was used to interpret and conceptualize the original data. Statements with similar meanings were merged into one category and the number of people expressing the same thought was noted. The datasets were based on the classification of student skills into communications and interpersonal skills, decision-making and critical thinking skills, processing and self-management capabilities (Taiwan Health Promoting School, 2012). (Table 1)

Table 1: The Hypothetical Variables of "Skill-based Life Health Education"

Communications and interpersonal skills	Decision-making and critical thinking skills	Processing and self-management capabilities
Interpersonal skills Negotiations and rejection capabilities Understanding the feelings of others Cooperation and team work Advocacy capabilities	Decision making and problem solving skills Critical thinking skills	Ability to increase self confidence, self discipline, and take responsibility, influence, or promote change Ability to control ones' emotions Ability to control ones' emotions and anti-stress

Modified from "Taiwan Health Promoting School" (2012)

FİNDİNGS

Interviews of elderly clients by students elicited the following information.

For example, as quoted from the records of Student A5, "At first I did not know what to talk about, but finally I felt encouraged to speak with him, and the dialogue eventually seemed to become more natural. This was very encouraging to someone like myself who had always been at a loss for words."

As quoted from the records of Student A4 commenting on interpersonal skills: "The elderly are actually very eager to be taken care of, and we should be more active in looking after them."

As quoted from the records of Student B5 commenting on understanding the feelings of others: "Caring means knowing when someone needs to be cared for. It is a matter of give and take, and it can not be achieved unilaterally" (spirit of serving). However, the ability to negotiate and reject was not significantly improved because most of the time students are listening and so they are unable to make recommendations except at a superficial level. Students could raise issues and comment on them, but they could not troubleshoot them. Student A6 provided an example: "Social change has led to increased numbers of single people and double-income-no-kids families. Thus the number of vulnerable families and vulnerable elderly has increased. More volunteers devoted to caring are highly encouraged" (advocacy capabilities).

From observations during their period of service, students were able to comment or raise issues bearing on the care and environment of the elderly. For example, "I found that many elderly people have serious hearing impairments, so that we must speak loudly and slowly."--Student B22.

An example of focus on issues of the elderly: "The actions of students can be more focused on community care by encouraging more participation and meaningful community service activities."--Student B29.

An example of focus on current environmental issues: "Recruiting young students to establish social service teams in order to regularly help with clean-up work."--Student C3.

An example of raising issues of current service, not just silently receiving service: “Listen to what the elderly say, and find practical ways to help them, other than ways that we think subjectively are ideal and feasible."--Student B15.

"One day we will finish the course and never visit uncle Chen again. What will he think of us then?! What will the other elderly not served by us think of us then?!"--Student C4.

Students who provided more substantial feedback indicated that the service learning program helped enhance their confidence, ability to handle issues and take responsibility, and self-management skills. Through visits, students overcame communication barriers with others, addressed the concerns of others appropriately, identified personal strengths and weaknesses, and recognized self-value.

For example: "I’ve learned how to express other peoples' concerns, how to initiate conversation and chat with people."--Student B9. "Service not only helped others, but also enabled us to gain experience, adopt new attitudes, and find practical ways to resolve problems."--Student A11. "Participation in social service activities will greatly influence our future service as doctors and nurses. Only by providing service at basic levels, can we become good doctors in the future!”--Student B19.

Students learned that it was sometimes necessary to provide services under poor hygienic conditions. Controlling emotions and stress in such circumstances was a challenge. For example: "Some old people were incontinent, and they were unable to get rid of the flies attracted to their faces and feet. I need to learn to accept such a situation which I would never have tolerated before."--Student C5.

The feedback from our students can enhance future service learning as summarized below.

An excellent medical staff needs to be knowledgeable and needs to have good communication skills. Our

IETC 2014

students will be members of future health care teams. Though their backgrounds, abilities, and attitudes currently vary and their social class and environment may differ from those of their elderly clients, students find through service learning courses and listening that the elderly are not that difficult to get along with.

During service-learning courses, students discover their shortcomings and identify issues. "I used to think that the elderly at home were annoying, but now I can adapt and take the initiative to care for the people around me, especially the elderly at home. Caring must be self-initiated, through empathy for the feelings of the elderly, changing one's attitude for the sake of the elderly, and learning how to care for them."

Having learned how to think and see things from different perspectives, students then thought about "how to improve the health of the elderly", "whether visits to provide services would disturb the elderly", "what aspects of life would be changed for elderly who received visits and those who did not at the end of the course", etc. Thus the attitudes of students toward the elderly were improved.

During the service learning period, students gained greater respect for service, the efforts made by their teachers, the importance of the community of volunteers, and the hard work of enthusiastic volunteers.

Students learned that there were community elderly in need of care, identified the social problems, and learned that basic education, concepts, and work improved these problems. Vulnerable groups need love in addition to material support. Learning to help the elderly living alone, students become more confident in their ability to provide care. Service learning enhanced empathy, self-satisfaction, and knowledge of how to care for vulnerable people and how to communicate with others. Service learning is expected through the process of sharing to reduce future occurrence of medical malpractice.

CONCLUSİONS

Traditional medical education including classroom teaching and internship training cannot meet the needs of those with chronic diseases, especially the elderly (Shapiro et al., 2009). More and more scholars have recommended exposing students to real patients as early as possible during training (Shapiro et al., 2009; Borges & Hartung, 2007). In Shapiro's study (2009), students taking the course "long-term community care" noted that the elderly were in fact their teachers. Second-year medical students visited chronically ill patients on average of 4.4 times during eight months. The course was highly rated by students for its impact on enhancing their appreciation for patient-centered care, improving their knowledge of community resources, and improving their understanding of the roles of allied health professionals. In Borges' study (2007), first-year medical students spent six hours helping to prepare and serve food to clients at community-based agencies. Most students endorsed volunteering their time to assist the indigent. Our project involved more students and longer and repeated home visits (at least six times or 14 hours per semester). Through direct experience, students can learn and improve communications and interpersonal skills, decision-making and critical thinking skills, and processing and self-management capabilities.

The American Association of Medical Colleges includes altruism, compassion and empathy, trust and honesty among the qualifications of twenty-first century physicians. Effective communication increases the level of satisfaction of both doctors and patients, supports the treatment program, and facilitates the making of more appropriate medical and policy decisions. Service courses teach students to pay attention to the cultural and ethnic background sensitivities of their patients (Klig, 2005). Crandall and Marion (2009) believe that use of effective communication tools and multiple opportunities to practice these skills paired with constructive feedback provided by educators will preserve and enhance student attitudes. In our project, students were able to overcome the language barrier, identify subjects of conversation, and reduce the barrier to student-elderly interaction by being willing to listen.

Though negative attitudes toward medically underserved patients have declined (Crandall & Marion, 2009; Chen, Lew, Hershman, & Orlander, 2007), empathy level was reported to be highest in first-year students but lower by the end of internship and throughout residency (Chen et al., 2007). The attitudes of students in traditional or problem-based learning curricula become increasingly negative over the four-year period of study (Prince et al., 2000; Seabrook, 2004) and are not influenced by the preclinical curriculum. A lack of attending and resident role models and time pressure were described as major barriers to

IECT 2014

empathy (Afghani et al., 2011).

The present study has a few limitations. The reflections of students who visited elderly living alone program were self-reported. Similar to other studies (Leung et al., 2007), our study found it difficult to determine 'real' feedback outcome even by objective assessment. Long-term outcomes are often difficult to obtain. Further research on community service volunteerism before college admission may predict a change in social attitudes. Such an achievement requires proper supervision and guidance.

Through experiencing, students learned to recognize the differences between the living environment of others and their own living environment, view things from a new perspective, communicate with others, and then change themselves. Experiencing also improved doctor-patient communication and increased the student's capacity for empathy, ensuring that students will look forward to their future as medical practitioners.

Acknowledgements

The authors wish to thank the social workers at Fu-Dey Citizen House for helping us to make the service learning program a success. This study was funded in part by the Joint Research Grant (98TMU-WFH-14) from Wan Fang Hospital and Taipei Medical University.

Setting a global mindset for future entrepreneurs: the share of bulacan state university as an academic institution

Dr. Gualberto A. Magdaraog Jr.94
Bulacan State University, Malolos City,3000, Philippines

Abstract

As an academic institution that provides opportunity both for future managers and entrepreneurs and the builders of entrepreneurial foundations as well as molders of competitive skills, this research study aims to presents the share of the College of Business Administration faculty and experience of students on how to develop a global mindset among the students. Global mindset is the ability of someone to influence individuals, groups, organizations, and systems that are unlike him/her (Javidan, 2007). This study covers the graduating business and entrepreneurs students for the academic year 2013-2014. A mixture of qualitative and quantitative technique in data gathering was utilized to determine and assess the perception of the respondents in the development of global mindset. The results revealed that the institution provides the students an adequate avenue to think creatively and responds to ideas quickly which is a psychological factor in setting the minds globally of the students. Also, by allowing a quite number of foreign students to mingle with local students, the study reveals that the institution provide the students an opportunity to learn and observe the actual practices and behavior of people from other countries. As such, this study provides inputs to further develop the curriculum and projects for the programs to strengthen the share of the institution in developing a global mindset to the students.

Keywords: Global, Mindset, Entrepreneurs, Students, Development, Inlfuence

.

1 Introduction

More than ever before in history, the effects of globalization are being experienced around the world. The interconnectedness and interdependency of cultures is felt within and between the organizations, cultures, and societies of the world. That's why today's changing global competitive landscape has created a need for managers to develop a global mindset. Whether you are a senior business leader or an Olympic athlete, the key to success is a winning mindset (Smith ,1999). This term, along with the alternative, "positive mental attitude", are, unfortunately, often viewed as meaningless business jargon. However, it is true that battles are won and lost in people's heads long before they are fought. Our thoughts dictate our moods, our emotions, our body language and, ultimately, our ability to perform. Ensuring the way you approach a challenge mentally is correct is the key to success. What most people forget is that thoughts are not random; we can learn to control them to ensure that we always perform with an aura of self-belief. The world's top business leaders have a strong connection with their inner thoughts and train them, as an athlete would train a muscle, to make them work in their favors.

IETC 2014

Business schools and universities are currently facing a number of challenges. Their missions and strategies must change and adapt to reflect changes in the educational and business environments. Over the next decade or so, all businesses must face and deal with a number of interrelated forces: demographics, technology, and sustainability not only the impact on each other, but they are the fundamental drivers of globalization. Indeed, each of these forces interact and influence each other in a complex brew specific to each country, industry, and business. Whether we like it or not, globalization is here to stay; and most likely will even expand its reach and influence. How should higher education prepare students to be prepared in this era of increasingly rapid change?

2. Research objectives

This study aims to determine how the College of Business Administration of Bulacan State University develops a global mindset among its students as future entrepreneurs. Specifically, the study sought to reveal the following objectives.

1. Developed attitudes and social experiences that add to global mindset as perceived by the student-respondents;
2. Importance of attitudes and social experiences that add to global mindset as a future manager as perceived by the student-respondents;
3. Experiences of faculty members that contribute to the development of global mindset among the students.

3. Methodology

This study was conducted in the College of Business Administration of the Bulacan State University, Philippines involving graduating students and selected faculty members. Survey method was utilized to quantitatively describe specific aspect of a given population. (Kraemer, 1991). The survey is used to gather data on the student's perception about global mindset and its importance. An online questionnaire using Google documents was sent to their email if they were unavailable to answer the printed survey questionnaire. Faculty members teaching entrepreneurial subjects to students from different courses expected to contribute in the development of global mindset among the students, were interviewed individually. In some cases, an unscheduled focused group interview were conducted to gather the about the experiences of faculty members that they can share among their students that they believed to be contributory in developing a global mindset.

4. Research instruments

The instruments used in this research were; a printed and online self-constructed survey questionnaire, and a semi-structured interview questions. The self-constructed survey questionnaire was used to gather data related to the factors that add to the development of global mindset as perceived by the student-respondents and its importance as a future manager. This is a multiple choice and likert scale survey questionnaire sent to the student via Google documents or personally during their breaks. The questionnaire was answered in minimum time duration of about 3 to 5 minutes.

The semi-structured interview questions were used during one-on-one interview and focused group discussion with the faculty. This is to gather information on the experiences of the faculty in the different phases of professional career that believe to be contributory of developing a global mindset among the students.

5. Results and discussion

IECT-2014

5.1. Developed attitudes and social experiences that add to global mindset

Factors related to the development of global mindset involves both psychological and social. Psychological factors relates to individual's setting of positive attitude that builds enthusiasm despite presence of differences in culture, belief and practices. This is related to the ability of the mind to set flexibility and adaptability on situation or condition that is different from expected. Social factors are experiences of students within the campus that perceived to be contributory in developing of global thinking. Table 1 reveals that the students generally believe that they were able to think creatively and respond to a new idea quickly, enjoy browsing websites and information about other countries and excited to explore new environment or workplace. Under social factors, most of the student respondent were able to experience to mingle with other people with different foreign and local culture, second was able to observe different people's value system and reasoning based on the teachings and experience of their culture and lastly having an opportunity to meet business people from different places locally and internationally.

Table 1. Developed Attitude and Social Experience that Add to Global Mindset as Perceived by the Students

Psychological assessment factors	F	Rank
Enjoy browsing websites and information about other countries.	64	2
Excited to explore new environment or workplace.	60	3
Think creatively and respond to new ideas quickly.		
Have tolerance to take work under pressure.	74	1
	48	
Social assessment factors		
Were able to mingle with other people with different foreign and local culture.	75	1
Experience ease with starting conversation with a foreign people.	43	
Have a network of people from different discipline and to some extent other countries.	27	
Able to observe different people's value system and reasoning based on the teachings and experience of their culture.	69	2
Have an opportunity to meet business people from different places locally and internationally.	62	3

IETC 2014

The data revealed that on the psychological level, the College of Business Administration were able to provide within the program a sense of awakening of the minds of the students. They were given an opportunity to think creatively and be able to not just simply look into the situation within their reach, but to look into the situation globally, considering the situation around the world. One specific example of which is when students are ask to research on topics such as economics, finance, business opportunities, and even as simple as a corporate name or product name, they would always look for what is it in the news, what is happening around the globe, what are the international laws covering such topics, what is trending in the internet. They show high enthusiasm to explore the internet and view what is outside of what they see daily. In one of their subject in the program, International Business for management students and New Market Development in Entrepreneurship, students were very active in researching and discussing issues on foreign markets, international trade relations, and the ASEAN integration. As a result, there were student researches that focused on topics relative to effects of foreign laws, regulations, and integra-

tions. In line with these global mindsets of the students, the College of Business Administration were able to send interested students to participate in foreign trips in other countries such as Beijing, sponsored by the Confucius Institute; Singapore and USA, coordinated by the Public Employment Service Office, and other Asian countries coordinated by the Office of External Affairs.

5.2. Importance of attitudes and social experiences that add to global mindset

The follow up objective of this study is to determine the level of importance of the above developed attitudes and social experiences of the students in the development of global mindset. This is to set the areas for improvement or strengthening of the attitudes and experiences of the students. Table 2 shows that creative thinking and be able to respond quickly to new ideas is very important attitudes in developing a global mindset. As to social experience, students perceived that it is important to have an opportunity to mingle with other people with different foreign and local culture.

Table 2. Importance of Attitudes and Social Experiences that add to Global Mindset

Psychological assessment factors	F	Verbal interpretation	Rank
Enjoy browsing websites and information about other countries.	3.73	Highly Important	3
Excited to explore new environment or workplace.	3.82	Highly Important	2
Think creatively and respond to new ideas quickly.	3.87	Highly Important	1
Have tolerance to take work under pressure.	3.52	Highly Important	
Social assessment factors			
Were able to mingle with other people with different foreign and local culture.	4	Highly Important	1
Experience ease with starting conversation with a foreign people.	3.46	Moderate Important	3
Have a network of people from different discipline and to some extent other countries.	3.19	Moderate Important	
Able to observe different people's value system and reasoning based on the teachings and experience of their culture.	3.88	Highly Important	2
Have an opportunity to meet business people from different places locally and internationally.	3.44	Moderate Important	

The table shows that students gives high importance to activities that allow them to think creatively and requires them to explore new environment. This is manifested by the number of students who actually join educational field trips, quiz bee competition, debates, students conventions, youth assemblies that involved competition using limited resources and skillful thinking. Table below show that number of students participation in different activities involving creative thinking conducted in other places for lst Semester of 2013.

Table 3. Participation of Bulacan State University to various activity.

IETC 2014

Activity	Number of Student Participant	Venue
International Business Management Conference	45	Manila
Retreat and Team Building Activity	200	Quezon Province
CBA Educational Field Trip	987	Camarines Sur
Go Negosyo	120	World Trade Center Manila
Accounting Quiz Bee	20	Bulacan
Mid Year Accounting Convention	65	Baguio City
Student Business Registration	36	Bulacan
Overseas Training	4	USA, Singapore

Experiences of faculty members that contribute to the development of global mindset

Faculty members share their actual life story of success as an entrepreneur through video presentation supplemented by classroom discussion of life challenges and how they were able to surpass it by thinking differently and innovatively. This involved giving attention to quality of outputs and services that leads to recognition from one place to another, and eventually to a larger market.

Faculty member experiences and opportunity to travel from different countries allows a wider learning of different cultures, tradition and practices related to the conduct of business. This allows them to motivate and inspire students to think globally and encourage them to grab all possible opportunity to travel from different countries as well.

Faculty members keep themselves updated to global issues and trends related to marketing, technologies and business strategies by attending international seminars and symposia, workshop and conferences. Faculty members keep themselves connected to industry related professional organizations and networks to able to gain exchange of ideas and experiences of other successful entrepreneurs.

6. Recommendation

Based on the above findings, the school may strengthen the development of global mindset by promoting activities that encourage creative thinking among students. Establishing trade fairs conducted by students will provide them challenges to think of new, innovative and unique business that is expected to get the buyer's attention.

For social aspects, the College may provide the students a test scenario on how the students will react together with other people from different cultures by inviting foreign students in a social gathering together with business people and allow them to communicate freely and be able to observe and understand different cultures of the guest.

In addition, programs like foreign language communication will help students to develop a global mindset. The Institution may consider offering other languages such as French, Nihonggo, Korean and Spanish. In this case, communicating and socializing with other nations will not be a hindrance for the students to be globally competitive. Other suggested activities that help develop global mindset that can also be implemented in the Bulacan State University College of Business Administration are as follows.

- Cultural Partner Program
- Globalization Seminars
- International Awareness Week
- International Coffee and Tea Hour
- International Education Week

IETC 2014

- Language and International Trade Conference
- Member of International Club
- Study Abroad Fair

To date, the College of Business Administration continues to provide the students an opportunity of internship program to other countries thru participation and membership to international and national networks of business industry. The College of Business Administration also send students delegates to join international youth camp, symposium, workshops and educational field trips to abroad to actually influence and expose them to the global arena where they will be field after graduation.

Share of structural engineering in curricula of CTU vs. selected European faculties of architecture

Ing.Marketa Vavruskova[1,a], Ing.Martin Pospisil, PhD.[1,b]
[a] *vavrumar@fa.cvut.cz*
[b] *martin.pospisil@fa.cvut.cz*

[1] *Czech Technical University in Prague, Faculty of Architecture, Department of Load-Bearing Structures, Thakurova 9, Praha 6, 166 34, Czech Republic*

Abstract

Objectives

Comparison of percentual share of Structural Engineering in curricula of Czech Technical University with 27 leading European German (15) and English (12) speaking universities.

Results

Bachelor curricula:

35%	leading British universities, Architectural Engineering combined courses
10-15%	English speaking European universities
15-25%	German speaking European universities

Master curricula:

Up to 5%	majority architectural courses
Up to 45%	universities offering further specialization in Structural Engineering

Conclusions

With 8.33% share in bachelor studies, Structural Engineering subjects at the Faculty of Architecture, Czech Technical University in Prague, seem to be underrepresented in context of European universities, where the share ranges between 10-25%.

Keywords: structural mechanics education, structural mechanics for architects, structural engineering architectural curricula

IETC 2014

1. Introduction

The subject is being researched for the use of Faculty of Architecture at the Czech Technical University in Prague (CTU). In the introductory analysys (Vavruskova, Pospisil, 2013), percentual share of Structural Engineering subjects in curricula at CTU was compared to two leading German speaking universities (TUM Munich, Germany, ETH Zurich, Switzerland) and two leading English speaking universities (University of Bath, United Kingdom, Imperial College London, United Kingdom).

Structural Engineering is an essential subject in Architecture courses in European universities, but its share on curricula varies according to the type of course as well as type of university. There are currently two main types of architectural courses: Architectural Engineering and Architectural Design.

Architectural Engineering is predominantly offered by faculties of Civil Engineering, which put more emphasis on technical subjects. Architectural Design, mostly offered by faculties of Architecture, is more artistically orientated. Following courses were taken into account whilst comparing the amount of Structural Engineering in curricula: Structural Mechanics, Statics, Concrete Structures, Steel Structures, Wooden Structures and Foundations.

For bachelor Architectural Design courses, the study showed relatively high percentage of Structural Engineering subjects in curricula at the German speaking universities (12.5 % - 13.5 %) in comparison with other European universities (4% - 9 %). To find out whether German speaking universities have bigger volume of Structural Engineering in general, following study has been carried out.

10.1. Selection of universities

Fig.1 Map of selected universities

For the comparison with Czech Technical University in Prague, 27 leading European German (15) and English (12) speaking universities have been selected in accordance with rankings listed at the end of this article.

List of the selected universities as shown on the map:

English speaking universities – England, United Kingdom

1. UB University of Bath, England
2. UC University of Cambridge, England
3. WSA Welsh School of Architecture, University of Cardiff, England
4. UL University of Liverpool, England
5. UCL University College of London, England
6. NCL Newcastle University, England
7. NTU University of Nottingham, England
8. SSoA School of Architecture, University of Sheffield, England

English speaking universities – Ireland

9. UCC University College Cork, Ireland
10. UCD University College Dublin, Ireland

English speaking universities – Scotland, United Kingdom

11. UE University of Edinburgh, Scotland
12. UG University of Glasgow, Scotland

German speaking universities – Germany

13. RWTH RWTH Aachen
14. TUB Technical University of Berlin
15. AHS Alanus University, Bonn
16. TUD Technical University of Dresden
17. FH FFM Frankfurt University of Applied Sciences
18. HCU Hafen City University, Hamburg
19. LUH Leibniz University of Hannover
20. TUM Technical University of Munich
21. ABK ABK Stuttgart
22. TUS Technical University of Stuttgart
23. BUW Bauhaus University Weimar

German speaking universities – Austria

24. TUG Technical University of Graz
25. KUL University of Art and Design Linz
26. TUW Technical University of Wien

German speaking universities – Switzerland

27. ETH Technical University of Zurich, Switzerland

University conducting the study – Czech Republic

28. CTU Czech Technical University in Prague, Czech Republic

10.2. Selection of courses

For the purpose of this study, only Architectural Design and Architectural Engineering courses have been selected as in courses with specialization in Landscape, Urban Design etc. amount of Structural Engineering is negligible. However, only a few universities offer Architectural Engineering courses, as seen on the chart bellow.

10.3. ECTS standard

Most of the above listed universities support ECTS (European Credits Transfer and Accumulation System), which has been used as an objective quantity indicator. It represents a standard for comparing the study attainment and performance of students of higher education across the European Union and other

IETC 2014

collaborating European countries. For successfully completed studies ECTS credits are awarded. One academic year corresponds to 60 ECTS credits that are equivalent to 1500-1800 hours of study in all countries. For universities which do not support ECTS, the share of a particular subject in curricula was recalculated to comply with ECTS.

2. Structural engineering as a proportion of curricula

2.1 Bachelor courses:

- **Length of bachelor architectural courses**. Bachelor architectural courses at most universities from our sample take three years. The exceptions, where such courses take four years, include for example Technical University of Stuttgart and Alanus University of Bonn. The Scottish universities, University of Edinburgh and University of Glasgow, also have four-year bachelor studies, but they have one year shorter architectural masters studies. University of Bath has a three-year Architectural Engineering course followed by one-year professional placement.

- **Share of Structural Engineering in bachelor architectural curricula**. Overall share of Structural Engineering in bachelor architectural curricula ranges between 5-42% within our sample.

- **Architectural Design vs. Architectural Engineering courses**. Most architectural courses are offered as Architectural Design. Architectural Engineering courses are offered only at three universities from our sample, The Czech Technical University, University of Bath and University of Glasgow. Interestingly, share of Structural Engineering in bachelor curricula does not differ significantly between Architectural Engineering and Architectural Design courses, typically ranging between 15-35%.

- **Combined courses of Structural Engineering and Architecture**. Two universities from our sample, University of Edinburgh and University College of Dublin, also offer combined courses of Structural Engineering and Architecture. Share of Structural Engineering in curricula of such bachelor courses ranges between 35-39%.

- **German vs. English speaking universities**. In general, Structural Engineering represents higher share of architectural bachelor curricula at German-speaking European universities (Germany, Austria, Switzerland) vs. English-speaking European universities. Such share ranges between 15-25% for the former compared with 10-15% for the latter.

- **Share of Structural Engineering in bachelor architectural curricula vs. ratings of universities**. While, as explained above, the overall share of Structural Engineering in curricula of bachelor architectural courses is generally higher in German-speaking European universities vs. English-speaking European universities, two British universities represent an exception. Architectural bachelor curricula at University of Cambridge and University College in London have 38% and 42% share of Structural Engineering, which is among the highest from our sample. We also note that these two universities belong to the top rated British and European universities.

- **Share of Structural Engineering in bachelor architectural curricula at The Czech Technical University**. Structural Engineering represents only 8% of the bachelor architectural curricula at the Czech Technical University, which is among the lowest within the context of our European sample, where such share typically ranges between 10-25%. This share is for example approximately 80% lower compared to the leading UK universities and 45-67% lower compared to German-speaking universities from our sample.

IETC 2014

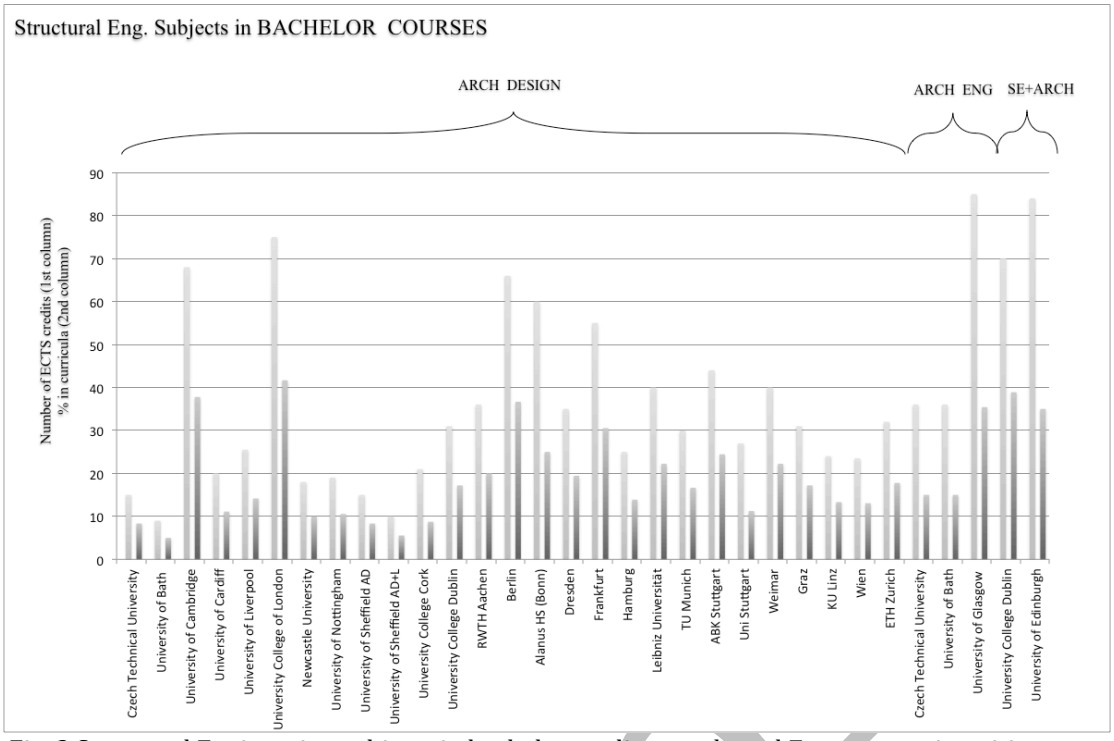

Fig. 2 Structural Engineering subjects in bachelor studies at selected European universities

2.2 Master courses:

- **Length of master architectural courses**. Master architectural courses at most universities from our sample take two years, following three-year (exceptionally four-year) bachelor courses. As mentioned about the two Scottish universities, University of Edinburgh and University of Glasgow, offer four-year bachelor courses followed by one-year master courses. University College of Cork, Ireland, offers bachelor, but no master courses in architecture.

- **Share of Structural Engineering in master architectural curricula**. The share of Structural Engineering on Architectural Design curricula is significantly lower compared to that for bachelor curricula in our sample of universities, usually below 5%. Three German universities, FH Frankfurt, LU Hanover and HCU Hamburg, represent an exception with such share in a range of 12-29%.

- **Architectural Design vs. Architectural Engineering courses**. As mentioned above, Architectural Engineering courses are offered only at three universities from our sample, The Czech Technical University, University of Bath and University of Glasgow. Share of Structural Engineering in Architectural Engineering master curricula ranges between 4-42%.

- **Architectural master courses with specialization on Structural Engineering**. Some universities offer further specialization on Structural Engineering as part of their architectural master courses. These include for example TU Berlin, HCU Hamburg, TU Stuttgart, BU Weimar, KU Linz and TU Vienna. This specialization boosts the share of Structural Engineering on architectural master curricula to 10-45%.

- **Combined courses of Structural Engineering and Architecture**. As mentioned above, two universities from our sample, University of Edinburgh and University of Glasgow, also offer combined courses of Structural Engineering and Architecture. Share of Structural Engineering on curricula of such master courses is around 42%.

- **Masters-only architectural courses**. Some architectural courses are available as master only and they

take four years. These include Architectural Engineering at the University of Bath and Architecture Courses at Sheffield University. Share of Structural Engineering on curricula of such courses ranges between 27-37%.

- **Share of Structural Engineering in architectural master curricula at The Czech Technical University**. Architectural Design master courses at The Czech Technical University have no Structural Engineering in their curricula, similarly to approximately two thirds of universities from our sample. Curricula of the Architectural Engineering master courses provided by the Faculty of Civil Engineering at The Czech Technical University contain approximately 4-5% of Structural Engineering. This share is considerably lower compared to European alternatives such as combined courses of Structural Engineering and Architecture or Architectural Design with specialization on Structural Engineering.

Additional notes:

- There were no specific data on curricula available for master architectural courses at the following universities from our selection: University of Cambridge, University College of Dublin, TU Dresden.

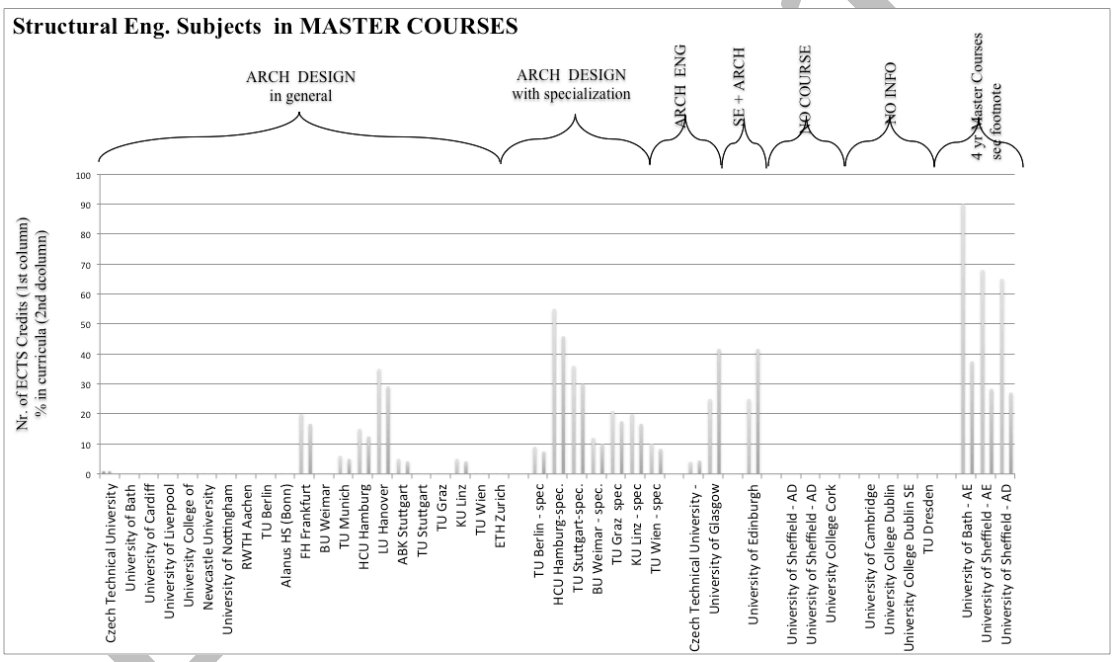

Fig. 3 Structural Engineering subjects in master studies at selected European universities

3. Conclusions

Structural Engineering appears to be an important part of architectural curricula at all European universities, especially for the bachelor courses. That said share of Structural Engineering on architectural curricula varies considerably among the analyzed universities, ranging between 5-42% in bachelor courses and 0-45% in master courses. This among others depends on whether the courses are offered as 'pure' Architectural Design on one hand or Architectural Engineering (possibly Architectural Design with specialization on Structural Engineering) on the other.

German-speaking and the best UK universities tend to have higher than average share of Structural Engineering on their architectural curricula. In bachelor studies, Structural Engineering represents around 35% of curricula at leading British universities and at architectural engineering combined courses. Most English-speaking European universities have 10-15% of Structural Engineering in their curricula. German speaking European universities (Germany, Austria, Switzerland) show overall higher volume of Structural Engineering in their courses, which varies between 15-25%. For majority master architectural courses, Structural Engineering subjects represent up to 5% of curricula. Some universities offer further specialization in Structural Engineering, which boosts share of Structural Engineering subjects in their curricula to 10-45%

Finally, with 8.33% share in bachelor studies, Structural Engineering subjects at the Faculty of Architecture, Czech Technical University in Prague, seem to be underrepresented in context of the above-mentioned European universities, where such share most typically ranges between 10-25%. Share of Structural Engineering on architectural curricula at The Czech Technical University is also low in curricula of the Architectural Engineering bachelors and master courses provided by the Faculty of Civil Engineering in comparison with similar European Architectural Engineering or Architectural Design courses with specialization on Structural Engineering.

We plan to further broaden our sample to non-English or non-German speaking European universities (e.g. Spanish, French, north European universities) as well as to study more detailed content of the courses and their possible interconnections with other technical subjects.

Simulation in the elimination of conceptual problems related to the issue of nerve conduction

Pınar Köseoğlu[a], Akın Efendioğlu[b],95

[a]*Department of Secondary Science and Mathematics Education, Hacettepe University, Ankara, Turkey*
[b]*Department of Primary Education, Cukurova University, Adana, Turkeyi*

Abstract

The issue of nervous system, one of the subjects of biology, is difficult and abstract to understand, and is inherently capable of causing misconceptions. Conducting a class allocated to the subject matter by employing effective teaching methods and techniques is, therefore, very important for fully understanding the subject and for eliminating such conceptual mistakes. Information and communication technologies are frequently used in biology education in order to form effective learning environments. In this way, problems which cannot be resolved through traditional methods of teaching can be overcome. This research aims at determining the effects of teaching through simulation- which has been performed in relation to the topic of nerve conduction- on concept teaching and on eliminating the misconceptions. The study group for the research was composed of 25 third year students attending the Biology Education Department of Hacettepe University Faculty of Education. In consequence, it was observed that the misconceptions carried by the students were removed thanks to classes taught through the simulation.

Keywords: Nervous system; teaching through simulation; misconception

IETC 2014

1. Introduction

The role played by qualified teachers is extremely important in creating the manpower necessitated by the epoch and in raising the quality in education. For a developed society, teachers need to have adequate technological, pedagogical and field knowledge, and to follow technological developments. In terms of teachers' efficacy, Shulman (1987) divided the knowledge that teachers should carry into seven categories; namely, (a) field knowledge, (b) pedagogical field knowledge, (c) knowledge of curriculum including materials and the programme, (d) pedagogical knowledge including knowledge of classroom management and organisation, (e) knowledge of learners and their characteristics, (f) knowledge of the educational environment and the circumstance of it, (g) knowledge of educational objectives, targets and values and of the philosophical and historical foundations of them. The first two of the categories are evaluated as the efficacies of the special field. According to Shulman, field knowledge is composed of teachers' knowledge of the concepts and phenomena in their field; and pedagogical field knowledge consists of the ways of representing and formulating to make a subject comprehensible to others. For effective teaching, teachers must have sufficient field knowledge and be able to transfer the knowledge into learners efficiently. Hence, in order to be able to perform an effective biology teaching, firm knowledge of biology and skills to effectively present the topics of biology are necessary.

E-mail address: koseoglup@gmail.com

Information technologies are expected to be integrated into the process by both teachers and learners in the teaching and learning of biology. Students cannot learn the topics deeply and meaningfully without technological devices, especially in the case of complex science topics. Besides, technological devices can help learners by establishing the models in their minds with animations (Ainsworth and VanLabeke, 2004; Boucheix and Schneider, 2009; Mayer and Moreno, 2002). Multimedia animations as a technological device bring the microscopic concepts and topics into the macroscopic level, and can provide learners with better learning environments; and thus they can raise the quality of learning (Dalacosta, Kamariotaki-Paparrigopoulou, Palyvos and Spyrellis, 2009; Özmen, 2011).

Due to the general content of the topics, terms of Latin origin, and the complex associations between topics; many topics in the high school biology curriculum are considered to be difficult by students. The topic of Nervous System is also one of the topics difficult to comprehend, and by its nature, it causes misconceptions because of the abstract concepts available (Lazarowits and Penso, 1992; Bahar, Johnstone and Hansell, 1999; Tekkaya, Çapa and Yılmaz, 2000; Tekkaya, Özkan and Sungur, 2001). For this reason, researching into whether or not prospective teachers have any misconceptions in the topics of nervous system difficult for students to understand, and eliminating them if they have any are very important in raising the quality of biology education conducted in schools.

This research aims at determining the effects of teaching through simulations- which has been performed in relation to the topic of nervous system- on concept teaching and on eliminating the misconceptions.

2. Method

2.1. Study group

The study group was composed of 25 third year students attending the Biology Education Department of Hacettepe University Faculty of Education.

2.2. Research model

This research was designed in the single group pre-test – post-test model, an experimental research model.

2.3. Data collection tool

Nervous system

- The test on Nervous System contained questions requiring written answers and drawings for the purposes of uncovering the prospective teachers' knowledge in relation to the target behaviours specified in the curriculum for high school 3rd grade biology course.

IETC 2014

Audio-visual Simulation

- Original animation was produced by Physio Viva Educational Animations Company. Having the permissions necessary, the audio-visual simulation was adapted by the researchers and in this adaptation process the Adobe After Effects software was used.
- The content of the simulation was prepared in accordance with the target behaviours specified in the curriculum for high school 3rd grade biology course.
- In the part about impulse transfer, such topics as the structure of pre-synaptic and post-synaptic neurons and the procedure of impulse transfer between two neurons were included.

2.4. Analysis

The answers given by prospective teachers to the questions concerning the nervous system were grouped according to the similarities and differences, and then the frequencies and percentages were calculated.

3. Findings

3.1. The answers given by prospective teachers to the questions concerning impulse transfer

For the questions on nervous system, in relation to impulse transfer, the prospective teachers were asked to draw a picture of a nerve cell and to describe the changes occuring in the nerve cell by using the drawing.

The findings obtained from the prospective teachers before and after teaching through simulations in relation to impulse transfer:

According to the pre-test results, 5 (20%) of the prospective teachers were able to represent the structures of a nerve cell via drawings correctly. 10 (40%) prospective teachers were able to draw the picture of a nerve cell only without demonstrating the structures. It was also found that 10 (40%) of the prospective teachers represented the structures of the nerve cell incorrectly.

The most frequent misconception was the confusion of the terms axone and dendrite. One of the participants (4%) stated axone as synapse.

Another misconception was the direction of the transfer. Only 5 (20%) of the prospective teachers mentioned the direction of the transfer; yet 4 (16%) of them were found to have misconception in this matter (by describing the direction of transfer as from the axone into the dendrite).

Only 2 (8%) talked of the change of electrical load; and none of the participants were able to answer the questions fully.

IETC 2014

According to the the post-test results, 14 (56%) of the prospective teachers were able to represent the structures of a nerve cell correctly on a figure.

2 (8%) of the participants drew a picture of a nerve cell without demonstrating the structures.

1 (4%) of them confused the terms axone and dendrite.

12 (48) of them who talked of the direction of transfer were able to state it correctly.

6 (24%) talked of the change of electrical load. Only 6 (24%) of the students were able to answer the question fully.

3.2. The answers given by prospective teachers to the questions concerning the concept of synapse

The prospective teachers were asked to explain the concept of 'synapse'.

Synapse is the area where a neuron transfers the impulse into the axone, dendrite, soma, muscle or soma, muscle or gland of another neuron (Campbell, 2013).

According to the pre-test results:

6 (24%) of the prospective teachers did not give an explanation about the concept. 16 (64%) gave insufficient explanations by saying 'it is the space between the axone and the dendrite; and 2 (8%) were found to have misconceptions. One of those who had misconceptions described it as "a concept occurring with the passing of an impulse from the axone into the dendrite or from the dendrite into the axone" while the other described it as "the point of junction of the dendrites".

The number of those who explained the concept correctly was only 1 (4%).

According to the pre-test results;

2 (8%) of the prospective teachers did not give an explanation on the concept. 7 (28%) of them gave insufficient explanations by saying "it is the space between the axone and the dendrite".

The number of those who explained the concept correctly was 16 (64%).

3.3. The answers given by prospective teachers to the questions concerning the concept of neurotransmitter substance

The prospective teachers were asked to explain the concept of 'neurotransmitter substance'.

Neurotransmitter substances play a role in transferring the impulse. They are chemical substances, and they enable an impulse to pass from a neuron into another or into the effector organ.

According to the pre-test results:

15 (60%) of the prospective teachers did not give an explanation on the concept. 7 (28%) used the statement "chemical substance enabling transfer from the axone into the dendrite". 1 (4%) used the statement "an intracellular substance". 2 (8%) were found to have misconceptions. "ıt is the substance placed in the dendrite side of the neuron cell", "carrier substance".

According to the post-test results:

1 (4%) of the prospective teachers did not give an explanation about the concept. The number of those who explained the concept correctly was 24 (96%).

IETC 2014

4. Conclusion and recommendations

It was found through this research that insufficiency of knowledge and misconceptions were available with regard to nerve impulse transfer. The misconceptions and insufficiency of knowledge were in parallel to the findings obtained in research conducted by Özsevgeç (2007) with prospective biology teachers for the unit "Controller and Organizer Systems". The research found that the insufficiencies and misconceptions were reduced to a certain extent with classes taught through simulations.

It is pointed out by both teachers and students that the nervous system is a topic difficult to learn. The fact that the concepts of the topic are abstract and that biological events are at the microscopic level can lead to learning problems. In order for meaningful learning to occur, teaching techniques which do not direct students into memorization and which make them active should be preferred by teachers. Animations will carry the microscopic concepts and topics into the macroscopic level and thus will be able to raise the quality of learning. Curricula and course books must guide teachers in techniques of teaching through animations. Additionally, the topic of systems has concentrated content. The parts related to real life must be emphasised and the content must be made lighter, and re-organised by revising the time, and the teaching techniques.

Social media usage by open education faculties: Atatürk university case

Türker Elitaş96
Fırat University, Communication Fakulty, 23119 Elazığ Turkey

Abstract

Social media, which provide to sharing of resources irrespective of physical space and time in terms of individual and institutional practices, has been important assistant element. The universities ,which include tuition activity among essential functions, whack up course contents and information with students using social media. Especially, universities which include open education faculty defined as distance education, thanks to social media examine and evaluate student without attendance.

Keywords: Social Media, Open education Faculty

IETC 2014

Preamble

The information and communication technologies, which had substantially improved after the 90's, had introduced various innovations and improvements from the coding of the information to the delivery of it to the receivers. Especially convergence, which takes place at the communications literature as the meshing of data processing systems, and the digitalization that enable the production, delivery and storage of such data, renders employ the delivery of the picture and sound to everyone, without any need for time and space, at those days that information had became instantaneous.

Convergence of the TV and radio channels and the newspapers with digital and telecommunication technologies, open the way for new services and products that will be presented on digital communication media; such as Internet (Yıldırım,233:2010). Especially as a result of the Internet the, the social media, which is an important corner-stone at the phase of transition from one-way information sharing to two-way and simultaneous information sharing, is becoming one of the most important platforms of forming new life-forms for the new generations; and the new generations are meeting their personal and social needs; such as socialization, entertainment, and even education, via the social media.

In addition to its multimedia features, the getting easier of it had entrenched the place of the social media within the daily living practices; and the education institutions, which may not be indifferent to such developments, had go into the effort of using the social media with an efficient and effective manner.

* Corresponding author. Tel.: +905052602188.
E-mail address: turkerelitas@gmail.com

The existence of the universities, especially the ones that have open education faculties within their structures, at the social media for the purposes of educational activities, and their effective usage of this communication environment had brought with the result of performing the remote education course contents and student evaluation transactions via social media. Our work, which places the Open Education Faculties to the center, studies the relation between the open education faculties and the social media by using the method of "content analysis", in the sense of revealing the social media, in which the picture and sound contents are paid importance, and revealing for which purposes had the social media been used during the education periods of the open education faculties.

1. Conceptual framework

This work, which studies the usage of the social media by the open education faculties, is in need of a conceptual framework in order to discuss the topic in detail. With the purpose to specify this effect, subjects like "social media" and "open education faculties" will be explained conceptually by the means of literature review.

Following the explaining of the concepts, the open education faculty that takes place at the focus point of the work, will be analyzed by using the content analysis method in terms of the sample of usage of the social media by the Ataturk University.

1.1. Open education faculty

Open Education is a sort of a remote education system which had been opened for various departments first in Anadolu University and then in Ataturk and Istanbul Universities, for the ones who could not attain a definite grade at the annual university entrance exams for formal training, or for the ones who may not attend the regular courses at the university.

Those faculties, which had been constituted with the attempts of the Anadolu University first, are now presenting services with various departments, especially at social sciences, firstly in Ataturk and then in Istanbul Universities, parallel with the increase in he recent years, at the number of the persons who desire to attend a higher education program in Turkey.

The remote education system, which had became a field of study in Turkey since from the 1960's, had actively came into service at 1982 as a result of various reasons. *"The remote education attempts in Turkey between the 1960's and 1980', could not be transformed into effective and continuous practices as a result of the undetermined and unfounded attitudes of the governments"* (Özer,4:1989).

As a result of such unfavorable situations and the disbelief of the public towards the remote education the activation of such faculties had always been delayed till 1981, in which the 2547 numbered law on the universities had taken effect and the remote education had taken a place in the public documents.

Thereafter the necessary steps had started to be taken for the institutionalization of the open education faculties.

"With the 2809 numbered law, the Open Education Faculty opened by Anadolu University, had been given the task to provide remote education all over the country, with a central manner" (Özer,5:1989). At the beginning the number of the students enrolled to the Anadolu University Open Education Faculty was 30.000;

IETC 2014

and this number had today reached to 650.000, which makes the faculty one of the most important remote education centers all over the world (Curabay,Demiray,97:2003).

The enormous increase at the number of the students and the changes at the conceptualization of education in Turkey had emerged the need for new open education faculties, and after the Anadolu University, the second open education faculty had been opened in Ataturk University in order to close the gap.

The preregistrations are made online at the open education faculties, and the courses are followed by the students by the passwords given to them by the affiliated university or by the publications made at definite hours of the day by public broadcasting channels.

In addition, the course books prepared by the affiliated universities are the resources that the students may procure after they complete necessary procedures for enrollment to the university, both the increase at the number of the students at the recent years and the increase of the place of the social media in the daily life, had made the social media an important complementary element in the sense of the following of the lectures and the evaluating of the students.

1.2 Social media

The developments at the information and the technology do shape the life of the individuals' routine life forms, especially by making the Internet users gain new attitudes and behaviors. Especially the development of the technology as web 2,0 is the main reason for such a development at the social media. The besiege of the individual starts right at this moment.

As the Web 2,0 had been presented to the service of the users a transition from one-way information sharing to two-way and simultaneous information sharing had taken place, and this age had been named as "The Second Media Age" (Poster, 1995). As a matter of fact the concepts of "Web 2.0" and "Social Media" are generally used instead of each other. It would not be appropriate to argue that such a usage is completely wrong, however those two concepts do not completely mean the same thing. "*Web 2.0 is mostly defined as the online applications, and the social media is defined as the social aspects of such applications"* (Koçak,29:2012). Parallel with the technological shift from web 10 to web 2.0, there took place some substantial and important changes at the social aspects of such technological shift applications.

Web 2,0 is accepted to be the beginning of the social media. Today, by the means of the blogs, labeling, synchronize contents, as a result of easy publication of the content, and with the freedom to share and making comments to the content (multidimensional communication) the individuals are in a close relation with the social media at any time of the day.

"Social media is a humanistic communication means which the basis of is sharing and discussing without any limitations by the time or the space (Vural ve Bat, 2010: 3351). The two-way communication, the passing away of the time and the space, and the individuals' enjoying those, had opened the door to use the social media for various purposes.

The social media had first appeared at the beginnings of 90's, with the software named mIRC, easing the chatting of the individuals between each other (http://sosyaling.com). mIRC had been subject to a deep ,nterest, and the beginnings of the 90's had been entered in the history of Internet as "the era of mIRC". The mIRC era was the era at which the people had first encountered with the communicational dimensions of the Internet, and also at which the seeds of mistrust and insensitivity had been sowed for the first time. By the end of the 90's the social media had appeared in front of the people with a different trend; the trend of dictionaries and blogs. With this trend the social media had proven that besides establishing communication it may also be used as a source of information.

"Social media is the aggregate of the web services which receives most of its contents from its users and which collects contents from other web-sites" (Koçak,30:2012).The social media, consisting of various positive and adverse features intended for the purpose of use, consists of various threats and convenience, not

IECT 2014

for the provider but for the receiver, especially in the sense of education and informing and the two-way using of the social media by the provider and the receiver.

2. Method

2.1. Purpose and scope

The work intends to introduce the ways of usage of the social media by the open education faculties, which use the social media as an effective activity field in terms of education, and how much active are they at the social media, with reference to the communication activities of Erzurum Ataturk University Open Education Faculty's official Facebook Page (ATA-AÖF).

With that purpose, the wok includes the Ataturk University Open Education Faculty and it has a particular importance in the sense of identifying the perspective of the faculty about the social media, its purposes to use the social media, and its frequency of using the social media.

2.2. Method and limitations

With the purpose to set forth the necessary information for this work, we first applied to the literature review method and formed the conceptual framework of the work. At the research and assessment phases of the work, the content analysis method had been used in order to attain the necessary systematic and objective information. *"Content analysis is a scientific research method being used in order to make meaningful and valid inferences for the texts and the context they are used at"* (Krippendorff 2004: 18). Within that scope, the content analysis method is being used at a variety of communication means, including but not limited to the television and radio shows, posters and banners, personal conversations, and the messages of the advertisements (Gürel,Alem,2010:336).

The concept of "social media" that had been handled within the scope of this work, has been limited with Facebook, because of its including many participation areas of different types and because of the intention to prevent the possible mistakes that may take place as a result of the broadness of the research field. As a matter of fact Facebook is the most commonly used and popular social media platform, with the highest number of members; and the possibilities it offer meets the concept "social media" at an adequate level. The conceptual framework of the work has been limited with the concepts "open education faculty" and "social media"; and the research and assessment parts, in which the content analysis method had been used, had been limited with the official Facebook page of Ataturk University Open Education Faculty (ATA-AÖF). Another limitation has been applied in the sense of the period of research. For the purposes of the work the Facebook page of Ataturk University Open Education Faculty (ATA-AÖF) had been examined for a period of one month, which is between the dates of July 19th and August 19th of 2014.

Assessment and result

IECT 2014

The open education faculties, in which no physical attendance is necessary, just like the faculties providing formal education, apply to communication measures in order to get institutionalized and to increase their rate of preferability. The social media, enabling the improvement of the personal and institutional relations by the means of the interactive communication opportunities it provide, is an effective communication means that the open education faculties use in order to attain their institutional targets and goals. The social media, differentiating from the conventional communication means in the sense of instant sharing the necessary information without any need for time and space, creates a process, with the participation of all parties that would bring the efficiency and effectiveness of the communication among the organization and its target groups to the highest level. Within the scope of that work, intending to set forth the usage means of the social media by the open education faculties, researches had been performed on the Facebook page of Ataturk University Open Education Faculty ATA-AÖF. Accordingly, before all, researches had been made on the statistical data of the official Facebook page of ATA-AÖF with the purpose to see at what point of its communication activities does the Ataturk University Open Education Faculty places the social media, and to better comprehend its usage activities and forms. Please find below, at Chart – 1, the statistical information regarding the Facebook page of the Ataturk University Open Education Faculty

Statistics of the Facebook Page	
Date of Establishment	2013
Likes	9.664
Most interaction from the city of	İstanbul
Age Range of the persons who liked the page	18-24
Average number of the users talking about the page	124

Chart 1: Statistical Data on the official Facebook page of ATA-AÖF (http://facebook.com) (Access: July 19th, 2014)

The statistical information about the official Facebook page of ATA-AÖF provide important and updated information regarding the communication activities of the Open Education Faculty at the social media. The faculty, which had initiated its educational activities in accordance with the 14.04.2010 dated decision by the Board of Ministers (http://ataaof.edu.tr), just after a little time after its establishment had taken important steps in the sense of institutionalization. The faculty, conducting institutional communication activities at various social media, had opened its Facebook account in 2013, which indicates that it is an organization that is well aware of the power of the social media. The faculty, giving lectures at 20 different programs, namely 4 license, 15 associate, and 1 license completion (http://ataaof.edu), is getting bigger and bigger each and everyday with its students above 20.000. Today, the number of the likes at the official Facebook page had reached to 9.664, almost half the number of the Faculty's students, indicates that the Faculty had used an effective social media communication strategy. The amount of the users talking about the page, which is 124, is not quite a big amount, but it may not be considered as low as it is considered that the page had been established not so long ago. The age of the users who liked the page is between 187 and 24, and this indicates that the page is being followed by the students. One of the features of the open education faculties is to have students living in different cities. In that sense Istanbul is the city that the utmost interaction takes place on the page, and this shows the demographic structure of the Faculty's students. We can also say that the prominence of Istanbul is about the high population of the city.

Another point that we focused on within the scope of the work is the applications at the official Facebook page of the Faculty. The applications at the page provide particularly important data regarding the Faculty's means of usage of the social media and its purposes to use the social media. Please find below, at Chart – 2, the applications at the official Facebook page of the Faculty and their contents.

Page'a Applications

Chart - 2: ATA-AÖF Official Facebook page – applications and contents (http://facebook.com) (Access: July 19th, 2014)

The application titled "Timeline", which is one of the applications at the official Facebook page of the Faculty, is an application that Facebook provides to all its users and that provide access to contents shared from the date the page is opened to the actual date. By the means of this application it becomes easier for the students to follow the contents shared at the page of the Faculty, and make it possible to reach the past contents.

The application at the page, titled "About", provides information to the users regarding the institutional identity of the Faculty. This application, which includes orienting links, the vision and the mission regarding the accounts at other social media platforms, with the general information regarding the Faculty and the page, and which focuses on organizational identity and activities, becomes prominent at the point of institutional image constructed with effective communication strategies. The controlling of the information by the Faculty about itself, and the access of the page's users to the information regarding the faculty by the means of the primary source is a particularly important communication strategy. As a matter of fact the institutional information is an subject that the target groups evaluate by using rational criteria. Establishing controlled and orienting information regarding a subject is particularly important in the sense of influencing the visitors.

Another application, which draws the attention, is the application named "More". The "Page Rules" function that takes place in the application content, consists of the rules that the users shall comply with during their visit to the page. It is so normal to expect the Open Education Faculty, which is a public organization, to comply with the public rules at the social media application areas. The "Likes" function at the application includes statistical information regarding the users those liked the page. This function, that enables the users to access to the information regarding the page, provides the opportunity to measure the population in the page.

The "video" and "photograph" functions are commonly used in the sense of the continuing of the education activities, by presenting visual and audio supportive materials and education programs to the students. At the page of the Faculty, generally the videos of the education programs and the images used for the announcing of such programs may be found.

The "visitor Page" and "Social Media" applications, specially formed for the page, indicates that the Faculty conducts effective and comprehensive communication activities. The collecting of all the information tak-

ing place at the Web Page of the Faculty under a simple application, gives the students the opportunity to make their transactions by using the social media, without entering the web page. The links at the application link the user to the website. Those links include a wide spectrum, including but not limited to the student affairs, exams, academic calendar, contact, Faculty's Programs, and director – lecturer – student information systems.

By the function "I want to be a student" the new students are given the opportunity to obtain information regarding the faculty and the enrollment procedures. To state briefly, this application, which may be considered as a miniature of the webpage, enables a comprehensive and multidimensional information transfer, and gives the students to perform all their transactions by using their Facebook accounts, and this increases the attention and participation level against the page. Creating a multifunctional communication environment, which can respond to all of the expectations of the students, would positively effect the image of the Faculty on its potential target group.

The "Social Media" application includes the links that route the users to the accounts of the Faculty at other social media platforms. In addition to the contact, information, and help links, with the search link routing the user to Google Search Engine and with the links for the accounts of the Faculty at Facebook, Twitter, Youtube and Google+, the students are giving the opportunity to make use the other communication channels easily. Thus, all the communication channels of the Faculty transfers information to the target groups with a synchronized manner.

With the purpose to make the usage means and the effectiveness of the official Facebook page of the Faculty more comprehensible, it is necessary to examine the contents of the shares at the page. As a matter of fact, in this environment in which relations depending on sharing are constructed, the contents shared clearly set forth the usage means and usage purposes of the users. Within this scope, please find below, at Chart – 3, the data regarding the surveys conducted on the contents of the shares at the page of the Faculty's page.

Content Distribution			
Content		**F**	**%**
Announcement		11	68,75
Celebration		1	6,25
Training Video		4	25
	TOTAL	16	100

Chart – 3: Content distribution of the Shares (http://facebook.com) (Access: July 19th, 2014)

The sharing contents examined under the category titles of Announcements, Celebrations, and Training Video, have been categorized with regard to the common meanings they include. The number of the shares during the course of the research includes an effectiveness level that may be considered as normal. Within the one month period, during which the research had been conducted on the page of the Faculty, it had been observed that 16 shares had been made on the page, which 11 (68,75%) of was for announcement, 4 (25%) of was for training video, and 1 (6,25%) of was for Celebration purposes. The widely using of the Announcements, which is one of the communication methods that the public organizations most commonly use, at the shares on the page of the Faculty, sets forth the similarity of the communication strategies maintained at the conventional and social media areas. Furthermore, a training a video, including the course contents and the lectures, had been shared at the page at least once a week. During the course of the research 29th, 30th, 31st, and 32nd programs had been shared. The celebration shared for the Ramadan Feast had been taken into assessment within the scope of the research.

Facebook provides the necessary environment and the hardware necessary for embodying the organizational communication strategies on the basis of a two-way communication. Functions; such as the likes, the comments, and the sharing, enables the achieving of feedback. Please find below, at Chart – 4, the data, which may set forth the effectiveness of such functions.

Distribution of comments, likes, and shares

Content		Comment		Likes		Shares	
		F	%	F	%	F	%
Announcement		178	79,5	160	55,9	3	60
Celebration		13	5,8	112	39,2	-	-
Training Video		33	14,7	14	4,9	2	40
	TOTAL	224	100	286	100	5	100

Chart - 4: Distribution of the comments, likes, and shares for the shared contents (http://facebook.com) (Access: July 19th, 2014)

The basic feature of the social media that distinguishes it from the conventional communication means and media, is the continuance of the communication process with an interactive manner, by the participation of the parties. The feedback functions at Facebook forms communication channels that enable the effective operation of the interactive communication process. Within that scope, the comments', likes', and sharings' distributions of the shared contents gives us a clue about how the feedback process works. The content that ensure the maximal interaction about commenting is announcements. In total 224 comments had been made by the users, which 178 (79,5%) of was for announcement, 33 (14,7%) of was for training videos, and 13 (5,8%) of was for celebration purposes. Most of the comments are consisting of the questions that are not really much related with the content. When the number of the likes are examined, it is observed that the announcement contents prevail. The sharings had been liked for 286 times in total, which 160 (55,9%) was for announcement, 112 (39,2%) of was for celebration, and 14 (4,9%) of was for training videos. One important point here is that, the celebration message, which had been shared for once, had been liked the most. However, it is not surprising that the sharing about the Ramadan Feast, which is about a communal sensibility, had been liked at high numbers. When the number of the sharings are examined, it is observed that the announcement content is prominent in that category. It had been noted that the shared contents had been shared by the users at their pages for 6 times. There are 6 contents that had not been shared, which 3 (60%) of was for announcement, and 2 (40%) of was for training video purposes. The celebration content had not been shared by the users. As the comment, like, and sharing numbers are examined, it can be assumed that the interaction process is at a normal level, and the interaction may increase at the following processes. The status of the increase at the data achieved supports this comment.

One of the main features of the interactive communication is the return to the source that feedback is provided to, and thus the birth of the interaction as a result of cyclicality. At the examination made within that scope we handled the responding situation of the comments to the shared contents by the Faculty's page. Thus, the responding of the comment contents is an issue that shall be handled within the scope of informing. Please find below, at Chart – 5, the data regarding the research.

Distribution of Responding the Comments						
Content	Unresponded Comment		Responded Comment		TOTAL	
	f	%	f	%	f	%
Announcement	24	14,5	154	85,5	178	100
Celebration	4	30,8	9	69,2	13	100
Training Video	7	21,2	26	78,8	33	100
					224	100

Chart - 5: The distribution of the comments made to the sharings (http://facebook.com) (Access: July 19th, 2014)

When the responding distributions of the comments to the sharings at the page of the Faculty, which the total number of is 224, it has been observed that 189 (84,5%) of them was responded by the page, and 35 (15,5%) of them had not been responded. In general, the comments are about the educational issues of the users. The 84,5% of the comments had been responded by the page, which indicates that the Faculty is using the social media quite effectively in the sense of an interactive process. It had been observed that the responses to the comments are sometimes official and sometimes sincere, and this is the indicator of a

balanced communication strategy. As the shared contents are examined it is observed that 178 comments were made in total and 154 (85,5%) of them had been responded by the page, and 24 (14,5&) of them had not been responded by the page. In total 13 comments were made to the celebration content, and 9 (69,2%) of them had been responded and 4 (30,8%) of them had not been responded. In total 33 comments were made to the training video, and 26 (78,8%) of them had been responded and 7 (21,2%) of them had not been responded.

As a result, it has been identified that the Ataturk University Open Education Faculty, examined within the scope of the study, has been using the social media for announcement, informing, training, and congratulation purposes. Announcements and notifications are the methods that the public organizations commonly use at communication activities. As a matter of fact, at the Faculty's page, in which the organizational communication strategies, considered within the scope of the public relations, are being practices, there took place the announcements regarding the issues that may interest the students, training videos that give the students the opportunity to participate in the training period, the notification system that enable the responding of questions, and the celebration message that is considered within the scope of establishing a positive image. The Faculty continues its organizational image and its communication strategies via social media on one hand, and enables the easy access of the students to the course contents by providing the lectures on the electronic media. At that point, it becomes possible for the students of the Open Education Faculty to take part in the process without becoming distanced from the education process. The students get answers to most of their questions, and this stops the information pollution. When the findings achieved from the Faculty's usage of the Facebook, it is observed that the social media accounts provide a plenty of advantages to the students, and assist them to have an effective education period.

The applications at the Faculty's page, in addition to their contribution to transmit the institutional identity to the target group, they also assumes a role to strengthen the bonds among the students and the Faculty. With the Visitor Page and the social media applications formed by the Faculty a multi-media environment had been formed and functions that enable easy access to the contents taking place at the website had been presented. This improves the preference rate of the social media, and enable the users to access to the required satisfaction.

Furthermore, the social media application formed by the Faculty, which continues its existence at all the popular social media platforms, in order to improve its recognition and usage level, enables the users to easily access to the other social media platforms. Thus the necessary coordination among all the communication activities will be enabled.

When the number of the sharings during the course of the research is considered, it had been observed that the usage frequency was neither so high, nor at low levels. At that point we can argue that the shares of the Faculty at the social media are at a normal frequency. In addition, when the rates of the comments, likes, and the sharings are examined it had been identified that the interaction effectiveness was not so high. When the numbers of the likes, comments, visits, talks, and sharings are compared with the number of the likes of the page, it had been observed that their number is quite low. However, despite the Faculty had been recently established, its efforts to actively use the social media indicates that it will use the social media more effectively in the future. In addition, the activities of the Faculty at all other popular social media platforms indicates that the Faculty had placed the social media at an important point among the communication processes.

Strategic practices of public diplomacy policies in educational field and Turkey's potential for cultural diplomacy

Assoc. Prof. Abdullah ÖZKAN97
İstanbul University, 34116, Turkey

Abstract

Public Diplomacy has become a primarily preferred strategic factor in the new international system in which strategic value of communication has grown, the concept of public diplomacy has become prominent, the accurate information and persuasion have gained importance. Unlike traditional diplomacy, public diplomacy that prioritizes affecting other countries' public opinion aims non-state actors and public opinions. These are goals of public diplomacy: Informing and manipulating foreign public opinions; increasing this effect; correcting misunderstanding and establishing the ground for a deep inter-society dialogue. Public Diplomacy management, based on mutual communication and interaction, largely benefits from the elements of soft power such as culture, education, sport and etc. for creating mutual sympathy. This paper explains the role of public diplomacy in the new century, underlines the success of strategies practiced in educational field and emphasizes on the Turkey's potential for cultural diplomacy.

Keywords: Turkey, Cultural Diplomacy, Education, Strategy, Policies

IETC 2014

1. Introduction

Recently, the perception based on propaganda and one-way information becoming ineffective is among the most important changes and transformations. The symmetric communication, persuasion and interaction, in the new international order, have gained importance while the concept of public opinion has become prominent. Thus, decision and policy makers have required the participation of public opinion to the decisions, as they start to play a determinant role in both countries and societies in the new century in which democracy, human rights and freedoms have gained importance. Public opinions inquire, discuss, learn and participate to the process with the development of communication technology, rapid access to information, internet becoming widespread (Özkan, 2014a, 301).

This radical change has created the need to interact with public opinions (both local and foreign public opinions), convey accurate information properly, express and introduce oneself and establish mutual understanding. In the 21st century, Public Diplomacy is the most practiced tool to communicate and establish relations with other countries and societies effectively. The countries implementing Public Diplomacy based on mobilizing current soft power potential (education, culture, sport and etc.) achieve to make other countries/societies adopt their policies (Nye, 2005, 2).

The flexible Public Diplomacy perception is the most preferred approach in the new century. It is aimed in this approach that the mutual understanding is established between countries and societies by using soft power elements intensely (Signitzer, & Wamser, 2006, 438). While in the flexible approach, the long

* Corresponding author. Tel.: +0-090-212-4400000 (12682).
E-mail address: abdullahozkan@istanbul.edu.tr

term activities gain importance, an atmosphere for the mutual understanding is created by benefitting from education opportunities, life styles, political and economic systems and artistic skills (Yağmurlu, 2007, 17).

The education includes crucial possibilities and opportunities to establish sympathy and relation between countries and societies through Public Diplomacy policies. Countries could address to foreign societies with their language, culture and education opportunities while they could convey/teach their cultures. Thus, they could introduce themselves. As a result of this relation based on mutual trust, countries could have support for their policies and gain the sympathy of public opinions. In this paper, there are examples of public diplomacy practices in several countries and the methods and technics that were used and resulted in success in educational field.

In this paper, the literature review method is used. These are also discussed elaborately in the paper: practices and public diplomacy strategies used in educational field after public diplomacy and relevant phenomena of soft power are discussed. In addition to the past and required practices, it is also argued in the paper that the present value of Turkey could be used effectively in the public diplomacy policies. It is mentioned that the countries achieving to use great potential in the educational and cultural fields properly with a strategic intelligence will gain competitive advantage in the 21st century.

2. Paradigm shift in the international order

The globalization process has brought about several changes in financial, social, political and cultural fields. This process has almost resulted in a paradigm shift across the world. The 21st century will be remembered with the changes and transformation brought by the globalization process. While the 20th century represents Cold War era in other words nation-states world with limited communication/interaction; the 21st century represents an era that communication method and tools have become widespread, the concept of public opinion has become prominent and the image, perception and prestige have gained importance.

In the globalization process, non-state actors have appeared and they have played an active role in global relations. The interstate relations have shifted to the international level from the nation-state one. Public opinion is one of the most important elements of the new international order. During this process, the accurate and realist information and so the persuasion of public opinions have become important (Yavaşgel, 2004, 1). The will in the foreign policy issues is not only the will of government representatives but also various political and cultural elements (Canbolat, 2009, 4). In the new international system, now, NGOs, opinion leaders and highbrows have taken part both in policy-making and implementation. After the new international system and approach have enabled the mentioned support, different opinions and distinctive points of views easily affect the decisions. While the globalization process, in the new international system, deepens the mutual dependence on primarily financial and political issues, the borders between domestic and foreign policy have been removed (Sönmezoğlu, 1989, 488). The improvements in domestic policy have also become a part of foreign policy and domestic policy has directly started to affect the foreign policy-making process. The new international system has a multipolar characteristic and this decreases the effect of military, strict and realist approaches on inter-state relations despite the increasing importance of idealism, cultural relations, diplomacy and interaction. Due to all these developments, the implementation of foreign policy for states and countries has been legitimized by considering social, global and political backgrounds (softpowers) (Canbolat, 2009, 8).

3. The new century and public diplomacy

IECT 2014

In the new century, some significant paradigm shifts have occurred in diplomatic field. The diplomacy is defined as the process in which a government expresses opinions about specific topics directly to the decision makers of foreign countries and this process is managed by the government officers through negotiations (Gönlübol, 1993, 115). The concept of diplomacy includes various political manipulation methods and technics used in the foreign policy of a state (Sönmezoğlu, 1989, 323). The rapid developments in globalization process deeply affect the diplomacy. These developments lead a comprehensive change (Tiedeman, 8). The "inter-state" diplomatic relations during Cold War era, have turned into "inter-society" relations with the paradigm shift. In the new international order, several new actors appear such as media, public opinion, NGOs and international associations. Furthermore, these actors have started to affect the decision makers directly (Kalın, 2011, 6).

Public Diplomacy aims to manipulate manners of public to shape and implement the foreign policy. It also embodies the matters –out of traditional diplomacy frame- the effort of molding public opinion in foreign countries, interaction of NGOs and cultural communication process (Morrow). The governments and NGOs, with Public Diplomacy, could express their opinions to foreign NGOs and public opinions (İnan, 2012, 64). Public Diplomacy emphasizes on the communication process launched to establish sympathy of foreign public opinions for their opinions, missions and interests (Signitzer, 2008, 206).

Unlike traditional diplomacy, Public Diplomacy aims non-state actors and public opinions rather than foreign governments. Via Public Diplomacy, countries could deepen the dialogue between their own citizens with foreign citizens and associations. Public diplomacy has some other goals such as informing and manipulating foreign public opinions, enhancing this manipulation and correcting misunderstandings (Doğan, 2012, 13). Public diplomacy enables that governments and NGOs could express their opinions to the foreign public opinions and NGOs (İnan, 2012, 64) while other governments could communicate by serving their opinions, missions and interest besides helping to establish sympathy (Signitzer, 2008, 206). The policies implemented by the countries, aiming to have effective results from public diplomacy practices should be certainly rational, convincing, legal and defendable as it would be impossible to declare and defend policies which are against the international law and based on illegal methods (Kalın, 2012, 151). The countries having public diplomacy vision primarily update their images, correct misunderstandings and establish bridges to develop relation with other societies (Leonard, & Alakeson, 2000, 10).

4. The concept of "soft power" in diplomacy

The power is defined in international order as ability of affecting the manner of other societies and acting freely (Nye,2005,2). In the international order, the concept of power has dramatically changed; "soft power" has replaced "hard power" in the Cold War era. The countries, now, impress others with their soft power potential (science, art, culture, sport, education and etc.) rather than army, weapon and etc. (Snow, 2009, 3). These countries, manage to use soft power elements, have become attractive and so they could declare their policies. Furthermore, the policies of these countries could easily be adopted by the foreign societies. This process is based on mutual communication and interaction, persuasion and cooperation.

Joseph S. Nye (2005) making the first scientific study on the concept of "soft power" says that the policies with attractive identity, political value and institutions and also based on moral values and legitimacy are necessary to create soft power. He also underlines that an attraction center could only be created by this way and the preferences of foreign society could be manipulated through persuasion. As it is seen, this process underlined by Nye is long-term and challenging. This also requires being decisive, being patient and working hard besides using all the present soft power elements accordantly. During the planning process of public diplomacy strategy, these should be determined to have effective results: Which soft powers will be used, when, how and who will manage (Özkan, 2014a, 305).

IETC 2014

This is one of the public diplomacy goals to enhance the image and prestige of countries via mutual understanding (Simonin, 2008, 24). Recently, credibility and prestige are the most important elements for countries. As long as a country has these values it could express its own policies to foreign countries and societies and become an attraction center. In communication, the source of message is as important as the message. In public diplomacy, countries are the sources. The messages in frame of public diplomacy are so reliable and credible that the countries are reliable and prestigious. It would not be enough to focus just on the message while creating public diplomacy. The perception of countries as sources conveying the message to the target group is, also, required to be changed. Thus, the soft power elements should be used properly. The strategic communication method together with the concept of soft power could establish a permanent success in public diplomacy (Özkan, 2014a, 306).

Countries could mobilize soft power capacities and use them effectively just with the public diplomacy vision. On the other hand, in the international order, the competitive power of countries that fail to develop public diplomacy policies with strategic power and to use effective tools and methods of public diplomacy will be weakened.

5. The concept of education as a soft power element

The public diplomacy policies are conducted by primarily NGOs. Afterwards, these are accepted as main actors of public diplomacy: universities, schools, opinion leaders, media and news agencies, domestic mass media, global business, private sector industry, pressure groups and supra-state institutions (Szondi, 2008, 17; Signitzer, 2008, 209; Sancar, 2012, 91).

In this paper, education as a soft power element will be discussed and so the role of universities and schools as actors will be analyzed. In public diplomacy, the schools and universities are important tools for their support to research process and being a cultural implementer of public diplomacy. The research centers in the universities have contributed to the public diplomacy strategy with their scientific report, analyses and publications. Universities are, also, effective in implementing cultural diplomacy and conveying the public diplomacy messages properly. Besides all these, universities hold international conferences, seminars, workshops and congress for supporting the conveying message process. The scientists either representing Turkey in abroad or participating to these activities in Turkey are both message sender and receiver. These people are effective public diplomacy tools as they have important and credible identity and prestige. Therefore, the information transmitted by them is thought as credible (Sancar, 2012, 92).

Unfortunately, universities in Turkey could not keep up with the rapid development in the world. Still, there is no center for research and practice at any university in Turkey. There is a need to research the concept of public diplomacy scientifically and create a comprehensive roadmap about future strategies and policies.The schools in foreign countries are also important tools in public diplomacy. The law of host country is applied in these schools but they transmit their own cultural values via foreign language courses, course books and cultural and art activities. In Turkey, some schools transmit their own cultural values to Turkish students: The French high schools such as Saint Benoit, Sainte Pulchérie, Saint Joseph, Saint Michel, Notre Dame de Sion and İzmir Saint Joseph; German high schools such as St. George's Austrian High school; and others such as Galileo Galilei Italian High school, Robert College, Üsküdar American High school, Tarsus American High school (Sancar, 2012,94). Analogously, Turkey should aim to create schools in foreign countries within the public diplomacy vision as the cultural value transmitted via education will be persistent.

6. Public diplomacy policy practices of countries in educational field

IETC 2014

Countries that prefer to conduct their public diplomacy policies via education aim to leave a lasting impression in long term. It is observed that many EU member countries choose to popularize the public diplomacy policies via education.

Many European countries are more successful as they become culturally attractive in educational field. For instance, half of the popular languages spoken in the world are European languages (mostly spoken European languages are English, Spanish, Portuguese, Russian and German). Latin America via Spanish and Portuguese, the Commonwealth via English and Franchofon countries mostly in Africa via French are connected to Europe. In educational field, some European languages have international agency networks acting for popularizing their language and culture. The French Institution, Cultural Centers and British Council sponsored by their governments are examples for it. Besides these official institutions, more is available that serve to the same purpose and established by NGOs such as Alliance Française and German Goethe Enstitut. Europe has a rooted tradition in international cultural relations and allocates important fund. Three countries, respectively spending the most on this are France, England and Germany (Akçadağ, 2012, 234).

France has wide diplomatic network, deep cultural relations and international media. In worldwide, France having embassies, consulates and diplomatic mission over 650 has established almost 200 institutions and culture centers in abroad. The centers sponsored by the government and aimed to teach French language and culture like Institut Français are very common in Africa. Although the public diplomacy vision of France is shaped by the Foreign Affairs; Department of International Cooperation and Development, Ministry of Culture and Ministry of Higher Education and Research support this vision. In educational field, France gives financial support to 22000 foreign students coming from abroad. 80% of scholarships given to these students are provided by the bilateral agreements between France and other governments. Besides, there are two programs: First is Eiffel for students coming from Latin America and Asia and second is 'Major' for students having French Baccalauréat (high school diploma) and living in abroad. To support French public diplomacy, there is also a network composed of cultural centers and institutions. 'Radio France Internationale' broadcasting almost in 20 languages makes contributions to promote French culture in abroad with nearly 50 million audiences (Akçadağ, 2012, 235).

Foreign and Commonwealth Office, *British Council* and *BBC World Service* are important institutions in public diplomacy. Moreover British government has allocated the largest budget for these institutions. *Foreign and Commonwealth Office* having 153 Embassies and High Commissioner across the world, 10 delegates and 70 consulates within the international organizations is responsible for implementing and coordination of British foreign affairs and for national interests. *British Council* having 220 centers in 109 countries makes effort for educational and cultural relations and includes a wide range area such as art, science, language courses and social work. *BBC World Service* broadcasting in 43 languages reaches to 150 million people (Akçadağ, 2012, 235).

Goethe Institut established to teach German language and culture with over 120 centers and German Academic Exchange Service (DAAD) managing the academic exchange programs in educational field are the basic elements of German public diplomacy. *Deutsche Welle*, one of the major broadcasting corporations with its broadcasts in over 29 languages reaches nearly 40 million audiences. Considering Spain, cultural ties with Latin America are deepened by the public diplomacy practices. 40% of the scholarships offered by Spanish Ministry of Foreign Affairs are given to Latin America and Caribbean countries while 14% of it is given to students coming from North America and Middle East countries. Besides, there are special university cooperation programs between Spain and Latin America countries. These three institutions are important for Spain in terms of educational and cultural relations: *The Cervantes Institute* established in 1991 and sponsored by the government; Institute for Oversea Cultural Activity Collaboration established in 2000 for organizing international activities in Spain and the Carolina Foundation established in the same year for improving cooperation in cultural and educational field with countries having historical ties with Latin America and Spain. Spain has become an attraction center as a result of its long term efforts in educational and cultural field and gained more success in many fields, primarily tourism (Akçadağ, 2012, 236).

As it is understood, the European countries have put the elements of language and culture at the core of public diplomacy. They have also aimed to be an attraction centers in the world with their efforts in educational field. Considering the results, they have achieved many of the goals.

China is one of the countries determining the education and culture as the basic elements of public diplomacy. China, one of the heading countries in the new international system, has established Confucius Institute and Confucius College; emphasizes deeply on student exchange programs and offers scholarships for tens of thousands students from across the world. Media is also a significant tool to popularize Chinese; *China Radio International* broadcasts in 43 languages and *Xinhua*, the Chinese news agency broadcasts in English. Chinese Public Television reaches to the whole world via satellite. The internet opportunities are, also, used effectively. Besides, many Chinese websites are created in control of Information Agency to support public diplomacy and these websites include information about Chinese language, values and culture, recent news about China and official information. (Akçadağ, 2012, 185).

Lastly, we will analyze the last country, the USA. Like China, education and culture are the most important sources of public diplomacy. The United States Information Agency (USIA) benefits from the "universal American culture" effectively.

USIA has several goals such as enabling academic and cultural transmission, reaching people via informing and radio broadcasts and developing public diplomacy. The most known academic Exchange program is Fulbright including 125 countries and governed by USIA. International Visitors is the other program under the control of USIA. Every year, nearly 5000 future leaders coming from different countries could witness American institutions in situ. Today, 28% of all students applied to foreign universities have been studying in the USA. Hundreds of thousands lecturers are employed there. This increases the success of the American public diplomacy when these students and lecturers return their countries with a positive perception about American values and institutions. The following years after the Cold War, nearly one million people participated to the cultural and academic Exchange program of the USA and many of them were assigned to important positions in their countries. The American public diplomacy managers see education as a significant tool to transmit their values and benefit effectively (Akçadağ, 2011,9).

As it is seen, countries taking advantage of possibilities and opportunities with a favorable strategy could effectively transmit their public diplomacy policies to foreign countries/societies besides convincing them easily and developing a mutual understanding.

7. Cultural diplomacy and Turkey

Turkey needs to benefit from possibilities and opportunities of public diplomacy, express itself correctly, create positive image and build "nation-branding". For Turkey, the management and strategy of public diplomacy are the most significant tools to build nation-branding. (Özkan, 2013, 10). Turkey has realized the importance of public diplomacy too late and so it could not use this strategic power effectively. "*Office of Public Diplomacy"* has been established firstly in 2010 within the Prime Ministry. "*Public Diplomacy Institution"* founded within a NGO has started to act since 2001. Unfortunately, apart from these two institutions, there is no other institutional structure scientifically. This prevents that Turkey could not benefit effectively from the public diplomacy possibilities and opportunities as there is no perception of value of public diplomacy yet and the society is not completely informed about the capacity of the new century's strategic tool. Besides, nearly 200 Turkish universities have strategic potential for public diplomacy. These academic institutions should definitely be mobilized to support future roadmap of Turkey about public diplomacy (Özkan, 2013, 11).

Cultural diplomacy is defined as controlling the international area with cultural sources and by simplifying cultural change. These are also among the goals of cultural diplomacy that policies of a country are adopted, approved and sympathized by exporting cultural samples (Cull, 2009, 33).

The governments of countries could only have a positive perception and image when they transmit their values, ideas and messages via cultural diplomacy- a significant element of soft power. The credibility will be established following to such an atmosphere and this also enables creating a mutual understanding.

IETC 2014

These are significant tools of public diplomacy: education and language. Countries that benefit from these two elements create a ground for introducing, being shared and sympathized by teaching their language to foreign societies and conducting exchange programs in education (Sancar, 2012, 170).

The cultural values have important role in creating and transmitting the public diplomacy policies. Culture could be the attraction center as it includes the whole spiritual and material values of a country. The most determinant part of public diplomacy vision should definitely be created by the cultural history and wealth along with civilization background. The cultural artifacts produced by the culture industry affect the whole world while artificial objects have replaced the local cultures after being destroyed. Turkey, now, should be extremely careful and selective about artifacts of the culture industry and avoid from "cultural mandate". Cultural mandate leads weakening and destroying your culture slowly in front of your eyes. For this reason, Turkey should primarily take steps to support its culture. However it is impossible to put the effect of global culture aside. The Countries, supporting their culture could have different acquisitions after interacting with the artifacts of culture industry. It is necessary for Turkey both to prioritize its cultural background and realize the possibilities and opportunities of globalization of culture.

The Yunus Emre Foundation, established in 2007 benefits effectively from the significant element of culture, "language" and cultural values. This Foundation has been established for the goals of promoting Turkish language, history, arts and culture across the world. It also aims to enhance the exchange programs with other countries. The Yunus Emre Institution which is affiliated with Yunus Emre Foundation conducts studies for the promotion and teaching of the Turkish culture, history, language and literature, and also performs various activities involving cooperation with other institutions to support scientific studies and their publication.

The Yunus Emre Institution conducts studies to support promotion of Turkey and Turkish language, culture, arts and history with the Yunus Emre Turkish Cultural Centers in abroad. It is aimed in the Yunus Emre Turkish Cultural Centers to support promotion of Turkey and deepen the relations between Turkey and other countries via scientific projects, cultural activities and courses. Yunus Emre Turkish Education and Teaching Centers (YETEC) which is organizationally a part of the Yunus Emre Institute conducts activities in foreign countries to teach Turkish as a world language and gives support for promotion of Turkey and Turkish language. "Turkology Project" conducted by the Yunus Emre Institute is a significant study for public diplomacy vision. Turkology project, aiming to develop Turkish language teaching, deepen the relation with other countries and produce a Turkish speaking mass, provides lecturer and material for nearly 40 departments of Turkish Language and Literature and Turkish language courses (yee.org.tr).

The Yunus Emre Institute that is established affiliated with the Foundation is a big step to use cultural values and language as a strategic communication tool. It is significantly important to increase and popularize the studies along with planning for producing the permanent values. The societies knowing about Turkish cultural values and speaking Turkish will naturally adopt and support Turkish public diplomacy policies. It will be always easier, more convincing and credible to promote Turkey, its values and policies.

Turkey has recently made important initiatives within the public diplomacy activities through TIKA (Turkish Cooperation and Coordination Agency). TIKA, established in 1992, aims to assist countries willing to develop - primarily Turkish-speaking and neighboring ones- and establish cooperation in economic, commercial, technical, social, cultural and educational field via projects. When it is analyzed carefully, it will be understood that these are among the goals of public diplomacy strategy of a country. For this reason, TIKA has an important role in promotion, spread and support of public diplomacy activities and cultural values in abroad. TİKA is important for being an institution to represent Turkey in abroad. It also has achieved permanent practices and conducted important studies in capacity building. (Özkan, 2012, 90).

NGOs and the business world play a significant role in protecting, promotion and spreading the Turkish values of culture. Notably with the recent steps taken in democratization, the perception of NGOs has developed and so NGOs have become more attractive. NGOs, also, are the most important tools of the implementation of public diplomacy policies. For this reason, it is crucial for Turkey to mobilize the potential of all the NGOs for the public diplomacy vision. Countries will acknowledge and adopt each other after NGOs develop a dialogue with foreign NGOs, establish collaboration in many fields -notably cultural one- and maintain the process of mutual listening/knowing/understanding. The presence of societies, closely related to each other, is important for achieving the implementation of the public diplomacy policies. The messages and views of NGOs could be adopted and received more easily as they are independent of a public authority, state or government.

IETC 2014

Simultaneously, the business world has strategic values for public diplomacy. Businessman does not conduct just their business but he represents his country. Businessman, also, plays significant role in promotion of his country culturally, socially, politically and economically. Turkey, recently, has made important economic initiatives and has become a country that it has made contribution and investment to several countries notably in the Middle East, North Africa and Central Asia besides building business relation. Businessman could serve to the public diplomacy vision for Turkey. However, rather than acting freely, businessman should be channeled into a determined policy. The expectations from them should be told and the public diplomacy vision should be promoted through the business world. Businessman should have enough knowledge, skills and vision to serve like an ambassador in abroad. Besides the sympathy for Turkey, the relation developed by businessmen will serve to their economic interest. The message of business world will be more credible and persistent as it is independent of the public authority. This is significant for effectiveness of the public diplomacy policies.

As the other element to mobilize cultural potential is mass media, TRT (Turkish Radio and Television Association) is the most important tool for Turkey. TRT, as a public broadcaster, plays an important role in promotion of our culture and explaining our policies through the recently created channels for foreign societies such as TRT Avaz, TRT Arapça and TRT Turk. This will also make contributions to the promotion of Turkey and adoption of the public diplomacy policies by other societies that TRT has created two more channels; one is addressed to Balkans and the other is an internationally effective and popular news channel.

8. Conclusion

In the new international system, public diplomacy is one of the most strategic tools for a proper promotion of a country to the foreign societies. Public diplomacy is analyzed in three dimensions: "Daily communication and information", "Strategic planning and nation-branding" and "Building long-term relations and developing them" (Nye, 2005, 83).

This is important for "*Daily communication and information"* that the accurate information should be permanent, always in time and create a correct perception. These are also significant for effectiveness of the message to attract the public opinion and to establish the holism and cohesion. The second, "*Strategic planning and nation-branding*" is based on long term planning and strategy. Public diplomacy makes great contributions to the nations "branding". The convincing opportunity of countries, developing "nation-branding" and enhancing the image in the public opinion, might improve. The messages might be more effective if a country is credible and reputable. The third dimension of public diplomacy, *"Building long-term relations and developing them"* emphasizes on the permanent successes. To make the messages permanent, relations with the target country and society in various fields should be established through the tools and methods of public diplomacy. The tools notably such as educational activities, exchange programs and practical trainings create significant opportunities for establishing permanent and long term relations. These relations enable that countries come closer so they could increasingly understand and convince each other (Özkan, 2014a, 303).

The public diplomacy practices in educational field create strategically that countries could express themselves and convince other societies. If a country is aware of this opportunity, benefits from it and creates a proper ground, it could be "an attraction center" which is crucial for public diplomacy. Simultaneously, with the public diplomacy practices in educational field, societies learn and adopt the foreign languages and cultures. The common characteristic of countries implementing public diplomacy policies effectively is being powerful and developed in the international order. On this success, the long term investments on elements such as education, culture and language and communicating with other societies via these elements have significant effect. The "capacity building" is conducted by educational practices and this makes policies more permanent and deep-rooted. The cooperation and long term relations do not easily suffer from every crisis and unexpected problems besides endless success. Actually, the countries, conducting public diplomacy in educational field should constantly develop education system along with

IETC 2014

its infrastructure and quality as only this enables creating a strategic value and this value could be offered as an attractive option.

In Turkey, a really effective public diplomacy practice is not available in educational field. However, cultural richness and historical values of Turkey indicate the presence of a serious potential. Turkey is a country that would take important steps only if it has public diplomacy vision to mobilize this potential. In the fierce competition environment of the 21st century, it is inevitable that Turkey should take required steps without further delay.

Students' aptitude to edutainment

Asst. Prof. Bora BAŞARAN
Anadolu University, Faculty of Education, Eskişehir, 26470, Turkey

Abstract

Today, education institutions continue to invest to partly mythologized technologies. More recent shifts in technology supported course offerings undoubtedly pushes the need of teachers who are armed with pedagogical components necessary to provide a technology supported quality course. Such shifts are also telling prospective German as a foreign language teacher about the role of the future education in contemporary Turkey.

Engagement and motivation has been a challenge when working with students learning a second or foreign language. There is no doubt about the benefits of using edutainment methods with foreign language learners. But how high is the qualification of the German as foreign language students in this regard? Observations, surveys and projects for exams of Students who visited the Computer-Assisted German Training I-II courses provided relevant data to determine the findings for this study.

In providing a comprehensive overview of the educational use of technology by the students for vocabulary teaching, this paper contributes and highlights key tensions emerging from the current research that should be considered by practitioners and researchers alike.

Keywords: Edutainment, Foreing Language, Students Aptitude, Vocabulary.

IETC 2014

1. Introduction

The use of technology for teaching and learning in education systems causes no surprising reactions by insiders. The usability of technology is not surprising; perhaps from a historical perspective there is nothing new. From clay tablets, as a rough example, which were used especially as a writing medium throughout the Bronze Age and well into the Iron Age to the tablet Pcs of the modern classrooms. Maybe this are exaggerated examples but it is fact that the uses of technology and out coming tools have influenced practice in educational systems. On the other side it is hard to explain the current position of technology in the education systems or ever harder to predict what its integration will mean in the future. However, education institutions continue to make educational reforms and invest into unpredictable technologies nowadays (National School Boards Association, 2007; Greenhow, Robelia & Hughes, 2009; Jonassen, Howland & Marra, 2011; Chih, 2014); which will not lasting for ages, like the clay tablets and from this angle to mythologized technologies. Despite, it is also observable in the context of technological developments, that the educational environment and educational systems will remain changing by increased technological components. From this point, educators are facing a process for determining which technological tools or new methods for implementing them are appropriate for given classrooms and their challenges.

In Turkey, the Ministry of National Education has recently initiated the "Movement of Enhancing Opportunities and Improving Technology" project. This project aims to improve computer literacy in schools through providing students with access to emerging tools and resources (MNE, 2012). This is an enormous investment in schools infrastructure. All schools will be equipped with interactive white boards, data projectors, Internet connection.

Technological improvements has also a critical influence foreign language teaching (Louise, 2012). The following timetable is experimenting to demonstrate the dramatically altering relationships in foreign language education.

Fig. 1. Technology in the classroom timetable

There is no claim on completeness, topicality, quality and correctness of Figure 1. It is quite difficult to expect, due to the nature, a complete and up to date timetable. There are so many piece of technology, which should be included even if it is for a demonstration purpose. A very comprehensive topic, which would exceed the scope. Technology has a palpable influence on the daily life of a foreign language teacher and it offers colossal prospects for increasing the effectiveness and efficiency of foreign language teaching and learning. Over the past few years, various technologies are more integrated then ever into most areas of education (William, 2013). On the use and misuse of technology in education, respectively foreign language teaching, technology has his own pro and con viewpoints. Like societal, cultural, equity, educational and technical aspects. More recent shifts in technology supported course offerings undoubtedly pushes the need of teachers who are armed with pedagogical components necessary to provide a technology supported quality course (Robert, 2013). Such shifts are also telling prospective German as a foreign language teacher about the role of the future education in contemporary Turkey

Efforts to educate German foreign language teacher's to use technologies for teaching in educational processes are in reality efforts to make from teacher's "Edutainers". Without their own experience and awareness, this is not an easy task. Pursuant to the technology acceptance model, users needs with regard to technology, their experience with the technology, their awareness of technology and purpose of use can change instructional practices and learning experiences (James & Elisabeth, 2011). These features may further determine ongoing teacher candidate's opinions, particularly when the technology is in active use in the classrooms (Mayer, 2014).

Motivational features are capable to boost student learning through stimulating generative processing and the role of specific positive emotions can be a benefit to cope with complex learning processes (Magner, Schwonke, Aleven, Popescu, & Renkl, 2014; Plass, Heidig, Hayward & Homerand Um, 2014). In order to achieve this benefit and to provide ample opportunities for professional development for enhancing the educational experiences of our students the courses "Computer-Assisted German Training I-II." have been added as elective courses into the curriculum of German as foreign language teacher education Program.

2. The course

The launch of innovative educational technology projects has led the embodiment of interactive whiteboards (IWB) into the Turkish educational environment. Developments like whiteboard installations in the Faculty of education of the Anadolu University are not only exciting; it is also a challenging experience for all faculty members. As the teaching stuff adapt their courses to interactive whiteboards, they find that whiteboard teaching bearing challenges, raises new issues, but at the same time presents many opportunities for professional development and for enhancing the educational experiences of their students. Planning and implementing technology effectively means not only to effort and optimise material's qualities for its specific application it also means that this education technology must remain focus on people, on meeting needs, and on social inclusion, not on technology as a one-stop solution (Jeff, Susan & Robert, 2014)

Computer-Assisted German Training I-II courses positioned on the needs of the future German as foreign language teachers. The courses are not about what they teach it is about how. Each sections has two theoretic and two practical overall four hours. The first six weeks of a 12-week length course covers the following topics:

- Creating quizzes and activities for language teaching and learning,
- Integrating Digital Assets into language teaching materials,
- PowerPoint for language learning,
- Digital Storytelling,
- Social networking and instructional materials,
- Evaluating commercial products.

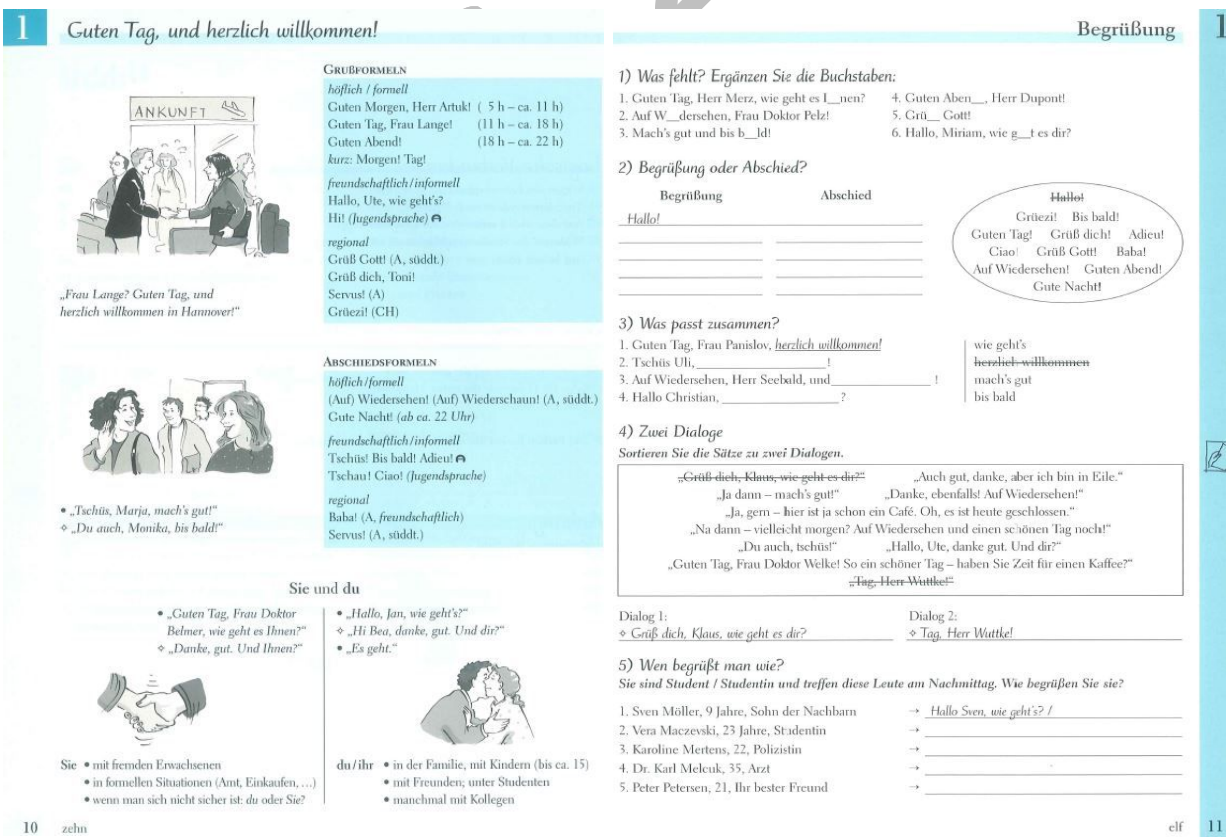
The course participation means also for all the 30 participants to attend in several mini-surveys. All 30 Students were asked on the very beginning about their thoughts in terms of Computer-Assisted German Training. This paper will not proceed to a statistical comparison of Students tendency, due to the lack of a statistically significant number of participants neither the theoretical underpinnings of IWB use in language learning from the perspective of cognitive learning theory. Even from the perspective of Students, wide range of benefits were identified, including the personal development and there is no doubt about the benefits of using edutainment methods for foreign language learners. The data discussed here is the qualification of the ongoing German as foreign language teachers in this regard. Student build working teams to prepare a 40 minutes lesson and evaluate others lessons by a given form to find out the pros and contras from their own perspective.

3. Student experimental lessons

After theoretical and practical six course weeks, the prerequisites for experimental lessons were determined. Their target audiences was elementary school students and they war asked to plan a lesson for 40 minutes using PowerPoint. Several textbooks were offered as reference sources. Some contents of the textbooks, irrespective of subjects, was seen as very difficult to explaining. Teams are build and individual chapters were picked to create an experimental lesson in two weeks time. Following topics are chosen;

Table 1. Experimental Lessons Topics.

Computer-Assisted German Training I	***Computer-Assisted German Training II***
. Guten Tag und herzlich willkommen! (welcoming)	. Ich hätte gern vier Brötchen (In the bakery / On the market)
. Stellen Sie sich bitte kurz vor! (Details of the person)	. Alles für Ihre Küche (All about the kitchen)
. Ich bin Ärztin - kann ich Ihnen helfen? (Occupations & activities)	. Wir möchten gern ein Konto eröffnen (At the bank)



IETC 2014

. Das ist meine Familie!(Family and kinship)	. Kochkünstler (Cooking and Eating)
. Meine Freunde, meine Kollegen (Social relationships)	. Entschuldigung, wo finde ich Kartoffel-Chips (In the supermarket)

A sample lesson plan was given as a guideline for forming their own lesson.

- Goals: Students will be able to Identity Important words of the course. They will also be able to understand and use these words.
- Objectives: Given a set of pictures, the students will match the picture to the word.
  Introduction: Through questioning, establish students' background knowledge of classroom vocabulary.
- Development: Using the picture dictionary as a reference model the appropriate actions or words.
  Practice: Students will repeat the vocabulary while looking at the presentation. Students will work with
  partner- asking each other questions about words of the unit.
- Accommodations: Students in the class will complete worksheets.
- Checking For Understanding: Listen to the students pronounce the vocabulary.
- Closure: Review the vocabulary words Assign practice work at home.

An evaluation form were handed out before; which is also used later by each team, to evaluate other presenting respectively teaching teams. Each team had a meeting day, if they need it, before their experimental lesson, to show or rather to explain their unit for early feedback and to make recent edits if there was any necessary. While each team hold their lesson other class members was taking the role of the elementary school students. On average two or three experimental lessons were hold, designed and presented by students. The evaluation forms are handed out before the lessons started. Afterwards each section was discussed under the aspects of the evaluation form.

4. Summarized lesson sample and students

evaluation

Fig. 2. (a) Textbook unit page sample; (b) Textbook unit exercises page sample.

Each unit from the textbook has also one exercise page, so the students must also include unit exercises to their lesson. Based of the given space limitations of this paper one example will be summarized. The name of the unit in the Textbook is “Alles für Ihre Küche” All about the kitchen. The teaching topic here are the objects in our kitchens. A common context for language learners; which allows an easy comparison and sampling.

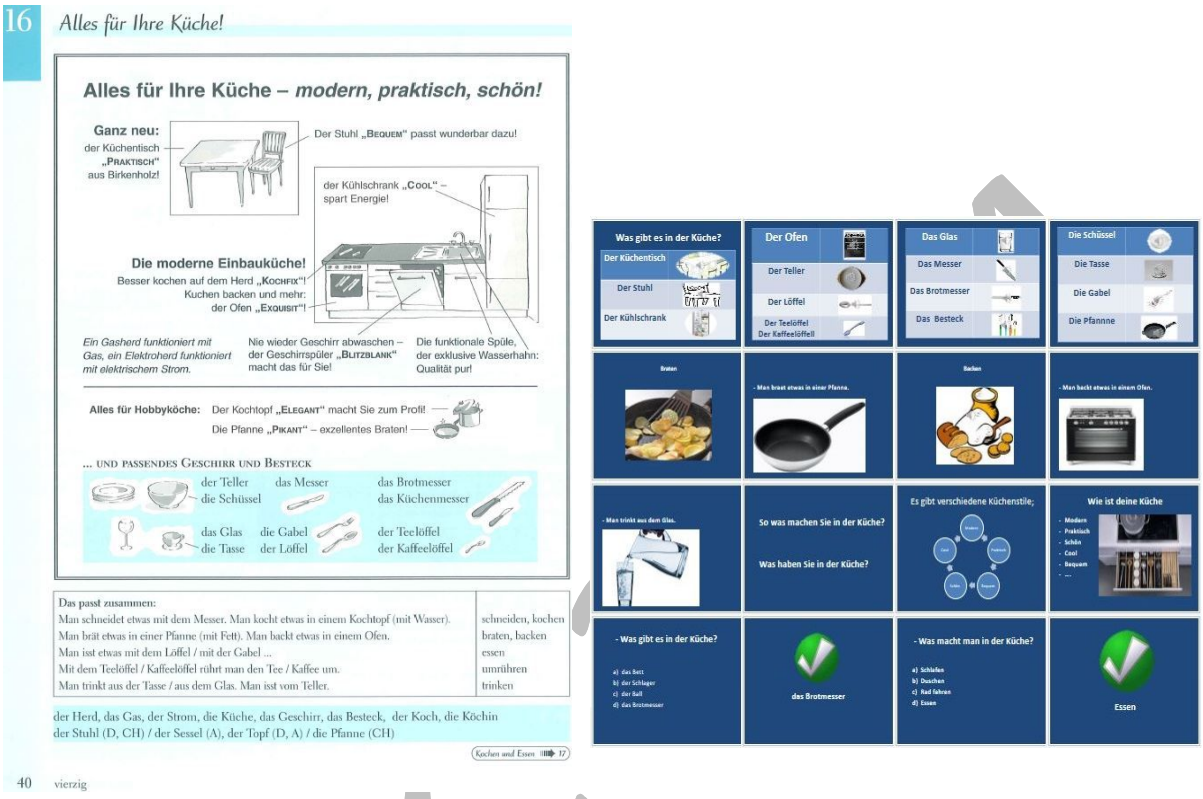


Fig. 3. (a) Textbook All about the kitchen unit sample; (b) All about the kitchen lesson presentation.

The figure 3. (b) Only shows a mixture from the lessons PowerPoint. The vocabulary is articulated this is beyond visualization, also after each sets a multiple-choice test is added. Therefore, the elementary school students must response to the questions. Colors and fonts, font sizes are according to the given instruction. Moreover, a simplicity dominates the PowerPoint slides. The absence of turmoil and chaos facilitates to follow the lesson. Each course participant, had to take notes to the given evaluation form.

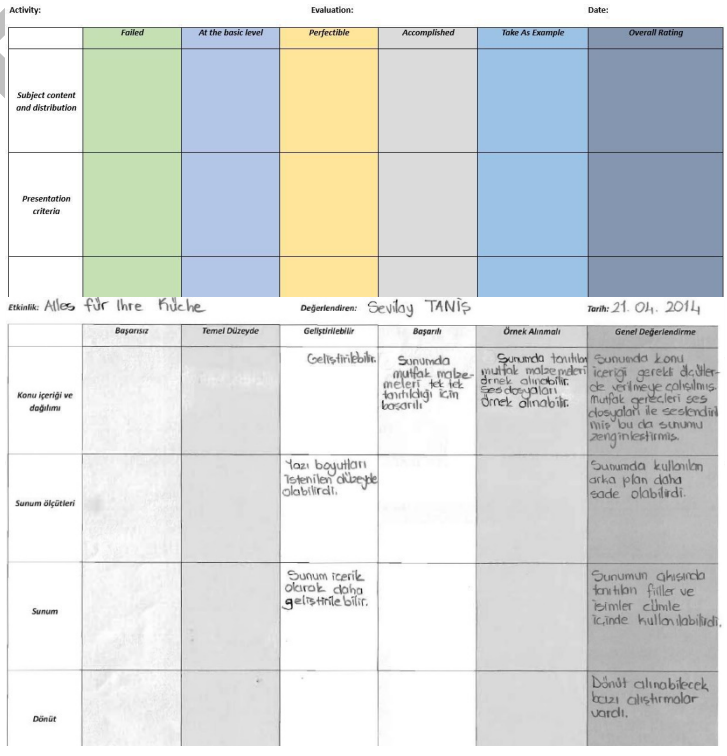

Fig. 4. Evaluation form sample in English.

Fig. 5. Filled authentic evaluation form sample.

The first two columns left are titled with "Failed" and "At the basic level" of the lessons in terms of: Subject content and distribution, Presentation criteria, Presentation and Feedback in up to down sequence. None of the given evaluation forms had this columns filled. The critiques formulated in the third column of this evaluation form that has the title "Perfectible". All aspects have been discussed after reading, even if they was not filled out. Each point had to be justified and explained.

5. Results and discussion

A number of new technologies have emerged in recent years that have been largely regarded and intended for educational use. The influence of technology on the daily teaching life of a foreign language teacher offers increasing the effectiveness and efficiency of teaching and learning. Teachers need to be armed with pedagogical components necessary to provide a technology supported quality course. Efforts to educate German foreign language teacher's to use technologies for teaching in educational processes are in reality efforts to make from teacher's "Edutainers". Without their own experience and awareness, this is not an easy task. Only their own experience, awareness of technology can change instructional practices and learning experiences for the future. Computer-Assisted German Training I-II courses offered ongoing teacher candidates a theoretical and practical starting for their own active use of technology in the classroom in order to concretise their own experience and awareness.

This study investigated the opinions and expectations of 30 ongoing German as foreign language teacher candidates after an experimental active technology use in the classroom. From the Student's point of view, not all courses are suited to technology supported Foreign language teaching; there is often a concern expressed about the time taken to prepare and maintain such courses, motivate students, cope with an expected greater demand from students in technology supported classes, and intellectual property issues. It is especially emphasized that the programs offered in the curriculum also lack in supporting students in establishing a technological teaching philosophy. Teacher candidates reported the importance of offering such kind of courses. If future teachers are expected to adopt current actively use of technology theories, these practices should be compulsory as part of the policy for teacher education programs. Findings revealed that in developing these characteristics, not only contents and processes have a vital role but also the physical environment and teacher educators' tendencies and knowledge have significant effects on the professional development of a future teacher. At this point, participants strongly criticized the physical conditions of faculties of education. Thus, it is strongly recommended that quality of physical conditions should be accepted as a part of an effective teacher education process. The participants of the study reported that educators are insufficient in being role models for ongoing teachers. The educators expect students to develop certain skills and adopt certain teaching methods. However, educators fail to do the same thing; educators tend to use of ineffective and traditional methods of teaching according to the participants. This understanding strongly points to the need for further research in Turkey to examine the attitudes and methods of teacher educators in relation to technology supported teaching and learning.

Students' experiences in using spectrum: textbook or classroom?

Amiza Mohamed Noor, Mohammad Attaran[*], Norlidah Alias
Faculty of Education, University of Malaya, Kuala Lumpur, Malaysia

Abstract

Since the 2000s, many universities have introduced virtual learning environments in their educational system to deliver "blended learning" (BL). The University of Malaya, in Malaysia, launched its BL system, named SPECTRUM in 2010. Five years after its implementation, this research aims to gain a more detailed and deep understanding of the lived experiences of postgraduate students in the faculty of education who have been using SPECTRUM for their learning practice. The research purpose required focusing attention on the qualitative aspects of the experience itself. So phenomenology is chosen as an appropriate methodology to answer the research question. We have used focus group and individual semi -structured interview for collecting data. Results show that students found SPECTRUM as a useful platform in their studies. Lecturers' styles of using SPECTRUM in the classroom contributed to students' experience. They perceive SPECTRUM as an online classroom for interaction and textbook when materials are uploaded weekly.

IETC 2014

1. Introduction

Blended learning (BL) has become an inevitable tool in education on any campus all over the world. Since the 2000s, many universities have introduced virtual learning in their educational system to deliver "blended learning" (BL) (Osgerby, 2012). Since most postgraduate students are also working, they cannot come to campuses all the time for face-to-face meetings and discussions. Therefore, BL is introduced to help students acquire knowledge and exchange ideas through technology anywhere and at any time. A BL system is supported by technology and a combination of teaching techniques including self-study, classroom and on-the-job instruction; fitting with the individual learners' needs (Gray, 2006). That is why University of Malaya has adopted this technology through its system 'SPECTRUM' where students are able to interact according to their various learning styles. This research aims to gain a detailed and deep understanding of the lived experience of postgraduate students in the faculty of education who have been using SPECTRUM for their learning practice.

[*] Department of Curriculum and Instructional technology, Faculty of Education, University of Malay, 50603 Kuala Lumpur, Malaysia, Tel: +603-7967-5134

The term 'blended learning' is recently used by US researchers in their studies on online based teaching and learning (Wakefield, Carlisle, Hall & Attree, 2008; Tselios, Daskalakis & Papadopoulou 2011) However, there are other alternative terms such as "hybrid", "technology-mediated instruction", "web-enhanced instruction", and "mixed-mode instruction" that are used in current research literature (Martyn, 2003). According to Staker and Horn (2012), BL is a formal education program where student learn partially through content and instruction online with some element control over time, place, path and/or pace. From Gray's (2006) training perspective, "BL using an effective learning model with suitable supporting technology coupled to an appropriate mix of teaching techniques such as self-study, classroom and on-the-job instruction, tailored to the needs of each individual learner." Nevertheless, Oliver and Trigwell (2005) argued that BL is concerned with the process of blending media, teaching processes and presentation, rather than students' learning. Sharpe, Benfield, Roberts and Francis (2006), on the other hand, concluded that the term is ill defined, yet remained a useful as it could mean different things to different people.

In this fast developing world, technology has taken center stage in education. Many past researchers have taken an interest in BL and the classrooms. Delivery modes may vary from face-to-face, blended, and fully online. Bleffert-Schmidt (2011) and Risner, (2011) found that no statistically significant difference was found between three different delivery modes which are face-to-face, blended, and fully online. However, general satisfaction and appreciation of the blended modality was observed. Online classroom pedagogy was more student-centered (Ruck, 2012).

McDonald (2012) indicated three different patterns of blended learning in higher education: supplementary learning, interdependent learning and adaptable learning. Supplementary learning is the experience pattern of adult learners when they assign meaning to BL based on perception of face-to-face and online component (McDonald, 2012). Meanwhile interdependent learning is the complimentary relationship between online and face-to-face components of the course to generate greater understanding of the course content, peer and the instructor and adaptable learning is the adaptability of the learning structure and process which learners feel would beneficial between traditional learning or online learning (McDonald, 2012).

In addition, the differences in the course contexts, experience of process and learner orientation influence the meaning of blended learning. Eventually, adequate technical support is important for implementing blended learning Moukali (2012), as well as teacher technical training (Peruso, 2012). In terms of interaction, this indicated that teacher feedback on discussion board lowers student satisfaction as well as grades (Giacumo, 2012). BL also has an influence on teaching practices and behavior. According to McDonald (2012) and Ruck (2012) students are more responsible for their own learning and teachers provide better-personalized assistance, keep better track of student progress, and cover more material in BL. Edginton and Holbrook (2010) research reported on students' initial concerns were on their ability to communicate with the instructor about the online components, but shifted to their own time management skills at the end of the course. However, Shroff and Vogel (2010) observed that students were eager to engage in textual dialogue in the online discussions and participated more compared to the face-to-face discussions.

Blended learning demonstrates positive attitudes, on the students' side, toward the value of intercultural awareness (Risner, 2011). On the faculty development level, adopting blended learning environment leads to improving the educators (Badawood & Steenkamp, 2012). According to Vaughan (2007), the lecturers suggested that blended courses create enhanced opportunities for teacher-student interaction, increased student engagement in learning, added flexibility in the teaching and learning environment, and opportunities for continuous improvement.

2. Research questions

Many past research about blended learning focuses on students' perception and satisfactions with the purpose of evaluating blended learning implementation in the classroom. Little research has been done to understand students' experience of using blended learning in their studies. This research will look at an in depth account and lived experiences of postgraduate students who used SPECTRUM to learn. The research question of this research is as follow:

IETC 2014

- What do UM postgraduate students' experiences in learning through SPECTRUM?
- What contexts or situation influenced UM postgraduate students' to use SPECTRUM?

The focus of this study will be on postgraduate students from the faculty of Education in University Malaya.

3. Research methodology

The purpose of this research requires a focus on the qualitative aspects of the experience. Therefore a phenomenological method is chosen to answer the research question. This method allows data to be analysed and reported in a descriptive and interpretative manner.

Data collection is done through interview with postgraduate students in a focus group and also some one-on-one sessions. Students were chosen by purposive sampling method based on availability and convenience.

Interviews were conducted in semi-formal way that allow students to freely express their experiences in using SPECTRUM. The study was designed to investigate students' experience in using SPECTRUM in their studies as well as their feelings towards the online system. Consequently, researcher plays an important role in the study as an active interpreter.

Postgraduate students from the faculty of education were first contacted to find a suitable time for an interview. Nine students were available for interview. Two interviews were conducted in a group while the rest was one-to-one. Then data was collected through a semi-structured interview. Initial question were asked followed by additional question derived from students answers. Students' responses were then transcribed into text for further analysis. Initial readings of the data were done to find similar concepts or ideas. A second reading was carried to connect the concept or ideas of similar traits.

4. Research findings

The interviews talks could be classified into following themes; Function of SPECTRUM, Lecturers' style of using SPECTRUM and SPECTRUM as a textbook or classroom.

4.1. Functions of spectrum

SPECTRUM is a BL tool that serves several functions to users. Out of the many functions SPECTRUM has, students express that it is useful for them to get notes and submit assignments. They perceive SPECTRUM as a place to share information. One of them says:
"…sometimes when the lecturer is giving notes in the class, PowerPoint, we don't have enough time to write or we miss the class we still can download from the SPECTRUM."

From the above excerpt we can infer that student uses SPECTRUM to download notes prepared by lecturers. There were other instances in the interview where students feel that lecturers who uploaded the PowerPoint notes or other material in SPECTRUM helps in the learning process.
"We just read. We don't have to find other articles... They are provided in the SPECTRUM. It's easier for us. Because some of our friends are working and they don't have time to search for other articles."

Furthermore, students find the function of uploading files onto SPECTRUM helps them save time and energy. In terms of submitting assignments, student express that it is convenient to upload it online than to hand it in personally.

IETC 2014

"We don't have to come here, make an appointment with her just to submit the hard copy."

The data also shows that the word 'time' being used over and again. Whether it is time in the classroom or time outside the classroom, students are aware that SPECTRUM is useful for them to counter the lack of time. Furthermore students log on to SPECTRUM on a weekly basis usually two to three times a day. Their time on SPECTRUM are used for different purposes.

"Between… but it is certainly more than three times. Usually I will log in, let's say I log in on a weekend, skip a day and I'll log in again… For example, if tomorrow there's a class, then this morning I will log in."

However, it is apparent that this habitual log in is dependent on lecturer's activity in the SPECTRUM as well. When asked about when they will use SPECTRUM on their own, a few students say that they will unless the lecturer doesn't use SPECTRUM at all.
"I would share something through SPECTRUM because my friends had done so and I use the information. So of course we have to contribute something too. Unless if the lecturer never use SPECTRUM for their class. It's because everybody won't look at SPECTRUM. Lecturer themselves only log in a few months before."

Student uses SPECTRUM for different purposes such as to share information, get notes or submit assignment. Both full-time and part-time students are aware that by using SPECTRUM to get information from lecturer and friends, it helps them reduce time to look for materials to read and help them focus on their studies. Students recognize the usefulness of SPECTRUM only because the lecturers are active in using the web-application in their class. This brings us to the next theme identified in the data, Lecturer's style.

4.2. Lecturer's style of using spectrum

. Different lecturers have a different but somewhat the same way of using SPECTRUM in the classroom. Based on the interview, we have identified three distinctive ways lecturer uses SPECTRUM which are; Lecturers who uses SPECTRUM fully, Lecturers who only upload notes onto SPECTRUM and Lecturers who doesn't use SPECTRUM at all. Below is an excerpt from one of the interview on the matter:
"There's a lot of way lecturer using it [SPECTRUM]. Some had post material early. So we can read first at home… meaning to say when we enter class we're ready. There are lecturers who teach first. Then they will post [notes] on SPECTRUM. But for me, who is staying in Tapah, I think it's easier if lecturer post it early before rather than later. Plus, if I'm not in class, at least I would get the notes as well. I won't be left behind. However, there are lecturers who doesn't use SPECTRUM too. Those who doesn't use SPECTRUM, we have to fully depend to the class sessions."

Lecturers who use spectrum fully would use some feature in SPECTRUM like the forums for discussions, announcement board, upload notes and the function of submitting papers online. We see a recurrent theme of lecturer's style of using SPECTRUM and students experience. It seems that it is more beneficial to students when lecturers uses SPECTRUM. One student claims that SPECTRUM is beneficial for student who doesn't have time.

"But for people who working, part-time, and then they have other commitments, ok this SPECTRUM, like, some sort like last minute study, it's very helpful, and make the person feel like not so stressful. And can depend on the spectrum and so on."

On the other hand, students believe that even if the lecturer do not use spectrum to upload notes, they should use it to get in touch with students. Without the use of SPECTRUM, it is difficult to get information.

"If he didn't want to put notes, at least he could put announcements or important reminders."

However, it is apparent that the student's purpose of using SPECTRUM is tied to how the lecturers implement it in their classroom. This brings us to the fact that lecturers will introduce SPECTRUM to students. They will brief students on the basic ways of using the application. This gives a chance for students to get familiarized with SPECTRUM. However, the usefulness of this web application takes time to get used to. Therefore, many of the interviewed students had the same thoughts of using SPECTRUM for the first

IETC2014

time; it is a new 'thing' that they have to learn on their own. As for Lecturers who do not use SPECTRUM in their classes, students claimed to experience difficulty and have a negative perception towards it.

"…I'm not familiar with SPECTRUM. It's because when I was in the first semester, I never use SPECTRUM. All my lecturers use e-mail, more towards e-mail or we have our own yahoo group to upload notes. So we don't use SPECTRUM at all. But I'm only just getting acquainted with SPECTRUM this semester."

Without encouragement from the lecturers they would not use SPECTRUM and thus have difficult to get the full benefit of blended learning using SPECTRUM. Furthermore, student will need to learn how SPECTRUM works on their own or with the help of friends. However, students who are introduced to SPECTRUM by lecturers have an advantage of getting acquainted with SPECTRUM faster. Lecturers' style of using SPECTRUM is important to implement blended learning in the courses. If the lecturer's do not use the application, students will not get any beneficial experience from it.

4.3. Spectrum as a classroom or textbook

SPECTRUM is seen as a textbook for some students while others feel as though it is an online classroom. For some classes, lecturers will post notes in a weekly basis. Students feel that with this they are able to keep track of their learning.

"So far for me, it's easy to use SPECTRUM because it is [organized] week by week, it's like a text book. I'll know that this week we'll be learning about what topic because it follows a week by week view."

This type of view is also beneficial to Postgraduate student because most of them prefer to read or go through notes before classes to get a general idea of the lesson. As certain lecturers uses SPECTRUM to upload notes for students before classes; so, students are able to take learning into their own hand. An excerpt from the interview below expresses how students use SPECTRUM as a textbook:

"…in case she [the lecturer] is going to ask us anything and we are still blur, we can still refer to the notes she has given before."
"Especially when the lecturer asks us to read the article … then we really need to study and go through the article. Because sometimes the article is really hard to understand…"

On the other hand, there are lecturers who use SPECTRUM to get students to interact with each other. Here students perceive that SPECTRUM is like an online classroom. The environment set up in the class will determine the environment in SPECTRUM as well. Student says that if the lecturer exudes a negative aura, then they will feel the same way in SPECTRUM.

"It's like going to an online class…."

"You have to be formal. You cannot post something however you like. We have to think twice before we post. Is our grammar right? Just in case the lecturer will read it. Because it's just like being in class."

There is a wall between the student and educator that impedes students from expressing themselves freely. They believe that they should always be professional and formal in the class. Therefore, when blended learning is introduced, they see it as an online class where everything is formal which leaves little room for ad-lib or development of character. Students see SPECTRUM as a textbook for them to keep track of their studies but when interaction takes place in the forum, they see it as an online classroom to discuss further about the topic of the week.

5. Discussion

Analysis of the interview transcription shows various interesting points from students experience with SPECTRUM. All students agree that SPECTRUM was a useful platform in their studies. This is similar to past research on students' perception on BL (look at Edginton & Holbrook, 2010; Tselios, Daskalakis, & Papadopoulou 2011; Uğur, Akkoyunlu & Kurbanolu, 2011; Smyth, Houghton, Cooney & Casey, 2012). Students are more aware of the usefulness of BL after using the system (Edginton and Holbrook, 2010). In

IECT 2014

terms of using BL in the classroom, results of this study show that students need time to familiarize with how spectrum works. Students will get use to SPECTRUM if lecturers use it in their classrooms. However students who meet with lecturers who never use spectrum at all in the first semester will need more time to adjust. According to Wakefield, Carlisle, Hall and Attree (2008) students did not engage with the e-learning resources probably due to lack of awareness regarding the e-learning component and inconsistent access to computing facilities. Postgraduate students in our study had no trouble with connectivity. However, even with lack of knowledge in the use of SPECTRUM, students will inevitably learn to use the online application. Student priorities persist that teacher presence is a vital component for student's success and satisfaction (Peruso, 2012).

Students experience SPECTRUM as an online classroom when interaction is required in the forums but it is more used as a textbook when educators only upload the learning materials. This allows students to have greater time flexibility and improve their learning outcomes (Vaughan, 2007). However, Smyth et. al. (2012) mention in their students that the online component was more invasive on students everyday life as they had less time for break from studying. In our study, students were given a choice to read the notes before or after the lectures. This increases their learning time and was not in any way forced. In a research done by Akkoyunlu and Meryem Yilmaz Soylu (2008) on thirty-four students at Hacettepe University learning styles and views, results shows no significant differences between their achievement level and learning styles. Even though the information gathered here are deem useful to gather initial ideas of what the students experience and in what context, there are some limitations to the current study that could be addressed in future research. This study did a purposive sampling method and therefore could not have covered the vast range of students in the faculty. Further study could also be done to find teachers experience in using spectrum seeing as teachers play a larger role in enhancing students experience in using spectrum. Another criteria that could be taken into account are the type of student the faculty have, such as local students or foreign students.

Students' perception of mobile augmented reality applications in learning computer organization

Nazatul Aini Abd Majid98, Hazura Mohammed and Rossilawati Sulaiman
Fakulti Teknologi dan Sains Maklumat, Universiti, Kebangsaan Malaysia,43600 Selangor, Malaysia

Abstract

Augmented reality is a human-machine interaction tool that presents information generated by computer on the real world using a camera. Augmented reality technology has the potential to draw students' attention to visualize a layer of information on real objects using handheld devices such as tablets and smartphones. The objective of this study was to assess students' perception of the use of augmented reality in learning microprocessor. Therefore, a mobile application was designed and developed by integrating elements of augmented reality for teaching and learning this topic. This study was conducted based on the ADDIE model that consists of five phases: Analysis, Design, Development, Implementation and Evaluation. The study found that students' perception of the use of augmented reality is positive based on the average mean score. However, the disadvantage of this application is the use of images as compared to the use of real microprocessor as the learning object. An area for future study is to assess the students' perception of the use of real objects as the learning object in using mobile augmented reality application.

Keywords: mobile augmented reality; teaching and learning; computer science

IETC 2014

1. Introduction

Computer organization and architecture is one of the core subjects in the computer science programs. The importance of this subject was stated in the IEEE / ACM Computer Science Curriculum 2008 report in which all computing students need to gain an understanding and appreciate the functional components in a computer system, its features, performance and also the interaction between the components (Stallings, 2013). One of the main components which is also the most complex component in the computer system is the central processing unit (CPU) or microprocessor. Providing a learning environment that can engage students to learn continuously this complex component is difficult because the materials are very theoretical and hard to visualize. Thus, there are several learning tools that have been developed such CPUsim tool for simulating the operation of microprocessor (Mustafa 2011). However, there is still a lack of teaching aids that links between theories and the real microprocessor.

The problem in engaging students in learning this complex material has motivated this study to use augmented reality (AR) technology as one of the learning technology. The aim of this study is to identify the students' perception towards the use of AR technology in learning complex materials. Therefore, the objective of this study is to design and develop an AR based application for learning microprocessor, and evaluate students' perceptions on the use of AR in learning this complex subject.

2. Background

AR technology was born after virtual reality technology. Virtual reality replaces reality with a simulation. On the other hand, in AR technology, a view of a reality can be modified by addition of digital information so that it can improve a person's perception of the reality. In AR, there are four main components: (1) a camera to capture a target information, (2) marker which is the target information, (3) mobile phones to store and process information when the captured image is the target information (marker), and (4) digital content is the content that will be displayed on the screen when the camera is able to track the marker. Fig. 1 shows an example of an AR application where the marker is a real memory stick called random access memory (RAM). When the camera phone has tracked the RAM, the phone will then display digital information associated with the marker on the screen.

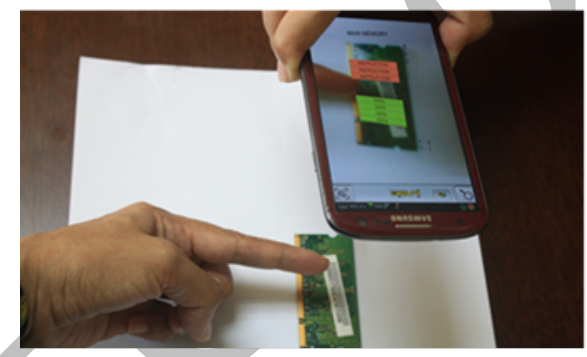

Fig. 1. AR technology can add digital information on the real object through the mobile phone screen

Now, the use of AR in education has become more widespread and practical. Table 1 shows four main features for some applications in education. These features are: environment, instructional approach, level and peripheral. The first application, Alien Contact! (Dunleavy, Dede et al. 2009), for example, is developed for outdoor environment. The instructional approach for this application is based on role, the level is school and the peripheral used is handheld devices. Instructional approach is classified based on the use of AR in which Wu et al (2013) divided the usage into three categories: role, task and instruction. AR-Dehaes toolkit (Martín-Gutiérrez, Saorín et al., 2010) is an application that is based on task. This application had positive responses from engineering students. Therefore, the question of this study is whether a mobile AR based application can get positive response from computer science students in learning complex materials?

Table 1. Examples of AR application in education

Application	Environment	Instructional design	Level	Peripheral
Alien Contact! (Dunleavy, Dede et al., 2009)	Outdoor	Role	School	Handheld devices

ACCampus (De Lucia, Francese et al. 2012)	Outdoor	Location	University	Handheld devices
EULER (Liu et al., 2009)	Outdoor	Task	School	Handheld devices
AR-Dehaes toolkit (Martín-Gutiérrez, Saorín et al., 2010)	indoor	Task	University	Desktop

3. Methodology

The ADDIE model has been used as a research methodology. In this model, there are five main phases of analysis (A), design (D), development (D), implementation (I) and evaluation (E).

3.1. Analysis

In the analysis phase, the content of the application was selected based on a specific topic in the computer organization and operating systems course. Since microprocessor is an important topic in this subject, a set of exercises has been identified with four main sub topics:
(1) Introduction
(2) The main functions of microprocessor
(3) Components on a motherboard
(4) How microprocessor processes data

3.2. Design

In the design phase, the application was designed based on five layers: application, the application programming interface (API), Metaio software development kit (SDK) and operating system. In the first layer (application layer), the main focus is user interface and logic operations. There were four main buttons for four different sub topics. In the second layer (API), Android SDK based on Java was selected. The third layer involves Metaio SDK where there are three major components: capturing, tracking and rendering. Capturing component will capture images from the camera. Then, the tracking component will process the image based on the specified markers. In this study, an image of a motherboard was used as a marker. When images recorded by the camera have been identified similar with the marker, then the rendering component will display the specified digital content on the mobile phone screen. The last layer in this architecture is the operating system where android mobile phone platform was chosen in this study.

3.3. Development

In the development phase, three tools have been used:

- Eclipse Integrated Development Environment (IDE) for the development of the Android platform using the Java
- Metaio SDK for the development of AR applications
- GIMP for image editing

In the development phase, the main interface has been developed where there are five buttons, A, B , C , D and E. The E button is for non-academic content. When students click button A and track the image of a motherboard, digital materials displayed on the screen is a video. Students need to answer some simple questions based on the video. When students click button B, the digital information is displayed on the screen along with the audio that explains the concepts and basic functions of a microprocessor. To increase students' knowledge about a number of components on a motherboard, students can click button C

IETC 2014

to see a list of labels for the main components related to microprocessor. Button D is to help students in identifying how the microprocessor, main memory and bus are working together in the execution of a command. Button E is also included in the application to provide an opportunity for students to relax during practice. When students click button E, a 3D model is displayed on the screen of the mobile phone.

3.4. Implementation and evaluation phase

The fourth phase of the methodology is implementation where the application was used by 24 students in a lecture room while learning computer organization and operating systems course. Students were allocated to a small group where each group consisting of two to four students. Each group used a tablet that was installed with the application. The groups were required to discuss how to solve a set of exercises that have been developed based on digital information displayed on the mobile phone screen. The fifth phase is the final evaluation phase where each student will fill out a questionnaire to determine the level of satisfaction of using the AR application. Questionnaires used in the form of a five point scale adapted from Martín-Gutiérrez, Contero et al. (2010).

4. Results and discussion

Descriptive statistical analysis was carried out to identify the satisfaction level of using the developed AR application in learning complex materials. The mean and the frequency, scale of 4 to 5, were calculated to identify the level of student satisfaction for using the application. It can be seen from Table 2 that item 4 has the highest level of satisfaction with min 4.54 and frequency 24. While item 7 has the lowest level with a mean value of 3.92 and a frequency of 1. The overall mean for each of the attributes are in the range of 3.92 to 4.5. This indicates that the respondents were satisfied with the use of the AR based application in learning microprocessor. Two responses of students who support item 4 are as follows:

"*AR allows content to be more interesting for students to learn and students are more attentive when learning*"
"*This application can be used as a learning tool to attract students*"

This positive response is as expected where AR applications such as AR-Dehaes (Martín-Gutiérrez, Saorín et al., 2010) also received a positive response from the students.

Table 2: Frequency (scale of 4 to 5) for the satisfaction of using mobile apps AR

Item	Satisfaction	Frequency	Mean
1	I am motivated to use AR in learning	23	4.38 (0.58)
2	AR technology is attractive to use in learning	23	4.29 (0.55)
3	Do you think the use of AR can improve spatial skills	22	4.33 (0.64)
4	AR technology is attractive	24	4.54 (0.51)
5	AR technology seems original	10	4.46 (0.72)
6	AR technology seems useful	24	4.16 (0.38)
7	AR technology seems satisfactory	17	3.92 (0.65)
8	Technology AR seems flexible (you can do the training either at university or in your room)	22	4.08 (0.72)

During the implementation of AR technology in learning microprocessor, students enjoyed, interested and active in discussions to complete the tasks. Fig. 2 shows the situation where each student in the group actively gives their opinion in completing the tasks. AR appears to increase student motivation and interest where some students want to practice using AR in the future as shown below:

IETC 2014

"*Need a lot of tasks that use mobile AR for every student*"
"*Do more exercises in class with proper supervision from lecturers*"

Fig. 2. Students discuss actively to solve the problem using mobile application based on AR

In terms of flexibility, there were some students who did not agree with item 8 which is AR technology seems flexible. This may be due to some students who did not have a mobile phone or tablet that supports this AR application. AR application requires Android platform 4.0 and above. Feedbacks from students on the use of devices are:

"*Must have affordable device and use the device to do the assignment and presentations*"

However, there are still many a number of students who support that AR seems flexible. One of the comments related to this is:

"*Students can learn and study everywhere*"

For item 7, AR technology is satisfactory, had the lowest mean score, 3.92. This may be because there are some limitations of the developed AR applications. Some comments related to this situation are:

"*Learning using AR can be improved by clear and better audio, sharp visuals and explanation*"
"*Better sound or voice, clear image and video*"

Low mean score may also relate to the use of an image as a marker, not a real object. This is because Azuma et al. (2001) stated that digital information in the form of 2D can be beneficial for collaborative activities, by allowing the spread of information in the physical world. Therefore, further research uses real 3D objects as a marker would be very interesting because this new technology allows us to manipulate real objects as the learning object.

5. Conclusion

s

An AR mobile application has been designed and developed in this study in order to identify students' perceptions in learning complex materials in a computer science course. This application was implemented to 24 second year students who took computer organization and operating system course. Results of the evaluation showed that most of the students were motivated to

IETC 2014

use AR in learning. They also think that the application was useful and attractive. However, there were students who did not have suitable devices for using the AR based application. In the future, it would be most likely that there are many students who will have suitable devices so that they can use this application in and outside the classroom.

Synchronous and asynchronous e-learning styles and academic performance of e-Learners

Mehdi Mehri Shahabadi[a] Megha Uplane[b]99

[a] Research scholar, Department of Education and Extension, University of Pune, Pune-411007, India

[b] Associate professor, Department of Education and Extension, University of Pune, India

Abstract

It is important to keep in mind that every individual is a unique learner. Educators have, for many years, realized that some learners prefer certain methods of learning. These methods, referred as learning preferences or learning styles. This study was aimed to ascertain the learning styles of students in mode of synchronous and asynchronous e-learning and to compare the learning styles of e-learners with their academic performance. Synchronous or asynchronies e-learner determiner test and the Kolb's Learning Styles Inventory (KLSI 3.1) were conducted to identify differences in the learning styles among 731 e-learners from six virtual universities which were confined in Tehran and categorized in three different academic performance groups including low, mediocre and high . The sample was selected by multi-stage sampling based on Cochran formula and researchers conducted Kruskal-Wallis test to assess whether there is any significant difference within synchronous and asynchronous e-learners' learning styles based on their academic performance groups. The results revealed that in synchronous e-learners while, synchronous e-learners in low, mediocre and high academic performance groups preferred Assimilating and Diverging styles. In contrast, the results demonstrated that asynchronous e-learners in low, mediocre and high academic performance groups preferred Assimilating and Converging styles. Researchers conducted Mann-Whitney U as Post Hoc and their effect size value was calculated for significant Post hoc tests.

Keywords: Learning style; Academic performance; Synchronous; Asynchronous; e-Learner

IETC 2014

4. Introduction

The review of each one of the recent learning theories has shown an emphasis on the role of learners as major point of any learning process which has become popular among the educators. Basically, individual differences are effective on the process of learning among learners so, today this principle has become a natural reality as the ancient great philosophers believed it.

The approach of the learner-oriented in instruction has emphasized on the influence on the part of the learners about the content, activities, materials, and pace of learning. This approach is more popular than the other approaches which as four foci's including knowledge-oriented, learner-oriented, assessment-oriented, and community-oriented. The concept of these approaches have considered the individual differences as the most concerned role for the learners (Froyd & Simpson, 2008). An example to practical

* Corresponding author. Tel.: +919225803190; fax: +0-000-000-0000 .
E-mail address: meghauplane@gmail.com

development and necessity to improve and adapt the above mentioned approaches which are reflected to one of the major challenges, published in a report entitled "A Nation at Risk".

Concurrent with stressing on recent advancements in educational technology, researchers believe that learning environment is one of the causes to satisfy the learners' diverse requirements. The developed web systems particularly brought about a revolutionary phase in education by bringing an alternative "anytime and anywhere" learning delivery methods for online learners around the world (Zolfaghari, Shatar Sabran, & Zolfaghari, 2009).This kind of advancement in educational technology has produced many benefits for both individual learners and organizations in several ways. Individual learners take advantage of self-paced learning environments in which they have control over their pace of learning, information flow, selection of learning activities, and time management.

Personalization of learning environment is a phenomenon which emphasis on effective individual characteristics during a learning process. It has become important gradually when distance learning has become more electronically. It is a process that emphasis on learning-oriented process and learning style of the learners is a determinant factor in improvement of any learning process. Regarding the necessity to facilitate the learning process as ultimate purpose in any ICT-based environment, recent theories related to learning and educational psychology should be considered. It becomes more important when education has not any access to target e-learners. Virtual University and e-learning centers provide opportunities for e-learners to learn at their own paced and their learning style.

Unfortunately, quick developing of online learning environments and growing demand in the extension service for e-courses without research by researchers and educators being equipped with the necessary skills required for successful completion has created some issues which need comprehensive consideration. Undoubtedly, taking advantages of all research and researchers in case of learning styles of learners in online learning environment are impossible. Considering these issues of learning styles, the authors strive to focus on the above questions and answers via review of the theoretic frameworks and foundations.

4.1. Learning styles and effective factors

A literature review on learning styles introduced them as individual preferences which are as per the individual and differ from one learner to the others (Dunn, 2000; Felder, 1996; Honey & Mumford, 1999; Kolb & Kolb, 2005; Peter, Bacon, & Dastbaz, 2009; Ramayah, Sivanandan, & Nasrijal, 2009). Hence, learning styles of students are affected by some variables, study of these situations are necessary (Ally & Fahy, 2004; Garland & Martin, 2005; Honigsfeld & Dunn, 2003; Lau & Yuen, 2010; Sanders & Hausler, 2007; Shukr, Zainab, & Rana, 2013; Slater, Lujan, & DiCarlo, 2007; Smith, 2008; Terrell, 2002).

Review of definitions in learning styles show that one of the most effective factors in distinguishing the learning styles from other similar concepts such as cognitive styles or thinking styles is depends on relation between learning styles and learning environment(Dinn, 2009). Although, several theorists have described the learning style but Keefe's definition is repeated due to its consideration on individual differences and its relation with learning environment as an indicator in distinguishing the learning styles from other concepts including cognitive styles or thinking styles.

Keefe (1979) defined learning styles as the "composite of characteristic cognitive, affective, and physiological factors that serve as relatively stable indicators of how a learner perceives, interacts with, and responds to the learning environment"(Keefe, 1979).

The major effective factors on learning styles have been considered in a long spectrum including several factors. Garner, Furnam, Jackson, and Miller believe that the behavior associated with the four basic learning styles are shaped by transactions between people and their environment at five different levels of personality, educational specialization, professional career, current job role, and the adaptive competencies are most effective factors (Kolb & Kolb, 2005).

Although, the above mentioned researchers have considered on some factors while, others highlighted different factors which can influence on learning styles such as culture, school atmosphere, expectations, teaching style and classroom practices. Given and Reid (1999) have classified these factors into social variables, personality types, modality preference, cognitive processes, movement and later alit and emotional factors. Dunn (2000) believes that four learning-style traits significantly differentiate between groups and among individuals within the same group. They differ by achievement level, gender, age and culture.

4.2. Kolb's learning style theory

The authors used *Kolb's Learning Style Theory (*KLSI) which is on the basis of Experiential Learning Theory (ELT) and that is built upon the idea that learning preferences can be described by using two continuums: active-reflective and abstract-concrete. It creates four types of learners: active-abstract (Converging), active-concrete (Accommodating), reflective-abstract (Assimilating), and reflective-concrete (Diverging). The LSI is designed to determine an individual's learning preference (Esichaikul & Bechter, 2010).

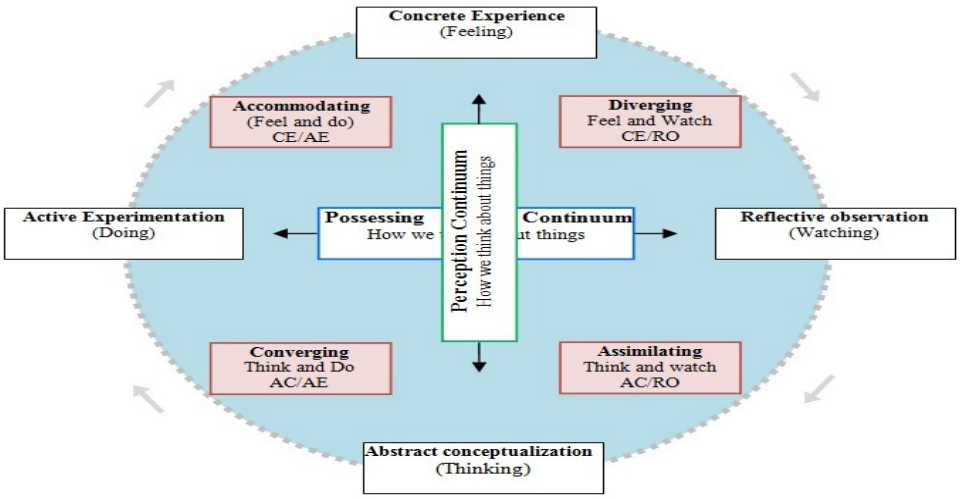

Figure 1. Kolb's learning styles cycle

4.3. Synchronous and asynchronous e-learning

Online learning due to the use of advanced and sensitive tools enables the e-learners to apply those tools which are adapt to their individual preferences. This (personalized the learning environment) is a process that any modern educational theories have emphasized on it. Today, the preferred learning style is as one of the most important criteria for recognizing any individual differences in learning process which have been considered for adaptability. Sabine Graf (2007) has mentioned this as a necessity and stated that adaptability includes all facilities to customize the system for the needs of the educational institutions (Graf, 2007).

Methods of providing e-content in an online classroom, instructors, learners, interactive tools, modes of interaction and many other factors in online learning modes are classified into two modes including synchronous and asynchronous e-learning. This part focuses on the mentioned modes and some concerned issues.

Synchronous e-learning have been expanded due to proven demands in various eras such as education. In the online educational environment, there is no physical meeting. Synchronous and Asynchronous learning tools, such as threaded discussions, instant messaging and blogs, play an important role in humanizing online courses by replicating the classroom experience of information exchange and social construct, not just between learners and instructors but among the learners as well.

People might just know it by reference to a particular vendor, tool or software program that enables the creation and delivery of synchronous e-Learning. Synchronous e-learning is live, real-time (and usually scheduled), facilitated instruction and learning-oriented interaction.

In this type of learning, learning experiences are live and real-time. The roots of synchronous e-learning are derived from three main influences: the classroom, the media, and the conference (Clark et al., 2007). Several researchers provide a comprehensive definition of the synchronous e-learning which is unanimous and it must include two components. They are interactions and time. Khan (2006) on the basis of these components defines Synchronous e-learning as "Interact of participants with an instructor via the Web in real time" (Khan, 2006).

Asynchronous online learning is defined variously due to some components, its nature and facilities that are common in some characteristics. On the other hand, one of the popular definitions that focus on the components of asynchronous e-learning introduced it as "an interactive learning community that is not limited by time, place or the constraints of a classroom"(Mayadas, 1997).

Asynchronous e-learning is similar to synchronous e-learning which is a learner-centred process which uses online learning resources to facilitate information sharing regardless of the constraints of time and place among a network of people. Asynchronous e-learning takes advantage of computer-mediated communication (CMC) to achieve the promises of learning "anytime and anywhere" through asynchronous online discussions. Asynchronous e-learning is on the basis of constructivist theory, a learner-centred approach that emphasize on the importance of peer-to-peer interactions. This approach combines self-study with asynchronous interactions to promote learning, and it can be used to facilitate learning in traditional on-campus or regular education, distance education and continuing education. This combined network of learners and the electronic network in which they communicate are referred to as an asynchronous e-learning network.

IECT 2014

The conditions and factors driving the Asynchronous e-learning are different so, this method is defined by another component. Khan (2006) on the basis of these components mentioned that "Asynchronous learning refers to instruction that is not constrained by geography or time" (Khan, 2005).

4.4. Academic performance

Academic performance is multidimensional variable which might be affected by internal and external classroom factors so the authors assumed the different learning style as a determiner of classroom factor in relation to the different academic performance groups.

In fact, this study follows an outcome-centric approach which has attempted to classify academic performance in terms of the learning outcomes that are designed to match, or the particular competencies that are designed to measure. Thus, the outcome-centric approach is a taxonomy process and then overall generality of the taxonomy can have advantages and disadvantages. The general nature of the taxonomy means that it is easily applicable across the different disciplines (Anderson, Krathwohl, & Bloom, 2001; Semper, 2008).

Researchers are eager to assess the learning styles of e-learners in different modes of e-learning and their academic performance. Thus, researchers based on above mentioned approach, and necessity to evaluate whether there is any significant difference between successful academic performance groups and particular learning styles in the mode of synchronous and asynchronous e-learning or not. On the basis of nature of academic performance and outcome-centric approach of the research and three existent groups of academic performance in educational system and higher education of Iran selected three different levels of academic performance for the study. The categories are on the basis of average marks of the last two semesters of the sample and the authors have transformed them to the Grade Point which has achieved by each one of the sample. They include low (0-13 out of 20 as the maximum marks which everybody can obtain from an exam), mediocre (14-17 out of 20 as the maximum marks which everybody can obtain from an exam) and high (18-20 out of 20 as the maximum marks which everybody can obtain from an exam). It should be noted that in a graduate degree, the students who obtain an average which is less than 12, are considered failed students while, in post graduate degree the fail criteria is 14. Researchers eliminate the students who have average marks less than 10 or very low academic performance.

1.5. *Objectives of the study*

- To determine learning styles of synchronous and asynchronous e-learners
- To compare learning styles of synchronous and asynchronous e-learners based on their academic performance groups
- To compare learning styles of synchronous and asynchronous e-learners

1.6. Research questions

- What are preferred learning styles of synchronous and asynchronous e-learners?
- Is there any significant difference in learning styles within different academic performance groups of synchronous e-learners?
- Is there any significant difference in learning styles within different academic performance groups of asynchronous e-learners?
- Is there any significant difference in learning styles of synchronous and asynchronous e-learners?

2. Methodology of the research

IETC 2014

Regarding the objectives of the research, the authors have applied multi methods to interpret different research types based on research requirements. Researchers used survey method for description of the learning styles while; researchers used casual-comparative method in order to compare the learning styles of synchronous and asynchronous e-learners based on their academic performance.

2.1. Sampling and sample

Sample size: The researchers regarding the two modes of virtual learners (Synchronous & Asynchronous) and by *Synchronous or Asynchronous e-learner test* selected 388 Synchronous and 343 Asynchronous e-learners from six virtual campuses which were confined in Tehran. The total sample size for the study includes 731 e-learners. The authors conducted the sampling procedure within virtual universities by multistage sampling design as follow:

In the first stage, the authors selected all colleges and Universities which had presented their course in online mode. These Universities comprise of twenty e-learning centers and virtual Universities in Tehran. In *the second stage* the authors selected six universities out of twenty by simple random sampling. In the *third stage,* the authors selected all the students of these Universities and sent the e-questionnaires to all of them. *In the last stage* of sampling of e-learners, the authors selected the sample of the study by stratified random sampling from those who filled up the e-questionnaires in each of the online circumstances including synchronous and asynchronous e-learning environment. For this procedure, Universities have linked the e-questionnaire and students have filled up and duly submitted the same. Due to the large number of completed e-questionnaires Lottery Sampling technique was administrated.

2.2. Data collection tools

Synchronous or asynchronous e-learner test: a questionnaire for e-classes:

The authors developed an instrument which is suitable to determine the preferred or the most used mode of learning among e-learners in online learning environment. The instrument has focused on the measure being used by admitting students in synchronous e-learning classes in order to determine mode of learning environment. This questionnaire includes 22 questions and is related to the synchronous e-learning classroom (e-classroom), tools, preferred e-facilities, attending issues, trainers, and its affiliated modes that are synchronous or asynchronous learning. Questions were asked to the virtual students purposefully and indirectly about the preference types, available methods which are provided and commonly used instruments by the students through online environment. The main objective of the questionnaire was distinguishing synchronous from asynchronous learner. Likert scale is used and each question is rated on five–point scale of distress (1-5) ranging from "Strongly Disagreed" to "Strongly Agreed".

Kolb's Learning Styles Inventory (KLSI V.3.1):

The authors have used Kolb's Learning styles Inventory (KLSI V.3.1) as a main instrument of the study. This form of the Kolb's Learning styles Inventory (KLSI V.3.1) created by instruments of Google Docs in e-format. This form of the inventory is suitable for synchronous and asynchronous e-learners. The e-format of the instrument linked to website of selective virtual Universities that are as sample of the study after allowing by the Universities (Appendix-B certificate of the institutes). This instrument is consisted of twelve sentences, with a choice of endings. The respondents were asked to rank the four endings for each of the sentence according to their preferences about their learning.

2.3. Reliability of the research tools

Conducting a pilot study in this study was necessary because the authors have used different tools such as e-instrument. To assess the above mentioned purposes, doing a pilot study was essential. The researc-

IECT 2014

hers have conducted the instrument among 37 virtual students and Cronbach's alpha through test-retest design during three weeks was found a= 0.752.

2.4. Statistical tools

The authors used nonparametric statistical tools considering some criterions. The obtained data from determiner Synchronous or Asynchronous e-learner test and Kolb's Learning Styles Inventory were categorized in rank or ordinal scale and due to serious violation to the assumptions of parametric data, the authors used nonparametric tests(Pagano, 2013). The authors used Kruskal-Wallis H Test and the Mann-Whitney test used as Post Hoc test and their effect size value was calculated for significant Post hoc tests. effect size in some nonparametric tests such as Mann- Withney U and Kruskal-Wallis which are used in this study are computed through division of Z on N square $(r) = \frac{|Z|}{\sqrt{N}}$ (Corder & Foreman, 2009). Researchers analyzed data by SPSS.

3. Results of the study

In order to examine the differences between learning styles of students based on variables of the study in two different modes of learning, the authors analysed the research questions in three parts. Based on this classification, researchers in first part determined learning styles of synchronous and asynchronous e-learners and second part was considering to the differences of learning styles within different academic performance groups. Finally, researchers compared preferred learning styles in mode of synchronous and asynchronous learning along with comparing on the basis of different academic performance groups.

1. What are preferred learning styles of synchronous and asynchronous e-learners?
This research question was relevant to the first objective of the research which is stated as follows: *"To determine learning styles of synchronous and asynchronous e-learners".*

Table 1. Distribution of Learning Styles of students based on mode of e-learning

Learning Style		Diverging	Assimilating	Converging	Accommodating
Synchronous	Frequency	146	181	37	24
	Percent	37.6	46.6	9.5	6.2
Asynchronous	Frequency	78	89	127	49
	Percent	22.7	25.9	37.0	14.3

a. Mode = Synchronous Vs Asynchronous

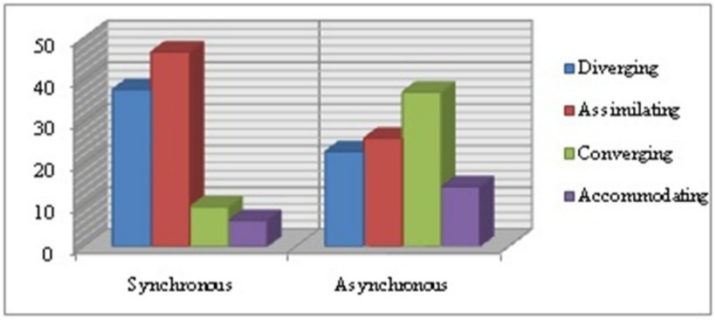

Figure 2. Distribution of Learning Styles of students based on mode of e-learning

Interpretation: Table and concerned figure show in mode of Synchronous e-learning, most of the students preferred Assimilating while, Diverging was preferred as the second learning style in Synchronous e-learning environment and Converging and Accommodating learning styles were preferred subsequently. In contrast, in mode of Asynchronous e-learning, e-learners mostly preferred Converging learning style while, Assimilating, Diverging and Accommodating were preferred as their learning style preferences subsequently.

2. Is there any significant difference in learning styles within different academic performance groups of synchronous and asynchronous e-learners?

This research question was relevant to first objective of the research which is stated as follows: *"*To compare learning styles of synchronous and asynchronous e-learners based on their academic performance groups*".*

The authors in order to examine the differences in learning styles of students within different academic performance groups and in two different modes of learning, analysed data through Kruskal-Wallis Test for each mode of e-learning separately. These processes continue with conduct Mann-Whitney *U* test as Post Hoc for those results which were significant. Thus, due to above mentioned reasons, the first and the second research questions and based on differences in learning styles within Low, Mediocre and High academic performance groups in two mode of e-learning, conducted statistical analysis presented in following Ranks table and Kruskal-Wallis table.

Table 2. Output of Rank table on the basis of Academic Performance Groups

No.	Environment	Academic Performance Groups	Frequency	Mean Rank	Preferred style	Total
2	**Synchronous e-learning**	Low:10 -13 out of 20	122	229.76	Assimilating	388
		Mediocre:14-17 out of 20	210	182.60	Diverging	
		High:18-20 out of 20	56	162.29	Diverging	
3	**Asynchronous e-learning**	Low:10 -13 out of 20	88	152.69	Assimilating	343
		Mediocre:14-17 out of 20	197	180.66	Converging	
		High:18-20 out of 20	58	171.88	Assimilating	

The output of Kruskal-Wallis Test for each one of research questions based on differences in learning styles within three academic performance groups of the students in three different environments summarized in the following Kruskal-Wallis Test table.

Table 3. Output of Kruskal-Wallis Test based on Test statistics

		Test Statistics[a,b]		
No.	**Test**	**Chi-square**	**df**	**Asymp. Sig.**
2	**Synchronous e-learning**	22.559	2	.000
3	**Asynchronous e-learning**	5.246	2	.073

a. Kruskal Wallis Test

b. Grouping Variable: Academic Performance

A Kruskal-Wallis test was conducted to determine whether statistically significant difference between learning styles in different academic performance groups in synchronous and asynchronous modes of

learning separately. The results of the analysis interpreted in separate research questions as "2. Is there any significant difference in learning styles within academic performance of learners in synchronous e-learning environment in Tehran Universities?"

Interpretation: A Kruskal-Wallis test was conducted to determine whether statistically significant difference between learning styles of students and different academic performance in Synchronous e-learning environment. The results indicated that whether x^2 =22.559 (df =2, N = 388) is larger than the critical value of the Kruskal-Wallis (5.99) while, p= .000< 0.05 = α. The students of low academic performance recorded a higher median score (Md = 229.76, N=122) than the other academic performance groups while, mediocre performance group recorded the second median (M =182.60, N=210) and high academic performance group recorded the last median (Md = 162.29, N=58). Thus, there exists enough evidence to conclude that there was a significant difference in learning styles within academic performance of students in synchronous e- learning environment in Universities of Tehran.

The results of the analysis indicated in the third question as "3.Is there any significant difference in learning styles within academic performance of students in asynchronous e-learning environment in Universities of Tehran?" there was no any statistical significant difference in observed variables. The results demonstrated as follow:

Interpretation: A Kruskal-Wallis test was conducted to determine whether statistically significant difference between learning styles of students and different academic performance groups in asynchronous e-learning environment. The results indicated that whether x^2 =5.246 (df =2, N = 343) is less than the critical value of the Kruskal-Wallis (5.99) and p= .073> 0.05 = α. Mediocre performance group recorded a higher median score (Md = 180.66, N=197) than the other groups while, students in high academic performance group recorded the second median (Md = 171.88, N=58) and low academic performance group recorded the last median (Md = 152.69, N=88). Thus, the authors found out that there was no significant difference in learning styles within academic performance of students in asynchronous e-learning environment in Tehran Universities.

A Post Hoc: Mann-Whitney U

Mann-Whitney U is a Post Hoc test which is applicable whenever the analysis of Kruskal-Wallis test is significant. In order to determine most effective factor in significance difference among three groups that were including Low, Mediocre and High academic performance, the authors conducted Mann-Whitney U as Post Hoc test between each two academic performance groups and the results were categorized in the table 4. It should be noted that the authors have not done any Post Hoc analysis for asynchronous e-learning. Regarding the above mentioned, due to not having any significance in the results of Kruskal-Wallis Test so, conducted Mann-Whitney U as Post Hoc test in asynchronous e-learning environment was not required.

IETC 2014

Table 4. Output of Mann-Whitney U Test as *Post Hoc test* within academic performance for synchronous e-learners

Environment	**Academic Performance**	**Mann-Whitney U**	**Wilcoxon W**	**Z**	**Asymp. Sig. (2-tailed)**	**N**	$(ES) = \frac{\lvert Z \rvert}{\sqrt{N}}$
Synchronous e-learning	Low & Mediocre	9723.500	31878.500	-3.997	.000*	332	0.22
	Low& High	2200.500	3796.500	-4.287	.000 *	178	0.32
	Mediocre & High	5292.000	6888.000	-1.253	.210	266	-

A Mann-Whitney *U* test was conducted to evaluate and determine the research questions related to significant difference between learning styles and academic performance groups of students including low, mediocre and high academic performance groups. The results of the analysis show that the major and root causes of these differences in synchronous e-learning and regular learning were due to differences between learning styles of one academic performance group with another or others. The authors summarized them as follow:

Interpretation: A Mann-Whitney *U* Test was conducted and the results indicated that in Synchronous e-learning, analysis of differences between learning styles of students among low and mediocre academic performance groups was a significant while, U=9723.5 (N=332), z= -3.997>1.96 and *p*=.000< .05=α. The results show a mediocre ES of academic performance groups on learning styles (ES=0.22). At the same time, it repeated among Low and High academic performance groups while, U=2200.5(N=178), z=-4.287>1.96 and *p*=.000<.05=α. The results show mediocre ES of academic performance groups on learning styles (ES=0.32).

The results of the Mann-Whitney *U* test indicated in synchronous e-learning environment differences between learning styles of low and mediocre academic performance groups and low with high academic performance groups was a major reason for having the differences in learning styles of students.

It was necessary to compare the learning styles of learners in mode of Synchronous and Asynchronous. Thus, authors considered on a separate question to asses this research question as follow:

4. Is there any significant difference between learning styles of learners in mode of Synchronous and Asynchronous in Universities of Tehran?

This research question was relevant to third objective of the study which is *"*To compare learning styles of synchronous and asynchronous e-learners*".*

Table 5. Output of Mann-Whitney U Test based on mean ranks

Ranks				
No.	**Academic Level**	**Frequency**	**Mean Rank**	**Sum of Ranks**
1	**Synchronous**	388	329.67	127913.50
2	**Asynchronous**	343	407.09	139632.50
	Total	731		

Table 6. Output of Mann-Whitney U Test in learning styles based on mode of learning

Post Hoc: Test Statistics[a]					
Mann-Whitney	**Wilcoxon W**	**Z**	**Asymp. Sig. (2-tailed)**	**N**	$ES = \frac{\lvert Z \rvert}{\sqrt{N}}$
52447.500	127913.500	-5.401	.000	731	0.2

Interpretation: The Mann-Whitney *U* test conducted in order to evaluate the fourth research question and significant difference between learning styles in different modes of e-learning including synchronous, asynchronous. The results indicated that U=127913.500 (N=731) while, z = -5.401>1.96 and *p*=.000 < .05=α. The results show mediocre ES (ES=0.2). Thus, the results revealed a significant difference between learning styles of e-learners in mode of "*synchronous-asynchronous".*

IETC 2014

4. Discussion

Researchers based on the conducted analysis and comparisons within learning styles of learners demonstrated that there was a significant difference between learning styles and academic performance of students. Learners of the first academic performance group (10-13) preferred learning in Assimilating style while, the second (14-17) and the third (18-20) groups opted for Diverging style. In contrast, researchers found out that there was no significant difference between learning styles and Academic Performance of asynchronous e-learners. The results indicated that the first Academic Performance group (10-13) preferred learning through Assimilating style while, the second group (14-17) preferred Converging and the third academic performance group (18-20) went for Assimilating style.

These results are relevant to findings of Dunn, Beaudry, Lu, Jia, Gong and Clark (2008), and Klavas (1989) that demonstrated the academic performance of convergers and assimilators were higher than diverge and accommodators while, Akbari, Ghanbari and Ghanbari (2013) in their results concluded significant and positive relationship between the different learning styles and the academic performance of the sample.

In contrast, Zywno (2002) found out that there was no significance difference between learning style and academic achievement based on hyper media treatment. Marium Dinn (2010) found out the same results within regular learners while, Nick Zacharis (2011) studied the differences between learning styles among online and regular learners. The results indicated that there was no any effect on selected modes of learning, including online and regular and ability to successful complete of the courses.

5. Conclusion

As researchers reported, the first preferred style of students in asynchronous e-learning is Converging and Assimilating style; while Diverging and Accommodating styles followed subsequently. Converging and Assimilating styles are similar in dimension of abstract conceptualization thus; those students who preferred these styles may experience the asynchronous e-learning environment similarly. As reported by Kolb (2005), students who use the abstract conceptualization value scientific approaches in solving the problems instead of the artistic approach characteristics' of the concrete experience dimension. Thus, preferring the abstract conceptualization is processing towards giving the meaning the contents which are relevant to the Converging and Assimilative learning styles. The most ability of Converging style which was selected by asynchronous students is in practical application of ideas and theories. Asynchronous students prefer solving their problem and finding solution for issues, the problems and deciding about them in decision making process. They prefer to be involved with technical issues rather than social and interpersonal issues. Individualized learning projects that allow for practical applications, online laboratory, listservs to provide information in various formats including text, video, graphic & sound, experimenting new, ideas, simulations, labs and practical application and doing individual assignment are some preferred and suitable methods of learning among asynchronous e-learners.

An individual with an Assimilating style as the most preferred one has included Abstract Conceptualization (AC) and Reflective Observation (RO) as the dominant learning abilities. Individuals with this learning styles preferred organizing information into logical & concise form, learn by watching and thinking, prefer reading, lectures and analytical models, prefer logic values, information and science careers and prefer personalize learning. Researchers recommend to facilitate learning process in mode of synchronous e-learning through providing interactive synchronous tutorials concepts, theory and analytical models, individualized learning projects that includes personal reflections on assigned readings, Synchronous chat tools, e-face to face communicate with instructors as coach or helper.

Abstract

Comparative Teaching Methods Regarding Arabic and Turkish Grammar in Arabic Preparatory Grammar Courses at Divinity Schools in Turkey

Arabic has been of great importance for Turks ever since they converted to Islam. At that time Arabic was accepted as the language of education in the Medreses. This situation continued for 500 years during the Selcuk Era, and the 600 years of the Ottoman Empire. At one time during the rise of the Ottoman Empire, Islamic scholars (ulema) are approached Beyazid II and asked to write a history of the Turks in Turkish. After much debate among the scholars, the Seyhulislam complained "Your Majesty! The Turkish language is unrefined and out of tune. You cannot convey knowledge with it."

This response illustrates the understanding among the Ottomans that Arabic was the language of science version that of arts and poetry and Turkish that of administration. Arabic has much importance in Turkish daily life, as it was undoubtedly the language of religion. The Turks embraced Islam so much that they abandoned their word for God (Tanri) and adopted the Arabic word (Allah). Henceforward, people doubted one's faith if the word Tanri was used.

However, Arabs would not be upset if another Arabic word for God (Ilah) was used for Allah. Persians also would not have any problem if the word "Huda" was used for Allah.

Arabic became so influential to the Turkish language that the majority of words were borrowed from it. Statistically, the approximate percentage of Arabic origin words remains 20 to 30%.

In this sense, it is very important to consider Turkish grammar from this perspective. The number of borrowed Arabic words are clear from a brief glance at a few grammatical terms: sentence (Cumle), word (Kelime), noun (Isim), verb (Fiil), particle (Edat), adjective (Sifat), adverb (Zarf), pronoun (Zamir), command (Emir).

We can see this if we briefly examine a grammar book. For example, if we look at the third chapter from Mustafa Ozkan's *Syntax of Anatolian Turkish (*Sevinçli, Veysi-Özkan, Mustafa: *Türkiye Türkçesi Söz Dizimi (Kelime Çözümlemeli)*, Akademik Yay. İst. 2009.*)*:

''Chapter 3: Sentence Types (Ucuncu Bolum: Cumle Cesitleri)
I Sentences According to Verbs: (Yuklemlerine Gore Cumleler)
1) Nominal Sentence (Isim Cumlesi)
a) Simple-Time Nominal Sentence (Basit Zamanli Isim Cumlesi)
b) United-Time Nominal Sentence (Birlesik Zamanli Isim Cumlesi)
2) Verbal Sentence (Fiil Cumlesi)
a) Sentences with Simple Verbs (Basit Fiillerle Kurulan Cumleler)
b) Sentences with United Verbs (Birlesik Fiillerle Kurulan Cumleler)
c) Sentences with United-Time Verbs (Birlesik Zamanli Fiillerle Kurulan Cumleler)''

From the above citation from the grammar book, 21 of 32 words, or 66% were of Arabic origin.

But in terms of sentence structure and emphasis, as well as a number of other aspects, Turkish grammar is very different from Arabic.

In order to better understand learning, we have considered students enrolled in grammar courses for years at the Arabic language department in the preparatory class at the faculty of Divinity.

We have used this method for years in our work on comparative grammar teaching methods on Turkish grammar.

Our work can in the future also be of assistance to those who learn and teach Arabic.

Key Words: Arabic, Turkish, Grammar, Theology, Preparatory Courses, Comparative Method

ÖZET

Türkler İslamiyet'i seçtiği günden beri, Arapça onlar için çok büyük bir önem arz etmiştir. O kadar ki Arapça, medreselerde eğitim dili kabul edilmiştir. Bu durum hem 500 yıl hüküm süren Selçuklu, hem de 600 yıl hüküm süren Osmanlı dönemlerinde böyle devam etmiştir. Osmanlı'nın İmparatorluk anlayışını da yansıtan meşhur sözlerden biri şudur: *"Osmanlı İmparatorluğu'nda İlim Dili Arapça, Sanat (şiir) Dili Farsça ve İdare Dili Türkçe idi."* Hatta Osmanlı'nın Yükselme Döneminde II. Beyazıd-ı Veli, Ulemadan bir Türk Tarihi yazılmasını ama Türkçe yazılmasını istemişti ve

[100] Yüzüncü Yıl Üniv. İlahiyat Fak. Hadis ABD Öğretim Üyesi.

demişti ki *"Türk Tarihi, Türkçe yazıla."* Uzun tartışmalardan ulemanın kararını Reisu'l-Ulema, Padişaha şu şekilde arz etmişti. *"Hünkarım! Türk Dili natıraş ve dilhıraştır. Onunla ilim olmaz."*

Türklerin hayatında Arapçaya bu derecede önem verilmesinin en büyük sebebi, onun *Din Dili* olması idi. Türkler İslam'ı ve terimlerini o kadar benimsemişlerdi ki kendi öz dillerindeki Tanrı kelimesini dahi neredeyse terk etmişler onun kullanıldığı her yere Allah kelimesini yerleştirmişlerdi. Tanrı kelimesinin kullanılmasının neredeyse itikadi bir sorun olarak görülüyordu.

Hâlbuki *Tanrı* kelimesinin Arapçadaki karşılığı olan *İlah* kelimesinin kullanılması konusunda, Araplar hiçbir beis görmemişlerdi. Aynı şekilde Farsçadaki karşılığı olan *Hüda* kelimesinin kullanılmasında da, Farisiler hiçbir sorun görmemişlerdi.

Arapça ile bu kadar içli dışlı olmanın bir sonucu olarak Türkçede kullanılan kelimelerin birçoğu hala Arapçadır. Bu konuda tam bir istatistikî bilgi olmamasına rağmen bu oranın % 20-30 arasında olduğu tahmin edilmektedir.

Bu durum *Türkçe Dilbilgisi* açısından değerlendirildiğinde yine azımsanmayacak bir derecede Arapçadan etkilenmenin söz konusu olduğunu görmekteyiz. Mesela, dilbilgisi ile ilgili ilk anda akla gelen birkaç konu sıralayacak olursak, *Cümle, Kelime, İsim, Fiil, Edat, Sıfat, Zarf, Zamir, Emir...* gibi başlıklarının dahi çoğunun halen Arapça kelimeler olduğunu görmekteyiz.

Rastgele açtığımız bir Dilbilgisi kitabının içindekiler kısmına göz attığımızda bunu görebilmekteyiz. Mesela biz, elimizin altındaki bir dilbilgisi kitabını[101] açtığımızda içindekiler kısmının Üçüncü Bölümünde şunları gördük:

"ÜÇÜNCÜ BÖLÜM CÜMLE ÇEŞİTLERİ

I. Yüklemlerine Göre Cümleler:

1) *İsim Cümlesi*
   - *A. Basit Zamanlı İsim Cümlesi*
   - *B. Birleşik Zamanlı İsim Cümlesi*

2) *Fiil Cümlesi*
   - *A. Basit Fiillerle Kurulan Cümleler*
   - *B. Birleşik Fiillerle Kurulan Cümleler*
   - *C. Birleşik Zamanlı Fiillerle Kurulan Cümleler..."*

Daha yeni kaleme alınmış bu dilbilgisi kitabından yaptığımız yukarıdaki alıntıda, toplam 32 kelimenin 21 tanesi yani % 66'sı Arapça kelimelerdir.

Fakat bütün bunların yanı sıra *Türkçe Dilbilgisi* temel olarak, cümledeki söz dizini, vurgu anlayışı... gibi birçok açıdan *Arapça Dilbilgisi* ile tamamıyla zıttır.

Yıllardır İlahiyat Fakültesi Hazırlık Sınıflarında, Nahiv Dersi okutan Arap Dili Bölümü mezunu birisi olarak biz, öğrencilerin dersi daha iyi anlayabilmeleri için bu iki dilin dilbilgisi yapılarını, örneklerle karşılaştırmaktayız. Bu konuda ki yıllara dayanan birikimimizi akademik bir çalışma olarak değerlendirmenin faydadan hali olmayacağını düşündük.

Bu çalışmamızda biz yıllardır uygulamalı olarak gerçekleştirdiğimiz bu metodu, *Türkçe Dilbilgisi ile Karşılaştırmalı Nahiv Öğretim Metodunu* ele alacağız. İki Dilbilgisinin benzer ve farklılıklarını sistematik bir şekilde karşılaştırmalı olarak bazı temel konular bazında işleyeceğiz.

Daha çok öğretime (uygulamaya) yönelik olarak tasarladığımız bu çalışmamız bu yönüyle ileride Arapça öğrenen ve öğretenlere de yardımcı olabilecektir.

Anahtar Kelimeler: Arapça, Nahiv, Türkçe, Dilbilgisi, İlahiyat, Hazırlık Sınıfı, Karşılaştırmalı Yöntem.

GİRİŞ

"Bir dili iyi bilen diğer dilleri kolay öğrenir" şeklindeki meşhur söz, dil öğretiminde çokça uygulanan yöntemlerden birisinin temelini oluşturmaktadır. Bu yöntem "*Karşılaştırmalı Dil Öğretim Yöntemi"*dir. Gerçekten, ikinci bir dil öğrenilirken farkında olunarak ya da olunmayarak en çok yapılan şey onu diğer bir dil ile karşılaştırmaktır. Kendisiyle karşılaştırılan bu diğer dil, genellikle o kişinin *anadili* olmaktadır.

Peki, *anadil* ne demektir? Annemizin konuştuğu dil midir? Ya da babamızın konuştuğu dil midir? Ya da içinde yaşadığımız milletin konuştuğu dil midir? Yoksa herhangi bir sebeple ayrı düştüğümüz, kendisinden uzak bir yerde doğduğumuz ve büyüdüğümüz, başka bir coğrafyadaki kendi asli milletimizin konuştuğu ve fakat bizim öğrenemediğimiz ve dolayısıyla konuşamadığımız bir dil midir bizim *anadili*miz?.. Bu sorular daha da çoğaltılabilir. Fakat bizim anlayışımıza göre anadil, kişinin 6 yaşından önce öğrendiği dildir. Bu birden fazla da olabilir. 6 yaşından sonra öğrenilen diller artık *anadil* değildir. Başka ((öteki) bir dildir.

Malumdur ki anadiller semai (duyumsal) olarak öğrenilir. Bu öğrenme yönteminin, "kolay olması" gibi faydaları var belki ama noksanlıkları da yok değildir. Bunların başında özellikle "Dilbilgisi" gelmektedir. Çünkü *dilbilgisi* semai olarak değil de kitabi olarak öğrenilmesi gereken bir *dilbilim*dir. Doğal olarak

[101] Sevinçli, Veysi-Özkan, Mustafa: *Türkiye Türkçesi Söz Dizimi (Kelime Çözümlemeli)*, Akademik Yay. İst. 2009.

IETC 2014

bunun öğrenildiği yer okullardır. Okul veya medrese okumayan kişiler anadillerini rahat konuşurlar ama dilbilgisi kurallarını bilemezler. Bu durum anlaşılabilen bir konudur. Nitekim anadili Arapça olan bazı öğrencilerimizin İlahiyat Fakülteleri hazırlık sınıflarında muhadese (diyalog) derslerinde başarılı olmalarına rağmen sarf, nahiv, yazı, inşa… gibi derslerde, Arapça ile yeni tanışmış diğer öğrencilerimize nispetle daha çok zorlanmalarının sebebi budur. Hatta daha önce Arapçayı hiç okumamış diğer öğrenciler, Türkçe dilbilgileri iyi ise, Nahiv konularını onlardan daha çabuk kavrayabilmektedirler. Bunun sebebi giriş cümlemizde de belirttiğimiz gibi bir dili iyi bilmeleridir.

Bilindiği gibi *Arapça, İslam Medeniyet Dili*dir ve muazzam bir zenginliktedir. Halen, onlarca ülkede yüz milyonlarca insan tarafından konuşulan birçok lehçelere sahip çok yaygın, canlı ve hareketli bir dildir. Aynı şekilde *Türkçe* de binlerce yıl boyunca tarihteki birçok devlet ve İmparatorluk tarafından kullanılmış çok eski bir dildir. Halen dahi birçok devlet tarafından kullanılan, değişik lehçelere sahip oldukça zengin ve yaygın, ayrıca dünyadaki sayısı nadir denebilecek *İmparatorluk Dillerinden bir dil*dir.

Diğer taraftan yüzyıllar boyunca İslam Âlemi'nin sancaktarlığını ve hamiliğini yapan Türkler, din dili olan Arapçadan pek çok kelime, vecize, deyim ve ıstılah (terim) almışlardır. O kadar ki bir *İmparatorluk Dili* olan *Osmanlıca; Arapça*, *Farsça* ve *Türkçe* kelimelerden, neredeyse birbirine yakın oranlarda oluşan müşterek bir dil gibiydi. Aynı şekilde *Cumhuriyet Dönemi Türkçesinde dahi, Dilbilgisi* başlıklarının birçoğu (kelime, cümle, isim, fiil, sıfat, zarf, zamir, emir… vs.) halen Arapça kelimelerle ifade edilmektedir.

Bizim bu çalışmamızın gayesi, Türkçe bilen ve ikinci bir dil olarak Arapçayı öğrenmek isteyen öğrenciler için, iki dili kısmen de olsa karşılaştırmak ve "*Karşılaştırmalı Dil Öğretim Yöntemi"*ni örneklerle ortaya koymak olacaktır. *Arap Nahvi'nin (Cümle Bilgisinin)* öğretilmesinde *Türkçe Dilbilgisi* ile karşılaştırılması; ele alınan konular bazında ve sistematik bir metot çerçevesinde uygulanacaktır. Nitekim, benzer sayılabilecek bir gaye ile İngilizce bilenlere yönelik olarak hazırlanmış, Arapçayı basit seviyede de olsa (sarf ve nahiv de kısmen dahil olmak üzere) öğreten özel seriler vardır[102] Bu araştırmada biz, *bu iki* muazzam *dilin, dilbilgilerinin her yönü ile karşılaştırılması* gibi *büyük* bir iddiada bulunacak değiliz. Sadece, İlahiyat Fakültesi Hazırlık sınıflarımızda Arapça Nahiv dersindeki bazı temel konuları öğretirken, ilgili konuların Türkçe Dilbilgisindeki karşılıklarını göz önünde bulundurmak ve örnekler getirmek suretiyle uyguladığımız *"Karşılaştırmalı Öğretim Yöntemi"ni göstermeye çalışacağız.*

"Arap Nahvi" ifadesinden kastımız, Arapçadaki *"Cümle Bilgisi" (Sentaks)*dir. Türkçe Dilbilgisi ifadesinden de kastımız, Türkiye Türkçesindeki *"Söz Dizimi"*dir.

FİİL CÜMLESİ

Arapçada *Fiil Cümlesi*; herhangi bir fille başlayan, geçmişte işlenmiş veya şu an işlenmekte ya da gelecekte işlenecek bir işi, oluşu ya da hareketi anlatan cümlelerdir ve olayları zamana bağlı olarak anlatır.[103] Türkçede ise *Fiil Cümlesi;* yüklemi çekimli bir fiil olan cümleye denir. Fiil cümleleri; bir oluşu, durumu, duyguyu ya da istek ve temenniyi ifade ederler.[104]

Arapçada Fiil Cümlesindeki esas unsurlar *fiil* ve *fail*dir. Bunların ardından *mef'ulun bih* de gelebilir. Buradaki *fiil* Türkçe *Fiil (Eylem) Cümles*indeki *yüklem*dir, *fail* de *özne*dir, *mef'ulun bih* ise *nesne (düz tümleç)*dir.

Fiil cümlesine bir örnek:

كَتَبَ الْمُتَعَلِّمُ رِسَالَةً. Öğrenci bir mektup yazdı.

Bu basit fiil cümlesi üzerinden Arapça ile Türkçeyi karşılaştıralım:

1) Cümle öğelerinin sıralanışı açısından iki dilin karşılaştırılması:

a) Her iki cümlenin *fiil*lerine baktığımızda; Arapça cümledeki كَتَبَ kelimesi fiildir ve cümlenin başındadır. Fakat aynı cümlenin Türkçesine baktığımızda bu kelimeye karşılık gelen *"yazdı"* kelimesi *yüklem*dir ve cümlenin sonundadır.

b) Arapçada *fail* dediğimiz *özne*nin cümle içindeki yerine bakalım. Arapça cümledeki الْمُتَعَلِّمُ kelimesi faildir ve cümlenin ortasındadır.[105] Fakat aynı cümlenin Türkçesine baktığımızda bu kelimeye karşılık gelen *"Öğrenci"* kelimesi öznedir ve cümlenin başındadır.

c) Arapça cümledeki رِسَالَةً kelimesi *mef'ulun bih*dir ve cümlenin sonundadır. Türkçe cümlede buna karşılık gelen kısım *"bir mektup"* kelimeleridir. Cümle içinde buna *nesne (düz tümleç)* denir ve öğelerin sıralanmasındaki yeri özne ile yüklemin arasıdır.

[102] Örn. Abdurrahim, Dr V. : *Durusu'Lugati'l-Arabiyye/Arabic Course for English-Speaking Students*, UK İslamic Academy, 2004

[103] Maksudoğlu, *Arapça Dilbilgisi*, s. 242; Çörtü, *Nahiv,* s. 206; Aslan, *Nahiv*, s. 10.

[105] Fail hakkında gerniş bilgi için bkz. Aslan, Ahmet, *Nahiv*, s. 84-101).

IETC2014

d) Sonuç olarak Arapçada fiil cümlesindeki öğelerin sıralanışı şu şekildedir: *Fiil-fail-meful*. Arapçanın kendi fonetiği ile seslendirdiğimizde ise şöyle olur: *Fi'lun-Fa'ilun-Mef'ulun*. Türkçe fiil cümlesinde ise cümle öğelerinin sıralanışı şu şekildedir: *Özne-Tümleç-Yüklem.*

2) Cümledeki öğelerinin irab açısından incelenmesi:

a) Arapçada irab; amilin icabına göre cümledeki kelimelerin sonlarındaki harf ve hareke değişikliklerine denir. Cümle yapısına göre öğelerin her birinin son harfleri ya da bu harfin harekesi çeşitli değişikliklere uğrar. Şöyle ki: Cümledeki her bir kelime, cümle içindeki yerine göre *merfu, mansub, mecrur* yada *mec-zum*dur. Mesela müfred kelimeler için, son harfin harekesi *ötreli, üstünlü, esreli* ya da *harekesiz*dir.[106] Türkçede ise böyle bir sorun yoktur. Çünkü hareke diye bir mefhum yoktur. Zira Arapçada hareke denen sesler, birer müstakil sesli harf olarak *Türk Alfabesi*ndeki yerlerini almışlardır.

b) Fiil cümlesinde *Fail* daima *"merfu"* olur. Onun merfu olması demek mesela müfred/tekil kelimeler için son harfinin harekesinin dammeli (ötreli) olması demektir. Türkçede böyle bir durum yoktur.

c) Fiil cümlesindeki *Fiil öğesi*; eğer zaman bakımından mazi ise çeşitli alametler üzere mebnidir, fakat muzari ise çeşitli amillere göre merfu, mansub yada meczumdur. Onun irab alametleri ise, bazen harf, bazen de hereke diğişikliği şeklinde olur. Aynı şekilde gelecek zaman ve emir halleri için de çeşitli ve teferruatlı irab durumları ve alametleri vardır. Bütün bu durumların hiçbirisi Türkçedeki fiiller için söz konusu değildir.

d) Yine *fiil* için geçerli diğer bir durum da failinin sayısına *(tekil, ikil, çoğul)* göre son harfinin değişebilmesidir. Türkçedeki cümlelerin fiillerinde ise *tekil* ve *çoğul*a göre sonlarının değişebilmesine (-ler/-lar eki almasına) rağmen, failin *ikil (iki kişi)* olması durumu için özel bir ek yoktur.

e) Mef'ulun bih (nesne/düz tümleç) daima mansubdur. Mansub olması demek mesela müfred kelimeler için son harfinin harekesinin fethalı (üstünlü) olması demektir. Türkçede ise böyle bir işaret söz konusu değildir.

f) Arapçadaki fiil cümlelerinde daha birçok teferruatlı bilgi vardır ki bunların hiçbirisi Türkçede yoktur. Bu kadar teferruatlı İrab konularının Türkçede olmaması, Türkçenin Arapçaya göre daha sade bir dil olduğu şeklinde yorumlanabilir. Ama diğer taraftan, bir dilin kurallarının çok ve teferruatlı olması ve kelimelerin, delalet ettikleri şahıslara, sayılara, cinsiyete, zamana, belirlilik ya da belirsizliğe göre ayrı şekiller, ekler ve alametler alması, o dilin zenginliğini ve muhataplarına verdiği değeri yansıtan bir gerçekliktir. Ayrıca bu durumun, o dil ile düşünen kişilere çok daha geniş bir hayal, düşünce, ilham ve hareket sahası da açtığı erbabının malumudur.

3) Cümle öğelerinin sıralanışındaki fonetik/ses yapısı açısından iki dilin karşılaştırılması:

a) Malumdur ki her dilin bir fonetik yönü vardır. Fonetik özellik dillerin ses yapısı ile alakalıdır ve herhangi bir dildeki *Şiir ve Musiki Edebiyatı*nın gelişmesinde çok önemlidir.

b) Arapçada fiil cümlesi öğeleri olan *"Fi'lun-Fa'ilun-Mef'ulun"* kelimelerinin Arap fonetiği ile seslendirilişine dikkat ettiğimizde (bu kelimelerdeki kesme işaretinin hemzeye {ا} değil de çok yumuşak bir ses olan '*ayın {ع}harfine* delalet ettiği akıldan çıkarılmamak kaydıyla) kulağa hoş gelen çok güzel bir sesteşlilik ve hatta şiirsellik söz konusudur. O kadar ki yüzyıllar boyunca Osmanlı Türkçesindeki şiirlerin vezin ölçüleri dahi bu kelimelerle veya bunların müştakları (türetilmişleri) ile ifade edilmişlerdir. Arap Şiirinin ve musikisinin bu denli geniş ve yaygın olmasında, *Arap harflerinin fonetik yapısı*nın etkili olduğu da yadsınamayacak ayrı bir olgudur.

c) Türkçedeki fiil cümlesi öğeleri olan *"Özne-Tümleç-Yüklem"* kelimelerinin Türk fonetiği ile seslendirilişine kulak verdiğimizde ise böyle bir *hoş seda* yerine, belki şiirselliği de zorlaştıran çok sert sesler ile karşı karşıya kaldığımızı fark ediyoruz.

4) Fiil Cümlesi öğelerinin kelime manaları ile cümle içindeki görevleri arasındaki uyumluluk açısından iki dilin karşılaştırılması:

a) *Fiil* kelimesinin Arapçadaki lügat manası, *iş, oluş, hareket* bildiren bir mana içermekte olup cümle içindeki öğesel pozisyonu da aynı şekilde iş, oluş, hareket bildiren kelimenin yerine delalet etmektedir. Mesela yukarıdaki örnekte "*ketebe*" kelimesi, cümlenin *fiil* öğesidir. "*Ketebe*" kelimesi yazmak şeklindeki bir iş, oluş ve hareket ifade etmektedir. Onun öğesel karşılığı olan *fiil* kelimesi de zaten aynı anlamdadır.

b) Türkçede ise *yüklem* kelimesi ile cümledeki *fiil (eylem)* arasında bu kadar bir uyumluluk söz konusu değildir. Mesela yukarıdaki örnek cümlede "*yazdı*" kelimesinin cümle içindeki öğesel karşılığı *"yüklem"* ile ifade edilmektedir. "*Yüklem ve yazdı"* kelimeleri arasında, *fiil-yazdı* ikilisi kadar bir manasal uyumluluk yoktur.

c) Arapça cümledeki *Fail öğesi*, *fiil* kelimesinden türetilmiş (müştak) bir kelime olup "*o işi, oluşu, hareketi gerçekleştiren"* anlamına gelmekte ve cümle içindeki öğesel pozisyonu da aynı şekilde *fiili gerçekleştiren*in yerine delalet etmektedir. Mesela yukarıdaki cümlede *fail* kimdir? Yazma fiilini gerçekleştiren öğrencidir. Öğrencinin bu fiili gerçekleştirmesi zaten onu *fail* yapmaktadır ve bunun öğesel karşılığı da aynı kelime *(fail)* ile ifade edilmektedir. Dolayısıyla "*fail"*in kelime manası ile cümle içinde, *fiili gerçekleştiren öğrenciye*

[106] Geniş bilgi için bkz. Birgivi, *Avamil ve İzhar*, s. 56-62.

IETC 2014

delalet eden bir öğe olması arasında çok mükemmel bir uyumluluk vardır. Türkçe örnekte ise aynı derecede bir uyumluluk fark edemiyoruz. *"Özne"*nin kendi kelime manası ile cümle içindeki öğesel yeri, yani *yazma eylemini gerçekleştiren öğrenciye delalet etmesi* arasındaki uyumluluk, Arapçadaki kadar değildir.

d) *Muf'ul* kelimesi de aynı şekilde fiil kelimesinden türetilmiş müştak bir kelime olup, *failin o fiili üzerinde gerçekleştirdiği şey* anlamına gelmekte ve cümle içindeki öğesel pozisyonu da *yapılan bir şeyi* ifade eden kelimenin yerine delalet etmektedir.

e) Aynı bakış açısıyla "t*ümleç"* kelimesini incelediğimizde; bu kelimenin sözlük manası ile öğe olarak cümle içinde kullanıldığı pozisyonu arasında, Arapçadaki kadar bir uyumluluğun var olduğunu söylemek pek de mümkün görünmemektedir.

5) Son olarak, iki dil arasındaki en bariz farklılık ya da zıtlık cümlelerin yazılış ve harflerin sıralanış şeklindedir. Arapçanın, Arap harfleriyle ve sağdan sola, Türkçenin ise Latin harfleriyle ve soldan sağa yazıldığı herkesin malumudur. Yukarıda verdiğimiz örnek cümlemizde de görülmektedir.

İSİM CÜMLESİ

Arapçada *İsim Cümlesi;* herhangi bir isim ile başlayan, bir durumu ya da bir varlığın nasıl olduğunu haber veren cümlelere denir ve bunlar bir hüküm bildirirler.[107]

Türkçede de yüklemi isim cinsinden olan cümlelere *İsim Cümlesi* denir ve isim cümlelerinin hüküm bildirişi ek fiil (-dır, -dir, -tır, -tir) ile sağlanır.[108]

İsim cümlesinde iki öğe vardır. Birincisi cümlenin kendisi ile başladığı kelimedir ki buna *Mübteda denir*. İkincisi bu ilk kelimeyi niteleyen ve onun durumunu bize bildiren kelimedir ki buna da *Haber* denir.[109]

Türkçe isim cümlesinde Mübtedanın karşılığı *Özne*dir. Haberin karşılığı ise *Yüklem*dir.

İsim cümlesine bir örnek:

Bahçe güzeldir. لَحْيَةٌ جيدٌ

Bu basit isim cümlesi üzerinden Arapça ile Türkçe arasında bazı karşılaştırmalar.

1) Cümle öğelerinin sıralanışı açısından iki dilin karşılaştırılması:

a) Arapça cümlede لَحْيَةٌ kelimesi mübtedadır ve cümlenin başındadır. Türkçe cümlede buna karşılık gelen *"Bahçe"* kelimesi öznedir ve o da cümlenin başındadır.

b) Arapça cümlede جيدٌ kelimesi haberdir ve cümlenin sonundadır. Türkçe cümlede buna karşılık gelen *"güzeldir"* kelimesi yüklemdir ve o da cümlenin sonundadır.

c) Fiil cümlesinin tersine isim cümlesindeki öğelerin sıralanışı hem Arapçada hem de Türkçede aynıdır: Mübteda-Haber. Özne-Yüklem.

2) Cümledeki öğelerin irabları açısından incelenmesi:

a) Mübteda daima merfudur. Onun Ref' (merfu olmasının) alametleri, kelimenin tekil, ikil ya da çoğul olmasına göre değişik olmakla beraber mesela müfred isimler için son harfinin harekesinin dammeli (ötreli) olmasıdır.

b) Haber de aynı şekilde daima merfudur. Ref alameti olarak yukarıda söylenenler bunun için de geçerlidir.

c) Özne ve Yüklem öğelerin için böyle bir şey söz konusu değildir. Çükü Türkçede irab yani kelime sonlarının her bir öğe için farklı olması diye bir şey yoktur.

3) Marifelik-Nekrelik açısından iki dilin karşılaştırılması:

a) Arapça isim cümlelerinde mübteda daima ma'rifedir. Yani belirli bir isimdir. Ma'rifelik alameti başındaki {ال} takısıdır.

b) Haber ise daima nekredir. Nekrelik alameti sonundaki tenvindir. Yani kelimeleri -en, -in, -ün şeklinde bitmeleridir.

c) Türkçede ise *"Bahçe güzeldir."* cümlesindeki öznenin yani *bahçe* kelimesinin, bağlamda aksine bir karine yoksa hem belirli hem de belirsiz olması mümkündür. Çünkü Türkçede belirlilik ya da belirsizlik sadece zihindedir. Onların Arapçada olduğu gibi yazıya yansıyan bir alametleri yoktur. Dolayısıyla bu cümledeki bahçe kelimesi siyak ve sibakında (bağlamında) aksine bir karine yok ise her iki şekilde de anlaşılabilir. Eğer bahçe kelimesini belirli kabul edersek, zihinlerde var olan belli bir bahçenin güzel olduğundan bahsedilmektedir. Eğer onu belirsiz kabul edecek olursak cümlemiz *"Bahçe güzel bir şey."* anlamına gelir. Ma'rife-Nekre/Belirlilik-Belirsizlik konusu Arapçada, Türkçenin tersine çok şümullü bir konudur. Dolayısıyla biz onu biraz sonra müstakil bir konu olarak da işleyeceğiz.

4) -dır -dir (imek) eki açısından iki dilin karşılaştırılması:

a) Türkçede isim cümlesindeki yüklem, ek fiil i- (imek) ile çekime girer. Bu ek fiil için sadece 4 çekimli şekil (şimdiki zaman, görülen geçmiş zaman, öğrenilen geçmiş zaman ve şart) bulunmaktadır. İsimler ancak bu

[107] Maksudoğlu, *Arapça Dilbilgisi*, s. 241; Çörtü, *Nahiv,* s. 205; Akdağ, *Arapça Dilgilgisi*, s. 185; Aslan, *NAHİV*, s. 9; Uralgiray, *Arapça İlk ve İleri Dilbilgisi*, s. 103-7; Antaki, *el-Minhac*, s.7.

[108] Sevinçli, *Türkiye Türkçesi Söz Dizimi,* s. 137; Hengirmen, *Türkçe Dilbilgisi, s.* 360.

[109] Geniş bilgi için bkz. Aslan, *NAHİV*, s. 73.

IETC 2014

kiplerle çekimlenerek yüklem olurlar. Bu çekimlerin en çok kullanılanı ise, şimdiki zamanın teklik üçüncü şahıs eki olan "-dır, dir; -tır, tir" "-dur, dür; tur, -tür" ekiyle kullanılan şekildir.[110]

b) "Bahçe güzeldir." cümlesindeki "güzeldir" kelimesi yüklemdir. İsmin (sıfatın) sonuna imek çekim eki (-dir. şeklinde) eklenmiş ve isim bir nevi fiile dönüştürülmüştür. Bu ek, yüklemin tanınması için çok güzel bir alamettir.

c) Arapçada ise böyle bir alamet yoktur. Biz haberi ancak cümle içindeki yerinden (pozisyonundan) tanıyabiliyoruz. Çünkü ona (habere) has bir ek veya işaret yoktur. İsim cümlesindeki bu durum, Türkçenin Arapçaya göre farklı, bariz ve pratik bir yönünü ortaya koymaktadır.

5) Öğelerin kelime manaları ile cümle içindeki görevleri arasındaki uyumluluk açısından iki dilin karşılaştırılması:

a) Arapça isim cümlesindeki birinci öğe *Mübteda;* başladı anlamına gelen *"bedee"* kelimesinden müştaktır[111] ve başlangıç yeri anlamına gelmektedir. Yukarıdaki örnekte görüldüğü gibi mübtedanın cümle içindeki yeri de gerçekten cümlenin başlangıcıdır. Yani kelime manası ile cümle içindeki görevi arasında tam bir uyumluluk vardır.

b) Yine aynı şekilde Arapça isim cümlesindeki ikinci öğe *Haber*in kelime manası, *bir şeyin durumunu birine bildirmek* anlamına gelmektedir ve cümle içindeki öğesel görevi de gerçekten mübtedadan sonra gelmekte ve onunla ilgili bir durumu bize haber vermektedir. Yani bu öğenin kelime manası ile cümle içindeki görevi arasında tam bir uyumluluk vardır.

c) Fakat diğer yandan, Türkçe isim cümlesindeki öğelerin kelime manaları ile cümle içindeki öğesel manaları arasında bu denli bir uyumun var olduğunu söylemek ise pek de mümkün görünmemektedir. Zaten bu öğe isimleri fiil cümlesinden alınmıştır.

d) Arapçada, *İsim Cümlesindeki Öğeler* ile *Fiil Cümlesindeki Öğeler* farklı isimlerle ifade edilirler. Yani farklı bir cümle yapısında, bu yeni cümle çeşidine özel yeni öğe isimleri, ayrı ıstılahlar (terimler) vaz' edilmiştir. Fakat Türkçede ise fiil cümlesindeki öğeler (özne-yüklem), isim cümlesi için de kullanılmış ve bu cümle çeşidine has yeni öğe isimleri düşünülmemiştir.

6) Mübteda ile Haberin birbirine uyumu açısından bir karşılaştırma:

a) Arapçada mübteda ile haber arasında cinsiyet bakımından bir uyum söz konusudur. Yani mübteda müzekker ise haber de müzekkerdir. Yine aynı şekilde mübteda müennes ise haber de müennestir (Carim, *en-Nahvu'l-Vadıh*, c. III, s. 4). Türkçede böyle bir durum yoktur.

b) Arapçada mübteda gayri akil (eşya ve hayvan gibi) ise onun haberi müfret ve müennes gelir. Türkçede böyle bir konu yoktur.

c) Arapçada haber müştak (ismi fail, ismi mef'ul, sıfat-ı müşebbehe gibi türetilmiş) ise onun irabı, sayı ve cinsiyet bakımından mübtedaya uymak durumundadır. Türkçede ise böyle bir mefhum yoktur.

MARİFE VE NEKRE

Arapçadaki ma'rifelik ve nekrelik konusu, Türkçede belirlilik ve belirsizlik olarak ifade edilir. Arapçada her bir kelime ya ma'rifedir ya da nekredir. Ma'rifenin çok çeşitleri ve teferruatları vardır. Biz sadece ma'rifelik ve nekrelik alameti açısından ele alacağız.

1) Arapçada marife bir kelimenin başına daima {ال} takısı gelir. Yani Ma'rifelik alameti {ال} takısıdır. Mesela kapı anlamına gelen لبَبٌ kelimesi ma'rife (belirli)dir. Çünkü başında {ال} takısı mevcuttur. Bu demektir ki bu kapı herhangi bir kapı değil, bilinen belirli bir kapıdır.

2) Arapçada nekre bir kelime eğer gayri munsarif (çekime gelmeyen) değilse, tenvin ile yani -en, -in, veya -ün şeklinde biter. Bu onun nekrelik alametidir. Mesela kapı anlamına gelen ببٌ kelimesi ki bunun telaffuzu babün şeklindedir nekre (belirsiz) bir kelimedir. Çünkü sonu (ün) ile bitmektedir. Bu demektir ki bu kapı bilinen belirli bir kapı değil herhangi bir kapıdır.

3) Türkçede ise belirlilik ya da belirsizlik sadece zihindedir. Onların Arapçada olduğu gibi yazıya yansıyan bir alametleri yoktur. Dolayısıyla mesela "kapı" kelimesi tek başına yazıldığında onun belirli mi ya da belirsiz mi olduğu anlaşılamaz. Ancak bir metin içinde ise ve siyak-sibakında (bağlamında) onun belirliliği ile ilgili bir karine var ise belirli kabul edilir. Aksi takdirde belirsiz kabul edilir.

4) Ma'rife-Nekre/Belirlilik-belirsizlik konusu Arapça dil kitaplarının hepsinde teferruatlı bir şekilde işlenmektedir.[112] Fakat Türkçe dil kitaplarında bizim görebildiğimiz kadarıyla, müstakil bir konu olarak ele alınmamaktadır.[113]

5) *"Ma'rifelik-nekrelik/belirlilik-belirsizlik"* konusundaki bu farklılıklar, Arapçanın Türkçeye göre daha teferruatlı, bariz ve pratik bir yönünü ortaya koymaktadır.

---

IECT 2014

İSİM TAMLAMASI

Arapçada isim tamlamasına izafet terkibi veya kısaca izafet denir. Arapçada *İzafet;* bir ismin kendisinden sonra gelen bir diğer isimle bir hususiyet veya bir destek kazanmasına denir. İzafet genellikle ardı ardına gelen iki isimden oluşur. Birinci isme muzaf (desteklenen), ikinci isme ise muzafun ileyh (destekleyen) denir. *Muzaf* kelimesinin Türkçedeki karşılığı *tamlanan*dır. *Muzafun ileyh*in Türkçedeki karşılığı *ise tamlayan*dır.[114]

Türkçede isim tamlaması; iki veya daha çok ismin sahiplik, tahsis, tür, cins vb. nitelikleri belirtmek üzere özel bir biçimde bir araya gelmesinden oluşan kelime grubuna denir. İki temel unsuru vardır. Birincisi tamlayan (belirten), ikincisi tamlanan (belirtilen). Tamlamada asıl anlam ikinci kelimenindir. Birinci kelime ikinci kelimeyi belirtir ve ikinci unsura ekli ya da eksiz bağlanır. Ekli bağlandığında *Belirtili İsim Tamlaması* (örn. kuşun kafesi), eksiz bağlandığına ise *Belirtisiz İsim Tamlaması* (örn. Kuş kafesi) yapılmış olur.[115]

İzafet terkibine (isim tamlamasına) bir örnek:

بابُ المَدْرَسَةِ Okulun kapısı

Bu basit isim tamlaması üzerinden her iki dilin karşılaştırılması:

1) Arapça izafet terkibindeki بابُ kelimesi *muzaf*tır. المَدْرَسَةِ kelimesi ise *muzafun ileyh*tir.
2) Türkçe isim tamlamasındaki *okulun* kelimesi *tamlayan*dır, *kapısı* kelimesi ise *tamlanan*dır.
3) Arapça izafet terkibindeki muzaf birinci kelimedir, Türkçe isim tamlamasında buna karşılık gelen *tamlanan* ise ikinci kelimedir.
4) Arapça izafet terkibindeki muzafun ileyh ikinci kelimedir, Türkçe isim tamlamasında buna karşılık gelen *tamlayan* ise birinci kelimedir.
5) Arapça izafet terkibinde asıl olan kelime ilk kelimedir. Yani muzaftır. Vurgu ona yapılır. Türkçe isim tamlamasında ise asıl olan kelime ikincisidir. Yani tamlanandır. Vurgu ona yapılır.
6) Görüldüğü gibi, öğelerin sıralanışı ve vurgunun yeri her iki dilde birbirinin tersidir.
7) Arapça izafet terkibinde ikinci kelime olan *muzafun ileyh* marifedir (belirlidir). Dolayısıyla başında (ال) takısı gelmiştir. Aynı şekilde Türkçe isim tamlamasında da *tamlayan (okulun kelimesi)* belirlidir. Fakat herhangi bir belirlilik işareti taşımamaktadır. Çünkü Türkçede böyle bir işaret yoktur. Belirlilik sadece zihindedir. Bununla beraber (–un) şeklinde bir *ilgi eki*ni almıştır. Bu ek, *tamlayan eki* olarak da ifade edilir.[116] Tamlayanı bu eki alan isim tamlamaları, *Belirtili İsim Tamlaması*dır.[117]
8) Arapça izafet terkibindeki birinci kelime olan *muzaf da* marifedir (belirlidir). Fakat onun marifeliği (ال) takısından değil, *marife olan bir kelime tarafından tamlanmasından* anlaşılmaktadır. Yani tamlayan okul belirli ise onun tamladığı ve dolayısıyla bir hususiyet kazandırdığı kapı daha da belirli hale gelmiştir.
9) Aynı durum Türkçedeki isim tamlaması için de geçerlidir. Okul (tamlayan) belirli olunca, onun bir özelliğini beyan ettiği kapı (tamlanan) da belirli hale gelmiştir. Ama yukarıda belirttiğimiz gibi belirlilik alameti yoktur. Ona bitişen –sı eki sadece *iyelik eki*dir.[118]
10) Arapça izafet terkibindeki ikinci kelime yani muzafun ileyh nekre olsaydı başındaki (ال) takısı düşecekti. Buna mukabil sonu tenvin ile bitecekti. Yani bu kelime (مَدْرَسَةٍ) şeklinde olacaktı ve manası *"okul kapısı"* olacaktı. Buradaki okul belirli bir okul değil de herhangi bir okulu ifade edecekti.
11) Aynı şekilde Türkçe isim tamlamasındaki ilk kelimenin yani tamlayanın belirsiz olması, yani *okulun* kelimesi yerine *okul* denmesi durumunda da bu tamlama belirsiz isim tamlaması olacaktı. İki dil arasında bu açıdan bir benzerlik vardır.

SIFAT TAMLAMASI

Arapçada bir ismin kendisinden sonra gelen bir sıfat ile nitelenmesine ve bir hususiyet kazandırılmasına *Sıfat Terkibi* veya *Sıfat-Mevsuf* ya da *el-Mevsuf ve's-Sıfatu* denir. Bu terkibin iki öğesi vardır: *Sıfat* ve *Mevsuf*. İlk kelime mevsuftur, ikinci kelime sıfattır. Sıfat daima mevsuftan sonra gelir.[119]

Türkçede ise sıfatların adları nitelemesi ya da belirtmesiyle oluşan tamlamalara *Sıfat Tamlaması* denir. Sıfat tamlamasında sıfatlar tamlayan, adlar da tamlanan durumundadır. Bu tamlamanın da iki öğesi vardır ve bunlar isim tamlamasıyla aynı öğelerdir: *Tamlayan ve Tamlanan*.[120]

Sıfat tamlamasına bir örnek:

IECT2014

Kısa kalem. اَلْقَلَمُ قَصِيرٌ

Bu basit sıfat tamlaması üzerinden her iki dilin karşılaştırılması:

1) Arapça sıfat terkibindeki اَلْقَلَمُ kelimesi *mevsuf*tur, قَصِيرٌ kelimesi ise sıfattır.
2) Türkçe sıfat tamlamasındaki *kısa* kelimesi *tamlayan*dır, kalem kelimesi ise *tamlanan*dır.
3) Arapça sıfat terkibindeki mevsuf birinci kelimedir, Türkçe sıfat tamlamasında buna karşılık gelen *tamlanan* ise ikinci kelimedir.
4) Arapça sıfat terkibinde sıfat ikinci kelimedir, Türkçe sıfat tamlamasında buna karşılık gelen *tamlayan* ise birinci kelimedir.
5) Arapça sıfat terkibinde asıl olan kelime ilkidir. Yani mevsuftur. Vurgu ona yapılır. Türkçe sıfat tamlamasında ise asıl olan kelime ikincisidir. Yani tamlanandır. Vurgu ona yapılır.
6) Görüldüğü gibi, öğelerin sıralanışı ve vurgunun yeri, her iki dilde birbirinin tersidir.
7) Arapça sıfat terkibinde birinci kelime olan mevsuf ma'rifedir (belirlidir). Dolayısıyla başında (ال) takısı gelmiştir. Türkçe sıfat tamlamasındaki *tamlanan*da ise herhangi bir ek veya takı yoktur.
8) Arapça sıfat terkibinde ikinci kelime olan sıfat da marifedir (belirlidir). Dolayısıyla başında (ال) takısı gelmiştir. Çünkü bu konuda mevsufuna tabidir. Türkçe sıfat tamlamasında ise böyle bir durum söz konusu değildir.
9) Arapça *Sıfat Tamlaması*ndaki "sıfat"; *sıfatı hakiki* ve *sıfatı sebebi* olmak üzere iki çeşide ayrılır. Ayrıca sıfatı hakiki de kendi içinde *müfret, şibhi cümle, isim cümlesi, fiil cümlesi* gibi çeşitlere ayrılır…[121] Fakat biz bu kadar teferruata inerek bu çalışmamızın ana gayesinden uzaklaşmak istemiyoruz
10) Arapça sıfat terkibinde sıfat mevsufuna 10 açıdan tabidir:

a) Bunların 3'ü irab bakımındandır:
1) Mevsuf merfu ise sıfat da merfudur.
2) Mevsuf mansub ise sıfat da mansubdur.
3) Mevsuf mecrur ise sıfat da mecrurdur.

b) Bunların 3'ü sayı bakımındandır:
1) Mevsuf müfred/tekil ise sıfat da müfred/tekildir.
2) Mevsuf tensiye/ikil ise sıfat da tensiye/ikildir.
3) Mevsuf cemi/çoğul ise sıfat da cemi/çoğuldur.

c) 2'si ma'rifelik-nekrelik/belirlilik-belirsizlik bakımındandır:
1) Mevsuf ma'rifel/belirli ise sıfat da ma'rifel/belirlidir.
2) Mevsuf nekre/belirsiz ise sıfat da nekre/belirsizdir.

d) 2'si de cinsiyet bakımındandır:
1) Mevsuf müzekker/eril ise sıfat da müzekker/erildir.
2) Mevsuf müenneslik/dişi ise sıfat da müenneslik/dişidir.

Sıfat ile mevsuf arasındaki bu mükemmel uyumluluğu Türkçeye kıyasladığımızda maalesef göremiyoruz. Yukarıdaki 10 maddenin sadece birinde (isim tekil ise sıfatın da tekil olduğunu) görüyoruz. Diğer 9 maddedeki uyumluluğun hiçbirisi Türkçedeki sıfat tamlamasında mefhum olarak dahi yoktur. Sonuç olarak, *Sıfat Tamlaması* diye ifade edilen bu konuda Arapça, Türkçeye nazaran neredeyse 10 misli daha teferruatlı, daha geniş ve daha zengin bir yapı arz etmektedir.

SONUÇ

Arapçadan Türkçeye geçen kelimelerin bir hayli fazla olması Türkiye'de doğup büyümüş öğrencilere Arapçanın öğretilmesini daha da kolaylaştırmaktadır. Bu kolaylık dilbilgisinde de görülebilmektedir. Türkçe Dilbilgisi konu başlıklarının dahi hala Arapça olarak kullanılması (kelime, cümle, isim, fiil, sıfat, zarf, zamir, emir… vs.) bunun en güzel örneklerindendir.

Meslek hayatımızdaki tecrübelerimizden ve uygulamalardan yola çıkarak gerçekleştirdiğimiz bu mütevazı çalışmamızda ortaya çıkmıştır ki T.C. İlahiyat Fakülteleri Hazırlık Sınıflarında Nahiv Dersinin Türkçe Dilbilgisi ile Karşılaştırılarak Öğretilmesi Yöntemi, Türkçeyi bilen öğrenciler için oldukça faydalı ve pratik bir metottur. Bu çalışmamızda biz, yıllardır uyguladığımız bu yöntemin ne kadar faydalı ve kolay olduğunu, Arapça *Cümle Bilgisi*ndeki *bazı* temel konularda örneklerle göstermeye çalıştık.

Bu yöntemin uygulanabilmesi için öncelikle hocanın her iki dili de iyi bilmesi, ardından da öğrencilerin Türkçe Dilbilgilerinin yeterli bir seviyede (en azından lise seviyesinde) olması gerekmektedir. Haliyle bu yöntemin başarılı olabilmesi, hem öğreticinin hem de öğrencinin Türkçeyi bilmesi şartına bağlıdır.

Bu çalışmamızda ortaya çıkan tabi sonuçlardan biri de şudur ki İlahiyat Fakültelerimizin Hazırlık Sınıflarında Nahiv derslerinin Türkçeyi bilen hocalar tarafından işlenmesi, Türkçe bilen öğrencilerin daha başarılı olabilmesi açısından uygun bir seçim olarak görülebilir.

[b]*Computer and Networking Engineering Study Program, Ujung Pandang State of Polytechnic, Indonesia*

Abstract

Before designing and implementing a mobile learning system, it is important to ascertain the perception of future users towards mobile learning since their perception will influence their willingness and readiness to use the system. This research investigated the perception of teachers in Indonesia of mobile learning to ascertain their readiness to engage in mobile learning for training. This study conducted a survey with 308 high school teacher respondents. The results show that teachers in Indonesia had positive perception of mobile learning and were looking forward to engage in mobile learning. Financial and device issues were not obstacles for the teachers to participate in a mobile learning environment. Interestingly, the knowledge and readiness for mobile learning of teachers who taught ICT subject was lower than teachers with mathematics, science, and other subjects. Findings obtained from this study are used as a base for designing and developing a mobile learning system for ICT training for teachers in Indonesia.

Keywords: teachers, mobile learning, perception, training system

IETC 2014

5. Introduction

With the rapid development of mobile technology and the increasing availability of wireless mobile devices in everyday life, mobile learning can be a solution to the problem of delivering ICT training to teachers in Indonesia. These problems include a lack of opportunity for teachers, geographical challenges and, time and cost problems (Yusri and Goodwin, 2013). Mobile learning is a type of learning model allowing learners to obtain learning materials anywhere and anytime using all kind of wireless handheld devices such as; mobile phones, personal digital assistant (PDA), wireless laptop, personal computer (PC), and tablet (Ozdamli and Cavus, 2011).

The potential of a mobile learning system in a training environment was studied by Sampson (2006) and Tucker and Winchester III (2009). The research suggested that mobile learning is suited to deliver training and provides the benefit of personalized education anytime and anywhere. Another study on mobile learning for training used a Mobile Performance-centered Self-directed System (mPSS) for education and training in engineering education (Martin, Gil, Lopez, Oliva, Monteso, Martinez, & Peire, 2009). This project was implemented in real training settings and users expressed satisfaction with the system.

Mobile learning has proven to be an effective tool for skill training. The Mobile Learning Network (MoLeNET), the largest mobile learning initiatives in Europe, has conducted projects specifically aimed at using mobile technologies for vocational learning in areas such as hair beauty, heating and ventilation,

* Corresponding author. Tel.: +61-8-8201-5678
E-mail address: iin.yusri@flinders.edu.au

plumbing, and wood machining (Douch et al, 2010). The projects were successful and highlighted the key benefits of mobile learning for training, which are engagement with learning, flexibility of learning, learner retention and achievement, personalization of learning, and access to learning resources.

Cisco learning network also develop mobile learning applications for IT training (Cisco, 2012). These applications have been developed specifically for network engineers who wish to take the CCNA certification but they are only available for selected brands of video-enabled mobile devices including Apple, Android, and BlackBerry.

Before designing and implementing a mobile learning system, it is important to ascertain the perception of future users towards mobile learning since their perception will influence their willingness and readiness for using the system (Mahat et al, 2012). Studies about perception and readiness on mobile learning in the literature had mostly university students as their object of research. Research that focuses exclusively on teachers' perception and readiness on mobile learning is very limited

The main propose of this study is to investigate the perception of teachers in Indonesia towards mobile learning in order to evaluate their readiness to engage in mobile learning for training. Information obtained from this study will be used as a basis for designing and developing the ICT training system.

6. Methodology

The participants of this survey comprised teachers from general and vocational high schools in South Sulawesi Province, Indonesia. The reason that teachers from general and vocational high schools were used is because ICT will be integrated into all subjects in the high school curriculum and therefore the data that will be collected will be of use in designing an ICT Training System specifically for them.

The questionnaire comprised two sections; the first section was related to the demographics of the participants and the second section consisted of questions relating to teachers' perception on mobile learning. All questions had a five-point graded response scale. Teachers in this study were recruited directly and the questionnaires were handed out to teachers in their school where they were asked to complete them either before, while waiting for their class, or after the class had finished.

The survey was carried out for a period of 2 months in July – August 2013 with 308 participants from 25 high schools in South Sulawesi Province, Indonesia. Ethical approval for the survey was granted by the Flinders University Social and Behavioural Research Ethics Committee (Project No. 6095). Research permission for the survey was also granted by Regional Government of South Sulawesi Province, Indonesia (No. 0114/P2T-BKPMD/19.36/06/VII/2013).

7. Findings

7.1. Teachers' demography profile

The following section summaries the respondent profile. Table 9 indicates that there were more female than male teachers in this study (67.2% compared to 32.8%) and the majority were aged between 41 to 50 years old, which is 41.2% of the participants.

IECT 2014

IETC 2014

Table 9. Teacher demography and background

Teacher demography and background (N=308)	Frequency	Percentage (%)
Gender		
Female	207	67.2
Male	101	32.8
Age range

Social science	55	17.9
Bahasa	32	10.4
ICT	19	6.1
Other subject	76	24.7

IETC 2014

In terms of academic qualification, the highest level achieved by most of participants was a Bachelor Degree (72.7%), followed by Master's Degree (18.5%). Only 7.8% of teachers had achieved a Diploma. Overall, there were two distinct groups of respondents according to their years of service as teachers, which are 7 years and less (27.3%) and between 15 to 21 years (25.3%).

Of the participants, 84.42% were teaching in a general high school, consisting of 178 junior high schools and 82 senior high schools. The remaining 15.58% respondents were teaching in a vocational high school. Most respondents were teaching Social Sciences, Science, Mathematics, English and Bahasa.

7.2. Perception of mobile learning

This section deals with the assessment of participants' perception of mobile learning. Teachers were given 20 statements and were asked to rate the statements using a 5-point scale. The statements were adapted from Hussin et al (2011) and were divided into five groups; knowledge, learning method, device, financial and readiness on mobile learning.

Table 10 shows the feedback from teachers on statements about knowledge towards mobile learning. The majority of teachers (55.5%) either disagreed or strongly disagreed that they knew what mobile learning was about. The table also shows that 14% of teachers indicated a neutral response and 30.5% agreed and strongly agreed that they had clear idea about mobile learning. Most of the teachers (87.9%) either agreed or strongly agreed that they wanted to know more about mobile learning. 10.2% of teachers indicated a neutral response and only 1.9% disagreed regarding seeking more information about mobile learning. 90.2% of teachers agreed that mobile learning is good for working adults for self-development. Even though 24% of total teachers thought that mobile learning will make their life difficult, there were 83.4% of teachers who agreed that mobile learning can save their learning time.

Table 10. Perception on mobile learning

No.	Statements	SA (%)	A (%)	N (%)	D (%)	SD (%)
Knowledge on mobile learning						
A1	I know what mobile learning is about	11.7	18.8	14.0	52.3	3.2
A2	I want to know more about mobile learning	28.2	59.7	10.1	1.9	0
A3	I think mobile learning is good for working adults who want to learn new skill for their professional development	32.1	58.1	8.1	1.0	0.6
A4*	Mobile learning will make my life difficult.	5.2	18.8	25.3	45.8	4.9
A5	Mobile learning will save my learning time	17.2	66.2	14.9	1.6	0
Learning method issues						
B1*	I prefer conventional learning than mobile learning	10.4	13.3	34.1	33.8	8.4
B2	I would like my tutor/instructor to integrate mobile learning in my training/course in addition to face-to-face meetings	30.8	58.8	9.1	1.3	0
B3	I would like my tutor/instructor to integrate mobile learning besides online forum in my training/course	18.8	61	18.8	1.3	0
B4	Mobile learning is an alternative to web based learning	17.5	54.9	25.6	1.9	0
B5	Mobile learning is an alternative to conventional learning	17.9	35.4	29.2	16.2	1.3
Device issues						
C1	I don't know how to use 3G facilities in my mobile phone	7.8	46.1	17.2	25.3	3.6
C2	I need to learn how to use my mobile phone for mobile learning	25.0	64.0	8.4	2.3	0.3

IECT 2014

C3	I will upgrade my mobile phone if mobile learning is going to be implemented in my course	17.9	48.4	26.0	7.5	0.3
C4*	I think I am not ready for mobile learning using mobile phone facility.	3.2	8.8	15.9	53.6	18.5
Financial issues						
D1	I don't mind paying extra money for mobile learning	22.4	54.5	15.9	7.1	0
D2*	I am afraid I will spend more money on my mobile phone bill because of mobile learning	6.5	26.6	24.7	39.9	2.3
Readiness on mobile learning						
E1*	I don't think I want to be involved in mobile learning	10.4	14.6	12.7	54.9	7.5
E2	I am not ready for mobile learning now	8.4	48.4	20.8	16.2	6.2
E3	I will be ready for mobile learning after 2 years	18.8	58.1	18.5	3.9	0.6
E4	I am looking forward to engage in mobile learning	20.8	59.7	17.5	1.9	0

*negative statements

Legend: SA = Strongly Agree; A = Agree; N = Neutral; D = Disagree; SD = Strongly Disagree

In terms of learning method, 42.2% of teachers preferred mobile learning over conventional learning. Most participants (89.8%) strongly agreed and agreed that mobile learning should be integrated into the face to face meeting method. 79.5% of teachers strongly agreed and agreed that mobile learning should be combined in their training beside an online forum. More than 50% of participants agreed that mobile learning is an alternative to conventional learning and 74.4% strongly agreed and agreed that mobile learning is an alternative for web-based learning.

There were four statements given to participants in terms of device issues, of which 53.6% of teachers agreed that they did not know how to use 3G facilities in their mobile phone. However, 89% of them had a willingness to learn how to use their mobile phone for mobile learning and 63% of teachers were ready to upgrade their mobile phone to participate in a mobile learning course.

Financial issues is not an obstacle for the participants to engage in mobile learning. The majority of teachers (76.9%) either agreed or strongly agreed that they did not mind paying extra money for mobile learning. The table also shows that 15.9% of teachers indicated a neutral response and only 7.1% disagreed. Furthermore, 43.2% of teachers disagreed and strongly disagreed that they were afraid they will spend more money on mobile phone bills because of mobile learning. 24.7% of teachers indicated a neutral response and 32.5% either agreed or strongly agreed to the statement.

Table 10 also shows that 62.5% of teachers disagreed and strongly disagreed with the statement "I don't think I want to be involved in mobile learning". In terms of implementation time of mobile learning, only 22.2% of teachers felt ready, if mobile learning is implemented now, and 76.9% felt ready if mobile learning is applied in two years.

Overall most teachers (80.5%) were looking forward to engage in mobile learning.

7.3. Cross-tabulation of demography profiles associated with perception on mobile learning

IECT 2014

This study also investigated and identified the individual factors associated with the groups' statements. The mean of all responses from each respondent in a group statement was taken to form an individual mean. Following this, the group mean was obtained from the mean of individuals' means. The respondents who have an individual mean greater than or equal to the group mean were categorized as 'high', while the respondents with individual means lower than the group mean were labeled 'low'. These data were then cross tabulated with the respondent profiles. Table 11 shows the knowledge, learning method, device, financial and readiness issues by each category in teachers' demography profile.

Table 11. Results of cross-tabulation

N = 308	Knowledge		Learning method		Device		Financial		Readiness	
	% High	% Low	% High	% Low	% High	% Low	% High	% Low	% High	% Low
School										
Junior High School	62.86	37.14	70.86	29.14	87.43	12.57	93.14	6.86	56.57	43.43
Senior High School	67.44	32.56	83.72	16.28	90.70	9.30	96.51	3.49	52.33	47.67

IETC 2014

Bahasa	56.25	43.75	78.13	21.88	87.50	12.50	90.63	9.38	56.25	43.75
ICT	47.37	52.63	68.42	31.58	100.00	0.00	89.47	10.53	47.37	52.63
Other subjects	61.84	38.16	69.74	30.26	85.53	14.47	93.42	6.58	61.84	38.16

Knowledge on mobile learning was cross tabulated with demography profiles and results show that the percentage of teachers with a positive knowledge of mobile learning was higher than the percentage of them with low knowledge of mobile learning, for all types of school. The results also show that male teachers had a better knowledge of mobile learning than female teachers.

In the term of age, the 21-30 year old group had the highest percentage of teachers with positive knowledge of mobile learning (83.33%), followed by 31-40 and 41-50 year old groups, with 71.08% and 62.20% respectively. The lowest percentage of teachers with a positive knowledge of mobile learning was found in the 51-60 year old group. These features matched with the results of the cross-tabulated areas of knowledge and years of experience. The result reveals that young teachers with experience less than 7 years (80.95%) have better comprehensive knowledge of mobile learning compared to other teachers. Only 49.15% of teachers with 22-28 years of service had positive knowledge of mobile learning.

All teachers, in this study, with doctoral background had good understanding of mobile learning, while 83.33% of teachers with diploma background also had clear idea. Furthermore, 68.42 % and 62.05% of teachers with a Master's degree and Bachelor degree respectively, had an understanding of mobile learning. Interestingly, the lowest percentage of teachers with a positive knowledge of mobile learning, in terms of subject of teaching, was found in the group of teachers with ICT subjects (47.37%).

The learning method of mobile learning was not an issue for most of teachers. The percentage of teachers with positive responses on learning method of mobile learning was relatively high for types of school and educational background categories. Teachers in others categories of teachers' profiles also presented more positive responses on learning method issues of mobile learning.

The results also indicate that the percentage of teachers that perceived device and financial issues as an obstacle for engaging in mobile learning were significantly lower in all categories of teachers' profile than those who did not. The reason for this was that they were financially independent.

When readiness on mobile learning were cross tabulated with the demographic profile of teachers, the results show that the percentage of teachers ready for engaging in mobile learning is higher than those who are not ready in; types of school, gender, and educational background categories. In contrast, only 25% of teachers with more than 35 years of experience were ready for mobile learning. The group of teachers who were teaching ICT subjects were found to be the lowest percentage of teachers who were ready for mobile learning in terms of subject of teaching.

4. Conclusion and future work

The perception of teachers in Indonesia of mobile learning has been presented in this paper. Overall, teachers in Indonesia have a good perception towards mobile learning. Their knowledge of mobile learning was average but they had a willingness to learn more about mobile learning. Financial and device issues were not obstacles for the teachers to participate in a mobile learning environment. Interestingly, the knowledge and readiness of teachers, who taught ICT subjects, of mobile learning were lower than teachers with mathematics, science, and other subjects. Findings obtained from this study are being used as a base for designing and developing a mobile learning system, for ICT training, for teachers in Indonesia

Future work will design a mobile learning system for ICT training using mobile phones. This system will be developed to solve the problem of delivering ICT training to teachers in Indonesia. A training module will be tested using the system.

Abstract

Before designing and implementing a mobile learning system, it is important to ascertain the perception of future users towards mobile learning since their perception will influence their willingness and readiness to use the system. This research investigated the perception of teachers in Indonesia of mobile learning to ascertain their readiness to engage in mobile learning for training. This study conducted a survey with 308 high school teacher respondents. The results show that teachers in Indonesia had positive perception of mobile learning and were looking forward to engage in mobile learning. Financial and device issues were not obstacles for the teachers to participate in a mobile learning environment. Interestingly, the knowledge and readiness for mobile learning of teachers who taught ICT subject was lower than teachers with mathematics, science, and other subjects. Findings obtained from this study are used as a base for designing and developing a mobile learning system for ICT training for teachers in Indonesia.

Keywords: teachers, mobile learning, perception, training system

IETC 2014

8. Introduction

With the rapid development of mobile technology and the increasing availability of wireless mobile devices in everyday life, mobile learning can be a solution to the problem of delivering ICT training to teachers in Indonesia. These problems include a lack of opportunity for teachers, geographical challenges and, time and cost problems (Yusri and Goodwin, 2013). Mobile learning is a type of learning model allowing learners to obtain learning materials anywhere and anytime using all kind of wireless handheld devices such as; mobile phones, personal digital assistant (PDA), wireless laptop, personal computer (PC), and tablet (Ozdamli and Cavus, 2011).

The potential of a mobile learning system in a training environment was studied by Sampson (2006) and Tucker and Winchester III (2009). The research suggested that mobile learning is suited to deliver training and provides the benefit of personalized education anytime and anywhere. Another study on mobile learning for training used a Mobile Performance-centered Self-directed System (mPSS) for education and training in engineering education (Martin, Gil, Lopez, Oliva, Monteso, Martinez, & Peire, 2009). This project was implemented in real training settings and users expressed satisfaction with the system.

Mobile learning has proven to be an effective tool for skill training. The Mobile Learning Network (MoLeNET), the largest mobile learning initiatives in Europe, has conducted projects specifically aimed at using mobile technologies for vocational learning in areas such as hair beauty, heating and ventilation,

* Corresponding author. Tel.: +61-8-8201-5678
E-mail address: iin.yusri@flinders.edu.au

plumbing, and wood machining (Douch et al, 2010). The projects were successful and highlighted the key benefits of mobile learning for training, which are engagement with learning, flexibility of learning, learner retention and achievement, personalization of learning, and access to learning resources.

Cisco learning network also develop mobile learning applications for IT training (Cisco, 2012). These applications have been developed specifically for network engineers who wish to take the CCNA certification but they are only available for selected brands of video-enabled mobile devices including Apple, Android, and BlackBerry.

Before designing and implementing a mobile learning system, it is important to ascertain the perception of future users towards mobile learning since their perception will influence their willingness and readiness for using the system (Mahat et al, 2012). Studies about perception and readiness on mobile learning in the literature had mostly university students as their object of research. Research that focuses exclusively on teachers' perception and readiness on mobile learning is very limited

The main propose of this study is to investigate the perception of teachers in Indonesia towards mobile learning in order to evaluate their readiness to engage in mobile learning for training. Information obtained from this study will be used as a basis for designing and developing the ICT training system.

9. Methodology

The participants of this survey comprised teachers from general and vocational high schools in South Sulawesi Province, Indonesia. The reason that teachers from general and vocational high schools were used is because ICT will be integrated into all subjects in the high school curriculum and therefore the data that will be collected will be of use in designing an ICT Training System specifically for them.

The questionnaire comprised two sections; the first section was related to the demographics of the participants and the second section consisted of questions relating to teachers' perception on mobile learning. All questions had a five-point graded response scale. Teachers in this study were recruited directly and the questionnaires were handed out to teachers in their school where they were asked to complete them either before, while waiting for their class, or after the class had finished.

The survey was carried out for a period of 2 months in July – August 2013 with 308 participants from 25 high schools in South Sulawesi Province, Indonesia. Ethical approval for the survey was granted by the Flinders University Social and Behavioural Research Ethics Committee (Project No. 6095). Research permission for the survey was also granted by Regional Government of South Sulawesi Province, Indonesia (No. 0114/P2T-BKPMD/19.36/06/VII/2013).

10. Findings

10.1. Teachers' demography profile

The following section summaries the respondent profile. Table 9 indicates that there were more female than male teachers in this study (67.2% compared to 32.8%) and the majority were aged between 41 to 50 years old, which is 41.2% of the participants.

IECT 2014

Table 12. Teacher demography and background

Teacher demography and background (N=308)	Frequency	Percentage (%)
Gender		
Female	207	67.2
Male	101	32.8

Other subject	76	24.7

IETC 2014

In terms of academic qualification, the highest level achieved by most of participants was a Bachelor Degree (72.7%), followed by Master's Degree (18.5%). Only 7.8% of teachers had achieved a Diploma. Overall, there were two distinct groups of respondents according to their years of service as teachers, which are 7 years and less (27.3%) and between 15 to 21 years (25.3%).

Of the participants, 84.42% were teaching in a general high school, consisting of 178 junior high schools and 82 senior high schools. The remaining 15.58% respondents were teaching in a vocational high school. Most respondents were teaching Social Sciences, Science, Mathematics, English and Bahasa.

10.2. Perception of mobile learning

This section deals with the assessment of participants' perception of mobile learning. Teachers were given 20 statements and were asked to rate the statements using a 5-point scale. The statements were adapted from Hussin et al (2011) and were divided into five groups; knowledge, learning method, device, financial and readiness on mobile learning.

Table 10 shows the feedback from teachers on statements about knowledge towards mobile learning. The majority of teachers (55.5%) either disagreed or strongly disagreed that they knew what mobile learning was about. The table also shows that 14% of teachers indicated a neutral response and 30.5% agreed and strongly agreed that they had clear idea about mobile learning. Most of the teachers (87.9%) either agreed or strongly agreed that they wanted to know more about mobile learning. 10.2% of teachers indicated a neutral response and only 1.9% disagreed regarding seeking more information about mobile learning. 90.2% of teachers agreed that mobile learning is good for working adults for self-development. Even though 24% of total teachers thought that mobile learning will make their life difficult, there were 83.4% of teachers who agreed that mobile learning can save their learning time.

Table 13. Perception on mobile learning

No.	Statements	SA (%)	A (%)	N (%)	D (%)	SD (%)
Knowledge on mobile learning						
A1	I know what mobile learning is about	11.7	18.8	14.0	52.3	3.2
A2	I want to know more about mobile learning	28.2	59.7	10.1	1.9	0
A3	I think mobile learning is good for working adults who want to learn new skill for their professional development	32.1	58.1	8.1	1.0	0.6
A4*	Mobile learning will make my life difficult.	5.2	18.8	25.3	45.8	4.9
A5	Mobile learning will save my learning time	17.2	66.2	14.9	1.6	0
Learning method issues						
B1*	I prefer conventional learning than mobile learning	10.4	13.3	34.1	33.8	8.4
B2	I would like my tutor/instructor to integrate mobile learning in my training/course in addition to face-to-face meetings	30.8	58.8	9.1	1.3	0
B3	I would like my tutor/instructor to integrate mobile learning besides online forum in my training/course	18.8	61	18.8	1.3	0
B4	Mobile learning is an alternative to web based learning	17.5	54.9	25.6	1.9	0
B5	Mobile learning is an alternative to conventional learning	17.9	35.4	29.2	16.2	1.3
Device issues						
C1	I don't know how to use 3G facilities in my mobile phone	7.8	46.1	17.2	25.3	3.6
C2	I need to learn how to use my mobile phone for mobile learning	25.0	64.0	8.4	2.3	0.3

IECT 2014

C3	I will upgrade my mobile phone if mobile learning is going to be implemented in my course	17.9	48.4	26.0	7.5	0.3
C4*	I think I am not ready for mobile learning using mobile phone facility.	3.2	8.8	15.9	53.6	18.5
Financial issues						
D1	I don't mind paying extra money for mobile learning	22.4	54.5	15.9	7.1	0
D2*	I am afraid I will spend more money on my mobile phone bill because of mobile learning	6.5	26.6	24.7	39.9	2.3
Readiness on mobile learning						
E1*	I don't think I want to be involved in mobile learning	10.4	14.6	12.7	54.9	7.5
E2	I am not ready for mobile learning now	8.4	48.4	20.8	16.2	6.2
E3	I will be ready for mobile learning after 2 years	18.8	58.1	18.5	3.9	0.6
E4	I am looking forward to engage in mobile learning	20.8	59.7	17.5	1.9	0

*negative statements

Legend: SA = Strongly Agree; A = Agree; N = Neutral; D = Disagree; SD = Strongly Disagree

In terms of learning method, 42.2% of teachers preferred mobile learning over conventional learning. Most participants (89.8%) strongly agreed and agreed that mobile learning should be integrated into the face to face meeting method. 79.5% of teachers strongly agreed and agreed that mobile learning should be combined in their training beside an online forum. More than 50% of participants agreed that mobile learning is an alternative to conventional learning and 74.4% strongly agreed and agreed that mobile learning is an alternative for web-based learning.

There were four statements given to participants in terms of device issues, of which 53.6% of teachers agreed that they did not know how to use 3G facilities in their mobile phone. However, 89% of them had a willingness to learn how to use their mobile phone for mobile learning and 63% of teachers were ready to upgrade their mobile phone to participate in a mobile learning course.

Financial issues is not an obstacle for the participants to engage in mobile learning. The majority of teachers (76.9%) either agreed or strongly agreed that they did not mind paying extra money for mobile learning. The table also shows that 15.9% of teachers indicated a neutral response and only 7.1% disagreed. Furthermore, 43.2% of teachers disagreed and strongly disagreed that they were afraid they will spend more money on mobile phone bills because of mobile learning. 24.7% of teachers indicated a neutral response and 32.5% either agreed or strongly agreed to the statement.

Table 10 also shows that 62.5% of teachers disagreed and strongly disagreed with the statement "I don't think I want to be involved in mobile learning". In terms of implementation time of mobile learning, only 22.2% of teachers felt ready, if mobile learning is implemented now, and 76.9% felt ready if mobile learning is applied in two years.

Overall most teachers (80.5%) were looking forward to engage in mobile learning.

10.3. Cross-tabulation of demography profiles associated with perception on mobile learning

IECT 2014

This study also investigated and identified the individual factors associated with the groups' statements. The mean of all responses from each respondent in a group statement was taken to form an individual mean. Following this, the group mean was obtained from the mean of individuals' means. The respondents who have an individual mean greater than or equal to the group mean were categorized as 'high', while the respondents with individual means lower than the group mean were labeled 'low'. These data were then cross tabulated with the respondent profiles. Table 11 shows the knowledge, learning method, device, financial and readiness issues by each category in teachers' demography profile.

Table 14. Results of cross-tabulation

N = 308	Knowledge		Learning method		Device		Financial		Readiness	
	% High	% Low	% High	% Low	% High	% Low	% High	% Low	% High	% Low

IETC 2014

Bahasa	56.25	43.75	78.13	21.88	87.50	12.50	90.63	9.38	56.25	43.75
ICT	47.37	52.63	68.42	31.58	100.00	0.00	89.47	10.53	47.37	52.63
Other subjects	61.84	38.16	69.74	30.26	85.53	14.47	93.42	6.58	61.84	38.16

Knowledge on mobile learning was cross tabulated with demography profiles and results show that the percentage of teachers with a positive knowledge of mobile learning was higher than the percentage of them with low knowledge of mobile learning, for all types of school. The results also show that male teachers had a better knowledge of mobile learning than female teachers.

In the term of age, the 21-30 year old group had the highest percentage of teachers with positive knowledge of mobile learning (83.33%), followed by 31-40 and 41-50 year old groups, with 71.08% and 62.20% respectively. The lowest percentage of teachers with a positive knowledge of mobile learning was found in the 51-60 year old group. These features matched with the results of the cross-tabulated areas of knowledge and years of experience. The result reveals that young teachers with experience less than 7 years (80.95%) have better comprehensive knowledge of mobile learning compared to other teachers. Only 49.15% of teachers with 22-28 years of service had positive knowledge of mobile learning.

All teachers, in this study, with doctoral background had good understanding of mobile learning, while 83.33% of teachers with diploma background also had clear idea. Furthermore, 68.42 % and 62.05% of teachers with a Master's degree and Bachelor degree respectively, had an understanding of mobile learning. Interestingly, the lowest percentage of teachers with a positive knowledge of mobile learning, in terms of subject of teaching, was found in the group of teachers with ICT subjects (47.37%).

The learning method of mobile learning was not an issue for most of teachers. The percentage of teachers with positive responses on learning method of mobile learning was relatively high for types of school and educational background categories. Teachers in others categories of teachers' profiles also presented more positive responses on learning method issues of mobile learning.

The results also indicate that the percentage of teachers that perceived device and financial issues as an obstacle for engaging in mobile learning were significantly lower in all categories of teachers' profile than those who did not. The reason for this was that they were financially independent.

When readiness on mobile learning were cross tabulated with the demographic profile of teachers, the results show that the percentage of teachers ready for engaging in mobile learning is higher than those who are not ready in; types of school, gender, and educational background categories. In contrast, only 25% of teachers with more than 35 years of experience were ready for mobile learning. The group of teachers who were teaching ICT subjects were found to be the lowest percentage of teachers who were ready for mobile learning in terms of subject of teaching.

4. Conclusion and future work

The perception of teachers in Indonesia of mobile learning has been presented in this paper. Overall, teachers in Indonesia have a good perception towards mobile learning. Their knowledge of mobile learning was average but they had a willingness to learn more about mobile learning. Financial and device issues were not obstacles for the teachers to participate in a mobile learning environment. Interestingly, the knowledge and readiness of teachers, who taught ICT subjects, of mobile learning were lower than teachers with mathematics, science, and other subjects. Findings obtained from this study are being used as a base for designing and developing a mobile learning system, for ICT training, for teachers in Indonesia

Future work will design a mobile learning system for ICT training using mobile phones. This system will be developed to solve the problem of delivering ICT training to teachers in Indonesia. A training module will be tested using the system.

Teachers' attitudes toward the use of e-portfolios in speaking classes in English language teaching and learning

Ahmet Erdost Yastibas[a]124, Saban Cepik[b]
[a]*School of Foreign Languages, Zirve University, Gaziantep, 27260, Turkey*
[b]*School of Foreign Languages, Zirve University, Gaziantep, 27260, Turkey*

Abstract

E-portfolios have been used in English language teaching (ELT) to assess and improve writing skills. They can also be used to assess and improve speaking skills. Though the attitudes of students toward the use of e-portfolios in speaking classes are known to be positive, teachers' attitudes toward this method is unknown. Therefore, this study aims to find out the attitudes and perceptions of teachers toward implementing the use of e-portfolios in speaking classes. As it is a small-scale qualitative study, semi-structured interviews were carried out with four listening and speaking teachers who use e-portfolios in their listening and speaking classes. The interviews were content analysed. The results indicated that teachers, like students have positive attitudes toward the implementation of e-portfolios in speaking classes, though there are some challenges to overcome.

Keywords: E-portfolio; Speaking; English Language Teaching; Speaking Teachers; Teachers' Attitudes

IETC 2014

1. Introduction

E-portfolios have been used in English Language Teaching (ELT) as an assessment and teaching tool to improve students' writing skills, yet e-portfolios have not been commonly implemented in speaking classes (Cepik & Yastibas, 2013). Therefore, Cepik and Yastibas integrated the use of e-portfolios into speaking class in order to improve and assess students' speaking skills and study the effects of e-portfolios on students' attitudes toward speaking at an English preparation department of a Turkish private university. The results of the study indicated that students formed positive attitudes toward the e-portfolio implementation in speaking courses. Meanwhile, the department adopted an e-portfolio assessment policy in speaking courses in addition to midterm and final speaking tests, which had already been the standard for speaking courses at the department. The researchers wanted to find out what speaking teachers' perceptions and attitudes toward the use of e-portfolios in speaking classes are in a second study. This interest formed the aim of the present study.

Writing skills are generally assessed and taught with the use of e-portfolios (Cepik & Yastibas, 2013), and students can improve their writing skills through this process (Erice, 2008). Studies on teaching and assessing writing through the e-portfolio process focus on students' attitudes and perceptions about process. They indicate that students' attitudes and perceptions are positive (see Erice, 2008; Abbaszad Tehrani, 2010). Similarly, speaking like writing can be assessed and taught effectively by using e-portfolios, and students have positive attitudes toward the process in speaking courses (Cepik & Yastibas, 2013). However, there seems to only be a few studies that directly focus on what teachers think about the e-

* Corresponding author. Tel.: +90-342-211-6666.
*E-mail address:*ahmet.yastibas@zirve.edu.tr

portfolio process. The lack of information on teachers' attitudes toward the process may create a contradictory issue because perceptions and attitudes about e-portfolios are generally constructed based on students, so assumptions about it are derived from this focus. The assumptions about e-portfolios may be more comprehensive if teachers' attitudes together with students' attitudes are taken into account during the derivation process. Although this study deals with the attitudes of teachers who use e-portfolios in speaking courses, it will reveal to what extent teachers' attitudes match with students' attitudes. Also, it will help to find out how comprehensive the assumptions built on students' attitudes toward the use of e-portfolios in speaking course are. This study, therefore, can serve as a basis for other studies to test the assumptions regarding e-portfolios from both teachers' and students' perspectives.

There are many studies that focus on the use of e-portfolios in writing courses, but its use in speaking courses has not been dealt with much in Turkey (Cepik & Yastibas, 2013). Cepik and Yastibas (2013) used e-portfolios to improve speaking skills of Turkish EFL students. They have mentioned its effects on the students' speaking skills and attitudes toward the use of them in speaking courses. In accordance with the previous study, the present study deals with teachers' attitudes toward the use of e-portfolios in speaking. The present study will complete the previous study that involves only students' attitudes. As a result, the previous and present studies may help teachers gain more insight about the integration of technology into speaking courses, its effects on students' speaking skills, and assessment of speaking skills through e-portfolios.

2. Literature eview

The literature review is based on the definition of e-portfolios, their benefits and challenges, and students' attitudes toward the use of them for different purposes in various courses. They are mentioned successively. However, the literature review does not include a section on the teachers' attitudes toward e-portfolios due to the lack of studies on the topic.

2.1. E-portfolios

According to Lorenzo and Ittelson (2005), e-portfolios are the personal and digital collection of artefacts of an individual including 'demonstrations, resources, and accomplishments' (p.2) for a variety of contexts and time periods. They have also mentioned that e-portfolios digitize students' works and can use the Internet to store them. In addition, Gray (2008) has stressed that an e-portfolio is "the product, created by the learner, a collection of digital artefacts articulating experiences, achievements and learning" (p.6). Gray has also stated that it is "a purposeful aggregation of digital items – ideas, evidence, reflections, feedback, etc., which presents a selected audience with evidence of a person's learning and/or ability" (p.7). Different definitions of e-portfolios indicate that they are student-centred. They also store students' individual works digitally and help follow students' learning process in different contexts and time periods.

2.2. Benefits of e-Portfolios

E-portfolios are commonly used tools in different areas of education. This commonness has resulted in many studies on its use and its effects. These studies have revealed some benefits of e-portfolios. One of the benefits is having an online virtual environment. Students share their "goals, achievements, and insights with advisors and counsellors" (Goldsmith, 2007, p.31) in this environment. Meanwhile, this gives them a chance to check whether they have met their educational and career goals. It can also indicate their achievements and skills through their e-portfolios to get a job. In other words, e-portfolios are effective

IECT 2014

tools to improve students' marketability, career planning and development since they include learners' achievements, learning experiences, and skills (Lin, 2008; Reese & Levy, 2009).

E-portfolios create a collaborative and communicative learning environment. Bolliger and Shepherd (2010) have integrated e-portfolios in an online course and researched how students' learning would be influenced by e-portfolios by looking as several factors, such as students' perceptions, communication, motivation, and connectedness (the relationship between two people). They have found that communication between peers and between students and instructors have become more effective. The study also shows that students can understand program-level expectations in online courses. The integration of online courses could motivate students to learn (Bolliger & Shepherd, 2010). In another study, Lin (2008) has worked with pre-service teachers and studied the effect of e-portfolios on them in terms of communication. The study indicates that e-portfolios can initiate communication, interaction, and collaboration between peers. Students were able to complete and improve their e-portfolios based on their peers' feedback (Lin, 2008). As a result, this promoted working collaboratively (Kocoglu, 2008).

E-portfolios lead to an improvement in the learning process and authentic assessment of students. E-portfolios make students responsible for organizing and producing material for a specific purpose, evaluating their work, and reflecting on the findings regarding their own learning process, experiences, and skills (Goldsmith, 2007). Consequently, e-portfolios contribute to students' taking control of their own education and this motivates them to study (Akçıl & Arap, 2009). They also facilitate and document their experiences authentically (Reese & Levy, 2009). Additionally, students are in charge of their own e-portfolios, so e-portfolios make students' learning individualized and personalized (Schmitz, Whitson, Heest & Maddaus, 2010). This entire process makes students autonomous because e-portfolios helps them be the directors of their education and makes them aware of important factors, procedures, and attitudes in learning (Gonzalez, 2009).

E-portfolios allow for reflection. They require reflection because reflection makes students think critically, reason analytically, and integrate their critical thinking and analytic reasoning within their learning (Rhodes, 2011). While reflecting, students revisit their learning experiences and start to look at the way they view their learning in a more different way (Lin, 2008). Students develop a sense of purpose and focus while they are reflecting because they compare their work to a standard (Lin, 2008). In this way, they can learn whether their work meet the standard or not and if it is the latter to figure out a way to meet the standard (Lin, 2008). Therefore, they are supposed to participate actively in the presentation and representation of their learning, so they can be motivated and try to do their best as Rhodes mentions. E-portfolios provide individual feedback to them about their learning, experiences, achievements, strengths, and weaknesses (Goldsmith, 2007). Consequently, students can improve their learning through self-reflection and feedback.

E-portfolios also promote academic advising or supervision (Reese & Levy, 2009). They track students' progress through reflection and feedback (Reese & Levy, 2009). According to them, it creates a continuous flow of information about students' own learning process between students and their teachers. According to Bashook, Gelula, Joshi, and Sandlow (2008), e-portfolios help teachers have more meaningful and interactive communication with their students. They have mentioned that teachers understand their students better by discovering insights about their attitudes, beliefs, and problems.

E-portfolios enhance students' technology skills (Lin, 2008). Students are required to collect their work digitally, so they need to be familiar with the use of technology. This process blends students' "information literacy, technology fluency, and domain knowledge" (Reese & Levy, 2009, p.3). E-portfolios require technology skills, such as uploading pictures and using Word so that students can learn, review, and improve their works. This process may require that students revisit their technology skills and could result in improving them (Lin, 2008).

2.3. Challenges of E-portfolios

Despite their benefits, e-portfolios may challenge both teachers and students. For example, students' understanding of technology may affect the e-portfolio process negatively. According to Dalton (2007), how students perceive technology has an effect on the implementation of e-portfolios because some students' familiarity with technology may lead to decisions about what is useful or not for them. Such decisions may affect and lower the efficiency and effectiveness of e-portfolios (Dawn, Smith, Peterson, Cone, Slazar, Bond & Godwin, 2011). Also, the way students evaluate and understand technology affects the way

IECT 2014

they use the e-portfolio system. To illustrate, an e-portfolio system should be flexible. If not, it may impact the learning process negatively as Dalton points out. It is the flexibility that makes e-portfolios more engaging, gives learners more control, and helps students become more active in their own learning. Other challenges include the lack of self-assessment, reflection, technology, and meta-cognitive skills in student's educational background. They may decrease the effectiveness of e-portfolios and bring about being "overwhelmed by the course management system, the portal, and the e-portfolio" (Goldsmith, 2007, p.39). Another challenge may come from inexperienced teachers who implement e-portfolios in their courses. According to Goldsmith (2007), the lack of experience of institutions and educators with the e-portfolio process can cause problems for the implementation of an e-portfolio system, so implementations of e-portfolios require learning how to use the software for the e-portfolio platform and understanding "the assumptions on which an e-portfolio was built" (Goldsmith, 2007, p.38; Gray, 2008).

2.4. Students' attitudes toward e-portfolios

When e-portfolios are implemented in a course for a variety of purposes, it leads to a number of positive and negative changes. The positive and negative changes influence the way students form their attitudes toward the e-portfolio implementation. Akçıl and Arap (2009) have found that pre-service teachers have positive attitudes toward e-portfolios. It is because they think that e-portfolios promote life-long learning, enable them to take the control of their learning, and motivate them to study (Akçıl & Arap, 2009). In another study, Genc and Tinmaz (2010) have worked with pre-service Computer Education and Instructional Technology teachers and found that e-portfolios enhance skill and knowledge development of pre-service teachers. Hung (2012) has emphasized that student ELT teachers can work in a community to practice, integrate their content knowledge with their learning, and improve their critical thinking through e-portfolios. Also, e-portfolios can facilitate peer feedback and promote professional development. On the other hand, Hung has stressed that they can cause learning anxiety and resistance to technology. According to Lin (2008), pre-service teachers can engage more in reflective activities, develop effective learning strategies, gain and review technology skills through e-portfolios. However, they lead to some problems such as frustrations, time consuming, and uncertainty about the knowledge and organizational strategies (Lin, 2008). Kubilan and Khan (2012) have also worked with pre-service English language teachers. They have found that e-portfolios can help pre-service teachers develop an understanding of the teacher's role, their teaching skills and activities. According to them, they can also improve their linguistic and technology skills, and comprehend content knowledge. As a result, they formed positive attitudes toward e-portfolios (Kubilan & Khan, 2012). However, Kubilan and Khan have stated that there are some problems related to the e-portfolio implementation that include interrupted Internet connection, time constraints, and issues related to validity and reliability.

While the main concern of above studies is the perceptions of pre-service teachers from different departments, the studies mentioned here focus on the perceptions and attitudes of EFL/ESL students. According to Baturay and Daloğlu (2010), the students in an online course think that e-portfolios are beneficial and enjoyable. Baturay and Daloğlu have mentioned that e-portfolios are indicators of learning gain because students can keep the track of their learning and get feedback about their work. E-portfolios enable them to identify their strengths and weaknesses by assessing their own learning. As Baturay and Daloğlu have stated, e-portfolios promote self-regulated learning skills of students and improve their critical thinking skills by making them focus on real-life applications of language, problem-solving, and developing creativity. Similarly, self- and peer-based formative assessments are promoted by e-portfolios (Welsh, 2012). According to Welsh, this can foster the self-regulation learning skills of students. Erice (2008) has employed e-portfolios in writing classes. Erice has found out that students can improve their writing skills through e-portfolios. They have also developed positive attitudes toward the use of e-portfolio in writing classes (Erice, 2008). In another study, Abbaszad Tehrani (2010) has used net-folio (another name used for e-portfolio) to improve students' writing skills. The study indicates that students have formed positive attitudes toward the use of net-folio in writing (Abbaszad Tehrani, 2010). Additionally, Cepik and Yastibas (2013) used e-portfolios in speaking classes to improve and assess speaking skills. They found that e-portfolios can help students become responsible, active, and autonomous while studying. In addition, students can assess their own learning themselves, feel less anxious and more self-confident and motivated to speak (Cepik & Yastibas, 2013). In addition, Rizthaupt, Ndoye and Parker (n.d.) have stated that students can identify their strengths and weaknesses and can improve their own learning. In addition, e-portfolios can help students display their knowledge, skills, and accomplishments. E-portfolios are an alternative and authentic assessment tool in evaluating students' learning.

IECT 2014

As understood, whatever the reasons for the use of e-portfolios in courses, e-portfolios engage students in learning and learning activities. They make them active and autonomous. They make them responsible for their own learning. In addition, they motivate students to study, enhance their self-assessment, technology, and critical thinking skills, and build their self-confidence. Owing to the positive contributions of e-portfolios for students' learning, students seem to form positive attitudes toward them.

3. Methodology

3.1. Participants

Twelve EFL teachers who taught listening and speaking courses at the English preparation department of a private university in Turkey participated in the study voluntarily. Five of them were male teachers while seven of them were female. Six of them were native-speakers of English while the rest were non-native speakers. All of the participants experienced the process of e-portfolio implementation in speaking courses since it was required to assess students' speaking skills through e-portfolios.

3.2. Data collection procedure

The study was carried out at an English preparation department of a Turkish private university. First, the researchers took permission from the university to conduct the study. Then the participants were chosen. Twelve ELF teachers accepted to participate voluntarily after being informed about the content and aim of the study. Finally the interview preparation process started. It was prepared in three steps:

- First step: Four of the participants were chosen randomly and asked to write their personal ideas and experiences about e-portfolio implementation in speaking courses. The first four teachers' writings about e-portfolios were analysed with content analysis by the researchers. The researchers identified four major issues: the effects of e-portfolios on students, the effects of them on teachers, and students and teachers' requirements in using e-portfolios in speaking courses.

- Second Step: Four interview questions were prepared based on the content analysis gathered in the first step, and were given to four different teachers who were chosen randomly, but did not join the first step. These new teachers were interviewed and the researchers analysed those teachers' responses to the questions through content analysis. Then the researchers compared the findings of the first step to the findings of the second step.

- Third Step: Before finalizing the interview questions, the researchers also took the following conditions into considerations. One of the researchers was teaching listening and speaking courses and used e-portfolios in his classes to assess and teach students' speaking skills. He continuously talked with other listening and speaking teachers about their experience in their own listening and speaking courses, which helped to share personal ideas, different problems encountered in class, different solutions developed to overcome problems, and suggestions to improve the implementation. Two other instructors contributed to the content analysis. All of these factors were taken into consideration. The questions in the first interview were modified and finalized. Then the final version of the semi-structured interview was given to the last four teachers who did not participate in the first and second step of this study. The researchers analysed the responses of the last four teachers that participated in the present study by using content analysis.

IECT 2014

3.3. Data collection instrument

The present paper is a small-scale qualitative study, so a semi-structured interview was used to collect data. It is preferred because according to Talmy and Richards (2011), it can help 'generate insights' (1), and these insights can be related to matters such as language learning, motivation, and language attitudes. The interview has four pre-determined questions that focus on the effects of e-portfolios on students' speaking skills, the effects of them on teachers' teaching and assessing speaking skills in their courses, requiring students to prepare their e-portfolios, and requiring teachers to implement e-portfolios in their own courses.

In order to make the interview reliable, the participants were grouped randomly and could join only one of the three steps mentioned in data collection procedure at different times. Each of these steps required written responses of each participant. As a result, the following was avoided: (a) that participants might affect each other and (b) that a participant might take part in different steps of the study and repeat his/her ideas. When the three content analyses of the research were compared to each other, the findings were consistent with each other.

The interview was also valid. It had three orientations. First, twelve different teachers joined only one part of the study. They shared what they experienced and examined the implementation of e-portfolios in speaking classes. Second, the researchers evaluated the e-portfolio implementation in speaking courses and looked at the attitudes of students toward the use of e-portfolios in speaking classes. The research also included one of the researchers' own experiences. Third, one of the researchers discussed the e-portfolio system with other instructors. These orientations enriched the scope of the interview. With the knowledge gained, the researchers were able to prepare questions that could measure what the study aimed to find out, which made the interview valid because Kimberlin and Winterstein (2008) defined validity as "the extent to which an instrument measures what is purports to measure" (2278).

3.4. Data analysis

The data collection instrument was totally qualitative, so the content analysis method was applied to analyse it. The qualitative data analysis procedure mentioned by Cabaroğlu (as cited in Köse, 2006) was applied to do content analysis. The model is composed of the following categories: familiarization, coding/labelling, clustering, defining codes operationally, retrieving and organizing data, and looking for interrelationships between categories (Köse, 2006). Yet, familiarization, coding/labelling, clustering, retrieving and organizing data, and looking for interrelationships between categories were used.

4. Findings

Content analysis was employed to analyse and evaluate the semi-structured interviews of the four teachers. Five categorizations were developed depending on the content of the interview questions: benefits of e-portfolios for students, drawbacks of e-portfolios for students, students' requirements, teachers' requirements, and the impact of e-portfolios on teachers. Accordingly, the findings were mentioned in this order.

4.1. Benefits of e-portfolios for students

IETC 2014

Three of the four teachers think that e-portfolios can promote the use of language. An e-portfolio is an individual study of a student, so he/she has to use the target language in order to complete the assignment given to him/her, which results in the independent and communicative use of the language. The following comments illustrate this:

Teacher 1: *The speaking portfolio also forces students to learn how to utilize the target language independently.*

Teacher 3: *In e-portfolios, students find an area to express themselves and use L2 communicatively.*

As seen, Teacher 3 also mentions that students have an area to express themselves. This motivates them to participate in e-portfolio activities actively. E-portfolios engage them in their learning. In the e-portfolio process, they are given time to improve their learning through their own efforts such as researching, organizing their findings, and creating their e-portfolios. As a result, these may help them to be active participants and to be responsible for their own learning. Two comments taken from Teacher 3 below illustrate what is mentioned clearly. The comment taken from Teacher 1 below also supports what is mentioned though it is related to a negative issue.

Teacher 3: *They [students] take it [e-portfolio] really seriously and even the most silent/passive students put effort into their e-portfolios.*

Teacher 1: *Collecting, cataloging, and creating the portfolios were difficult at times. Furthermore, the idea of producing drafts of a speaking portfolio was a new concept for some students…*

Teacher 3: *E-portfolios help them [students] spend time alone to work/research a topic.*

E-portfolios create a collaborative and interactive atmosphere in the classroom. Students may work in groups, so they can share what they have found out and collaborate with each other to prepare their videos. It makes the classroom interactive. The following excerpts indicate this clearly:

Teacher 1: *The speaking portfolio is a great way to promote classroom interaction and collaboration between students.*

Teacher 3: *…They might prepare something in a group…. group works increase their sharing skills and give them chances to learn from each other.*

E-portfolios also enable students to identify their strengths and weaknesses, so students can have a chance to overcome their weaknesses. In their e-portfolios, students can reflect what they have achieved and how they have found and overcome their weaknesses. Namely, e-portfolios improve students' self-assessment and self-reflection skills so that they can improve their learning. To illustrate:

Teacher 1: *Additionally, when structured correctly, [e-portfolios] can promote self-assessment and reflection.*

Teacher 3: *… Individual studies make them aware of their good/strong and bad/weak sides about the language.*

In addition to these contributions of e-portfolios to students' learning, Teacher 4 also believes that students can improve their discussion skills such as questioning.

E-portfolios allow students to make connections between what is learned in the classroom and how what is learned can be used in real life. To understand this better, the e-portfolio system used in listening and speaking courses at the department should be explained. Students are given two assignments in each quarter (there are four quarters in a regular school year). The assignments are given according to the assignments outlined in the listening and speaking course book. The teachers select two e-portfolio topics based on two units. While preparing their portfolios, students need to choose a topic related to the assignment, research the topic, and compose a text by using the target vocabulary of the unit . The excerpt taken from Teacher 4 exemplifies this issue:

Teacher 4: *… However, it [e-portfolio] is a good opportunity for them [students] to create a speaking sample using the vocabulary from the chapters.*

IETC 2014

4.2. Drawbacks of e-portfolios for students

Before e-portfolios are implemented, variables such as cultural context, teachers' ability to promote creativity, and technological elements should be determined and taken into consideration. Otherwise, this may limit the effectiveness and efficiency of e-portfolios, which may make the process difficult for students and teachers. Teacher 1 clearly indicates this:

Teacher 1: *I think the speaking portfolio is BOTH good and bad. Because the speaking portfolio depends on many variables (cultural context, teachers' ability to promote an environment conductive to creativity, technological elements), it can be a hard feat to manage.*

In order to prepare an e-portfolio for a speaking course, many factors are dealt with at the same time. Students are responsible for selecting a suitable topic for the assignments, researching, collecting and classifying what they have found, and finally creating their assignments. In this process, students are also supposed to produce four videos for two assignments. The first and third videos are first drafts of the two assignments and the teacher provides feedback. The second and forth videos are the final edited and reproduced versions of the first and third videos. This is a heavy burden on students and makes their learning more difficult. The excerpt below supports this issue:

Teacher 1: *Collecting, cataloging, and creating the portfolios was difficult at times. Furthermore, the idea of producing "drafts" of a speaking portfolio was a new concept for some students, which made the process more difficult.*

Students researched and composed their scripts to study before recording their videos. They memorized or read their scripts while preparing videos. Therefore, it is not an actual speech, but just a record of memorization or reading, which avoids fluency and spontaneity of speaking. Teacher 2 and Teacher 4 mention this issue as follow:

Teacher 2: *Since it [e-portfolio] is a recorded material, students memorize their speech. There is almost no production in e-portfolios.*

Teacher 4: *… Most of the students write down what they are going to say and then memorize it or read it. In these cases, it is not a true sample of their ability to speak.*

Apart from other participants, Teacher 2 considers e-portfolios in classes as 'a waste of time' because according to her, e-portfolio lacks assessment and process standards. Also, she mentions that e-portfolio is not motivating and beneficial for students because teachers are not well informed about e-portfolios, which also impacts classes negatively.

4.3. Students' requirements

Students' requirements refer to what students need to have or do in order to prepare their e-portfolios. Two of four teachers listed the steps taken to prepare students for the e-portfolio process. The steps include brainstorming about the topic, outlining speech, getting feedback from their peers and teachers, preparing videos and editing them according to the feedback given to them. For example, Teacher 2 lists them as follows;

- *Brainstorm about the topic*
- *Brainstorm about the supporting ideas*
- *Outline their speech*
- *Get feedback from their peers*
- *Make their 1st video*
- *Get feedback from their teachers*

IETC 2014

- Make their 2nd video

This proves that students should use their critical thinking skills when they brainstorm and outline their speech. They should collaborate with other students to work. They should be aware of their learning because when they get feedback from their peers and teachers, they should check their projects and improve them according to peer and teacher feedback.

Teacher 1: *First and foremost, a devotion to and motivation for the project is necessary. Without sincere excitement or motivation to produce a speaking video this project cannot be completed successfully. Especially when taking into consideration the processes of draft education, revision, self-assessment and self-reflection, motivation is a must.*

Teacher 3: *Students need … more importantly motivation.*

The excerpts show that preparing an e-portfolio is really a difficult task to carry out for students because of the requirements. Therefore, it may cause demotivation and frustration among students. But if students are motivated, they can prepare their e-portfolios and be successful.

Another requirement is having technology skills. In order to create an e-portfolio, students are supposed to prepare videos. Therefore, they should know how to use computer programs like iPhoto and iMovie, which are free software used in Apple's IOS operation system. The following excerpts are indicators of this.

Teacher 1: *Additionally, some technological knowledge is necessary (operation of a camera, computer, or a voice recorder.*

Teacher 3: *Students need a camera, a voice recorder, internet for researches, iMovie programme for well-developed projects…*

Teacher 3 emphasizes the need for teacher guidance to produce successful e-portfolios. Teacher guidance helps students comprehend assignments, find out strengths and weaknesses in their e-portfolios, and improve their learning by overcoming their weaknesses. In addition, Teacher 3 points out that student autonomy is another need for students. Students can become autonomous if they are free to choose what to study in their assignments.

4.4. Teachers' requirements

Teachers' requirements refer to what teachers need to have or do in order to implement the use of e-portfolios in their classes. The first requirement is that they have technological skills like their students. During the e-portfolio process, students need technical support in such situations, such as recording their video, uploading pictures to their videos, or the use of a camera or voice recorder. This requirement of students necessitates teachers having technology competence. To illustrate:

Teacher 1: *Technological knowledge is necessary on the teachers' part. Either in operation of a learning management system site for collection of the videos or in assisting the students' with operations of their computer for recording purposes.*

Teacher 2: *[Teachers] help them with computers/programs.*

Teachers should be able to plan effectively and be well organized. They should provide students with the framework that needs to used to produce their e-portfolios. To do this, teachers should have reasonable expectations of what can be achieved by students and have a clear understanding of their students. They should get familiar with their students. They should have a clear standard and a rubric to evaluate students' e-portfolios. In addition, they should provide students with individual, clear, and detailed feedback so that students can be encouraged to discover their weaknesses and strengths and to find solutions to improve their weaknesses. The following excerpts help to understand these matters.

Teacher 2: *[Teachers] provide students with a pack including brainstorming charts, outline pages, feedback pages as well as a rubric…. [Teachers] give clear and detailed feedback.*

IETC 2014

Teacher 4: *First the teacher must present the ideas and topics for the portfolio.*

Teacher 3: *The teacher should plan the activities and be organized. S/he should know his/her students and also know who is working on what topic. S/he should watch/listen to e-portfolios and give individual feedback one by one.*

Though it may seem that the e-portfolio process is teacher-centred, teachers' and students' roles are defined, and priority is on the students. Teachers should be facilitators, observers, and guides when they work with their students in class. To illustrate:

Teacher 2: *[Teachers] monitor students in groups and help them when needed.*

Teacher 3: *S/he [the teachers] should give students suggestions when s/he thinks it is necessary.*

Teacher 1: *When students are given controlled freedom to express themselves, the products are surprising.*

Students are in charge of preparing their own videos. Selecting, organizing, and creating portfolios are their responsibilities. During this procedure, they are the decision makers of their own e-portfolios, though teachers guide them. Therefore, their e-portfolios are individual and different from each other. They reflect their owners' creativity. This makes teachers be flexible and open to creativity. The following excerpt from Teacher 1 shows this:

Teacher 1: *The teacher should be open to creativity. When students are given a controlled freedom to express themselves, the products are surprising.*

Teacher 3: *… Good works should be praised and insufficient works should be encouraged.*

In addition to these requirements, Teacher 3 also emphasizes the need for praise and encouragement. As seen, one of the requirements of students is to be motivated. One way to motivate students is to praise and encourage them as they work. When a student is praised and encouraged by teachers, he/she can have the excitement and motivation that are required to carry out the requirements of the e-portfolio process.

4.5. Influences of e-portfolios on teachers

The impact of e-portfolios on teachers refers to how e-portfolios in listening and speaking courses affect the way teachers teach and assess speaking. Teacher 2 does not think that e-portfolios affect the way she assesses and teaches speaking skills in her classes. On the other hand, the responses of the other three teachers show that they are affected by e-portfolios to some extent. Three of them agree that e-portfolios are good outside classroom activities for students. They force students to learn how to utilize target language by using target vocabulary from their course book in a real-life situation. Also, they encourage students to use the target language not only inside the class but also outside the class. Therefore, students' e-portfolios are indicators of the fact that students improve themselves and master the target language. The following excerpts support this:

Teacher 1: *Seeing how a student uses the language outside the classroom is undoubtedly an indication of mastery.*

Teacher 4: *… the portfolio is a reflection of the sincere hard work of a student to learn and use English effectively.*

Teacher 3: *… E-portfolio gives them [the students] freedom to put their ideas into action. They jump from pages to stages. E-portfolios bring them closer to real life, which means English or a language is not only grammar or not just something that they use in class.*

Teacher 3 also thinks that e-portfolios changes students' understanding of a language. It considers a language only as a classroom subject or a set of grammatical rules. Instead, it shows that the language they learn can be also spoken and used outside the classroom. E-portfolios help students be aware of the real function of the language: communication, because they generally view a language as an in-class activity and a set of linguistic items.

IETC 2014

During the e-portfolio process, students are required to prepare four videos for two assignments and store them on an online language management system. The first and third videos are the first versions of students' works. Students get feedback from their friends and teachers, and then they prepare the second and third videos by improving them according to the feedback given. Therefore, e-portfolios keep track of students' learning, so they enable teachers to follow their students' progress. They also help teachers recognize and identify their students' problems in speaking, so teachers can contribute to students' improvement of their weaknesses. Teacher 3 and 4 point to this issue as follows:

Teacher 3: *It [E-portfolio] can influence how I assess speaking skills in some ways. For example, it can reveal pronunciation problems as well as patterns of mistakes in grammar.*

Teacher 4: *Speaking e-portfolio influences the way I assess speaking in my listening & speaking class…. E-portfolios are helpful to assess speaking; they give you tips about the improvement of the students.*

Apart from them, Teacher 1 states that students prepare and rehearse their scripts before they record their videos. The preparation and rehearsal influence fluency and spontaneity of students' speech. Therefore, alternative classroom activities that promote spontaneity should be used to assess speaking, too. According to Teacher 4, e-portfolios are fun for students to prepare. Also, students have a chance to display their works to others through e-portfolios and are praised and encouraged whatever quality their works are, so students are satisfied with and proud of their work.

5. Discussions

The use of e-portfolios in speaking courses promotes the use of the target language because students are engaged in learning (Schmitz, Whitson, Heest & Maddaus, 2010). According to Goldsmith (2007), e-portfolios require students to be responsible for organizing and producing the material for a specific purpose, evaluating their work, and reflecting on their findings about their own learning process, experiences, and skills. Consequently, e-portfolios contribute to students' taking control of their own education and motivating themselves to study (Akçıl & Arap, 2009; Cepik & Yastibas, 2013). Students who prepare e-portfolios in their listening and speaking courses take the responsibility of organizing and preparing their own portfolios, which enables them to participate in learning activities actively. They become aware of their strengths and weaknesses in their e-portfolios because e-portfolios require self-assessment and self-reflection as Rhodes (2011), Gonzalez (2009), Schmitz et al. (2010), and Cepik and Yastibas (2013) have stated. They try to overcome their weaknesses and reflect on what they have done in their e-portfolios. According to Lin (2008), e-portfolios can promote interaction and collaboration in class, which motivates and encourages students to complete and improve their e-portfolios benefitting from their peers. The use of e-portfolios in speaking courses enables students to collaborate and interact with their peers and teachers during the e-portfolio process. E-portfolios promote working collaboratively (Kocoglu, 2008). As e-portfolio assignments are given from the units studied in listening and speaking courses, the connection between what is learned in the classroom and how it is used in real life is established. Consequently, students can improve their speaking skills (Cepik & Yastibas, 2013).

Though e-portfolios contribute to students' learning in some ways, they also create some challenges for them. There are many factors such as cultural context and teachers' ability to be creative may decrease the efficiency and effectiveness of e-portfolios in speaking classes. According to Dalton (2007), an e-portfolio system should be flexible, so it should enable students to engage in their learning, give them more control over their learning, and enable them to be more active in their learning. However, speaking e-portfolios are very intensive because it requires selecting a topic, researching this topic, organizing the ideas, composing a text, recording a video, and re-recording the video according to the feedback given. As a result, the e-portfolio process makes students spend a lot of time to meet these requirements, so it may demotivate them. Goldsmith (2007) has mentioned that when teachers have no or little experience with the e-portfolio process, some problems during the implementation of an e-portfolio system may occur. Therefore, when e-portfolios are implemented, teachers should learn how to use the software for an e-portfolio platform and to understand "the assumptions on which an e-portfolio was built" (Goldsmith,

IETC 2014

2007, p.38; Gray, 2008). Accordingly, teachers participating in the present study mention that the use of e-portfolios in speaking courses may be demotivating for students because teachers may lack technical skills to carry out the process and may not have clearly stated standards for students' assessment. In addition, students memorize or read their scripts when they record their videos. Though it eases students' job, it affects the fluency and spontaneity of their speech.

In order to produce e-portfolios, students should use their critical thinking skills (Rhodes, 2011) because they need to brainstorm about the assignments, research, combine what they have found out, compose and outline their speech. While they are preparing their e-portfolios, they need to work, interact, and share ideas with their peers and teachers. It makes communication among students and between students and their teachers more effective as Bolliger and Shepherd (2010) have claimed. Teachers only help students when students need help. Motivation is key to encourage students to work and complete their e-portfolios (Bolliger & Shepherd, 2010). Students who prepare speaking e-portfolios should be motivated because the content of e-portfolios is very intensive and requires students to spend a lot of time. This process may be tiring and boring for students, but if they are motivated and excited, then they can complete their e-portfolios. Students should be free to choose what to study and how to prepare their e-portfolios, which encourages them to be responsible for their learning, to join the process actively, and to become autonomous. E-portfolios blend students' "information literacy, technology fluency, and domain knowledge" (Reese & Levy, 2009, p.3). They need to have some technology skills to produce their e-portfolios, which means revisiting the existent technology skills and improving them (Lin, 2008). Likewise, students who prepare e-portfolios for the speaking course should have some technology skills because they are required to record their videos by using a computer and to arrange their videos by using some programs like iMovie when they prepare their e-portfolios.

According to Goldsmith, the implementation of e-portfolios may create some problems because teachers may not have enough or any experience with the e-portfolio system. They also may not have a clear understanding of the assumptions of an e-portfolio system. Therefore, teachers should plan and organize everything related to e-portfolio implementation in speaking courses. First, they should set reasonable objectives that students can achieve. Then they should clearly state standards to implement, assess, and evaluate the e-portfolio process. They should know how to use the learning management systems and how to use programs such as iPhoto and iMovie in order to help students record and arrange their videos. As Lorenzo and Ittelson (2005) and Gray (2008) have stated, e-portfolios are the digital collections of a person's works. As a result, individuals are the focus of e-portfolios and personalize their learning through e-portfolios (Schmitz et al., 2010). Teachers who implement e-portfolios in speaking courses, therefore, should facilitate, observe, and guide students during the e-portfolio process because the main focus of e-portfolios is on students' improvement. They should give clear, understandable, and formative feedback to students about their e-portfolios individually. This can create a continuous flow of information between students and teachers about students' learning progress that can be followed easily because e-portfolios keep track of their learning (Reese & Levy, 2009). In addition, teachers who use e-portfolios in speaking classes should be flexible and open to creativity because each e-portfolio is unique in terms of organization and design. In order to motivate students to produce their e-portfolios, teachers should praise students' works and encourage students to work.

E-portfolios are good activities because they encourage students to use the target language outside the classroom. Students need to utilize the target language in a communicative and independent way because they communicate their ideas about the assignments in a way they design and organize on their own. This indicates that students can improve their use of language and master it as Baturay and Daloğlu (2010) have mentioned. The use of language in this way may change students' point of view about the language. They replace the view that the language is a set of linguistic rules and a classroom subject with the view that the language is used to communicate ideas, as Gonzalez (2009) has emphasized. Teachers keep track of their students' learning process because e-portfolios store their works (Baturay & Daloğlu, 2010; Reese & Levy, 2009). Therefore, they can follow whether their students improve themselves or not. When students complete their e-portfolios, they can also follow their own progress. They have a chance to show their products to their peers and teachers, so this can make them satisfied and motivated. But the preparation of speaking e-portfolios may result in memorization of the speech. Memorization influences the fluency and spontaneity of the speech. Therefore, e-portfolios in speaking course should be supported with activities that enhance spontaneous speech.

IECT 2014

6. Conclusion

There are some problems related to the lack of standardization in the e-portfolio process, in terms of grading rubrics and the lack of understanding the basic principles of the use of e-portfolios in speaking classes and memorization tactics students use in their videos. The teachers generally think that e-portfolios are a good way to encourage the use of the target language outside the classroom. They claim that students improve their self-assessment, self-reflection and language skills. In addition, students can improve their social skills by collaborating and interacting with their friends, and take risks in their learning by participating actively and taking responsibility for their learning. According to teachers, students have a chance to use the target language in real-life situations by making connections with what they learn in the classroom and how they can use their learning in real world. Students can display their works to others, which helps them to be motivated and build self-confidence as well. The teachers' responses indicate that e-portfolios help them to follow their students' progress, to identify their strengths and weaknesses, and to give feedback about their weaknesses to students individually. Therefore, it can be said that teachers' attitudes toward the use of e-portfolios in speaking classes are positive.

Abstract

The growth of mobile technologies was evolutionary in the progression of technology, it opened a revolution in computing in a quicker time frame. The easy availability and extreme mobility with rich set of applications made smartphones an inevitable tool for students. This is the high time for academic domain to go for innovative teaching practices with the inclusion of mobile technologies to bridge the gap between academia and industry in a considerable manner. This paper is aimed to introduce an innovative approach of learning computer programming on smartphone platform. The proposed approach intends to introduce a new pedagogy of teaching programming on a platform by developing applications instead of teaching a programming language for creating applications. The main premise of this practice is the introduction of a tailored module to teach Java programming language while developing apps for a leading mobile platform-Android. The proposed module can be an appropriate alternative for the module 'Introduction to programming' of computer science curriculum across the globe. Pilot implementation has been done in one of the premier higher education centres of Gulf Council Country (GCC). An ontology based implementation of the proposed module ensures its consistency in delivery and the future work will focus more in this direction.

*Keywords:*Andorid;ontology;pedagogy;smart device; ontology

IETC 2014

1. Introduction

Mobile devices have started a new era in computing than ever before. The evident reflection of this vital change is there in all domains including teaching and learning sector, at least in the higher education sector. The swift that mobile internet has been explosively done from simple mobile phones to high end smartphones made it to serve as equivalent to a mini computer or more than that with its features for teaching and learning. The easy usage and easy accessibility of smart phones, the interaction that these ubiquitous devices offered with the capability of data transfer with higher data rate made it as an inevitable tool of educators. Quite lot of researches has been done and plenty of methods that can facilitate learning have been developed for the years ranging from traditional to electronic manner. The growth of mobile technologies opened a new horizon called mobile learning (m-learning) not just as an extended version of e-learning but as an extended paradigm. The mobile devices when used for learning purpose can create more active learning experience that improve student engagement, learning and course retention (Jooston, 2010). Besides these, the use of mobile technologies enhance the motivation level of students by offering the scope of applying 'learning by doing' approach instead of learning and doing. In fact, m-learning justifies one of the popular quotes from Chinese philosopher Confucius about learning "*I hear*

* Corresponding author. Tel.: +91-451-2452371; fax: +91-451-2454466.
E-mail address: drmaryshanthi@ruraluniv.ac.in

and forget, I see and I remember. I do and I understand". It is a fact that the paradigm of m-learning has to be well supported by appropriate teaching pedagogy for its effectiveness as well as its implementation in curriculum across the globe. Agile pedagogies are more right candidates for m-learning due to their underlying learning approach and learning element. One of the areas where m-learning can go in a deeper manner is computer science/engineering courses. Students from various engineering disciplines are very much keen on developing and even deploying their mobile applications on repositories like play store. In primitive way of teaching and learning, deployment of an application is far away from curriculum and which is considered as one of the reasons for the gap between the academia and ICT industry. Innovative teaching practices with the inclusion of mobile technologies can have the possibility to bridge the gap in a considerable manner.

This research proposes an innovative way of teaching programming on smartphone platform by deriving a tailored course 'Introduction to programming with Java on Android platform'. The derived course has been delivered to a cohort of first level programming learners with an agile pedagogy derived suiting to m-learning. In section 2, review of related works is furnished to specify the background of research. Innovative practice and learning framework is discussed in section 3. Application and Evaluation of practice is presented in section 4. Ontology based implementation possibility is covered in section 5 followed by the future work.

2. Related works and background of research

In recent years, the efficiency of constructivism learning method, the transition from computer based learning to web based learning and the improvement in technologies have made mobile learning one of the most popular learning styles (Yamamoto, Demiray, & U, 2010)(Yamamoto, 2011). The umbrella of mobile learning covers a wide range of its perspectives and it can be represented within any of the learning scenarios ranging from blended learning to spaced learning. Many of the older definitions of mobile learning focused more on the aspect of learner being mobile while the new smart devices and the dramatic increase in data transmission offers a more flexible view of mobile learning considering both learner and devices. The two hypotheses designed for this research and their confirmation by experiments/surveys have led to the core outcomes of this research.

Hypothesis 1: Many designers and mobile learning initiatives are converting existing e-learning courses by only resizing them to smaller screens and user interface differences.
Hypothesis 2: There is no or minimal consideration for optimizing the learning experience by leveraging the capabilities of the mobile platform by utilizing alternative approaches.

Literatures and practices have shown that the growing number of mobile innovations continue to enter the landscape, educators are now interested in to redesigning traditional learning scenarios to mobile ones that leverages the unique capabilities of the mobile platform. Being specific, learning java programming in android platform is an example of one such effort. For historical reasons, the way of learning programming have created a fear in mind of undergraduate beginners and it created unnecessary layers of learning for many students (Tigrek & Obadat, 2012). Researchers believe that the conventional way of learning a programming language from scratch to advanced level for developing applications play a major role in this direction. This makes the learning less efficient to apply in the domain of their interest and time consuming for study. Challenges for learning programming are similar for Computer Science and non-Computer Science beginners. Literatures revealed that tailored courses with examples are always interesting for the novice programmers in introductory programming courses (Forte & Guzdial, 2005).

The motivation of this paper is to create a tailored course in Introduction to Java programming on smartphone platform. This can be done by leveraging the learning curve of a new technology into a traditional programming course. A pilot survey has been conducted among a focus group to identify the mobile device used often for learning. In Fig. 1, the result of the survey represented. The chain of information in learning programming can be migrated to smartphone platform without creating another layer on top of traditional programming module.

IETC2014

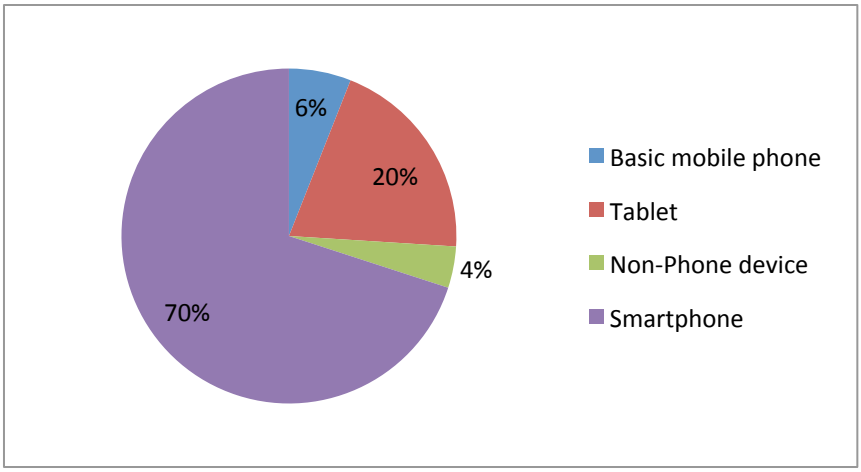

Fig.19. Mobile devices used by the students of pilot study

One of the leading mobile platforms with more apps-Android was chosen as the appropriate platform to introduce this innovative learning approach due to its rapid growth in the domain and acceptance of hand held manufacturers across the globe. ABI Research's updated market forecasts show that "The annual volume of smartphone app downloads will reach 56 billion this year". Of different OS platforms, Google's Android will account for 58% of the total, with Apple's iOS commanding an annual share of 33%. Microsoft's Windows Phone will finish the year with a slice of slightly smaller than 4%, with BlackBerry trailing it with 3%" (ABIresearch).

In a nutshell, the main premise of the proposed tailored modules to teach Java programming language while developing apps for a leading mobile platform-Android on a smartphone platform. The proposed module can be an appropriate alternative for the module "Introduction to programming", currently offered as an introductory programming module to students of various computing specializations. Through this approach, it is expected that learning programming directly on a smartphone platform will motivate the students and becomes enjoyable when they take the phone with what they have learned and share with family and friends.

IETC 2014

3. Innovative Aspect and proposed pedagogy

3.1. Background of practice

The innovative aspect of this research is to introduce a new style of teaching computer programming on smartphone platform. The innovation is applied to teach Introduction to programming with Java on Android platform in Middle East College, sultanate of Oman. The core aspect of this practice is to teach Java programming while developing Apps on android. This can combine two stages of learning into one stage by teaching directly on smartphone platform. The practice introduce a new curriculum under a new pedagogy which covers basic java programming skills on android platform for a novice programmer following with advanced topics which are suitable for higher level engineering and BSc (Hons) courses. The derivation of a framework for the proposed hybrid course's curriculum under an innovative pedagogy is the major deliverable of this approach which ensures the scope for developing subsequent teaching and learning materials in line with the innovative aspect.

3.2. Application of the practice

The practice has been implemented on pilot study basis to a cohort of the level 2 module Internet Programming (COMP 0331.2) of Middle East College. The rationale behind the selection of this cohort and module was its java based nature and the students of the cohort completed the traditional way of learning programming language in their elementary programming module- Introduction to programming. Students were briefed on the innovative approach for their learning paradigm shift. When introduced the concept of learning Java on mobile platform, students started paying more attention to the approach and had shown their enthusiasm especially when realized the scope of transferring their work to smartphones towards the completion. The pilot sessions conducted at one of the software labs where 30 computers with Local Area Network. Students used the computers where Computer Aided Software Tools (CASE) was installed for the smartphone application development platform.

3.2.1. Tools and techniques

Android mobile operating system is exclusively for devices such as smartphones and tablets. Most of the code is released under a free software license. The inclusion of such an open source mobile operating system in the curriculum can make only a positive implication in operational aspects of college. An open source Integrated Development Environment (IDE)-Eclipse is used to develop applications Fig. 2. By plugging Android SDK, Eclipse IDE can be made suitable for programming for android platform. The mentioned was set up created by students with the assistance of Student Technical Leaders (STL) in existing software lab without making any software or hardware implications. Android Development Tools (ADT) is a plug-in for the Eclipse IDE, which extends the capabilities of Eclipse developed Android applications. Tools aid to create application, to design UI (User Interface), and to debug the application. The built in emulator provides a great opportunity for the novice programmer to simulate the real device.

IETC2014

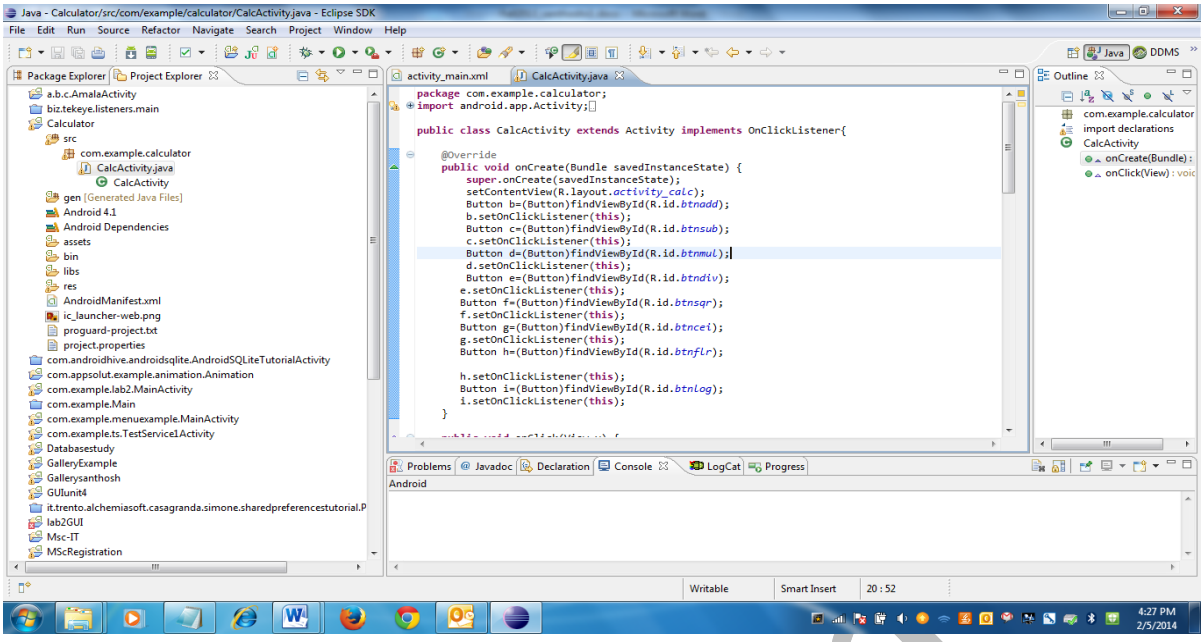

Fig. 2.Eclipse IDE with ADT

A simple calculator mobile application was developed with GUI and functionality in a single lab session on top of their introductory programming concepts. Students simulated their application on the default emulator shown in Fig.3.The students of entire cohort quickly remembered the programming features to be applied when they emulate the functionalities on a prototyping manner. Since paired programming approach was applied as part of the applied pedagogy, one noticed the flaws and missing components of the partner's coding.

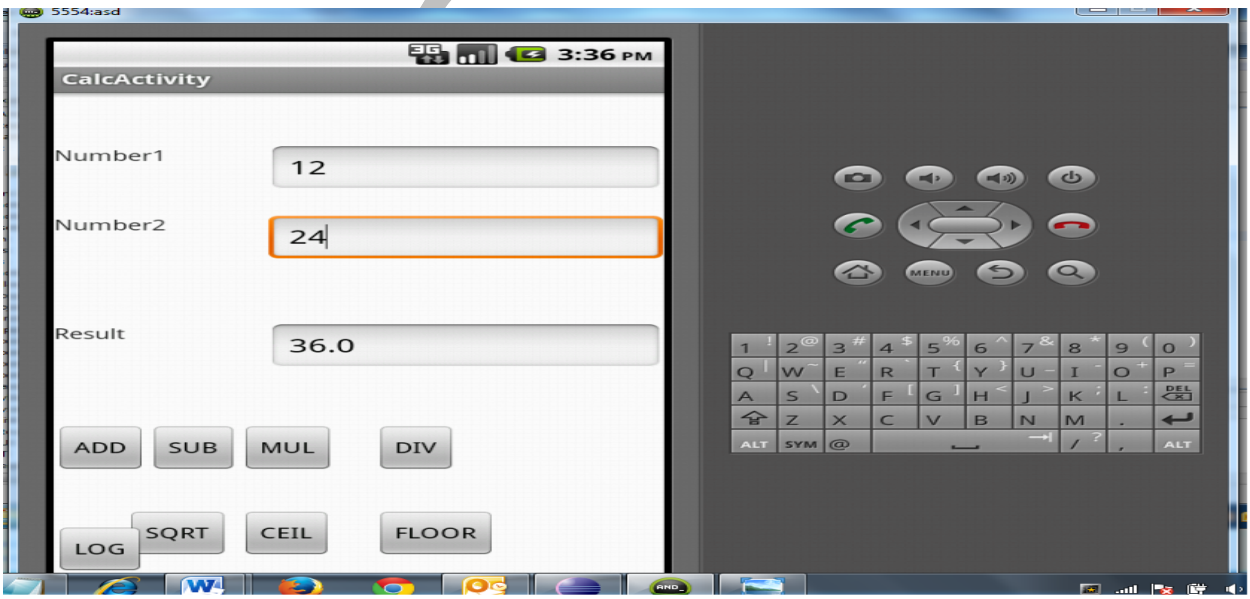

Fig. 3.Simulator view of simple Calculator android mobile application

3.2.2. Proposed pedagogy

The core of the framework of proposed pedagogy is incorporated with two components- learning elements and learning approach. Main stages of both aspects are briefed below which was applied on pilot study.

<table>
<tr><th>Learning elements</th><th>Learning approach</th></tr>
<tr><td>Introduction to programming on android platform

This section includes basic programming constructs such as control structures-sequential, selection, and arrays.</td><td>Extreme programming and paired approach

Agile learning approaches such as structured and guided teamwork will be part of the learning approach. Paired programming, a convenient way for programming will be incorporated. Experience demonstrated that when there is a person behind, team has more tendancy to try new things and realize one’s mistake in coding.</td></tr>
<tr><td>Object Oriented programming with Java

This section covers the core object oriented programming with java on android. Android environment is rich with the libraries available. Plugged in tools that exposure to the objects will be inevitable early when working with a smartphone. It is necessary to cover conceptual material about object oriented programming (OOP) at the same point (Machanik, 2007).</td><td>Blooms taxonomy

Revised Bloom’s taxonomy applied to structure the course outline, classify the exercise problems and surveys (Ari, 2011).
<table>
<tr><td>Remember</td><td>Recognize and Recall</td></tr>
<tr><td>Understand</td><td>Interpreting, Summarizing,
Inferring, Explaining</td></tr>
<tr><td>Apply</td><td>Executing and Implementing</td></tr>
<tr><td>Analyze</td><td>Differentiating and organizing</td></tr>
<tr><td>Evaluate</td><td>Checking and Critiquing</td></tr>
<tr><td>Create</td><td>Generating and Producing</td></tr>
</table></td></tr>
<tr><td>Adequate Java programming

Java APIs that is needed for phone programming is covered in this section by concentrating on the essential patterns and keeping minimum background details. Unlike conventional traditional java courses, topics like applet, file operations, GUI development with API… this approach is pretty much in line with the fact of student’s capacity to learn is limited by the brain.</td><td>Peer teaching

Peer learning with group will be implemented in a unique way. Each team will have a dedicated member for each lecture who is responsible of learning the material and teaching it to the other member. Quizzes and exams will be tracked for each problem whether the student was in teaching role or student role. This technique will be called Share Time Pair Teaching (STPT).</td></tr>
</table>

IETC2014

Lab tutorial Tools and programming environment for Android Java. Android Development Environment (Eclipse IDE), Android SDK and deployment is the core learning element	**Lab exercises** Programming tutorials with an underlying principle 'How' rather than 'Why' to develop a conceptual model of the tools and programming environment for Android Java.
Case studies Case studies from the Android Developer's site should be incorporated. These examples come with the installation and make it available in the computer for the student.	**Application specification** Application specifications will be assigned to student teams to give a bigger picture of application development in regular basis. This will have many benefits including motivation.

3.2.3. Evaluation of the practice

Qualitative observation based and quantitative questionnaire based evaluation was conducted among the students of pilot study group. It has been observed that students couldn't even believe that platform based program learning can integrate various aspects so quickly. The proposed approach integrated GUI development, business logic development and deployment as separate components. Implicitly the students developed their mobile applications with industry standards such as component based development and application development with 'high cohesion and less coupling'. A questionnaire which investigates feedback on four core aspects was circulated among a focus group and the results are shown in Fig 4. The practice was well accepted and appreciated.

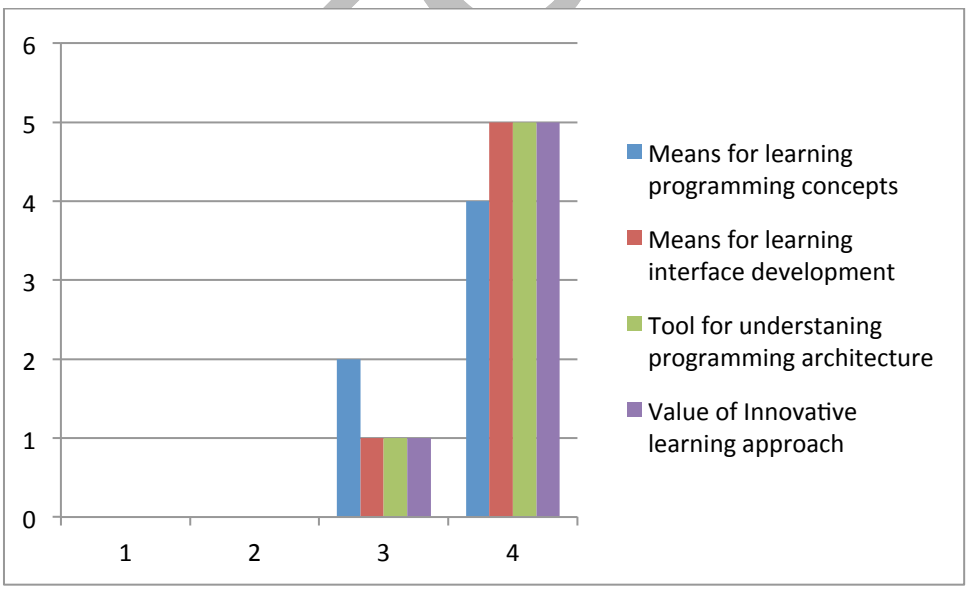

Fig. 4. Feedback analysis of pilot group

3.2.4. Recommendation of the practice

First level module, Introduction to programming offered by the Department of Computing of Middle East College to undergraduate beginners belonging to different specializations is the first full-fledged programming course of curriculum. The same module has been recommended to implement the innovative approach with an intention of introducing new mobile platform into curriculum from the beginning of engineering study. It also intended to update existing higher level engineering modules with a new mobile device and micro controller system. Since the smartphones are equipped with sensors, by connecting a microcontroller board with wireless communication to a smartphone the data acquisition by mobile platform becomes a solution without limit in engineering study and that increases the efficiency in mobile devices which can further take this practice to Augmented Reality (AR). AR technology, having developed in a very short time, has proved to be innovative and efficient technology in order to solve some kind of problems.AR can be defined as interactive device between human and computer, which has been developed by a computer in real world environment (Nee, A.Y.C, Ong, G, & Mouurtzis, 2012)

4. Ontology based implementation

An ontology based implementation of the proposed tailored course will ensure the much needed knowledge sharing and reusability to the education domain. Ontology is recognized as a term referring to the shared understanding of some domains of interest, which is often conceived as a set of classes (concepts),relations, functions, axioms and instances(Gruber, 1993).The growth of e-learning and computer based educational systems should support the import and export of knowledge in a standard format with common semantics. Ontology can be used as a skeletal foundation for a knowledge base. One of the motivations to build ontology for Introduction to Java programming with Android is connected with the attempts to create more effective teaching strategies by unifying the different views on the domain. As of now, different teachers introduce Java programming based on many different parameters of their own, such as the order of topics, emphasis on concepts. Though the order in which the teacher presents the material is up to him/her, the basic hierarchical link structure is not violated provided an ontology based approach is followed. Researcher proposed a hybrid methodology for ontology development derived from traditional software engineering process models and tools (John, 2010)followed in one of his previous publications. Fig 5 illustrates the framework followed for the proposed implementation of the tailored course derived from the innovative approach.

IETC2014

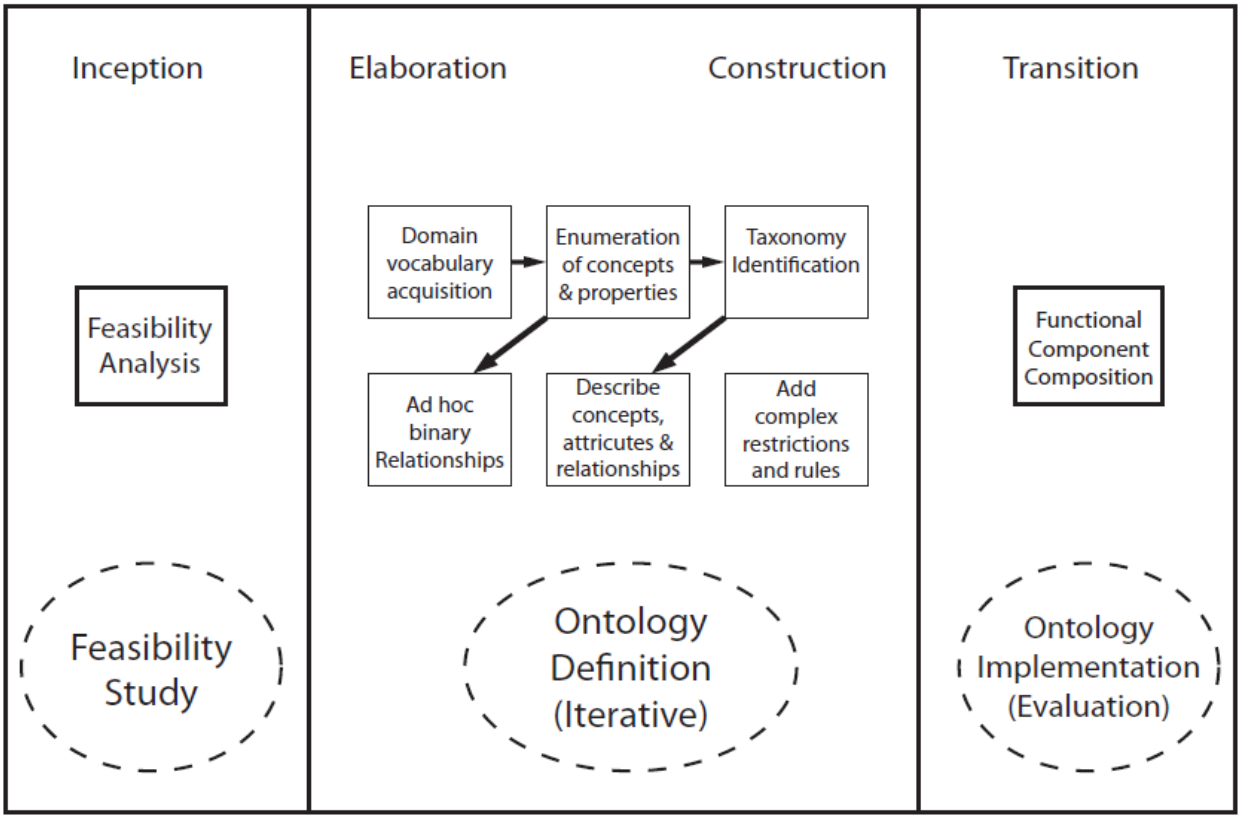

Fig 5. Hybrid Methodology followed for ontology development

5. Conclusions and future work

This research paper applied an innovative approach intending to introduce a new pedagogy of teaching and learning programming by developing applications for a platform instead of learning a programming language for creating applications. The proposed approach gives the opportunity for the students to develop a product in the form of mobile applications while learning their first programming course of curriculum. The proposed teaching and learning approach offers the opportunity for the students to transfer their work to personal handheld devices and then showcase to their friends and parents by making use of mobility. The proposed approach develops peer learning and paired programming approaches in the early stages of curriculum and cater them to follow agile methodologies. The proposed approach implicitly applies good software engineering principles and component based architecture from the first level programming course. The proposed approach can enhance the thoughts of entrepreneurship and product commercialization from student life itself which can inspire their creativity beyond the conventional academic limits. The paper proposed an ontology based implementation for ensuring the consistency by following a skeletal foundation for a knowledge base. Future work will complete the total ontology development of the domain concerned and will integrate with E-learning system (Moodle). The integration will be experimented in Middle East College for evaluating the viability of developed ontology.

Acknowledgements

Authors also take this opportunity to express a deep sense of appreciation to Dr. Arun N.S, Head of Computing Department of Middle East College, Sultanate of Oman for his support, and motivation without which this paper would not be possible.

Technological impact on teaching of online managerial accounting

Wikil Kwak126
University of Nebraska at Omaha, 6708 Pine Street, MH228AA, Omaha, NE 68182-0048

Abstract

Using technology in teaching college level Managerial Accounting is an inevitable trend as massive open online courses (MOOCs) are proposed as cost saving tools for many entry-level college courses. However, its benefits won't be evident for several years and there is still much debate among experts (Wall Street Journal, May 12, 2014). Our university is no exception and we are trying online teaching on a trial basis. I have been teaching online principle-level Managerial Accounting for more than two years now. From my observations over the past two years, motivated students are doing as well as the face-to-face students are, but non-highly motivated students struggle and failure rates are high. It may be acceptable to use MOOCs for social or humanities subjects, but some technical classes like accounting, do not translate effectively as a mechanism to deliver course content. I tested empirically using a Regression Analysis computer assignment to examine this issue and our class results show online students underperformed on this assignment compared to in-class students. Our college uses Echo360 for recording lectures and I made the recording available for the assignment. I provided face-to-face explanations and help for in-class students, but online students worked primarily by themselves.

Keywords: online teaching, managerial accounting, technological impact on teaching

6. Introduction

Online courses may play a more important role in higher education in the future. Massive open online courses (MOOCs) are popular because they benefit non-traditional students as well as students in remote locations (Wall Street Journal, May 12, 2014). However, how to proctor exams and online security issues are concerns for MOOCs. The University of Nebraska at Omaha, initiated an ad hoc MOOC committee, but not much progress has been made so far. The ad hoc committee is inactive currently because of no budget support from the university.

Online schooling has success stories teaching English in Venezuela, for example (Wall Street Journal, June 18, 2014). However, whether this model will apply to other courses is an empirical question. This paper will examine current issues in teaching online managerial accounting. The next section reviews relevant papers for this research. The following section describes the method I use. The last section summarizes my findings and the limitations of this research.

7. Prior research

There are several models to assess student performance. Crisostomo (2011) uses a static instrument with 60 multiple choice questions with a pre- and post-test to measure student learning. However, for my

* Corresponding author. Tel.: 402-554-2821; fax: 402-554-2680
E-mail address: wkwak@unomaha.edu

IETC 2014

study, I used one computer assignment to compare online student performance with in-class student performance.

The computer and other media affect the learning process of today's students (Jones and Wright, 2010). Basic computer skills are necessary to earn a degree in today's college education, but we do not teach remedial classes anymore because of budget cuts. However, there are huge individual differences in computer mastery levels. Jones and Wright (2010) used the Group Embedded Figures Test in their study. This test is for field-dependence developed by Witkin et al. (1971). Field-independent individuals show greater analytical skills than field-dependent individuals and accounting and engineering attract more field-independent individuals (Hicks et al. 2007). However, managerial accounting classes are required for all business majors and these issues are not clear because this course is taken before they choose their specific majors.

DeBerg and Chapman (2012) used common final exams with several sections of different pedagogical methods and found that performance on the final exam shows that students who learned with the textbook and students who learned in a nontraditional format have no statistical difference. This is the approach I used for my study since this method applied to principles of financial accounting which is equivalent to our managerial accounting. In addition, they emphasized that too much focus on student evaluation of teaching instruments by administrators to determine teaching effectiveness should be avoided.

Wernet et al. (2000) shows that increases in enrollment are due to part-time and adult students. These non-traditional students need online classes to pursue their goals. Online classes provide flexibility and convenience for adult learners (Machuca, 2007). Singh and Pan (2004) propose online classes are as good as in-class learning. However, recent huge student loan defaults from for-profit online institutions show total online class degrees are becoming a questionable value. It also depends on the course content and course delivery method. Managerial accounting needs basic analytical skills to understand the course content. Therefore, teaching online managerial accounting needs to include some basic computer skills as we specified in our course objectives.

8. Methods

We have five learning goals for Managerial Accounting (ACCT2020) at the University of Nebraska at Omaha. These are as follows:

Goal 1: Students are good decision makers.
Objective 1: Students consider alternatives.
Objective 2: Students make appropriate choices.

Goal 2: Students have a knowledge base necessary to function in today's business environment.
Objective 1: Demonstrate knowledge from the business core courses.
Objective 2: Demonstrate understanding in an area of specialization.

Goal 3: Students can appropriately use technology.
Objective 1: Demonstrates the ability to use technology as a tool in problem solving.

Goal 4: Students have the ability to communicate effectively.
Objective 1: Demonstrate the ability to employ clear, concise and effective written communication skills.
Objective 2: Demonstrates effective oral communication skills.

Goal 5: Functions effectively within a work related team.
Objective 1: Demonstrate the ability to contribute to achieving team goals.

IETC 2014

Goal 3 requires three computer assignments. These assignments are worth 100 points out of total of 700 points for online classes. Also, 150 points of the total of 700 includes online homework. One of these three computer assignments is the regression analysis assignment.

The computer project below is an example of regression analysis. I designed this assignment to measure the five traits required by our College of Business Administration last year with the ad hoc committee from each department within the college.

8.1. Computer project # 3

* Using "Excel," do the following problem using "the High-Low Method" and "Regression Analysis" and turn in the Excel file including your recommendation.

* Feel free to ask any questions concerning this project. You can discuss this project with other classmates, but do not copy somebody else's outputs. Remember the due date.

*To run the regression using **the Excel Program, use Tools, Data Analysis, Regression and choose x – cost driver and y – costs we want to predict. If you are using regression for the first time, click Tools, Add-ins, Analysis toolpak, Regression just for setting up the regression program once.**

Problem: The King Corporation is developing a model to explain and predict overhead costs. It produces only one product-line so that a simple count of the number of units produced each month may be a good measure of activity to begin with. The company has collected data for the past twelve months:

Month	Overhead Cost	Production Units
1	$254,500	40,000
2	184,500	24,000
3	165,400	21,000
4	178,000	23,000
5	192,000	25,000
6	225,000	31,000
7	210,000	28,000
8	230,000	30,000
9	195,000	29,000
10	224,000	36,000
11	200,000	32,000
12	240,000	38,000

Required:

1. Open a spreadsheet and enter the data.
2. Create another worksheet and enter the High-Low method formula to calculate variable cost per unit and total fixed costs. Use $y = a + b(x)$ formula. Enter a (total fixed costs) in Cell 20B and b (variable cost per unit) in Cell 20C.
3. Create another worksheet and run regression (Least Squared Method) and save the output.
4. Create another worksheet and save both outputs by linking worksheets. Determine whether the High-Low method or Regression Analysis is better to predict monthly overhead costs. Explain which model is the better? Why or why not?
5. Use absolute cell address in $y = a + b(x)$ formula (Use absolute August X Value) to predict January and December overhead costs. Do you think these predicted overhead costs are reasonable?

Each question measures a task required by UNO CBA as follows:

Task A: Create a spreadsheet from a blank worksheet, using separate data input section
Task B: Write basic math equations
Task C: Link worksheets within a file
Task D: Use absolute and relative cell addresses
Task E: Perform regression analysis

IETC 2014

The following is the results. I teach two face-to-face classes and one online class.

Process For each task:
Y: indicates that student meets expectations
N: indicates that student fails to meet expectations

Summary Assessment Requirements:

# yes Tasks	Rating	
0	**F**	**Fails to meet expectations**
1	**F**	**Fails to meet expectations**
2	**F**	**Fails to meet expectations**
3	**F**	**Fails to meet expectations**
4	**M**	**Meets expectations**
5	**E**	**Exceeds expectations**

Table 1: Overall Results

Student Performance:							
Student group	Task A	Task B	Task C	Task D	Task E	# of Yes	Summary Assess (E, M, or F)
1	y	y	y	n	y	4	M
1	y	y	y	n	y	4	M
1	y	y	y	y	y	5	E
1	y	y	y	y	y	5	E
1	y	y	y	y	y	5	E
1	y	y	y	y	y	5	E
1	y	y	y	y	y	5	E
1	y	y	y	n	y	4	M
l	y	y	y	y	y	5	E
1	y	y	y	n	y	4	M
1	y	y	y	y	y	5	E
1	y	y	y	y	y	5	E
1	y	y	y	n	y	4	M
1	y	y	y	y	y	5	E
1	y	y	y	y	y	5	E
1	y	y	y	y	y	5	E
1	y	y	y	y	y	5	E
0	n	y	n	n	y	2	F
0	y	y	y	n	y	4	M
0	y	y	y	y	y	5	E
	19	20	19	13	20		

SUMMARY:	# Students	% students
Failing to meet - F	1	5%
Meeting - M	6	30%
Exceeding - E	13	65%
Total	20	100%

Student group 1 refers to face-to-face students and 0 refers to online students. Overall 95% meet or exceed expectations. This result satisfies college requirements. However, comparing online and face-to-face student performance show online student performance is lower. Average scores of face-to-face students are 96% compared with average scores for online students which are 77%. These are the results for Spring 2014. I need to collect additional data to do more statistical analysis.

Table 2 reports each student's grade.

Table 2: Individual Scores

Points	Missed	Earned Points	Percentage	Class
50	2	48	96%	1
50	2	48	96%	1
50	0	50	100%	1

50	0	50	100%	1
50	20	30	60%	0
50	12	38	76%	0
50	2	48	96%	0

IETC 2014

9. Summary

I tested empirically using a Regression Analysis computer assignment to examine the effectiveness of online managerial accounting and the class results show online students underperformed on this assignment compared to in-class students. We use Echo360 for recording lectures and I made it available for the assignment. I provided face-to-face explanations and help for in-class students, however, online students worked primarily by themselves.

The limitation of this study was that it was a small sample study. Since this assignment was given as the last assignment of Spring 2014 and I gave 4 weeks to complete it, a lot of students gave up and the sample I collected was only a small portion of total enrolled students. I may need to design a better research method to measure effectiveness of online classes in the future.

Technology based ınstruction of precipitation titrations

Canan Koçak [a] , Fatma Alkan [a] 127
[a]*Hacettepe Üniversitesi, Faculty of Education, Beytepe, Ankara, 06800, Turkey*

Abstract

The aim of this study is to investigate the effects of technology based chemistry education on preservice teachers' views related to the role of technology on teaching and learning and achievement in chemistry. To determine preservice teachers' views of science teacher candidates about the roles of technology on teaching and learning in education The Roles of Technology on Teaching and Learning Practices Scale developed by Çil (2008) was used.. As a result of the research it has been determined that preservice teachers' developed positive views towards the roles of technology on teaching and learning practices and the achievement of the preservice teachers' has increased.

Keywords: Chemistry, technology based education, teacher candidates

IETC 2014

1. Main text

In the constructivist paradigm, it is believed that each individual's past experiences, beliefs and perceptions are different and that through them knowledge is constructed in diverse forms by that individual (Jonassen, 1990). This is because learning is an active process and in this process knowledge is handled by means of organisation. Individuals use different channels in order to process knowledge visually and aurally (Mayer, 2001). One of these channels is technology. Technological devices change daily, and like the way it is in daily life, technology can also be used in forms that respond to the needs of education and instruction settings (Van Wyk & Louw, 2008). The more the learners use knowledge the more their usage of it improves (Klauer, 2001). With the inclusion of technology in the field of education, the construction and application processes of knowledge have transformed alongside the process of accessing it.

Technology is constantly changing and improving. The newest technologies also render the teachers' educational instructions more important and interesting. According to Uşun (2000), educational technology is the kind of technology that increases the quality in the learning-teaching process and makes it more productive and efficient for both the teacher and the student. Teachers and trainee teachers, who can choose the most appropriate tools and materials for the students, stand out in the implementation of technology at schools. This is because teachers and trainee teachers are the people who facilitate the use of technology at schools and classrooms (Heinich, Molenda, Russell & Smaldino, 2002).

Hooper and Rieber (1995) propose a model that consists of five stages for the facilitation of new technologies in education: familiarisation, utilisation, integration, reorientation and evolution. At the familiarisation stage, the teachers themselves learn how to use the technology. At the utilisation stage, they begin to use this newly learned technology in the classroom, but since there will be some problems during application, tolerance is necessary. At the integration stage, technology becomes an inseparable part of the teachers in class from instruction to classroom management. At the reorientation stage, the teachers manage to effectively implement the technology as a tool based on the function and the aim of the class. Final-

* Corresponding Author Canan Koçak. Tel.: +90-312-297-67 83 fax: +90-312-297-20 83
E-mail address: canan.kck@gmail.com

ly, at the evolution stage, the teachers, with the help of their gained experiences, can use the technology much more actively and successfully according to the structure of the class and the aims of education and instruction, by reshaping it. However, unfortunately, most teachers may not be able to get as far as the integration stage. Therefore, especially in teacher training, it is of great importance that technology is employed and that the trainee teachers are provided with educational and instructional opportunities for its use. Moreover, when the idea that sciences preoccupied with exploring facts and technology aiming at transforming those facts into application in daily life steer the course of life is considered, the importance of science in life could be better understood. According to Layton (1993), the knowledge acquired with the help of activities used in science education shares similarities with technological knowledge (Hill, 1998). Particularly in fields like chemistry, in which scientific applications are executed, learning is rendered more permanent, productive and effective with the use of technology.

2. Main text

The aim of this study is to examine the effects of technologically supported titration applications in chemistry classes on the opinions of trainee teachers regarding the role of technology in education and instruction activities and their success in chemistry. The study group of the research consists of 31 trainee teachers enrolled at Hacettepe University's Faculty of Education. In the study, participants' opinions on the traditional face-to-face instruction method and the technology-supported instruction that was prepared for their chosen subject of argentometric titration are analysed in detail. The research pattern of pre-test/post-test with experimental/control group is employed in the study. Whilst instruction with chemistry laboratory activities supplemented by technologically supported titration applications is employed in the experimental group, instruction with traditional verification laboratory approach is used in the control group. The opinions of the trainee teachers on the role of technology in education and instruction activities are evaluated by means of the analysis of their replies to the questions in "The Role of Technology in Education and Instruction Activities Assessment." The opinions of the trainee teachers on the role of technology in education and instruction activities are assessed along the lines of how effective technology is in teaching certain skills and how important technological tools are inside the classroom. Furthermore, "The Titration Achievement Test," developed by the researchers, is used in order to determine the success of the trainee teachers.

2.1. Data collection tools

2.1.1. The role of technology in education and instruction activities assessment

The assessment that is used to determine how technology shapes education and that has been conducted with over one thousand participants all over the United States (Crystal, 2006) has been adapted to Turkish by Çil (2008). The questionnaire titled "The Role of Technology in Education and Instruction Activities" is expanded by Çil (2008) with additional items in consideration with the education and instruction activities in Turkey. It consists of two main sections and seventeen questions in total. Cronbach's alpha coefficient for the reliability of the questionnaire came out 0.705.

2.1.2. The titration achievement test

A test is developed as a part of the research in order to measure the trainee teachers' success on titration. Validity and reliability inspections are done on the 15-item multiple choice achievement test with the participation of 250 trainee teachers. As a result of the work done with ITEMAN Windows Version 3.50 statistics software, the Titration Achievement Test with an average difficulty level of 0.5 and Point Biserial Correlation of 0.621 is developed.

2.2. Data analysis

In the first part of "the role of technology in education and instruction activities assessment," how effective the trainee teachers find technology in teaching various skills and applications is explicated. In the

IETC 2014

second part of the assessment, the trainee teachers' opinions on the importance of technological tools in the classroom are examined. Furthermore, the data from the Titration Achievement Test, developed by the researchers in order to determine the success of the trainee teachers, is used.

3. Results

In the research, the pre-test and post-test scores of the participants in experimental and control groups at the "The Role of Technology in Education and Instruction Activities Assessment" and "Titration Achievement Test" are checked to determine whether there were meaningful differences between the groups. As the number of participants in the sample is low, it is decided that using parametric tests might lead to errors in evaluation, and thus, the non-parametric U Test (Mann-Whitney test) is used.

3.1. Findings of the role of technology in education and instruction activities assessment

The Examination of the Pre-Test Results of the Experimental and Control Groups at The Role of Technology in Education and Instruction Activities Assessment The data acquired through "The Role of Technology in Education and Instruction Activities Assessment" used as a pre-test with the trainee teachers is shown in Table 1.

Table 1. The Mann-Whitney U test results on the experimental and control groups' pre-test scores.

	Group	N	Mean Rank	Sum of Ranks	U*	p
How effective is technology in teaching various skills?	Experimental group	15	15.94	255.00	119.00	.984
	Control group	16	16.07	241.00		
How important are technological tools in the classroom?	Experimental group	15	15.84	253.50	117.50	.922
	Control group	16	16.17	242.50		
The Role of Technology in Education and Instruction Activities Assessment	Experimental group	15	15.75	252.00	116.00	.892
	Control group	16	16.27	244.00		

*p> .05

As can be seen in Table 1, it is found that statistically, there is not much meaningful difference between the sub-dimension scores of the trainee teachers in the experimental and control groups at The Role of Technology in Education and Instruction Activities Assessment before the implementation (U=119; 117; 116 p>0.05). In other words, it is established that there is not much meaningful difference between the opinions of trainee teachers in the experimental and control groups on the role of technology in education and instruction activities before the implementation.

3.2. The comparison of the experimental group's pre-test and post-test scores at the role of technology in education and instruction activities assessment

In order to determine whether there is any contribution of technologically supported teaching practices on the opinions of trainee teachers participating in the research on the role of technology in education and instruction activities, the non-parametric alternative to the t-test, Wilcoxon Signed-Rank test is applied to the pre/post-test scores. The results reflecting their effects are seen in Table 2.

IETC 2014

Table 2. The Wilcoxon signed-rank test results on the experimental group's pre/post-test scores at the role of technology in education and instruction activities assessment.

	Group	N	Mean Rank	Sum of Ranks	Z	p
How effective is technology in teaching various skills?	Negative Ranks	9	7.67	69.00	-2.36	.018
	Positive Ranks	3	3.00	9.00		
	Ties	3				
How important are technological tools in the classroom?	Negative Ranks	9	7.33	66,00	-1.44	.149
	Positive Ranks	4	6.25	25,00		
	Ties	2				
The Role of Technology in Education and Instruction Activities Assessment	Negative Ranks	11	8.41	92.50	-2.51	.012
	Positive Ranks	3	4.17	12.50		
	Ties	11				

In Table 2, it can be seen that there are meaningful differences between the pre-test and post-test scores of the experimental group at the Role of Technology in Education and Instruction Activities Assessment along the lines of both the assessment in general after the implementation of technology-supported instruction and "how effective technology is in teaching various skills" [z=- 2.36; -1.44; -2.51, p<.05]. That the differentiation is in favour of the post-test results stand out, when their ranking averages and totals are examined. In other words, the technology-supported teaching of the subject of argentometric titration has affected the opinions of trainee teachers, particularly on the effectiveness of technology in teaching various skills, at a statistically meaningful level.

3.3. The comparison of the control group's pre-test and post-test scores at the role of technology in education and instruction activities assessment

In order to determine whether the scores of the trainee teachers in the control group at the Role of Technology in Education and Instruction Activities Assessment change significantly between the repeated measurement before and after the traditional laboratory instruction, the non-parametric Wilcoxon test is used. The results of the analysis are shown in Table 3.

Table 3. The wilcoxon signed-rank test results on the control group's the role of technology in education and instruction activities assessment pre/post-test scores.

	Gorup	N	Mean Rank	Sum of Ranks	Z	p
How effective is technology in teaching various skills?	Negative Ranks	12	8.46	101.50	-1.73	.083
	Positive Ranks	4	8.63	34.50		
	Ties	0				
How important are technological tools in the classroom?	Negative Ranks	10	8.95	89.50	-1.67	.093
	Positive Ranks	5	6.10	30.50		
	Ties	1				
The Role of Technology in Education and Instruction Activities Assessment	Negative Ranks	11	9.27	102,00	-1.75	.079
	Positive Ranks	5	6.80	34.00		
	Ties	0				

IETC 2014

When the z values in Table 3 are examined, it can be seen that there was not much meaningful differentiation between the pre/post-test scores of the trainee teachers in the control group [z= -1.73; -1.67; -1.75, p>.05]. In other words, the traditional instruction of the subject of argentometric titration without the support of technology did not have meaningful effects on the opinions of the trainee teachers on the role of technology in education and instruction activities.

3.4. The examination of the experimental and control groups' pre-test scores in the titration achievement test

As a part of the research, in order to measure the trainee teachers' success on the subject of argentometric titration, a valid and reliable achievement test is developed. The test, which is prepared to determine the trainee teachers' levels of knowledge on the subject of argentometric titration, is given to the participants before the technology-supported instruction. The trainee teachers' answers to the 15 multiple choice questions in the achievement test are examined and evaluated.

In the research, the pre-implementation titration achievement test averages of the trainee teachers in the experimental group, with whom technology-supported instruction is employed and in the control group, with whom traditional verification laboratory approach is utilised are analysed using Mann Whitney U Test. The results are summarised in Table 4.

Table 4. The results of the mann-whitney u test on the achievement pre-test scores of the experimental and control groups.

Group	N	Mean Rank	Sum of Ranks	U*	p
Experimental group	15	14.34	229.50	93.5	.448
Control group	16	16.82	235.50		

*p> .05

According to the analysis results in Table 4, a statistically meaningful difference between the achievement pre-test averages of the experimental and control group trainee teachers is not seen (U=93.5; p>0.05). This result shows that there are no meaningful differences in the trainee teachers' levels of knowledge on the argentometric titration subject between the experimental and control groups before the implementations.

3.5. The comparison of the pre-test and post-test scores of the experimental group in the titration achievement test

The difference between the trainee teachers' pre-test and post-test scores after the implementation of technology-supported instruction and traditional verification laboratory approach are examined using the Wilcoxon Signed-Rank Test. The findings are summarised in Table 5.

Table 5. The wilcoxon signed-rank test results on the experimental group's achievement pre-test and post-test scores.

Group	N	Mean Rank	Sum of Ranks	Z	p
Negative Ranks	15	8.50	136.00	-3.53	.000
Positive Ranks	0	.00	.00		
Ties	0				

When Table 5 is examined, a statistically meaningful differentiation is seen between the pre-test and post-test scores in the achievement test of the trainee teachers in the experimental group after the technology-supported laboratory implementations [z=-3.53, p<.05]. The mentioned differentiation is determined

IETC 2014

to be in favour of the post-test scores, when the ranking average and the total are studied. Therefore, it could be said that technology-supported instruction of the subject of argentometric titration has improved the success of the trainee teachers in a manner that would statistically make a meaningful difference.

3.6. The comparison of the achievement pre-test and post-test scores of the control group

The results of the analysis to determine whether there has been a significant change in the success of the control group's trainee teachers in the repeated measurements before and after the traditional laboratory instruction are presented in Table 6.

Table 6. The wilcoxon signed-rank test results on the control group's pre/post achievement test scores.

Group	N	Mean Rank	Sum of Ranks	Z	p
Negative Ranks	2	3.50	7.00		
Positive Ranks	12	7.64	84.00	-2.701	.007
Ties	2				

When Table 6 is examined it is seen that the achievement pre-test and post-test scores of the trainee teachers in the control group does not show meaningful differentiation [z=-2.701, p>.05]. In other words, the traditional instruction of the subject of argentometric titration, without technology-supported instruction did not lead to a statistically meaningful increase in success.

4. Conclusion and discussion

Educators are continuously working on new research regarding how technology can be implemented effectively in order to increase the quality of instructional activities. This research is conducted with the participation of trainee teachers in order to add a new study to the field. The aim of this study is to examine the effects of technology-supported titration applications in chemistry classes on the trainee teachers' opinions on the role of technology in education and instruction activities and their success in chemistry. The opinions of the participants on the traditional, face-to-face instruction approach and the technology-supported instruction method prepared to supplement the subject of argentometric titration are examined.

Whilst instruction with chemistry laboratory activities supplemented by technology-supported titration applications is employed in the experimental group, instruction with traditional verification laboratory approach is facilitated in the control group. When the average values belonging to the pre-test and post-test scores of the experimental and control groups are examined in the research, the increase in the experimental group's achievement scores after the implementation of technology-supported instruction practices stands out. Essentially, that the members of the experimental and control groups, who have pre-knowledge on the subject of titration, to gain more information during instruction activities is a natural process. However, when the post-test achievement results of the groups are compared, it can be seen that there is a statistically meaningful differentiation between the students of the experimental and control groups in favour of the experimental group and that there is a greater increase in the achievement scores of the experimental group's students in comparison to those of the control group. This increase in the post-test scores of the experimental group's students could be taken as a sign that the laboratory applications based on technology-supported instruction has positive effects on the achievement of the trainee

IETC 2014

teachers. As the implementation of technology in education and instruction provides students with opportunities to work individually, it is known to improve the success of student learning (Zhao, Wang, Wu & He, 2011; Hsiao, 2012).

In the study conducted by Özmen and Kolomuç (2004), the effect of technology-supported instruction on student success in chemistry classes is examined in an experimental way. At the end of the research, the success was measured to be higher in comparison to the traditional method. In the study, when the average values of the pre-test and post-test scores of the experimental and control groups are examined, it becomes noticeable that the experimental group's success scores and the positive opinions on the role of technology in education and instruction activities show an increase following the implementations of technology-supported instruction. Another important finding of the study is that the post-test scores that reflect the opinions of the trainee teachers in the experimental group on the role of technology in education and instruction activities reveal a statistically meaningful increase. This finding means that the trainee teachers' opinions on the role of technology in education and instruction activities have changed in the positive. There were similar findings in the study conducted by Çil (2006), whereby the trainee teachers were found to deem technology effective in the classroom. This finding of the study was also emphasised in the works done by Atam (2006), Aykanat, Dogru and Kalender (2005). Integrating technology in the education process is not enough on its own to introduce technology to the education and instruction settings, trainee teachers need to receive applied training on using educational technologies before they join the profession (Çoklar et.al, 2007). Therefore, it is recommended that the trainee teachers are made a part of such implementations often before they join the profession and that they should be studied with larger samples on other subjects.

Technology based counseling: perspectives of Turkish counselors

Sule Bastemur[1] Erdal Bastemur[2]

[1]Yuzuncu Yil University, Educational Science Department (sulebastemur@gmail.com)

[2]Ministry of Education (bastemurerdal@gmail.com)

Abstract

The purpose of this study is to analyze the Turkish counselors' perspectives about using Internet for counseling purposes in their professional life. The questionnaire prepared by the researchers based on literature review and experts' opinion. It was sent to counselors via e-mail, 542 counselors returned the questionnaire. Findings were analyzed by using descriptive statistics. Counselors' perspectives about online counseling were also examined by content analysis. Results indicated that counselors have positive perspectives about online counseling and think that it is applicable to Turkey, but they need more information about online counseling. Results were discussed in light of current literature.

Keywords: counseling; technology support; online counseling; Internet.

IETC 2014

1. Introduction

The growth of using technology created opportunities for counselors to provide online counseling as an alternative technique to traditional counseling (Elleven & Allen, 2004). Even though the delivery of technology-based counseling continues to grow, questions and critics about distance online counseling has increased (Laszlo, Esterman, & Zabko, 1999; Reimer-Reiss, 2000).

Various tiers are used for technology-based therapy. These are e-therapy or e-counseling (Manhal-Baugus, 2001; Tate, Jackvony & Wing, 2003), cyber therapy or cyber counseling (Maples & Han, 2008; Suler, 2000), online or Internet based counseling (Pollock, 2006; Rochlen, Zack, &Speyer, 2004); e-mail therapy (Murphy & Mitchell, 1998; Shapiro & Schulman, 1996); web counseling (Young, 2003). The term online counseling will be used in this study.

There are so many definitions regarding technology counseling. According to Nickelson (1998) online counseling is a type of technology based counseling in which counselor and clients are not in the office setting and there is distance between them. According to Bloom (1998) online counseling is distance counseling and counselors and clients use electronic resources to communicate. Alleman (2002) states that online counseling is an ongoing, text-based, technological interaction between counselor and clients, which aims to improve the client's behavioral and psychological wellbeing. Another definition of online counseling is a therapy which is not restricted with therapy, may also contain consultation, psycho education for the purpose of behavioral and mental improvement, pursued by licensed counselors through phone, e-mail, synchronous chat, and videoconferencing. As it is seen, there are numerous definitions and different forms of technology based counseling.

Even though Internet counseling has created excellent opportunities for both counselors and clients, it is still a question of debate. Some of them are whether or not the client and/or counselor have

access to online counseling, the result is effective or not, ethic issues and cultural problems. The first advantage of online therapy is ease of access (Pomerantz, 2002) because online counseling can be done any time of the day (Bailey, Yager, & Jensen, 2002) and Internet connection is the only necessity to access; people can easily counsel (Manhal-Baugus, 2001; Maples & Han, 2008). People who have problems in accessing counseling services because of illness, disabilities or transportation problems (Maples & Han, 2008), who has social phobias (Fenichel ve ark, 2002), or who has anxiety to seen by a counselor ((Lange, van de Ven & Schrieken, 2003) and all family members in the family online counseling (King, Engi & Poulos, 1998) may access to online counseling services. The second advantage is the therapeutic power of writing (Murphy & Mitchell, 1998). Because writing is a therapeutic tool (Walker, 2007), it is thought that the client may be more honest and easy to self-disclose (Fenichel & ark., 1992). They may easily say what they really want to say because of the equal relationship between counselor and client (Yager, 2001). Another one is using links or videos (Ainsworth, 2002) in the session because counselor may use related links or videos to help the client in the online counseling session. At last, online counseling has financial advantages (Griffiths, 2001) because it is cheaper than face-to-face counseling. Beside these advantages, online chatting records also help clients to read again and again what they talked about and this may help them overcome their problems. These records also help counselors use them as a means of supervision and consultation (Murphy & Mitchell, 1998).

On the other hand, there are some disadvantages. Loss of human interaction is the first and most important disadvantage (Maples &Han, 2008). The therapeutic relationship may decrease because of lack of verbal and visual communication as well as gesture expression (Manhal-Baugus, 2001). Because of lack of non-verbal cues, counselors may not understand or feel what the client feels or they miss when the client cries therefore counselors may not empathize with the client (Suler, 2000). Thus, misunderstandings may happen between them (Manhal-Baugus, 2001). Other disadvantage is the fact that it is technology-based. Because Internet is a necessity for online counseling, people may not always access it easily (Gingerich, 2007). Some villages may not have Internet or frequent power failure may cause loss of Internet. Thus, it is hard to reach all people. Sometimes people who have limited knowledge of using Internet or people who are very slow to write on computer may not reach out for online counseling services (Maples & Han, 2008). Sometimes technological problems related mail non-delivery (Griffiths, 2001) or camera problems (Maples & Han, 2008) might happen. Lastly, it may be difficult to respond to crisis through online counseling (Childress & Asamen, 1998).

Research about online counseling focuses on different problems related to depression, anxiety disorders, eating disorders, Internet addiction, couple relationship problems, family based problems, or occupational problems (Harry & Issack, 2013; Kirk, 2000; Pollock, 2006; Skinner & Zack, 2004; Tate, Jackvony & Wing, 2003). Most of these research's results show that online counseling help to the clients for decreasing their problems. Some research focused on whether face-to-face counseling or online counseling is effective, the results indicate that both counseling types are effective (Magaletta, Fagan, & Peyrot, 2000). Other research focused of which type of counseling is preferred by clients and results from that study indicate that people prefer online counseling over face-to-face counseling (Schopp, Johnstone, & Merrell, 2000).

1.1 Online counseling in Turkey

In parallel with the technology uses at counseling services throughout the world, technology uses in counseling services have increased in Turkey. Counselors mostly use technology in counseling services such as networking with students, parents and colleagues, preparing surveys and reaching students, as well as finding materials for students (Savaş & Hamamcı, 2010). The first computer based occupational counseling program was used in 1990 for nine years (Kuzgun & Sözalan, 2000). However, this program was focus on choosing the proper occupation and was not about online counseling.

Because online counseling is not common in Turkey, the limited research about online counseling mostly focuses on what counselors, students, or their families think about online counseling. According to Savaş (2006) counselors do not think that online counseling is proper in Turkey's school settings. Even though school counselors have high self-confidence about using online counseling (Basak, Uysal, & Asici, 2010), they have negative thoughts about using it in school setting. Negative perspectives of online counseling may be related to the problems in the counseling profession. For example, quota per capita of students to counselor in a school setting varies between 500-3500 (Hatunoğlu & Hatunoğlu, 2006). It is difficult to provide counseling to all students in these kinds of schools. On the other hand, materials for online

counseling such as computer and Internet connection could not provide for counselors in Turkey's school setting however some private teaching institutions have online individual counseling services. Briefly, the purpose of this study is to describe what Turkish counselors think about online counseling in their professional life.

2. Methodology

The present study was designed with descriptive model. Descriptive model aims to describe relevant cases (Karasar, 2009).

2.1 Sample

Maximum variation sampling strategy for purposeful sampling aims to sample of heterogeneity and aims at capturing and defining the main teams that cut across a great deal of participant or program variation (Patton, 1990) used to select the sample. The sample of this study is consisted of counselors in Turkey. The participants (N=542) 299 were female and 243 were male. Participants were chosen according to counselors who are a member of Turkish Psychological Counseling and Guidance Association. Participants were informed as to the purpose of the study through an electronic format of a questionnaire. Consent was derived via e-mail and google.doc.

Table 1

Sampling of Study

	Female		Male	
	f	**%**	**f**	**%**
Profession				
Counselor	245	45,0	195	36,1
Counselor Expert (MS degree)	33	6,0	29	5,4
Academician	21	3,9	19	3,6
Experience				
0-5	201	37,1	153	28,2
6-10	79	14,6	66	12,1
11-+	19	3,6	24	4,4
Education				
Bachelor	233	42,9	190	35,1
Masters	53	9,8	49	9,0
PhD	13	2,5	4	0,7

IETC 2014

Work setting				
Public School	235	43,4	191	35,3
Private School	28	5,1	23	4,2
University	21	3,9	24	4,4
Other setting	15	2,7	5	0,9

As it is seen on the table, 245 of the participants are female counselors. 33 female counselors are counselor experts and 21 of them are academicians. On the other hand, 195 of the participants are male counselors, 29 male counselors are counselor experts and 19 of them are male academicians. Participants' years as a counselor also varied. 201 female counselors have 0-5 year experience, 79 of them have 6-11 year experience, and 19 of them have 11 and up years of experience. 153 male counselors have 0-5 years experience, 66 of the have 6-11 years experience and 24 of them have 11 and up years experience. 233 female counselors have bachelors' degree, 53 of them have master's degree and 13 of them have PhD degree. In addition to that, 190 male counselors have bachelors' degree, 49 of them have master's degree and 4 of them have PhD degree. At last, participants worked in a variety of setting such as private, public, universities, and other settings. 235 female counselors work in public schools, 28 female counselor work in private schools, 21 of them work in the university setting and 15 of them work in other settings. 191 of male counselors work in public schools, 23 of them work in private schools, 24 of them work in the university setting, and 5 of them work in other settings.

2.2 Instrument

"Counselors' Perspectives about Online Counseling Questionnaire" was developed by researchers for the purpose of analyzing the opinion of counselors about using Internet based counseling in their professional life. The questionnaire consists of 21 items, which has 4 open-ended questions, and 17 scalar items, which were prepared by researcher according to literature review and experts' opinion (Rochlen, Beretuas, & Zack, 2004).

2.3 Process

The questionnaire was formed to online scale and google.doc. The links were sent to counselors via the Internet because present study focuses on online and Internet based counseling, online questionnaires were used to collect data.

3. Results

Table 2

Items on the Questionnaire 1-17

	Agree		**Undecided**		**Disagree**	
	f	**%**	**f**	**%**	**f**	**%**
Item 1: Counselors should do counseling over the Internet.	344	63,5	93	17,1	105	19,3
Item 2: It is beneficial to send e-mail from clients to counselors	268	49,5	101	18,6	173	31,9

IETC 2014

Item 3: Clients should only online contact with their counselors for the purpose of cost or appointment.	91	16,7	110	20,4	431	62,9
Item 4: It is beneficial to apply online test, questionnaire or scales to clients by counselor.	386	71,2	81	14,9	75	13,9
Item 5: Online counseling should be given as a course to students in counseling education.	402	74,2	71	13,1	69	12,7
Item 6: It is useful to give simultaneous psychological support to multiple clients by online support group.	203	37,5	64	11,8	275	50,7
Item 7: Online counseling services are for only clients who cannot able to get face-to-face counseling.	205	37,8	43	7,9	294	54,3
Item 8: Not to be in same environment or office reduces the effectiveness of therapy.	274	50,6	96	17,7	172	31,7
Item 9: Online counseling services are at risk of violation of privacy.	351	64,7	94	17,4	97	17,9
Item 10: To online meet with parents about students is appropriate	238	43,9	104	19,2	200	36,9
Item 11: Online counseling services are playing an influential role in crisis intervention	247	45,5	111	20,4	184	34,1
Item 12: It is easier to access online counseling services than face-to-face counseling services.	413	76,2	35	6,4	94	17,4
Item 13: Online counseling services are only for clients who have a big concern about sharing their problems (such as LGBTQ related topics, sexual problems or relationship problems)	127	23,4	111	20,4	304	56,2
Item 14: Online counseling services are financially advantageous for clients	375	69,2	63	11,6	104	19,2
Item 15: Online counseling services are financially advantageous for counselor	251	46,3	147	27,1	144	26,6
Item 16: It is easier to express what clients want to tell to the counselor over online counseling.	322	59,4	74	13,7	146	26,9
Item 17: Online counseling has applicability possibilities to our country	310	57,3	113	20,8	119	21,9

As seen on Table 2, 63% of the counselors think that Internet based counseling should be done by counselors. The rates of counselors who are undecided was 17% and those who disagree are at 19%. 49% of counselors think that clients can send e-mail to counselors. However, 31% counselors do not agree to receive the e-mails from their clients. 62% of the counselors do not agree to contact their clients for the sole purpose of cost or the appointment. 16% of them agree to get e-mail from their clients for the purpose of costs or appointments. 20% of the counselors are undecided about contacting the counselor for these purposes. Most of the counselors (71%) agree about applying online tests, questionnaires or scales. On the other hand, 13% of them do not agree to apply tests, questionnaires or scales online. 14% of them are undecided. The biggest portion of counselors (74%) agrees that online counseling should be a course or lecture in counseling education at universities. However, 13% of the counselors are undecided and 12% of them disagree. More than half counselors (50%) do not agree about simultaneous psychological support group program. 37% counselors agree but 11% of them undecided. 37% of the counselors think that online counseling services are for only those who are not able to get to face to face counseling. On the other hand, 54% of them do not agree with the aforementioned statement. 7% of them are undecided. Most of the counselors (50%) think that not psychically being in the same office reduces the effectiveness of therapy. The rates of counselors who disagree about it are 31%. Counselors (64%) think that online counseling services are at risk of violation of privacy. Undecided rate (17%) and disagree rate (17%) are also similar. 43% of the counselors agree positively about online meetings with parents, 36% of them disagree and %19,2 of them are undecided. 45% think that online counseling has an important role in crisis intervention but 34% of them disagree. 76% of the counselors agree about it is easier to access online counseling than face-to-face counseling. 17% of the disagree about it and 6% of them undecided. Most of the counselors (56%) disagree that online counseling services are not only for clients who have big concerns

IETC 2014

about sharing special problems. On the other hand, 23% of them agree and 20% of them are undecided. 69% of the counselors think that online counseling are financially advantageous for clients. 19% disagree and 11% are undecided. In contrast the item 14, most of the counselors (46%) agree that online counseling services are financially advantageous for clients. 27% of them are undecided and 26% of them disagree. 59% of the counselors agree that clients may easily express what they want to talk about, 26% of them disagree and 13% are undecided. 57% of the counselors think that online counseling has applicability possibilities to our country. On the other hand, 21% of them think that it is not applicable and 20% of them are undecided.

The result of content analysis for four open-ended questions (listed 18-21) listed below.

"What are the positive sides of online counseling services?" was asked to counselors.

Table 3

The positive perspectives of counselors toward online counseling services.

	f
Financial advantages	96
Easy to access	87
Feel more comfortable about telling the problem	83
Help clients who have psychical disabilities	56
Feel more confident	49
Easy to express feeling	36
Saving of time	24
Time management	13
Accessing abroad	6
Help to crisis intervention	5
The power of writing	5
Reading chat records again and again	3

As seen on Table 3, the highest frequency statements are financial advantages, easily accessible, feeling more comfortable about telling problems to the counselor, helping clients who have psychical disabilities and feelings of increased confidence.

"What are the negative sides of online counseling" was asked to counselors.

Table 4

The negative perspectives of counselors toward online counseling services.

	f
Reducing effectiveness of therapy	205
Required to Internet access	189

IETC 2014

Required to have a good use of technology	114
Lack of empathy because of not to be in the same physical environment	108
Lack of non-verbal behaviours such as gestures.	76
Have a difficulty about paying attention on the therapy	34
Lack of psychical support when client need (such as hug, holding hands)	28
Security or privacy problems such as reading chat records by others	24
Calling or emailing counselors after termination	13
Cyber bulling to counselor	9

As seen on Table 4, the highest frequency statements are reducing the effectiveness of therapy, requirement of Internet access, requirement of to ability to use technology, and lack of empathy from not being in the same physical environment.

"Which topics are appropriate for online counseling?" was asked to counselors.

Table 5

The topics which are appropriate for online counseling services

	f
Disability	365
LGBTQ problems	289
Sexual problems	255
Social phobia	78
Relationship problems	67
Partner violence	34
Lack of self-confidence	28
Aimlessness	23
Problems related to body image	15
Identity problems	8
Career planning	5
Family pressure	5
Cultural issues	4
Conflict resolution	3
Social support between related problems	1

As seen on Table 5, the highest frequency statements are disability, LGBTQ problems, sexual problems, social phobia, and relationship problems.

"What skills does a counselors need for counseling?" was asked to counselors.

Table 6

IETC 2014

Ability that online counselors should have

	f
To have a knowledge of high technology	346
To be trustable	224
To accept client with all kind of problems	173
To have license of online counseling	159
To have an experience about online counseling	146
To be competent of his/her job	127
To have a high level of communication skills	110
Have a high skill of problem solving	94
To be open to listen	78
Have high skill of writing ability	76
To have a high self awareness	53
Open to criticism	45
Do not judge the clients	34
To open to give and take feedback	21
To have a high skill of interpersonal relationship	16
To be tolerant	13
To have high motivation	9
Open to change	7
To have a humor	5
To be well-planned	5
To focus on problem solving	2

As seen on Table 6, the highest frequencies of statements are to have a knowledge of high technology, to be trustable, to accept clients with all kind of problems, to have a license in online counseling, to have experience in online counseling, to be competent in his/her job, to have high communication skills, and a high skill of problem solving.

Discussion

In recent years there has been an increased amount of study addressing technology based counseling as an alternative technique in the counseling profession. Even though there is limited research about it in Turkey, the results of this study show that Turkish counselors think that online counseling has applicable in Turkey. Because of the questionnaire that was used for this study have different dimensions, counselors' positive and negative perspectives toward online counseling and counselors' perspectives of technology usage will be discussed. At last, counselors' positive and negative opinions about online counseling, topics that are appropriate for online counseling, and the abilities online counselors should have are discussed.

IETC 2014

According to the results, more than half of the counselors think that online counseling is a necessary technique and is applicable in Turkey. Hence, the biggest part of counselors think that online counseling should be given as a course in counselor education. Counselors state that the positive sides of counseling are easier to access than face-to-face counseling, easy to express feelings, and financial advantages. According to Andersson (2010) the most important advantages of online counseling is to increase the accessibility to mental health services. On the other hand, the negative sides of online counseling stated by counselors is not being in the same environment reduces the effectiveness of therapy and has a risk for potential privacy violations. The reason for these negative opinions can be explained with the lack of ethical standards, insufficient techniques, and the existing negative thoughts about effectiveness of online counseling (Murphy & Mitcheell, 1998). Counselors' perspectives about technology usage in their profession are also positive because counselors think that scales, questionnaires, or surveys may be applied online. Other results, which were obtained in this study, are counselors' indecision about online counseling. Most of the counselors think that they do not have enough knowledge about online counseling and support of online counseling courses in counselor education.

According to the results obtained from the open-ended questions, counselors think that online counseling is financially advantageous. Counselors also think that clients' easy access to counseling services allows them to open themselves easily. They also think that online counseling is advantageous for clients who have difficulty accessing counseling because of a disability. Studies about online counseling also support these opinions because online counseling is financially advantageous for clients (Anderson, 2010), clients can easily access and open themselves (Pomerantz, 2002), client can access counseling services despite of illness, disabilities or transportation problems (Maples & Han, 2008). On the other hand, counselors indicate that online counseling decreases the effectiveness of therapy; a required knowledge in using the Internet and a substantial degree of technology knowledge, and not being in the same environment decreases empathy. Literature also supports that online counseling may decrease empathy (Suler, 2000), because the Internet is a necessity, people may not always access it (Gingerich, 2007) and limited knowledge of technology can be a cause of difficulty (Maples & Han, 2008). Counselors also indicate that the topics or problems which are appropriate for online counseling are disability, LGBTQ, relationship problems and social phobia but researches show that depression, anxiety disorders, eating disorders, Internet addiction, couples relationship problems, family based problems, or occupational problems (Harry & Issack, 2013; Kirk, 2000; Pollock, 2006; Skinner & Zack, 2004; Tate, Jackvony & Wing, 2003) may be appropriate for online counseling. At last, counselors state that the abilities online counselors should have are high technology knowledge, trustworthiness, accepting clients and having a license in online counseling.

Online counseling is increasingly extending into counseling accompanied by significant benefits and challenges. Research has been implemented on counselors and clients concerns about online counseling services. The findings from this research suggest that counselors are willing to implement online counseling but they do not know how to do it. There are some practical implications for counselors and researchers. First, counselors who want to make online counseling more popular should implement it more. Second, professional associations should provide more information related to online counseling to counselors students. Third, online counseling should be given as a course on counselor education. At last, because Internet use continues to increase, more research needs to be placed on the emphasis of online counseling and its policies, ethical codes and techniques.

IETC 2014

Tendencies of engineering students on applying technological innovations

Hasan Tinmaz[a]128, Ilker Yakin[b]

[a]*Assistant Prof. Dr., Istanbul Gelişim University, Department of Computer Engineering, Istanbul 34315, Turkey*
[b]*Assistant Prof. Dr., Mersin University, Department of Computer Education and Instructional Technology, Mersin 33000, Turkey*

Abstract

As Information and Communication Technologies (ICTs) infuse more into our daily lives, their effects and significance become more visible for everyone. On the other hand, not all ICTs are welcomed by everyone. Some technologies or tools are more preferable whereas some people totally ignore some ICTs. In that sense, diffusion of any innovation is significant to implement research studies. Therefore, this study aimed to reveal current situation on diffusion of innovation tendencies for Faculty of Engineering (92 students from Computer, Industry and Mechatronic engineering, and departments) who will be the prospective adapters of ICTs into different sectors in their jobs. Tendency on adapting and implementing current ICTs could be listed within the most important competencies of any engineering department. The study instrument which was adapted by researchers starts with 10 demographic questions (gender, department, what social media tools they use, and etc…) one question asks for possible barriers, 20 questions on 5-point-Likert scale focusing on unfolding their tendencies on diffusion of innovations. The concept of time and administration gained prominence made a statistically significant difference among participants in revealing current situation on diffusion of innovation tendencies for students from faculty of engineering.

Keywords: Diffusion of Innovation; Adoption of Innovation; Technology Acceptance; Technological Innovations; Innovation Tendencies

IETC 2014

5. Introduction

Since technological innovation is important for an economic boost, conception of diffusion of innovation has been one of the central construct to be researched. As Pantano and Di Pietro (2012) noted people's psychological traits are one of the main factor in their decision of new technology acceptance. That is why many attitude-behavior models have been developed and used to reveal these determinants in the literature. To illustrate, Rogers (2003) tried to explain differences in diffusion of innovations via user characteristics by defining diffusion innovation as a process occurring among the members of a social system over time with certain channels. More specifically, innovation attributes such as relative advantage, compatibility, complexity, trialability, and observability play an instrumental role in potential adopters' evaluation regarding innovations (Rogers, 2003). Other related factors have been asserted in the literature such as adoption costs, network effects, and usage behavior (Ryan & Tucker, 2012). Zarmpou, Saprikis, Markos and Vlachopoulou (2012) explained this phenomenon in a general manner via using the theory of reasoned action that personal in nature (attitude) and social influence (social or subjective norm) are major elements for users' intention to adopt a technology.

* Hasan Tinmaz. Tel.:+90 212 422 70 20 / 236; fax:+90 212 422 74 01.
E-mail address: htinmaz@gelisim.edu.tr

In general, personal attitude towards applying technological innovations becomes a prominent factor. Zarmpou et al. (2012) suggested that personal innovativeness covering motivational elements has the strongest effect among other factors to adopt new technologies. Beside personal factors, social influence and contextual influences drive individuals' intention to adopt or continue the innovation, most notably in the later stage of the new technologies (Sun & Jeyaraj, 2013). When time as one of the components of the process is taken into consideration, the actual adoption period becomes even more important. In general, adoption of a new technology has been considered as a slow actualization process (Smith & Ulu, 2012). Khanagha, Volberda, Sidhu and Oshri (2013) stated that adoption is a process occurring step by step and gradually. Similarly, adopting and applying contemporary technologies in education have happened relatively at slow pace (Harrison, Tomas, & Crook, 2014).

Although the impact of individuals' intention on applying and adoption of technological innovations have been extensively tested and validated through empirical researches in the literature, there has been little research in this area highlighting present situation of students enrolled in university level in terms of their innovation dispositions. Therefore, this study aimed to reveal current situation on diffusion of innovation tendencies for Faculty of Engineering who will be the prospective adapters of ICTs into different sectors in their jobs. The following research questions guided this study:

- What are the possible barriers for students to accepting new technologies?
- Do male and female engineering students differ in terms of their perceptions regarding technological innovations?
- Do second and third grade students enrolled in engineering departments differ in terms of their perceptions regarding technological innovations?
- Is there any significant difference in students' perceptions regarding technological innovations across three engineering departments?

6. Methodology

2.1. Participants

This study included 92 students (72 male and 20 female) from Department of Computer Engineering (N=25), Department of Industrial Engineering (N=28), and Department of Mechatronics (N=39) of one private university from Turkey. 44 second grade and 48 third grade students participated voluntarily in the study. The demographics of the participants are represented in Table 1. From the table, it seems that 90% students use Facebook whereas only 61% use Twitter. Students mostly have a laptop and only very few have their blogs or personal websites.

IETC 2014

Table 1. Demographics of participants

	Gender		Grades	
	Female	Male	2nd Grade	3rd Grade
Having a Facebook account	17	66	38	45
Having a Twitter account	13	43	30	26
Having a mobile phone with internet connection	18	52	35	35
Having a tablet	5	23	14	14
Having a laptop	17	62	38	41
Having a personal website	1	9	3	7
Having a personal blog	4	8	5	7

Having a Skype account	13	43	33	23

2.2. Design of the study & instrumentation

In general, the main purpose of the survey research is to delineate the characteristics of a population (Fraenkel & Wallen, 2009). Since the study aimed to disclose current situation on diffusion of innovation tendencies for Faculty of Engineering students, non-experimental survey research method was employed. Administration of the survey instrument to the participants was chosen as the mode of data collection. Therefore, a questionnaire which was adapted from the study of Savery (2005) was firstly scrutinized to suite Turkish language, and after administration a reliability analysis was conducted. According to the Cronbach's Alpha value with .85, the questionnaire had high internal consistency reliability.

Aside from demographic questions, the questionnaire was composed of three main sections addressing students' social media and technological tool usage, the factors preventing them from accepting new technologies, and their perceptions regarding technological innovations. The last section of the questionnaire was consisted of twenty one items on a 5-Likert scale (from strongly disagree to strongly agree).

The data obtained was analyzed with PASW Statistic 18 package. As for data analysis, non-parametric techniques were used throughout the study due to the violation of normal distribution assumption. While the differences between genders, grade levels and perceptions regarding technological innovations were statistically checked by Mann-Whitney U Test for each item, The Kruskal-Wallis Test was used to determine whether there was a difference between departments in which students enrolled and students' perceptions in terms of technological innovations for each item.

7. Results

The descriptive statistics were used to find out the possible barriers to accepting new technologies. Table 2 demonstrates these main factors.

Table 2. Possible barriers of accepting new technologies

Barriers	n	%
Cost	62	67.4
Security problems	31	33.7
Privacy problems	26	28.3
Necessity of follow new versions	23	25
Need for technical support	20	21.7
Being under stress	12	13
Necessity of training to learn	8	8.7

According to the results, 67.4% of the students state that cost of the new technologies is main barrier to accepting these technological innovations. Security problems (33.7%) and privacy problems (28.3%) are considered as other factors which have an effect for the acceptance. Lastly, 25% of the students believe that following new versions of the technologies can be considered as another barrier.

As for main instrument which was administered to determine students' perceptions of the technological innovations, Table 3 presents the item descriptions, item means and standard deviations for each item.

Table 3. Survey Items

Item No	Item	*M*	*SD*

IETC 2014

1	I am eager to be the first to try new technological innovations	4.07	1.16
2	I adopt technological innovations into my life.	4.15	0.82
3	I offer my adopted technological innovations to the others as well.	4.33	0.69
4	I am willing to follow the lead of others in adopting technological innovations.	3.08	1.21
5	I need to be convinced of the advantage of technological innovations by others.	2.83	1.30
6	I am suspicious of technological innovations.	2.56	1.26
7	I am always following technological innovations.	4.06	1.01
8	My opinion about technological innovations is respected by others too.	3.76	0.95
9	I adopt technological innovations but do not attempt to influence others to do so.	2.86	1.31
10	I go along with technological innovations out of necessity.	1.84	1.15
11	I am resistant to change.	1.67	1.13
12	Technological innovations I use have a relative advantage than what I used before.	3.92	0.98
13	Technological innovations I use are better than what I used before.	4.08	0.80
14	Technological innovations I use are consistent with my existing values.	3.97	0.93
15	Technological innovations I use are consistent with my needs.	4.03	0.95
16	Technological innovations are difficult and complex to learn.	2.10	1.11
17	I need more time to experiment with technological innovations before they are implemented.	3.69	4.09
18	The technological innovations I use are visible to others.	4.05	0.83
19	The results of using technological innovations are visible to others outside of close friends (such as school, work and etc…).	4.06	0.73
20	Using technological innovations has enhanced my image or status in my life.	3.56	1.09
21	I think that I do not have enough time to implement new ideas into my life	2.55	1.38

It is good to reveal that students are recommending others to use technological innovations like innovation agents (item 3, M=4.33) while adapting these innovations into their lives initially (item 2, M=4.15) and following innovations all the time (item 7, M=4.06). Moreover, the students perceive that technological innovations are bringing goodness to their lives (item 13, M=4.08) and are in harmony with their current needs (item 15, M=4.03). On the other hand, there seems to be a moderate level of suspiciousness regarding technological innovations (item 6, M=2.56) and having time for putting them into practice (item 21, M=2.55).

The differences in perspectives to perceptions regarding technological innovations between gender variable were statistically checked by Mann-Whitney *U* Test for each item. Table 4 depicts only the significant items.

Table4. The differences between items in relation to gender

Item No	N	*U*	Mean Rank		*Z*	*p*
			Female	Male		
4	92	505.5	57.23	43.52	-2.086	.037
21	92	362.0	28.60	51.47	-3.48	.000

A Mann-Whitney *U* Test revealed significant differences in the item 4 and item 21 for males (*Md* = 3.00, *n* = 92) and females (*Md* = 4.00, *n* = 92), *U* = 505.5 (item 4) and *U* = 362.00 (item 21), *z* = -2.086 (item 4) and *z* = -3.48 (item 21), *p* = .037 (item 4) and *p* = .000 (item 21). It seems that male students are more enthusiastic about tracking the steps of a leader for newer technologies.

IETC 2014

Nonetheless, mean rank of the female (Mean Rank=57.23) was higher than male (Mean Rank==43.52) for item 4, mean rank of the male (Mean Rank==51.47) was higher than female (Mean Rank==28.60) for item 21. Thus, the female students look more reluctant to adapting technological innovations due to the time constraints.

Similarly, A Mann-Whitney *U* Test was used for each item to determine whether there is a significant difference in students' perceptions regarding technological innovations for second and third grades students. Table 5 demonstrates only the significant items.

Table 5. The differences between items in relation to grade level

Item No	N	*U*	Mean Rank		*Z*	*p*
			2nd Grade	3rd Grade		
4	92	649.50	37.26	54.97	-3.264	.001
21	92	751.50	39.58	52.84	-2.448	.014

A Mann-Whitney *U* Test revealed significant differences in the item 4 and item 21 for second grades (*Md* = 2.00, *n* = 92) and third grades (*Md* = 3.50, *n* = 92), *U* = 649.50 (item 4) and *U* = 751.50 (item 21), *z* = -3.264 (item 4) and *z* = -2.448 (item 21), *p* = .001 (item 4) and *p* = .014 (item 21). Moreover, mean ranks of the 3rd grade (Mean Rank=54.97 for item 4 and Mean Rank=52.84 for item 21) were higher than mean ranks of the 2nd grade (Mean Rank=37.26 for item 4 and Mean Rank=39.58 for item 21) for both significant items. It might be concluded that due to the more loaded curriculum in third grade, they have less time to realize and adapt technological innovations.

The differences in perspectives to perceptions regarding technological innovations between departments variable were statistically checked by Kruskal-Wallis Test for each item. According to the test result, there is no statistically significant difference in students' perceptions regarding technological innovations across three different departments that students enrolled.

8. Conclusion

In revealing current situation on diffusion of innovation tendencies for students from faculty of engineering, two important items from the questionnaire made a statistically significant difference among participants. The concept of time and administration gained prominence in this research to answer research questions.

In the literature, three prototypical models (simple NPV model, single-purchase model, and repeat-purchase model) have been asserted to ascertain the impact of ambiguity regarding technological improvements on adoption decisions (Smith & Ulu, 2012). Regardless of model considered or followed, time as a factor has played an instrumental role for the decisions. Under the lights of the findings obtained thorough this study are consistent with this theoretical models. Therefore, it can be concluded that creating enough time to adopt new technologies into daily life has been one of the main factors of individuals' adoption processes.

Diffusion of innovation through a population has been dominated by two types of effects – mass media communications and interpersonal relationships (Sun & Jeyaraj, 2013). Taking innovation attributes (relative advantage, complexity, and compatibility) proposed by Rogers (2013) into account, these attributes have an impact on the person's intention to adopt and use an innovation. More specifically, personal innovativeness covering individuals' willingness to use new technologies might be considered as one of the key factors for applying innovation (Sun & Jeyaraj, 2013). That is why some indirect components having an effect on personal adoption of new technologies play an important role. Social influence; to illustrate, can be given as a characteristic or disposition for this understanding. In general, technological administration

IETC 2014

has an effect on triggering the adoption of technological innovations (Khanagha et al., 2013). Therefore, obtaining try to follow the lead of others which is one of the statistically significant items for this research is consistent with both theoretical and practical research evidences highlighted in the literature.

Although the results of this research are limited to a small number of students from specific engineering departments, these findings confirms the theoretical arguments. On the basis of these findings, this study contributes to growing empirical diffusion of innovation research. More scientific investigations regarding adoption of technological innovations could be useful for field research for the field.

Abstract

This study investigated tertiary level EFL university students' attitudes toward computer based concept mappings in a six-week writing program. Based on the pretest and posttest design, twenty freshmen constructed their computer-based concept maps collaboratively. The 24-item instrument was revised from Lee's questionnaire (2010), in which the participants' attitudes, the perceived usefulness of computer-based concept mapping were investigated, and their opinions toward collaborative concept mapping were collected on a five-point scale. Results showed that students did not have any significant attitude change toward concept mapping. However, higher rating of their perceptions toward the usefulness of computer-based concept mapping, and toward collaborative construction of concept mapping was found.

Key words: computer-based concept mapping; collaborative

1. Introduction

Computer concept mapping, based on the theory of constructivists, who proposed that learning environments were most effective when learners were actively involved in constructing their own meaning and doing so within authentic learning environment (Brown, Collins & Duguid, 1989) where concept mapping supported the construction of knowledge via analysis, inferences from texts through elaboration with prior knowledge (Pearson & Johnson, 1978) and synthesis (De Simone & Schmid, 1998). It was a widely used instructional and pre-writing tool, which helped teachers and students visually represented their knowledge and depicted relationships among concepts. Concept mapping also allowed the learners to abstract information, related ideas, and represented them by enclosing the concepts in nodes and attached by links. It also improved ESL and EFL students' writing by helping them generate better compositions, richer contents, and better organizations across different proficiency levels (Conklin, 2007; Lee, 2010; Lee, 2013; Liu, 2011; Ojima, 2006; Zaid, 2011).

Based on the theory of scaffolding of Vygotsky (1978), the studies of collaborative learning have been the focus of recent research. In collaborative learning, students constructed their cognitive structures by representing concepts and their ideas socially (Stoyanova & Kommers, 2002).

IETC 2014

* Corresponding author. E-mail address:chensc@yuntech.edu.tw

1877-0428 c 2015 The Authors. Published by Elsevier Ltd.

The separate benefits of collaborative learning and concept mapping suggested that the combination of these two approaches were effective in improving learners' knowledge construction (Carnot, Feltovich, Hoffman, Feltovich & Novak, 2003; Stoyanova & Kommers, 2002), lectures listening (Czerniak & Haney, 1998), and text readings (Amer, 1994). Possible explanations may be related to that fact by collaboratively constructing a concept map, students needed to discuss concept arrangements and their interconnected relationships, negotiate meaning, and construct knowledge (van Boxtel, van der Linden, Roelofs & Erkens, 2002).

Collaborative mapping as a pre-writing strategy has been the focus of research. Studies related to teaching students to construct concept maps collaboratively or individually had different results. For instance, Lee (2010) explored the effects of individual concept maps constructions versus collaborative concept maps constructions used by 75 Korean students' writing. Results showed that collaborative mapping group had slightly higher scores than its counterpart. However, Liu (2011) investigated 94 freshmen computer-assisted concept mapping construction on their writing, and no significant difference in compositions between individual and collaboratively mapping was found.

Mixed results were also reported in the studies of the participants' attitude and opinions toward concept mapping. For instance, Conklin (2007) investigated eighty-two 9 graders' attitudes toward using concept mapping in expository essay writing in their Biology classes. The participants perceived concept mapping was a useful tool to visualize, plan, organize, think creatively. Kwon and Cifuentes (2009) introduced concept mapping to 160 seventh graders, including 74 boys and 87 girls. They all agreed that concept mapping helped them organized information leading to better understanding and the ability to answer questions easily. It also assisted them in memorizing the science concepts and retained the learned concepts to prepare for exams.

On the other hand, Ojima (2006) investigated three Japanese English as a second language writers' attitude toward concept mapping. Results showed that collaboratively planning might not have been effectively applied to learners. Some of the participants had trouble to changing their writing habits, and expressed uncertain feelings toward the need for using this strategy. One thought they could cope with current writing tasks without maps. In line with the studies, Lee (2010) examined the effects of concept maps constructions used by 75 Korean students' writing, and the participants' opinions toward concept mapping. The findings showed that the participants' attitude did not have any statistically change.

In order to clarify the issue and fill in the gap in the literature, this study attempted to explore the participants' perceptions toward collaborative computerized concept maps as a pre-writing strategy before and after a six weeks writing program.

2. Method

2.1 Participants

Twenty tertiary level EFL university students participated in a six-week writing program by self-selecting their partners. The average of their TOEIC (Test of English for International Communication) test scores was about 762. The average age of the students was 18 years old, and the proportion of female participants was 75% while the male participants were 15%.

IECT 2014

2.2 Instruments

The instrument was revised from Lee's questionnaire (2010), in which 24 items were designed to evaluate participants' attitude toward computer-based concept mapping (7 items), their perceptions of the usefulness of computer-based concept mapping (7 items), and their experiences and opinions toward collaborative concept mapping (10 items). Students rated the items on a five-point scale ranging from strongly agree (5) to strongly disagree (1). The questionnaire was validated by the researchers as appropriate for this study. The reliability was established at .83 (Cronbach's α).

2.3 Procedure and data analysis

Before the writing program, the participants completed the pretest of attitude toward computer-based concept mapping questionnaire. Furthermore, to examine the effect of the computerized concept maps on the learners' writing, the researchers introduced VUE (Visual Understanding Environment) to the students for its ease of manipulation. The software was designed by Tufts' Academic Technology department and was commonly used in computerized concept mapping experiments (i.e., Kumar & Saigal, 2005; Kumar, Saigal, Chavez & Schwertner, 2004). Writers can create their nodes with different symbols, and display the relationship between each node with the connecting arrowed lines.

The formal study was conducted during a weekly two-hour writing class period. During the six-week writing program, the researchers chose several topics for the 6-week writing assignments including "An unforgettable memory about _____", "A memorable social event in the past", "Too much stress on teenagers?" and "How do you feel about the lottery fever in Taiwan?" respectively. The topics were chosen because they were related to students' daily experiences.

Each topic was introduced with one or two sample paragraphs to activate their background knowledge before writing. The length of each composition was required to be at least 300 or 400 words. All of the students were asked to compose their own writings according to their maps, and the writing assignments were to be finished during the two-hour class period. At the end of this program, the same attitude questionnaire was administered as the posttest to the participants. Descriptive statistics and pair sample *t*-tests were conducted to evaluate the participants' attitude change between the pretest and the posttest.

3. Results

Three constructs were designed to evaluate the participants' attitude toward computer-based concept mapping, their perceptions of the usefulness of computer-based concept mapping, and their opinions toward collaborative concept mapping. Pair sample *t*-tests showed that even though they had significantly positive increase in the construct of computer-based collaborative concept mapping (p=.004), students did not have any significant attitude change toward concept mapping in their overall performance. The finding was in agreement with Chiu (2004), who explored the use of concept mapping by 96 students. Attitudes toward concept mapping did not have any significant differences after the program. Detailed analyses were illustrated as follows.

3.1 Attitude toward concept mapping activity

IETC 2014

Generally speaking, no significant overall attitude change was observed in the first construct. Specifically, item 2 and item 6, designed to elicit learners' self-perceived interest and fun toward using computerized concept maps, declined after six weeks of writing program. With regard to the three reverse items, the means of item 5, "Creating concept maps was time consuming." and item 7, "Drawing concept maps was difficult for me." increased while the means of item 3, "The concept maps I developed were useless to me in writing an article." declined. Overall, students showed moderate agreement toward the statement that using concept maps can facilitate writing (pretest mean = 3.32, posttest mean = 3.25); however, as shown in the data, drawing concept maps was regarded as time consuming and difficult, resulting in the decline of students' interest even though they thought concept maps were useful.

Table 1. Attitude toward concept mapping

	Questions	***Pretest***		*Posttest*		*p*
		Mean	*SD*	*Mean*	*SD*	
1	I was interested in concept mapping as it was discussed in class.	3.55	.904	3.55	.677	1.000
2	I enjoyed drawing concept maps to help me create an article.	3.60	.928	3.53	.716	.628
3	*The concept maps I developed were useless to me in writing an article.	3.38	.667	3.30	.758	.584
4	I want to know more about the use of concept maps.	3.68	.764	3.53	.816	.083
5	*Creating concept maps was time consuming.	2.68	.917	2.73	.784	.743
6	Concept mapping was fun.	3.50	.716	3.38	.667	.230
7	*Drawing concept maps was difficult for me.	3.05	.714	3.20	.723	.309
	Subtotal	3.32	.382	3.25	.392	.158

*reverse items

3.2 Perception of the usefulness of concept mapping strategy

Although no significant differences were observed on learners' perception in the construct (see Table 2), students' had positive attitudes and higher rating in their perception toward the usefulness of computer-based concept mapping. The means of 7 items all increased after six weeks training. Specifically, the means between the pre- and post-survey of item 12, "I think that concept mapping helps me plan a more creative writing." increased from 3.18 to 3.43. It showed the participants' had an increasing agreement toward the usefulness of concept mapping in writing.

Table 2. Perception on the usefulness of concept map

	Questions	***Pretest***		*Posttest*		*p*
		Mean	*SD*	*Mean*	*SD*	
8	I think that concept mapping helped me organize my ideas in writing.	3.65	.700	3.78	.577	.303
9	I think that concept mapping helped me summarize my understanding of the topic.	3.63	.740	3.68	.616	.736
10	I think that concept mapping helped me recall more vocabularies and expressions for the given topic.	3.25	.776	3.33	.656	.596
11	My writing is easier when I use a concept map than my writing when I do not use a concept map.	3.28	.599	3.48	.679	.146
12	I think that concept mapping helps me plan a more creative writing.	3.18	.712	3.43	.781	.031*

IETC 2014

13	I felt that concept mapping improved the quality of my writing.	3.45	.597	3.65	.622	.058
14	I use all the components in my concept map (e.g., nodes, links, hierarchical orders) to write my article.	3.45	.815	3.58	.781	.430
	Subtotal	3.41	.462	3.56	.470	.086

3.3 Experience on collaborative concept mapping

In terms of the participants' rating toward collaborative concept mapping, a significant increase can be found in the construct ($p < .001$). As reflected in the 10 item rating, the students had high satisfaction toward concept mapping and enjoyed constructed their concept maps collaboratively. The means of all of the items increased after six weeks of writing training. Specifically, the participants' perceptions for item 17"Our group concept map was closely related to my final composition." and item 18 "During group concept mapping, I learned different connotations of English words" reached statically significant. These findings provided evidence that students considered collaborative mapping did help them in language learning and writing. It was in line with the studies of Ojima (2006), who proved that concept mapping have positive effects on learners' perceptions.

Table 3. Experience on collaborative concept mapping

	Questions	***Pretest***		*Posttest*		*p*
		Mean	*SD*	*Mean*	*SD*	
15	Our group actively discussed the given topic while collaboratively creating our group concept map.	3.55	.887	3.80	.616	.234
16	I learned new words / expressions during our group concept mapping activity.	3.05	.887	3.35	.745	.163
17	Our group concept map was closely related to my final composition.	3.30	.733	3.65	.587	.005**
18	During group concept mapping, I learned different connotations of English words.	2.85	.671	3.30	.733	.004**
19	During group concept mapping, each group member took equal responsibility in developing our group concept map.	3.75	.716	4.00	.562	.096
20	During group concept mapping, I actively participated in discussions to develop our concept map.	3.95	.605	4.10	.447	.267
21	During group concept mapping, our group members discussed the meanings of concepts and their relationships.	3.60	.821	3.95	.605	.149
22	I feel that concept mapping facilitated our group discussion.	3.55	.686	3.90	.641	.069
23	In my writing, I used new vocabularies that I had learned from our group concept mapping activity.	3.35	.745	3.45	.826	.541
24	Our group concept map represents our group's effort very well.	3.55	.686	3.60	.754	.804
	Subtotal	3.45	.496	3.71	.348	.004**

Note. ** $p < .01$

4. Conclusion

This research explored EFL learners' perceptions toward computerized concept maps as a pre-writing strategy. While there were no significant differences in the attitude between the pretest and the post test, the participants had significantly more positive attitude toward collaborative mapping in langu-

IETC 2014

age writing after the writing program. The result was in agreement with other studies which reported that constructing concept mapping collaboratively was a helpful and enjoyable activity in learning (Chiu, 2004; Kwon & Cifuentes, 2009; Lee, 2010). Collaborative mapping engaged students in discourse and provoked interaction (van Boxtel, van der Linden, Roelofs & Erkens, 2002), which may trigger learners' learning effectiveness and process of knowledge acquisition (Stoyanova & Kommers, 2002).

There were several limitations of this study. Firstly, even though the participants found concept mapping beneficial and useful, they had increasingly negative attitude toward concept mapping activity in the 6 week writing program. This factor, along with other possible issues of academic workload, and motivation, represent limitations on the use of concept maps. In addition, no comparison group was employed in this study, and the training last only for 6 weeks. Therefore, using a control group and longer training duration were strongly suggested for future studies.

Abstract

Massive open online courses is a kind of learning phenomenon which has just emerged in recent years. MOOC are popular in all countries by its virtues especially it can help students to learn from high quality resources. Now more people hope to establish the course alliance among colleges or universities. This presentation will discuss connotation of course alliance and analyze its current situation in China. In the end we design the direction of Technology & Art of TV Shooting course alliance made up of some universities in Jilin Province. The aim is to produce best learning resources and opening up new way of thinking in classes. So it can give students full exploratory learning with communication, cooperation and also supported by expert guidance. This approach can make the best of combination of virtual reality and true reality. We hope learning will no longer just to accept knowledge and information, but it can enhance people to explore the unknown knowledge and acquire pleasant experience in cooperative context.

Keywords: MOOC platform; Course alliance; Teaching method

Introduction: With the increasing maturity of network communication technology and massive open Online Courses (MOOC - Massive Open Online Courses) in the global boom, teaching organization form is breaking through the long tradition of class , the Massive walls of colleges and universities are trying to be pushed down, a new community of curriculum is forming. So we decide to establish a new model that can promote efficiency and quality of teaching. Based on the analysis of the situation of colleges in Jilin Province, our four colleges found an alliance to teach students together.

- Main point

1. The connotation of course alliance

According to Wikipedia, alliance is a joint by two or more natural persons, companies, organizations or governments (or any combination of above) to participate in joint activities or to achieve results together and share each other's resources as the goal of professional groups. (Wikipedia， 2012) Alliance of course can be understood as courses, two or more teachers or teaching groups form a professional group. The word "course alliance" can be traced back to 2001, the Massachusetts Institute of technology (MIT) to carried out the open courseware plan, with the concept of "knowledge of public welfare, free sharing" .and many universities have responded actively and positively. In July 2002, the workshop held in Paris of France the Educational Association of United Nations agreed to expand the Open courseware to Open education Resources (Open Educational Resources, OER), and put forward the Open education Resources is "through information and communication technologies for educators, students, the scholars, based on a non-commercial use, can be free to consult the various education Resources, reference, or applications." and in 2005 set up the Open courseware union (Open Course Ware Consortium, OCWC) (Matthew,2013) ,

IETC 2014

the prototype of this can be thought of as Course alliance. The institutional development has nearly more than 200 Universities members of resources sharing and some cooperation alliance, such as Spanish open courses in colleges and universities alliance (OCW - University), African network University (substitutes Virtual University, AVU), Japan open courseware alliance (JOCW), south Korea open courses alliance (Chesapeake OCW Consortium), and China's open courseware alliance (CORE), each league has attracted many hundreds of courses. Languages such as Spanish open courses in colleges and universities alliance (OCW - University) already has 111 universities in 23 countries opened 1407 courses, the universities mainly come from Europe and Latin America Spanish-speaking countries (Jinzhong Yang, 2013). The purpose of the alliance is to take advantages of strong courses instead of the weak unit, promote education development fairly. Course alliance can be further understood as in order to better improve the quality of teaching, to a greater degree to realize education fairness and cultivate more talents by different colleges and universities teachers or groups of different regions in the organization. Regional courses alliance is mainly involved in the region on the connected economy, culture are similar, facilitate unified organization, coordination and management of space (Bing Gao, 2011), the regional this paper studies mainly refers to the group of universities in Jilin province.

2. **The necessity and feasibility of course alliance**

2.1 the necessity

2.1.1. Promote the education fairness. It is people that caused the imbalance of education resources allocation and led to the unfair of education, talent cultivation and teacher's professional development have formed a huge gap. As far the per capita possession of education funds, colleges affiliated by province were more less than affiliated by MOE; From the perspective of the teachers, high quality schools have a lot of doctoral tutor, but the poor schools may be a handful. For the experimental conditions, the scientific research funds is sufficient in the colleges affiliated by MOE, but some colleges affiliated by province have not used any kind of network teaching platform. Obviously it is an indisputable fact.

Alliance of course can make students to share the best, most high-quality learning resources of teachers and better communication environment, it can effectively promote education fairness, improvement of students' learning experience, so as to improve the quality of personnel training.

2.1.2. Improve the students' autonomous learning abilities and interests. Reform on the way of teaching has always been education advocated by the topic and the behavior, since the 1980 s, which ranges from the computer assisted instruction (CAI) to the use of large screen projection, video booth, electronic whiteboard multimedia teaching, and the teaching way in continuous development and progress, but always can't get out of the small classroom, fails to break through the thick walls, and knowledge update is too lag, student learning is still more to accept knowledge in a passive state. Weariness truancy phenomenon, college students employment and recycled phenomenon (undergraduate course graduation after returning to training in vocational education institutions), and so on are problems. Alliance of course allows students to expand field of vision, wider students exchange, access to the guidance of high quality teachers, flexible approach to learning. Hence students' learning interest, independent learning ability will be strengthened, the learning effect will be greatly improved.

2.2 The feasibility

2.2.1. Policy support. In March 2012, the ministry of education issued "development plan of educational informatization decade (2011-2020)", emphasized that further strengthening the construction of infrastructure and information resources, focus on promoting the depth of the integration of information technology and higher education, promoting education content, teaching means and methods of modern, innovative talent training, scientific research organizations and social service model, pushing forward the innovation of cultural heritage, and promoting higher education quality improving.(Document of MOE,China,2012) this gives policy support on education informatization. In the past two years, the funding for college education informatization is almost millions of yuan, education informatization environment has been improved significantly, many schools have their own network teaching platform. State advocates national class quality and provincial class quality construction. Meanwhile it advocates the Pub-

IETC 2014

lic Class of Video, Video Resources Sharing. Love Course website has been uploaded which provides high quality thousands courses of universities.

2.2.2. The formation of large-scale online courses concept and environment. As MOOC comes like tide, MOOC platform concept and role have been increasingly in front of the general education workers. Since 2012, with Coursera and Udacity and edX as the forerunner and representative of the rapid development of Internet teaching platform MOOC , this kind of teaching model has been open and accessible (Xibin Han,2012). By the "troika" MOOC platform, Edx.org, Coursera.org, Udacity.com have attracted more than 100 world famous universities to participate in in just half a year , more than 500 courses online registered learners of millions. (Laura Pappano, 2013) MOOC main part is the teaching video, supplemented by a various means of interaction and communication space, design concept consider the learners as the center, pay attention to the participation and exploration of students, MOOCs via the Internet creating a virtual space, but create a real learning space, with the help of technical means, it break the limitation of time and space. MOOCs are an important innovation, that is, through the application of social networking services such as Facebook, Wiki, Blog, Twitter and so on in order to establish the direct contact between students and teachers, creating similar to professionalization and specialization of immersion learning community, makes the social learning process and to meet the learners based on the knowledge to pursue personalized needs(Ruolong Ma, Songhe Yuan2013).Talking about MOOC operation mode, the real pioneer of MOOC, Stephen Downes had ever divided the MOOC into cMOOC and xMOOC, "c" refers to the correlation study of socialism theory (Connectivism), which emphasizes learning communities (community) and connect (connection), foothold is learning mode change. "X" is derived from the Massachusetts institute of technology MITx and later the edX, emphasizes the scalability (scalability), foothold is the exploration of business model (Ruolong Ma, Songhe Yuan2013). In fact, you can see more MOOC is in the sense of "x", means of higher education under the impact of the new type of network course will use commercial operation mode, and can reduce costs and then becomes free. From this perspective, we can conclude that relying on the inherent walls surrounding the campus of higher education teaching model will likely be completely overturn, university may reshuffle. Therefore, via MOOC platform, the emergence of the courses league and development provides a good technical foundation and good digital environment.

2.2.3. Opening MOOC platforms in China. On October 10, 2013, Tsinghua University launched a first domestic massive open online course MOOC platform "school online xuetangX.com", to provide online courses worldwide. In April 2014, Shanghai Jiaotong University launched a platform independent research and development of course - good university online (cnmooc.com), which is representative and super star lesson for guokr.com, mooc.chaoxing.com, zhihuishu.com wisdom tree, fruit shell etc., some of these platforms transplant the foreign practices, but also has different degree of innovation, which can accommodate the curriculum resources and the corresponding function such as teaching, evaluation, interactive communication which opened the prelude of Chinese MOOC, for a number of courses in the same alliance cooperation between colleges and universities to provide the powerful guarantee, and promote the schools of high quality courses open to other students. The chief of education higher education department chief Da-liang Zhang holds that compared with traditional network teaching, MOOC has following characteristics, the first is adapting mixed teaching method. The second is a large scale. A classroom capacity is limited, but the scale of the MOOC is very big, which may also be tens of thousands of people. The third is personalization, which is suitable for every learners personalized learning. The fourth is discussion in community, which can have more and more people to participate.

Comprehensive research at present, in brief, Chinese MOOC is putting courses on a sharing platform, many colleges students learn the same curriculum, the combination of online learning and classroom teaching form the mixture of teaching methods. It is different from previous blended learning, and that scope covers many colleges and universities, shows the characteristics of large-scale teaching, also in a larger extent, the advantage of high quality resources. It is also different from NetEase Public Class, from that open platform course is not a one way, but it is the interactive, sharing, evaluation, etc. Since the emergency of the first Chinese MOOC, the Wisdom Tree and the good university online and Love Course Net has opened on May 8, 2014.It is China universities MOOC platform. It has 56 courses online first, at this point, Chinese MOOC is beginning.

3. The league of curriculum in China

In October 2013, represented by China University of Science and Technology China's first batch of 985 schools (C9) had established alliance with AAU of the United States , the European Union for research

universities (LERU), head of the Australian eight school alliances (Go8).This is called the Declaration of Hefei, the core of the alliance means the high quality course of sharing agreement, which symbolize China's higher education will establish cooperation relationship with the development universities of the world. [10] After that the United States has had eight universities of the LVY league, Australia has G8 coalition, domestic also in October 2009, C9 league, which consist of Beijing university, Tsinghua university and other 9 domestic universities , Warsaw Pact alliance headed by Tsinghua university and so on a dozen intercollegiate alliance, but these have not formed a substantial union course. Course alliance should be considered in the true sense in China is in April 2012, initiated by Shanghai municipal education commission and more than 30 colleges joined to "Shanghai university curriculum center" (http://www.ucc.sh.edu.cn) platform, the object only provide to the union of college students in Shanghai universities, which offered in March 2013. Professor Liu Jing ,the director of Shanghai municipal education commission says, there are more than 2400 students in 7 classes run for learning in the first semester, and now the second semester course volume doubled, nearly three thousand students for the classes. [11] This is the first union organization aimed at teaching. Since then, China's East-West University Course Sharing Alliance was formally established in April 2013 in Chongqing University, its members including China Renmin University, Beijing University of aeronautics and astronautics, Beijing institute of technology, Harbin industrial university, Fudan University, Shanghai Jiaotong University, Sichuan University, Chongqing University, Lanzhou University, etc. 62 colleges and universities. East-west University course sharing alliance helps to solve the problem of insufficient elective courses, and each college campus from across schools, cross-regional, cross-border, cross-cultural education teaching, focus more on professional ability and creativity, high level talents with international vision(Baidu Pedia). In July 2013, the online education development international BBS held in Shanghai Jiaotong Uiversity, Shanghai Jiaotong University and other C9 colleges and part of the "985" will be set up to some high level online course platform, which realized the online sharing high quality courses, the first attempt to Chinese teaching mode reform, explored the cross-school joint minor professional training mode, and took the lead in exploring and implementing the open courses online resources open to the public.In August 2013, Shanghai Jiaotong University, Xi 'an Jiaotong University, Beijing Jiaotong University, Hsinchu jiaotong University, Southwest Jiaotong university, launched a "association of online learning", as the five school open courses of learning platform, offering free courses for Chinese learners learning opportunities（ Jianbo Yu,2013). As a result, it opened the prelude of alliance of courses in colleges and universities.

4. The design of the regional university curriculum alliance

There are more than 40 major colleges and universities in Jilin province. For an instance by the terms of the TV Camera Technology, there are more than 10 colleges and universities has opened this course. For decades, various universities have different versions of textbook, and experimental conditions, speaker teachers also have different level. The course in the Northeast Normal University is the high-quality curriculum in the school, but it is just regular classes in other colleges. Based on this, we made a sampling survey in the four colleges of Jilin province about this course , there are four aspects to be consider, one is a teacher qualifications, the second is the experimental conditions, the third is learning materials and resources, the forth is the ability of final work independently, winning the prize. Survey results shows that the colleges affiliated by MOE teachers is strong, the experimental condition is superior, rich teaching resources, student work in the national award-winning number is more, Based on this, we combined four colleges teachers to established courses alliance . The preliminary design is based on the domestic existing MOOC platform.

4.1. The league goal:

Aiming at domestic and international frontier, gather together of university teachers, break the wall type closed school, produce high-quality learning resources and open.

4.2. Methods:

(1) The teaching way transformation. Draw lessons from domestic colleges and universities curriculum alliance experience, through the way of sharing resources, based on the existing domestic MOOC platform, choose a combination of online learning and classroom learning based hybrid learning model, discussion of students' autonomous learning, cooperative learning, instructional learning motivation factors and rules of operation, forming alliance operation mechanism of the development of the course. Course teachers union discuss teaching material selection, teaching outline, teaching content, teaching form design,

creation, learning resources, the teaching video recording and publishing platform. The schools teachers teaching at the same pace and adopt tilting classroom teaching mode. Live online classes are offered two times each semester, which lets the students understand the latest developments in camera technology. (2) The assessment mode diversification. The use of the platform is to provide large data evaluation and behavior evaluation of the school and many other kinds of evaluation, the combination of which makes the evaluation more objective and more focused on development.

Leaving off the low level and low efficiency of education, holding on an open mind, ideas, the design of a new learning mode in the teaching of new thinking, new methods and course alliance maybe a good break-through point. To explore new pattern of higher school teaching organization form still has long way to walk for us.

The Attitudes of Blended Students Towards Social Networks Facebook (Thesis Article)

Nazire Burçin Hamutoğlu129
Department of Computer Education and Instructional Technology,University of Sakarya,54300,Sakarya,Turkey

Abstract

In this study, the attitudes of blended students of Sakarya University Education Faculty over social networks, Facebook; has been analyzed in terms of gender, having internet access, log in to Facebook from mobile phone, class, places where the family lives, mother's education level, father's education level, the frequency of daily Facebook, the frequency of weekly Facebook variables. The resarch has been conducted with blended learning students, studying with the department of computer education and instructional technology of sakarya University Education Faculty. The sample of research consist of a total of 145 people 50 of which are females and 95 of which are males. Distributions of blended learning studens who took part in the research according to their genders were as follows: %34,5 of females and % 65,5 of males. Second, third and fourth grade blended learning students from computer education and instructional technology has taken part in this research. The research has been conducted according to scanning model. A set of data has been formed depending on the answer of the blended learning students to the attitudes towards Facebook survey. The data collected through the survey has been analyzed with the help of exploratory factor analysis, Cronbach alpha reliability, frequency and percentage, t-test, ANOVA and the correlation coefficient techniques.
At the end of the research, according to the t-test results, it has not been found the significant differences with the gender, having internet access, log in to Facebook from mobile phone varibles towards Facebook. Also with the ANOVA analysis carried out significant differences in terms of class, frequency of daily Facebook, frequency of weekly Facebook variables. In addition, it has not been found the significant differences with places where the family lives, mother's education level, father's education level.

Keywords: Social Network, Facebook, Attitude.

IETC 2014

1. Introduction

Changes in human life occur constantly. Ages of people must keep pace with these changes in life. The information society that we are also in it, information and technology is changing rapidly every day. One of the changing information and communication technology is internet. With the development of the internet, there have been recent developments in Web technology. After from Web 1.0, Web 2.0 technologies where users are active, entered our lives. The most widely used in the developments of Web 2.0 technologies are undoubtely Social Networks. Social networking sites are software that support collaboration, information sharing, interaction and communication of people in different environment and have their own interests, needs and allows them to come together in pursuit (Pettenati ve Ranier, 2006:334). Social networks are based on the principle that create a profile and share with communicating others.

Between social networking sites, the most important of the network that actively serves users with these features is Facebook. It is an online social networking software that each users creates several groups for communications by private or public writings as a community according to the permission of the net-

E-mail address: bhamutoglu@sakarya.edu.tr

work and that interacts with them and that allows information to be shared with other users. Users on Facebook promote themselves in an online profile, make friends with other people and can write comments under the typewriters and photos of other users's photos, videos, information, status updates etc. (Peluchette ve Karl, 2010). Included with the application on Facebook that allows users to participate in and active way and continuity, it can be also widely used in education (Genç, 2010). For being used effectively on education, students must be of the positive thoughts against Facebook. Therefore it is important for students to determine what their attitudes toward Facebook. Attitude is a psychological variables which give directions the learning results of an individual's behaviour and cause a bias in decision-making (Ülgen, 1995). Attitudes are not only actually behaviour, but it also drive on behavior and behavior behind psychological variables. Gagne ve Briggs (1979) point out that attitudes should take in the process of learning (Akt. Pala, 2006:179). Therefore concept related to attitudes in education must be known. Küçükahmet (2003) supports this perspective with ''students that have attitudes and habits effect their achivements''. For instance if students have positive attitudes against Facebook, using it on lessons can be increased their achivements. Because of using effectively Facebook on education nowadays, the requirements of this research present that attitudes of students' thoughts against Facebook is significant.

Nomanclature

EFA	Exploratory Factor Analysis

2. Method

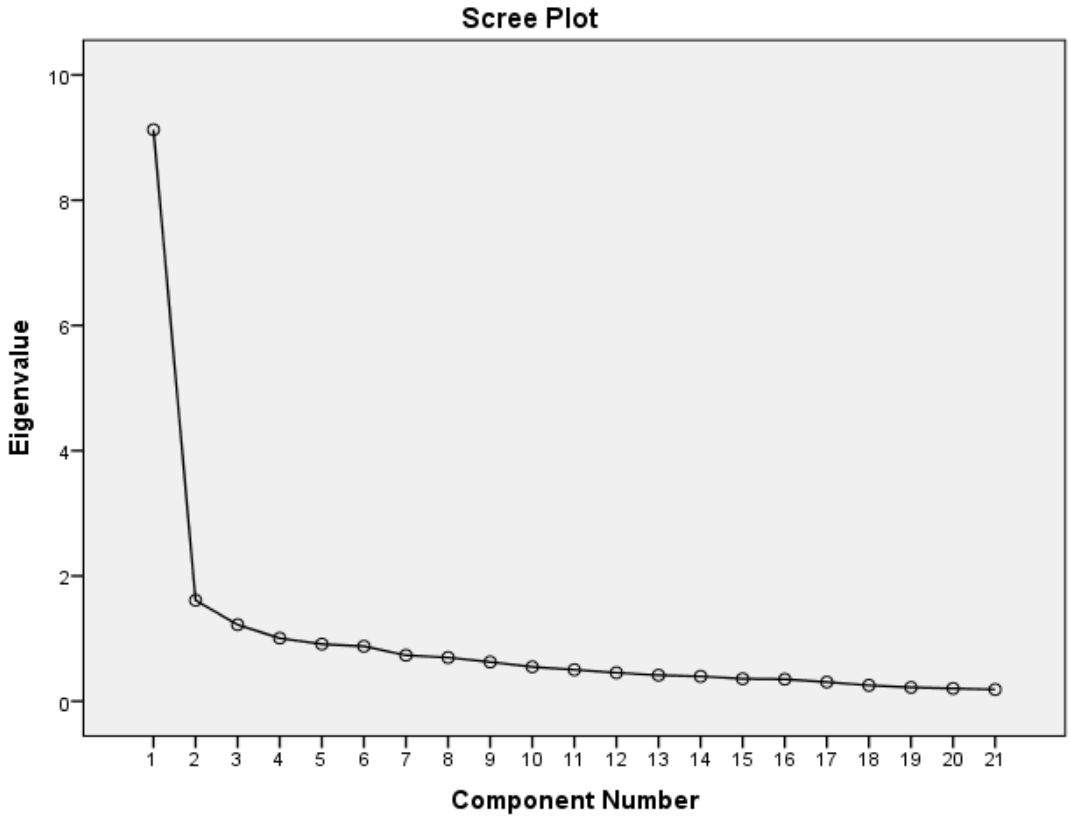
2.1. Research model and Sample Selection

The research planned and conducted screening model. The research of sample constituted 145 blended learning students who education Sakarya University Faculty of Computer Education and Instructional Technology in 2012-2013 academic year. Sakarya University student affairs according to information from the official database; the research of system constituted 193 blended learning students. So this study research represents a large proportion of the system.

2.2. Data Collection Tools

The research was developed by Yixin Zhang for students and in 2007 publishes " Computers and Education Journal, Internet Attitude Scale modeled 5s against Facebook Likert Attitude Scale was developed.

3. Process



3.1. Facebook Attitude Scale

Facebook towards the attitude scale with an extensive literature review by researchers and consultants, attempted to establish the theoretical basis of the scale. Situated in the literature regarding the attitude of the Internet, developed by Zhang Yixin "Development and validation of an internet use attitude scale" is article 40-item Internet Attitude Scale samples were taken after obtaining the necessary permits. First, the sample scale "Internet" instead of the word "Facebook" was changed by typing the word. Then by 2 experts who know English at a good level Turkish 'had been translated and Turkish forms back translate firstly the scale's English then its Turkish applied to know English-Turkish 34 people in Sakarya University. The scale's of items edited to Facebook attitude scale and Considering the results performed on linguistic equivalents; correlation of 0.5 with skin removed 1 item from small scale item pool was created. Examined based on expert opinion and necessary corrections were made. And then take into account national, local, cultural, Turkish form was examined and done back correction and Turkish form was obtained for pre-application. The scale of items were examined to adapt Facebook and were reduced 36. The remaining 36 items, five scale Likert ("1" strongly disagree, "2" disagree, "3" undecided, "4" agree, "5" strongly agree) written in the grading scale.

After this adaptation / development process in order to make the validity and reliability study this scale was applied 153 pilot students who educate Sakarya University Faculty of Education Department of Computer Education and Instructional Technology. According to this pilot study Facebook attitude scale reliability analysis results; the scale's of 36 items internal consistency coefficient to calculate with Cronbach Alpha was found .93.

Construct validity was examined attitude scale of Facebook as a validation study. Exploratory factor analysis for construct validity (EFA) is made. Conducted in order to examine the validity of the scale exploratory factor analysis (EFA) According to the results the scale's eigen values are removed from the other 15 substances that the scale is larger than one factor damaging the structure. The core values of a structure consisting of 21 items scale greater than one single factor explains 43.45% of the total variance. This explained variance ratio is above 30% is regarded as sufficient tests in development work in the behavioral sciences (Büyüköztürk, 2004). Results of this analysis in Table 1, the eigenvalues-factor scatter diagram is presented in Figure 1. When these findings examined, that can said the scale is valid. From the validity study the scale of 21 items internal consistency coefficient to calculate with Cronbach alfa was calculated again and was found .94. The reliability of the examination said that Facebook Attitude Scale was developed in a consistent structure of its own. SPSS 19.0 for validity and reliability analysis (Statistical Package for Social Sciences) program was used.

Figure 1. The Eigenvalues-Factor Scatter Diagram

3.2 An Exploratory Factor Analysis (EFA)

Exploratory factor analysis was conducted for the construct validity of the scale. Exploratory factor analysis of the test results will take place in the determination of material, the core values of factors consisting of items 1, they have at least .30 worth of load factor of substances, take part in only one factor among the factors involved in the matter and was sure that at least two factors .10 difference (Büyüköztürk, 2011). This criteria has been decided to remove unsuitable material from the scale. Common factor variance obtained from the exploratory factor analysis and factor loadings were reporting. After the factor analysis, internal consistency coefficient of the scale was examined. All analyzes were

performed using the SPSS program in research and in the analysis; level of significance was accepted as .05.

Firstly for the construct validity of the scale with the data obtained from the scale exploratory factor analysis was conducted. In order to perform this analysis to test the adequacy of the sample primarily the Kaiser-Meyer-Olkin (KMO) test was examined. KMO value was found to be .909.This value's 70 is greater due to factor analysis can be performed on these data it was concluded. Secondly, looking at the Bartlett Sphericity test (x ^ 2 = 1438.536, p = .000) showed significant differences in the data obtained and was found to be suitable for factor analysis. As a result validity Figure 1 as seen single factor has been found that the scale has a structure.

Table 1. Result of EFA

Item	The Common Factor Variance	Load Factor Value
i3	0,437	0,661
i4	0,541	0,736
i6	0,367	0,606
i8	0,568	0,753
i11	0,451	0,672
i13	0,290	0,538
i14	0,473	0,688
i15	0,580	0,761
i17	0,449	0,670
i21	0,490	0,700
i22	0,319	0,565
i23	0,422	0,649
i24	0,362	0,602
i31	0,401	0,633
i35	0,430	0,656
i28	0,433	0,658
i16	0,395	0,629
i10	0,464	0,681
i29	0,493	0,702
i5	0,512	0,716
i1	0,250	0,500

Eigenvalues (Tot. = 8,33)
Explained Variance % Total = 43,45

When Table 1 is examined, Facebook attitude scale structure consists of a single factor. Load values of the 21 items in the scale factors ranged from 0.50 to 0.76. Located in the scale factor explains 43.45% of the variance. It was found that exploratory factor analysis of the scale revealed a total of 21 items and consists of a single factor. These values of the scale shows the blended learning student attitudes toward Facebook that a good way to explain. While, minimum point that can be developed from the Facebook Attitude Scale is 21, maksimum point is 105.

3.3 Reliability

Total internal consistency coefficient of the 21-item attitude scale of Facebook was found .94 as Cronbach alfa. This value is considered to be an acceptable value for the reliability of the Facebook Attitude scale.

4. Data Collection

Attitude scale against Facebook was planned in the screening model. Screening studies are studies aimed at collecting data to determine the specific characteristics of a group (Büyüköztürk, Çakmak, Akgün, Karadeniz ve Demirel, 2010). In this study, was filled by 145 blended learning students who education Sakarya University Faculty of Computer Education and Instructional Technology. These forms filled out by the researchers collected data set was created.

IETC 2014

5. Data Analysis

Facebook Attitude scale, with data collected for analysis were transferred to SPSS 19.0 package program and datas were analyzed.The data's analysis was examined with frequency and percentage values, t-test, ANOVA, Scheffe Post Hoc test. Level of significance in the analysis of the data is .05.

6. Findings

Table 2. BLSATF according to gender variable

Factor	Gender	N	$\bar{x}$	S	sd	t	p
Attiude of Facebook	Female	50	71,42	14,49	143	1,109	,269
	Male	95	68,20	17,61			

Table 2 shows that there is not significant differences on blended learning students according to gender variables on Facebook attitude. It is observed that p-value is larger than .05 (t = 1.109, p> .05).

Table 3. BLSATF according to having internet access variable

Factor	Having internet access	N	$\bar{x}$	S	sd	t	p
Attiude of Facebook	Yes	109	70,49	15,98	143	1,500	,136
	No	36	65,72	18,20			

Table 3 shows that there is not significant differences on blended learning students according to having internet access variables on Facebook attitude. It is observed that p-value is larger than .05 (t = 1.500, p> .05).

Table 4. BLSATF according to accessing with mobile phone to facebook variable

Factor	Use mobile phone while login to Facebook	N	$\bar{x}$	S	sd	t	p
Attiude of Facebook	Yes	77	71,87	13,95	143	1,993	,048

IETC 2014

No	68	66,41	18,89

Table 4 shows that there is significant differences with accessing to facebook on mobile phone variable. It is observed that p-value is smaller than .05 (t= 1,993, p<.05). It means that the students attitudes on facebook who accessing with mobile phone ($\bar{x}$ =71,87) is higher than the others (x =66,41).

Table 5. BLSATF according to Class Grade variables (ANOVA)

		Sum of Squares	sd	Mean Square	F	p	Differences
Attiude of Facebook	Between Groups	3630,44	2	1815,22	7,12	,001	3-2
	Groups inside	36170,59	142	254,722			4-2
	Total	39801,03	144				

Table 5 shows that there is significant differences with class grade variables. It is observed that p-value is smaller than .05 (F(142, 2)= 7,12; p<.05). It is observed that the differences are between 4th-3rd and 2nd classes. According to the Scheffe test it can be say that ;

*Students of studying in 3rd grade ($\bar{x}$=73,60), have more positive attitudes towards facebook to the in 2nd grade students ($\bar{x}$=63,27).

*Students of studying in 4rt grade ($\bar{x}$=73,27), have more positive attitudes towards facebook to the in 2nd grade students ($\bar{x}$=63,27).

Table 6. BLSATF according to the family's place of residance variables (ANOVA)

		Sum of Squares	sd	Mean Square	F	p	Differences
Attiude of Facebook	Between Groups	1009,35	3	336,450	1,223	,304	
	Groups inside	38791,68	141	275,118			
	Total	39801,03	144				

Table 6 shows that there is not significant differences on blended learning students on Facebook attitude, according to the family's residence place variables . It is observed that p-value is larger than .05 (F(3, 141)= 1,223; p>.05).

Table 7. BLSATF according to the mother's education level variables (ANOVA)

		Sum of Squares	sd	Mean Square	F	p	Differences
Attiude of Facebook	Between Groups	1655,02	3	551,67	2,039	,111	

IETC2014

	Groups inside	38146,01	141	270,53		
	Total	39801,03	144			

Table 7 shows that there is not significant differences on blended learning students on Facebook attitude, according to the mother's education level variables . It is observed that p-value is larger than .05 ($F(3, 141) = 2{,}039$; $p>.05$).

Table 8. BLSATF according to the father's education level variables (ANOVA)

		Sum of Squares	sd	Mean Square	F	p	Differences
Attiude of Facebook	Between Groups	370,77	3	123,59	,442	,723	
	Groups inside	39430,26	141	279,64			
	Total	39801,03	144				

Table 8 shows that there is not significant differences on blended learning students on Facebook attitude, according to the father's education level variables . It is observed that p-value is larger than .05 ($F(141, 3) = ,442$; $p>.05$).

Table 9. BLSATF according to "how often spending time on Facebook in a day "variables (ANOVA)

		Sum of Squares	sd	Mean Square	F	p	Differences
Attiude of Facebook	Between Groups	5298,58	3	1766,19	7,218	,000	7-up and never
	Groups inside	34502,45	141	244,69			4-6 and never
	Total	39801,03	144				

Table 9 shows that there is significant differences with spending time on Facebook in a day variables. It is observed that p-value is smaller than .05 ($F(3, 141) = 7{,}218$; $p<.05$). According to the scheffe test result, it can be say; the students who spends longer time on Facebook have more positive attitudes towards to Facebook.

Table 10. BLSATF according to "how often spending time on Facebook in a week "variables (ANOVA)

		Sum of Squares	sd	Mean Square	F	p	Differences
Attiude of Facebook	Between Groups	6512,68	3	2170,89	9,195	,000	11-up and 1-5
							11-up and never

IETC 2014

Groups inside	33288,35	141	236,08	6-10.and never
Total	39801,03	144		

Table 10 shows that there is significant differences with spending time on Facebook in a day variables. It is observed that p-value is smaller than .05 ($F(141,3) = 9,19$; $p<.05$). According to the scheffe test result, it can be say; the students who spends longer time on Facebook have more positive attitudes towards to Facebook. This result is similar to, as indicated on Table 9.

Conclusion

6.1. Results, Discussion and Recommendations

In this study, Facebook Attitudes levels of blended learning students were examined. To serve this purpose, blended learning students from Sakarya University Computer Education and Instructional Technology department, studying in 2nd, 3rd and 4th grade, views are investigated.Facebook Attitude levels of blended learning students were analyzed with t-test and ANOVA; according to gender, class level, having internet access, login to Facebook with mobile phone, residence of family place, mother's education level, father's education level, frequency of using Facebook in a day and in a week, variables. The results show that there is a significant difference according to the class level, login to Facebook with mobile phone, frequency of using Facebook in a day and in a week, variables.

The ANOVA test results show that there is a significant differences between 2nd and 3rd class students and 2nd and 4th class students. To check out the differences reason, Scheffe test results determined that students, studying in high grade have more positive attitude towards Facebook than studying in 2nd class. The reason of that may be say, experimention on Facebook is increasing by their class level. There is also a significant differences with frequency of using Facebook in a day and in a week. To check out the differences reason, Scheffe test results determined that students who spends over 4 hours on Facebook in a day have more positive attitude than other cases. And also, frequency of week has the similar result. The t-test results, show that there is a significant differences between login to Facebook with mobile phone and in other case.

In the light of the survey results, the students views show that Facebook is useful to; " communicate with a remote person, communicate with friends and share course materials." Charnigo ve Ellis (2007) observed that Facebook is an important tool to communicate in the campus, which has a difficult physical facilities. Students have some instability about the items which related about professional business and studying on Facebook. This findings show that they do not use more often Facebook to academic purpose. Junco and Cotton's (2012) results are similar to this findings. The students also represent that, "Graphics and hyper links on Facebook draw my attention ."

The high grade students have more positive attitude towards Facebook may be associate with the using of Facebook more often in the courses in 3rd and 4th classes. This finding is also related about spending time and experience on Facebook have effect the attitude towards Facebook. Tiryakioğlu and Erzurum (2011), have some related findings that Facebook effects the educational experiences, teachers have positive attitudes and they use to communicate and to share.

To summarize the results, it is observed that students use Facebook actively by sharing courses materials and communicating with each others. In this view, to have an attention on the students, a course modul may be add on Facebook. In this manner, the educational activities may be provide on Facebook. Creating a group and sharing course materials on Facebook may be an other idea, to have effective activities and learnings. Facebook can be use actively in educational environment especially in distance education. The researcher may take care of this idea and may search the reason of not using Facebook for academic purpose by using the qualitative method.

Abstract

Chang Jung Christian University and National Hsin-Feng Senior High School cooperated in hosting a series of teacher training camps, teaching module design discussions relating to Team-Based Learning (TBL) and green geothermal energy in 2012. The teaching program began in September 2013, focusing TBL on "green energy". Coupled with field visits, guest lecturers, and participation in competition, the teaching program aims to strengthen the learning effectiveness of students, and emphasize digital technology and hands-on module experience. Four cross-disciplinary senior high school teachers were invited to apply TBL methodology in innovative teaching and learning of geothermal energy. The teachers raises questions to trigger group discussion and in-class discussion on the principle and practice of energy use in daily life, as well as the establishment of energy-saving facilities. After self-learning, students then shared their learning experience with other students. Finally, the feedbacks and suggestions by the students and teachers on the TBL methodology are provided for a reference for TBL in the future.

Keywords: Team-Based Learning (TBL), green geothermal energy, cross-domain teaching and learning

IETC 2014

1. Introduction

The "Whitepaper on Innovative Education" proposed by the Ministry of Education of Taiwan points out that innovation capability broadly includes creativity, innovation and entrepreneurship mechanisms. The outcome of innovation is the creative performance of the general public in various fields. Science and technology education has an emphasis on "learning by doing", expecting that students can learn in practice with stimulus of new experiences and knowledge, and strengthen their problem-solving ability (H.C. Wang, 2004). In the knowledge based economy, there is a high demand for talents with creative and innovative thinking. However, in the current educational system of Taiwan, when students face problems, teachers and parents tend to help them solve the problems or directly give answers. Under the traditional teaching methodology for science education, students can only passively accept the knowledge in class, while unable to apply their knowledge in daily life, thus lacking problem-solving and learning migration abilities (C.H. Wang, 2009)(M.Y. Shih, 2012).

Although there are diverse teaching methods, students still learn passively as they follow the traditional pattern of "do as the teacher teaches". The two problems of the current teaching and learning methods, namely "team spirit" and "self-learning" can be solved by team-based learning (TBL). Hence, this paper presents the case study of National Hsin-Feng Senior High School, which uses emerging technology (geothermal energy) as the content of school course or non-standard educational activity, develops innovative curriculum or teaching activity modules, and designs scientific inquiry-based teaching strategies or activities. By using geothermal energy as the teaching theme and developing merge-integrated teaching, the

teaching methodology aims to enhance the emerging technology literacy and learning effectiveness of high school students in off-shores island of Taiwan.

2. Literature review

2.1. Team-based learning (tbl)

TBL is a method of carrying out group discussion in a large class, and encouraging active learning of students (Y.W. Wang, Y.W. Wang, and J.-G. Hsieh, 2010). There are two approaches: the educational strategies for the development of academic environment, and the development and educational process at workplace. During employee recruitment, companies not only concern about professional ability, but also expect the employees to have the ability to work in teams. However, this ability is neglected in school education of Taiwan. Moreover, students in Taiwan still follow the traditional pattern of "do as the teacher teaches", which is passive learning (M.Y. Shih, 2012). Therefore, to enhance students' teamwork and self-learning abilities, the learning method should be re-designed.

In recent years, another popular teaching method is flip teaching, which flips the content and time of classroom teaching with those of assignments outside of class. TBL incorporates flip teaching with group learning, in order to make learning more effective and cultivate the teamwork spirit of students. Compared with the teacher-oriented didactic teaching, TBL is a dialectic teaching, which allows students to go through the thinking process and reflect whether the students can apply the knowledge. It is student-oriented. Unlike the team-oriented learning method, which only adds group projects in the curriculum, TBL is an integrated, systematic teaching strategy, which includes changes in the curriculum design. It requires students to spend classroom time on applying the knowledge rather than absorbing the knowledge. Under TBL, the personal learning effect is closely related to the overall formation, development and performance of the team. The comparison results of traditional teaching methods and TBL are as shown in Figure 1.

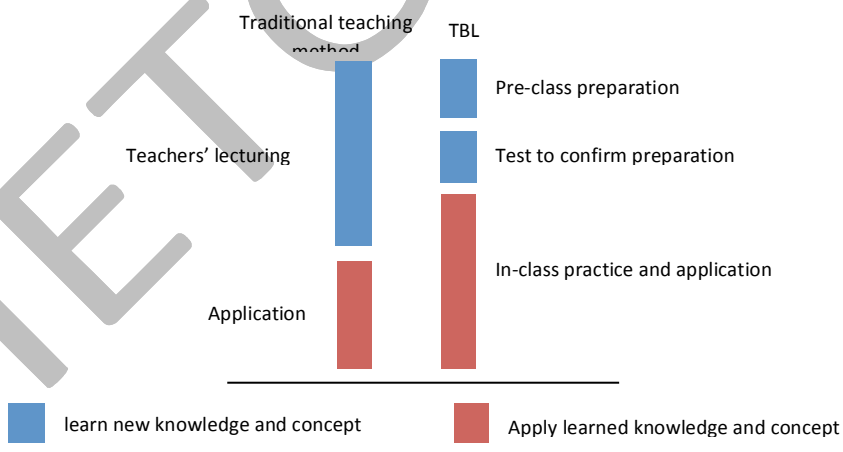

Fig. 1. Comparison of the traditional teaching methods and TBL (L. K. Michaelsen, 2004)

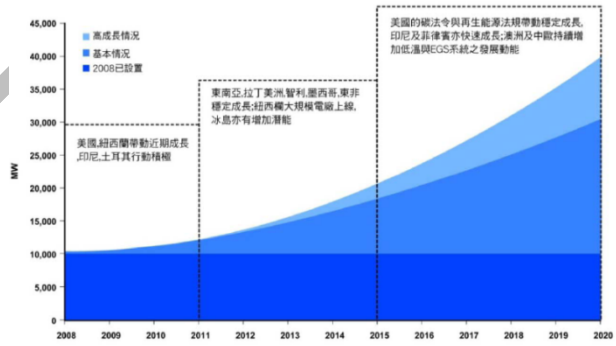
2.2. Cipp evaluation

CIPP, proposed by Stufflebeam et al., represents the four evaluation items of context, input, process and product (D.L. Stufflebeam, and T. Kellaghan(Eds.), 2003). C represents context evaluation to provide the basis for determining the target, which is the most basic evaluation; I represents input evaluation to determine how to use resources to achieve goals, including the selection, design and development of curriculum resources; P represents process evaluation, which starts after the completion of curricular resource

IETC 2014



design to provide regular feedback to the people in charge of the curricular courses; P represents the cause evaluation to understand the results of the educational system to help decision-makers determine whether the curricular courses should be terminated, modified or continued (C.C. Huang, 2011). CIPP evaluation is an evaluation system mainly applied in the entire program or project, focusing on the overall process evaluation. It suggests that "the main purpose of evaluation is not to prove improvement, but deliver a professional judgment" (C.T. Wu, 1993) (Y.L. Hsieh, 2010). Therefore, it integrates both qualitative and quantitative research methods, and expects to provide the most needed information for evaluators by objective and realistic observations (C.H. Wang, 2009) (D.L. Stufflebeam, and T. Kellaghan(Eds.), 2003).

This study applied the CIPP model to evaluate the students' learning attitude, teaching objectives, and teachers' needs under Context; to evaluate the problem orientations, learning strategy, and teaching design under Input; to evaluate the content, strategies, teacher-student interaction, and learning assessment problems during the teaching process under Process; and evaluate the effectiveness of problem-oriented learning under Product. The CIPP model was used to correct and improve the teaching method, in order to achieve the optimal results.

2.3. Green geothermal energy

Geothermal energy is a green energy with many characteristics. It is a clean and environmentally friendly energy. The infinite energy dissipated by the earth can be directly used for power generation or as renewable energy, without the impact of depletion, climate changes, or the development of other energy sources. The land use surface area is very small, thus, it is less likely to damage the natural environment.

The traditional geothermal energy requires low cost. Although the cost of the newly developed EGS is relatively high, it is still cost effective if compared with fossil fuel carbon sequestration, nuclear waste disposal costs of nuclear energy, wind energy and solar power grid problem. The cost of EGS can be substantially reduced after the technology is mature. Therefore, many countries have invested in the exploration and development of geothermal energy, including those with rich geothermal energy sources, such as the United States, New Zealand, Japan, Iceland, the Philippines and Indonesia, as well as those lack rich geothermal energy sources, such as France, Germany, Australia and South Korea. According to the statistics from the Emerging Energy Research, by 2008, the total amount of geothermal power worldwide was about 10.5 GWe (1 GWe=1,000 MWe=1 billion watts). It is estimated that the total worldwide geothermal power amount by 2020 will increase by 3 to 4 times to reach between 31.5 GWe to 40.5 GWe, as shown in Figure 2.

IETC2014

Fig. 2. Global geothermal energy use: current status and future outlook (ITRI, 2008)

After the enactment of the Renewable Energy Development Act on July 8, 2009, the development of renewable energy has been booming in Taiwan. Solar power and wind power are the major power sources, but they are subject to climate changes. Geothermal energy is a sustainable and stable source of power supply. Due to the technical limitation in the early stage of development, the site selection must be at hot spring geology, thus resulting in disputes with the hot spring hotels in terms of water rights and water usage amount. Moreover, the limitation of water output restricted the power generation amount; hence, the cost of geothermal energy power generation was high. At present, the geothermal energy power plants in operation, such as those in Iceland, New Zealand, Italy, and the United States, are mostly in regions with volcanic activity or on geological fault zone, and hot spring is used for thermal energy power generation.

This study used emerging technology (deep geothermal energy) as the content of school course or non-standard educational activity, develops innovative curriculum or teaching activity modules, and designs scientific inquiry-based teaching strategies or activities. By using geothermal energy as the teaching theme and developing merge-integrated teaching, the teaching methodology aims to enhance the emerging technology literacy and learning effectiveness of high school students in off-shores island of Taiwan.

3. Application of smart life into senior high / vocational high school curriculum

The teaching program was implemented by the team of Chang Jung Christian University. It carried out TBL, discussed the acceptance of the students and teachers of TBL, guided the students to collect and analyze data through the project-based learning, and develops the problem-solving and self-learning abilities of the students. Finally, the CIPP model was used for evaluation, and proposal of suggestions and improvement methods. The team also introduced the college student TA into the high school classes, and further promoted the teaching method to other courses. The major tasks include:

(1) To assist teachers in junior and senior high school to prepare and gather relevant information on green geothermal energy and low-carbon energy;
(2) To assist observation of in-class curriculum and course activities;
(3) To regularly organize summer and winter camps and model-making activities, to hold "Energy-saving Green Map" on May 16, 2014 and "Green Energy Science Summer Camp" from August 20 to 21, 2014, to plan and design activity lessons;
(4) To assist high school teachers establishing good channels of communication with the university teams.

Finally, the feedbacks and suggestions by the students and teachers on TBL were discussed for the reference of future application of TBL.

The specific objectives of this study are as follows:

(1) Applying TBL on the course development and merge-integrated teaching of "high school earth science": in the high school earth science courses, the team-oriented focus is on "sightseeing tourism". The teachers raise questions concerning daily life problems, such as the relationship between the environmental development and topography, the impact of volcanoes and earthquakes on the environmental use. The students are encouraged to participate in group discussion and in-class discussion. Then they conduct self-learning and share their learning with other students. They then discuss the methods of geothermal energy development and utilization.
(2) Applying TBL on the course development and merge-integrated teaching of "high school geography": in the high school geography courses, the team-oriented focus is on "sightseeing tourism". The teachers raise questions concerning daily life problems, such as the relationship between landscape conservation and environmental development, the impact of landscape planning and environmental use, the combination of the community building and geothermal energy industry. The students are encouraged to participate in

IECT2014

group discussion and in-class discussion. Then they conduct self-learning and share their learning with other students. They then discuss the methods of geothermal energy development and utilization.

(3) Applying TBL on the course development and merge-integrated teaching of "high school physics": in high school physics courses, the team-oriented focus is on "green energy", emphasizing "eyes, hands and brains". The teachers raise questions concerning daily life problems, such as energy units, energy generation, energy conversion, energy consumption and energy conservation. The students can conduct self-learning, participate in group discussion, and discuss with the teacher. Then they share their learning with other students to train the observation ability and creativity.

(4) Applying TBL on the course development and merge-integrated teaching of "high school biology": in high school biology courses, the team-oriented focus is on "biotechnology". The teachers raise questions concerning daily life problems, such as the relationship between plant growth and the environment and temperature. The students are encouraged to participate in group discussion and in-class discussion. Then they conduct self-learning and share their learning with other students. They then discuss the methods of improvement.

4. TBL module

To achieve TBL in learning green geothermal energy, experimental teaching was conducted from September to November 2013. The subjects were the top 5% freshmen students of high school. The 44 students were grouped for teaching. In mid-November, formal teaching was conducted on 44 students in one class. Under TBL, group discussion and individual learning were carried out simultaneously, in order to guide students to understand the content of geothermal energy, and cultivate their abilities to think about geothermal energy-related issues from the geographical, biological and physical aspects. They also learned geothermal energy related knowledge and abilities that can be applied in daily life. To design the TBL course outline, the team from Chang Jung Christian University held a number of workshops on the principles and application of TBL for the teachers of National Hsin-Feng Senior High School. After the curricular modules were developed for TBL courses, the student underwent individual test (iRAT) and team test (tRAT). Then, team assignments, reports, and peer evaluation (P-E) were conducted for evaluation. The TBL approach changed the learning and teaching mode of the students and teachers. Besides learning new knowledge and broadening the vision, the students have more time for discussion, take initiative for peer interaction, have higher learning participation, achieve effective peer communication, and gain thinking ability.

5. Product benefits

The environmental improvement, academic achievement, technological innovation, economic benefits, social impacts, evaluation of academic or practical values, and major contributions are described as follows.

(1) Environmental improvement: This project focuses on integrating green geothermal energy technology into teaching outline, and highlights the characteristics of TBL, and how to develop creative and suitable teaching material teaching aids for students to enhance the emerging technology literacy of diverse ethnic groups. With the equipment and resources provided by universities (National Quemoy University and Chang Jung Christian University), the perceptions of high and medium-end low-carbon buildings and geothermal energy can be strengthened. Through training of high school seed teachers and implementation courses, the green geothermal energy technology is integrated into the design of teaching aid and lesson plan, so that the university and high school can establish the cooperation partnership.

(2) Academic achievement: through resource introduction, to assist high school teachers in the construction of the basic knowledge and capabilities of teaching and learning design, develop relevant curriculum design and explore methods of emerging energy technologies. The design challenges the traditional lecturing of teachers. Under the leadership of expert lecturers, the learning of knowledge and capabilities of emerg-

IETC 2014

ing technology was enhanced. The initial design of teaching was changed into the student-oriented explorative teaching, team-oriented learning, problem-oriented learning model. Four TBL teaching plans were developed. Table 1 shows the design of biology teaching and learning.

(3) Knowledge innovation: In the first year, under the guidance of experts and scholars, the teachers' learning of knowledge and capability of emerging technology was enhanced. Resources were introduced to assist high school teachers to build the basic knowledge and ability of teaching and learning design. Teachers adjusted the design of teaching and learning into student-oriented innovative learning. In the second year, the green geothermal energy and TBL were introduced into curricular content and programs of teaching and learning.

Table 1. Design of biology teaching and learning.

Course theme	The geothermal energy in Taiwan	
Teaching objectives and course outline	. To understand the techonology of geothermal energy application around the world . To discuss the emerging technology of geothermal energy application . To cultivate the confidence and enthusiasm in facing the challenges of technilogical development	
Units	Unit 1: Technology of geothermal energy application Unit 2: The emerging technology of geothermal energy application	
Teaching design	Activity 1: Usage of geothermal energy in Taiwan Question by the teacher: What are the ways of using geothermal energy in Taiwan? Teaching guideline: To guide the students answer (hot spring, boiling egg, hot spring vegetables)	Activity 2: The limiations and problems of using geothermal energy (Transport of hot spring water) (Difference between hot spring water and regular water) Activity: usage of geothermal energy
Teaching design	Activity: Usage of geothermal energy Transport of hot spring water (materials, distance, piping positions) Hot spring vegetables (weight, size, results; growing rate and concentration in soil)	
Teaching effectiveness evaluation	. Knowledge: students' understanding and application of the knowledge . Affective expression: students' learning attitude, teamwork . Thinking ability: in-class discussion, homework . Problem-identifying and solving abilities: the problems identified by the students and solutions . Information ability: the ability of the students to collect and use information . Skills: students' skills and the ability to present the skills . Creation expression: the learning portfoil and presentaiton of learning results

6. Conclusion

This project constructed the high scope courses by using the CIPP model in a stable and pragmatic manner. In the first year, capability building activities were held to verify the directions, content integration and teaching approaches of the high school courses. Then, the teachers discussed about the selection of teaching material, collaboration of teaching method, cross-disciplinary and cross-grade coordination, in order focus on TBL model. Diverse teaching and learning evaluation methods were adopted, including paper-based test, learning sheet, and observation report. The goal of the first year, namely building the foundation for curricular design, has been reached. In the second year, the preliminary evaluation will be conducted on the course effectiveness, which is the third stage of the second phase of CIPP model (input evaluation and process evaluation). In the third year, the overall performance evaluation on the students in the high scope course will be conducted, in order verify whether the overall curriculum design is appropriate and learning effective is enhanced, specifically whether the students' understanding of green geothermal energy can be demonstrated in their daily life. This project complies with the spirit of the high scope program, and guides high school teachers in the design of teaching and learning evaluation. The

IETC 2014

evaluation not only assesses the knowledge, but also the participation and gain in the learning progress. It is believed that the evaluation model can provide students an opportunity to demonstrate their abilities, enhance learning success, learn about the low-carbon life and green geothermal energy.

IETC 2014

The development model of knowledge management to strengthen Thai ict community learning center

Assoc. Prof. Dr. Narong Sompong, Dr. Nattaphon Rampai130
Department of Educational Technology, Faculty of Education, Kasetsart University, Thailand

Abstract

The objectives of this research were to: 1) study the problems, obstacles, and best practices in Local Wisdom Knowledge Management for strengthening Thai ICT Community Learning Centers (ICT-CLC) in various areas of Thailand; 2) develop Local Wisdom Knowledge Management Model to strengthen Thai ICT-CLC; 3) construct a training operation plan for administrative committee members and staff to strengthen the center; and 4) evaluate the KM strategic operation plan for strengthening ICT-CLC.

The research sample included 49 administrative committee members and staff of 8 ICT-CLCs in the central provinces of Thailand. Five experts were also included as part of the focus group who critiqued the strategic operation plan for strengthening ICT-CLC. The research instruments composed of a questionnaire on ICT-CLC and strategic plans, training operation plan, and an evaluation form for strategic operation plan assessment. The data were gathered using a survey on basic information of ICT-CLC in the central provinces. Based from this, the strategic plan was developed and tried out with the target group. Finally, the assessment of the plan was conducted.

Findings showed that most of the small, medium, and large ICT-CLCs had problems and obstacles in terms of center management and services. Moreover, most of the small centers did not have long-term plan activities and maintained the local wisdom study and collection. The result of the strategic plan development revealed that the first strategic plan included issues on human development, efficiency in services, and availability of training services for administrative committee members. The second strategic plan involved the improvement of the quality of life, issues in the environment, community, sociality, and capability in enhancing the learning of the people in community through electronic media.

The results of the strategic plan utilization found that the suitability of the plan was at a high level. The assessment of the ICT-CLC involving the plan revealed that the community participated in local wisdom collection with the team and bring about the indigenous knowledge to construct online media on two websites: **www.donpingdad.ictlearningcenter.org** and **www.khemasampun.ictlearningcenter.org**. The Local Wisdom Knowledge Management Model in strengthening ICT-CLC had been tried out and tested. The result showed that the model was applicable at a good level. This could be also applied to the other centers.

IETC 2014

1. Introduction

The concept of Thai ICT Community Learning Center was founded in Thailand in 2001-2002. Since then, many organizations have supported their activities. The Ministry of Information and Communication Technology (MICT) emphasized the development of Thailand as a Knowledge Base Society. Projects on One Temple One Learning Center (OTEC) and Information Community (i-Community) were established. After a short period of development, Thai ICT Community Learning Center was then established in 2007 with the support of MICT.

From 20 centers in the beginning, the centers expanded throughout the country with almost 1,887 centers in 2013. The Thai ICT Community Learning Centers are generally managed by the CEO of the organization where the centers are located in the various places (e.g. school, temple, Local Administrative Bureau etc.). A community board is also created to help advice the ICT center management on lead policies and to increase the transparency of the center's activities.

The management team intended to strengthen the role of the community board to be more concrete and participatory, which is expected to improve operations. Thai Community ICT Learning Centers were established to develop the lifelong learning of people in the community by using ICT as tools. However, there were limitations and issues in the management and services. Almost all of the centers could not integrate ICT applications in enhancing the potential in the community development.

Another significant limitation include the community's inability to search, collect, and gather knowledge, content or other local wisdom. Therefore, ways to manage their learning about ICT to support their daily lives should be enhanced by the ICT Community Learning Center (Sompong, 2014). The community contents such as the specific knowledge and local wisdom should be collected and put into websites and other kinds of electronic media. The center administrator should encourage the organization to gather data and put them in a database or website for sharing and learning with other members. The services should be planned and worked out with short and long – term strategic plans. In doing so, potential of the center could be strengthened.

Therefore, to enhance the ICT potential into the knowledge-based society, this research investigated and developed the KM model for strengthening ICT Learning Centers in the future. This can be used in reinforcing the competencies of the staff and the indigenous people in the remote communities. This can eventually create an impact to community development using ICT- based learning under the strategic plan implementation of the center committee. Moreover, the outcome can decrease the gap of digital divide as well.

Some studies showed that ICT Community Learning Centers (ICT-CLC) in Thailand experienced many problems in the operation. The centers need to enhance their potential to serve other ICT learning centers. Findings of this research could be used to strengthen the capacity in improving teaching and learning ICT utilization in the community through training and allowing them learn how to operate their own centers using the strategic plans.

2. Objectives

The objectives of this research were to:

1) study the problems, obstacles, and best practices in Local Wisdom Knowledge Management for strengthening Thai ICT Community Learning Center (ICT-CLC) in various sizes of Thailand;

2) develop Local Wisdom Knowledge Management Model to strengthen Thai ICT-CLC;

3) construct a training operation plan for administrative committee members and staff to strengthen the center; and

4) evaluate the KM strategic operation plan for strengthening ICT-CLC.

IETC 2014

3. Review of related literature

When people use computers to help them complete tasks which they regard as problems, they are likely to have a more positive attitude towards the use of computers, and are likely to look for further tasks which can be completed using a computer. However, if people use a computer to complete what they regard to be an unnecessary task or in using the computer and the task is made more difficult or less satisfying, then they are less likely to use

computers in the future. One way to bring ICTs to indigenous communities is to develop digital community centers that should be considered in implementing such centers (Newhouse, 2002).

This emphasizes the need to create an enabling environment for sustainability through public policy, careful planning, creation of local content and most importantly through direct involvement of the indigenous people being served. Therefore, the involvement of the information society is embedded in their use and adoption of ICTs. It is clear that the "digital divide" can turn into a "digital opportunity". Moreover, infrastructure and technology are generally the most dominant factors in the ICT development practice. These are also essential elements that need to be considered to match any given locality. Therefore, the ICT development stage should enable the analysis of needs and conditions in the selection of appropriate technology to match the community's circumstances. The selection and deployment of the technology to be used has to be tailored to benefit indigenous communities.

ICT Learning Center in the community can achieve success if it carries out intensive reflection and organizational work of the team. These concerns the organization leader and the committee members who have high leadership competencies which could be developed to the good performances by training. Therefore, training strategies may be one of the ways to develop the skills of ICT Learning Center's members in the communities.

4. Scope of the study

1) The study area included the lower central provinces of Thailand. The target centers were sampled from 8 provinces namely, Nakorn Prathom, Ratchaburi, Karnjanaburi, Supanburi, Samut Songkram, Samut Sakorn, Petchaburi, and Parjeob Kheereekhun. The sample was composed of ICT Community Learning Center in 3 sizes: small, medium, and large centers. Best practices were analysed at Klong Ban Keing (small) in Ampawa District, Samut Songkram Province; Ban Rang Mai Dang (medium) in Muang District, Rachaburi Province; and Ban Pluk Mai Lai (big) in Kampang Sean District, Nakorn Prathom Province. The administrator and staff of each centers in these 3 provinces were then selected as respondents of the study.

2) The strategic plan for strengthening ICT-CLC was used and assessed by 2 centers located in Petchaburi Province. Five experts in the field of Agriculture, Educational Technology, and Knowledge Management were involved in critiquing the model. Then, the KM model was developed and verified.

3) The Knowledge Management 5- Step Model was developed in terms of: Step 1 - Explore & Capture; Step 2 - Identify & Organize; Step 3 - Exchange & Apply; Step 4 - Transfer & Share; and Step 5 - Collect & Store. The model was modified and tested after the assessment.

5. Methodology

IETC 2014

5.1 Population and sample of the study

The respondents of the study came from the central regions of Thailand. In determining the number of samples, the centers were classified by location, management, and size (small, medium, or large). The respondents included: 1) 34 administrator and staff of the ICT-CLC committee from 3 groups in 3 selected centers; 2) 15 members of ICT-CLC committee in Petchaburi Province chosen purposively from 2 centers for the implementation of the strategic plan, and 3) 5 experts in agriculture, educational technology and ICT for the focus group meeting.

5.2 Research instruments

1) Structured questionnaire used in the survey of the best practices of the centers' administrators: Part 1 - general information for ICT-CLC, Part 2 - problems and obstacles in services, and Part 3 - best practices and needs.
2) Evaluation questionnaire for the centers' training course for participants.
3) Strategic plan for strengthening the 2 centers which involved activities from training to practice.

5.3 Data collection

1. The researcher gathered data about the problems, needs, and some administration issues in the Thai Community ICT Learning Centers. Three centers in the central regions of Thailand (small, medium, big) were studied.
2. The researcher gathered data from the 3 centers about their best practices, problems, and needs, and some administration issues in the ICT Community Learning Centers.
3. The training course was arranged for 15 participants by the researcher. This training focused on the knowledge and practice potential enhancing plans to improve the ICT Learning Centers. The training courses were evaluated by the researcher.
4. The activities of the strategic plans were implemented on the remote area.
5. Strategic plans and operation for strengthening two ICT-CTC were launched at the center namely, Khemasampun and Donpingdad in Petchaburi Provinces.
6. The community participation were followed up and evaluated using five steps.

   Step 1 Study of local wisdom

   Step 2 Knowledge capture of the center

   Step 3 Follow up and monitoring

   Step 4 Media production for communication

   Step 5 Evaluation

7. Model revision of KM in local wisdom to strengthen for ICT Community Learning Centers
8. Modify and test the model of KM in local wisdom
9. Conclusion and report writing

.

5.4 Data analysis

Data were analyzed using SPSS for windows. Descriptive statistics such as means, standard deviation, and percentage were used. Qualitative data analysis using thematic approach and photo and video recording analysis were employed.

IECT 2014

6. Research findings

Part 1 The basic information and practices of ICT-CLC about local wisdom

Most of the problems and obstacles of three ICT-CLCs were found at moderate and high levels in terms of personnels (3.51), infrastructure and ICT facilities (3.27), and administration (3.22) which could be divided into the following issues:

1. **Training.** The problems were at a moderate level (2.99). The training service for community was not conducted regularly. The training curriculum was not formulated in the beginning so the training program was not sustained.
2. **Administration.** This problem was at a moderate level (3.22). There were no the reports to community, no operation plan or prior plan for activities, and sometimes, the center closes the service.
3. **Equipment.** The problem in infrastructure and facilities was at a moderate level (3.27). The computer sets, especially in the small size centers, were not enough for services and training. Some buildings of centers lacked aircons.
4. **Location.** This problem was at a moderate level (2.30). The centers were far from the downtown and were difficult to reach. Some areas were located in the church and school. Some were located near internet cafés so users prefer to use the computers in these shops rather than in the center.
5. **Staff.** The problem involving center's staff was at a moderate level (3.51). This include the insufficient number of service staff who are knowledgable in using ICTs, and the number of nonpermanent staff and part-time staff.
6. **Networking.** The problem was at a moderate level (2.96) in terms of lack of human networking, no connection in the centers, and ICT issues in government offices.
7. **People participation.** This problem was at a moderate level (3.30). The people in community did not see the significance of the ICT-CLC.

Part 2 The strategic plan for strengthening ICT-CLC

The strategic plan was developed based from the survey data gathered from the ICT Community Learning Centers. In general, this included 2 strategies.

2.1 Opportunities to increase capacity and enhance the learning standard of people with electronic media (e-Learning).

1. Making policy to promote media creation for learning community plan

Planning	Project/Activity	Output/Indicator
1. Making policy to promote media creation for learning the community plan	1. The workshop training for video on demand in local wisdom documentary project 2. The development of local wisdom database for continuing the learning project	1. Satisfaction of trainee 2. Efficiency of local wisdom database

IETC 2014

2. Promotion of staff & volunteers to develop & use electronic media (e-Content) to continue community learning plan	1. The organization of ICT knowledge bank	1. Efficiency of organization of ICT knowledge bank 2. Satisfaction of customer services in organization of ICT knowledge bank
3. Promotion & cooperation of public & private sector to e-Contents co-creation for community learning plan	1. The development of e-Learning media to increase capacity in agro-industry project 2. The development of e-Training in the occupations course for the people project	1. Efficiency of e-Learning media & e-Training 2. Satisfaction on e-Learning media & e-Training

IETC 2014

2. Development of the quality of life, community, environment, and national stability strategy.

Planning	Project/Activity	Output/Indicators
1. Enhancing the stability of economy and occupations for people plan	1. The ICT based learning & sharing for wealthy project 2. The promotion of leadership & administration project 3. The promotion of local wisdom & occupations for the people project	1. Percentage of occupations & employment 2. Percentage of increasing benefit for people 3. Value of overall economy
2. Developing the quality of life, community, healthy, and security in life and property plan	1. The enhancement of ICT knowledge for quality of life project 2. The knowledge enhancement of community network for quality of life development project 3. The promotion of alternative energy use & production project	1. Percentage of ICT use via community network system 2. Percentage of happiness in people & community 3. Number of alternative energy use & production in household
3. Conservation of Thai identity for ASEAN community plan	1. The promotion of knowledge conservation for historic and cultural purposes in 4 regions of Thailand project 2. The promotion of basic English language skills project 3. The promotion of learning for culture in ASEAN community project	1. Percentage of people knowledgeable in Thai history 2. Percentage of people with basic English language skills 3. Percentage of people with of culture in ASEAN community

2.2 The evaluation of strategic plan

Findings of the focus group discussion in the Strategic Plan for strengthening ICT-CLC Capability revealed 6 issues. These were as follows:

1. The suitability of the strategic plan for strengthening ITC-CLC

The suitability of the plan was at a high level. It can be used in the training course with the objectives matching their size. The consideration for the strategic plan focused on the motivation to participate in the center, develop the structure of the center organization, and the training curriculum compatible with ICT skills.

2. The suitability of work plan and activities of ICT-CLC

The center activities should be planned with emphasis on computer skills, specifically on using the internet in their daily lives and on the identities of the community.

3. The suitability of the project under the workplan of ICT-CLC

The plan should be used after the community recognition of the significance of the center. This could inform the people, motivate, and encourage them participate in the activities. Available media in the village may be used to match their needs.

4. The suitability of the product and index under ICT-CLC

The product showed in the plan maintained the ICT application to the basic IT literacy and devices, develop the website and simple computer software for community use.

5. The suitability of the financial requirements under project of ICT-CLC

The budgetary requirement of the project need not be equally distributed but should depend on the level of the project significance. Some projects were capable of requesting financial support from the ICT Ministry.

6. The opinion and suggestion toward the strategy

The priority of the plan should train the staff and provide assistance to develop some media in the internet. This could support the people to learn more about their knowledge wisdoms and the ways to apply the web for major occupation development. This may also be good for outsiders to learn about the products and services of the community.

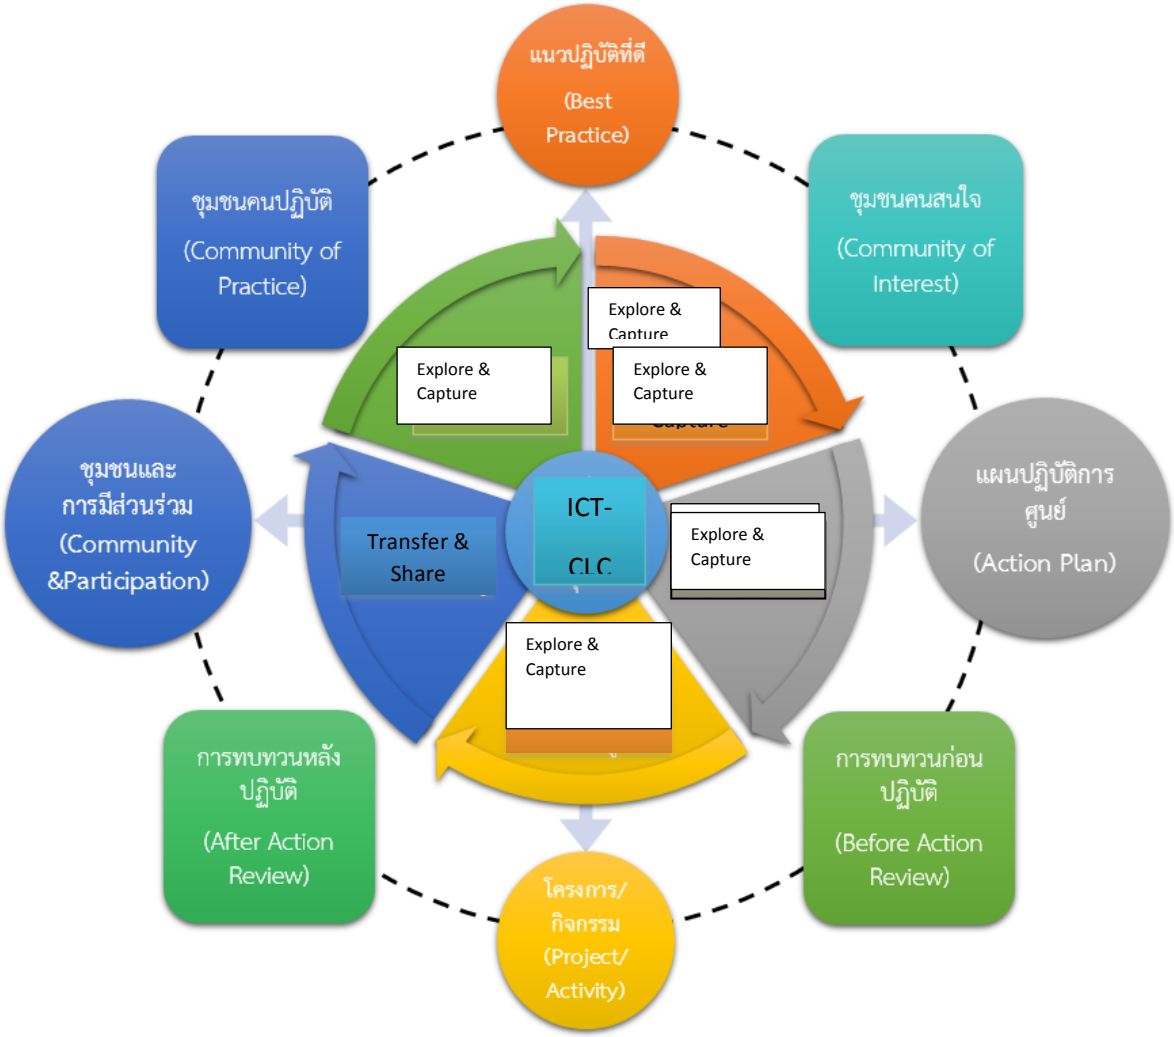
The ICT-CLC committee and staff worked as volunteers so they need to have compassion for the community. In order to uplift their morale more, their sacrifices must be recognized may be by MICT.

The network collaboration among the nearby ICT-CLC should be included in the plan in terms of exchanging the knowledge and products of each community. The electronic commerce may be developed and worked out together by the community members, involving the private sectors.

In conclusion, the following strategies can be used as suggested by the experts:

1. The recognition strategy or the paradigm shift on how to use ICT in ICT-CLC focusing on knowledge access and sharing. The operation plan would not only be used just as "the Internet Café".
2. The participatory strategy of the community to emphasize the perception, accessibility and participation in the center development such as center management structure and people services through the various communication.
3. The enhancing potential strategy for center staff and people in the community.

Part 3 The evaluation of the action plan



Findings in the implementation of strategic plan revealed that the suitability of the plan was at a high level (4.11). The assessment of the ICT-CLC involving the plan also found that the community participated in local wisdom collection with the team and bring about the indigenous knowledge to construct the online media on two websites: http:// donpingdad.ictlearningcenter.org and http://khemasampun.ictlearningcenter.org.

The Local Wisdom Knowledge Management Model in strengthening ICT-CLC was tried out and tested. The result showed a good level. This implies that it could be applied in the other centers. The target center staff had the skills and the ability to workout (4.57), and could bring about the knowledge to utilize with the network.

Part 4 The evaluation of the KM Model for strengthening ICT-CLC

The output of the model was modified after the researcher implemented the strategic plan and the experts' verification. The evaluation showed that the KM Model for strengthening ICT-CLC has high efficiency level for use in other centers. The final KM 5-Step Model was verified as follows:

7. Discussion and conclusion

The investigation of the practice of the ICT-CLC in small, medium, and big – size centers in the central regions of Thailand showed that there were some aspects in the training, management, equipment, location, personnel resources, human network, and participation that are required to improve and strengthen the service potentials. These finding bring about the strategic planning by the researcher and the target centers in the remote area in the lower central region of Thailand. The strategic plan had been implement at 2 centers in Petchaburi Province.

The strategic plan implementation showed that the center and staff were satisfied. They could use the knowledge gained from the training program to develop their website and use in disseminating their local wisdom to the community and outsiders, as well. They could share their capabilities by using ICT knowledge under the strategic plans. This may come from the outcome of strengthening the potentials of the center administrator and staff with the participation of the people of the community.

This research recommends the following: 1) the administrator should have a policy on public relation about the center services in collaboration with other centers as networks; 2) the administrator of ICT-CLC should plan the budget for the long-term activities to implement the program effectively. They should be open for other sectors to participate in the projects, especially the private sector; 3) the center administrator should prepare the operation plan for the important project in ICT teaching and learning of the community; 4) the development of the internet infrastructure and the stability of the network by continually providing service facilities; 5) the center staff should develop their knowledge management for

local wisdom, improve their online learning media production techniques, show compassion, and strengthen the service for the center care officer, and upgrade the capability in equipment services from time to time.

8. Author acknowledgements

The authors would like to acknowledge the Kasetsart University Research and Development Institute for the research grant and the Kasetsart University Department of Educational Technology for the facilities and equipment used in this research.

The development model of learning though virtual learning environments (VLEs) for graduated students, department of educational technology, faculty of education, Kasetsart University

Assist. Prof. Dr. Sunchai PATTANASITH, Dr. Nattaphon RAMPAI,
Assoc. Prof. Jongkol KANPERM 131
Department of Educational Technology, Faculty of Education, Kasetsart University, Thailand

Abstract

This research aims to develop the model of learning though Virtual Learning Environments (VLEs) for graduated students that study in Department of Educational Technology, Faculty of Education, Kasetsart University which divide into two stages: the first stage is to study the appropriate model of learning though Virtual Learning Environments (VLEs) and the second stage is to develop the model of learning though Virtual Learning Environments (VLEs) for graduated students. The participants are master degree students (regular and special program) that study in Department of Educational Technology in 2014 academic year and divide into 2 groups (control and experimental group). Research tools are: analysis and synthesis data form, student's satisfaction questionnaire, self-directed learning skill measurement. Data are analyze by Arithmetic mean, Standard Deviation (S.D.) and T-test.

Research finding show that the model of learning though Virtual Learning Environments (VLEs) for graduated students that study in Department of Educational Technology are include the 4 main elements: 1) Learner, 2) Collaborative Learning, 3) Self-Directed Learning skill, and 4) Online Learning Environment. Finally, in the first stage show the appropriated model which is the "Prototype" that can be develop into the system of Virtual Learning Environments (VLEs) in the next stage.

Keywords: Virtual Learning Environments (VLEs), Self-Directed Learning skill, Graduated student

Chapter 15 Nomenclature

A	Virtual Learning Environments (VLEs)
B	Self-Directed Learning skill
C	Graduated student

1. *Introduction*

The graduated student quality is the needs factor to student achievement development. Quality ongoing professional development contributes to student growth and success. The student's learning style has been changed: from Gen. X to Gen. Y and to Gen Z. The quality content and resources that are available to teachers from any place and any time, and the diversity channel of learning that can help student to get their knowledgethat can deliver relevant, accessible, and ongoing support has stimulated the development of online teacher professional development programs. The limited learning environment to let student to get opportunity to exchange and share knowledge is decreased between them in real situations. Online teacher professional development programs make it possible for educators to communicate, share knowledge and resources, and reflect via asynchronous interactions. Online learning courseware and Virtual world programs can make it possible for student to learn has no limit and to communicate, share knowledge and resources. Moreover, Dabner (2011) suggest that the many current ICT-supported reform

IETC 2014

efforts demand teachers to assume the role of epistemic facilitator of knowledge construction supported by technology. In addition, Davis et al. (2011) explored the characteristics of such technology training programs were discussed to help students learn how to use technologies as instructional tools to enhance their teaching and students` learning. The condition of education in Thailand today still has several problems. Especially, the quality of learners seems shortages (Secretariat of the Council of Education, 2010: 53). Along with the lack of pedagogy skills that is not match in the actual practical needs for higher education. Particularly, the lack of the self-directed learning skill of graduate students to use that knowledge management let the opportunity to exchange and share knowledge is decreased between them and focuses on the upstream of training from real situations process furthermore, Lee, et al (2010) have suggests that the common difficulties and limitations regarding the implementation of knowledge management into classrooms cultures. In addition, Erkunt (2010) exhibited that students' collective inquiry relied on socially distributed cognitive resources that were generated by their social interactions in class and online using technology. The concept of social media that based on the appropriate tool and the medium to deliver knowledge, and helps learners can communicated with each other (Catherall, 2008) especially in teaching and learning using the potential of internet network to access with various sources of learning. The main purpose of this study is to research and develop activities to be appropriate with the learners that integrated with the concept of knowledge management and social media. The question then becomes, "How to develop the appropriate model of Learning though Virtual Learning Environments (VLEs) for Graduated Students, that study at Department of Educational Technology, Faculty of Education, Kasetsart University". More over the results of quality assessment of model that is body of knowledge to develop the learning skill of graduated students. In addition the results can be the information to support the higher education systems policy maker.

2. Objective

This research aims to study, develop, and evaluate the appropriated model of Learning though Virtual Learning Environments (VLEs) for Graduated Students, Department of Educational Technology, Faculty of Education, Kasetsart University.

3. The review of related literature

This research focus to review of related literature that divide into 5 main parts:

1. Educational Technology Department environment
2. Online learning (MOODLE-LMS Courseware)
3. The learning styles
4. The virtual world (virtual/ reality environment- Second Life)
5. The student's learning outcome

4. Methodology

The first phase focus to study the model of Learning though Virtual Learning Environments (VLEs) for Graduated Students.

1.1 Analyzing the elements of online learning are included the learning and teaching online learning activities management system (MOODLE).

IETC 2014

1.2 Analysing the elements of virtual learning environment are included the virtual environment tools and channels to learning and teaching (Second Life). The second phase: Developing the model of knowledge management via web-based learning to enhance graduate student's self-directed learning skill and assessment tools.

1.3 Integrating the elements of online learning and virtual learning environment (SL+MOODLE=SLOODLE) by the matrix analysis technique.

1.4 Studying the appropriate quality of model by the 3 experts in the educational technology and virtual learning environment field

The second phase go for develop system of Learning though Virtual Learning Environments (VLEs) for Graduated Students and assessment tools.

2.1 Developing the system of Learning though Virtual Learning Environments (VLEs) based on the model and quality evaluated by the 3 experts (educational technology and virtual leaning environment field).

2.2 Developing the student's learning outcome form by the 55-60 graduate students who study in first semester, 2014 for study the research tools quality (try-out methods). The third phase: Evaluating the model of knowledge management via social media to enhance graduate student's self-directed learning skill.

2.3 Studying the efficiency of system of Learning though Virtual Learning Environments (VLEs) for Graduated Students.

2.4 Preparing the all of research tools which using in the next phase.

The third phase is to evaluating the model of Learning though Virtual Learning Environments (VLEs) for Graduated Students.

3.1 Population and samples:

3.1.1 Population are the graduate students who study in second semester, 2014 academic year at Faculty of Education, Kasetsart University

3.1.2 Samples are 60 graduate students that collected by random sampling technique and learn with the system of Learning though Virtual Learning Environments (VLEs).

3.2 Research tools:

3.2.1 The model of Learning though Virtual Learning Environments (VLEs).

3.2.2 The graduated student's learning outcome form.

3.2.3 The graduated student's satisfaction form.

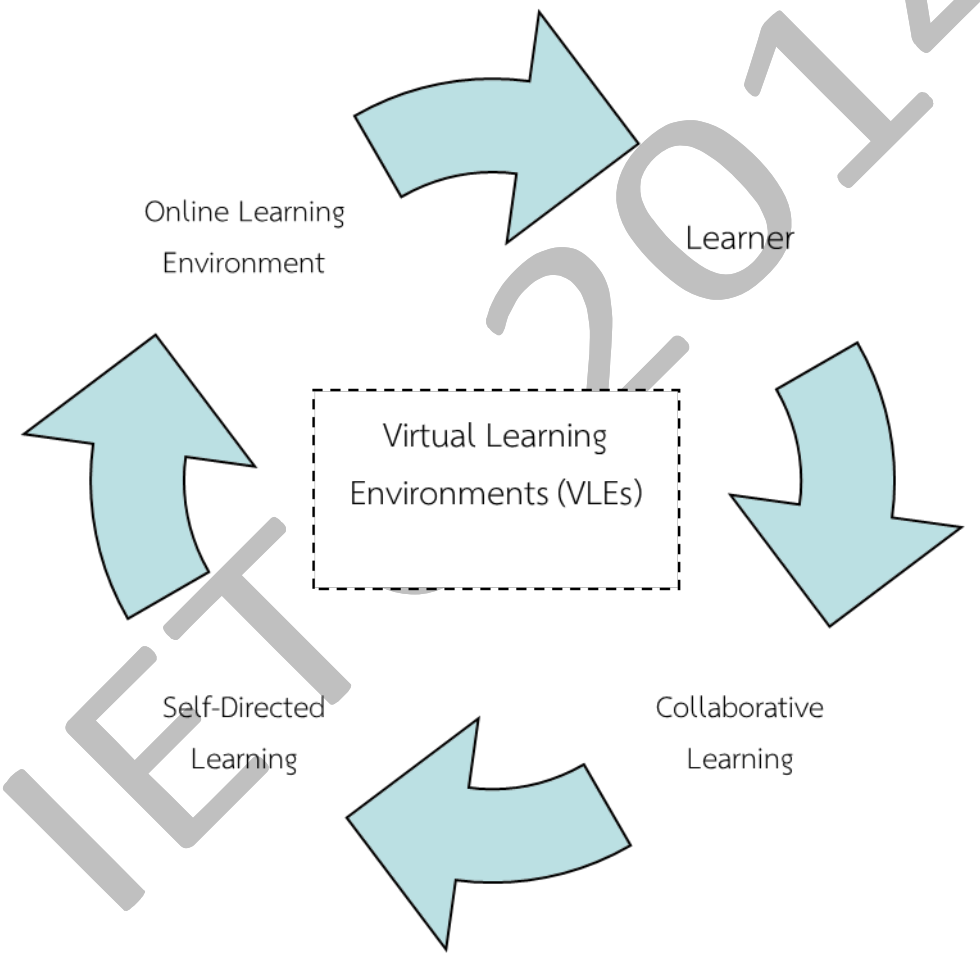
3.3 Data analysis:

3.1 Descriptive statistics (mean and S.D.) are used to describe the basic features of the qualitative data.

3.2 Qualitative data were analyzed by category group and issuing data technique.

5. Results

The model of Learning though Virtual Learning Environments (VLEs) for Graduated Students was appropriated with the criterion of quality, detail are as follow:



1.1 Learner who are graduated student with different learning styles (Kolb Learning Styles, 1984)

1.2 Collaborative Learning that approaching to learning and teaching online learning activities management system (MOODLE-LMS Courseware).

1.3 Self-Directed Learning that focus on the student's learning outcome including the Self-Directed Learning skill test and Attitude test (satisfaction).

1.4 Online Learning Environment including the elements of virtual learning environment especially in virtual environment tools and channels to learning and teaching (Second Life). Details see in fig-1

IETC 2014

IET 2014

Fig-1. Model of Learning though Virtual Learning Environments (VLEs) for Graduated Students

6. Conclusions

The result of research in the first phase showed that the Model of Learning though Virtual Learning Environments (VLEs) for Graduated Students was appropriated and fit to the quality of educational media, this is because;

1. Online learning skills development is an emerging trend it is still a "new frontier". Educators around the world experience many demands on their knowledge, time, and professional development.
2. Developing and sustaining an effective online learning community can be challenging even in the midst of an era of much technological advancement.
3. The online learning technologies have the potential to transform the professional development of students; penetrate cultural, discipline, and other barriers; bring educators together to learn, share successes and challenges; and co-construct and transfer learning.
4. The results of the training and simulation program have led to significantly improved grades on students' critical skills tests, taking scores from a 56% success in 2007, to 95% at the end of 2008 after the simulation was instituted.

7. Acknowledgements

This research was funded by Educational Technology Department, Faculty of Education, and The Research & Development Institute, Kasetsart University, Thailand.

Abstract
The impact of computers on children is seen as visual and audial. Visual effects on the screen is made by shapes and writings. Each new image on the screen carries a novelty for the child. Thus they act as a stimulator. Children, keeping up with the flow of information on the screen constantly intensify their attention and have to be warned in each new screenshot. Computer training lets the children learn through the play. Also it's an attractive tool for the children (Arıcı ve Demir, 2009). By reviewing the literature it can be said that small children can learn faster by the help of computer-assisted education. Therefore this study's purpose is to prepare a computer-assisted training programme to teach colors, numbers and shapes names in English to 60-72 months children who do not have any foreign language education and also do not know anything about foreign language. This study also aims to examine the impact of the prepared programme on the acquisition of basic foreign language concepts. The computer aided education programme includes basic English concepts like colors, numbers and shapes. A further objective of the study is to arouse curiosity of the children to different languages and to improve the children's awareness to other languages. 160 children participated in the research. "Color, Number, Shape Names English Evaluation Form" used to examine the children's knowledge about the color, number, shapes names in English before the programme and after the programme. As a result of the analysis, the developed computer-assisted training programme in English (color-number-shape) has been found effective in teaching English names of colors, numbers and shapes to the children who doesn't have any prior English knowledge.

Keywords: Computer aided language learning, english basic concepts,

1. Introduction

Last improvements in the education technologies necessitate implementation of modern approaches such as learner autonomy in foreign language learning and teaching fields (Can, 2012). Fast, scientific and technologic developments in information era create new possibilities for educational practices by increasing flexibility in education. Accordingly, computer which is the most prevelant technological tool used in education field turns to be a necessity rather than a luxury (Kozikoğlu, 2013). Computer, with its importance for both social life and education practices, differs from traditional educational apprehension by representing an alternative which addresses diverse senses. Taking advantage of information technologies for increasing efficiency in language teaching and offering different solutions to students is crucial for our country's problematic foreign language education which is far beyond desired success (Kozikoğlu,2013).

Effect of computers on children can be observed as visual and auditory. Visual effect is formed by the shapes and writings on the screen. Every new image on the screen is a new experience for the child. That is why it is a stimulator at the same time. Child has to focus his/her attention on information flow constantly and be stimulated by each new screen image. Computer aided education enables child learn through play. It is also an interesting tool for child (Arıcı & Demir, 2009).

IETC 2014

Computer aided education method, whose effect on academic success is being studied, can be used successfully with many learning methods (Tomakin &Yeşilyurt,2013). Then, it would be inevitable to make use of computer for teaching children in preschool period which is the most rapid development period. Computer has many benefits such as representing different alternatives and materials in language learning, adjusting in line with student's learning speed, individualization of the teaching, enabling student to have selfcontrol in the process, promoting the motivation, increasing student's success and making education interesting (Kozikoğlu,2013).

Effect of computers on children can be observed as visual and audio. Visual effect is formed by the shapes and writings on the screen. Every new image on the screen is a new experience. That's why it is a stimulator at the same time. Child has to focus his/her attention on information flow constantly and be stimulated by each new screen image. Computer aided education enables child learn through play. It is also an interesting tool for child. Child gets different shapes and results by using different buttons and by changing images on the screen. For example, finding out two same shapes among many options and placing one shape into another are perceived as play by children whereas they are actually learning to distinguish different geometric shapes (Arıcı & Demir, 2009).

Foreign language teaching is a long term and consistent phenomenon which has impact on child's brain development. Computer aided education (CAE) not only creates fast and high level interaction but also enables students learn foreign language in a shorter time period. CAE is an interdisciplinary field CAE is used in the fields such as foreign language teaching, second language acquisition, linguistics, semantics as well as in researches about teaching listening, speaking, reading and writing skills (Tomakin & Yeşilyurt, 2013). A meta-analysis study conducted by Nicholas Vernadakis, Andreas Avgerinos, Efi Tsitskari and Evridiki Zachopoulou (2005) found out that computer is more accessible for children and they can learn faster because of the fact that children learn better with images and sounds. McCarrick and Xiaoming (2007) claimed that playing with computer increases child's social, cognitive, language developments and their motivations as opposed to general assumption that computer disrupts the communication. In Demir's (2007) research that compared traditional and computer aided education for three and four years old children, it was found that children who had computer aided education are more successful in acquisition of color concept. Kaçar and Doğan (2007) also put forward that, in a sample of 6 years old children attending preschool institutions, the children who had computer aided education are more successful in acquisition of number and shape concepts compared to those had general education methods. Moreover, the opinions of the participants' families were also evaluated. According to all of the families, computer aided education is necessary in preschool period.

Clements (2002) claimed that children's interaction with computer in the early period improves their critical thinking, problem solving and decision making skills. When related literature was examined, on the basis of previous researches on computer aided education and researches supporting the results related to importance of language education, it would be put forward that young children experience rapid learning with computer aided education and early introduction to foreign language education improves children's cognitive development and awareness. For this reason, the aim of this study is to create a computer aided education program that would teach the concepts of color, number, shape in English to 60-72 month old children who are not aware of another language and did not have any foreign language education previously, and to analyze the program's effect on children's foreign language learning.

Problem : Is computer aided foreign language education program effective on preschool children's acquisition of color, number, shape concepts in English?

2. Material and method

2.1. Population and sampling

In Anatolian side of İstanbul province, Fikirtepe and Yenisahra districts in which low income families reside were chosen as sampling of the research. One school was chosen from each district by purposeful sampling method. After interviews with school manager and educators about children's economic conditions, it was confirmed that parents are from low socioeconomic status, All of the children from three different kindergartens in these two schools participated in the research. In total, 160 children participated in the research, 78 (48,8%) of the participants are girls whereas 82 (51,2%) are boys. The participants have an age mean of 5.68 years with standard deviation of 0.46. There is no computer in the classrooms of children. 134 of children have computers at home whereas 26 of them do not. When looking at the number of children in the families, it was found that 53 (33,1%) of children have one, 56 (35%) of them have two, 41 (25,6%) of them have three, 7 (4,4%) of them have four, 3 (1,9%) of them have five siblings. When looking at the education levels of the parents, it was found that 65 (40,6%) mothers are primary school and 21 (13,1%) mothers are high school graduates, 51 (31,9%) mothers have university and 23 (14,4%) mothers have master degrees. On the other hand, 58 (36,3%) fathers are primary school and 29 (18,1%) fathers are high school graduates, 59 (36,9%) fathers have university and 14 (8,7%) fathers have master degrees.

2.2. Data collection tools

English Instrument for Color, Number and Shape Concepts : Instrument for color, number and shape concepts designed by Dağal, Balat, Kamburoğlu and Şallı was used in the research. The instrument consists of 27 items. 10 items test color, 10 items test number and 7 items test shape concepts' names in English. Assessment is done as "1" for correct answers and "0" for incorrect answers. Total score or each concept group can be evaluated separately. This research is based on total score.

Information Form: It includes questions regarding children's gender, date of birth, number of children in the family and education levels of the parents.

Education Program of Color, Number and Shape Concepts in English in the Computer: Four different programs were designed to teach children color, number and shape concepts in English. Firstly, colors, numbers and shapes were introduced in each part of the program. Afterwards, students listened the songs about the concepts. Then, they practiced color, number and shape concepts in the computer. At the second week, children played computer games, designed by researchers, about color, number and shape concepts taught previous week. Different pictures in the Adobe Flash program were used to depict the 27 different concepts. Program gives the child chance to repeat with a feedback that has an appropriate voiceover. Child can repeat as much as he/she desires. Within Community Service course, the undergraduate students contributed to the current study in part of the pre implementation regarding evaluation of the program with children. The program aims to teach these concepts: colors; red, yellow, blue, green, orange, purple, brown, black, white, pink, numbers; 1-10 and shapes; circle, triangle, square, rectangle, heart, star, ellipse.

Data Collection Procedure: Implementation of the research lasted ten weeks. In the first week, researchers got acquainted with the children and implemented **'English Instrument for Color, Number and Shape Concepts'** individually. Researchers carried out all the evaluations, program development and implementation with Community Service course students. Beginning from the second week, the program was introduced to children and the first program was put into practice. Four laptop mice that will be used in the study with children were introduced and children were allowed to use them freely. All program implementations were carried out individually with each child and it took between 15 and 20 minutes on average for children to use the program. Educator made child watch the program, made him/her repeat when needed and repeated the question on the screen at the last part of the program when it was necessary. Child tried to find correct answer by clicking with mouse and was given feedback with phrases such as "You did fine, very well" for correct answers. Four different programs were implemented for eight weeks. The program used in the first week was implemented in the second week by redesigning it to use only questions. Four week program was designed in a way that each week will be repeated with the questions next week. **English Instrument for Color, Number and Shape Concepts** was re-implemented with children as post-test at the last week.

IETC 2014

3. Findings

The findings about the development of english computer aided education program for acquisition of color, number and shape concepts in preschool children without foreign language education background presented below.

Table 1. Arithmetic mean and standard deviation results of participants' scores regarding pretest and posttest of English color, number, shape concepts

N=160	X	Ss	Sh
Pretest	10,67	5,96	0,47
Posttest	22,72	4,30	0,34

Table 2. T-test analysis of participants' pretest and posttest scores regarding English color, number, shape concepts

	x	Ss	Sh	t	df	p
pretest- posttest	-1,21	6,10	0,48	-24,972	159	0,000

It was found that there is a significant difference between the pretest and posttest scores of children in the English color, number, and shape concepts. (p<.05).

Table 3. Arithmetic mean and standard deviation results of participants' pretest and posttest scores in English color concept

N=160	X	Ss	Sh
Pretest	4,09	2,66	,21
Posttest	8,88	1,77	,14

Table 4. T-test analysis of children's pretest and posttest scores in English color concept

	x	Ss	Sh	t	df	p
pretest- posttest	-4,78	2,90	0,23	-20,932	159	0,000

It was found that there is a meaningful difference between children's pretest and posttest scores in English color concept (p<.05).

Table 5. Arithmetic mean and standard deviation results of participants' pretest and posttest scores in English number concept

N=160	X	Ss	Sh
Pretest	4,69	3,32	,26
Posttest	9,11	1,65	,130

Table 6. T-test analysis of participants' pretest and posttest scores in English number concept

	x	Ss	Sh	t	df	p
pretest- posttest	-4,42	3,26	0,26	-17,153	159	0,000

It was found that there is a meaningful difference between children's pretest and posttest scores in English number concept (p<.05).

Table 7. Arithmetic mean and standard deviation results of participants' pretest and posttest scores in English shape concept

N=160	X	Ss	Sh
Pretest	1,89	1,65	,13
Posttest	4,72	1,83	,14

Table 8. T-test analysis of participants' pretest and posttest scores in English shape concept

	x	Ss	Sh	t	df	p
pretest- posttest	-2,84	2,29	0,18	-15,692	159	0,000

It was found that there is a meaningful difference between the children's pretest and posttest scores in English shape concept (p<.05).

IETC2014

Table 9. Arithmetic mean and standard deviation results of participants' pretest and posttest scores in English color, number and shape concept

		X	Ss	Sh
Girls	Pretest	4,36	2,44	0,28
	Posttest	9,14	1.46	0,16
Boys	Pretest	10,24	6,46	0,71
	Posttest	21,80	4,80	0,83

Table 10. T-test analysis of participants' pretest and posttest scores in English color, number, shape concept

		x	Ss	Sh	t	df	p
Girls	pretest- post-test	-4,78	2,73	0,31	-15,424	77	,000
Boys	pretest- post-test	-1,156	6,42	0,70	-16,293	81	,000

Children's pretest and posttest scores in English color, number and shape concepts were analyzed in terms of gender and it was found that there is a meaningful difference between pretest-posttest scores of boys and girls (p<.05).

Table 11. Arithmetic mean results of the participants' pretest-posttest scores in terms of their mothers' level of education

Mother's level of education	N	Mean score of pretest	Mean score of posttest
Primary School	65	8,7231	21,8308
High School	23	12,0476	22,8095
Undergraduate	21	12,5686	23,1765
Graduate	51	10,7391	24,1739

Table 12. Variance analysis of participants' pretest-posttest scores in terms of their mothers' level of education

	Source of variance	Kt	Sd	KO	F	p
Pretest	Between groups	470,188	3	156,729	4,723	,003
	Within groups	5176,912	156	33,185		
	Total	5647,100	159			
Posttest	Between groups	110,807	3	36,936	2,035	,111
	Within groups	2831,093	156	18,148		
	Total	2941,900	159			

The children's mean scores regarding English color, number, shape concepts were analyzed in terms of their mothers' level of education and it was found that there is a meaningful difference (p<.05) in the pre-test scores, whereas there is no a meaningful difference (p>.05) in the posttest scores in terms of their mothers' level of education. When children's mean scores were analyzed in terms of their mothers' level of education, it was found that the children of mothers with undergraduate and high school degree have higher scores in the pretest. In general, absence of a meaningful difference between posttest scores can be interpreted as computer aided education program removes the difference which is the result of mothers' different level of education, in other words it is an indication of the positive effect of the program.

Scheffe test was used because of the fact that there is a meaningful difference in the pretest results. Analysis of Scheffe test is presented in the Table 13.

Table 13. Scheffe Test for participants' pretest scores in terms of their mothers' level of education

		Mean differ-ence	Standard devia-tion	Sig.
Primary school	High school	-3,32454	1,44596	,157

	High school	-1,30849	1,73870	,904
	Undergraduate	-1,82950	1,44690	,660

Children's mean scores of English color, number and shape concepts in terms of their mothers' level of education were examined with scheffe test according to variance test result. It was found that there is a difference between the pretest scores of children of mothers with primary school degree and children of mothers with undergraduate degree. The difference is in favor of children of mothers with undergraduate degree.

Table 14. Arithmetic mean results of participants' pretest-posttest scores in terms of their fathers' level of education

Father's level of education	N	Mean score of pretest	Mean score of posttest
Primary School	58	7,9828	21,8621
High School	29	14,3448	22,7586
Undergraduate	59	11,6102	23,1017
Graduate	13	10,6923	24,6923

Table 15. Variance analysis of participants' pretest-posttest scores in terms of their fathers' level of education

	Source of variance	Kt	Sd	KO	F	p
Pretest	Between groups	862,354	3	287,451	9,375	,000
	Within groups	4752,338	155	30,660		
	Total	5614,692	158			
Posttest	Between groups	101,898	3	33,966	1,855	,140
	Within groups	2838,366	155	18,312		
	Total	2940,264	158			

Participants' mean scores of English color, number, shape concepts in terms of their fathers' level of education were analyzed and it was found that there is a meaningful difference ($p<.05$) in the pretest scores, whereas there is no a meaningful difference ($p>.05$) in the posttest scores related to fathers' level of education. When children's mean scores were analyzed in terms of their fathers' level of education, it was found that children of fathers with high school degree have higher scores in the pretest. Absence of a meaningful difference between posttest scores of children in terms of their fathers' level of education can be interpreted as a success of computer aided education program. The difference between posttest scores in terms of mothers' level of education was not meaningful in the same way.

Table 16: Scheffe Test for participants' pretest scores in terms of their fathers' level of education

		Mean difference	Standard deviation	Sig.
Primary school	High school	-6,36207*	1,25932	,000
	Undergraduate	-3,62741*	1,02386	,007

	High school	-3,62741*	1,02386	,007
	Undergraduate	-2,70955	1,69915	,470

Children's mean scores for English color, number, and shape concepts in terms of their fathers' level of education were examined with scheffe test according to variance test result. It was found that there is difference between the pretest scores of children of fathers with primary school degree and children of

IETC2014

fathers with high school degree. The difference is in favor of children of fathers with high school degree. It cannot be made any evaluation for the comparisons of other groups due to absence of difference.

4. Discussion and suggestions

Computer increasingly takes place in lives of children. In the region where the research took place, most of the children have a computer in their homes despite the fact that they are not aware of existence of another language. Keeping this in mind, the aim of this study was to design an English computer aided education program that would teach concepts of color, number, shape in English to 60-72 month old children who are not aware of existence of another language and did not have foreign language education previously, as well as to analyze its effect on children's foreign language learning. Results of the research show that computer aided foreign language education program has an effect on children who did not have foreign language education previously.

In Chude and Miksad's (1997) research, children aged from 2 years 10 months to 5 years 0 month were given computer aided education. Then, computer aided education was compared with traditional education and it was found that level of cognitive development of children who participated to computer aided education improved more. In Schetz's (1989) research done with 22 students that were not good at concepts, articulation and language, training was given to children about amount, quality, time/sequencing, names and verbs through computer aided education. According to their teacher's opinions, there was 41% improvement in the performances of the students.

Peng, Wah and Ishak's (2009) research results also put forward that computer aided education has huge impact on young children's literacy education.

In the computer aided education program used in this research, games also took place for English word teaching. Likewise, Chuang and Chen's (2007) research indicated that video games increased 3rd grade students' cognitive development.

It is seen in the literature that computer aided education is used in many education models. In general, every computer aided education program is found to be more effective than other education programs. Although computer is usually used in the foreign language education, researches about foreign language education with computer aided education were not found in the literature. It is known that foreign language education in young ages is very important and learning with computer aided education is faster. In this context, frequent use of computer aided education program in foreign language education, making research about effectiveness of computer programs which are being already used in foreign language education or being designed for the same purpose, contributing to the literature through designing new and advanced programs can be suggested as the results of this study.

The effect of computer aided education program on the development of concept in 48-60 months children

Gülden U. Balat[a] Asude B. Dağal[b], Volkan Kanburoğlu[c] 133
[a,b,c]*Marmara University Ataturk Education Faculty Preschool Education Department, Goztepe Campus, İstanbul/Turkey*

Abstract

Children gain the most important basic concepts which help them understand and know about life, during preschool education. According to Manocha and Narang (2004) "concepts" are the basic units of all types of learning. Human beings from the infancy to old age learn new concepts and use old concepts in new situations of their daily life. Individuals differ in their level of concept formation depending on their age, intelligence and experience.
The aim of the present study was to examine the effectiveness of the computer aided education (CAE) in making 48-60 months children who attend preschool education institutions to gain the concept of "position in space". 109 children, who were 48-60 months of age and who attended four different classes in two different primary schools in Istanbul, have participated to the study. In the study, a pre-test post-test control group design was used. Computer-aided education training program for teaching the concepts of position in space prepared by Uyanık Balat and Kanburoğlu (2009) was applied individually to each child in the study. To measure the development of concepts of position in space, BOEHM Test of Basic Concept (BOEHM-3) was applied to both groups before and after the computer-aided education program.
The study revealed significant difference between the pre-test and post-test scores for both of the experimental and control groups. The difference between the post-test scores of the experimental and control group are seen to be significant in favor of the experimental group. Accordingly it can be said that the computer aided education (CAE) is effective in making 48-60 months children to gain the concept of "position in space". Results are discussed in line of other related researches.

Keywords: Computer aided concept education, preschool, position in space concepts.

1. Introduction

In the preschool period, concept development of children is quite fast. Ministry of National Education's education program aims to develop the basic concepts of color, geometric shape, dimension, amount, direction, number/counting, sense, emotion, opposite concepts and time in children (MEB, 2013). Concept development of children aged 3-6 is considered to be an important indicator of both their language and cognitive development. Concept development is also crucial for children to identify and make sense of the world.

According to Üstün and Akman (2003), concept is an inner process symbolizing common feature of objects and events. This symbolization is generally done with a word or a noun. Therefore, children begin to learn the concepts when their abilities to regulate the perceptual stimulus improve. Even though concepts can be both concrete and abstract, children's concept development develops from concrete to abstract. According to Hougland (2000), children aged 3-4 years are developmentally ready to discover computer; therefore educators can create computer corners as learning corner. In the preschool and primary school period, a library created by appropriate software programs must be set up and making use of it should be encouraged.

Edwards (2005) mentioned that computers increasingly take place as teaching tools in preschool classes. Nonetheless, making use of computer in the class is a choice of the teacher because his/her competen-

IETC 2014

cy in computer is one of the most influential factors in integration of computers to their preschool class. According to Arı and Bayhan (1999), first point related to computer aided education that should be paid attention by educators is "programs".

Computers are very useful in accessing to and transferring information. However it does not seem possible for computers to completely change the instructor-learner model which is implemented successfully to date. In other words, computerization is going to make accessing to and transferring information easier but for active use it cannot replace the instructors. Information society needs individuals who access to information easily, use this information in an effective way and produce information at the same time. Educating such individuals required by information society can be possible only if education environments guided by educators capable of using information and communication technologies are created (Büyükduman, 2002). Computer aided education is a teaching method in which students interact through using programmed teaching materials on computers, learn through computer programs and evaluate themselves by keeping track of their own learning (Senemoğlu, 2009).

Varol (1997) put forward that using computer for education purposes has many benefits. Some of these benefits for preschool period children can be stated as:

- Computers provide students opportunity for interaction.
- Computers help to maintain the quality standards in teaching through package programs.
- Computers provide flexible teaching for each student's individual learning needs. By doing so, they eliminate learning differences due to students' different needs, capacity and perception. Students can repeat computer programs as many as they want.
- Computers enable learning to be fast and permanent by using equipment (multimedia) such as sound, animation, color and drawing.
- Computers can be used as an educational environment.
- Computers enable their users to develop personal practices and teaching materials through appropriate software programs.
- Computers motivate students for the topic they study.
- Computers reinforce students' knowledge.

Individual differences among preschool children are quite diverse. Reducing the differences among development levels of children can be aimed by making use of software programs appropriate for children's age and their developmental characteristics in classrooms as part of computer aided education.

Nowadays, information technology is used by children actively in a controlled or uncontrolled way. Computed aided education is a good example of using these technologies in a controlled way. Use of software programs created for sophisticated development of children under guidance of educators in a classroom environment should be become prevalent as one of the efficient use of information technology. There are not computer corners as learning center in Turkish public preschools. Computer aided education in preschool classrooms does not take place in the last preschool educational program of the ministry (MEB, 2013). When previously mentioned benefits of using computer in preschool classrooms are taken into consideration, it is clear that it can be benefited from using computer aided education programs in preschool education institutions. In the present study, it was aimed to examine the effectiveness of the computer aided education (CAE) in making 48-60 months children who attend preschool education institutions to gain the concepts of position in space.

2. Method

IETC 2014

Population and Sampling: Sample of the research was chosen from the public schools of Ministry of National Education on the Anatolian side of Istanbul city. All children of three different preschool classrooms in two schools were included and 109 children participated to the research. The participants have an age mean of 4,94 years with standard deviation of 0.32. 56 of the children were in the control group and 53 of them were in the experimental group. There were 30 (56,6%) girls and 23 (43,4%) boys in the experimental group while there were 29 (51,8%) girls and 27 (48,2%) boys in the control group. All of the children were 5 years old. When looking at the education levels of the parents in the experimental group, it was found that 5,7% of mothers are primary school and 49,1% of mothers are middle school graduates, 5,7% of mothers high school degrees, 34,0% of mothers university degrees and 5,7% mothers have masters degrees. On the other hand, 43,4 of fathers are middle school, 17% of fathers have high school, 35,8% of fathers have university degrees and 3,8% of fathers have masters degrees. When looking at the education levels of the parents in the control group, it was found that 7,1% of mothers are primary school and 17,9% of mothers are middle school graduates, 5,4% of mothers high school degrees, 42,9% of mothers university degrees and 26,8% mothers have masters degrees. On the other hand, 7,1% of fathers are primary,25,0% of fathers are middle school, 23,6% of fathers have high school, 50% of fathers have university degrees and 14,3% of fathers have masters degrees. When looking at the number of children in the families in experimental group, it was found that 7 (5,2%) of children haven't any siblings, 17 (12,6%) of them have one, 10 (7,4%) of them have three, 1 (0,7%) of them have four siblings. And also when looking at the number of children in control group, it was found that that 23 (41,1%) of children haven't any siblings, 25 (44,6%) of them have one, 8 (14,3%) of them have three siblings. Every child in the experimental group has computer at home while only one child in the control group does not have computer at home and 55 (98,2%) of them have computer at their home. In the experimental group, 23 (43,4%) children have a computer in their rooms whereas 30 (56,6%) children do not have one in their rooms. In the control group, 53 (94,6%) children have a computer in their rooms while 3 (5,4%) children do not have one in their rooms.

3. Data collection tools

Boehm Test of Basic Concept (BOEHM-3, 2000): The test was developed by Ann. E. Boehm and Boehm-3, 2000 revised version was used in this study (Boehm, 2001). The test can be applied to all children from preschool to primary school second grade (60-96 months). It consists of small booklets which include 50 basic concepts and aims to assess children's level of qualitative, spatial, quantitative concepts related to their language and cognitive development. During the attempts to translate the test into Turkish, the validity of E Form was found to be .002 and test repetition and test accuracy was found to be .879 (ICC); moreover, Croncbach Alfa was calculated as .862 and Spearman–Brown accuracy was calculated as .829 (Uyanık Balat, 2003; Uyanık Balat & Artan, 2004). To assess children in this study, "position in space" part of the test was used.

Information Form: In this form, there were questions related to parents' level of education, family's income level, children's gender, age and number of siblings, having or not a computer at home and in children's rooms.

Computer Aided Education Program for Teaching the Concepts of Position in Space: Three different programs, which are included in the BOEHM-3 test (2000) and created for teaching position in space concepts necessary for writing and reading skills of children, were developed in the study. Different pictures in Adobe Flash program presenting 25 different concepts were used. The program gives children chance to repeat as much as they want and give feedback with appropriate voice over. As part of their Community Service course, students whose names were provided below contributed to the present study by helping to develop the program, conducting pre-implementation to evaluate the program with children and implementing the program to children individually in the schools. The concepts aimed to be taught in the program are: top, middle, side, end, top right, corner, last, far, above, separated, sequential, next to, under, in front of, furthest, similar, over, back, top left, between, bottom, jump, forward, backward…

Data Collection Procedure: Implementation of the study took eight weeks. At the first week, the educators met with children and the first implementation was conducted by using BOEHM-3 test's parts related

to relevant concepts. In addition, the laptop mouse that will be used in the implementation was introduced to children and was provided to the children for their free use. All program implementations were conducted individually and children spent an average of 5-7 minutes in the program. Educators asked children the question related to the concept on the screen and wanted them to identify it. Children tried to find the correct concept by clicking the mouse and encouraged with voice and video responses of the computer such as "well done, very good, would you like to try again?". Examples are provided below. Three different programs were implemented throughout six weeks in which the first week's program was repeated at the fourth week, the second week's program was repeated at the fifth week and the third week's program was repeated at the sixth week. Post-test related to relevant concepts was implemented to the children at the last week.

4. Results

Findings related to the effectiveness of the computer aided education (CAE) in making 48-60 months children who attend preschool education institutions to gain the concept of "position in space" are represented in Table 1 to Table 4.

Table 1. Pre-test results related to comparisons of experimental and control groups' scores of position in space concept (BOEHM-3)

Group	X	N	S	t	sd	p
Experimental	,6875	53	,18828	-1,257	105,789	,212
Control	,7312	56	,17530			

As seen in Table 1, there is not a significant difference between the pre-test scores of children in the experimental group and those in the control group (t(105,789)=-1,257; p>0,05). Therefore, it can be stated that the experimental and control groups were equivalent in terms of their mean scores in concept of position in space before the study.

The mean scores of the position in space concept were calculated for children in both control and experimental groups. The comparisons between two groups' pre-test and post-test scores were calculated by using dependent t-test; the comparisons of two groups' post-tests scores were calculated by using independent t-test. Both results are presented in the tables below.

Pre-test and post-test mean scores of children in the control group were compared with dependent t-test and the results are represented in Table 2.

Table 2. T-test results related to comparison of pre-test and post-test scores of children in the control group for position in space concept (BOEHM-3)

Control	X	N	S	T	Sd	p
Pre-test	,7286	56	,17572	-8,725	55	,000
Post-test	,9550	56	,07076			

As seen in Table 2, there is a significant difference between the pre-test and post-test scores of children in the control group (t(55)=-8,725; p<0,01). This difference is in favor of post-test scores.

Due to the fact that the control group experienced a teaching process, an increase in the scores for the concepts of position in the favor of the post-test was expected.

Mean scores of the pre-test and post-test of children in the experimental group were compared with dependent t-test and the results are represented in Table 3.

Table 3. T-test results of comparisons between pre-test and post-test scores of the experimental group for the concept of position in space (BOEHM-3)

Experimental	X	N	S	T	Sd	p

IETC 2014

Pre-test	,6875	53	,18828	-12,217	52	,000
Post-test	,9879	53	,02429			

As seen in Table 3, a significant difference is observed between the pre-test and post-test scores of children in the experimental group (t(52)=-12,217; p<0,01). This difference is in favor of post-test scores. As in the control group, due to the fact that experimental group also experienced a teaching process but with computers, an increase in success and a significant difference in favor of post-test scores was expected.

Mean scores of the post-test of children in the experimental and control group were compared with independent t-test and the results are represented in Table 4.

Table 4 . T-test results of the comparisons between post-test scores of experimental and control groups for concept of position in space (BOEHM-3)

Group	X	N	S	T	Sd	p
Experimental	,9879	53	,02429	3,153	108	,002
Control	,9558	56	,07038			

As seen in Table 4, a significant difference is observed between the post-test scores of children in the experimental group and those in the control group (t(108)=3,153; p<0,01). Increase in the scores in favor of both experimental and control group is observed in the pre-test/post-test comparisons within the groups. This increase was expected due to the fact that both groups experienced a teaching process. Since determining effect of intervention to the experimental group is considered to be the main purpose of the study, independent t-test comparison results between groups have more importance. These results indicate an increase in favor of experimental group when mean scores of both groups after training were compared. In other words, computer aided education implemented to the experimental group enabled children to learn concepts of position in the space more successfully.

5. Discussion and suggestions

The present study aimed to examine the effectiveness of the computer aided education (CAE) in helping 48-60 month old preschooler gain the concept of "position in space". A pretest posttest control group design was used in the study. The study revealed significant differences between the pre-test and post-test scores for both experimental and control groups. An expected significant difference was found in the scores of concept of position in space for the control group who did not receive computer aided education of concepts but education of concepts of position in space. The post-test scores of the experimental and control group were significantly different with experimental group having higher scores. Accordingly it can be said that the computer aided education program for position in space is the indicator of the effect in children's concept development. Similarly, Aral and Bütün-Ayhan also examined the effectiveness of computer aided education on six year old children's concept development by using the programs available on the market. They found meaningful differences in children's concept of "position in space". Kaçar and Doğan (2007) compared general education and computer aided education methods in terms of their effects on the development of the concepts of numbers and shapes with six-year-old children and they found out that children who had computer aided education were more successful in concept development. Moreover, data gathered from the families of children in the study revealed that families whose children participated in the research supported that computer aided education in preschool period is useful for their children.

In addition to increasing children's successes, computer aided education helps higher level thinking skills which in turn enables them to learn by comprehending instead of memorizing (Renshaw & Taylor, 2000). Clements (2002) claims that the interaction of children with computer in early ages develop their critical thinking abilities, problem solving and decision making skills. In his research comparing the effectiveness of traditional and computer aided education in teaching children aged 3-4 the concept of color, Demir (2007) found out that children who had computer aided education were more successful in developing the concept of color.

IECT 2014

In conclusion, findings of the present study demonstrate that computer aided education can be utilized in the preschool education programs. Educators can be encouraged to utilize computer aided education based on children's age and development levels. Moreover, preschool practitioners should improve themselves in computer aided education and they should be able to maximize their use of education technologies.

Abstract

This study examined the effect of computer games on increasing speed, attention and consistency of students in learning mathematics. The population of the study comprised of all first year male students of public schools of district one of Urmia City in the academic year of 2012-2013. Using multi-stage cluster sampling, at the result, one class was selected randomly to form the experimental group and other class as the control group. Toulouse – Pieron. (1986) attention test and a test of speed, endurance and mathematics achievement tests was used to assess research variables. The results indicated that computer games had a significant effect on increasing the speed and attention of the experimental group in mathematical calculations compared to the control group; however, the effect of computer games on math learning and stability of math learning was not significant. Results suggest that computer games can be used as training aid alongside teacher training.

1. Introduction

Today, advances in science and technology influence our life style to a great extent. They have imposed numerous changes in all aspects of life. In the field of education, clearly a new generation of technological tools has been designed to transform the traditional methods of education and help students improve their learning. Most modern classrooms have computers giving an opportunity for teachers and professors who take advantage of ICT to enhance teaching and learning. The idea of using computers in education dates back to the late 1960s. Since then a number of different theories on the use of technology in learning environments have been proposed, and it has been attempted to use computer as a tool for educational and training purposes (long, 2007).

Computer games have become one of the most important entertainment tools for children, teenagers and even adults all around the globe. Allowing access to the virtual world with unlimited possibilities, computer games compulsively attract many people. In fact, they have become an integral part of human society. In other words, by providing virtual fun and entertaining environments (Demirbileka & lema Tamer, 2010), and having characteristics such as being interesting and exciting, computer games stimulate motivation and create a sense of enjoyment of learning. They not only have become one of the most significant recreations for all age groups, but also they have potentials to be used for educational purposes as a new strategy (Prensky, 2003; Tuzaun & et al., 2009; Grimley & et al., 2011, among many others). Therefore, video games can no longer be seen as mere entertainment tools. Today the positive effects of video games are emphasized more than ever. As Games have become a tool to communicate, teach, and influence attitudes and behavior, numerous studies have suggested that they have positive effects on problem

solving, achievement as well as creating interest and commitment in learning (Tuzaun & et al., 2009; Kim, Park, & baek, 2009). Therefore, it can be assumed that computer games are useful for learning purposes. Although researchers have found little evidence which supports this proposition, and some insist that video games are ineffective for learning purposes (Kreijns, Kirschner, & Jochems, 2003) and some other highlight the negative effects of exposure to the media, especially television, such as reduced cognitive performance in children and adolescents (Miller et al., 2007), but what is certain is that the beneficial effects of video games in learning cannot be simply denied; Despite the fact that designing and studying educational games is a multi-faceted process, there is a general agreement among teachers and educators on the effectiveness and usefulness of computer games in learning environments (Rastgar Pour, & Marashi, 2012).

Mathematics is an important subject in school education. The complexity of the act of thinking and learning as well as the relatively difficult and abstract nature of mathematics (Lowire, & Jorgensen, 2011) makes learning this subject more challenging in comparison to theoretical and empirical sciences. Researchers consider overreliance on traditional practices, absence of modern methods of teaching (Sadiq, 2007) lack of equipment and training aids, low cognitive stamina, and affective factors as the main reasons for academic failure and lack of motivation among students (Natasha et al., 2010). One of the best ways to generate interest and motivation among students is using computer games to improve the skills required for learning a subject. Computer games simulate similar-to-real-life situations and induce thinking and problem-solving, and through internal processes, help the learner successfully engage discovery in a new situation. Therefore, success in completing a task generates interest and inclination toward the subject (Kebritchi, 2010).Thus, the most effective way to help the development of these elements is designing situations that compel students to think and solve problems and as a result increase the attention and speed of learning. In this regard, Abrams. (2008) emphasizes that computer games are one of the most powerful motivational tools and an aid for learning mathematics. Similarly, Ke. (2008) argues that video games motivate students to learn math more effectively than pencil and paper methods. Therefore, we can say that educational computer games are a new method to create a suitable environment for active learning since not only will the students be able to learn materials with enjoyment and without fatigue, but also they will be able to understand abstract concepts well in an electronic environment (Çankaya & Karamete, 2009). Çankaya and Karamete. (2009) studied the effect of educational computer games on students' attitudes towards mathematics, and reported a positive attitude as the achievement of the study. Demirbileka and Tamer. (2010) aiming at developing a theoretical framework on the use of educational computer games in mathematics teaching, conducted a qualitative study and investigated the views of thirteen math teachers in Turkey and came to the conclusion that computer games have a significant positive effect on students' academic success. Grimley & et al. (2011) also studied the effect of video games on learning performance compared to the method of presentation, and concluded that students who have been trained in the use of computer games, experience increased emotional intelligence and higher alertness, are more active, have more participation, and develop a sense of competitiveness.

However, some researchers have pointed to the negative effects of computer games (Kronenberger et al., 2005; Miller et al., 2007, among many others). Kronenberger et al. (2005) for example, consider computer games as addictive and contributive to disorders such as attention deficit which undermines cognitive functions in children and adolescents and their solving skills. Considering that a review of the literature of the effect of computer games on mathematics learning brings to light contradicting and polar results, and considering the significance of learning mathematics as an academic subject, the present research intends to use the computer game "Ocean Express" to study the effect of computer games on speed, accuracy, and persistence in learning mathematics among secondary school children.

1.2. Research hypothesizes

1. Video games have positive effect on increasing the attention of math students.
2. Video games have positive effect on increasing the speed of math students.
3. Video games have positive effect on increasing the learning ability of math students.
4. Video games have positive effect on increasing the learning consistency of math students.

2. Methodology

2.1. Research design

This study has pre-test – post-test quasi-experimental with control group design, sample consisted of all first year male students of public schools of Urmia City in the academic year of 2012-2013. Using the multistage cluster sampling method, four schools and out of which two classes were randomly selected, one class was selected randomly to form the experimental group and other class as the control group. First, both the experiment group and the control group were pre-tested. After an initial instruction on «Ocean Express», the experiment group played the game for ten 45-minute sessions. Meanwhile, the control group took part in regular traditional math classes after the designated period, both groups were post-tested. The intervention took place twice a week for an overall of five weeks. Then, after another three weeks, the subjects were tested for learning consistency.

2.2. Measurement instruments

Toulouse-Pieron Attention Test: The Toulouse-Pieron Test (1986), quoted by Iravani, (2008), was used to measure the attention the reliability and validity of the test proved satisfactory based on the Pieron Study.

Learning Test: The researchers designed the learning test using the entire content of the first-grade math book in accordance with Table D (Content - Target). The test comprised of 50 multiple-choice questions, and the participants had 60 minutes to answer them. Each question had 2 scores, and no negative score was considered for wrong answers. The validity of the test was evaluated based on its correlation with academic performance index scores ($r = 0.81$, $p < 0.01$), and the significance confirmed the validity of the test.

Learning Speed Test: To calculate the speed of learning, the response time of each student was recorded separately (in minutes) using a stopwatch. The learning speed of each individual student was then calculated based on the time of providing correct answer to each question. To assess the validity of this test, the rate of learning speed in a different school was first evaluated. The results in the present study were also evaluated by experienced mathematics teachers, and its criterion validity was calculated to be 0.73.

Learning Stability Test: The test was aligned with the math learning test whose validity and stability had been established, and was held three weeks later than the post-test. The validity of the test was assessed based on its correlation with academic performance index scores ($r = 0/79$, $p < 0.01$), and the results confirmed its validity and reliability.

Raven's Progressive Matrices Test: Raven's Progressive Matrices test for 9-18 year-old students was used to measure the participants' IQ. The convergence of the reliability and validity of the Raven's Progressive Matrices in Iran (Rahmani, 2007) with the WISC-R total score has been reported to be standing at 0.73. Also its test-retest reliability has been reported to be 0.91.

3. Results

The Analysis of Covariance (ANCOVA) was used to compare the effects of computer games in increasing attention, speed and consistency of learning mathematics in the experimental and controls groups. The

IECT 2014

result of the Levine's test for homogeneity of variance in attention, speed and consistency of math learning was (F = 1.08, p = 0.30), (F = 2.28, p = 0. 26), (F = 0.25, p = 0.62) and (F = 0.95, p = 0.31) respectively. Thus non-significant results indicated that variance of control and experimental groups were homogeneous. In addition, the result of the homogeneity of regression slope test for speed and attention in mathematical calculations was (F = 0.003, p = 0.95) and (F = 0.20 p = 0.66), respectively and for the learning components of mathematics and stability were (F = 0.53 p = 0.47)) and (F = 1.59, p = 0.21), respectively. Non-significant results indicate that there is no interaction between covariant variables and experimental manipulation. Table 1 indicates the ANCOVA results.

Table 1: Tests of Between-Subjects Effects

Variable	Group	Mean	S.D	*F*	*d.f*	*p*	Eta squared
Attention	experiment	51.28	9.34	210.83	1,47	0.001	0.82
	control	43.80	8.70				
speed	experiment	45.04	9.34	15.26	1,47	0.001	0.24
	control	36.12	8.70				
Learning	experiment	48.92	13.35	1.17	1,47	0.28	0.02
	control	52.84	12.91				
Stability	experiment	67.92	19.90	2.15	1,47	0.15	0.04
	control	57.56	23.11				

According to Table 1, the mean scores of experimental group in attention were more than that of the control group. F-test results shows that the difference is significant (F = 210.83, p = 0.001). Experimental intervention significantly increased the attention of the students. In addition, group membership explains 82 percent of the variance. According to Table 1, the average of the experimental group in speed was more than that of the control group. F-test results shows that the difference is significant, (F = 15.26, p = 0.001). Experimental intervention explains 24 percent of score variations in the math leaning speed post-test. This indicates that computer games have a significant effect on accelerated math calculations in the experimental groups. ANCOVA results in Table 1 also shows that experimental intervention had no significant effect on math learning (F = 1.17, p = 0.28) and learning stability (F = 2.15, p = 0.15). This indicates that computer games have no significant effect on increasing math learning and learning stability.

4. Discussion & Conclusions

Base on the role of computer games in increasing the speed and attention of mathematics learning, it can be proposed that students are naturally oriented toward computer games because computer games are enjoyable (Demirbileka, & lema Tamer, 2010). With characteristics such as being interesting, exciting and emotionally stimulating, and considering the joy of learning concepts in video games (Prensky, 2003; Tuzun et al., 2009; Grimley et al., 2011, among many others), computer games can be quite effective in increasing the level of motivation and emotional stimulation of students (Prensky, 2003). This relationship can be expressed using Hebb's (1995) arousal theory. In his theory, Hebb's (1995) explains the relation between the level of arousal and cognitive functioning. Emotional behavior is implicitly associated with accelerated performance in line with the emotional excitability (Hebb, 1995). It can be proposed that through increasing the level of motivation and excitability (Prensky, 2003; Tuzun et al., 2009), computer games excite students cognitively activating their RAS. Considering that RAS is responsible for the brain's arousal in response to external stimuli (Reeve, 2009), it increases the student's awareness and interest in

IETC2014

solving mathematical problems. However, some studies (Grimley et al., 2011), have reported no effect of computer games on mathematics learning. The findings of the present study regarding the effect of computer games on mathematics learning and stability of mathematics learning is consistent with these researches as well.

According to Grimley et al. (2011) this lack of effect is because of: (1) the complexity of computer games which may prevent the student from having a clear understanding of the objectives and content, (2) irrelevant parts of a computer game which may unnecessarily prolong the time of learning, (3) the game may not be interesting for all student to the same degree; thus motivation may decrease and the learning may fail. Some researchers also believe that there is no clear causal relationship between mathematics achievement of students and using computer games (Shafie, Wan, & Wan, 2010). These studies divide this lack of relationship into two categories of instrumental and cognitive. Among the instrumental factors, mismatch between a computer game and the goal of learning, generality of the content of the game, the teacher's limited familiarity with the method of learning through computer games compared to traditional methods, and temporal limitations in familiarizing students with the games have been mentioned. Regarding cognitive factors, these studies suggest that cultural differences between students' cognitive structures and game's characters and consequently the inability of students to adapt their cognitive structures to the games' content and characters leads to their lack of understanding of the game's concept. In this regard, some studies (Kronenberger et al., 2005; Miller et al., 2007), discuss the negative effects of exposure to the media, especially TV, on cognitive performance especially in children and adolescents. Kronenberger et al. (2005), for example, proposes that exposure to the media and computer games lead to violence and cognitive disorders. Also, Christakis et al. (2004) says that computer games bring addiction because of the plasticity of brain neurons, leading to attention deficit disorder (ADHD) in children and adolescents.

Limitation of the study sample to first grade secondary school students prevents extension of the results onto students of other grades and schools. Also, lack of complete control of nuisance variables including the students' previous experience with computer games may reduce the internal validity of the study. However, regarding the established effect of computer games on enhanced speed and attention in mathematics learning, teachers and instructors are advised to use computer games along with educational classes and traditional methods. Considering the different performance of the right and left hemispheres and the different mathematical abilities in male and female students, the moderating effect of gender merits further research.

Acknowledgment

Finally, it is necessary to thank all of the principals, teachers and students in Urmia's schools that participated in this research eagerly and we wish their success.

The effect of using English story books in English courses by adapting them to different activities on the foreign language success of the students

Dr. Kerim Karabacak[a*], Serdar Erdem[a]

[a]*Sakarya University, Education Faculty, Department of Education Science, Hendek, Sakarya, Turkey*

Abstract

This research is realized as an experimental study on fifth grade students and related to present the effect of using English story books in English language education success of the students. The research has been realized in Controlled Last Test Model which has been a model of control group that takes place in experimental studies. The working group is formed of first grade students of Turgut Reis Secondary school which is located at Sultanbeyli Province of İstanbul. The data taken from experiment and control groups have been transferred to SPSS and the analysis of the data has been made by using t-test in order to compare the average of the groups. It has been determined that using English story books in English courses by adapting them to different activities increased the success when compared with traditional methods and techniques according to the findings..

1. Introduction

As it can be understood from the definition of education as formation of a requested and intentional change in the lives of the individuals (Ertürk, 1982), education has a dynamic structure because of human being's taking place as a social entity at the basis of it. The dynamic structure of education has been formed of needs and expectations which can be differentiated according to the periods. Effecting of the human being as a source of the developments in science and technology has been inevitable with the effect of these needs and expectations. The learning wish provided firstly meeting the human beings' with books and written sources then audial and visual materials by the development of educational technology.

The educational developments which appeared as a reflection of scientific and technological developments brought many innovations in foreign language education, the richness of the content in foreign language education simplified the adaptation of the developments which have been lived in education to language education. As a result of this, the teachers can use different technics and materials which are being developed every day and can find effective methods to establish meaningful learning on their students Different learning methods are put forward with the researches by taking the individualistic differences into account. In these studies, learning strategies of the students and learning styles have been tried to be determined (Demirel, Başbay and Erdem, 2006: 51). The findings of these researches which have been valid in foreign language education make the student the focus point of education. "Multiple

Intelligence Theory" as a basis of the studies which have been made on this field also defends the same reality. According to this theory, intelligence is not one dimensioned, on the contrary it is multiple dimensioned (Sönmez, 2012). Every child has a potential for the development in one field or more than one field (Gardner, 1993). The teachers, as a result of difference between the individuals, face with students who have different kinds of intelligence in foreign language classrooms. Every student has a field in which he can be better, this situation can be determined by observing their classroom performance. Whereas some students are observed that they are good at on verbal fields such as poetry and composition, some of them have the ability on music and arts. In case of teachers' making their plans according to these learning differences, meaningful learning can be provided for students and also the quality of education can be increased. Providing permanent learning can only realize by selecting relevant techniques and contents to learning levels, learning styles and strategies and intelligence types of the students.

As learning-teaching preparation process belongs to the teachers in the frame of published curriculum, foreign language teachers should provide relevant learning environments for the students by taking their readiness level, wishes and expectations. The teachers should be careful about the differences between the students and individualize the teaching and evaluation (Demirel, 2007). They should adapt different techniques, resources and materials which will provide permanent learning by taking the students' needs analysis and intelligence types instead of using traditional techniques and materials in their classrooms. Songs, games and stories from different sources which have been prepared with this idea are being used in foreign language education and their positive effect on education is being observed. Games and songs in these resources provide younger students to exhibit a positive attitude towards foreign languages by transforming the learning environment to an entertaining situation for the students, these are entertaining activities which have been effective to take attention of the students and provide their contribution to the course (Ara, 2009). The story books which simplify understanding of the foreign language and state themselves for the students are being used in the classroom for a long time. The stories are educational materials which provide effective learning with their reality, recognition and entertainment (Rossiter, 2002). The stories provide the development of conscious, communication and culture by adapting them to courses in addition to providing effective learning (Georgiou and Verdugo, 2011). The teachers who use stories in their courses can organize teaching aims, concepts or ideas around a story (Saban, 2005: 106). The placement of the stories in foreign language courses in this way provide them be equipped learners by providing them thinking (Erkaya, 2005).

The stories also effect foreign language success by providing contribution to understanding skills (Haven and Ducey, 2007: 38). The stories which address to the students with dominant verbal intelligence can also establish meaningful learning environments for the students with visual, audial and kinesthetic intelligence by the way of adapted different techniques and activities .For example; whereas the stories are being used as a material to develop reading and understanding skills at the basis , they can be transformed to a speaking text which will develop listening skill , a source which will develop his creative writing skill and drama activities which will provide the students physical participation with planning. The students enter an effective learning environment by providing individualistic and participant interaction with storytelling activities (Aiex, 1988). So, their monotonous learning lives will become environments which reply to the interest, request and skills of the students. This will provide every student to find an activity relevant for himself in a part of the course and active participation in the course and these will all bring success together.

1.1 The aim of the research

The aim of this research is to present the effect of story books in foreign language education on the success of students in English courses.

1.2 The importance of the research

When the success ranking of our country is examined in international foreign language exams, it is seen that there are many factors underlying the failure of the students, the most important factor in failure is that the students do not have any interest and wish about the course. When the learning environments,

IECT 2014

which have been planned without taking interest, need and wish into account, are associated with prejudices which can be formed against learning a different language, the expected success cannot be realized. The effect of story books which will be used with different technics in foreign language education will be determined with this study. It is important in the context of presenting the direct effect of story books on foreign language education.

1.3. Limitations

This research is limited with secondary school 1st grade students who are being educated in Turkey in 2013-2014 educational period.

2. Method

2.1. Research model

Research model of experiment and control group taking place in experimental methods of quantitative research methods has been used in this research in which the effect of story books on the success of secondary school students. To determine the difference between experimental group and control group, whereas story books have been used in courses in experimental group, classical teaching method has been used in control group.

2.2. Working group

The working group is established from 1st grade of secondary grade students in Turkey, İstanbul Sultanbeyli Prvince , Turgut Reis Secondary School which has been determined by aimed sampling method. Two groups have been preferred in which English course time has been longer and communication could be provided easily with the aim of providing sustainability in the research. 48 students who take place in the research are from experiment group, 48 of them are from control group. 21 students from the experiment group are girls , 27 of them boys, 22 students from the control group are girls , 26 of them boys. All students in the groups started to learn English in 4th grade. Because of this reason, there is not a difference between experiment and control groups in the frame of English learning past .Also a pre-test has been applied with the aim of providing validity after the groups had been determined. The data related to the test results has been given in Table 1. There is not a meaningful difference between the averages of the every two group.

Table 1. T-test results related to the scores of experiment and control groups before the application

Time	Groups	$\overline{X}$	N	sd.	t	p
Pre- application	Experiment group	52,7	48	23,9	0,544	0,589
	Control group	50,15	48	24,5		

IECT 2014

T-test results of success test are seen in Table 1 before starting with two groups. According to this table, as "t=0,544"and "p=0,589" values have been taken, there is not a meaningful difference between the knowledge or success situation of two groups at "p<0,05 meaningful level. In other words, the data related to pre-application test shows that there is not a difference between the success levels of experiment and control groups.

2.3 Data collection instruments and data collection

Two test instruments as pretest and last test as data collection instrument have been used in the research. The items requiring twinning and short answers have been preferred instead of multiple choice answers in these tests which have been developed for measuring skills at "comprehension" level. The questions which have been asked at the level of knowledge and comprehension in two tests are the questions related to measuring the acquisitions in 1st grade of secondary school English curriculum in Turkey. At the same time, the results of two pilot tests which include multiple choice questions and have been applied by a private publishing house have been evaluated with the aim of determining the effect of story books at central plot exams on success. The exam data of November exam which has been realized three times in some cities in Turkey generally in a significant period and other exam data has been taken together for one student and statistical procedures have been applied by using these averages. Also at the end of April 2014, the tests under the name of "last test" which has been applied to two groups have been applied again with the name of permanence test.

The study started on November 12, 2013; it ended on December 23, 2013 by making 12 course hours of application in total, 2 hours in elective English courses in every week. While going on studies in experiment group, education went on relevant to the yearly curriculum in elective English courses in control group.

2.4. Analysis of the data

The data which have been taken at the end of the application has been transferred to SPSS 15 statistical program. "Last test" results have been benefited with the aim of determining the difference levels between experiment and control group. Last tests which have been applied after the study in the groups have been analyzed by using t-test (Paired Sample Test). Also, after a permanence test has been applied in April 2014, "t-test" statistical analysis procedure has been realized for the twinning groups while comparing last test averages of every group with permanence test averages.

3. Findings

The effect of story books on the student success which have been adapted to different activities in foreign language courses (English) in the research is being tested. According to the last test results which have been realized in the research in Table 2, "t-test " results of the twinning groups and some descriptive statistics take place.

Table.2. "T-test" results of experiment and control groups after the application

Time	Groups	$\overline{X}$	N	sd.	t	p

IETC 2014

After the application	Experimental group	70,83	48	19,44	2,33	0,024
	Control group	60,04	48	21,90		

p<0,05

According to the results of t-test which have been realized between experiment and control groups determining effect of English story books on student success, "t=2,33 and p=0,024" values have been taken. As these values provide the condition of being below "p<0,05" meaningful level, it shows that there is a meaningful difference between the last test results of experiment and control group. In this situation, when the averages of every two groups have been examined, it is observed that the average of experiment group has been "70, 83", the average of control group has been "60, 04". According to these values, the success average of the students in experiment group is 10, 79 points higher than the students in control group. In other words, English story books which took place by adapting to different activities in English courses increase the success of students in English.

Table. 3. Last test and Permanence test "t-test" results of the groups

Groups	Tests	$\overline{X}$	N	sd.	t	p
Experimental group	Last test	70,83	48	19,44	6,55	0,000
	Permanence test	65,33	48	19,96		
Control group	Last test	60,04	48	21,90	3,65	0,001
	Permanence test	51,08	48	21,87		

p<0,05

When "t-test" results which have been realized between last tests and permanence tests of experiment and control groups in Table 3 have been examined, there is a meaningful difference between the average of last test and permanence test of experiment group (t=6,55 and p=0,000). Whereas last test average of experiment group is "70,83" its permanence test average has been "65,33". When the results of "t-test" of control group is examined, as "t=3,65 and p=0,001" has been , it has been determined that there is a meaningful difference between the averages at that point. Also, it can be seen from the table that last test average of control group has been "60,04" and permanence test average has been "51,08" .According to these findings, it cannot be told that English teaching with story books by adapting them to different activities increases the permanence of the knowledge learned much. But, when the average of two groups have been examined, there is a "5,50" points difference between the last test and permanence test of experiment group , "8,96" points difference between the last test and permanence test of control group. According to the findings taken, it can be told that forgetting rate of experiment group is less than the control group.

4. Discussion, result and proposals

4.1 Discussion

IETC 2014

The story books and activities contribute to the foreign language education by increasing foreign language success of the students according to this experimental research findings in which the effects of activities which have been adapted from English story books on English course success have been examined. The studies made on foreign language education in or out of the country have the qualification that the findings of this research on English course success is supported. Rossiter (2002) asserted that the stories have been educational materials providing effective learning with their remembrance, realism and joy aspects. The observed students during the research lived different learning lives by the way of stories and adapted activities and these differences motivated them to the courses. As a result, success in foreing language of the students has been observed. Haven and Ducey (2007) and also Aiex (1988) reached the same findings which support Rossiter's (2002) ideas. Whereas Haven and Ducey (2007) think that the stories effect success by contributing foreign language skills of the students directly; Aiex (1988) defended that the students had effective learning lives by entering individualistic and participative interaction with story activities . Morrow (1985) examined the effect of explaining story on understanding the read document in his study, according to his findings he stated that explaining a story is an active process which provides analyzing the events, verbal language development and helps the students understand what they listen. Saban (2005) stated in the research he made that the stories can be used in organizing the teaching aims, concepts and ideas and this will decrease the workload of teacher and the student.

Georgiou and Verdugo (2011) and also Erkaya (2005) took the stories in a different concept in their studies and they tried to demonstrate that the stories not only effected foreign language success but also the life of the student as a whole. Whereas Erkaya (2005) states that the stories provide the students to be equipped learners by making them think with the integration of story books to foreign language courses, Georgiou and Verdugo (2011) states that the stories provide the students to be equipped by making the students think and also providing effective learning by adapting the stories into courses.

The students on foreign language education field showed that usage of English story books and adapted activities effectively in foreign language courses helped learning the foreign language actively. In this research, the students on whom foreign language education has been realized with the help of English story books and activities adapted from the books have been more successful than the students who have been taught with traditional methods and techniques.

4.2. Proposals

If the teachers want to increase their English success, they should give place to English stories and activities related to these stories in their courses. The teachers can use the activities such as reading stories, listening the recorded stories, video watching actively in their courses to use the stories in the development of reading, listening, writing and speaking skills which have been four basic factors in the development of foreign language.

The teachers can present the required structures and words in a context as a force of the subject by adding short stories in the activities in English course books.

English teachers can present alternatives to their students by establishing an English story library in their classrooms. So, they can make the students gain habit of reading English story books.

Proposals to the researchers

1. The relationship between the usage of story books and developing four basic skills in foreign language courses can be searched for.
2. The contribution of storytelling can be examined on the student's understanding and concept development.

IETC 2014

The effectiveness of an interactive multimedia courseware with cooperative mastery approach in enhancing higher order thinking skills in learning cellular respiration

Fazzlijan Mohamed Adnan Khan[a], Mona Masood[a,]*[134]
[a,b]*Centre for Instructional Technology and Multimedia, Universiti Sains Malaysia, Pulau Pinang, Malaysia*

Abstract

The main objective of this study is to integrate mastery and cooperative learning approaches together with an interactive multimedia to enhance students' high order thinking skills in the learning of Cellular Respiration. A multimedia interactive courseware was developed and applied in three different strategies, namely the Multimedia-assisted Mastery Learning (MML), Multimedia-assisted Cooperative Learning (MCL) and Multimedia-assisted Cooperative Mastery Learning (MCML). The MML used a self-learning approach while MCL and MCML involve learning in groups. This study involved a quasi-experimental design whereby the domain scores of analysing, evaluating and synthesizing were the three dependent variables. The independent variable was the interactive multimedia courseware with the three approaches. Eighty-four, 88 and 90 pre-university students went through the MML, MCL, and MCML respectively. The MANCOVA was applied to analyse the performance scores of each of the three higher order thinking skills based on the three approaches with the implemented courseware. The result revealed that the MML and MCML students performed significantly better in the creating domain score compared to MCL. Overall, the findings of this study suggest that the multimedia interactive courseware with the combination of mastery and cooperative learning approaches brings a positive effect in the learning of Cellular Respiration.

Keywords: multimedia learning, learning biology, multimedia-assisted learning, mastery learning, cooperative learning

1. Introduction

Biology education involves studying living organisms and how they interact with each other and their physical environment. Rice (2013) reported that biology was an abstract area which existed in unorganized structures and, therefore, it often results in students' learning difficulties. Complex processes and the use of technical terms made it difficult to learn some topics such as cellular respiration (Patro, 2008; Rice, 2013). This subject contains many abstract concepts that are difficult to understand. As such students must be able to conceptualise and construct abstract concepts in biology in order to understand and make sense of them. Many students' demonstrate common misconceptions concerning biology, including their understanding of topics such as cellular respiration, photosynthesis, ecology, genetic, classification and the human circulatory system (Tekkaya, 2002). Furthermore complex processes and the use of technical terms such as in the topic of cellular respiration, make them difficult to learn (Patro, 2008). Hence, it is important to design a high quality instructional system to enhance the teaching and learning of difficult and abstract topics as part of the subject of biology.

Cooperative learning and mastery learning are two of the most used learning strategies which focus on different aspects of the teaching and learning processes. Since both strategies require the assessment of student learning to be criterion referenced, learning becomes non-competitive. Both strategies emphasize the teacher's role as a facilitator by working with students closely to accomplish students' learning goals. At the same time, these strategies are flexible in their applications. One the other hand, cooperative learning and mastery learning have been found to yield positive results in many studies (Grant, Fazarro, &

* Mona Masood. Tel.: +6012-423-2559; fax: +604-657-6749.
E-mail address: msmona@usm.my

Steinke, 2014; Guskey, 1997; Kulik, Kulik & Bangert-Drowns, 1990). Although each has its own characteristics, the aim of this study is to incorporate these two strategies to produce and enhance an effective learning environment. As suggested by Guskey (1990), the sum of its part (mastery learning and cooperative learning) creates a greater whole (cooperative mastery learning). Hence in this study, the researcher tries to embed the three learning strategies in a multimedia interactive courseware and seek the effectiveness in the learning of cellular respiration (Fig. 1).

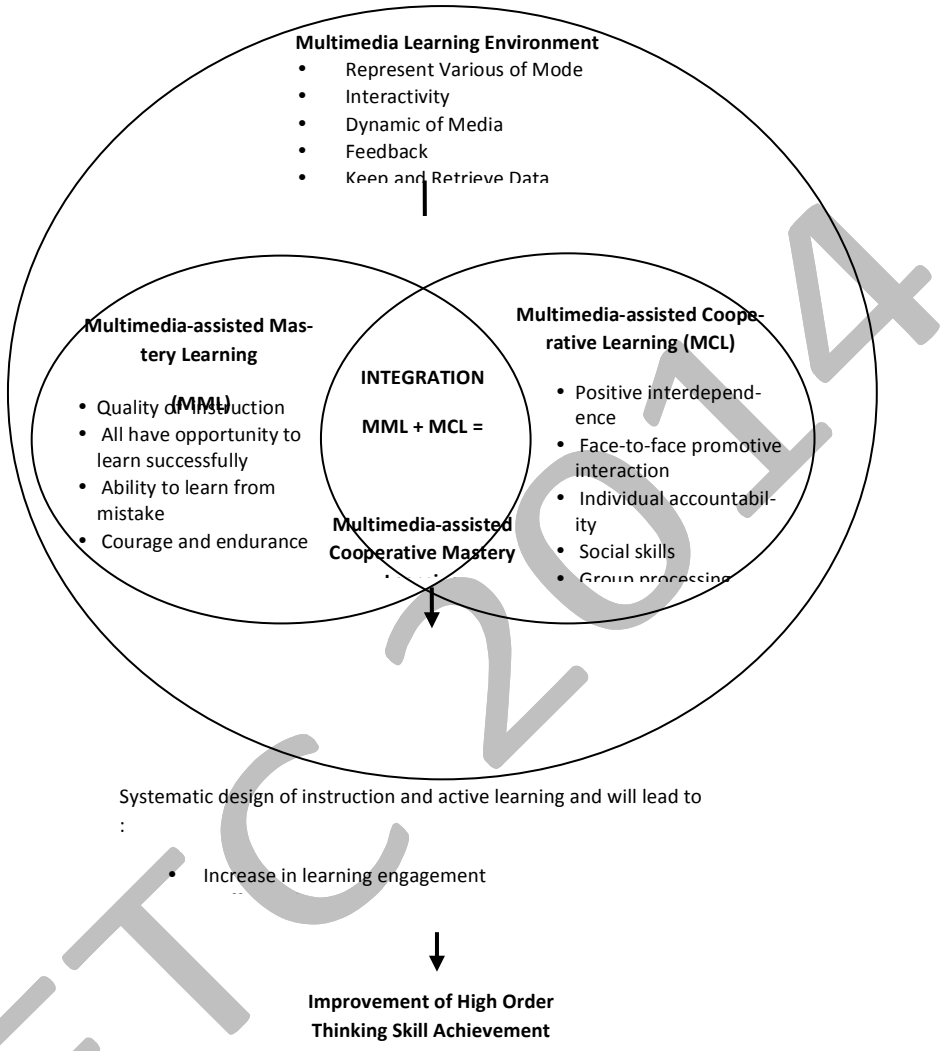

Fig. 1. The Features of the MML, MCL and MCML Approaches in Multimedia Learning Environment

The cooperative structures could meet various needs of students by positive interdependence, positive interaction, accountability, social skills and group processing through three main processes. First, they gathered students in teams in where interpersonal interaction and cooperation were rewarded. Second, they provided the teacher with opportunities to concentrate on diversity in composing teams. Lastly, they allowed students from diverse backgrounds to contribute in a unique and individual way. In team activities, students are fully engaged to help each other by clarifying misunderstandings and correcting learning errors to achieve criterion-referenced standard. More importantly, students should be presented with the well-designed mastery learning instruction within a cooperative learning situation (Guskey, 1990; Zimmerman & DiBenedetto, 2008). Therefore, cooperative learning will be well coupled with mastery learning in where students in cooperative learning groups are guided through well-designed instruction.

IETC 2014

2. Research objectives

This research is mainly intended to integrate mastery and cooperative learning approaches in an interactive multimedia learning environment. The innovation used aimed to improve students' biology achievement score for high order thinking skills in Revised Bloom's Taxonomy, specifically on the topic of cellular respiration. The combination of all elements in mastery and cooperative learning within the interactive multimedia environment would offer a comprehensive learning experience needed for an effective and efficient teaching and learning of biology concepts. In this study an interactive multimedia courseware was systematically designed in three different approaches namely the Multimedia-assisted Mastery Learning (MML), Multimedia-assisted Cooperative Learning (MCL) and Multimedia-assisted Cooperative Mastery Learning (MCML). Students in the three learning approaches used the same instructional materials. The MML used a self-learning approach while both the MCL and MCML learned in groups. The mastery learning elements were embedded inside the MML and MCML courseware while the MCL omitted the mastery learning elements. The effects of the three learning approaches on achievement score of higher order thinking skill were investigated. Specifically the research question is:

- Do students who receive MML, MCL and MCML strategies differ in terms of their achievement score for analyzing, synthesis and creating domain?

3. Research hypothesis

Based on the research question, the hypotheses were therefore presumed as follows:

H_0 : There are no significant differences in the achievement score of Bloom's high order thinking skills domain among students in the MML, MCL and MCML strategies

H_{01}: There are no significant differences in the achievement score of analyzing domain among students in the MML, MCL and MCML strategies

H_{02}: There are no significant differences in the achievement score of evaluating domain among students in the MML, MCL and MCML strategies

H_{03}: There are no significant differences in the achievement score of creating domain among students in the MML, MCL and MCML strategies

4. Methods

In this section, the population, sampling and the multimedia interactive courseware are elaborated.

4.1 Subject

This study adopted a quasi-experimental design. The sample of this study consists of Pre University students from three Matriculation Colleges in Malaysia. Their ages ranged from 18 to 19 years old. A total

IETC 2014

of 262 Matriculation Biology students participated in the research. Eighty-four students were assigned in the MML group, 88 students were in MCL group and 90 were in MCML group.

4.2 Multimedia interactive courseware context

The methodologies of mastery learning and cooperative learning were chosen because decades of research indicated both to be successful methodologies when employed with elementary, secondary, and undergraduate students (Guskey, 1997). Evidence indicated that both the cooperative learning and mastery learning gave positive results for cognitive outcomes (Guskey, 1997; Mevarech & Susak, 1993).

The approach to design the interactive multimedia courseware was based on Bloom's proposed mastery learning strategy, Mayer's Cognitive Theory of Multimedia Learning, Alessi and Trollip's instructional systems design, and Gagné's nine conditions of learning. The content of the Cellular Respiration in the courseware embraced the Bloom's revised taxonomy. Fig. 2 shows an example of the integration of the Cellular Respiration content within the cognitive domain respectively.

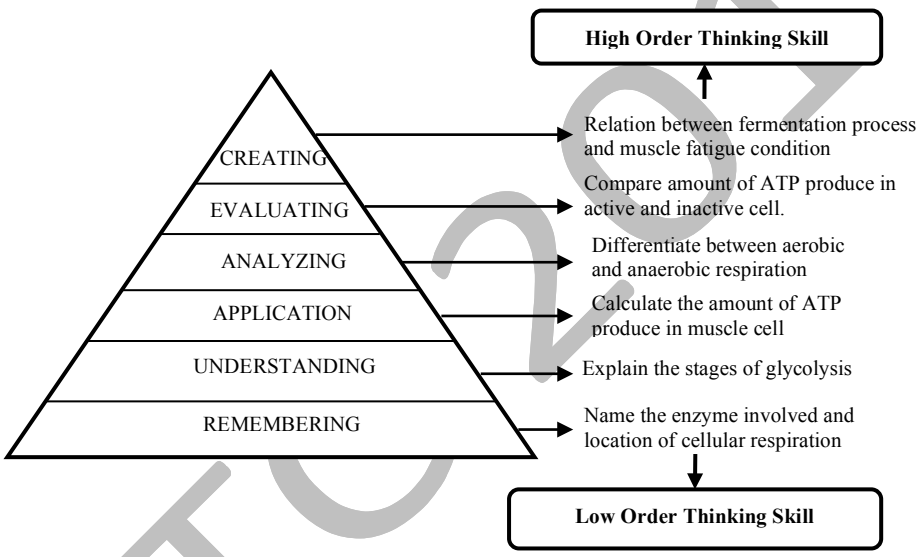

Fig. 2. Example of Cellular Respiration Content Related to the Revised Bloom's Taxonomy Domain

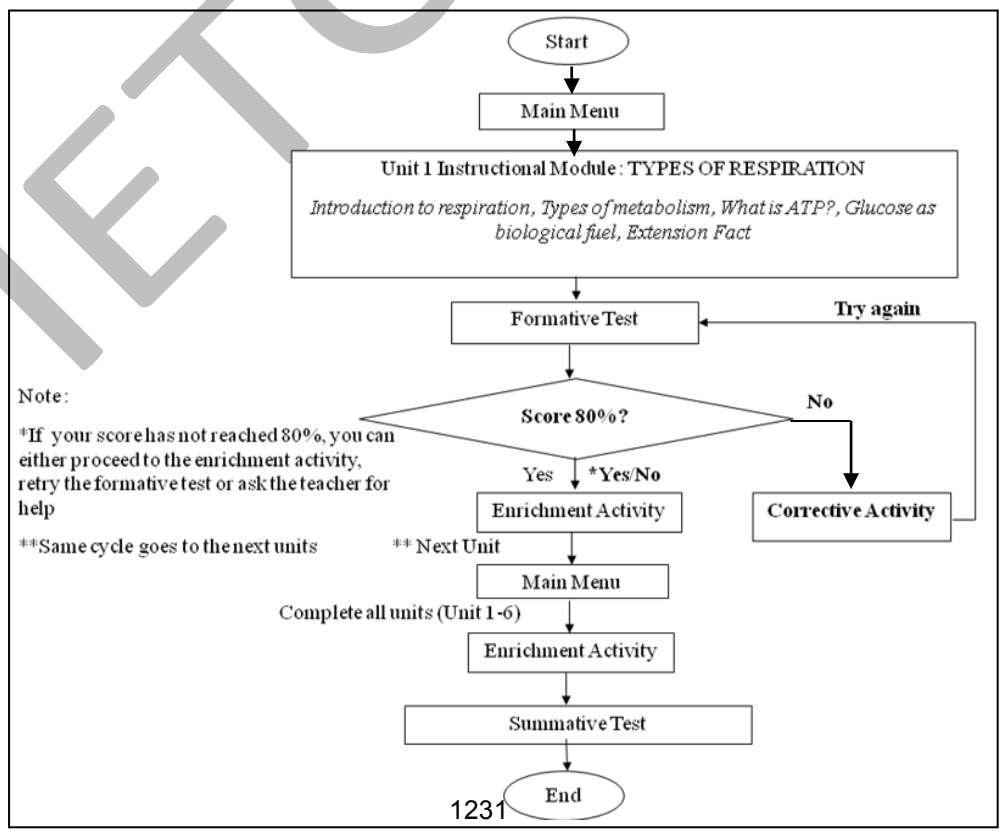

The researcher developed the multimedia interactive courseware entitled "Cellular Respiration" by using Adobe Flash CS4 as the main authoring tool. A series of templates were created through rapid prototyping. The courseware was designed with mastery learning elements, which was used in the MML and MCML strategies. Conversely, during the MCL approach the mastery learning elements in the courseware were hidden and deactivated. Before conducting the experiments, the courseware was field-tested. These

IETC2014

field tests served as an evaluation in which the courseware was revised through formative evaluations (beta and alpha test) and pilot test. Table 1 shows the comparison between the components in MML, MCL and MCML. Meanwhile Fig. 3 illustrates the flow chart of the courseware.

Table 1. Comparison Between Components in MML, MCL & MCML

Strategy	Component										
	Self Learning	Group Learning	Instructional Module	Formative Test A	Score ≥ 80	Corrective Activity	Formative Test B	Enrichment Activity	Summative Test	Score Feedback	Group Reward
MML	✓	×	✓	✓	✓	✓	✓	✓	✓	✓	×
MCL	×	✓	✓	✓	x	x	x	x	✓	✓	✓
MCML	×	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓

IETC 2014

Fig. 3. Flow chart of Multimedia Interactive Courseware

5. Result and discussion

As seen in Table 2, the descriptive statistic shows that the achievement mean score of the creating domain (Pre Test – Post Test) for students who used the MML (M=10.94) and MCML (M=10.67) was higher than the achievement mean score for the students using MCL (M= 9.06).

. Descriptive statistics on achievement score of analyzing, evaluating and creating domain for MML, MCL and MCML

		Strategy			Total
		MML	MCL	MCML	
Achievement Score of Analyzing Domain	n	84	88	90	262
	M	4.14	4.08	3.98	4.06
	SD	1.20	1.17	1.19	1.87
Achievement Score of Evaluating Domain	n	84	88	90	262
	M	4.36	4.35	4.43	4.48
	SD	1.38	1.50	1.37	1.41
Achievement Score of Creating Domain	n	84	88	90	262
	M	**10.94**	**9.06**	**10.67**	10.21
	SD	1.88	2.19	2.12	2.23

A multiple analysis of covariate (MANCOVA) was performed to investigate students' achievement score (posttest) of the higher order thinking skills in the Revised Bloom's Taxonomy. Three dependent variables were used (1) achievement score of the analysing domain, (2) achievement score of the evaluating domain, and (3) achievement score of the creating domain. The independent variable was the multimedia interactive courseware. Students' achievement score of the analysing domain, the evaluating domain, and the creating domain on the pretest that was administered were used as the covariate in this analysis. Preliminary assumption testing was conducted to check for normality, linearity, univariate and multivariate outliers, homogeneity of variance-covariance matrices and multicollinerity, with no serious violations noted. The results of the MANOVA test (Table 2) showed that the Wilk's lambda of 0.89 was significant, F = 5.02, p <0.05. Thus, hypothesis one (H_{01}) , which stated that the population means on achievement score of Bloom's higher order thinking skill domain variables (i.e., analyzing, evaluating and creating domain) were the same for the three groups, was rejected.

3. Multivariate test of the effect of learning strategies on the achievement score of Bloom's high order thinking skill domain

Effect		Value	F	Hypothesis df	Error df	*p*	Partial Eta Squared
Strategy	Pillai's Trace	.09	3.02	8	514	.00	.05
	Wilks' Lambda	**.89**	**5.02**	**6**	**508**	**.00**	**.06**
	Hotelling's Trace	.09	3.04	8	510	.00	.05
	Roy's Largest Root	.08	4.90	4	257	.00	.07

When the results for the dependent variables were considered separately (Table 4), using a Bonferroni adjusted level of .017, the mean score of the analyzing domain was not significant, F = 0.49, p > 0.025. Likewise, the results for the mean score of the evaluating domain was not significant, F= 0.15, p > 0.025.

IEC 2014

Both results showed that there were no significant differences of the analyzing and evaluating domain scores among the groups. Therefore, H_{01} and H_{02} were accepted. The only difference to reach statistical significance, was the mean score of creating domain, $F = 14.48$, $p > 0.025$. The result showed that there were significant differences of the creating domain score among the groups. Therefore, H_{03} was rejected.

Table 4. Test of Between Subjects Effects

Source	Dependent Variable	Type III Sum of Squares	df	Mean Square	F	*p*	Partial Eta Squared
Strategy	Analyzing Mean Score	1.39	2	.69	.49	.61	.004
	Evaluating Mean Score	.61	2	.303	.15	.86	.001
	Creating Mean Score	**123.72**	**2**	**61.86**	**14.48**	**.00**	**.10**
Error	Analyzing Mean Score	362.11	256	1.42			
	Evaluating Mean Score	510.39	256	1.99			
	Creating Mean Score	1094.71	**256**	4.28			

An inspection of the creating domain mean difference in Table 5 indicated that two groups differ significantly, (1) Group MML and MCL ($p=.00$, $p<.05$) and (2) Group MCML and MCL ($p=.00$, $p<.05$). The MML and MCML groups did not show any significant difference ($p=.90$, $p>.05$).

Table 5. Comparison Mean Difference of Creating Domain for MML, MCL and MCML groups

					95% Confidence Interval	
(I) Strategy	(J) Strategy	Mean Difference (I-J)	Std Error	p[a]-Value	Low Bound	Upper Bound
1 MML	**2 MCL**	**1.67***	**.34**	**.00**	.91	2.82
	3 MCML	.23	.32	.90	-.59	1.11
2 MCL	**1 MML**	**-1.67***	**.34**	**.00**	-2.82	-.91
	3 MCML	**-1.44***	**.33**	**.00**	-2.37	-.84
3 MCML	1 MML	-.23	.32	.90	-1.11	.59
	2 MCL	**1.44***	.33	**.00**	.836	2.38

In summary, although mastery learning, MML (conducted systematically) was the most vital instructional method to make students succeed, it was better when supported by cooperative learning. This finding suggested that the advantages in cooperative learning were not obviously shown in the achievement scores without mastery learning, (MCL). This study showed that mastery learning plays a primary role and when incorporated with cooperative learning, the students will learn more in the cooperative environment. Some students may be weak in the socialization and interaction skills and may need guidelines when using the mastery learning approach. Likewise, some students need peer guidance during the learning process to achieve the higher order thinking skill. The slower learners need confidence in their ability to reach higher mastery standard. Based on that reason, students are not motivated to correct their learning problems in order to attain mastery. Through the use of cooperative learning, students can be provided with high quality corrective activities, assisted through their peers immediately following any forma-

tive test without waiting for the teachers' help. Thus, students are highly engaged in their learning and are able to diagnose their weaknesses to solve higher order thinking problem. The students also learned the skill of seeking out help cooperatively and confidently. Also, learning in teams accelerates important incentives that will strengthen motivation and reduce anxiety. Furthermore, the use of student learning teams serves not only correctives but enrichment purposes as well.

6. Conclusion

In conclusion, this study demonstrates that that the MML and MCML strategies are superior compared to the MCL strategy to enhance higher order thinking skills especially for the creating domain. The findings of this study propose an easy but powerful approach through the use of a multimedia integrated learning courseware with a series of high quality instructions in mastery learning and cooperative mastery learning. Students that used MML and MCML are more capable to developing potential solution to solve high order thinking skill problem. We hope the results of this study can encourage more sciences teachers to incorporate cooperative mastery learning to enhance higher order thinking instruction.

Abstract

Introductory video games have become an attractive form of entertainment and have surpassed television viewing as a preferred sedentary activity choice for users. Introductory video games are more and more popular for users studying E-learning topics. Atomic energy is important in the fields of science education, industry and research. However, the lack of a thorough understanding of nuclear energy and radiation, and the attitudes towards the safety of nuclear power are important issues. This paper discusses the teaching of the fundamental knowledge of nuclear power to students, to enhance their understanding of including nuclear power and safety concerns. This objective was achieved by means of e-learning which contains a variety of information about general science. This plan established a Nuclear Energy 3D eBook by integrating an eBook and TV devices, using the Tsing Hua Open-pool Reactor (THOR) as an example. We employed a nuclear energy education design in a serious game. We recruited N users to participate in THOR nuclear energy education learning. The present study examines the usage pattern of electronic game devices among university students in Taiwan. A survey was conducted among 31 students in a university, with 17 males and 14 females in the age range of 19–21. The results showed students can clarify their ideas about nuclear power by using the materials. The impact of nuclear energy 3D eBook on users who learn using the 3D teaching materials was also examined.

1. Introduction

Today, computers and electronic games have become an important part of education and this is a worldwide trend (Anderson et al., 2008; Christakis et al., 2004; Iannotti et al., 2007; Jaruratanasirikul et al., 2009; Phillips et al., 1995; Donald et al., 2011). Many different game devices have been developed in the last two decades. The Nintendo DS (NDS) and Portable PlayStation (PSP) are two commonly used devices. Mobile phones with touch-sensitive screens, such as the iPhone, offer thousands of games available to download from digital stores (Chandler & Chandler, 2011).

People display more persistence and motivation in seeking information on the Internet than when using traditional online sources (Bilal, 2000). There are more and more eBook multimedia online sources. Therefore, the main aim of this study is to examine the pattern of video games. The objective is to identify the current pattern of university students. We focus on a nuclear energy 3D eBook and its learning advantages, as well as the design and construction of a somatosensory technology. A TV video game environment to assist teachers observe and analyze student learning behaviors using a nuclear energy 3D eBook was proposed.

IETC 2014

2. Literature review

Previous studies developed rich functionalities to support reading on the Web, PCs, tablets, mobile phones, and e-book devices. With the popularity of e-book devices such as the Kindle and iPad, various e-book software companies have developed applications such as annotation, search, navigation, dynamic representation of contents, and e-book management. Several e-book systems support shared annotation (Rau et al., 2004; Wolfe, 2008), collaboration (Wei & Chen, 2006), content visualization (Hornbæk & Frokjær, 2003) and the construction of cognitive maps (Liang et al., 2013). The concept of the e-book system must achieve three major goals. First, it must provide basic annotation functions such as highlighting, commenting, and bookmarking, which are the most necessary functionalities for e-book readers. Second, the system must support students in creating a visual cue map. Third, the system should motivate readers to create contextual cues (Thayer et al., 2011). Some issues were encountered at the initial stage of e-book design for students. For example, Hourcade et al. (2003) revealed commercial e-books are likely to be insufficient to satisfy students' diverse needs. They concluded the use of e-books to support literacy leads to problems resulting from lack of choice. In addition, there are features of e-book functionality that support students' development of literacy and provide them with access to stories. They include book processing, multimedia additions, the interactivity of the story, etc. However, the legibility might be beyond a student's reading level (De & Bus, 2003). Revelle et al. (2002) developed a visual search interface to support students in data searching with a hierarchical information structure. With the support of a visual query interface and scaffolding for Boolean concepts, students were able to perform searches and construct search queries that surpassed their previous search techniques.

Moreover, some researchers examined a series of new user interface paradigms which serve to mediate the collaborative learning among students, with a sociocultural aspect (Kerawalla et al. 2008; Yuill et al. 2009). The results suggest additional features are still needed to improve the content of collaborative conversations that support joint understanding and individual comprehension development. In addition, Tung and Deng's (2006) ''computers are social actors" paradigm asserted human-to-computer interactions are fundamentally social responses, and they suggested enhancing the interactivity of an e-learning environment can stimulate the presence of social actors, which can promote a student's learning experience and increase their motivation. Considering the social constructivism in learning with e-books, Larson (2009) investigated how the collaborative online learning communities featured in e-book reading can provide students with equitable opportunities to share their thoughts and voice their opinions about literature. The findings suggested the students' engagement in online literature discussions promoted socially constructed learning, and the students' skillful and in-depth communications reflected their prior experiences in both real and virtual environments. These studies revealed social interactivity and scaffolding instruction are both crucial for learning with e-books, just as Blewitt et al. (2009) argued shared book reading and scaffolding procedures could enhance students' vocabulary learning.

A basic requirement for building a somatosensory technology is the combination of the real and the virtual. Many studies have minimized the virtual objects registration error and increased the realness of virtual objects (Ronald & Bishop, 1994). Drastic and Milgram listed a number of cues that can be used to interpret depth, including image resolution and clarity, contrast and luminance, occlusion, depth of field and accommodation (Drastic & Milgram, 1996). The 3D information is calculated at the point where there is an occlusion problem for a moving virtual target, using the proposed method (Hee et al., 2009).

There are more than twenty-three million players are registered for massively multiplayer online games in the MMOData.net and where popular commercial video games generate more money than movies, one could argue that it is time for education to embrace the potential of video games. With the prevalence of game playing among children and young people, the potentials of using digital games to facilitate learning have been suggested by researchers and educators alike (e.g., Gee, 2007; Oblinger, 2004; Prensky, 2001; Squire & Jenkins, 2003; Li & Tsai, 2013). Since digital games were used to achieve various learning outcomes (Connolly et al. 2012), what learning outcomes were stressed by researchers is also the interest of this current review. Therefore, this study aims to integrate somatosensory technology with nuclear energy education to improve function and allow innovation using the Tsing Hua Open-pool Reactor (THOR).

3. Nuclear energy education learning in thor research reactor

The following explains the nuclear energy environment of THOR shown in figure 1. The aim of the nuclear energy 3D e-book is to provide user interfaces that allow inclusive design, enabling greater interaction for users.

Fig. 1. The environment of THOR

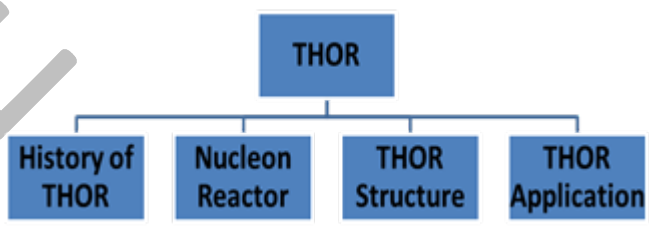
This study is divided into four modules, as shown in figure 2, including the History of THOR, Nuclear Theory, an outline of the THOR Structure and THOR applications. The finger 3 shows the nuclear energy 3D eBook interface design.

(1). History of THOR (Since 1961~): the history, the evolution, the present status and the major achievements and applications of THOR.

(2). Nuclear theory: the nuclear fission reaction, the reaction types for neutrons, the utility and application of a research nuclear reactor, i.e. THOR.

(3). THOR structure: the important parameters of THOR, the control system, the reactor core, the cooling system, the regional radiation detection and monitoring system, etc.

(4). THOR applications: the major applications of THOR, such as for neutron radiography, neutron scattering, neutron activity analysis, isotope production and boron-neutron capture therapy (BNCT).



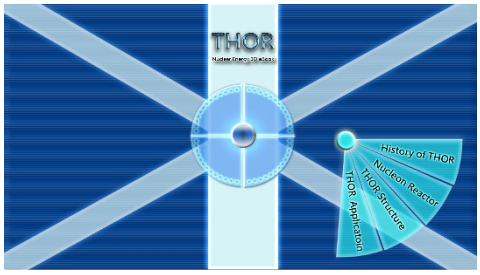


Fig. 2. The nuclear energy 3D eBook modules design

IETC 2014

Fig. 3. The nuclear energy 3D eBook inferface design

4. Experimental evaluation

The study process involved three programming language classes of 31 students, consisting of 17 males and 14 females aged 19-21 years old at a university of information management department in Taiwan. The experiment time was 2 hours per week for a total of 3 weeks.

A quasi-experimental research method was used in this study. The Cronbach's Alpha value is 0.932. The architecture is developed using Java, Open Ni, ASUS Xion sensor, Android 4.2 and Maya software. In this section the system structure and the operational environment are described. To test the effectiveness of the nuclear energy 3D eBook, figure 4 shows the nuclear energy 3D eBook with somatosensory technology operational results. Figure 5 shows the nuclear energy 3D eBook, using somatosensory technology on a mobile platform. It shows the video, the 3D model and 3D animation.

Fig. 4. The nuclear energy 3D eBook.

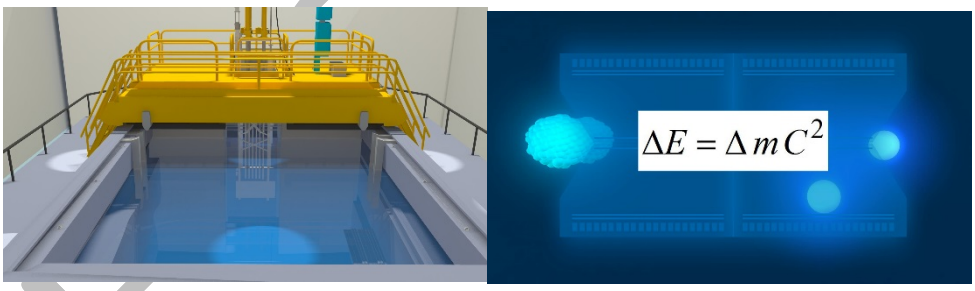

Figure 5. The nuclear energy 3D eBook operation results.

Table 1 presents the mean and SD values of the pretests and posttests for the experimental group. The test of homogeneity of within-class regression was conducted for nuclear energy course, the pretest and posttest mean values (standard deviation value) in were 31.29(22.322), 66.13(20.765).

Table 1. Mean (SD) values of pretest and posttests for THOR somatosensory technology.

	Pretest Mean(SD)	Posttest Mean(SD)
Experimental Somatosensory Technology group	31.29(22.322)	66.13(20.765)

Independent t-tests indicated the flow experience score was significant in the experimental group. The results show the pretest and posttest scores increased significantly in the experimental group in table 2. Significant differences existed between the posttest of the experimental group (t =-7.233, p = 0.000). That

is, teaching the THOR 3D e-book digital material for strategy helped decrease the differences between the pretest and posttest among students.

Table 2. Summary data of experience from t-test.

	T	df	P
Pre-Post	-7.233	30	.000**

** p<0.05

5. Conclusions and future work

The present study examined the effectiveness of nuclear education in a serious game among users. Users may be highly attracted to the game and frequent playing can affect their nuclear knowledge. Our results showed use of the 3D ebook by integrating an eBook and TV devices is effective. As a strategy to increase knowledge of nuclear processes, this study established a nuclear energy 3D eBook by integrating an eBook and TV devices, using the THOR research reactor as an example. The benefits of this study are it provides 3D eBook processes and somatosensory technology. It also provides proper knowledge of atomic energy and improved the 3D multimedia digital content and development capabilities.

Future study will focus on the standardized processes and a digital storage system in service, emphasizing data management, stability and security. The increasing use of computers and electronic media within the education system and its potential effect of encouraging a sedentary lifestyle need to be further addressed by both the family and the education sector.

The examination of prospective teachers' information and communication technology usage and online communication self-efficacy levels in Turkey

Ömer DEMİR* **Halil YURDUGÜL***

Hacettepe University, Faculty of Education, Computer Education and Instructional Technologies, Ankara, Turkey.

Abstract

The concept of readiness to e-learning necessitates students possess a number of competencies, two of which are their ICT usage and online communication self-efficacy levels. Thus, in current research prospective teachers' ICT usage and communication self-efficacy levels with respect to some demographic variables were explored. 1693 volunteer prospective teachers constituted the sampling of the study. In present study, there were two scales, whose reliability coefficients are respectively .894, and 846. With regard to findings, it appeared that solely grade level has no statistically significant influence on prospective teacher' online communication self-efficacy levels. Further findings are discussed in the full paper.

Keywords: ICT self-efficacy; online communication self-efficacy; prospective teachers

1. Introduction

It is an undeniable fact that the face of education is being changed by the rapid advancement of Information and Communication Technologies (ICT). Today, it has become almost impossible to envisage education without ICT. Hence, using computer, internet and other technological devices and/or capabilities effectively are of paramount importance for teachers with the goal of being able to keep up with current pedagogical approaches and incorporate modern technologies into education successfully. Aside from ICT usage self-efficacy, online communication self-efficacy is another indispensable asset to which today's teachers must definitely possess. It goes without saying that along with the change of medium where communication takes place the way people communicate to each other also changes. Since learning has much thing to do with communication, the way people learn changes too. As well known, McLuhan and Fiore (2001) puts forward that medium influences people and the way they act a great deal. Palloff and Pratt (as cited in Hung et al.,2010) revealed that shy students engage in online environments more than non-shy ones do compared to traditional environments. What is more, in the famous debate between Kozma and Clark, Kozma (1994) asserted that medium affects our learning. In short, as there are a number of media involved in e-learning environments like content management or learning management systems, it could be expected that that relating medium might have some impact on people, the way they communicate, and consequently the way they teach and learn.

There is a benefit of giving definitions of concepts investigated in current study before further discussing these concepts in that in some studies these concepts might mean quite different things. The first concept handled in this study is ICT usage self-efficacy. There is use in giving definition of self-efficacy first in order to comprehend what ICT usage and online communication self-efficacy are. The concept of self-efficacy was first added to literature by Bandura (1977) in the social learning theory. Bandura defined self-efficacy as an individual's own perception regarding organizing required activities and his/her being able to complete them successfully in an attempt to show a certain performance. Subsequently, by making use of Bandura's definition, Akkoyunlu, Orhan and Umay (2005) defined it as an individual's believe in

IETC 2014

his/her abilities rather than these abilities themselves. In this regard, Hung, Chou, Chen, and Own (2010) defined internet self-efficacy as follows: It is an internet user's trust towards his/her own ability to use internet. Under the lights of all above definitions, we may define ICT self-efficacy in a similar way. It is an individual's own believe towards how much he/she is good at using internet, computer and other related ICT technologies. As far as online communication self-efficacy is concerned, it might be defined as an individual's own perception regarding how much they understand the language and the culture peculiar to e-learning environments and how well they can express themselves in these kind of environments.

Above defined concepts have been examined in the literature great many times especially in the scope of readiness to e-learning or online learning. In a model developed to measure students' readiness to e-learning, Akaslan ans Law (2011b) covered the component of competency of technology, which is alike ICT usage self-efficacy. Likewise, Dray, Lowenthal, Miszkiewicz, Ruiz-Primo, and Marczynski (2011) encompassed a similar component in their model. Similarly, there are many other models pertaining to readiness to e-learning incorporating alike components in the literature (Hung et al., 2010; Mercado, 2008; Tubaishat and Lansari, 2011; Watkins, Leigh and Triner, 2004). On the other hand, there also appears to be a substantial body of research in which models concerning readiness to e-learning including online communication self-efficacy component or a similar one were proposed (Dray et al., 2011; Hung et al.; Watkins, Leigh and Triner, 2004).

Within the scope of present study, it was aimed to study prostective teachers' ICT usage and online communication self-efficacy levels with referance to some demographic variables such as gender, department, and grade level. Thus, it was determined how much prospective teachers trust themselves in both ICT usage and online communication. In this manner, it was ascertained with the combination of these two concepts how much ready they are for e-learning as teachers of the future even though readiness to e-learning is not limited to these two concepts, yet had to be limited due to space restrictions obligated in current study.

2. Method

2.1. Sampling and population

The sample of the study consisted of 1693 volunteer prospective teachers enrolled in any program at Faculty of Education of Hacettepe University, whereas the population of the study was Faculty of Education of Hacettepe University. The data were gathered during spring term of 2013-2014 academic year. Convenient sampling method was employed. The distribution, mean, and standard deviation of sample with regard to some demographic variables are illustrated in Table 2.

2.2. Data collection tool

In order to collect data, two scales were utilized in current study. First scale used to measure the construct of ICT usage self-efficacy is comprised of twelve items, while second scale used to measure the construct of online communication self-efficacy is comprised of five items. The sample items are given in Table 1.

Table 1. Sample items from the measurement tools

ICT usage self-efficacy
I can easily use windows operating systems
I can easily use office programs (word, excel, and power point)
I can easily use web browsers (Internet Explorer, Google Chrome etc)
I can easily reach the information I seek for on the internet
Online communication self-efficacy
1) I can easily express myself in written communication (emotions, jokes etc)

IETC 2014

2) I can easily pose questions in online discussion environments

After the scales were administered to participants, the obtained data were analyzed based on structural equation modeling. In order to determine fit between empirical and hypothesized model, four goodness-of-fit indices, which are NFI, NNFI, CFI, and lastly IFI, were reported for supporting the factorial validity of the scales. The values of these are respectively as follows: .96, .95, .96, .96. On the other hand, Cronbach Alpha reliability coefficients of ICT usage and online communication self-efficacy scales were respectively found as .89 and .85. These values are satisfactory in accordance with the recommendation of Nunnally and Bernstein (1994), Schermelleh-Engel and Moosbrugger (2003). The standardized solution screen of the measurement tool is provided in Figure 1.

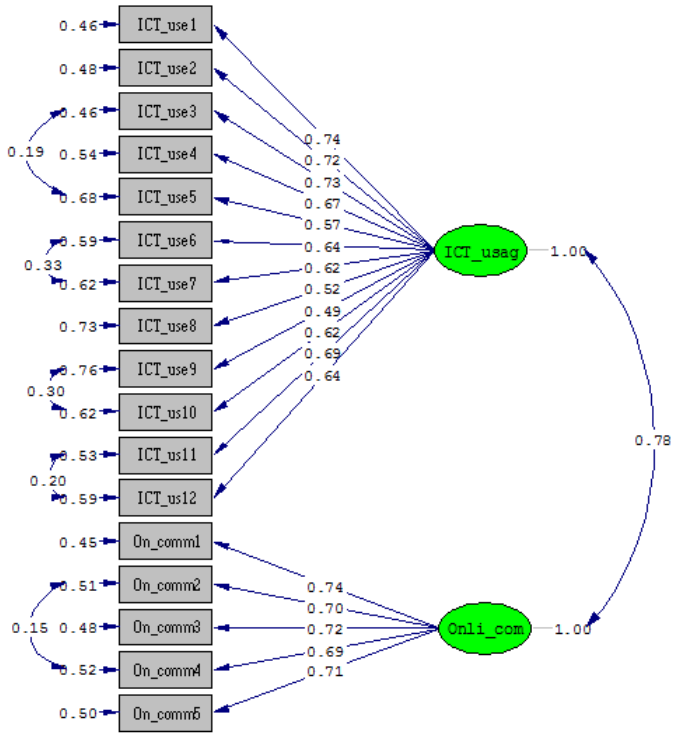

Figure 1. Construct validity of the measurement tools (Standardized Solution Screen)

2.3. Process

First, a project application was made to Scientific Research Projects Coordination Unit of Hacettepe University. Subsequently, required ethical permission from Hacettepe University Ethics Commission and administrative permission from the deanship of Faculty of Education were obtained. After that, an optical form was prepared to facilitate the data collection process. Moreover, a ball point pen and a lead pencil were given to participants as present.

2.4. Analysis

In this study, with the aim of determining differences in prospective teachers' ICT usage and online communication self-efficacy levels, overall scale scores and descriptive statistics were respectively obtained and the differences with reference to independent variables were examined. For a detailed descriptive statistics of the sample, please see Table 2.

Table 2. The distribution, mean, and standard deviation of sample with regard to gender, grade level, and department

Demographic variable	Frequency	ICT Usage Self-efficacy	Online Communication Self-

				efficacy	
		Mean	Std. Dev.	Mean	Std. Dev.
Gender					
Male	336	5.93	.86	5.98	1.03

* Computer Education and Instructional Technologies
** Primary Mathematics Education
*** Psychological Counseling and Guidance

In this study, means obtained with respect to levels of independent variables were aimed to be compared in terms of a linear model such as ANOVA. However, such linear models are based on a number of assumptions, the most important of which is the normal distribution of data set. That is why, first, Kolmogorov-Smirnov test was performed to check if data is normally distributed. Since the data show a non-uniform distribution, Kruskal-Wallis Test instead of ANOVA was performed to determine as to whether there is a statistically significant difference or not. Significance level was set as .05.

3. Finding

In this part, findings regarding prospective teachers' ICT usage and online communication self-efficacy levels were reported.

3.1. Findings regarding prospective teachers' ICT usage self-efficacy levels

In this part, findings concerning prospective teachers' ICT usage self-efficacy levels were adverted (See. Table 3).

Table 3. Demographic findings regarding prospective teachers' ICT usage self-efficacy levels

Demographic variable	Chi-Square	Asymp. Sig
Gender	46.70	.000
Grade level	20.94	.000
Department	184.78	.000

As it is illustrated above in Table 3, there was concluded to be a significant difference between female and male prospective teachers in ICT usage self-efficacy levels (p=.000,χ^2=46.70). The difference is in the favor of male ones. When it comes to the finding about grade level, it was revealed that there is also statistically significant difference among grade levels (p=.000,χ^2=20.94). Prospective teachers' ICT usage self-efficacy levels are noted to rise steadily until senior year where it diminishes a little. Lastly, like two prior variables it was seen there is statistically significant difference in the prospective teachers' ICT usage self-efficacy levels with reference to department in which they are enrolled (p=.000,χ^2=184.78). It was concluded that the department of Computer Education and Instructional Technologies (CEIT) has the highest score, while the department of Psychological Counseling and Guidance has the lowest.

IETC 2014

3.2. Findings regarding prospective teachers' online communication self-efficacy levels

In this part, findings regarding online communication self-efficacy levels were touched upon (Sea.Table 4).

Table 4. Demographic findings regarding prospective teachers' online communication self-efficacy levels

Demographic variable	Chi-Square	Asymp. Sig
Gender	33.03	.000
Grade level	7.01	.072
Department	141.64	.000

First, as shown in Table 4 there was found to be a statistically significant difference pertaining to prospective teachers' online communication self-efficacy levels with regard to gender (p=.000,χ^2=33.03). Male prospective teachers are noted to have much greater online learning self-efficacy levels than female ones do. As far as prospective teachers' grade levels are concerned, in contrast to gender, statistically non-significant difference was obtained (p=.072,χ^2=7.01). Finally, with regard to prospective teachers' departments it was concluded there was a significant difference at the level of .05 (p=.000,χ^2=141.64). It was revealed that prospective teachers of language education departments (English, French, and German) and the department of CEIT have a great deal higher online communication self-efficacy levels than prospective teachers of other departments do.

3.3. The relationship between prospective teachers' ICT usage and online communication self-efficacy levels

Together with other aforementioned finding, it was also revealed that there is statistically significant positive strong relationship between prospective teacher' ICT usage and online communication self-efficacy levels (r=.78)

4. Discussion

In this part, findings regarding prospective teacher' ICT usage and online communication self-efficacy levels were discussed in term of some demographic variables, which are gender, grade level, and department.

4.1. Discussion regarding prospective teachers' ICT usage self-efficacy levels

In the present study, a statistically significant difference was found in terms of gender in the ICT usage self-efficacy construct. More specifically, males were found to have greater ICT usage self-efficacy levels than female counterparts did. In a study conducted with university students Hung et al. (2010), on the contrary, found that there is no significant difference with respect to gender in the factor of computer/internet self-efficacy. Likewise, in Bunz, Curry and Voon's (2007) study there is no gender difference in computer competency component. Unlike two above studies, Moftakhari (2013) revealed that the use of technology readiness of males is higher than that of females. Conversely, Shen, Cho, Tsai, and Marra (2013) revealed that female students have greater self-efficacies to handle tools in a Content Management System (CMS). As exemplified above, there is no strong agreement in the literature as to whether there is an impact of gender on prospective teachers' ICT usage self-efficacy levels.

When it comes to discussion of grade level with respect to prospective teachers' ICT usage self-efficacy levels, it was concluded that there are statistically significant difference. The difference is in the favor of more experienced students. This finding is contrary to that of Hung et al. (2010) where no difference exists. In a study carried out with prospective teachers Akkoyunlu and Kurbanoğlu (2003), on the other hand, found that the prospective teachers' computer self-efficacy perception levels boost as grade level

IETC 2014

promotes. As seen, in the literature it is not clear whether grade level affects prospective teachers' ICT usage self-efficacy levels or not.

As far as prospective teachers' ICT usage self-efficacy levels in terms of department are concerned, it was revealed that there is a statistically significant difference. As expected, the department of CEIT has the highest score. Akkoyunlu and Kurbanoğlu (2003) were seen to reach a congruent result in a study. They found that students of CEIT had higher computer self-efficacy levels compared to those students from other departments. Additionally, Moftakhari (2013) concluded that university students' use of technology readiness levels vary depending on their departments with English Linguistics, Turkish Folklore, and Information management having the highest scores while Philosophy, and French Language and Literature having the lowest ones. To sum up, there is an evident consensus that department influences university students' ICT usage self-efficacy levels. Expectedly, CEIT students have greater ICT usage self-efficacy levels than students of other departments do in that there are many courses teaching how to utilize ICT technologies in the curriculum of the department of CEIT.

4.2. Discussion regarding prospective teachers' online communication self-efficacy levels

As it is in ICT usage self-efficacy construct, researchers concluded that prospective teachers' online communication self-efficacy levels vary with respect to gender. Furthermore, the results of present study show that males possess greater online communication self-efficacy levels compared to females. This finding is inconsistent with that of Hung et al. (2010). On the other hand, Caspi, Chajuta, and Saportaa (2008) revealed that women prefer written communication more than men do. Similarly, Shen et al. (2013) came to the conclusion that female students have higher self-efficacy levels to interact with both instructors and classmates for academic purposes. In contrast to the findings of Caspi et al (2008) and Shen et al (2013), the finding of Bernard, Brauer, Abrami, and Surkes (2004) is seen to be consistent with that of Hung et al (2010). In conclusion, in the literature there appear to be a number of contradicting findings pertaining to prospective teachers' online communication self-efficacy levels with respect to gender; therefore, it is rather hard to draw a precise conclusion about it.

The only non-significant difference attained within current research is that there is no statistically significant difference in the prospective teachers' online communication self-efficacy levels with reference to grade level. On the contrary, in a study carried out by Hung et al. (2010) whose related finding is not in line with present one, junior and senior college students exhibit significantly greater readiness in online communication self-efficacy construct than freshman and sophomore ones do. Since there being no adequate research pertaining to the previously mentioned construct, to conclude something precise and meaningful is quite hard. On the other hand, it was found that there is a statistically significant difference in the prospective teachers' online communication self-efficacy levels according to department in which those students are enrolled. The difference was expectedly in favor of language education departments (English, French, and German) and CEIT inasmuch as language education departments by their nature deal with language, which is a communication tool in essence. As far as CEIT is concerned, within present study "online" communication self-efficacy construct was examined instead of just verbal, written or other communication ways or patterns, which do not entail ICT usage skills or competency, so given that CEIT students take great many courses and consequently get accustomed to those online tools and doing things in online way much more than students of other departments do. Nonetheless, there seems to be no study in the literature neither supporting nor disapproving this finding.

4.3. Discussion regarding the relationship between prospective teachers' ICT usage and online communication self-efficacy levels

The findings of the current study suggest that there is statistically significant positive strong relationship between prospective teachers' ICT usage and online communication self-efficacy levels. In contrast, Hung et al. (2010) reported that there is almost no relationship between mentioned constructs. On the contrary, Yurdugül and Alsancak-Sarıkaya (2013) indicated that there is strong relationship between above-mentioned constructs.

IECT 2014

As it might be inferred from the findings above, it is vague as to whether there exists a statistically significant relationship between above-mentioned constructs. Some findings of current study are different from those of some other ones cited in this study and this situation may stem from the fact that the sample of some studies is comprised of university students while that of current study is exclusively comprised of prospective teachers.

5. Implications

There appears to be very few studies regarding prospective teachers' ICT usage and online communication self-efficacy levels and the consequences of these studies seem to be contradictory; therefore, more study should be conducted in order to obtain results that are more consistent. Besides, more courses related to integration of technology into education could be added to curriculum of all departments in order that students will have higher levels of ICT usage self-efficacy and become better at communication via online tools.

Acknowledgements

We, as the authors of the present study, would like express our deepest thanks to Scientific Research Projects Coordination Unit of Hacettepe University because of its vital financial aid, without which present study could not have been carried out.

IETC 2014

The impact of international student mobility on subsequent employment and professional career: a large-scale survey among polish former erasmus students

Paweł Bryła135
University of Lodz, Faculty of International and Political Studies, Narutowicza 59a, 90-131 Lodz, Poland

Abstract

The Erasmus programme contributes to quality improvement in higher education at 3 levels: system (policy), institutional, and individual, and thus enhances employability of university graduates who have taken part in Erasmus mobility. This paper aims to present selected results of a large-scale empirical study on the impact of international student mobility on subsequent employability and professional career. We addressed our questionnaire to 14705 Polish alumni, including all Erasmus programme participants in 2007 and 2008. We have received 2450 completed questionnaires. As the survey was conducted in 2012, the respondents could report their professional career over 5-6 years after the return from a study period abroad. Only 1.6% of the former international student mobility participants mentioned they had never worked, with a vast majority having a white-collar job or even a managerial position. As much as 68.6% reported they had ever worked abroad. We wanted our respondents to estimate the importance of selected factors for their career development and job position. Higher education and proficiency in foreign languages were judged very important by the majority of our study subjects. 1/3 of former international student mobility participants considered international experience to have a very important influence on their professional development and position.

Keywords: international student mobility; Erasmus; Poland; employability; professional career

IETC 2014

1. Introduction

One of the principal tendencies in current university education is the internationalization process (Bryła, 2012), which includes international student mobility. Poland, next to Turkey, is one of the most dynamic participants of the European student exchange programme Erasmus, even though certain obstacles to international student mobility persist (Bryła & Ciabiada, 2014).

Temporary study in another European country has remained an exceptional and professionally highly rewarded experience for students from Central and Eastern European countries (Teichler & Janson, 2007). The Erasmus programme enhances the employability of graduates by enabling them to participate in an international collaborative project without the need to extend their degree length (James, 2013). The concept of mobile learning encompasses three dimensions: mobility of the technology, learner mobility, and mobility of the learning process and the flow of information (El-Hussein & Osman, 2010). This paper will focus on the second and third dimensions, as it aims to examine the impact of international student mobility on subsequent employability of Polish former Erasmus students on the basis of a large-scale survey. Certain elements of intercultural education may be achieved within international online learning communities (Xiaojing et al., 2010; Taras et al., 2012; Taras et al., 2013), but it seems justified to argue

* Tel.: +48 42 665 58 30; fax: +48 42 665 58 31.
E-mail address: pbryla@uni.lodz.pl

that participation in international student mobility programmes, like Erasmus in Europe, allows to obtain a much wider and more intensive educational and social experience, which will have strong implications for the subsequent professional career. A recent study based on data from 48 countries and regions concludes that countries aiming to attract talents from other countries should pay more attention to attract international students and encourage them to seek working opportunities in local employment markets after finishing study (Wei, 2013).

The Erasmus programme contributes to quality improvement in higher education at 3 levels: system (policy), institutional, and individual, and thus enhances employability of university graduates who have taken part in Erasmus mobility. According to the literature review reported in the European Commission (2008: 38) Erasmus impact study, the Erasmus experience has an effect on the nature of the career but not so clearly on the success of the career. Erasmus graduates are more likely to have jobs that have visible international remits, but the jobs are not necessarily higher in status or income. Employers seem to be more positive about the career effect of the Erasmus than the students themselves. The career effect is, however, not homogenous across the regions. Erasmus has a stronger effect on the careers of students from Central and Eastern European (CEE) countries compared to students from Western Europe. The long-term effects of participation in the Erasmus programme include the establishment of an international network of former Erasmus friends, which may have both private and professional character, and is usually maintained by activities in online social media, especially Facebook (Bryła, 2014).

2. Literature review

A Dutch study confirmed that learning environment is important for students' learning as well as their involvement in extra-curricular activities, and that these two elements of university education are determinants of career success (Vermeulen & Schmidt, 2008). In a survey among Erasmus students from the University of Oviedo, it was found that job prospects are an important motivating factor to engage is international student mobility, and the overall assessment of the planned stay is acceptable, good or excellent in most cases (Fombona et al., 2013). In a study quoted in (*Internationalisation…,* 2010: 11), it appeared that in the long run (more than five years after graduation), differences start to become measurable: mobile students on average were found in better-paid jobs than non-mobile students; of course, this may have been caused by self-selection, i.e. 'potentially better' students are more mobile.

On the basis of a project called VALERA (VALue of ERAsmus mobility), which focuses on establishing the impact of mobility on the mobile students' and teachers' careers within the Erasmus programme, Oliver Bracht et al. (2006) presented to the European Commission a Final Report on 'The Professional Value of Erasmus Mobility'. There were 5 target groups asked to share their perceptions of the impact of Erasmus mobility: national Erasmus agencies, ministries of education, conference of rectors/presidents/vice chancellors, umbrella organisations of employment agencies, and companies. For the questionnaire's needs Poland was grouped into Eastern Europe country group (together with Bulgaria, Hungary, Czech Republic, Latvia, Estonia, Lithuania, Slovakia, Romania, and Slovenia). The survey shows that formerly mobile students are considered by most experts to be superior to non-mobile students with respect to various competences. On average, in all 9 mentioned competences Erasmus students are better rated than non-mobile students. Many experts agree that former Erasmus students are in a better situation when it comes to job search. 68% of experts surveyed in East Country Group think that mobile students have a better chance of being taken into consideration as one of the final candidates by employers. More than a half of surveyed (58%) believe that former Erasmus students spend less time on job search than their non-mobile fellows. According to ½ of Erasmus experts, former Erasmus students will get employed sooner than non-mobile students. The interviewed experts believe that participation in Erasmus improves the characteristics of employment and work.

Apart from expert opinions, Bracht et al. (2006: 50-51) investigated mobility from the perspective of students. The questionnaire addressed primarily the career of former Erasmus students after graduation, i.e. the transition to employment, the early employment history thereafter and the actual employment and work situation at the time the survey was conducted. A broad range of indicators of professional success was employed: (a) graduation and job search, (b) initial employment, (c) present activity, (d) employment

IETC 2014

situation and status at the time of the survey, (e) links between study and work assignment, (f) links between orientations and assessment of the professional situation, (g) international aspects of employment and work (working in an international context, international tasks, European and international mobility).

Furthermore, an employers' survey was undertaken in the study on the professional value of Erasmus mobility (Bracht et al., 2006: 84). The following themes were addressed in it: basic information on the employing organisation and their staff, including their international activities; actual numbers of university graduates recruited and former Erasmus students and other internationally mobile students among them; modes and criteria of recruiting university graduates; perceived competences of former Erasmus students; positions and assignments of former Erasmus students; demands of the organisations with respect to competences potentially fostered by study in another country; perceived match or mismatch with supply and suggestions for the change of European and international activities of the universities. Employers from Central and Eastern Europe attach more importance to their candidates' international experiences than their Western European counterparts. 48% of the surveyed employers in Central and Eastern Europe said that work experience abroad was an important recruitment criterion, compared to 27% in Western Europe. 41% of respondents in Central and Eastern Europe expressed such an opinion regarding a study abroad period, whereas it was shared by only 25% of employers in Western Europe. The most important recruitment criteria in Central and Eastern Europe included: personality (indicated by 89% of respondents), foreign language proficiency (87%), and computer skills (87%) (Bracht et al., 2006: 90). It is worth noting that all these competences are likely to be improved during student mobility. Employers from Central and Eastern Europe appreciating study periods abroad in their selection among candidates were asked to rate the importance of different characteristics of the study period abroad. Actually, they emphasised: the language spoken Turing the study period abroad (83%), the subject area (67%), length of the study period abroad (58%), the specific host country (55%), and reputation of the host higher education institution (49%).

Over 90% of Polish outgoing Erasmus students believe that the study period abroad may be helpful in their future professional careers (Kolanowska, 2008a: 85). In a study of Kolanowska (2008b: 13), only 14.3% of Polish universities reported they collected information on the impact of the Erasmus study or placement on the employability of graduates. Only 7 universities provided more detailed information on this question. They mentioned that they collected this kind of information with the use of surveys conducted by university career offices, e-mails and talks with alumni, and individually obtained information from former Erasmus grant holders. Unfortunately, the quoted study asked only about the way of collecting the information, and not about actual findings concerning employability of former Erasmus students.

In an article for *Dziennik Gazeta Wyborcza,* Prof. Barbara Kudrycka, Polish Minister of Science said: "*Studies at another university, in another city or country allow to get rid of complexes, believe in yourself and get to know your own value. A better educated and more mobile students are beneficial to themselves and the economy*" (Grabek, 2011). Mr Jan Truszczyński (General Director for EU Education and Culture in the European Commission since October 2009*)* in the interview with Mr Roman Gutkowski from EurAactiv said: "*Scientific studies have shown that students who went on scholarships abroad, after completing their studies are more likely to find a good job quickly, and a few years after graduation they earn more than their fellows who had no contact with other than their own university, with a different foreign language, with a different culture than his/her own. Even young people who learn in vocational schools and had the opportunity to participate in a few-week internship abroad, take advantage of it, which pays off in the future*" (Truszczyński, 2011).

In a case study developed by Vossensteyn et al. (2010: 102), there are some interesting opinions of Erasmus participants from Poland. One of the perceives the participation in Erasmus mobility as a kind of investment in the professional career: "*Students that are motivated to take part in the Erasmus programme know that they are investing in their careers and that is the great drive and incentive for them to go to study abroad. They are aware of the fact that they are investing in themselves*". The relationship between participation in the Erasmus and the financial benefits acquired is stressed by a participant who claimed that: "*We found that internships of all kinds are highly valued by potential employers, and an internship abroad is definitely an 'added value' to a graduate's diploma*". According to Bótas & Huisman (2013), Polish students' participation in the Erasmus programme has a positive impact on their academic achievement, cultural, social and linguistic capital, but, at the same time, it has a negative impact on degree completion as they get highly paid jobs, which prevent them from fully developing their cultural capital.

3. Sample characteristics

We invited to take the survey all Polish students who had filled in their evaluation forms on the website of the Foundation for the Development of Education System regarding their Erasmus mobility for studies in 2007 (5942 study subjects) and 2008 (6635 study subjects). We added to the sample all graduates from the Faculty of International and Political Studies of the University of Lodz (2128 study subjects) in order to create a control group of internationally immobile students and some representatives of various age cohorts. Thus altogether we addressed our questionnaire to 14705 Polish students through the Internet professional survey service called moje-ankiety.pl in November and December 2012. We received 2450 completed questionnaires. Therefore, the response rate amounted to 16.7%, which may be considered a very good result for this kind of research methodology, taking into account the length of the questionnaire and the associated time and effort required to fill it in.

2369 of our study subjects studied abroad for at least a semester or trimester, whereas 81 did not take part in such mobility. Out of the 2369 study participants who had had a study period abroad, 82.6% studied abroad once, 14.5% twice, 2.1% three times, and 0.7% more than 3 times.

27.7% of our respondents in the former international student mobility sample were males, and 72.3% were females. In the control group, there were 79.0% of females and 21.0% males. This result may be due to several factors, including the higher participation of women in university education and their higher propensity to take part in surveys.

We have obtained answers from former Erasmus students representing 115 Polish higher education institutions. Therefore, our sample is very diverse and resembles very well the general population of all Polish outgoing Erasmus students. Unsurprisingly, the ranking is led by the biggest state-owned universities. The top 5 include: University of Warsaw, Adam Mickiewicz University of Poznan, University of Lodz, University of Wroclaw, and the Jagiellonian University of Cracow. The third rank of the University of Lodz stems partly from its remarkable performance within the Erasmus programme and partly from the extension of our sample to other age cohorts from the Faculty of International and Political Studies. It is also worth noting the high positions occupied by technical universities, including the Technical University of Lodz, which was the 6th regarding the number of respondents. We were unable to identify the home university of almost 6% of our respondents due to incomplete data, ambivalent abbreviations, mistakes, and deliberate refusal to provide the information.

22.3% of the internationally mobile Polish students in our sample took part in their mobility at the Bachelor level of studies, 78.2% at the Master level, 4.6% at the doctoral studies level, and 4.1% said it was another level of studies (including 5-year studies leading to a Master, engineer studies, medical studies, non-degree studies, postgraduate studies, MBA, MFA, after completing studies in Poland, study sessions/certificates, a language course, a college, secondary school, a thematic Socrates course, a summer school, a research scholarship).

Our respondents reported having taken part in international student mobility, which lasted (for the first time) usually a semester (62.9% of answers). Less than 1/3 of the study subjects studied abroad for a year, and only 2.2% spent there more than one year. As far as the second and third-time mobility is concerned, its duration tends to be longer, but these are relatively rare cases.

The main destination countries for the student (first-time) mobility of our study subjects were: Germany, Spain, France, Denmark, UK, Portugal, Finland, Belgium and Italy (**table 1**). In total, 37 host countries are represented in our sample, as it concerns not only Erasmus mobility, but all kinds of student mobility. Nevertheless, Erasmus accounts for a vast majority of destination countries mentioned by our respondents.

Table 1. Our respondents by international student mobility host country

IETC 2014

4. Selected results

We wanted to know the current job position of our study subjects who had taken part in international student mobility. It turned out that a vast majority of them (almost 2/3) had a white-collar job, with additional 8% holding managerial positions. There were 7% of self-employed in our sample. Blue-collar workers constituted 2.2%, which stems from the fact that we investigated only university graduates who were highly qualified and attractive on the labour market. There were 2.4% of trainees. Less than 5% reported unemployment, which is a very good result taking into account the situation of their age cohorts on the Polish labour market. Almost 6% were not active on the labour market as students or full-time parents, and 5% considered their job situation did not fall in any listed category, but taking into account their detailed answers, they could usually be added to the remaining categories, especially white-collar workers, self-employed, and not active on the labour market. A few performed voluntary jobs or reported working on the basis of civil law contracts instead of classical labour law arrangements (usually because of the desire of employers to avoid high obligatory social security contributions). The professional situation of respondents from the control group turned out to be even slightly better, which might be a bit surprising, but we must take into account their high competencies, including proficiency in foreign languages.

Only 1.6% of the former international student mobility participants mentioned they had never worked (compared to 2.5% in the control group). Therefore, most of those who were unemployed or inactive at the time of our survey had had some professional experience, which may be considered a very positive phenomenon. The most dangerous is long-term unemployment and lack of activity. Some spells of these are inevitable.

Which may be a bit surprising, as much as 68.6% reported they had ever worked abroad. This may be an indication of the link between international student mobility and international professional mobility. Perhaps, a considerable share of the responses concerned simultaneous working and studying abroad. In the control group, this figure was also rather high – 53.1%, probably because it comprised only graduates of international studies, who had a much higher command of foreign languages than the average Polish student.

Table 2. The duration of fixed-term job contracts among former Polish international student mobility participants (in months)

Source: own research

Among those who worked, 50.8% had a permanent job contract, 28.1% a fixed-term contract, and 21.1% another type of contract. The average duration of fixed-term contracts amounted to 21 months, and the median was 12 months (**table 2**). The duration of fixed-term contracts ranged from 1 month to 10 years. However, ¾ of the respondents with such a contract had it for 2 years or less. The other types of contract included: contracts to perform a task (civil law contracts), temporary job agency, research grant, medical traineeship, doctoral scholarship, self-employment, freelancing, apprenticeship, traineeship, teleworking, probation period, substitute job, undeclared work. In the control group, the share of those with permanent job contracts was a bit lower at 43.2%, which indicates a lower level of job stability than among former international student mobility participants. The average duration of fixed-term contracts in this group was 18.8 months (a bit less than in the main sample), while the first quartile, median and third quartile were the same as among former international student mobility participants.

We asked our respondents to define the scope of operations of their organisations (where they worked). It turned out that the majority of former international student mobility participants were engaged in organisations with an international remit of activities (53.6% compared to 17.1% having a national scope, 9.5% - regional, 11.0% - local, and 8.8% - not applicable). This may suggest certain association between the international student mobility and the selection of the future career path. There may be some additional factors influencing this result, especially the self-selection bias. Those students who take part in international mobility tend to know foreign languages better, and therefore, are more attractive for companies having an international scope of operations. Nevertheless, we may infer certain connection between these two elements. If former Erasmus students do not work abroad, they may still make use of their skills in an international organisation located in their country of origin. In the control group, the respondents who had not engaged in international student mobility defined the scope of operations of their organisations as follows: local – 13.6%, regional – 12.3%, national – 22.2%, and international – 48.1%. Even though the control group was composed of former students of international relations, it turned out their organisations were less international compared to former international student mobility participants representing all possible field of studies. If we examined graduates from other fields of studies who had not taken part in international student mobility, this difference would probably be much more pronounced, which suggests a link between the international student mobility and the level of internationalisation of the future employer.

We were interested in the self-perceived congruence of the respondents' work with their education level. Over 2/3 (67.1%) of the study subjects believe the most appropriate education level for their job is Master, whereas only 6.1% consider that higher education is not appropriate for the job they perform. It is worth mentioning the relatively high share of doctoral qualifications felt as the most appropriate (8.7%), which suggests good quality, highly demanding jobs in our sample. The relative share of Bachelor (11.9%) and Master requirements may result partly from the Polish tradition of university education. Only recently was the division into two levels of studies introduced. Previously, we had the model of continuous 5-year university education leading to a Master degree (with some minor exceptions like medicine, which lasts 6 years). In the control group, there were following perceptions of the appropriateness of education level for the current job: below higher education – 11.1%, Bachelor – 11.1%, Master – 65.4%, doctoral – 9.9%. Therefore the distribution of answers was quite similar to that in the main sample.

We wanted to get to know if the field of studies of our respondents was congruent with their job. The majority of the study subjects (52.6%) felt that their own or related field of studies corresponded well with their work. 1/6 (17.9%) believed that exclusively their own field of studies was appropriate. 12.2% reported that a completely different field of studies would be better, and 11.6% considered there was no particular field of studies appropriate for their work. These results indicate a rather strong congruence between the field of studies of our respondents and their subsequent professional career. It confirms a generally traditional view of one's career path, where early specialisation choices matter. However, there is also a considerable segment of respondents who either had difficulties in finding an appropriate job or perhaps got a job on the basis of other competencies than formal university education. The share of jobs with strictly predetermined education requirements turned out to be rather low, which suggests a certain level of flexibility on the part of employers and the importance of additional criteria in the recruitment

process. In the control group, 6.2% of respondents indicated that only their own field of study was the most appropriate for their current job, which was significantly less than in the main sample. It may suggest that proportionately more former Erasmus students perform jobs dependent on their university education choices. 45.7% replied that it was their own field of study or a similar one, 25.9% believed that it should be a completely different field, and 19.8% thought there was no particular field of studies necessary for their current job. The share of answers in the last two categories was much higher than among former international student mobility participants. It may indicate a weaker fit between the university education profile and current professional career among those who did not engage in international student mobility.

The former international student mobility participants were asked how many times they had changed their jobs. 29.8% reported no changes, because either they kept the same job throughout their career or they were not employed at all. More than ¼ (25.9%) said they had changed their job once, 18.3% twice. More than 1/5 had already changed their job three times or more (11.2% - 3 times, and 12.2% more than 3 times). Therefore, we observed a significant level of professional mobility in our sample, especially that the respondents were fairly young. The link between student mobility and subsequent professional mobility is not clear, but our results confirm the co-existence of both phenomena in our sample. As far as graduates who did not take part in international student mobility are concerned, almost 1/5 (19.8%) mentioned they had never changed their job. It was a smaller share compared to the main sample, which may support the hypothesis that Erasmus (and other kinds of international student mobility) leads to a higher level of job security in future careers. In the control group, 30.9% of the respondents reported having changed their job once, 19.8% - twice, 16.0% - three times, and 12.3% - more often.

We wanted our respondents to estimate the importance of selected factors for their career development and job position (**table 3**). Higher education and proficiency in foreign languages were judged very important by the majority of our study subjects. 1/3 of former international student mobility participants considered international experience to have a very important influence on their professional development and position. Almost 1/5 specified Erasmus mobility for studies as a key factor in this regard. Objective qualifications were much more important than informal support from one's family or friends in obtaining the job position. Other mobility programmes and Erasmus mobility for a work placement had a smaller influence, partly because of our sampling method. The respondents were free to provide additional determinants of their career. They mentioned: activity in student organisations; ambition; good quality secondary school; willingness to continue a family business; personality traits; self-confidence; professional experience; chance; thirst for experiences; interests; passions; proficiency in Excel software; qualifications as an accountant; working abroad for a few months several times; contact with the employer during one's studies; contacts established during one's studies; professional skills; marriage which led to emigration; situation on the labour market – the employers look for those who stay in Poland and are faithful to their company; self-learning; negative experiences from one's previous job; traineeship; money; joining one's partner; field of education; persistence in reaching one's goals; testing oneself; postgraduate studies; interpersonal abilities; additional trainings; improving one's competencies; specialisation as a legal advisor; voluntary jobs; technical skills; participation in the Work&Travel programme in the USA; respect from the employer abroad; knowledge of the industry. The other factors were considered very important by less than 3% of the study subjects.

5. Conclusion

The results of our large-scale survey among Polish former international student mobility participants confirm certain implications of this element of university education on their subsequent employability and professional careers. It concerns both the quality of their jobs and the scope of operations of their organisations. Erasmus mobility contributes to the acquisition of multiple skills and competencies, which are highly valued by future employers, but also constitutes a valuable social and cultural experience. The utility of international student mobility in the university education process is hard to overestimate, not only from the perspective of subsequent transition to work.

The importance of computer-aided courses in architectural education

D. Guney
Yildiz Technical Universty, Faculty of Architecture, Yildiz, Besiktas, Istanbul, 34349 Turkey

Abstract

Intensive technology usage in education has been increasing in every field recently. Because computer based visual technology has been developing and becoming the most popular trend in the recent years. In addition to these decreasing prices of the computer based systems make this trend more attractive. Architectural education is one of the most difficult and expensive education and based on visual material. That's why computers and complicated software usage in architectural education has increased dramatically. Using these software, an architecture student can perform his/her project design spending less energy-time but more realistic. But the disadvantage of these systems is to make students computer addicted and design their project without creativity. This paper aims to study advantages and disadvantages of this trend and to find a balance level. According to this concept, courses in architectural design are investigated. What kind of computer systems and software use in education is searched? Based on response of students, the advantages and disadvantages of this trend are studied.

Keywords: Type your keywords here, separated by semicolons ;

1. Main text

Computing technology has achieved in the last two decades a tremendous advance; for example processing speed and circuit density have increased by order of magnitude. The software field has also progressed considerably, with new software development tools, programming languages and methodologies. This new powerful computing environment is packaged and made available to individual users in the form of 'Personal Computers', and to engineers or designers in the form of the new generation of 'Graphical Workstations'. During the same period, continuous research and development in the computer aided design field, has enabled to harness this computer power, and provide designers with new tools. Computer based design tools offer significant advantages over traditional design practice. In fact, they allow performing design operations in ways that have never been possible before. The process of architectural design since its first inception has aimed at the production of 'good' buildings. The process itself, the teaching of design, and the evaluation methods and criteria, are subject to change and depend on the state-of-the-art in research and technology. The concept of abstraction (or modelling) in architectural design is historically linked to the level of complexity of the design product. It involves the representation of existing structures and can be described as an attempt to recreate reality. Developments in the field of computer modelling, computer graphics and more recently in cognitive psychology and artificial intelligence provide the theoretical basis to build fundamentally new tools to support the architectural design process, in particular for design abstraction and evaluation. The first generation design tools that have emerged from the early computer technology development have mainly concentrated on model building for drawing production, with the exception of few design evaluation systems. These were underpinning the graphic characteristics of traditional architectural representation, where generally the abstraction hides most of the meaning of the drawing -not to the designer, but to the computer. It is the ability of a

IETC 2014

computer aided design system to 'understand' the implicit information contained in a drawing, that gives it the 'competence' to support 'intelligent' modelling and evaluation (Belhadj, 1989).

The future of architectural education has been at the forefront of architectural debate, particularly since the recent increasing computer base education. The technological and scientific development, particularly during the last century, had a decisive role in the evolution of the construction industry. The result of this progress has been the dependence of building constructions from any climate conditions and at the same time the use of heating systems, cooling, air and lighting systems (Jencks, C., Kropf K. (eds.),2006, Klotz, H., Cook, J.W.,1981, Lampugnami, V.M., Hanisch, R., Schumann, U.M., Sonne W. (eds.), 2004).

Information technology and computer aided education have been playing more important part of the life for the recent years. The computers and information technology are widely used to develop teaching possibilities. Although education is a complex process in which human and technical resources should be used and planned very carefully, teaching and learning concepts have changed radically. Computer aided virtual education and distance learning methods might replace the classical education methods in close future. Regarding this new concepts the education on all disciplines needs evaluation and development. Computer aided techniques and courses are one of the important factors of these developments

In discussing architecture education it is important to make clear first of all how one understands architecture. Because architectural education completely different than engineering education (Guney, 2011). The making of architecture involves political, social, technical, economic, aesthetic, ethical and ecological questions: to what extent are all of these relevant to education? The problem remains even if one defines architecture as an art, for the art of building and planning certainly requires a broad understanding that at least does not exclude any of the dimensions just mentioned. Yet the best way to make people sensitive to the aesthetic qualities of architecture may not be to start with economy. From this point of view, during architectural education, student should has to have enough background for technique, mathematic, engineering, art, technology, economy, law, sociology and psychology.

Architectural education has been heavily criticized. “Architectural pedagogy has become stale” (Colomina, 2012). Education, its underlying rituals and processes, has not really changed over the past 20 years and this is one of its biggest weaknesses. Schools of architecture are struggling to keep up with the current issues that are transforming architecture practice, and students are not educated to meet the industry and wider market needs (RIBA, 2005).

Advances in technology are continuing to place new demands on the construction industry. These include advances in computer software, construction and assembly methods, and materials. Architecture practices must adapt to the changing context of technology, to work more efficiently and effectively. Building information technologies present new opportunities and challenges to the architectural profession (Andenas, Livingston and Nelson, 2012). The increased use of Building Information Modelling (BIM) programs is altering the way in which many architectural practices are working. As sustainable design advances, the search for computer software that can exchange information continues. BIM introduces an alternative form of design process, procurement and construction, and changes the responsibilities of different consultants within the design team. Stakeholders, including the client, architect, engineer, contractor and subcontractor, will be able to access the building information model. It will require ‘adaption, investment and greater teamwork between the core trades’. The BIM model is a jointly developed design process, enforcing a collaborative and interdisciplinary way of working that ensures that all parties involved record all modifications to the design and build.

2. Trends of architecture education

According to a report by The Scientific and Technological Research Council of Turkey (TUBITAK), the percentage of computer ownership among Turkish households is 12.3% in 2000. A similar research made in 1997 reports this amount as 6.5%, thus it is seen that the amount of computer ownership at homes doubled in three years. When computer ownership percentages are investigated for different income groups, it is observed that computer ownership percentage reaches to 64.7% in the high income group,

while it is 8.2% in the lower-middle and 2% in the low income group (TUBITAK 2001). According to this data, technology using is rapidly increasing. Today almost all students in department of architecture has their own lab top computer.

Rapidly developing virtual education and distance learning methods are replacing today the classical education methods. The rapid growing visualization techniques are one of the important factors of these developments. With the help of visualization techniques we are able to create computer graphics that display data, particularly multidimensional scientific data, for human interpretation. This technology becomes today an integrated part in the education and used to develop attractive presentations especially for three-dimensional cases, which the students have difficulties to understand.

2.1. Goals of computer aided education (cae)

The use of computer networks and information technology are becoming an important part of the everyday work on almost any profession, especially in the scientific areas and changed education concepts and many universities and education organizations decided to plan new strategies concerning computer based technologies. As a result of these developments Computer Aided Education (CAE) methods came out. These methods have been utilized and developed more than for fifteen years in many universities and organizations. The goal of CAE is to develop the learning capacity of students and increase the teaching productivity and effectiveness of instructors with the help of advanced computer based technology. This technology should be an integrated part in the education. It is also desirable to use this technology to develop attractive courses for distance education. Another area of interest is to use computers, information technology and equipment to develop attractive and understandable demonstrations of basically tasks and typical projects in the field of architectural education.

2.2. Advantages of cae

Using CAE methods students can state and explain the basic concepts in the subject easily and are able to participate in discussions of advanced concepts related to the subject content. With the visualization techniques computer graphics images are created and these images display the data and the mathematical relations of the interested subject for the interpretation, particularly of multidimensional cases. CAE provides also the substructure for interactively communication possibilities with international colleagues and presentation of the subject interested worldwide.

3. Design process and computer aided education in architecture

3.1. Computer aided architectural design (caad).

When generating models of buildings on computers, the only aspects that can be modeled are those which can be quantified, it is on these quantifiable elements that the evaluation will take place. Generally, it consists of three operations;

1. Measuring the model,
2. Performing calculations on those measurements and then
3. Comparing the results with targeted performances.

The building 'prototype' would be a three-dimensional building model, either computer generated or human generated. The computer aided architectural design process would then consist of evaluating the design solutions by comparison with computer models of existing buildings as shown in Fig. 1.

IETC 2014

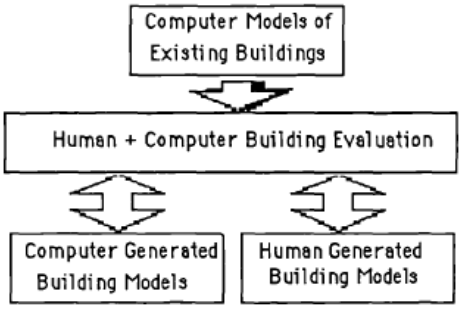

Fig. 1. Human/computer architectural design interaction.

According to Shaviv (1987), alternative design solutions should be generated automatically; according to design requirements formulated as constraints and as objective functions. Then, the generated alternative would be evaluated and appraised by means of automatic programs. Finally, the deficiencies of the proposed solution, identified by the evaluation, would be rectified through the automatic or manual generation of new and better design alternatives.

3.2. Computer aided architectural education concept

The first step of analyzing CAAD education is to understand "why" it is important. We believe that the increasing importance of CAAD is largely due to the new possibilities and modes of design thinking that it brought to architectural design. Earlier conception of the use of computers in design was the vision of a tool which "assists" existing design processes (Mitchell, 1994). During the 1980s, computers have been increasingly used for drafting purposes, a design activity which is now almost completely computerized in architectural offices. If the role of computer in architectural design remained merely as a drafting tool, its effect on architectural education would not be much different than that of pencils and drawing papers. However, beginning from the 1990s, developments in CAAD opened up new perspectives and challenged existing processes. Due to new visualization software, forms once were difficult to imagine became easy to produce and the "virtual" established as a legitimate architectural object. The next important change was the implementation of network technologies which gave rise to CSCW (Computer Supported Collaborative Work) and e-commerce. CSCW enabled collaboration of geographically distributed design professionals and formation of "virtual teams" (Tasli, 1999). All of these events have affected traditional architectural design practices, although the impact was less far-reaching compared to large industries such as aerospace and automotive. The reason for this is probably the peculiar characteristics of the building industry. The building industry is more fragmented, project-specific and culturally diverse compared to the other industries (Pektas and Pultar, 2006). These factors hindered transformation of conventional practices in some extent, however, the incremental change is still in progress.

A key topic for CAAD education is the content. "What" should be taught as CAAD, the theories, the methods, or the skills? Is CAAD an essential part of architectural thinking or just another skill that can be sought for competitiveness in the job market? Two opposite ends can be defined with respect to this question. Some view CAAD simply as a skill (Novitski, 1999) and others advocate that CAAD teaching should be related to the theories of architecture and/or should develop its own "digital design theory" (Oxman, 2006). Because of the wide diversity of the approaches to CAAD, categorizing the domain of digital design is a difficult task and of course, many interesting approaches are somewhere in between. Design ability is based on imagination. However CAAD supports architect to improve and visualization of his/her imagination as shown in Fig. 2.

IECT 2014

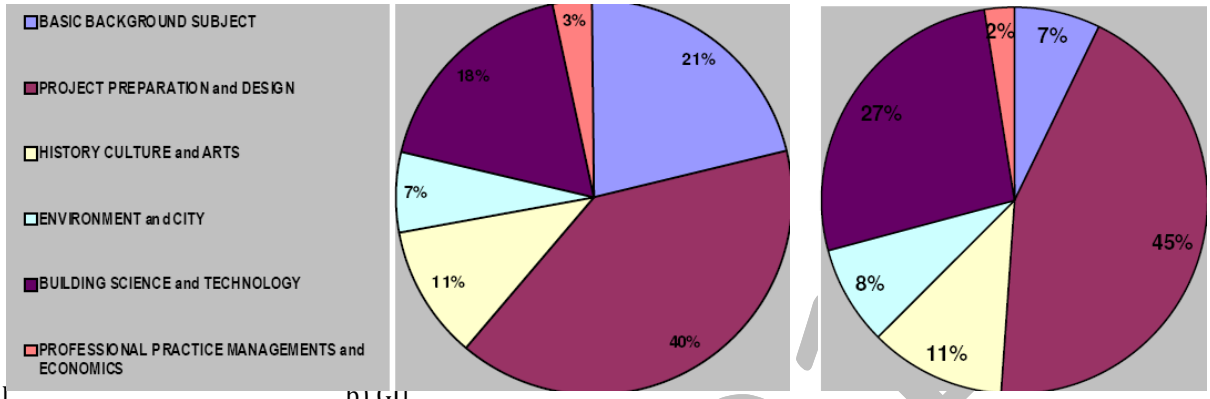
Fig. 2. Hand sketch and CAAD drawing.

The conception of CAAD as a skill has been promoted mostly by practitioners and pragmatists due to the fact that CAAD has already become a driving force for architectural market. In a recent survey, practicing Turkish architects were asked to identify the factors that have been most influential in architectural practice within the last ten years. Following the developments in construction materials, computer technologies ranked second in a number of factors. Moreover, the factors ranked third and fourth in the survey were also related to computers; namely, Internet and communication technologies and CAD technology (YEM, 2006). Under the demanding market conditions, architects seek for competence in the production of digital renderings, animations and construction documents while employing new graduates. Due to these developments and to the massive increase in architecture graduates, manual drafters with no architectural education have disappeared in recent years. They have been replaced by CAAD operators probably about half of whom are qualified architects (Stevens, 1997). Regarding these issues, schools are forced to shape the content of their CAAD curriculum to provide necessary skills and a competitive advantage for their graduates.

3.3. Computer aided architectural education in turkey

CAD teaching is now a part of curricula in almost every architectural school; however, it seems that the rapid implementation of computers in design education has caught academia unprepared to develop a pedagogy for a digital practice. Studies which focus on the use of CAD in design education are mostly theoretical and/or descriptive in their research approach. Few empirical studies – which test their hypotheses statistically – have been reported in the literature (Hanna & Barber 2001). Attitudes of students toward the use of computers in design are one of the neglected issues in that respect. Most of the descriptive studies in this field imply that students have positive attitudes toward computer usage in design, however, a systematic examination of this attitude and its correlates is lacking.

The relation between the students' and teachers' attitudes toward computers is one of the controversial issues in computer attitude research. Some researchers have suggested a relation between the student and teacher attitudes toward computers. For example, Downes (1993) reported that a good role model, in the form of a classroom teacher who uses computers, leads to more positive attitudes toward computers for secondary school students. On the other hand, there are often differences between students and teachers in their attitudes to information technology (Zoller & Donn 1993). Smith (1986) showed that teacher computer efficacy scores are significantly and negatively related to that of students. Then, she commented that as students' confidence went up with more exposure to computer classes, apparently teachers' confidence went down. Previous research revealed that studio instructors of the Department of Interior Architecture and Environmental Design (IAED) are not very willing to use computer technology in their professional studies (Erkip et al. 1997).

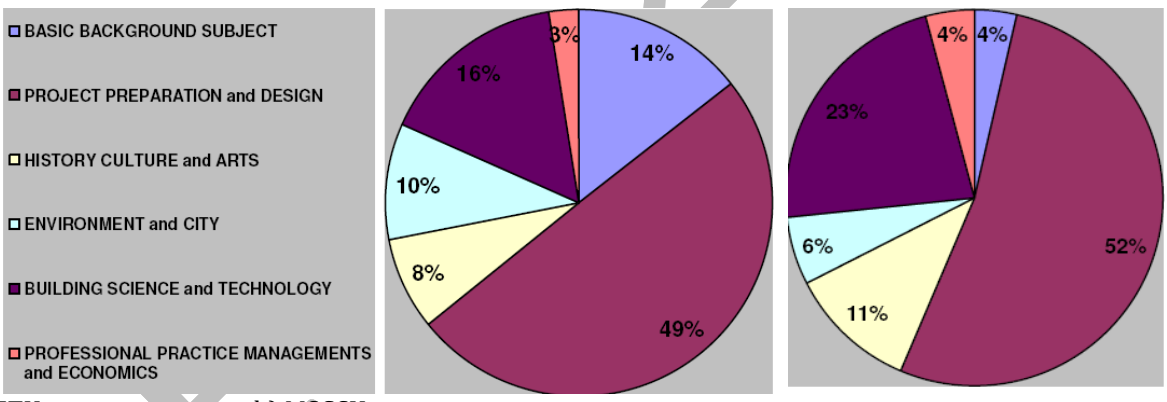


Istanbul Technical University (ITU), Department of Architecture is one of the oldest (university established in 1773) in Turkey. Gazi University Department of Architecture is other well-known department (university established in 1982) in Turkey. The distribution of the courses in ITU and GU according to groups is shown in Fig. 3a and 3b.

CAAD courses are evaluated as "Building science and technology" group. According to ITU, the focus of education in ITU Department of Architecture is % 15 vocational, % 25 arts oriented, %35 academically oriented, %25 technique oriented. Among the 1441 students, 788 (%55) student of the total number is receiving education in bachelor phase, while 457 (%32) students in master and 196 (%14) in PhD phase.

IETC 2014

Regarding the student involvement in research process, students of GU Department of Architecture in bachelor is %82, in master %12, and in PhD %6.



Middle East Technical University (METU), Department of Architecture is another important department (university established in 1956 with the support of Pennsylvania University (USA) and United Nations (UN)) in Turkey. . Regarding the student involvement in research process, students of METU Department of Architecture in bachelor is %57, in master %27, and in PhD %16.

a) ITU b) GU

Fig. 3. Distribution of courses in ITU and GU Department of Architecture.

Mimar Sinan Fine Arts University (MSGSU), Department of Architecture is another oldest department (university established in 1883) in Turkey. Regarding the student involvement in research process, students of METU Department of Architecture in bachelor is %88, in master %8, and in PhD %4. The distribution of the courses in METU and GU according to groups is shown in Fig. 4a and 4b (Ozelgul, 2009).

a) METU b) MSGSU

Fig. 4. Distribution of courses in METU and MSGSU Department of Architecture

Five well known architectural departments' curriculums are studied. These departments are ITU (Istanbul Tech. Univ.), METU (Middle East Tech. Univ.), Gazi University (GU), MSGSU (Mimar Sinan Güzel Sanatlar Üniversitesi), YTU (Yildiz Technical University). According to their curriculum, compulsory technology courses (CAAD based) are investigated and details are given below:

The comparison of the weight of CAAD courses credits distribution is given in Table 1. Of course there are more elective course related with CAAD subjects. This table (Table 1) just gives us an idea about existing situation based on compulsory courses.

Table 1. Weight of CAAD courses distribution according to universities in Turkey.

Name of the university	Total Credit	CAAD Credits	Percentage (%)
ITU	153	8.5	5.6

METU	154	16	10.4
GU	144	13.5	9.4
MSGSU	176	9	5.1
YTU	180	14	7.8

3.4. Analysis of advantages and disadvantages of caad.

Similar to all technology intensive courses, CAAD courses have positive and negative effects to the architectural student education. Generally if technology is properly used and effectively organized the consequences are very useful. However, if technology is replaced with education in this case results are maleficent to the student education.

Advantages:
Easy storage and sharing
Faster design stages
Easy to make revisions on the design
Drawing more alternative designs
More precise and accurate design
Better understanding, evaluation and reproducing for design environment and purposes
Remote control and sharing
3D visualization
Time saving
Better and faster communication with following projects (structural, mechanical, electrical, landscape, interior etc. design)
Avoids coincidences of improper structural, mechanical and electrical equipment

Disadvantages:
Decreasing design and imagination ability of students
Negative impact of CAD on contemporary design creativity
Low quality design
Technology addiction
Less personal contact and interaction between students and advisors
Instead of better design, better visual outputs are preferred
Inadequate literature follow

As show above, CAAD has both advantages and disadvantages. The most import thing is how to balance these positive and negative effects of technology intensive education. In this stage, university, faculty and advisor vision and behavior is too important.

There is plenty of evidence that CAD is now widely used in the profession. The most worrying recent evidence regarding CAD is that of student work. There is a growing feeling that a worrying trend is developing. Many students' project and design have been controlled and examined. In each case, I found examples of students combining impressive and convincing computer presentations with poor design which is the worst negative effect of CAAD. Of course, the software cannot intend anything, and certainly the developers did not intend such results, but the effect remains. This phenomenon can also be illustrated with reference to the graphic design (Lawson, 2002).

A small but significant and growing proportion of student work all seems to exhibit similar common characteristics. Because it is possible to produce a certain kind of 3D form in a CAD package, the student does so, bypassing that critical visual editing faculty that we try to inculcate in design schools. Even worse, some of these forms are relatively easy to generate in CAD but are hard to represent in manual perspective—for example, shell forms based on ellipsoidal sections, rotations of curved parabolic forms and so on. Perhaps this encourages students to believe that because they have drawn something infrequently seen, they are being creative. Another problem is that the software is usually a generic 3D package that can only handle form in the abstract—it does not address or comprehend the construction or materiality of the objects represented. Contrast this again with the work of Santiago Calatrava. Many of his original design drawings are freehand watercolors, but are approximately to scale. His staff, after they have applied all

IETC 2014

their sophisticated engineering software to these forms, often calculates them to be very near the size his original sketch showed. Calatrava knows about materials and their strengths, weaknesses and structural characteristics. Now, it is quite possible today to take a position about architecture that relegates structure to a purely supporting role. The negative effects should be minimized; the positive effects should be maximized by applying correct assumption.

4. Conclusions

In this paper, a framework for addressing most of the important aspects of computer aided education in architecture is analyzed. In architectural education, computers and visualization software are creating interesting opportunities for design experimentation and less energy-time consuming for designer. However, it is increasingly observed that, such experimentation is not well connected to building real-life projects. Parametric 3D modelling and dynamic simulation in virtual environments enable students to evaluate future performances of designs and developments in this area seem promising for bridging the gap between the fantasies of digital world and the materiality of the real-life. As costs of such systems decrease and their compatibility with modelling software increase, more educators will be able to utilize them and we may have a better understanding of how to teach students to design digitally. CAAD education research has already established with its own knowledge base and research methods. It is suggested that CAAD education should focus more on better interaction between real and virtual environment to better respond to the demands of the market and students personnel progress. Otherwise students CAAD operation capability will increase however their creativity and project quality will decrease. We will have very presentable, colorful, charming projects and drawings but these projects will probably distant from execution and real life. When these unsatisfactory projects would be executed, builders on site would experience serious troubles caused by insufficient projects.

Many famous architects do not themselves use computers or CAAD directly. Thus, while Ian Ritchie creates innovative structural form with CAAD, Santiago Calatrava also creates highly original structural form, but does not use CAAD directly. He uses CAAD for finite element (FEM) structural analysis but uses physical models for form generation. This is remarkable for two basic reasons. First, Santiago Calatrava is not only an architect but also an engineer and is clearly highly numerate and used to working with computers. Second, he creates adventurous forms that are too complicated and difficult to draw by hand, but he prefers making physical models to using computers namely CAAD. Many architects who would be viewed by their peers as creative contributors to the field have expressed concern about using CAAD for design.

Finally, it should be emphasized that the concept and meaning of the use of CAAD in design is subject to rapid change due to developments in computer technology. Researcher explains that in the studies on computer attitude, 'computer use' have been defined loosely without discriminating and categorizing different uses and purposes. They criticize this approach for not responding to expanded CAAD applications. In view of this problem, my study has attempted to focus on use of CAAD in architectural education. Considering the lack of appropriate tools for attitude measurement in this particular field, it is expected to contribute in that respect. I hope that this study will form a basis for future studies, which will aim at a deeper analysis of students' attitudes toward different computer applications in design. In addition to this, more studies and researches should be carried on this subject in order to balance positive and negative effects of CAAD (namely intensive computer use) in architectural education.

IETC 2014

The importance of ethics in the teaching profession

Marta Gluchmanova136

Technical University of Kosice, Bayerova 1, Presov, 08001 Presov, Slovakia

Abstract

Speaking about the profession of teacher, it is necessary to consider contemporary global ethical issues in education and educational research. There is an opportunity for students to develop a critical stance towards some of the most pressing ethical issues in education and educational research in contemporary societies. In a school context and with the support of school polices, programs and practices, ethical education helps students to develop for example in depth knowledge and awareness of their own and other cultures.

Keywords: ethics; teaching profession; human dignity; teacher;

IETC 2014

1. Introduction

I state that one of the principal goal of teacher's work is to help remove the hurdles that teachers face every day in order to do their jobs. There are numerous ethical dilemmas that educators face on a daily basis. Michael, G. Gunzenhauser provided some background on ethical theory to explain the extent to which ethics as we have traditionally understood it in education has helped – but not completely – how educators respond to the challenges of being a professional educator. But first, the author very briefly summarized the various ways that educational theorists have approached these issues in the most recent literature on ethical teaching and ethical leadership. I will mention some essential works that centers the importance of ethics for educational practice, and all are especially recommended as resources for making ethics central to educational practice: Gert Biesta (2006) argues that we should go "beyond learning" in how we think about educational practice; Felicity Haynes (1998) draws from a broad range of ethical theory to argue for an ethics of consequences, consistency, and care; Robert Nash (2002) explains how "three moral languages" – rules and principles, character, and basic beliefs – can be brought to bear on ethical issues and professional practices; Ken Strike (2006) bases his ethics for school leadership partly on John Rawls' social ethics. When students define *ethics*, they connect the term to specific expectations that society has for professionals in professionals settings, such as codes of ethics. When students define *morals*, the term (or its variant morality) is usually reserved for prescriptive standards of behaviour imposed by some powerful entity. For these students, they consider the latter term to be outdated and dogmatic. According to Gunzenhauser moral principles are the basis of deontological ethics, and rules and duties are the basis for moral actions. Deontological ethicists consider these principles to be universal and categorical, and in ethical conflicts, deontological ethicists argue over which rule or principle should be more prominent. From the consequentialist ethics, the educator can draw the importance of the consequences of one's actions and the justification for a public education that serves all children to the best of their abilities. A moral actor can make the notion of consequences as complicated as she would like, considering even what kind of society she helps to create by acting the way she does in a certain situation. In that sen-

* Corresponding author. Tel.: +0-000-000-0000 ; fax: +0-000-000-0000 .
E-mail address: marta.gluchmanova@tuke.sk

se it can form the basis for a social ethics. Concerning the virtue ethics the most important set of virtues in the school are the ones that are being cultivated in the students. What virtues are the adults modelling for the students and encouraging through curriculum? To what extent are the difficulties the teachers having with the curriculum affecting the students? What is it they are learning? Virtue ethics can be more helpful if we could get a handle on those effects (Gunzenhauser, 47-50).

Then Gunzenhauser argues for three tenets of professionalism for educators: 1. As a professional, an educator is in a position to profess substantive beliefs about the meaning and value of education. In other words, a professional educator has a philosophy of education and engages others who may have different ideas about the meaning and value of education. A philosophy of education grounded on the care of the self is a philosophy of possibility. 2. As a professional, an educator is in a position to exercise ethical and professional judgment. An educator is in a position to continually develop ethical and professional judgment throughout his career and in his various positions of responsibility. Further, professional judgment spans the positions of educators throughout the educational sector. Active/ethical professionalism applies to educators, school leaders, school boards, teacher educators, graduate educators, and policymakers. 3. As a professional, an educator is in a position to acknowledge and resist opportunities to enact normalization on herself, students, and colleagues. One very important part of articulating an active/ethical professionalism is being clear on the role that resistance plays in order to achieve more defensible educational aims than those that are encouraged by high-stakes accountability policy. To act ethically, an educator needs to understand how and why her work must at some level be resistant (Gunzenhauser, 126-127).

2. The importance of ethics

When I stress the importance of ethics in education, it constitutes the repository of their social and cultural values, and the medium of their historical memory. In common usage multicultural education generally refers to education about different ethnic groups. As dialogue on cultural difference and education has spread to other nations, it has become more sharply focused on complex issues of identity, diversity, and citizenship. "the relationships between democracy, citizenship, and education cannot be treated in isolation from the question of multiculturalism." Several vectors of globalization have converged to raise the topic of multicultural education to the level of public, or at least professional, debate around the world today. The increasing cross-national mobility of people and the transnational communication of ideas that took place in the twenty-first century has fed into the contours of diversity around the world. It has also led to international dialogue. With increased human mobility and increasingly thick networks of communication, the common social fact of unequal educational experiences and outcomes is increasingly the subject of transnational dialogue. Educators around the world are faced with new challenges of balancing local, national, and global norms and moral as well as ethical values in the process of educating children. While fostering a sense of citizenship remains an important function of mass schooling, it is becoming less and less viable to do so at the expense of socializing children for their futures in a global society (Sutton, 100).

Schools should ensure multicultural perspectives are incorporated into all aspects of school life by: promoting diversity as a positive learning experience, incorporating multicultural perspectives across all learning domains, incorporating multicultural, anti-racism, and human rights perspectives in school policies and practices, enhancing teachers' and students' intercultural understanding and cross-cultural communication skills. Teaching multiculturalism in the classroom is important. At the basic level, multicultural education provides a fundamental education for all students, with the purpose of eliminating discrimination because of ethnic origin and background. By incorporating many cultures into the classroom, schools can celebrate diversity, learn about cultures around the world and raise awareness. There are four steps to bring multiculturalism into each classroom: 1. Provide a basic education for all students – it means to keep in mind that there are stereotypes for international students. By understanding that you will be teaching students from many different walks of life, you will have won half the battle. Therefore, do not favor or ignore international students specifically. You may feel like you should favor these students so you can teach them more, but it is important to treat all of your students, international or not, with the

IECT 2014

same respect and understanding. 2. Address language and cultural norms: dispel myths that are often associated with certain cultures; avoid using jargon while speaking; be willing to use multiple forms of communication to convey ideas; repeat and recap information; use visual aids for clarity; teachers encourages the usage of multiple modes of learning: including logical, mathematical, literate, kinesthetic, music and spatial methods; active listening may also help when there is a moderate language barrier; reading material on cultural norms may also help with transitions. Gestures in one part of the world may not mean the same thing in others. 3. Make it a learning experience - if you have just a few international students in your classroom, the best way to integrate their new perspective into your classroom is to integrate their cultures into the curriculum as well. One of the best ways for younger students includes incorporating fairy tales and folklore into the learning. Storytelling is a great way to have your students learn about new customs.

In connection with contemporary global issues in multicultural and globalized school environment I would like to stress ethical and human approach. Humanity and human dignity are the terms used in moral, ethical, and political discussions to signify that a being has an innate right to respect an ethical treatment. Young people must be able to measure current events against the yardstick of the principles of humanity, dignity and law and not just in terms of economic or political criteria; develop resistance to feelings of impotence and indifference and refuse to become hardened the face of complex and negative world events; develop tangible bonds of solidarity with the suffering or needy; develop the strength to reject acts which take account only of the end to be achieved and not of the consequences to themselves and others; to incorporate the minimum standards of behaviour to respect in the event of conflict in the values handed down by official educational establishments, families and social authorities and in the rules of the society.

3. Human dignity in the profession of teacher

When we speak about human dignity in the globalising teaching of ethics, it is necessary to state that in the process of ethics education, disparate (including potential) moral agents meet, in which various levels of ability to respect others can be observed (Bergem, 95). This is connected to the fact that some students at preschool age, but most at school age, come to a completely new school environment and dispose of varied levels of expressing appreciation and respect towards others. In the teaching profession, a very demanding and responsible job connected to a constant inflow of new students arises for, first of all, teachers (but, naturally, also for other pedagogical workers) to lead them in their reasoning and decision making, and to such behaviour and actions that are manifested in the form of respect towards all human beings, and mainly parents, teachers, other pedagogical workers, classmates and all other people they come in contact with. Teachers of ethics could be a significant stimulus (in the interaction with, especially, parents, but also other adults, primarily relatives, i.e. members of the nuclear and extended family) when forming students on their journey to achieving higher quality, or added value, of human dignity of a moral agent in the future (however, depending on the behaviour and actions of every individual). A crucial role of teachers, as well as the teaching profession as such, is to, together with parents and families, help students on their path from potential to full moral agents, which also means that they help children and youths in developing awareness of those times when respect and appreciation towards man depends, to a large extent, on his/her behaviour and actions (Strike & Soltis, 42). This also concerns emphasising the fact that respect and appreciation on the part of teachers (and also other adults) towards students at a higher school age (starting with puberty) depends, to a certain extent, on their behaviour and actions (Joseph & Efron, 213). In this way, the level of human dignity becomes partly dependant on their behaviour and actions.

With regard to the above facts in school and out of school environment, I assume that the principle and value of human dignity should be among the most significant in the mutual relationship of the teacher

IETC 2014

towards students and vice versa. Education at school should be directed at a full development of human personality and a strengthening of respect for human rights. It should help mutual understanding, tolerance and friendship (Fitzmaurice, 49). This aspect especially emphasises awareness of the obligation to accept this value and show respect, above all, on the part of teachers towards students. On the other hand, it embodies the obligation, or commitment, within the teaching profession, so that teachers lead and educate children and youths to mutual respect and appreciation towards the human dignity of other children as well as adults.

The globalising features in education are discipline and violence in and out of school which are becoming a problem of the present era (Morrell, 43). It has been a long time since good teachers rejected corporal punishment as a means which, in education, does not lead to anything good, but only humiliates human dignity and either nurtures self-conscious people or leads to further aggression and violence. In schools, we can most frequently come across verbal aggression, which, in many cases, may negatively influence not only the mentality of the teacher but also students. With regard to the problem of aggression and violence, I would also like to point out some aspects which are closely connected to shattering human dignity, or humiliation of individuals or some groups of students by means of behaviour or actions of teachers, or, possibly, their classmates or other individuals who are, in some way, involved in the school's functioning. It is often true that if the teacher does not respect the student's dignity, then he/she cannot expect his/her own dignity to be respected. Many of us remember teachers who formed our lives in a positive way but also such teachers, or principals, who degraded children's dignity, favoured boys over girls, or vice versa, or were only interested in children of influential parents (Billings, 66).

4. Conclusion

Every teacher should show an equal level of dignity to every person as an individual starting with their first common lesson. Teachers' respect towards the dignity of their students should also be manifested through how they fulfil their professional obligations; one of which is to clarify to the students, at the very beginning, the details of their study, the criteria of evaluation, the dates of their sessions, etc. Each lecture or seminar should start on time, and provide students with help or advice if necessary. Teachers at all levels of education should ensure the cognitive, intellectual and moral progress of their students and show them appropriate respect and appreciation. Keeping the set rules and requirements for fulfilling students' obligations and making sure that they do not change in the course of the term or school year merely through the teacher's wilful decisions is also a way of showing respect for the human dignity of students on the part of the teacher.

I state that a moral way of life helps the development of human life, it protects and supports it. At present, contemplations on these global ethical issues have been revived, thanks to, in part, discussions on ethics and morality regarding various professional aspects of human life. Many deal with moral issues occurring in individual professions and look for ways to solve them. With regard to these activities, there is an effort to integrate moral reasoning in people's professional lives in order to achieve happiness and contentment, or to minimise negative consequences. The new characteristics of the globalized world and its accelerated process of modernization have caused society to face situations considered unthinkable until then.

The influence of different variables in evaluation within the building degree in the Polytechnic University of Madrid

M. Nieves González García[a,]*, Alfonso Cobo Escamilla[a], Esther Moreno Fernández[a], M. Isabel Prieto Barrio[a], Pilar de la Rosa García[a]

[a]*Polytechnic University of Madrid, Escuela Técnica Superior de Edificación, Avda. Juan de Herrera, 6. 28040 Madrid, Spain*

Abstract

In this paper we have analyzed different factors that affect the subject "Prevention and Safety I" evaluation, within the Building Degree from the Polytechnic University of Madrid and its influence in its students' learning, in order to establish guidelines for improvement in the evaluation. This paper reflects the influence in the evaluation of the base the students already have, the student's perception of the evaluation and the kind of evaluation made. With the results obtained, we have reviewed the teaching planning for the next year, in order to improve the learning objectives fulfilment.

IETC 2014

1. Introduction

The adaptation of the university studies in Spain to the European Higher Education Area (hereinafter EHEA), has involved a change in the way of guiding the teaching, starting from broad and specific objectives, which allow to train professionals, from broad and specific skills which the student has to be able to develop and some learning results which the student must demonstrate. In the EHEA is foreseen, inter alia, the European Credit Transfer and Accumulation System application, whose purpose consists in establishing a credit system in order to promote the comparison among studies and the students and graduates' mobility. This system involves that the teaching objectives consist, not only in knowledge acquirements, as traditionally, but also in the development of a range of competences, that is, capacities and skills (Delgado & Oliver, 2006).

One of the most important issues of teaching is assessment (Hannan & Silver, 2005). Reviewing and qualifying are very important aspects in teaching and they affect in the process of helping and encouraging students to learn and understand their progress in their learning. For us, the teachers, they help us to find our weaknesses, in order to find the best way to teach. What would be ideal is that reviewing and qualifying interlock, benefiting learning and being related with the planned objectives and the obtained results (Ames & Ames, 1991).

The assessment type determines the number of approved, but not always the level of knowledge acquired. That is why it is important to study the influence of different methods of assessment, in order to determine which one reflects better the learning. In assessment also affects, as the assessment method, the human factor, what is to say, what the student thinks about the adequacy or inadequacy of the assessment system (Bain, 2004).

Taking into account the previous premises, the aim of this paper is to analyze the different factors which affect assessment in the technical subjects and its influence in the students' learning, through the

analysis of the assessment made in the subject "Prevention and Safety I" from the Building Degree from the Polytechnic University of Madrid, during the year 2013-2014, in order to establish guidelines to improve assessment. This subject is taught in the third year and the analysis has been made with students who have studied this subject in the continuous assessment mode.

2. Approach to work

2.1. Stages of the research

"Prevention and Safety I" is a compulsory subject of third year (sixth semester) of 6 ECTS credits and of type II. The continuous assessment done in the subjects during the year 2013-2014 has been chosen by the 99% of the students. This assessment has been divided into three large parts:

- Three individual practices, made during the semester, concerning particular parts of the contents. Each one calculates the 10% of the global mark. Each test involves a particular part of the contents different from the other tests'.
- A group practice, which calculates the 10% of the global mark.
- A global test, made at the end of the semester, which calculates the 60% of the global mark. In this test, which is global and concurrent to all students, regardless of their group, all the contents of the subject are included and it is necessary to obtain a minimum mark of 5 out of 10 in order to pass the subject.

To analyze the type of assessment and respond to the aim of this research, we are going to study assessment from different points of view. First, we are going to analyze directly the marks. Then, we are going to study assessment from the students' point of view, relating their perception of the subject to the results. Finally, we will analyze the influence of the different methods of assessment in the marks.

2.2. Data gathering strategy

The students' marks are in the database of the teachers who teach this subject, whereas the data offered by the students are part of the filling of a datasheet by the students of the groups 2 and 3 of the subject "Prevention and Safety I", during the year 2013-2014. This sheet was filled individually inside the classroom, three months after the start of the classes, but without having presented the group practice, in order to avoid that the obtained mark could influence the valuation of the subject. All the valuations were made in a scale from 1 to 5, in this way: 1-strongly disagree; 5-strongly agree. The sheet was divided into four large blocks, which allowed the data gathering in the following aspects: The call in which they passed the basic and fundamental subjects for the understanding and the learning of the subject, the student valuation of the fulfillment of the learning objectives planned in the subject, the method of assessment used and the effectiveness of the system of assessment concerning the learning and the encouraging.

3. Results

The global analysis of the gathered data from the students for this research is detailed below:

- The number of students to whom we have made the research is 80. 50 students have passed all the specific subjects that contribute necessary knowledge to know the structural process where the preven-

IETC 2014

tion and safety are analyzed (62.5%). 40 students have passed subjects scheduled in the teaching plan at the same time as "Prevention and Safety I" (50.0%).

- Only 4 students asked for being tested by the "Only final test". The percentage of students who have passed the subject is the 70.0% (56 students).
- The average valuation of the students about the relation between the hours and the ECTS credits is 3.8 and about the benefits of the type of assessment is 3.5.
- The average valuation of the students concerning the achievement of the learning objectives is 3.8, and about the benefits of assessment in the learning is 3.4.

The results obtained in the system of assessment done in the subject "Prevention and Safety I" in the year 2013-2014 are showed below (Fig.1).

As showed in the picture, the percentage of students who have failed the subject is the 30.0%, compared to the 70.0% who have passed it, what shows a high number of passed students in continuous assessment, because it is a very practical subject (Fig.1).

Fig. 2 shows the relation between the marks obtained by the students and the base of knowledge the students have when they start to study the subject. We have considered as basic subject: Principles of Construction Materials, Chemistry and Geology and as specific subjects: Construction Materials I and II, Introduction to Building Construction, Masonry and Cladding Construction, Timber and Concrete Structure Construction, Steel Structure Construction, Roof and Envelope Construction, Site Equipment and Auxiliary Systems. We have also checked if the students have passed two specific subjects more, which, in the education program are taught in the same semester as "Prevention and Safety I". They are Site Work Planning and Management I and Bill of Quantities and Real Estate Valuation and Assessment.

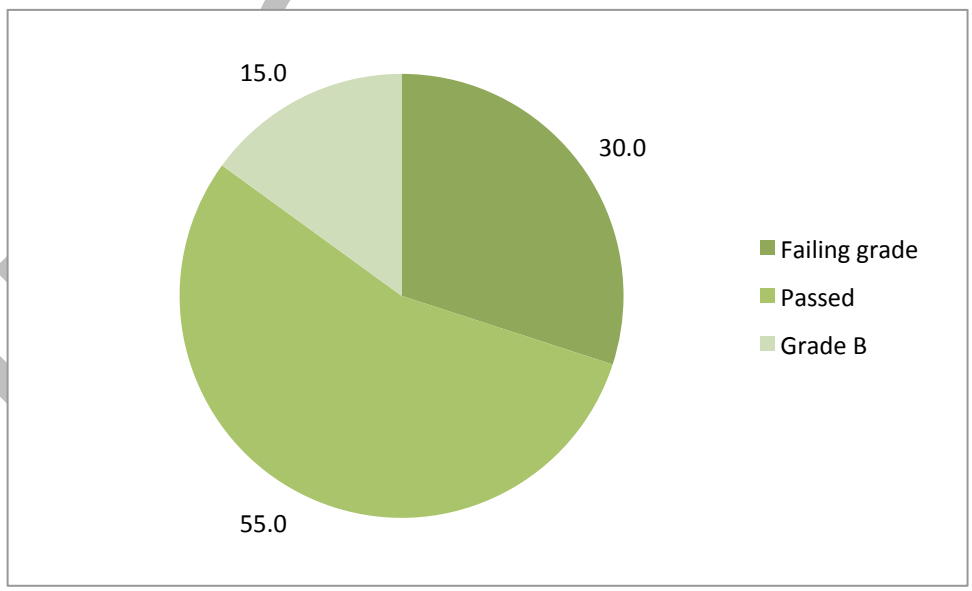

Fig. 1. Percentages depending on the marks.

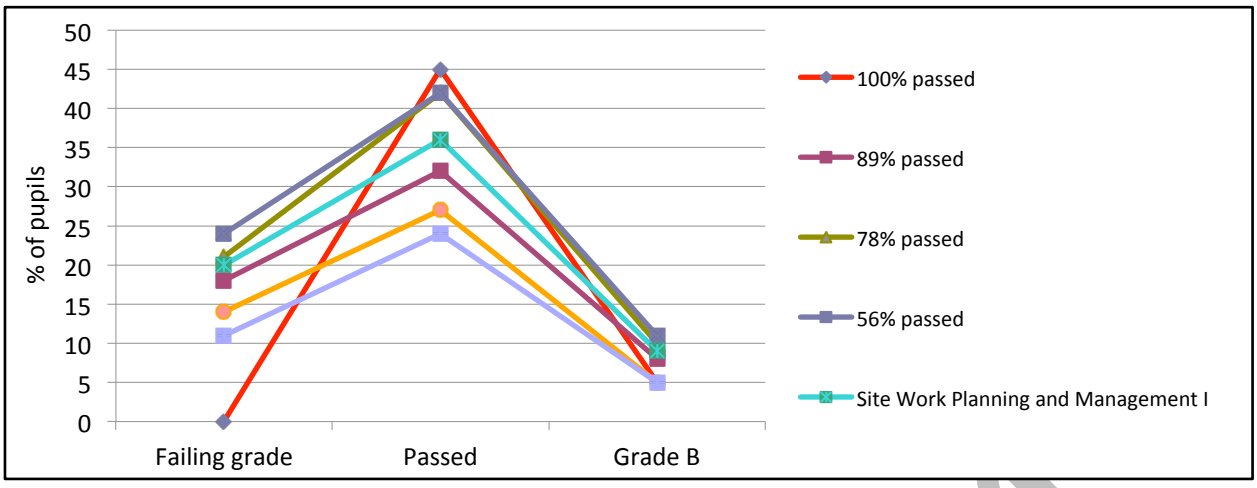

Fig. 2. Percentage of students who have passed the basic and specific subjects.

Next, we are going to compare the marks with the students' perceptions in different aspects. Fig. 3 relates the marks with the perception of the students between hours spent in the subject and ECTS credits. There, we can see that the students who obtained better marks are the ones who express better interrelationship between hours and credits. Fig. 4 relates the marks with the student's valuation about the type of assessment used. This figure shows that all students have a similar perception between the type of assessment and the marks.

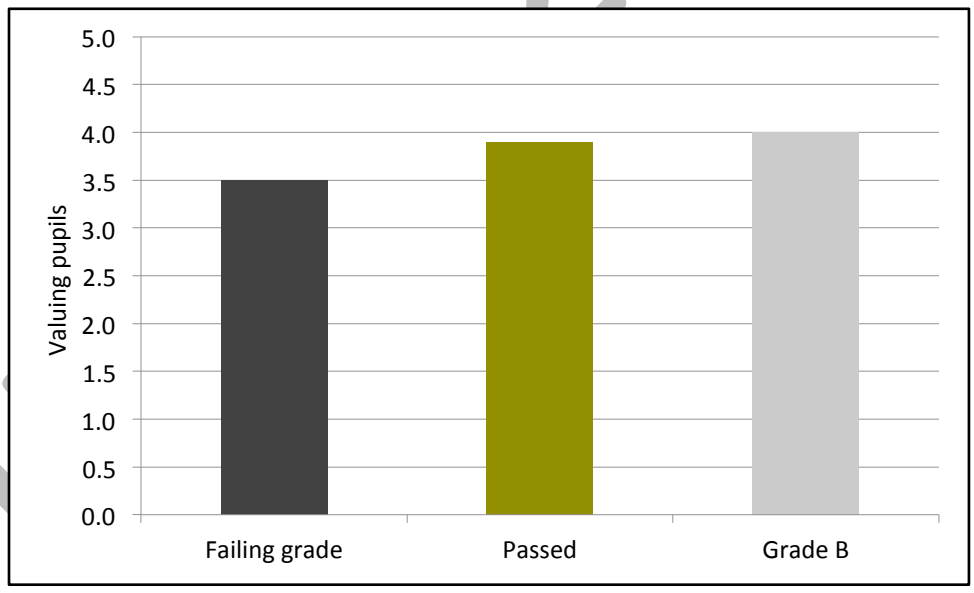

Fig. 3. Relation between the marks and the valuation about the relation hours-ECTS credits.

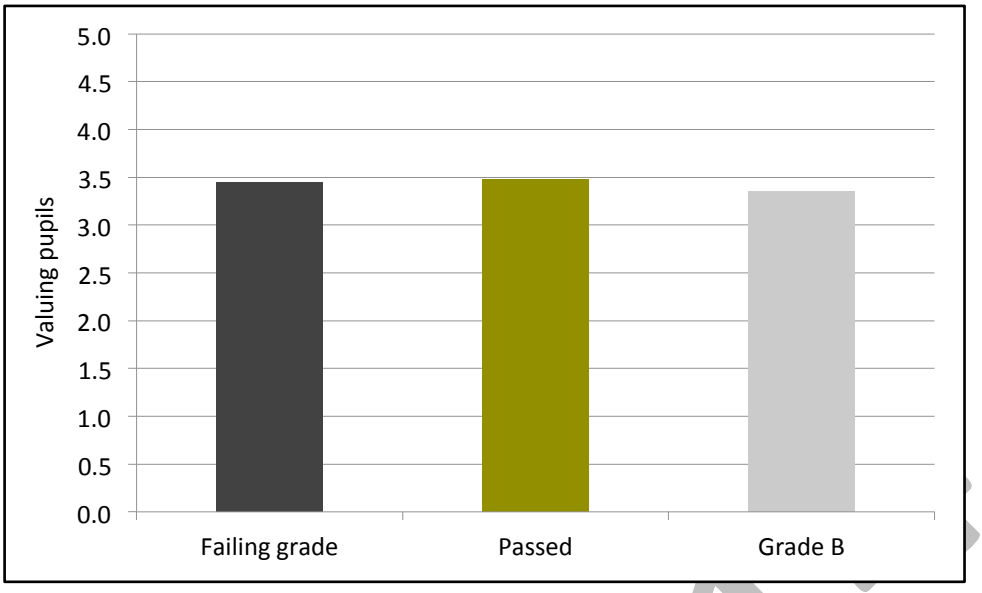

Fig. 4. Relation between the marks and the valuation of the type of assessment done.

Fig. 5 shows the relation between the marks and the perception about the fulfillment of the learning objectives. Oddly enough, the students who have failed value better this parameter. Finally, within the assessment analysis from the student's perspective, Fig. 6 shows the relation between the marks and the students' valuation about the usefulness of the type of assessment used for learning. Here, the students with better marks are, again, the ones who value better the method of assessment used.

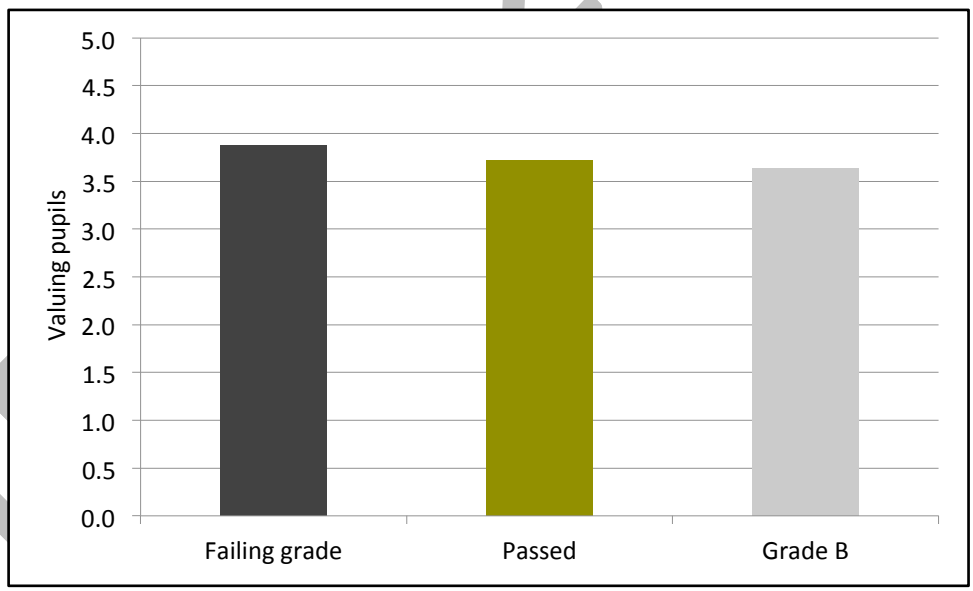

Fig. 5. Relation between the marks and the valuation of the learning objectives.

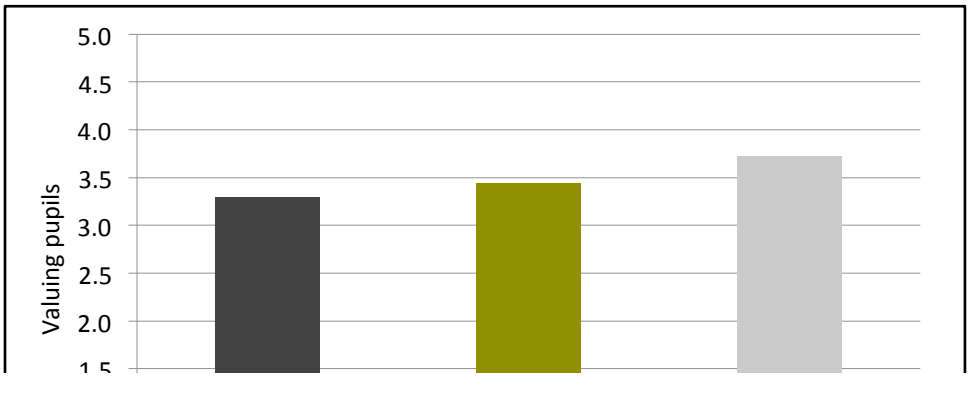

Fig. 6. Relation between the marks and the valuation of the benefits of assessment in learning.

4. Results analysis

The students' marks (Fig. 1) show that the percentage of students who pass the subject rises to the 70.0%, what involves a wide dedication to the subject.

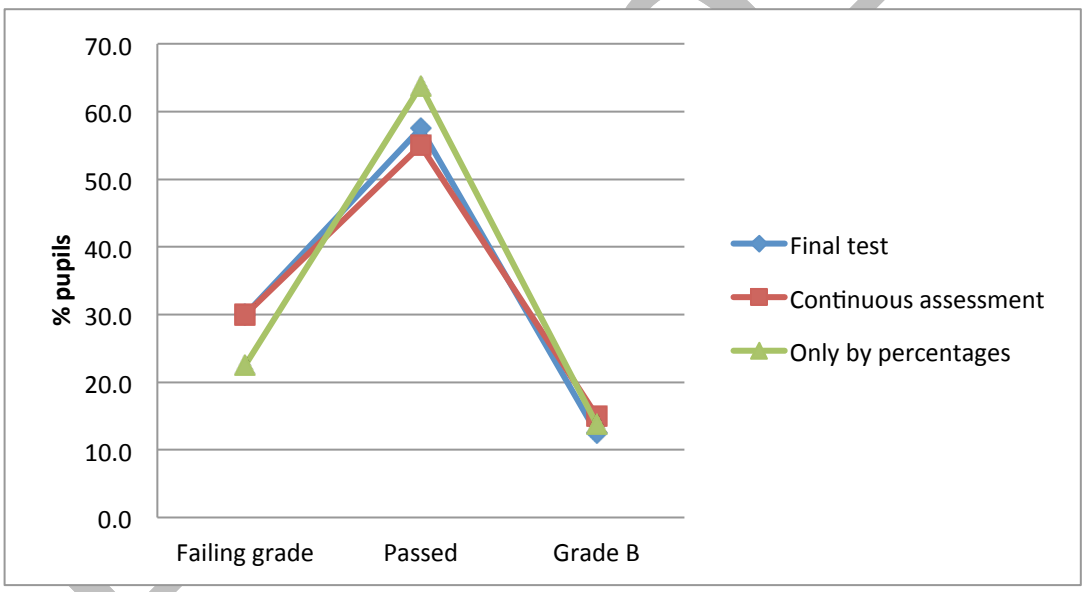

Fig. 7. Relation between the students' marks and the type of assessment.

Fig. 2 shows that the students who have passed the 100% of the basic and specific subjects have obtained better marks than the rest, especially when none of them has failed Prevention and Safety I. We can see that the percentage of failing grades in Prevention and Safety I increases as the student has failed more subjects. Also, the students who have passed the subjects Site Work Planning and Management I and Bill of Quantities and Real Estate Valuation and Assessment have a lower number of failing grades.

As can be seen in Fig. 3 and Fig. 6, the marks obtained by the students are proportional to their perception of the relation hours-ECTS credits and the benefit of assessment in the learning of the subject.

Analyzing Fig. 7 we can notice how, from the students' learning, the type of assessment affects the marks. However, when assessment is based only in the exams, the results are almost equal to the continuous assessment results. The only difference is that through continuous assessment the number of B grades is higher than through the assessment with exams only. The way to improve the results would be to remove the requirement to obtain a 5 at least in the gradable test in continuous assessment. Applying the same percentages indicated for the individual and group practices and the exam that we indicated in section 2. 1, and removing this requirement, we would have obtained a 7.5% less of failing grades.

5. Conclusions

As a response to the aim of the research, we are going to detail the conclusions and the possible strategies to improve.

- The student's perception of a subject is a determining factor in his motivation, obtaining better marks the students who have a positive view of the subject.
- The overcoming of basic and fundamental subjects from previous years affects, clearly, the marks.
- It is necessary that assessment benefits learning, encouraging the feedback, the motivation and the understanding skill by the students of his own learning process.
- The type of assessment used affects the marks and the way of confronting the subject learning. Continuous assessment is the better way to drive the student's work and the easiest way to acquire the required skills. However, it is necessary to remove the requirement of obtaining a minimum mark of 5 out of 10 in the grading test.

The influence of learner characteristics on social presence

David B. Mykota137
College of Education, University of Saskatchewan, Saskatoon, Saskatchewan, S7N 0X1, Canada
[b]Second affiliation, Address, City and Postcode, Country

Abstract

Social presence is one of the more important constructs for determining the level of interaction and effectiveness of learning in an online environment. The purpose of the present study is to determine what individual learner characteristics can influence student ratings of their online social presence. The results build on previous research reported but with a larger sample size drawn from practicing teachers enrolled in online postgraduate courses. The study also affirms that the revised Computer-mediated Communication Questionnaire (Tu, 2005) is an adequately reliable measure of the construct social presence.

Keywords: Social presence, Computer-mediated Communication, Learner Characteristics

IETC 2014

1. Introduction

The genesis of social presence lies in the conceptualization from social psychology of immediacy (Weiner & Mehrabian, 1968) and intimacy (Argyle & Dean, 1965) surrounding face-to-face communication. In face-to-face communication, immediacy refers to the psychological distance between two speakers, whereas intimacy is the closeness obtained, verbally and non-verbally, among individuals and maintained by immediacy behaviours (Rettie, 2003). When applied to computer-mediated communication, (i.e. CMC) Short, Williams, and Christie (1976) report that the social effects experienced are caused by the degree of social presence afforded users with Gunawardena (1995) further noting that immediacy behaviours enhance and maintain social presence.

To frame good pedagogical practices for online learning, Garrison, Anderson, and Archer (2000) developed the community of inquiry model to recognize the transactional relationship between instructors and learners through the interaction of cognitive presence (of the learner), teaching presence (i.e. the structure and process), and social presence (i.e. affective interpersonal communication). According to Garrison et al. (2000), these elements, which define the community of inquiry model, are fundamental to a successful higher education learning experience. A key component in the model is the concept of social presence, which refers to the affective domain as it relates to interpersonal communications.

In assessing social presence within a text-based, asynchronous environment, Rourke**,** Anderson**,** Garrison**,** and Archer (2001) identified three categories of communicative responses: affective indicators (i.e., values, beliefs, feelings, and emotions); cohesive indicators (i.e. group presence and commitment); and

* Corresponding author. Tel.:1-306-966-5258 fax:1-306-966-7719.
E-mail address: david.mykota@usask.ca

interactive indicators (i.e., attending in a socially meaningful way). Although Rourke et al. recognize that the coding and analyzing of CMC text-based transcripts using the aforementioned indicators provides a measure of the density of social presence, they also contend future exploratory studies including factor analysis would aid in further defining the construct.

The construct of social presence is the critical affective ingredient for online learning. Several researchers have demonstrated that social presence is a vital concept to be facilitated, developed, and sustained as it encourages and supports communication-based learning (Garrison et al., 2000; Kim, Kwon, & Cho; 2011; Lobry de Bruyn, 2004; Rourke et al., 2001; Tu & McIssac, 2002). However, learner characteristics including age and sex (Packham, Jones, Miller, & Thomas, 2004); one's readiness for e-learning (Smith, Murphy, & Mahoney, 2003); and computer self-efficacy (Hayashi, Chen, Ryan, & Wu, 2004) can also influence the persistence and motivation of online learning among students.

2. Purpose

The objective of the present study then is to determine what if any individual learner characteristics that include sex, age, teaching experience, number of online courses courses taken, years using the internet, years using email, and self-rated computer-mediated communication (CMC) proficiency can influence teacher ratings of their online social presence. A valid and reliable measure of social presence was administered (CMCQ: Tu, 2005) and demographic variables including age, sex, number of years teaching, number of online classes taken, and readiness for online learning (as measured by CMC proficiency) were determined. This research provides the opportunity to better assess what individual learner characteristics affect the degree of social presence experienced within an online learning environment.

3. Method

The participant sample is derived from students (i.e. practicing teachers) enrolled in postgraduate special education online courses offered at the University of Saskatchewan. The postgraduate program is comprised of 9 courses that are offered over a two-year period. Using convenience sampling, 275 students enrolled in the postgraduate program participated with a 90 percent response rate attained. Those enrolled in the program were varied demographically in age, proficiencies with computer mediated technologies, years of teaching experience, and experience with online learning. Participants in the study voluntarily completed the computer-mediated communication questionnaire (CMCQ; Tu, 2005). The sentence stems on the CMCQ were used to identify social presence in a text-based system with the CMC tools (email, discussion, and chat). The respondents were asked to complete each of the instrument's 24 items on the basis of a five-point Likert scale converted to a numerical weighting ranging in options from 0 (uncertain); 1 (strongly disagree); 2 (disagree); 3 (agree); and 4 (strongly agree). A reliability analysis for the instrument was conducted with a Cronbach alpha reliability coefficient value equal to or above .70 considered to reflect a high internal consistency. A visual inspection of the corrected item total correlations was then conducted with items below .10 deemed as outlier test items. Two items were deemed as outliers and were removed (i.e. items 4 & 19). The subsequent reliability analysis of the 22 remaining items reflected relatively high internal consistency with a Cronbach alpha reliability coefficient for the CMCQ instrument calculated at .732. A total raw score was then calculated with high scores indicating a strong degree of online social presence and low scores indicative of a lack of social presence.

IETC 2014

A self-rated CMC proficiency variable was obtained by aggregating three other five-point Likert scale variables, exclusive of the CMCQ, that pertained to the forms of CMC specific to each of email, discussion, and chat. A reliability analysis for the new variable was conducted with a Cronbach alpha reliability coefficient value equal to or above .70 considered to reflect a high internal consistency. A visual inspection of the corrected item total correlations for the three variables was conducted with items below .10 deemed as outlier test items. The Cronbach alpha reliability coefficient for the CMC proficiency scale was calculated at .824, indicative of a high internal consistency, with no items deemed as outliers. The mean values for the three five-point Likert scale variables pertaining to CMC forms of communication (email, discussion, and chat) were then combined and calculated to provide a new mean value representative of a CMC proficiency scale with low scores indicative of a high self rated CMC proficiency.

Correlation coefficients were used to determine the relationship between social presence, as measured by the total score on the CMCQ, and individual demographic, internet, email, and online learning readiness (i.e., CMC proficiency) variables. To determine which combination would be a better predictor of social presence scores, the variables were entered into a multiple linear regression analysis (enter method) to obtain a regression equation. The non-manipulated categorical variables were all dummy coded for inclusion in the multiple regression analysis (Pedhazur, 1997). Analysis of variance was used to determine if there were any significant differences in social presence scores as a function of the individual demographic and readiness variables.

4. Results

Frequency counts for the demographic variables age, sex, number of years teaching, number of online classes taken are displayed in Table 1. When examining the frequency counts, it was found that although sex was initially a variable considered having a potential impact on social presence it was excluded from further analysis because of the low number of males in the sample.

Table 1. Frequency Demographics, N=275

Demographic Variable	Frequency	Percent
Sex		
Male	20	8.3
Female	254	91.7
Age		
18-25	39	14.1
26-33	95	34.3
34-41	84	30.3
42 or older	59	21.3
Teaching Experience		
0-3 years	83	30.2
4-6 years	59	21.3
7-10 years	61`	22
More than 10	72	26

IETC 2014

Number of Online Courses		
1 course	113	40.8
2-3 courses	78	28.2
4 or more courses	86	31.0

Correlations for the dependent variable (i.e., total score on the CMCQ) and the independent variables (i.e., age, teaching experience, number of online classes taken, years using email, years using internet, and CMC proficiency) are displayed in Table 2. Inspection of Table 2 reveals significant correlations between the CMCQ and the number of online classes taken and the online learning readiness variable CMC proficiency, with age and number of years teaching also moderately correlated with one another.

Table 2. Correlations

	CMCQ Social Presence	Number of Online Courses	Age	Teaching Experience	Years Using Email	Years Using Internet	CMC Proficiency
CMCQ Social Presence	1	.149*	.043	.045	-.029	-.019	-.233*
Number of Online Courses	.149*	1	.118*	.085	.072	.101	-.261**
Age	.043	.118*	1	.623**	-.222**	-.185**	.119*
Teaching Experience	.045	.085	.623**	1	-.122*	-.083	.059
Years Using Email	-.018	.072	-.222**	-.122	1	.664*	-.306**
Years Using Internet	-.004	.101	-.185**	-.083	.664**	1	-.261**
CMC Proficiency	-.223**	-.261**	.119*	.059	-.306**	-.261**	1

* Correlation is significant at the 0.05 level (2-tailed). **Correlation is significant at the 0.01 level (2-tailed).

For the multiple regression analysis the CMCQ is the predictor variable for social presence. Independent variables include age, teaching experience, number of online courses taken, years using the internet, years using email, and CMC proficiency. The enter selection method for the independent variables in the linear regression analysis was used. Examination of the strength of the equation reveals that the predictive power of the equation was moderate at 11 per cent where the proportion of variation in predicting online social presence is accounted for by number of online courses taken and CMC proficiency (Y=59.22 + 1.19[courses online] + [-3.76][CMC proficiency]). The multiple R was .33 and the proportion of variance accounted for was .11 (F [6, 258]=5.21, p<.00). The moderate predictive power of the equation was likely due to restricted variability in the sample, as "the reduced variability will cause the value of *r* to be less than its value in the unrestricted sample" (Glass & Hopkins, 1996, p. 123). For the present study, because only learners in their first year of online courses were sampled there was evidence of restricted variability in the sample.

One way ANOVA's were used to determine whether a significant difference occurred among students in online social presence based on age, teaching experience, number of e-learning courses taken, years using the internet, years using email, and readiness for online learning (i.e., CMC proficiency). The analysis of variance results indicate that a significant main effect for number of online learning courses F (2, 273) = 3.991 p<.05 exists with Levene's test of homogeneity of variances insignificant. In conducting the post hoc analysis, the Scheffé statistic was used because pairs of means with dissimilar group sizes are compared. The mean difference for online social presence, as measured by the total score of the CMCQ, was significantly lower for learners in their first online course as compared to those who had taken 2-3 or four or more online courses.

IETC 2014

4. Discussion

The present study sought to explore what if any individual learner characteristics of teachers enrolled in online special education courses predict the degree of social presence experienced. Findings reveal that the number of online courses taken followed by self-rated CMC proficiency are significantly correlated and are the salient predictors of social presence. Interestingly, the number of years of teaching experience and age of the teacher enrolled in the online courses are not significantly correlated with social presence as measured by the CMCQ. This would seem to indicate that online learning is accessible to learners of all ages. However, a limitation of the study is the use of convenience sampling and the homogeneity of the sample as it relates gender, although research on the construct social presence has found that gender differences do not appear to exist (Kim, Kwon & Cho, 2011; Tu, Yen & Blocher, 2011). Nevertheless, a more systematic sampling procedure should be considered in future research.

The functionality of CMC technology incorporated into text-based online learning environments and the usage of such tools among students can effect affective communication among users. If we desire our learners to be highly collaborative in their professional practice then it is important that they are provided the requisite training necessary to embrace computer-mediated communication so as to emulate these practices in their course work.

Further, instructors need to construct interaction patterns to overcome the inherent challenges of the medium. Informality and friendliness modelled by the instructor coupled with frequent interaction can facilitate this process (Tu, 2002; Tu & Yen, 2006). What this implies is that development and support for faculty in delivery of online courses is needed. Similarly, novice online students with limited CMC proficiency skills need to be made aware of how interaction is structured for online learning. Nevertheless, social presence can also be developed through instructional design strategies that include limiting enrolment (i.e. to a 30:1 ratio; Rovai, 2001) development of collaborative course assignments (Aragon, 2003; Mykota, 2013, So & Brush, 2008) and enhanced media integration (Kim, Kwon, & Chow, 2011).

5. Conclusion

Affective communication for online learning needs to recognize that instructors and course designers must facilitate and deliberately structure interaction patterns to overcome potential barriers to establish social presence. Moreover, if online learning is an accessible and flexible learning environment and if educators desire their learners to be highly collaborative in their professional practice then it is important that they are provided the requisite training necessary to embrace computer-mediated communication. This study contributes to knowledge and research on social presence through the applied measurement of the construct and confirms previously reported findings on CMC proficiency (Mykota & Duncan, 2007). Future research should continue to explore the construct, social presence, as measured by the CMCQ with varying samples and contexts so as to replicate previous research on the validity and reliability of the instrument. Additionally, qualitative phenomenological or grounded theory studies could be conducted to delve in-depth into the meaning of affective communication in a text-based environment and its effect on the learner's cognitive presence.

The influence of using e-learning tools on the results of students at the tests

Tomáš Moravec[a], Petr Štěpánek[a], Petr Valenta[a138]
[a]*University of Economics, Prague, sqw. W. Churchill 4, 130 67 Prague 3, Czech Republic*

Abstract

The paper describes the e-learning tools introduced to enlarge the range of background studying tools for students in the obligatory course Law basics at the University of Economics, Prague. Furthermore the paper analyses the influence of introducing e-learning tools on the results of students at the progress test of this course. The analysis compares the results of questions from the area of law where the tool was provided in a pilot version with the results of questions, where the e-learning tool was not provided. The results from the previous year, when the e-learning tool was not available at all are examined and compared too. We expect the positive influence of using e-learning tools on the results of students would be confirmed and if yes we will continue in further e-learning tools development.

Keywords:E-learning tools, Knowledge of students, Evaluation of results

IETC 2014

1. Introduction

The University of Economics, Prague (UEP) is the biggest public university of economics in the Czech Republic. Students of all branches of economics studies at the UEP are acquainted at least with basic principles of law in general and with the main principles of the commercial law in the course Law basics.

This course is assured by the Department of Business and European Law and is obligatory for all students of the UEP. The course is attended by approximately more than 2 000 students per academic year. The main aim of this course is to provide students with necessary basic knowledge of law especially in the field of the theory of law, theory of state, civil law and main principals of contract law. Special focus is put on business law at the national and also European level.

This knowledge is necessary for further consecutive courses in all study programs at UEP and should be useful for students after finishing their studies at their work and also in a daily life.

The knowledge of students is checked at final oral examination. To successfully pass the course students should be acquainted with basic terms of theory of law; they should identify the applicable legal provisions, know the basic types of contracts, determine the differences among types of business companies and identify the conditions for liability and the consequences of breaching obligations.

To ensure the high level of standard and the highest possible benefit of the course for students any possible improvements are constantly considered. One of the improvements was the introduction of the system of progress testing of students which is done by computerized tests in the mid-term and at the end of the course. In case of failing one of the tests students are enabled to resit the test once. When failing both of the tests or when failing the resitting test the student fails the whole course and has to repeat it following semester.

* Corresponding author. Tel.: +420 224 095 227; *E-mail address:* valenta.pe@gmail.com

The computerized method of progress testing of students helps the lecturers to continuously analyse the results of students at progress tests and at final exams at the same time. It also enables the lecturers to gain other useful data for further analysis of problematic issues, parts of the course, misleading questions or differences among particular lecturers.

One of the improvements the lecturers would like to introduce as well is to provide students an e-learning tool that would enable them to continuously check their knowledge after each lecture, to better understand each topic and to better prepare themselves for progress tests and final exam.

Provided e-learning materials should also help students to deal with the impacts of the process of re-codification of private law in the Czech Republic which has been effective since 1st January 2014.

The old Civil Code and the Commercial Code were derogated and replaced by the new Civil Code and the Companies Act. New legal regulation has brought many changes having direct impact on many areas of Czech private law especially on entrepreneurs because business law was the area with the most significant changes. The new Civil Code regulation has also unified the main principles of law of obligations which were unclearly spread both in the old Civil Code and the Commercial Code till the end of 2013.

It is necessary to deal besides other things with fundamental changes concerning Czech Limited Liability Company (s r. o.) and Public Limited Company (a. s.) new rules for company's statutory body members or dissolution of corporations as legal entities especially regarding the differences between the new and old legislations.

E-learning materials could therefore help students better understand the consequences of mentioned legal changes and their impacts.

The e-learning tool was elaborated and provided to students in pilot version in previous semester only in certain topics (areas of law) that are presented to students during the course.

The analyses of results of students at progress computerised tests in case of the set of questions concerning these areas and in case of questions from the areas that were not covered by the e-learning tool and their in-depth comparison are discussed further in the article. The elaboration of e-learning materials for all lectured topics will be decided based on the results of the research. The differences in particular types of questions which are included in the computerised test will be also analysed and discussed.

2. Literature Review / Research rationale

In the literature there exist many studies which examine the influence of provision the e-learning tools to the results of students.

Fatih Baris and Tosun described the influence of using e-tools in the education process at the high school and concluded the positive influence of this tool on students.

Heath described the benefits and also disadvantages of creating and developing of electronic portfolios which could be used for different purposes.

Horovčák et al. conclude that electronic version of testing presents modern and effective form of feedback from students to teacher and that electronic testing has its own unique place in the whole education process.

Stanescu et al. also prove the advantages of an e-learning tool that permits generation of questions from the certain base of question defined previously.

IETC 2014

Viciana et al. describe a computerized system that allows researchers creating, applying and tabulating surveys and paper instruments in an automatized way and consider them as a useful tool since it permits to input data with higher precision and no need for previous codifications.

Dindar et al. also describe the role of multimedia in education and in testing of students.

Deep research of using multiple choices testing at entrance exam for University of Economics in mathematics which is also computerized was conducted by Klůfa who perceives multiple choices testing as optimal and objective for entrance examinations at University of Economics, Prague.

3. The context of the study and the research questions

The main aim of the paper is to analyse the data available from computerized system of testing of students in the obligatory course Law basics before and after providing the e-learning tool for them in some areas of lectured topics and to verify if the provision of the tool has had some impact on the results of students at the progress tests. For this purpose the essay shall discusses following hypothesis at first.

H1: The provision of the e-learning tool has got a positive impact on the correctness of answers of students at the progress test.

When providing the e-learning materials for students only in some areas of lectured topics we presume that students could rely on provided materials and will concentrate primarily on these topics and their results in questions from other topics will therefore tend to get worse. To analyse this presumption following research hypothesis is discussed:

H2: The provision of the e-learning tool only in some areas of lectured topics has got a negative influence on results of students in case of questions from the areas of law where the tool was not provided.

To verify the influence of the provision of the e-learning tool it is also necessary to compare the results of students in case of questions from the area of law where the tool was provided in a pilot version with the results of students in case of questions, where the e-learning tool was not provided. In this context we pose following research hypothesis.

H3: The differences in correctness of answers of students in areas where the e-learning tool was provided are more positive than the differences in correctness of answers of students in areas where the e-learning tool was not provided.

To confirm and validate the findings of the analyses and exclude other influences we would also like to verify the results by comparing them with the control sample results from the previous year when the e-learning tool was not available. For this purpose the last two hypotheses are brought up.

H4a: We presume that the differences of average correctness of answers at regular test and at the resitting test from last year when the e-learning tool was not available are not significant.

H4b: The differences in correctness of answers of students in areas where the e-learning tool was provided are more positive than the differences in correctness of answers of students at the test from the previous year.

4. Changes in the correctness of answers after additional study materials were provided

After above mentioned considerable changes of Czech legislation which has been effective since 1st January 2014 the content of lectures of the course Law basics had to be revised and the content of the lec-

IETC 2014

tures deeply modified and adapted to new recodified legislation. Together with this the question base of the computerised progress testing had been examined and largely revised too.

After the changes were applied the results of students got significantly worse and many of them failed especially the second progress test, which is focused mainly on business law. The e-learning tool was therefore prepared afterwards and provided to students before the resitting test.

The research was carried out afterwards by analysing the data collected from the results of all students at the second (regular) progress test and from all students at the resitting second test, when the e-learning tool was available. In the pilot version the e-learning tool was available for topics covering 153 questions out of 447 questions in total. For each question of the test the correctness rate at the regular test and at the resitting test was examined. Afterwards the correctness of answers on each question from regular test was deducted from the correctness of answers on each question at resitting test.

Table 1 describes the analysis of results from part of the test where the e-learning tool was provided in pilot version. This part covered 153 questions which were distributed into three categories according to the type of the question (choice question with one correct answer, choice question with multiple correct answers and open question) and for each type of question the average correctness of answers before introducing the e-learning tool (at the regular test) and after (at the resitting test) and its differences were examined.

Table 1 Difference in average correctness of answers before and after the provision of the e-learning tool

Type of question	Number of questions where the tool was available	Average correctness of answers before tool was provided (%)	Average correctness of answers after tool was provided (%)	Difference in average correctness (percent points)
Choice with one correct answer	71	48.63	67.46	18.83
Choice with multiple correct answers	54	33.01	53.13	20.13
Open question	28	47.61	67.03	19.42
Total	153	43.10	62.33	19.23

Derived from Table 1 we can see that average correctness of answers differs for each type of question and especially at choice questions with multiple correct answers which are more difficult to answer the average correctness was around 33 % before the tool was provided. Despite this fact we can see that after the provision of the tool the average correctness of answers increased in average by around 20 percent points at each type of question. As a result of findings as described above we can confirm H1 and state that the provision of the e-learning tool to students helped to increase the average correctness of answers at the test from 43.10 % to 62.33 % and the average correctness grew by 19.23 % percent points.

5. Changes in the correctness of answers in case the additional study materials were not provided

We presume that the provision of the e-learning materials only in some areas of the course could have caused negative impact on the correctness of answers on questions from the other areas where the e-learning tool was not provided. We have therefore decided to deeply examine also the answers on this part of questions, (294 questions out of 447 questions in total) in Table 2.

Table 2 Difference in average correctness of answers in areas without the provision of the e-learning tool

Type of question	Number of questions where the tool was not available	Average correctness of answers at regular test (%)	Average correctness of answers at resitting test (%)	Difference in average correctness (percent points)
Choice with one correct answer	115	52.56	51.41	-1.15
Choice with multiple correct answers	163	30.70	39.96	9.25
Open question	16	41.50	60.13	18.62

Total	294	39.88	45.53	5.66

The Table 2 describes the comparison of results at regular the test and at the resitting test. In this case, where the e-learning tool was not provided the results of students did not get worse. The average correctness of answers in case of this set of questions increased from 39.88 % to 45.53 % and the average of correctness grew by 5.66 percent points. Partial results are slightly negative in case of choice question with one correct answer (difference is minus 1.15 percent points) on the other hand the results are quite positive at open question (increase by 18.62 percent points).

We can conclude that students underestimate a little their situation before the resitting test at the choice questions with one correct answer but in general we can conclude and reject the H2. The provision of the e-learning tool only in some areas of lectured topics did not have a negative influence on the results of students in case of questions from the areas where the tool was not provided.

6. Comparison of the correctness of answers on questions with and without study materials provided

To deeply analyse the influence of introducing the e-learning tool we would like to compare the results of students in case of questions from the lectured topics where the tool was provided in a pilot version with the results in case of questions, where the e-learning tool was not provided as it is shown in Table 3.

Table 3 Comparison of average correctness of answers on questions with and without the e-learning tool

Type of question	Difference in average correctness of answers on questions with the tool (percent points)	Difference in average correctness of answers on questions without the tool (percent points)
Choice with one correct answer	18.83	-1.15
Choice with multiple correct answers	20.13	9.25
Open question	19.42	18.62
Total	19.23	5.66

Results summarised in Table 3 confirm that the positive difference of average correctness of answers on questions where the e-learning tool was subsequently provided is higher than on questions where the tool was not available. Only in case of open questions the correctness comparing regular and resitting test increased regardless the provision of the e-learning tool. Students probably concentrate on this type of questions before the resitting tests more, because this type of question is the most difficult to answer.

Summarizing the results we can confirm our presumption at H3. The average correctness grew by 19.23 percent points in case of questions included in the e-learning tool and by 5.66 in case of questions not covered by the materials when comparing the regular and resitting test.

7. Verification of the changes in the correctness of answers comparing the results from the previous year

To verify the data gained by previous analyses we would like to exclude other possible factors that could influence the differences in average correctness at regular test and ressiting test. We are therefore going to compare the data with the control sample of results of students from the previous year (2013) when the e-learning tool was not available. We presume that the differences of average correctness of answers at regular test and at the resitting test from last year would not be significant. At the same time we presume that when comparing the difference of average correctness of answers on questions after the

IECT 2014

provision of the e-learning tool this year and the differences of average correctness of answers at regular test and at the resitting test from last year the positive influence of the e-learning tool will be confirmed.

Table 4 Comparison of difference in average correctness of answers with results from the previous year

Type of question	Number of relevant questions 2013	Average correctness of answers regular test 2013 (%)	Average correctness of answers resitting test 2013 (%)	Difference in average correctness of answers 2013 (percent points)	Difference in average correctness of questions with the tool 2014 (percent points)
Choice with one correct answer	35	67.00	66.13	-0.87	18.83
Choice with multiple correct answers	62	46.23	43.34	-2.90	20.13
Open question	2	72.97	71.43	-1.54	19.42
Total	99	54.11	51.96	-2.15	19.23

As indicated in the Table 4 differences in average correctness of regular and resitting test were slightly negative in previous year and the average correctness was almost the same at both tests and at each type of question. We can therefore confirm hypothesis H4a and conclude that there are no other influences that could affect the differences in average correctness at regular test and ressiting test.

We can also confirm the hypothesis H4b and state that the positive impact of provision of the e-learning tool is relevant also in this case.

At the same time we can see that the average correctness of answers was notably higher last year which confirms our presumption that the tests were further more demanding this year due to the significant changes in legislation but this question was not the subject of our research.

8. Limitations

The presented study has also some limitations. The e-learning tool was provided in the course of the semester before the resitting test. In the study the results of regular and resitting test are compared and the correctness rate between these tests could differ. Based on the comparison of correctness rate on the control sample from previous year this limitation was disproved.

The research was influenced by above mentioned fundamental legislative changes which caused that large part of question base had to be changed. When comparing the data from current year with the data from previous year only the questions which remain were included. Despite this fact we consider the scope of the research and the number of questions as sufficient.

The provision of supplementary study materials in the course of the semester before the resitting test we do not consider as entirely convenient and students passing the resitting test got an advantage than the students who successfully passed the regular test before. The e-learning tool was provided only in pilot version and only for part of the topics presented at the course on the other hand. The main aim of its provision was to help students to overcome the difficult situation of legislative changes. The results of pilot version of provided tool are further examined and the outcomes will be used in favour for future students. For the following semester the e-learning materials is planned to be provided for all topics and in a sufficient advance.

9. Conclusion

IECT 2014

We have discussed all research hypotheses questions posed in the paper. We can conclude that the e-learning tool was successfully introduced into the Law Basics course in the pilot version. The research confirmed that the provision of the e-learning tool for students has got positive influence on their results at progress test. At the same time the presumption that provision of the e-learning tool could have a negative impact on students who will rely only on this materials was disproved. The results of the research were confirmed by analysing the data also on control sample from previous year where it was proved, that the correctness rate did not change at all without providing the e-learning tool.

The possibilities of ICT use for compensation of difficulties with reading in pupils with dyslexia

Pavel Zikl[a]139, Iva Košek Bartošová[b], Kateřina Josefová Víšková[c], Klára Havlíčková[d], Alice Kučírková[e], Jolana Navrátilová[f], Barbora Zetková[g]

Abstract

The paper presents the possibilities of using ICT for compensation of difficulties with reading in pupils with dyslexia and during re-education. These include mainly text editing, use of different fonts, special educational software, improvement of teaching process, use of multimedia etc. Furthermore the paper presents the results of a research project focusing on a comparison of reading speed and efficiency (the number of mistakes) when using the standard writing fonts and OpenDyslexic font (a font created for dyslectics). The data has been collected using a standardized reading test, the results have been statistically processed.

Keywords: ICT in education; writing font; dyslexia; pupils with special needs

1. Introduction

The article treats the possibilities of ICT use for the work with dyslectic pupils, focusing on text editing and adjustment of the visual aspects of the text to the needs of the pupils.

British Dyslexia Association (BDA) approved the following definition: „Dyslexia is a specific learning difficulty that mainly affects the development of literacy and language related skills. It is likely to be present at birth and to be life-long in its effects. It is characterised by difficulties with phonological processing, rapid naming, working memory, processing speed, and the automatic development of skills that may not match up to an individual's other cognitive abilities. It tends to be resistant to conventional teaching methods, but its effect can be mitigated by appropriately specific intervention, including the application of information technology and supportive counselling"(British Dyslexia Association, 2007). Dyslexia is the most frequent specific learning difficulty and it complicates all activities dependent on reading performance, consequently it has an essential impact on the child's success at school. The difficulty affects the basic variables of reading performance – speed, correctness, reading technique and comprehension. Moreover, it causes difficulties with orientation in the text (repetition of the beginning of words, skipping of lines etc.) and text reproduction. Incorrect reading or even mangling of words result in the so-called specific errors including static inversions (e.g. confusing letters of similar shapes such as b-d-p, a-o-e, m-n, l-k-h etc.), kinetic inversions (e.g. mixing of syllables), skipping or adding of extra syllables, words or sentences, inappropriate use of diacritics or guessing of word endings. However, the occurrence of specific errors is highly language specific both in terms of frequency and the presence of the various types (e.g. diacritics, specific pronunciation errors etc.). A specific error which inevitably occurs in all languages is the confusion of letters of similar shapes (see the presentation of the research project below).

Dyslectic children have general skills disproportionately better than reading skills. Furthermore, they are worse at reading in comparison with their peers. Pupils with dyslexia, a difficulty affecting the acquisi-

* Corresponding author. Tel.: +420 493 331 386
E-mail address: pavel.zikl@uhk.cz

IETC 2014

tion of reading skills, achieve lower levels of reading efficiency although they are provided with normal educational guidance and have adequate intelligence.

One of the biological causes of dyslexia is a dysfunction of the magnocellular system. Dyslectic people have on average 30 % less magnocellular neurons compared with the control group. The system plays an essential role in reading, being responsible for the gathering of visual data. (Stein, 2003; Stein, Walsh, 1997). It is crucial for eye movements during reading, especially for the quick motional feedback preventing excessive fixation on the word being read. The malfunction of the magnocellular system manifests itself in an impairment of visual perception, leading to chaotic eye movements and consequent difficulties with the identification of letters etc. The effect of the chaotic eye movements is that letters seem to be moving making it impossible for the dyslectic reader to capture them and process their shape and order (e.g. if *c* and *l* come close together they look like *d*) (Zelinková, 2003).

Reading performance of pupils with SLD is affected by a number of factors, such as motivation and interest in reading, didactic procedures or socio-cultural environment, however, the graphic qualities of the text such as font size or line spacing are no less important (Zelinková, 2003). Some research projects (The effect of print size on reading speed in dyslexia., 2005) dealing with the influence of font size on reading speed in dyslectic pupils even assumed that appropriate graphic properties may enable dyslectic pupils to achieve a curve of development comparable with the curve of healthy individuals. Previous research confirmed that difficult visual conditions lower reading performance of dyslectic individuals.

There are a number of studies examining the influence of visual features on the improvement of reading performance of dyslectics. According to Stein (2003) the confusion is greater if font size is small, while bigger font size has a positive effect on reading (Stein, 2003, Stein, Walsh, 1997). A similar study (The Effect of Font Size on Reading Comprehension on Second and Fifth Grade Children: Bigger Is Not Always Better., 2013) dealing with the influence of font size on reading comprehension does not deny the findings, however, it also revealed that font size, line length and spacing etc. have a bearing on the reading performance of younger pupils, while having almost no effect in older pupils. This is connected with the fact that readers gradually develop a skill to decode smaller and smaller print. Nevertheless, it does not explain why dyslectic individuals require bigger font size to improve their reading. Considering the character of dyslexia discussed above, a plausible explanation seems to be that bigger font size creates bigger spaces between adjacent letters, which decreases their clustering and facilitates their identification (DeLamater, 2010).

More factors which have been examined in various studies apart from font size and line spacing include the use of serif/sans-serif typeface, letter spacing or the use of a special font. Research projects focusing on the appropriateness of serif/sense-serif typefaces for reading brought different findings. Some people found that a serif typeface helped them to focus on the current line, while others felt that it complicated the identification of letters. An explanation of the positive effects of sans-serif typeface is that bigger spaces between letters enable faster identification. Another finding in support of the use of sans serif typeface is that the majority of participants in the research prefer sans-serif typeface even if the reading was slower in comparison with serif typeface. (Pijpker, 2013). LDA (Learning Disabilities Association) states that the use of bigger font size, line spacing or a special font depends on the individual needs of every pupil (Accommodations, Techniques and Aids For Learning., 2014).

British Dyslexia Association recommends appropriate choice of font and background colour, the use of thick paper which is not transparent, the use of suitable font or font size as a prevention of visual stress and a means of facilitating the reading (Dyslexia style guide, 2014).

Hughes and Wilkins (2000) claim that children with reading difficulties are more susceptible to visual stress and graphic aspects of the text influence them heavily. Visual stress manifests itself in unpleasant visual symptoms during reading such as illusionary shapes, movement and colours of the text, broken or blurred print and general visual irritation. Furthermore, it may cause pain in the eyes and head, frequent loss of orientation in the text and worsened comprehension. Readers with dyslexia face more difficult word recognition and in comparison with other readers they are forced to focus more on the print, which makes them more sensitive to all visual aspects of the text that might cause visual stress, such as the contrast of black and white, line spacing, font or quality of the print. This finding led the authors to further examination of the influence of the visual properties of the text on reading in dyslectics. It is the font size and spacing that Hughes and Wilkins (2002) found to be the most important factors. The final part of the

study The Effect of Font Size on Reading Comprehension on Second and Fifth Grade Children: Bigger Is Not Always Better (2013) revealed that bigger letter spacing and word spacing affect reading even more than font size.

2. The possibilities of ICT use for the compensation of reading difficulties in dyslectic individuals

With respect to the development of Information and Communication Technologies and their integration in all spheres of social life including education, our company places considerable demands on teachers and their pupils in terms of the teaching methods and work with modern technology. It searches for the possibilities to use ICT as a tool enabling the implementation of new educational methods, improvement and modernization of education, finding new possibilities and making the teaching process more efficient (Vzdělání 21, 2014).

ICT is a suitable tool of individualization and satisfaction of the need to adapt the teaching process and methods to the needs of individuals, who are physically, mentally or socially disadvantaged in comparison with the rest of the population, i.e. the individuals with special needs.

The goal of the new progressive teaching method called *interactive teaching* is to offer to students a more amusing and less monotonous form of education, increasing their attention and motivation to learn. An equally important goal is the effort to involve the pupils themselves in the education process, enabling them to actively participate in it and shape it instead of being mere passive listeners (Interaktivní výuka, 2014).

In the course of the last five years, the Interactive Whiteboard (IWB) has become almost a common piece of classroom equipment, replacing the older overhead projectors, video, and TV or data projectors. The advantage of IWB is that it gives the teacher the possibility to create electronic multimedia materials combining photos, pictures, videos and hyperlinks to other sources. Such materials make teaching better arranged, more illustrative, systematic, and attractive and are more efficient in holding the weaker attention of pupils with SLD.

Technology permits teachers to provide materials using different media, webpages, e-mail etc. and to easily adjust them to the varying needs of pupils since it is easy to update and store them or insert references to further materials in any form.

There are a number of online gateways offering teachers further education, inspiration but also vast amounts of quality teaching materials available for free (in the Czech Republic these are created within subsidized projects whose results must be offered for free). IWB enables fast adjustments of the content and graphics of the material (change of font, font size, line spacing, background colour, font colour) according to the needs of individuals with SLD. For instance, it is possible to assign individual work to a group of pupils, asking them to take a test using the poll device enabling to answer questions which appear on the board, which gives us the possibility to provide immediate feedback and work with mistakes before they become fossilized, involving all the students at the same time. Another advantage of electronic materials is that they are not only easy to present but also easily made accessible to the whole class, which makes it possible to actively work with them or use them for practice at home. Moreover, they function as a clear outline of schoolwork for pupils with dyslexia or other learning difficulties.

A suitable complement of IWB is an interactive textbook. Interactive textbooks enable the use of interactive material (pictures, audio, video, animations etc.) in class. The individual subjects include audio and video recordings and references to webpages providing further information on the topic at hand. Furthermore, the subjects are connected by inter-subjects relations, which helps the children realize that it is necessary to combine some pieces of knowledge with others, supplement and connect them instead of separating them (Interaktivní výuka, 2014). For example, the design of reading books maximizes the amount of acquired knowledge and the saves the teacher time since it includes a tool for selection of difficult and less common words, audio versions of the texts, useful hyperlinks (e.g. a map of the place described in the text, encyclopaedic knowledge about the animal or plant mentioned in the text etc.), or

IETC 2014

questions and tasks to use with the text etc. Interactive textbooks enable the change of font size; however, unlike with e-book readers or tablets it is not possible to adjust line spacing, background, brightness or font.

Furthermore, modern technologies facilitate and seed up the communication between the individual participants in the teaching process (email, webpages, Facebook, e-learning etc.). E-learning is another step forward in the field of self-education (Zounek 2009). In e-learning, ICT are used to prepare courses offering online access to electronic materials and education independent of the school building, self-study, communication with other participants and management of the study). As far is primary education is concerned, it is used rather to provide further training for teachers.

Modern technologies play an important role in the education of pupils with special educational needs as well. Special software designed for children with special educational needs is a very useful didactic tool. Software for pupils with dyslexia or other SLD often focuses on the individual senses – aural and visual perception, orientation in space, it supports attention and development of memory but also helps with re-education in case of problems with specific skills such as arithmetic, writing, acquisition of grammatical rules reading etc. (Zikl, 2011).

An advantage of ICT use in teaching individuals with special educational needs is the already mentioned individualization enabling the teacher to involve all pupils at the same time despite their differing needs. The children can work independently on materials prepared in advance or in an electronic environment. Another asset as the possibility of compensation in the case of common activities since the software and various devices permit the pupils to eliminate the negative effects of their difficulties (e.g. write essays on a PC, read a book using tablet, which enables graphic adjustments of the text, listen to instructions instead of reading them etc.).

Both the effort to find a supportive tool improving reading capacity and the development and greater accessibility of ICT result in a more frequent use of e-book readers and tablets. These devices enable the reader to change font size, background, brightness, line spacing or typeface, which makes them friendly to dyslectic readers.

The use of special software or audio visual technologies in teaching is attractive and often also amusing. The richness of the accessible technologies permits interactive engagement with the teaching matter using different senses, which facilitates understanding and makes everything easier to remember. Modern technologies and software are useful complements of traditional didactic tools, their function is to motivate the learners, teach them to correct their own mistakes and be more independent.

3. The influence of font on the quality of reading in dyslectics

The aim of our research was to determine the impact of the choice of font on the reading of pupils with specific learning difficulties, i.e. reading speed and error rate in terms of both quality and quantity.

We compared the reading performance of pupils with SLD achieved when using the common sans-serif font Arial and the font Open Dyslectic. The font was created specifically for dyslectics with the goal of eliminate the most frequent difficulties such as confusion of letters of similar shape or letters which are mirror images of one another etc. The author tried to achieve this by introducing minute changes of letter shapes, their inclination or line weight (OpenDyslexic, 2014). The case of *b* and *d* may serve as an example of this. The two letters are identical in shape but one is a mirror image of the other. In the font Open Dyslectic, they have slightly different shapes, line weight of the curve and inclination (see figure 1). The font is not used in the Czech Republic yet, however, there is a Czech version covering the special Czech characters available for free. Foreign studies (Could a simple font help dyslexics read?, 2014) state that the use of Open Dyslectic does not increase reading speed but reduces the occurrence of specific reading errors. Besides the unique shape of individual letters, individuals with dyslexia view positively the bigger letter spacing and word spacing. The article OpenDyslexic font gains ground with help of Instapaper (2012)

IETC 2014

explains that better readability of the font moderates the effects of visual stress, which is another positive point.

Fig. 1. A sample of Open Dyslexic font (OpenDyslexic, 2014)

3.1. Research objectives and methods

Our objective was to verify whether the use of the specific font affects reading quality in dyslectics in the Czech Republic and whether the font is suitable to be used for re-education and compensation of their problems.

We compared the sans-serif font Open Dyslectic with the commonly used sans-serif font Arial. The text which we chose to collect data is a part of a standardized reading test used to diagnose dyslexia in the Czech Republic (Matějček, 1992). Since the pupils were asked to read the same text repeatedly (in different fonts) we selected an article called "Latyš", which is a piece of writing in an imaginary language structurally equivalent to Czech (the incidence of consonants/vowels, word length etc.). All the tables with texts in the individual fonts were adjusted according to the norms of the standardized test (the article Latyš) – same text, same number of words per line, font size, line spacing etc. The administration of the individual tests followed the standard procedures of the Reading test (recording of mistakes, instructions etc.). Each pupil read the same text twice in two different fonts, the second reading taking place two weeks after the first. The point of introducing the interval of two weeks was to prevent children from remembering the text as well as from using their intelligence to compensate for their reading difficulties, which is the purpose of texts in an unknown language. In order to maximize objectivity, the pupils were divided into random groups and they read the texts in different orders.

Research sample comprised 150 pupils of fourth and fifth grades from 58 primary schools (75 dyslectic pupils and 75 intact ones, 1-2 pairs from each school). Each pupil with dyslexia was paired with an intact pupil from the same school, class and of the same sex and age. The description of the research sample is given in table 1.

We formulated the following hypotheses:
H1: Dyslectic pupils will read more words per minute with Open Dyslectic than with Arial.
H2: Dyslectic pupils will make fewer mistakes with Open Dyslectic than with Arial.
The test was also administered in the control sample (intact pupils) so that it was possible to compare whether the different fonts have an effect on reading speed and error rate.

Table 1. Description of the research sample

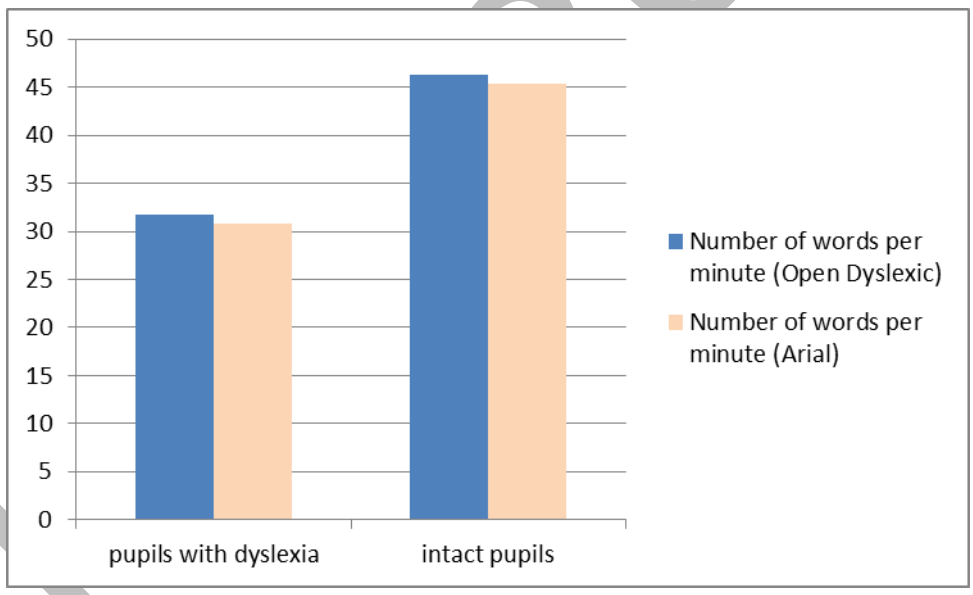
	Dyslectic pupils	Intact pupils
Number of participants (boys/girls)*	75 (49/26)	75 (49/26)
Average age	10,24	10,13

*the ratio of boys/girls corresponds with the higher occurrence of dyslexia in boys

3.2. Research results

The results showed the expectable difference in reading speed and error rate between dyslectics and intact pupils. Reading speed of pupils with dyslexia is one third lower than reading speed of intact pupils, the difference being more or less constant irrespective of the font used (31,3 % with Open Dyslexic, 32,2

IECT 2014



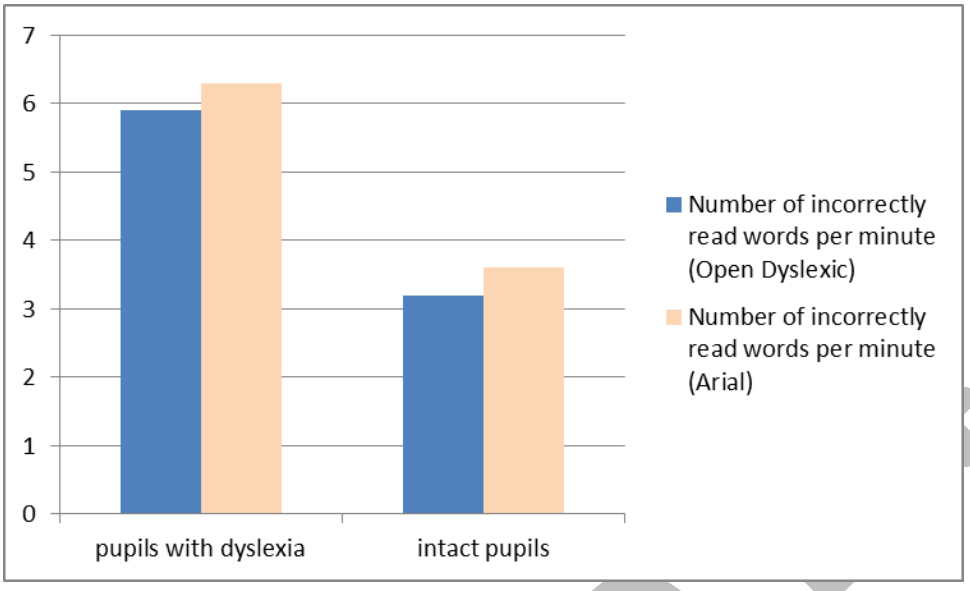
% Arial; Table 2). The difference in error rates is also considerable (84,4 % more mistakes with Open Dyslexic, 75 % more mistakes with Arial; Table 3). Nevertheless, this difference is very marked and it is not statistically significant.

Our main objective was the analysis of the results concerning pupils with dyslexia. As table 2 and graph 1 show, reading speed was approximately constant irrespective of the font, to be precise, when reading the font Open Dyslectic pupils were slightly faster (by a mere one word per minute). Neither the error rate was significantly influenced by the choice of font, which is evident from table 3 and graph 2. When reading Open Dyslectic, pupils made slightly fewer mistakes, however, the difference is minimal and not statistically significant.

Neither hypothesis was confirmed by the research, which suggests that the choice of font has no marked impact on reading speed and error rate.

Table 2. Number of words per minute

	average	standard deviation	median	T-value	Z-value
Dyslectic pupils (Open Dyslexic)	31,8	11	31	0,6238	0,701389
Dyslectic pupils (Arial)	30,8	9,06	30		
Intact pupils (Open Dyslexic)	46,3	12,94	43	0,4157	0,4218
Intact pupils (Arial)	45,4	12,54	43		
The differences in the results in this table are not statistically significant.					



Graph 1. Number of words per minute.

Table 3. Number of incorrectly read words per minute

	average	standard deviation	median	T-value	Z-value
Dyslectic pupils (Open Dyslexic)	5,9	3,48	6	-0,6389	0,727558
Dyslectic pupils (Arial)	6,3	4,29	6		
Intact pupils (Open Dyslexic)	3,2	2,61	3	-0,7626	-0,5718

Intact pupils (Arial)	3,6	3,9	3

The differences in the results in this table are not statistically significant.

Graph 2. Number of incorrectly read words per minute.

Nevertheless, it is impossible to generalize and state that a different font has no importance since a positive effect might have been present only with some pupils, which is not evident from the overall results. Some of the participants claimed that the text on Open Dyslectic was easier to read, while others had a subjective feeling of worse readability. Some of the pupils may have a better subjective feeling about reading, they may be less tired and more motivated (and able to read longer) without their error rate and reading speed being affected.

Error rates were slightly lower with Open Dyslectic, mainly in pupils which made very frequent mistakes. For example, there were 12 pupils who made 10 or more mistakes with Open Dyslectic but there were 16 such pupils with Arial. These results suggest that the effect of Open Dyslectic might be present mainly in pupils with more serious reading difficulties. However, statistical testing of this requires more data collection and a more detailed analysis.

Furthermore the results might have been affected by different amount of experience with the individual fonts. While children often use Arial, Open Dyslectic was entirely new to them and it is possible that after familiarization with it the results might have been better.

As re-education of pupils with dyslexia should be individualized it is possible to offer a choice and try which font (as well as line spacing font size etc.) is more suitable for each pupil, since there are likely to be significant differences between the individual pupils.

4. Conclusion

To conclude, we may state that the use of the font Open Dyslectic, which was designed specifically for pupils with dyslexia did not lead to any marked improvement of reading speed or error rates in comparison with the commonly used font. Although the comparison shows slightly better results with Open Dyslectic, especially in pupils with serious problems, the font was not proved to be statistically better. On the other hand, a number of pupils claimed that Open Dyslectic was more readable for them, so it is possible that certain individuals might find the font more suitable than common fonts. The use of ICT enables us to

make quick and easy adjustments of the texts, permitting the pupils to try different fonts and graphic arrangements and chose the most efficient option.

The potential of video game in Malay language learning for foreign students in a public higher education institution

Norlidah Alias, Fuziah Rosman, Mohd.Nazri Abd. Rahman, Dorothy Dewitt

Department of Curriculum and Instructional Techmology,

Faculty of Education, University of Malaya,

50603 Kuala Lumpur. Malaysia

drnorlidah@um.edu.my, fuziah@siswa.um.edu.my; mnazri@siswa.um.edu.my, dorothy@um.edu.my,

Abstract

The current study is aimed at investigating the potential of video game in teaching Malay language for foreign students in a Public Higher Education Institution (PHEI).The main objective is to consolidate the opinions of experts on types of video games, predicted year of appearance, and suitability of types of video games. Fuzzy delphi (FDM) is mainly used to consolidate a consensus of selected 30 experts from various disciplines and backgrounds. The administered instrument consists of 35 sub items across three themes.The findings show that the experts have reached consensus on items 1.1 to 3.5, with *defuzzification* value of 0.640 to 0.727. It is found that narrative genre, and platformer games are suitable for foreign learners to learn Malay language. The results also suggest that computer-based video games will not be the trend in Malay language learning from 2024 to 2028 (*defuzzification* value of 0.727). Instead, *augmented reality games* and *Mobile learning* will be dominant trends in future. The findings also show that expert consensus was reached on the effectiveness of video games in developing vocabulary of Malay language (*defuzzification value of* 0.693). In short, the experts "strongly agreed" that video game is potentially effective in teaching Malay language for foreign learners in the selected PHEI.

Keywords:Video games, Malay Language learning, Fuzzy Delphi

IETC 2014

1. Introduction

In this 21st century the role of Malay language has changed its context from an official language, national language and language of knowledge to a language learned as a foreign language. The Malay language is used in all Malaysian Public Higher Education Institutions (PHEI), Private Higher Education Institutions (PrHEI) and in institutions overseas in China, Russia, the United Kingdom, Uzbekistan, among others. Awang Sariyan (2006) also stated that bahasa Melayu, while not as widely needed as the English language. Its has own place among major languages of the world especially among foreign language learners. This is because teaching and learning of bahasa Melayu (BM) in PHEI has been introduced to foreign and

international students as a compulsory subject (Fai'zah Abd. Manan, Mohamad Amin Embi, & Zamri Mahamod, 2010).

Based on the experience of the International Islamic University Malaysia (IIUM), the BM course was made compulsory to foreign students at IIUM. According to Siti Baidura Kasiran and Nurul Jamilah Rosly (2011) most foreign students taking basic degree courses at the university learn BM as a third language. Students not only have to learn BM, they must pass the subject as acondition for graduation. The BM for Foreign Students course was made compulsory for all foreign students at IIUM by a Senate decision in April 1991.

The course offered is split into two parts, namely *Kursus Bahasa Melayu I untuk Pelajar Asing* (Malay Language Course I for Foreign Students) (LM 1010) and *Kursus Bahasa Melayu II untuk Pelajar Asing* (Malay Language Course II for Foreign Students) (LM 1011). The contact hours for this course are 50 minutes per session and classes are held twice a week (Siti Baidura Kasiran & Nurul Jamilah Rosly, 2011).However, in 2011 the BM course for foreign students was reviewed based on the decision by the senate 373rd meeting on 30th September 2011.

Video games has been used for the learning process and is referred to as *game-based learning* (Squire, 2003) or *digital game-based learning* (Prensky, 2001). This is supported by Tang et al.(2009) who also stated that the term used is computer game in education and it is also referred to as '*digital game-based learning*' (Prensky, 2001) and another term used is'*games-based eLearning*' by Connolly dan Stansfield (2007) in Tang et al. (2009). In fact, video game can be regarded as a teaching aid with potential for application in various disciplines in education (Moreno, 2008; Squire, 2003; Prensky, 2001).

2. Literature review

Studies on use of video games in language learning outside Malaysia mostly focused on effectiveness of computer games, digital games and video games by researchers (Muhammet Demirbilek, Ebru Yilmaz, & Suzan Tamer, 2010; Shelton & Scoresby, 2011; Ricardo Rosas et al., 2003; Ranalli, 2008; Walsh, 2010; Yildiz Turgut & Pelin Irgin, 2009). Other studies have focused on development and design of video games and application of existing video games for language learning, example *The Sims* (Ranalli, 2008), SHAIEx, a digital game byAdaptive Hypermedia system (Laleh Aghlara & Nasrin Hadidi Tamjid, 2011) as well as application of virtual 3D in language learning (Berns, Pardo, & Camacho, 2013; Ibanez et al., 2011; Piirainen & Tainio, 2009).

In Malaysia, research on video games in language learning had been conducted for Arabic language by Muhammad Sabri Sahrirdan Nor Aziah Alias (2011). Muhammad Sabri Sahrir, Nor Aziah Alias, Zawawi Ismail and Nurul Huda Osman (2012) used a design and developmental research (DDR) approach to develop a prototype for online vocabulary games in learning Arabic. A case study for transfer of vocabulary through computer games was carried out by Nadzrah Abu Bakar and Elaheh Nosratirad (2013) in English as a Scond language (ESL) subject using the existing video game SIM 3 as the platform for vocabulary learning. In addition, Fuziah Rosman et al. (2013) has done a meta analysis on the potential of video game in BM vocabulary learning for international students in Malaysia.

3. Statement of the problem

IECT 2014

Studies on learning of BM as a foreign language mostly cover language learning strategies (Fa'izah Abd. Manan, Zamri Mahamod & Mohamed Amin Embi, 2009; Fai'zah Abd. Manan, Mohamad Amin Embi, &Zamri Mahamod, 2010; Yong, Siti Saniah Abu Bakar, Chan, & Vijayaletchumi, 2010; Siti Saniah Abu Bakar & Sharala Subramaniam, 2012) whereas analysis of student errors was done by Siti Baidura Kasiran dan Nurul Jamilah Rosly (2011) as well as Yong danVijayaletchumi (2012). Study on video game in the context of language learning was done by Walsh (2010); Yildiz Turgut and Pelin Irgin (2009); Muhammet Demirbilek, Ebru Yilmaz and Suzan Tamer (2010); Ranalli (2008); Piirainen and Tainio (2009); as well as Laleh Aghlara and Nasrin Hadidi Tamjid (2011). These studies mainly touched on two main topics: the type of video and the effectiveness of video game in language learning. Among the types of video games discussed are Massively Multiplayer Online Role Playing Games (MMORPGs), online video game, 3D Multi-User Virtual World, and SHAIEX (*Adaptive Hypermedia System*). However, the effectiveness of video game in language learning is mostly seen in studies on learning of English as a Second Language (ESL) or English as a Foreign Language (EFL).

Further, studies were done on approaches to BM learning for foreign students such as the study by Siti Radziah Azit (2005) regarding implementation of multimedia in BM language learning and the study by Anuradha (2008) on designing a BM language learning portal for foreign students at University of Malaya. However, there does not seem to be any studies on the use of video game for learning BM for foreign students in PHEI as areare research reports on foreign students in PHEIs.The study by Fuziah Rosman, Norlidah Alias, Saedah Siraj, Husaina Banu Kenayathullah, Abd Razak Zakaria, and Ghazali Darusalam (2013) only used a meta analysis approach on the potential of video game in BM vocabulary learning by international students in Malaysia.

4. Objectives

In general, this study is aimed at investigating the potential of video game in implementing learning of BM as a foreign language in a Public Higher Education Institute (PHEI). The research objectives are given in the following:

4.1 To obtain expert consensus on the predictions of the type/genre of video game in implementing learning of BM by foreign students in a PHEI.

4.2 To obtain expert consensus on prediction of emergence of video game based on technology used in implementing teaching and learning of Bahasa Melayu among foreign students at a PHEI.

4.3 To obtain opinion of experts regarding the suitability of each type of video game for the aspect of basic skills in Bahasa Melayu in implementing learning of bahasa Melayu by foreign students in a PHEI.

5 Theoretical framework

In this study, the theoretical framework used is the model of curriculum by Hunkins and the social constructivist theory. Discussion will begin with the Hunkins curriculum model followed by social constructivist theory. Hunkins (1980) in Ornstein and Hunkins (2004)outlined seven phases in decision making on curriculum namely: a) conceptualizing the curriculum and verifying it; b) diagnosis; c) selecing content; d) selecting experiences; e) implementation; f) evaluation, and g)sustainment. The Hunkins curriculum model is used to design the futuristic curriculum in determining the suitability of selecting

IETC 2014

video game elements and implementation of curriculum in BM language learning for foreign students in PHEI.

Social constructivism is a theory derived from Piaget's cognitive development theory and the *Zone of Proximal Development*, ZPD introduced by Vygotsky (Mok, 2013). ZPD is the performance and ability of students to solve problems exceeding their capability as well as achieving development at a higher potential. In the context of this study, social constructivism theory is used in the aspect of video game as the medium of instruction or *scaffolding* in implementing learning of Malay language among foreign students in PHEI. This theory shows that the process of learning Malay language through video games can enhance the performance of a student whether aided by a teacher or more proficient peer to succeed and be motivated according to capability level.

5. Methodology

This study uses the *Fuzzy Delphi* technique introduced by Murray, Pipino, and Gigch (1985) and revised by Kaufman and Gupta (1988). FDM is a combination of *fuzzy set numbering* or *fuzzy set theory* applied in thetraditional Delphi technique. This technique is not new in future studies and a fast and effective technique for obtaining consensus from experts without too many iterations or cycles (Norlidah Alias, Mohd Nazri Abdul Rahman,& Saedah Siraj, 2013).

Two main considerations are found in FDM, namely the*Triangular Fuzzy Number and Defuzzification Process*. Triangular Fuzzy Number has three values (m_1, m_2, m_3) namely the minimum value, most reasonable value and the maximum value. Defuzzication is used to determine the ranking for each variable or item or each subvariable or sub item. Three equations can be applied to determine the ranking:

6.1 $A_{max} = 1/3 * (a_1 + a_m + a_2)$

6.2 $A_{max} = 1/4 * (a_1 + 2a_m + a_2)$

6.3 $A_{max} = 1/6 * (a_1 + 4a_m + a_2)$

Next, a list of 30 experts was selected as the expert panel in this study. The data collection is implemented through the Fuzzy Delphi approach. Firstly, interviews were carried out, and the Delphi technique was used to develop a questionaire. Next, the questionnaire responses were analyzed using *fuzzy number* technique. A 5-point scale was used (Norlidah Alias, Mohd Nazri Abdul Rahman & Saedah Siraj, 2013). The purpose was to obtain consensus among the experts to predict the type of video game required for instruction in the basic skills for BM for foreign students. The answers from the experts is placed on a scale from 1 to 5 with the fuzzy value (Table 1).

Table 1: Five point scale

Scale (Linguistic variable)	
Highly Disagree	(0.00, 0.10, 0.20)
Disagree	(0.10, 0.20, 0.40)
Moderately Agree	(0.20, 0.40, 0.60)
Agree	(0.40, 0.60, 0.80)
Highly Agree	(0.60, 0.80, 1.00)

IETC2014

6. Results

Data analysis was carried out using the *Fuzzy Delphi* technique to ascertain the level of consensus between experts. The findings for all items have been analysed by determining the distance between 2 *Fuzzy numbers* for calculating the threshold value, **d** (Chu & Hwang, 2008) as follows:

$$d(\bar{m},\bar{n}) = \sqrt{\frac{1}{3}\left[(m_1 - n_1)^2 + (m_2 - n_2)^2 + (m_3 - n_3)^2\right]}.$$

In this study, the prerequisite (1) was fulfilled because the *threshold* value for most sub items is ≤ 0.2, but for part of the sub items only. Nevertheless, the second condition (2) also was fulfilled because the expert consensus had exceeded 75%. The result of summing up the *threshold* values ≤ 0.2, showing that this study found a *threshold* value exceeding 75% and recording 77.8% for all items encompassing 41 sub items.

Subsequently, analysis shows the prediction of the types of video games in implementing learning of BM for foreign students in PHEI. In item 1, there were five sub itemsas explained in Table 2.

Table 2: The ranking for different genres of video games used in implementing BM learning among foreign students

Item	Predicted type / genre of video game	*Fuzzy evaluation*	*Defuzzification*	Ranking
1.1	Video games of all types/genres need to be applied in learning of BM among foreign students.	(13.2, 19.2, 25.2)	0.640	4
1.2	Video games on racing are very suitable for learning activities in BM learning among foreign students.	(11, 17, 23)	0.567	5
1.3	Online video games must be used in learning BM among foreign students whether in class or outside class.	(14.2, 20.2, 26.2)	0.673	3
1.4	Video games of the narrative genre are suitable for learning of BM by foreign students.	(14.9, 20.8, 26.8)	0.694	1
1.5	The learning situation for BM learning among foreign students will be more interactive by implementing *video simulation games*.	(14.8, 20.8, 26.8)	0.693	2

Based on Table 2, the majority of experts agreed with item 1.4 with a *defuzzification* value of 0.694 in the first rank. This shows that video games in the narrative genre are very suitable for learning BM as a foreign language.

IECT 2014

The following analysis shows that the predicted time of emergence of video game based on technology used in implementing BM learning among foreign students in PHEI. For item 2, there are five sub items and five phases in question, namely from 2014 - 2018, 2019 - 2023, 2024 - 2028, 2029 - 2033 and 2034 – 2038, as given in Table 3.

Table 3: Predicted emergence of technology-based video game in learning of BM among foreign students.

Item	Prediction	subitem	Predicted time frame	Fuzzy evaluation	*Defuzzification*	Ranking
2.1	Bahasa Melayu video game for foreign students will be available on any gadget and public interactive board.	2.1.1	2014 – 2018	(10.8,16.8,22.8)	(0.560)	2
		2.1.2	2019 – 2023	(13.2,19.2,25.2)	(0.640)	1
		2.1.3	2024 – 2028	(9.4,15.4,21.4)	(0.513)	3
		2.1.4	2029- 2033	(6.5,10.4,16.4)	(0.370)	4
		2.1.5	2034-2038	(5.2, 9.8, 14.6)	(0.329)	5
2.2	Potential of *Mobile learning* with the capability of video game technology using touch screen through smart phone or tablet in implementing learning of BM by foreign students.	2.2.1	2014 – 2018	(13.8,19.6,25.8)	(0.658)	1
		2.2.2	2019 – 2023	(13.2,19.2,25.2)	(0.640)	2
		2.2.3	2024 – 2028	(9.1,15,21.2)	(0.503)	4
		2.2.4	2029- 2033	(9.8,15.4,21.4)	(0.518)	3
		2.2.5	2034-2038	(5.6,10,14.4)	(0.333)	5
2.3	Augmented Reality Gameswill feature virtual technology *Depth-Sensing Cameras* in smartphones and tablet more effective for learning of bahasaMelayu.	2.3.1	2014 – 2018	(7.9,12.8, 18)	0.430	5
		2.3.2	2019 – 2023	(13.4,19.4,25.4)	0.647	2
		2.3.3	2024 – 2028	(13.8,19.8,25.8)	0.660	1
		2.3.4	2029 - 2033	(8.5,13.4,19.4)	0.459	4
		2.3.5	2034 - 2038	(9.2,14.3,19.6)	0.479	3
2.4	Computer based video game will not become the trend in Bahasa melayu learning among foreign students.	2.4.1	2014 – 2018	(7.7,12.6,17.8)	0.423	5
		2.4.2	2019 – 2023	(9.8,14.8,20.6)	0.502	4
		2.4.3	2024 – 2028	(15.8,21.8,27.8)	0.727	1
		2.4.4	2029 - 2033	(11.5,17.4,23.4)	0.581	2
		2.4.5	2034 - 2038	(10.4,16.1,21.8)	0.537	3
2.5	Transfer of nano technology knowledge can be the trend in shaping the use of video game in learning BM among foreign students.	2.5.1	2014 – 2018	(9.5,15.2,21)	0.508	2
		2.5.2	2019 – 2023	(13.2,15.2,25.2)	0.640	1
		2.5.3	2024 – 2028	(8.4,14.4,20.4)	0.480	3
		2.5.4	2029 - 2033	(8.1,13.2,19.2)	0.450	5
		2.5.5	2034 - 2038	(9,1.13.9,18.8)	0.463	4

The ranking according to expert consensus for all sub items is given from 2.1.1 until 2.5.5 is shown in Table 3.Based on Table 3, the majority of experts agree withsubitem 2.1.2 and its *defuzzification* value of 0.640 in the first rank. This shows that video game in BM for foreign students can be found in any gadjet and public interactive board predicted from 2019 - 2023.

The majority of experts also agreed with subitem 2.2.1 with a *defuzzification* value of 0.658. This shows that the potential of *Mobile learning* will see the capability of video game technology on touch screen of smartphone or tablet in implementing the learning of BM among foreign studentsis expected from 2014 - 2018.

Meanwhile, for item 2.3, The majority of experts also agreed with subitem 2.3.3 with a *defuzzification* value of 0.660 in the first rank.This shows that Augmented Reality Games*featuring* virtual technology such

as Depth-Sensing Camerasin smartphones and tablets will be more effective in BM learning predicted from 2024 - 2028.

Similarly with item 2.4, the majority of experts agreed withsubitem 2.4.3 with a *defuzzification*value of 0.727 in the first rank. This implies that video game based on computers will not be the trend in BM learning among foreign students is expected between 2024 - 2028.

Lastly, for item 2.5 the majority of experts agreed with subitem 2.5.2 with a *defuzzification* value of 0.640 in the first rank. This shows thattransfer of nano technology knowledge will be the trend in video game in learning of BM among foreign students as predicted to occur over the years 2019-2023.

The following is the analysis for prediction of suitability of video game type in the aspect of basic skills in implementing BM as a foreign language among foreign students in PHEI.For item 3, there were five sub items as explained in Table 4.

Table 4: Ranking for sub items 3.1 to 3.5on suitability of video game types in learning BM among foreign students

Item	Prediction of the suitability of each type of video game from the aspect of basic skills in Malay language	Fuzzy evaluation	*Defuzzification*	Ranking
3.1	Strategy video games are suitable for use in the aspect of grammar and sentence-building in BM for foreign students.	(14.4,20.4,26.4)	0.680	2
3.2	A*dventure* video games and *puzzle games* are very attractive for use in learning BM for foreign students in the aspect of understanding text in the form of animation and multimedia or *hypermedia*.	(13.4,19.4,25.4)	0.647	5
3.3	Problem solving games are more interesting for application in learning BM for foreign students in the aspect of BM acquisition.	(13.9,19.8,25.8)	0.661	3
3.4	Role playing games and simulation gamesare very suitable for mastering speaking skills or presenting ideas in learning BM among foreign students.	(13.8,19.8,25.8)	0.660	4
3.5	Platformer games are more effective for enhancing the aspect of vocabulary skills in BM by foreign students.	(14.8,20.8,26.8)	0.693	1

IETC 2014

Based on Table 4, the majority of experts agree withsubitem3.5 with a *defuzzification value of* 0.693 in the first rank. This shows that the video game platform *platformer game* is more effective in enhancing the aspect of Malay language vocabulary mastery among foreign students. The rankings as agreed to by the expert panel are given in Table 4.

8.Conclusions

Studies on a futuristic curriculum through video game are appropriate to be carried out in order to effect change in the curriculum in the next 5 to 10 years. The result of expert consensus proves that part of the elements of video game playing have potential in implementing learning of BM among foreign students in PHEI as shown by the consensus of experts at the level of 0.60 to 0.80. This means that the expert consensus was at the level of "agree" to "highly agree".

The impact of decision based on expert consensus shows that a new framework for designing curriculum based on potential of video game as a medium of instruction or *scaffolding* in BM language learning for foreign students in PHEI.This study suggests a new education policy be implemented by the relevant stakeholders especially the Higher Education Department and Ministry of Education Malaysia in general to highlight the potential of video games as a teaching aid too in all PHEIs in Malaysia. The language centers and faculties in all PHEIs should see the development of this technology as being capable of making language learning more attractive and interactive for application as a medium for BM language learning among foreign students.

The reduction of speaking anxiety in EFL learners through drama techniques

Mine Atas140
Kozan Sis Technical and Vocational Anatolian High School, Adana, 01510, Turkey

Abstract

The study on drama and anxiety reduction was conducted with 24, 12th grade students at a high school in Kozan, Turkey. The triangulation of the data was established with pre and post-tests, semi-structured pre and post-interviews, and student diaries. The teacher's reflections strengthened the qualitative aspect of the study. After six weeks of language and drama training, the drama techniques significantly lowered the speaking anxiety of EFL learners.

Keywords: Speaking anxiety; reduction of speaking anxiety; drama and speaking anxiety; anxiety and EFL; drama and EFL

1. Introduction

The word *drama* is originally derived from the Greek word *dran* which means "to do, to act." Action is an essential part of learning a language, as it develops body language, increases motivation, and keeps students involved in the learning process (Miccoli, 2003; Gorjian, Moosavinia, & Jabripour, 2010). Drama also creates a friendly, stress-free atmosphere where optimal learning occurs (Miccoli, 2003; Conejeros & Fernandez, 2008; Gorjian et al., 2010). Even when adults, let alone children, feel pressure on themselves, it becomes a burden to act, move or speak naturally, especially in public, which means anxiety.

While trying to find out if drama helps students' oral skills development, researchers have also found that drama lowers anxiety levels of EFL learners (Miccoli, 2003; Conejeros & Fernandez, 2008; Gorjian et al., 2010). Drama itself has become a teaching technique which encourages students to learn a new language in a creative and effective way. This means that drama techniques create an atmosphere where students learn in context, use their imagination, and spontaneously react. Speaking a language without any preparation is of great importance for fluency in EFL. Fluency requires "performance." To achieve fluency, a learner has to perform the language. However, speaking a foreign language in the classroom is inherently artificial. It is very difficult to involve students in artificial speaking activities. Students need lifelike situations to perform the elements of the language. They also need to feel as if they are not acting. When they are aware that they are imitating a foreigner, they become anxious.

Teenagers are afraid of making mistakes in front of their friends and their teachers. They feel embarrassed, anxious and humiliated. These feelings may cause reticence. When they are anxious, they can't speak. When they can't speak, they become more anxious. The purpose of this study is to examine the effects of drama techniques on speaking anxiety in EFL learners. The research question for this study is:

How does the use of drama techniques affect the speaking anxiety of EFL learners?

2. Review of literature

2.1. Speaking anxiety in EFL classes

Foreign language anxiety is a major element which affects performances and acquisition of FL learners. FLA occurs more in output language abilities such as writing and speaking than in input abilities (Chiu et al., 2010). In the study of Chiu et al.(2010), a high percentage of students reported that it was easy for them to become anxious when they spoke in English (p.109). Accordingly, students who tested high on anxiety in the study of Horwitz et al., remarked that they are afraid to speak in the FL (1986). Though the results of the study of MacIntyre and Gardner (1991) presented that speaking is the most anxiety-provoking activity in second language acquisition, half of their students reflected the use of speaking skills as confidence-building experience (p.303). Thus, it can be implied from this study that, when there is no anxiety provoking situation, speaking a FL can increase students' self-confidence. The level of self-confidence is one of the most important factors provoking anxiety because, when students experience high self-confidence, they are not afraid of making mistakes or having other students laugh at them. Besides, it was found in the study of Park and Lee (2005) that low self-confidence or high anxiety levels affect students' oral performances negatively. Zheng (2008) stated that when students are supposed to complete an oral task, their anxiety level can increase. Giving oral presentations and performing in front of other students was reported to be one of the most anxiety provoking situations, as well (Ohata, 2005; Woodrow, 2006). Ohata (2005) and Ay (2010) also mentioned the effect of "unpreparedness" on students' speaking anxiety. In this situation, a student reported that s/he feels weird, and prefers to keep his/her silence during whole class, and wishes not to be asked any questions (Ohata, 2005).

People are often anxious about their ability in a foreign language, especially in listening/speaking situations, which leads to a type of anxiety called "communication apprehension" (Macintyre & Gardner, 1991). This type of anxiety plays such a crucial role in FL speaking anxiety that even talkative people become silent in a FL class when they have communication apprehension (Horwitz et al., 1986; Aydın, 2008; Ay, 2010).

In summary, there are many reasons for why EFL learners experience speaking anxiety, such as:

- fear of public speaking,
- communicating orally
- immature vocabulary
- fear of making pronunciation mistakes
- limited grammatical knowledge
- unpreparedness
- fear of being laughed at
- taking an oral test
- native speaker effect
- error correction style of the teacher
- levels of English proficiency
- worrying about being understood or not
- shyness, and
- low self-confidence. (Wörde, 2003; Ohata, 2005; Woodrow, 2006; Awan et al., 2010.; Dalkılıç, 2013; Park & Lee, 2005).

When FL learners continually experience FL speaking anxiety, they react physically with heart pulpitation, sweating, and trembling. They also react psychologically with negative thoughts concerning language learning and speaking; having low level of self-confidence in language class; and by not looking

at the eyes of the teacher. They may also remain silent during the lesson. At this point, what teachers are supposed to do is to create an atmosphere of low or no anxiety. Only by doing this can the student overcome the apprehension of speaking an FL.

2.2. Use of drama for speaking anxiety

Even though the history of drama dates back thousands of years, the use of drama in language classrooms has played a small, but consistent role in language teaching for only about four decades. Nevertheless, the advantage of this technique hasn't been completely appreciated in second/foreign language learning (Dodson, 2000). Hamilton and Mcleod (1993) claim that the use of drama techniques fits naturally into the nature of language and language learning (p.2). According to Du Mont (2007), in drama, there is emotion and movement, both of which have the power for liberating linguistic abilities. Holden (as cited in Davies, 1990, p. 87) describes drama when he says, "In other words, drama is concerned with the world of 'let's pretend'; it asks the learner to project himself imaginatively into another situation, outside the classroom, or into the skin and persona of another person."

According to Schewe "if drama had a place in the curriculum then its purpose must straightforwardly be the improvement of pupil's speech." (as cited in Hölzl, 2009, p. 37). Among all the positive effects of drama in ELT, improvement of speaking has a very special place. Still, as the use of drama techniques for speaking skills is relatively recent, and there is limited research on the issue, the effects of drama activities on oral skills development of FL learners hasn't clearly been put forth (Zerey, 2008; Galante, 2012).

The previous research showed that the largest portion of anxiety in a FL classroom belongs to "speaking" an FL (Stroud & Wee, 2006; Woodrow, 2006; Wood Shand, 2008; Zerey, 2008; Gai & Yang, 2010; Galante, 2012). With the intention of finding a remedy for this disturbing situation, researchers, like Miccoli (2003), Wood Shand (2008), Zerey (2008), Gorjian et al. (2010), Galante (2012), have tried drama techniques in FL classrooms. Based on this research, it can be implied that drama changes attitudes and beliefs of students about learning a foreign language as well as speaking it in public or in FL classroom atmosphere. We can hopefully say that drama techniques psychologically and physically affect students' language abilities. Students' understanding of drama texts, their verbal knowledge, and communication skills improve. Drama keeps students active in the learning situations. Students' self-confidence and motivation increase. However, their anxiety level, which plays a major role in communicative skills in FL classes, decreases.

3. Method

3.1. Participants

This study was conducted at Kozan Anatolian Medical Vocational High School in the first term of academic year 2013-2014. The participants of the study were 24 students who were chosen through purposive sampling. They were 12th graders at the age of 18. Students at this level were preferred because they were studying at the department for emergency medical technicians. As there was only one class of students in this department, there wouldn't be unfairness to any other classes. Moreover, despite their negative feelings about English, most of the students were interested in studying language through drama and they complained about the time given to English speaking exercises during regular English classes. For these reasons, these participants were chosen, and all the students willingly agreed to participate in the study. The participants were number coded such as St1, St2, to ensure their confidentiality.

IETC 2014

3.2. Materials & design

To investigate how drama affects the speaking anxiety of EFL learners, the data was collected through pre- and post-questionnaires, semi-structured pre- and post-interviews, and student diaries. Foreign Language Classroom Anxiety Scale (FLCAS), designed by Horwitz, Horwitz, and Cope (1986), was used as pre- and post-questionnaire. During 6-weeks-drama course, the students kept diaries which gave better insights into the effects of drama techniques. The teacher video-recorded the drama sessions and took notes on her reflections. Right after the course period, students took post-questionnaires and answered the semi-structured, post-interview questions.

In this case study, qualitative data was collected through student diaries and semi-structured pre- and post-interviews, and teacher reflections. The one-group, pretest-posttest design was conducted for the quantitative data.

3.3. Procedure

Before beginning the data collection, the instructor talked to the students and confirmed all the students are willingly attending the study. First, the Turkish version of FLCAS was administered to the students as pre-test. There were 33 items in this five-points likert scale test. Second, 10 students out of 24 were chosen by lot for the interview. The interview was conducted one-to-one in an empty classroom. The interviewee was informed that his/her voice will be recorded for the benefit of the teacher. After the administration of the questionnaire and conducting the interviews, it was time to record a diary, and answer pre-drama questions. One day before the drama activities began, the pre-drama questions and drama-questions were pre-prepared and given to the students. All the questions written on the handout were read by the teacher and explained by giving examples to make sure that all the students clearly understood everything. The following day, the drama exercises began. Within the drama exercises, there were famous films, fairy tales and a final performance show. Using films is mostly preferred because, in films, there are human emotions which the students feel while acting the roles. Drama scripts were used which were previously prepared. The scripts were prepared according to learners' interests, age, and language level. Music was an important point in the study. The soundtracks of the films were effectively used in the drama activities to motivate students better. A soundtrack was played in the background of a drama activity or it was the activity itself. Props were also very important for the exercises. Students had a chance to create their own props which was very motivating for them, or they were able to choose from the variety of props which were brought to the classroom by the teacher.

Language games, role play, mime, improvisation (Dundar, 2012), and drama scripts (Karakaya & Kahraman, 2013) are the drama techniques used in this study.

Table 1 is prepared to briefly present which data collection tools were used for the research question, together with how it was applied.

Table 1. Data Collection Procedure

Research Question	Data Collection Tools	Data Collection Procedure
How does the use of drama techniques affect the speaking anxiety of EFL learners?	FLCAS	Turkish FLCAS Before-after drama sessions
	Semi-Structured Pre and post-interviews	Turkish 10 randomly-chosen interviewees (40%) Before-after drama sessions

Student Diaries	Turkish 24 students 6 weeks
Teacher's Reflections	Video records Notes

The Foreign Language Classroom Anxiety Scale (FLCAS) FLCAS was analyzed using the Statistical Package for Social Sciences (SPSS). To test the reliability of both pre-test and post-test questionnaires, Cronbach's Alpha statistic was used and calculated as 0.948 for pre-test and 0.914 for post-test. Because the statistics are very close to 1, reliability was found to be very high. Foreign language speaking anxiety level of the students was determined with the total scores of each student's answers to the FLCAS. The responses to each item in the questionnaire were analyzed calculating the individual item means. For each item, frequencies and percentages were also calculated to see the general distribution of the responses among the participants.

The qualitative data were collected through pre- and post-interviews, students' diaries, and teacher reflections which were analyzed using the content analysis technique. In the content analysis, the steps used by Zerey (2008, p. 73-74) were followed throughout the analysis process:

- Transcribing
- Coding/labeling
- Clustering
- Looking for interrelationships between categories
- Write-up

4. Findings & analysis

4.1. Foreign language classroom anxiety scale(FLCAS)

For the FLCAS, a paired samples t-Test was administered to the data in order to determine the difference between the pre and post-test results. In the following tables, the mean of pre-test scores showing the level of anxiety of the students was 3.07 over 5 and this represents "neither agree nor disagree" point on the Likert Scale. The mean of post-test scores was 2.40 over 5 and this nearly represents the "disagree" point on the Likert Scale. In the questionnaire, negative propositions was questioned. Because of that, it can be implied that the students' foreign language classroom anxiety decreased after the drama application.

Paired Samples t -Test shows that there is a statistically significant, positive difference between the means of pre-test and post-test scores, because t statistic is 3.592 and corresponding P value is 0.002 which is less than predetermined significance level 0.05.

Table 2. Paired Samples Statistics of FLCAS

	Mean	N	Std. Deviation	Std. Error Mean

IETC 2014

Pair 1	Pre-Test	3.0694	24	.80378	.16407
	Post-Test	2.4028	24	.62064	.12669

*N= number, *Std Deviation=Standard Deviation, *Std Error Mean=Standard Error Mean

Table 3. Paired Samples t-Test

	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference Lower	Upper	t	df	Sig. (2-tailed)
Pair 1 Pre-Test-Post-Test	.66667	.90919	.18559	.28275	1.05058	3.592	23	.002

*Df = Degrees of Freedom, * t = t-Test, *Sig. = Significance Level

The findings of the quantitative data show that drama positively affected students' anxiety, fear, nervousness, and embarrassment towards speaking in the FL. Most of the students benefited from drama exercises in ways such as speaking in FL when unprepared; feeling confident while speaking English; overcoming the feel of being worse at speaking English than other students; and the fear of being laughed at while speaking an FL.

4.2. Interviews

As for the interviews and the student diaries, the findings are not much different from the findings of FLCAS. During the pre- interviews, the students continually articulated that they are afraid of making mistakes while speaking. They mostly mentioned pronunciation mistakes.

St3. *If I don't know (the answer), I feel embarrassed. If I pronounce funny or silly, I feel embarrassed.*

When they were asked about their reaction to this disturbing situation, students reported that they stop speaking, feel ashamed, or get angry.

Similar to the findings of FLCAS, it is found in the post test that after the drama application most of the students started to feel better in English classroom, and consequently, found it easier to speak English.

St1. *There are many differences. For example, when we are in the classroom, it is just an ordinary lesson. But while doing drama activities, we both have fun and learn at the same time. It helps us to overcome our excitement.*

St2. *Speaking in a regular English lesson and speaking in a drama course is so different from each other. You learn speech patterns in drama. I mean you learn what to say with using these patterns. But it is more difficult (to speak) in a regular class. I mean, I think learning grammar rules is more difficult.*

However some students handled the issue in a different way:

St9. *As we are doing something "critical," as we believe that we shouldn't make a mistake, we give more importance to drama. But in a regular English class, when we make a mistake, you can correct it. We don't need to get anxious. However we get anxious in drama as it is a "critical" issue.*

IETC 2014

4.3. Student diaries

In the student diaries, the responses of the students to the question asking if they feel comfortable, excited, anxious, frightened or happy, showed that most of the students were anxious, frightened, or excited while speaking English in the first drama session. However, when the last week arrived, no students felt this way. Some students also stated that their self-confidence had increased. In the first week, while half of students observed that their friends liked to speak English, after 6 weeks, all of the students agreed that their friends enjoyed speaking English. Moreover, after the six-week-drama application, students compared their thoughts and feelings towards English speaking situations with the ones they had before the drama application. The responses demonstrated that there is a great difference after six weeks. More than half of the students stated that they used to have problems with pronunciation. Almost half of the students stated that they used to abstain from speaking English lessons while some students expressed that they used to be afraid of making mistakes while speaking English. Similarly, some of the students said that they used to get excited while speaking, However, some complained about that they used to have poor vocabulary. Yet, these negative situations turned into positive thoughts and feelings with the help of drama application. Many of the students stated that they are not afraid of making mistakes while speaking English. Most of the students expressed that their pronunciation has improved. More than half of the students stated that they feel comfortable in English lessons, while some students said that they spoke better after the six-week-drama application.

4.4. Teacher's reflection

As a result of my observations, I start to believe that drama is a must in foreign language teaching. After 6-week-drama application, I conclude that drama helped my students to discover themselves; see their strengths and weaknesses; face their fear or nervousness; and overcome these relatively negative feelings. The students who were always abstaining from speaking English and acting, started to raise their hands when I asked for a volunteer. These students also wanted frequently to be called on. Although there was not an observable improvement in their pronunciation, after the application, students weren't afraid of making mistakes while pronouncing a word.

On the other hand, warm up activities also had a significant effect on lowering speaking anxiety levels. During warm up activities, both the students and I enjoyed the language training experience. We acted, danced and sang out loud. Everybody laughed at each other which appeared to help students overcome the fear of being laughed at.

After the drama application, it was clear that their friendship became stronger. There was no grouping among the students any more. All of them wanted to share a scene with a volunteer who they really don't know very well. This also helped students to overcome their fear of making a mistake in front of their friends.

Drama had many positive effects on students. Among the most important ones, we can count the lowering of speaking anxiety levels; improving self-confidence; increasing motivation; decreasing the level of their fear of being laughed at; and being called on in English class.

5. Discussion

In order to explore the effects of drama on the speaking anxiety of students, the findings of FLCAS, interviews, students' diaries ant the teacher's reflections were analyzed. As a result of the comparison between the pre-test and post-test (FLCAS) anxiety scores of the students, it is found that there is a significant difference between the anxiety levels of the students before and after the 6-week-drama

IECT 2014

application. Examining the items specifically related to speaking in FL (Items 1,9,14,16,24,27,33) provided data to support the argument of the present thesis. The findings revealed that drama application lowered students' speaking anxiety in FL.

Moreover, the post-interview results showed that students constantly mentioned their previous concerns about pronunciation which is reported to decrease after the drama application. Similarly, in the students' diaries, the most frequently (n=15) mentioned issue was the improvement of pronunciation after the drama. It is clear in the findings of the present study that pronunciation is considered to be among the dominant elements of FL speaking. As it is accepted as an obligation to pronounce well or perfect in FL, students get anxious when they don't have a good command of it.

Another outcome of the drama application was that students felt comfortable. The word "comfortable" might define several situations here such as, not excited, not anxious, not embarrassed, no fear of making mistakes, no grammar rules, and feeling comfortable among friends. Regardless of these meanings, most of the students said that they feel more comfortable in drama classes than in regular classes. However, there were 2 students who reported that speaking in drama classes was more difficult than in regular classes. One of these students said that the reason for the difficulty was that they had to give attention to more than one thing at the same time, such as the lines, intonation, pronunciation, and of course acting. The other student explained the reason for the anxiety, underlining that drama is a "critical" issue. Since she finds drama more important than a regular lesson, she believes that when she makes a mistake in a regular class, the teacher can correct it, yet this is not possible in drama when she is on the stage. It would not be appropriate to assume that the reaction of the two students was evidence for the negative effect of drama. Rather, they need to be accepted as good outcomes. It was difficult for the first student to speak, as he put effort into the drama by speaking and expressing feelings at the same time, which shows his eagerness to do his best. On the other hand, since the drama activity was given excessive importance by the second student, she believed that she shouldn't make any mistakes. Both students also expressed that they enjoyed the drama activities, which shows that negative feelings towards English don't stem from anything related to the teacher, the other students, or the drama exercises. The reason for their speaking anxiety is directly related to the importance they give to what they are doing in drama.

Additionally, in line with the findings of Zerey (2008), after the drama application, students stated that they gained more self-confidence in speaking English. Pre and post-test included item 31: "I'm afraid that the other students will laugh at me when I speak the foreign language." It shows that the number of the students who are not afraid of being laughed at increases (n=17) in the post-test. According to the teacher's reflections, this might not have been caused by the decrease in laughter directed at the student, *b*ut by an increase in the students' level of self-confidence.

In addition to these favorable outcomes of the study, there is another issue to mention here. The findings of the FLCAS reveal that there is a statistically significant difference between the speaking anxiety levels of the students before and after the drama application. However, there are 7 items in the findings which differ from the other 28 items in the scale. Basically, what was found in the FLCAS was that the students got benefits from drama. These 28 supporting items showed significant support for the idea that drama has positive effects on students' speaking and general anxiety in language classrooms. Though, the findings of these 7 differing items (Item 2,5,8,11,14,18,28) don't show consistency with the majority of the items supporting the present thesis. According to the findings of the Item 5, most of the students (n=18) don't want to have more English lessons after the drama application, while in the student diaries, students frequently stated that they are happier and more comfortable in a language class. Similarly, all of the 10 interviewees reported that they like English classes after the drama application.

This was an unanticipated result which caused the researcher to re-examine the data in an attempt to understand why this situation occurred. The reasons for this apparent contradiction may be related to the students' ability to understand question content and the misunderstanding of the purpose of the questions during the administration of FLCAS. This seems reasonable because the student clearly responded in a positive way to the use of drama in other data collection areas of the study.

IECT 2014

6. Educational implications

The present study shows that drama has positive effects on the speaking anxiety of EFL learners which corresponds to the findings in the FLSA literature. To understand how and to what extent drama helps to lower the levels of speaking anxiety of EFL learners, it is necessary to explain the factors which contribute to anxiety in EFL classrooms.

In order to make use of the findings of the present study, anxiety in foreign language classes should be discussed with the students. They are not alone in the feeling of anxiety in language training classes. As most of the students suffer from the fear of making a mistake, they might also be told that everybody, even the native speakers, can make a mistake while speaking. The same thing happens in Turkish language training. Students should give the same level of respect as they prefer to receive from friends during language training exercises.

In addition, language teachers should be given special education concerning how to create an anxiety free atmosphere in classes. When a student becomes reticent in a language classroom, it means that the teacher has lost a student. The unwillingness of a student to participate in a language classroom is not a sign of discipline, but a sign of higher levels of anxiety, or no anxiety which might suggest complete disinterest. As Brown (1994) suggests, anxiety is a matter of degree. How it is perceived depends on if it is a mild or severe anxiety. Severe anxiety is debilitating while mild anxiety can be facilitating in FL classes. For this reason, anxiety, to a certain degree, could be considered as a beneficial effect on language learning.

Moreover, language teachers should also be informed about the positive effects of drama on speaking and anxiety of FL learners. The literature of FLCA also supports the effectiveness of drama for reducing speaking anxiety. Foreign language teachers could use drama as a powerful medium to teach FL; to motivate students to speak in FL; or to encourage student involvement in literature. On the basis of the observations performed in this study, teachers can work miracles in FL classrooms through the use of drama techniques.

7. Conclusion

This study shows that drama helped to reduce speaking anxiety in FL classes. Thus, the purpose of this study was to seek the answer to the question:

How does the use of drama techniques affect the speaking anxiety of EFL learners?

The study was conducted with a group of 12th graders in Kozan Anatolian Medical Vocational High School. The language levels of these 24 participants were A2. To answer the research questions, the quantitative data was collected through pre and post-tests by the use of FLCAS (Horwitz et al., 1986). The data was analyzed via SPSS program. Semi-structured pre and post-interviews, students' diaries, and the teacher's reflections were included to collect qualitative data which were analyzed through content analysis.

In the present study, it is found that drama application significantly contributed to the emotional quality of the FL classroom. Students felt better, got rid of their prejudices about English classes, and became eager to come to FL classes. In addition, drama lowered the speaking anxiety of the participants. The students started to speak without the fear of making mistakes. They willingly started to take part in English speaking situations.

IETC 2014

Helping students to speak in FL classes is a major responsibility of an FL teacher. In order to fulfil this duty, it is necessary to inform students that it is common to get anxious while speaking an FL, and they are not alone. Moreover the students need to know that the teacher is waiting there to help and courage them; not to correct their mistakes or insult them. When students start to feel secure in the FL classroom, they naturally start to speak.

In conclusion, all foreign language teachers need to motivate their students; encourage them to speak; and to allow them to make mistakes without punishment. In general, it is impossible to learn a foreign language without making mistakes. Given this situation, teachers should make adjustments in the language class to prevent negative feelings toward English language learning. According to this study, the use of drama in foreign language teaching promotes positive feelings toward the learning experience while it increases the likelihood that students will continue to involve themselves in language training.

The study of students' opinions on the knowledge management system to support online instruction for self-directed learning

Tipparat Sittiwong[a], Wanitcha Manyum[b]141
[a,b] *Department of Education Communication and Technology, Faculty Education, Naresuan University, Pitsanulok, Thailand*

Abstract

This research paper focuses on students' opinions towards knowledge management system for online instruction whose role is to enhance self-direct learning. The target group of this research work was the 43 graduate students who had been studied Master of Education in Educational Technology and Communications and undertaken professional training in the second semester in Academic Year 2011. Research tools conveyed to obtain data were 3 designed questionnaires: 1) an opinionating questionnaire inquiring the web site components for professional training, 2) a questionnaire collecting opinions towards the web site as a whole, and 3) a questionnaire to obtain satisfaction level of users. Statistical methods used in this research were and standard deviation, which presented in tabulated forms and descriptions.

Research findings reveal that students' opinions towards the web site components for knowledge management system governed by online instruction is at the value of =3.97, SD=0.55. Students recommend there be an assigned individual user log, which used to track and update personal record and linked to YouTube at all times or a program that enable a user to present his/her own academic presentation. It is also found out that students are greatly satisfied with professional records employed in the web site at the value of =3.95 and SD=0.50. The focused group suggests the Google Map be used as a potential locator to pinpoint places for professional training. This could be very productive to explore surrounded environments, the neighborhoods, and modes of transportation when a supervisor pays a visit to the place for his/her supervision/assessment. More importantly, this will serve as key information for other students should he/she plan to conduct professional training at the site, for he/she will have a trusted resource as to what kind of positions and job descriptions at the training place will be like. Students' satisfaction towards online instruction is of a high value at =3.83 and SD=0.65. There are 2 particular comments obtained from the audience:

1. Social media should be extensively used and site integration into the web site to achieve a better knowledge management system whether it is a purpose directed to peer to peer, student and supervisor, or student and mentor. This could prove to be an effective channel of communication yielding a number of solutions for unforeseen circumstance during an internship.

2. There should be a careful selection of application available in social media; it should efficiently contribute to development of knowledge management under a single accessible network where stakeholders can equally make use of.

Keywords: opinions, Knowledge Management System, Self-Directed Learning

Introduction

According to the development of knowledge management system for teaching through internet based learning for self-directed learning in higher education, it has served as a supporting mechanism used as a guideline for development of teaching delivery to facilitate knowledge management networks for lecturers and students. Such development enhances knowledge management system and makes possible by an implementation of required evaluation process, which includes using of technological innovation and a promotion of cooperative knowledge management among universities (Tipparat Sittiwong, Anirut Satiman and Surapon Boonlue et al). The results lead to the development of students who are keen on lifelong learning and a better guidance of curriculum development among universities in pursuit of well-qualified graduates. The results also reveal that students are well familiar with website and knowledge management system for teaching through internet based learning, since the system has already been in the E-learning base form which is easily accessible. Clearer, students understand lectures, lessons, experi-

E-mail address: s_tipparat@hotmail.com

IETC 2014

ences, or attitudes than writing in conventional internship report, for the aforementioned system provides features like editing, adding images, and chatting. For these reasons, the Department of Educational Technology and Communication agrees that knowledge management system for teaching in self-directed learning could be benefit for senior students in the annual professional training. After the crucial innovation of information technology and necessities of knowledge management system, the monitoring process of knowledge management system should be performed annually to apply its results in program development. The benefits of the monitoring process are to:

1. Identify potential problems and prioritize them in order to achieve required solutions.
2. Plan and develop the program in line with objectives and policies.
3. Implement the plan and effective solutions or adjustments.
4. Understand overall progress of the program, which serves as indispensable information for decision making of related problems.

Follow up and monitoring process, if practiced continually, could help to recognize forthcoming obstacles and resource requirements. The program is able to achieve goals and offer some suitable improvements and assessment results. As a result, the program would contribute to exact and up-to-date information, which considered a tool for effective management (http://wipharat0073.blogspot.com/2009/11/blogpost _05.hml, retrieved on November 5th, 2012). Such process is deemed a guideline for up-to-date information management and that the students max out experiences from professional training. These experiences could become knowledgebase and learning resources for junior students and be used to develop curricula in the Department of Educational Technology and Communication to produce highly competent graduates for labor markets.

To collect required data, questionnaires will be used to gather students' opinions towards the system whereas obtained information will be applied to a more up-to-date and efficient system, which significantly meets users' requirements.

Research objectives

To query the opinions on knowledge management system using from the students for teaching support on internet based learning in self-directed learning in higher education.

Benefits

The benefits from the study are to obtain information in order to improve the knowledge management system using from the students, to develop the teaching through internet based learning in self-directed learning of the Department of Educational Technology and Communication in the response of social requirements, and to reach the target of Quality Assurance of Faculty and TQF Standard of the university.

Methods

The population of this study was the 43 graduate students from Department of Educational Technology and Communication in the Naresuan University in the 2nd semester of the 2011 academic year

IETC 2014

Variables

The variables were students' opinions on the teaching through internet based learning in self-directed learning.

Tool

The tools were the professional training website structure questionnaire, the opinions on professional training questionnaire, and information technology system questionnaire.

Statistical tools

The descriptive statistical tools used in the study were mean and standard deviation.

Data collection

- The questionnaire collected from 43 students (100 % feedback) in professional training program of the Department of Educational Technology and Communication, the 2nd /2011 academic year.
- Students 'opinions analysis and conclusion following the research method.

Results

Table 1. The opinion analysis results on the professional training website structure questionnaire, 2nd /2011 of the knowledge management system development for teaching through internet based learning.

Assessment title	Mean	SD	Level
1. Public relation page – news, announcements, teaching and examination information, etc.	3.98	.77	Good
2. User account access system to log in to study provided lessons in the web page.	4.28	.66	Good
3. The online internship report in each semester and description of page usage.	4.09	.72	Good
4. The knowledge on professional training page.	3.91	.68	Good
5. The knowledge management activities on professional training page.	4.14	.67	Good
6. Types of knowledge documentation – e.g. image, html, pdf, PPT, etc.	3.81	.64	Good
7. The knowledge management activities on professional training – i.e. duties, training details, work presentation.	4.19	.70	Good
8. Communication channel.	4.02	.74	Good
9. The self-directed learning help desk and manual	3.81	.63	Good
10. Discussion page.	3.86	.71	Good
11. The related context on support learning resources page.	3.79	.77	Good

IETC 2014

12. The assessment result page.	3.86	.74	Good
13. The data collection of the professional training page.	4.07	.80	Good
14. The statistics on the system accessing.	3.81	.73	Good
Average	3.97	.55	Good

The table 1 displays the opinions on the professional training website structure questionnaire, 2nd /2011 for the knowledge management system development for teaching through internet based learning. The average of total result is in good level (= 3.97, SD = 0.55). Each item analysis results are all in good level following these details: User account access system to log in to study provided lessons in the web page (= 4.28, SD = 0.66), the knowledge management activity on professional training – i.e. duties, training details, work presentation (= 4.19, SD = 0.70), the knowledge management activity on professional training page (= 4.14, SD = 0.67), the online internship report in each semester and description of page usage (= 4.09, SD = 0.72), the data collection of the professional training page (= 4.07, SD = 0.80), communication channel (= 4.02, SD = 0.74), Public relation page – news, announcements, teaching and examination information, etc. (= 3.98, SD = 0.77), the knowledge on professional training page (= 3.91, SD = 0.68), the assessment result page (= 3.86, SD = 0.74), the discussion page (= 3.86, SD = 0.71), The statistical usage on the system accessing (= 3.81, SD = 0.73), the types of knowledge documentation – e.g. image, html, pdf, PPT, etc. (= 3.81, SD = 0.64), the self-directed learning help desk and manual (= 3.81, SD = 0.63),and the related context on support learning resources page (= 3.79, SD = 0.77).

The students recommend on the professional training website structure for the knowledge management system development for teaching through internet based learning that the system should be able to update the multimedia daily journal by its users and enable them to connect to YouTube or other presentation software.

Table 2. The result of opinion analysis on professional training questionnaire in 2nd/ 2011 academic year for journaling the training experiences.

Assessment title	**Mean**	**SD**	**Level**
The knowledge management system access	3.84	.52	Good
1. Web page using manual.	3.88	.59	Good
2. Simplicity and convenience.	3.91	.68	Good
3. Teaching and Learning instruction.	3.95	.58	Good
4. The clarity of teaching documents.	3.65	.78	Good
Web page designs	3.84	.62	Good
5. The decency of page designs for target users.	3.91	.75	Good
6. Attractiveness of page designs.	3.72	.75	Good
7. Website navigation links.	3.74	.79	Good
8. External links to supported documents.	3.81	.79	Good
9. Buttons and Icons.	3.79	.77	Good
10. Context exhibition technique.	3.77	.88	Good
11. Graphical designs	4.07	.80	Good
12. Rapidity of lesson access and document download	3.93	.80	Good
Learning lesson design	4.05	.51	Good
13. The clarity of lesson objectives.	4.28	.73	Good
14. Instruction, description, and example in the lessons.	4.21	.64	Good
15. The clarity of learning activity process.	4.12	.66	Good
16. Suitability for self-learning of the context.	4.07	.63	Good
17. The clarity of the title.	3.98	.74	Good

IETC 2014

18. The suitability of the quantity, frequency, and length of time.	4.02	.80	Good
19. The appropriation for self-learning of the pre-post evaluation.	3.88	.76	Good
20. The clarity of the process of learning activity determination.	3.98	.67	Good
21. The context appropriation for self-learner.	4.05	.69	Good
22. The clarity of each activity.	4.12	.66	Good
23. The suitability of the quantity, frequency, and length of time.	3.95	.69	Good
24. The appropriation for self-learning of the pre-post evaluation.	4.00	.62	Good
25. Benefits of learning activities for self-learners.	4.14	.74	Good
26. Participation between the students and lecturers on the learning activities	3.86	.67	Good
The communication and interaction between students and examiners.	3.95	.57	Good
27. Announcement of the learning activities or schedules.	3.84	.72	Good
28. Interaction between learners and lecturers (E-mail, Chat room, forum)	3.91	.81	Good
29. Interaction between learners and lecturers (E-mail, Chat room, forum)	3.93	.74	Good
30. Knowledge management on internet-based learning overview.	4.02	.60	Good
31. Facebook as a tool of communication and problems discussion.	4.05	.78	Good
Average	**3.95**	**.50**	Good

The table 2 exhibits the opinion on professional training assessment in the 2nd semester of the 2011 academic year. The average of total result is in good level (= 3.95, SD = 0.50). Each item analysis results are all in good level following these details: the knowledge management system access (= 3.84, SD = 0.52), web page designs (= 3.84, SD = 0.62), Learning lesson design (= 4.05, SD = 0.51), and the communication and interaction between students and examiners (= 3.95, SD = 0.57).

Except from the questionnaire, students recommend that application of Google Map to locate the places and environments of the company could be convenient for examiners and other students to access to details of the professional training.

Table 3. The result of opinion analysis on information technology system

Assessment title	Mean	SD	Level
1. The up to date of information	3.60	.69	Good
2. The clarity and reliability of the information	3.88	.66	Good
3. The comprehension of Information system	3.72	.77	Good
4. The benefits of the information in operation	4.00	.98	Good
5. User's demand response of the information	3.81	.73	Good
6. Categorization of the information	3.86	.80	Good
7. The systematic and ordering information presentation	3.81	.85	Good
8. The rapidity of the searching engine.	3.72	.88	Good
9. Accessibility of information	3.95	.90	Good
10. Simplicity of the information	4.07	.88	Good
11. Satisfaction on system overview	3.86	.86	Good
12. Convenience of information using	3.95	.75	Good
13. Rapidity of using.	3.74	.87	Good
14. Accuracy of the system	3.91	.81	Good
15. The comprehension of system	3.79	.80	Good
16. Consulting and solution providing	3.70	.74	Good
Average	3.83	.65	Good

The table 3 presents the opinion on information technology system. The average of total result is in good level (= 3.83, SD = 0.65). Each item analysis results are all in good level following these details: Simplicity of the information (= 4.07, SD = 0.88), the benefits of the information in operation (= 4.00, SD = 0.98), accessibility of information (= 3.95, SD = 0.90), convenience of information using (= 3.95, SD = 0.75), Accuracy of the system (= 3.91, SD = 0.81), the clarity and reliability of the information (= 3.88, SD = 0.66), satisfaction on system overview (= 3.86, SD = 0.86), categorization of the information (= 3.86, SD = 0.80), the systematic and ordering information presentation (= 3.81, SD = 0.85), user's demand response of the information (= 3.81, SD = 0.73), the comprehension of system (= 3.79, SD = 0.80), rapidity

IECT 2014

of using (= 3.74, SD = 0.87), the rapidity of the searching engine (= 3.72, SD = 0.88), the comprehension of Information system (= 3.72, SD = 0.77), consulting and solution providing (= 3.70, SD = 0.74), and the up to date of information (= 3.60, SD = 0.69)

Other recommendations

The knowledge management system should be applied by the social media for interaction between lecturers, students, and mentors in order to effectively improve the communication process. The problems occurred in the mid of training program will be resolved instantly by the cooperative management of students, lectures, and mentors.

The use of internet-based tool as social media online should be applied in order to narrow up the inequalities of training program knowledge access to use in the teaching entirely. The descriptive statistical tools used in the study were mean and standard deviation.

Discussion

As above research results, there are issues to discuss as follow.

1. While the overview opinions of students on the professional training website structure questionnaire, 2nd /2011 of the knowledge management system development for teaching through internet based learning exhibit in good level (= 3.97, SD = 0.55), there are points to be discussed from the opinions. Online internship report should be more convenient to use as a study result of Naowarat Jankomol (2011) on the staff promotion decision support system for administrators in Bangkok, which assisted the administrators to assess the employee performances conveniently. The study found that the system should be included with working performance index, staff performance records, and the performance evaluation. The staff performance records are similar to the internship report in the professional training which is able to report the brief details to whom concerned.

2. The overview opinions on professional training system in the 2nd/ 2011 school year for journaling the training experiences reveal a good level (= 3.95, SD = 0.50). The analysis in each title also appears all in good level as follows: the knowledge management system access (= 3.84, SD = 0.52), Web page designs (= 3.84, SD = 0.62), Learning lesson design (= 4.05, SD = 0.51), the communication and interaction between students and examiners (= 3.95, SD = 0.57). These are the basic elements of knowledge management system design for the endless development of professional training website. The further recommendations from students are Google Map as its properties are able to locate the organizations or companies and to explore environment nearby. This could facilitate the examiners and could be necessary information for the junior students who desire to be trained there. Boontham Kaewpeng (2002)'s study explored the pilot project of the 9 years compulsory education by Chiang Rai primary education office and found that the facility preparation for instant teaching resources and textbooks were insufficient for students. Hence, the professional training website should meet the user requirements as much as possible.

3. The opinions on information technology system are in good level (= 3.83, SD = 0.65) in consideration that the system could reciprocate their requirements well. Additional requirements are the practicable features and tools in order to use the professional training knowledge management for further progress.

Suggestion

IECT 2014

1. Under the knowledge management system, the social media application for the knowledge interaction between students to students, students to examiners, and students to mentors should be considered in order to improve the communication process effectively, be able to resolve problems instantly, and initiate the cooperation between students and students, students and examiners, and students and mentors.

2. The online tools of social media technologies should be applied in order to develop the knowledge management networks and narrow the inequalities of professional training knowledge access for effective teaching.

3. The application of knowledge management system should have publication to related people. They should realize the method and process of the system for the purpose of participating and discussion preparation

Suggestion for further study

1. The pursuance of the knowledge management system development for teaching through internet based learning should be attached to improve and update the system and its elements.

The use of e-portfolio-based assessment to develop students' self-regulated learning in English language teaching

Ahmet Erdost Yastibas[a]142, Gülsah Cinar Yastibas[b]
[a]*School of Foreign Languages, Zirve University, Gaziantep, 27260, Turkey*
[b]*School of Foreign Languages, Zirve University, Gaziantep, 27260, Turkey*

Abstract

Traditional assessment ways like multiple choice tests have been used to evaluate students' performance in English language teaching (ELT) at schools, but these assessment methods are not effective and efficient because they do not show the real performance of students. On the other hand, student-centeredness is the main focus of many teaching and learning methods and techniques used in ELT. It emphasizes learning by doing. As the main focus is on learning by doing, assessing this process requires different assessment methods that take factors, such as students' understanding and personal difference into consideration, while evaluating learners' performance. Therefore, educators need to develop new student-centred assessment methods to evaluate learners in ELT. One of these ways is the use of e-portfolios. E-portfolios can be used as an assessment in courses effectively to improve different learning styles of learners. One of them is self-regulated learning, which focuses on students' taking responsibility for their learning from the beginning to the end. This process includes setting goals and organizing learning environments according to their determined goals, but finding research on the use of e-portfolios as an assessment tool in self-regulated learning in ELT is rare. Therefore, this paper aims to find out whether e-portfolio-based assessment can be used to improve students' self-regulated learning through reviewing the literature. The result of the literature review indicates that e-portfolio-based assessment can develop students' self-regulated learning in ELT.

Keywords: E-portfolio; E-portfolio based assessment; Self-regulated learning

IETC 2014

1. Introduction

For many years, traditional assessment styles like multiple choice tests have been used to evaluate students' performance at school, but these assessment methods are not effective and efficient because they do not show the real performance of students and are mainly based on the behaviourist approach, which defines education as "habit formation." Therefore, traditional ways of assessment are not enough to measure the skills of learners in different courses. On the other hand, the constructivist approach, which focuses on students, supports student-centred activities in classroom and defines education as "learning by doing," and is the basis of modern education methods and techniques, such as the problem-solving method or the project-based method. As the main focus is on learning by doing, assessing this process requires different assessment methods that factor in students' understanding, personal differences, and individual performance when evaluating learners' performance. Unlike traditional assessment ways, the new assessment ways should be student-centred. Consequently, some new ways, such as e-portfolios are developed to assess learners. E-portfolios can be defined as electronically collected works and reflections of students, which are used to show their growth and development during the learning process (Gülbahar and Tinmaz, 2006, 311). The works and reflections of students are stored in electronic formats, such as graphics or CDs (Gülbahar & Tinmaz, 2006). Educators, instructors, and teachers know how to use e-

* Corresponding author. Tel.: +90-342-211-6666.
E-mail address: ahmet.yastibas@zirve.edu.tr

portfolios in their courses, but they cannot use them effectively to improve the different learning styles of students. One of them is self-regulated learning that focuses on students taking responsibility of their education from the beginning to the end. This process involves setting goals and maintaining a learning environment according to their determined goals (Zimmerman, 1990). However, the use of e-portfolios as an assessment tool in self-regulated learning has not been researched much in the English language-teaching field. Therefore, the aim of this paper is to find out whether e-portfolio-based assessment can be used to improve students' self-regulated learning by reviewing the literature about e-portfolios, e-portfolio-based assessment, and self-regulated learning in English language teaching. The present paper aims to answer the following question: Can e-portfolio-based assessment be used to develop students' self-regulated learning in English language teaching? If so, how does e-portfolio-based assessment develop students' self-regulated learning in English language teaching?

2. E-portfolio

In order to evaluate the relationship between e-portfolio-based assessment and self-regulated learning, this section explains what an e-portfolio is, along with its benefits and characteristics. This section starts with the definition of an e-portfolio. Then the section focuses on benefits of an e-portfolio and ends up with its characteristics.

2.1. Definition of e-portfolio

Rhodes (2011) mentions, "…ePortfolios might be the biggest thing in technology innovation on campus. Electronic portfolios have a greater potential to alter higher education at its very core than any other technology application we've known thus far" (p. 7). This emphasizes the importance of the use of e-portfolios in education because it can make students work digitally and in an organized, searchable, and transportable way, as Rhodes mentions. The definitions of e-portfolio focus on the features of being digital, organized, searchable, and transportable. In one definition, Lorenzo and Ittelson (2005) define an e-portfolio as "a digitized collection of artefacts including demonstrations, resources, and accomplishments that represent an individual, group, or institution" (p. 2). They also add that e-portfolios are "personalized, Web-based collections of work, responses to work, and reflections that are used to demonstrate key skills and accomplishment for a variety of contexts and time periods" (p. 2). In another definition, an e-portfolio is defined as "the product, created by the learner, a collection of digital artefacts articulating experiences, achievements and learning" and as "a purposeful aggregation of digital items – ideas, evidence, reflections, feedback, etc., which presents a selected audience with evidence of a person's learning and/or ability" (Gray, 2008, pp. 6-7). Consequently, the definitions indicate that e-portfolios include the artefacts of students that help others understand and observe the learning processes of students.

2.2. Benefits of e-Portfolio

According to Goldsmith (2007), institutions and students can benefit from e-portfolios since they allow them to understand "how well they are educating their students" and they are able to assess "their educational experiences and achievements, and how these are linked to their personal goals" (p. 31). They connect students' coursework to the outcomes of institutions, so students can "understand these connections as well as the connections between their own lives and their academic work" (Goldsmith, 2007, p. 37). This stems from a need to evaluate the improvement of students' "understanding of the self and the curriculum" (Gray, 2008, p. 9).

IETC 2014

According to Goldsmith, e-portfolios can enhance the learning process and assess learners authentically because of its requirements. They include taking the responsibility of their learning by making students organize their material for a specific purpose, self-evaluating their work, and reflecting their findings about their learning process, experiences, and skills. Students, therefore, can be in charge of their own learning and be motivated to study (Akçıl & Arap, 2009). Also, e-portfolios can assist to facilitate and document learners' experiences authentically (Reese & Levy, 2009). Consequently, they require students to be engaged in the process, so they can contribute to the enhancement of learning process and authentic assessment. Since students are responsible for their own e-portfolio process, they can individualize and personalize their learning (Schmitz, Whitson, Heest, & Maddaus, 2010; Gray, 2008).

In addition, e-portfolios can save students' and teachers' time and energy. Through the use of e-portfolios, students can store information easily, give easy access for viewing and review purposes, and minimize the any risks of loss (Goldsmith, 2007). E-portfolios can promote student autonomy. According to Gonzalez (2009), the European Language Portfolio encourages the use of e-portfolio assessment in language education because e-portfolios can increase students' awareness of the "language learning process and its implications" (p. 373). This process can help students become autonomous. First, they can find out and "become aware of all the important invisible factors, procedures, and attitudes involved in language learning" (Gonzalez, 2009, p. 382). Second, students can become the owners of their language learning and recognize that learning has to also occur outside the classroom.

E-portfolios promote feedback, reflection, and self-reflection. They possess digital collections of student artefacts related to their goals, achievements, experiences, ideas, and so on, and require students to reflect on their learning processes. Therefore, they can contribute to the assessment of students' own products and individual achievement and to the effectiveness of courses, programs, departments, or institutions (Reese & Levy, 2009; Goldsmith, 2007). They enhance the reflection of students since students understand their learning and have the "evidence of their capacity for critical thinking, analytic reasoning, and integrative learning" (Rhodes, 2011, p. 5). In one study, Lin (2008) indicates that reflection helped students revisit their learning experiences and make a change in the way they viewed their learning. According to Lin, students can develop a sense of purpose and focus through the use of e-portfolios because upon reflection, students make a comparison between their artefacts and the standards in order to understand and check first whether their artefacts meet the standards or not, and then how and why they meet the standards if so. Also, it can assess students formatively in terms of the evaluation of student learning, and summatively in terms of the evaluation of student progress and achievement as Rhodes mentions (2011). According to Rhodes, it can help learners to become active in the presentation and representation of their learning, so this can motivate them to do their best. Also, Goldsmith (2007) mentions that e-portfolios can provide students with individual feedback about their learning, experiences, achievements, and can provide feedback about the effectiveness of their work. Therefore, e-portfolios can improve students' learning through feedback and reflection, which supports permanent learning (Akçıl & Arap, 2009) and makes them more willing to overcome problems (Gray, 2008).

In short, e-portfolios can be used effectively and efficiently in teaching, learning, and assessment as they are learner-centred. They make students responsible for their learning by enabling them to organize and control the content of their e-portfolios, which helps them to personalize their e-portfolios. This responsibility requires students to reflect and assess their own learning.

2.3. Characteristics of e-portfolio

In reviewing studies related to the use of e-portfolios, ten common characteristics were noticed. The first characteristic of e-portfolios is *being authentic.* It is *authentic* because students take responsibility for their learning, so they are supposed to organize their e-portfolios, reflect on their own learning processes and findings, and improve their learning depending on their reflections (Goldsmith, 2007; Reese & Levy, 2009). Second, it is *controllable* since students can organize their e-portfolios, reflect and assess their learning processes, and make necessary changes to their e-portfolios according to their reflections (Goldsmith, 2007). Third, it is *communicative* and *interactive* because students need to communicate and interact with their peers and teachers to improve their learning (Bolliger & Shepherd, 2010; Lin, 2008). Fourth, it is *dynamic* since the structure of e-portfolios is continuously developing as a result of the organization of content, collection and selection of artefacts, the self-assessment and self-reflection of the learning process, and improvement made according to self-assessment and self-reflections. Fifth, it is *personalized* because students form their e-portfolios on their own (Goldsmith, 2007; Schmitz et al., 2010; Gray; 2008).

Sixth, it is *integrative* since e-portfolios create connections between students' lives and academic work (Goldsmith, 2007, p. 37). Seventh, it is *multi-purposed* in that it can be used for the assessment of students' learning performances and of institutions' education programs (Goldsmith, 2007), and for gaining employment in the future (Goldsmith, 2007; Lin, 2008; Reese & Levy, 2009; Kocoglu, 2008). Eighth, it is *multi-sourced* as it provides students with feedback on their learning, teachers with the assessment of students' performances, and institutions with the opportunity to assess their programs, courses, or departments (Goldsmith, 2007). Ninth, it is *motivational* because it gives students ownership of their own learning and leads to the improvement of their skills (Akçıl & Arap, 2009; Bolliger & Shepherd, 2010; Rhodes, 2011). Finally, it is *reflective* because e-portfolios requires reflection of one's own learning, so students can self-reflect and assess their learning processes via e-portfolios (Goldsmith, 2007; Reese & Levy, 2009; Lin, 2008).

3. E-portfolio based assessment

Yastıbaş (2013) has carried out a theory on the use of e-portfolios in speaking classes as an assessment tool. The results of the study show that e-portfolio assessment improved students' self-assessment skills because they could monitor their learning process, understand their strengths and weaknesses, and try to overcome their weaknesses. It also helped them to take responsibility for their learning and be aware of the progress of their learning (Yastıbaş, 2013). This makes the students more self-confident, motivated, and engaged in learning (Yastıbaş, 2013). In addition, the study suggests that e-portfolio assessment increased active participation because students had control over the organization, selection, and design of the content of their e-portfolios. In another study, Tonbul (2009) dealt with developing an e-portfolio model for a university. The study indicates that using e-portfolios in assessment and learning, students were able to reflect on their own learning and discover their strengths and weaknesses. According to Tonbul, it also increased collaboration and interaction between teacher and students, so it facilitated learning. It made students more responsible for their own learning, assisted them in monitoring their own learning by checking what they learnt, increased their self-assessment skills, and motivated them. In addition, Abbaszad Tehrani (2010) has used net-folio to improve writing skills. Net folio is another name used instead of e-portfolio. The results of that study show that net-folio motivated students and helped them to be responsible for their own learning because they took control of the content of their net-folios. It also improved the self-assessment and peer feedback skills of the students so that they could learn from each other, understand their strengths and weaknesses, monitor and follow progress in their own learning (Abbaszad Tehrani, 2010). In another study, Erice (2008) researched the impact of e-portfolios as assessment and learning tools in writing classes.. According to Erice, e-portfolios enable students to be owners of their own learning processes, and helped them to reflect on their learning by improving their self-assessment skills, motivated them, and also allowed them to follow the progress of their own learning.

These studies describe the contributions of e-portfolio based assessment, and these contributions are aligned with the ones mentioned in "Assessing with ePortfolios" (n.d.) and Chang (2008). The first study, "Assessing with ePortfolios" (n.d.) explains the contributions of e-portfolio assessment. It supports and encourages independent, self-directed, and individualized learning. It allows students to plan and compile the content. It enables students to reflect on their learning, performance, and achievement. It creates connections between students' learning and assessment criteria. Students can be responsible for their own learning and assessment and regulate their learning through e-portfolios in and out of the class. It provides a personalized learning space. It is a kind of sustainable assessment as it helps students identify their learning, make judgments about it, and be ready for future learning. It is continuous and evidence-based assessment. It allows learners to connect tacit knowledge with constructed knowledge. It keeps track of students' learning process. It enables students to own and direct their own learning as they select and reflect on their learning. In the second study, Chang (2008) categorized the contributions of e-portfolio assessment. According to Chang, students organize and develop their e-portfolios. It is the demonstration and reflection of students' learning process and achievements. It develops students' self-learning, self-evaluation, self-assessment, and self-reflection. It promotes teacher-learner interaction and reader evaluation. Students can participate in e-portfolio assessment actively. They can take part in the decision-making process actively (Chang, 2008, p.1757). It enhances the interaction between peers, peer assessment, and learning outcomes in the long run. Students are in charge of their own learning by planning their learning actively in e-portfolio assessment process. It supports students' creativity. It is motivates students to learn and help them evaluate themselves with confidence. It enhances students' technological skills.

IETC2014

4. Self-regulated learning

According to Zimmerman (2000), self-regulation is defined as "self-generated thoughts, feelings, and actions that are planned and cyclically adapted to the attainment of personal goals" (p. 14). In the academic arena, it requires the planning and managing of time, attention and focus on education, rehearsal, code, and the organization of information, making working environment productive, and utilizing social resources effectively (Schunk & Zimmerman, 1997). Also, Pintrich (1995) mentioned that academically it possesses self-directed processes that require learners to monitor, control and evaluate their effects, cognition, behavior, and certain aspects of the environment. In addition, according to Bandura (1986), personal, behavioral and environmental processes are interactive and required in self-regulation. Besides, some psychological components including motivation, strategies, self-awareness of performance outcomes, and sensitivity to environmental and social settings are required in self-regulation (Zimmerman & Risemberg, 1997). Depending on the definitions, self-regulated learning motivates students to set their own goals and decide which plans and strategies should be used to attain those goals, which increases their self-awareness of their performance and makes them monitor their learning process and control the social and physical setting (Wang, 2004).

According to Bandura (1986) and Zimmerman (2000), being self-regulated has three important processes or phases. For Bandura, self-observation, self-judgment, and self-reaction are important in self-regulating one's own learning process. Self-observation is the observing of one's own behavior in an attentional way, self-judgment is comparing one's own performances with that of a standard, and self-reaction is responding to self-judgment in an evaluative way (Bandura, 1986). Similarly, Zimmerman (2000) claimed that there are three phases in self-regulation that are cyclical and consist of three components: forethought, performance, and self-reflection phases. There are processes and beliefs such as motivation, self-efficacy, goal setting, and planning that trigger efforts to learn in the forethought phase, performance phase includes processes like attentional control, keeping records, and monitoring in which students concentrate on the task to optimize their performance, and self-reflection phase involves processes like self-evaluation in which learners compare their performance with a goal and evaluate their results (Zimmerman, 2000). To understand these phases better, Zimmerman (1998, 2002) considers some questions. In the forethought phase, learners can ask when and where they will write, how they will start, and what will help them to write. In the performance phase, they can try to find answer to the questions whether they accomplished the aim of the assignment, whether it is taking more time than the planned time, whether they can be encouraged to keep going, and what will help them. In the self-reflection face, the questions "whether the students did a good job, how they kept on task, what helped them, whether they gave enough time to complete the assignment, whether they chose the right study strategies, whether they set rewards and consequences for themselves, and whether the students followed their plans" are asked.

Depending on the cyclical method of Zimmerman for self-regulated learning, Hirata (2010) mentioned four components of self-regulated learning: cognitive/metacognitive, affective, behavioral, and environmental regulations. According to Hirata, cognitive and metacognitive regulation includes perceptions of previous experience, goal setting, and strategic planning in the forethought phase, implementing strategies, monitoring and controlling progress in the performance phase, performance evaluation, and strategic adoption in self-reflection phase. Affective regulation is related to motivational beliefs, perceptions about possible outcomes in forethought phase, and affective responses in the self-reflection phase, and needs to monitor and control motivation and emotion in the performance phase (Hirata, 2010). Behavioral regulation involves preparing for behavioral engagement in the forethought phase, undertaking and controlling planned commitments, noticing behavioral changes in the performance phase, behavioral adaption, and defensive reactions in the self-reflection phase as Hirata (2010) mentions. According to Hirata, environmental regulation includes the processes of observations about available resources and learning contexts in the forethought phase, managing resources, identifying problems, seeking help in the performance phase, environmental restructuring, and disengagement in the self-reflection phase.

In relation to the phases and components of self-regulated learning, Zimmerman and Martinez-Pons (1986) found out that there are 14 different self-regulated learning strategies used. They are self-evaluation, organizing and transforming, goal setting and planning, seeking information, keeping records and monitoring, environmental structuring, self-consequences, rehearsing and memorizing, seeking peer assistance, seeking teacher assistance, seeking adult assistance, reviewing tests, reviewing notes, and reviewing texts. While heavily relying on the strategy list created by Zimmerman and Martinez-Pons, two other scholars, Pape and Wang (2003) developed another 11-item list of self-regulated learning strategies. They are self-evaluation, organizing and transforming, goal setting and planning, seeking information,

IECT 2014

keeping records and monitoring, environmental structuring, self-consequences, attentional control, rehearsing and memorizing, seeking social assistance, and reviewing records (Pang & Wang, 2003). All of these strategies are based on being self-initiated.

The definitions, phases, components, and strategies of self-regulated learning describe the characteristics of a self-regulated learner. According to Zimmerman (1990), learners are proactive and reactive during their learning process. They look for information proactively when they need and are ready to take the necessary steps to master their skills (Zimmerman, 1990). Also, they establish goals by using appropriate strategies, their self-efficacy beliefs towards their capabilities are high, and these two affect their goal setting and the level of commitment to attain their goals (Zimmerman, 1990). This means that self-regulated learners are active in their learning process in terms of motivation, metacognition, and behavior (Zimmerman, 1990). According to Zimmerman, they are self-efficacious and possess positive attitudes toward learning, so they can act by selecting and structuring action. In addition, Schunk and Zimmerman (1997) mentioned that self-regulated learners are active participants because they can control their learning experiences in many different ways efficiently. They can do so by organizing and rehearsing information to be learned, holding positive beliefs about their capabilities, and putting a high value on learning (Schunk & Zimmerman, 1997). Consequently, the characteristics show that self-regulated learners initiate their own learning, use strategies to achieve their self-set goals, monitor their learning by checking what worked and what did not work. Therefore, they can have the ability to control and influence their own learning processes positively.

4.1. Studies related to self-regulated learning in English language teaching

Studies on self-regulated learning in English language teaching are based on the relationship between self-regulation and self-efficacy, motivation, academic achievement, and learning strategies. Also, some studies focus on the effect of self-regulation learning on writing, reading, listening, speaking, and vocabulary learning.

In Wang's dissertation (2004), the researcher focused on the relationship between self-regulated learning strategies and self-efficacy beliefs of four Chinese students learning English as a second language. The results of the dissertation show that self-regulated learning strategies of the students such as seeking social assistance and information, reviewing records, and environmental structuring affected the students' self-efficacy beliefs positively while they used the strategies more in reading than in writing. In addition, the focus of another project is on raising self-efficacy through self-regulated learning strategies in a secondary EFL classroom (Koehler, 2007). This study found that self-regulated learning strategies led to higher levels of self-efficacy, which resulted in more engagement of students in reading activities.

Hirata (2010) concentrated on the relationship between motivation and self-regulated learning in second language acquisition related to Kanji learning. Hirata found that self-regulated learning has a positive effect on self-regulated learning. Different aspects of motivation including intrinsic orientation and value, self-efficacy, and self-concept are predictors of different types of self-regulated learning. To illustrate, intrinsic orientation and value are indicators of cognitive and metacognitive self-regulated learning, while self-efficacy is related to behavioral regulation and self-concept is connected to environmental self-regulation (Hirata, 2010). Also, Al-Otaibi (2013) has studied the relationship between Saudi EFL learners' vision of future-self and their self-regulated learning behavior. According to Al-Otaibi, Dörnyei developed a second language motivational self-system in which ideal-self and ought self are defined. Dörnyei's system focuses on the discrepancy between a learner's actual self and his/her ideal self (Al-Otaibi, 2013). The results of the study indicate that ideal self increases motivation and self-regulated learning. This makes them be motivationally, meta-cognitively, and behaviourally ready to be active in their learning (Al-Otaibi, 2013). Also, it makes them self-efficacious and they have positive attitudes toward learning (Al-Otaibi, 2013).

Mahmoodi, Kalantari, and Ghaslani (2014) have searched the relationship between self-regulated learning, motivation, and language achievement among Iranian EFL learners. They have found out that self-regulated learning strategies affect the motivation of the students positively, while there is no connection between self-regulated learning and second language achievement. Also, the research indicates that the students use cognitive and metacognitive strategies more than behavioral strategies. Besides this, Garri-

IECT 2014

do-Vargas (2012) studied the relationship between self-regulated learning and academic achievement among English language learners. This dissertation indicates that self-regulated learning influenced motivation and self-efficacy in a positive way; therefore, self-regulated learning contributed to the learners' academic achievement in reading and writing. Also, Andrade (2012) states that self-regulated learning can improve learning proficiency, make learners satisfied, and help them increase their capacity for autonomy.

Bloom (2013) has focused on the place of goal setting and self-monitoring in self-regulated learning. He mentions that self-regulated learning strategies enables students to make higher academic achievements, make greater effort to solve problems, overcome obstacles, and motivate them to learn. Goal setting and self-monitoring are two of these strategies and help them to be aware of their learning, judge their learning ability, and adjust themselves according to their own evaluation (Bloom, 2013). Self-regulated learning increases self-confidence, self-efficacy, and motivation, so it results in active participation and increased collaboration (Bloom, 2013).

Çelik, Arkın, and Sabriler (2012) researched EFL' learners' use of Information Communication Technologies (ICT) for self-regulated learning. They have found out that ICT provides learners with opportunities to regulate their learning outside of the class by reaching their language learning goals and motivating themselves via ICT, making language learning an enjoyable process. Also, Cheng and Chau (2013) have investigated the relationship between self-regulated learning ability and e-portfolio achievement. The study shows that cognitive skills, metacognitive control strategies, and collaboration have a positive effect on students' e-portfolio achievements.

Lin and Gan (2014) studied Taiwanese college students' use of English listening strategies and self-regulated learning. The study finds out that self-regulated learning made students plan and evaluate their own listening education, give them a desire to acquire the knowledge, motivated them to succeed, and take action to become proficient (Lin & Gan, 2014). This process helped them to be more active in their learning, discover their strengths and weaknesses and use effective methods to succeed; therefore, self-regulation made them good listeners (Lin & Gan, 2014). Aregu (2013) studied the relationship between self-regulated learning and speaking efficacy and performance among Ethiopian students. As Aregu (2013) states, self-regulation made the Ethiopian learners more motivated and responsible for their learning. Therefore, self-regulated learning improved their speaking efficacy and performance.

In Filate's study (2012), the impact of self-regulated language learning among the reading achievements of grade 9 students was assessed. The results of the study show that cognitive self-regulation strategies were indicators of the students' reading performance and contributed to their reading performance. In Zarei and Hatami's research (2012), the relationship between self-regulated learning components and L2 vocabulary knowledge and reading comprehension of Iranian EFL learners was studied. The self-regulated learning components that were examined in this study were planning, self-check, effort, and self-efficacy. The study indicates that these components do not have an effect on vocabulary knowledge, while only self-check and effort have a direct and positive effect on reading comprehension. Pratontep and Chinwonno (2008) have focused on self-regulated learning among Thai university students in an EFL extensive reading program. The study reveals that self-regulated learning training about the strategies particularly related to metacognitive and performance improved the students' reading comprehension. Al Asmari and Ismail (2012) have searched self-regulated learning strategies as predictors of reading comprehension among students of English as a foreign language. Their study indicates that self-regulated learning strategies such as rehearsal, self-talk, and elaboration are indicators of reading comprehension. Mizumoto (2013) has dealt with enhancing self-efficacy in vocabulary learning through a self-regulated learning approach. According to Mizumoto, self-regulated learning increased self-efficacy in vocabulary learning. Hence, it helped the participants improve their vocabulary knowledge. Hamedani (2013) studied the relationship between self-efficacy and self-regulation in vocabulary acquisition of Iranian EFL learners. Hamedani mentions that there is a strong relationship between self-efficacy and self-regulation, which results in an increase in vocabulary acquisition.

The study of Soureshjani (n.d.) has focused on the relationship between self-regulation and motivation and Iranian EFL learners' writing achievement. The results of the study point out that there is a strong connection between motivation and self-regulated learning, so it has a positive impact on the learners' writing performance. Zhang (n.d.) focused on self-regulated learning in an online ESL writing class. According to Zhang, self-regulated learning has a positive influence on motivation; therefore, the students could benefit from an online writing course.

IECT 2014

4.2. Studies related to self-regulated learning and e-portfolio

There are few studies whose focus is on the enhancement of self-regulated learning through e-portfolios in different areas rather than English language teaching. In one of these studies, Alexiou and Paraskeva (2010) have worked on enhancing self-regulated learning skills through the implementation of e-portfolios in a computer science university. The results of the study show that e-portfolios make students more engaged and enthusiastic about their learning, and also there was a high correlation between cognitive, motivational, and affective factors. They suggest that the use of e-portfolios supports and promotes students' learning, so the structuring of e-portfolios can enhance self-regulated learning skills. In addition, there are some e-portfolio systems such as the Electronic Portfolio Encouraging Active Reflective Learning Software (ePEARL) (Abrami, Wade, Pillay, Aslan, Bures, & Bentley, 2008) and MySelf E-portfolio (Alexiou & Paraskeva, 2013) that are developed and used in some studies. Abrami et al. and Alexiou and Paraskeva mention that their e-portfolio systems are structured according to the phases of self-regulated learning developed by Zimmerman. Abrami et al. have found out that the efficiency and effectiveness of e-portfolios depends on the enhancement of self-regulated learning skills, since teachers and students were not familiar with self-regulated learning, and it was difficult for teachers to teach self-regulated learning strategies. Alexiou and Paraskeva (2013) emphasize that a self-regulated oriented e-portfolio could increase motivation and self-efficacy and could be used for professional and academic development. Also, the study shows that students could acquire some skills of self-regulated learning, and so e-portfolios could be used to improve self-regulated learning. In another study, Jenson (2011) focused on how to promote self-regulation and critical reflection through students' writing e-portfolios. The results of the study have indicated that e-portfolios could develop self-regulation and critical reflections of students in writing. Similarly, Mackenzie (2014) has studied medical students' experiences using an e-portfolio for self-regulated learning. Mackenzie has stressed that e-portfolio helped the students acquire some elements of forethought and reflection phases, but they did not acquire elements of performance phase, so e-portfolios could enhance students' self-regulated learning skills, but to make it more effective and efficient, self-regulated learning instruction should be given more importance. Lou and Blaustein (2014) complied a literature review study on the relationship between e-portfolios with motivation, self-regulation, and academic achievement. Their review of the literature indicates that the use of e-portfolios is associated with motivation and reflection, can increase learners' strategies, motivation, academic achievement, and technology aptitude, is student-centred, offers user-control, and needs full commitment and planning. In addition, a review study on self-regulated learning in technologically enhanced learning environments was carried out in Europe. The review implies that technological tools can be used to promote and enhance self-regulated learning (Carneiro, Lefrere, & Steffens, 2007).

5. Conclusion

The literature review indicates that e-portfolio-based assessment can be used to develop students' self-regulated learning in English language teaching because the focus is primarily on students. This focus has some certain characteristics that promote and support the conclusion mentioned. First, e-portfolio-based assessment requires students to be active participants in the learning process because they are in charge of every step of e-portfolio-based assessment, such as selecting and organizing the content of e-portfolios, setting goals, and evaluating their learning process. Similarly, self-regulated learning aims to make students active in their learning process by helping them to take responsibility for their own learning. Being responsible for one's own education enables them to control their own learning processes, which is another common thing between e-portfolio-based assessment and self-regulated learning. Third, e-portfolio-based assessment provides students with artefacts that they can use to monitor their own learning process. Monitoring one's own learning can enable one to assess and reflect on one's own work, which can help to understand one's strengths and weaknesses, what worked and what did not work, and improve learning according to those findings. Like e-portfolio-based assessment, self-regulated learning requires self-reflection that can allow students to find out their strengths and weakness, and whether the strategies they choose worked or not, and to improve their learning. In addition, both self-regulated lear-

IETC2014

ning and e-portfolio-based assessment can motivate students since they are individualized learning types and can enable students to monitor the development in their learning. In e-portfolio-based assessment and self-regulated learning, motivation to study can assist students in forming positive attitudes toward learning, as they can understand what they can achieve. This feeling can make students more self-efficacious and self-confident. Hence, both self-regulated learning and e-portfolio-based assessment can prepare students behaviourally, metacognitively, and motivationally for their learning processes. Consequently, the aim of this form of assessment is to enable students to individualize and personalize their learning by supporting and encouraging active participation, taking responsibility of one's own learning, observation and reflection of learning by students. This indicates that both of them can be connected to each other, and e-portfolio-based assessment can promote self-regulated learning.

The use of multimedia in increasing perceived knowledge and awareness of cyber-bullying among adolescents: A pilot study

Nadia Abdul Wahab[a], Wan Ahmad Jaafar Wan Yahaya[b], Balakrishnan Muniandy[b]
[a]*Faculty of Computer and Mathematical Sciences, Universiti Teknologi MARA Perlis, 02600 Perlis, Malaysia*
[b]*Center for Instructional Technoloy and Multimedia, Universiti Sains Malaysia, 11800 Penang, Malaysia*

Abstract

As cyber-bullying has become more serious lately, steps should be taken to ensure that this threat is curtailed. Some schools currently use small group discussions, large school assemblies, or lecture workshops to address this problem and these methods are often ineffective. Other than these conventional methods, initiative that could be taken includes developing a multimedia application that would be able to assist adolescents in increasing their knowledge and awareness on cyber-bullying. This paper reports the findings of a pilot study on the use of a multimedia application, CyBA in increasing the knowledge and perceived adolescents towards cyber-bullying among adolescents. A quasi-experimental research design with pre-test and post-test was used to investigate the effectiveness of CyBA. The result indicates that knowledge and perceived awareness among the adolescents were increased after they were exposed to the multimedia application.

Keywords: multimedia; cyber-bullying; adolescents

1. Introduction

The issue of bullying has long been a topic of discussion amongst educationists, academicians and researchers. Smith & Thompson (1991) defined bullying as a set of conduct that is done intentionally and causes physical and psychological harm to the receiver. Bullying is an aggressive behaviour that is repeatedly carried out towards others individually or as a group (Olweus, 1993). Bullying is not limited merely to physical conduct like beating, kicking, pinching or pushing someone; it also exists in other forms as in speech, by calling someone names, cruel jokes, threatening or slandering (Olweus, 1993). Bully victims may experience depression, low self-esteem, health problems, poor grades, and suicidal thoughts (Olweus, 2010).

As the technology evolves, bullying has also evolves to include electronically based forms of aggression. Now, there is a new channel though which someone is bullied, and that is through the Internet and other telecommunication devices like cell phones. This form of bullying is known as cyber bullying. Kowalski & Limber (2007) defined cyber-bullying as *"bullying through e-mail, instant messaging, in a chat room, on a website, or through a text message sent to a cell phone."*

As the exposure to media has increased over the past decade, adolescents' utilization of computers, mobile phones, stereos and televisions to gain access to various mediums has also increased (Lenhart & Madden, 2007). As a result of the amount of time adolescents spend using these devices, their total media exposure is high (Lenhart & Madden, 2007). Unfortunately, not all individuals are able to take advantage of what the Internet has to offer. For some children and adolescents, the cyber-world can be a place where they are exposed to violence, aggression, mistreatment, and harassment, which is now commonly known as cyber-bullying (Hinduja & Patchin, 2008).

Like traditional bullying, cyber bullying victims are also exposed to the negative consequences of this phenomenon. These include the possibility of someone facing psychological function deficiency and other problems such as being anti-social, anxiety disorder and depressive symptoms (Cappadocia, 2008; Tynes & Giang, 2009; Wolak, et al., 2007). Most victims of cyber-bullying are frequently distracted, feel low esteem, anxiety and have a tendency to commit suicide (Patchin & Hinduja, 2006). A study on cyber-bullying amongst teenagers and found that 33% of the respondents admitted that they were victims of cyber-

IETC 2014

bullying, while 22% of teenagers felt sadness and wished to commit suicide as a result of cyber-bullying (Patchin & Hinduja, 2006).

Given that cyber-bullying has become more serious lately, steps should be taken to ensure that this threat is curtailed. Some schools currently use small group discussions, large school assemblies, or lecture workshops to address the problem of cyber-bullying with students and these methods are often ineffective (Beale & Hall, 2007; Diamanduros et al., 2008; Keith & Martin, 2005). Other than the conventional methods and the involvement of parents, schools and society in curtailing this problem, other initiatives that could be taken include developing a multimedia application that would be able to assist adolescents in increasing their knowledge and awareness on cyber-bullying.

1.1. Multimedia learning

The advances in multimedia technology open up even more opportunities in innovating ways to learn, to acquire information and to increase knowledge. According to Harun and Tasir (2003), multimedia opens up frontiers to educators in the application of a variety of teaching techniques, while students are given opportunities to have control over a learning session. This shows that multimedia is able to create a more interesting learning environment compared to conventional methods which are governed by text books.

In multimedia learning, visual and auditory information is used as a method of presenting a lesson. Learners will then use this information to form knowledge. Mayer (2001) opined that people learn better from words and pictures than from words alone. The meaning of 'word' here encompasses written and spoken texts, while 'picture' includes static graphic images, animation and video.

According to Harun and Tasir (2000) a teaching approach based on multimedia is capable of having positive effects on students in the teaching and learning processes as this process moves information from static text books to a new learning pattern that is more interesting, dynamic and interactive with the aid of additional media such as audio, video, animation and graphic. In addition to that, multimedia application in the field of education will give rise to a new concept of learning, a combination of education and entertainment, which is edutainment and it will replace the traditional text book with the electronic text book which has a friendlier approach (Harun & Tasir, 2000).

The characteristics and advantages of multimedia have encouraged the researcher to develop Cyber-Bullying Application (CyBA), to increase perceived knowledge and awareness amongst adolescents towards cyber-bullying. Development of an interactive multimedia application that comes with attractive graphics, audio and animation have great potential in attracting the interest of adolescents in gaining a deeper understanding of this issue. In addition to that, advanced internet technology and the existence of gadgets like tablets and smart phones make it easier for teenagers from all walks of life to access this application.

2. Multimedia application development and description

The Cyber-bullying Application (CyBA) will be used to instil knowledge and awareness about cyber-bullying amongst teenagers. For the purposes of this research, the groups that serve as target learners of the research are lower secondary and upper secondary school students. The age of the learners ranges from 13 to 17 years old. CyBA is divided into 4 main modules, which are:

- What is cyber-bullying – gives information about the definition of cyber-bullying and the method through which cyber-bullying is conducted as well as the examples of cyber-bullying acts.
- The dangers of cyber-bullying – provides information about the dangers of cyber-bullying to victims and the reasons these acts should be avoided.
- Overcoming cyber-bullying – provides awareness to teenagers on steps to handle cyber-bullying, tips for communicating in the cyber world in order to avoid incidences of cyber-bullying, ways to curb the growth of cyber-bullying among teenagers.

IETC 2014

- Activity – This module consists of reinforcement activities in the form of quizzes with the purpose of providing reinforcement for the knowledge and awareness of teenagers on the topic of cyber-bullying that is presented in the three modules above.

When using this application, the user is free to select any module to explore. The user also has control over the presentation of the animation whereby control buttons are prepared so that the users are able to play, pause, rewind, forward and replay the animation. Fig. 1 and Fig. 2 show some screen-shots of CyBA.

a b

Fig. 1. (a) screen-shot of the main page; (b) screen-shot of the intro page.

a b

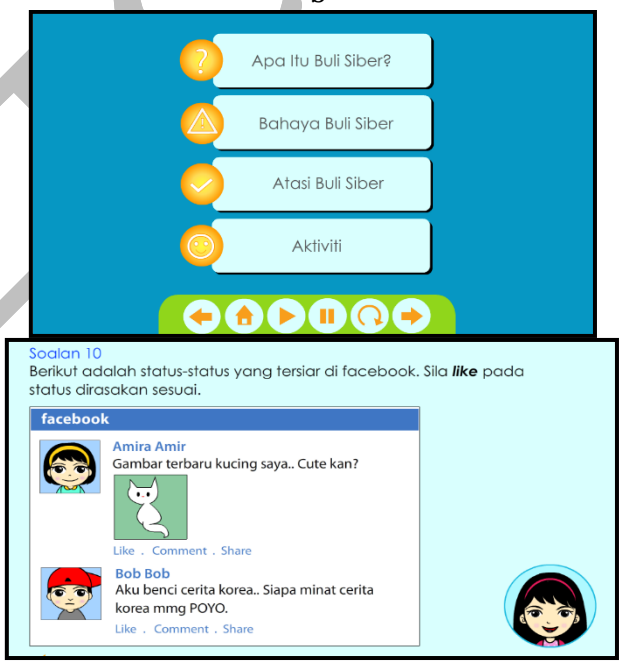

Fig. 2. (a) screen-shot of the main menu ; (b) screen-shot of the activity page.

3. Method

In preparation for the actual study, a pilot study was carried out to test logistics and gather information prior to larger study. A pilot study will be able to detect any deficiencies in research design or procedure and therefore improve the quality and efficiency of a research. The pilot study had been conducted using the same procedures as in the actual study.

A quasi-experimental research design with pre-test and post-test was used to investigate the effectiveness of the multimedia application during the pilot study. A quasi-experimental study is a type of evaluation which aims to determine whether a program or intervention has the intended effect on a study's participants (Trochim, 2006). Quasi-experimental design was chosen as the randomization of subjects is impractical. Although true experiments are considered stronger than quasi-experiment alone, it is believed that the quasi experimental research is useful in situations where randomization is unfeasible (Cook & Campbell, 1986).

32 students (14 males and 18 females) participated in the pilot study. They are from two different schools in Perlis state, Malaysia. The age of the participants ranges from 13 to 17 years old. During the first week of the pilot study, the participants were asked to answer the pre-test before the treatment. The pre-test utilized the Cyber-bullying Knowledge and Awareness Instrument (CBKAi) which was developed by the researcher. On the following week, the participants were given treatment using CyBA. Right after the treatment, the participants were then asked to answer the post-test. Pre-test and Post-test tests are identical and have the same set of questions but the items were be arranged in different order.

3.1. Research instrument

In this study, the researcher developed the instrument to measure the level of adolescents' perceived knowledge and awareness on cyber-bullying. This instrument is known as the *Cyber-bullying Knowledge and Awareness Instrument* (CBKAi). It was used as the pre-test and post-test of this study. CBKAi consists of 28 items. 10 items will be utilized to access the level of knowledge that the students posses in understanding the characteristics, method and the nature of cyber-bullying. Another 18 items is used to measure the level of awareness that the students have regarding the consequences of cyber-bullying, coping strategy of cyber-bullying and steps to prevent the growth of cyber-bullying among teenagers.

CBKAi was validated by a senior lecturer from a public university who is also an expert in cyber-bullying. As suggested by (Anastasi & Urbina, 1997) the content validity is performed to determine whether it comprises a representative sample of the behaviour domain to be measured. Foxcroft, Paterson, Le Roux, & Herbst (2004) stated that the content validity could be improved by using experts to review the test specifications and the selection of items. The experts will be able to review the items and give comment whether the items comprise a representative sample of the domain.

CBKAi was tested for its reliability with 30 respondents. The analysis was done using SPSS 20. The Cronbach's alpha internal consistency reliability coefficient for the instrument is 0.919 for items that are related to perceived knowledge and 0.810 for items that are related to perceived awareness. The statistics show that this instrument is a reliable instrument to be utilized in this study.

4. Result

The data collected in pilot study was analyzed using descriptive statistic. Table 1 and Table 2 show descriptive statistic for the perceive knowledge and awareness score from the pilot study. The perceive knowledge and awareness score is higher in Post-test compared to Pre-test. The result clearly indicates

IETC 2014

that perceived knowledge and perceived awareness among the adolescents were increased after the participants were given treatment using CyBA.

Table 1. Perceived Knowledge Score in Pre-Test and Post-Test.

	Pre-Test	Post-Test
Sample size	32	32
Mean	55.56	66.62
Standard Deviation	2.29	2.57

Table 2. Perceived Awareness Score in Pre-Test and Post-Test.

	Pre-Test	Post-Test
Sample size	32	32
Mean	46.93	56.53
Standard Deviation	5.63	4.48

5. Conclusion

Although limited by small sample size, this pilot study suggests that the perceive knowledge and awareness of cyber-bullying among adolescents were increase after they were exposed to CyBA. The result of this study clearly shows that a multimedia application has a positive impact in increasing perceived knowledge and awareness of cyber-bullying among adolescents. The pilot study will guide the researcher in conducting the actual study with larger sample size.

UM postgraduates experiences with spectrum

Amiza Mohamed Noor, Mohammad Attaran*, Norlidah Alias
Faculty of Education, University of Malaya, Kuala Lumpur, Malaysia

Abstract

This study looks at students experience while using SPECTRUM (as a virtual space in terms of Blended learning) in their learning process. The research is a phenomenological design study and uses a semi-structured interview to collect data. A total of 9 postgraduate students from the Faculty of Education in the University of Malaya were interviewed. Results based on the two main themes, which are the challenges and the benefits of BL show that students are aware of the benefit SPECTRUM has on their learning process. However, they do still face challenges regarding the BL platform

Keyword: Blended Learning, Spectrum, Experience

1. Introduction

Blended learning is now becoming an important tool in the educational system. Higher Education Institutions all over Malaysia has acknowledged the benefits of e-learning to cater for a wide variety of students as well as to help renew the teaching and learning process. In a study done by Mohamed Amin Embi (2011), he found that 42.3% of 26 Higher Education Institutions in the study offered online courses to supplement the face-to-face mode. University of Malaya has also invested in creating its own e-learning tool. Every course is now available online automatically as SPECTRUM takes information on courses, instructors and students form the University's database (Raja Maznah & Abdul Halim, 2011). After more than five years of implementing SPECTRUM in the university, this research sought to understand postgraduates' students experience in using SPECTRUM as a BL tool. Two themes as pointed out by Smyth, Houghton, Cooney and Casey (2012) are the challenges and benefits of BL as a learning tool. Therefore, this article gives the finding towards the challenges and benefits of using SPECTRUM form postgraduate students' point of view in the Faculty of Education.

2. A brief history of spectrum
3.

The use of E-learning dates back to year 2003. However it was still in its early stages and not many lecturers used them in every classroom. In 2005 to 2006, University of Malaya used two e-learning system concurrently which were called Moodle and Learning Care. Later in 2007, an official report was made to choose one e-learning platform and further develop it. The University decided to stick with Moodle for its better benefits and user-friendly purposes. Thus SPECTRUM was developed. Dr. Abdul Halim Sulaiman,

* Department of Curriculum and Instructional technology, Faculty of Education, University of Malay, 50603 Kuala Lumpur, Malaysia, Tel: +603-7967-5134

IETC 2014

Deputy Director of University of Malaya Academic Development Center, officially coined SPECTRUM in 2009. The name SPECTRUM is an abbreviation where 'SP' stands for Student-Powered, 'EC' for E-Collaboration, 'TR' for Transforming and 'UM' for University of Malaya. Every lecturer and students now uses this e-learning tool in UM. Dr Abdul Halim Sulaiman, in an interview, says *"SPECTRUM is developed in hopes to change the way students learn and the way lecturers teach".* SPECTRUM is a simple e-learning application that allows students to communicate with each classmates and lecturer online. The e-learning tool is connected to students and lecturer's e-mail account, which further notify users of any new content. Lecturers in University of Malaya are encouraged to use SPECTRUM in their teaching for at least one of their undergraduate courses (Raja Maznah & Abdul Halim, 2011).

4. Theoretical framework

Many theories on education and technology crop up as the years pass by. With the integration of technology into education there is a need to understand how technology should be utilized to bring out the best in utilizing BL in education. Education today should focus on specific information or skills such as "learning to learn" skills that helps students to cope with technological change (Roblyer & Doering, 2013). The Technology Integration Planning (TIP) model is a model used when teachers need to select the best strategies to integrate technology in their classroom. There are three phases in its implementation and a total of 7 steps. This model gives teachers a general approach to identifying and addressing challenges involved in integrating tech into teaching.

The three phases are analysis of learning and teaching needs, planning for integration and post-instructional analysis and revisions

Along with the TIP model there are also a few conditions that need to be met when integrating technology into classroom. This is to ensure the technology based strategies work best to support the teaching and learning process. According to Roblyer and Doering (2013), when the National Education Technology Standards (NETS) was established, necessary conditions were describe so teachers could exploit the potential power of technology. These conditions were summarized in ISTE's NETS for teachers (2008) book, as well as online at http://www.iste.org (Roblyer & Doering, 2013). The essential conditions for effective technology integration are standards and curriculum support, required policies, access to hardware, software, and other resources, skilled personnel, technical assistance, appropriate teaching and assessment approaches and engaged community. The conditions mention focus more on the requirements that educators need to fulfill. However, we use this understanding of what necessary conditions needed to successfully have a BL in classroom based on student's experience. These conditions will be used to identify the challenges students face in a BL classroom. When a condition is not met, there will be problems. However, when it is met there will be benefits.

5. Blended learning

There is still no ultimatum for the definition of BL. However there are ways to look at BL that may help to uncover its characteristic and usefulness for different purposes. In a general definition, BL is understood as the use of both face-to-face and online method of teaching and learning (Martyn, 2003; Gray 2006; Staker and Horn, 2012). This definition gives way to several models of BL in a classroom setting. As the term gets more attention from educators, many models of BL are developed. These models are created in an attempt to harness the usefulness of BL in the classroom. Staker and Horn (2012) reported on 4 models of BL emerging in the education sector today. The models are rotation model; flex model, self-blend model and Enriched-virtual model. The rotation model is further divided into four subcategories that are station-rotation model, lab-rotation model, flipped-classroom model and individual-rotation model.

The rotation model is a program where students rotate on a fixed timetable or at a teacher's decision between learning modalities. At least one of the stations uses online learning. The other method or station might include activities such as small-group or full-class instruction, group projects, individual tutoring and pencil-and paper assignments (Staker & Horn, 2012). Station rotation and lab-rotation modal have the

IETC 2014

same concept in which students rotate between places or groups. The difference is station rotation happens in the class while lab-rotation modal happens on campus in several classes or computer labs. Individual rotation looks at students have a personal schedule in which they will use to rotate between different stations. This model differs from the other three because student does not necessarily go to every available station or modality.

Flex model in a BL model where primary delivery of content and instruction are done through the Internet. Face-to-face support by teachers is provided on a flexible and adaptive as-needed basis. Some activities that is used in this model are small-group instruction, group projects, and individual tutoring (Staker & Horn, 2012). Self-blend model is where students take one or more online courses to enhance the learning process of certain subject. The last model is the enriched-virtual model. This model concept started out as a full time online learning which was later adept to be a BL learning model. Students get to decide between attending a face-to-face class and learning online. It may seem similar to Flipped classroom and enhance-virtual model. However, student does not attend the on line campus every weekday and it is a whole-school experience.

Farahiza Zaihan Azizan (2010) proposed several other frameworks for effectively implementing BL in higher education institution such as Khan's Octagonal Framework and Carman's BL Process. Khan's Octagonal Framework has eight dimensions where each of them represents a category of issues to be addressed. The dimensions are Institutional pedagogical, technological, interface design, management, resource support and ethical. Carman's BL Process (Carman, 2005) applied 5 different learning theories to propose a framework that focus on 5 key ingredients of BL process, which are live events, self paced learning, collaboration, assessment, performance support materials.

In the higher education in University of Malaya, BL model used is a simplified version of the flipped-classroom model as proposed by Staker and Horn (2012). Students are required to attend classes on a weekly basis as well as monitor their activity online using SPECTRUM.

6. Past researches on bl

Technology has taken center stage in education and many researchers have shown an interest in BL. Delivery modes in classroom now differ from face-to-face, blended, and fully online. However, Bleffert-Schmidt (2011) and Risner, (2011) reported no significant difference between the three different delivery modes. Even so, classroom pedagogy was more student-centered (Ruck, 2012), and has attained a general appreciation in the educational community.

Several research focusing on students as the sample shows that BL does in fact benefit students. From student's point of view, blended learning is a positive affect toward the value of intercultural awareness (Risner, 2011). Edginton and Holbrook (2010) reported that student' had concerned when using BL platform for the first time. They were unsure about their ability to communicate with the instructor about the online components. However, at the end of the course, their perception shifted to focus on their time management skills (Edginton & Holbrook, 2010). In another research, Shroff and Vogel (2010) observed that students engage in textual dialogue in the online discussions and participated more compared to the face-to-face discussions. According to Vaughan (2007), lecturers suggested that blended courses create enhanced opportunities for teacher-student interaction, increased student engagement in learning, added flexibility in the teaching and learning environment, and opportunities for continuous improvement.

Though BL platform has been in used for a few years now, there are some challenges towards online learning tool. According Mohamed Amin Embi (2011). One of the two major challenges lecturers faced are concerning the integration of e-learning into their lesson while balancing between teaching and research. The other major challenge would be time constraints educator face (Mohamed Amin Embi, 2011). In his study, Mohamed Amin Embi (2011) also highlighted challenges student faced are lack of access and feedback from lecturers.

7. Research question

IETC 2014

The study looked at postgraduate students' experiences in using SPECTRUM in a BL class. The research questions of the research are as below;

- What are the challenges students faced when using SPECTRUM?
- What are the benefits students' experiences when using SPECTRUM?

8. Research methodology

The purpose of this research requires a focus on the qualitative aspects of the experience. Therefore a phenomenological method is chosen to answer the research question. This method allows data to be analyzed and reported in a descriptive and interpretative manner. Data collection was carried out by interview sessions with postgraduate students. To get an in depth account on students experience in using SPECTRUM, a semi-structured interview method was used. A guide was developed prior to the semi-structured interview to aid researcher in getting answer from respondent. The interview guide addressed several questions such as; students general view of SPECTRUM, Experience of using SPECTRUM, Purpose of using SPECTRUM, Program content and, Program delivery.

All students are postgraduate students from the faculty of Education with different courses. Students were chosen by purposive sampling method based on availability and convenience. Students were allowed to use any language they are comfortable with. The study was designed to investigate students' experience in using SPECTRUM in their studies as well as their feelings towards the online system.

Consequently, researcher plays an important role in the study as an active interpreter. Postgraduate students from the faculty of education were first contacted to find a suitable time for an interview. 9 students were available for interview. Two interviews were conducted in a group while the rest was one-to-one. Then data was collected through a semi-structured interview. Initial question were asked followed by additional question derived from students answers. Students' responses were then transcribed into text for

further analysis. Initial readings of the data were done to find similar concepts or ideas. A second reading was carried to connect the concept or ideas of similar traits.

9. Findings

The findings presented here are of two themes where each contains sub-themes. Several benefits found in the data are accessibility to information, time saving, and helpfulness to the learning process. Some of the challenges students met while using SPECTRUM are learning to use SPECTRUM, Technical difficulty and formality in interactions. The first part will talk about the benefits students experience when using SPECTRUM in a BL class. The next part will look at the challenges students face when using SPECTRUM.

8.1 Benefits of using spectrum

Students have positive perception to the usefulness of SPECTRUM in their learning process. They claim that SPECTRUM allows them to have access to the subject content easily. They see SPECTRUM as a place to get and share information with one another.

"I think SPECTRUM is a useful platform for us because for postgraduate students sometimes when the lecturer upload notes or "friends sharing" you know, we can read before the class starts and can share something like that…"

"…and when people do their presentation they can upload their slides as well."

IETC 2014

Another benefits that students feel helped them were the ability to download notes before and after classes. This aids them in their note-taking process and also allows them to prepare for lesson.

"Yeah, sometimes when the lecturer is giving notes in the class, power point, we don't have enough time to write or we miss the class, we still can download from the SPECTRUM."

Another benefit students experience with SPECTRUM is the flexibility of time. This is one benefit that is known to the educational world and is often reported on. Students in this study find that they are free to choose when to engage in the subject content uploaded in SPECTRUM. Students claim that it saves their time from having to look for reading materials on their own.

"We just read, we don't have to find other articles. They are provided in SPECTRUM. It's easier for us. Because some of our friends are working and they don't have time to search for other articles."

"Maybe because we have a lack of time. Maybe fulltime students will have more time to read up."

SPECTRUM was also considered a helpful tool for the students learning process. Students were not told of the benefits SPECTRUM has on their education but by using it they realize that BL does help them be independent learners. Students expresses that SPECTRUM help them to keep track of the course content and lessons.

"…You can go back to the notes if you accidentally loose the hardcopy given by lecturers… with SPECTRUM we can go back and print them again or read it online."

"We can still keep track of what happens… sometimes we forget what we had learned last week, so we go back to SPECTRUM to check."

"So if you have the time…the whole syllabus is there, so roughly you know what the lecturer is going to teach… it is very good, because, let say you missed out something, you don't understand, you can go back."

Overall findings shows that students did in fact realized the benefits of SPECTRUM by experiencing it firsthand. There was no need to specifically tell them the objective of such e-learning platform. The few benefits here are all related to students learning process. Thus SPECTRUM has indeed change the way student learn but giving them the independence of taking charge of their studies.

8.2 Challenges in using spectrum

Even with the benefits mention above nothing is without its challenges. One of the challenges that students experience when using SPECTRUM is learning to use SPECTRUM. The criteria of a successful integration of technology in classroom are standards and curriculum support where certain skills need to be set in order to support both subject and content with technology. However, students only receive little guidance towards using SPECTRUM. Thus they are left to explore SPECTRUM on their own. Older students claim that it is rather difficult for them to get used to SPECTRUM. Often they would acquire help from friends and family member. On the other hand, younger students who are IT savvy still claims that it takes time to get used to SPECTRUM without proper guidance.

"..It takes time."
"Of course I have difficulties, I have to ask my kids to help me…"
"I only have a problem with uploading assignments. Ah, maybe I don't know how. Maybe I'm not skillful in using SPECTRUM yet."

Lack of technical assistance does not only occur towards educators. In fact, technical difficulty is still a pervasive challenge that students face. Though UM has various means to counter these problem, students are still unsure of the support that is available to them. In this case, data shows that students sometimes face a problem with their username and password. Students also expresses that they initially did not know whom to turn to when problems like this occur.

IETC 2014

"…Except in the beginning of the semester, I don't know why it took so long to log in. I couldn't log into spectrum. In fact, after that thing happened, I also didn't bother. I don't know if mine can't open or what."

Another criteria that is necessary when using technology in classroom is presence of an engaged community. The benefit of BL is its flexibility to be access by students wherever and whenever they want. However, data shows that a challenge student face is regarding the interactions that happen in SPECTRUM. SPECTRUM is not like a social network. Most students nowadays interact in different social network such as Facebook, Twitter or Instagram. Social network gives them the freedom to express themselves. Thus, when they use SPECTRUM for discussions, students feel a total opposite to the online interactions they are

used to. Students feel that SPECTRUM has a more formal and serious atmosphere when it comes to communications.

"…it's more professional and educational…."
"and most of us don't put personal things, we put it in our Facebook."
"We do the conversation in Facebook."
"Just formal language with the lecturer."

There is little engagement between communities. Interactions are perceived as forced and formal. Furthermore, students are more reserved when it comes to using SPECTRUM to interact. They perceived it being as a formal setting where each member are supposed to exhibit a certain level of knowledge that is expected from a master students. Students feel a little pressured when it is made compulsory to post comments in the forum on SPECTRUM.

"…We're afraid if we're late to do the task in SPECTRUM or missed an announcement…"
"Did we give the right link that's useful…"
"…There's nothing to interact on in there except if there's a new forum. Another thing is if we want to chat with friends there's no chat box"

Students also express that they feel SPECTRUM should be more user friendly in regards to the changes made. Their experiences using SPECTRUM is affected by the layout display of the e-learning platform.

"There must be some instruction or guidelines on how to use… if you really want to change that, make a workshop or something… Let the students know that it has changed…give fliers or give information on the changed version."

"In my opinion, sometimes SPECTRUM is not user-friendly. One reason is when we want to start a new forum topic and another is I'm not familiar with SPECTRUM."

10. Discussion

The findings contribute to the understanding of postgraduate students experience in using SPECTRUM in a BL classroom. Their experience highlighted the benefits and challenges of pursuing BL in classroom in higher education. The data reveals that SPECTRUM supports students to gain accessibility to information, in saving time, and to help in their learning process. The flexibility SPECTRUM offers to students on where and when to engage with the content supports past research (Staker & Horn, 2012, Smyth et al., 2012). BL allows students to easily monitor their lesson and receive course content. Furthermore it save time in having to find reading materials. SPECTRUM is seen as a place to share information. The benefits of BL in the Faculty of Education are probably because of the educator's activeness in using SPECTRUM in their class. This support past research on BL where educators still plays an important role in determining the successfulness of a BL model (Peruso, 2012).

Some of the challenges students experience while using SPECTRUM were the fact that they had to get used to using SPECTRUM. Though SPECTRUM is easy to use, students perceive it as a not so user-friendly e-learning platform. They need guidance instead of having to explore the platform on their own. Technical

IETC 2014

difficulty is also one challenges students face as they have trouble logging into SPECTRUM. Another challenge student's face is the unattractiveness of SPECTRUM elements. According to Mohamed

Amin Embi (2011), students expresses that e-learning platform has lack of interesting content and uninteresting content as compared to other online applications such as Facebook. This is also shown in the data collected for this research where student expresses the dullness SPECTRUM as compare to social networks they are used to. Furthermore, students are more used to the conduct of a social network and feel the interaction in SPECTRUM as a problem.

BL has to have a clearer objective when implemented into classroom as well as a develop community for student to feel it as more user-friendly. There are other ways for interaction to happen and those that do happen in SPECTRUM are either too formal or forced engagement from lecturers. Thus the corresponding activity such as discussions is seen as another activity for the course requirement. It masked the fact that SPECTRUM can be used for educational or beneficial interactions between students and teachers. The study does have its limitation and may not be able to represents other students from different faculty. Therefore further research should be done to identify the similarities and differences of students experience in using SPECTRUM throughout the campus.

11.Conclusion

This study aimed to understand postgraduate students from the faculty of education's experience with using SPECTRUM in a BL classroom. It confirmed past research about the usefulness of BL in classroom and gave a first look at how students use SPECTRUM and in what context. Though the research is still in its early development, it is clear that further study into this matter might help educators understand students' perspective towards BL. There is a need to see what students face everyday in order to help educators to carry of an effective BL class on campus.

Using of simulation in technical subjects education process

Juraj Camaj143, Martin Kendra, Jana Lalinská
Faculty of Operation and Economics Transport and Communication,, University of Zilina, Zilina, 010 26, Slovakia

Abstract

Teaching of technical subjects is a very complicate and complex process. It is demand on logical thinking and imagination. One of the choice to make learning process simplify is using of illustrative examples of the real process. The paper deals with the didactically potential of using simulation software of logistics center. It is used for improving teaching of the modeling of transport processes. Simulation software due to their own variability, construction layout and configuration of applied technology creates the elite place for the evaluation of all parts. Active use of the simulation tool in the teaching of modeling of transport and transport processes is of great importance for understanding of the synergies activities in marshalling yard, intermodal terminal and warehouse. Simulation enables direct visualization and such facilitate the understanding of the activities and feedbacks between them.

Keywords: simulation model, technical subject, transport technology

IETC 2014

1. Introduction

The education process of professional transport subjects is a very complex system. It takes place under conditions of interaction and the conditionality objective (logical and gnoseological) and subjective (psychological) factors. From the perspective of cybernetic science the teaching can be understood as a kind of governance as purposeful activity aimed to develop the psychical processes and system of control properties. Consequently the factors governing the system (teachers) are rightly set out requirements planning the teaching process. These factors are valid, including a mastery of the subject curriculum and its didactic transformation into the student's operational language. Only after it can be expected that the pedagogical activities of teacher will be purposeful, conceptually clarified, operational, creative and ultimately effective.

Planning of pedagogical activities is in many ways different compared to the programming of other human activities. This difference is given by the factors that enter into the teaching process. Relatively stable educational objectives and content of the teacher's work will be conducted in variable and always well understood and incompletely recognizable conditions (new pupils, the variety of psychological readiness, new environment, new teacher´s experiences, his/her mental condition, etc..). Hereby planning of the teachers activities based on incomplete information and therefore it becomes the role of preparing teachers for the teaching very demanding, requiring significant pedagogical mastery.

Dynamics and variability of the conditions of the teaching process makes difficult the teacher's decisions about the optimal methods, forms and means of teaching. For the reasons outlined above the teachers planning bears activities risk that the proposed procedures do not always yield the expected results. Each teaching unit is set by teachers before the solution unplanned situations requiring swift response and improvisation. Those factors are affecting the attitudes of teachers to planning activities.

2. The research as a teaching method

The purpose of the research is collect of knowledge. This knowledge needs to be searched and discovered. In the fields of engineering - comparing to natural sciences and philosophy - there are found mainly the specific results of the research. These lead to specific solutions, technological process or final products; in contrast with philosophy or the natural sciences, where the research or study is ideally a matter of impartial objective of mind.

The scientific research is the development of means of transport didactics of vocational subjects. Its characteristic features are:

- • Objectivity
- • Verifiability
- • Methodically
- • Reproducibility

Conformably to their aims of transport research can be subdivided to:

- • Basic (this typically takes transport as theoretical science)
- • Applied (uses exact methods and their potential applications of transport)

A solution to difficult problems requires the originality - new approach of mind, a willingness to explore new horizons, maintaining of objectivity, endurance even by failures.

2.1. The problem interpretation

The essence of creative interpretation is the activity, independence and creativity of students. It is a most effective method of learning specialized subjects of transport. The student is an active participant wondering just of acquire the scientific or technical problem (origin, evolution, default hypothesis, critical points, the doubts and weaknesses) with continuous verification of the accuracy of thought. The student identifies the problem.

The problem interpretation gives rise to the original visions, development of critical thinking, creative and adaptive activity of thought. It is a school of thought in front of teacher and student dialogue about the problem.

The scenario of problematic interpretation is based on a listener dragged into the action and his/her active part in a "dramatization" teaching unit. The method requires excellent professional and teaching skills of teacher and also students to be available.

2.2. The autonomous research

The method of individual student´s research activities ensures the active participation in the instructional activities. The basis of the method is to solve the defined problem or task, at which the application or reproduction of actual knowledge is not enough to resolve them. The independent research in the teaching of transport subjects also includes the adaptation of knowledge in other conditions (nonspecific transfer).

In this method the teacher plays a role of professional consultant. His/her main task is to prepare some specifications of tasks and problems to be solved. The tasks are compiled to use creative knowledge and skills, openness of variation solutions and participation of students in solving so called difficult tasks. While solving the teacher is in role of corrector, in the case the corrector of incorrect solutions on key issues (check-points).

IETC 2014

2.3. The experimental research

Trainee researcher has often distorted and simplified view of the research work. He has no experience with severe problems. A systematic research work is the most important aspect. The initial phase comprise of the orientation on the subject (information gathering). The next phase is represented by the preliminary results - a set of experimental conclusions. Later, it will be extended, strengthened or rejected. A phase of substantial results is characterized by increasing knowledge improved with the concrete results and conclusions. The last phase - "packaging" - means an arrangement of accumulated empirical and experimental data. It also means the theoretical justification of the results and the practical processing work (text, graphs, tables and figures).

Methods of individual student research activities guarantee the active participation of the student on taught activity. The essence of the method is to solve a defined problem or task. Application or reproduction is not enough to solve the current knowledge. As a separate research shall be deemed also adaptation of knowledge in other conditions (unspecified transfer).

The teacher has a major role in preparing the assignment of tasks and problems to solve. Tasks are drawn up to the creative use of knowledge and skills, and openness of variation solutions and involving pupils in solving so called difficult tasks. The teacher is a corrector of solutions, especially in case of wrong solutions of key issues (control points).

The process of scientific discovery is based on systematically arranged progress. Researcher, working individually or in the research group, establishes the vision of the outcome of own already acquired knowledge. The result arises through a certain methodology.

For applying research teaching methods, a teacher has to base on precisely defined grounds, that students already must have previously acquired (Prerequisites).

3. Modelling of railway transport

Major logistical task of transport is relocation as important service activities. The movement of goods and people is a complex of service activities that deals with the implementation of specific transport systems.

In addition to rail transport routes the technical implementation of relocation usually requires expensive and considerably mobile sources, such as railway locomotives and wagons. In order to minimize these sources, they are usually not moved by elements after one, but collectively in groups, in so called transport complete.

Due to the speed limits of particular transport modes is not the largest relocation timeframe. More important point of delays in transport goods are the transport terminals.

3.1. Transport terminals

Transportation terminals are also known as logistics centres. They are places of the transport system which perform the sorting transport elements from one set to another.

Some of the most famous types of transport terminals in railway transport are:

- The marshalling yards, where the wagons are sorted between transport set (freight trains) for individual destinations
- The Passenger terminals, where the passenger transfers from one means of transport to another and which often have multimodal character. There shall meet several modes of transport (rail, bus, air, etc.).

IETC 2014

- Container terminals, which have multimodal dimension similar as the passenger terminal (typically they meets rail, road and waterborne), but their function is sorting (transshipment) of containers.
- Warehouses, which function is to balance unevenly dimensioned material flows in terms of time, space and product range.

Transport terminals are among the most complex and comprehensive service systems. They include expensive and complex technical equipment and complicated technological processes.

They have been designed and managed so as to ensure the necessary performance and quality of service processes at minimum cost to the utility source. This can be achieved by various means. Some of them are modification of infrastructure, use of alternative types of resources, improving the work schedule of resources, improvement of technological processes, modification of decision-making strategies or complete reengineering of transport terminals.

Due to the high complexity of transport systems the application of exact mathematical methods is very limited.

Classical expert studies without using objective tools of management do not give sufficiently objective arguments and this may cause concerns for the decision or even aversion to implement any rationalization measures.

In relation to transport terminals various problems are solved and also with varying degrees of complexity. We can divide these problems into two basic categories - spatial planning (design) and planning processes of technological activities, including the management of employees' work.

3.2. Simulation model of transport terminal

Computer simulation is a method that is used for analysis, evaluation and optimization of systems that exist or could exist. The basic process includes building a computer simulation model, abstraction, experimentation, interpretation and use of the results.

The most effective tool for solving problems of transport terminals satisfying these requirements is simulation model of the transport terminal. The principle of simulation techniques is the replacement of the existing or the designed transport hub by dynamic computer model of the hub, which reproduces well the processes and animates the real system. This method allows the experimenter to verify the computer to simulate the series of different operational scenarios of terminals. Consequently, in practice, he can recommend the implementation of such measures, which verify the simulation model and has led to the terminal operation at the required qualitative and quantitative level.

Creation of models in rail transport is actually dealing with two at first glance significantly distant disciplines. The first and also keys´ discipline is area of information technology, namely technology creation and use of simulation models of complex service systems. The second discipline is the area of transport technologies, in particular technologies in marshalling yards, intermodal terminals and warehouse.

Although such connection may be a little unusual, in this case it is deliberate. If the task is to establish the quality transport engineers in rail transport, they shall have acquired not only technological disciplines transport but also the various simulation techniques.

There is displayed the demonstration processing the technological process of ending train in Fig. 1.

IETC 2014

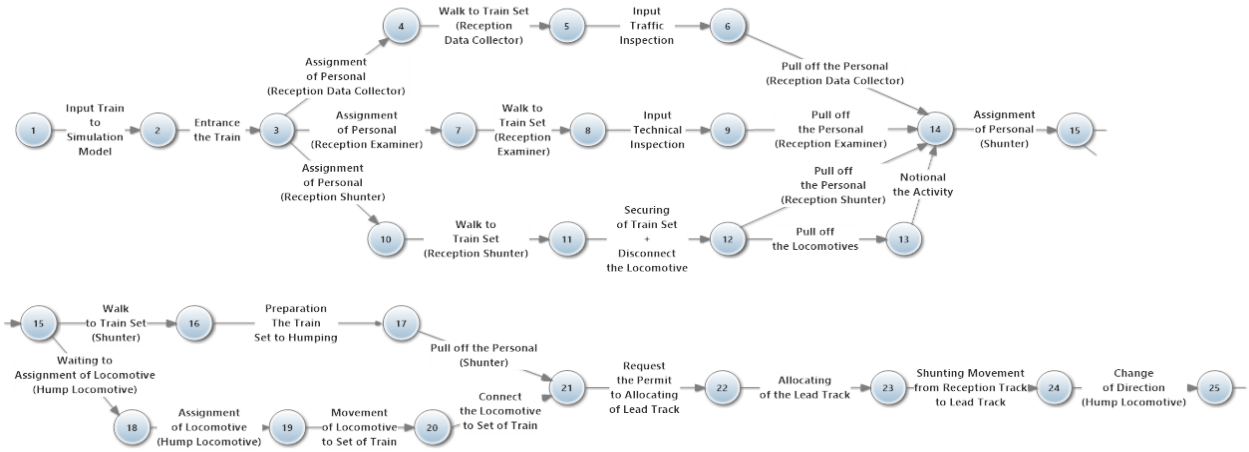

Fig. 1. Part of technology activities in process diagram (ending train)

4. Modeling of transport operation processes in the logistic center by using the tool Byron

4.1. The links between modules

There are created interlinks between all the modeled modules. Output current requirements of any module can be directed to the input current requirements in another module, possibly outside the simulation model (completes went the simulation). A student has available all these variants in all modules in process of setting each part.

This option explains to students all the possibilities of behavior of the train sets. It simplifies the students understanding the links between the modeled modules, their interaction and complexity of their management.

Modules can simulate the processes separately, but also all three modules together. The outputs of one module can be input for other modules. Admission requirements to individual modules from outside can enter several alternatives, but also through individual inputs outsourcer.

Links between individual modules are shown in Fig. 2.

Fig. 2. Links between individual modules

4.2. Marshalling yard

Marshalling yard is an important hub in the process of rail transport. Marshalling yard simulation model allows students to choose from several standard configurations each track groups, approximation in

IFTC 2014

marshalling yard activities, and especially dimensioning of each source. The model also allows to simulate several variants of technological processes. These options give the student a comprehensive view of all the factors of individual capacities and processes of marshalling yard.

Allows the students to choose:

- standard configuration of rail groups (serial or parallel),
- number of tracks in each group (reception tracks, sorting tracks, departure tracks, secondary sorting tracks).

The main part of specifying configuration parameters yard is completed with a choice:

- configuration from a predefined set of rail groups
- method of sorting wagons.

Input flows of parameters are presented by the cars which are transported by in trains. Every wagon, including pallets stored therein, shall be defined destination. Outlet flow are presented by the outgoing train sets which are formed by the need to (enough number of wagons - the collection of standard) or on a timetable (scheduled requirement.

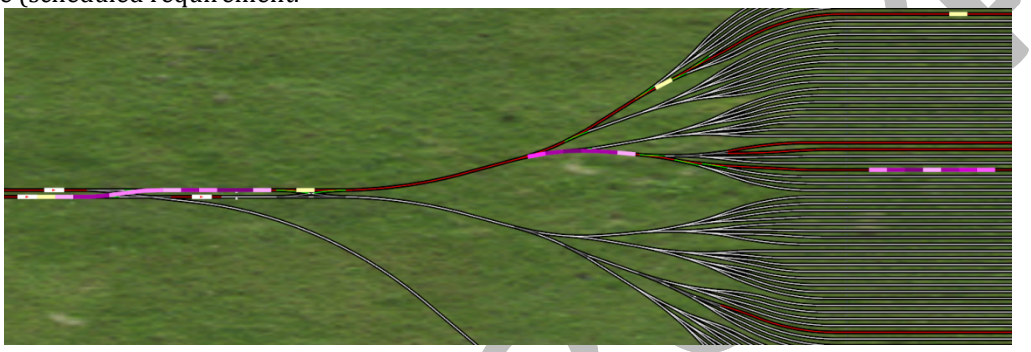

Fig. 3. Sorting process in simulation model.

4.3. Intermodal terminal

The intermodal terminal provides a basic preview of the infrastructure and processes in terminal. The model allows students to choose between two basic types of internal infrastructure, with defined handling tools:

- The 1st category terminal – the portal bridge crane and crane car with spreader
- The 2nd category terminal – only crane car.

Each configuration of intermodal terminal contains one transshipment module with the following parameters:

- number of tracks at a transfer module,
- the number of lanes on the road and stop in a truck with transshipment module
- capacity of storage area (containers, trailers),
- input (road, rail),
- output (road, rail).

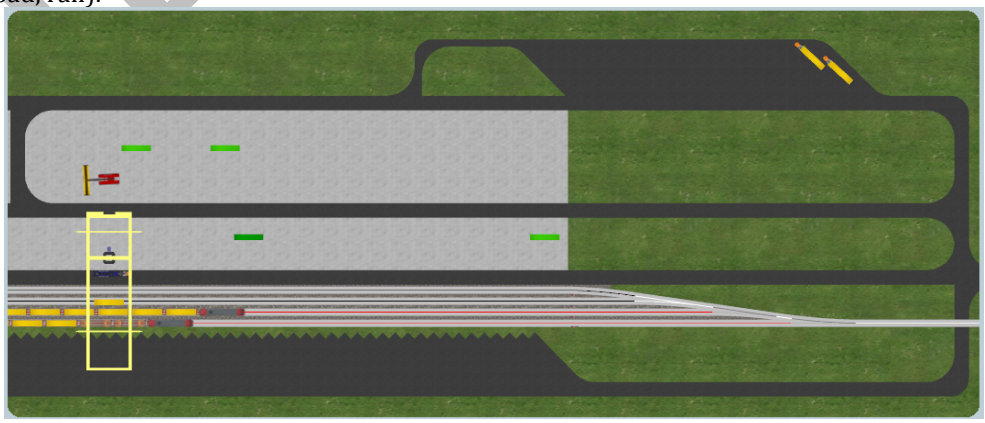

Fig. 4. The intermodal terminal in the simulation model.

Input flow of parameters represent containers and semi-trailers which are transported to the wagon sets, then a truck with a container or truck with trailer. Output flow represents the requirements for delivery of containers and semi-trailers. Requirement occurs randomly or according to a fixed time (planned requirement for delivery).

4.4. Warehouse

Storage is the inseparable part of every logistics system. Warehouse is the object or area specifically designed and intended for the storage of goods which is equipped with storage technology and equipment intended for the reception, storage, handling, repair and distribution of goods.

The student thus pays attention to the importance and the all-important functions of the warehouse that must be performed. The primary function of the warehouse is quantitative, temporal and spatial adjusting of disparities in balancing different sized material flows. Other warehouse roles include:

- The insurance function - arise from foreseeable and unforeseeable risks in the supply and distribution
- The assembling function - creating a range of supply according to specific customer requirements
- Speculation function - stockpiling on the evolution of market prices, the supply, the distribution
- Technology function - focus on qualitative changes of stored goods unrelated to the production process

The modeled warehouse allows to create links between railway and road transport.

The student has a choice of two basic types of infrastructure, with defined handling tools:

- Type 1 - Warehouse for forklift truck or forklift supported,
- Type 2 - Stock to the vehicles with thrust and twist fork or stacker. The layout of storage space is defined on the basis of selected type of handling equipment with a specified minimum building module.

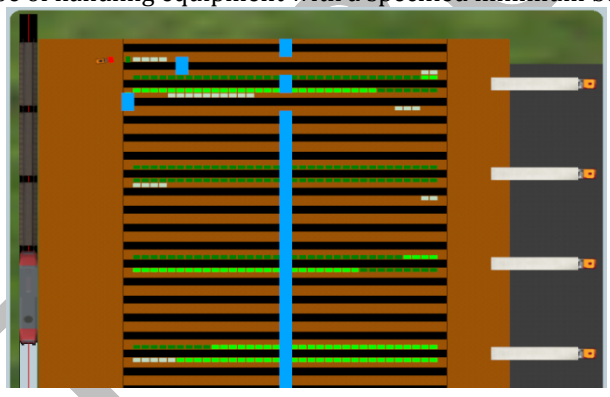

Fig. 5 The part of warehouse in technology process.

Input flow of parameters is presented by the palettes that can be brought in through sets of railway wagons or by goods road transport vehicle loaded with pallets on the loading area of the relevant vehicle, or stored in a container.

4.5. Result

Evaluation of simulation belongs to the final steps for the simulation run was carried. A student evaluates all the set elements in the simulation and interprets individual obtained results. He/she evaluates adequately all the set parameters of simulation with all restrictions.

Successful simulation results can be interpreted in the form of tables or graphical representations of using the various elements over time.

a. b.

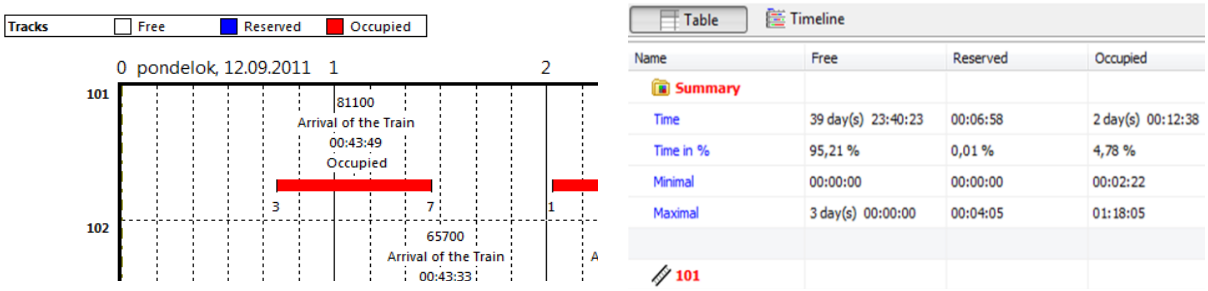

Fig. 6. Results of simulation run

5. Conclusion

Teaching of technical subjects is a very complicate and complex process. It demands a logical thinking and imagination. Using of illustrative examples of the real process is one of the ways how to make learning process simplify.

Planning and infrastructure optimization, scheduling and sources of management practices in transport hubs cannot be done without a thorough and objective assessment of the consequences of the decisions.

However, the transport hub represents a complex dynamic system. There are complex links among its elements service processes have a complex interdependencies. A lot of them have stochastic status. Because of this complexity hubs and traffic in them is currently the most effective technique of examining the consequences of decisions experimentation for sufficiently faithful simulation model and operation of infrastructure hub. Obviously, such a complex simulation model hub is also very large and complex. Building model and its practical use is possible when two conditions are met. The first condition is sufficient performance of the computer used for experimentation. The second condition is the use of such architecture simulation model, which allows to build a model to understand in its complexity, sufficiently intelligible, maintainable and flexible. These architectures are currently the subject of intensive research.

The computer simulation as the primary method is used for finding answers to a customer's questions and problems. Simulation of systems enables testing of alternative solutions, proposals and decision-making strategies with essentially lower costs in comparison with experiments on the real system, which are often even not feasible due to financial, ethical and other reasons.

Simulation software Byron due to its own variability, construction layout and configuration of applied technology creates the elite place for the evaluation of all parts. Active use of the simulation tool in the teaching of modeling of transport and transport processes is very important for understanding of the synergies activities in all modules. Simulation enables direct visualization and such facilitates the understanding of the activities and feedbacks between them.

The Paper was created within the project co-financed by EU funds called "**The quality of education and human resources development as pillars of the knowledge society at the Faculty PEDAS, University of Zilina**", ITMS code 26110230083 solved at University of Zilina.

Abstract

A literature review was conducted as part of a development project to flesh out a number of issues: How can game component design be adapted to accommodate seniors' physical or intellectual limitations? How should a game interface and its components be displayed on the screen to facilitate game navigation? What restrictions should be considered when selecting computer game equipment to be used by seniors? What are the guidelines for efficient game audio, video and text readability? This communication first presents the pedagogical and technological adaptations of the online educational game: "Live Well, Live Healthy!" This adaptation of the Bingo game has allowed us to introduce learning content with the objective of improving the quality of life for seniors. Second, the methodology used for the validation of the ergonomics of this educational game with seniors and third, the results of validation and the recommendations from the seniors to improve the ergonomic conditions.

Keywords: Educational Game; Seniors, Ergonomic conditions, Validation

IETC 2014

1. Introduction

Online games aimed at seniors need to address the particular needs and physical limitations of this target group. Several researchers have attempted to use commercial digital games in their investigations with seniors, while others have adapted games or have done research to establish requirements for digital games for seniors. However, research is still limited about the ergonomic requirements of online games created for seniors.

These are being studied as part of a project funded by an Insight Grant from Canada's Social Sciences and Humanities Research Council. The goal is to examine, through the use of online games designed for seniors, the key factors for effective implementation of digital games for this audience. More specifically, our study has the following objectives: 1) develop and publicize online educational games for maintaining or adopting healthy lifestyles for retired seniors 55 years and older; 2) test these games with the target audience to check their ergonomic quality (design, user-friendliness and educational readability) and 3) test these games with the target audience in order to assess the effect they have on the adoption of healthy lifestyles. In this paper, we describe the pedagogical and technological adaptations we made to an online Bingo game to introduce learning content, taking into account the ergonomic criteria that we identified in the literature for seniors 55 and older, the methodology and the testing results of 27 seniors as well as their recommendations to improve the game, "Live Well, Live Healthy!"

2. Seniors and games

The aging population represents a serious challenge for healthcare systems and social insurance in the 21st century. The number of people aged 60 and over is growing faster than other age groups and is expected to reach two billion in 2050 (Aalbers, Baars & Olde Rickert, 2011). In 2010, almost five million Canadians were over the age of 64 years. In 2036, they will number more than 10 million (HRSDC, 2011).

These aging seniors are facing the decline of their physical and cognitive abilities, loss of long-term companions and social support, changes in their familial or professional environment, different lifestyles, and the increased likelihood of developing chronic and disabling diseases. But what are they doing to improve their quality of life? Can games help them effectively meet the challenges of aging?

An increasing number of studies have demonstrated that video games can have a positive impact on seniors: digital games can provide physical training for seniors and can overcome their isolation (Rosenberg, Deep, Vahia, Reichst, Plamer & Kerr, 2010; De Schutter, 2011; Diaz-Orueta, Facal, Herman Nap & Ranga, 2012; Astell, 2013). These studies also show that the effects of these games depend on the needs and individual characteristics of seniors and that systems need to be developed that are capable of adapting to the demands of this population. An inappropriate design can act as a barrier to seniors' use of games, thus reducing the games' physical, cognitive and social benefits and consequently seniors' health and quality of life (Whitlock, McLaughlin & Allaire, 2011). It is therefore important to ensure that games offered to seniors have appropriate ergonomics.

In the case of online educational games, the ergonomist develops solutions that inform and guide the user while minimizing the cognitive and technological information load as much as possible (Barnard, Bradley, Hodgson & Lloyd, 2013). A technology will be adopted if the person is attracted to using it, and its user-friendliness must be appropriate for the user: the technology must not be too difficult to use.

In order to establish the ergonomic indicators of online games for seniors, we rely on three quality criteria: 1) the design: the components of the game must adapt to the characteristics of the users, 2) user-friendliness: the game interface and computer equipment must be easy to use, and 3) readability: the way in which the text, illustrations and videos are visually presented must facilitate reading and understanding by users.

We now examine how we addressed these criteria during the educational adaptation and computerization of the Bingo game for seniors.

3. The adaptation of the Bingo Game

According to a survey of 932 Canadian seniors (Kaufman, Sauvé, Renaud & Duplaa, 2014), the game Bingo turns out to be the most mentioned game by respondents. In the remainder of this paper, we look at how the structure and content of this popular game have been adapted to create an educational online game for seniors.

3.1. The game design

An increasing number of studies advocate that it is necessary to create a design specifically tailored to players from the 'baby boomer' generation. Various aspects of the Bingo game have been adapted in terms of design to create an educational game for seniors (Callari, Ciairano & Re, 2012; De Schutter, 2011; Diaz-Orueta, Facal, Herman Nap & Ranga, 2012; Hwang, Hong, Hao & Jong, 2011; Lopez-Martinez, Santiago-Ramajo, Caracuel, Valls-Serrano, Hornos & Rodriguez-Fortiz, 2011; Marin, Lawrence, Navarro & Sax, 2011 ; Ogomori, Nagamachi, Ishihara, Ishihara & Kohchi, 2011; Pham & Theng, 2012; Sauvé, 2010a; Shang-Ti,

IETC 2014

Huang & Chiang, 2012; Theng, Chua & Pham, 2012; Whitlock, McLaughlin & Allaire, 2011; Wu, Miao, Tao, & Helander, 2012).

Challenge. The game must maintain a constant challenge for the players. In our "Live Well, Live Healthy!" game, we have put in place mechanisms (Fig. 1B) that allow players to choose from three levels of difficulty at the start of the game. These levels are based on the seniors' knowledge about the learning content (easy, medium and difficult) of the game (Fig. 1A): easy corresponds to 75 % of the content which refers to the prior knowledge of the seniors; medium is 50 % and difficult is 25 %. We also integrated into the game mechanics Bonus balls that are drawn at random during the game, thus reducing the gap between the players that are too strong and those that are weaker (easy = 3, medium = 2 and difficult = 1).

Fig. 1. Main page interface of the game

Competition. The game must create competition among seniors to maintain their interest. In our "Live Well, Live Healthy!" educational game, we first determined it would take three participants or more to create competition between seniors. We gave the opportunity to vary the duration of the game by allowing players to choose how the game ends and thus decide the playing time: a complete row of vertical boxes requires less time than a full card or the contour of the card (Fig. 2A). Similarly, players choose the degree of difficulty (easy, medium and difficult) before starting the game. We opted to display the scoring system in the game interface at any time for each player (Fig. 2B). Then we inserted points that reward or penalize the player according to whether they answer the question correctly or not, which in turn allows the player to place a token in one of the boxes on the card. The penalty is 50% less than the gain in order to maintain the interest of players, in particular, for those who have little knowledge about the content to be learned. Finally, we changed the rules that determine the winners and losers in the context of an online game without a game master: the first player to click on the Bingo button (Fig. 2C) after correctly placing their tokens on the Bingo card wins 50 points. Players who have a "Bingo" at the same time but were not fast enough to click on the "Bingo" button first, only receive 25 additional points. Should a player click on the Bingo button and not have their tokens placed correctly, the game continues and the player loses 25 points.

Learning Content. To ensure effective learning, the game must incorporate learning content while maintaining a balance between learning time and play time to maintain the player's interest. In our "Live Well, Live Healthy!" game, we have built a mechanism to display a question every time the number of a ball drawn at random is on a card of one or more players. If the player answers the question correctly, a token appears in the box and the player earns points (20 points for an easy question, 30 points for a medium question and 50 points for a difficult question). If the player does not correctly answer the question, the token will not appear in the box and the player loses half of the points allocated to the question. We prepared 40 questions instead of 75 (the number of balls) to ensure that these questions come at least twice during a game whose aim is to complete a full card.

Feedback. The game must provide feedback to support the learning of the defined content Immediate feedback, related to each learning task, allows the player to identify successful activities and those they have failed. In our "Live Well, Live Healthy!" game, we have integrated visual feedback in the question card window; it uses a

Fig. 2. Point system

smiley or sad face to communicate the results of game (Fig. 3A) and textual and audible feedback to explain the correct answer (Fig3. B-C). A tutorial is also included to guide the seniors as the game progresses. Players can open or close the tutorial at any time with a single click. At the end of a game, each player's total points is listed, where achievement is highlighted with the sound of applause and players are ranked according to their ability to correctly answer questions and carry out learning activities. The game must allow players to see what they have learned by providing an overview of the results of the game's learning activities. When the game is over, each senior can see their learning process in a personalized environment.

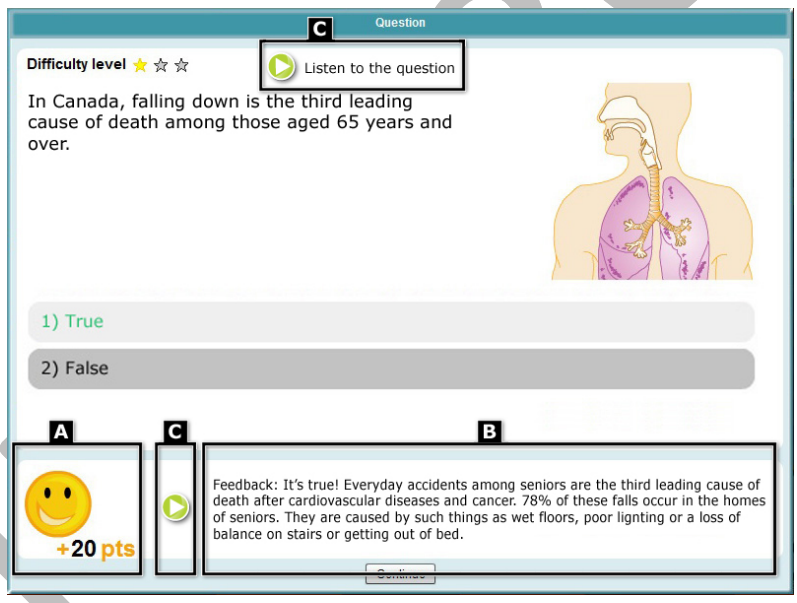

Fig. 3. Question Cards

3.2. The game's user-friendliness

Studies have found that seniors' problems with technology use are most frequently associated with user-friendliness and could be solved by an appropriate design of the screen display and game navigation (Pearrow, 2007; Hwang, Hong Hao & Jong, 2011; Marin, Lawrence, Navarro & Sax, 2011; Sauvé, 2010b; Whitlock, McLaughlin & Allaire, 2011).

The display screen of the game and the learning activities. The board, tokens, navigation buttons, instructions, score and rules must be displayed and accessible to ensure that the game runs smoothly. In our "Live Well, Live Healthy!" game, we restricted the display size of the game board to the smallest resolution used by our target audience: 1024X768. For screens with larger dimensions, we inserted a back-

ground of the same color as the background of the board and programmed the display so that the board is positioned in the center of the screen. This window is always visible regardless of other superimposed windows that appear. A second window may appear superimposed onto the game board. It contains questions, answers, feedback, the tutorial or the rules of the game. The size of this window is variable but always smaller than the board.

Navigation in the game. The game should provide easy navigation and must meet certain conditions. In our "Live Well, Live Healthy!" game, we divided the game interface into three zones: a) the Bingo card, rules, and tutorial; b) information on the game's progress: the type of game, randomly drawn ball, and the Bingo button for ending the game; and c) information related to the actions of players: players' names and their scores as well as the control of the microphone and chat. At all times, the board, tokens, navigation buttons, instructions, score and rules must be displayed and accessible to ensure that the game runs smoothly. All player actions are done using single clicks. We opted for buttons with words rather than symbols for ease of use by seniors who were not born in the digital age. Finally, we limited the number of superimposed windows to a maximum of two. When a second window appears in the center of the screen, the game board will be grayed out and become inactive.

3.3. Educational readability for multimedia

By readability, we mean the way in which a text, an illustration or a video is visually presented (formatting) in order to make reading and understanding easier for users. A readable interface is an indispensable component of any digital product (Ergolab, 2003), particularly one intended for seniors. Educational games must meet certain formatting criteria for text, videos and illustrations (Kellner, 2008; Millerand & Martial, 2001; Nogier, 2005; Marin et al, 2011; Melonio, Tarantino & Mascio; 2012; Thoa, 2004).

Text. The layout of the text on the screen must facilitate reading and viewing. In our "Live Well, Live Healthy!" game, the text is left-justified and the only font used is Arial (12 pts for regular text and 14 pts for headings). This font is the most commonly used on the web, as it provides users with the best readability. Upper case is only used for headings on the site to facilitate navigation. The vocabulary used in our rules, instructions, questions and feedback were adapted to our target audience. Experts and our target group validated our adaptation via game trials.

Illustrations. The use of illustrations must be relevant to the content of the game. In our "Live Well, Live Healthy!" game, we included mechanisms to facilitate the viewing of images. Players may enlarge illustrations to full screen with a simple click of the mouse. We also tested the length of display time for illustrations using various types of connections: low, medium and high speed. Computer display time in all cases was immediate. Finally, we assessed the usefulness of each image illustrating game questions by the inter-rater method.

Sound. Use of spoken texts can motivate seniors. In our "Live Well, Live Healthy!" game, we integrated a virtual voice so players may listen to the questions, rules and instructions, instead of reading them, therefore facilitating game play for seniors who suffer from visual impairments. Sound control is always available and associated with a button to activate or mute the sound, thus giving players full control over sound features.

4. Methodology

In order to validate the "Live Well, Live Healthy!" game, we used the *Learner Verification and Revision* (L.V.R.) method. This method focuses on the user, is characterized by flexibility and is well adapted to the context in which the product will be used (Nguyen et al, 2008). It allowed us to identify and correct errors and problems (Thulal, 2003; Maddrell, 2008) and to effectively validate a prototype in the course of development with a sample of the target users for whom it was created. This method, also known as a user trial, has also been used in educational games development research (Sauvé, 2010c). The process involves validating the prototype through a sample of the target audience in order to measure its effectiveness.

IETC 2014

For validation of the game's ergonomics, we chose a sample of 27 seniors aged 55 and over and who are retired.

In addition to the demographic data, knowledge of the Internet and online gaming, and the type of computer equipment - 8 statements on the ergonomics of the online educational game were evaluated using a short online Likert scale questionnaire. Efficiency of design - 16 statements - covers competition, challenge, learning content and feedback. User-friendliness - 17 statements - refers to the instructions and rules linked to navigation within the communication tools and the ease of carrying out the action as well as the display size and the layout of the web game. Educational readability - 8 statements - focuses on the vocabulary used and the visual treatment of the text, photos and videos. Each ergonomic aspect also included one open-ended question. An observation grid filled out by an auxiliary researcher completes the qualitative data.

Participants in the validation process were informed of the research and signed a consent form. All measurement scales were found to possess satisfactory psychometric characteristics. Overall, the analysis shows that the scales used were adequate because for the vast majority they explain beyond 50% of the variance of the measured variables and their accurateness indices are beyond 0.60, which is sufficient for an exploratory study.

5. Main results

Respondents. There were 27 seniors who participated in the experiment of which 56% were women and 44% were men. Those aged 55-59, or 33%, formed the largest group of respondents, followed by those aged 60-64, or 26%, then those aged 65-69, or 22% and finally those aged 70-74, or 19%. All participants are independent and live at home or in an apartment. They evaluate their computer skills as intermediate (59.3%), beginner (29.6%) and expert (11.1%). The vast majority (92.6%) have played Bingo. More than two-thirds of them use tablets (iPad or Android) and less than half (40.7%) use a smartphone. Finally, less than half (44.4%) play games on the internet.

Design. Respondents identified that playing against other people (4.5 / 5), having the choice of duration (4.0 / 5) and how the game ends (3.9 / 5), obtaining points or not as they answer correctly or not (4.3 / 5) helps maintain competition (4.28 / 5) among the players. Integrating Bonus balls (4.27 / 5) and the choice of the level of difficulty of the questions (4.0 / 5) maintains a sense of challenge (4.13 / 5) throughout the game. As for the learning content (4.05 / 5), respondents indicate that the game takes into account their prior knowledge (4.35 / 5) to help them earn points and that the questions were not too difficult (4.0 / 5), most have opted for the Easy level, and that the repetition of the questions (3.92 / 5) in the game more or less helped them to earn points. Regarding the feedback mechanisms (4.32 / 5), they consider that the feedback for their incorrect answers to questions helped them to correct themselves (4.35 / 5), the smiley or sad faces quickly informed them about their performance regarding the question (4.38 / 5), the tutorial informed them on actions to be performed during the game (4.26 / 5) and that having access to a summary of their right or wrong answers helped them to measure what they have learned and allowed them to review any incorrect answers to the questions (4.29 / 5).

User-friendliness. In terms of the display (4.37 / 5), respondents indicate that animations add interest to the game (4.2 / 5), that the game board (4.4 / 5) and the questions (4.4 / 5) are displayed within the screen, the Rules (4.3 / 5) and Tutorial (4.3 / 5) buttons are visible on the game interface and easily accessible, the positioning of the tutorial in the center of the game allows them to read the instructions properly (4.3 / 5), the score of the players is well located (4.6 / 5) to track the progress of the players, the Bingo button is well located in the game (4.7 / 5) and finally, that the button for the microphone is more or less visible (3.9 / 5). Regarding navigation (4.1 / 5), the game requires little computer knowledge from the seniors (4.1 / 5), the tutorial (4.1 / 5) and rules (4.0 / 5) helps them to understand how the game works and the rules (4.0 / 5) are available at all times with a single click. With respect to the controller used to play the game (4.1 / 5), the keyboard (4.1 / 5) and mouse (4.4 / 5) are easy to use during the game while the touch screen (3.9 / 5) is a little less easy.

IECT 2014

***Educational readability*.** The text (3.97 / 5), the size (4.1 / 5) and the color (4.1 / 5) of the characters of the words found on the card and the tutorial allows for easy reading; however, the font size of the questions (3.7 / 5) seem less easy to read. The respondents felt that the language is appropriate (4.1 / 5). Regarding the sound (4.0 / 5), the respondents noted that it is audible whether for the rules or the questions and that the sound control button is easy to use. Finally, the images are large enough to be well seen on the screen and the time for them being displayed is instantaneous on all computers (4.3 / 5).

Table 1. Results of validation

Categories	Conditions	Results
Design	Challenge	4.13
	Competition	4.28
	Game content	4.05
	Feedback	4.32
Readability	Text	3.97
	Illustrations	4.27
	Sound	4.00
User-friendliness	Display	4.37
	Navigation	4.09
	Controller	4.14

6. Recommendations for revising the game

Various recommendations were drawn from the observations and qualitative data of the questionnaire to improve the game.

Challenge. Respondents suggest adding a second Bingo card to increase their chances to win, to set a response time to reduce the wait between the drawing of two balls when the player does not have the number on his card, to display a message when a player has correctly answered all questions from a difficulty level to encourage the player to move to a higher level, to readjust the message that says that players must click on the Bonus number on their card corresponding to the Bonus ball in order to avoid making the other players wait and thus crippling the game until the player executes the action.

Competition. Respondents have a diverging view on the time allotted for answering the questions: according to the rhythm of the players or a timed response. Some players take a long time to respond, which may slow the pace of the game and reduce the motivation of the waiting players. Several players suggested reducing the minimum number of players to two instead of three, which would allow them to play as a couple or with one of their grandchildren.

Learning content. Respondents have conflicting opinions concerning the repetition of questions during the game; for some it is viewed as a good way to winning more points and for others, it reduces competition.

Feedback. Respondents recommend displaying a message inviting them to view their results (good and bad responses) when the game is over; this consultation would help them perform better during future games.

IETC 2014

Display. Players suggest increasing the size of the Rules and Tutorial buttons to make them more visible to some respondents. They suggest adding a message to the tutorial explaining their location and operation. They suggest moving the display of the Bonus ball from the center to the right of the interface to allow players to view the entire Bingo card as well as being able to click in the O column. They find that it would be important to know the name of the player who created the gaming session, especially when there are multiple games being played at the same time because they do not know which game to join.

Navigation. Respondents propose including in the first message of the tutorial explaining the choice of the level of difficulty and how the game ends that you need to click the Continue button to activate the game. This action is not intuitive for some players. They recommend eliminating the message, "This number is not on your card" when the player does not have the number on the card, and consider it an unnecessary message. They suggest adding a message to the tutorial explaining how the Bonus ball works. Players understand they cannot answer a question or gain points if the number on the ball is a Bonus ball they have previously won on their card. Finally, they suggest adding an explanation for the Microphone button as soon as the game starts.

Text. Respondents recommend increasing the font size of the words in the questions by at least 2 pts or include a button allowing them to magnify the question screen.

Illustrations. Respondents suggest increasing the color contrast of the buttons (Join, Start Game) in order for them to be easily seen and read on the screen.

Sound. Players suggest slightly accelerating the speed of the virtual voice to improve listening.

The recommendations of the respondents were taken into account and have been included in the pedagogical and IT revisions of the game.

Conclusion

As part of this developmental research, the "Live Well, Live Healthy!" game for seniors is being prepared with the help of the generic shell of the educational game of Bingo, which has been developed by taking into account the ergonomic conditions that we identified from the literature; for references and more detail, see http://cvje2concepteur.savie.ca. This game was validated with 27 seniors using the LVR method. While recognizing the limitations of the testing: the seniors were recruited through the suggestions of names from the students and members of the team (family and friends) and through word of mouth of these people among their friends, the positive results of validation will allow us to review the games and to experiment on them in the autumn of 2014 with seniors (n=150) in both French and English.

When ergonomic conditions are included during the design stage, online educational games become easier to use and thus costs to correct problems can be avoided. In other words, good ergonomics will increase the degree to which a specific group of users are able to play a game and effectively accomplish tasks; therefore, ensuring that good results are obtained to the satisfaction of users in a specific usage context. Display selection, fonts, screen element organization, navigational elements, visual, audio and text formatting on the game interface, as well as rules and tutorials all play an important role in ensuring that the educational game is adapted to the specific needs of seniors, and ensure that the game environment is user-friendly, useful, simple and motivating.

E-Learning Policy and SMART Education in South Korea

Jinil Yoo144

Department of Hungarian, Hankuk University of Foreign Studies, Yongin-si 449-791, Republic of Korea

Abstract

"The informatization of education" means a total change in content, method, target etc. of education in the society of informatization. The goal of education informatization is to build a so-called new Eutopia which is characterized by open education and lifelong learning, namely which makes it possible for anyone to receive his/her wanted education anytime and anywhere on the basis of information & communication technology.

In 1996, the Republic of Korea established a five-year comprehensive education informatization plan, which is in its fourth stage as of 2014. The plan of education informatization consists of four stages: 1st stage (1996-2000), 2nd stage (2001-2005), 3rd stage (2006-2010), and 4th stage (2010-2014). Established separately from the stage-specific plan in 2011, the smart education strategy is aimed to expand and develop a project of "ICT-based creative talent cultivation" in the four-stage education informatization plan and to change a social paradigm in order of informatization → ubiquitous → smart. The essence of the smart education strategy lies in creating a 3D educational environment based on the development and distribution of digital textbooks. To this end, a cloud-based education information service system is being built as an infrastructure for education information service. Therefore, this presentation will look into South Korea's advanced e-learning and smart education policies that are pursued on the basis of the development of IT.

7. Introduction

"The informatization of education" means a total change in the content, method, target etc. of education in the society of informatization. The goal of education informatization is to build a so-called new Edutopia which is characterized by open education and lifelong learning, namely which makes it possible for anyone to receive his/her wanted education anytime and anywhere on the basis of information & communication technology (ICT). In South Korea, education informatization began with "the computer education plan" established in July 1970. The computer education was extended from commercial high schools into technical and general education high schools and even into elementary schools in accordance with the fifth education curriculum in 1987 and underwent an epoch-making transition through "the reinforcement plan for school computer education" in December 1987. The plan was to present basic directions on education informatization not only by consolidating computer education, but also by distributing education computers, expanding computer application and computerizing school office work. Thereafter, five computer networks were built for government institutions (administration, education & research, finance, defense and public security), education computers were distributed to schools according to "the school computer education support plan," and computer education was spurred according to a comprehensive plan for developing and distributing the Computer-aided Instruction (CAI). At the same time, pan-governmental informatization began to be propelled, as the Basic Act on informatization Promotion was enacted to cope with worldwide computer distribution. Accordingly, every government agency had to work out a basic plan on informatization promotion and implement it every year. From 1996 on, a five-year comprehensive

E-mail address: yoojinil@hufs.ac.kr

IETC 2014

education informatization plan was set up every five years and is in its fourth stage as of 2014. This presentation will look into the education informatization plan and SMART education which is implemented as part of e-learning policy in the Republic of Korea. In establishing their policies, other countries will get much help from South Korea which is advanced in e-learning policy and education based on advanced IT.

8. Education Informatization Policy in South Korea

In terms of syntax, Korean students find the greatest difficulty in using the correct word orders of Hungarian. Word orders are defined grammatically in Korean, while they can vary, depending on the wishes of speakers in Hungarian. For instance, a sentence of the third form is always composed in order of subject (S) + object (O) + predicate (P) in Korean. However, things are different in Hungarian: if no specific vocabulary is emphasized, a sentence is composed in order of S + P + O, but for example if O is emphasized, it is composed in order of S + O + P. In Hungarian, a sentence generally employs an order of S + P + O + other components, but if a specific vocabulary is emphasized, it is placed before a verb. Like this, Hungarian word orders are very variable. Therefore, it causes difficulties to Korean students accustomed to fixed word orders. In South Korea, an education informatization policy has been implemented in four stages every five years since 1996. The policy is in the forth stage as of 2014. The following is a stage-specific education informatization plan:

The material infrastructure for education informatization was built with the distribution of education computers, teaching advanced materials, school and campus computer networks etc. in the plan's first stage from 1996 through 2000. An education information service like Edunet was opened and education programs were developed and distributed. The groundwork for education informatization was laid with a systematic pursuit of teachers' informatization to help them use education information services. Not only was office work computerized at government agencies, but the computerization of teachers' tasks was made possible with the development and distribution of a comprehensive information management system for elementary and middle schools. The system laid the groundwork for the current education and administration system "NICE." From 2001 through 2005, the second-stage education informatization project greatly contributed toward enhancing the levels of the material groundwork built in the first stage and eventually the quality levels of public education using ICT. ICT was elevated to a key means and goal of nationwide human resource development, as the Ministry of Education was reorganized into the Ministry of Education and Human Resources and was raised to the ministry of Deputy Prime Minister. Besides, education informatization was extended into higher education, lifelong education, infant education, special education, genius education etc. In the third stage, from 2006 through 2010, e-learning was changed into u-learning, as the internet environment was transformed from cable to wireless. In scope and content, the project was expanded in a direction that takes the initiative in education innovation. Especially as the results of the second stage education informatization was made known all over the world, developing countries scrambled to import South Korea's education informatization models, thus promoting the export of international consulting and e-learning. In the forth stage, from 2010 through 2014, a policy was pursued to build a learner-focused digital society and leap into the seventh biggest science and technology power, as the informatization was unified in education and science and technology sectors with the integration of the Ministry of Education and the Ministry of Science and Technology. This period is characterized by the education informatization that is aimed at sharing, openness, participation and cooperation and focuses on the cultivation of creative talents.

Established separately from the stage-specific plan in 2011, the SMART education strategy is aimed to expand and develop a project of "ICT-based creative talent cultivation" in the four-stage education informatization plan and to change a social paradigm in order of informatization → ubiquitous → SMART. The essence of SMART education strategy lies in creating a 3D education on environment based on the development and distribution of digital textbooks. To this end, a cloud-based education information service system is being built as an infrastructure for education information service. The education informatization project is characterized by requiring the balanced development between ICT and material (hardware and software), human and information resources and the establishment of the infrastructure, such as relevant laws and organizations.

9. Revitalization of SMART Education in South Korea

It is well known that social each filed is drastically changing with the innovation of ICT. Individuals or organizations are required to change for survival and development in the transition into the knowledge & information based society represented by globalization, networking, digitalization and smartization. Now is the time when human resource development is emphasized to cope with such change. In such trend, e-learning and SMART learning are new concepts that are recently spoken of in the filed of education. It also demonstrates social interest that the new concepts are often referred to. These days, the Ministry of Education is pursuing new directions

IECT2014

and policies related to e-learning-SMART learning. This encourages schools to expand a new form of education like web-based online education (cyber education). Such e-learning-SMART learning education, which emerges as "a new type of education in the ubiquitous age," is joined by offline universities as well as cyber universities. Universities are more and more interested in e-learning and SMART learning, as the government's relevant policies come to the surface one after another. Since 2000, the government has pushed ahead with ICT-based education, e-learning, u-learning, SMART education etc. by its education informatization project. These days, the government puts stress on the roles and capabilities of teachers especially to promote the interactions with students.

ICT education is to build an infrastructure for ICT-based education by installing PCs in classrooms and combining them with super high-speed communication networks and to establish operation directions for education. E-learning is to make individual learning possible anytime and anywhere by developing contents and building a cyber home learning system, a central teaching & learning center, an EBS system for the college scholastic ability test, a cyber education system for broadcasting high schools, etc. Ubiquitous-learning is to make it possible to get access to internet and search necessary data by building wireless communication networks, developing digital textbooks and distributing tablet PCs and IPTVs. SMART education is to perform five key tasks, i.e. introduction of online class, introduction of online evaluation, application of digital textbooks, reinforcement of teachers' capabilities and construction of cloud-based education environment.

10. Concept of SMART Education in South Korea

SMART education is a 21st century education paradigm to develop every student into a global leader by innovating the content, method, evaluation, environment, system etc. of education using ICT and ICT-based network resources. “SMART” is a combination of five concepts: Self-directed, Motivated, Adaptive, Resource Enriched and Technology Embedded. "Self-directed" is aimed to change a student and a teacher into a producer of knowledge and a mentor and to make a student study independently by diagnosing and evaluating achievement online. "Motivated" is aimed to emphasize teaching and learning methods to reorganize knowledge based on experience, solve problems creatively and make an individual evaluation based on process. This concept is focused on experience and problem solution. "Adaptive" is aimed to strengthen the flexibility of education system, realize a customized learning to connect personal preferences with future occupations, and evolve a school into a place to provide students with individual learning according to their levels and aptitudes. "Resource Enriched" is aimed to use the contents public institutions and individuals have developed on the basis of cloud education service and expand the joint use and cooperative learning using collective intellect, social learning etc. This concept is focused on open market and social networking. "Technology Embedded" is aimed to realize an education environment where students can learn anywhere and anytime through IT and are assured of maximum learning options using various teaching methods. This concept is focused on opening.

11. Conclusion

Though its stages are different from each other in objective, direction and content, the education informatization policy is ultimately aimed at improving the quality levels of public education. South Korea has now reached a world's top-level education informatization environment by establishing a comprehensive plan to seek a balanced development of three major resources and build a corresponding infrastructure and inputting resources continuously. Such education informatization policy will increase in importance with the development of ICT in the future as well. After all, it will be a solid driving force to foster creative talents and build an environment where they exercise their capabilities to the utmost.

On the problem of categorizing students based on their cognitive styles and teaching strategies

Michaela Kykalová[a], Elena Anatolievna Vasilyeva[b145]

[a,b]*University of Hradec Králové, Rokitanského 62, Hradec Králové 3, 500 03, Czech Republic*

Abstract

The research determines different types of students according to their dominant cognitive learning styles. We are focused on the students of Russian language at high school, acquiring statistical representation of various typological groups we cluster the students into to verify whether the development of metacognitive skills does improve the efficiency of learning foreign languages.

The research includes a survey based on the works by Howard Gardner and others. We categorize students according to their dominant cognitive learning styles and corresponding teaching strategies. Two hundred respondents were included in the survey. The paper also provides a historical background of the subject.

IETC 2014

12. Introduction

Compulsory teaching of a second foreign language no later than from the 8th grade of school was introduced in the academic year 2013/2014. This step is a reflection of the EU policy of multilingualism and multiculturalism. In connection with this, an increase has been recorded in the number of schools that offer Russian as well as an increase in the number of students who choose this language apart from English language. In the center of our interest lies the classification of types of students who chose Russian as the second foreign language. If we take into account the fact that one of the basic approaches of modern pedagogy is paedocentrism, we can see possibilities of improving the efficiency of teaching the first foreign language as well as the second foreign language in the classification of students according to the type of learning (type of intellect) and subsequent individualization of teaching with regard to each of the types. In conducting our research, we depart from H. Gardner's theory.

2. Preceding Methodology

[145]Corresponding author: Elena AnatolievnaVasilyeva. Tel.: +420 722 745 561; fax: +420 495 513 890

E-mail address: elena.vasilyeva@uhk.cz

In the 1970s in the USA, psychiatrists John Grinder and Richard Bandler dealt with the issue of neuro-linguistic programming. The scholars examined the behavior of very successful people and attempted to define basic elements in their communication and behavior that positively affect their success. This is the basis of the theory of multiple intelligences, a method which gives rise to numerous debates among scholars but which has found application in the curricula of many American educational institutions. This theory is based on the philosophy of language teaching according to which the intellect of man is composed of many different equivalent intellects, which we must first uncover, and only then it is possible to develop them in the process of teaching. This theory was developed by the American scholar Howard Gardner as a counterpoint to the classic IQ test, based on the idea of a compact innate and unchangeable human intellect. In Gardner's view, IQ tests only measure the linguistic and logical skills of a person, but teaching practice shows that people gain knowledge in different ways. The scholar further contends that language is not connected only with the linguistic abilities of an individual, but with all parts of human intellect. Besides, this theory also had its predecessors. As early as in 1904, the French scholar and psychologist Alfred Binet dealt, in a sense, with a variety of intelligence when he and Theodor Simon created, on the basis of their long-term examination of children in their natural environment, a so-called Binet–Simon scale, which was a scale of various skills, broken down by age of children, which was, according to the authors, typical for the mastery of these skills. This finding was the core of Binet's claim that it is not possible to generalize intelligence, that it is diverse; he also examined the approach of mentally disabled children to the mastery of these skills (Lojová & Vlčková, 2011; Gardner, 1993; Binet, 1907).

A pioneer in the field of examination of children in terms of their preferred intelligence was, without a doubt, Maria Montessori. In her profession as director of the school Casa dei Bambini (C*hildren's House*), she was fully aware of the peculiarities and differences of individual children, and therefore also promoted individual work with each child or their division into smaller groups according to the predominant style of learning.

In the 1970s, phenomenological psychology appeared, examining subjective human experience, on the basis of which the Swedish scholar and psychologist FerenceMarton, together with his British colleague Noel Entwistl, later introduced a qualitative research method, phenomenography (Lojová & Vlčková, 2011; Mareš, 1998).

In 1984, American theorist David Kolb focused on the natural preference of learning styles and, based on his so-called experiential learning psychology, defined four types of students: 1. diverging (sensitive students, able to look at a problem from different angles, they like observing), 2. assimilating (students requiring a clear logical explanation), 3. converging (students preferring practical experience over theory, they like solving problems), and 4. accommodating (students who like experimenting, during which they involve their excellent intuition and instincts) (Osland & Kolb & Rubin, 2006).

3. Theory of Multiple Intelligences

The theory of multiple intelligences was comprehensively described for the first time in Gardner's 1983 publication *"Frames of Mind: The Theory of Multiple Intelligences"*. Gardner sees intelligence as the ability to solve problems and to participate in the results that are important for a particular cultu-

IETC 2014

re or community. In his book, the author formulates a number of criteria that define intelligence as a prerequisite of the ability to solve problems or difficulties fitted into cultural context and create one's judgment. The author defines the following eight types of intellect:

- Verbal or linguistic intelligence (*so-called "wordsmart" or "booksmart"*)
- Logical-mathematical intelligence (*so-called "numbersmart" or "reasoningsmart"*)
- Visual-spatial intelligence (*so-called "picturesmart" or "art smart"*)
- Bodily-kinesthetic intelligence (*so-called "body smart" or "movementsmart"*)
- Musical or aural intelligence (*so-called "music smart" or "soundsmart"*)
- Interpersonal intelligence (*so-called "peoplesmart" or "groupsmart"*)
- Intra-personal intelligence (*so-called "selfsmart" or "introspectionsmart"*)
- Natural or naturalist intelligence (*so-called "naturesmart" or "environmentsmart"*)

The first two types of intelligence (verbal and logical-mathematical) are most apparent mainly in the process of education in schools, the other three (visual-spatial, bodily-kinesthetic and musical) are associated with artistic movements, and the remaining three types (interpersonal, intra-personal and natural) were described by Gardner as "personal intelligence" (Gardner, 1993). However, all types are interconnected, complementary, and rarely work alone. The basis of the theory of multiple intelligence is the fact that every individual has a unique set of intelligences that interconnect and cooperate in solving problems, which is the essence of the uniqueness of each individual (Lojová & Vlčková, 2011).

Academic psychologists viewed Gardner's theory of multiple intelligence with skepticism. By contrast, it was accepted by teachers very positively. Teachers and theorists of education did not hesitate to apply this theory in practice. One of the reasons of the positive acceptance of the theory in the school environment is the fact that it provides a conceptual framework for the organization of the educational process, for the building of a new approach to the arrangement of the lessons and the classrooms themselves, and it is focused on the specific needs of different types of students (Kornhaber &Fierros &Veenema, 2004).

Mindy Kornhaber, together with her colleagues from Harvard University, in the framework of the group's project "Project Zero", which has been carrying out its research since 1967, tested 41 educational institutions in the USA that use the theory of multiple intelligences in practice by using globally standardized entrance tests for U.S. universities – SAT (Scholastic Assessment Test). The research showed that the progress of students of these schools in three years of study was really substantial; one of the findings also was a decrease in the number of missed classes and an increase in the participation in leisure activities organized by the educational establishments (Gardner, 1993; Kornhaber &Fierros &Veenema, 2004).

4. Research and results

To conduct our psycho-didactic research, the method selected was a questionnaire drawn up on the basis of the literature studied and focused on five types of students according to their predominant intelligence. All items of the questionnaire were created in accordance with the characteristics of the individual, most commonly occurring, learning styles, with the manner of receiving information by students, their typical needs, behaviors, and prevailing intelligence.

IETC 2014

In addition to H. Gardner's theory, in compiling the questionnaire, another theory taken into account was that of the prominent Czech scholar M. Sovák, who, in his publication "*Learning need not be torture*" (*Učení nemusí být mučení*), defined four basic types of students according to their most frequent needs in the learning process. These are: 1. aural-speech, 2. visual, 3. tactile and motional, and 4. verbally-conceptual (Sovák, 1990).

Furthermore, S.F.Reif's theory, working with seven types of intelligence, sometimes called learning styles, was taken into account. The author bases her classification of students on the type of intelligence the individual uses the most. The types of intelligence are: 1. verbal, 2. logical-mathematical, 3. spatial, 4. musical, 5. bodily-kinesthetical, 6. interpersonal and 7. intra-personal (Reifová, 2007).

On the basis of the above theories, all respondents were, after the evaluation of the questionnaires, divided into five categories, which are further explored and analyzed in this paper. The types of students are: 1. aural-speech, 2. visual, 3. bodily-kinesthetic, 4. logical-mathematical, 5. verbal. The reason of the choice of these five categories was the mutual similarity and permeability of individual theories and types of classification of students according to the senses which the individual uses most frequently as well as according to the intelligence which is developed to the greatest extent in them. (See Gardner's and Rief's bodily-kinesthetic type and Sovák's tactile and motional one, logical-mathematical type by both Gardner and Rief and the verbally conceptual type by Sovák, musical and aural-speech one; and last but not least Sovák's visual type of a student, which corresponds with Rief's spatial intelligence and visually-spatial intelligence by Gardner, when a student has a high perception of drawings and sketches).

It can be easily proved using the above classification that every student has different ways of learning, different interests and motivation, and therefore different teaching activities are suitable for them. The teacher's task is thus to actively engage students in learning activities and stimulate the development of different types of intelligence and the various senses of the students.

A total of 200 students of the Russian language of different age groups from schools in the Hradec Králové region, the Pardubice region, and the Vysočina region were tested. The selection of educational institutions was significantly restricted by teaching of Russian, which unfortunately is not yet in place in all types of schools. Research was conducted in five secondary schools, and, for comparison a small sample of students of the University of Hradec Králové participated in the test too (these were students of the follow-up Master's program Teaching of Russian in lower and upper secondary school). The comparison of learning style preferences was crucial as they are changing with age because, from the perspective of ontogeny, time is an important factor influencing the development of human intelligence.
The respondents were subsequently divided into groups according to age in order to obtain an overview of their development over time (respondents aged 15 – 16 years; 17 years; 18 years; 20 – 22 years; 23 – 24 years).

In the questionnaire presented, the respondents gave their opinions on a total of 35 statements; always 7 statements were focused on each learning style of the student, his/her predominant senses and intelligence. The respondents were asked to assign a point value to each statement according to the following scale (0 = I don't agree with this statement at all, 1 = this statement describes me parti-

IETC 2014

ally, 2 = I completely agree with this statement). Statements representing each type were not presented in blocks but were randomly mixed. In the evaluation of the questionnaires, the total number of points for each of the five types of intelligence was added up, which was subsequently verified by the sum of the number of zeros, one's and two's. The highest number of points obtained represented the biggest agreement of students with statements representing a specific type of intelligence, and therefore the greatest preference by students of this type. Summary results were recorded in charts according to the different age groups of respondents. A total of six charts were created in this research, the last of which, the sixth, is the final overview of the complex scoring of all of the surveyed respondents.

In the paper, we will only present the results and conclusions of the research conducted.

4.1. The group of students aged 15 to 16 years

The group of students aged 15 to 16 years contains a total of 58 respondents, whose score is shown in Fig. 1. In this group of respondents, two types of students are predominant: aural-speech (22.7%) and bodily-kinesthetic (22.5%). The visual (19.3%) and verbal (18.9%) types are very balanced and the logical-mathematical type has significantly fewer points (16.6%), which is generally repeated in all the surveyed groups, which also confirms the hypothesis of M. Sovák that the group of students of the logical-mathematical type is generally the least represented one.

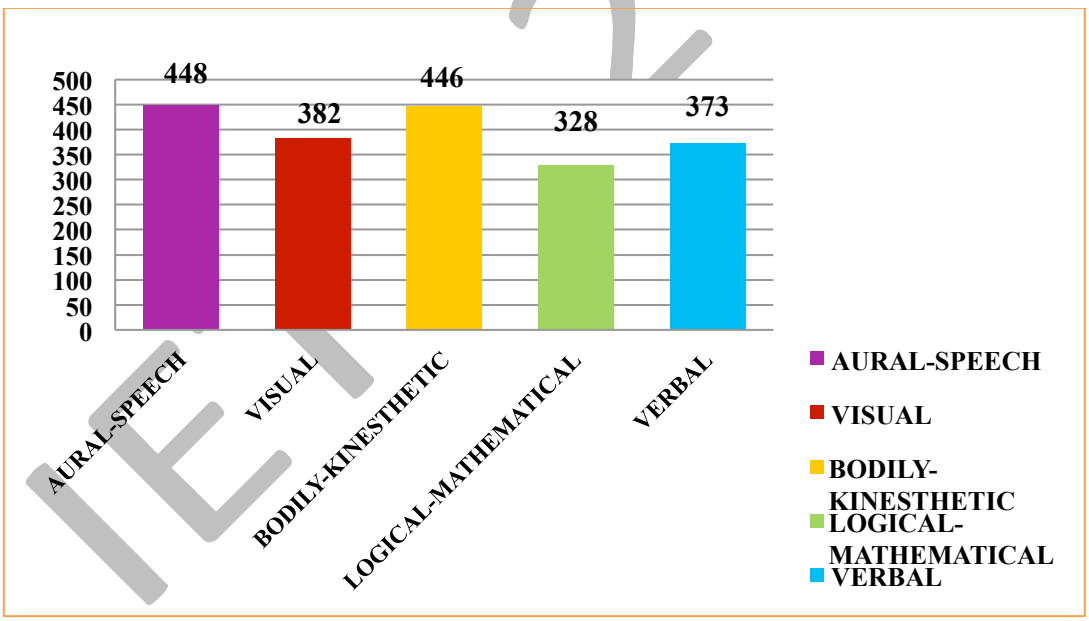

Fig. 1. Points scored – students aged 15 to 16 years.

4.2. The group of students at the age of 17 years

The group of students at the age of 17 years old had a total of 59 respondents (see Fig. 2.). Also in this sample, the aural-speech type of students is most represented (23.4%), followed by the bodily-kinesthetic type (22.7%). The third largest group of respondents in this sample are representatives of the verbal type of learning (19.7%), followed by representatives of the visual type (19.2%) and the logical-mathematical one (15%).

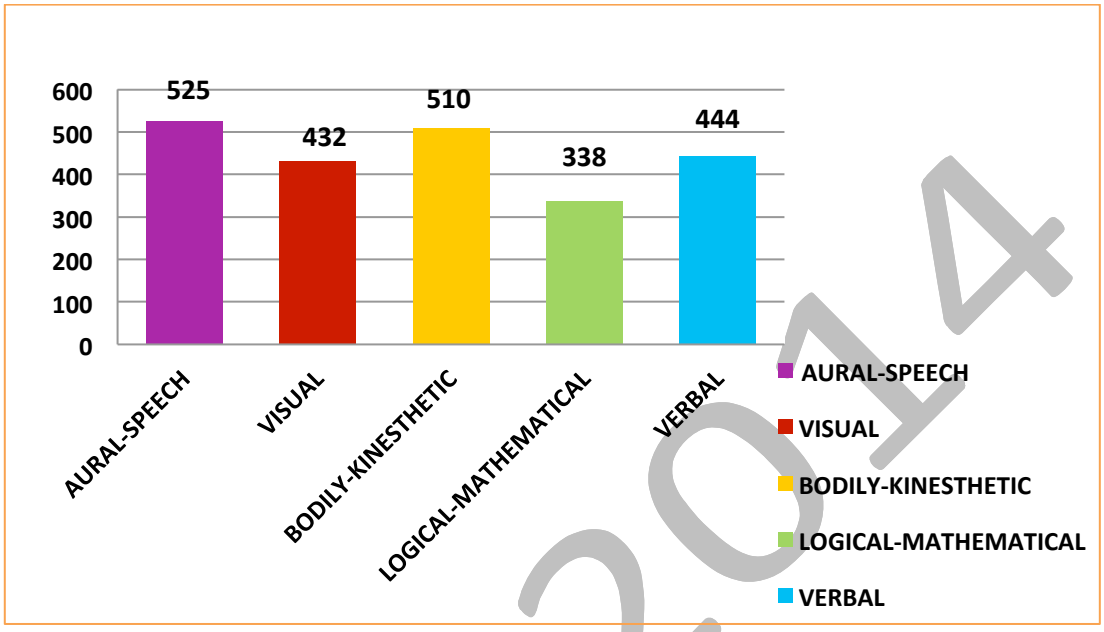

Fig. 2. Points scored – students aged 17 years.

4.3.The group of students at the age of 18 years

Fig. 3.shows the distribution of students in a 12-member group of 18-year-olds. The dominant type is the aural-speech one (24.7%), followed by the bodily-kinesthetic type (21.5%) and the visual type (20.5%). 19.1% of students belong to the verbal type, and the least frequent is the logical-mathematical type (14.2%). These results basically copy the previous ones without a significant change in the positions of the individual types.

IETC 2014

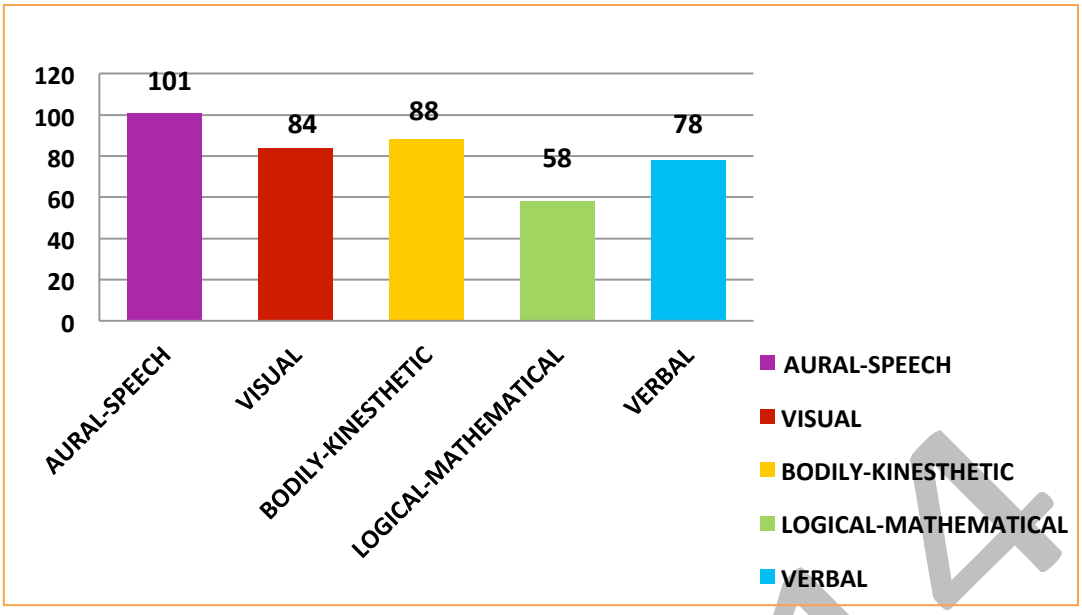

Fig. 3. Points scored – students aged 18 years.

4.4. The group of students aged 20 to 22 years

Fig. 4.shows answers of a total of 20 students aged 20 to 22 years. The sample of respondents is composed of individuals older than in the previous three groups. The fact that every year plays an important role in adolescence and forming of personality is also demonstrated by the results obtained – although the most represented type is the aural-speech one (22.9%) and the second largest group consists of representatives of the visual type (21.8%), which did not happen in any of the previous groups. The results obtained can be interpreted that at this age, students need, in addition to the teacher's verbal description also visual material. In foreign language teaching, it is therefore most suitable to include elements of audiovisual methods.

IETC 2014

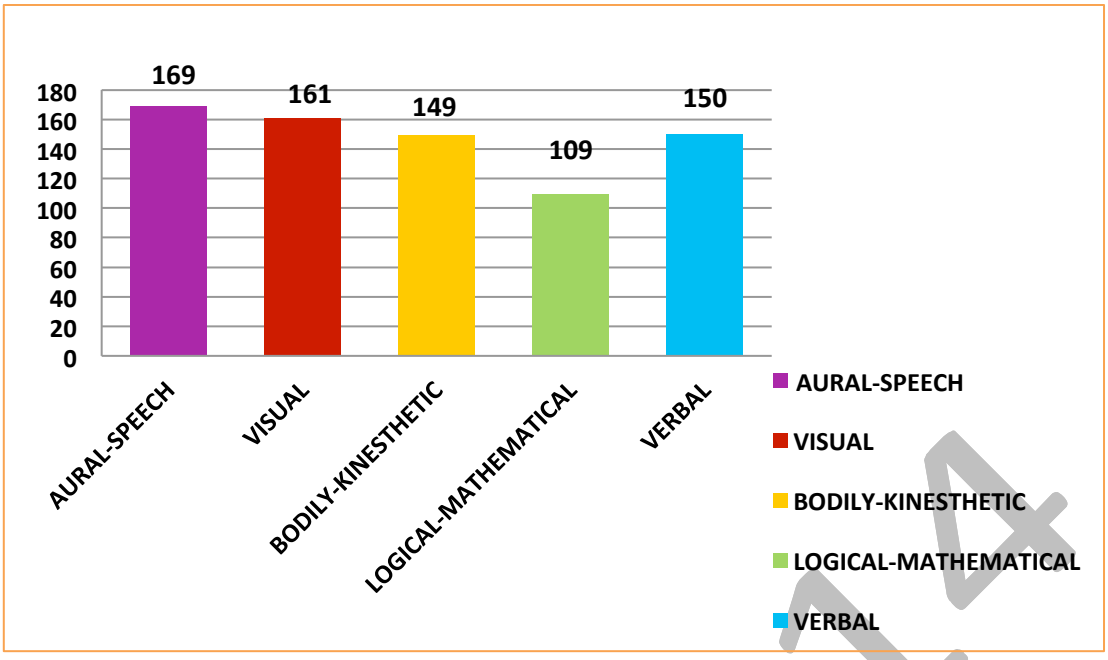

Fig. 4. Points scored – students aged 20 to 22 years.

4.5.The group of university students aged 23 to 24 years

The fifth chart presents the research results in a group of 13 respondents – university students aged 23 to 24 years (see Fig. 5.). The most numerous group in this sample are representatives of the verbal type of students (22.6%), followed by the bodily-kinesthetic type (22.4%) and the aural-speech type (20%). On the basis of the results one can conclude that the representatives of this age group are no longer dependent on the verbal description of the teacher and, on the contrary, prefer their own discussion with suggestions for solutions to problems or their own projects and their public presentation, which fully corresponds to the reality. The number of representatives of the visual type (17.4%) and the logical-mathematical type (17.6%) reflects the assumption that for older students there is usually no need for support in the form of visual images, diagrams or photos.

IETC 2014

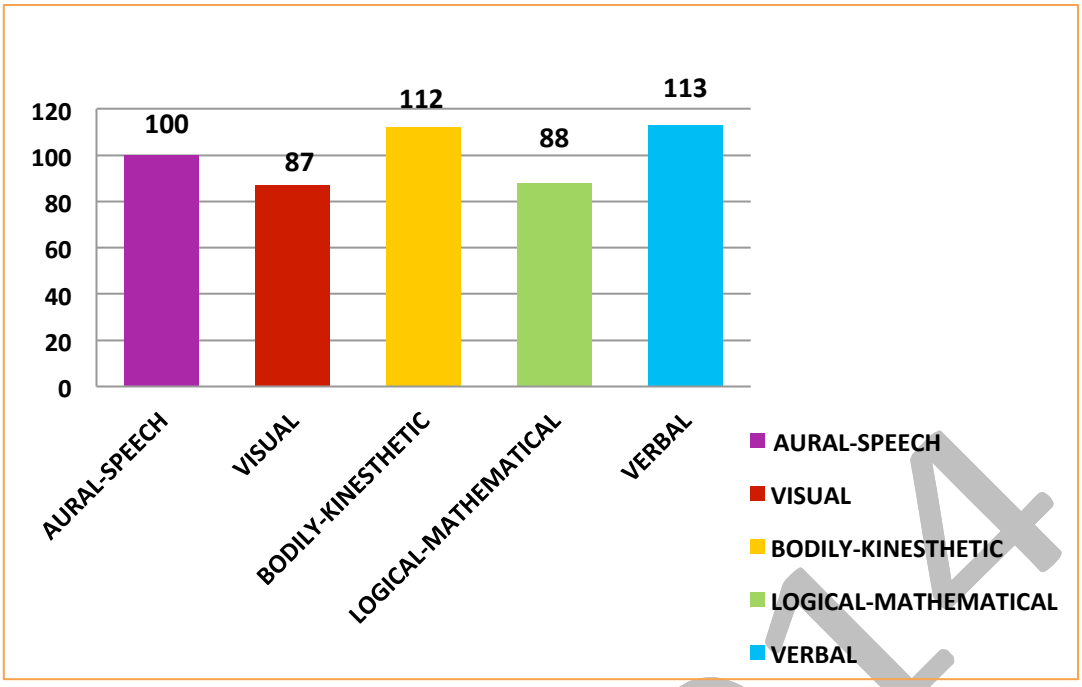

Fig. 5. Points scored – university students aged 23 to 24 years.

4.6. Summary

Last two charts present summary results of the research (see Fig. 6. and Fig. 7.). When sorting preferences of individual intelligence types in ascending order, the least frequent type of students is the logical-mathematical type (15.8%), which is confirmed by the partial results of our research as well as M. Sovák's claims.

The second least numerous group consists of representatives of the visual type (19.2%). At the beginning of the research, a hypothesis was formulated that due to the intense influence of mass media on shaping the personality of a child, the visual type of intellect will be predominant in the group of students. The results of the research did not confirm this assumption, on the contrary, it turned out that this type of students is among the least represented ones in the sample.

In third place is the verbal type of students (19.9%). All of the respondents were students of generally-oriented fields of studies or humanities disciplines; it can be noted that the result confirms the theory of H. Gardner, who claims that verbal types are mostly students of humanities, who like discussing problems.

The bodily-kinesthetic type of students (21.9%) is represented mainly by active students, who need motion and constant switching of activities in the course of one teaching unit. At the beginning of the research, we expected that the bodily-kinesthetic type of intellect would be represented in the research sample by only a small number of respondents, which would correspond to the decline in physical activity of children in contemporary society. Quite surprisingly, however, this type was in second

IETC 2014

place in the summary overview as to the number of points obtained, and it was significantly represented in all age categories.

The absolutely most widespread type of student in general seems to be the aural-speech type (23.2%). These individuals prefer aural memory; in teaching, work with recordings and other audio materials should prevail, and the teacher must be prepared for the fact that their speech will be a model for the students, who will imitate them. For this reason, it should not be deformed by accents or defects.

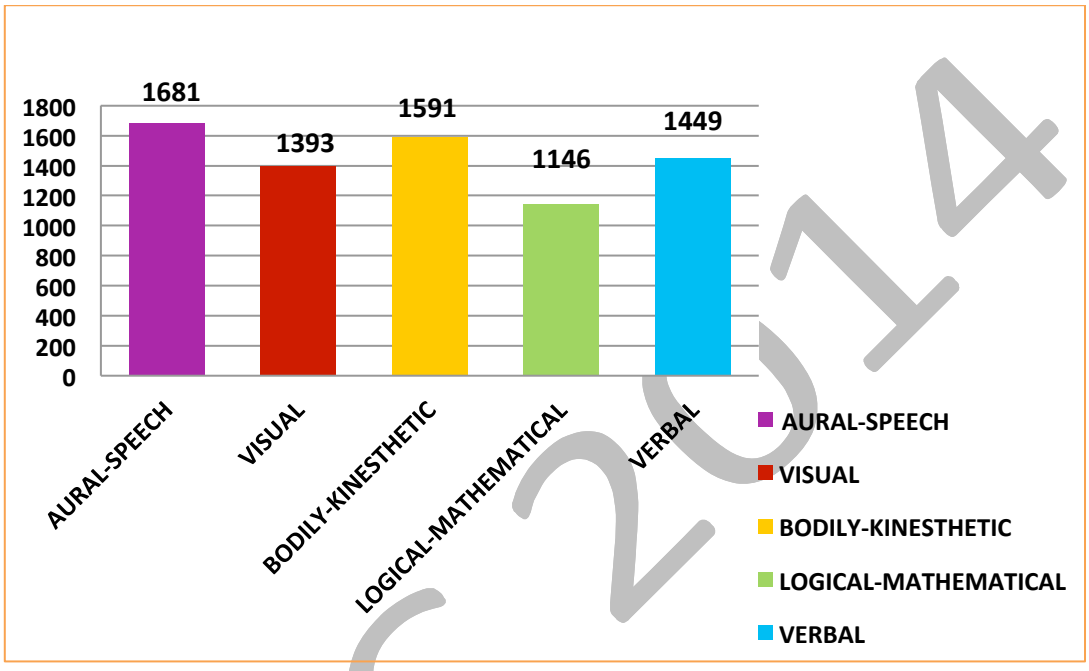

Fig. 6.Total points for different types of students.

IETC 2014

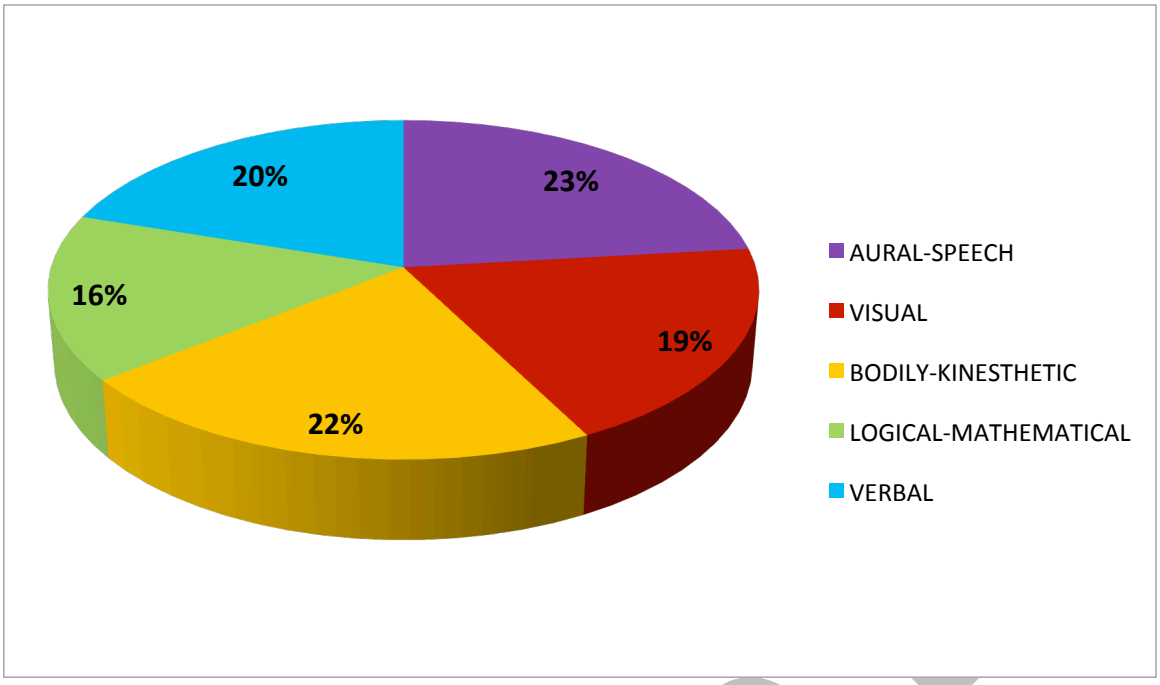

Fig. 7.Preferred intelligence type percentage of respondents.

5. Conclusion

This paper attempts to show that even though the children play videogames, watch TV and browse the internet in their free time nowadays, they still need to hear a new piece of information and to change activities during the lesson. In view of the fact that visual type of student is surprisingly not dominant as the questionnaire proved.

The charts also demonstrate that preferences of individual intelligence types change with age of students.

In conclusion, we express our agreement with the claim of J. Mareš that every child is a specific personality with individual learning styles that develop, and over time they permeate and change. It is then up to the teacher to respect students and try to understand their specificities at least to a certain extent. (Mareš, 1998).

irfan@istanbul.edu.tr

Lect. Dr. Tuncer Can
Istanbul University, Hasan Ali Yücel Faculty of Education, Department of Foreign Language, English Language Teaching
tcan@istanbul.edu.tr

The continuous development in technologies like wireless connection, voice and video recording, and the capability to use various media types that are independent of time and place has made the virtual worlds more applicable and accessible. The recent developments in computer and Internet technologies and in three-dimensional modeling necessitate the new approaches and methods in the education field and bring new opportunities to the higher education. The investment in the infrastructure of the Internet in Turkey has made the outreach to such technologies faster and easier than ever before. The use of different learning materials and applications other than classroom and course books requires the reconsideration of education concept, methods, applications, teachers' roles, interaction types and the education environment itself. One answer to these concerns could be using the three dimensional virtual learning environments in the higher education. Many higher education institutions are employing one of the most widely used virtual worlds the Second Life Platform and are conducting classes on their virtual campuses, and organize meetings, seminars and conferences. In this study, Istanbul University Virtual Campus in Second Life Platform has been designed and used for classes with pre-service teachers from English Language Teaching department and Computer and Instructional Technologies Teaching department. The experience of pre-service teachers on this platform has been recorded and they have been interviewed afterwards.

[b]*Second affiliation, Address, City and Postcode, Country*

Abstract

The purpose of this research was to carry out an empirical study upon determining teacher performance and student satisfaction in educational life. Education and teaching have an important place all around the world. Two different questionnaires including 25 questions were performed to teachers for their personal evaluation and measuring student satisfaction through their own viewpoints. The same questionnaire was designed for student satisfaction, and performance of teachers was evaluated in terms of students. The obtained data was statistically evaluated using SPSS program. Professional commitment as the first factor among the addressed questions had a structure including the aspects as commitment of a teacher to his/her profession, job enthusiasm, developing and innovating yourself, performing the assigned duties on time and correctly. In empathy and sacrifice as the second sub-title included teachers' trying to understand the requests and complaints of students better, and making efforts for leading them to the right way. In the questionnaire of determining the student satisfaction, empathy and sacrifice, and professional commitment were discussed.
Key Words: *Teacher Performance, Student Satisfaction, Leadership in Education*

1- INTRODUCTION

In recent information age, education is a system affecting from the implementation carried out in science and results of these implementation from all respects. In the adaptation of individuals to each other in this changing world and raising of them in accordance with the social goals, educational establishment has been accepted to have a significant role. Education is a process starting from the moment we were born and maintaining as life-long. Over the years, developing education through creative thinking and presenting to people without any profit motives expanding positively is a fact up to individuals' themselves. During this process, people see the people around themselves as a role model affecting primarily from their families, and then from the people around and their teachers. Teachers are no doubt the ones having the most important duty after families. Education means each teacher's being able to raise a socially beneficial product, and owning the product of his/her own. The more teachers carry on their duties affectionately, the more success will be inevitable for students and teachers. When looked from a broad perspective, the children are a product. Raising, developing, contributing upon themselves, noticing imperfections and criticizing or not are included with-

IETC 2014

in the field of a teacher. A teacher should be a leader offering an insight into students constantly. Whereas students are expected to be luckier, more satisfied and confident rather than the previous years through the rapidly changing technology, they have been noticed to have increased anxiety and worries. At this point, teachers should create an atmosphere that will keep students away from these worries. This is teaching. In order to increase the performance of a student positively, parents and teachers should encourage students for participating in extracurricular activities. Constant studying of students exhausts their brains and bodies; and no efficiency can be obtained. Therefore, physical activities such as sports will be beneficial for students' spending energy and mental fatigue. For that reason, knowing that to what extent individuals gain these behaviors become important. And this makes assessment and evaluation studies important in schools. Performance-based status determination is a type of evaluation depending upon students' presenting their knowledge and skills revealing a performance or product. Moreover, performance evaluation as an alternative to tests created using multiple-choice and short-answer items presents open-described duties providing opportunities for students to use their special knowledge and skills for factual circumstances (Kumandaş et al., 2013).

Education of pedagogues always reflects the processes in a society in terms of content and method. During the recent few years, Russian society has experienced radical changes, and made great changes in its educational system and the education of pedagogues assigned in kindergarten schools and the other schools. Content and methods of studying with children affects the curriculum and analysis of education and retraining for pedagogues. In past, the pedagogues presented the common fact to the students through reproducing. The curriculum included detailed instructions related to all sides of the study they would carry out with students pedagogues had to study with. Training and retraining of the pedagogues followed common ideological dogmas integrated in all institutions of the society. The ideology infiltrated into all educational systems. The main purpose of a kindergarten was to raise Soviet citizens having a real communist attitude against effort and obeying the rules determined by their own groups (Ryzhova,2012, 21). The basic feature of the modern period (2000-2012) is great changes' providing all processes started during the Post Perestroyka Period to be systematized and developed. Furthermore, the effect of state upon the content and organization of education has also increased. New State and Federal Regulations were published for the curriculums of pre-school educational institutions. Beside aiming to make pre-school Russian education to be more people oriented, the quality of education has also been expected to be more similar to the European standards. In regulations; development of children psychology and children personality, being away from school-type education, the partnership between kindergarten schools and kindergarten schools, and families, and initiative of children have been regarded. Pre-school education has recently been depended upon an integrative approach including different types of children activities (Ryzhova, 2012).

This empirical study was carried out in Halit Ziya Uşaklıgil Elementary School. Performances of teachers, their relationships with students, and student satisfaction were analyzed in this study. The questionnaire scale used for teachers was categorized into two titles as factor. The first of these was professional commitment, and the other was empathy and sacrifice. It was prepared using the concepts such as professional knowledge of teachers, their efforts to renovate themselves, rewarding the success of students, establishing easy communications with students, and innovating knowledge. The empathy and sacrifice under the second title included teachers' understanding the requests and complaints of students better, making efforts to lead the students correctly, and organizing the content of lessons more attract-grabbing. In the evaluation performed to determine student satisfaction, the questions related to whether they were satisfied from the performance of teacher or not. This part was categorized into three titles. Those were openness in communication, professional commitment, and

IETC 2014

finally, empathy and sacrifice.

In this study, a questionnaire including totally 25 questions were addressed to teachers, and 12 to students; and the questionnaires were collected performing face-to-face method. The questionnaire was performed to 100 teachers, and 120 students. After the evaluation of the questionnaires, the obtained data were controlled in SPSS 17.0 program in terms of their reliability and validity. It was analyzed through correlation, regression, and factor analyses; and those were presented in tables and figures.

2- LITERATURE

2.1 Definition of Education

Education is a concept developing individual within the period from birth to death; and is hard to be defined because it includes political, social, cultural, and individual dimensions at the same time. Education is the whole of the processes when people develop abilities, attitudes, and other types of behaviors prized in the society they live in. Education is a social process as well as a psychological fact including the parents. Because, children primarily take the people around them as a role model.

Education is also learning. And learning is establishing cumulative correlation of knowledge. Learning is always based upon available knowledge and cognitive structures. As mentioned by Ausubel (1978); "If I had wanted to gather whole educational psychology under only one principle, I would have said so: The unique important factor affecting education is the current knowledge of the student. Determine this, and educate in accordance with this. Learning is cooperative." Education means organizing by yourself: as being very different from old behavioral viewpoints, efficient learning has strong metacognitive (creative thinking) features such as planning, management and taking time to consider. Education and training are target-oriented; teacher defines the targets of learning. Through the necessary educational instruments, learning targets can be defined by teacher or learning materials (Güleryüz, 2011, 118). Education is the common understanding of technologic and pedagogic viewpoints; and aims to convey learning to people in a productive way as a whole including information and communication (Göksoyet al., 2014, 292-305). Education is a process maintaining during the life. Within this process, individuals sink themselves into the effort of self-realization recognizing their psychomotor skills beside their interest and personality. Attitudes and behaviors of teachers towards students also play an important role upon supporting and enhancing the students' self-realization efforts. Teachers' having a positive viewpoint towards students and students' having characteristics such as citizenship virtue, responsibility and mutual sacrifice, liveliness and kindness are also a part of education (Aydın et al.,2013, 3).

2.2 Leadership

Leadership in education reveals itself through authority, duty, execution and effect. Formal authorization can only provide status leadership to the administrator. And informal authorization is granted by a group; and this, in fact, is a kind of leadership granted for the administrator. The grades of effect are understood well from the responses returned by the group members. In an educational organization, expectations of members can be regarded as a response to leadership in management. The behaviors of administrators expected by members are essential in structure of the institution. The leader mostly works with these two dimensions. Recent educational leaders should be well-informed and versatile above all. Only such leaders can determine goal-oriented policies, and deal with the instruments that will actualize these. A leader is an administrator distinguishing between what education and enterprise are and what these should be, and using human and material sources positively. Development in education is a leadership problem; therefore, the problem is raising and employing the admin-

istrators that have or possibility to have a leadership qualification. Effective leadership performance and eagerness to work with anyone in your organization provides more careful. In addition, training their students set a goal in life and can make them emotionally stronger. Especially transformational leaders achieve these results in one or more ways. They may meet the emotional needs of each student and/or they may intellectually stimulate students (Bass, 1991). Maintenance of leadership in education depends upon the maintenance of this raising process and placing elements into the system that will encourage such leader administrators to be in the system. It has recently been mentioned that these administrators have been present in practice whether the effect of management class in education is accepted or not. Therefore, the problem is to develop the ones on-the-job rather than raising the new ones (Bursalıoğlu, 2010, 210). Although the theories related to leadership were established many years ago, the importance of acquiring and practicing the leadership skills has increased in the 21st century (Landis et al., 2014,1). School leadership is a field including social justice and ways to educate students. Social justice is a situation of balance provided through considering the issues such as living standards and level of income in different parts of a society (Woods et al., 2013, 2). Furthermore, especially the educational institutions can establish a more productive and efficient organizational structure using modern leadership approaches such as transformational leadership (Egri and Herman, 2000).

Through leadership in education, the primary aim of this research study was to discuss student success and expressive motivational approaches as a whole analyzing the critical and complex relationship between the fundamental leadership qualifications. The environment and external factors (for example; poverty, violence, social support) affect the success of teachers and students in an urban school area (Bethani,2011, 1). Efficient leadership and management have been accepted in all institutions as the time passes by. The teachers are for reaching to profound targets determined for them by schools and colleges. In the global economy, educated workforce has been essential for protecting and developing the power of competition. In a rapidly changing environment; society, schools, colleges and universities are for preparing people to employment. Teachers, their leaders and administrators are productive people necessary for "delivering" the high educational standards (Bush 2008, 8).

Leadership in education is modeling, informing and motivating. As mentioned by Artur Sanio "We cannot be successful suddenly; this actualizes step by step." Namely, in order to be productive for students, teachers should have adequate knowledge and equipment; and this is possible through teachers' innovating themselves and improving their knowledge whenever possible (Aksu, 2011, 11). As an efficient leader, a teacher has responsibility for developing vision, sharing his/her vision, and organizing learning experiences appropriate to individual differences. While teachers actualize their leadership roles, they play these roles both at school and classroom. Teacher leadership is the ability for playing and developing roles at a cognitive level in school activities and organizing the in-class activities efficiently sharing their knowledge with students and innovating themselves constantly (Apaydın et al., 2011, 107-129; Eagly et al., 2003).

The qualification of leadership disappears when teachers have uninterested behaviors towards their students and in culture isolation, and when they blame their students for failure frequently depending upon the factors. When a compelling educational model is applied without empathy and sacrifice, not only students but also all employees affect from this (Fleming et al., 2007,7). Leadership of school manager is one of the most important variables for increasing the learning performance of students and creating a qualified learning environment. The concept of leadership should not only be analyzed within the scope of school manager's leadership, but also analyzed through an understanding providing opportunities for whole school members to take the lead. Moreover, at schools where leadership capacity is high, Kılınç mentioned that a broad-based and efficient participation, high-level trust, values creat-

IETC2014

ed by the school members and implementations increasing the success of students have become intense (Kılınç et al., 2014). Leadership concept at schools is quite important for strengthening the cultural structures of schools and appropriate ethical behaviors of teachers. Besides, "school manager" as a leader successful in his/her field defines the vision and mission of school (Uğurlu et al., 2012).

2.3.Teacher Performance

Performance evaluation is one of the most important functions of studies carried out upon determining the efficiency and success level of pedagogues. In the study, the literature related to performance evaluation was reviewed; a model was determined to discuss student satisfaction and performance evaluation system of teachers, and performances of pedagogues were evaluated in accordance with this model (Uysal, 2011, 13).Evaluation of teachers was especially emphasized. The most familiar one among the various evaluation criteria was success depending upon seniority. As in any profession, old generation seniority and new generation adequacy have been argued. Selection of seniority is arisen from the difficulty in evaluation of the teachers. The benefits of seniority as an evaluation criteria are its including the feeling of social justice, preventing personal effects, being an indicator of organizational commitment, its being easily-measurable, preventing destructive competition, its retrieving from pressure and decreasing the difficulty of evaluation (Bursalıoğlu, 2010, 46-47). Evaluation of teacher performance by the students defines the efficiency of a teacher. Whereas some administrators consider teacher performance measurement as a feedback instrument, most of them feel this as a threat against teacher while taking personal decisions (Odabaşı, 2004, 26). In a classroom, teacher performance and leadership affect student success positively, and has an important place in establishing a positive relationship with the student. Secondary education teachers prefer rescuer, developer and enterpriser roles. Secondary education teachers can be mentioned to display highly complicated behaviors among these roles (Apaydın et al., 2011).School's fulfilling its functions, in other words its mission, depends upon teachers' displaying the performance expected from them as the ones playing the key role among the educational employees. Teachers' presenting the highest level of performance is possible through the presence of implementations such as providing feedback related to their performance in schools they carry on their duties, determining the educational needs and potentials, providing support and orienting those (Çorbacı et al., 2013, 3).

Performance of a teacher is essential for providing efficiency and productivity during the education and training process. Since teacher performance can be mentioned to affect participation of students into lesson, and student satisfaction directly. Performance evaluation of teacher has a "compass" role upon students to provide educational targets to be actualized at the highest level. This study had a field research quality because of its trying to determine thoughts of teachers related to students (Aksit, 2006). In teacher performance, the personal qualifications expected from a teacher are (Çelikten et al., 2005,10):

Teachers are good observers; and they are in an effort to innovate themselves constantly; behave patiently, stand up to circumstances, and control their feelings. They are devoted to their students. They are respectful for different beliefs, views and groups, and peacemaker. They are open for improving and criticizing themselves. Teachers are a model for students through their thought and behaviors; they are good-humor, tolerant and affectionate. Moreover, they have leadership features. They are encouraging and supporting. They make efforts to find solutions to problems instead of complaining. They know the basic concepts of educational sciences, and facilitate learning. They are open-minded, modern, and flexible when appropriate. The professional qualifications determining the teacher performance are; general culture, pedagogical content knowledge, supervising and planning the teaching process, productive use of the course period productively for students, organizing a participative teaching

environment, observing and following the improvement of students (Erden, 2011, 153-154).

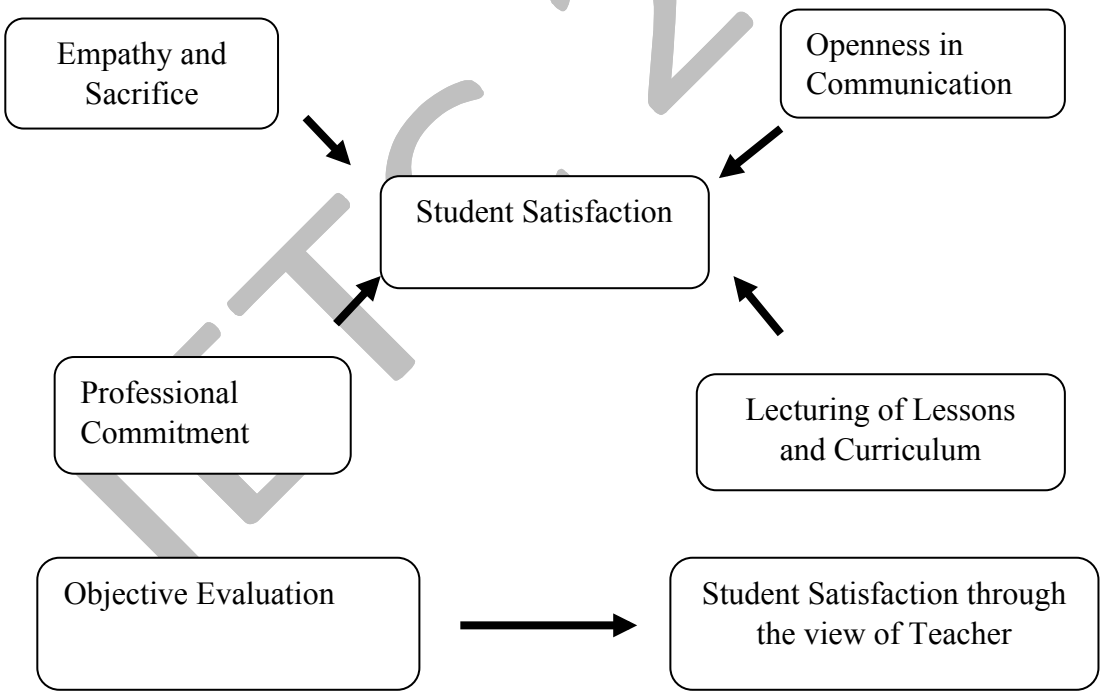
2.4. Student Performance

While evaluating the concept of performance, students should firstly determine their own purposes. A life experienced hopefully and efficiently is a successful life. In order to be successful, it is not necessary to study hard, but to study efficiently. In order to be successful, the purpose should be defined clearly, and preparing annual, monthly and weekly programs for this purpose is a fundamental condition. The researches carried out upon people proved to be successful through using various criteria have emphasized these students to have such characteristics (Güleryüz, 2011). Curriculum is the leading one among the techniques used for student performance. This curriculum includes all activities related to actualizing all purposes of the National Education (Adanalı, 2008, 38-39). For example, authentic evaluation is a kind of evaluation in which students actualize their responsibilities in real life. Concept map is writing or drawing the cognitive schemes of individuals related to any subject on a paper considering as objectified through a paper or observation. Peer evaluation is students' assessing the assignments of their friends such as homework, projects, reports, etc. The other factor determining the performance of students is dramatization; namely, practicing the game components out of school can provide an important opportunity for overcoming the significant problems of schools. Adaptation of these motivating implementations into education will have a positive effect upon the interest of students towards lesson. Academic success and performance of the students will no doubt increase through the increase in their interest and motivation (Yıldırım, 2014,11). According to Cianni and Wnuck, the leading factors that will be provided by the team career model revealing the high-performance teams during career improvement process of students to the organization are as such (Akın, 2005, 12-13). High productivity and the success that will be provided through the motivation of being a team member are strengthened in time. Team spirit provided through team career model increases productivity in project team studies.

In concept of commitment, team members adapt to be a member of a project team providing career development opportunities for themselves. In order to help for the physical, mental and psycho-social development of students as a whole, pupil personnel services takes over important tasks besides management. A teacher should be near students as a guide, so student satisfaction can improve positively. Different from teaching and administration services, pupil personnel services are for preparing the environment that will provide development of students exceeding their own limits (Satan 2013,7).Teachers and parents should discuss the homework of students, remind them of their homework in their free time, and create a quiet and relaxing study environment in order to provide them to be successful in their educational life. Institutions, families, and teachers should always be ready for helping to children (Mulford et al., 2004,156). When the literature related to student performance was analyzed, several studies proved that tests and questionnaire methods had significant effects upon student performance and reminding the information learnt before (Yıldırım, 2014,54).

3. METHODOLOGY AND APPLICATION

In this section, methods and implementations used during the scope of the research, creation of scales, sample selection and data collection, validity and reliability analyses of the scale, correlation, regression and factor analyses were included. In this thesis study, performance of teachers carrying on their duties in Halit Ziya Uşaklıgil Elementary School, and satisfaction of students studying at the same school were measured. The questionnaires were



IETC 2014

performed as one-to-one to teachers and as face-to-face to students in the classroom. The questionnaire forms were prepared according to 7-point Likert scale for answering the questionnaires performed to teachers and students in the research. The choices related to assessment of the answers in the questionnaire was as 1) I totally disagree, 2) I mostly disagree, 3) I partly disagree, 4) I am indecisive, 5) I partly agree, 6) I mostly agree, 7) I totally agree. The data obtained from the questionnaire were analyzed using SPSS 17.0 program. After determining the subjective evaluation of teachers, their performance over the students and satisfaction of students, factor and reliability, correlation and regression analyses were performed.

Within the scope of the research, total number of questions addressed to teachers was 25, and total number of questions addressed to students was 12. The questionnaires were performed to totally 220 people including 100 teachers and 120 students.

The research hypotheses were as below:
H1A- Professional commitment of teachers affects student satisfaction directly and positively according to their own subjective evaluations.
H1B-Empathy abilities and sacrifice of teachers affect student satisfaction directly and positively according to their own subjective evaluations.

Figure 1: Dependent and independent variables in the research model

Although the scales used in the research model were used in previous scientific studies, reliability analyses of the scale were important within the scope of the research. Reliability is arisen from the internal consistency of measurement regarding the relationship between the questions within a variable. Reliability analyses and validity analyses of the questions used in the questionnaire were mentioned in the table below in details. The construct validity of the

research model was tested through factor analysis; whether the scale was mono or multi-factor was researched, and the statistical analyses were provided to be fulfilled optimally.

Table 1.Factor Analysis

Sub-titles	***Item Numbers***
Teacher Success	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12,13
Student Success (From the Viewpoint of Teacher)	14, 15, 16, 17, 18, 19, 20, 21, 22, 23 24, 25

Questions	Cronbach Alpha	Factor Load	KMO
I have an effort to increase, develop and renovate my professional knowledge.	,921	,697	
My professional commitment and job enthusiasm are more than they should be.	,923	,623	
I perform the assigned duty on time and correctly.	,919	,719	
I am a model for students through my clothes, words, and behaviors.	,918	,765	
I avoid from using unclear, meaningless, slang language.	,919	,750	
I reward my students after noticing their success.	,917	,791	
I aim my students to acquire behaviors of looking into subjects from different viewpoints, consulting, discussing, and asking questions.	,916	,827	
I provide performing studies related to observation, experiment, and new inventions.	,926	,552	,907
I can associate the subject I lecture with the previous ones.	,918	,767	
I care for the requests and thoughts of my students in my communication as a teacher, and I try to understand them.	,915	,848	
I create opportunities that provide my students to associate what they learn with their lives.	,918	,762	
As a farseeing teacher, I explain my teachers that everything will be better in future.	,924	,636	
I take time my students for teaching and leading them.	,917	,801	
I can easily see my teachers whenever I need.	,891	,657	
My teachers make efforts for the solution of the problem I mentioned.	,887	,728	
I trust in teachers of our school.	,855	,718	
The lessons are lectured in accordance with our level of knowledge.	,886	,720	
I consider that what I learn at school will be beneficial in my daily life and/or my subsequent educational life.	,889	,650	

IETC 2014

The lessons are amusing,	,888	,686	,823
The opportunity for learning and achieving is provided for us.	,884	,777	
I can easily ask anything I do not understand to my teacher.	,884	,803	
I can easily discuss my views and suggestions in classroom and school garden.	,885	,713	
Teachers behave unbiased in evaluation of exam results (oral exam, written exam).	,892	,621	
Prepared exam questions and evaluations measure the real success of students.	,892	,595	
The content of the lessons was organized in a way grabbing my attention.	,890	,645	

In factor analyses, it was observed that the questionnaire scale used for teachers was categorized into tow sub-titles within inside. Those were professional commitment, and empathy and sacrifice. Professional commitment as the first factor among the addressed questions had a structure including the aspects as commitment of a teacher to his/her profession, job enthusiasm, developing and innovating yourself, performing the assigned duties on time and correctly. In empathy and sacrifice as the second sub-title included teachers' trying to understand the requests and complaints of students better, and making efforts for leading them to the right way. In questionnaire of determining the student satisfaction, empathy and sacrifice, and professional commitment were discussed.

In questionnaire of determining the student satisfaction, three main factors were clearly determined. Those were professional commitment, empathy and sacrifice, and openness in communication. Those determined factors were evaluated through both the viewpoints of teachers and students, and then analyzed. The findings revealed as the result of the analysis were evaluated in conclusion section.

Firstly, correlation analysis was performed. The correlation coefficient indicates the direction and size of the relationship between the variables. This coefficient has a value varying between (-1) and (+1). Positive values represent direct linear relationship. And negative values represent a reverse linear relationship. This coefficient's having the value of (0) represents that there is no linear relationship between the variables included into the research. In the research, the correlation analysis related to all variables was created through SPSS program before regression analysis providing opportunity to find a cause & result relationship between the variables. The correlation analysis of this study was presented in the table below.

When the factors having effect upon the student satisfaction were analyzed, it was noticed that the factors including the questions related to lecturing of the lessons and curriculum had a direct effect upon student satisfaction. The main reason for this was that the teachers who lecture pleasant and satisfying lessons leave a positive effect upon the students. The factor of openness in communication as an independent variable including the high correlation proved that the teachers that were open for dialogues with students are affected more by the students, and students participated more in lessons of the teachers they love. Openness in communication means students' reaching to their teachers whenever they want, and their asking questions without hesitation. Under normal circumstances, these two factors were expected to be in a positive strong relationship with student performance.

4 Lecturing the lessons and curriculum	,593** ,000	,658** ,000	,574** ,000	1	,607** ,000	-,226* ,024	-,166 ,098	-,148 ,142
5 Objective Evaluation	,386** ,000	,501** ,000	,479** ,000	,607** ,000	1	-,139 ,168	-,181 ,072	-,098 ,330
6 Openness in Communication	-,133 ,188	-,121 ,231	-,104 ,305	-,226* ,024	-,139 ,168	1	,475** ,000	,300** ,001
7 Lecturing the lessons and curriculum	-,129 ,200	-,044 ,664	-,073 ,469	-,166 ,098	-,181 ,072	,475** ,000	1	,391** ,000
8 Objective Evaluation	-,150 ,136	-,050 ,623	-,062 ,541	-,148 ,142	-,098 ,330	,300** ,001	,391** ,000	1

Regression analysis used in general for the analysis of quantitative variables is categorized into two as basic and multi-directional. Multiple regression analysis analyzing the relationship between one dependent variable and more than one independent variable is a natural extension of simple regression analyses (Kleinbaum et al. 1998, Uzgören, 2007; Quoter). In our research, regression providing to find the cause & result relationship between the variables was analyzed using SPSS program. The results obtained from the regression analysis were interpreted in tables. R^2value of the table (coefficient of determination) expressed to what extent independent variables could be defined by the dependent variable, and F value expressed whether the model was statistically significant or not.

Regression analysis results related to the questionnaire data of teachers and students participated into the research were presented and interpreted in tables.

Table 3.*Professional Commitment*

	β	**T**	**P**
Professional Commitment	-,182	-1,254	,213
	Dependent Variable: Student satisfaction through the view of teacher R^2= ,042 F=,831 P: ,213		

As could be seen from the table, professional commitment of teachers did not affect the satisfaction of students according to their own subjective evaluations. The level of significance was quite over the limit value of .005; and F value and Beta (β) coefficient proved that there was no significant relationship between these two variables.

Table 4.*Empathyand Sacrifice*

	B	**T**	**P**
Empathy and Sacrifice	,179	1,051	,296
	Dependent Variable: student satisfaction R^2= ,042 F=,831 P: ,296		

As could be seen from the table, empathy and sacrifice fact of teachers did not affect the satisfaction of students according to their own subjective evaluations. F value and Beta (β) coefficient proved that there was no significant relationship between these two variables.

Table 5.*Openness in Communication*

	B	**T**	**P**
Openness in Communication	,014	,099	,921
	Dependent Variable: student satisfaction R^2= ,042 F=,831 P: ,921		

As could be seen from the table, teachers' openness in communication did not affect the satisfaction of students according to their own subjective evaluations. Considering F value and Beta (β) coefficient, it was proved that there was no significant relationship between these two variables. In other words, student satisfaction revealed in teachers' own subjective evaluations was insignificant rather than the students' own subjective evaluations.

Table 6.*Lecturing the Lessons and Curriculum*

	β	**T**	**P**
Lecturing the Lessons and Curriculum	-,143	-,926	,357
	Dependent Variable: Student satisfaction R^2= ,042 F=,831 P: ,357		

As could be seen from the table above, teachers' lecturing the lessons and curriculum did not affect the satisfaction of students according to their own subjective evaluations. The level of significance was quite over the limit value of .005; and F value and Beta (β) coefficient proved that there was no significant relationship between these two variables.

Table 7.*Objective Evaluation*

	B	**T**	**P**
	-,038	-,290	,773

IETC 2014

Objective Evaluation	Dependent Variable: student satisfaction R^2= ,042 F=,831 P: ,773

As could be seen from the table above, objective evaluations of teachers did not affect the satisfaction of students. F value and Beta (β) coefficient proved that there was no significant relationship between these two variables.

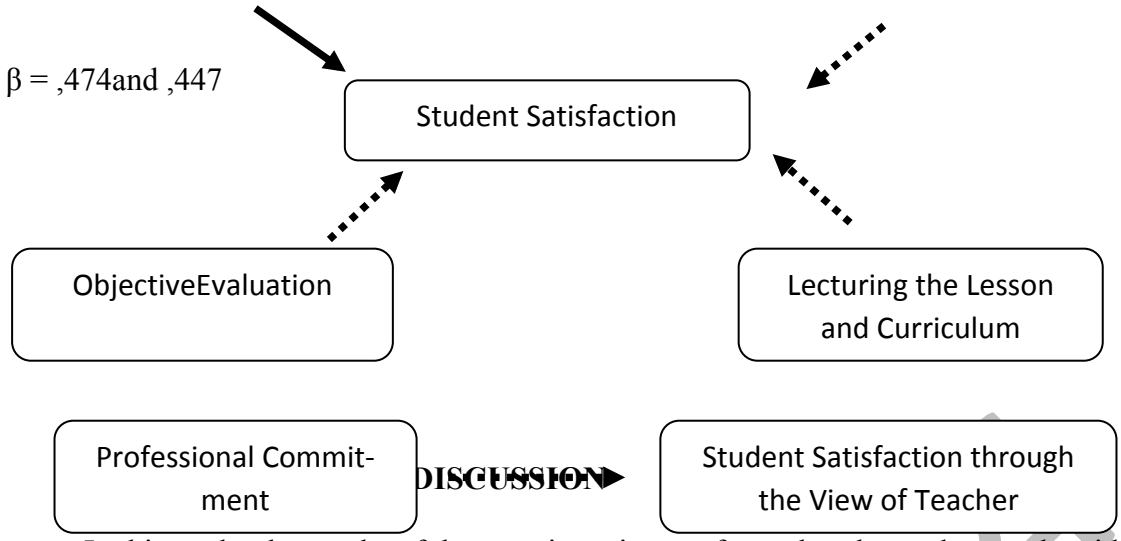
Table 8.*Empathy and Sacrifice, Student Satisfaction*

	B	**T**	**P**
Empathyand Sacrifice	,590	5,782	0,00
	Dependent Variable: student satisfaction R^2= 471, F= 43,183 P: 0,00		

When Beta (β) value and significance level of the independent variable called as empathy ability and sacrifice of teacher was analyzed in terms ofthe student satisfaction, it was proved that this ability of teachers increased the student satisfaction by 47.1%. Depending upon this, it could also be said that in case these abilities of teachers have been used in whole educational system, a great performance increase will be experienced.

Table: 9. *Empathy and Sacrifice, AverageStudent Satisfaction*

	B	**T**	**P**
Empathyand Sacrifice	,595	6,237	0,00
	Dependent Variable: average student satisfaction R^2= ,537 F=56,345 P: 0,00		



When Beta (β) value and significance level of the dependent variable called as empathy ability and sacrifice of teacher was analyzed in terms ofthe student satisfaction, the 53.7% direct and positive relationship proved only one thing:teachers who are aware of this ability, and use this ability always affect student performance and satisfaction positively and directly.

According to the results of this additional analysis, it can be possible to mention that especially empathy and sacrifice variables increased the student satisfaction when evaluated through the subjective viewpoints of teachers. Moreover, when the same situation was analyzed from the viewpoints of students, it had no significance upon these two variables.

Figure 2. Dependent and Independent Variables in Regression Research Model

IETC 2014

In this study, the results of the questionnaires performed to the study sample within the scope of the research were evaluated. Subjective evaluations of teachers related to themselves, teacher performance and student satisfactions in terms of students were measured. Depending upon this, students had contrast ideas on areas teachers considered as successful. In other words, teachers and students who filled in the questionnaires considered the same thing from two different viewpoints, and did not understand each other. Research's causing such result indicated that the mutual relationship between teachers and students should be evaluated more carefully and elaborately. Whereas teachers' qualification of empathy as understanding the problems of students and sacrifice as a business philosophy were noticed as a very important virtue by teachers, these were evaluated as meaningless by the students. According to the questionnaire results, teachers considered that both empathy and sacrifice, openness in communication and objective evaluation were all efficient upon students; however, the students did not share the same ideas with their teachers. This was an indicator of the lack of communication between students and teachers.

As result of the questionnaire performed to teachers upon evaluating themselves and measuring student satisfaction, the questionnaire scale used for teachers was categorized into two titles. Those were professional commitment and empathy and sacrifice. When professional knowledge was considered through the own viewpoints of teachers within the presence of concepts such as self-adaptation efforts and rewarding the successful students, a significant difference can be mentioned to be obtained. The empathy and sacrifice under the second title included teachers' understanding the requests and complaints of students better, making efforts to lead the students correctly, and organizing the content of lessons more attract-grabbing. When results of these were analyzed, it was understood that the teachers had a complete confidence in themselves, they experienced no problem in communication with their students, and were satisfied with their current communication. Furthermore, because teachers considered themselves as fully-equipped, expectations of teachers can be regarded to be deemed as difficult by students.

In the evaluation upon satisfaction of students, questions related to whether they were satisfied with their teachers' performances or not were asked. The questions were categorized into three main titles. Those were openness in communication, professional commitment, and empathy and sacrifice. In questionnaires, because the students were not obliged to write their names, the students can be considered to express their ideas easily without hesitation and fear. The obtained result proved that students were not satisfied from teacher performance and student satisfaction in contrast to teachers. As result of the research carried out by MNE (Ministry of National Education) Department of Educational Research and Development in 1999

upon "modern teacher profile in the 21st century," whereas teachers considered themselves as adequate, the students considered their teachers as inadequate in students and teachers group interacting mutually for teaching activities in classroom environment. Having similar results in two studies as the one was carried out 14 years ago and the other carried out recently in 2013 upon "teacher performance and student satisfaction in educational life" proved that the education and training system in Turkey has not been systematized yet without an exact progression.

When the research was analyzed in terms of two variables, it could be mentioned that there was a serious communication problem between teacher and students. Neither teachers understood the students nor did the students understand teachers. Whereas the teachers of the modern age improve their knowledge, approach students in a friendly manner rather than a teacher, and try to communicate more. This study carried out in Halit Ziya Uşaklıgil Elementary School proved an essential fact. Teacher and student relationships on the basis of education quality that have been discussed for years should be revised radically, modern pedagogical educational techniques should be integrated into the system, and an educational system that will strengthen the dialogue between teachers and students should be established. Applied training should be regarded more apart from the pedagogical theories. In the case a modern, elaborate educational model has been applied considering all these, a more positive result can be obtained for both teachers and students. Determining before the problem emerges and developing a precaution will be better rather than experiencing a problem and overcoming it. But it should not be forgotten that, education and communications primarily starts in family.
