Dear Guests…

Welcome to the 14th International Educational Technology Conference; IETC-2014, Chicago- USA. "The International Educational Technology Conference (IETC)" is an international educational activity for academics, teachers and educators. IETC promotes development and dissemination of theoretical knowledge, conceptual research, and professional knowledge through conference activities, proceeding books, and the Turkish Online Journal of Educational Technology (TOJET). Its focus is on sharing, creating and disseminating knowledge among academicians, school administrators and teachers about the use of instructional technology for learning and teaching in educational field. This conference is now a well-known educational technology event worldwide and the number of paper submissions and attendees are increasing every year. This year, IETC-2014 is held in Chicago and will last three days. The first day is devoted to keynote presentations. We have many keynote speakers including Prof. Dr. Durmuş GUNAY and Prof. Dr. Buket AKKOYUNLU from Turkey, Prof. Dr. Saedah SIRAJ from Malaysia, Prof. Dr. Steve HARMON, Prof. Dr. J. Ana DONALDSON, Prof. Dr. J. Michael SPECTOR, Prof. Dr. Theresa J. FRANKLIN, Prof. Dr. Kay A. PERSICHITTE, Prof. Dr. Sharon SMALDINO from the USA. They will share their knowledge, research and experiences with us and talk about the recent developments in the field of educational technology. On the second and third days, conference participants from all over the world will present their academic works, research and classroom practices about educational technology.

I hope that we will meet again at the 15th International Educational Technology Conference - IETC-2015 which will be a combined academic event with IRSEM, International Research Symposium on E-Learning and New Media organized by AECT on May, 2015 in Istanbul, TURKEY.

Thank you for your participations and contributions for the success of this conference.

Prof. Dr. Aytekin İŞMAN

General Coordinator of IETC

IETC 2014

IETC 2014 Organizing Committee

General Coordinator

Prof. Dr. Aytekin İŞMAN, Sakarya University, Turkey

Coordinators

Prof. Dr. Ferhan ODABAŞI, Anadolu University, Turkey

Prof. Dr. J. Michael SPECTOR, University of Georgia, USA

Associate Coordinators

Dr. Ahmet ESKİCUMALI, Sakarya University, Turkey
Dr. Abdullah KUZU, Anadolu University, Turkey
Dr. Eric Zhi Feng LIU - National Central University, Taiwan

Conference Secretary

Dr. İrfan ŞİMŞEK, Istanbul University, Turkey
Dr. Kerim KARABACAK, Sakarya University, Turkey
Mustafa ÖZTUNÇ, Sakarya University, Turkey

A critical look at the digital technologies in architectural education: when, where, and how?

Dr. Levent Kara
University of South Florida, School of Architecture & Community Design, Tampa, Florida, USA

Abstract

In the past decade, architectural education has seen an increasing amount of digital technologies being involved in the design studio curricula. Following the trends in the profession, these various technologies of computer aided drafting, enumerating, modeling, and analysis became not only key pedagogical nodes in the design studio, but also started to shape the overall curricular structure of architectural education as they also needed to be implemented as support courses in order to compensate the learning curves and the number of software available to architects. These digital technologies range from one end of simple drafting, conventional three dimensional modeling, and more sophisticated animation of buildings with a computer, to the other end of inventing new tectonic and spatial geometries using parametric computations. In this context, it will be unrealistic to argue against teaching and using digital technologies in architectural education. When one thinks how the profession has evolved in the past decade, it is necessary to embrace these tools in the architectural curriculum. However, a discussion that has not been clearly resolved is when, where, and how these digital tools are thought and used in the architectural education. My paper argues that the conventional tools of hand drawing, physical modeling, and hand making should be embraced in the foundational levels, and the digital tools should be introduced after developing a certain set of skills of one-to-one physical making where a sense of tectonic resolution, scale, and spatial experience is cultivated as a basis of architectural thinking with digital tools. In what follows, I will discuss this viewpoint through examples from architectural design studio education in the United States and in Turkey.

Keywords: architectural pedagogy; architectural design; digital architecture; CAD; CAM; computational design; architectural design studio; architectural drawing; architectural modeling; architectural thinking; architectural geometry

IETC 2014

1. Three schools, three practices

I will discuss the use of digital tools in the architectural education by focusing on three universities. Two of these universities are in the United States and one in Turkey and all three programs are accredited professional degree programs. I will first introduce the general structures of the schools, and discuss the approaches to the digital tools in the context of overall curriculum and design teaching attitudes. I believe a proper understanding of the general design pedagogies of the schools is an important part of when, where, and how the digital tools are implemented in the architectural education as a normative curricular question.

1.1. Background

School A is a 4+2 professional program in the United States. There are 8 undergraduate studios, 3 graduate studios, and a thesis semester. Digital tools start at the 3rd year of the undergraduate program, usually second term, and the rest of the program heavily uses digital technologies in the studios. Drawing and modeling programs are taught as a separate required one semester support course in the 2nd year, before the students start using these in the architectural design studios. However, the digital course uses projects from the 2nd year studios as base for its assignments.

School B is a 2 year professional graduate program in the United States, with also a 2 year core program that accepts students with other majors. There are 6 studios, and 2 semesters of thesis. Digital tools start in the 1st year of the graduate program, or the 3rd year of core program, usually the first term. So, there are only two design studios that use digital production and incorporation into thesis depends on the par-

ticular student. Digital tools are taught as elective courses, and there are no required courses. Depending on if and when the student chooses to take the digital elective, studio projects may be used as basis for the digital course assignments.

School C is a 4 year undergraduate program in Turkey. There is a masters program, however, due to professional licensing requirements in Turkey, the masters program does not count towards professional credit. There are total 8 studios that count towards professional credit. The digital tools are introduced in the 1st year and the rest of the program heavily relies on digital production and presentation in the studio. Drawing and modeling software are taught in required support courses in two semesters in the first year of the program along with the graphic component of the design studios.

2. Curricular structures and approaches to architectural design teaching

Despite the difference in number of design studios, School A and B follow similar approaches in design teaching. The first foundational studios emphasize hands-on making in different media, from hand drawings and sketching to physical models. Both schools structure these foundational studios around a concept of making that takes the product as a one-to-one scale made object rather than representing an architectural construct on the world in another scale. Therefore, the early studios aim at establishing a sense of tectonic making and seeing space in one-to-one crafted constructs even before they can be called architecture in the general sense of the term indicating habitable structures. Designing habitable structures, or the notion of building, is introduced gradually towards the second year and third year of education. The first year's assignments focus on ideas of space making and tectonic construction in volumetric and expanded conditions, introducing concepts of internal scale, joint resolutions, hierarchy, repetition, movement, and iterative relations between elements, materials, and spatial and tectonic moments, without making these part of a broader notion of building. Thus, a fundamental sense of spatio-temporal experience is cultivated through hands-on, one-to-one making, laying the ground for the basic strategies of controlling and managing the complexity of architectural space. The transition from these tectonic and spatial constructs to designing habitable structures and buildings takes place with the introduction of design problems that address questions of experience, movement, sight, light, and sense of enclosure relative to human scale in the form of fragments rather than full programmed buildings. The advantage of introducing architectural typologies and fragments as design questions is that the students transition from spatial and tectonic constructs to constructs that house human body much efficiently and steadily, being able to think about architectural experience with only focusing on certain aspects of it rather than tackling the problem in the complexity of a building. The result of these transitional assignments follow the complexity of the one-to-one constructs, carrying the knowledge of space and tectonics acquired, and thus a rich sense of architectural experience. In this way, the architectural typologies, or fragments, like door, window, stair, etc. become problems of boundary, threshold, movement, visibility, scales of enclosure, etc., parameters of spatio-temporal experience, rather than given known elements. Thus, along with a highly developed sense of space, tectonics, and experience, architectural design and making becomes a process of inquiry into the domain of lived human experience.

School C introduces a notion of basic design in the first semester, gradually going towards habitable space and even to the questions of interventions and context immediately in the second semester. This basic design approach follows the Bauhaus pedagogy of making things as discussions on basics of geometry in two and gradually three dimensional systemic constructs. Even if this basic design approach sounds similar to what Schools A and B introduce in the foundational studios, the main difference is the basic design approach takes the systems as ends in themselves and does not address the questions of space and tectonics as rigorously as the foundational design approach. (Please see Angelil 2003 and Franzen 1999 for further discussion of systemic versus spatial and tectonic making.) Typically the basic design starts with two dimensional graphic exercises that concern pattern relations, rhythm, hierarchy, in an elemental system. Then these get extruded in relief studies, gradually unfolding into three dimensional constructs. Similar to foundational design approach, the products at this level are one-to-one makings without a scale relative to human body or habitation. However, the questions that these systemic constructs focus are the elemental relations that iterate onto each other, thus the systemic resolution takes the priority as an end in itself rather than giving way to discussions of spatiality as a key concern. While a systemic construct can be deemed successful in terms numerical proportion and rhythm relations between its elements, it may

IECT 2014

not necessarily result in a successful spatial system if the elemental relations are controlled by iterative steps or numerical hierarchy rather than the space formulated and constructed as a relation between these systemic elements. These more pattern oriented two and three dimensional studies unfold into a larger scale site comprehension study with a system of interventions on a usually chosen real site. While there is a strong connection between pattern studies and large scale site operations, because the complexity of initial pattern studies fall short of addressing phenomenal experience in terms of tectonic and spatial resolution, the lessons of the pattern studies do not carry into the architectural scale required by the site assignments. Similarly, the basic design skills acquired in the first semester, gradually fall back into a more conventional architectural making as the program advances in the later years. Typically, the second year immediately starts to address questions of buildings and sites in small scale, and then the later years increase the level of complexity of building programs and scales of site operations.

3. Digital tools in the curricula

Schools A and B start to use digital tools in the studio only after establishing a very strong background of hand making in drawing and physical models, and only when the program starts to address buildings in the complex sense of a given architectural program on a given site. Because the students already cultivated the skills of thinking and making space with a strong sense of tectonic resolution, the digital tools can be utilized in their full potential from establishing difficult geometries to representing speculations of architectural experience in two and three dimensional digital constructs. The two schools differ in that School A teaches digital tools as a required support course in the second year of the 4+2 curriculum and School B only teaches in elective courses. While the digital course in School A uses the second year design studio projects as assignments, it is not before the third year the digital tools are used in the architectural design studio as part of the process and presentation of an architectural problem. School B requires digital tools in the third year of the Core program, or the first year of the Graduate program. In terms of production efficiency and the strength and variety of process and presentational techniques, the level of digital incorporation in the studio does not differ recognizably between the two schools. This shows that teaching digital tools as a required support course vs. electives, or even workshops, does not make a difference in the overall success of integration of digital tools in the design studio. Students learn the tools when they need them in the studio more efficiently than as a separate course. Because the assignments in the separate support courses tend to focus on the basics of drawing or modeling with software, these tools do not find their full potential before the students use them as tools of thinking and presentation for complex design problems they encounter in the architectural design studio. While the learning curves for each software vary, and there are a number of different software to learn, they usually share a basic common ground in vector and surface based operations, and each software start to show its strengths and weaknesses when applied on real time design problems. Thus, each student, regardless of what they can do with digital tools before they start to use them in the architectural design studio, starts to develop her/his own set of digital tools and techniques through working with them on particular design problems, and refine their skills through various process and presentational challenges they face in the design studio. Even if some students do not have much knowledge of digital tools, in a few weeks they start to use the tools without the learning curve becoming a hindrance for the design process. Also, when they learn the tools while applying them in the studio, the knowledge becomes much more permanent. This is indeed not very different from a professional office environment, where particular software are learned on the job through particular applications.

School C starts to use digital tools in the very first year while also teaching the basic software at the same time as a separate support class. The software production becomes part of the design process and presentation very early on. While most of the students show a recognizable skill set in using the particular software they are taught, because the production in the studio favors digital over manual making, this skill set remains limited to particular problems and software. When digital production takes over early on in the studio, the spatial and tectonic knowledge that comes from hands-on making does not find its full potential in the studio. Because the digital tools immediately come with the filter of a screen or print out, thus delayed results, there are certain shortcomings in the comprehension of the notion of internal and relative scale which then result in a lack of tectonic resolution and spatial refinement. This is not exclusively the problem of introducing the digital tools early on, but it is a result of not cultivating enough the

IETC2014

manual tools of thinking and making space. There is an immediate feedback in manual labor which controls the perception of the maker, and results in the development of an internalized sense of spatio-temporal experience. Through the filter of digital tools, this development becomes hindered. Because a distinct knowledge of space making is not developed outside the digital realm, the students also become heavily dependent upon certain software and their limitations. Likewise. because they do not have the broader conception of space making and its possibilities, they stick to what they know they can do through particular digital tools. This also limits the free flow between different digital tools, and more importantly between digital and manual tools, that is very prominent in the student work of Schools A and B. This free and transparent flow between digital and manual media is a much emphasized point in the discussions of design process and the use of manual versus digital tools. (Please see Pressman 2012, 101-103 and Yee 2013, 91-100 for further discussion on manual and digital tools integration in the design process.) Accordingly, the design process, which becomes a domain of inquiry in the Schools A and B, is reduced to more conventional ways of thinking about design problems and architecture. Thus, while an intention for architectural experimentation and exploration into the domain of human experience is visible in the work of the former schools, the work in School C tends to fall short of addressing more contemporary questions of space making as architectural research.

4. Discussion

For the past decade or two, architectural profession has seen an increasing amount of incorporation of digital tools in the thinking and making of space. New formal and structural geometries enabled by computational techniques become more and more prevalent. Also, the design and construction work flow become much transparent and smoother with the advent of integrated software environments. Within this context, these digital tools started to emerge in the architectural education as key components of general curricula and design teaching in particular. While it is inevitable that these digital tools are used more and more in the design studios, when, where, and how these tools are implemented in the curricular structure make a recognizable difference in not only whether the full potentials of these tools are utilized or not, but also in the way the future architects cultivate the necessary complex set of skills to deal with architectural challenges in today's and tomorrow's world. While the process and production in the profession moves toward digital environments -think for a moment that even the physical models are now mostly produced with CAM techniques- these tools still require an internalized knowledge of seeing, thinking, and making space which cannot be cultivated through digital environment alone. Thus the manual production, hands-on making of one-to-one drawings and models still form the core of architectural thinking, and must be kept as part of the foundational curriculum in the architectural education. It is only through a strong background of spatio-temporal experience and tectonic construction that these tools can find their full potentials as tools for thinking rather than just tools of limited making of preordained geometries. Hands-on making sets and calibrates an immediacy that digital tools cannot and cultivates a sense for space, scale, and possibilities of phenomenal experience that digital tools can express in their use but cannot cultivate in their applications. Architectural students who use digital tools in later years of architectural programs after being given a strong manual foundation can more efficiently move between manual and digital tools and between different digital tools, thus have advantage over students who are exposed to digital tools early in the architectural program as they have a more refined and broader set of tools to deal with the complexities of architectural challenges. With this understanding of tools and the variety available to them, they also have a better sense of architectural design process that establishes a domain of inquiry and formulation for various architectural problems beyond the determination of tools at hand which may even involve invention of hybrid tools between manual and digital or between various digital tools.

A proposed conceptual framework in measuring social interaction and knowledge construction level in asynchronous forum among university students

Durairaj, K.[a] & Umar, I.N.[b]
Centre for Instructional Technology & Multimedia, Universiti Sains Malaysia, 11800 Penang, Malaysia

Abstract

This paper presents a conceptual framework of a study that aims to measure students' social interaction and knowledge construction in an asynchronous online forum. In order to acquire meaningful learning through online forum, the proposed framework is grounded on three theories, namely social constructivism, theory of online learning and connectivism theory. In addition, a combination of multi analysis techniques in analyzing the forum messages was proposed, which include content analysis, cluster analysis and social network analysis. This study intends to elucidate the proposed conceptual framework with particular emphasis on the advantages of applying each method of analysis.

Keywords: Asynchronous Forum; Content Analysis; Cluster Analysis; Social Network Analysis; Social Constructivism, Theory of Online Learning; Connectivism Theory

IETC 2014

1. Introduction

One of the most widely used asynchronous communication tools in online courses is discussion forums. Discussion forum can improve students' understanding (Balaji & Chakrabarti, 2010) and also increase students' grades (Khoshneshin, 2011). Even so, past studies showed the students' interaction level is still low, and forum is still not popular (Wise, Speer, Marbouti & Hsiao, 2012). To create quality interactive discussion, the students should read the existing messages in the forum before posting their messages (Wise, et al., 2012a). However, they are lack of knowledge to apply the proper procedures for sending messages in the forum. For instance, most students focused on selected forums only (Peters & Hewitt, 2010), resulting a deviation from the topic being discussed (Hou, Chang, Sung, 2007). There are also students who just read the messages and do not take part in the forum. In addition, a high level involvement by the instructor may reduce the students' interaction level as they feel less confident in stating their ideas (An, Shin, & Lim, 2009). Based on the existing literature, the authors aimed to develop a conceptual framework that highlights these problems as well as to propose ways to improve the students' interaction level and knowledge construction in online discussion forum.

2. Analysis

A combination of different methods of analysis is valuable as each analysis could provide different information on the subjects. Moreover, each approach has its own limitations which can be compensated for by using an alternative method in order to collect comprehensive findings. Therefore, this paper attempts to explore the advantages of combining three types of analysis in asynchronous forum.

2.1. Content analysis

Content analysis is an effective technique for researchers to get a better understanding of the cognitive processes and the quality of online learning (Gunawardena, Lowe & Anderson, 1997). Although there are many models of content analysis, but this study recommends the use of Interaction Analysis Model (IAM) by Gunawardena, et al., (1997). As this study is focusing on the participants' knowledge construction in an online forum, the IAM model is favorable to be used in collaborative and constructivist learning environment. According to Gunawardena, et al., (1997), the knowledge construction process involves several phases starting from a lower level to higher level comprises of (a) sharing/comparing information (phase 1), (b) exploration of dissonance (phase 2), (c) knowledge co-construction (phase 3), (d) testing/modification of co-construction (phase 4), and (e) agreement/application (phase 5). The IAM was developed to measure the quality rather than the quantity of interaction to determine students' involvement to change the understanding of the individual or to generate new knowledge (Gunawardena, et al., 1997).

2.2. Cluster analysis (listening behavior)

Listening behavior consists of when and how students interact in discussion forum (Wise, et al., 2012). Expressing opinions or contribution in online discussions is conceptualized as speaking while listening consists of reading the opinions and ideas from peers (Wise, Speer, Marbouti & Hsiao, 2011). Students' action or task with existing post in the online discussion is considered as their engagement in the forums. Listening behavior patterns can be classified according to six domains, namely, temporality, breadth, depth, speaking, reflection and final grade with 13 variables (Wise, 2012). This study employs Wise's taxonomy involving four specific domains (temporality, breadth, depth, and speaking) and ten variables. Reflection domain is excluded in this study due to the limitation of the system used, while the final grade was also excluded due to the confidentiality of the students' grades.

Temporality domain involves four variables: average length of session, percentage of sessions with posting actions, average number of sessions per discussion and average number of reads before contributing a post. The breadth domain involves two variables: percentage of posts viewed at least ones and average number of views per discussion. The depth domain consists of one variable, i.e., the average length of time reading a post. Lastly, speaking domain involves three variables: the average number of posts contributed per discussion, average number of words per post and average length of time creating a post served. Cluster analysis was applied to determine the patterns of online listening behavior for every student according to their level of interaction in asynchronous discussion forums. The outcome of this analysis will suggest clusters with several patterns of listening behaviors among the participants in the online forum.

2.3. Social network analysis

According to Vercellone-Smith, Jablokow and Friedel (2012), Social Network Analysis (SNA) is a tool that can be used to assess the overall pattern of social interaction and information exchange that takes place in the overall discussion forum. Besides that, it could identify at-risk students in the class (MacFadyen & Dawson, 2010), and provide a visual representation of students' learning task (Dawson, Bakharia, Heathcote, 2010). Social network analysis can provide visual information such as strong or weak ties in the network. This will provide us with the information about potential high achievers or low-performing students in the class. An early identification of these students will allow the instructor to further encourage or to find a solution to help these students.

Betweenness centrality, closeness centrality, degree centrality and density are the variables used in SNA to analyze the social level of interaction among students in the online forum (Vercellone-Smith, et al., 2012). In SNA, the participants are 'nodes' and the connections (links) among the nodes pictured with arrowed lines. SNA can identify the participants in the network and the role played by them with regard to the degree centrality, closeness centrality, and betweenness centrality. These measurements provide the individuals' behavior information in the network, for instance; (a) a measure of distance from other participants (closeness centrality), (b) have more direct contact with other participants (degree centrality), or (c) found in a rewarding position, between other participants (betweenness centrality) (Hanneman, 2001). To gain this information, a software known as SNAPP developed by Dawson, et al., (2010), can be utilized.

IETC 2014

In this paper, SNA will be used to analyze students' engagement and social level of interaction in asynchronous discussion forums by categorizing them accordingly as active or passive participants. A participant is considered active if the participation rate is in the third quartile (upper quartile) and he/she is considered passive if the participation level is in the first quartile (lower quartile) (Lipponen et al., 2001). Consistently, students' participation level is considered high when their involvement for each activity (responses/post) are located at the third quartile and is considered low if located on the first quartile. A student is considered as a bridging participant if his/her value of betweenness centrality is located in the upper quartile of the group. Participants also considered the leader of information if the in-degree value is at the third quartile in the group. A student is identified as at-risk participant when the in-degree or out-degree value is located at lower quartile in the forum. Participants also identified as isolated participants if they have zero in-degree value.

- Degree Centrality
  Degree Centrality is used to evaluate network connectivity. This information can be found by measuring in-degree and out-degree - the number of a student's connection (links) with the other participants. In-degree centrality means the relation of a participant when received messages from others. Out-degree centrality means a participant sent messages to others. A participant is identified as more active in spreading information, opinion, comment or discussion if the value of out-degree centrality is high. In other words, it means the particular participant is influential in the network and popular. A leader of information is often associated with the high centrality (Brass, 1992), while the isolated participants are the those who may not have contact with peers (McDonald, Stuckey, Noakes & Nyrop, 2005).
- Closeness Centrality
  The closeness centrality is the individual's close position with others in the network. Nodes with high closeness centrality are participants closely with the others in the network. They can access all other nodes in the network easily. Students with high closeness values interact with others faster and often effective in transferring information. They also no longer rely on others to reach all participants in the network. Conversely, when a student has a low closeness value, but with the high central, he/she can receive the information flow in the network quickly. The speed of information spread in the network depends on the link in the path traveled. These students gain more contacts easily, easy to interact with others and more prone to influence to perform a task.
- Betweenness Centrality
  Betweenness refers to the extent a node lies between other nodes in a network. Participant with high betweenness value is called bridging participant or mediator. These participants can control the flow of information between students. A node with a high betweenness value regarded as a leader by other participants in the network (Mullen & Salas, 1991) as they help to coordinate the tasks and information flow in the network. If a network has an average high betweenness value, this shows there are mediators of information exist in the network.
- Eigenvector Centrality
  Eigenvector is to measure participants communication with active or passive participants in the group. If the eigenvector centrality is located on the third quartile in the group, it indicates that the participant tends to interact with active members. Conversely, if the eigenvector centrality is in the first quartile, it show that the participant tends to interact with students who are not active.
- Density
  Density is used to show student involvement in the network as a whole. As the density value of a network is 100%, this shows all students communicate with one another. Conversely, if the density is 0, meaning the network does not have any communication or contact among participants. In this study, participants are considered to interact at a high level or connected to each other if they have a high density of more than 75%.
- Direction of Interaction
  Direction of interaction indicates to whom a participant's response to in a discussion forum. It is shown by the arrows in a network diagram. There are two types of interaction direction: unidirectional and reciprocal interaction.

3. Theories

IETC 2014

The next section will discuss the three theories (social constructivism, theory of online learning and connectivism theory) that form the base of this study's framework.

3.1. Social constructivism

Social Constructivism provides solid theoretical foundation in providing guidelines for contrive discussion to enhance learning. Social interaction among participants in the learning context is seen as the primary source of cognitive and social development. This theory provides a deeper understanding on how a student acquires knowledge by interacting with a knowledgeable someone actively. Vygotsky (1978) introduced the concept of Zone of Proximal Development (ZPD), which means the distance between the actual development and the level of potential development that can be achieved through adult guidance or in collaboration with a peer who is more knowledgeable. This ZPD can be achieved by using scaffolding in the form of encouragement, guidance or reminders to help and motivate students to complete a given task. Involvement and interaction of students in group discussions provide them with the opportunity to make generalizations and transfer their knowledge, to synthesize the ideas of others and build an understanding to facilitate learning. This theory also emphasizes the importance of feedback in order to help individuals construct their knowledge. Based on the social constructivism learning theory, this study proposes using asynchronous discussion forums with collaborative learning method to analyze students' knowledge construction level.

- Collaborative
  Collaborative refers to students who work in small groups to do activities that are shared with the same goal. According to Vygotsky (1978), individuals learn more effectively by using a collaborative learning method. Students build collaborative knowledge through an interactive process involving sharing, consultation and modification of information (Gunawardena, et al., 1997). Through feedback, interaction and scaffolding, students will be able to build new knowledge. In this study, students are expected to actively construct meaning based on their existing knowledge and experience due to interactions in the online forum. From the perspective of social constuctivist, learning is a social activity that involves the construction of shared knowledge.

- Theory of online learning
  Theory of online learning refers to the preparation of learning in an online environment where interaction is the basic element of this theory. This theory was proposed by Terry Anderson (2004), who emphasizes that an effective learning environment should involve interaction between three macro components, namely students, instructors and content. This interaction will develop individual learning experiences on a deep level of new knowledge construction (Anderson, 2004). As such, Anderson (2003) argues that a deep and meaningful interactions will occur as long as one of the three forms of interaction (students to instructors, student to student or student to the content) exists at a high level. This study focuses on dialogue and discussion in an asynchronous discussion conducted in a hybrid learning environment. Similarly, six types of interactions, recommended by Anderson and Garrison (1998) can be simply applied in an asynchronous discussion forum environment. Multilateral interaction directly affects the meaningful learning occur through a collaborative approach in exchanging knowledge. The three most interactions in asynchronous discussion forum inclusive of; (a) student-instructor (involve dialogue and feedback), (b) student-student (involve the exchange of ideas, information and dialogue among peers, using collaborative approach) and (c) students-content (i.e., learning contents, course materials). Essentially, in online environment, all interactions, including interaction with content, peers and instructors occur through the interface (in this case: the computer). In summary, this online learning theory emphasizes on an interactive learning in order to achieve meaningful learning using a collaborative approach. Asynchronous discussion forums can provide opportunities for students to interact with contents (simulation of cognitive), instructors (support and enhance learning) and student to student (social interaction) in achieving learning outcomes.

3.2. Connectivism theory

Connectivism theory means network-based learning. George Siemens is the founder of the Connectivism theory and introduced it as a learning theory for the digital age (Siemens, 2004). Based on this theory, the learning process involves cognitive and affective domains. Connectivism emphasizes two important skills in the learning process is the ability to find the latest information and filter the information. Along this line, sharing knowledge is a vital component of this theory. It is important for the

IECT 2014

node to identify the resources that are reliable, and distinguish important information to create critical thinking. At the same time, the accuracy and validity of the information may also change. This theory allows students to gain experience of active learning by finding, presenting, analyzing, evaluating and making sense of relevant knowledge and geared towards meaningful learning. Students play an important role in determining the content of learning, communication and participation. The ability of students to see the relationship between a particular field, idea and concept is the basic skills (Siemens, 2008). The activity in forum allows students to share their knowledge in the process of finding and acquiring new information that can be trusted as well as determine the links that allow them to gain experience of active learning. Overall, connectivism allows students and teachers to access the latest information as well as to provide meaningful learning opportunities.

4. Conceptual framework

Conceptual Framework (Figure 1) is grounded on social constructivist learning theory. Two additional theories supporting this study are theory of online learning and Connectivism. In order for meaningful discussion to occur, an interactive interaction should take place in a constructivist learning environment. In addition, based on social constructivist learning theory, asynchronous discussion forum using collaborative approach is proposed in this study. This forum is conducted using an online learning facility in hybrid mode and supported by the theory of online learning. Theory of online learning emphasizes interaction and the computer interface acts as mediator for communication to occur between peers, instructor and content. Principles of connectivism are applied by the students in order to produce meaningful learning. To collect a comprehensive data on students' engagement and also on knowledge construction, three methods of analysis are proposed in this study: (i) content analysis, (ii) listening behavior (categorization of students according to their level of interaction) and (iii) social network analysis (SNA). This study also attempts to examine the correlation between the level of knowledge construction and social network, for instance between centrality and the knowledge level. Consistently, Gunawardena et al., (1997) claimed that high level of interaction will produce a high level of knowledge construction as well.

5. Contribution to knowledge

This framework has also made some contributions to the knowledge about online discussion forums.

- The main contribution of this study, is perhaps the multiple analyses in order to obtain comprehensive and extended information on students' engagement and knowledge construction. This study has proposed three methods of analysis on the forum content, namely, content analysis, cluster analysis and social network analysis. It is hoped that this suggestion will contribute to the online discussion literature.
- Cluster analysis on the patterns of listening behavior proposed by Wise (2012) is not widely used. Thus, the authors suggest this analysis to be used in evaluating the students' interaction level. This method can assist the instructor in identifying the types/clusters of students in order to facilitate teaching and learning using online discussion (especially to increase their levels of interaction and knowledge construction).
- Next, the combination of three theories (social constructivism, theory of online learning, Connectivism theory) that formed the theoretical proposal will contribute to the online discussion literature.
- Thus, this study provides a conceptual framework for further studies, especially for future research in online learning environment.

6. Conclusion

Realizing the importance of social interaction in producing higher knowledge construction, enhancement on students' achievement and producing critical thinkers, this study attempts to innovate a conceptual framework. The results of this study are expected to increase knowledge construction and interaction levels using a collaborative approach. Therefore, learning can be most effective when appropriate methods are applied to achieve its goal. This conceptual framework may aid and contribute as an alternative approach to instructors in monitoring the students' engagement and social interaction level. The proposed conceptual framework may benefit higher institutions.

IETC 2014

A replication study on the multi-dimensionality of online social presence

David B. Mykota

College of Education, University of Saskatchewan, Saskatoon, Saskatchewan, S7N 0X1 Canada

Abstract

The purpose of the present study is to conduct an external replication into the multi-dimensionality of social presence as measured by the Computer-Mediated Communication Questionnaire (Tu, 2005). Online social presence is one of the more important constructs for determining the level of interaction and effectiveness of learning in an online environment. This study is unique as it provides the opportunity to replicate previous research on the dimensionality of the instrument and offers insight as to the nature of social presence among students enrolled in higher education postgraduate online courses.

Keywords: replication analysis, social presence, online learning

IETC 2014

1. Introduction

To frame good pedagogical practices for online learning, Garrison, Anderson, and Archer (2000) developed the community of inquiry model recognizing the transactional relationship between instructors and learners through the interaction of cognitive presence (of the learner), teaching presence (i.e. the structure and process), and social presence (i.e. affective interpersonal communication). According to Garrison et al. (2000), these elements, which define the community of inquiry model, are fundamental to a successful higher education learning experience. A key component in the model is the concept of social presence that refers to the affective domain as it relates to interpersonal communications. If social presence is absent, learner frustration develops because of the poor quality of interpersonal interactions (Rifkind, 1992). Conversely, a high degree of social presence in online learning is viewed as synonymous with an interactive environment (Lobry de Bruyn, 2004; McIssac & Gunawardena, 1996).

In assessing social presence within a text-based, asynchronous environment, three categories of communicative responses have been identified (Rourke**,** Anderson**,** Garrison**,** & Archer, 2001): affective indicators (i.e., values, beliefs, feelings, and emotions); cohesive indicators (i.e. group presence and commitment); and interactive indicators (i.e., attending in a socially meaningful way). Although Rourke et al. (2001) recognize that the coding and analyzing of CMC text-based transcripts using the aforementioned indicators provides a measure of the density of social presence, they also contend future exploratory studies including factor analysis would aid in further defining the construct.

The construct of social presence is the critical affective ingredient for online learning. Although earlier research on social presence has found it to be related to learner satisfaction (Gunawardena & Zittle, 1997) others such as Wise, Chang, Duffy and del Valle (2004) argue that it is more of a correlational than causal variable. Nevertheless, several researchers have demonstrated that social presence is one of the more important constructs to determine the level of interaction and effectiveness of learning in an online environment (Garrison et al., 2000; Gunawardena & Zittle, 1997; McIssac & Gunawardena, 1996; Lobry de Bruyn, 2004; Richardson & Swan, 2003; Rourke et al., 2001; Tu & McIssac, 2002). For example, Kim, Kwon, and Cho (2011) found that students who valued media integration, quality instruction and interactivity had increased social presence perception and heightened learning satisfaction While So and Brush (2008) demonstrated that in a distance learning environment, student perception and overall satisfaction of collaborative learning is associated with social presence (So, 2008).

Part of the difficulty in aggregating findings is the varying way that researchers have measured and reported social presence. For example, earlier efforts were found lacking because they were created for the face-to-face environment and then adapted to online learning without proper validation procedures. Recently, Sung and Mayer (2012) found a five-factor solution for the Online Social Presence Questionnaire that included social respect, social sharing, open mind, social identity, and intimacy. However, according to Sung and Mayer (2012) a limitation of their study is that it focused only on university students in Korea and consequently future research needs to examine if similar findings would be replicated in samples with different ages, genders, grades, intellectual levels, and cultural backgrounds.

Another instrument that has been developed to measure the construct, social presence, in a computer-mediated communication (CMC) environment is the Computer Mediated Communication Questionnaire (CMCQ; Tu 2005). The exploratory factor analysis of the CMCQ resulted in a four factor multi-dimensional model of online social presence (Tu & Yen, 2006). With the increased frequency of research reports using the CMCQ (Mykota & Duncan, 2007; So, 2008; So &, Brush, 2008; Stein & Wanstreet; 2003; Tu & McIssac; 2002; Tu & Yen, 2007) the need to explore the multidimensional characteristics of the instrument with different samples in varying contexts (i.e. replication analysis) is warranted so as to advance understanding of the construct's operationalization and interpretation.

Problematic to replication analysis are the lack of standardized metrics available to make informed comparisons of exploratory factor analysis (EFA) procedures conducted with separate data sets. Good EFA studies detail what might be expected for replication results. This can include the number of factors present, whether the factors are correlated or not, the factor loadings for the communalities that comprise the factor and the names of the factors as informed by substantive interpretation which includes the theoretical underpinnings for the factors identified (Osborne & Fitzpatrick, 2012). With the lack of standardized metrics, a similar procedure is advocated for EFA replication purposes whereby items are examined to see if they load to the same factors and if the individual item factor loadings are equivalent (Osborne & Fitzpatrick, 2012).

2. Purpose

With procedures for analysis having been reported in the literature and a basis for the interpretation of EFA replication data established it was decided to undertake a replication analysis. The main objective of the study then is to conduct an external replication (i.e. an independent external sample) of the CMCQ (Tu, 2005) using the same EFA procedures as previously reported by Tu and Yen (2006). By doing so a better understanding of the instrument's (CMCQ; Tu, 2005) generalizability will occur while adding to the extant research on the measurement of the construct social presence in an online learning environment.

3. Method

The participant sample is derived from students enrolled in the postgraduate special education program offered at the University of Saskatchewan. The postgraduate program is comprised of 9 courses that are delivered over two years. Using convenience sampling, 275 students (90% response rate) enrolled in the postgraduate program participated in the study. Participants in the study voluntarily completed the computer-mediated communication questionnaire (CMCQ; Tu, 2005). The sentence stems on the CMCQ were used to identify social presence in a text-based system with the CMC tools (email, discussion, and chat) The respondent was asked to complete each of the instrument's 24 items on the basis of a five-point Likert scale converted to a numerical weighting ranging in options from 0 (uncertain); 1 (strongly disagree); 2 (disagree); 3 (agree); and 4 (strongly agree). The frequency counts for the demographic variables age, sex, and numbers of online classes taken are reported in Table 1.

IETC 2014

Table 1. Frequency Demographics, N=275

	Frequency	Percent
Sex		
Male	20	8.3
Female	254	91.7
Age		
18-25	39	14.1
26-33	95	34.3
34-41	84	30.3
42 or older	59	21.3
Number of Online Courses		
1 course	113	40.8
2-3 courses	78	28.2
4 or more courses	86	31.0

To determine the adequacy of the sample for factorial analysis the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (i.e. KMO) and Bartlett's Test of Sphericity were calculated. The replication analysis of the CMCQ's multidimensionality also included a reliability analysis of the instrument's items. A visual inspection of the corrected item total correlations for the CMCQ was conducted with items below .10 deemed as outlier test items with a Cronbach alpha reliability coefficient value equal to or above .70 considered to reflect a high internal consistency. Following the procedures previously reported by Tu and Yen (2006) a principal components analysis with varimax orthogonal rotation was conducted on those items deemed to reflect high internal consistency. Subsequent to the orthogonal rotation a principal axis factor analysis using a promax oblique rotation was undertaken. In determining what factors were to be retained a two-line scree test of those the factors with eigen values >1 was applied. The methods described for the exploratory factor analysis replicates the methods of the initial validation study conducted (Tu & Yen, 2006). By following the same procedure undertaken by Tu and Yen (2006) a comparative analysis of whether the same factor structure with equivalent factor loadings and item communalities of the CMCQ can occur. The methods outlined are consistent with procedural aspects of replication analysis as reported by Osborne and Fitzpatrick (2012). As an external replication of the previously reported EFA undertaken (Tu & Yen, 2006) the present study adds value as it aids in determining the degree to which the CMCQ factor structure generalizes to a new data set and if there are any items considered challenging or problematic.

4. Results

A reliability analysis for the instrument (i.e. 24 items) was conducted with two items deemed as outliers and removed (i.e. items 4 & 19), see Table 2. The 22 remaining items reflected relatively high internal consistency with a Cronbach alpha reliability coefficient calculated at .732. In determining the appropriateness of conducting a factor analysis the Kaiser-Meyer-Olkin (KMO) Measure of Sampling Adequacy and Bartlett's Test of Sphericity were calculated (Tabachnick & Fidell, 2007). For the data the KMO statistic is between .7 and .8 (i.e. .734) which is deemed as being good, this indicates the sample should be adequate for the conducting of a factor analysis (Hutcheson & Sofroniou, 1999). Bartlett's Test of Sphericity tests the null hypothesis that the correlation matrix is an identity matrix, which implies the variables are uncorrelated. In this case, Bartlett's Test of Sphericity was significant (χ^2 (754) = 231 p < .05) which leads to the

IECT2014

rejection of the null hypothesis and to the conclusion that there are correlations in the data set and that the data is appropriate for the conducting of a factor analysis.

Table 2. Item-Total Statistics

Item	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
q1	46.6606	87.463	.345	.719

q20	47.7263	85.328	.333	.718
q21	46.8686	89.052	.267	.724
q22	46.3102	91.021	.172	.729
q23	46.8029	85.023	.389	.714
q24	48.0073	88.601	.145	.736

Like the initial EFA validation study conducted by Tu and Yen (2006), a principal components analysis with varimax orthogonal rotation was used to explore the underlying factor structure. Using the Kaiser criterion the first stage of the analysis identified seven components with eigen values greater than 1. In total these components accounted for 51.4% of the variance in the test items. The five factor pattern that best met the criteria of simple structure (Thurstone, 1947) and was clearly interpretable, and in this instance replicable as reported in the previous EFA (Tu & Yen, 2006), was retained. In the rotated component matrix the five components were well defined by 3-4 test items that had high loadings (≥.320) on only one component with those items that did not have a high loading on any one component or loaded across components excluded, see Table 3.

In the previous EFA with the CMCQ (Tu & Yen, 2006) a promax oblique rotation was also conducted because aspects of the multidimensional construct social presence as measured by the CMCQ were correlated. For the second phase of the EFA replication analysis, a similar procedure was adopted to determine the degree of correlation between the factors. In the principal axis factoring analysis using a promax oblique rotation, seven factors with eigen values greater than 1 were extracted accounting for 51.4% of the variance. A process similar to that used for the identification of a simple structure that is clearly inter-

pretable and replicable resulted in a five-component solution being retained. In the original EFA conducted by Tu and Yen (2006) the structure matrix was used for interpreting the oblique rotation. The structure matrix is a simple correlation of the variables with the factors. Following the procedures conducted in the original EFA, items with correlations ≥.320 for a factor and not correlated with another factor were retained see Table 4.

Following the EFA procedures conducted by Tu and Yen (2006), both the item and factor loadings for the principal components analysis with varimax orthogonal rotation and the structure matrix for the principal axis factoring analysis using a promax oblique rotation were reported. In keeping with EFA replication practices (Osborne & Fitzpatrick, 2012) the factor structure and squared difference for item loadings on the factors for the orthogonal rotation and oblique rotation used in the original (Tu & Yen, 2006) and replication studies were compared. The factor structure and item loadings for the principal components analysis with varimax rotation are reported with the squared difference for item loadings determined, see Table 5. A similar procedure was used for the oblique rotation and is presented in Table 6.

In the replication analysis the five factor solution was comprised of the Social Form of Communication, Privacy, Intimacy, Social Context, and Interactivity factors, see Table 7. The Social Form of Communication factor was realted to how CMC is viewed as a pleasant, social form of communication. The Privacy factor was related to the confidentiality of the CMC medium. The Intimacy factor describes the degree to which students express their personal stories and feelings. The Social Context factor realted to the ability of CMC to build trusting, caring, social relationships. Finally, the Interactivity factor related to one's CMC skill set and communication style.

Table 7. External Replication: Factors, Items, and Item Stems

Factor	Item	Item Stem
Social form of Communication	7	CMC is a pleasant means of communicating with others
	1	CMC are social forms of communication
	15	CMC allows realtionships to be based upon sharing and exchanging information
Privavcy	18	It is unlikely that someone might obtain personal information about you in CMC
	14	CMC is technically reliable (e.g. free from reliability errors).
	24	It is unlikely that someone might redirect your messages.
Intimacy	11	The language used to express oneself in CMC is meaningful
	3	CMC messages convey feeling and emotion
	12	The language used to express oneself in CMC is easily understood.
	17	The aggressive over-participation of others in CMC may cause to participate less.
Social Context	16	CMC allows me to build more caring and social relationships.
	20	CMC permits the building of trust relationships
	6	CMC is a sensitive means of communicating with others.
Interactivity	22	My keyboarding skills allow me to be comfortable participating in CMC.
	23	I am comfortable with the communication styles employed by CMC users.
	13	I am comfortable participating, even if not familiar with the topics.

5. Discussion

The external replication failed the most basic tenant of internal consistency reliability analysis with the determination of outlier test items (i.e. items 4 & 19). Nevertheless the reaming 22 items did meet the

IETC 2014

threshold for retention with the Cronbach alpha reliability coefficient deemed as moderately good and the sample determined to be appropriate for factor analysis.

In assessing the congruence of the factor matrixes presented it is clear that the communalities and item loadings for the factors do not meet structural equivalence in the strictest sense. Although the factor structure and pattern for item loadings across factors differs from the original EFA validation study conducted by Tu and Yen (2006) there are some similarities that are worthy noting. As such, there is some evidence that the Privacy, Social Context and Interactivity factors and item loadings have moderate item equivalency.

In both studies the Privacy factor was the second factor retained in the factor matrix. In the original EFA oblique rotation it accounted for 7.241 percent of the variance (Tu, 2005). In the replication analysis the amount of variance accounted for was slightly higher at 8.106 percent. Items 24 and 18 in both studies loaded above the .320 correlation with the squared difference for the item loadings being low. The Social Context factor (i.e. factor 1), in the original EFA, accounted for the most variance at 24.042 percent (Tu, 2005) whereas in the replication analysis the amount of variance explained was 5.625 percent. For comparative purposes in the original EFA items 1, 3,16, and 20 had item loadings that warranted retention. In the replication analysis the item loadings were mixed with 16 and 20 loading on the Social Context factor (i.e. factor 4), item 1 loading on the Social Communication factor (i.e. 1) and item 3 loading on the Intimacy factor (i.e. 3). In all instances the squared differences for the four items is low, however, only items 16 and 20 loaded on a single factor. The last remaining factor that exhibited moderate equivalency was the Interactivity factor. In the original EFA the Interactivity factor (i.e. factor 3) accounted for 6.839 percent of the variance (Tu, 2005) whereas in the replication analysis it accounted for 5.469 percent of the variance (i.e. factor 5). For comparative purposes two out of the three items from the original EFA loaded in the replication analysis. In this respect, items 13 and 23 had low squared differences whereas item 8 which loaded on the Interactivity factor in the original EFA validation did not in the replication analysis and instead had a relatively low item loading on Factor 3.

Further similarities between the original and replication EFA studies can be found among those items that did have component loadings above the absolute value. (i.e. .320). In this instance items 2, 5, 19 and 21 did not load on any communality in either study. Based then on the results of the replication analysis there is some evidence of moderate to low equivalency with the original EFA, however it would be erroneous to assume the strong structural equivalence exists. As to why this might have occurred it is important to understand that an EFA external replication analysis is specific to the context and sample from which the study originated. In the present replication analysis, limitations exist in the sample as it was drawn from those individuals who had little or no previous experience with online learning.

As well, the sample is from a different cultural context. In this respect, cultural mindset and native language communication patterns have been shown to shape computer mediated communication patterns (Yildiz, 2009). The degree of media integration in online learning has also been found to be a significant predictor of social presence (Kim, Kwon & Cho, 2011) and could be another possible explanation as to potential differences within the online programs from which the sample was drawn. Although the sample for the replication analysis is not heterogeneous in gender composition, research on the construct social presence has found that gender differences do not exist (Kim, Kwon & Cho, 2011; Tu, Yen & Blocher, 2011).

IETC 2014

6. Conclusion

In the external replication analysis convenience sampling was used, however, this is viewed as a limitation as it affects the generalizaibilty of the results. Future research should continue external replication of social presence instrumentation in varying contexts and with more systematic sampling procedures. As well, refinement of the item pool and item construction of the CMCQ might alleviate some of the issues surrounding structural equivalence and the generalization of findings.

Abstract

The learning of science has always been a major obstacle for our Italian students. The cause is probably not to be found in the complexity of the content, but rather in the particular in which way learners are usually initiated in these subjects. The purpose of this study is to focus our attention on the possible positive effects that digital teaching aids can have on learning-related scientific disciplines. In fact, it is thought that the new digital tools can be a bridge between students' prerequisites and the teacher's, and ensure the achievement of objectives that do not concern only the content, but above all the means of achieving path to achieve them. In particular, we discuss an experience conducted at the Professional Institute "L. Scarambone "Lecce (in the South of Italy). With this brief research we will evaluate the effects on the development of the skills of logical and scientific tools online that foster the development of scientific content better than traditional teaching with the paper book.

Keywords: education; technology

1. Introduction

Italian students have always difficulties in scientific learning. The causes, of course, are many: the complexity of the issues, but also the unique approach by which the learners are usually introduced to these subjects. So far the only and almost exclusive tool for knowledge has always been the textbook, which has long been under surveillance on suspicion of its prevailing dogmatism and of its unecessary methods for the construction of scientific knowledge. Today, in contrast to the past, we have in addition to the traditional textbook, another resource, the digital one, on whose validity the debate is still very open. To my knowledge we have in fact, at present, no quantitative data on the possible positive effects of the use of computer tools used in the writing processes. But we could do some reflection and think about alternative teaching strategies, also pursuant to Article 11 of Law no. 221/2012 (and recently specified by Ministerial Decree of 27 September 2013 n. 781), which provides "per le nuove adozioni, a decorrere dalle scelte effettuate nell'anno scolastico 2013-2014, a valere per l'anno scolastico 2014-2015, libri di testo in una nuova versione digitale o mista (costituita da un testo in formato cartaceo e da contenuti digitali integrativi, oppure da una combinazione di contenuti digitali e digitali integrativi)" [for new adoptions, on the basis of the choices made during the school year 2013-2014, applicable to school year 2014-2015, textbooks in a new digital version or a mixture (consisting of a text in printed format and digital content supplements, or a combination of digital content and supplementary digital]. If the student was dropped in an immersive environment, i.e. in a class that makes use of digital technologies that stimulate multimodal perception, then he or she would actually acquire not only the best knowledge of scientific content - for which we have already done some research that has produced positive findings - but also best quality in written text. For this purpose, we present a small experiment carried out in Lecce - my own town in Italy, - offering results which, although still to be verified, given the paucity of available data, may reveal important clues about the different impact of the two strategies on the language skills acquired, which suggest an area for comparison studies and an opening towards the use of new technologies in teaching.

2. The school

The "Luigi Scarambone" Vocational School in Lecce is a higher secondary education (average age 15-18). The school has about thousand students, mainly from disadvantaged backgrounds with a low level of aducational achievement. Some attend day and others evening courses. Precisely because of the lack of trust and willingness to study which is seen only as an obligation to be fulfilled, and not as an opportunity for personal growthand social redemption, in the school in question there is also a high level of non attendance, equal to 21.24% and of failure to gain any qualifications, 12.46%.

2.1. The i.School Project

Dario Cillo, the school principal, has a difficult environment to manage, as he said during the XVIIII GISCEL Conference (Group Intervention Study in the field of Education and Linguistics) "si è dato come *mission* quella di valorizzare la didattica laboratoriale come strumento prioritario per l'acquisizione di conoscenze e competenze. Il *learning by doing*, come avveniva nella bottega artigiana, è divenuto, anche nel quadro di discipline non propriamente laboratoriali, e grazie alla didattica digitale, la metodologia di base per l'Insegnamento/apprendimento, favorendo - attraverso la manualità, la manipolazione, l'uso multimediale dei sensi - il dialogo costante del "fare" con il "sapere"". [He said that his mission is to enhance teaching methodology, as a means for the acquisition of knowledge and skills. The *Learning by doing* method, as it happens in the artisan shop, has become, even in the context of disciplines which are not properly practical, and thanks to digital learning, the basic methodology for teaching / learning, encouraging - through the textbook: through handling - the multimedial use of the senses - the ongoing dialogue of "doing" with "knowledge".] (Cillo, Miglietta *in press*). The "L. Scarambone School was one of the first schools in Italy, from 2009, to adopt Classroom 2.0 (14 are planned by the end of 2014), and to experiment the use of tablets and wireless networks in education." (Cillo, Miglietta *in press*). The school, thus conceived, immerses each student in a motivating enviroment and equipped with various formats of computer: from desktop to tablet. While the textbooks are supported by self-produced digital texts, learning objects, specific apps, as well as handouts and books produced by the teachers and collected in a specific Learning Object Repository. As stated by principal Cillo "Sulla scia delle esperienze del *Future Classroom Lab* di *European Schoolnet* e del modello *TEAL (Technology-Enabled Active Learning)* proposto dal *MIT*, nonché dei primi esperimenti italiani di Aule 3.0, abbiamo realizzato la nostra Aula 3.1, riscoprendo ruolo e funzione del laboratorio come micro-rappresentazione di spazi aperti, mobili e componibili per la didattica digitale" [In the wake of the experiences of the Future Classroom Lab of European Schoolnet and the model TEAL (Technology-Enabled Active Learning) proposed by MIT, and the first experiments of Italian Classroom 3.0, we made our Classroom 3.1, rediscovering the role and function of the laboratory as a micro-representation of open spaces, with modular furniture for digital learning.

3. The experiment

In the experiment carried out in Scarambone Vocational School we took in consideration two 2nd grade classes. They were dealing with a unit of the science curriculum, related to the cardio-circulatory system: in one class, which we will call "class A", this was dealt with only the aid of the traditional textbook; in the other, "class B", however, the same topic was illustrated using the 3D *Heart Decide,* an iPad app. After a series of lectures given, by the same teacher for the same number of hours, each student in classes A and B was asked to produce an expository text about the cardio–vascular apparatus. Through comparative analysis of the texts produced in the two classes we were able to detect similarities and differences. For the study of the peculiarities of the projects we will focus mainly on the connectives, i.e. the yield of reformulations, oppositions, simplifications, conclusions, etc.. which are the focal points of a scientific text. We should stress, in fact, the difficulties that students encounter in the planning process of the text, due to the lack of competence in the introduction of new referents in the construction of logical relationships between concepts sometimes made by connections which are too far apart, or sometimes poorly reported or not reported at all.

Let us start with traits that best characterize the texts produced by the two classes under study. As already remarked by Steve Higgins in his *Does ICT Improve Learning and teaching in schools?* in a systematic survey conducted by Goldberg, Russell and Cook (2003), students who use computers when

IECT 2014

learning to write, are not only more motivated, but produce longer and better quality texts than those written by hand. And this is precisely what determines the gap between the texts of Classe A and B. The texts of the former were shorter - no more than half a page - not very precise and less detailed than those produced by class B, which were even two pages long and stringent and detailed in the description not only of the operation of blood circulation, but also of the organs involved in it. The texts of the class subjected to the bookish style, showed a lack of conceptual elaboration and contained empty phrases such as: "il cuore è uno degli organi più importanti" [The heart is one of the most important organs]; il cuore è formato da tessuto muscolare" [the heart is made up of muscular tissue]; " il cuore è un organo involontario; il cuore è un tessuto muscolare cardiaco striato"[the heart is an involuntary organ; the heart is a striated cardiac muscle tissue] that reproduce statements from the textbook. The texts of class B, however, were more original. Each started with different opening words, probably because they were the result of a personal re-elaboration of thought, freed from the written page.

- "La porta superiore del cuore si chiama atrio" ["The upper chamber of the heart is the atrium"]
- "Tutti noi per respirare abbiamo bisogno di ossigeno per respirare" ["To breathe we all need oxygen"]
- "I due vasi arrivano nella porta destra del cuore e la porta superiore detta atrio" ["The two vessels arrive in the heart's right chamber and the atrium's upper chamber"]

"L'ossigeno deve arrivare alle cellule per produrre energia (ATP) attraverso il sangue" ["Oxygen has to get to the cells to produce energy (ATP) [ATP: "Adenosine Triphosphate"] through the blood"]

In addition, in the texts of Class A, which made use only of the textbook, there were some gaps in the transition from small to large cardio-circulation: not always, in fact, thematic progression was respected. The hierarchy of topics was evaded and then logical consistency was also sacrificed. Instead, in the texts of class B, thematic progression was achieved in almost all cases and logical consistency respected. Another substantial difference is noted at the lexical level. In fact, while in Class A, vocabulary was limited and there was scarce use of adjectives, in the texts of Class B, as well as a general lexical richness, a vivid array adjectives was noted. For example, blood was characterized as ruby red, bright red, in Class B as opposed to dirty blood, oxygen-rich in Class A. Regarding the similarities, however, from the analysis of the texts available, it can be observed that the two classes presented, albeit at different levels, a deficit in the development, organization and grammaticalization of thought. Juxtapositions, fragmented syntax, a set of referents often embedded in a text that was not very consistent and orderly, are traits that are common to the designs of both classes. In particular, in those of Class A, syntax was extremely elementary and proceeded predominantly by juxtaposition, or by parataxis with only a few subordinate clauses. It follows that those who Prandi and De Santis (2011: 250) define as *referenti* [referents] and *processi* [processes], factors which require cohesive ties, were sometimes, if not often, rendered in a disjointed and disconnected textual structure. In Class B, despite the disjointed structure, one began, however, to glimpse a timid emergence of a more complex syntactic structure, characterized by final, causal and temporal relative clauses. In addition, there was a more frequent use of connectives that indeed have great importance in scientific texts, as they create unity and cohesion within the text and make explicit the logical-semantic relationships between parts of the text.

IECT 2014

4. Connectives

In all the texts analyzed we found:

a) explanatory conjunctions:

- "Il cuore è un muscolo costituito da un tessuto muscolare cardiaco involontario, ed è diviso in quattro cavità (parti) cioè: ventricolo destro, ventricolo sinistro, atrio destro e atrio sinistro" (classe A)[2] ["The heart is a muscle consists of an involuntary cardiac muscle tissue, and is divided into four chambers, that is: the right ventricle, the left ventricle, the right atrium and the left atrium"]

- "Il cuore è un muscolo volontario. È costituito da due ventricoli cioè destro e sinistro" (classe B) ["The heart is a voluntary muscle. It consists of two ventricles i. e. left and right "]

Notice how in the first fragment that cioè ["that is"] is redundant, since it precedes a colon that, at the textual level, performs the same function.

b) adverbs of time, usually the common, 'poi' ["then"], for sequences of events:

- "[..] e le vene riportano il sangue pieno di anidrite[3] (SIC!) carbonica e di sostanze di rifiuto al cuore che poi pompa il sangue verso i polmoni per farlo ricaricare di ossigeno." (classe A) ["…and veins carry the blood filled with carbon dioxide and waste products, back to the heart that then pumps it to the lungs to make it recharge with oxygen."]

- "La circolazione del sangue parte dal cuore che attraverso le arterie porta il sangue ricco di ossigeno e di sostanze nutritive alla cellula del nostro corpo e le vene riportano il sangue pieno di anidrite (SIC!) carbonica e di rifiuto al cuore che poi pompa il sangue verso i polmoni per farlo ricaricare di ossigeno" (classe A) ["The blood circulation starts from the heart that, through the arteries, carries oxygen-rich blood and nutrients to the cells of our body and the veins carry blood, filled with carbon dioxide, back to the heart that then pumps it to the lungs to make it recharge with oxygen"]

- "La piccola circolazione sono l'arteria polmonare portano il sangue contenente CO^2 e poi prende l'ossigeno e riportano il sangue con ossigeno al cuore attraverso le vene polmonari" (classe A) [The mall circulation is the pulmonary artery carrying blood containing CO^2 and then takes the oxygen and carries blood with oxygen back to the heart through the pulmonary veins"]

- "Il colore del sangue è rosso scuro e rosso vivo. Il sangue è rosso scuro quando è ricco di anidride carbonica che poi verrà ripulito nei polmoni e riportato al cuore attraverso le vene polmonari" (classe B) [The colour of the blood is dark red and bright red. The blood is dark red when it is rich in carbon dioxide which is then cleaned up in the lungs and carried back to the heart through the pulmonary veins"]

- "le vene entrano nel cuore e finiscono nell'atrio destro dove il sangue è pieno di ossigeno attraverso le vene arriva il sangue sporco lo portano nell'atrio destro dove poi viene pulito e poi lo portano nel corpo" (classe B) ["the veins go into the heart and end up in the right atrium where the blood is full of oxygen. The dirty blood comes through the veins. lt is carried to the right atrium where it is cleaned up and then carried back to the body"]

There were also some cases also 'dopo' ["after"] the conjunction that introduced an implicit temporal sentence:

- "Questo sangue "sporco" passa nel ventricolo destro e tramite l'arteria polmonare viene portato nei polmoni lasciando CO^2 e prendendo ossigeno, dopo essersi ripulito tramite la vena polmonare il sangue ritorna al cuore" (classe B) ["This "dirty" blood passes through the right ventricle and trough pulmonary artery is brought into the lungs, leaving CO^2 and taking oxygen. The blood, after being cleaned through the pulmonary vein, returns to the heart"]

[2] Some of these fragments are available also in Cillo, Miglietta, *in press*
[3] The yield of t d is due to interference of the phonetic dialects of Salento. The same phenomenon can also be observed in the next fragment.

IECT 2014

The only cases of progression of tenses are sometimes entrusted to the tenses, the future or the past participle:

- "nella piccola circolazione cioè al cuore ai polmoni viene trasportato sangue ricco di anidrite carbonica e verrà ripulito nei polmoni e riportato al cuore attraverso le vene polmonari" (classe B) ["In the small circulation that is the carbon dioxide -rich blood is transported from the heart to the lungs and it will be cleaned inside the lungs and carried back to the heart through the pulmonary veins"]

- "il sangue, ricco di ossigeno e nutrienti viene distribuito in tutto il corpo (periferia), partito dall'aorta passano arterie, arteriole e capillari arteriosi arriva nella cellula, arrivato nella cellula il sangue lascia l'ossigeno e nutrienti e prende CO_2 e sostanze di rifiuto" (classe A) ["the oxygen-rich blood is distributed throughout the body (periphery), coming from the aorta through arteries, arterioles and capillaries get into the cell. When the blood arrives into the cell, leaves the oxygen and nutrients and takes CO^2 and waste products"]

c) the adversative conjunction 'mentre'["while"] was very frequent in the texts of Class B, but occured only once in those of Class A:

- "l'arteria esce dal cuore mentre la vena entra" (classe B) ["the artery leaves the heart and enters into it"] (Class B)

- l'arco toracico si divide in due parti importanti: dal cuore all'addome viene chiamato arco toracico mentre dall'addome al bacino viene chiamato aorta addominale" (classe B) ["the chest arch is divided into two major branches: from the heart to the abdomen it is called chest arch while from the abdomen to the pelvis it is called the abdominal aorta "]

- [...] il sangue è ricco di ossigeno ed è di colore rosso vivo mentre nella piccola circolazione il sangue è ricco di anidride carbonica ed è di colore rosso scuro" (classe B) ["the blood is rich in oxygen and is bright red while in the small circulation blood is rich in carbon dioxide and is dark red in color"]

d) The conjunction 'inoltre' ["furthermore"], sometimes, rather than being an additive, serves to mark an orderly succession, serving as filler, a conversational signal:

- "La pressione arteriosa varia, il picco massimo si ha quando il cuore si contrae (pressione sistolica) mentre il minimo (pressione diastolica) si ha per le contrazioni quando il cuore si espande e si riempie di nuovo di sangue. Le arterie inoltre aiutano il cuore a pompare sangue. Fatta eccezione per le arterie polmonari, che portano il sangue ai polmoni per ossigenarlo. Inoltre, le arterie vanno rimpicciolendosi in condotti sempre più piccoli" (classe B) ["blood pressure varies, the maximum peak occurs when the heart contracts (systolic) and a minimum (diastolic) when the heart expands and refills with blood. The arteries also help the heart to pump blood. Except for the pulmonary arteries, that carry blood to the lungs to oxygenate it. Furthermore, the arteries tend to shrink into ever smaller ducts"]

e) The adversative conjuction, 'invece' ["whereas"] does not occur in the texts of Class A, but in the texts of Class B is less frequent than 'mentre' ["while"]:

- " Quando il cuore si contrae si chiama sistole whereas quando il cuore si rilassa chiama diastole" (classe B) ["When the heart contracts it is called systole, whereas, when the heart relaxes it is called diastole"]

IECT 2014

- "Il sangue delle vene è composto di anidride carbonica ed è più scuro, invece il sangue delle arterie è più chiaro perché è composta da ossigeno." (classe B) ["Veins blood is composed of carbon dioxide and is darker, whereas the arterial blood is lighter because it is made up of oxygen"]

- "Le arterie, invece, fanno in modo che avvenga la grande circolazione, cioè il sangue ricco di ossigeno, quindi di colore rosso vivo, vada dal cuore alla periferia (SIC!)" (classe B) [The arteries, whereas, are so that the large circulation takes place, i.e., the oxygen-rich, then bright red, blood go from the heart to the periphery"]

As can be seen, in the last fragment there are three cohesive conjuctions: adversative, explanatory and conclusive that, however, are not used proficiently: we are faced with a complicated sentence before presenting complex anomalies, probably due to a poor habit of stand-alone text planning.

f) the adverb'infine' ["finally"], indicating the final stage of a process, in this case blood circulation, occured only once in the texts produced by Class B:

- In questa maniera il sangue rilascia l'ossigeno alle cellule e prende l'anidride carbonica. I capillari si raccolgono infine nelle vene dove viene riportato il sangue al cuore" (classe B) ["In this way, the blood releases oxygen to the cells and takes up carbon dioxide. Finally the capillaries gather into veins where the blood is carrried back to the heart"]

g) the conjunction 'quindi' ["then"], with explanatory value, occurred only once in texts of Class B:

- "Le vene fanno in modo che avvenga la piccola circolazione, cioè i sangue ricco di CO^2 (anidride carbonica) quindi di colore rosso scuro, arrivi nell'atrio destro [….]" ["The veins allow the small circulation take place, i. e. allow the blood rich in CO^2 (carbon dioxide) and therefore of a dark red colour, to reach the right atrium"]

5. Conclusions

From this brief analysis we put forward conclusions on what might be the results if we adopt new technologies instead of the textbook, which, however, we do not believe should be discarded altogether, but rather kept as support.

As we have noted, the class that used the iPad achieved positive results, and performed better than the class that stuck to the traditional textbook. The texts they produced were longer, richer in scientific-technical terms and adjectives that best characterize body parts than the texts of the students who studied with the textbook alone. This constituted a substantial difference.

Furthermore, although there were no significant differences particularly with regard to the syntactic-textual structure of the texts produced by the two classes, the fact that there is a particular incidence of use of juxtapositions and coordinated sentences in Class A compared with a higher frequency of use of subordinated in the texts of Class B should not be underestimated. In addition, even connectives, which are almost non-existent in the texts produced by Class A, -only a few examples of 'poì', 'cioè'- are more numerous in texts produced by the class that used the iPad. Indeed, you can sometimes count as many as three in a single period, although at a syntactic level they are not always proficiently employed.

These results should, therefore, lead us to reflect upon the potential of new educational media, which stimulate cooperative learning, and put the student at the center of the learning process. The student thus becomes an active subject of his or her knowledge, who constructs ideas, reworks, plans his or her own content in texts that affirm his or her originality and his or her distance from a prepackaged knowledge, which is that offered by the traditional textbook. On this subject, Edgar Dale already expressed similar ideas almost seventy years ago. The American educator, in 1946, in his *Audio-visual methods in teaching* denounced the abstract verbiage of the textbook in favour of the introduction of audio-visual media in

IETC 2014

schools of all levels in order to promote a real learning as opposed to a 'bookish' one. Dale noted that the adio-visual media should not be used mechanically, but in an "operational sharing of ideas."

But to ensure that visual data form the basis for a good text it is necessary to achieve a methodology which integrates science and linguistics where these two must learn to work together, so that "doing" science with new technologies converge with "doing" language. As Cristina Lavinia (2004:93) noted, "dobbiamo superare la "scissione tra le due culture" , la cultura umanistica e quella scientifica, che spesso sembrano non comunicare tra loro; per cui, chi possiede l'una pensa di non poter capire l'altra e, in particolare, di non poter dir niente a proposito di contenuti sentiti come proprietà esclusiva di ciascuno" [we must overcome the "split between two cultures", the humanistic and scientific ones, which often do not seem to communicate with each other. In fact, he who comes from one of two backgrounds thinks he can not understand the other and, in particular, that he can not say anything about the contents which are reported upon as exclusive domain of the other].

As I noted at the eighteenth Giscel conference "one might think, for example, of using digital technology for the construction of the text, even during the science lesson: a lesson in two voices. On one hand the display of the small and large blood circulation, on the other the diagrammatic representation of a mirror, to be filled with the individual portions of text, that correspond to the individual paragraphs, and the branches connecting the logical connectives that join in succession, temporal and causal, blocks of text. Replacement exercises can then be designed to verify the changes of meaning or miscommunication when the wrong cohesive ties are created, or even the cohesive sense is omitted. One can show how a '"myocardial infarction of the text" can be produced when "cohesive movement" stops just like it happens in our body. In short, it would be desirable to reflect on language, grammar on the 'anatomy', to prove that the movement works if the grammar of the text works. We are only at the first steps. We must learn to walk together towards a new integrated scientific-humanistic digital teaching.

A service learning student-community project

George Kontos[a,]*
[a]*Western Kentucky University, 1906 College Heights Blvd., Bowling Green, KY 42101*

Abstract

A collaborative project is described. In this project, students in a web design class were asked to contact local non-profit organizations and create websites (collections of web pages) to benefit these non-profits. Two phases of the project, planning and implementation, are described. The project, suitable for both online and face-to-face instruction, required that students keep a journal. The instructor did a follow-up investigation to assure that the websites that students created were indeed what the non-profit asked for.

Keywords: web; page; site; webpage; website; design; planning; implementation; online; face-to-face; student; business; community; collaboration; service; learning; project; journal; follow-up; feedback

1. Introduction

Many non-profit organizations lack the knowledge and resources to create a website that could effectively attract the public. Web developers can be found and can certainly help, but at a price.

In my introductory web page design class students learn early in the semester that the overall process of developing a website is more than creating the web pages. Before they are assigned the project, they have already been through about two thirds of the course and they have learned that a useful website is attainable only after the planning phase has successfully been completed. The planning phase consists of defining the website's purpose and its target audience.

The steps that a student had to go through to complete the project included: create a list of local non-profits to contact and ways to contact them; identify one local non-profit that is interested and willing to work with the student; collect all needed data (logos, images, etc.); sketch the navigation structure; determine the content and links for each page; sketch the page layout for each page; and finally create the website with its web pages. Besides these steps, each student had to keep a journal and after the website was created the instructor had to make sure that it was what the non-profit really wanted.

The importance of training our students properly in web design is of outmost importance. The overall process of developing a website is not just creating the web pages and linking them together. Good planning includes sketching the navigation structure of the website and determining the content and navigation of each web page. In addition, keeping a journal of meetings with the non-profit and interactions is equally important.

2. Steps in developing a website

In my Web Design class, I spend about three thirds of a semester covering the basics of Adobe Dreamweaver with a brief introduction to HTML. A major topic during the first two thirds of the semester is website development with the emphasis being on defining the purpose and target audience. This is the

* Corresponding author. Tel.: +1-270-780-2588; fax: +1-270-745-3544.
E-mail address: George.Kontos@wku.edu

IETC 2014

first step in the planning of a website. If one does not know why this website is needed or what the intent (purpose) for the website is then the website will not be successful to accomplish anything of value. Just as important, if no thought is put into who will look at the website (audience), it will not be of interest to the ones who need the information. A simple example is that if one is to create a website to attract potential customers for a restaurant, the website creator needs to pay attention that the website should be designed as a tool whereby people learn about the restaurant and what makes it to be a good restaurant. An attractive menu advertising specials of the day with clear and attractive pictures of the dishes is essential in this case. If the restaurant caters to adults as well as to children, then the designer should take this into consideration when designing the website. At the end, the planning phase should include a navigation structure (fig. 1) that, in the case of a restaurant, might look something like this (Marrelli, 2009):

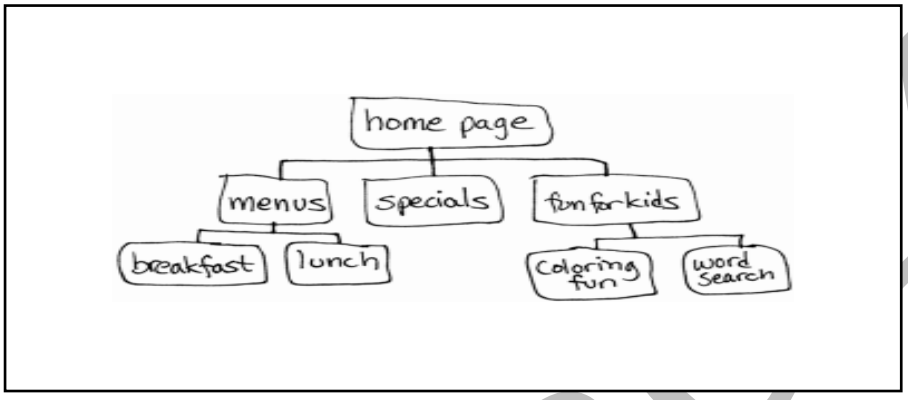

Fig. 1. Navigation Structure for the Restaurant website

Note that at this stage, the navigation structure could only be a sketch drawn by hand, although the designer could use simple and readily available software such as Microsoft Word or Microsoft PowerPoint to create it. This sketch, as it's evident in the example, should show the arrangement of the pages from general to specific.

The next phase is the implementation phase where the designer needs to use the software of choice (in my class, Dreamweaver) and create the website. In our restaurant example, this should include the needed navigation bars and the content for each page such as the one in this example that shows only one of the web pages, the Lunch Menu page (fig. 2) (Marrelli, 2009).

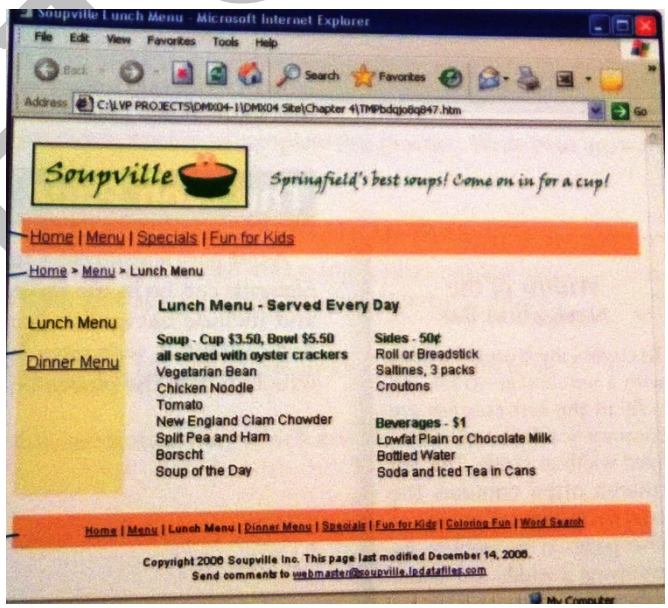

Fig. 2. Lunch Menu web page of the Restaurant website

While creating the website, the designer should carefully follow four basic design concepts. The first design concept is that an effective website should be appropriate for the intended audience by matching purpose and target audience. The second is that there should be a meaningful arrangement of the web pages that follows principles based on user expectations. The third is that the website should be consistent by using consistent cues. Finally, the fourth design concept is that it should make it easy on the user to traverse through it. These four design concepts might seem obvious but it is easy to overlook them. Once the students are introduced to these basics of website design, and after they have already created at least two websites with a few web pages each, then they are ready to work on the project.

3. Service learning

The following paragraphs briefly explain service learning (Western Kentucky University Service-Learning Faculty Handbook, 2014).

Service-learning can be described as "learning by doing while helping others." It is considered a form of experiential learning in which students participate in an organized activity that meets learning objectives and identified community needs at the same time. Course content improves the quality of student service projects. The service experience enhances student learning.

The three integral components of service learning are: meaningful service, applied learning, and reflection. Meaningful service means that faculty and students work together with the community to identify a project. Applied learning means that the project is related to the course and helps students practice what they have learned in the course. Reflection is when students can use the project for meaningful learning.

The types of service learning include Problem-solving or community-based research projects, placements at community organizations, faculty-led programs (assignments or options, student-led programs, direct-service projects, indirect-service projects, and interdisciplinary and international service-learning projects).

4. The project

The steps that a student had to go through to complete the project included:

- Research local non-profits
- Make a list of local non-profits
- Choose an interested non-profit
- Meet non-profit representatives to discuss
- Plan the web site
- Implement the plan
- Revise as needed
- Complete project to the non-profit's satisfaction

In the process, students would need to collect all needed data (logos, images, etc.); sketch the navigation structure; determine the content and links for each page; sketch the page layout for each page; and finally create the website with its web pages. Besides these steps, each student had to keep a journal and after the web site was created the instructor had to make sure that it was what the non-profit really wanted. To enhance the project's effectiveness, assessment should be conducted on any level and not just the end-product itself (the website); students should journal throughout the course of the project and document what they have learned going through the entire process. Directions for preparing the journal should include questions that the students must answer such as: How did you search for non-profits that might

IETC 2014

be interested in you developing a web page for them? Did you use the phone book or did you get your contacts by using the phone, email, or the Internet? What is the name and other contact info of the one non-profit that you actually selected? What is the date that you made the initial contact with this non-profit?

In addition, in the journal, students should write a brief summary of what was discussed at each of the meetings that they had with this non-profit, including date for each meeting and whether the meetings were conducted by phone, email, etc. Other info such as what they learned while working with this non-profit in general and describe the non-profits' needs for having the website that the student created for them. Finally, students should comment on what experience they might have gained while working on the project.

After the project was completed, there was feedback that the instructor requested from the non-profit. Here are some examples of such feedback:

Feedback #1:

Everything went wonderfully well in working with Jessica. She made and kept appointments and was prompt in replying to my e-mail and phone messages. She was always business-like and pleasant to work with. Jessica worked with your outline and that helped us both to be very clear and specific about what needed to be on the website. She made good suggestions and took direction very well and was a pleasure to work with.

Feedback #2:

Melna was very easy to work with and created a great site for our office. We have needed a useful and user-friendly website for quite some time so I am very pleased that she created this for us.

Feedback #3:

It has been a pleasure working with Annette on this project. I appreciate having had the opportunity for this website to have been part of the learning process in one of your classes. We worked on an ongoing basis to come up with what the website would look like. I then gave her additional ideas to help with development. She seems to have a very creative mind when developing the website and an understanding of what the end user would want to see. We formally met 6 to 8 times to formally review and work on the project. I am very happy with the work she has done. It looks great and will be a very useful website.

5. Benefits

Some of the benefits for students include that students make new contacts with potential future employers, they apply class knowledge to real life, and they boost their resumes. Benefits for the non-profits include that they get help to complete unfinished projects and/or create the website that they could never have created without help. Non-profits needs this help because they may lack the knowledge to create an effective website, they may lack the resources needed to create it. They may also lack the funds to finance creating the website or they may lack the time to devote in its design and implementation.

6. Problems and replications of the study

One of the problems in implementing the project was that I did not make it an absolute requirement in this class that students find a non-profit and not just a local business. As a result, some of my students selected a local business rather than a non-profit to complete their project. This did not diminish the use-

IETC 2014

fulness of the project as some local businesses received a lot of needed help from my students and at the same time my students learned from working on their projects. In future implementations I can request that only non-profits are to be used by all students. However, this may prove to be too restrictive for some students who have to complete a major project in a limited amount of time, especially if the class is large and is taught in a rather small community.

A study of EFL college students' acceptance of mobile learning

Hsin-Hui Chung [a], Shu-Chu Chen[a*], Min-Hsiu Kuo[b],

[a] *National Yunlin University of Science and Technology, University Road, Section 3, Douliou, Yunlin 64002, Taiwan, R.O.C*

[b] *National Chia-Yi Senior High School, No. 738, Sec. 2, Daya Rd., East Dist., Chiayi City 600669, Taiwan, R.O.C*

Abstract

Mobile devices with Internet applications have dramatically increased the convenience of accessing information for EFL college students in language learning. This study used Technology Acceptance Model as a theoretical framework to examine the factors related to Taiwanese EFL college students' behavioral intention to use mobile English vocabulary learning resources. Data collected from the questionnaires of eighty four EFL tertiary level college students were analyzed by using correlation analyses and regression. Results showed that the participants' behavioral intentions had high positive correlations with mobile devices' compatibility, self-efficacy, perceived ease of use respectively. It had a moderate positive relationship with usefulness. Regression analyses showed that perceived usefulness, perceived ease of use, self-efficacy, and compatibility account for 71% of the variance explained in behavioral intentions to use mobile English vocabulary learning resources. Compatibility is the best predictor of users' behavioral intention of use.

Key words: behavioral intention, perceived usefulness, perceived ease of use

1. Introduction

With the advance of modern technology, the society has been transformed to 'mobile society'. Mobile learning technologies have influenced many aspects of education, and provide new method for instructors to deliver knowledge and motivate students to engage in various learning activities (Derting & Cox, 2008;Mitra, 2007; Siozos et al., 2009).Through mobile learning, people can download different English learning apps to their smartphones,and other mobile devices via Apple App Store,Google Play,Windows Phone Store, and BlackBerry App World. Also, because of the rapid development of mobile technology in higher education, students using mobile devices with Internet accesses have expanded communication methods, opportunities for collaboration, access to traditional learning and information resources (Donaldson, 2010).Thus, mobile learning will become the milestone of the technology education.

2. The research models

The research direction of recent studies have focused on implementation of mobile learning in developed countries (James, 2008), environment settings for mobile learning (Brown, & Parsons, 2006; Chao & Chen, 2009; Liu& Jin, 2008; Virvou & Alepis, 2005), and users' acceptance in mobile learning (Liu & Li, 2009; Phuangthong & Malisawan, 2005).Many theories have been proposed to account for the user's acceptance of technology. One of the most widely used models to explain a potential user's behavioral intentions of using a technological innovation is Technology Acceptance Model (TAM) proposed by Davis (1989).

This model, with high reliability and validity as reported in Adams (1992), included the constructs of perceived ease of use, perceived usefulness, and attitudes towards using and behavioral intention of use (1989). Based on the theory, users' perceived ease of use influenced the intention of users thereby affecting perceived usefulness (Davis, 1989).TAM has been applied in a wide variety of contexts and many technology acceptance studies identified the factors influencing the users' behavioral intentions of use and the actual use of mobile learning technology devices. These studies also showed the weight of these factors may differ as a function of different user types and e-learning technology types. For example, Ronnie, Christopher and Eugenia (2011) adopting the Technology Acceptance Model (TAM) examined students' behavioral intention to use an electronic portfolio system. The result showed that perceived ease of use (PEOU) had a significant influence on learners 'attitudes towards usage.

Seliaman and Turki (2012), based on Acceptance Model (TAM), explored Saudi university students' use of mobile devices and smart phones for accessing their course materials, searching for information related to their disciplines, sharing knowledge, conducting assignments. The results showed that students' perceived usefulness of mobile learning was closely related to the factors including their course materials accessing, searching for information related to their disciplines, sharing knowledge, finishing their homework.

Also, many researchers investigated students' attitudes and perceptions toward a new technology such as mobile learning, podcasting, and other technology-based applications (Al-Fahad, 2009; Alghazo, 2006; Andone et al., 2007; Boon et al., 2007; Croop, 2008; Fozdar & Kumar, 2007; Stockwell, 2008; Yousuf, 2007).For instance, Ahmad and Steve(2013**)** investigated the acceptance rate of university students' intention to adopt mobile learning. The result showed that 55% of the students accepted mobile learning in a higher education. The applicability of the TAM has been well supported by a considerable body of previous research across a wide range of educational settings (Pituch & Lee, 2006).

Venkatesh and Davis (1996) revised the TAM model with the inclusion of additional external variables, which influenced a person's acceptance of information systems. One of the important external variable in the TAM research included users' computer self-efficacy. It is found that individuals with high efficacy expectations were more likely to succeed in a given task. High self-efficacy individuals usually work harder and longer than low self-efficacy individuals (Wood & Bandura, 1989).

In addition to self efficacy as one of the external factors, the other factor (i.e. compatibility) was included in this study. Compatibility is related to the reasons why someone adopted new innovations. One of the most popular models is Rogers' Diffusion of Innovations (Sherry & Gibson, 2002). Rogers (2003) identified five constructs in his Diffusion of Innovations model, and it shaped the rate and likelihood of adoption (1995). . This model included the constructs of relative advantage, compatibility, complexity, trialability and observability. In this study, the researcher only chose compatibility as the other external variable because the compatibility of the innovation is closed related to the user's life and practices.

Base on the previous study, Technology Acceptance Model (Davis, 1989) was employed by many different researchers in different study fields. Importantly, studies on the TAM have incorporated domain-specific external variables into the standard model, providing an elaboration of its theoretical structure. Also, some studies also pointed out that the weight of these factors may differ as a function of different user types and e-learning technology types. The present study extended the TAM by including two additional constructs, Self-Efficacy and Compatibility, to provide further insight into the user acceptance in a specific learning context. Therefore, the researches aimed to investigate tertiary level EFL college students' Acceptance toward Mobile vocabulary learning app. The research questions were as follows:

1. What are the relationships among the constructs of the model?

2. Which factor can best predict users' behavioral intention of using mobile vocabulary learning resources?

3. Methodology

3.1 Participants and instruments

The participants were 84 tertiary level EFL college students including 68 male and 16 female Engineering students. They were asked to fill in a 20-item questionnaire, adopted from Davis' Technology acceptance model (1989) and Roger's Innovation Diffusion Theory (1995).The instrument consists of five constructs including perceived ease of use (4 items), perceived usefulness (4 items), self-efficacy (4 items), compatibility (4 items) and using intention (4 items). Using a 5-point Likert scale ranging from 1= strongly disagree to 5= strongly agree, each respondent was asked to indicate the extent to which she/he agreed or disagreed with the given statement. In terms of the reliability for each construct, Cronbach's α value for perceived usefulness was .87; perceived ease of use .86;self efficacy, 0.802; compatibility .901; intention to use .82. The definition of each construct, and the items included in each construct were illustrated below.

3.2 Data analysis

The statistical software SPSS 17 was used to calculate these collected data. For the research questions, descriptive statistics, correlation analyses and multiple regressions were used to answer the research questions.

4. Results

4.1 Descriptive statistics of the constructs

Descriptive statistics showed that among the five constructs, ease of use had the highest rating (mean=16.04), followed by self -efficacy (mean=15.95), behavioral intention (mean=15.18) while compatibility (mean=15.02) had the lowest rating.

In terms of each item in the construct of usefulness , referring to the fact that learners believed that mobile vocabulary learning app can promote their efficiency in learning vocabulary, item 5 had the highest rating whereas item 6 had the lowest one(see Table 1).

Table 1. Items in the Construct of Usefulness

Item		*M*	*SD*
5	Using learning vocabulary through mobile phones is not restricted by time and place	4.17	.691
6	Using learning vocabulary through mobile phones can help me access the information I needed.	3.76	.887
7	Using learning vocabulary through mobile phones enhance my effectiveness on my learning.	4.10	.830
8	Learning vocabulary through mobile phones provides helpful guidance in performing tasks.	3.93	.929

In terms of learners' performance in the construct of perceived ease of use, they believed learning vocabulary through mobile phones can save time (see item 2) while "learning vocabulary through mobile phones is convenient" had the lowest rating in the construct (see Table 2).

Table 2. Items in the Construct of Ease of use

Item		*M*	*SD*
1	Learning vocabulary through mobile phones is easy for me.	4.11	.822
2	Learning vocabulary through mobile phones saves time.	4.12	.827
3	Learning vocabulary through mobile phones is convenient.	3.88	.884
4	Learning vocabulary through mobile phones is easy to use.	3.93	.875

According to Innovation Diffusion Model theory, the definition of Self-Efficacy was defined as users' ability of using mobile application through mobile interface. Item 9 had the highest rating while item 12 had the lowest one (see Table 3).

Table 3. Items in the Construct of Self-Efficacy

Item		*M*	*SD*
9	I could complete learning vocabulary tasks through mobile phones if there is no one around to tell me what to do	4.15	.814
10	I could complete learning vocabulary tasks through mobile phones if someone had helped me get started	3.86	.880
11	I could overcome the difficulties encountered when I used mobile phones to learn vocabulary.	3.62	.943
12	I could complete learning vocabulary tasks through mobile phones whatever mobile phones how difficult is.	3.39	1.042

According to Innovation Diffusion Model theory, compatibility refers to the fact that users believed that learning vocabulary through mobile phones was related users' life experiences. Item 16 had the highest rating while item 15 had the lowest one (see Table 4).

Table 4. Items in the Construct of Compatibility

Item		*M*	*SD*
13	To use learning vocabulary through mobile phones, I don't have to change anything I currently do.	3.79	.958
14	Using learning vocabulary through mobile phones does not require significant changes in my existing work routine.	3.80	.861

IETC 2014

15	Using learning vocabulary through mobile phones is same as using other software I have used in the past.	3.75	.930
16	Using learning vocabulary through mobile phones can reinforce from computer.	3.85	.898

In terms of Using Intention, it refers to the intention of individuals of using mobile in the future (Taylor & Todd, 1995). Thus, the researcher defined it as a person's intention of using mobile phones in learning vocabulary. As shown in Table 5, item 17 had the highest rating while item 20 had the lowest one.

Table 5. Items in the Construct of Using Intention

Item		*M*	*SD*
17	I am willing to use mobile phones to learn vocabulary	3.99	.843
18	I will continue using mobile phones to learn vocabulary in the future.	3.76	.939
19	Overall, I will learn vocabulary through mobile phones.	3.71	1.001
20	I will recommend others learning vocabulary through mobile phones	3.58	.947

4.2Results of research question 1

Correlation analyses showed that perceived ease of use and perceived usefulness, self-efficacy, compatibility and using intention had high correlation among one another (p<.01). As shown in Table 6, the participants' behavioral intentions had high positive correlations with mobile devices' compatibility (r=.829, p<.001), self-efficacy (r=.762, p<.001), perceived ease of use (r= .709, p<.001) respectively. It had a moderate positive relationship with usefulness (r=.679, p<.001).

Table 6. The Inter- correlation among the constructs

Variables	Ease of use	Usefulness	Efficacy	Compatibility	Intention
Ease of use	-				
Usefulness	.770**	-			
Efficacy	.692**	.67**	-		
Compatibility	.76**	.77**	.80**	-

4.3 Results of research question 2

IETC 2014

In order to clarify the relative contribution of these variables, the researchers conducted linear regression analyses. Results showed that perceived usefulness, perceived ease of use, self-efficacy, and compatibility account for 71% ($R^2=0.719$) of the variance explained in behavioral intentions to use mobile English vocabulary learning resources (see Figure 1).

Perceived ease of use and Perceived usefulness explain 54% of the variance in behavioral intention of use ($R^2=546$).Self-efficacy, perceived ease of use and compatibility combined to explain67% ($R^2=679$) of the variance in perceived usefulness while self-efficacy and compatibility explain 60% ($R^2=604$) of the variance in perceived ease of use.

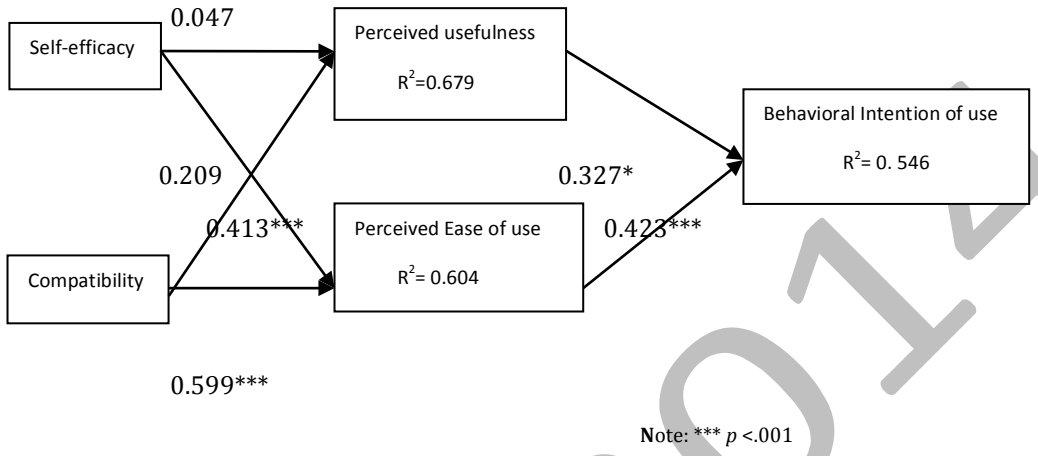

Figure 1. Results of Multivariate Regression Analyses

One indicator of the predictive power of path models is to examine the explained variance or R2 values. R2 values are interpreted in the same manner as those obtained from multiple regression analysis. They indicate the amount of variance in the construct that is explained by the path model (Barclay et al., 1995).The path coefficients and explained variances for the proposed model in this study were shown in Figure 1 and Figure 2.According to Figure2, Compatibility can best predict users' behavioral intention of use (p<.001).

Based on the findings in the study, we also found compatibility had significant effects on perceived ease of use and the behavioral intention, which were in agreement with previous studies (Chang & Tung, 2008; Chau & Hu, 2001; Hardgrave et al., 2003; Wu &Wang, 2005).

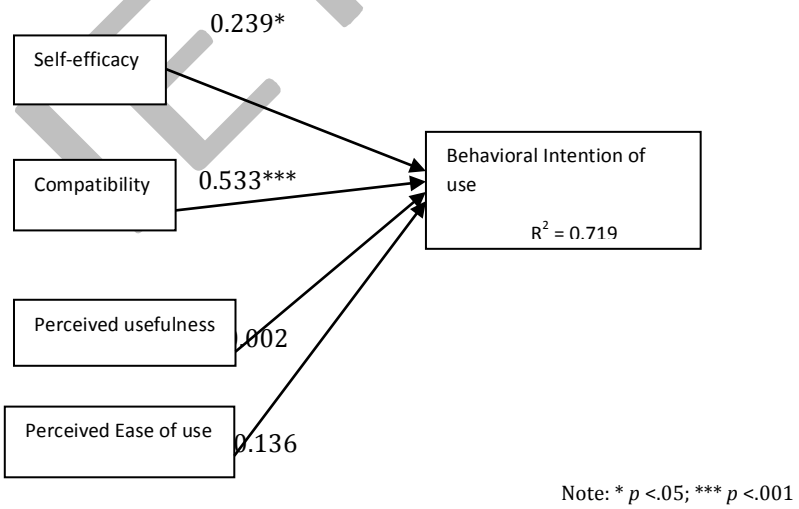

Figure 2 Results of Regression Analysis

5. Conclusion

This study used Technology Acceptance Model as a theoretical framework to examine the factors related to Taiwanese EFL college students' behavioral intention to use mobile English vocabulary learning resources. According to the results, college students' behavioral intentions had high positive correlations with mobile devices.

Regression analyses also showed that Perceived usefulness, perceived ease of use, self-efficacy, and compatibility account for 71% ($R^2=0.719$) of the variance explained in behavioral intentions to use mobile English vocabulary learning resources(see Figure 1).Learners' behavioral intention to use mobile English vocabulary learning resources was significantly determined by Compatibility.

As previous studies demonstrated, we found that the TAM appeared to provide researchers a theoretically sound model used to predict the users' behavioral intention to use the mobile learning systems. According to TAM, perceived usefulness and perceived ease of use had a significant positive effect on learners' behavioral intention to use the m-learning systems. Such was the case in this study; the m-learning systems users thought that the higher perceived usefulness resulted in a higher behavioral intention to use the m-learning systems. Furthermore, these findings supported existing research that both usefulness and ease of use were believed to be important factors in determining the acceptance of m-learning systems, as proposed by Davis et al. (1989). Finally, this study also indicated that perceived ease of use had a positive direct effect on perceived usefulness. The results were in agreement with what Venkatesh and Davis (2000) found in their study.

Based on findings, some suggestions for future studies were proposed. Firstly, researchers may include actual use behaviors or other external variables in their future studies that might influence students' behavioral intentions on mobile learning. Secondly, the study investigated tertiary level EFL university students from one university. It was suggested that inclusion of more university students or other mobile devices, systems were strongly suggested for future research. Thirdly, the impact of culture on mobile learning acceptance could be studied in experimental settings. Furthermore, many researchers explored students' behavioral intentions toward mobile learning, but few investigated teachers' behavioral intention on mobile learning. It might be interesting to compare teachers' and students' behavioral intention on mobile learning and teaching. Finally, it can include actual use behaviors or other external variables that affect the acceptance of mobile learning, in order to predict and explain users' acceptance of mobile learning in future studies.

A Study of Psychological Variables and Scholastic Achievement of Distance Learners with Disabilities in Nigeria

Bolanle T. Opoola, Victor I. Aleburu, Maruff A. Oladejo, Bolatito A. Lagoke, Afusat O. Busari
Federal College of Education (special) Oyo, +234 Nigeria

Abstract

Education of students with disabilities has received constant attention in the recent times. Disabilities are of different types; physical, hearing impairment, visual impairment, mental retardation and others. The educational needs of the disabled students are a bit different from the ones for mature and reforming non-traditional learners. Hughes (Octernaud 1990). The concern for the scholastic achievement of non-able distance learners is therefore the concern of researchers in the field of distance education. The scholastic achievements of distant learners with disabilities can be predicted by several variables. This study determined the extent to which the selected factors when taken together would predict the scholastic achievement of distance learners with disabilities scholastic achievement of the National Open University of Nigeria. Participants in this study were distance learners with disabilities selected from all the six-geopolitical zones of The National Open University of Nigeria. The instruments employed included (SATDLQ) Students Attitude Towards Distance Learning Questionnaire, (DLSES) Distance Learners Self Efficacy scales of 70 items among others. Data elicited were analyzed though multiple repressions Analysis (Backward or Stepwise elimination procedure). This study also provides some recommendations for improvement of scholastic achievement of distance learners with disabilities in National Open University of Nigeria. Participating academic/tutorial facilitators were also suggested to encourage the formation of tutorial study groups that will encompass students of different ages for sharing of ideas and knowledge.

Key words: Noun; Scholastic Achievement; Multiple Correlation; Distance Learning; s; Disabilities.

1. Introduction

There has been a growing interest in the education of students with disabilities in the recent times. This is contingent on the fact that students with disabilities constitute a distinct population with educational needs that are different from mature and returning non-traditional learners Hughes (Octernaud, 1990). Concerns are equally being expressed as regards the scholastic achievement of these categories of students. Pamela (2006) noted that the scholastic achievement of non-abled distance learners has been a source of concern to researchers in the field of distance education. Moisey (2004) also observed that students with disabilities took courses at higher rate than their non-disabled counterparts and reported that these students with disabilities experienced somewhat less success in these courses. Moreover, completion and performance rates ranged from 40% for students with psychological disabilities to more than 65% for students with sensory disabilities. In view of this, Oladejo (2010) opined that there is little doubt that distance education can enhance access to students with disabilities and that disability specific support services can enhance success. The researchers also observe that it appears that the scholastic achievement of distance learners with disabilities has not received much attention in Nigeria.

The scholastic achievement of distance learners with disabilities can be predicted by several variables. Studies have linked scholastic achievement of distance learners with disabilities to psychological variables (Oladejo, 2010). Generally, psychological variables are important in distance learning system because for the performing students, researchers agree on the necessity of being psychologically stable (Sewart, Keegan & Holmberg, 1983; Murphy, 1989; Suciat, 1990; Chan, Yum, Fan, Jegede & Taplin, 1999; Ojokheta, 2000; & Ergul, 2004). Some of the psychological variables identified by scholars as motivating

IETC 2014

distance learners include self-efficacy beliefs, locus of control, self esteem, goal achievement (Pintrich & De Groot, 1990; Abdul-Raham, 1994; Pajares & Miller, 1994; Sheets, 1995; Lim, 2000), goal satisfaction, self-worth, self-acceptance, study habits (Sweet, 1986; Strein, 1995), self-concept, self-regulation skills (Bandura & Martinez-Pons, 1990; Pajares & Kranzer, 1995; Lim, 2001; Wang & Newlin, 2002).

In the area of disability studies among distance learners, Ommerborn, (1998, 2001) has made an extensive review of studies worldwide. The review suggests the need for improving the disabled-specific support services and its access to needy students. According to Horn and Berktold (1999), based on longitudinal data for 1989-90 enrolled students in post-secondary education, majority of students with disability are males and older compared to their counterparts without disabilities. Further, nearly half of those with disabilities left the College without completing their studies as against one-third of students without disabilities.

Distance education provides distinct advantages for many students with disabilities by offering access to postsecondary educational opportunities that may not be present at more conventional universities. For example, Paist (1995) notes that flexibility in the location, scheduling, and delivery of distance education programs can provide disabled students with what may be their first real access to higher education. Similarly, Ommerborn (1998) in an extensive review of distance education programmes worldwide for students with disabilities notes similar findings, emphasizing that in addition to improving access, it is equally important to ensure that students with disabilities receive the support they require to ensure success in their studies.

However, for the purpose of this study, the researchers investigated self-efficacy, self-regulation, study habits, self-concept, goal achievement, locus of control, stress and attitudes towards distance learning as psychological predictors of scholastic achievement of distance learners with disabilities at the National Open University of Nigeria.

1.1 Statement of the problem

All over the world, academic performance appears to be one of the major criteria for judging educational standard and quality. Thus, the scholastic achievement of distance learners with various forms of disabilities has also been a source of concern to researchers in the field of distance education. This study will therefore, provide a causal explanation of scholastic achievement of distance learners with disabilities. It will build and test a nine-variable model that will consist of some psychological variables namely self-efficacy, self-regulation, study habits, self-concept, goal achievement, locus of control, stress, attitudes towards distance learning and scholastic achievement at the National Open University of Nigeria.

1.2 Objectives of the study

In line with the title of this work, the broad objective of the research was to carry out a causal model of some psychological variables and scholastic achievement of distance learners with disabilities at the National Open University of Nigeria. Specifically, the objectives of the study among other things were to:

1. determine the extent to which the selected factors, when taken together, would predict the scholastic achievement of distance learners with disabilities at the National Open University of Nigeria.

2. find out the relative contributions of each of the factors to the prediction of the scholastic achievement of distance learners with disabilities at the National Open University of Nigeria.

3. determine if there was any significant gender difference in distance learners with disabilities' scholastic achievement at the National Open University of Nigeria.

4. investigate if there was any significant difference between employed and unemployed distance learners with disabilities' scholastic achievement at the National Open University of Nigeria.

IETC 2014

5. find out if there was any significant difference between married and single distance learners with disabilities' scholastic achievement at the National Open University of Nigeria.

This study was carried out on some psychological variables and scholastic achievement of distance learners with disabilities. Thus, the study covered the only distance learning-dedicated University in Nigeria, the National Open University of Nigeria (NOUN). Participants in this study were distance learners with disabilities to be selected from all the six geo-political zones of the National Open University of Nigeria. The selected factors included in the study as predicting the scholastic achievement of distance learners with disabilities are psychological variables namely self-efficacy, self-regulation, study habits, self-concept, goal achievement, locus of control, stress, attitudes towards distance learning. To this end, all the six geo- political zones of the country will be covered.

2. Literature review

This section brought to the fore, a detailed theoretical and empirical review of some existing literature that are relevant to the present study. The review of related literature is carried out under the following sub-headings.In the area of disability studies among distance learners, Ommerborn, (1998, 2001) has made an extensive review of studies worldwide. The review suggests the need for improving the disabled-specific support services and its access to needy students. According to Horn and Berktold (1999), based on longitudinal data for 1989-90 enrolled students in postsecondary education, a majority of students with disability are males and older by as compared to their counterparts. Further, nearly one-half of those with disabilities left the college without completing their studies as against one-third of students without disabilities. Moisey (2004) analyzed the characteristics, enrolment and completion rates of undergraduate students with disability at Athabasca University. The study found out that most of the disabled students have received one or more types of assistance and support for their studies and that it has improved their course completion rate.

Burgstahler (2001) has suggested Universal Instructional Design to enhance access to and success of disabled students in both distance and on-campus setting. Fichten, Asuncion, Barile and Lamb (2003) studied the disability services provided in Canadian higher education institutions, both on-campus and distance education setting. They raised serious concern over the need for improving disability-specific access and support services in distance education institutions. Kim-Rupnow, Dowrick and Burke (2001) have emphasized the need for outcome based research to understand the access and effectiveness of disability-specific support for students with disability in distance education. A summary of the experiences of western countries in providing access to post-secondary/higher education for students with disabilities in conventional and ODL mode has brought the following important points:

- In recent years, across the world, there is an increase in the enrolment of students with disabilities in higher education.
- disability-specific support services received little attention in distance education system as compared to on-campus education
- Lack of information on admissions and disability-specific services for disabled students in distance education limits the understanding of their problem
- Available research studies in the field show that only fewer than half of the enrolled students with disabilities receive support for their higher education
- Application of adaptive technology to assist learning of disabled has shown positive results in reaching out the disabled and it had improved their success rate.

IETC 2014

♦ Students with disabilities are facilitated through various forms of e-learning that had increased their access and success in learning.

Psychological variables, also known as motivational characteristics, are very important in the literature of distance learning. Equating psychological variables as motivational is better understood in the definition of motivation by Mitchell (1982:81) that "Motivation represents those psychological processes that cause arousal, direction, and persistence of voluntary actions that are goal directed". Steers and Porter (1987, pp. 5-6) believed that "When we discuss motivation, we are primarily concerned with (1) what energizes human behaviour; (2) what directs or channels such behaviour; and (3) how this behaviour is maintained or sustained." Understanding what motivates distance learners has therefore, been a topic of much research over the past quarter of a century (Mitchell, 1982). This is because for the performing students, researchers agree on the necessity of being psychologically stable (Sewart, Keegan & Holmberg, 1983).

Motivation therefore, is an interactive construct representing the direction a person is going, the emotional energy and affective experience supporting or inhibiting movement in that direction, and the expectancies that a person has about reaching their destination or achieving their goals. MST does not prefer or rank any one of the three components, it views all three components as functioning in an interdependent triumvirate process. If any one of the components is absent in a particular episode, then the subject will not be motivated to initiate activity even though the other two components are firmly in place (Ford, 1992).

There has been a great deal of disagreement among researchers about the nature of motivation and the operation of motivational processes. However, most professionals agree that the presence of motivation was inferred from the behavioral indicators, choice of tasks, effort, persistence, and achievement. Although the index *choice of task* may sound appealing, it is usually not a useful index in the academic setting as students typically have few choices in that environment. In the academic setting, students who are motivated to learn usually expend *effort*, the second index, to succeed. Students that are motivated to learn usually expend greater mental effort during instruction, organizing, and rehearsing information, monitoring level of understanding, and relating new material to prior knowledge (Pinrich & De Groot, 1990). Some researchers, like Albert Bandura, Paul Pintrich, and Dale Schunk, have all assessed students' mental effort and found a relationship to self-efficacy. Self-efficacy, on the other hand, correlated positively with effort and achievement (Schunk, 1983).

Educational problems go beyond declining performance scores; most schools today face a crisis in student motivation (Meece, 1993). Student motivation is therefore, critical for learning, and several researchers have found a positive and robust correlation between motivation and academic performance (Urugoghi & Walberg 1979; Vellerand & Serecal, 1993). The concept of motivation is one of the most important psychological variables of learning in any educational environment (Maehr, 1984). Questions of why students engage, pursue, and accomplish certain goals or tasks, or why they avoid others, have been the subjects of scholarly inquiry since the writings of Socrates, Plato, and Aristotle.

Motivation, especially within the distance education context, provides the fuel for student engagement. This is because, without motivation, students will neither think about nor organize their knowledge due to the separation of students and the instructor by time and place. There are many constructs of motivation that have emerged from different theoretical approaches during the last quarter of the twentieth century. Social-cognitive learning theory defines motivation in terms of the students':

1. (a) self-efficacy beliefs about their abilities to engage, persist, and accomplish specific tasks (Bandura, 1986; Stipek, 1988);
2. (b) goal-setting activities (Dweck & Leggett, 1988); and
3. (c) learning strategies and cognitive and meta-cognitive processes (Pajares & Kranzler, 1995; Schunk, 1995).

Since the beginning of the twentieth century, the concept of motivation has been studied according to a variety of perspectives (Overton, 1984; Weiner, 1992). In the last thirty years, many models,

IETC 2014

approaches and theories have inspired researchers studying motivation and education. According to Pintrich & Schunk (1996), many are the results of modern conceptions of human beings and of the way in which they learn.

Motivation as earlier asserted by Bandura (1991), is multi-dimensional. It measures impulsive and deliberate action; it is concerned with the internal and external factors; and also observes causes for behaviour (Halawah, 2006). It can therefore, be defined as a general tendency to interact with and to express influence over environment. Student's motivation for learning is generally regarded as one of the critical determinants, if not the most important determinant of the success and quality of learning outcome (Mitchell, 1992).

From available research on motivation and academic performance, it is quite evident that motivational constructs do in fact, impact the academic performance of students. There are studies documenting the correlation of the Scholastic Aptitude Test, American College Testing (Ward, 1993), Mathematics (Carpenter, 1993; Ward, 1993; Gist, 1996), High School Grade Point Average (Price & Kim, 1976; Carpenter, 1993) and College Entrance Examination (Price & Kim, 1976) scores and the performance of College students. Also well documented are studies in the areas of arts and sciences, psychology, philosophy, and natural sciences.

Many psychological variables predict college GPA, that is, academic performance, and retention. Brooks and DuBois (1995) found that emotional variables exerted a strong influence on how well students adjusted to their first year of college, which is a strong predictor of academic success (Heyningen, 1997). It has further been reported that the possession of high self-confidence (Boyer & Sedlacek, 1988; Foster, 1998), self-control (Wolfe & Johnson, 1995), and having an achievement-oriented personality (Foster, 1998) are associated with a higher academic performance. In addition, students who are adaptive perfectionists tend to adjust better to college and as a result, have higher rates of retention and performance (Rice & Mirzadeh, 2000). It has been suggested that personality variables may be useful predictors of future college performance and attrition (Cross, Harper, Osher & Kneidinger, 2000).

Furthermore, Gottfried (1990) found positive correlations between psychological variables and performance. Specifically, she reported that young students with higher academic intrinsic motivation had significantly higher performance. She also found that early intrinsic motivation correlates with later motivation and performance, and that later motivation is predictable from early performance. It was also reported that perceived academic competence was positively related to intrinsic motivation.

In addition, Halawah (2006) in his study on the effect of motivation, family environment and student characteristics on academic performance, established a positive correlation (r= 0.7) between performance and motivation. It therefore, appears that students who feel competent and self-determined in the school context develop an autonomous academic motivation which in turn, had a positive impact on school performance (Fortier, Vallerand & Guay, 1995).

However, some studies have reported little or no significant relationship between psychological variables and scholastic achievement. A study conducted by Niebuhr (1995) examined relationships between seven psychological variables and students' academic performance specifically, focused on individual motivation and its effects on academic performance. Findings show that student motivation had no significant effect on the relationship with academic performance. Another earlier study of Boggiano, Main & Katz (1991) regarding differences on gender in motivation found that females were significantly more extrinsic than males, thus, female students' performance is less associated with their interests than male students' academic performance (Shiefele, Krapp & Winteler, 1992). Also, Stipek & Ryan (1997) reported that few studies that have examined motivation in young children established that it is a weak predictor of academic performance.

The present study examined such motivational characteristics, that is, psychological variables as self-efficacy beliefs for distance education, self-regulation skills, study habits and self-concept with respect to academic performance of distance learners in Nigerian Universities.

IETC 2014

- Regulation: Distance Learners' Self Regulation Skills Scale (DLSRSS) with 15 items that reported Cronbach alpha reliability coefficient of 0.68.
- Distance Learners' Study Habits Inventory (DLSHI) comprises has 20 items and has Cronbach alpha reliability coefficient of 0.76.
- Self-Concept: Distance Learners' Self Concept Scale (DLSCS) with Cronbach alpha reliability coefficient of 0.76. It has 15 items.
- Stress: Hopkin's Symptom Checklist consisting of 30 items. It is a four point rating scale. The Cronbach alpha reliability coefficient of this scale was 0.74.
- Self-Esteem: The modified version of Basavanna's Self-esteem Scale consisting of 28 items was used for studying self-esteem. The original true-false type of response pattern was changed to a three point rating scale, on which a high score indicated low self-esteem. It had a reliability coefficient of 0.96.
- Locus of Control: The Rotter Internal-External Control Scale that consists of 23 items and has Cronbach alpha reliability coefficient of 0.72.
- Goal Achievement: Goal Achievement Rating Scale of 20 items with Cronbach alpha reliability coefficient of 0.65.

The researchers also used a self-designed distance learners' bio-data master sheet (DLBMS) to collect students' results from various study centers.

3. Findings

Findings from the present study revealed that the eight psychological factors, namely self-efficacy, self-regulation skills, study habits, self-concept, students' attitude, locus of control, goal achievement, stress when taken together, accounted for 2% of the variance in students' academic performance. This shows the importance of the selected explanatory variables to the criterion variable. This is consistent with some earlier related studies which established significant relationships between some students' psychological characteristics and academic performance in distance learning programmes. For instance, the present study is in agreement to some earlier studies such as those of Woodley and Parlett, (1983), Powell et al., (1990), Abdul-Rahman (1994), Parker (1994), and Sheets (1995) that reported positive correlation between students' socio-psychological variables and academic performance. Findings from this study however, contradicted the works of Boggiano, Main & Katz (1991), Niebuhr (1995) and Stipek and Ryan (1997) as these studies showed that student motivation had no significant effect on academic performance and that few studies which have examined motivation in young children established that it is a weak predictor of academic performance.

The reason behind this finding might not be unconnected with the fact that students, who feel competent, self-efficacious and self-determined in the school context, develop an autonomous academic motivation which in turn, had a positive impact on school performance. Furthermore, some factors made significant contributions. Those factors that made significant contributions are self-concept ($r=.026$; $p<.05$), students' attitudes ($r=.035$; $p<.05$), stress ($r=.033$; $p<.05$), study habits ($r=.023$; $p<.05$) and self-efficacy ($r=.002$; $p<.05$) respectively. This is not surprising because distance learning places more responsibilities on the shoulder of the students than the institutions. Ergul (2004) argued that for distance learners to be able to achieve, they need to control their learning, be more efficacious, develop good study habits and also regulate themselves. This finding therefore confirmed the results of the earlier studies such as Pintrich and De Groot (1990) and Zimmerman and Martinez-Pons (1990) who reported significant and positive correlation between self-efficacy and academic performance.

Also, this study reported significant difference in the scholastic achievement of distance learners with disabilities based on marital status as revealed from hypothesis 3. It therefore contradicts studies conducted by Chacon-Dugue (1985), Wang and Newlin (2002) and Ergul (2004) established insignificant correlation between marital status of distance learners and their academic performance. This is however, in line with those of Woodley and Parllet (1993) and Powell et al. (1990) that found a significant relationship between marital status and academic performance of distance learners. The rationale behind this finding might not be unconnected with the fact that single distance learners with disabilities are likely to

IETC 2014

be less occupied with home demands than the married ones who have children and spouses to take care of.

4. Conclusion

All the eight students' psychological characteristics (self-efficacy, self-regulation, study habits, self-concept, goal achievement, locus of control, stress, attitudes towards distance learning,) contributed differentially to the scholastic achievement of distance learners with disabilities at National Open University of Nigeria. Some recommendations are hereby made towards the improvement of the scholastic achievement of distance learners with disabilities at NOUN. These recommendations are based on the summary of findings and conclusion reached thereafter. The recommendations are stated below:

* Students should pay serious attention to all the selected factors, most importantly those that have significant contributions on their scholastic achievement.
* Participating academics/tutorial facilitators in the programmes should always encourage the formation of tutorial study groups that will encompass students of different ages for the sharing of ideas and knowledge. In addition, academics should always display positive attitudes to the students so that they too can have positive attitudinal dispositions towards the programme.
* Guidance Counselors, Study Centre Managers and other Administrative Staff should always focus on the development of positive image of students in the learning activities.
* Institution's Administrators should always organize regular seminars and workshops for students through which information on the influence of the selected factors on their scholastic achievement would be disseminated to them.
* Distance learning Institutions should provide adequate special students' support services and facilities in order to develop in the students, positive attitudinal dispositions towards distance education in general and their courses of study in particular. Specifically, adequate provision should be made for special learning need students, who may be disadvantaged in the inclusive education system. Furthermore, distance education institutions need to devise a mechanism of keeping distance learners highly motivated until the completion of their programmes. Essentially therefore, keeping on the institutional agenda, the learning needs of the students and addressing them appropriately is hereby suggested.

IETC 2014

A technological approach to creating and maintaining media-specific educational materials for multiple teaching contexts

Michael Klenner5
University Of Applied Sciene Zwickau, Germany

Abstract

Depending on the teaching context different types of educational materials are used. To best support the various forms of communication, the educational content should be provided in a suitable media form. For example: visual PowerPoint slides for face-to-face teaching; detailed lecture notes for follow up at home and self-study online content for e-learning. Each media type has particular characteristics, which lead to a range of individual ways of creating content using media-specific authoring tools. The effort required to offer concurrent educational materials for different teaching contexts increases with every additional medium. The author has to create and maintain every single document, although there is an overlap in content and structure between all the materials.
This paper discusses the requirements for authoring and maintaining those documents and how they are received and analyzes the lack of current authoring technology. Based on this pre-study, a technological approach is demonstrated, which combines media-specific formats and authoring tools with a connected single-source content system.

Keywords: Media Specific Writing; Multiple Teaching Contexts; Authoring Technology

IETC 2014

1. Introduction

In history, the most common form of education was the traditional lecture at medieval universities. Commonly, an instructor would read from a hand written source to the audience. Due to the lack of expensive hand written books, the only way to receive the content was by listening to the readings and explanations while taking note (Schwinges 1999). Since this time, the teaching process has evolved rapidly. To this day, a number of different ways to access educational sources exist. Teaching and learning take place in a lot of different forms and situations. For the best outcome and learning success, it is important that every teaching context is supported by the best fitting learning strategies and educational materials. Every teaching context is specified by some individual characteristics, and teachers have to care about these to be able to create and provide the best possible education environment. Nowadays there is hardly a teaching situation imaginable where only a single communication channel is used like the oral speech of the lecturer. To take into account of other receiving ways, new teaching forms and communication channels are used to deliver the learning content to the audience. Nearly all kinds of teaching environments use additional educational materials to support or replace the teacher in the learning process. If you look at today's students daily learning routine, it can be seen that the learning "environment is filled with visual, electronic and digital texts, those texts that are referred to as 'multimodal'" (Walsh M. 2006). It's for that reason that more and more modern educational documents in different media forms are produced with the help of computer technology.

1.1. Planning and creation of educational materials

When an author wants to provide adequate education materials for a teaching context, one has to pass a complex creation process. Kerres (1999) suggested an approach based on multiple steps. In the first step, an author has to determine the topic, identify the target audience, and set adequate learning objectives. Based on this screening, the appropriate contents are chosen to fulfill these objectives. In the next

E-mail address: mikl@fh-zwickau.de

step, the decision has to be made in which didactic manner the author wants to guide through these contents. The selected contents get organized into a learning path which defines in what order these contents get presented to the audience. The result of this phase is a structured topic which contains all contents in a learning friendly order. Not until then is it time to think about the educational materials which should be used to deliver these contents. The author has to decide which media form can support the chosen teaching context in the best way possible. On the base of this media selection and the elaborated contents in form of the structured topic, the author can start to create the actual education materials. Kerres (1999) refers to the fact that the didactical preparation of a learning topic should be detached from the media-specific depiction of the associated contents. This creation process ensures that an author can concentrate completely on the line of argumentation, without thinking how it is visualized on the educational materials. Several authors have stressed the importance that the content development should be done independent from the material production. Using the example of presentation slides, Tufte (2003) states that the borders of the medium restrict the writer in his possibilities to express the content. Keller (2003) takes this idea little further: "But PowerPoint has a dark side. It squeezes ideas into a preconceived format, organizing and condensing not only your material but - inevitably, it seems - your way of thinking about and looking at that material." This basic idea can be applied for all other media forms too, because every medium has some particular limits for the expression of content.

1.2. Providing educational materials for multiple teaching contexts

It gets even more difficult when an author wants to provide a course with its elaborated contents in some additional concurrent teaching contexts. Walsh, M. (2009) analyzed several studies, where multiple educational materials were used in some multimodal learning environments. She came to the conclusion that learners can profit by the mixture of different media forms. It is certainly possible to use only one single document for all teaching situations. However, the desired learning success can then fail because the learners cannot follow the content of the course in an appropriate manner. In a previous publication, Walsh, M. (2006) states that various factors have influence on the interaction between the reader and the material. Beside some other factors, she points to the "the immediate situation in which the text is being read at any particular moment." (Walsh, M. 2006) Because of the uniqueness, every teaching situation uses some specific forms of education materials. For example: visual PowerPoint slides for face-to-face teaching, detailed lecture notes for following up at home, and self-study online content for e-learning. Not all educational material suits to every teaching context. This has the effect that several unique documents are required to support each teaching context adequately. The author has to create and maintain every single document, although there is an overlap in content and structure between all the materials. The problem is, these materials differ in style and extent. This paper describes the impact of media-specific styles of educational materials, and discusses the requirements for authoring and maintaining those documents. After analyzing the lack of current authoring technology, a new approach is demonstrated on how authors can create and maintain those educational materials more efficiently.

2. Media style characteristics

The style of educational materials differs in context of the perceptive situation. An author has to care about the following style characteristics of media forms to be able to create materials which fit the target teaching environment.

2.1. Access type

How do participants get access to the materials? In general, this can be divided in two ways: private and public. Students have private access to material when they get their own copy of a document and can use it on their own. The other way is by public access, when only the instructor has a single example of the material. The most important difference is that the instructor has complete control over the use of the document. For example, this can be seen on a PowerPoint presentation. The audience gets public access when the instructor presents the slides with a projector. The instructor controls the presentation time and duration of each slide. It's not possible for a student to go back or stay any longer at a specific slide in the material.

IETC2014

2.2. Materialization

There is the distinction if the materials are delivered in a digital or analogue way. Digital documents require an electronic device to use them, while a usual sheet of paper can be used without any technologic prerequisites.

2.3. Semiotic style

There are different semiotic systems (text, image, video, audio etc.) which are used in media types in a variety of ways. Depending on the teaching context, all of these semiotic systems have different advantages and disadvantages. This means that some semiotic systems are more adequate for some media forms than others. Images, for instance, can be perceived and conceived in a fast and intuitive way while texts can describe details more precisely. The author does not only have to choose from different semiotic systems. There are also a variety of possibilities to depict the identical message with divergent use of signs and symbols from the same system. For example, some media types prefer text as short bullet items (like presentation slides), while others use well written full sentences.

2.4. Degree of specificity

Content can be expressed in different degrees of specificity. Depending on the teaching context, authors have different preferences in which level of detail they want to present on the topic. For example, when presentation slides are used to visualize the oral speech of a lecturer, the content on the slides is usually compressed to some short abstract phrases while extensive lecture notes can contain explanations in a more detailed fashion.

2.5. Content fragmentation

Every media form has a specific way to group and order the depiction of the content on the low level of the document structure. On the one hand, there are some media types which don't need much effort to achieve this media-specific fragmentation layout. For example, fluent continuous text produced with a word processor gets fragmented into several sheets of paper automatically by the software. On the other hand, there are media types with a more strict fragmentation layout like PowerPoint slides. The author has to care about the content fragmentation and spread the whole topic into several uniform slide fragments.

2.6. Expression variety

To depict a message, it is not always possible to use the same expression in all types of media forms. Every media type supports a set of structural elements to express messages and organize the content. The quantity and behavior of these elements are not the same for all types of documents. For example, it is impossible to use a video or audio clip on a simple sheet of paper.

3. Authoring technology

After exploring some important style characteristics of media types, it is apparent that several independent educational materials are required to support multiple concurrent teaching contexts adequately. This section will provide an overview about current authoring technology approaches which can be used to create those educational materials. It is necessary to distinguish between two basic strategies: firstly, creating individual separated files by using media-specific editors, and secondly, generating materials from single-source contents automatically.

3.1. Media specific authoring tools

The most common way to create educational materials is certainly the usage of some media-specific editors. There is a wide range of authoring software solutions which are designed to create and edit only one particular media type. For instance, there are the well-known software packages like Microsoft Office, Apple iWork as well as some open source alternatives such as Apache OpenOffice. All of these packages

IETC 2014

contain editors which support some specific media forms like presentation slides (e.g. Microsoft PowerPoint) or continuous text documents (e.g. Microsoft Word). Using these tools lends a big advantage to the creation process. Usually these editors are able to take care of all media specific characteristics of the particular target media. For instance, almost all word processors offer an empty sheet of paper after starting a new document. From the beginning, it is clear which media type is the most desirable. Additionally, an editor like this mostly offers designing tools which are specialized to create content for the current media form. Endowed with a media-specific editor, it is easy to produce educational materials which fulfill the most common design requirements.

Returning to the fundamental issue of multiple concurrent teaching contexts, it has to be clarified how such tools support the creation and maintaining of different education materials. Depending on the target media types of the educational materials, a number of media specific authoring tools are deployed simultaneously. Usually an author has to create an independent document file for each teaching context to take into account all relevant media characteristics. Therefore the number of files increase with every new teaching situation. For example, when an author offers presentation slides, lecture notes, and e-learning resources for the same learning content, there are already three separate files and three different authoring tools involved. The most significant down side is that the files are not connected to each other, hence the only way to share redundant content between the files is to use the well-known copy and paste function (Rockley et al. 2012 p.50). This leads to problems when parts of the content or structure are to be changed. This can happen, for instance, when an old course may be updated and reused in a new semester. New content should be added, and existing content should be moved to another position or deleted. The author has to apply all changes to every independent file redundantly and manually.

3.2. Single source publishing

Figure 1 shows the basic components of a traditional single source workflow. The main idea of this approach is that there is only one single source storage which contains the whole content base, without any layout or formatting information. Furthermore, various transformation rules exist which direct how this single source content gets transformed into some media-specific output materials. (Stigler 2003 p.203)

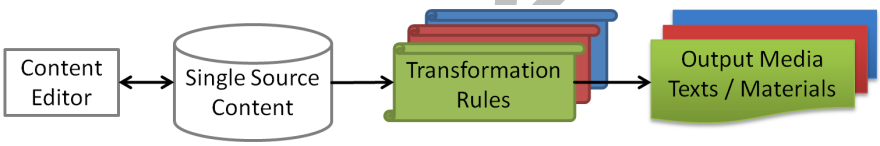

Figure 1 traditional single source publishing workflow

The single source publishing approach was developed originally for technical documentations in the early 1990s. The goal was to reuse existing content for different document versions to support various communication channels (Rockley et al. 2012 p.50). Because of similar requirements, authors of more recent studies have proposed that this authoring technology can also be used to produce educational materials (Walsh, L. 2007 p.914, Closs 2011 p 26).

Mackenzie (2011 p.92) states, that this "method particularly suits projects where the content of the different versions overlaps significantly and the information is likely to be revised or updated frequently". This way has a huge advantage over the first approach which was dealing with several separate files. With a single source strategy, it is possible to make content modifications (like inserting, moving, or deleting) at a central point. "A document is updated one time and then 'transformed' rapidly and dynamically into multiple formats as needed" (Sapienza 2002, p. 157).

When publishing from single source content, it does not mean that all output materials are using the exact same content and structure with only another media style. A fundamental idea is that the whole learning subject is split into smaller content fragments (individual texts, pictures, videos etc.) and stored at a central point. From this basic set of information, pieces of content for the output material can be chosen arbitrarily. Rockley et al. (2012 p.51) explains this development as follows: "At the beginning, single sourcing meant identical content and multiple channels, but as authors became concerned about the effectiveness of identical content used in multiple channels, they moved to customized content. This type of content is customized to meet the needs of the customer, the type of content to be developed, and the

IETC 2014

channel. Content is deliberately built for customized output from the single source to meet specific audience needs or output requirements."

Despite all the advantages, there are also downsides of this approach. In Figure 1, it is visible that the single source content gets created and changed by a generic editor. Like any other authoring software, this editor supports a limited set of expressions to depict the content. The consequence is that the output materials can only contain content expressions which are supported by the editor. For instance, when the editor is not able to handle video material, it is impossible to get a movie clip into the output material. Another problem becomes visible by looking closer at the transformation rules and the automatic output creation process. The problem is, an author can influence the appearance of output material only in an indirect way. The author has to revise the transformation rules for the target media type to change the output appearance. These rules contain strict instructions for a computer on how to transform the single source content into a media-specific file. On the one hand, this works fine for media-types with strictly defined layouts, like fluent continuous texts with predefined style templates. On the other hand, there are media types which allow a bit more creative designing, like free positioning and orientation of pictures and texts in presentation slides. For example, Pötzsch (2007, p.95) was able to show that a lot of PowerPoint users create free designed text-image-collages without use of the default layouts. For a computer algorithm, it is impossible to do something like this on the base of a transformation rule. Finally, it can be summarized that on the one side, the single source publishing approach is able to manage overlapping content at a central point, but on the other side, it can be seen that this technology is unable to take care of all media specific characteristics of the output materials.

4. The best of both worlds

Based on these previous findings, a technological approach is demonstrated which combines both authoring strategies into a single approach. The objective is to get the best of both worlds: using media specific editors with some kind of single source content management. Figure 2 demonstrates this functionality.

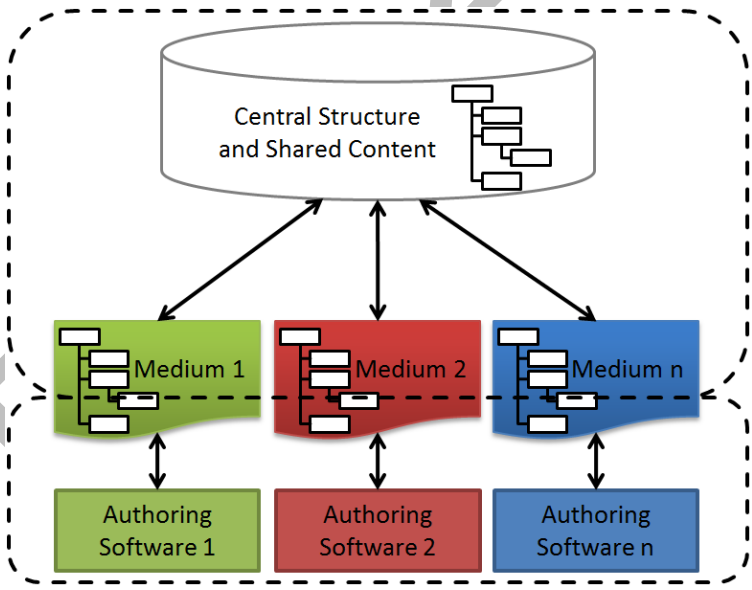

Figure 2 media-specific files connected with a single source base

The base for this approach is the idea that the characteristics of materials and their media types can be divided into two groups: shared characteristics which are the same for all concurrent materials, and media-specific characteristics which are unique for every single material. The concurrent educational materials were created on the base of a planned and structured course topic, therefore they share the same structure and content. In contrast, the depiction of the content, layout, and formatting are media-specific characteristics.

IECT 2014

To confer about the shared media characteristics, each concurrent material is connected to the same external single source base. This central data store contains all information which is shared between the concurrent materials such as the overall structure and redundant content. As all materials are connected to the central data store, it is possible to apply changes to all other connected materials. For instance, when an author deletes some content in a material, this content change gets committed to the single source base. From here, this change gets applied to all other connected materials.

Furthermore, all these materials are saved in traditional media-specific file types. Therefore these files can be edited with usual authoring tools. This means the author can use all options which are offered by the media-specific authoring software to create materials in an optimal way. Since the material files are connected to the central data store, all the concurrent materials belong to the same structure; a set of ordered and encapsulated structure items. Nevertheless, it is the task of the specific media file to depict the content of these structure items. There are 3 ways to handle a structure item in a specific medium:

- Each connected material can use particular expressions to explain the same content. So it's possible that the same message is depicted in one media file with text, and in another media file with a picture.
- It's possible to use shared content which is synchronized between all connected materials by the central data store. This means when an author changes a shared content text in one material, these changes get committed to the single source base and thereby are applied to all other connected materials.
- Apart from the ability to use shared content or media specific alternatives, it is also possible to leave out structure items. It's not required that every structure element from the single source base must be present in every material. It therefore means that each connected material has only a subset of the central super structure.

The connection between the single source base and the material files can be realized with software plugins inside the media specific authoring tools. These plugins have to synchronize the shared structure and content with the single source base.

5. Conclusion

The findings of the study show that in current teaching environments, it is not easy to provide the best suiting educational materials, particularly when similar content should be taught in multiple teaching contexts. The currently available authoring approaches have great difficulties in various areas. Some strategies are not able to create all media types in adequate ways, while others are not able to manage the overlapping learning content in an effective manner.

For all the media specific characteristics of the educational materials, this study suggests a new authoring approach that combines media-specific formats and authoring tools with a connected single-source content system.

At the moment, two Microsoft Office plugins are being developed to connect the content between Word and PowerPoint files as a first implementation of this concept.

Activating devices and their use in e-Learning – focussed on handicapped students

Jiří Dostál*
Palacký University, Žižkovo náměstí 5, 77140 Olomouc

Abstract

The article deals with the questions related to the activation of students using the electronic technologies for their studying emphasizing the handicapped students. It focuses on the problem of the transformation of the passive students into "the immediate participants in studying" in context of obstacles placed in front of those students which, due to their handicap, are limited in the process of studying.

The article states e.g. that the activation plays an important role in the effectiveness of the studying and it is desirable to look at it bipolar. It means that the reflection has to be found during the instruction as well as during studying - on the side of a pupil as well as on the teacher's side. Thanks to inclusive trends that manifest themselves in education in Europe, it is possible to meet the handicapped students in common education more often and therefore it is desirable to pay attention to this issue.

Keywords: e-learning, activation of a student, handicap.

1. Activating devices and their use in e-Learning

Education is connected to the humanity from the whole beginning, it goes through the continuous development and it goes under the gradual innovative processes as well. E-Learning became a phenomenon in the middle of the 20th and 21st century and it includes a number of sub-elements that are in many cases connected in the coherent system that enables individual´s effective development not only intellectually. This development should be done through active studying when the student is developing intensive study activity that is ideally motivated by his own interest and that is conducted without distinct pressure and the aid of other person. However, the activity should be specifically aimed, led, controlled and evaluated. It is needed to create a proper situation using the activating devices for the students' active studying.

The modern educational technologies are able to ensure the abovementioned facts. From the technological point of view, we can speak about the extensive systems meant for the studies of fully distance character that use the sophisticated devices to provide cooperative studying. On the other hand, it can be meant only as a support of the full-time studying conducted in the traditional conception.

If the e-Learning should be a full alternative or a component of the traditional education, then it has to be based on the deep and complex pedagogical analysis of the educational process and its elements, processes and links.

The modern educational technologies provide a number of opportunities for conducting a more effective studying only in case of the *effective activation of students*[6]which is valid to the "face-to-face" instruction as well as to the distance instruction that has a lot of specifics. Due to them, every person can become a student in case of the distance education, healthy or with a handicap, but he/she has to be able to study individually and to have his/her own responsibilities for the educational procedure and an aim

* In this chapter the term "*student"* is used; however, in the given context it can be changed to different terms such as "pupil", "educant", "the educated one", "the studying individual", etc.

IETC 2014

that he/she wants to reach. This is conclusively related to the desirable application of the equal opportunities in the educational fields.

T. Svatoš (Svatoš, 2009) states that the new educational technologies represent a progress in the development of the didactical devices that support the educational purposes. Their common signs are:

- Integrality (link of the partial devices to the "higher" unit),
- Multimediality (presentation based on different information from one source),
- Interactivity (the user is actively taking part in the process of instruction – studying),
- The increased importance between so-called hardware and software,
- The independence of the educational roles (greater independence especially for the "educated one")
- Opening of the relatively new forms of education (distance education, e-learning, blended-learning, individualized instruction) that are based on the management of the individual´s studying activity which supports his/her self-education.

E-Learning is closely related to the use of the informative and communicative technologies in the fields of education. In accordance to the general perception it is understood as a kind of studying during where the gaining and using of knowledge is distributed and simplified by electronic devices (Průcha, Walterová, Mareš, 2009). Due to high educational potential became the e-Learning a perspective emerging area of the pedagogical theory and practice which is continuously, systematically and intensively being dealt with on the national and international level – those authors should be mentioned: S. B. Eom and J. B. Arbaugh (Eom, Arbaugh, 2011), R. C. Clark and R. E. Mayer (Clark, Mayer, 2011), Y. J. Joo, K. Y. Lim and E. K. Kim (Joo, Lim, Kim, 2011), A. Mauthe and P. Thomas (Mauthe, Thomas, 2004), J. Anderson and R. McCormick (Anderson, McCormick, 2005), S. Bennett, K. Maton and L. Kervin (Bennett, Maton, Kervin, 2008), S. Kluge and L. Riley (Kluge, Riley, 2008), R. Möhlenbrock (Möhlenbrock, 1982), M. F. Paulsen, (Paulsen, 2003), D. S. Smith and J. B. Caruso (Smith, Caruso, 2010), D. Tapscott, (Tapscott, 1998), A. Bates and G. Poole (Bates, Poole, 2003), R. Ramanau, A. Hosein and Ch. Jones (Ramanau, Hosein, Jones, 2010).

The possibilities of the students' (i.e. studying individuals') activation are different and it is not possible to think only about the study supports that are already holding concrete educational content. The means of the students' activation vary, e.g. the communication between the teacher and the student, the educational activities and environment etc. The primary aim of the activation process is the transformation of the passive students into the "the immediate participants in studying" (Kotrba, Lacina, 2007), however, the activation process is linked to the tutor as well. The activity of the students is understood as an increased and intensive activity which is based either on the inner slope, spontaneous interests, emotional motives and vital needs, or on the conscious effort (Maňák, 1998). It can manifest itself in many ways, e.g. as an exploring activity, physical activity, technical activity, artistic activity, sport activity, etc., and it is clear that not all of them are related to the e-Learning, or more precisely - it cannot be induced like that. The activation methods are defined as procedures that lead the instruction in such a way that the educational aims are gained mainly on the basis of the own study work of the students and the focus is emphasized on the thinking and problem solving (Maňák, Švec, 2003).

In terms of the educational process and aim achieving is substantial the inner activity because it is developed from one´s personal devices, from students' interests, from their attitudes and conviction. This activity can be in some cases hard to initiate and to direct the required way; that is why the teacher[7] has a wide field of possibilities when it comes to the external activation. Attention has to be paid to the apparent, pretended and formal activity which is educationally useless.

In relation to e-Learning there appears to exist passivity of the students which is the opposite of the activity. This state is not desirable and it has to be eliminated and this can be done with help of the educational e-Learning technology that can be considered as one of the assumptions of the successful students' activation.

2. Possibilities of students' activation in the e-Learning

[7] The term "teacher" will be used, however, in a given context can it be changed into similar terms such as "pedagogue", "tutor", "author of the study support", "educationalist", "mentor", "the teaching one", etc.

IECT2014

The substantial task of the teacher and the didactic devices is to activate the student properly, because if attention of the students is not paid, the mastering process cannot be done effectively. Motivation is also very closely related to that. All the processes of cognition, either perception or thinking, are aimed to an object. The basic sign of the attention is therefore the focus on the object (thing) which can be materialistic or psychical (the content of our mind) and concentration on it (Linhart, 1987). Feelings, perceptions, memory, thinking, images, these are all psychical processes that have their own specific content. Attention does not have this specific content; however, it manifests itself in cognition and thinking, memory and other cognition processes (Pardelt, Boroš, 1979). If the attention incorporates itself into the cognition process, it means that the human not only hears but also listens, listens to something and hearkens; not only sees, but also watches, has his eyes on something, observes; and his cognition turns into *active* treatment with the perceived material and into its obtaining for a specific aim (Rubinštejn, 1964). Those all are essential moments to which should be proper attention paid and they are important for realization of the successful process of the studying – the e-Learning.

If we now focus the problematic of attention in terms of e-Learning, it can be concluded that in the fields of psychology it is desirable to use the sophisticated learning systems with a number of tools. Why does the study via e-Learning with use of multimedia elements catch attention of the students? We should focus on the education as a whole. Its use is an opposite to the verbal style of teaching but it cannot be denied that any content of education can be taught without multimedia's effect on it, e.g. only in verbal way. It is known from the fields of psychology that any contrast between the stimuli catches attention. We should keep in our minds that educational process with use of multimedia offers to the students an alternative, something new – the activities of the active character. Those are activities very substantial for the students' development and not only a simple perception of the verbal interpretation of the teacher. In this considered case is the attention from the side of the students paid inadvertently, unintentionally and is paid because of the catchiness of the object and is conditioned by immediate interest. This moment has for the education a significant importance because of the reason that it is undisputed that intentional attention is developed from subconscious attention.

Subconscious attention is not clearly passive but includes also the activity of the subject. It is unconditionally necessary that the students' attention is paid to the teacher and that the teacher can establish the e-Learning process on subconscious attention conditioned by an immediate interest. The use of multimedia's effect in terms of subconscious attention is only one of the possibilities; however, it is not the significant one. It is desirable though to support the development of the intentional attention of the students with use of different didactic devices as well.

Motivation is closely related to the activation process and it is a direct result of the cognitive and affectively social factors. M. Badinská (Badinská, 2007) argues that by using the informative technologies is the educational process becoming motivating and dynamical.

3. Limits and possibilities of activation of the handicapped students during the e-Learning

It is currently possible to observe a trend of the increasing integration and the inclusive efforts and pursuits in order to integrate the handicapped students into the common educational institutions. However, it causes a number of special needs for creation of the materialistic didactic devices that are going to be adapted to the concrete needs and possibilities of the handicapped students.

e-Learning can to the handicapped students mean a pro but an obstacle as well. It depends on a number of circumstances, but mainly on the type and the range of a handicap. Moreover, it has to be considered that every teaching object has its typical specialties and orderliness and therefore it needs own appropriate methods and organisation forms (Ludíková, 1989). e-Learning enables, due to its flexibility, the realization of education which is adapted to the people with special educational needs, mainly to the people with physical and cognitive handicap, in the specially modified environment which enables alternative ways of communication (e.g. purely audio or purely visual communication in the sign language, etc.).

IETC 2014

J. Glozar and col. (Glozar a kol., 2007) state that the principles guarantying to the handicapped people the highest possible accessibility to the e-Learning course already in its creation are mostly identical to the needs that can be stated generally:

- exact and clear structure of the course that corresponds to the clearly formulated educational aim,
- clear and correct literary language whose complexity corresponds to the educational aim (but is not more complex than needed),
- correct technical treatment, i.e. in accordance to the applicable standards for the source code.

According to S. Nečas (Nečas, 2008) the visual function causes from the psychological point of view a number of difficulties:

- visual acuity – corresponds to the visual exactness, differentiation of the distance and proximity, a human being has to use compensational aid; otherwise he/she is unable to move safely,
- ability to adequately visually perceive under different lighting conditions,
- the field of vision sets the range of the ability to perceive visually. Degenerative retinal disease is very typical. In order to see, a human have to look on things by sideways look and has difficulties to orientate himself/herself in the environment,
- colour vision – disorder of the colour vision is often indicated among visually handicapped people, limitations for a practical life are not significant.

The hearing has the compensative function among the *visually handicapped students*; therefore it has to be considered when using e-Learning. While creating the e-Learning materials for the visually handicapped or blind students, the following specifics have to be kept in mind (Pavlíček, 2012):

- a visually impaired does not work with PC intuitively but analytically (he/she has to learn some concrete ways and solutions and that makes it a significant difference between the working of a visual impaired user and a user who has no visual impairment),
- a visually impaired user has to work with an operational system and some of the applications set up specially in order to make them accessible,
- a visually impaired user uses PC and all the programmes mainly by a keyboard with help of the keyboard commands (shortcuts),
- a visually impaired user gains information linearly – he misses the context of the displayed information,
- a "screen reader" opens up to the visually impaired user only information in text form (therefore he/she is not able to work with pictures, graphs, etc. – it is needed to use so-called tactile graphics here),
- a purblind user sees in one time only a (small) part of the screen during the use of the software magnifying glass, he/she misses the context of the showed information,
- some of the purblind users need a different set up of the screen scheme than the standard adjustment (e.g. "High contrast of black")

Loss of hearing does not have to be a problem in e-Learning, however, if deafness is congenital then there appear problems during understanding of the terms and the electronic study supports have to be adjusted to those. The possible auditory stimuli, that could under the other circumstances be used, are replaced by visual ones but those sometimes do not show a whole picture of the reality.

In case of the *physically handicapped* students there are mostly no difficulties with the perception of e-Learning because mostly those handicapped students are paraplegics and quadriplegics with significant handicap of the lower limbs. e-Learning courses are in those cases a significant contribution to overcome the obstacles and they open up education with minimal the need of physical movement in the terrain. However, handicap of the upper limbs (tremor, damage of the fingers' fine motor skills) or their complete dysfunction can dramatically modify the ability of use of the computer technologies. Those cases have to be usually treated by supportive hardware devices (a special mouse, a special keyboard, writing with the help of compensatory attachments, writing with the help of eyes, etc.). Relatively low frequency and typological differences of those cases make it impossible to formulate the general principles of availability – it has to be achieved individually (Glozar a kol., 2007).

Even the *mentally challenged* students can successfully educate themselves with the use of e-Learning, however, it depends on the level of their mental challenge. There are developed and successfully used special computer programmes that contribute to the development of the educated individual's character effectively.

IETC 2014

Mental challenge is defined as a serious handicap of the mentality development from the prenatal, perinatal or early postnatal aetiology and they lead to the significant limitation in the adaptive functioning of the handicapped child or adult in his social environment (Říčan, Krejčířová, 1997).

The main signs of the *mental retardation* are (Nečas, 2008):

- a low level of the mentality that manifest itself mainly by insufficient development of thinking, limited ability to learn and therefore a difficult adaptation to the common life conditions,
- the handicap is congenital (except for the dementia),
- the handicap is permanent even though it is possible for a slight improvement depending on the aetiology and action, i.e. educational and therapeutic influences.

As K. Zatloukal and M. Ulrich (Zatloukal, Ulrich, 2008) state, the e-Learning materials can help in educational process to the students with a mental challenge. They have a number of specific problems given by their dysfunction or dysfunctions. It is hard to integrate them with the others and therefore the specific and different attitude is needed. If the education there is led by appropriate means with appropriate educational materials, it is possible to achieve very positive results.

The **concluding information** about stylizing the content itself in the electronic document in order to make it available also to the students with handicap, and, they can easily move and orientate; states M.Kudláčková (Kudláčková, 2012):

- text – different sizes and shapes of the fonts can be used for the differently sighted persons. It is appropriate to have a possibility to increase the font size or to decrease it in accordance to the needs of the individual. The lowest font size of 12 – 14 is recommended. The contrast between the text and the background should be as big as possible. Information in form of an image should be commented (described). Used font should not be too narrow but too wide neither;
- structure – the author should use a variety of styles of the headings which helps to create the automatic contents. For the students with handicap is it much easier, due to those headings, to orientate within the text. Those styles of headings should be used logically (e.g. heading 1 – used for the name of the main chapter). The text should be divided into paragraphs and well structured;
- images – all images should have a brief comment. Graphs, schemes, maps, etc., have to have a word equivalent (or an audio equivalent) so that it is clear what information wants the author to be shared;
- hyperlink – most of the time is pasted with the help of *ctrl-c* and *ctrl-v* which is very simple; however, this kind of hyperlink does not have to make sense to the people with handicap (hyperlink is actually processed by a subtraction software in form of letter by letter and the original sense of the sentences can get lost in there). Therefore it is useful to describe the hyperlinks as well;
- colour – if the author uses colourful combinations in order to highlight the text, he should make it with help of the most possible contrast (light tones on dark tones and vice versa);
- multimedia – if the author wants to use an audio or video object, he/she should mention this within the text and he/she should briefly describe what is its content and if it is important for the understanding of the content. If the video contains an essential communication then it has to be described in more detail, the transcription should be made or audio recordings should be delivered. If the video contains subtitles, they have to be transformed separately (outside the main text);
- formats – they are a specific types of documents that are being used commonly by the authors in their e-Learning courses. They can deliver information in whole in a certain format, e.g. MS Word, MS Excel, MS PowerPoint, PDF format, web format, etc. According to EBU, the best choices in transforming information to the students with handicap are the online formats. MS Office formats are relatively well available, however, also here can occur several problems (mainly in structuring of the text);
- scientific symbols – to make the mathematical and scientific symbols available is a complex thing to do because some of the students with handicap prefer to read mathematics in the Braille alphabet, some of them need a bigger font (sometimes even with a specific highlight), some of them cooperate with a voice output (combination of speeches). Authors use often images in their graphical representation of the mathematical notation (either on websites or in other formats such as Word, Excel) and those have to be commented as well.

The virtual worlds can be effectively used as specific educational platforms for the handicapped students. Their value in this context is appreciated by K. Olševičová and K. Mls (Olševičová, Mls, 2010) who state that the virtual worlds can be used as specific educational platforms, e.g. there was created and successfully tested a virtual environment in Germany where the handicapped students were training the

IECT 2014

life situations and tasks (Groenewegen, Heinz, Fröhlich, Huckauf, 2008). The importance of the multiusers virtual environment is appreciated as well by H. Marešová (Marešová, 2012) who states that their use took a new dimension of the experiencing education into the process of education.

The webcasting systems came currently to the fore in accordance to education of the handicapped students. L. Herout (Herout, 2010) remarks that the biggest potential can be seen mainly when the individuals with special needs in the education, such as students with learning disorder, handicapped students or on the other side very talented students who need individual resolution in order to achieve the defined educational aims, are tried to integrate within the common collectives.

4. Conclusion

No e-Learning education can be performed effectively if it is not projected in a high quality before so that the students become active. This condition applies even more when speaking about the handicapped students.

Activation of the students can be performed with help of different means and devices, i.e. here can be mentioned the use of stimulation, models, electronic conferences, appropriate design of the user's environment and the didactic games. But the most important are the problem learning and education. A human remembers longer and better things that he/she explored by his own active and heuristic activity; this states also J. Linhart (1982, p133). It is not enough to explain only the matter, some of the parts have to be processed into the problems that should be solved by the students individually. The study materials should lead students to their individual thinking and inferring.

Already in the phase of the preparation of the e-Learning courses should be the specifics of the handicapped students considered because the modification can be later very problematic. Attention should be paid not only to the technological side but also to the personal one, i.e. the mentors and tutors should take part in the special preparation focussed on the acquiring of the competences that are necessary for the effective e-Learning education of the handicapped students.

ADULT LEARNERS' PERCEPTIONS OF DESIGNED HYPERMEDIA IN A BLENDED LEARNING COURSE AT A PUBLIC UNIVERSITY IN MALAYSIA

Maslawati MOHAMAD, Harieza HUSSIN, Shahizan SHAHARUDDIN
Centre for General Studies, National University of Malaysia
Malaysia
maslawatimohamad@yahoo.com

Abstract

With the advent of the computer and the Internet, many higher institutions in Malaysia have begun to integrate conventional teaching with these two technologies. This approach in learning which is also called 'blended learning' offers significant benefits, namely time and location shifting. However, the principles applied to activities designed as a blended course must be taken into consideration–especially when the students are off campus adult learners with minimal opportunity to attend conventional tutorials. A study was conducted to look into this issue by seeking feedback from adult learners regarding blended learning within an academic reading course at a Malaysian public university, National University of Malaysia (UKM). The study was aimed at finding ways to improve the course offered to off campus students who were scattered throughout the country. The method of inquiry of this study is qualitative in nature and which utilizes observation, Think-aloud Protocol and semi-structured interviews as the research instruments. The subjects of this study were selected off campus students who were attached to various hospitals. The focus of this paper is to discuss the students' feedback pertaining to the designed hypermedia and comprehension questions. This paper also explains some pedagogic implications. The implications drawn is of great value to the students; teachers as the facilitators; teachers as the course designers and the administrators in improving blended learning course offered to UKM off campus students.

Keywords: hypermedia; adult learners; blended course; off campus students

INTRODUCTION

Since the 1950's Computer Assisted Language Learning (Beatty, 2003) or CALL has been used as resource for language learning. Throughout the early years of CALL, students had to move to a computer lab or computer terminal for instruction, but CALL has progressed tremendously since then. Currently, with the advent of computer technology and the changes in government policy, English language lessons such as reading can now be conducted in virtual classrooms utilizing the computers and the Internet. Reading, as a skill, is an important component of language teaching and learning (Wallace, 2010). It is argued that when there is little reading especially in formal education, there would be little language learning taking place (Nuttall, 2005; Wallace, 2010). For that reason, many language programs incorporate reading lessons. In a conventional reading course, students obtain their input through lectures and tutorials in lecture halls and classrooms. If the students face any difficulties in their reading, they can always seek assistance from their respective teachers or their fellow classmates. With CALL, the traditional ways of learning has evolved to include the use of new technologies to enhance the teaching and learning, as well as the development of reading skills among learners. From 2008 to 2010 distance learners in the Allied Sciences Faculty at the National University of Malaysia (UKM) took English for Life Sciences which was a preparatory reading course to equip the students with relevant reading strategies for use in their coursework. The main objective is that by the end of the course, the students would be able to apply the appropriate reading strategies that can facilitate their reading of academic reading materials especially on Life Sciences. The course designers who were also the researchers, however, were aware that they should not be blinded with all the positive aspects of CALL as highlighted by various studies. Findings of studies suggested that students, particularly adult learners, faced many difficulties in comprehending hypermedia docu-

IETC 2014

ments. Thus, the researchers felt that it was crucial to embark on a study to investigate the issue on local ground. The main objective of this study was to investigate the distance learners' perception of the reading materials in the course which is in the form of hypermedia documents. The major question for this study was: what are the learners' perceptions of the designed hypermedia? It is hoped that the findings of the study could guide and facilitate the course designers in designing better hypermedia documents especially for the teaching of English for Specific Purposes reading course.

LITERATURE REVIEW

INTEGRATING ICT IN ENGLISH FOR SPECIFIC PURPOSES COURSES IN A MALAYSIAN SETTING

Technology in a language course is used to tailor to the needs of specific groups of users. Some educators (Ramesh & Sanjaya, 2007; Wallace, 2010) categorize the purposes for reading into several categories, namely survival, educational, environmental, informational, occupational, recreational and ritualistic. In general, higher institutions in Malaysia try to equip their students for using English for environmental, occupational and informational purposes (Halimah, 1998). The educators also try to create contexts so that the students could fully function in these three main areas. To date, higher institutions in Malaysia normally offer one or all three types of English courses: English for Proficiency, English for Specific Purposes or English for the Workplace to equip the students for the abovementioned purposes (Radha, 2007). It is argued that local tertiary students encounter problems when reading academic texts (Radha, 2007). This problem is a serious problem in the Malaysian context because most of the references at the tertiary level are written in English. Furthermore, with the advent of the Internet, many students at the tertiary level read from websites to equip themselves with relevant knowledge in completing their assignments and preparing for tests and examinations.

In Malaysia, the use of virtual classrooms in the teaching of English is quite new. Most virtual classrooms offered at higher institutions use the hybrid approach since most Malaysian educators as well as the students are still in the transition between traditional and e-learning mode (Rozhan & Helen, 2004). According to Keerti (2009), a hybrid program is a program which combines a myriad of methods namely face-to-face classroom (physical delivery), online programs and self-paced learning. Thus, the users, namely both the educators and the students, need to adapt to the new technology to gain the benefits that technology offers. As Dail (2004: 24) wrote in her doctoral thesis, "as the computer technology evolves to meet the demands of society, society must continue to adapt to changes in the technology". Further to this, teaching and learning styles have been altered due to the widespread use of the Internet and the World Wide Web (WWW) (Grabe & Stoller 2002; Wallace, 2010). The teaching and learning in higher institutions in Malaysia is also very much affected by these developments, in addition to the government policy to promote lifelong education. Online learning through the utilization of the Internet is seen as the right move toward fulfilling both the needs of new media as language learning resource, and addressing lifelong education as envisaged by the government. However, in the Malaysian setting, online learning is closely associated with, or rather restricted to, distance learning whereby students take a particular course off campus, therefore, may not be at the same place to learn the subject, and the learning takes place via online (Norlida, 2006).

The English for Life Sciences course focused in the study employed blended learning approach but utilized the use of virtual classrooms for its reading component. Blended learning, as mentioned previously, is a combined instructional method, namely face-to-face instruction with computer-mediated instruction. It has been argued that one of the benefits of blended learning is an increased access to knowledge (Lee & Chung Hyun, 2013). The course designers were interested to see how far the use of online materials (heretofore known as hypermedia documents) that they designed or adopted were an efficient and a good way to help students develop their reading skills, according to the perceptions of the students. According to Beatty (2003), hypermedia refers to hypertexts but the links are not just from text to text but they also involve links to various media such as sound, images, animation and/or video. By conducting research on the users' perceptions of the use of hypermedia, necessary improvements could be made to the designed hypermedia in order to tailor to the needs of many parties in their own institution namely the teachers, distance learners and the administrators.

IETC 2014

ADULT LEARNERS AND READING

This study involved adult learners as research participants, thus, it is essential to describe the characteristics of adult learners since they have different characteristics in comparison to young learners. The participants in this study could be categorized as adult learners as they fulfill the definitions given by many scholars. Knowles and Holton (1998) defined adult learners as people who have arrived at self-concept. That is, they are able to be responsible and take charge of their own life particularly learning. They would tend to grow resentment to others who impose their wills on them. They prefer to be involved in the decision making process which involve their well-being. Carnine et al. (1997) emphasized that adult learners are capable of appraising, managing and regulating their own reading performance).Other scholars including Miller and Stine Morrow (1998) added that adults are able to conceptualize the content of what they have read. They could relate their prior knowledge to bring meaning and later to develop better understanding of the reading materials.
All the adult learners in the course offered at UKM possessed a Diploma in related fields of Life Sciences. Therefore, as far as reading is concerned, they could relate their academic knowledge and working experience toward enhancing their reading comprehension. Apparently, adults are capable of becoming self-directed learners as they possess the characteristics mentioned earlier and additionally, due to their greater sense of responsibility, are able to manage their time wisely in comparison to youths (Timarong et al., 2000).

Due to the above characteristics of adult learners, the course designers designed the course (English for Life Sciences) materials, activities and evaluations accordingly. This course which adopted a hybrid approach allowed the adult learners, as students of the course, to have more freedom in 'managing, regulating and appraising their own reading and performance' **(**Carnine et al. (1997), as mentioned earlier on in this article. They were given ample time to navigate their own reading, and to complete their assignments. However, the adult learners were still provided with sufficient support with regard to resources, templates, guides and samples. The class instructor also served as a facilitator to guide them in reading the hypermedia documents, and in answering the reading comprehension questions. The class instructor also modeled the usage of hypermedia reading strategies (Corbel, 2004). They could also discuss with their classmates via online forum to complement each other's understanding of the reading materials and to provide social support. Social support is pivotal to create a sense of belonging among distance learners (Pica et al., 1989). The assistance of their peers through collaborative learning could help the students' maintain their motivation, attain/acquire new skills and reading strategies, check their understanding and share new ideas (Murphy & Gazi, 2003).

In many cases, adults relative to children can resist new reading strategies as they are already comfortable with their own reading strategies (Laird, 1985). Nevertheless, in the current scenario, adult learners do not have much choice but to adjust themselves to a new curriculum (Knowles & Holton, 1998). It is further explained that new information can also be perceived as a tool that leads to changes which some adults resist. In this instance, the process of unlearning the already existing reading strategies is a need even though the process is difficult. This process can also be lengthy because they need to learn new hypermedia reading strategies and unlearn the existing reading strategies at the same time. This could be problematic for some adult learners.

Another researcher, Tseng (2008) conducted an interesting research on learners' difficulties in reading websites. His participants were asked to do reading comprehension exercises on the Internet. His interviews show that readers faced some difficulties including eyestrain, the tendency to skip lines and getting lost on the computer screens. They also had difficulties in taking notes as well as in overcoming old reading habits, and had the tendency to get distracted by reading irrelevant websites. Based on his findings, he proposed some pedagogical suggestions accordingly. His suggestions included the need for the teacher to be cautiously selective in choosing educational websites for their students, and the need to train the students on how to adjust the computer screens and web pages on their own. His study also revealed that teachers should also teach their students how to read texts on the web.

It is safe to conclude that adult learners' ability to comprehend the hypermedia documents is heavily dependent on how they are capable of relating the information of the hypermedia documents to their existing knowledge and their capability of adapting themselves to the accompanying assignments given to them (Carrel,l 1987; Yahya, 2008). Their inability to do so will lead them to feel unmotivated and inhibited to read (Laird, 1985). Hence, they need to be given appropriate scaffolding instructions and assistance to

IETC2014

ascertain their success in learning particularly in a course which integrates a lot of reading activities using hypermedia documents.

THEORETICAL BACKGROUND

COGNITIVE THEORIES

Cognitivism is a study of what happens in the brain or the study of mental processes namely sensation, perception, attention, encoding and memory which behaviorists do not examine in their theories (Jordan et al., 2008). Cognitivists believe that human learn in linear form (Jordan et al., 2008), involving mental processes such as mental planning, goal-setting and organizational strategies. In this regard, the use of meaningful feedback is important in order to facilitate and support crucial mental connections that aid comprehension (of certain subject materials). Learners' data processing mechanism identifies a particular (language) learning opportunity, processes and retrieves the information for the purpose of gaining understanding of the information, makes the necessary connections for creating new knowledge and assimilating new information. Cognitivists believe that if educators are able to understand how the learning process (such as organizing and processing of information) takes place, they are able to design learning activities to optimize learning.

Cognitive theories are also relevant to adult learners. Adult learners also learn in linear form. Humans go through a few stages when they develop their intellectual capacity but it does not stop when the learners reach a certain age (Rogers, 2002) or a certain stage (Lantolf & Thorne, 2006). Rogers (2002) states that a person is more intelligent at the age of 50 than 30 as his intelligence is more developed at this point of time. He adds that in order for a person to learn, he must first need to understand. With reference to hypermedia documents, a question worth asking is how these kinds of documents present difficulties for adult learners? Rogers (2002) and Lantolf and Thorne (2006) suggest that learning materials in the form of hypermedia documents necessitates the application of certain guiding principles. One is that hypermedia documents should be divided into meaningful units and then mastered. The hypermedia documents should then be developed from simple to complex. Moreover, there is a need for hypermedia documents for adult learners to include practice of intellectual exercises. It is because at this age they prefer activities which challenge their intellectual capabilities. One of the activities that promote higher degree of comprehension is exploration. Unlike in traditional reading lessons where the answers or responses are delayed, prompt answers should accompany the multimedia exercises so as to enable the readers to evaluate their abilities quickly. After assessing their reading comprehension level, they would then adjust their hypermedia reading strategies to improve their reading comprehension.

The design of the reading component comprising hypermedia documents in the course offered to the Life Sciences students at UKM was based on the suggestions given by Rogers (2002) and Lantolf & Thorne (2006). Nevertheless, it is not possible for the course designers to speculate on the perceived usefulness of the documents, or the reasons behind any difficulties encountered in using the hypermedia documents among the relevant students. In this respect, although the principles behind its design were adhered to during the design stage, it was felt necessary to conduct a study that seek the adult learners' perceptions of the designed hypermedia in order to shed light on the issue that may arise in the use of the documents among adult learners. It is hoped that this study could provide some insights for the course designers to improve upon the designed hypermedia and ultimately enhance the students' reading comprehension of English for Life Sciences materials.

RESEARCH METHODOLOGY

The research design employed by the researcher in this study is a case study in order to conduct an intensive study of a specific group of people. Merriam (2009) defines a case study as a study which is aimed at gaining a comprehensive understanding of a situation and it is a process rather than the outcome or product of the phenomena. Under the umbrella of a case study, this study is known as an intrinsic case study which intends to catch the complexity of a single case. Thus, the findings could not be used to generalize to

the general population (Stake, 1995). The findings could only be applicable to a group of people which possesses the same characteristics or traits (Miles & Huberman, 1994). This complies with the objective of the researchers whereby there was no intention to study this specific case to understand other cases.

Trochim (2006) and Merriam (2009) proposed that in a case study, a combination of research instruments should be used to corroborate the data evidence or to serve the purpose of triangulation. By adopting a few research tools, the findings of each research tool will at the end be able to cross-illuminate each other (Perakyla, 2000). The research tools employed in this study were observations, semi-structured interviews, and Think Aloud Protocol (TAP). If there are any discrepancies among these sources of data, the researcher asked the participant/s further questions in the following meeting so as to resolve the discrepancies. The researcher has taken some necessary measures to ascertain the validity and reliability of this study. The measures include expert validation of questions for the semi-structured interview questions, member checks/participant validation and audit trail. These measures are proposed by Uma Sekaran (2004:3) in that, "… the reliability measures indicate the extent to which it is without bias and hence ensures consistent measurement across time and across the various items in the instrument". The measures utilized are also recommended by Creswell (2003), in particular the need for researchers to be honest since the researcher is the main instrument. Yin (2009) notes that in a case study, all measures must be applied throughout the conduct of the case study.

In order to observe qualitative research etiquettes, the data was arranged according to the participants' pseudonyms. The participants were assured that their real names would not be revealed so as to not to breach their privacy (Angrosino, 2000). In addition, the researcher also sought consent from the participants. Only participants who volunteered were accepted as the participants of the study. The researcher made prior appointment according to the participants' convenience. The interview responses were transcribed verbatim.

DATA COLLECTION TOOLS

In order to obtain the answers to the research question posed in the study, observation, TAP and semi-structured interviews were utilized. The participants were observed individually for five times. The researcher went to the participants' workplace or homes in order to observe them reading the prescribed hypermedia documents. Each observation lasted between 60 to 80 minutes. While reading, the participants also employed Think Aloud Protocol to express their perceptions of the hypermedia documents uploaded earlier onto the UKM website. The TAP was then followed by semi-structured interviews which lasted about 30 minutes each participant.

PARTICIPANTS & SETTING

First year students registered in the Allied Sciences Faculty were required to enroll in an English course namely English for Life Sciences. The course focuses primarily on reading life sciences hypermedia documents from diverse sources namely books, journal, newspapers, websites and magazines. These hypermedia documents were adapted and uploaded as the prescribed reading for this course.

The designed hypermedia documents were used by the distance learners; all of whom were adult learners with at least a few years working experience in health related organizations. At the time of the study, the learners were attached to hospitals, municipal councils and universities. Their ages ranged between 30 and 45 years old. The students had limited face-to-face meetings with their facilitators and fellow classmates, that is, they only saw one another during the initial two weeks. For the remaining twelve weeks of the semester, the students studied at home or workplace. They became 'self-directed learners' until Week 15 when they gathered at UKM to sit for the final exams. There were eight participants in this study.

FINDINGS AND DISCUSSION

In general, when the participants were asked about the contents of the hypermedia documents prepared

IETC 2014

by the course designers, the interview responses were varied. First, most of the participants viewed that the number of reading articles was sufficient. Second, two of the research participants regarded the contents as being good, relevant and beneficial for their studies and work. The participants INTAM and INTFA (pseudonyms) stated that: "*Some of the contents are good. I could obtain a lot of knowledge from the reading materials" and "I believe the hypermedia help me since they are related to medical science. They are also relevant because they discuss updated issues and general knowledge*". As adult learners, it is very essential for the learning materials to be relevant and directly applicable to their working environment (Akyel & Ercetin, 2007). Adult learners do not learn for the sake of learning but to perform a task, to solve a problem or to lead a more satisfying life (Laird, 1985).

The above participants also mentioned that the teacher should select credible websites as they had found a few inaccurate statements in the hypermedia documents. The participants in the study were adult learners who possessed a Diploma in health sciences and had a few years of working experience. There is, therefore, a good likelihood that they could identify credible sources and those which were not credible such as texts from the Wikipedia, newspaper articles and blogs whose writers are people who may or may not come from a medical background. It is also possible that the respondents were able to identify inaccurate information which appeared in some of the hypertexts using previous schemata.

With reference to contents, in contrary to INTAM and INTFA, many of the other participants commented that the contents of the hypermedia documents were uninteresting which caused them to read only 40% to 60% of the uploaded hypermedia documents on the UKM website. When probed further, the participants cited reasons such as the presence of a large number of unfamiliar words especially jargons and terminologies ("*some of the words are too high level for me as I regard my English as at moderate level. When the contents contain many unfamiliar words, I would feel bored).* However, for INTAM, the hypermedia documents were not difficult. This difference in opinion could be due to a few reasons. One is that INTAM was used to reading journal articles in the Life Science discipline, as expressed in the following statement: *"I'm used to reading journals so I don't have much problem thus far".* It could be said that participants would find the contents to be difficult unless they had experience reading journal articles written in the life sciences. Another reason for the difficulty can be said to be language related. Evidence of this comes from some participants' suggestion concerning the use of glossary to accompany the hypermedia documents. The participants expressed preference for a bi-lingual glossary, such as English and Bahasa Melayu to aid understanding. This evidence is taken from INTSA, "*I prefer to get the translation from English to Malay. Straightforward*".

In addition, the glossary should be in the form of hyperlink ("*I could easily use the hyperlinks to the glossary. It enables me to make quick reference on the words that I'm not familiar with*"). The glossary should consist of important words in the hypermedia documents. Acknowledging that there are terms in Malay that do not have one-to-one relationship with the terms in English, one participant suggested in the interview that the English teachers should work collaboratively with content lecturers to produce a glossary of terms. However, it is difficult to ascertain if this is a language problem or issues pertaining to accuracy of information since the participant was able to identify two wrong translations ("*There are translated words which are inaccurate like 'chronic' and 'acute'. I suggest that the English instructors seek assistance from the content lecturers to ascertain the accuracy of the translation*"). Related to the accuracy problem could be the credibility of the online sources as reading for adult learners who are professionals in their own field.

Moreover, individuals' attitude also affected their interest in reading as admitted by INTRA and INTLI, "*OK, by nature I feel lazy to read or refer to reading materials" and "It is because by nature I don't enjoy reading. I prefer the hypermedia but reading takes a long time".*

> From the observations and participants' TAP, it is found that visual design and effect played a role in the participants (losing) interest in reading. The participants tend to skip the hypermedia documents which were regarded as being 'too long', and perhaps too taxing to read as the result of the size of the words being '*too small'* and the gaps between the lines as being 'narrow'. When enquired further, the participants stated that, "*Sometimes, the website contents make me confuse lah. Some of the reasons are the arrangement is too compact, the words are too small, or the paragraphs are too long. I would prefer if the contents are in point forms and they are put into simple sentences".* It was also reported by the participants that when the hypermedia documents were too long, the size of the words too small and there existed narrow gap between the lines, the participants would experience eye and mental fatigue easily. INTLI stated, "*I could not concentrate for a long period of time"*. Another participant, INTNI,

gave similar view, "*As I mentioned earlier, my retention power is limited I could only read one or two paragraphs then I quit reading".* When they experienced eye and mental fatigue, they tend to skip lines and got lost on the computer screen.

When discussing these 'on the screen' reading difficulties, all the participants admitted facing the same problem. The findings of this study are almost similar with Tseng's (2008) study. When reading printed texts, readers tend to move their eyes from left to right, in a straight line. However, when reading a hypermedia document, readers read information in scattered bits and pieces and not as a textual whole. Their eyes move in circular motion (Nelson, 1992). These difficulties progress with age. These participants, being adults, were used to reading printed materials during their schooling years unlike younger learners who are very exposed to the Internet at an early age, and therefore are very well accustomed to the digital print. Design issues come into play at this point. Rightly so, hypermedia documents are designed as they are because they are meant to be interactive and allow for links to other sources, as most other texts online. This particular issue calls for design considerations, on the part of website designers or those more specialized in IT, but as language teachers and designers of digital language learning materials, there is a need to be aware of potential challenges associated with physically reading hypermedia documents among adult learners. On that note it may be possible to engage in prior training for both teachers and learners in terms of dealing with new media and how that might conflict with using traditional texts. It is worth noting at this point that sufficient user training or preparation has been found to be very important toward ensuring success for an e-learning endeavor (Sami & Mohd Mudasir, 2013).

In addition to the situations surrounding most of the participants, one other issue is degree of familiarity. It was reported by the participants concerned that their working environment did not require them to access and use hypermedia documents. It took them a longer time to adapt to the 'new reading environment'. It could be possible that some degree of motivation was lost in the process because of the challenges associated with adapting themselves to the new environment (Laird, 1985). The participants' actual reading environment, as it was encountered at work, appears to be in contrast to the reading they were expected to do in the course. In this instance, there was a need for the participants to learn new reading strategies involving hypermedia documents.

With respect to retention power, Tseng (2008) stated that the retention power of adults is also lower than children's resulting in faster eye and mental fatigue). In many cases, adults relative to children resist new reading strategies as they are already comfortable with their own reading strategies (Laird, 1985). Nevertheless, in the current scenario, adult learners do not have many options but to adjust their reading strategies. It is important that the course designers make necessary improvements to the designed hypermedia documents to facilitate reading.

Some other issues require consideration as well. 'Dullness' of the contents of the hypermedia documents were mentioned, and this was attributed to the 'size of the words'; or font size; ("*The size of the words is too small therefore, it is less attractive*") and the lengthiness of the paragraphs, including aspect of color. ("*Limited colors on the pages*"). Three of the participants stated the font size should be 16. Being adult learners, they tend to shoulder multiple responsibilities (family, work and study), so it is possible that lengthy articles were viewed as 'cumbersome' because they faced the problem of time constraints. The participants further commented that when the selected article was too long, the participants lost interest in reading even at first glance ("*I quit reading immediately when I see the article is too long*"). Continuous forty-five minutes of reading was reported by the participants to be physically demanding as it put a strain on the eye, subsequently causing them to lose concentration. Added on to these challenges were issues such as not owning a laptop, not having Internet connection and having short retention power ("*At times we do not have sufficient time, do not have a laptop and others to access the website*").

The textual organization of hypermedia documents was also commented on. It seems that the participants preferred hypermedia documents with subheadings; citing constant disturbances from family members at home and work demands. In that respect, it could be said that they needed a text which was easier for them visually. According to the participants, the subheadings should be of different colors to enable them to distinguish between subheadings and paragraphs. This can be illustrated by a statement obtained from interview responses given by INTAM and INTLI,

IECT 2014

"***The texts should be designed i**n such a way that could ease our reading like putting in the subheadings and mark them in different color*"

And courses in UKM have started to integrate IT and use its potential for academic or professional purposes". Currently, very few teachers in UKM are tech savvy in the area of learning management systems (LMS). They need to be more computer savvy before they could train the students. They need to be exposed to a different set of language pedagogy for hybrid teaching and to be trained on how to exploit the potential of course management systems before designing a course. She also wrote that the facilitators and course designers need to be trained on course management systems, ethics and conventions that govern the use of online information before designing the course. "The trainings must be conducted continuously, as attitude change would not occur overnight (Norizan 2003, p. 205)". The teachers who often are also the course designers must be knowledgeable and efficient to manage and deliver suitable course materials. Without sufficient knowledge and support, both parties, the teachers and the students, could easily become technophobic and frustrated as designing and using hypermedia documents, for instance, is a complicated and demanding task (Moras, 2001; Dudeney & Hockly, 2007).

CONCLUSION

It is only through research that the details of the needs can be revealed. It is hoped that the findings of this study which are derived from the students' responses are able to provide some guidance especially for the course designers and also the teachers. These findings could facilitate the course designers to improve the designed hypermedia documents especially for use in English for Specific Purposes course, such as the one offered for Life Sciences students in the study. It is also hoped that efforts would be focused on developing more online materials to fulfill the needs of Malaysian distance learners. It is because with respect to language skills in the Malaysian scenario, the students considered reading as the most important skill (Radha, 2007).

Abstract

Applied computer laboratory lessons could be unproductive because of many students in there. Correcting students' mistakes one by one is wasting lesson time. Especially for beginners, most of these mistakes caused by complex integrated development environments. In this study, we develop a client server application for computer laboratories. Developed application is able to compile programming language source code remotely. Thus, students don't need to make something out of the writing source code. Furthermore, instructors don't need to install compiler to the each computer in laboratory. For start lesson, it is enough that server has just been configured.

Keywords: computer programming education, computer laboratory, client server application

1. Introduction

Computers are used almost in all business areas. Therefore, it is inevitable that computer courses become parts of the school curriculum (Mayer, 2013). These courses are at the level of the computer operator for social classes while the technical classes need to be more specific and detailed. Most of these courses are consist of computer programming courses. Computer programming is a difficult and challenging subject area which places a heavy cognitive load on students (Mow, 2008).

It is obvious that programming courses done in the computer laboratory. Conventional way of teaching computer programming is installing compiler and integrated development environment (IDE) to all students' computers. While this is not a problem here for engineering students, but there are some difficulties for vocational school students because of they don't have any enough background knowledge about computer programming (Ismail, Ngah, & Umar, 2010).

One of the challenges faced by students is complexity of IDE. Spending time for configuring IDE for every new project and correcting issues caused by project creation mistakes in the limited time of lesson is wastes lesson time. By the number of computers in the lab this problem being more complicated.

In this study, we predict that an application for providing very simple interface for single file source code writing and simply compiling and running may help to students to concentrate writing code rather than configuring IDE. Therefore we developed an application using laboratory network infrastructure to achieve this goal. This application was designed for client / server structure. This design is consistent with laboratory network infrastructure. Teacher's computer implies the server while students' ones are clients. Client side of developed application does not need any installation; it is simply executable file like notepad application coming with Windows™ operating system. Server side of this application needs that preferred compiler tool path has been configured. Once server application is configured, it is ready to compiling. A typical laboratory network infrastructure is shown as Figure 3.

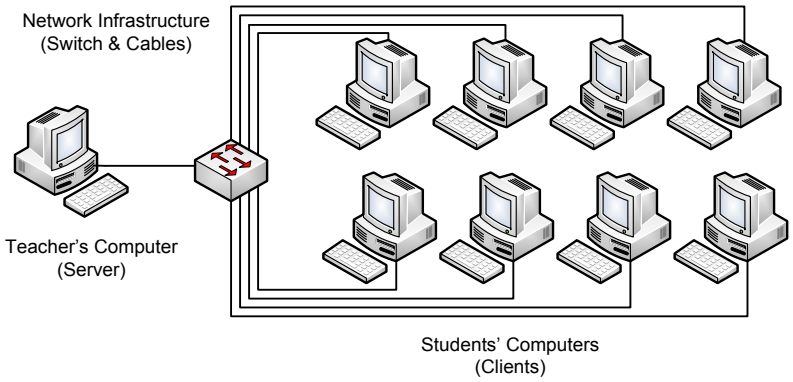

Figure 3 A Typical computer laboratory network infrastructure

2. Available programming environments

There are many programming languages available today. Many popular programming languages like C++, C#, Java, web scripting languages like PHP have same syntax notation with C for fundamental statements. Also almost all embedded chip manufacturers have C compilers for embedded development. Arduino is most popular example for this (Arduino, 2014). So we prefer C language for teaching to students. Therefore students can easily migrate own knowledge to many sections in programming like step up to advanced programming languages or drill down to embedded programming.

Every programming language needs a suitable compiler. Compiler translates the source code to the executable binary code for specific platform or processor. Compilers are an executable command line tool that takes source codes as input files and generates output files.

Source codes are simply text files. Writing source code does not need any specific tools. Basically a text file editor is enough for writing it. But many projects consist of multiple source codes that cause complicated compile sequence. For helping programmers to writing source code there are many advanced editors have been developed called as IDEs.

IDEs are designed for programmers and/or engineers that profession is computer programming. These IDEs contains advanced editor, compilers, tools and helpers. Table 1 shows available IDEs that suitable for using for education in laboratories.

IDEs showed in Table 1 are selected with these criteria: a) Designed for Windows platform. b) Supporting at least C / C++ language c) Having at least C / C++ compiler internally or externally. d) Usable for free without any license issue. These IDEs are tested on a single core CPU, 512MB RAM computer with Windows XP SP3 clean installation. This computer had a 16 Mbps internet connection. Previously installed components have been uninstalled and temporary folders and registry have been cleaned before installation of every individual IDEs. Every installation wizard has been completed by its default options. Some setups contain its pre-requirement components for install these automatically while required. Some installations download its updated components from Internet while installing. After installation of every IDEs, a simple "Hello World" program has been compiled and ran for testing.

Table 1 Available integrated development environments that suitable for using in education

IDE Name and Version	Pre-Requirements	Compiler	Setup Size	Installed Size	Setup Duration
Microsoft Visual C++ 2010 Express	-	Microsoft C++	175 MB	385 MB	16 min 30 sec
NetBeans 8.0 CPP IDE	JDK, MinGW	MinGW	62 MB	217 MB	6 min 30 sec
Eclipse Luna IDE	JRE, MinGW	MinGW	165 MB	223 MB	25 sec
Bloodshed Dev C++ 4.9.9.2	-	MinGW	9 MB	60.7 MB	1 min 50 sec

IETC2014

Orwell Dev C++ 5.7.1	-	MinGW	45 MB	341 MB	1 min 55 sec
CodeLite 6.1.1	-	MinGW	45 MB	328 MB	40 sec
C Free 5.0	-	MinGW	14 MB	89.1 MB	15 sec
CodeBlocks 13.12	-	MinGW	101 MB	259 MB	50 sec

Bloodshed Dev C++ has small setup size and simple interface. Unfortunately Dev C++ development has been stopped in 2005 and does not support anymore. This IDE is still working on many systems but having some issues with newer operating systems (Bloodshed, 2014).

Orwell Dev C++ is based on Bloodshed Dev C++ and updated releases are available on its web site. Orwell Dev C++ has similar interface with Bloodshed Dev C++ (Orwell, 2014).

C Free is another small sized and simple interfaced IDE and does not need any pre-requirements (Arts, 2014).

NetBeans and Eclipse are based on Java and haven't got build in compiler. Java Runtime Environment (JRE) or Java Development Kit (JDK) must be installed before installation of these IDEs. Preferred compiler should install separately and these IDEs needs to have been configured before compiling (Eclipse, 2014; Netbeans, 2014).

CodeBlocks has similar interface to NetBeans and Eclipse. But setup file includes its pre-requirements and compiler (Codeblocks, 2014).

Microsoft Visual C++ 2010 Express is a part of Microsoft Visual Studio IDE. Supporting wide range of tools causes huge setup media and seriously long setup time (Microsoft, 2014).

CodeLite IDE was installed successfully but had crashed without any message. We could not able to run this IDE for presented test system (Codelite, 2014).

3. Application for teaching and learning fundamental programming

The common difficulty of these IDEs is installing, configuring and maintaining on many computers. Inspecting students' source code and correcting mistakes is another difficulty in laboratory. Finally, collecting students' work files is another problem in many times. Our developed application is designed to bring solutions to these problems. There are some studies that aim to similar purposes (Karkalas & Gutierrez-Santos, 2014; Rodrigues, Marques, & Martins, 2014).

Many computer laboratories have a local network that computers are able to communicate with others and able to connect to the Internet. There are many computer classroom management applications have been developed by thanks to network infrastructure. Developed application in this study is using network infrastructure in computer lab.

Application is designed in two separate modules called as client and server. Server module is running on teacher's computer. Client modules are running on students' computers. The preferred compiler should have been installed on teacher's computer. Client modules do not need any installation or configuration. Client module consists of one simple executable file. Once server module has ran, it broadcasts its own IP address to the all clients. Client modules captures these IP address and ask student to enter name for connect. Once after connecting to the server, it is ready to compile and run. Server module lists connected clients by names and IP addresses. Teacher is able to see and any student's source code and console out by clicking on it.

IETC 2014

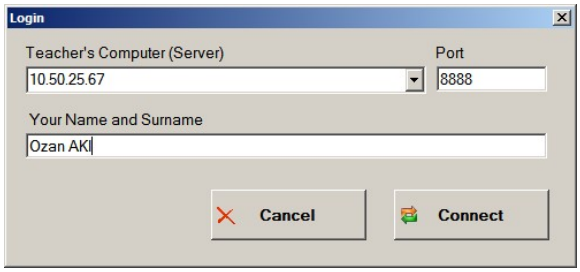

Figure 4 Client module's login screen

Client module interface is very simple like a notepad. There is a file menu that consists of file operations like new, open, save, close a file. Another menu has only one choice that named Compile & Run. When student click on compile and run menu, source code is sending to the server module for compiling. If code has any syntax error and compiling has failed, compiling results send back to the client module. These error and warning messages viewed on console window at the client application. Students can correct the code and try again until the compiling is successful.

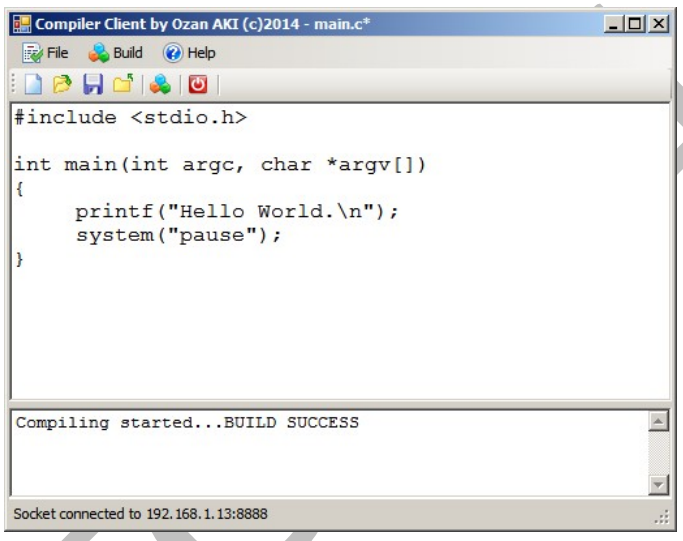

Figure 5 Client module's main screen

When any client code compiling is successful, compiled and linked executable file is send back to the client and automatically run that students can interact and view results. After the lesson or unit, teacher can collect all compiled source codes with students' names by one clicking into the any folder.

This application was developed by Microsoft Visual Studio C# Language with Dot Net Framework 4.5 for Windows platforms. Socket programming and threading techniques are used (Schildt, 2011). Transmission Control Protocol (TCP) is used for transmit source code and executable file. User Datagram Protocol (UDP) is used for dispatch server IP address. Every compiling process started as new thread for avoid blocks other compiling requests. Returned executable file is running as local console application in client computer. Students can fully interact with their built application.

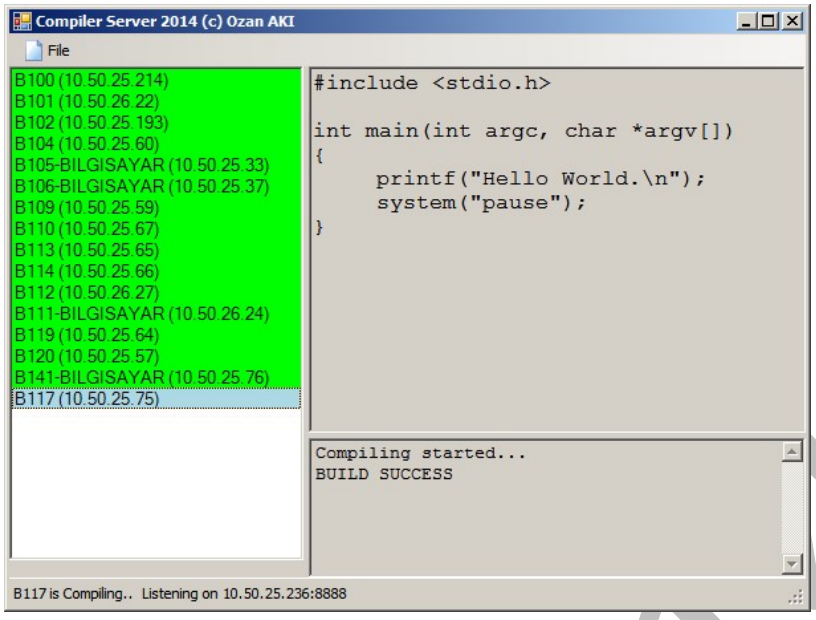

Figure 6 Server module's main screen

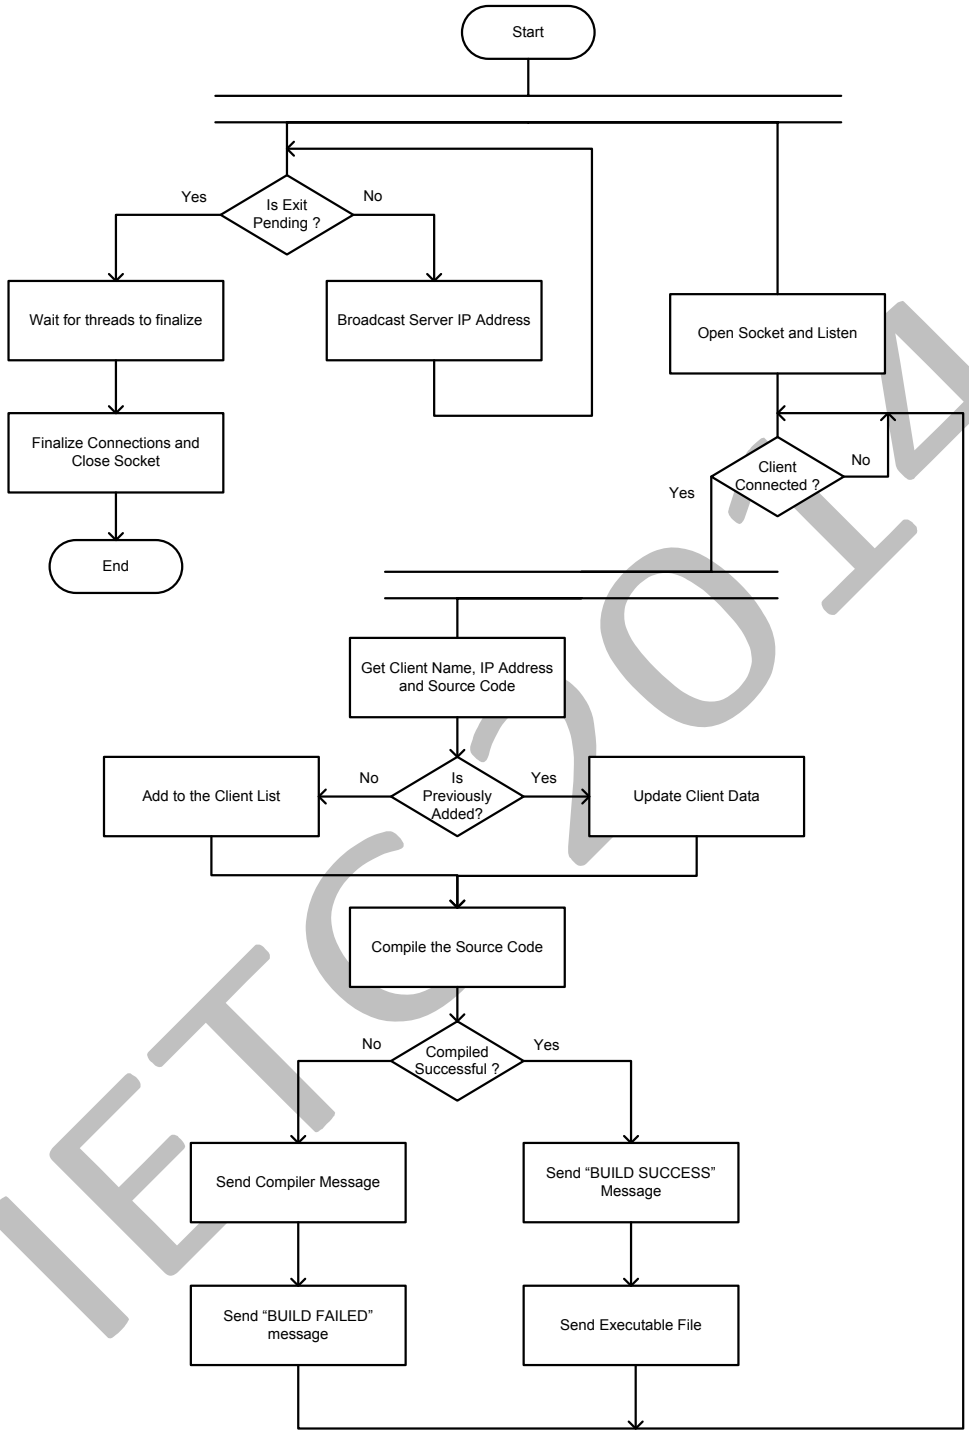
Advantages of this application can be listed as below;

- Does not need to install compiler to the all computers
- Teacher can see any students' source code and console results on their screen
- Teacher can collect all source codes by students' name by one click
- Students don't need to do any configuration. Students can just writing code and simply compile and run it.
- Client computers do not need to be a high-end hardware.

Probability disadvantages of this application are listed below;

- Clint module have not an advanced editor that helps and suggests while writing code
- Client module have not coloring source code key words
- Client module does not indicate an error by coloring line.

4. Discussion and results



Developed application is an initial attempt to realize the idea. Application is tested in computer laboratory with 16 clients. Minimalist GNU for Windows (MinGW) is used for compiler tool chain on server. All clients had compiled remotely its source code successfully. After all compiling processes, all students' source codes were collected easily by one click. Test results shows that this application could help teaching of computer programming but not tested on real lesson conditions yet.

On the other hand, IDEs should not be considered to be disregarded by this application. This application is designed for beginner students in computer programming. After meeting students to the programming, of course students should learn using of least one IDE for programming.

An empirical study of critical success factors of mobile learning platform from the perspective of instructors

Muasaad Alrasheedi9 and Luiz Fernando Capretz
Western University, 1151 Richmond St, London, Ontario, N6A 3K7, Canada

Abstract

Mobile learning is newest learning platform and based on the rapid rate of proliferation of mobile technology throughout the world is expected to grow at a rapid rate. However, the adoption of m-Learning is proceeding at a cautious rate. This mismatch in the rate of growth of the technology itself and the use of the technology in learning is a subject of extensive interest to researchers. However, research in the area has been mostly focused on understanding the success factors of the platform from learners' perspective. In this research, we have conducted an extensive analysis of the extent to which various factors are considered to impact the success of mobile learning from the perspective of instructors. This is because instructors not only are one of the core users of the platform they also hold a great deal of influence in promoting the platform usage among learners. The results of the research were not found to be statistically significant showing that greater population size is required to assess various hypotheses.

Keywords: m-Learning, mobile learning, higher education, critical success factors, empirical studies.

1. Introduction

Mobile phone is easily the most profligate technology the world has ever seen, in terms growth, reach and technical advancements. While its prominence can be traced to the 1980s, in less than three decades the mobile technology has revolutionized the way people communicate and access information (Alrasheedi & Capretz, 2013a). This has result in rapid spread of mobile phones among the global population. For instance, while the reach of mobile phone was limited to about one-third of global population in 2004 (Paul & Seth, 2012), according to the recent estimates by World Bank, over 90% of the world population live within the range of a cell phone tower in 2010. This means that the number of people using mobile phones increased from less than 700 million in early 2000s to over 5 billion or 70% of the world population in 2010 (The World Bank Institute, 2012). Mobile phone technology has also grown leaps and bounds in terms of its versatility, which almost continual addition and extension of features and capabilities. This has made them devices of choice by an increasing number of people us to stay in touch with the rest of the world. Even though, educational systems have been shaped by the emerging technologies practices (Capuruço and Capretz 2009).

With this background, one would expect that the concept of mobile learning would be adopted at a similar rate, especially in higher-learning institutions in the technical sector where both learners and educators are more tech savvy. While much of the research suggests that the interest in exploring mobile learning has remained high (Rockley & Cooper, 2012) the adoption in the educational sector has been slow (Peters, 2009). This is especially true for higher educational sector, where the adoption of mobile learning has been especially slow. Interestingly students in higher education are receptive towards the idea of usage of mobile learning as they are comfortable with the technology. However, researchers speculate the issue lies with instructors many of whom do not understand how to use these devices in learning, while others are uncomfortable with the technology. The lack of an adoption framework combined with rapidly changing technology and concerns about security and privacy have only slowed down the actual adoption

IETC 2014

rate (Wilen-Daugenti, 2009). It can be seen that attitude of instructors is one of the major bottlenecks to the success of mobile learning. The detailed analysis of the opinions of instructors is the subject of the present study.

The structure of the paper is as follows. Section 2 presents the literature review where several relevant aspects related to mobile learning and perception have been discussed. Section 3 presents the research model and the hypotheses that would be tested. Section 4 presents the research methodology. Section 5 presents the analysis of data comprising of demographic analysis, correlation analysis and determination of regression equation. Section 6 presents a discussion of the results and the limitations of the present study. Section 7 presents the conclusion.

2. Literature review

Mobile learning offers users several unique features that were not possible in traditional learning platforms and even in e-learning to so extent. The first among these features is mobility that refers to the prospect of having flexibility in terms of time, place, pace and space that is not achievable when using non-mobile versions of devices (Andrews, et al., 2010). Another unique feature of mobile learning is collaborative learning. While collaboration is a part of education in traditional learning scenarios as well, the use of mobile devices means that learners can now interact with fellow students and educators from different locations even when they are not in a formal classroom. Mobility combined with collaborative learning makes the m-Learning platform different from any other existing learning platform, whether it is traditional face-to-face learning or other technology-based platforms like e-Learning (Kukulska-Hulme & Taxler, 2007).

Because of the ubuiquitousness of mobile technology, it difficult to escape the immense ramifications offered by the mobile learning platform. Ironically, every single feature that makes mobile learning possible has a downside to it, including the technology. First, the wireless communication technologies might offer anytime, anywhere learning possibilities, but the actual feasibility depends on the interest and diligence of learners (Kukulska-Hulme, Introduction, 2005). The education sector spends a lot to time and effort into making sure that students actually learn something and hence the focus on face-to-face interactions during learning and examination sessions. Wireless technology adds an additional burden because universities would be expected to impart successful degrees to the same caliber of students, if mobile learning is to be included as a mainstream education platform (Ally, 2009). Second, the security issues related to internet technologies are too pertinent to be ignored. This means that the university has to spend a significant amount to ensure that their systems are secure (Alrasheedi & Capretz, 2013b). This, in turn means, rising cost of education. As one of the objectives of distance education has always been reducing cost of learning, this aspect may nullify any cost savings. The hand-held device technology also acts as barrier in several ways. First the rapidly changing features, means that the development and modification of the learning platform has to keep up its pace with changes in technology. As new models of all brands of phones turn up every few months, this is not a very easy thing to do. Also unlike standard computers, the user interfaces of mobile devices are too varied and hence designing a common user interface itself is a challenge. Finally, as multiple technologies exist in terms of the types of handsets, the operating systems, and device capabilities, the implementation of mobile learning platform to make it user friendly is extremely difficult (Melhuish & Falloon, 2010).

As can be seen from above, there are several legitimate barriers to the adoption of mobile learning by users. From a developer's perspective solutions are a cross between the requirements and budget. The requirements are decided by the users. Hence, the exact requirements of a successful mobile learning platform can be best decided by the users themselves. Researchers have conducted several studies to assess the factors that learners consider important. But as discussed at the start, learners are already receptive to the idea of mobile learning. It is the instructors who are skeptical of the idea and are slow to adopt the principles of m-Learning. As the success of any educational paradigm is dependent on the interest of the educators, it is important to understand the factors that educators consider important while adopting m-Learning. Furthermore, it's vital for instructors to improve the teaching strategies (Seddigi, Capretz, & House, 2009).

IETC 2014

Ironically however, not many studies have been conducted in this regard. The few studies that have been conducted offer interesting background, though the studies are extremely limited in scope. MacCallum and Jeffrey (2009) conducted such a study in New Zealand on tertiary education. The researchers find that the educators have ambivalent feelings towards m-Learning in higher education sector. While all educators agree with the wide ranging benefits of the platform they are concerned about the integration of these technologies with the curriculum and the time taken for the implementation. While educators welcome low level integration of mobiles to support learning activities, the use of m-Learning as a separate platform is not one they are highly receptive to (MacCallum & Jeffrey, 2009). An extensive study conducted by Pollara (2011) in US found another reason why higher education faculty are not overtly receptive to the use of mobile technology in learning. The research found that faculty perceptions on the usefulness of mobile technology in education were affected because many believed that students used the devices actually for socializing purposes when they reported that they were doing study-related tasks. In their view, this affected the entire learning process by distracting students, to the extent that some instructors actively banned the use of mobile devices inside the classrooms. Interestingly students believed that they would perform better if the use of mobile phones were not restricted (Pollara, 2011). This background only serves to highlight how important is it to conduct a detailed study into understanding the perspective of instructors towards m-Learning in the higher education sector.

3. Research model & hypothesis

The purpose of the research is to present a research model for assessing how and to what extent different factors affect educators' perspectives on the use of m-Learning, in the higher education sector. Figure 1 below shows the research model diagram.

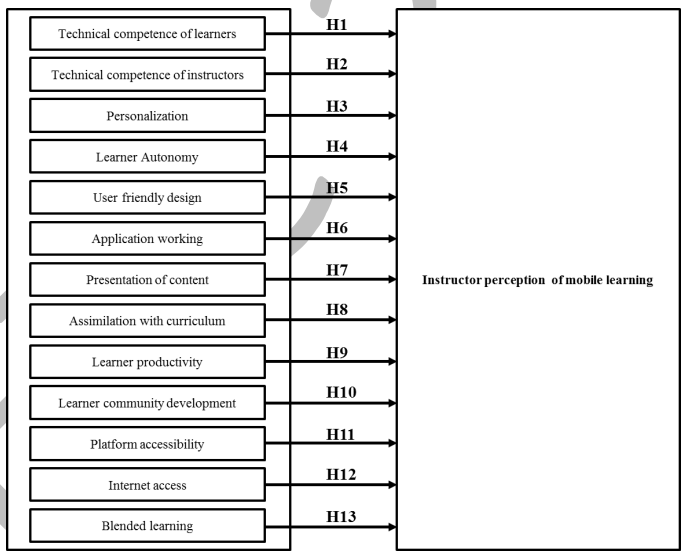

Fig. 1. Research model – critical success factors affecting the success of mobile learning from instructors' perspective

Educators are the backbone of learning and hence their attitude towards a new platform is extremely important to understand. Our previous research found 13 factors that affect the overall attitude towards the m-Learning platform (Alrasheedi & Capretz, 2013c). To determine the user satisfaction levels we have conducted a detailed survey targeting the educators using the m-Learning platform. (In this paper the words instructors and educators have been used interchangeably).

Overall the objective of the research is to determine the answer to the following question:

"To what extent do various critical success factors impact instructors' perception of a mobile learning platform?"

The multiple linear regression equation of the model is as follows:

Instructor perception = $c_0 + c_1f_1 + c_2f_2 + c_3f_3 + c_4f_4 + c_5f_5 + c_6f_6 + c_7f_7 + c_8f_8 + c_9f_9 + c_{10}f_{10} + c_{11}f_{11} + c_{12}f_{12} + c_{13}f_{13}$.

In the equation c_0, c_1, c_2, c_3, c_4, c_5, c_6, c_7, c_{08}, c_9, c_{10}, c_{11}, c_{12}, and c_{13} are coefficients and f_1, f_2, f_3, f_4, f_5, f_6, f_7, f_8, f_9, f_{10}, f_{11}, f_{12}, and f_{13} are the 13 independent variables. To empirically investigate the research question, the 13 hypothesis are derived as presented below:

hesis 1. Technical competence of students positively affect the overall instructor perception
)othesis 2. Technical competence of instructors (from their own perspective) will positively affect the overall instructor perception
hesis 3. Extent of personalization will positively affect the overall instructor perception
hesis 4. Extent of learner autonomy will positively affect the overall instructor perception
hesis 5. User friendly design of m-learning platform will positively affect the overall instructor perception
)othesis 6. Better application working (ease of platform usage) will positively affect the overall instructor perception
)othesis 7. Possibility of interesting ways of presenting the course matter will positively affect the overall instructor perception
)othesis 8. Assimilation with curriculum, from learners' perspective, will positively affect the overall instructor perception
hesis 9. Perception of increased learner productivity will positively affect the overall instructor perception
)othesis 10. Perception of increased opportunities for learner community development will positively affect the overall instructor perception
)othesis 11. Perception of improved platform accessibility will positively affect the overall instructor perception
hesis 12. Perception of improved internet access will positively affect the overall instructor perception
hesis 13. Blended learning possibility will positively affect the overall instructor perception

4. Research methodology

Instructors are not only one of the primary users of the mobile learning platform, they also act as mentors to the primary users – the learners. In addition, instructors are also responsible for course design and dissemination, which makes them the more important user in terms of the extent to which they use the m-Learning platform. The present study focuses on gathering the opinions of instructors and analyzing them in a systematic manner. To collect the data we gave the questionnaire to various undergraduate and post graduate instructors teaching different courses in five universities in Saudi Arabia. We assured the instructors that the survey was confidential: their identity would not be disclosed and their primary responses would be used for this study only. We received a total of 64 completed questionnaires.

4.1. Reliability and validity analysis of measuring instrument

The present survey of mobile learning comprised of a series of questions determining the attitude of educators towards m-Learning platform. Nine of these questions were straightforward involving single-item measurements. However, four of the questions involved multi-item rating scales: learner productivity, learner community development & platform access, which use four-item measurements; and internet access that uses three-item measurement. In addition, the overall learner perception is also measured using three-item measurement. In all these cases it is important to assess the reliability of the measurement scales. This is done to quantify the reproducibility of a measurement and is performed using an internal consistency analysis – calculating the Cronbach's alpha. The limits of the satisfactory levels for this reliability coefficient has been performed by various researches. Most of the studies cite the studies by van de Ven and Ferry, who consider that coefficient of 0.55 and higher is satisfactory (Van de Ven & Ferry,

IETC 2014

2008). Recent studies by researchers like Osterhof, however have increased this the minimum satisfactory level of the reliability coefficient to be somewhat higher at 0.6 (Osterhof, 2001). In our case, the reliability coefficient is all cases is >0.8, which means that the measuring instruments used are reliable. The Table 1 below shows the values of Cronbach's alpha and PCA eigen values for the factors discussed.

Table 2. Cronbach's alpha for multi-measuring rating scales.

Success Factors	Item Numbers	Cronbach's alpha	PCA eigen
Learner Productivity	(ix to xii)	0.9360	1.7159
Learner Community Development	(xiii to xvi)	0.8415	1.6147
Platform Accessibility	(xvii to xx)	0.9462	1.7019
Internet Access	(xxi to xxiii)	0.8078	1.6440

4.2. Data analysis procedure

The data analysis procedure for the present study comprises of three steps. The first step is to check if there is a parametric correlation test between the dependent and independent variables to check if any of the critical success factors or hypothesis could be rejected. The second step involves conducting a non-parametric test is conducted between the the dependent and independent variables in order to reduce the external validity threat (Raza, Capretz, & Ahmed, 2012). The third step is the actual regression analysis to determine the regression equation i.e. the value and sign of the coefficients for each of the variables.

5. Hypothesis tests and results

5.1. Demographic distribution of the population

This section discusses the distribution of the population based on demographics. As mentioned, the total population comprised of 64 teachers. Of this, 47 (~73.44%) were male and 17 (~26.56%) were female. Further, as mentioned earlier, the population comprised of tutors from different universities. The distribution was reasonably uniform. Only one of the instructors was under 25 years of age. A majority i.e. 36 or >50% of the instructors were between 36-55 years of age. The next largest age group was 26-35 years, which involved about 21 of the instructors. Only 6 instructors were over 55 years of age. An overwhelming majority of the instructors i.e. 61 out of 64 were employed full-time, the remaining were employed part-time. In terms of the teaching levels, 48 instructors or 75% of the population taught Undergraduate classes, while the remaining 16 instructors or 25% of the population taught post graduate classes.

One of the important aspects of demographic analysis was to understand the extent of mobile phone proliferation among this group of users. The survey results were extremely interesting in this regard. All the instructors owned mobile phones. Further an overwhelming majority i.e. 59 out of 64 instructors or 92.2% of the instructors owned a smart-phone or a PDA. Additionally, 55 instructors or 85.94% also owned a desktop PC, while a significant majority i.e. 62 instructors owed a laptop/tablet PC/mini notebook. All the instructors had internet installed on at least on of these devices, and a significant majority i.e. 59 instructors or 92.2% of the instructors had internet installed on their mobile phones. This data shows that the mobile phone and internet penetration was extremely high among instructors and they were both aware of and were active users of the mobile phone as well as internet technologies in tandem.

5.2. Hypothesis testing using parametric and non-parametric tests

Before conducting the actually regression analysis, additional tests were conducted on the hypothesis to see if any of these could be rejected thus simplifying the analysis. To test the hypotheses H1-H13, parametric and non-parametric statistics were used to examine the Pearson and Spearman correlation coeffi-

IETC 2014

cients between the individual independent variables i.e. the critical success factors and the instructor perception of the critical success factors.

Table 3. Hypothesis testing using parametric test.

Hypothesis	Critical Success Factor	Pearson Correlation Coefficient	Spearman Correlation Coefficient
H1	Technical competence of learners	0.476	0.433
H2	Technical competence of instructors	0.689	0.592
H3	Personalization	0.647	0.555
H4	Learner Autonomy	0.658	0.627
H5	User friendly design	0.610	0.582

The results of the statistical calculation for the Pearson correlation coefficient are shown in Table 2 below. It is commonly fact that the lower the p-value the better chance there is of rejecting the null hypothesis and hence the more significant is the result in terms of its statistical significance (Stigler, 2008). In the present case, all the p-values are 0.00. This means that the results are significant.

5.3. Testing of the Research Model

A multiple linear regression equation for our research model was presented earlier. Following is the linear regression equation:

$$\text{Instructor perception} = c_0 + c_1f_1 + c_2f_2 + c_3f_3 + c_4f_4 + c_5f_5 + c_6f_6 + c_7f_7 + c_8f_8 + c_9f_9 + c_{10}f_{10} + c_{11}f_{11} + c_{12}f_{12} + c_{13}f_{13.}$$

In order to determine the coefficients of the equation above we run a regression analysis. In addition to giving the model coefficient the regression also gives the direction of association. As can be seen from the model equation above, all the critical success factors are assumed to have positive association with the user perception. The regression analysis will inform whether this is true in all cases. Further, the analysis does not include any categorical predicators. The results are given in Table 3 below.

The result of the regression analysis offer interesting insights into the model. First, not all the coefficients are positive. This means that critical success factors – Technical Competence of Learners, User Friendly Design, Learner Community Development and Platform Accessibility – all have negative association with instructor perception. This deviates from the expected relationship.

The final regression equation is as follows:

$$\begin{aligned} &Instroctor\ perception \\ &= 0.830 - 0.072\ (Technical\ Competence\ of\ Learners) + 0.104\ (Technical\ Competence\ of\ Instructors) \\ &+ 0.014\ (Personalization) + 0.221\ (Learner\ Autonomy) - 0.020(User\ Friendly\ Design) + 0.036\ (Application\ Working) \\ &+ 0.036\ (Presentation) + 0.043\ (Assimilation\ with\ Curriculum) \\ &+ 0.258\ (Learner\ Productivity) - 0.250\ (Learner\ Community\ Development) - 0.019\ (Platform\ Accessibility) \\ &+ 0.249\ (Internet\ access) + 0.250\ (Blended\ learning) \end{aligned}$$

IECT 2014

From the regression analysis, it is seen that the model accounts for 53.76% variability in the dependent variable i.e. instructor perception. However, the p-values in all cases is more than 0.05, which means that none of the relationships is significant. This means that the relationship coefficients cannot really be said to show the actual relationships between the dependent and independent variables.

Table 4. Multiple regression analysis of the research model.

Critical Success Factor	Coefficient term	Coefficient value	t-value	p-value
Technical competence of learners	f_1	-0.072	-0.50	0.621
Technical competence of instructors	f_2	0.104	0.57	0.575
Personalization	f_3	0.014	0.08	0.937

Blended learning	f_{13}	0.250	1.64	0.108

IETC 2014

6. Discussion of the results

The results of data analysis presented in this paper is only a snapshot of the detailed analysis. Further exploration of several of the interrelationships can be conducted using the data. These have not been covered here because of the results of the regression analysis.

The demographic analysis of the results shows a highly skewed distribution towards the male population. However, the presence of female instructions was not insignificant either as they comprised of one-fourth of the entire population. As expected most of the instructors are between 26 and 55 years of age, with a few instructors over 55 age limits. Also, there is a minuscule representation of instructors less than the age of 25, as is expected in general from the faculty of tertiary technical institutions. Interestingly most of the instructor population was found to be technically savvy and very comfortable with owing and using advanced mobile phone devices. The use of internet was also universal and a majority of the population accessed internet from their mobile devices. The instructors were also found to be technically savvy an owned other devices likes desktop PC, laptops and tablet PCs. This clearly shows that lack of technical awareness is not an issue to the adoption of mobile learning platform within five Saudi Arabia universities.

The effect of four of the critical success factors - learner productivity, learner community development, platform accessibility, and internet access, as well as the dependent variable 'instructor perception' was

determined using responses from multiple-items in the survey. As such, it was important to first assess the reliability of the instrument. This was done by conducting an internal analysis, by conducting an internal analysis by determining the Cronbach's alpha for these multiple-items. It was found that the Cronbach's alpha in all the cases was >0.8. This is clearly much higher than even the recently determined higher threshold of 0.6. Hence, the averages of the response could be used for determining the individual variable coefficients in the research mode.

The next step involved determining whether there was a correlation between the different independent variables and the dependent variables. In the present study both parametric and non-parametric studies were carried out. This was to remove the threats to external validity. In all the cases, the Spearman's Rho was found to be somewhat lower than Pearson's coefficient though the correlations were always >0.4. More importantly, all the hypothesis were found to be statistically significant as the p-values in each cases for both parametric and non-parametric correlation analysis was found to be 0.00. This meant that in all cases there was a reasonable correlation between the various critical success factors and the instructor perception based on the current data.

Once, it was made sure that the critical success factors had statistically significant relationships with instructor perception, the next step was to determine the regression model. It is at this point that the present study reaches a hitch. First, in case of the variables the expected direction is negative - Technical Competence of Learners, User Friendly Design, Learner Community Development and Platform Accessibility. This means that in all these cases, the instructors believe that the critical success factor is inversely related to the success of mobile learning. Interestingly, all the four factors are related to learners. It is very easy to believe that instructors consider that these factors are not of much important when deciding the success of mobile learning. One of the research studies in the literature review section points towards the attitude that instructors believe that mobile phones are disruptive to m-Learning, which might explain this attitude. Another interesting aspect is that none of the coefficients are >0.3, which shows that instructors are divided into what they believe are the critical factors for the success of mobile learning. Among the factors, the most influence was attributed to Learner Autonomy, Learner Productivity and Internet Access.

Additionally, and more crucially, in none of the cases the p-value was <0.05. In fact, in all the cases, the p-value was higher than 0.1 and in some cases it was even greater than 0.9. This shows that based on the current data, none of the relationships was found to be statistically significant. This might be because the population size was small and comprised of only 64 instructors which was used to analyze 13 hypotheses. Another reason might be because most of the success factors were considered from the learner perspective.

6.1. Limitations of the study

As mentioned earlier, this research did not explore all the interrelationships between the demographic factors and the instructor perception. Some factors such as gender are believed to have an effect on the user perception on mobile phones. The regression equation included only continuous parametric data and so the demographic categorical variables were not considered. The idea was to first explore the relationships without assessing the internal factors responsible for the individual responses. As none of the relationships were found to be statistically significant, the internal analysis using demographic variables was not conducted. The analysis can be a part of future analysis, once more data is collected to see whether increasing the survey population. As all the critical success factors showed significant correlation with the dependent variable i.e. instructor perception, this is a reasonable assumption to make.

7. Conclusion

In this paper, we have presented the results of a detailed and systematic investigation into the critical success factors affecting user perception of m-Learning from the perspective of instructors. As instructors are one of the crucial user groups, it is important to understand the factors they consider crucial for the success of mobile learning. The results of our study showed that none of the factors analyzed were statis-

IETC 2014

tically significant. The reason for this can be attributed to the large number of hypothesis tested and the small size of population. Future studies would involve whittling down the number of hypotheses and increasing the size of population.

The study result also showed that according to instructors, the following factors – Technical Competence of Learners, User Friendly Design, Learner Community Development and Platform Accessibility – had negative association with the success of mobile learning. Again this result cannot be said to be conclusive because the results were statistically not significant. Finally, the research was limited because the impact of demographic factors on survey responses was not assessed. Future work would endeavor to sort all these aspect of the research.

Analysis of students' listening behavior patterns in an asynchronous discussion forum

Durairaj, K.[a] & Umar, I.N.[b]
Centre for Instructional Technology & Multimedia, Universiti Sains Malaysia, 11800 Penang, Malaysia

Abstract

Of late, it is common to see the use of asynchronous forum in a hybrid learning environment. This study employs Wise, et al.,'s (2012) patterns of listening behaviour to explore the students' interaction level in an online forum platform. Listening behaviour refers to tasks such as when and how students interact in discussion forums. A total of 23 postgraduate students from a public higher educational institution in Malaysia involved in this study. Using a cluster analysis method, the results indicated four types of listening behaviours. Based on these analyses, some strengths and potential weaknesses in the discussion forum were identified.

Keywords: Asynchronous Discussion Forum; Cluster Analysis; Listening Behavior; Interaction.

1. Introduction

Online forum can be used to complement learning and teaching, particularly in blended or hybrid learning courses. According to Balaji and Chakrabarti (2010), asynchronous discussion forum can increase students' understanding and give them the opportunity to share information, perspectives and experiences. Besides, it leaves an impact on achievements (Cheng, Paré, Collimore, & Joordens, 2011). Thus, it is important to know the level of interaction or students' engagement in an online discussion forum. Students' engagement level can be analyzed using social network analysis and cluster analysis. In this study, cluster analysis is carried out to classify the students' level of interaction and participation in an online forum.

2. Listening behaviors

In this study, expressing opinions or contribution in online discussions is conceptualized as speaking while listening consists of reading the opinions, contributions or post of peers (Wise, Speer, Marbouti & Hsiao, 2011). Listening behavior consists of when and how students interact in discussion forums (Wise, Speer, Marbouti & Hsiao, 2012). According to Wise, et al., the actions or tasks of students with existing posts in the online discussion are considered as their engagement in the forum. An example of the listening behavior action is opening or reading and replying the posts sent by other participants. Listening behavior patterns are classified according to several domains such as temporality, breadth, depth, speaking, reflection and the final grade (Wise, et al., 2012). This study only employs four specific domains consist of 10 variables, involving temporality, breadth, depth and speaking. The final grade is also excluded due to the confidentiality of the students' examination results. Reflection is excluded in this study due to the limitation of the learning management system being used.

Temporality includes four variables include average length of session, percent of sessions with posting actions, average number of sessions per discussion and average number of reads before contributing a post. The depth consists of one variable, namely the average length of time reading a post. For the breath domain, it comprises of two variables, namely percentage of posts viewed at least once and average num-

IETC 2014

ber of views per discussion. Speaking involves three variables, namely the average number of posts contributed per discussion, average number of words per post and average length of time creating a post.

The study analyzes the patterns of online listening behavior for every student participant according to his or her level of interaction in the discussion forum. The level of students' interaction is important in learning because (i) the interaction affects the quality of learning (Trentin, 2000), (ii) interaction is a significant cause for making teaching and learning (Vygotsky, 1978) and (iii) it will affect the learning process as well (Garrison & Anderson, 2003). The quality of the interaction determines the success of online learning and teaching. Instruction becomes more effective when it occurs in a dialogue form where students can interact with their peers or instructors who guide their learning. However, online discussion forums found to have many constraints in achieving the learning objectives.

3. Asynchronous discussion forum

The asynchronous discussion forum may contribute to understanding the learning content, knowledge construction and student achievement. However, it is still less popular among students (Wise, et al., 2012). In asynchronous discussion forums, students are less involved or not willing to ask their peers (Anuratha Kanniah & Pramela Krish, 2010). Although students' participation is needed, they rarely post messages in online discussions (Cheung & Hew, 2006).

To create a quality interactive discussion, it is advisable to read existing messages before posting one's own messages (Wise, et al., 2012). However, students do not follow the procedures to be involved in the discussion. This resulted in: (i) no sequence in delivering forum (Herring, 1999), (ii) discussions that deviate from the topic of learning (Hou, Chang, Sung, 2007), (iii) no link to the original forum and thus forum becomes an independent statement (Khine, Yeap, & Lok, 2003), (iv) the discussion becomes disjointed and inconsistent (Zhu, 2006) and, (vi) forum would be meaningless (Thomas, 2002). According to Peters and Hewitt (2010), students also focus on the selected forum only. These issues will affect the quality of discussion and the learning process. Consequently, the students' level of thinking, as well as their knowledge construction will be affected. Therefore, there is a need to analyze the students' listening behavior patterns in terms of reading and responding to their peers' messages. These listening behavior patterns will be measured and analyzed based on the posts they sent in the online forum.

4. Objectives

Based on the problem statement, the objectives of this study are;

- To analyze the listening behavior patterns (levels of reading and responding peers' message) according to their level of interaction in the forum.
- To group the students into clusters according to their level of listening and responding to their peers' messages in the discussion forum.

5. Methodology

The study was conducted at a public university in Malaysia involving an asynchronous discussion forum as part of a coursework requirement. A course at postgraduate level (master by coursework) was chosen for this study. This course is offered in a hybrid mode whereby weekly face-to-face class sessions as well as online learning session using a learning management system (LMS) are applied. The discussion forum is part of the LMS activities carried out for the online learning session. A total of 23 postgraduate

IETC 2014

students enrolling in the course involved as the participants in this study. The instructor provides a topic of discussion and the students are required to respond to the assigned topic. The log files extracted from the online forum activities are used for data processing. These include the information such as the number of students' view, read and reply messages or post messages and the time in each of the tasks in the forum. Based on these data extracted from the log files, cluster analysis will be used to analyze the students' listening behavior patterns as proposed by Wise, et al., (2012).

6. Findings

The sample consists of 23 participants involved in asynchronous discussion forums. The agglomeration schedule, icicle, and deudogram vertical graph are used to identify the number of clusters present in the discussion forum.

Table 1: Agglomeration Schedule (four clusters).

Agglomeration Schedule

Stage	Cluster Combined		Coefficients	Stage Cluster First Appears		Next Stage
	Cluster 1	Cluster 2		Cluster 1	Cluster 2	
1	22	23	4.502	0	0	20
2	2	8	17.863	0	0	11
3	9	19	35.588	0	0	9
4	11	15	55.899	0	0	12
5	13	14	79.019	0	0	11
6	5	12	102.196	0	0	14
7	3	4	130.543	0	0	13
8	7	10	176.469	0	0	12
9	9	16	232.698	3	0	13
10	17	21	307.471	0	0	16
11	2	13	402.628	2	5	15
12	7	11	521.173	8	4	15
13	3	9	668.614	7	9	19
14	1	5	853.757	0	6	19
15	2	7	1194.828	11	12	18
16	17	20	1559.322	10	0	17
17	6	17	2106.500	0	16	20
18	2	18	2857.638	15	0	21
19	**1**	**3**	**3811.788**	**14**	**13**	**21**
20	**6**	**22**	**5690.428**	**17**	**1**	**22**
21	**1**	**2**	**16246.048**	**19**	**18**	**22**
22	**1**	**6**	**54751.076**	**21**	**20**	**0**

Based on the Agglomeration Schedule (Table 1), there are four clusters in the classification of listening behavior patterns here. The differences are so significant for the last four sets of data. In specific, the differences are significant between 19 and 20 (3811.788-5690.428), between 20 and 21 (5690.428-

16246.048), between 21 and 22 (16246.048-54751.076). This is reinforced by Figure 1.0 (Vertical Icicle graph) indicating four clusters. Next, deudogram (Figure 2.0) also suggests four clusters, namely cluster 1 (students 22 and 23), cluster 2 (students 17, 21, 20 and 6), cluster 3 (students 2, 8, 13, 14, 11, 15, 7, 10 and 18) and cluster 4 (students 3, 4, 9, 19, 16, 5, 12 and 1).

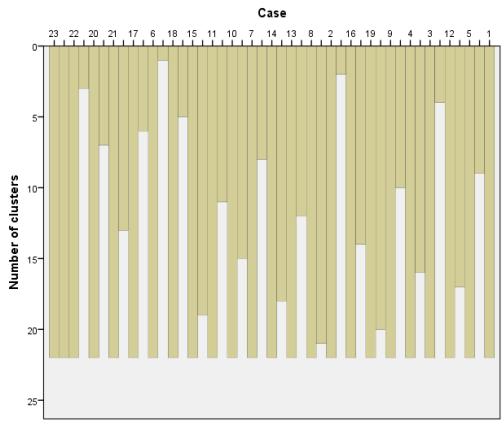

Fig. 1. Graph vertical icicle for cluster analysis of asynchronous discussion forums

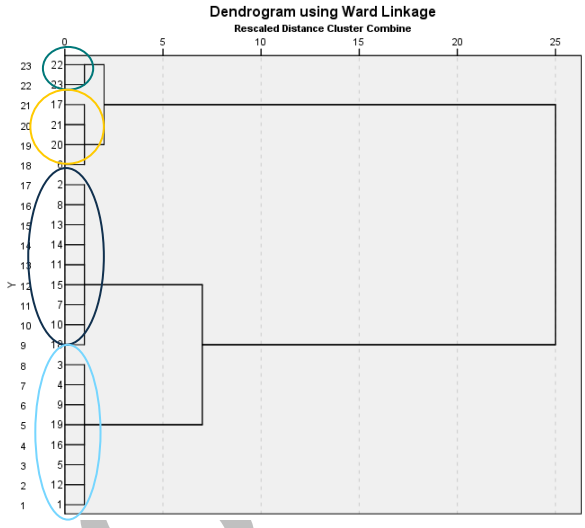

Fig. 2. Deudogram for cluster analysis of asynchronous discussion forums

6.1. Characteristic of each cluster listening behaviors patterns

One-way ANOVA was further used to identify the characteristics of each cluster. Table 2.0 indicates the findings for all ten variables for the four clusters identified earlier.

Table 2: ANOVA results to test the differences in terms of the 10 variables between the four clusters

Domain	Variable	Cluster	N	Mean	Standard Deviation	F	p

IETC 2014

		Total	23	92.43	49.27		
Speaking	Average length of time creating a post	1	8	.06	.04	.844	.487
		2	9	.11	.19		
		3	4	.27	.52		
		4	2	.00	.00		
		Total	23	.11	.24		

The classification of listening behavior patterns were also supported by the ANOVA findings (Table 2.0). The significant differences between the four clusters exist in three variables only, namely (i) the percentage of sessions with posting actions, (ii) average number of posts contributed each discussion and (iii) average number of words in one post. The insignificant differences between the four clusters are in terms of: (1) the average length of session, (2) percent of posts viewed at least once, (3) average number of views each discussion, (4) average time reading a post, (5) average number of sessions per discussion, (6) average number of reads before contributing a post, and (7) average length of time creating a post.

Next, for each variable, the clusters are ranked accordingly. Thus, for each variable, the highest ranking cluster is categorized as 'Highest', the second highest ranking is categorized as 'High'. The third highest ranking is categorized as 'Low', while the lowest ranking is categorized as 'Lowest'.

- Cluster 1: Based on Table 2, the variables are placed in four different categories. Cluster 1 recorded the highest ranking in three variables: (1) the percentage of sessions with posting actions, (2) average time reading a post and (3) average number of posts contributed each discussion. In addition, this cluster is ranked as 'High' in five other variables: (i) average length of session, (ii) percentage of posts viewed at least once, (iii) average number of views each discussion, (iv) average number of reads before contributing a post, and (v) average number of words per post. This cluster was ranked as 'Low' for two other variables, namely, average number of sessions for each discussion and average length of time creating a post. No variable ranked as lowest.

- Cluster 2: This cluster is ranked as 'Highest' in two variables: (a) average number of sessions for each discussion and (b) average number of words per post. In addition, it was categorized as 'High' for two other variables: the average number of posts contributed each discussion and average length of time creating a post. Cluster 2 is categorized as 'Low' in six other variables: average length of session, percent of sessions with posting actions, percent of posts viewed at least once, average number of views each discussion, average time reading a post and average number of reads before contributing a post. No variable was identified in the 'Lowest' category.

- Cluster 3: This cluster was ranked as 'Highest' in five variables: the average length of session, percent of posts viewed at least once, average number of views each discussion, average number of reads before contributing a post, and average length of time creating a post. It was ranked 'High' for three other variables: the percentage of sessions with posting actions, average time reading a post and average number of sessions for each discussion. Moreover, two variables were ranked as low category, namely, average number of posts contributed each discussion and average number of words per post. No variable is ranked as the lowest.

- Cluster 4: This cluster was ranked as the 'Lowest' in all ten variables: the average length of session, percentage of sessions with posting actions, percentage of posts viewed at least once, average number of views each discussion, average time reading a post, average number of posts contributed each discussion,

IETC 2014

average number of sessions each discussion, average number of reads before contributing a post, average number of words per post and average length of time creating a post. No variable was ranked either in the highest, high or low category.

6.2. Discussion of listening behavior patterns

The listening behavior patterns were analyzed based on four domains, namely, temporality, breadth, depth and speaking. The temporality domain was classified as coherent, incoherent or moderate. The breadth domain was categorized as comprehensive, limited or moderate. Depth domain was identified as extended, limited or moderate. The fourth domain – the speaking domain – is classified as the most frequent, moderate or infrequent.

Table 3 shows the summary of the characteristics of students based on their listening behavior patterns or levels of reading and responding peers' message. Since there are four clusters being identified, the position (ranking) of each cluster for each variable in the study also identified. The finding of this categorization is shown in Table 3.

Table 13. Listening Behavior patterns on each cluster based on four domains.

	Temporality	Breadth	Depth	Speaking
Cluster 1	Moderate	Moderate	Extended	Moderate
Cluster 2	Moderate	Moderate	Moderate	Frequent
Cluster 3	Coherent	Comprehensive	Moderate	Moderate
Cluster 4	Incoherent	Limited	Limited	Infrequent

- Cluster 1 (C1): Focused Listeners, Moderate Speakers, Moderate in Temporality (8 students)
  Compared with other cluster, C1 strength lies in the depth domain that is to read and understand peers' post in extended level. But these students are moderate in accessing or choosing certain posts to read (breadth). Similar to C2, C1 students spend time (temporality) moderately in online forum. They only contribute or respond (speaking) moderately in the forum. Furthermore, their ability to provide feedback or overall response is moderately good. In the study by Wise, et al., (2012), this cluster is closely associated with concentrated listeners and integrated talkers cluster. For the speaking domain, this study shows C1 members as moderate speakers.

- Cluster 2 (C2): Moderate Listeners, Active Speakers, Moderate in Temporality (9 students)
  The strength of C2 is in the speaking domain. C2 students contribute the most frequent posts or responses. They moderately access (breadth) and read the posts of peers (depth). They spend time (temporality) moderately to post in the forum. They did not view or read all the posts, instead, they choose to read a particular post and then provide or contribute actively. C2 students spend time (temporality) that is similar to the first cluster. For this cluster 2, although they indicated similar result by Wise et al (2012) in terms of moderate temporality and breadth (Wise et al., 2012 called it as concentrated listeners) but they are not in the extended depth. Also, although C2 members scored frequent in speaking domain, it could not be related to reflective talkers as proposed by Wise et al., because it does not have reflectivity variable in this study.

- Cluster 3 (C3): Extended Listeners, Moderate speakers, Coherent in Temporality (4 students)
  The strength of C3 involves two domains - temporality and breadth. C3 students spend maximum time in asynchronous forums compared with the students in the other clusters. Similarly, their ability to provide feedback or overall response (breadth) is at highest level compared with other clusters. However, they only contribute post or respond (speaking) moderately in the forum. Despite their breadth of scope is comprehensive, the reading in understanding (depth) their peers' post is at the moderate level. This cluster is similar to broad listener and reflective talkers of Wise et al.,'s (2012) cluster due to the similarities in three domains as often extended temporality, comprehensive breadth and moderate in depth. However, both studies contradict each other in the speaking domain as this study involves moderate whereas Wise et al.,'s finding indicates frequent speaking.

IECT 2014

- Cluster 4 (C4): Silent Listeners, Incoherent Temporality (2 students)
  C4 students' participation in online forum is at the minimum level (temporality). They just view (breadth) and read (depth) some peers post without any contribution (speaking). As for the research by Wise, et al., (2012), it can be closely connected to the superficial listener but not intermittent talker as no contribution was made by the students.

7. Recommendations

Listening behavior analysis can provide detail information about the students' tasks or activities, in which the students can be clustered based on their interaction level. This information can help instructor to identify those with do not participate in order to increase their level of interaction as well as to help them constructing their knowledge. Analysis of clusters allows the instructor to focus on the strengths and weaknesses in the discussion forum as an initial step to diagnose the students. This approach allows the instructor to diversify the scope and topic of discussion. In addition, cluster analysis can provide data on the number of members in the clusters. This allows the instructor to focus in detail by meeting the student personally or focus on target groups by uploading material with content suitable for the students in the online forum.

For example, Cluster 1 involved eight students identified as Focused Listeners and Moderate Speakers. The task could be addressed in a wider scope of discussion as their weakness lies in the breadth and contribution. Next, for Cluster 2 (Moderate Listeners, Active Speaker, 9 students), the focus should be on the breadth and depth of each topic discussed. Also, students can be exposed to apply their knowledge in different situations with the setting for an example. This can produce a broader topic of discussion as well as in-depth discussion on the topics. For cluster 1 and cluster 2, when the weaknesses are corrected, this will indirectly improve the time (temporality) spent in the discussion. While for Cluster 3 (Extended Listeners, Moderate speakers, 4 students), the strengths of the students of this cluster are in the domains of temporality and breadth. Then the focus should be on the depth of the topics discussed. Followed by the last cluster (Silent Listener, 2 students), these students need personal approach and opportunity given by the instructor to enable them to engage in the discussion.

This study will contribute to the understanding of the importance of the cluster analysis approach in asynchronous discussion forums. However, it is suggested that an interview session to be carried out to extend the findings further by investigating students from each cluster to obtain further insight into their engagement in online discussion forums. This will assist in providing further information to understand which particular aspect that requires improvement. Thus, a mixed methodology is recommended as this approach allows for the collection of data from multiple sources for deeper understanding of the investigation.

In order to increase social interaction, a collaborative approach is suggested. For example, the findings from the study of Fariza Mohd Nor, Afendi Hamat and Mohamed Amin Embi (2012) showed that collaborative approach can provide a positive impact on online learning. Along this line, future research should examine the effectiveness of collaborative approach by evaluating the quality or knowledge construction among the participants. This can be achieved by applying the content analysis method, for instance, using the Interaction Analysis Model by Gunawardena, et al., (1997). This method can also examine the effectiveness of social interaction in an online discussion. Content analysis and social network analysis method in asynchronous forum can provide even inclusive results on interaction level of the students. Combining content analysis methods and social network can provide information covering both the cognitive and social aspects occur an online environment.

8. Conclusion

IETC 2014

The effectiveness of asynchronous discussion forum in assisting the instruction and learning depends on the tasks or activities conducted. For example, the success of asynchronous discussion forums depending on the students' interaction, participation and the quality and the extent of scholarly discussions taking place. The analysis of these online forum activities - listening behaviors - will reflect the types of participants. Based on this analysis, further suggestions can be made to improve their learning.

Architectural education, project design course and education process using examples

Safiye İrem Dizdar10
Mersin University, Architectural Department
Turkey, Mersin, 33343

Abstract

Architecture is a discipline which creates healthy, livable and aesthetic spaces for the users using the opportunities of the natural environment to satisfy the needs and desires of the users within specific criterion. As it is the case in other design based disciplines, importance of theoretical and applied studio courses which bring the student design capability and creativity in architectural education is so remarkable. The most important facts that prepare the student for the profession and design process are the basic studio courses which basic design and space concepts are given.
This study examines the working methods of students on a project design course and education process using examples.

Keywords: Architectural Education, Design Studios, Space.

IETC 2014

1. Architecture as a concept

One of the various definitions of architecture is "the art and activity of building, designing and organizing space and its surrounds, where functions and festivities connected with human life created as a community and individually are carried out."At the same time there are also emotional approaches to the definition of architecture. In this regard one finds "a synthesis attained within a communal process that succeeds in attaining the level of civilization, includes subjective and aesthetic values and is completed with the achievement of a product" (İzgi, pp. 35-41). Architecture is tied to many aspects as one understands from its definitions and has become the subject of different evaluations from the point of view of concept, scope, professional duty, responsibility and education. The unity and the interconnected relationship of these definitions are unavoidable. When compared with other artistic branches, it is an activity that involves different directions and relies on intellectuality as all artistic activities do. During the design and action process, architecture in the broadest sense creates a new, artificial atmosphere by limiting and dividing the piece chosen from nature.

2. Architectural education

Those who resort to the accumulation of experiment register advances and, turning that accumulation into knowledge makes the worker a master (İzgi, p. 75). From the beginning of building construction until the present, master-apprentice created the educational model. This method that relies on application produced an education system in which the architect through experimentation possessed all the knowledge required of the profession. We see past examples of this in the archival records. In Ottoman history the

Tel.: 03243610608; fax: 03243610109.
E-mail address: iremdizdar@yahoo.com

"Imperial Architects' Society" was an organization that included classifying masters and journeyman architects under the management of the chief architect. This organization that handled work for government and military purposes continued with architectural education. In Europe organizing that began in the Renaissance continued with the Fine Arts Academy that Vasari established in Florence and the Fine Arts Academy in Paris in the seventeenth century. The powerful developments in the West led to the creation of their like with the establishment of the Sanayi-i Nefise-i Mektebi Ali (High School of Fine Arts) under the leadership of Osman Hamdi Bey in the nineteenth century. This approach at the same time stressed the unity of the architect-art person. It can be explained as follows: The purpose of the type of creativity was organized so that architectural education was included under the roof of the fine arts. The Ecole des Beaux-Arts continued its tradition for many years[11] and experienced changes to its identity, status and program among educational organizations through the Industrial Revolution. (İzgi, pp. 75-79). The Bauhaus that followed the Ecole des Beaux-Arts was a school that relied on an educational foundation that included all the fields of architectural creativity with the idea of the basic unity in architectural education and began from zero under the supervision of a master. The foundation of the educational studios within the architectural discipline was laid with the educational program, the goal of which was to unite them. The aforementioned educational programs were applied in architectural education and included experimental studies to acquaint students with the basic principles of creative movements that lay at the foundation of the visual arts (Dikmen, p. 1511). One sees that the teaching method gained importance through the Bauhaus student-teacher (master-apprentice) interaction. An educational method was used that recognized the possibility of the student being active and developing freely and the possibility of learning while doing, discovering the fundamental characteristics of the means being used and free of moulds. In the Bauhaus curriculum that developed with the theory of Gestalt[12] perception, the student proceeds through the apprentice, journeyman and master levels during the educational process that includes all the necessary applications for the level of creative work and the scientific fields. The innovation that the Bauhaus principles brought to its form of architectural education in counter-distinction to that of the Ecole des Beaux-Arts was of the students being free and active instead of being classically prepared and accepting of passive and guided instruction (Dikmen, p. 1512). In Turkey architectural education was organized under the Council of Higher Education (YÖK). The university in the institutional and theoretical sense has to be an effective, obligated, complete and free organization in the fields of education, research, criticism and educating faculty.

3. Design

The meaning of the word design is as follow: it is a process that includes something being drawn and/or being built as a whole with its mass and its surroundings following criticism and documentation of the theoretical, functional, spatial, structural and actual characteristics of the whole building whose function has been altered in order to meet the requirements (Dikmen, p. 1514). In design's basic principle, it is important to walk around every part of the aforementioned virtual space, think about contextual approaches and, in short, experience it. The process is an artistic phase and within it there is choice, decision making and responsibility. At the same time the documenting of every detail and data is essential in order to achieve further perceptions of the building correctly. During the design development process which is two dimensional at the beginning it generally reaches a three dimensional virtual appearance. Transferring a three dimensional abstraction into two dimensions is achieved using technical drawing methods. The perspective sketches that are prepared by various methods during the design process, the colored or black / white lines, models, photographs of models, animations and thoughts are useful from the point of view of fixing and transfer.

[11] Assigning the same topic to all of those engaged in working for a diploma and setting up an award competition.

[12] The Gestalt Concept appears as a reaction to the "behaviorist concept" in which learning is only evaluated within the relationship of warning-reaction (W-R). Contrary to the behavior concept in which every W-R relationship is independently examined, it ensures that the intellect creates a tie between those warning.

3.1. Design studio

Design studios are places in which students obtain basic knowledge related to architecture. One of the difficulties experienced in this process is not having the infrastructure which would prepare those students among the ones who come knowing beforehand something about the profession of architecture. In other countries generally university preferences are clarified at the middle school level and educational opportunities provided that are directed at this. In Turkey the students are placed in departments related to the choice and placement tests after middle school. If the architectural students are placed in the aforementioned department that is outside their personal interests, they begin the process without any accumulation of professional knowledge.

One of the other problems met with during the period of architectural education is that the person comes to university education from different educational models. Among these one can find the teacher from the centrally molded education whom one doesn't need to cross examine. In architectural education the one who can relay what he is thinking and produce endless solutions is the aforementioned centrally educated student. These types of approaches that reveal suitable strength at the same time reduce the output expected of the education.

In architectural education the studios are the places in which architectural design education is experienced. They rely on the principle of developing skills and sharing ideas. In the design studios the basic problem for the educational element and the student is that there isn't a method that suits every student. The reason is that there are differences in individual creativity which is tied to the person's perception of design and which is individual. In this situation the approaches that reveal creativity must concentrate on the ways of elucidating the problem, being able to create different and unusual solutions to the problems, being able to dream and relate this and achieving the skill of original thinking. There is the need for criticism of the concept that one thinks up in various languages of the preliminary sketch, model, perspective, etc. in order to develop the design and turn it into a finished product. If the design were an abstract concept, the way to approach it would include the exact opposite.

The healthy progress of the process and adding the active-creator-researcher brings a healthy result. In this process the critiques on the table create a multi-lateral atmosphere of rethinking and production. In the master / apprentice relationship the goal is to develop the student's design skills while accepting criticism. At this point it is expected that the teacher has the personality to direct the student to think differently, research and be cross examined. It is expected of the student that he will introduce himself with his own words in his own way, debate and create his own individual design rather than a repetition of the master. Jury evaluations that are assembled in the sense that different teachers offer critiques and the participation of guest jurors provide for the creation of a synthesis of different points of view for the student. In this regard it mustn't be forgotten that the design studio is a continually interactive area.

3.2. The impossibility of design if it didn't exist – creativity

The concept of creativity is not to make something out of nothing but it must be evaluated as the vehicle and method used so something does exist (Dikmen, p. 1515). To approach the subject with different perceptions and points of view earns the individual the adjective of creative. In order for a different point of view to be achieved the student's motivation has to be affected. During the design stage the appearance of creativity is not from books or repeating what has been taught; it comes as criticism of what the student produces and the production of new knowledge. For this reason design studios have to be organized in a way that can bring to life an imitator and a developer of a way of seeing and thinking and a model for attaining knowledge. The skill of being able to teach only quality creativity requires increasing the intellectual accumulation on subjects of research and skill. That every student has a different development process and style of learning necessitates the use of more than one method at one time. For this reason design methods are experimental change that has to happen with traditional methods.

3.3. Operating in design studios

The purpose in design studios is to provide that the problem given to the student is one to be thought of during the studio process and in daily life outside the studio. In studio education the way to achieve a talent for criticism and understanding through the entirety of experimental and conceptual knowledge is

IETC 2014

through an argumentative atmosphere and counter criticism. The basic structuring of studio education can be identified as follows:

-Student centered education,

-The possibilities of multiple solutions for the problem, and

-Programs that can change in accord with studio dynamics.

Of the factors that affect the learning level of the students who enter the architecture department is that they don't have the same level of knowledge and concept. When this situation is observed, evaluating the dynamics which the differences have created well and providing support and motivation create an important process.

3.3.1. Problem identification

During the operational period of the design lesson the characteristics of the subject that will be done and detailed information should be given to the students verbally and in writing. Information such as the research, production of ideas, preliminary sketch work, pre-scale model and final scale model and due date should be announced to the students on a time line. In critiquing the problem, identification of the problem should be clarified for the student by observing whether what is wanted during the project's progress was understood or not. In situations where it seems necessary, the student's better perception of the product can be ensured by identifying the problem on examples of three-dimensional models. Because identifying the problem correctly means that the solution has been transferred to the design correctly. What is expected of the student is the production of an effective design that suits the target (creating the assemblage-conceptualizing-stain work) and projecting this in a correct fashion. (See Picture 1-5)

3.3.2. Research

After the project has been introduced the program, target group and the research on sample subjects are requested from the students. Here the goal is to ensure that the students have enough information about the subject and to increase the speed of their perception. If design is thought of as a process, it could be thought that every bit of information learned would provide positive additions to them during the design process. However, during the research process it mustn't be forgotten that internet and library searches aren't enough and examining extant examples along with them is an important point. One can say that design samples made up to the present that suit the design wanted in the project can be examined by the students and the design critiques will be useful for observing how change or development occurred. Sharing the research carried out by the students with other students and educators in the studio atmosphere provides a positive addition to the production of ideas during the progress of the project.

3.3.3. Producing ideas and sketch work

All the information which is acquired as the result of research carried out during the process of producing a solution to the project that has been taken up as the design problem should be transferred to the production of thoughts and ideas along with the effects of cultural life. This stage is one of education's most important pieces of the design's principal problems and the process of producing ideas. The development of ideas produced by means of sketches must always be a part of architectural education. In this regard the student must begin with the accumulation of all the field lessons to sketch the production of the creative idea which is wanted or can answer the need. At this stage the functional diagrams, the situational plan and the silhouette studies occupy an important place (See Pictures 5-14).

The affect of the sketches made with paper and pen which play an important role in the solution of the problem must be conveyed to the student. The technology developed in our day and advanced programming techniques provide great ease at the design stage. The students who want to use this situation are skipping the work on producing ideas and sketches which we can characterize as the most important stage of the design process and directly begin their designs on the computer. But sketches give the student very important clues about what the design that appears should resemble. That other components like typology, color, images, materials and the use of the structural system are drawn in sketches is useful for the students approaching the project with different points of view as well as developing the process of producing ideas.

In the situation in which the design begun in a virtual atmosphere continues, the student is restricted by the limits on the skills of the program used and without noticing it permits the design to go in the direc-

IECT 2014

tion of the program. In the situation in which several students work in this fashion perhaps producing designs that resemble one another could be discussed in terms of the program's characteristics. While computers and tablets get between brain and hand coordination in the computer situation, in sketch work both brain and hand coordination are used together. In this way the production of ideas can be done freely multiplying without any reduction. The students become accustomed to working with sketches and undoubtedly after graduation it will provide positive additions to them as designers.

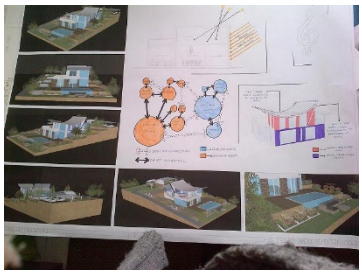
3.3.4. Critiques, modeling

The critique brings together points of view about the student and teacher's design process in the architectural design studios. When a short break is taken in the work for the critique process, it creates an atmosphere for sharing ideas. Critiques don't have a single purpose or a clear format. They can be done in many various forms and the work process can expose very many different points of view.

Critiques have two important characteristics. The first is to put the entire attention on the student's work and the process. The second is that the student shares his work with the educator and other students. As a result there's an exchange of views that adds to the design process. At this stage the student would apply the corrections on the sketches in line with the design critiques made of the sketches. The critiques made ensure that the student is pointed in the right direction. Later on the student may apply the most suitable design solution to the drawing and bring the design to the final stage. After that the student prepares a three-dimensional preliminary scale model in the measurements wanted. The purpose in wanting the preliminary scale model is to ensure knowing how the two-dimensional design will be seen physically in three dimensions and being able to study it in relation to the environmental data. The presentation of the design applications done for the solution of the problem is very important for the student and the educator. A successful solution can turn an unsuccessful situation through the application of a carelessly made scale model. For this reason the student should take pains over making the scale model to prevent situations like these (See Pictures 15-24).

4. Evaluation – solution

The completion of architectural education is documented with a diploma, etc. The process which results in the acquisition of the title of architect is the beginning of a new educational period. Architectural education must rely on the goal of a broad education aimed at acquiring a cultural level related to architecture. As a special section within this concept, by being evaluated and achieving a common level, one can reach a successful result. The teacher's relaying information in architectural education that must rely on the free choice of the profession at the beginning and the method that relies on his logic in which correct mistakes are tied to formulas must always be questioned. Depending on the sources for the accumulation of information that the architectural candidate feels the need for through personal approach, observation and effort, his acquiring an accumulation of information must be supported and not remain within the boundaries of the organization. The sources that nourish this education, the students, teaching staff, professionals, bureaus and construction sites have to effectively contribute to the education, and the validity of the system of thought and development must be ensured at every level of the education.



Architecture has shown a development directed for a long time at expertise in various fields like design, construction and management. In this regard the students who make up the foundation of the education are the candidates who will take on the duty of being faculty members later on. For those who join education and management, it is just as necessary and useful as for organizations and faculty. In this process the candidate must be supported in order to possess a preparatory accumulation while being independent of the subject that he has chosen. Because architectural design education has a multi-layer and experimental atmosphere, the continuity of the flow of information among the disciplines must be achieved according to the view of the architectural candidate. Gaining the atmosphere of the assembled studio function has to be conceived not as a product but as a process that is focused and has to be focused. Today the ability of drawing what they dream of will become the acquisition of the unity of the concepts of technology and art.

Aspects of chemical technology teaching at university

Hanna Wilczura-Wachnik13, Bazyli Semeniuk, Andrzej Kaim, Adam Myslinski
Faculty of Chemistry, University of Warsaw, Pasteura 1, 02-093Warsaw, Poland

Abstract

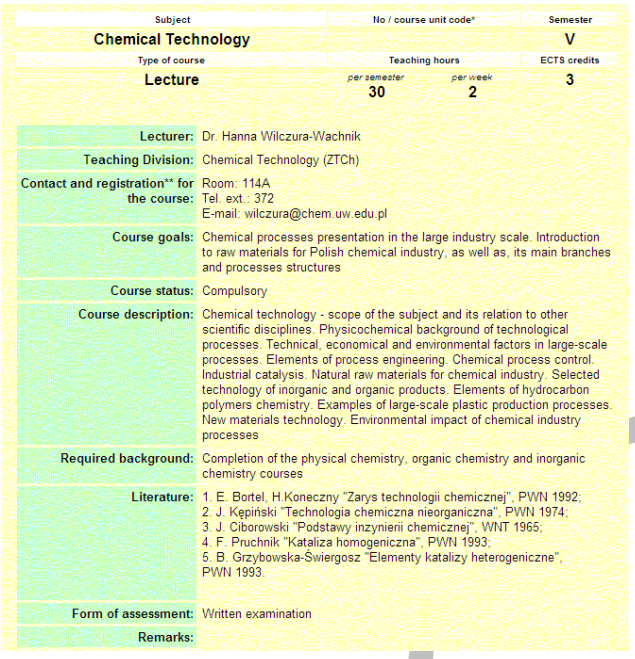
International Educational Technology Conference has been founded in 2001. The first of "The International Educational Technology Symposium (IETS)" was held at Sakarya University in Turkey in 2001, and this year IETC 2014 will be organized in USA. As it is written in the official document IETC "is an international, non-profitable, educational technology activity with the mission of educational technology in education and its practical application." During 13-th conferences different aspects of education on different levels have been presented.

In this presentation I would like to discuss some aspects of Chemical Technology teaching at university. It is a very specific problem. Why? University is not a technical school, there are not given any engineering courses except chemical technology. Usually students at university have not well enough technical background. Faculty of Chemistry University of Warsaw is a large research and teaching centre with fully developed programmes in fields of chemistry. Among many courses given at our faculty Chemical Technology belongs to courses difficulties making students. Chemical Technology Division experiences will be presented in context of the course contents, student teacher communication, types of supporting materials for lecture and laboratory. There will be presented examples of experiments manuals, schemes of installations for periodic and continuous chemical processes, unit operations and unit processes simulations using CHEMCAD™ version 6 program.

*Keywords:*chemical technology; lecture; students experiments

1. Introduction

Chemical technology teaching at university it is a very specific problem. Why? University is not a technical school. There are not given any engineering courses except chemical technology. Usually students at university have not well enough technical background. Faculty of Chemistry University of Warsaw is a large research and teaching centre with fully developed programmes in fields of chemistry. Among many courses given at our faculty Chemical Technology belongs to courses difficulties making students. Keeping it in mind teachers prepare a many supporting materials for both lecture and student laboratory.



Presently, computers involve on easy communication between student and teacher. Now, students are able to find on faculty web-pages all information they need about studies program, courses contents etc. Moreover, suitable computer programs and networks give a chance on visualization, prediction and graphical presentation studied processes, in chemical technology research area.

Chemistry belongs to experimental sciences. Theoretical background is very important but experiments involve to verify it in practice. On chemical technology courses (specially on laboratory) students have a very good occasion to combine and use in practice previously acquired knowledge during curses of physical chemistry, analytical chemistry, organic chemistry etc.. Chemical technology lecture at Faculty of Chemistry University of Warsaw gives students the basic knowledge of the chemical processes in the large industrial scale, introduces to raw materials for chemical industry, as well as, presences main branches and processes structures. Required background for students who attend this course is completion of the physical chemistry, organic chemistry and inorganic chemistry courses.

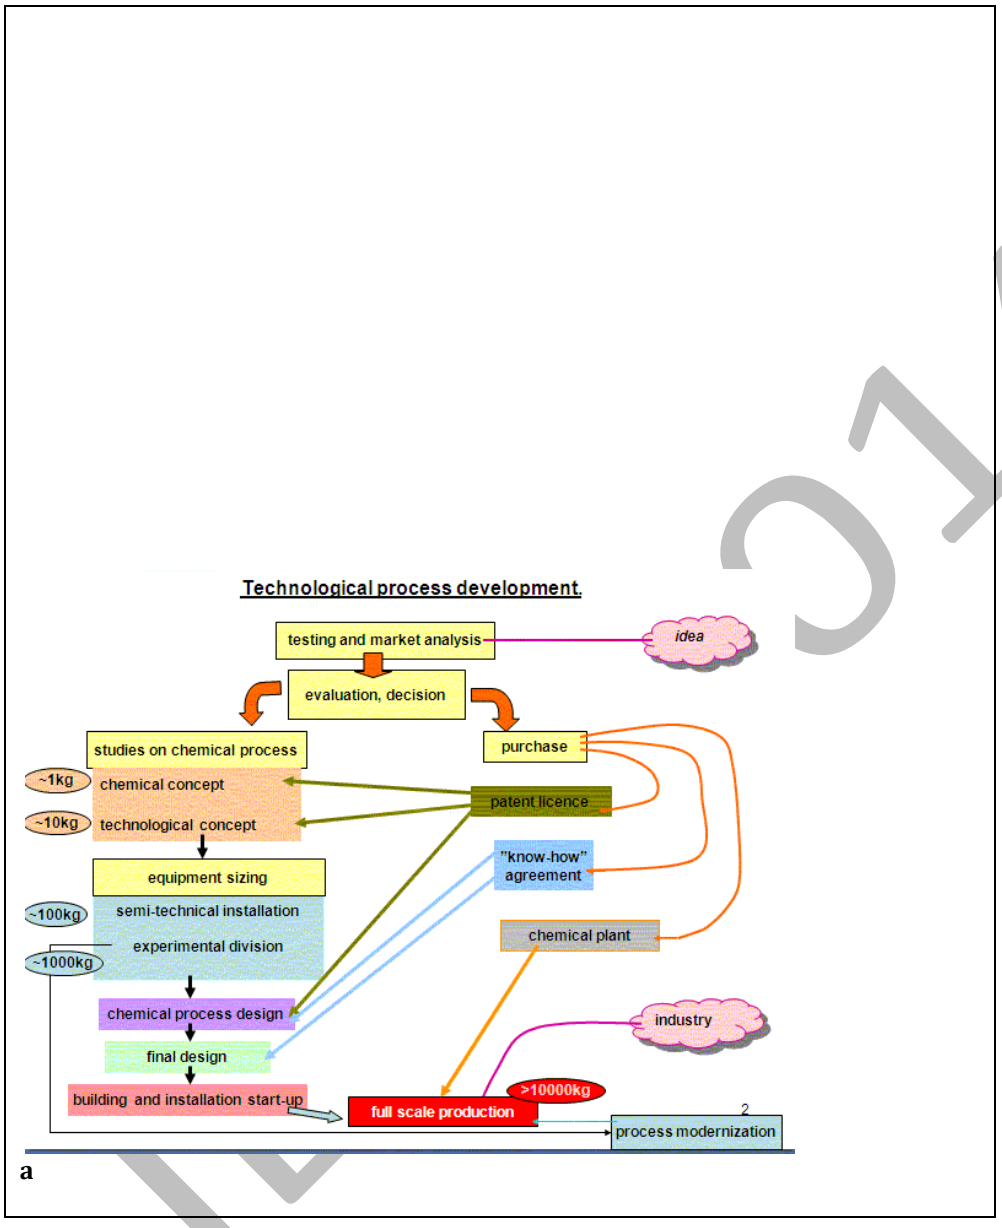
IETC 2014

Chemical technology laboratory is conceived as a complement to the lecture and giving a chance to contact to chemical technology processes in practice in a small scale. In the frame of this course students attend to experiments, classes and computer experiments. During this course students learn for example how in chemical technological process (continuous or periodic) detergent, soda, PAV are produced. On the base of own experimental data student prepare a material balance. Next using CHEMCAD™ program student simulates such process (keeping the same parameters and conditions) and compare to obtained experimental results. Due to lack of rudiments of chemical engineering in the university curriculum, simple demonstrative examples for the basic course should be selected from the simulator program with a great care. Application of simulator program to specialization courses was more effective comparing to bachelor level students (Semeniuk 1998).

Subject	No / course unit code*		Semester
Chemical Technology			**V**
Type of course	**Teaching hours**		**ECTS credits**
Lecture	*per semester* **30**	*per week* **2**	**3**

Lecturer:	Dr. Hanna Wilczura-Wachnik
Teaching Division:	Chemical Technology (ZTCh)
Contact and registration for the course:**	Room: 114A Tel. ext.: 372 E-mail: wilczura@chem.uw.edu.pl
Course goals:	Chemical processes presentation in the large industry scale. Introduction to raw materials for Polish chemical industry, as well as, its main branches and processes structures
Course status:	Compulsory
Course description:	Chemical technology - scope of the subject and its relation to other scientific disciplines. Physicochemical background of technological processes. Technical, economical and environmental factors in large-scale processes. Elements of process engineering. Chemical process control. Industrial catalysis. Natural raw materials for chemical industry. Selected technology of inorganic and organic products. Elements of hydrocarbon polymers chemistry. Examples of large-scale plastic production processes. New materials technology. Environmental impact of chemical industry processes
Required background:	Completion of the physical chemistry, organic chemistry and inorganic chemistry courses
Literature:	1. E. Bortel, H.Koneczny "Zarys technologii chemicznej", PWN 1992; 2. J. Kępiński "Technologia chemiczna nieorganiczna", PWN 1974; 3. J. Ciborowski "Podstawy inzynierii chemicznej", WNT 1965; 4. F. Pruchnik "Kataliza homogeniczna", PWN 1993; 5. B. Grzybowska-Świergosz "Elementy katalizy heterogeniczne", PWN 1993.
Form of assessment:	Written examination
Remarks:	

Figure 1. Chemical technology lecture page on faculty web-page.



2. Chemical technology – lecture

The lecture content is the following: scope of the subject and its relation to other scientific disciplines, physicochemical background of technological processes, technical, economical and environmental factors in large-scale processes, elements of process engineering, chemical process control, industrial catalysis, natural raw materials for chemical industry, selected technology of inorganic and organic products, elements of hydrocarbon polymers chemistry, examples of large-scale plastic production processes, new materials technology, environmental impact of chemical industry processes. Detailed information's about contents of each lecture students can find on lecture web-page (Wilczura-Wachnik 2013). The picture of such page is shown in Figure 1. Supporting materials for lecture students can find on course web-page (Wilczura-Wachnik 2013).

As it was mentioned earlier, students at university have no technical background. Because of that teacher has to find the certain way to explain technological problems using simple graphs, diagrams schemes etc.

IETC 2014

Examples of lecture slides are presented on Figures 2aand b. It is obvious that is impossible to explain engineering problems without technical symbols. This part of chemical technology lecture is the most difficult for university students. Teaching staff at Chemical Technology Division noticed the significance of laboratory experiment combining to computer simulation in teaching process.

a

IECT 2014

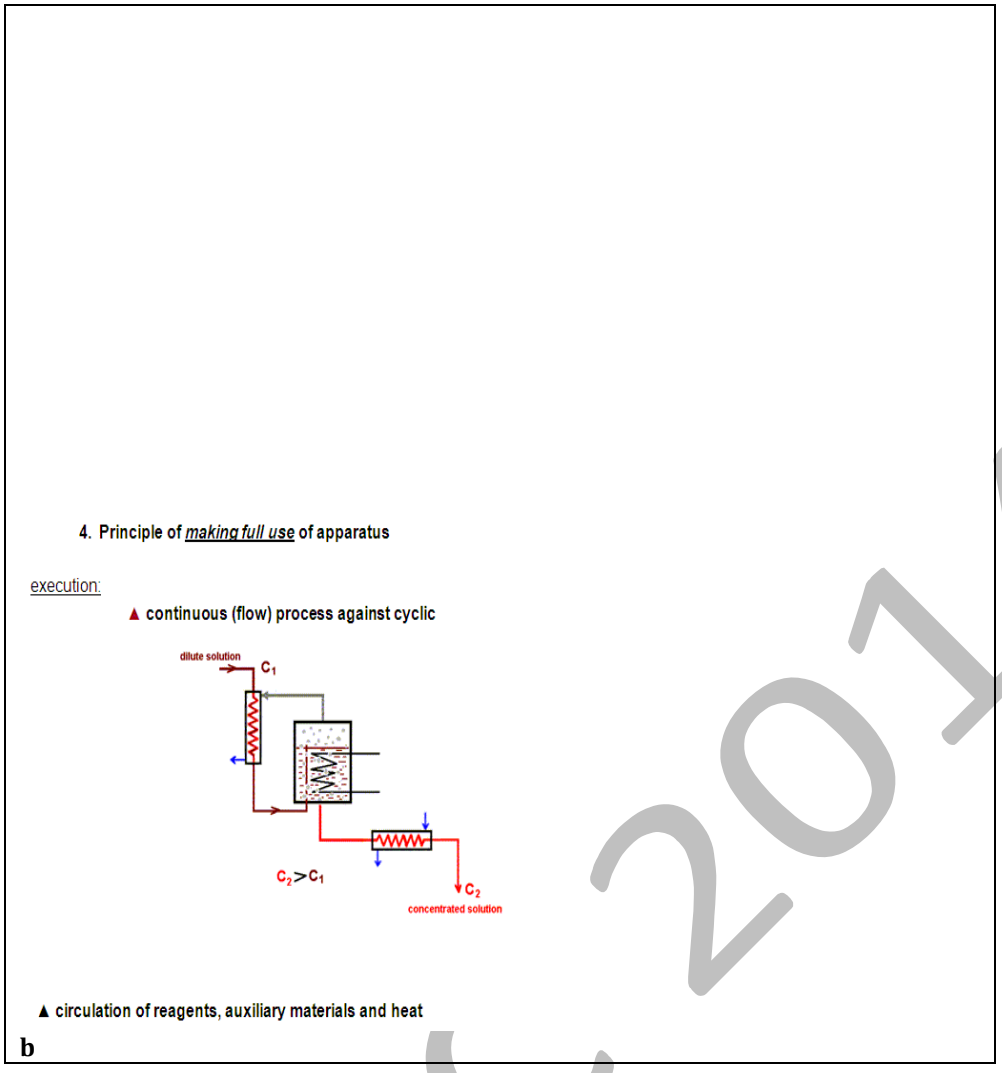


Figure 2. Examples of chemical technology lecture slides. (a) Technological process development , (b) scheme of operation unit (Wilczura-Wachnik, 2013).

Using slide (b) shown on Figure 2 teacher is able to explain 4-th technological principle of making-full use of apparatus as well as example of unit operation .

The balance sheets represent a separate package in the teaching of chemical technology both within the framework of the lecture and laboratory. On Figure 3 is shown an example of Sankey diagram.

IETC 2014

Sankey diagram

Theoretical material balance of NH_4HCO_3 in reaction: $H_2O + NH_3 + CO_2 \rightarrow NH_4HCO_3$							
Raw materials (compounds)				products			
	compound	kg	%		compound	kg	%
1	H_2O	227,9	22,79	1	NH_4HCO_3	1000,0	100,00
2	NH_3	215,2	21,52	2	-	-	-
3	CO_2	556,9	55,69	3	-	-	-
	Total amount	1000,0	100,00		Total amount	1000,0	100,00

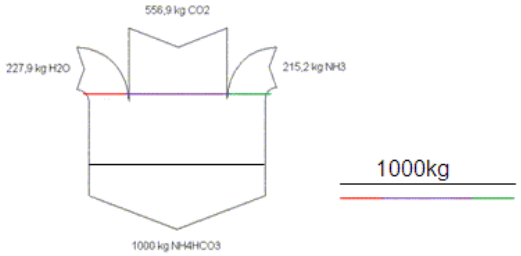

Figure 3. Example of material balance.

3. Chemical technology – laboratory

Chemical technology laboratory is organized in such a way that each teacher takes care on six students. These students are divided in two three person groups. Each group works on one installation. Our experience shows that this is the optimal number of student groups. Students cooperate during experiments; learn to organize work in group. Usually, spontaneously appears emerging leader, who directs the work of the entire group.

Chemical technology laboratory is organized in the following way: test or quiz from theoretical background connecting to experiment, next students have a time (around 10 minutes) to recognize elements of installation (they can use manuals). Next is a time to talk to teacher and explain how the experiment will be realized. Finally students begin experiment and until the end of laboratory they take care about installation. Before leaving laboratory is obligatory for student's present results sheet, clean installation and make order on place they work.

Students have free access to all supporting materials (manuals, theoretical introduction, and literature) to each exercise on laboratory web-page . On Figures 4a and b are presented schemes of installation

IETC 2014

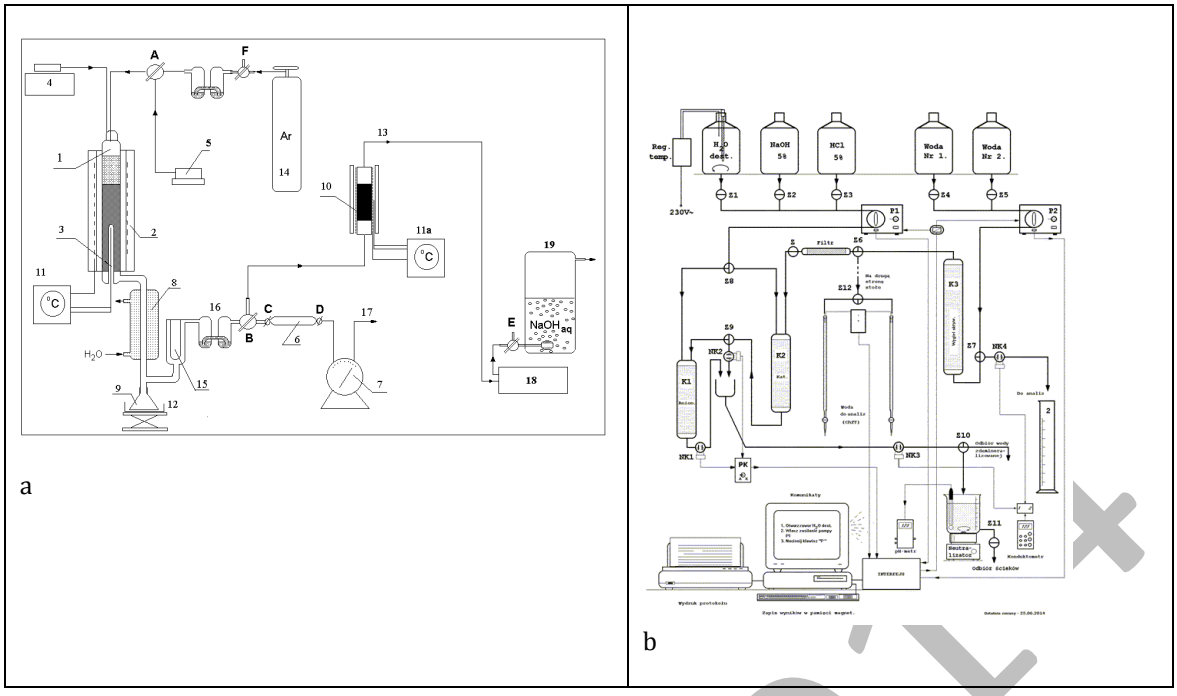

Figure 4. (a) Catalytic cracking installation (Wilczura-Wachnik, 2013) , (b) Water treatment installation (Myslinski 2013).

As it was mentioned earlier for some technological processes is possible to make its computer simulation using CHEMCAD program. In chemical technology teaching it is a very important educational helper. For students are offered computer simulations of unit operations and processes as testing of rectification column, suspension polymerization of styrene and others. First page of instruction to CHEMCAD for suspension polymerization of styrene (Kaim, 2012) is shown on Figure 5. Each instruction for computer experiment contains theoretical introduction to problem undergoing simulation. The second part of such manual is instruction to CHEMCAD procedure. Except the aim of the simulation there are given detailed information about each computer window as well as possible action. Examples of such windows are presented on Figures 5-10.

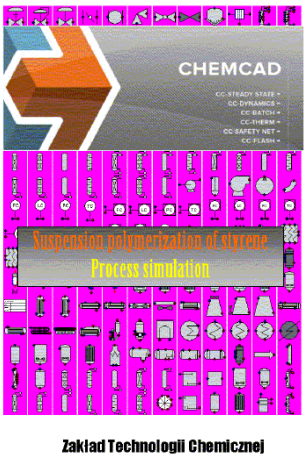

Figure 5. First page of instruction - simulation unit process (Kaim, 2012).

Below on Figures 10 – 14 are presented examples of CHEMCAD version 6 windows.

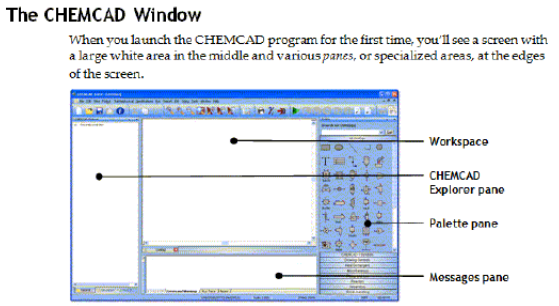

Figure 6. Structure of the CHEMCAD version 6 window.

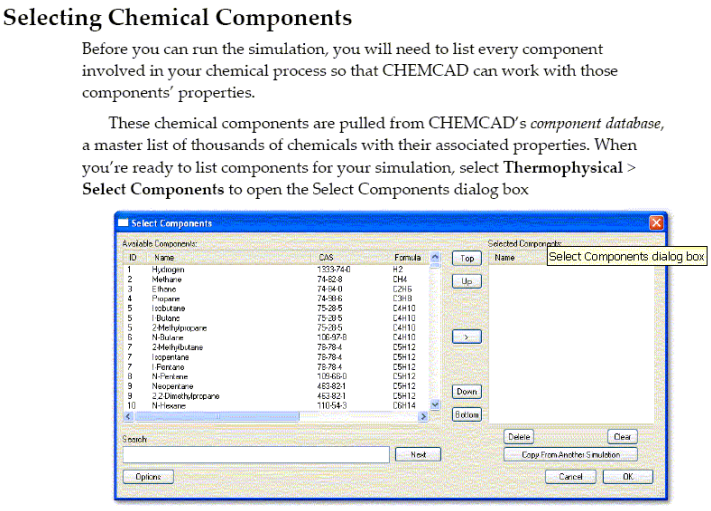

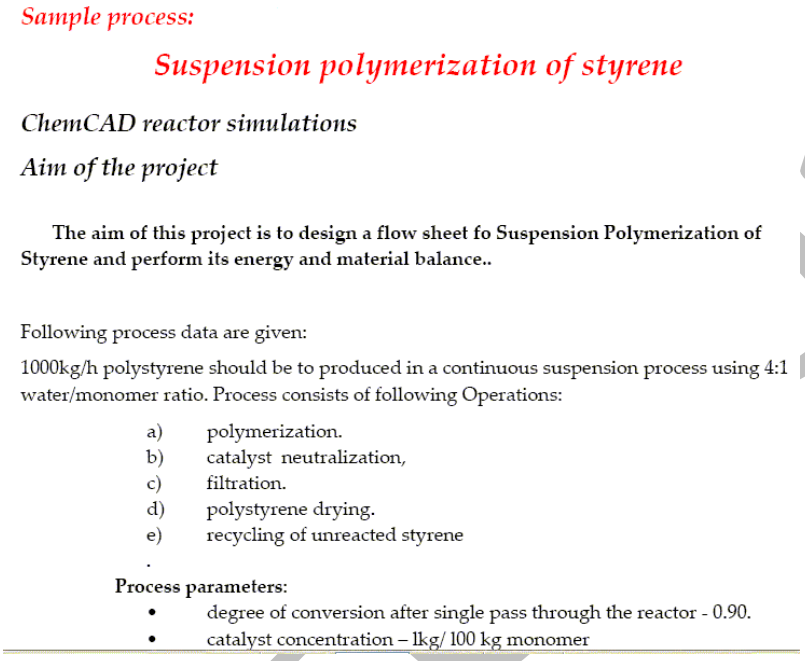

Figure 7. Example of CHEMCAD window.

Sample process:

Suspension polymerization of styrene

ChemCAD reactor simulations

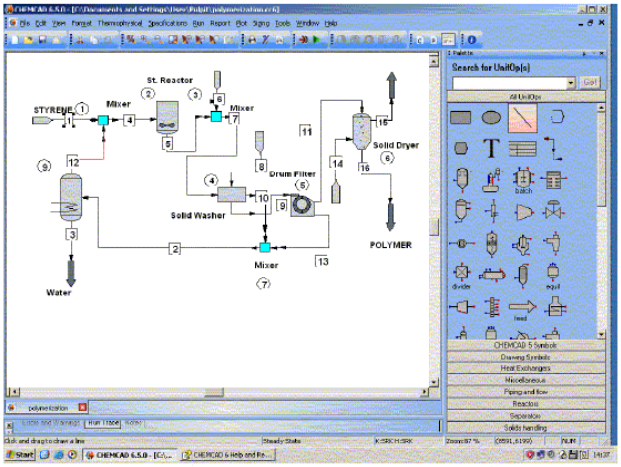
Aim of the project

The aim of this project is to design a flow sheet fo Suspension Polymerization of Styrene and perform its energy and material balance..

Following process data are given:

1000kg/h polystyrene should be to produced in a continuous suspension process using 4:1 water/monomer ratio. Process consists of following Operations:

a) polymerization.
b) catalyst neutralization,
c) filtration.
d) polystyrene drying.
e) recycling of unreacted styrene



.

Process parameters:

- degree of conversion after single pass through the reactor - 0.90.
- catalyst concentration – lkg/ 100 kg monomer

Figure 8. CHEMCAD window – beginning of project entitled "Suspension polymerization of styrene".

IETC 2014

6. Go to Format => Engineering Units. Choose the engineering units you want. You can at any time go back and change these engineering units.

Figure 9. Six CHEMCAD window in project "suspension polymerization of styrene.

IETC 2014

10. Now you are ready to try to have ChemCAD converge the mass and energy balances. Go to Run => Run All to run the simulation. If you do that and you get the message "Recycle calculation has converged" you probably succeded. You should only check if the desired products (concentrations) have been obtained. If you get an error box, that means it didn't converge. You have to correct can now look at the results.

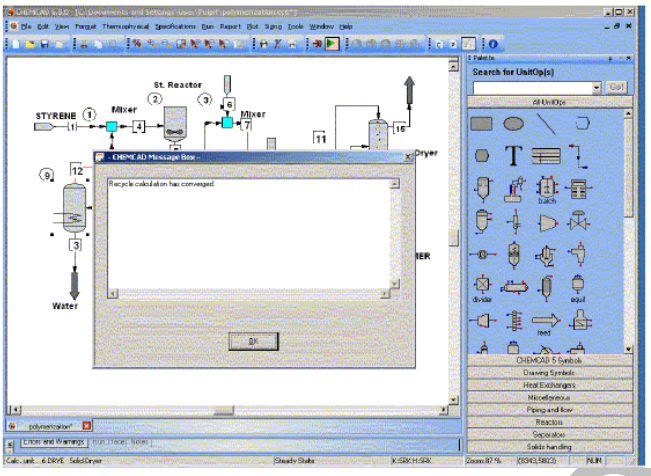


Figure 10. Ten CHEMCAD window in project "suspension polymerization of styrene

4. Conclusions

In conclusion, a significant progress in educational technology which has been observed on the end of previous centaury made a chance to organize the educational process in a unique way. Presently chemical technology course at university appear for students more interesting comparing to the past. Computers and suitable program simulations used during chemical technology courses involve students at university to get theoretical experience in engineering aspects of chemical technology.

Acknowledgements

The author would like to thank Colleagues from Chemical Technology Division at Faculty of Chemistry U.W. for sharing materials, also the EU POKL 04.01.01-00-100/10 for financing the participation in the Conference.

IETC 2014

Aspects of Students about Information Technology Courses in Social Science

Fatma Önay Koçoğlu Bakioğlu, Elif Kartal, Zeki Özen, Çiğdem Selçukcan Erol, Sevinç Gülseçen[14]*

İstanbul University, Informatics Department, Beyazit, Istanbul, 34452, Turkey

Abstract

Information Technology (IT) is used in almost every area of higher education. However, it can be clearly seen that number of courses intended to teach the use of IT in social science is quite low in Turkey. There is a gap between generations who design curriculum and who take classes at universities. If we consider digital natives will attend universities soon, it is very important to redesign the curriculums including topics about IT. Besides the number of IT courses in science curriculum is more than the number of IT courses in social science curriculum.

In this study, authors aimed to determine the aspects of students about IT courses in social science. In this scope, a questionnaire is conducted to fourth grade students of Philosophy Department at Istanbul University who have taken Logic and Computer Practices II class. The questionnaire consists of 19 questions and it is conducted to 140 students.

According to study results, students expressed that IT courses are vital for their future professional life and workplace. They believe that it is necessary to add various IT courses such as office programs, information management, web design, database, and programming languages to curriculum in social science at higher education institutions.

Keywords: Higher education; IT courses; philosophy education; social science.

1. Introduction

Human needs sometimes can be considered as critical factors which acts in shaping the social processes. Today, information and technology become important almost in every field and also society is now referred to as information society. Information Technology (IT) which consists of integration of computer and communication technologies, and especially effects on developments in communication technogies infrastructure (Tahirov, 2009), has been one of the important and effective sub branches of today's world of technology. IT is defined as tools that helps to produce, collect, accumulate, process, retrieve, disseminate and protect information (Akkoyunlu, 1998).

Rapid developments in IT, has led to a shift and remodeling in social structure (Çalık and Sezgin, 2005). Furthermore, the existence of individuals who can use IT effectively will provide the ability of benefiting from this technologies at the highest level. However, goals toward becoming an information society, deficiencies and inadequacies related to user skills about usage of IT tools and digital literacy level of users cause ineffective usage of information and communication technologies (ICT) and hinders utilization of overall effect sufficiently (TBMM, 2012). Therefore, developed countries are intended to be literate, to access information, to gain and to develop their skills of using and assessing to information including all members of society untill reaching the 21st century which is the age of information and technology (Önal, 2010).

IETC 2014

Only in the last 10 years, changes and developments in the internet and mobile technologies affected business and services in various fields to perform their operations online. Furthermore, our daily and professional life is changed because of these changes in the requirements of contemporary society (Hamiti et al., 2014). Many tools that we use in our daily life is changed with technological development. We can give many examples of this change such as from the box office where we buy tickets to machines which we fill our cards, from queues at banks to internet and mobile banking, from phones which sent images as its biggest function to smartphones which give opportunity to almost every transaction.

Working life is not much different than daily life. Today, developments in IT, especially increment of internet infrastructure and usage network, significantly effect every sector; economic integration, which has occured with the disappearance of borders between countries, has changed quality and structure of provided services significantly with these developments (Özbilgin, 2003). In addition, advances in technology entails redefinion of professional requirements at the organizational level the workplace environment, health and safety at workplace reorganizing and restatement of business plans, job descriptions (Göktürk, 2007). Therefore, the new job descriptions which will be organized according to technological progress or new regulations in existing fields will create new jobs. However, at this point providing competitive edge will depend on effective use of IT tools.

Education is defined as the process of changing behavior of individuals in the desired way (Genç ve Eryaman, 2008). At the same time, considering the purpose of education which is educating individuals towards needs of the community, it is clear that education has quite important role in bringing up students for this IT era (Varol, 2002). High schools have an important role to provide IT education for students and to make them ready for global IT workforce (Csapo, 2002 in Randall and Zirkle, 2005). In schools large amounts of money is spent for computers/computer technologies but the more important issue is educational effectiveness of these technologies after integration to classrooms (Wilmore and Betz, 2000). The use of technology in education has increasingly gaining importance as technology education. In recent years, particularly the use of mobile technology in education is widespread. However, social sciences are considered to be less of studies in this field. Shih et al. (2010), specify that the use of mobile learning technologies for social sciences are reported less frequently than for the other sciences has technique-oriented content that develop the structural or systematic knowledge or skills of students.

According to these ideas, new education strategies and programs should be developed, IT should be used effectively as an education instrument (Gülseçen and Kubat, 2006), because, educational life without IT or IT tools is no longer possible for students and even for lecturers especially at higher education. Registration operations, searching book on a library, attending online courses and exams, communicating with the course lectrurer, etc. are some simple examples in terms of students. On the other hand, lecturers are trying to adapt IT for their courses and follow the developments for their students.

2. General Rationale and Hypothesis

Specifically universities, which are the most important institutions contribute a country's development and which provides the needed international qualified manpower by performing high levels of education and training activities at programs organized its internal structure training (Günay, 2004), is now trying to do own share in this new structure. In the process of restructuring, importance of acquiring the skills needed for higher education for individuals is increasing day by day (Saatçioğlu et. al., 2003) and IT usage is one of these skills.

These developments and new applications are quite proper, because one fact that we should take into account is nature of science that requires colloboration between researchers whether they are working at the same area or not. For example, a researcher who works at the business administration department, can need a software which helps to analyse data about customer behaviours and also the researcher need to know how to use this software. Another fact is sometimes students in higher education can be not curious enough to search about their studying area. In such cases only key is lecturers who can guide them

IETC 2014

to meet IT and IT tools. Moreover, it is important to decide which IT courses should be added to the curriculums.

At this point, when curriculum contents at universities in Turkey are examined, it is seen that fundamentals of IT courses are already existed. However, again we have to ask ourselves following questions: Are these courses enough for students?, Are students thinking that the IT courses that they have taken necessary for their business life?, How should IT education be according to students? and related to previous question what are student expectations from universities? Authors are inspired of these questions and the questions have become the start line.

In this study, it is accepted that IT education is disregarded at social science little more than science in Turkey. For this reason it is aimed to present aspects of social science students about IT courses at higher education in Turkey. Accordingly, a questionnaire is conducted to İstanbul University Faculty of Letters 4rd grade Philosopy Department students to find out their opinions about IT.

3. Method

Participants

The sample of the study consists of 140 forth grade students (102 female and 37 male at average age of 23) from the Department of Philosophy who had taken the course named "Logic and Computer Practices II".

Data Collection Tool

Questionnaire (see Appendix), which is prepared by authors, is used as data collection tool. The questionnaire is consisted of 19 questions. Two of them are demographic questions, 8 multiple choice questions are prepared to determine IT usage and IT education at universities and finally it has 9 open ended questions.

Data Analysis

Percentage and frequency tables are used to analyse data. Data analysis is performed with IBM SPSS Statistics 22.

Internal Validity of the Study

The questionnaire used as a data collection tool has been applied to students one to one. There has not been any redirection. There was not any question that has a clue about identity of the students. Age and gender were the only demographic questions of the questionnaire. Authors analyzed responses by themselves.

External Validity of the Study

Considering research group of the study, we can say that the results can be generalized limitedly. Generalizability of the results is possible with students who have the same education and features. A brief information about questionnaire is given to students before it is conducted.

4. Findings

IETC 2014

One hundred and forty students have responded the questionnaire, but participants have left blank some of the questions. 73% of them (102 students) is female and 27% of them (37 students) is male. Ages of students are between 21 and 42, the average is 23. 94% of students (131) has and only 6% of them (8) has not computer. Table 1 shows IT usage, general success rates and class assessments of students who participated this study.

Table.5. IT usage, general success rates and class assessments of the students

Questions	N	Minimum	Maximum	Mean	Std. Deviation
How many years have you been using computer?	138	1,0	24,0	9,678	3,7337
How many years have you been using internet?	136	1,0	18,0	8,426	3,3871
How many hours do you spend time on internet?	128	1,0	24,0	3,316	2,7125
What is your Weighted Grade Point Average (AGNO) at the end of the 7th term?	118	1,80	3,53	2,7208	,35644
Please evaluate your "Logic and Computer Practices II" course performance.	138	1,0	10,0	6,772	1,6535

Responses of "How do you describe yourself when it comes to technology?" question are given with frequency and percentage rates in Figure 1.

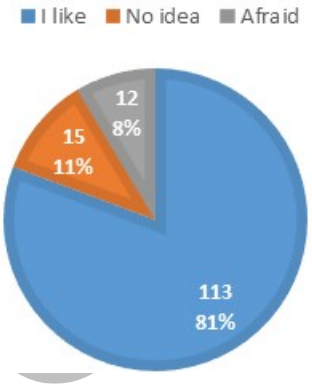

Figure 7. Attitude of the research group on technology.

Responses of "Do you think that IT courses which you have taken at university are sufficient?" and "Do you think that IT courses are necessary for your business life?" questions are given with frequency and percentage rates in Figure 2 – A and Figure 2 – B respectively.

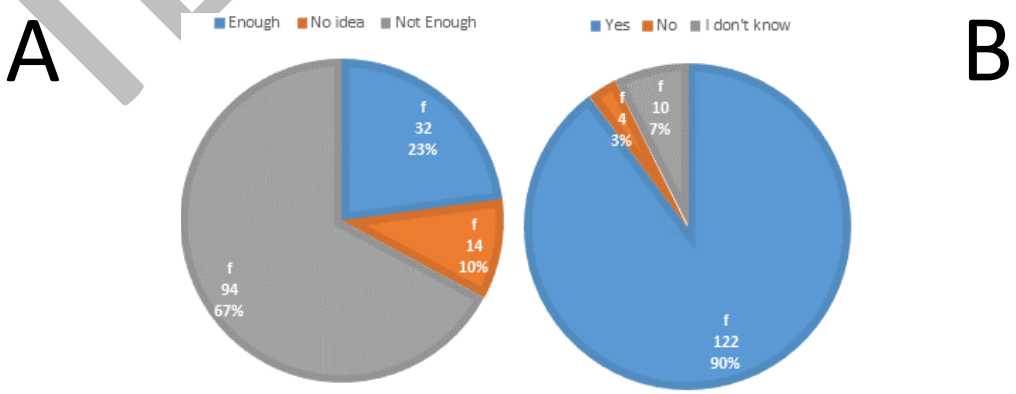

Figure 8 Aspects of students about IT education.

Responses of "What do you do on internet?" question is given with frequency and percentage rates in Table 2.

Table 2. Things that students can do on internet.

IETC 2014

It is obtained that when students are divided into groups according to their own description when it comes to technology, three groups have nearly the same average about evaluation their "Logic and Computer Practices II" course performance: I like technology (6.8), I have no idea (6.8), I am afraid of technology (6.7). Male and female students are both maximum 5 minute wait to open a web page. Average of the percentage of time that female students spend on the internet for research is 29% and average of the percentage of time that male students spend on the internet for research is 24%.

As Table 7 shows the results of the Independent-Samples T Test which compares computer ownership (Q9) and internet usage in years (Q13), there is obvious to see that in both Equal variances assumed and Equal variances not assumed cases the Sig. (2-tailed) < 0,05. Therefore, internet usage of students who have computers is different from students who do not have computers. In addition, if we look at Table 6, we can see that students who have computers have been using internet more than students who do not have computers.

Table 6. Group Statistics.

Q9. Computer ownership		N	Mean	Std. Deviation	Std. Error Mean
Q13. Internet usage (in years)	Yes, I have	129	8,636	3,3135	,2917
	No, I don't have	7	4,571	2,3705	,8959

Table 7. Independent Samples Test.

		Levene's Test for Equality of Variances		t-test for Equality of Means						
									95% Confidence Interval of the Difference	
		F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Q13. Internet usage (in years)	Equal variances assumed	,882	,349	3,196	134	,002	4,0642	1,2718	1,5488	6,5796
	Equal variances not assumed			4,313	7,336	,003	4,0642	,9422	1,8567	6,2718

5. Discussion and Conclusion

Considering demographic information of students, they have been using computer approximately for 10 years and internet for 8 years. They spend time on internet 3,3 hours per day. Students usually access internet via notebooks or smartphones (Table 5). Although average of AGNO is 2.7, their self-performance assessment of "Logic and Computer Practices II" course is 6.7 (1: The worst, 10: The best). Most students (81%) like technology (Table 1). For this reason, the sample group consists of students who mostly like technology, use computer and internet, can be classified as experienced and are above average in both general and course cases. Most of the students (67%) thinks that IT courses, which they have taken at university, are not sufficient. Furthermore, 90% of the students do not think that they will need this information for their business lives.

On one hand, most of the participants are using email, social media and search engines (Table 2). They also want to use these technologies during their educational life and their preference rate is higher when it comes to file sharing and communication with more than one person (Table 3). On the other hand, Table 3 shows that usage of blogs, Learning Management System and forums is lower. It is thought that the reason of this low rate has arisen because of their lack of information about related subjects (At Table 2, it can be easily seen that students are using them less than others).

Courses which students prefer to take during their educational life at university are respectively (from the most wanted): Office software (word, excel, powerpoint etc.), web programming, hardware, programming language (c, php, java, ..), information management, database, statistics software (for example SPSS, …) (Table 4). Many organizations are looking for office software usage skill today so it is normal to be at the top of the list for Office software. However, it is expected that information management and statistics software (for example SPSS, …) should be at the top of the list. This order is formed with lack of information about these terms more than requirement analysis.

If we consider students at universities are generation Y and generation Z is about to start university life, it is obvious to see that it is necessary to shape education contents according to IT needs in social science as well as other sciences urgently. This study can be extended to student who study at other departments in social science or to students who study at same department but from different national and international universities, so expectations of students can be determined clearer.

IECT 2014

Questions of the questionnaire:

1. How do you describe yourself when it comes to technology?
- I like technology.
- I have no idea.
- I am afraid of technology.

2. What do you do on internet? (You can chose more than one).
- Email
- Forum
- Group (Purpose of file sharing, communication with more than one people etc.)
- Social Media (Facebook, Twitter etc.)
- Search Engine (Google, Yandex etc.)
- Blog
- Learning Management System (Moodle, Blackboard etc.)

3. What do you prefer to be used in your educational life? (You can chose more than one).
- Email
- Forum
- Group (Purpose of file sharing, communication with more than one people etc.)
- Social Media (Facebook, Twitter etc.)
- Search Engine (Google, Yandex etc.)
- Blog
- Learning Management System (Moodle, Blackboard etc.)

4. Do you think that IT courses which you have taken at university are sufficient?
- Enough.
- No idea.
- Not enough.

5. Which course/courses do you prefer to take during your educational life at university? (You can chose more than one).
- Office software (Word, Excel, PowerPoint etc.)
- Hardware
- Programming Language (C, PHP, Java, …)
- Statistics Software (SPSS, …)
- Knowledge Management
- Database
- Web Design
- Others (Please write your own choices) :

_____
_____

6. Do you think that IT courses are necessary for your business life?
- Yes.
- No.
- I don't know.

7. Gender:
- Female
- Male

8. Age: _____

9. Do you have computer?
- Yes, I have.
- No, I don't have.

10. Do you have internet access?

IETC 2014

- Yes, I have.
- No, I don't have.

11. Which of the following device/devices do you prefer to connect to internet? (You can chose more than one).
- Desktop PC
- Notebook
- Tablet
- Smart Phone

12. How many years have you been using computer?: _____

13. How many years have you been using internet?: _____

14. How many hours do you spend time on internet?: _____

15. What is the percentage of time that you spend on the internet for research?: _____

16. How many seconds do you maximum wait to open a web page? : _____

17. What is your Weighted Grade Point Average (AGNO) at the end of the 7th term?: _____

18. Please evaluate your "Logic and Computer Practices II" course performance (please chose a number between 1 and 10; 1: The worst, 10: The best) : _____

19. Please write down your opinions about the questionnaire.

Attitude of Turkish EFL Learners towards e-Learning through Tam Model

Recep Cakır*, Ekrem Solak
Amasya University, Amasya,Turkey & Amasya University, Amasya,Turkey

Abstract

The purpose of this study was to understand the attitude of Turkish EFL learners towards technology and to determine role of these factors in the academic achievement of the participants. Survey method was used to collect data about technology acceptance of the Turkish Foreign Language Learners. This research was conducted at a state-run university in 2012-2013 academic year and subjects were 231 male and 279 female e-language learners from the Vocational Higher School taking up English course through e-learning. According to the results of the research, some of the TAM factors have effects on the academic achievement of the e-learners. It is understood that while anxiety towards e-learning has a negative effect on academic achievement; perceived ease of use, attitude, satisfaction and self-efficacy have a positive effect on the academic achievement of e-learners. These findings indicate that Turkish EFL learners have a positive attitude towards technology and they are at the stage to make a decision to adopt or reject the technology.

Key Words: TAM, TAM in language teaching, language teaching and technology

1. Introduction

While Prensky (2001) names today's students as digital natives, Tapscott (1998) calls them net generation. Because they are born in a different world which is full of digital technology and this technology is an important part of their lives. Prensky (2001) states that the new generation is exposed to a huge amount of information since early childhood and therefore they think and process information much faster and are used to multi-tasking. However, they have little patience for long tasks and get bored easily. Therefore, it is vital for teachers to make a shift in methodology and learning content.

It has been proved that information and communication technologies encourage learners to make progress in their foreign language learning and motivate the learners in a positive and creative manner (Sanders & Morrison-Shetlar, 2001). Sankaran (2000) found that students who preferred courses supported with technology performed better than those who were presented in the lecture format.

However, Huang &Liaw (2005) state that, no matter how sophisticated and powerful the state of technology is, it is the user having a positive attitude towards it. Therefore, it is the purpose of this study to determine the attitude of Turkish EFL learners towards e-learning through Technology Acceptance Model (TAM) and propose some suggestions if there are any deficiencies.

2.Technology Acceptance Model (TAM)

IETC 2014

Technology Acceptance Model (TAM) (Davis, 1989) generated from the Theory of Reasoned Action (TRA) (Fishbein & Ajzen, 1975) offers a theoretical basis for user acceptance and usage behavior of information technology. Figure 1 illustrates Technology Acceptance Model.

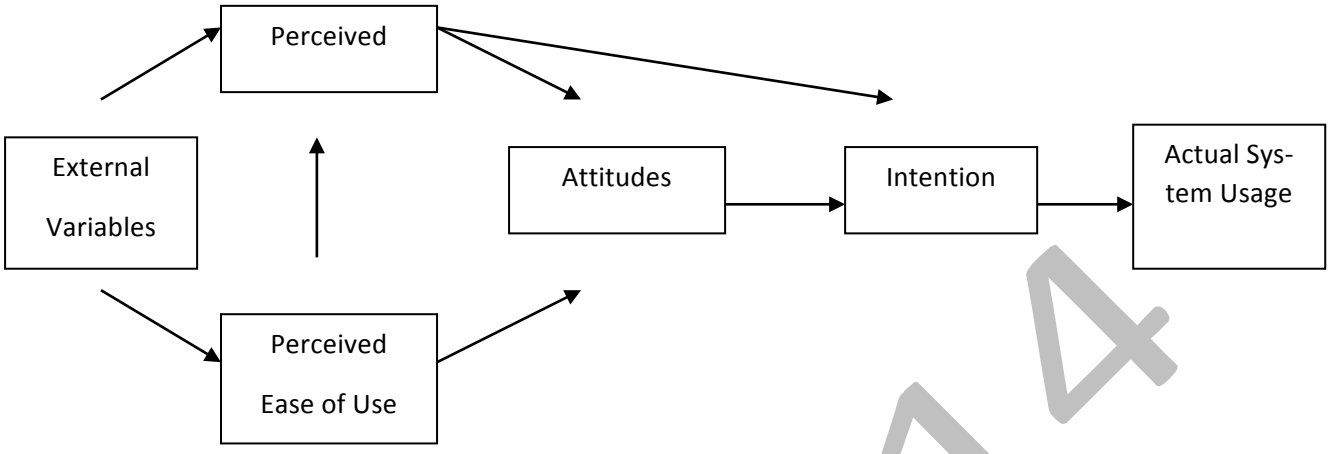

Figure 1: Technology Acceptance Model (Davis, 1989)

In TAM, there are two core beliefs as perceived usefulness and perceived ease of use which lead an individual's behavioral intention to adopt a system. Davis (1989) defines Perceived usefulness as "the degree to which an individual believes that using a particular system would enhance his or her productivity" while perceived ease of use is defined as " the degree an individual believes that using a particular system would be free of effort" (Davis, 1989). It can be stated that perceived ease of use has a direct effect on both perceived usefulness and technology usage (Adams et al., 1992; Davis, 1989). Davis (1989) cites that users' beliefs are directly related to a technology's usefulness, the attitude and the intention to use the technology. It is reported that perceived usefulness has stronger relationship with usage than other variables. Moreover, an individual adopts a technology if it is considered as convenient, useful and socially desirable even though it is not enjoyable to use the technology (Saga &Zmud, 1994).

TAM is a model widely used in the studies about the acceptance of technology. This model has been adopted and expanded in many studies in various types of technologies including e-mail, word processor, World Wide Web, enterprise resources planning (ERP) systems and proved high validity.

IETC2014

3. Review of Literature

Rogers (1995) states in his Innovation Decision Process theory that an innovation's diffusion is a process that occurs over time through five stages: Knowledge, Persuasion, Decision, Implementation and Confirmation. Accordingly, ''the innovation-decision process is the process through which an individual passes (1) from first knowledge of an innovation, (2) to forming an attitude toward the innovation, (3) to a decision to adopt or reject, (4) to implementation of the new idea, and (5) to confirmation of this decision'' (Rogers, 1995). In cases where technology is very recently introduced into the educational system, studies have mainly focused on the first two stages, that is, on knowledge of an innovation and attitudes about it. (Akbulut, 2008)

The early studies on attitudes to computer technology generally revealed that existing culture, interaction with the tutors and dialogue were the predictors of success in distance learning. Moreover, these researches suggested that there was no significant difference in achievement levels between distant and traditional learners.

Thomas (1987) emphasizes the importance of the cultural/social norms of a country to the acceptance of technology. Thomas states, ''How acceptable a new technology will be in a society depends on how well the proposed innovation fits the existing culture'' (p.15). A user may resist a technological innovation because it may not fit within their micro- or macro-cultures. Thomas names his hypothesis as the cultural suitability factor.As Stone (1990) argues in his assessment of interactivity in distance learning, high quality learning can occur as long as students have interaction with tutors.

Johnstone (1991) stated that there was no significant difference in achievement levels between distant and traditional learners, but there is considerable variance in student attitudes and satisfaction levels (cited in Threlkeld&Brzoska, 1994, p. 49).

According to Kirkup and Jones (1996) the success of distance learning courses cannot be predicted. They (1996) summarize the most significant weaknesses of distance education as (a) its inability to offer dialogue in the way that conventional face-to-face education does; (b) the inflexibility of its content and study method; and (c) the isolation and individualization of the student.

Hilgenberg & Tolone (2000) believe that one of the most common problems of many distance learning courses is the limitation of dialogue between teachers and learners, and amongst learners themselves.

Khine (2001) corroborated with Yuen and Ma (2001) revealed that affective attitudes, general usefulness, behavioral control, and pedagogical use to be significant in determining the use of ICT. Kumar & Kumar (2003) reported that most teachers believe that the amount of computer experience has a positive effect on attitude towards computers.

Glancing at the recent literature on technology acceptance and e-learning, Lee et al (2009) investigated critical factors on e-learning adoption in South Korea and their study proposes a research model which consists of four independent variables as instructor characteristics, teaching materials, design of learning contents, and playfulness, two belief variables as perceived usefulness and perceived ease of use, and one dependent variable as intention to use e-learning.

In his study, Lee (2010) combines the expectation–confirmation model (ECM), the technology acceptance model (TAM) and the theory of planned behavior (TPB) to propose a theoretical model to predict the users' intentions to continue using e-learning. The results suggest that satisfaction has the most significant effect on users' continuance intention, followed by perceived usefulness, attitude, concentration and subjective norm.

Sang et al (2010) focused on the impact of Chinese student teachers' gender, constructivist teaching beliefs, teaching self-efficacy, computer self-efficacy, and computer attitudes on their prospective Internet and Computer Technology (ICT) use. Results indicate that prospective ICT integration significantly correlates with all teacher related variables, except for gender.

Tzeng (2011) investigated users' perceptions of the technology and the perceptions' association with attitude towards and intention of using the technology. The results prove that for prospective users, attitudes have the strongest significant effect on usage intentions.

Cheung and Vogel (2013) used the technology acceptance model to highlight the factors that influence the acceptance of Google Applications for collaborative learning. According to the research results, the subjective norm represented by peers is found to significantly moderate the relationship between attitude and intention toward the technology.

Melendez et al (2013) examined the perceived playfulness in the context of a blended learning setting with existing gender differences. The study suggests that there exist gender differences in the effect of playfulness in the student attitude toward a technology and the intention to use it.

IETC 2014

In this study, it is believed that TAM is the ideal model to figure out the attitude of Turkish EFL Learners towards e-learning because it is very comprehensive and as can be seen, valid results have been obtained from the studies.

4. Method of the study

In this research, survey method was used to collect data about technology acceptance of the Turkish Foreign Language Learners. There have been several studies focusing on TAM in various fields so far but little attention has been paid to understanding the perceptions of Turkish Foreign Language Learners through TAM in Turkish Vocational Higher education context. This study can be considered unique, because the effects of subfactors of TAM in academic achievement are also discussed. Therefore, the results and the implications of this study will highlight a different aspect of e-learning regarding a different population. It is hypothesized in this research that

4.1. Subjects

This research was conducted at a state-run university in 2012-2013 academic year and subjects were 231 male and 279 female e-language learners from the Vocational Higher School taking up English course through e-learning. The subjects were elected on voluntary basis and the total number was 510. The participants study English course 2 credits a week. E-learners benefit from videos, notes, files etc. prepared by language teachers in an e-learning context. Videos that are composed of 15-20 minute presentations, a discussion board which learners ask questions at any time and e-content which is supported by animations are the main characteristics of the present e-learning program. E-learning system is at students' disposal for 24 hours.

5. Findings

Table1. Demographic data of the participants

		F	%
Gender	Female	279	54,7
	Male	231	45,3
Facebook	Yes	468	91,8
	Nor	42	8,2
Personal Computer	Yes	391	76,7
	Nor	119	23,3
The skill of using technology	insufficent	0	0
	Not bad	129	25,3
	sufficient	251	49,2
	Very good	130	25,5
Daily internet usage	1-3 hours	168	32,9
	4-6 hours	239	46,9
	More than 6 hours	102	20,2
Documents	rarely	114	22,4
	sometimes	159	31,2

IETC 2014

	frequently	186	36,5
	very often	51	10,0
videos	rarely	113	22,3
	sometimes	194	38,3
	frequently	175	34,5
	very often	25	4,9
Exercises	rarely	87	17,3
	sometimes	255	50,7
	frequently	120	23,9
	very often	41	8,2

According to the demographic data collected, each participant (N= 468, 92%) almost has a facebook. Nearly 77% (N=391) of the subjects have personal computers. While 130 (%25,5) subjects' skill of using technology is very well, 251 of them have a sufficient skill of using technology. In addition, %20,2 (N=102) of the participants use internet more than 6 hours a day.

Analyzing the use of e-learning materials by language learners, course documents, videos, and exercises are the most frequently used ones. While 186 participants use course documents frequently, 174 use course videos at the same rate. Furthermore, 120 of the participants studied the exercises frequently. On the other hand, very few participants state that they take advantage of form pages. While 42 students use the form page for technical reasons frequently, 54 subjects use foreign language course form page at a high rate. Moreover, voice files and messages are used at a low rate.

IETC 2014

Career aspirations and background of students opting for fashion education courses in India

G. Chirenjeevi Reddy[a] *, Dr. N. J. Rajaram[b]
[a]*Associate Professor,* [b]*Director*
National Institute of Fashion Technology,
Hitech City, Madhapur, Hyderabad- 500 081, India.

Abstract

Fashion education is one of the fast growing and prosperous vocational education streams across the world. It has rapidly expanded during the last two decades; the courses offered in fashion education are predominantly related to Apparel, Home Furnishing, Accessory and Communication fields which are diffused into the domains of Design, Technology, and Management. The scope, prospects and employment opportunities are enormous as the fashion industry has spread across many other fields. The students undergoing interdisciplinary vocational programs in fashion and allied subjects are required to develop an open mindset and balanced personality for effective learning in order to face the challenges in the dynamic real life fashion environment. For the continuous and overall development of the student in education, his present status, domain acquaintance, perceptions and aspirations play important roles. This study has been mainly conducted to understand students in the perspective of these aspects. Primary data through a well-designed questionnaire had been collected from over 180 students of 2013-14 batch who have taken admission into various fashion related courses (under and post-graduation) at National Institute of Fashion Technology, Hyderabad Center, India. The collected data has been compiled, analyzed and presented through descriptive statistics. The current research involved the analysis of data pertaining to Fashion Design, Technology and Fashion Management students both at UG and PG courses respectively. The findings of the study are useful in understanding the back ground of the students, their awareness on fashion education, source of information, preferences of careers and life aspirations. The findings of this study can help in refining the curriculum and the overall fashion education process.

Keywords: Fashion Education; Student Aspirations; Student Perceptions; Fashion Design; Higher Education; Vocational Education

IETC 2014

1. Introduction

In any higher education process, for the continuous all-round development of student, the correct choice of course and effective learning during the program are very important and mainly depends on student's interest, domain acquaintance, perceptions and aspirations. Career choice has become a complex task with the advent of information technology, the emergence of post industrial revolution with different fields and variety of jobs. According to Kerka (2000) career choice is influenced by multiple factors including personality, interests, self-concept, cultural identity, globalization, socialization, role model, parental grooming, social support and

* Corresponding author. Tel.: +91 924 656 1129; Fax: +91 40 2311 4536.
E-mail address: gcjeevi@gmail.com

available resources such as information and financial strengths. Once the students join the chosen course, the college is mainly responsible to understand the aforesaid factors and accommodate required learning for students to meet their aspirations. According to Salami (1999) many students made wrong choices in their career because of ignorance, inexperience, peer pressure, advice from friends, parents and teachers,

or tags attached with certain job types without adequate knowledge. As reported by Weber (2012), colleges across the U.S. are placing greater emphasis on job preparation and career development. According to (Yadav, 2014) now a days it is the children who decide about his/her career and the college in which he or she will pursue study, only small percentage of students are able to choose right career because they consult their parents, teachers and elder members of their family. Many researchers have studied in conventional higher education and found different parameters which influence career choice and curriculum deliverance and their influence however there were not many noteworthy studies found on fashion education and on how students recognize these courses from a career standpoint, what their backgrounds are, their intentions and aspirations. Therefore the present study has been undertaken and it is limited to students of Undergraduate Fashion Design (UGD); Fashion Design (FD), Textile Design (TD), Accessory Design (AD), Fashion Communication (FC), Knitwear Design (KD) and Undergraduate Fashion Technology (UGT) and Postgraduate Fashion Management(PGM) at National Institute of Fashion Technology (NIFT) Hyderabad, India.

2. Methodology

A questionnaire was developed with thirteen questions on demographic parameters of students and forty one questions pertaining to aspirations, perceptions, domain awareness and background status of students. Students responded to the questionnaire (hard copy) instantly during their admission reporting time. Out of about 210 students of newly enrolled, 186 students had responded; they are as follows: 139 Design (20 male and 119 female) under-graduates (FD, AD, TD, KD and FC), 26 technology (17 male and 9 female) under-graduates, and 21 (6 male and 15 female) management post-graduates.

The questionnaire comprised of closed ended questions with three different option types of yes or no, multiple choice or ten point scale. Wherever the students had marked more than one option on multiple choices equally divided weightage has been assigned to the all selected options and in final compilation the figures are rounded to nearest integer. The collected data was analyzed using descriptive statistics and compiled in tables or represented by graphs. Care was taken to ensure that wrongly answered questions were eliminated from the statistical analysis of that particular aspect of the study. The figures shown in the parenthesis of all tables are present value.

3. Demographic and course preference factors of students

The demographics of the sampled respondents was collected and presented here to elicit the information. The findings are; the mode (statistical) age of an under graduate student is 18 years and a post-graduate student is 22 years. Almost all students had their medium of instruction in school and college, as English with 86.74 percent of students from urban back ground. Table-1 furnishes the background of the students and table 2 shows gender ratio of students that are admitted. For about 86.6 percent of students these courses are of first priority of study and for the remaining 13.4 percent these are of second priority. Only one UG Design student out of total 186 students stated that she has considered this course as her last choice. 93.5 percent students stated that their parents have been highly interested in fashion studies and only remaining 6.5 percent students stated that their parents have low interest in these courses. From the sample collected it revealed that 25.4 percent of the students of Undergraduate Design program, 0.04 percent the students of Post Graduate Management and zero percent of the students of Undergraduate Technology program have taken special coaching for preparing for the national entrance examination and got admissions into fashion courses.

Table-1: Geographical background of the students absolute number and percentage in parenthesis

IETC 2014

Course	Urban	Rural
UG Design	115 (85.82)	19 (14.18)
UG Technology	22 (84.61)	4 (15.38)
PG Management	20 (95.24)	1 (4.76)
All Together	157(86.74)	24 (13.26)

Table-2: Gender ratios of students

Gender	UG Design	UG Technology	PG Management	All together
Male	20 (14.4)	17 (65.4)	6 (28.6)	44 (23.1)
Female	119 (85.6)	9 (34.6)	15 (71.4)	143 (76.9)

4. Fashion background of the students

4.1. Period in their lives at which the Students became aware of fashion courses

With the objective studying, at what points in the academic career the students came to know about these courses, data on three options were collected and the frequency of responses is shown in table-3.

Table 3: When did students come to know about fashion courses

Course	School days	Plus two & college days	Few days before applying
UG Design	99 (71.22)	40 (28.78)	0
UG Technology	16 (61.54)	9 (34.62)	1 (3.85)
PG Management	11 (52.38)	8 (38.10)	2 (9.52)
All together	126 (67.74)	57 (30.65)	3 (1.61)

The study found that most of the students knew about these courses during their school days (67.74 %). It clearly shows that the students identified their career choices and courses they would like to pursue well in their school days itself. The findings concurred with Shumba and Naong (2012), Watson et al. (2010), Barnett (2007), McMahon and Watson (2005), they found students are deciding their career choices long before they come to universities and the choice of subject they made whilst they were already in school. Very specifically, Alloway et al, (2004) identified that many students commenced their career planning during the junior grades in secondary school.

4.2. Information sources for students about fashion courses.

In order to determine from whom the students came to know about these courses; seven options were provided for their responses against each of design and technology undergraduate programs and one postgraduate program, as shown in Table-4.

Table-4: Source of first information about courses

Course	Parents	Relatives	Print Media	Friends	Teachers	Television	Internet
UG Design	28(20.29)	16 (11.59)	18 (13.04)	40 (28.98)	9 (6.52)	1 (0.72)	27 (19.57)
UG Technology	5 (19.23)	3(11.53)	1 (3.85)	12 (46.15)	1 (3.15)	0	4 (15.38)
PG Management	2 (9.52)	5(23.81)	4 (19.04)	5 (23.81)	2 (9.52)	0	3 (14.29)
All together	35 (18.82)	24(12.90)	23 (12.36)	57 (30.64)	12 (6.45)	1(0.53)	34(18.28)

Most of the students come to know about the courses from their friends (30.64%) and very few students come to know from television (0.53%). Similar trends have been seen in both the students enrolled for under-graduate and post-graduate. From the above it is clear that friends, parents and internet in that order are effective medium for providing knowledge on career options.

4.3. Motivation behind students to decide fashion career

In order to study, motivation behind students decision for fashion career five factors; self, parents, friends, relatives and teachers are considered for this study.

Table-5: Motivation for fashion courses

Course	Self	Parents	Friends	Relatives	Teacher
UG Design	72 (51.79)	43 (30.94)	11 (7.91)	6 (4.32)	7 (5.04)
PG Management	14 (66.67)	3 (14.29)	1 (4.76)	2 (9.52)	1 (4.76)
UG Tech	13 (50)	7 (26.92)	2 (7.69)	3 (11.54)	1 (3.85)
All together	99 (53.22)	53 (28.58)	14 (7.53)	11 (5.91)	9 (4.83)

Table-5 shows that self-motivation (53.22%) and motivation by parents (28.58%) are the two major factors which have influenced the students to join fashion courses. The same trend had been seen across all the courses. These results concur from those of Edwards and Quinter (2011) and Perrone, et al., (2001) who found that students own interests as well motivation from parents provide for their career choices. These results differed with Arudo (2008) who reported that the peer pressure also as a major factor that influenced career choice. Edwards and Quinter (2011) found in his studies that family members are more influential in student's career choices as compared to other persons. In a study Shumba and Naong (2012) have found that the family, ability of the student to identify preferred career choice and teachers are the three major factors influencing career choice of the learners. The above Table-5 clearly indicates that self-motivation and that of parent's contribute to career choices of the student and below Table-6 indicates that most of the students that prefer fashion programs had good acquaintance about the field.

Table-6: Fashion professional in family or acquaintances

Course	In family	Acquaintances

UG Design	18/137 (13.14)	53/136 (38.97)
UG Technology	6/26 (23.08)	10/23 (43.48)
PG Management	7/21 (33.33)	15/21 (71.43)
All together	31/184 (16.85)	78/180 (43.33)

4.4. No. of attempts made by the student to secure admission

The below table furnishes, the number of attempts the students make to get admission into fashion courses

Table-7: Number of attempts

Course	1st	2 nd	3rd	4 th
UG Design	116 (83.45)	19 (13.67)	0	4 (2.88)
UG Technology	19 (73.1)	7 (26.9)	0	0
PG Management	18 (85.71)	3 (14.29)	0	0
All together	153 (82.26)	29 (15.59)	0	4 (2.15)

From the above table it indicates that 82.26% of students have cleared the entrance exam in the first attempt and 15.59% of the students are in the second attempt. Surprisingly there were 2.15% of the students successful in the fourth attempt. It shows that the students prefer to pursue a fashion program from NIFT irrespective of their success in the first attempt. Similar trends were seen across the courses.

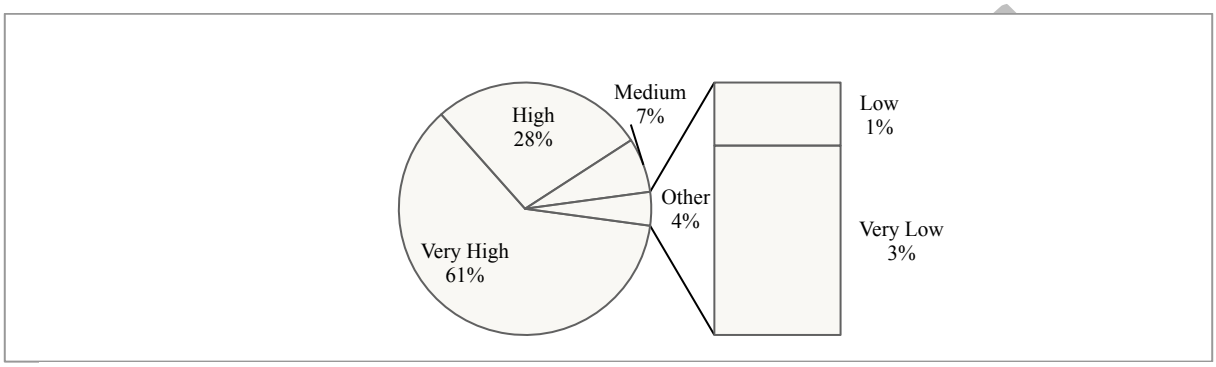
4.5. Parental educational qualification influence on child career decision

Parental educational attainment was positively related to academic involvement and is an important aspect that influences educational aspirations of children.

Table-8: Father's qualification

Course	PhD	PG	UG	HSC (10+2)	SSC (10th)	School drop-out
UG Design	6 (4.58)	36 (27.48)	68 (51.91)	11 (8.34)	5 (3.82)	5 (3.82)
UG Technology	0	7 (26.92)	14 (53.85)	5 (19.23)	0	0
PG Management	0	5 (23.81)	10 (47.62)	1 (4.67)	4 (19.05)	1 (4.67)
All together	6 (3.37)	48 (26.97)	92 (51.69)	17 (9.55)	9 (5.06)	6 (3.37)

Table-9: Mother's qualification



Course	PhD	PG	UG	HSC (10+2)	SSC (10th)	School dropout
UG Design	7 (5.04)	35 (25.18)	62 (44.60)	20 (14.39)	10 (7.19)	5 (3.60)
UG Technology	1 (3.70)	7 (25.93)	7 (25.93)	5 (18.52)	6 (27.00)	1 (3.70)

PG Management	1 (4.76)	2 (9.52)	10 (47.62)	4 (19.05)	4 (19.05)	0
All together	9 (4.81)	44 (23.53)	79 (42.25)	29 (15.51)	30 (16.04)	6 (3.21)

The above two tables viz; table-8 and table-9 show that about 70 percent of the student's parents are graduates or are better qualified (UG, PG or PhD). According to Mudhovozi and Chireshe (2012) parents' level of education have influenced career decisions among students.

4.6. Parent's inclination for fashion courses

The interest of parents on fashion course for their children has been collected on a 10 point scale.

Graph-1: Interest of parents on fashion courses as career option for their child

The scales are indicative of the interests as follows: Very high interest (10-9 scale points), High interest (8-7 scale points), Medium interest (6-5 scale points), Low interest (4-3 points) and Very low interest (2-1). The above percentage pie Graph-1 shows the compiled information.

5. Aspiration of the students

5.1. Occupational aspirations

In order to understand about the future career aspirations of the students and what they intend to do after graduation studies. The results obtained are given below.

Table-10: Future career occupation aspirations absolute number and percentage in parenthesis

Course	Own business	Job	Freelance	Teaching	Consultancy	Any other
UG Design	85 (61.15)	17 (12.23)	18 (12.95)	2 (1.44)	3 (2.16)	14(10.07)
UG Technology	13 (50.00)	9 (34.62)	3 (11.54)	0	0	1 (3.85)
PG Management	11 (52.38)	6 (28.57)	3 (14.29)	0	1 (4.76)	0
All Together	109 (58.60)	32 (17.20)	24 (12.90)	2 (1.08)	4 (2.15)	15 (8.06)

IETC

After completion of the graduation program the students find many kinds of opportunities in their respective fields like: join a company as employee, start his own business, become an academician, work as a freelancer, work as consultant or as an expert advisor. The above table-10 indicates that most of the students who take up fashion courses are inclined towards starting their own business.

5.2. Extra-curricular interests of students

According to Martin (2013) greater participation in extra-curricular activities was used as a means to provide valuable career transition and to develop professional habits like life-long learning. The importance of extra circular activities was published by Stevenson (2011) who says majority of students irrespective of age believe that the inclusion of extra-curricular activities on application forms/CVs is more important than the actual degree they gain in order to secure employment.

Table-11: Interest in extracurricular activities

Course	Sports	Games	Environment	Culture	Literature	All activities
UG design	21 (15.11)	23 (16.55)	17 (12.23)	43 (30.94)	22 (15.83)	13 (9.35)
UG technology	9 (36.00)	6 (24.00)	1 (4.00)	5 (20.00)	0	4 (16.00)
PG management	7 (33.33)	3 (14.29)	3 (14.29)	6 (28.57)	1 (4.76)	1(4.76)
All together	47 (25.29)	32 (17.20)	21 (11.29)	54 (29.03)	23 (12.37)	18 (9.68)

The above table-11 indicates that the students exhibited interests in extracurricular like cultural activities, sports and games.

5.3. Aspiration for national and international relocation

The compiled findings of Table-12 are in order to study the aspirations of students in National and International relocation to pursue their career

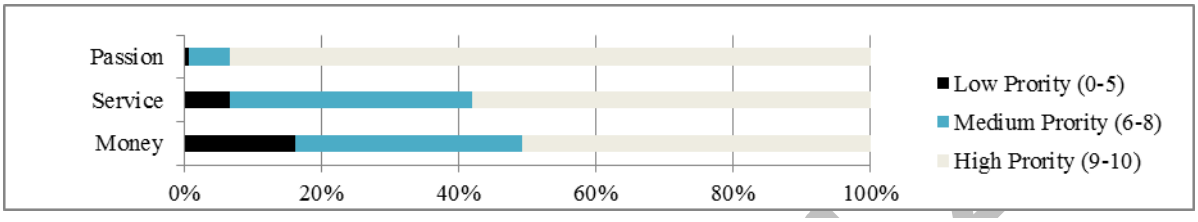


Table-12: Where students want to settle after completion of the course

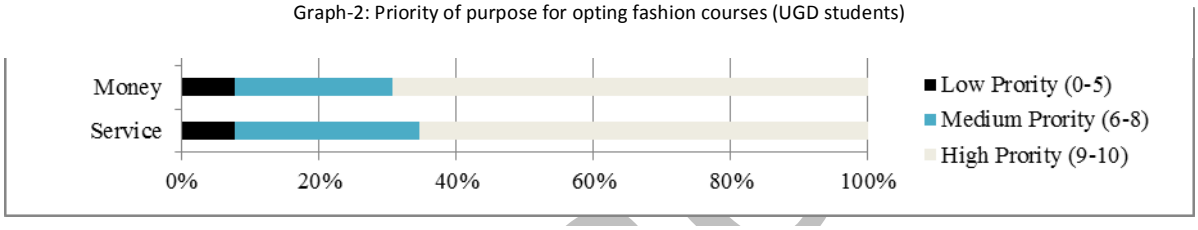
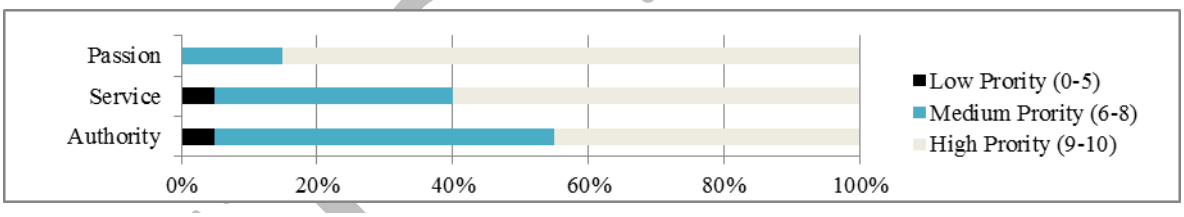
Course	India	Overseas
UG Design	71 (51.08)	68 (48.92)
UG Technology	13 (50.00)	13 (50.00)
PG Management	14 (66.67)	7 (33.33)
All Together	98 (52.69)	88 (47.31)



As far as the work location is concerned 53% of students would like to work in India while 47 % of them would like to work overseas after completion of their work. This is explicit from the table-12 given above.

5.4. Priority of purpose for choosing fashion courses



In a ten point scale option the data on the actual purpose for opting for the fashion course was gathered from the students. Five purposes were considered for the study; they are Fame, Money, Authority, Service and Passion. The priorities translated onto the ten point scale are as follows: low priority (0-5 points), medium priority (6-8 points) and high priority (9-10 points). The following graphs; graph-2 to graph-4 show the top three priority options of Design, Technology and Management students respectively in percentage.

Graph-2: Priority of purpose for opting fashion courses (UGD students)

Graph-3: Priority of purpose for opting fashion courses (UGT students)

Graph-4: Priority of purpose for opting fashion courses (PGM students)

It has become evident within the above analysis that students entering fashion education are generally motivated by a passion to learn about the subject and develop their creative abilities

6. Conclusions and discussion

The data pertaining to background, motivation and professional aspiration was collected to study the dominant factors. From the motivation stand point, the students own motivation was the main determinant, while on the parental back ground educated parents contributed to careers of their ward and most of the students were enabled by friends and electronic media (internet) for career choice. The design and management courses were preferred by female students, while the technology courses were sought after by male students. It is interesting to find that most of the students were keen in extra-curricular activities along with their interests in fashion courses. Most of the students have taken up fashion studies with the objective fulfilling their passions while many of them were keen on earnings but a few on glamour. The findings also revealed that the majority of the students demonstrated entrepreneurial interests and most of them had a background with English as the medium of instruction.

Students perceive and decide future career mostly during their higher secondary school days (i.e. VIII to X standard), not just at the entry in college education for their higher secondary education (12 year schooling). Therefore exposure to fashion awareness courses like seminars, counselling, art/creativity competitions to the students during the schooldays influence better and are more fitting. They can be organized by fashion colleges in coordination with schools. Awareness among the school students can be brought by publishing fashion education and career related articles in school magazines, conducting periodic open day sessions to school students where high school students can visit fashion colleges, and summer/ weekend/ holiday camps. It is effective to introduce fashion related subjects in the curriculum at the school level. It is to be propagated that fashion is not just restricted to apparel and ramp walks.

It is found that mostly urban students are pursuing these courses, as the main skills required to become successful in these career pursuits are creativity, sketching, presentation, spontaneity and good communication with prolonged working hours. Except for the communication skills the rural students possess the remaining skills to a large extent. Thus by encouraging and supporting rural students good fashion professionals can be evolved because of their innate skills which suit to fashion programs. Industrialization and post industrialization has made it possible for a common person to be richer as long as she or he has necessary skills and knowledge (Wattles, 2009).

After parents; teachers occupy the second position in terms of nurturing, grooming, guiding and encouraging students. This is due to the fact that they are very closely associated and know the abilities of the students in terms of knowledge, skills and attitude. However, it was found from the study that the teachers play a very minor role towards recognizing, motivating and suitably guiding the students for a fashion career. This may be because of ignorance of the teachers about fashion courses. This shows a need of fashion awareness courses for teachers, which may be planned during teacher the training programmes, like B.Ed. or M.Ed. Students should have wide range of career information related to Fashion and Design so that they can be able to explore before making their career choices at school level.

Most of the students aspire to start their own business as professional career after graduation. In any educational institution providing placements to passing out students is an important and critical but a challenging task. The demand or popularity of any course mainly depends on the placements historically. On the other hand some vocational courses including the ones in the fashion domain give an opportunity for graduates to start their own business with optimal resources and investment; it means rather looking for an employment opportunity these graduates can in turn offer employment to others. To successfully fulfil this social cause of the students required emphasis and orientation should be given towards entrepreneurship during the education process. Therefore the curriculum should include; improving managerial capabilities, soft skills, collaboration /networking with similar institutions. Internships in such areas with theoretical inputs and live projects opportunities are also important.

In vocational courses the context and deliverance of the curriculum is mainly dependent on the assignments and the back ground of the faculty delivering the subject. Therefore the institutions should orient and train the faculty keeping in view the student's aspirations and background and ensure curriculum deliverance in the appropriate context.

One key findings of the study is that more than 15 percent of the students get through the entrance in the second attempt preparing for one whole academic year. The reasons for this can be further explored and the required awareness & know-how for succeeding in the entrance examination in the first attempt can be determined and provided.

For the overall development of the student extra-curricular activities plays a very important role, as the students are interested in cultural, sports and games in that order. Hence emphasis should be given for these also along with the regular curriculum.

The study conducted based on the data collected clearly reveal that there are excellent prospects in fashion and design as career options. With the provision of awareness and revamping of the curriculum in the early stages of school education more number of students can be drawn into the careers in fashion. This also calls for refining the teaching methods and changing mind sets of parents, teachers and students about fashion education.

Abstract

The paper assesses the changes in the use of the computers and internet, and specifically internet communication, by students of the Faculty of Production Engineering, University of Life Sciences in Lublin, Poland in academic years 2009/10 and 2013/14. The structured questionnaire was used as the tool for collecting data. The results indicate there was a dynamic raise of students with their own computers and with direct access to internet. There was a complete swap in the number of desktop units in comparison to laptops. Social media became the most popular application of internet. However, the students used also internet and computers for class preparation. The data collected indicated that the respondends used internet and its available services in every day life.

Keywords: information technologies, internet, higher education, students, internet communication

1. Introduction

Communication revolution is the term used to describe a rapid development of communication due to improvement of new information technics and technologies. Information and communication technologies (ICT) have become common in all aspects of life. That includes education although ICT impact has not been as massive as in other spheres of life. It is obvious that the improvement in information transfer technics determines interactions within communication community and intercultural communication (Bugajski, 2007).

Internet can be defined as a worldwide, dynamically changing system of computer networks. It offers a lot of services such as remote login, transfer of files, electronic mail, World Wide Web (WWW), discussion groups etc. Internet has gradually become dominating telecommunication method equal to telephones and television in terms of popularity and speed (Grzenia, 2008). Nowadays internet is common and omnipresent so current students think that it has been forever. Despite those believes the creation of internet was an accurately defined process, both in terms of time and location. Moreover, this process was precisely planned and also controlled and coordinated. In the last decade there has been a tremendous increase in the number of internet and ICT users. In Poland, in 2012 71% of the households had access to internet whereas 64% of population, in the age 16-74, used computers. However, the last number is still lower than the EU average which was 73%, while in the Scandinavian countries it was above 90% (Społeczeństwo informacyjne, 2012).

It appears that the media which not that long ago was mainly of interest to scientists has not become accessible to increasing number of users, with young people forming the frontrunners (Szczepanowska & Fiedler, 2010). Internet has become a new social space, which provides for most of people's needs, including higher education (Kirkup & Kirkwood, 2005; Kamal & Banu, 2010; Patel et al., 2011; Sysło, 2012). With the introduction of specialised learning software such as WebCT and Blackboard, Questionmark Perception, and I-Assess ICT has also started to change the way students learn (Akkoyunlu& Erkan, 2013;

* Corresponding author. Tel.: +4881 531 97 36
E-mail address: edmund.lorencowicz@up.lublin.pl

IETC 2014

Uziak, 2009). Internauts, the users of internet, can satisfy their higher needs such as belonging or affiliation, respect and self-esteem by means of blogs or WWW. The provision can be extended to more hedonistic needs thanks to network games or the possibility of shopping via internet. The individuals in cyberspace can satisfy both individual and social needs.

Internet communication is based on the usage of a sign, an image or an icon, which replaces or limits the use of words. It also allows on the transfer of symbols, i.e. information, concepts, values, norms or statements (Juszczyk, 2011). Communication is a crucial process developing with human race since the dawn of time. However, the methods, opportunities and needs have been changing with time. Information, but also the speed of obtaining it as well as its transfer, is crucial in the current society. Indeed those features are fundamental reasons why internet is currently so important in the life of society; the additional features such as worldwide span, its multimedia aspect and interactivity are also significant. It is observed that the role of internet in the social communication, in its broad understanding, increases together with the extension of available services (Pawłowska-Mielech & Bocek, 2006).

There are three types of interpersonal communication within internet (Grzenia, 2008).

1. Conversation or chat, represented by all types of internet dialog.
2. Correspondence or mail, covering all types of communication based on electronic letter; that includes e-mail, groups, lists and discussion fora.
3. Hypertext, which represents texts available in WWW (also texts without hyperlinks) and not covered under the first and second type above.

However, the engagement of young people using internet is not always proper and may lead to many problems, including health issues. Although in comparison to other users university students excel in the level of computer knowledge and skills it does not stop that group from having serious issues with proper use of available technologies (Yau & Cheng, 2012; Lis, 2010). It is also not uncommon that their skills are shallow and use of internet is unsophisticated (Tutkun, 2011).

2. Objective, data and methodology

The objective of this study was to assess the changes in the use of the computers and internet, and specifically internet communication, by students. The study included bachelor's and master's degree students from the Faculty of Production Engineering of the University of Life Sciences in Lublin, Poland. The data collected covered years 2009-2014 (Lorencowicz & Kocira, 2012; Lorencowicz et al., 2013).

The method of a diagnostic survey was used in the collection of the data. The technique employed was survey and the questionnaire was used as the tool. Diagnostic survey is one of the most popular methods in social studies research. The method allows to collect information about functional and structural features and also the dynamics of social processes, opinions and views of a specific group of people. Surveys are almost always based on examining specifically selected sample of the general population. The aim of the study is a particular social phenomenon. The method of a diagnostic survey applies many techniques, including survey, interview or analysing the documents. The method implies and determines the selection of the appropriate research technique (Szczepanowska & Fiedler, 2010). As indicated before, the questionnaire was used in the current survey.

3. Results

The basis for the deductions in the current study was the empirical data collected through the questionnaires administered in the academic years 2009/10 and 2013/14. The study included a total of 325 (in year 2009/10) and 418 (in year 2013/14) students. Of the study group, the students from the rural areas constituted 61.85% in 2009/10 and 52.63% in 2013/14. In terms of the programme of study,

IETC 2014

the largest group represented Management and Production Engineering; 24.31% in 2009/10 and 70.57% in 2013/14. Agricultural and Forestry Engineering totalled 14.15% in 2009/10 and 6.94% in 2013/14, of all students participated in the survey. Programme in Transport was represented by 10.46% students in 2009/10 and 10.53% in 2013/14 (Fig. 1).

By analysing data from the survey it was concluded that there was a dynamic raise of students with access to internet, which reflected the general improvement in digitization and computerization in Poland. Among the study group the access to internet in 2009/10 had 86.77% and it increased over 12% to 99% in 2013/14. With the increment in the direct access to internet there was a decrease in the number of students accessing internet: using the university network by 3.45% (from 3.45% to 0.24%), hot-spots or internet cafés – 2.05% (2.39% to 0.34%) and via friends' access – 6.73% (7.15% to 0.42%).

Fig. 2 presents the distribution of surveyed students according to their level of study. It shows the increment in the number of students in the year 2 and 4 of the bachelor programme.

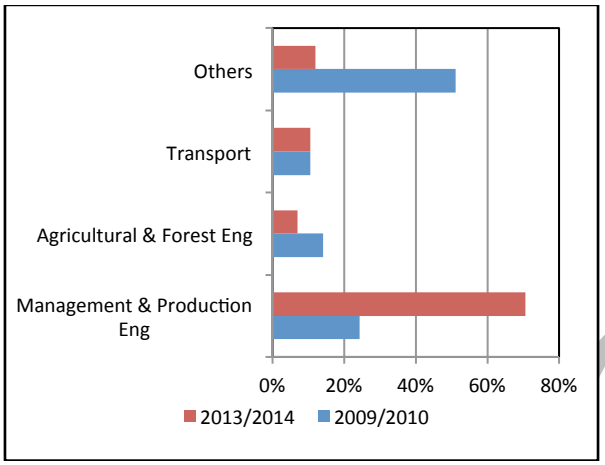

Fig. 1. Distribution of students according to the programme of study

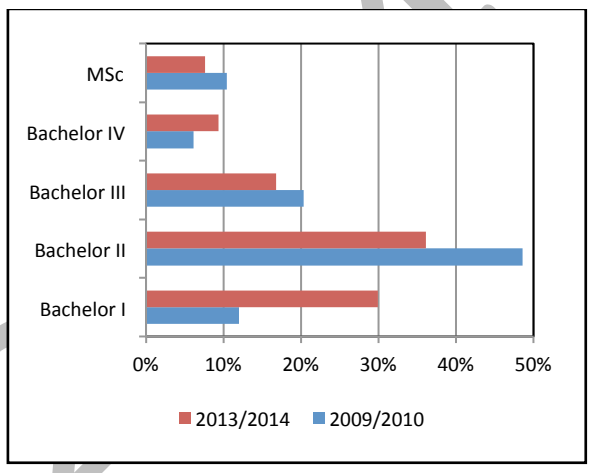

Fig. 2. Distribution of students according to the level of study

There was an increment of 18% in the number of students possessing their own computer; in 2009/10 more than three quarter of the students (78.15%) declared having their own computer whereas in 2013/14 almost all students had their own units (96.17%). At the same time the number of students not owning a computer dropped from 5.85% to 0.48%. There was also decline in the number of students sharing a computer with their siblings (from 14.15% to 3.35%). There was also a swap in number of laptops and desktops; the number of desktops dropped from 59.38% in 2009/10 to 19.38 in 2013/14 while the number of laptops increased spectacularly from 19.38% to 75.84%. The students affirmed owing also other computer hardware (Fig. 3).

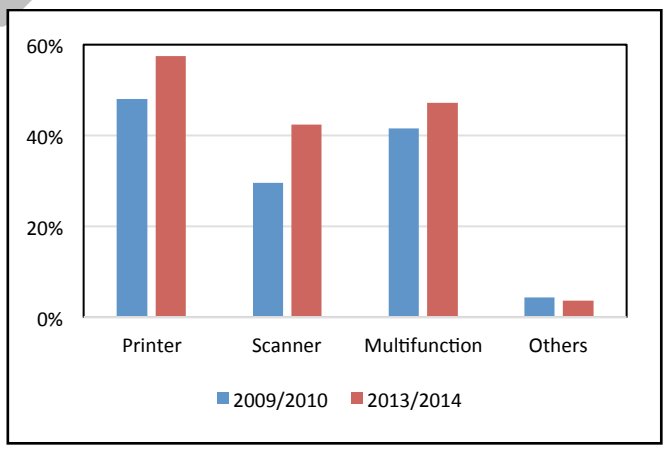

Fig. 3. Additional computer hardware

The results indicate that there was an increment in the additional computer equipment (Fig. 3). The increment was observed for all the equipment; printers, scanners and multifunction units. Reasonable and relatively low prices are obvious reasons for such a trend.

Fig. 4 shows the type of use of internet by the students. The graph indicates the general raise in the use of internet. The percentage increase of students using internet for seeking information was 15%. A similar trend (but the increase was only by 5%) can be observed in using internet in order to search for information related to students' programmes, courses and generally information related to their studies.

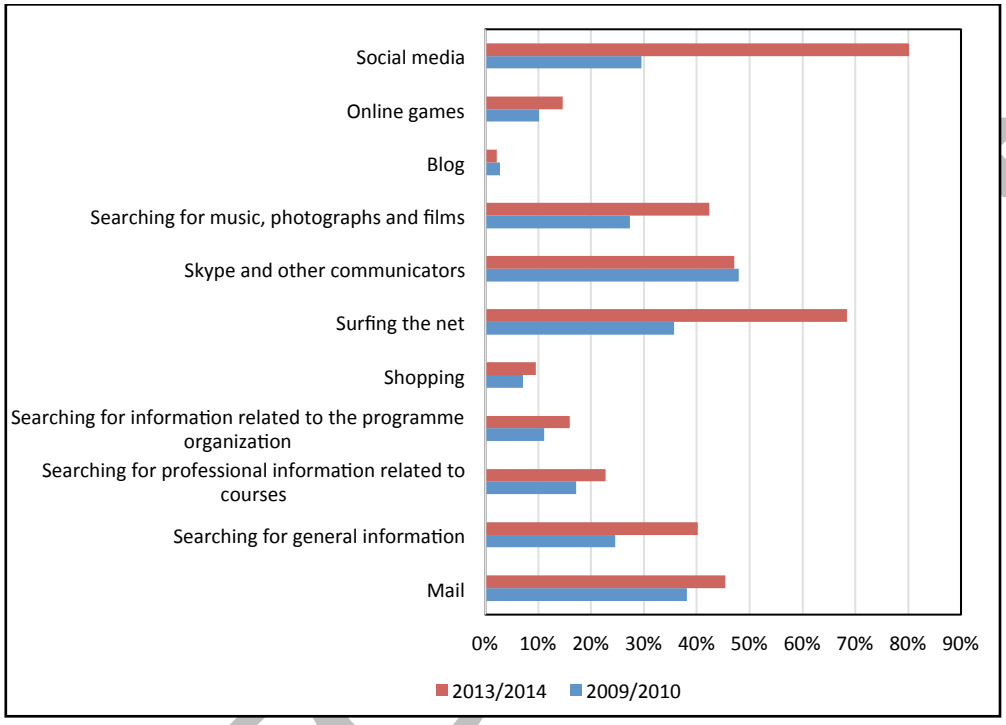

Fig. 4. Use of internet

More students use internet for shopping and for general internet surfing. Different types of internet communicators are also very popular among students. That includes Skype but also 'Gadu-Gadu', the most popular instant messaging system in Poland. Another important type of internet application was electronic mail, which allows for a quick and convenient method of communication. The use of blog is limited to only 2% of analysed population with most of the students not using it at all. It may be attributed to lack of time required to run a blog on every day basis.

The highest raise in application can be observed in social media. Within 4 years its popularity more than doubled, from merely 30% of students using it in 2009/10 to over 80% in 2013/14. Fig. 4 indicates that internet communication has become an important element in the life of students' population. It may indicate that the traditional form of communication, such as phone or old-style mail, will be gradually with time replaced by modern and swift communication forms. Collected data indicates that students consider internet to be very useful in their studies; 10% increment in the last 5 years. The above can be attributed not only to the general rise in the internet use but also with the number of learning, teaching and other information placed on different webpages. Additionally, internet provides for faster contact with friends, fellow students and acquaintances either through e-mail or social media. In the academic year 2013/14 there were no students who considered internet as redundant.

Fig. 5 shows the use of different software. It can be seen that there was an increment by 4% of users of Windows. The number of users of Ms Office, among the analysed population, increased by almost 7% and reached a value of above 90%. The use of other spreadsheets, text editors and graphics software each

dropped by 2%. The above proves an expansion and domination of Windows as an operating system and MS Office as a suite of desktop applications.

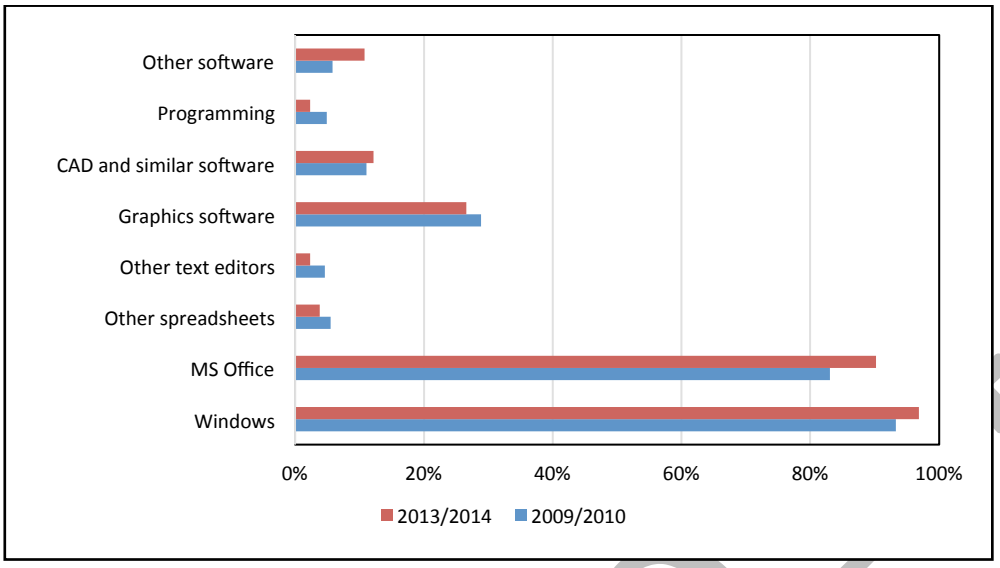

Fig. 5. Use of different software

Interestingly, less and less students write their own programs; programming dropped from very low 5% in 2009/10 to 2.5% in 2013/14. That is despite the fact that the analysed population consisted of students from engineering programmes.

The type of use of computers in everyday life is presented in Fig. 6. There was an overall rise in the use of a computer by students in all examined categories. The highest increase was in general net surfing; by 26%. A big group of students (over 50%) used a computer for listening to music and for watching movies.

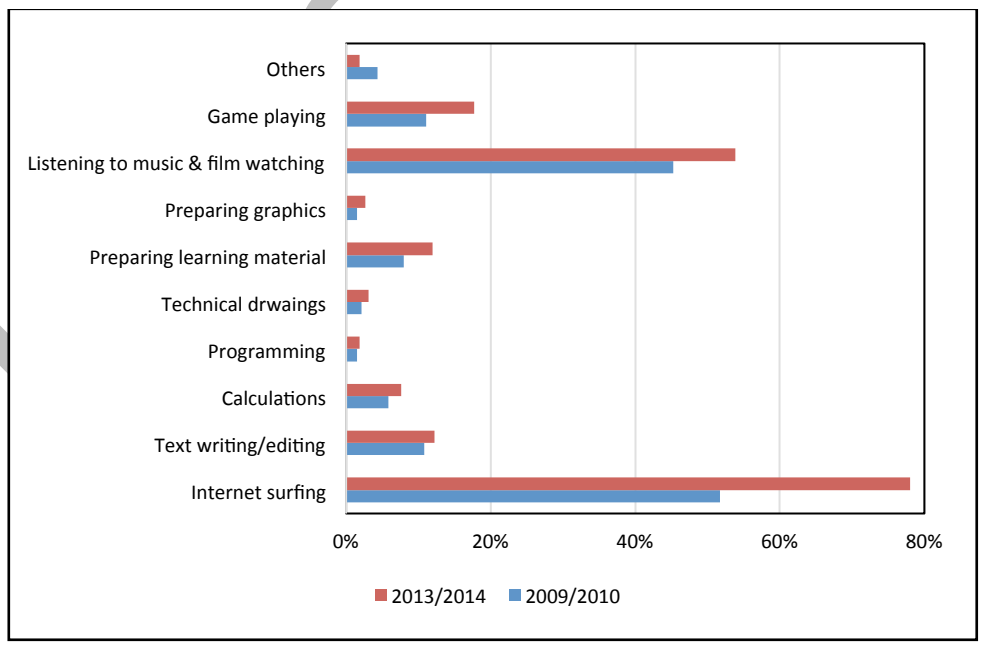

Fig. 6. Everday use of the computer

Although computer games were less popular nevertheless the percentage was still high at almost 18%. It is also important to observe that students were using computers for class preparations, text writing and editing and also for calculations. However, the level of computer use for calculations was relatively low for engineering students (less than 8%), the same applies to technical drawings (ca. 3%).

4. Summary and conclusion

The data collected indicated that the respondends used internet and its available services in every day life. Internet usage was for the students natural and something which would be difficult to live without. It was also established that it was relatively easy to get dependant on the net.

Internet is very popular and omnipresent and had big influence on students' life. Especially popular was internet communication, in the forms of mail and internet communicators, and also social media. In the period under review (between academic year 2009/10 and 2013/14) there was tremendous increase in the use of social media (more than 80%) whereas the usage of mail and internet communicators stabilized (both around 45%).

The actual reasons for the ever growing role of internet as the tool for social communication are its specific features, such as speed, growing access, scope and range of applications. It confirms the statement by Oliver (2002), made already in the beginning of the century, that the progress in information technology generates the necessity of new skills. The future development of new technologies depends on the progress of computer knowledge and skills of the society.

Charisma building in the e-learning classroom: an exploratory study

Fong-Ling Linda Fu[a],16, Chien-Liang Lin[b], Chia-jen Ting[c]
[acb]*No.64, Sec. 2, Zhinan Rd., Wenshan District, Taipei City 11605, Taiwan*

Abstract

Charismatic learning is the power to motivate the students, which is especially important in self-regulated learning. The results of the critical incident technique used in this study indicate that e-learning technologies do provide some good mechanisms to help instructors facilitate students' learning and make collaboration easier. Knowledge enhancement by self-regulation of learning is the preferred characteristic of charisma in the e learning classroom. Students mentioned some of the benefits such as the flexibility of the learning schedule, having access to on-line material for review outside of class, and having access to comprehensive supporting material for collaborative learning. Collaboration can happen in an on-line forum. Another characteristic of charismatic learning is the perception of trust in the instructor which is related to the availability and enthusiasm of instructors. The results suggest that in the e-learning classroom context the instructor should work more as facilitators than as the sole source of knowledge.

*Keywords:*Charismatic learning, e-learning, flow theory, critical incident technique;

1. Introduction

Why do we still need a new vision of learning charisma, in relation to the effectiveness of e-learning in higher education even though e-learning has been implemented for so many years? Because, although on the surface, new technology provides more resources, channels and opportunities for learning, in actuality, it is not easy to transplant the new digital learning environment into the traditional one and obtain positive synergy. The advantages of e-learning have been well discussed in the literature, for example, students who are shy about talking in public may feel better able to express their ideas in an e-learning environment (Francescato, Porcelli, Mebane, Cuddetta, Klobas, and Renzi, 2006). Students may also be attracted by the multi-media content of the digital classroom (Swan, 2004), and they may also have more opportunities to set their own learning strategies (Scriber and Encouraging, 2013). However, as there is weakness in all human interactions, not mean all students will gain benefits in e-learning classrooms.

Researchers have made efforts to "see" the effects of e-learning. Previous studies have tried to draw a picture of a classroom using the dramaturgy theory, with the teacher as the actor, the students as the audience, and the classroom as a theater (Halliday, Davis, Ward, and Lim, 2008). Halliday discussed the charisma of the teacher and role of the students in the creation of an attractive classroom environment. A charismatic teacher can inspire students to be willing to learn, and willing to cooperate with the teachers. Being able to evaluate and plot their learning experience is also very important.

Charm or charisma can also refer to the whole situation and not merely the leader. Based on ten years of teaching experience related to engagement in action and reflection upon andragogy theory, Raelin (2006) opposed the idea that successful learning is achievable only through reliance upon the charisma of the teacher. He argued that there has been too much focus placed on the teacher's charisma, their skills to excite the students to learn. He insisted that the greatest learning stimulant does not lie in how well prepared the lecturer is or how timely the feedback they give the student. Rather, it has to do with providing an effective-learning environment that encourages students to reflect, to construct, to take responsibility for and to accumulate their own learning. Raelin pointed out the importance of the idea of focusing on learning. The implication is that a teacher in the higher education system should be more a facilitator of

IETC 2014

knowledge in a community of inquiry. Teaching should thus be the orchestration of learning, rather than simple transmission of knowledge from the teacher to the student. A student should have more autonomy to learn how to learn and to choose the most appropriate path on his or her own. Also peers should help each other to integrate past knowledge, and to accumulate new knowledge.

Raelin's ideas remind us of what is at the center of learning. Students may be cognizant that a course providing self-regulated learning is much more attractive than one where the teacher is an excellent actor. Raelin's idea of putting the charisma back into learning is actually confirmed by flow theory (Killi, 2005). According to Killi, challenge is like blood pumped from the heart, bringing motivation for the learning process through cooperation with peers, reflection, searching for information, and so on. Learning charisma that comes from the challenge of learning itself may provide further stimulus to motivate and satisfy.

One problem with Raelin's paper was the lack of empirical investigation. The aim of this current study is to observe and measure learning charisma from the student's perspective in the e-learning classroom. Scenario-based data are considered suitable because learning performance is determined by the interaction of many factors, such as student background, teacher characteristics, characteristics of the learning content, pedagogical design, and the learning environment (Freitas and Olive, 2006).

Based on Raelin's (2006) and Halliday's (2006) research, the authors propose that learning charisma may be an effective vision to understanding the benefits of e-learning. The aim of the study is to classify student's satisfaction in the e-learning classroom and find the learning charisma. The study involves refining the elements of learning charisma using the critical incident technique. The purposes are: (1) to find the factors that enhance learning charisma; and (2) make propositions for the strategy of integrating e-learning into the traditional classroom.

2. Charisma and satisfactory factors in e-learning

Six important dimensions of the variables influencing students' satisfaction with e-learning are from previous studies and summarized in Table 1 (e.g., Sun et al., 2008; Fu, 2010; So and Brush, 2008). The first dimension is the learners' character, including students' self-efficacy and expectations. For example, the learner's anxiety about the use of computers has a negative impact on his/her satisfaction in e-learning. Student expectations of self-regulation to gain knowledge in e-learning lead to better performance but might not be related to satisfaction when compared to those who do not have expectations (Swan, 2004). The second dimension is the instructors' professionalism and attitude. The instructor's enthusiasm, professionalism, and expressive capability all impacted student satisfaction, but there might be a difference between the scenarios in e-learning and those in traditional classes (Sun et al., 2008; Fu, 2010). The third dimension is content design. Based on the technology acceptance model, content that is easy to use and useful is significantly related to students' satisfaction (Sun et al., 2008). Here the authors use "easy to learn" instead "easy to use" to refer to the learning situation. The technology dimension includes the benefits and problems associated with the e-learning platform, such as the flexibility of the learning schedule and strategy, accessibility and ease of use of the system, and so on (Scriber and Encouraging, 2013). The assessment dimension refers to the diversity and creativity of assessment, such as more personalized assessment (Sun et al., 2008). Last but not least is the very important dimension of students' satisfaction with e-learning is collaborative learning made possible by the available technology, such as online the chat room (So and Brush, 2008)

Table 1. Factors leading to satisfaction with e-learning from past studies

Dimension	Definition	Examples	Source
Learner	Learner's background and expectations of e-	1.Learner's self-regulation expectations	Paechteet al. (2010)

IECT 2014

	learning	2.Learner's self-efficacy	Ke and Kwak (2013) Kuo et al. (2014)
Instructor	Instructor's capability related to e-learning	Instructor's enthusiasm (e.g., response timelines) Instructor 's professionalism Instructor's communication skills	Fu (2010)
Content design	Content usefulness and ease of learning	E-learning course quality	Sun et al. (2008) Liaw and Huang (2013)
Technology	Benefits and problems with the platform	E-learning course provides flexibility Technology quality	Scriber and Encouraging (2013)
Assessment	Diversity in assessment	Assessment is creative	Sun et al. (2008)
Peer	Collaborative-learning	Collaborative-learning	So and Brush (2008)

However, ignoring the interactive effects and studying factors alone as has been done in previous studies does not reflect real scenarios. As noted by Swan (2004), the influential variables in learning are interactive, not independent. The authors suggest that the reason the interactions have been ignored in most previous studies is because they are so complicated, but overly simplifying satisfaction may cause the results to lose some validity. For example, satisfaction might come from the interactive benefit of learning strategies, schedules, assessment and collaborative-learning provided by using the e-learning technology (e.g., Fu, 2010; So and Brush, 2008; Liaw and Huang, 2013; Ke and Kwak, 2013; Kuo et al., 2014).

Charisma, as defined by the Oxford dictionary, is a kind of attraction which can inspire devotion in other people. Halliday, Davis, Ward, and Lim considered charisma in the classroom to be a deep ideological value shared between the leader and followers (Halliday, Davis, Ward, and Lim, 2008). Usually it is the teacher who plays the role of leader in the classroom. An instructor who can inspire students is considered a charismatic teacher. However, sometimes students can play the role of leader in commending, helping, or supervising the instructor's teaching. Charismatic leadership can also occur among students (friends) who interact frequently, who have similar values or perceptions as their leader (Pastor, Meindl and Mayo, 2002).

Understanding of how charisma is produced is usually context-based, analyzed based on the scene, the symbols, and the means of the interaction (such as speech, movement, and facial expression) between the leader and the follower. Halliday et al. described a classroom in higher education as being like a lecture theater, with many interactions happening between the instructor and the students, and between the students and their classmates. The task of a charismatic instructor is to provide sufficient challenge, inspiration, motivation, stimulation, confidence, and understanding to motivate students to learn. On the other hand, the willingness of students to cooperate with the teachers and the ability to evaluate and select their own learning strategy, are also very important.

Charisma in learning arises from a scenario of interactions between different factors and is not merely be limited to the leader, Simply preparing a good lecture or giving immediate feedback is not enough. Raelin argued that charismatic learning means that the instructor should provide an effective environment for students to accumulate knowledge. Based on this premise, the teacher is the facilitator to a community of inquiry, and that teaching is the orchestration of learning, not simply handing out knowledge as if feeding the students. It is better for students to be given more autonomy to learn how to learn, to choose the most appropriate way to learn. Peers are better off being able to help each other integrate past knowledge, to accumulate and form new knowledge. Charm in a classroom is not just the responsibility of the teacher, but goes back to the process of learning itself (Raelin, 2006).

Based on the above discussion of charisma in learning, charismatic learning is divided into three dimensions: trust, encouragement and knowledge enhancement.

The goal of this study is to discover what interactions between the elements of satisfaction will create a charismatic e-learning environment as shown in Fig 1. One scenario of satisfaction indicated the interaction of some satisfactory factors in e-learning: perceived importance of learning objectives (learner's expectations), usefulness of the content, good activity design and assessment, collaborative-learning, instructor as facilitator, and effectiveness of technology used. And the authors tried to discover one of charismatic learning: either trust, encouragement or knowledge enhancement from a scenario.

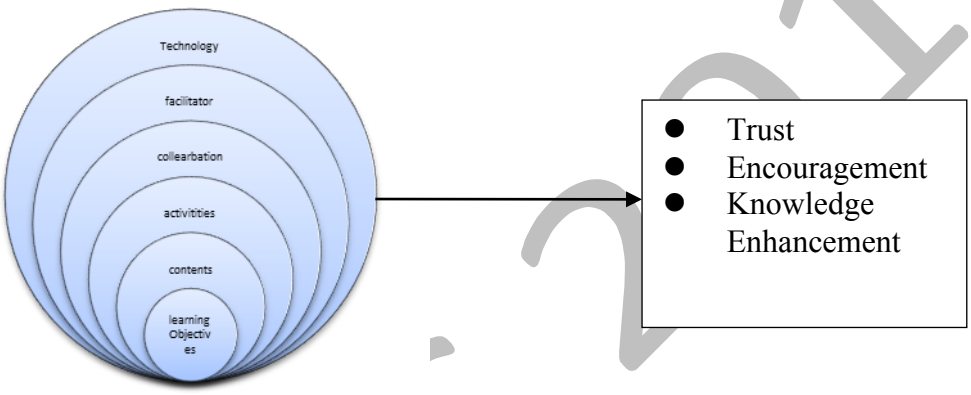

Fig. 1. Relationship between interactions of satisfaction factors and learning charisma

3. Research methodology for the critical incident technique (CIT)

This study utilizes a scenario-based analysis approach, the critical incident technique (CIT) to evaluate students' impressions. CIT was originally developed by Flanagan (1954) as a form of content analysis, but the set of procedures for gathering specific observations and important behavioural facts has grown in popularity with service-related research over the last three decades, in a large part due to its usefulness in solving practical problems and developing broad psychological principles regarding service encounters (Gremler, 2004).The study used the CIT to collect data for students' satisfaction with their learning experience in order to determine possible good interactions from different learning contexts.

3.1. Procedures of CIT

CIT is designed to make data collected in the field useful for answering research questions, while sacrificing the least amount of detail and depth possible (Bitner, Booms and Tetreault, 1990). CIT accomplishes this goal through a two stage process -- collection and classification. The first step, collection of behavioral observations, involves accumulation of self-reports from study participants. In the second stage, these collected events, phenomena or occurrences are classified so that the responses become useful for addressing practical problems (Flanagan, 1954). The four-stage CIT procedures used in the study can be

summarized as follows: 1) collect learning incident reports regarding satisfaction from students in the target classrooms; 2) categorize the incident reports into categories; 3) make name the categories; 4) examine the distribution of categorized reports to determine how important each category is.

Classified respondent data are referred to as "incidents." Incidents in the present study are comprised of interactions of learning factors as shown in Fig. 1: learning objectives, content, activities, facilitator, collaboration, and technology. This study probes for critical incidents by asking respondents to recollect especially satisfying e-learning experiences related to the target class they had participated in, including the time of the incident and what had happened, what the instructor had said or done, and what the outcome was. Most participants reported one incident per interview, but in some cases, two or three incidents were recalled, producing a total of 344 valid incidents from a sample of 320 students, surpassing the 433 incident average obtained in previous CIT studies (Gremler, 2004) and meeting the CIT analysis standard of 50 to 100 incidents for unambiguous activities (Flanagan, 1954).

3.2. Target courses

There were eight target courses. All were blended courses including e-learning classes and face-to-face classes. Four were basic science classes: Principles of Accounting, Research Methodology, Introduction to Computers, and Management Information Systems; three were more liberal classes: Information Technology and Literacy, Introduction to Software, and Objective-Oriented Programming Language. Some classes were perceived as more important and more difficult because they were required courses, such as Principles of Accounting, Objective-Oriented Programming Language, and Research Methodology. Students are generally willing to spend more time on required courses than elective courses.

4. Results and discussion

We found four major categories which seemed to satisfactorily describe the important characteristics of charismatic e-learning.

4.1. Knowledge enhancement by the facilitator using technology

The results indicated that knowledge enhancement was a critical type of charismatic learning in the e-learning environment. Student can control the learning process and strategy more in e learning environment. In face-to-face classrooms, instructors can more easily become the protagonist. Instead, in the e-learning environment, learning becomes the center of the learning activities and the instructor becomes the facilitator. For example, one incident described how well the instructor designed the discussion activities and provided sufficient material. Modern technology and multi-media material enhanced the level of interest and improved communication capability for e-learning. For example, through information shown in the forum frame, the instructor could know who and how many participants were in the forum and could give instant feedback to any specific student through the "VoIP" function. Students could browse the PPT materials using the Team Viewer e-learning software. All participants (instructor and students) could talk to each other using the "Talk" function.

Students usually had questions or encountered problems when they did homework or prepared for a quiz, not immediately after the lecture. Another example of an incident showed this to be the right time for the instructor to facilitate student's learning, not just by receiving his/her input, but also by enabling collaboration among the students. Many incidents in the different target courses described how the instructor designed good material for the students that allowed them to be prepared for the exams.

4.2. Knowledge enhancement through collaboration by using social media technology

Social media can provide a mechanism for initiating cooperation. In this category, the students were satisfied with the collaboration initiated with a team member, the convenience of the technology, and their grade. This category was also critical to team work assignments. Many students mentioned the usefulness of the Facebook community.

IETC 2014

4.3. Trust as facilitator in using e-learning technology

Two similar incidents serve as examples illustrating how trust was created in the e-learning classroom. In the first incident, the student perceived anxiety when the instructor announced the content of the exam, because they felt the challenge was too hard. However the student felt better after the instructor strove to remedy their anxiety as to whether they could complete all the assigned questions and how difficult the exam would be. And finally, the student obtained a satisfactory grade. The second incident illustrates how the teaching assistant effectively helped the student to complete their homework by using remote technology. All the incidents in this category indicated that trust in not just the facilitator but also in the e-learning technology provided extra opportunities for convenient communication between the student and the teacher.

Another example, this time for Principles of Accounting, normally a face-to-face class relates how the instructor also provided video tutorials to help students review. The student narrating the incident perceived the provision of online support materials such as video tutorials to be indicative of the enthusiasm of the facilitator. The student appreciated the support from the video.

4.4. Feel Encouragement (comfortable) due to the flexibility or availability of the technology

Unlike the encouragement received in a face-to-face classroom where most of the praise comes from the instructor, encouragement in the e-learning classroom comes from the usefulness of the technology. The technology provides more flexibility in terms of setting strategies and improving the efficiency of self-regulated learning, such as the selection of the learning schedules and processes to meet individual needs. It is also more convenient to transfer digital information or data than hardcopy information. One example incident ran as follows: “At nine o'clock, I get up in an empty dorm, eat breakfast and browse the materials on the e-learning platform. I felt the pleasure of learning”.

5. Conclusions

This study tries to determine what scenarios would allow the critical charismatic learning to be created in an e-learning environment. The scenario-based analysis approach (CIT) is used to classify students’ impressions of charismatic learning in incidents of satisfaction. The integrated effect was formed by the interaction of several factors: perceived importance of the learning objective, useful content, good activity design, collaborative learning, instructor as a facilitator, and effectiveness of technology used. Three kinds of learning charisma: trust, encouragement and knowledge enhancement were reviewed.

The results indicate that knowledge enhancement was the most critical type of charismatic learning in e-learning. In some difficult courses, such as Principles of Accounting or Objective-Oriented Programming Language, instructors provided on-line materials for students to review after class or they provided comprehensive supporting material for collaborative learning (discussion). To allow the learning content be the centre of learning, instructors combined efforts with e-learning technology to work as effective facilitators in the e-learning classroom. The findings verify that the charismatic learning proposed by Raelin (2006) .

A convenient communication platform helps collaborative learning and facilitates team work. Students seemed to prefer to use the social media they habitually used, such the Facebook, over chat rooms in the e-learning platform. The satisfactory incidents of collaboration also revealed that the students were satisfied with the final grade they got which they attributed to the facilitation of technology. Technology did act as an important facilitator of knowledge enhancement. Assessments such as homework or quiz were important to motivate students use facilitated materials in e-learning.

Trust usually came from the enthusiasm of the instructor who provided additional (unexpected) help. In situations such as when the students had problems doing homework or preparing for exams they appreciated the additional help received from the instructor or teaching assistant. Availability was increased by usage of e-learning technologies, such as email, chat rooms, or remote access technology. Instructors

IECT 2014

who provided online supporting material were considered to be more caring teachers, another type of trust by students.

Flexibility of the study schedule or strategy made students feel that the technology was good. For example, for an easy course, such as Information Literacy, students mentioned the flexibility of the class time (no need to get up early or being able to postpone study in the mid-term week) as being satisfactory. The incidents also combined with clear objectives were announced online to help students know how to set their own learning strategy.

The results described the roles of instructors, classmates or technology in the e-learning environment worked more as facilitators. Students perceived content or assessment as the centre of learning. We propose that to create a more charismatic learning environment, the pedagogical design of e-learning is better with a task with a clear objective, and integrated with useful content which has been decomposed and designed to be easily understandable. Multi-media content, selected to combine voice and figures with text, is better than text only. The students appreciated and considered the instructor to be enthusiastic if he/she prepared useful multi-media content. The role of instructor as facilitator is apparent. Collaboration can be either initiated by the instructor or by the students themselves. Activities more appropriate in the e-learning classroom are collaborative and self-regulated and finally the technology of e-learning does provide more opportunities for collaboration and communication among the instructor and students and among classmates as well as flexibility in setting individual strategies for learning.

Chemistry laboratory applications supported with simulation

Fatma Alkan [a 17], Canan Koçak [a]
[a]*Hacettepe University, Faculty of Education, Beytepe, Ankara, 06800, Turkey*

Abstract

The aim of this research is to determine the effect of chemistry laboratory applications supported with simulations on the chemistry achievements, chemical laboratory anxiety and attitudes towards the use of technology of pre-service teachers. The sampling of the research consisted of 31 teacher candidates enrolled at Hacettepe University Faculty of Education. In the research, chemistry achievement test, chemistry laboratory anxiety scale and attitude scale regarding the use of technology in education were used as data collection tools. As a result of the research, it was found that the laboratory practices supported with simulations were more effective than the traditional verification laboratory approach in improving the pre-service teachers in chemistry achievement and attitudes towards education technology as well as decreasing the level of their anxieties about the chemistry laboratory.

Keywords: chemsitry laboratory, simualtions, pre-serivce teachers;

1. Introduction

As technology becomes more involved in our daily lives and more widespread, it is inevitable that education has become associated with technology. Individuals who are not good technology users are nearly impossible to adapt to their environment (Alkan, 1995). Quality of use of technology influences both the quality of life (Li and Perkins, 2007) and education (Ferdig, 2006). Although use of technology is not a solution that can overcome all problems related to education, today technology has become necessary for education environment (Kirschner and Selinger, 2003); because technology carries daily life into education environment, provides instruments for developing learning and gives more opportunity to teachers and students for feedback, thinking and correcting (Bransford, Brown and Cocking, 2000). As technology makes interaction between teacher, student, manager and family, it provides appropriate environment for teacher to develop as well (Çobanoğlu, 2010). Technology is constantly changing and developing. Lectures become more important and interesting thanks to modern technology.

Increasing amount of knowledge, enhancement of communication facilities, wide spreading of technology have changed the expectations from education. Educational institutions are expected to cultivate individuals, who can use technology effectively. The education system expects the same function from teachers. This expectation includes not only the teaching of how to use the technology but also integration of technology into teaching activities. More continuous, effective and productive learning can be ensured via using technology especially in the environments, in which scientific practices are carried out, especially laboratories. Laboratory application is an important factor that affects teacher training. The basic aim of laboratory is to observe and results performing practical trial of theories. Teacher candidates studying at Department of Secondary Science Education have to apply the experiments related to their field before they begin their profession and be informed of methods used in laboratories (MEB, 2005).

Chemistry laboratory applications are expected to have a structure directing to use information and think critically, to have technical equipment to develop cognitive process capability and hand skills. Therefore, the effects of use of technology in laboratory on pre-service teachers describing a new problem, explaining an observation and deciding on an issue should be researched; since teacher candidates do not always have the opportunity to learn, observe basic information and reach to a meaningful result with laboratory applications. Within this frame, experiments supported with simulations and laboratory applications are considered to complete these lacks using technology.

IETC 2014

The objective of this study is to determine the contributions of experimental simulations to wholesomely conduct of laboratory activities and ensuring appropriate learning in laboratories. By this way, it is aimed to increase the success of pre-service teachers in chemistry laboratories, decreasing the concerns regarding laboratories, and determining the benefits of the use of technology for educational purposes.

2. Method

In the study, the pre and posttest research design was used with control and treatment groups. Members of the control and treatment groups were determined according to unbiased sampling method. While the teaching of the treatment group was carried out within the chemistry laboratory supported with simulations, the teaching of the control group was carried out with the traditional verification laboratory approach.

2.1. Sampling

The sampling of the research consisted of 31 pre-service teachers enrolled at Hacettepe University, Faculty of Education. In the research, chemistry achievement test, chemistry laboratory anxiety scale and attitude scale regarding the use of technology in education were used as data collection tools.

2.2. Data collection tools

2.2.1. Chemistry achievement test: Performances of pre-service teachers were determined via the chemistry achievement test, which was developed by the researchers. The chemistry achievement test consisted of 15 multiple-choice questions regarding volumetric analysis. The validity and reliability studies of the chemistry achievement test were carried out with the participation of 231 pre-service teachers. The item analysis was carried out with ITEMAN Windows Version 3.50 statistics program. The average difficulty, average distinctiveness value and reliability coefficient of the chemistry achievement test were determined to be 0.49, 0.62 and 0.75 respectively.

2.2.2. Chemistry laboratory anxiety scale: The anxiety of teacher candidates towards chemistry laboratory were determined by the "Chemistry Laboratory Anxiety Scale" developed by Bowen (1999) and the Turkish adaptation studies made by Azizoğlu and Uzuntiryaki (2006). The anxiety scale consisted of 20 statements in a 5-point Likert Type. The scale had four sub dimensions. The Cronbach Alpha reliability coefficicent of the use of laboratory instruments and chemicals sub dimension was 0.88, work with other students sub dimension was 0.87, data collection sub dimension was 0.86 and using laboratory time sub dimension was 0.87.

2.2.3. Attitude scale regarding the use of technology in education: The attitudes of the pre-service teachers towards education technologies were determined by the "Attitude Scale Regarding the Use of Technology in Education" developed by Öztürk (2006). The attitude scale consisted of 39 statements in a 5-point Likert Type. The scale had three sub dimensions. These dimensions were reflection of technology use in education on teaching processes, self-improvement regarding the use of technology in education, classroom management and technology use in education. Cronbach Alpha reliability coefficient of the scale was 0.90.

2.3. Data analyses

In the research, preliminary test and final test points were examined for the data obtained from the treatment and control groups. During the analysis of the data obtained from the research, nonparametric tests were used since the number of participants was below the value recommended in the literature and normality assumption was not fulfilled (Green & Salkind, 2008). While examining the data obtained from the chemistry achievement test, chemistry laboratory anxiety scale and attitude scale regarding the use of technology in education, Mann-Whitney U-Test was used to find out potential differences between the treatment and control groups prior to the application. The difference between the pre and posttest scores after the traditional verification laboratory approach, which was supported with simulations, was examined with Wilcoxon signed-rank test.

IETC 2014

3. Results

The descriptive statistics regarding the pre and posttest averages of the scales applied within the scope of the chemistry laboratory research, which was supported with simulations, were summarized in Table 1.

Table 1. Descriptive statistics of Pre- and Posttest scores.

Scale	Group	Pretest			Postest	
		N	M	SD	M	SD
Chemistry achievement	Treatment	16	6.25	2.32	11.75	2.17
	Control	15	5.60	2.29	7.73	1.67
Chemistry laboratory anxiety	Treatment	16	2.27	0.52	1.89	0.53
	Control	15	2.36	0.59	2.24	0.45
Attitudes regarding the use of technology in education	Treatment	16	3.78	0.40	3.98	0.39
	Control	15	3.79	0.53	3.86	0.47

Findings regarding the chemistry achievement;

In the research, the averages of the pre-application chemistry achievement test for the pre-service teachers in control group to whom traditional verification laboratory approach was applied and the treatment group, who were educated with simulation-assisted teaching, were analysed with Mann Whitney U-Test. According to the result of the analysis, no significant difference was identified between the pretest average scores of the control and treatment groups in the chemistry achievement test ($U=102.500$; $p>0.05$). This result indicated that, prior to application there were no significant differences between the knowledge levels of the pre-service teachers in treatment and control groups about the given topic.

As a result of the traditional verification laboratory approach applications, which were supported with simulations, the difference between the pre and posttest scores of the pre-service teachers in terms of their chemistry achievements was examined with Wilcoxon signed-rank test. The obtained findings were summarized in Table 2.

Table 2. Wilcoxon signed-rank test results of chemistry achievement.

Chemistry achievement	N	M	SD	Z	p
Treatment group pretest	16	6.25	2.32	-3.333	.001
Treatment group posttest	16	11.75	2.17		
Control group pretest	15	5.60	2.29	-2.255	.024
Control group posttest	15	7.73	1.67		

When the Table was examined, it was seen that the chemistry achievements of the pre-service teachers in the control and treatment groups increased after the applications and this increase was statistically significant ($Z:-3.333$; -2.255; $p<0.05$). This result showed that the traditional verification laboratory approach, which was supported with simulations, was effective in increasing the chemistry achievement levels of the pre-service teachers.

The posttest averages of the pre-service teachers were analysed through the Mann Whitney U-test. According to the result of the analysis, there was no significant difference between the posttest scores of the pre-service teachers in the control and treatment group obtained from the chemistry achievement test ($U=19.000$; $p>0.05$). According to this result, the average of the posttest on chemistry achievement obtained by the traditional verification laboratory approach applications supported with simulations, which was applied to the pre-service teachers in the treatment group, was higher than the scores obtained by the traditional verification laboratory approach, and this created a significant statistical difference in favour of the treatment group.

Findings regarding the chemistry laboratory anxiety;

IETC 2014

In the research, no significant difference was identified between the pretest scores obtained by the pre-service teachers in the control and treatment groups for the chemistry laboratory anxiety (U=95.500; p>0.05).

The findings regarding the chemistry laboratory anxiety pre and posttest average scores of the pre-service teachers in the control and treatment groups were indicated in Table 3.

Table 3. Wilcoxon signed-rank test results of chemistry laboratory anxiety.

Chemistry laboratory anxiety	N	M	SD	Z	p
Treatment group pretest	16	2.27	0.52	-1.990	.047
Treatment group posttest	16	1.89	0.53		
Control group pretest	15	2.36	0.59	-1.083	.279
Control group posttest	15	2.24	0.45		

It was seen that the chemistry laboratory anxiety averages of the pre-service teachers in the control and treatment groups decreased after the application. A significant difference was identified between pre and posttest average scores obtained by the pre-service teachers in the treatment group from the chemistry laboratory anxiety test (Z:-1.990; p<0.05). It was determined that the observed increase in the scores of the control group was not statistically significant (Z:-1.083; p>0.05). This result indicated that the laboratory approach supported with simulations, which was applied to the treatment group, was effective in decreasing the chemistry laboratory anxiety levels of the pre-service teachers, while the traditional verification laboratory approach applied to the control group was not effective. There was no significant difference between the chemistry lab anxiety posttest averages of the pre-service teachers in the control and treatment groups (U=87.50; p>0.05).

The results of the analysis carried out for the comparison of the pre and posttest scores with respect to the sub dimensions of the chemistry laboratory anxiety of the treatment and control group after the application and posttest averages of the experiment-control group were summarized in Table 4.

Table 4. Wilcoxon signed-rank test and mann whitney u –test results of chemistry laboratory anxiety sub dimensions.

Chemistry laboratory anxiety	Gorup	Pretest		Posttest		Wilcoxon signed-rank test		Mann whitney u –test	
		M	SD	M	SD	Z	p	U	p
Use of laboratory instruments and chemicals	Treatment	2.07	0.77	1.85	0.63	-0.881	.378	212.500	.081
	Control	2.32	0.67	2.33	0.59	-0.085	.932		
Work with other students	Treatment	2.14	0.68	1.89	0.65	-1.476	.140	112.500	.764
	Control	2.20	0.54	2.00	0.63	-1.209	.227		
Data collection	Treatment	2.42	0.69	1.97	0.57	-1.892	.058	79.000	.102
	Control	2.37	0.75	2.30	0.42	-0.526	.599		
Using laboratory time	Treatment	2.47	0.75	1.85	0.52	-2.559	*.011*	69.500	*.040*
	Control	2.55	1.02	2.25	0.62	-1.206	.228		

According to the Table, the decrease observed in the sub dimensions of the chemistry laboratory anxiety scale with respect to the pre and posttest averages of the pre-service teachers in the control and treatment groups were quite outstanding. However, this decrease observed in the scores revealed a statistically significant difference in using laboratory time dimension. When the posttest averages were examined in order to explain the effects of the teaching methods applied to the control and treatment groups on

IETC 2014

the sub dimensions of the chemistry laboratory anxiety scale, a significant difference was detected between the control groups regarding the use of laboratory time.

Findings regarding the approach for education technologies;

Findings related to the attitudes of pre-service teachers in control and treatment groups towards education technologies were given in Table 5.

Table 5. Wilcoxon signed-rank test results of attitude regarding the use of technology in education.

Attitude regarding the use of technology in education	N	M	SD	Z	p
Treatment group pretest	16	3.78	0.40	-2.743	.006
Treatment group posttest	16	3.98	0.39		
Control group pretest	15	3.79	0.53	-1.024	.306
Control group posttest	15	3.86	0.47		

It was observed that the averages of the pre-service teachers in the control and treatment groups regarding education technologies increased after the application. A significant difference was identified between the average pre and posttest scores of the pre-service teachers in the treatment group regarding education technologies (Z:-2.743; $p<0.05$). It was determined that the observed increase in the attitude scores of the control group regarding education technologies was not statistically significant (Z:-1.024; $p>0.05$). This result indicated that the laboratory approach supported with simulations, which was applied to the treatment group, was significantly effective in improving attitudes of the pre-service teachers towards education technologies, while the traditional verification laboratory approach applied to the control group was not effective. There was no significant difference between the posttest average scores of the pre-service teachers in the treatment group and control group regarding education technologies (U=95.000; $p>0.05$).

The results of the analysis carried out for the comparison of the pre and posttest scores in the sub dimensions of attitudes towards education technologies obtained by the pre-service teachers in the control and treatment after the application and the posttest scores of the treatment and control groups were summarized in Table 6.

Table 6. Wilcoxon signed-rank test and mann whitney u –test results of attitude regarding the use of technology in education sub dimensions.

Attitude regarding the use of technology in education	Gorup	Pretest		Posttest		Wilcoxon signed-rank test		Mann whitney u – test	
		M	SD	M	SD	Z	p	U	p
Reflection of the using technology in education in the teaching process	Treatment	3.82	0.39	3.97	0.44	-1.565	.118	112.000	.750
	Control	3.79	0.47	3.89	0.44	-1.051	.293		
Self-improvement in the using technology in education	Treatment	3.69	0.52	4.00	0.50	-2.332	*.020*	96.500	.352
	Control	3.79	0.87	3.80	0.74	-0.377	.706		
The using technology in education and classroom management	Treatment	3.85	0.55	3.96	0.54	-0.959	.338	110.000	.692
	Control	3.80	0.63	3.89	0.78	-0.817	.414		

According to Table 6, the improvement in attitudes towards education technologies with respect to the sub dimensions observed in pre and posttest scores of the pre-service teachers in the control and treatment groups were quite outstanding. When the pre and posttest scores were examined, no statistically significant difference was found in the treatment group regarding self-improvement in using technology

IETC 2014

in education. However; there was a statistically significant difference in the treatment and control groups when the posttest scores were examined.

4. Conclusion and discussion

As a result of the research, it was found that the laboratory practices supported with simulations were more effective than the traditional verification laboratory approach in improving the pre-service teachers in chemistry achievement and attitudes towards education technology as well as decreasing the level of their anxieties about the chemistry laboratory.

Reaching a modern education level would only be possible through integrating the developments in information and communication technologies into education programs. Computer technology has enabled the graphical and symbolical creation of the information in the memory of individuals. Computer technology has made learning more meaningful and ensured recalling of the learnt knowledge through ensuring the correlation of graphics and symbols among themselves while creating knowledge. It is believed that due to these functions, technological applications enable the increase of success levels and improve the attitudes of pre-service teachers while decreasing the levels of their anxieties. The literature contains varied studies, which obtained findings that are supportive of the research result. (She and Fischer, 2003; Yenice, 2003; Arıkan, 2007; Çağlar, 2007; Hançer and Yalçın, 2007; Sambur and Can, 2007; Bayram, 2012; Bilen-Kaya, 2012;).

Educational technology increases the quality of the learning and teaching process and makes this process more productive and effective for both teachers and students (Uşun, 2000). It is important to present teaching materials according to the learning speed and capacity of each student (Demirel, 2004). The activities supported with technology provide learners with the opportunity to prepare for the activities in their own learning speed. Therefore, technology-assisted teaching may increase the exam scores of students, and affect the general satisfaction and confidence levels towards subjects positively (Day and Foley, 2006). The researchers observed that technology-assisted activities increased students' interest in courses, decreased the time to achieve the teaching objective, and made students more effective in class. It was also observed that the experimental practices on virtual platform helped students understand the points they should pay attention during the practices in laboratories (Kıyıcı and Yumuşak, 2005). The effectiveness of the laboratory approach supported with simulations could be predicted through its increasing effect in the quality of the learning-teaching process, making the process more productive and effective, creating an environment for teachers, where students could prepare and learn the chemical experiments in their own learning speeds.

Chemistry is one of the science subjects interested in abstract incidents. Therefore, visual representations are of great importance for the description of abstract incidents in learning and teaching chemistry (Crawford & Cullin, 2004). Kozma and Russell (1997) reported that chemistry, as a field of study, was based on representations or symbols due to its nature and therefore, symbols and other forms should be used in order to create a clear meaning. Some researchers have indicated that three-dimensional visual representations enabled the understanding of chemical structures and related features (Urhahne, Nick & Schanze, 2009). The contribution of using technology in chemistry classes to teaching is a proven fact in terms of enabling the conceptualization of abstract statements with the help of visualization (Waight, Liu, Gregorius, Smith & Park, 2014). The abstract information of the pre-service teachers regarding volumetric analysis became concrete presentations with the simulation visuals used in laboratory practices. These concrete presentations decreased the cognitive burdens of the pre-service teachers and they became more successful accordingly.

This research emphasizes that individual differences should be taken into account while education activities are carried out. The properties of technology-assisted chemistry laboratory practices such as facilitating understanding and remembering, providing reinforcement, making lessons interesting and enjoyable, improving experimental skills, enabling the identifying of the tools and chemical substances to be used during experiments, have also contributed to the research results. This study is of great importance for ensuring the pre-service teachers, who will be the teachers of the future, to keep up with the age, which is rapidly developing and changing, and to guide their students in becoming well-equipped indivi-

IECT 2014

duals. Therefore, it is very important to increase the number of studies in this field as well as contributing to the literature with new resources.

Abstract

Autistic children are often impaired in initiating and responding to Joint Attention. In recent years, there has been an increase in the application of robots in diagnosis and treatment of autism. The purpose of the current research is primarily to originate the proper therapeutic scenarios and to implement two interactive humanoid robots as therapy assistants in autism treatment in Iran. In this paper, our focus is specifically on developing the necessary tools to improve joint attention and imitation in autistic children. To this end, the humanoid robots were programmed and teleoperated via Microsoft Kinect Sensor and Phantom Omni Haptic Robot to elicit reactions consisting of imitation of humans by the humanoid robots and vice versa. Our research target was to increase social interaction and involve autistic children in dyadic/triadic interactions.

Keywords: Human-Robot interaction (HRI), Autism Spectrum Disorders, Humanoid Robots, Joint Attention, Imitation

IETC 2014

1. Introduction

Statistics have shown an epidemic increase of Autistic Spectrum Disorders (ASD) worldwide since the 1960s, and this trend is also true for Iran**.** Autism is considered a brain development disorder which causes a lack of correct information processing, partial or complete impairment in language learning, impaired verbal and non-verbal communication, and problems in interpreting social situations (Edwards; 2011 and Scassellati; 2003). Autistic disorders are characterized by three major behavioral disorders: impaired interaction, impaired social communication, and impaired imagination and social creativity (Pouretemad; 2011).

There is no clear cut agreement on the prevalence of autism, and estimates vary from up to 100 out of a population of 10,000 (Pouretemad; 2011). The most recent statistics indicate that 1 out of every 88 children born in the United States is autistic (Scassellati; et-al, 2012). It is expected that more than 30,000 Iranians younger than 19 years old suffer from autism disorders. Autistic children share some common behavioral patterns which can generally be detected and modified. Individuals with autism often have some form of disorder in initiating and responding to joint attention (Pouretemad; 2011).

In recent years, robots have been increasingly used in education (Meghdari and Alemi; et-al, 2013) and autism diagnosis and treatment (Kozima; et-al, 2001 & 2007, Pioggia; et-al, 2007, Billard; 2003, Ferrari; 2009, Kim; et-al, 2012, Stanton, et-al, 2008). Research focusing on applying robots in autism treatment have pointed out that robots increase enthusiasm, focus, and attention; and cause novel social behaviors such as joint attention and automatic imitation. Research also indicates that autistic children work quite naturally with robotic technologies (Scassellati; 2003 and Diehl; et-al, 2012). When interacting with robots, people are mainly impressed by the robot's appearance (Scassellati; et-al, 2012). A variety of robots with different appearances and functions are currently being used around the world as therapy assistants in autism treatment; such as, Infanoid (Kozima; et-al, 2001), a robot the size of a human infant, is able to

move its hands and to open and close its mouth and fingers; Face (Pioggia; et-al, 2007) a very natural looking robot with silicon skin and high functions in showing facial expressions; Robota (Billard; 2003), a doll equipped with motors and sensors which is capable of moving its hands and feet and dancing; Muu (Kozima; et-al, 2007), a robot with one big eye and a cartoon-like appearance; Bandit (Ferrari; 2009), a humanoid upper body on a wheel base; Pleo (Kim; et-al, 2012), and Keepon (Stanton, et-al, 2008), animal-like robots, respectively, in the shape of a dinosaur and a bird, are some examples of the robots used in the research of autism treatment. The above mentioned robots are being used to elicit such behaviors as imitation, joint attention, and eye contact. The eminent feature of robots is their high level of repeatability and flexibility, as well as working without getting tired or making complaints. Since robots do not humiliate or belittle people, it is expected that autistic people face less anxiety in interacting with them and are more willing to participate in the learning exercises.

Our main objective is to explore clinical applications of two interactive humanoid robots as medical assistants (not a substitute for human therapists) in treating/educating children with autism in Iran (Meghdari, Alemi, Taheri; 2013). As a first step, this paper will focus on developing the necessary tools to improve two main social behaviours in children with autism namely as: imitation and joint attention. Preparing these robots to be used in eliciting their imitation of the patients and the patient's imitation of them, and designing proper therapeutic scenarios to improve autistic children's ability to initiate and respond to joint attention has been the purpose of this study. Our multi-disciplinary research team consists of robotics engineers, applied linguists, autism specialists, and psychologists.

2. Research methodology

The current study consists of the following two phases: the technical phase and the clinical intervention.

2.1 Technical phase

Initial step was to identify the necessary capabilities needed for a robot to be used for autistic therapy. According to the desired therapy scenarios, two humanoid robots called NAO and Alice manufactured by Aldebaran-Robotics and Robokind, respectively, are purchased. Each of these robots consists of specific features that will be used in the clinical stage. Additionally, the Alice Robot is capable of showing human facial expressions. The features of the two mentioned robots are as follows:

NAO-H21 Robot: This is a kid-sized humanoid robot with 57.3 cm in length, 4.5 kg in weight, with 21 degrees-of-freedom, equipped with 2 cameras, 2 microphones, 8 foot Force Sensitive Resistors sensors, one 2-axis gyrometer, one 3-axis accelerometer, capable of voice synthesis, different LEDs in eyes, body, and features a 500 MHz CPU. Beside the graphical user interface software, Choregraphe, it can be programmed using C++, Python, etc. To be used in an Iranian context, we have renamed it as "Nima" (see Fig.1).

Alice Robot: Alice, with the Iranian name "Mina", 69 cm high, weighting 5.7 kg, with 32 degrees of freedom (21 degrees of freedom in her body and feet, and 11 degrees of freedom in her face), equipped with two cameras placed in each of her eyes, temperature sensors, a 3-axis gyrometer, PIR, ground contact, and other sensors, and a 1 GHz CPU, is capable of showing different facial expressions such as joy, sorrow, anger, fear, and so on, thus being of great interest for children. This robot can be programmed in C++ and Java (see Fig.2). The robots' capabilities such as body movements, speech, and facial expressions will be used to design different therapeutic scenarios.

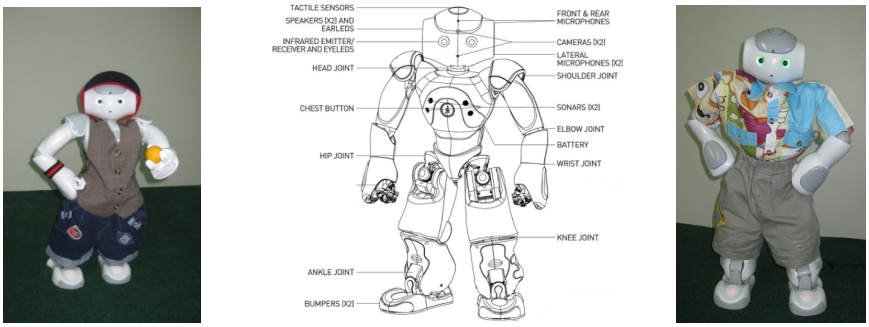

Fig. 1. A schematic overview of the NAO (*Nima*) Robot

IETC2014

Fig. 2. The Alice (*Mina*) Robot

2.2 Clinical interventions

In the second phase of the study, the clinical interventions are being initiated with the autistic children at the "Center for Treatment of Autistic Disorders (CTAD)" in the presence of the robots and therapist. The treatment process for a group of 3-10 years old patients will continue at least for a period of 10 weeks. The approach is a single subject design and the interventions are currently underway. Robots are used in therapy sessions for:

- Quantitative and qualitative assessment of the amount of initiating and responding to joint attention by children with autism and if any improvement is shown.
- Improving social and imitation skills in autistic children.
- Creating a happy, interesting, and exciting teaching atmosphere for autistic children.
- Educating the therapists to be able to apply a robot in different stages of the treatment.

3. Therapeutic scenario design

In this section, the three main objectives of this paper will be discussed in the following subsections:

3.1 NAO real time imitation using microsoft kinect

Imitation of the autistic patients' behavior is an effective way of triggering their attention toward the therapist [3, 8]. Imitation and turn-taking games are considered as good therapy to improve social interactions, sense of self, creativity, and leadership in children and even adults with autism. Accordingly, we plan to achieve real time imitation of upper body movements by the NAO of humans. We have used Microsoft Kinect sensor which gives us the real time position (x, y, z) of the player's joints. Using forward and inverse kinematics, we are able to teleoperate NAO and obtain good real time imitation.

To this end, eight joints of NAO's upper body including Head-Yaw and Head-Pitch from the head, Shoulder-Pitch, Shoulder-Roll, and Elbow-Pitch of both hands are commanded in order to have admissible real time position tracking of the users' hands and head. The base frame, zero positions of the upper body joints of NAO, and the appropriate link frames are shown in Fig.3.

IETC 2014

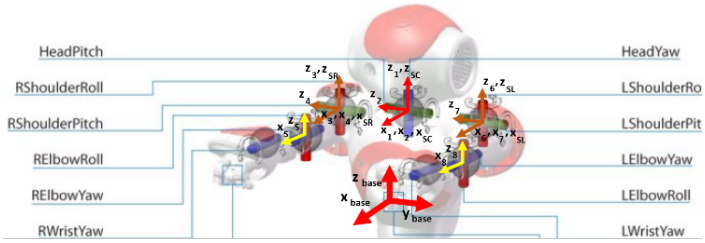

Fig. 3. NAO kinematic chains and upper body joints

For the homogenous transformation matrix ${}^{i-1}_{i}T$, the corresponding Denavit-Hartenberg (DH) parameters of NAO are given in Table 1.

Table 1. DH Parameters for Head, Right-Hand and Left-Hand of the NAO Robot

	α_{i-1}	a_{i-1}	θ_i	d_i
1	0	0	θ_1	0
2	$\pi/2$	0	$-\theta_2$	0
3	0	0	θ_3	0
4	$\pi/2$	0	$-\theta_4$	0
5	$-\pi/2$	$L_{RightArm}$	θ_5	0
6	0	0	θ_6	0
7	$\pi/2$	0	$-\theta_7$	0
8	$-\pi/2$	$L_{LeftArm}$	θ_8	0

We can combine DH transformation matrices of the corresponding joints to find the Head, Right Wrist, and Left Wrist positions of NAO:

$$ {}^{i-1}_{i}T = \begin{bmatrix} \cos\theta_i & -\sin\theta_i & 0 & a_{i-1} \\ \sin\theta_i.\cos\alpha_{i-1} & \cos\theta_i.\cos\alpha_{i-1} & -\sin\alpha_{i-1} & -\sin\alpha_{i-1}.d_i \\ \sin\theta_i.\sin\alpha_{i-1} & \cos\theta_i.\sin\alpha_{i-1} & \cos\alpha_{i-1} & \cos\alpha_{i-1}.d_i \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad (1) $$

$$ {}^{ShoulderCenter}_{Head}T = {}^{SC}_{1}T.\,{}^{1}_{2}T \quad (2) $$

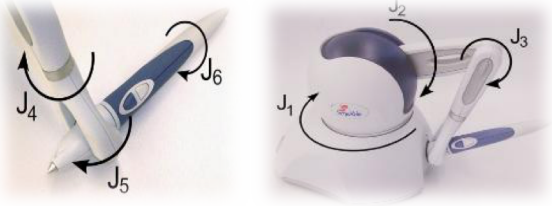
$$ {}^{ShoulderRight}_{ElbowRight}T = {}^{SR}_{3}T.\,{}^{3}_{4}T.\,{}^{4}_{5}T \quad (3) $$

IETC 2014

$$ {}^{ShoulderLeft}_{ElbowLeft}T = {}^{SL}_{6}T.\,{}^{6}_{7}T.\,{}^{7}_{8}T \quad (4) $$

$$ {}^{SR}_{WristRight}P = {}^{ShoulderRight}_{ElbowRight}T.[L_{RightForehead},0,0,1]^T \quad (5) $$

$$ {}^{SL}_{WristLeft}P = {}^{ShoulderLeft}_{ElbowLeft}T.[L_{LeftForehead},0,0,1]^T \quad (6) $$



The inverse kinematics for the considered eight joints is presented in Table. 2. Now, the robots are capable of imitating the patients through the data retrieved by the Microsoft Kinect sensor. Kinect's data sampling rate is 32 frames per second. The (x,y,z) coordinates of 20 points of the user's body are accessible in each data sampling. The accuracy of the imitation process is elaborated in detail in the Results section.

Table 2. Inverse kinematics for the Head, Right Hand and Left Hand of the NAO Robot

HeadYaw: $\theta_1 = a\tan 2(H_SC_y, H_SC_x)$
HeadPitch: $\theta_2 = a\tan 2(\sqrt{H_SC_x{}^2 + H_SC_y{}^2}, H_SC_z)$
RSh_Pitch: $\theta_3 = -a\tan 2(E_SR_z, \sqrt{E_SR_x{}^2 + E_SR_y{}^2})$
RShoulderRoll: $\theta_4 = a\tan 2(E_SR_y, E_SR_x)$
RElbowPitch: $\theta_5 = \pi - a\cos(\frac{\vec{R}_{Arm}.\vec{R}_{Forehand}}{\lvert\vec{R}_{Arm}\rvert\,\lvert\vec{R}_{Forehand}\rvert})$
LSh_Pitch: $\theta_6 = -a\tan 2(E_SL_z, \sqrt{E_SL_x{}^2 + E_SL_y{}^2})$
LShoulderRoll: $\theta_7 = a\tan 2(E_SL_y, E_SL_x)$
LElbowPitch: $\theta_8 = a\cos(\frac{\vec{L}_{Arm}.\vec{L}_{Forehand}}{\lvert\vec{L}_{Arm}\rvert\,\lvert\vec{L}_{Forehand}\rvert}) - \pi$

3.2 Teleoperating NAO using haptic phantom-omni

Operating a humanoid robot is not an easy task for patients and therapists. Empowering autistic children to move the robot joints arbitrarily causes the children to show creative social behaviors. This may also help them get involved in triadic Child-Robot-Therapist and Child-Robot-Child interactions. To reach this goal, we have used a 6-DOFs haptic manipulator (see Fig. 4) manufactured by The Sensable Technologies PHANTOM, as an interface between users and our humanoid robots. The first three DOFs of this device are active while joints 4-6 are passive. The haptic device makes it possible for users to touch or manipulate virtual objects, and it can apply force feedback on the user's hand.

IETC 2014

Fig. 4. Haptic Phantom-Omni Robots and its 3 active and 3 passive DOFs

Autistic children or others can move the haptic device's pen in 3D space and use it as a remote controller to enjoy playing with the humanoid robot. The θ_1, θ_2, θ_3, and θ_5 values recorded by Phantom-Omni encoders are assigned to Head-Yaw, Head-Pitch, Right-Shoulder-Roll, and Right-Elbow-Pitch joints of NAO, respectively. Similar to the previous subsection, the data have been sent via wireless to NAO in order to have real time position tracking.

3.3 Teleoperating NAO using Haptic Phantom-Omni

Delayed development of joint attention, is one of the central disorders in individuals with autism. Utilizing humanoid robots is expected to improve low- and high-level joint attention behaviors such as eye contact, showing, pointing, and gaze shifting through different therapies. So far, programming of the robots to have behavioral-verbal interactions with the patients, as well as, their preparation to take part in different therapeutic situations has been completed. The robots have been programmed using the robots' speech, movement, and facial expressions capabilities, to implement a number of different therapeutic sessions to improve joint attention and imitation of autistic children. To exemplify, they are capable of waving, saying hello and goodbye, one-leg balance in order for the autistic children to imitate the action, pointing to different pictures and asking the autistic child to do the same, expressing happiness for a gift or to encourage the children, or sadness during clinical interventions. Moreover, they can provide verbal reinforcement based on the effectiveness of the responses given by the autistic child. They also teach different colors by changing the color of the LEDs in the robot's eyes and body while introducing the color, and playing music for children while dancing (see Fig. 5). Reinforcement and rewards (i.e. smile, hugs, etc.) are given for the performance of any of the joint attention skills. Having the robot and the therapist imitate the child while the child is involved in a game is considered an effective way to establish joint attention opportunities.

IETC 2014

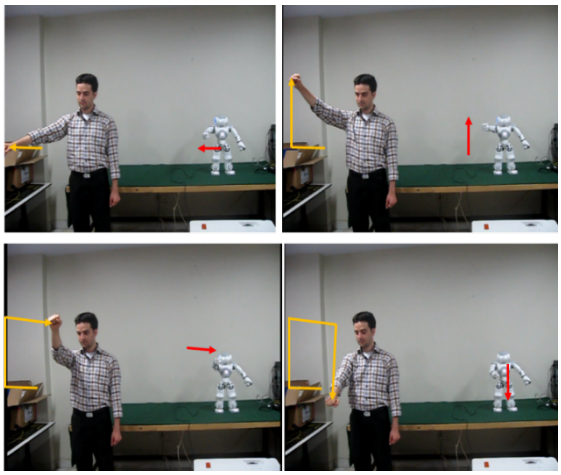


Fig. 6. Snapshots of drawing a square by the user

4. Results and Discussion

In this section, the experimental results of teleoperating NAO using Microsoft Kinect sensor is described. We have provided a C# code to save and process the joints' positions data gathered by Kinect. The goal is to have NAO imitate human upper body movements. Accordingly, the key points necessary for this purpose are Head, Center Shoulder, both Right and Left Shoulders, Elbows, and Wrists. Using inverse kinematics equations presented in Table. 2, the equivalent joint angles of NAO are calculated and sent wirelessly to the robot. Fortunately, the sampling rate of Kinect is adequate for good imitation. The lowest acceptable value for fraction of maximum speed of robot actuators is limited by imitation time delays. The upper limit is restricted by jerk increase in robot actions. It is experimentally found that these two requirements were met when this fraction was set to 0.8. Kinect data are noisy and the absolute position error of a fixed point may be more than 10 centimeters. Therefore, the data are filtered in order to smooth out short-term fluctuations through two methods: a) simple moving average of the previous 10 data, and b) 4^{th} order low-pass Butterworth filter with a cutoff frequency of 6 Hz.

As a case study, a person stood in 2 meters in front of the Kinect and moved his hands and head. The whole process took 113.4 seconds and included: movement of hands in arbitrary directions, elbows' flexion, drawing a circle and a square clockwise and counter-clockwise, and left/right and up/down head movements. In Figure 6, four snapshots of the process of drawing a square by the person are shown. Figure 7 depicts NAO's right wrist position in three situations unfiltered, applying moving average, and Butterworth filters to a person's right hand angle signals in a y-z plane. Figure 8 shows the right hand's angles versus time during the process of drawing a square. This part starts from t=31.3 (s) and lasts to t=35.1 (s). Figures 6-8 shows that NAO is able to imitate the person very well. The imitation accuracy is satisfactory for the clinical intervention sessions and therapeutic design. Although, usage of moving average or Butterworth filters decreases the imitation accuracy and slightly increase its time delay, filtering the angles' data makes the robot's movements much smoother and more reliable; and the robot's joints and body experience lower accelerations and jerks. The robot's imitation delay time is less than 0.4 sec. in the unfiltered and filtered angles' data. Figures 9-11 show the circle drawing movement's snapshots and right wrist position graphs.

5. Conclusion

In this paper, three main objectives were described. Teleoperating NAO using Microsoft Kinect was the first and the main goal of this article. Results showed that the imitation processes are acceptable based on good NAO movement quality and low imitation time delay. Similar to this but easier, NAO can also be teleoperated using a haptic robot as a remote controller. The same procedure can be used on the Alice robot. Finally, it was shown that real time humanoid robot imitation of a person and vice versa is possible. Using the robots' speech, movement and facial expressions capabilities, we designed different appropriate therapeutic scenarios to improve joint attention and imitation of autistic children. Clinical interventions are currently underway, and it is anticipated that the autistic children treated with this technology will enjoy faster improvement regarding making eye contact, initiating and responding to joint attention, imitation, and dyadic/triadic interactions. Moreover, a proper database associated with robotic assisted autistic treatment will be collected for comparative studies with conventional/traditional methods.

Abstract

Computer programming learning requires declarative and procedural knowledge. Novice learners acquire programming declarative knowledge via lectures, tutorials, and self-assessment. Cognitive overload within programming learning materials is one of several learning barriers. Self-assessing is important to assist learners to identify misconceptions and to encourage the correct construction of knowledge. Self-Test Questions (STQ) and solutions in print are common learning methods used in a typical programming learning environment. Comparatively, Self-Assessment Object (SAO) is a type of learning object used to examine usefulness in order to impart declarative knowledge. One hundred and three foundation engineering students, enrolled in a C programming module, took part in this study and were randomly assigned to two groups. A control group used STQ and an experimental group used SAO in a programming lab over seven teaching weeks. Post-test and supporting survey results suggest that SAO was able to support programming learning and mitigate the learning difficulties addressed in this study.

Keywords: introductory programming, novices, self-assessment object

1. Introduction

Learning Object (LO) is the decomposition of content into smaller pieces of information to accomplish a single learning outcome used to facilitate knowledge based and skill based courses (Wiley, 2000). It is also known as multimedia learning object (Bradley, Haynes, Boyle, 2008), knowledge object (Merril, 1998) reusable learning object (Polsani, 2003), content object (Learning Circuits, 2005), and web based learning tools (Kay, 2012). Clearly, the learning object technology suffers from agreeing to a standard definition. However, the content designers, instructional specialists, eLearning professionals, and academics involved in the design and development of learning object define the objectives, scope, and naming of the learning objects. Though various types of learning objects exist with different names, most of them conform to the main characteristics of granularity (size), reusability (technical and pedagogical), aggregation (assembly of several types of learning object), and self-contain (independent). The type of learning object used in this study is the self-assessment object. The aim of this object is to help learners improve their programming declarative knowledge.

Robins, Rountree, J, & Rountree, N (2003) pointed out that programming learning requires both declarative (knowing the programming concepts and syntax) and procedural knowledge (applying declarative knowledge to write a program). Programming courses at a beginner's level encourages learners to comprehend programming concepts, syntax and semantics, and the ability to write and test a program. A strong understanding of declarative knowledge is essential before learners attempt to write a program. Self-Test Questions (STQ) is a common approach used in many courses to help learners assess their understanding. However, the prevailing focus on self-assessment object is promising to facilitate better knowledge acquisition and enable identify misconception. The aim of this study is to explore the effectiveness of Self-Assessment Object (SAO) compared to self-test question, in order to improve

IETC 2014

programming declarative knowledge. This study also explores participants' learning experience to understand the usefulness of STQ and SAO in learning programming.

2. Review of literature

As there is no explicit definition of the various characteristics of learning objects, the types of LO seems to be heterogeneous. Research studies have shown that there are many different types of learning objects. However, they only follow informal classification based on experience and literature. Sicilia & Garcia (2003) noted that the types of learning objects can be classified by their structure, form of interaction, and granularity. E-learning professionals have structured the construction of objects based on four distinct types of learning modes, namely instruction, collaboration, practice, and assessment (Learning Circuits, 2005).

- Instruction objects - Explanations of theory are presented using objects like content, websites, events, activities, learner guides, etc.
- Collaboration objects - Learners discuss and share knowledge and new ideas using chat, e-mail, forums, discussion boards, etc.
- Practice objects – Opportunities are provided for learners to apply the knowledge acquired, such as role-play simulations, online labs, research projects, etc.
- Assessment objects - Learners can evaluate the depth of their acquired knowledge through pre-assessment, proficiency assessment, performance tests, and certification prep tests.

Assessment object (including self-assessment object) is comprised of try-yourself-questions that allow learners to assess their own understanding. Several assessment methods can be employed (e.g., identify mistakes in coding, fill in the correct statement, and match the correct statement) to help learners evoke semantics and the syntax of the programming language. Feedback is an important feature of the self-assessment object and enables learners to self-assess their acquired knowledge or skills (Haughey & Muirhead, 2005). When feedback is constructive and shows errors in the programming code that learners have produced, it can help them to recognize their misconceptions. Avoiding common errors or misconceptions is essential to improve comprehension (Mselle & Twaakyondo, 2012).

Learning programming is hard for first time learners (Ala-mukta, 2003). One of the reasons for this is the cognitive load in programming learning materials. Learners are bombarded with various textual and visual representations to learn the concepts of programming. These include the flow of control structure (e.g., for loop, while loop, and IF statements) and programming syntax and codes; as well as the key points and explanation, flowcharts, algorithms and/or pseudo code used to explain the concepts and programming codes. Another issue is that several programming concepts are often taught in a single lesson. Jenkins (2002) describes that programming classes are taught like a speeding train with no brakes. Therefore, it is rational to decompose lessons into several units to accomplish specific programming learning outcomes. Therefore, an SAO could be used to support each learning outcome. A single SAO includes several types of questions to help learners evaluate their understanding of both concepts and programming codes at the end of each lesson unit. A strong understanding of the concepts and related programming syntax and code is important for first time learners; before they can master programming writing itself. Self-assessing is one of the components of formative evaluation (Ramirez, 2010) and develops attributes and skills in learners to become resilient and self-motivating (Learning and Teaching Scotland, 2010).

IETC 2014

3. Methods

The participants of this study were one hundred and forty foundation in engineering students, enrolled in an Introduction to C programming course. Seventy (n=70) students were randomly assigned to a control group to use self-test question. Meanwhile, the other seventy (n=70) students were assigned to an experimental group to use self-assessment object at the end of each lesson.

3.1. Experimental procedure

A pre-test was administrated at the beginning of the experimental week. The pre-test consisted of ten multiple choice questions related to computer and programming terms and concepts. Six programming concepts (C integrated environment, variables and data types, operators, selection control structure, repetitive control structure, and array) were taught in three hour programming labs over seven teaching weeks. The programming lessons (concepts) were decomposed into several units and participants used STQ or SAO at the end of each lesson unit. For example, selection control structure was decomposed into six lesson units, as conditions, single IF, IF and ELSE, nested IF, linear nested IF, and non-linear nested IF. At the end of the experimental week, participants were requested to sit for a post-test; which consisted of thirty multiple choice questions related to C programming concepts, syntax, and codes. Participants' learning experience was measured using a Likert rating scale using the following five items; 1 - strongly disagree, 2 - disagree, 3 - uncertain, 4 - agree, and 5 - strongly agree. Table 1 shows the five items created to measure perceived relevance of self-assessment object and self-test questions.

Table 1.Perceived relevance of STQ and SAO.

code	item
C1	The self-test/self-assessment object helps to understand the lesson learnt.
C2	ılways finish the self-test ılways complete the self-assessment object
C3	I find the self-test/self-assessment object is an important learning activity.
C4	The self-test/self-assessment object helps me to recall the programming concepts and syntax.
C5	The solution for the self-test/self-assessment object is useful to show me my mistakes.

3.2. Experimental treatment

Fig. 1 shows the SAO screenshots for one of the programming concepts i.e., computer variables. The first task (question) was to arrange the programming codes to make a complete program. The second task was to find the correct syntax for variable declaration, and the third task was to find the syntax errors in a program. The self-test question consisted of the same type of questions and a solution sheet in print (see Fig. 2).

IETC 2014

3.

4.

5.

printf (“Hello There\n”);	#include <stdio.h>	{	main()	}

Question 2: Choose the correct syntax for variable declaration.

Variable	Syntax	
height	int height; [ ]	float height; [ ]
salary	int salary; [ ]	float salary; [ ]
Grade (i.e. 2)	char grade; [ ]	int grade; [ ]
id_no (i.e. R99345z)	char[10] id_no; [ ]	char id_no[10]; [ ]

Question 3: Rewrite the codes to avoid syntax error.

Int number; _____
int n1 n2 n3; _____
int a, float b ; _____
char gender _____

Fig. 2. Example of self-test questions for concept of computer variables

IETC 2014

4. Results and discussion

4.1. Participants profile

Data trimming was performed with respect to missing data in the pre-test and post-test scores. The final sample size was one hundred and three foundation in engineering students (control group n=53 and experimental group n=50). Seventy five percent of the participants were males and twenty five percent

were females. Eighty percent of the participants' in the control group (n=40) and 69% in the experimental group (n=36) were males. Ninety five percent of the participants were in the age range 17 to 19 years old.

4.2. Pretest and post-test performance

The total score for the pre-test was 10. The descriptive analysis for the control group and the experimental group in Table 1 shows that the level of prior programming knowledge was similar in both groups. Independent t-test results showed no significant difference in the pre-test mean score between both groups, $t(100) = -1.895$, $p > .05$. This result indicates that the participants in both groups were more or less on a similar level of prior programming knowledge.

Table 2. Descriptive results.

	Group	n	mean	SD	min score	max score	Equality of variance
pretest	Control	53	3.81	2.250	1	11	.912
	Experimental	50	4.66	2.237	0	11	
post-test	Control	53	6.23	2.228	1	10	.199
	Experimental	50	6.88	2.318	3	10	

The post-test mean score showed participants who used self-assessment object performed slightly better than those used self-test question. Independent t-test results showed no significant difference in post-test mean score between groups, $t(96) = .222$, $p > .05$. This result indicated that the self-test questions and assessment object were useful for learners to improve their programming declarative knowledge.

4.3. Survey results

Table 3 shows that participants highly appreciated that SAO (n=47, 94%) helped them to understand the programming lesson; compared to those using self-test questions (n=43, 81%). One of the possibilities for this is that the participants were unable to relate the usefulness of STQ to the programming learning context. Most of the participants in the control group agreed that they did not complete the self-test question at the end of the lesson (n=25, 47%); whereas satisfactory engagement with SAO was observed in the experimental group (n=39, 78%). Participants in both groups indicated that STQ (n=39, 74%) and SAO (n=41, 82%) was important to improving their programming declarative knowledge. A similar result was observed when participants were asked whether the STQ (n=39, 74%) or SAO (n=43, 86%) helped them to recall programming concepts and syntax. Participants who used SAO showed a higher positive response than those using STQ. The feedback used in SAO (n=41, 82%) and the solution to the self-test questions (n=42, 79%) was useful help them avoid misconceptions. Overall, uncertainty for all items was observed to be slightly higher in the control group than the experimental group. The survey results indicated that participant's appreciation was slightly higher towards SAO than STQ. Learners' engagement in an activity is important to promote better learning; this was more possible with SAO than STQ.

Table 3. Comparing self-test questions with self-assessment object.

Item code	Group	Strongly Agree	Agree	Uncertain	Disagree	Strongly Disagree
C1	Control (n=53)	15	28	8	2	-
		28%	53%	15%	4%	
	Experimental (n=50)	16	31	3	-	-

	Experimental (n=50)	13	28	9	-	-
		26%	56%	18%		

Learning from feedback is important to overcome misconceptions and improve learning (Juwah, Macfarlane-Dick, Matthew, Nicol, Ross, & Smith, 2004). The type of questions used in both self-test question sheets and self-assessment objects facilitated learning. The solutions to the self-test questions and the feedback on the self-assessment object were relatively important features for learners to identify their misconceptions. Johan & Bull (2009) suggested that detailed information about misconceptions assist programming leaners in recognising learning difficulties and enables reconstruction of correct conception. This study supports the fact that knowing common or possible programming errors is essential for novices. Furthermore, reflective questions on programming syntax and respective codes, by means of constructive feedback or solutions, would also be useful for novices.

5. Conclusion

This study examined the usefulness of Self-Test Question (STQ) with solutions and Self-Assessment Object (SAO) with feedback to help novice leaners identify common (or possible) programming errors. Comparatively, STQ and SAO facilitated learning to improve programming declarative knowledge. The type of question used in STQ and SAO also contributed to assisting learners identify their learning misconceptions. STQ with solution used in a typical programming learning environment and SAO with a feedback feature is commonly used in a blended learning environment. The survey results of this study indicate that learners prefer SAO compared to STQ. One of the possible reasons for this is that today's modern students prefer the integration of IT in their learning context. The post-test results and the supporting survey results suggest that SAO is useful in current programming learning environments. Collectively, this study suggests that by using SAO, it is possible to reduce cognitive overload in a programming learning environment.

IETC 2014

Comparing instructors' and students' perceptions towards CALL in higher education

Deniz Erguvan19*
Gulf University for Science and Technology, Masjid Al Aqsa St, Mubarak Al-Abdullah, West Mishref, Kuwait

Abstract

The purpose of this study is to analyse and compare the faculty members' and students' perceptions of a specific web-based instruction tool in a private higher education institute in Kuwait. 10 faculty members were interviewed and 66 undergraduate students filled in a survey regarding their opinions about the program. The questions posed to the faculty members and students aimed at seeking responses about faculty members' perceptions related to the strengths and weaknesses of the program, and opinions about the contribution to student learning. The analyses of the data reveal that participants, both faculty members and students have positive views towards the CALL experience. Instructors think CALL motivates students, adds variety to class, however, it also makes them question their role in the classroom, and also aggravates the already existing plagiarism problem among students. The analyses also show that most students enjoy using the program. Some disadvantages expressed by students are the workload, difficult questions and long, boring articles. Overall, students think the online program has contributed to their English skills.

Keywords: CALL; higher education; perceptions

IETC 2014

1. Introduction

For language teachers maintaining student attention is a challenge, and computer assisted language learning (CALL) offers new opportunities for supporting teachers to overcome this challenge. CALL can invigorate students (Lee, 2000), and offer some benefits such as the lessening the costs in the long run, and amplified opportunities for access to countless sources of information, increased opportunities for communication and personalization of the teaching process (Jorge, Jorge, Gutiérrez, García & Díaz, 2003). By using authentic materials with visuals and computer graphics, learning is not constrained in time and space. Learners are offered opportunities to communicate and learn collaboratively regardless of time and location through the internet. Students show an improved sense of achievement and interest in independent learning, with the ability to communicate and conduct research efficiently beyond the boundaries of the class (Shetzer & Warschauer, 2000).

* Corresponding author. Tel.: 965 60089076.
E-mail address: erguvan.d@gust.edu.kw

Recent studies have shown that the rewarding employment of educational technologies rest on the attitudes of educators, who determine how CALL is used in the classroom. Bullock (2004) found that teachers' attitudes are a major enabling and disabling factor in the implementation of technology. Similarly, Kersaint, Horton, Stohl, and Garofalo (2003) found that teachers who have positive attitudes toward technology feel more relaxed using it and usually incorporate it into their instruction. Internet based instruction can be effective only with the teacher's role as a "facilitator" who plans, designs and monitors the lesson (Brandl, 2002). In addition, scientists have also recognized the prominence of student attitudes in well-organized incorporation of ICT, and conducted research that focuses on students' attitudes towards learning language with computers. Students who see CALL as an important part of the course will also have high motivation and perceive CALL work as relevant to their needs. Therefore it seems that attitudes towards technology can serve as an alternative way to measure the efficiency of technology in the classroom, and to evaluate the effectiveness of CALL students' as well as instructors' attitudes should be considered.

For that purpose, 10 faculty members were interviewed and asked about their perspectives of the online program. Also 66 students who have used the program were questionnaires to express their opinions about the program. The questions have been designed to seek responses about faculty members' perceptions of using the branded program in EAP practice, perceptions related to the strengths and weaknesses of the program, opinions about the contribution to student learning. The objectives of the research could be summarized as finding out student and faculty perspectives of the CALL tool and to compare their perspectives.

2. Method

This study has used qualitative research methods. Within the scope of the research, in-depth interviews with semi-structured questions were conducted in order to obtain faculty views and perspectives about the commercial online tool. Apart from that, students were given questionnaires consisting of open ended questions regarding their perceptions on the program. The population of the study consists of all of the 10, 5 male and 5 female academics who used this program in 2013-2014 Fall term in the English department of a private Kuwaiti university, and 66 undergraduate students who used the program in the same term.

2.1. *Data collection tool*

10 participants were interviewed on their perspectives of the online instruction tool and asked various questions. Literature and expert opinion were consulted with in the preparation of these questions. For the purpose of the research problem, the open-ended questions posed to the participants are as follows:

1. What are your perceptions of the strengths (or advantages) of the program?
2. What are your perceptions of the weaknesses (or disadvantages) of the program?
3. Do you feel the program has contributed to your (students') English skills?

2.2. Data analysis

Audio recordings of faculty members were transcribed and converted into typed text. Interviews were analysed by "categorical analysis". The raw data was converted into codes and categories. In this context, a

IETC 2014

paragraph that expresses a complete opinion was specified as the unit of analysis. Qualitative research findings and their interpretation were created by analysing the views of participants under certain categories.

Student papers were anonymous, no names or identifying details were written on them. Content analysis was carried out on documents. The documents were "categorically analysed" and student responses were reduced to meaningful units, such as a word, a phrase, or a sentence. Words and phrases reflecting attitudes were identified and underlined. Qualitative research findings and their interpretation were created by analysing the views of participants under certain categories.

3. Findings

3.1. Findings related to perceptions of the program's advantages

Table 1 shows the faculty perceptions related to the advantages of the program.

Table 1. Faculty perceptions regarding the program's advantages

Advantages	Frequency
More motivating than conventional methods /students do more work	7
Differentiated instruction	6
Easy and flexible access to information / valuable database	4
Students are exposed to different types of exercises	4
Ease of making lesson plans/filing and sharing info	3

When asked the same question, students responded in a similar way. Table 2 shows that the most frequent advantages as perceived by students.

Table 2. Student perceptions regarding the program's advantages

Advantages	Frequency
Interesting and educational articles on various topics	25
Improving language skills	16
Independent learning / Freedom and flexibility	14
Multiple-choice questions	4

Students thought access to a rich database of articles on interesting topics was the greatest strength of the program. Textbooks or course books may have a wide array of reading texts but the options that students

IETC 2014

have in an online program is beyond comparison to the richest textbooks and the modern age students seem to be appreciating this aspect of ICT. Students tend to value the contribution of the program to their language skills, as well.

Although the program is mostly based on reading articles, students perceived the online program as contributing to multiple skills, including writing and vocabulary.

Following these two most frequently expressed advantages, freedom and independent learning was expressed as another advantage. The program allows students to work on any topic they like by using the search option, gives them the independence to read the text and answer the questions at their own pace. In addition, when they miss the class, they can still follow it by participating in the activity as not everything has to be limited to class time. Students have the chance to complete the work outside the class and they can use any device that will allow them to access to the internet. Students considered these options as independent learning and obviously appreciated them.

The advantages perceived by students and faculty show similarities as both groups agree on the richness of the database and they find reading texts quite educational and interesting. Likewise, easy access to information as perceived by faculty and independent learning, as perceived by students are similar concepts in that both concepts refer to the freedom of using the program regardless of the location and time. Faculty think students more work, which in turn improves language skills, as perceived by students. Students feel they are learning from the program as they are required to do quite a lot of work.

The only difference in advantages as perceived by two groups is differentiated instruction. Students do not consider this an advantage, in fact, some have even complained about the difficulty of the reading texts increasing in time. Students may not be aware of the fact that they receive articles tailored for their reading proficiency and faculty members should try to explain the rationale behind the difference in reading texts they receive.

3.2. Findings related to perceptions of the program's disadvantages

Table 3. Faculty perceptions regarding the program's disadvantages

Disadvantages	Frequency
Grading/technical difficulties	6
Plagiarism/Open to manipulation	6
Topics/types of articles	5
Teacher's role/ Management of the course	5
Failing to contribute in some skills	4

Table 4. Student perceptions regarding the program's disadvantages

Disadvantages	Frequency
Workload (the number of articles and questions in total)	14
Difficult questions	12
Scoring / grading issues	7

IETC 2014

Long and boring articles (lacking variety)	6
Technical problems (internet access, connection issues etc.)	4

The comparison of faculty and student responses reveals that workload is the biggest disadvantage of the program for both students and faculty members. For students, reaching the target poses a challenge whereas for faculty members this target represents grading difficulty. Students end up reading and writing more than they would do in a paper-pen class and instructors end up grading thousands of paragraphs, essays and calculating the averages for final grades. It is strange that both groups agree on the workload as it is generally students who make complaints on this issue. This points out to the fact that the number of reading texts students are required to do in a term should be revised.

Lacking variety or boring topics are also common concerns for both groups. Technical flaws of the program are also experienced by two groups. Whether the website has a weak technical structure or the university should strengthen its infrastructure is beyond the limits of this paper, however, constant problems experienced during the use of the program will definitely put students off using it.

Plagiarism is not considered a problem by students whereas for faculty members, it is a major concern. This could be a solution found by some students to alleviate the workload, which does not annoy their peers.

In conclusion, disadvantages or weaknesses of the program as perceived by faculty members and students show similarities, excluding the perception of plagiarism.

3.3. Findings related to participants' perceptions regarding students' feedback

Table 5. Faculty perceptions regarding the contribution to student learning

Skills	Frequency
Reading	6
Writing	5
Vocabulary	3
Not sure	3

Table 6. Student perceptions regarding the contribution to own learning

Skills	Frequency
Reading	25
Vocabulary	23
Writing	15
Other skills	4
No contribution	3

IETC 2014

Students and faculty members have similar viewpoints regarding the contribution of the program on their language skills. Both faculty members and students think the major contribution is in reading. The contribution in writing is the second major according to faculty members, however for students, it follows vocabulary. Among both students and faculty members, few of them think the program failed to make a contribution.

4. Discussion and Conclusion

According to user perceptions, the major strengths of the program lie within its motivating factor, its differentiated instruction, and contributing to student learning by exposing them to a variety of activities that would be difficult to pool and find materials for in a traditional class. An increase in motivation has been mentioned and established in many other studies that have been carried out in various settings. There seems to be a general consensus among teachers and students, and they mostly feel the use of ICT greatly contributes to motivation for learning. Students indeed find it more appealing to learn with computers than with traditional means (Bullock, 2001).

Differentiated instruction has been expressed by faculty members as one of the foremost strengths of the program. Differentiated instruction (DI) can be demarcated as a adjustment of the curriculum that empowers all students to learn (Theroux, 2004). Differentiated instruction is specifically useful for English language learners. English language learners (ELL) largely participate in general education programme and assessment and when students of with different traditions and linguistic qualifications are included in traditional classrooms, teachers face a problem (Stanford and Reeves, 2009, p. 3). Research that has been carried out on DI suggests that through differentiated instruction and activities, students take a greater accountability and own their own learning through activities that principally focus on students' multiple intelligences, higher-order thinking, and learning styles. DI helps students with different proficiency levels get engaged in the material (Bailey & Williams-Black, 2008).This feature of the program is valued by the faculty members because they do not have to go through the effort of abridging the content. However, students do not seem to be enjoying this feature of the program. The reason why students do not seem to appreciate this feature may be because of the difficulty level of the reading texts and the misperception that weaker students get easy texts. With this in mind, faculty members should clarify the foundations of the DI to their students and make sure students do not feel cheated when they are placed into a higher level by the program. Instead they should feel they are better than some of their peers and being placed into their correct levels will help them progress further.

Participant perceptions regarding the program's weaknesses list some grading difficulties and technical problems they experience while using the program as ICT tool's number one weakness. Indeed, integration of ICT in the classroom is not a perfect one. Jones's study points out seven major barriers in this process and 'facing technical problems' was mentioned by 13% of participants and listed as the fifth barrier in the study. Another similar study carried out on the barriers revealed "lack of adequate technical support" as one of the issues teachers face during incorporation of ICT with %39.2 of the participants (Samuel & Zaitun, 2007, p. 2). The grading load, as mentioned by the participants in this study could be associated with time pressures both outside and during class, and the technical shortcomings could be linked to lack of support or recognition for integrating computers; and inadequate training and technical support, as described in many other studies carried out by various researchers (Bordbar, 2010, p. 33). The World Bank Group report on the use of ICT in education also state that introducing and using ICTs to support teaching and learning is time consuming for teachers, teaching with ICTs takes more time, roughly 10% extra time is necessary to cover the same material. Another point the report touches upon is that the functioning technical infrastructure is critical and teachers and students alike must have adequate access to functioning computers, and be provided with adequate technical support, if they are to use ICTs effectively (Trucano, 2005).

The second weakness of the ICT tool was considered to be plagiarism by faculty members. Participants raised their concerns about students manipulating the placement test at the beginning of the term, copying and pasting internet sources or other students' responses for writing questions and even hiring others to do the homework for them. It is not unusual that this problem was not mentioned by students at all as they are not at the receiving end of the issue. With the development of information and communication technology, plagiarism has become a serious problem in the academic community. According to the

IETC 2014

studies, plagiarism rates among students are quite high and students mostly ignore or allow plagiarism because of a lack of knowledge, lack of consequences, or simply because ICT makes plagiarism easy to commit. Over 70% of students reported that they used the internet as the main source of plagiarism and that the main reasons for committing plagiarism were easy and unidentified access to the internet, time restrictions, procrastination, unproductive work management and work overload (Pupovac, Bilic-Zulle & Petrovecki, 2008). It is suggested that easily reachable information on the internet, the development of IT and the simple copy/paste command facilitate plagiarism. However, rather than holding ICT responsible for plagiarism, academics should form ethical relationships and academic merits to endorse an intellectual community. Attempts at eradicating academic misconduct and gratifying creativity and real acquirement of knowledge in universities and schools will contribute to achieving this goal.

Participant perceptions reveal that the management of the course is a problem area and also some users have trouble adjusting to the new role in an ICT class. Interestingly, students have not made any comments on the management of the course or the instructor's role in the classroom. They generally seem to be enjoying the newly found freedom in the class and being able to choose their own articles. This should tell the faculty members that there is nothing wrong with being a facilitator in the classroom and as long as they plan the lesson carefully, students will focus on the work in the class and enjoy independent learning. In this regard, many experts emphasize continuous training as essential to teacher development, and a slow approach, expecting teachers to take around three to five years to familiarize themselves with new technologies and related pedagogies. Similarly, partnership between the institute and private software developers is seen as effective in assuring educational software remains locally applicable to specific curricular objectives, both of which are important for encouraging teachers to make use of available ICT (Haddad & Rennie, 2005).

Currently there is great debate about how teachers should adapt current teaching skills and practice to accommodate the introduction of ICT, whether teachers are becoming redundant as a consequence of the use of ICT in education or whether a teacher-less classroom is likely. In fact, new educational technologies do not curb the need for teachers but they call for a redefinition of their profession. This redefinition elaborates on teaching methodology, assessment of learning, student supervision, communication, and evaluation. Most critically, the question of the extent to which teachers abandon control and let learners drive their own learning may create an obstacle in the adoption of ICT in the classroom (Wheeler, 2000). The roles of teachers have changed and continue to change to constructors, facilitators, coaches, and inventors of learning environments.

In conclusion, there is a noticeable similarity between faculty members and students perceptions regarding the use of CALL in writing classes. An increase in motivation as noticed by faculty members is true, as also expressed by students themselves. Students feel their language skills improved, which is also mentioned by their instructors, as documented in progress reports. Both students and faculty members noticed an improvement in reading skills.

Use of computer and internet technologies in the classroom seems to be creating a positive learning environment in freshman courses, but administrators should closely monitor student and faculty member perceptions regarding the use of the program and conduct needs analysis to ensure a smooth implementation of CALL. Teachers who have concerns regarding their roles in the classroom should be given in service training by the developers of the software and more senior users of the program. Further research is needed to assess the solid contribution of the program in achieving student learning outcomes.

Comparison of the ICT literacy level of the Mexican and Hungarian students in the higher education

Gabor Kiss[a], Carlos Arturo Torres Gastelú[b]20
[a]*Obuda University, Becsi ut 96/b, Budapest H-1034, Hungary*
[b]*Univesidad Veracruzana, C.P. 91090 Xalapa, Veracruz, México.*

Abstract

Communication and technology have an important role in life and especially in education. Nowadays, students generally use technology for communication. When using technology in education, there may be some communication barriers. In this research, it is studied about communication barriers that prevent teachers' candidates to use technology. The aim of this research is to find the communication barriers which teachers' candidates face when they utilize technology. First of all we have to see the ICT knowledge level of the students to make decision about the application and retraining methods. It is important to know can we find any difference in ICT literacy between the Hungarian and the Mexican students. We measured the ICT literacy level with a tool consisting of 15 items (Likert scaled. We worked with 720 students. The data analysis was performed with SPSS software using descriptive statistics and Mann-Whitney test. ICT literacy comparison has showed significant differences by countries, the Mexican students ICT literacy was on higher level (self-report) except by using learning platforms.

Keywords: ICT; knowledge; literacy; comparison; higher education; method; different; Hungary; Mexico

IETC 2014

1. Introduction

The aim of this research is to find the communication barriers which teachers' candidates face when they utilize technology. First of all we have to see the ICT knowledge level of the students to make decision about the application and retraining methods. It is important to know can we find any difference in ICT literacy between the Hungarian and the Mexican students to see how long is the way to finish the ICT revolution in these countries. On the other hand is it important to see which topic need more attention from the teachers in the high school to give a good knowledge for the student before they go in the higher education.

Some earlier research analyzed the ICT literacy of the students in Hungary on different levels (Kiss, 2009), (Kiss, 2010a), (Kiss, 2011a), (Kiss, 2011b). The current research analyses the ICT literacy level of the Mexican and Hungarian students in Higher Education.

2. Information technology education in Hungary

IT education is based on a national curriculum in Hungary (Ministry, E. H, 2003). According to the National Basic Curriculum (NBC) of Hungary the use of IT is to be demonstrated in the first four school grades since 2003 (e.g. search on the Internet, painting with computers etc.) and is taught in 1 class week-

* Gabor Kiss. Tel.: +36-30-9709-321; fax: +36-1-666-5484
E-mail address:kiss.gabor@bgk.uni-obuda.hu

ly. According to the Information Technology curriculum the following subjects are taught from the 5th grade to the 12th grade at the schools of Hungary in 2 classes weekly:

- Word processing
- Spreadsheet calculation
- Presentation
- Algorithm and programming
- Database management

Generally the Microsoft Office packet is taught and it can be seen that teaching Word processing takes 4 years in Hungary (Table 1). Basic algorithms or rather programming appears in Information Technology sooner, but recursion, list and tree data structures are only selectable part of the curriculum. Database management begins in the 9th grade. In grades 11-12 CS is just selectable. At basic level it is taught 2 hours weekly, on a higher level 3 hours weekly and a final exam can be taken.

Table 1. The subject of IT by grades in Hungary.

Subject	Grade							
	5.	6.	7.	8.	9.	10.	11.	12.
Word processing		✔	✔	✔	✔			
Spreadsheet calculation				✔	✔			
Presentation						✔		
Algorithm and programming			✔	✔	✔			
Database management					✔			

3. Information technology education in Mexico

The primary education is six years in length and runs from grade one through grade six and the content based on the national curriculum while the National Institute for Assessment of Education but not include Information Technology as subject in education.

The lower secondary education is three years in length and runs from grade seven through grade nine. The students follow either an academic track or a technical track but not include Information Technology as subject in education.

Upper secondary education is a further three years in length, after three years of lower secondary, and runs from grade 10 to grade 12 and it is the first level where ICT appear in official education form. In the general secondary school are 6 hours per month for Computer Science on the academic track and 3 hours per month for ICT on technical track.

4. Analyzing students' ICT literacy level

The purpose of this study is to compare the ICT literacy level of students from Mexican and Hungarian universities.

The number of participants: The sample consisted of 720 students, 302 Mexican and 418 Hungarian students (Table 2.).

Table 2. The number of participants by gender and country

	Male	Female	Total
Mexican	151	151	302
Hungarian	342	76	418

IETC 2014

Total	493	227	720

The students filled out a self-reported questionnaire with 15 items (Table 3). We have used Likert-type rating scales to measure the ICT literacy level of students (Likert, 1932).

Table 3. ICT literacy level items

Number of item	Item
1	Handling Operating System (OS)
2	Word processor
3	Spreadsheet
4	Database Management
5	Multimedia
6	Software specific to my degree
7	Using documentary bases (Such as EBSCO)
8	Web Browsing
9	Internet Communication
10	Internet Safety
11	Website design
12	Using learning platforms
13	Image Editing
14	Video Editing
15	Creating simulations and animations

Liker scales are commonly used by self-reported questionnaire, providing a range of responses to a given question or statement (Jamieson, 2004). There were 4 categories of response : 1 = basic level; 2 = medium; 3 = advanced, 4 = „master".

The reliability of the questionnaire obtained by the technique of Cronbach-α was 0.914 it means the reliability of the questionnaire is very good.

4.1. The results of independent samples mann-whitney u test

The Likert scale is ordinary scale, and as such we can calculate mean, min, max, median, modus, std. dev. etc. We can use the nonparametic tests where we need ordinary variables. We have two independent samples so we could use the Mann-Whitney-Wilcoxon test for 2 samples [14]. The Mann-Whitney-Wilcoxon test seems better choice versus t test by Likert-type data [15], because it is testing the medians of the samples.

We used the Mann-Whitney independent sample U test of SPSS to compare the means of scores taken by the students. Monitoring was held on p=5% significancy level in the whole analyzing process.

IETC 2014

We used 3 different ways of comparison: by countries, by gender and by gender in Hungary or in Mexico

Table 4. The results of Independent Samples Mann-Whitney U test by countries

4.1.1. The results of independent samples mann-whitney u test by countries

If we summarize the scores of all items and make the comparison we can see the ICT literacy lever of students by countries. The result of Mann-Whitney U test on the total scores has shown significant difference between the 2 group of students by ICT literacy, p=0.000.

We calculated the mean scores by items and also calculated the difference between them grouped by countries. Then we can made analysis process with Mann-Whitney U test (Table 4.).

According to the table we can find lot of significant differences just by one item can we recognize same result (Item 12th: "Using learning platforms.") in other cases the subjective ICT literacy level of Mexican and Hungarian students is different. Same examples show the frequency of the scores by different items (Fig. 1., Fig. 2, Fig.3.).

IETC 2014

Fig. 1. Handling Operating System (OS)

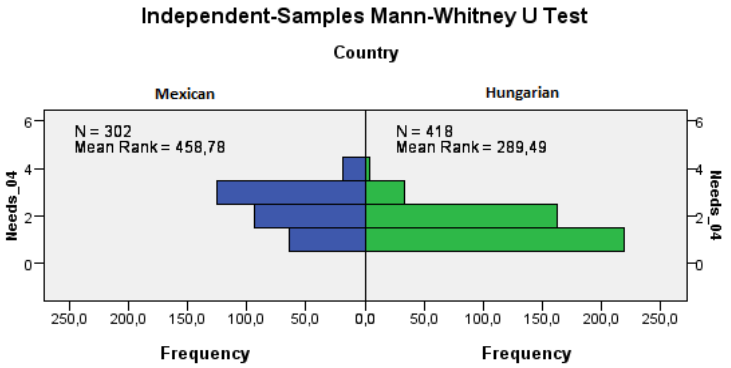

Fig. 2. Database management

According to the figures we can see the scores of the students from different countries; we can see that the subjective ICT literacy level of Mexican students is higher than the Hungarian students.

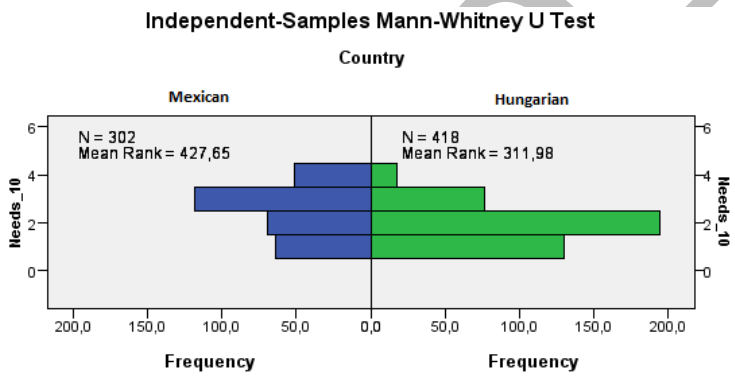

Fig. 3. Internet safety

4.1.2. The results of independent samples mann-whitney u test by genders

We calculated the mean scores by items and also calculated the difference between them grouped by genders. Then we can made analysis process with Mann-Whitney U test by boys (Table 5.) and girls (Table 6.).

Table 5. The results of Independent Samples Mann-Whitney U test by boys

Number of item	Item	Mexican boys (Mean score)	Hungarian boys (Mean score)	p
1	Handling Operating System (OS)	2,52	2,20	0,000
2	Word processor	2,71	2,40	0,001
3	Spreadsheet	2,48	1,98	0,000
4	Database Management	2,37	1,56	0,000
5	Multimedia	2,48	2,13	0,000
6	Software specific to my degree	2,16	1,67	0,000

7	Using documentary bases (Such as EBSCO)	2,36	1,52	0,000
8	Web Browsing	2,99	2,83	0,000
9	**Internet Communication**	**2,83**	**2,72**	**0,079**
10	Internet Safety	2,47	1,95	0,000
11	Website design	2,31	1,45	0,000
12	**Using learning platforms**	**2,21**	**2,10**	**0,153**

14	Video Editing	2,23	1,62	0,000
15	Creating simulations and animations	2,36	1,37	0,000

IECT 2014

According to the table (Table 6.) we can find significant differences by the big part of items just by three items can we recognize same result (Item 9th: "Internet Communication.", Item 12th: "Using learning platforms.", Item 13th: "Image Editing.") in other cases the subjective ICT literacy level of Mexican girls is higher as the Hungarian girls in the higher education.

4.1.3. The results of independent samples mann-whitney u test by gender in Mexico

We calculated the mean scores by items and also calculated the difference between the students grouped by genders in Mexico.

Then we can made analysis process with Mann-Whitney U test by gender (Table 7.).

Table 7. The results of Independent Samples Mann-Whitney U test by gender in Mexico

Number of item	Item	Mexican girls (Mean score)	Mexican boys (Mean score)	p
1	Handling Operating System (OS)	2,70	2,52	0,073
2	Word processor	2,81	2,71	0,427
3	Spreadsheet	2,52	2,48	0,751
4	Database Management	2,28	2,37	0,314
5	Multimedia	2,57	2,48	0,428
6	Software specific to my degree	2,18	2,16	0,870
7	Using documentary bases (Such as EBSCO)	2,25	2,36	0,309
8	Web Browsing	3,03	2,99	0,651
9	Internet Communication	2,97	2,83	0,192
10	Internet Safety	2,56	2,47	0,370
11	Website design	2,30	2,31	0,925
12	Using learning platforms	2,23	2,21	0,908
13	Image Editing	2,42	2,38	0,811
14	Video Editing	2,23	2,19	0,846
15	Creating simulations and animations	2,36	2,27	0,530

According to the table (Table 7.) we can not find any significant differences in the subjective ICT literacy level of Mexican girls and boys. It means the Mexican girls and boys have same subjective ICT literacy level in the higher education.

The situation is not so clear in Hungary. According to the table (Table 8.) we can see that the subjective ICT literacy level of Hungarian girls is higher by Item 12th :"Using learning platforms" and Item 13th: "Image editing" in the higher education.

On other hand the subjective ICT literacy level of Hungarian boys is higher by Item 1st: "Handling Operating System (OS)", Item 5th: "Multimedia" and Item 6th: "Software specific to my degree". It means the girls

IETC 2014

have found the way to use the ICT by learning to be more successful by exams at universities (Kiss, 2010b) and they are more creative by image editing.

The boys enjoy same advantage in higher education like in the secondary grammar schools in Hungary (Kiss, 2010c). They are more successful by find the deeper secret of operating systems, using different multimedia tools and software connection with the learning strategy in the higher education.

Table 8. The results of Independent Samples Mann-Whitney U test by gender in Hungary

Number of item	Item	Hungarian girls (Mean score)	Hungarian boys (Mean score)	p

14	Video Editing	1,62	1,59	0,998
15	Creating simulations and animations	1,37	1,28	0,397

5. Conclusion

In this research we have tried to analyze the subjective ICT literacy level of the Mexican and Hungarian students in the higher education. We have used a self-reported questionnaire with 15 items (Table 3) and Likert-type rating.

After the analyzing process we can say the subjective ICT literacy level of Mexican students is higher than Hungarian students.

We have made more analysis by gender by countries. In the following we share the important information connection with it.

We have found significant differences by boys by all items except two items (Item 9th: "Internet Communication.", Item 12th: "Using learning platforms."). It means the subjective ICT literacy level of Mexican boys is higher as the Hungarian boys in the higher education except by using Internet as communication platform and ICT tools by learning process.

IETC 2014

The results by girls are almost same. We could find significant differences by the items except three items (Item 9th: "Internet Communication.", Item 12th: "Using learning platforms.", Item 13th: "Image Editing.") It shows the subjective ICT literacy level of Mexican girls is higher as the Hungarian girls in the higher education except by using Internet as communication platform, ICT tools by learning process and image editing where the subjective knowledge level is same.

We made the analysis by gender in countries too and we have not found any significant differences in the subjective ICT literacy level between the Mexican girls and boys the subjective knowledge level by gender is same in Mexico in the higher education.

The situation was different in Hungary. The Hungarian girls have higher subjective knowledge level by using ICT tools until the learning process. It means the girls have found the way to use the ICT by learning to be more successful by exams at universities and they are more creative by image editing.

On other hand the subjective ICT literacy level of Hungarian boys is higher by Item 1st: "Handling Operating System (OS)", Item 5th: "Multimedia" and Item 6th: "Software specific to my degree" so they are more successful by find the deeper secret of operating systems, using different multimedia tools and software connection with the learning strategy in the higher education.

6. Future work

In this research we have concentrated on the subjective ICT literacy level of Mexican and Hungarian students in the higher education. In the following process would be important to see the really ICT knowledge level of the students in this countries. We could use the same tool what we used by analyzing the ICT knowledge level in Hungary and Slovakia earlier. We need to translate the questions in Spanish and share with the students in Mexico.

Main text

our modern world, computers are used as education tools where various new technologies are used together and ey present very important, creativity and productivity increasing opportunities both in the public and in the ivate sector [Dr. İsmail İpek., 2001].

IETC 2014

Computer based education is a modern education style used in education environments where the t eacher is
included too. The computers have characteristics of educating with activities like presenting the lesson contents,
repeating when necessary, problem solving, exercising etc. Therefore, the point of question is using the sit es which
are prepared with the purpose of education on the computer based education.
As mentioned before, according to the researches, using computer on the education process provides st udents to
develop thinking abilities, and at the same time increase their success level. In addition to this, compute rs create
positive effects on the attitudes of students towards lessons and learning [Gibbobs, A. S., & Fairweather, P. G., 1998].

IE 2014

Fig. 1. Main page of the site

r this reason, a computer program has been created by us with the purpose of making the mathematics education sier for the 6th grade students in the Azerbaijani schools; arouse interest for science, to ease the teacher struggle ıich is very hard. This computer program has been prepared in the site format with the HTML language and fully vered the mathematics lesson content for the 6th grade. As the program had been prepared in terms of a site, it can sily be given to all of the schools in Azerbaijan with internet and houses using internet. That is why students can ırn mathematics easily and profoundly either at school or in their own house. The main page of this course which named as "Mathematics 6" is shown on Fig. 1.

4 different buttons have been placed to this page. Three of those take place on the left side of the page. ose are the buttons of "Mündericat" (Contents), "İmtahan" (Exam) and "Yaratıcılar" (Site Creators). The fourth tton is the button of "Click here to download AzeriFonts" written in English with lower case after the iyazziyyat 6" (Mathematics 6) subject on top and the middle of the page. There might not be AzeriFonts (the ters of Azerbaijan alphabet) in each computer. For this reason, the alphabets of AzeriFonts have been copied to e file where this program is written and recorded. When the site is opened, even if the writings cannot be read operly, when clicking to the "Click here to download AzeriFonts" button, the writings in the main page are

my

e mathematics? If you like, you can learn it in your own computer very easily. If you don't believe, come and see ogether. First of all, look at the buttons on the left side of this page. With the help of those buttons, you an see e contents of the site and you can find information about its creators. At the same time, you can also meet with ıer interesting parts of the site. Now take a look. Learn and have fun. We wish you success!!!"

When we click to the "Mündericat" (Contents) button in the main page of the site, "Mündericat" is ened in a new page. Here, you can find all of the subjects that take place in the 6th Grade Mathematics school ok. If we click on any subject with mouse, the explanation of the subject will be immediately coming to the mputer screen (Fig. 2).

provided to be read Azerbaijani. Then the students can read this text written in the page. "Hello, friend! Do you

2. The contents page

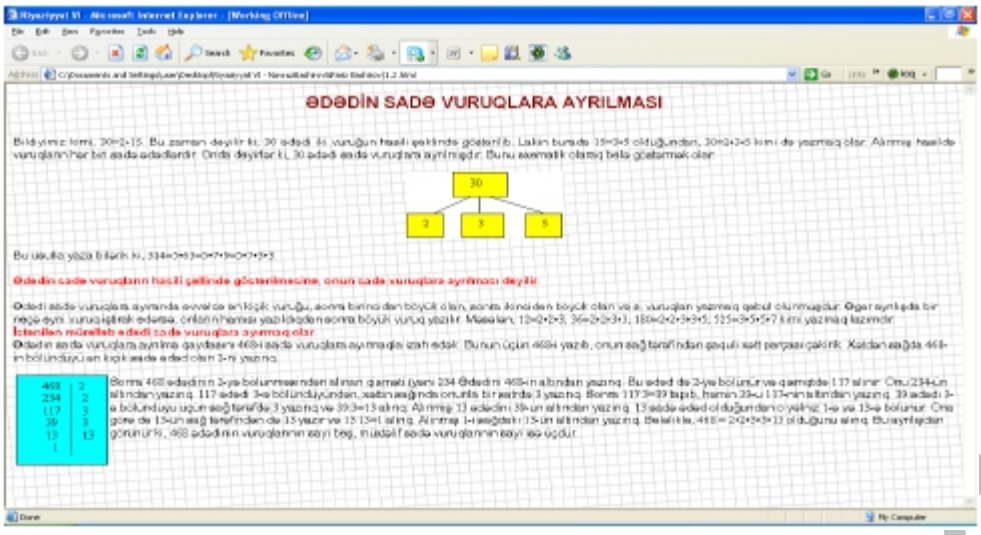

Fig. 3. The subject of simple and complex numbers

hen we click to the subject “Prime factorization of numbers, GCD and LCM” that take place in “Mündericat” with ouse, the page indicated in shape 3 is opened. The numbers are shown in the upper line of this table in here, and in

e numbers that have only 2 dividers are shown in red color. Those numbers which have the number of prime viders as 2 are also primal themselves. The dividers of other numbers are shown in black color. Those numbers are mplex numbers (Fig. 3).

the bottom line, the number of the prime factors that divides them are shown. Here, the numbers of prime dividers of

Fig. 4. The subject of prime factorization of numbers

this page, at the same time in the entire site, the rules are given in the red color. When this site was prepared, the

IETC 2014

quests of the 6th Grade students of that time have been taken into consideration.

After each lecturing given in the site, the solutions of various questions about that subject takes place. The estion solutions for the GCD and LCM subject that we told above is given in another page (Fig. 4). After those utions, lots of questions are given for students to make free solutions. In the site, after each subject, 15 questions e given for students to test their own knowledge.

When you click the "Exam" button that takes place under the "Contents" button given in the first page of e site, a new page is opened named as the "Tests". In this page, various subjects take place for students to do free t (Fig. 5). The student can test his/her own knowledge by solving the test questions of whatever subject he/she oose to. After the student chooses the subject, he/she should register. Afterwards, 15 test questions come about the bject he/she chose and after the student solves the current tests, the computer evaluates the knowledge of the ident. Besides, the solutions of the student's wrong solved questions are shown in red, and the correct solved sponses are shown with blue colored column.

5. The tests page

hen you click to the "Site Creators" button of this site prepared for middle school students, the pictures of people ho had created the program and information about them comes to the computer screen. Those people are Novruz şirov, Aynure Beşirova and Fariz Beşirov.

ally, we should also remark that this prepared site has been completed with a very interesting and funny section. the "Delphi" programming system in the context of the site, as those programs that teach students the rule of ding the GCD and LCM of the numbers and that makes it possible to calculate the GCD and LCM of requested o numbers, and as the programs that inform about palindromic numbers and that show whether the given number palindromic or not could work freely, they have been presented to the Ministry of Education in Azerbaijan to take ace in the newly developed internet site of the Ministry.

Wondershare

Results and Discussion

This site is prepared for Azerbaijan schools' sixth grade students to learn mathematics online with ease and covers mathematics textbook's entire curriculum. In a step by step fashion the site is designed and the content is epared. After each step completed work is shared by mathematics teachers and active students and their opinions e regarded. After the site is finished, it is tested in parallel classes of 10 Baku schools (Schools number 7, 45, 48, , 95, 104, 118, 245, 269 and 302) in 2005/2006 school year.

Two parallel classes are chosen from each school and the test results showed that in the classes whose idents do not use the site, of every 30 students 15 students (%50) are successful. When the parallel classes are nsidered, of every 30 students who use the site to learn mathematics 27 (%90) are VERY successful. The main ason behind this success was in the site students are advised to do exercises of each chapter. These results show at the site plays an important part in improving mathematics skills of sixth grade students.

After one year of trial suggestions of the teachers and active students of above mentioned schools are

counted for and the site is established fully functional. This site is integrated to Azerbaijan's local teaching portal d has been in use since 2006-07 school years. Over 4 million of students benefited from the site ever since.

Acknowledgements

We express our great gratitude to the principals of above mentioned schools for their efforts on separating rallel classes for testing of the site. (Classes denoted 6a used the site for mathematics class and classes denoted 6b l not use the site.) We also thank ministry of education workers for integrating the site to newly opened Ministry Education Portal.

Computers and children´s leisure time

Monika Žumárová21

Department of Social Pedagogy, Faculty of Education, University of Hradec Králové, Rokitanského 62, Hradec Králové 500 03, Czech Republic

Abstract

This work focuses on contemporary trends in leisure time activities of children with an emphasis on the growing impact of information and communication technologies. We spend more and more time at the computer, which greatly affects the lifestyle of all of us, especially teenagers and children. This study presents the results of a quantitative research survey focusing on the place of computer games and social networks in the leisure of children - how much time children spend at the computer during the week and during the holidays; in what kinds of activities they engage; how much time they devote to playing computer games, the Internet and social networks. The contribution deals with the benefits, but also the negative effects that computers produce.

Keywords: Children, leisure time, computers, lifestyle.

IETC 2014

1. Introduction

The topic of leisure time raises very pleasant feelings and thoughts of a time spent according to our interest, mood and possibilities. Our lifestyle and ways of spending free time are determined by our activities and the environment in which we grow up and live. On one hand, we are gaining possibilities such as mass communication, access to information or new technologies; however, the staggering pace of the technological revolution has its darker side as well. This concerns the spread of lifestyle diseases, social pathological phenomena and more and more frequent break-up of marriage and families and their communication. Another problem of contemporary families is insufficient communication between their members, which is realized via telephone calls, SMS, e-mails, chat, the Internet and social networks. These forms of communication are very comfortable but also impersonal, the result being a deterioration of family relationships. Modern communication and information technologies can be used both in good and bad ways.

Children dispose of a wide range of possibilities of spending their free time. The contemporary generation of children are excited about the new technological conveniences. (EU Kids, 2011) This is hardly surprising considering that many parents buy for their children the latest interactive toys since their infancy. These toys make sounds, shine with bright colours and are simply irresistible. The computer is a device found in every household and it is a common and indispensable tool influencing contemporary world. Children come into contact with computers before their enter school and use them to spend free time, to engage in attractive forms of entertainment and sometimes to communicate with their families.

The objective of the research survey was to describe current trends and ways of spending free time favoured by youths at secondary schools in the Czech Republic, focussing on the use of information and communication technologies and its impacts. Secondary objectives were to find out how much time children spend at the computer and whether they use this time also for education or solely for entertainment, furthermore, the research deals with the issue of the responsibility of parents, who should be aware of

* Corresponding author. Tel.: +420-493-332-525
E-mail address: monika.zumarova@uhk.cz

their children's ways of spending free time as well as the risks connected with spending several hours a day at the computer.

The use of free time is affected by many factors, such as natural and social conditions, personal circumstances and possibilities. Relying in the opinions of experts, we may define leisure time as a time span enabling free choice of activities, in which the individual engages willingly and which bring satisfaction and pleasant experiences.

Pávková et al. (2008) claim that we understand the term leisure time as "the opposite of obligatory work and duties, a time when we are allowed the free choice of activities, in which we engage voluntarily and with pleasure and which raise the feelings of satisfaction and relaxation." They include the following under the term leisure time: "relaxation, recreation, entertainment, hobbies, voluntary education, voluntary socially beneficial activities and time connected with them." The need for free time varies from person to person and so does our idea of free time. The use of children's free time depends to a large extent on their parents. They should profit from the possibilities offered by various organizations providing leisure time activities and consider the child's character and talents as well as his/her interests and choose an activity which will enable him/her to be successful in it and find satisfaction of his/her needs.

Children do not make a strict division between leisure time and other activities, games, work and educational activities; it is the motivation, competitiveness, emotions and natural curiosity which are crucial. (Charvátová, 2007) Games are an integral part of free time and the child should feel that s/he is not forced to do the activities and that leisure time brings pleasant amusement developing his/her abilities. The world of computers is very attractive to children because of its interactivity, accessibility and simplicity. Moreover, for the parents, the easiest way of attracting the child's attention and keeping him/her occupied often is to turn on the computer. The result is that the parents have plenty of time for themselves, they do not need to provide any other activities and most children, even the hyperactive ones, find computers compelling. Unfortunately, parents often use computers as a substitute for other possible leisure activities. They do not realize that prolonged time spent at the computer might be harmful to the children.

The development of personality is greatly affected by education and the social environment in which the child grows up. According to Pávková et al. (2008, , p. 15) it is the family who plays the key role in education, followed by preschool and school establishments and gradually by other institutions providing leisure activities. During adolescence, there is a strong influence of relationships with peers, which determine the choice of free time activities. Other important factors which have to be taken into account are mass media and information technologies, which play a significant role in interpersonal communication and which have become a common part of our lives. All of these influences overlap and supplement one another and a problem might occur at any stage of personality development, therefore it is meaningful to support young people and help them to overcome difficulties. Still, the cornerstone of forming interpersonal relationships as well as models is the family and the environment in which we grow up. Children gain the first experience of spending free time in the family. They perceive their parents as models and imitate their behaviour and lifestyle.

Nowadays, leisure time activities are a common part of our lives and the lifestyle of the family and its surroundings. *Lifestyle* is defined by Žumárová (2001, p. 158) as "an individualized and optimal organization of life into a harmonic whole. Lifestyle is characterized as a large complex of activities and the related attitudes, norms, values and habits, which has a lasting character and is specific for every person, expressing his/her individuality. The lifestyle of every individual is embedded in the wider social context, it is affected by historical development, traditions and the cultural and economic level of society." Kraus (2014, p. 173) draws our attention to the influence of information technologies in contemporary world, pointing out the "current phenomenon of the global forming of lifestyle being affected by the World Wide Web. This medium strongly supports the spread of global or consumerist lifestyle. Today, mass media announce what is new on the market, to what we should look forward, how to make money and how to live. Sadly, this supresses creative lifestyle, which encourages imagination, delight taken in being active and satisfaction from fulfilling one's duties."

The computer has become an entirely common device for the majority of us. Children see their parents use it and are not afraid of new technologies, neither the possibilities that computers offer. It is mostly elderly people who may have such worries, since working with computers makes them feel insecure. (Palyza, 2011) Children should gain the knowledge and experience necessary to work with computers and make active use of their assets and this knowledge should be provided mainly by their parents and teachers. The world of computers is very appealing and exciting to children and young people because it opens

IECT 2014

nearly limitless possibilities to develop one's ideas and thoughts and present them to other people. The young generation are not afraid of new technologies, they try out new possibilities and are attracted by the increasingly sophisticated and more powerful machines. (Nešpor, 1999) Teachers as well as parents should improve their knowledge and skills concerning computers and communication in order to be able to advise the children and show them how to make use of computers for their studies or their work in the future.

2. Empirical inquiry

2.1. *Research question*

The purpose of the research was to find out how much time children spend at the computer and whether this time span becomes longer during the holidays. Furthermore, the research deals with the fact that computer activities have become one of the most frequent ways of spending free time for children. This is why we also examined how the children spend the time with computers, whether they use them to find new information and to study or solely for entertainment in the form of computer games, chat and social networks. We were also interested in the risks connected with computer games or surfing on the Internet. In all of these areas, we verified whether there are any statistically significant differences depending on gender.

2.2. Research methods

The quantitative empirical survey was based on a questionnaire supplemented by interviews with pedagogues teaching ICT at the secondary schools attended by the respondents. We distributed the questionnaires personally in printed form and the pupils were informed of their purpose and instructed how to fill them in. The pupils filled the questionnaires in in ICT classes under the supervision of their teacher. In order to assure objectivity the questionnaires were anonymous. The questionnaire comprised 26 items and was divided into four parts. Part one focused on the basic personal data (gender, age etc.) and the activities in which the respondents engage during their leisure time. Some of the questions were bipolar, some were closed and some open. Part two dealt with the time spent at the computer and the specific activities of the respondents. The respondents were asked for a subjective estimate of the average time spent at the computer per working day. Part three concerned computer games. The respondents gave the frequency of playing computer games and the types of games which they play most. The final part focused on the risks connected with computers and computer games.

2.3. Research sample

The survey was carried out at seven secondary schools in the region of Hradec Králové in the course of November and December 2013. 857 pupils from secondary schools participated, 425 were boys and 432 were girls. They were aged from 12 to 14 years.

2.4. *Results and discussion*

The objective of the research was to find out how computers affect leisure activities of children at secondary schools. The obtained data show that 83,27 % of pupils have their own computer at home. Almost one half of the parents (44,74 %) use computers in their job and more than one half (67,32 %) use them at home. Thus, it is obvious that a computer is almost in every household and it is a part of common life.Computers represent a means of spending free time, which is supported by the fact that 63,81 % of children use them every day, while mere 36,19 % do not.

We also asked about the activities in which the children engage in their leisure time. They were given the following options: I do a sport, I attend art school, I spend a lot of time with my friends, I listen to music, I

IECT 2014

read books, I watch TV, I enjoy cultural activities (cinema, theatre) and I spend my free time otherwise. The pupils were allowed to choose more than one option. The most frequent leisure time activity of girls is listening to music (20 %), 16 % spend their time with friends, the time at the computer comes third with 14 %, followed by sports and TV with 13 %. Activities such as reading books, art school, culture and other activities all had below 10 %. Boys spend their free time mostly at the computer (19 %), second come sports and time with friends (18 %) followed by TV and listening to music (15 %), the remaining activities having below 10 % - reading books (8 %), culture, art school and other.

If we compare the two groups we see that computer activities are more frequently done by boys than girls (the difference being 5 %). Furthermore, sport is one of the top activities of boys and is less often preferred by girls (the difference being again 5 %). Girls attend art school more often (4% difference). Other activities are favoured more or less equally by boys and girls. Nevertheless, it is not possible to state that there are statistically significant differences depending on gender. Still, the results clearly show that computers have become one of the favourite means of spending free time for children at secondary schools.

2.4.1 Average time spent at the computer and the most frequent computer activities

The obtained data indicate that on average, children spend 2,47 hours a day at the computer and there is no statistically significant difference depending on gender. The most frequent answer was that the respondents spend 3 hours per working day at the computer. Children have more leisure time during the holidays, which they spend at the computer. We asked about the time spent at the computer at the weekend (i.e. on Saturdays and Sundays). The answers suggest that in this case the average time is 3,475 hours, which is approximately 1 hour more than on working days. On average, girls spend 2,273 hours a day at the computer at the weekend, while in boys the figure is 4,752. There is a statistically significant difference this time. We suppose that the time may be even longer during the holidays, however, it would probably depend on the season. Computers offer a wide range of activities. One of the goals of our research study was to find out in which computer activities children engage. Several activities were proposed in the questionnaire with the possibility to choose more than one option and add one's own.

The most frequent computer activity in boys are computer games (26,15 %), which confirms the statement that boys play computer games more than girls. Second comes search for information (16,49 %, the nature of the information was not specified in the questionnaire). The third place was taken by chat (16,34 %), which is a form of online communication. Again, it was not specified whether the respondents communicate with friends or strangers. Chat was followed by social networks (14,71 %), which is a new and a very popular computer phenomenon. The fifth place was taken by downloading music and films, which is connected with the children's interest in music described as one of the favourite activities in part 1 of the questionnaire. The remaining activities mentioned were e-mails (6,09 %), education (5,79 %) and other activities (1,34 %). Graph 2 gives the same data for girls.

The most frequent activity in girls is the use of social networks (20,16 %) followed by chat with 19,04 %, which demonstrates the difference between the preferences of boys and girls. Girls use the computer more as a means of communication, while for boys it is rather a means of entertainment. The third place in the case of girls was taken by search for information (17,60 %). Downloads of music and films come next (16,16 %). Computer games have mere 12 %, which is almost one half less than in the case of boys. This graph therefore again suggests that girls play computer games much less often than boys. The percentages of the remaining activities are: emails (7,04 %), study (4,96 %) and other activities (3,04 %).

The results of the survey and verification of hypotheses show that children still spend a great portion of their free time at the computer. Computers are an entirely common part of everyday life and enter the world of leisure time activities of many children. What was impossible to imagine ten years ago has become commonplace today. We should approach computers as useful tools facilitating communication, work and giving access to a huge amount of information. Nevertheless, it is also important to realize that they cannot replace other leisure activities representing healthy lifestyle of contemporary young generation. Parents should certainly offer other options to their children, such as sports, interest groups or time spent with the family and friends. Too much time spent at the computer has its risks and undesirable consequences for health.

IECT 2014

2.4.2 Preference for various computer activities

The need for game is natural for every child. Nowadays, children are surrounded by very sophisticated technological toys practically since their birth. Interactive toys, which are very popular with children, flash, move, play melodies or even talk. The lures of publicity and various catalogues capture the attention of parents and children since very young age, the strategies of producers and retail chains are perfect and impossible to fight or resist. Therefore, it is not surprising that if the child plays with sophisticated technological toys since his/her infancy, the computer seems common to him/her. Children like to try something new, appealing and interesting. It is impossible to prevent technological development and progress or completely forbid the children to use computers, nevertheless, it is important to consider alternative possibilities. It is desirable to introduce computers to the children step by step, set clear rules restricting their use and ensure that they will be observed. (Nešpor, 1999) Games clearly are natural activities for children, who should be offered the choice of various leisure time activities, which the parents encourage and are able to take part in them. The results of our survey already showed that the computer is one of the most frequent means of spending free time in children at secondary schools. Computer games are one of their favourite activities, especially in boys. Computer games can simulate situations in which many players never find themselves in real life. Players identify with heroes and experience the feeling of dauntlessness, the games stimulate competitiveness, logical and strategic thinking. These possibilities of self-realization and active participation in the game are appealing mainly to boys. The data based on the questionnaires brought information about the number of children who play computer games, the time spent playing and their preferences for particular genres of games. The results suggest that boys play computer games more than girls. Almost 46 % of girls play no computer games, while 94 % of boys do play computer games and mere 6 % do not. 20 % of boys and 23 % of girls play one game, 24 % of boys and 19 % of girls play two games. It is alarming that 50 % of boys play more than two games, while the same figure for girls is mere 12 %. A statistically significant correlation between playing computer games and gender was confirmed.

It is clear from the survey that computer games are still very popular with boys at secondary schools. We also intended to find out which types of games children prefer. We worked with the categorization of games devised by Černochová, Komrska & Novák (1998), who differentiate between the following genres: combat games, simulations, strategy games, puzzles, 3D-action games, sports games, adventure games, online games and other. The respondents were allowed to select more than one option. Boys like mainly online games and combat games, simulations and strategy games follow. Girls also prefer online games, followed by puzzles and strategy games.

Another area of our research was the average time spent playing one of the computer games. According to the results 12 % of boys and 48 % of girls play one game for less than 30 minutes. The next option (30 minutes to 1 hour) was selected by 41 % of boys and 28 % of girls and the last option (I play the game for more than one hour) was selected by 47 % of boys and 24 % of girls. We may therefore state that on average, almost one half of boys (47 %) who play computer games spend more than one hour a day playing. Moreover, a statistically significant dependence on gender in this area was confirmed.

2.4.3 The awareness of the risks connected with the use of computers and social networks

Computer games are becoming more and more sophisticated thanks to new technologies and lifelike graphics capable of drawing the player into their reality. Furthermore, the games are more accessible, even very young children being able to download them from the Internet. According to the opinions of experts, computer games can be a springboard for crimes, pathological behaviour and increased aggression in the society. The player feels as a mighty hero and is incapable of separating the virtual reality from the real world. S/he does not perceive the suffering of victims in combat and action games and consequently killing in reality does not appear frightful to him/her. The experts further point out the connection between the increasing violence in virtual reality and very frequent bullying and aggression in young people. One of the aims of the study was to learn whether children are aware of certain risks connected with playing computer games, whether they have been told about them and know something about them. 70 % of girls and 62 % of boys have already heard or know about the risks of frequent playing. Nevertheless, it is difficult to estimate whether the information is sufficient to dissuade children from playing.

The limitless possibilities which the computer brings are largely due to the Internet. It is a huge world of

IECT 2014

information which the children navigate skilfully and fearlessly and which offers communication, entertainment and freedom. This is truly compelling for most children, which many experts, schools but also responsible parents realized in the past few years. That is why one of the objectives of this study was to find out whether children are aware of the risks connected with computer use and communication via social networks. (Palyza, 2011) We assumed that the majority of children know the risks or at least heard about them, nevertheless, it is important to observe certain rules and be responsible. 92 % of girls and 79 % of boys have a profile in one of the social networks. These figures confirm the significance of social networks as a phenomenon of the present day, which is very popular, especially with young people. Social networks have become a trend mainly among children and young people, they enable communication with the whole world. The Interned is flooded with countless webpages used by people from the whole world to meet in virtual reality, communicate, share information, videos and pictures, exchange contacts and discuss their hobbies. The list of activities and possibilities at social networks is very long and beside a number of assets it brings a relatively large number of risks and dangers. Experts (Šmahel, 2003; Palyza, 2011) warn about the danger of personal data being stolen and abused. Children willingly share private information, e.g. about their interests, studies, activities or friends and the information spread very fast among a large number of people. Data of this nature as well as photos and videos may be easily abused. Another danger consists in the creation of fake profiles designed to gain the children's trust. Therefore, children should know about these risks, which may produce more problems. Many young people defend themselves claiming that their profile is not public and their messages and photos are only accessible to their friends. However, they do not realize that even their friends and family may abuse the data. It is desirable to warn the children but also their parents about the risks and explain how to protect themselves from possible consequences.

Further inquiry focused on whether children used social networks for what is considered high-risk behaviour, such as chatting with strangers and discussing their personal problems with them. The results showed that 40 % of boys and 45 % of girls chat, i.e. communicate, with strangers whom they never met in person. Another finding is that respondents do not talk about their private matters and worries with strangers – 86 % of boys and 95 % of girls do not write about their problems on the chat. Another risk consists in making personal photos public at social networks. Contemporary young people take pleasure in photographing anyone and anything that they find interesting. The popularity of taking photos is further supported by the fact that modern mobile phones are equipped with a quality camera and photographing and videotaping is easy even for young children. People possess large numbers of photos which they never get printed but simply upload them to a server designed for storing and presenting photographs. These photographs are only accessible to those who know the password. Another possibility to share photos is to use the application at Facebook enabling the upload of a nearly unlimited number of photographs to one's profile. Children do not consider sharing of photographs risky – 69 % of girls and 45 % of boys stated that they upload their photos to public servers. It is clear that girls share photos more than boys. The connections between profiles of friends make the photos accessible to a large number of users, which young people and children often fail to realize. They risk the loss of anonymity and potential abuse of their personal data.

We further verified whether parents know with whom their children chat, which might lower the risk of the abuse of personal data. The results clearly show that parents are no longer really in control over their children's communication via social networks. 35 % of boys and 41 % of girls answered that their parents know about the people with whom they chat. We may compare these figures with a related question asking about whether parents check their children's e-mails. The answers suggest that parents are unaware of whom their children write to over the Internet – the parents of 89 % of boys and 92 % of girls do not check their e-mails at all. We may consider e-mails to be a substitute for traditional written letters protected by privacy of correspondence. This makes us assume that the majority of parents find it improper to read someone else's letters. Moreover, e-mails are not connected with some of the risks of using chat at the social networks.

The Internet also provides access to information inappropriate for children. Such dangerous webpages may have erotic content or advance violence. (Konečný, 2011) Children are relatively skilful in Internet surfing and capable of circumventing simple measures blocking the inappropriate webpages. Our intention was to ascertain whether parents restrict the access to some unsuitable webpages. The answers show that parents of 46 % of boys and 39 % of girls check the visited webpages, while 54 % of boys and 61 % of girls stated that their parents are not aware of which webpages they visit. These results make it evident that the control on the part of the parents might be much stronger. We must hope that education

IECT 2014

and prevention in this area increase and parents become more responsible. Furthermore, there are organizations founded specifically for the purpose of protecting children from the dangers connected with the use of the Internet. In total, 76 % of boys and 80 % of girls claim that they observe the rules and do not put their personal data on the Internet. This means that 77,82 % of children observe the rules of safe handling of personal data on the Internet.

2.4.3 The awareness of the risks connected with the use of computers and social networks

The final part of the survey asked about the pluses and minuses of computers and activities connected with them. The respondents were allowed to select more than one option and add their own. As for the pluses of computers, the option most frequently selected by girls was the use of computers in many different fields, while boys selected mainly the option of the computer as a means of entertainment. The second most frequent answer given by girls was easy text processing plus access to information and entertainment, followed by storage of data. Boys put access to information second, followed by storage of data, easy text processing, and the use in many fields coming as the next-to-last option. Other options frequently added by the respondents include downloading of films and supplementary tool of education.

As far as the minuses are concerned, both boys and girls put addiction to computers first, possible criminality and pathological phenomena second and loss of communication and real relationships third. Both genders further selected time consuming nature of computer use, followed by the loss of anonymity. The most frequent other options included mainly medical issues caused by computers such as deterioration of sight, headache and backache.

The overview of answers clearly indicates that children are aware of certain risks and dangers connected with computers. On the other hand, the pluses of computer use prevail. Children cannot imagine their lives without computers, which is a development that we cannot stop.

The interviews with teachers suggest that information technologies entered the teaching of almost all subjects at secondary schools. The teachers use projectors connected to the computer to present information, pictures and videos. The teachers teach the children to make efficient use of the advantages of computers and also warn them about the possible risks. However, schools do not use software blocking inappropriate webpages. Another desirable thing is the cooperation with parents, which helps them not to underestimate the risks connected with the use of computers and the Internet.

3. Conclusion

Computers have become a common tool in our households, therefore parents should be aware of all the risks connected with their use by children. In functional families, computers are regarded as creative toys providing entertainment for the child but also access to information and essential help with study and work. It is useful to set clear rules of computer use, which the children should observe from the very beginning. The world of computers may have a positive educational influence on children and we cannot forbid the children to enter it or ignore it. It is desirable to explore it and spend our leisure time at the computer together with the children. Nevertheless, the computer cannot replace face-to-face communication and real family relationships, therefore, parents should know about the computer activities in which their children engage.

Černochová, Komrska & Novák (1998) summarized some of the recommendations for parents concerning the work with computers:

- Choose computer games for the children carefully, try to be well informed about the supply and respect the child's preferences.
- Monitor how much time the child spends at the computer and provide alternative activities, such as going out, sports or other hobbies.
- Work with the computer together with the child, be interested in his/her computer activities and the people with whom s/he communicates.

IETC 2014

- Require specific results of work with the computer, help the child to search for information and process it;
- Set time limits restricting computer use.
- Do not use the computer as a reward or punishment.

The objective of the present study was to draw the attention to the time spent by children by playing computer games as well as the possible problems which computer games might cause. Playing of computer games have no significant benefits, it is often a mere means of combating boredom or making up for bad relationships and communication in the family. Parents are very busy and the present global unfavourable economic situation contributes to fact that children spend little time with their parents and do not engage in more appropriate leisure time activities. Therefore, it is important that experts and teachers should warn about the risks connected with too frequent use of computers.

Healthy lifestyle and good use of free time should be a priority for all young parents, especially given the possibility to spend the time in a meaningful way and with minimal expenses. All we need is to find the time. Still, it should clearly be very easy to find considering how much of it we devote to entertainment and communication over the Internet.

Concept of legal protection of intellectual property rights

Baimoldina Svetlana Malikovna22
The candidate of jurisprudence, the associate professor of criminal and legal disciplines

of Eurasian National University, 2, Mirzoyana str., office 421, Astana, 010008, Kazakhstan

Abstract

Evolutionary processes of political system of society inevitably influence a condition of structure of the public relations, first of all, on formation of a new legislative platform of the state. Finding of the state sovereignty of the Republic of Kazakhstan promoted creation of objective public prerequisites for creation of the new legislative norms governing the public relations in qualitatively changed socio-political conditions.

Keywords: concept intellectual property, exclusive rights, patent, scientific works, industrial sample

IETC 2014

1. Introduction

In the context of joining International organizations, multilateral international agreements, which have mandatory requirement for equal protection of intellectual property right for both domestic and foreign authors, anticipating entrance of the Republic of Kazakhstan to the World Trade Organization (WTO), verya actual is the problem of improving measures, aimed at fighting problems of legal protection of intellectual property, in particular, providing their legal protection, preventing crimes in the spheres of using results of intellectual activity.

Professor Dzhekebayev U.S. is right claiming that "the new economic relations in our country are inseparably linked with formation and development as the states, and is right. Processes of cardinal updating of public life are accompanied by revaluation of many parties of legal life of the Republic, including methods and ways of the organization of fight against crime, improvement of the criminal, criminal procedure legislation. In this regard high-quality changes undergo criminal and legal and criminological theories. A number of the theoretical provisions which were considered until recently as firm, such as the bases of criminal liability, category of crimes, fault forms, the subject of a crime, the purpose of criminal penalty, are critically reinterpreted taking into account social changes, concrete requirements of law-enforcement activity".

The laws governing the public relations, arising at creation, use and operation of objects of the intellectual property, the systems which have laid to the main legislative foundation for protection of objects of intellectual property were consistently adopted. First of all, the Constitution of the Republic of Kazakhstan, which article 20 proclaims a freedom of speech and creativity, and also some other acts.

It should be noted that the legal language used in the sphere of a turn of creative results of human activity, such as, for example, the concept "intellectual property", "exclusive rights", "piracy" arose recently.

Now illegal use of objects of intellectual activity by various enterprise structures causes great damage not only to authors, founders and performers of objects of intellectual property, but also a significant

* Corresponding author. Tel.: +0-000-000-0000 ; fax: +0-000-000-0000 .
E-mail address: author@institute.xxx

damage to the state as in the budget of the state taxes for production, use and trade of counterfeit production don't arrive.

"In the participating states of the CIS level of counterfeit production fluctuates from 73% to 94% (Ukraine – 90%, Belarus – 94, Kyrgyzstan – 86, Georgia – 73%, and two last countries are members of the WTO), and in such countries as the USA, Great Britain, France, the Czech Republic it makes less than 10%, Finland and Italy – 10-25%, Poland and Brazil – 25-50%".

In legal literature illegal use of intellectual property rights also is called as "piracy", and production used by "pirates", not license production is called counterfeit or "piracy". The word "pirate" occurs from the English word "piracy", having following value:

1). piracy; piracy action;
2). author's offense of author's, publishing or patent law; plagiarism; counterfeiting;
3). illegal activity (especially unregistered radio station, private bus).

The concept of counterfeiting by scientists is understood as various illegal actions in relation to objects of intellectual property. So, for example, according to Shershenevich G. F. "distribution of the literary work for this purpose reproduced completely or in large part by the person which has no copyright and didn't get permission to that from the author or his successor, is called as counterfeiting and makes a criminal offense. However the room in anthologies of articles or fragments from other compositions, at least and more printed page isn't forbidden.

Pilenko A.A. opening counterfeiting questions in relation to patents, I meant the following: "under patent counterfeiting certainly deliberate and unauthorized implementation of the rights implementation of the rights belonging to the patentee, made in the territory of the state which has granted the patent, at such moment when this patent had prohibitive force and in the form of such activity which aimed at systematic contact with uncertain number of the third parties".

Besides, "violations of the right for works of art can happen doubly: a) any repetition, for monetary benefits, a work of art in its whole structure, without formal consent of the person having not of it the exclusive right, is called as counterfeiting, or illegal copying.

Counterfeiting will be, for example, the copy pictures, being at an exhibition, for its room in the magazine, the statue image on medals, creation of the building according to someone else's plan or a facade. However our law doesn't consider as counterfeiting that case when work of painting is represented by means of a sculpture and vice versa; c) repetition of separate parts from others work of art in the work is called as plagiarism, or illegal loan. The choice from others picture of groups, figures, the heads, a landscape, a sea look and their room in the picture with observance of the same drawing and lighting".

Defining the circle of people, carrying out counterfeiting, Pilenko A.A. considers that "first of all, the one who made this invention can be a countrefactor, certainly; and, in particular, in two cases: 1) as in, when the patentee declared the invention, him independently made and only incidentally coincided with what was also independently made accused (parallel creativity), and 2) also in, when the patentee borrowed – in this or that (even dishonest) – a form at accused the invention made this by last".

Use of counterfeit work without extraction of material benefit also is the fact of violation of intellectual property rights as exclusive rights of the author or the owner are thus violated.

Now the majority of the countries which are carrying out legal protection of objects of intellectual property, are guided by the term approved by the World Intellectual Property Organization (WIPO) by point VIII of Art. 2 from July 14, 1967. In particular, in it is specified that the intellectual property includes the rights relating to:

- to literary, art and scientific works;
- performing activity of actors, sound recordings, radio - and to telecasts;
- to inventions in all areas of human activity;
- to discoveries;
- to industrial samples;
- to trademarks, service marks, trade names and commercial designations;

IETC 2014

- to protection against unfair competition;
- and also all other rights relating to intellectual property in production, scientific, literary and art areas.

"The term "intellectual property" in this convention is used in collective sense, designating itself all rights for results of creative activity and some objects equated to it. The list of concrete types of exclusive rights containing in the Convention has approximate character and can be easily added with other results of intellectual activity. That the obligation to provide protection of all rights listed in the Convention in the countries isn't imposed on members of VOIS is obvious also and they define a circle of protected objects of intellectual property. That the obligation to provide protection of all rights listed in the Convention in the countries isn't imposed on members of VOIS is obvious also and they define a circle of protected objects of intellectual property".

According to some scientists, for example, Dozortseva V.A. "the term "intellectual property" is submitted legally insufficiently incorrect. It can make impression about distribution on results of intellectual activity and in general on non-material objects of the mode established by the law for the property right. This impression would be wrong". However, despite it, this term is legislatively fixed and gained rather wide circulation.

Merzilkina R. A. considers that "the intellectual property differs from real property that it possesses dual character: it is non-material, spiritual, however objected by means of the material carrier and when using results of intellectual activity certain material benefits not only for satisfaction of needs of the founder, but also all society" are created.

National legislations define distinction in concepts and norms about intellectual property, "existence of various legal systems and concepts, according to Churin N. F. complicates elaboration of definition of this concept exact, comprehensive and satisfying all as it is unequal in various countries".

The legislation of the Republic of Kazakhstan defines the list of objects of intellectual property in the new Civil Code where in section 5 called "Intellectual property right" all known types of objects of intellectual property, the bases of emergence of the rights for objects of intellectual property, personal non-property and property rights, exclusive rights and the property right to objects of intellectual property, validity periods and transition of exclusive rights to other person, ways of protection of exclusive rights are characterized.

According to Civil Code Republic of Kazakhstan Art. 961 objects of intellectual property right treat:
1) results of intellectual creative activity;
2) means of an individualization of participants of a civil turn, goods, works or services.
Results of intellectual creative activity treat:
1) works of science, literature and art;
2) executions, soundtracks and transfers of the organizations of a broadcasting;
3) inventions, useful models, industrial samples;
4) selection achievements;
5) topology of integrated chips;
6) unsolved information, including know-how (know-how);
7) other results of intellectual creative activity in the cases provided by the present code or other acts.

Means of an individualization of participants of a civil turn, goods, works or services treat:
1) trade names;
2) trademarks (service marks);
3) names of places of an origin (indication of an origin) goods;
4) other means of an individualization of participants of a civil turn, goods and services in the cases provided by the present Code and acts.

Objects of copyright, according to the Law RK "About Copyright and Adjacent Rights" of June 10, 1996 No. 6-1, Art. 7 are:
1) literary works;
2) drama works;
3) scenario works;

IETC 2014

4) choreography and pantomime works;
5) pieces of music with the text or without text;
6) audiovisual works (film, TV and video movies, filmstrips and others film and teleworks);
7) works of a sculpture of painting, graphics and other works of the fine arts;
8) works of applied art;
9) works of architecture, town planning and landscape gardening art;
10) photographic works and the works received in the ways similar photo;
11) cards, plans, sketches, illustrations and the three-dimensional works relating to geography, topography and to other sciences;
12) computer programs;
13) other works.

Objects of copyright also treat: derivative works (translations, processings, summaries, papers, summary, reviews, performances, musical arrangements and other processings of works of science, literature and art); collections (encyclopedias, anthologies, databases) and other compound works representing on selection and (or) an arrangement of materials result of creative activity.

As specifies Serebrovsky V. I., "copyright governs only those relations which are connected with creation and use of works of science, literature and art".

"Object of copyright, - Shershenevich G. F. wrote. - the literary work as the product of spiritual creativity given a written or verbal shape and intended to the address in society is. Reports on court sessions, scientific societies, zemstvoes, etc., not expressing spiritual creativity of their originators, can't be considered as such objects".

In the dictionary of russian of Ojegov S. I. there are two semantic values of work: 1. Creation, product of work, creativity, nature work, work of art, literary work. The second value of this word means result, a result of multiplication .

Generalizing work as a material benefit in a counterbalance of the philosophical category combining the material and ideal phenomenon, Militsin A. gives the following definition of work: work in author's and legal sense – object of a material world, a product of creative activity of the person, existing or existing in the objective form, protected by copyright as individual connection of a matter and a form and as that or in the form of the copies capable to be object of the real rights.

Necessary criterion of object of copyright is creative character and an objective form of its expression. There are different formulations of concept of creativity. According to Yurchenko A.S. creativity is not "intuition", not sudden "inspiration", not unconscious inspiration when the invention or an improvement suggestion appears suddenly, without labor efforts of the person. Creativity is a work, besides work difficult and laborious, caused by social requirements of society. Technical creativity as is natural as development of technology" is natural.

Creativity is peculiar only to the people possessing creative thinking. This circumstance needs to be considered in the course of identification of perpetrators, involvement of suspected persons to the criminal liability, intellectual property rights carrying out violation, and also the characteristic of the identity of the studied criminal.

Necessary indicator of creative activity is the novelty of work which is expressing as in an external form (objective signs of work), and in the internal contents (subjective signs of work). There are the works which value can be shown in the most part in an external form. Works of the fine arts belong to such works.

For work creation the author sometimes needs certain time. The author, in search of the new image, a new form of work, the solution of any task, abstracts, dreams, analyzes information arriving from world around and comes to the new decision, before, born in consciousness of the person, and then, are embodied in a material subject. But the law protects only what have a material embodiment in various forms, allowing to perceive work by sense organs. The ended work may contain some parts which can be separate independent independent works or to be visually and are ideologically interconnected with each other, are addition of the following or the previous component.

IETC 2014

"Copyright and related rights, - Pankeev I.A. fairly notes. - can exist and be protected fully only when they will be effectively protected. Numerous researches, acts etc. are devoted to ways and methods of such protection. It is a question not only of a piracy, unauthorized the print out and reprints, plagiarism, illegal sale, etc., but also of fair terms of the contract, high-quality execution of the taken obligations".

In the Law of the Republic of Kazakhstan "About copyright and related rights" of June 10, 1999 in article 6 of item 2 it is specified that copyright extends both on the published works, and on the unpublished works existing in any objective form: 1) written (manuscript, typewriting, musical notation, etc.); 2) the oral; 3) sound-or videos; 4) images; 5) volume and spatial and in other forms. In the same article it is said that copyright doesn't extend on actually ideas, concepts, the principles, methods, systems, processes, opening and the facts [13, Art. 6].

Also, copyright of work isn't connected with the property right to material object in which work is expressed. Transfer of the property right or the right of possession of any material object doesn't attract transfer of copyright of the work expressed in this object.

Copyright arises at the time of creation of work of science, literature and art in an objective material form, and for objects of copyright it isn't required to obligatory registration of work, other special registration or observance of any formalities. The author and (or) the owner is enough for the notification about the exclusive property rights has the right to use a sign of protection of copyright which is located on each copy of the work, consisting their three elements:

1) Latin letter "C" in a circle ©;
2) Name (name) of the owner of exclusive copyright;
3) Years of the first publication of work.

The author or the owner can register the rights in official registers. Registration is carried out by authorized body according to the legislation of the Republic of Kazakhstan, namely according to the Instruction about the state registration of the rights for the works protected by copyright and the adjacent rights.

The subject of copyright is the natural person which creative activity created work. If work is created by joint work of two or more persons in a co-authorship, the right for the created work belongs to authors in common irrespective of, whether forms such work one indissoluble whole or consists of parts, each of which has as well independent value.

Questions of the theory of development of copyright as subjective civil law by the legislation of the Republic of Kazakhstan Ikhsanov E.U. brought.

The part of the rights for work can pass to the legal entity on the basis of the author's contract, according to the current legislation of the Republic of Kazakhstan "About copyright and related rights". In more detail questions of transition of copyright under the contract reveal in Abuova R. Z. scientific works.

Features of transfers of rights at the conclusion of the author's contract for works of the fine arts are in details shined in Ikhsanov U.K. scientific works.

With the advent of new technologies and forms of fixing and reproduction of sounds and the image, transfer to air, a cable broadcasting, there was an opportunity to extend works in unlimited number that in turn promotes illegal use of works without the knowledge of authors and performers. In this regard, there was a new form of fixing of the rights of authors and performers, is called as the adjacent rights. The adjacent rights are regulated by the Law of the Republic of Kazakhstan "About copyright and related rights".

According to article 34 of the Law of the Republic of Kazakhstan "About copyright and related rights" the adjacent rights extend on statements, executions, soundtracks, transfers of the organizations of an on-air and cable broadcasting irrespective of their appointment, the contents and advantage, and also from a way and a form of their expression.

Subjects of the adjacent rights are performers, producers of soundtracks and the organization of an on-air and cable broadcasting.

IETC 2014

As well as for copyright, for emergence and implementation of the adjacent rights it isn't required observance of any formalities. The manufacturer of a soundtrack and (or) the performer for the notification about the rights has the right to use a sign of protection of the adjacent rights which is located on each copy of a soundtrack and (or) on each case containing it and consists of three elements:

1) Latin letter "P" in a circle: ®;
2) name (name) of the owner of the exclusive adjacent rights;
3) years of the first publication of a soundtrack.

Actions of the adjacent rights is carried out in case of observance of the certain conditions stipulated in article 36 of the Law of the Republic of Kazakhstan "About copyright and related rights".

Further, the following group of objects of the intellectual property, protected Art. 184-1 of Criminal Code Republic of Kazakhstan, is objects of industrial property. The inventions, useful models, industrial samples belong to industrial property.

The public relations, namely, property, and the related non-property relations arising in connection with creation, legal protection and use of objects of industrial property, are object of regulation of the Patent law of the Republic of Kazakhstan, No. 427-1 accepted on July 16, 1999.

The device, way, substance, strains of microorganisms, cages of plants and animals, and also use of the device known earlier, a way, substance, a strain on new appointment can be objects of the invention.

Other objects of intellectual property (selection achievements, topology of integrated chips, trademarks, service marks, names of places of goods origin and others), are regulated by other acts.

The significant contribution in formation and development of science of intellectual property right to the Republic of Kazakhstan, mainly Patent law, was brought by professor Kaudyrov T.E. In particular, it defines system of the legislation on protection of intellectual property rights in two main directions: statistical and dynamic aspects.

All normative legal acts concerning results of intellectual creative activity, make separate subsector of the civil legislation – the legislation on intellectual property. This subsector including according to electronic legal base about 70 regulations of various level, was finally created and assumed logically verified air with acceptance in 1999. Special part of the Civil code of RK. In system of institutes and sections of civil law this subsector it is accepted to call "intellectual property right".

Over time the public relations concerning protection of intellectual property rights developed step by step and supplemented with new laws, normative legal acts. Historically, intellectual property right shared on two main types: copyright and related rights and patent law.

Forming concept of legal protection of intellectual property rights, we will consider contents of the word "protection of intellectual property rights". In Ojegov S. I. dictionaries. Dalya V. I. legal dictionaries there is no separate independent concept of protection of intellectual property rights.

In the dictionary of russian of Ojegov S. I. under the word protection, is understood four different values: in the first understanding it is meant "protecting, to protect from encroachments, from hostile actions, from danger, to protect the child, to protect the city from the enemy, to protect, secure against something, to defend (opinion, views) before someone's criticism, objections, to protect the point of view, to defend the dissertation, the project, the diploma – publicly at meeting of an academic council or before the special commission to defend provisions of the thesis, the project, the diploma.

In the second understanding: protection is that protects, serves as defense, to look for protection, be to me protection, to take under protection.

In the third understanding: the word protection makes the collective sense, the protecting party in trial.

In the fourth understanding: the word protection has collective value: part of team (football, hockey) which protects gate to play in protection.

IETC 2014

In Dahl V. I. explanatory dictionary. under the word to protect, protect it is meant to preserve, protect, defend, defend, to intercede, not to give in offense; to close, block protecting, to protect itself, to protect himself. Protection – anything, the subject hiding, protecting, protecting whom or something; defense, protection, board. God – my protection! Protect, defender.

In the legal encyclopedia under Tikhomirov M. Yu. edition. also there is no concept of protection of intellectual property rights. In this encyclopedia the word "protection" (English defense, protection) is understood in two aspects: in the first aspect protection is a complex system of the measures applied to ensuring free and appropriate realization of the subjective rights, including judicial protection, legislative, economic, organizational and technical, etc. means and actions, and also self-defense of the civil rights. In the second aspect protection is the right accused or suspected to be protected from charge by means of statements and petitions, uses of legitimate rights, etc. in the resolved way, and also at any stage of process to demand presence of the defender. The defender has to watch strict observance of formalities during process and, without breaking a duty to give truthful evidences or without applying the proofs forging truth, to take measures to that the accused wasn't condemned without sufficient proofs.

About the importance of protection of inventions Shershenevich G. F. notes as follows: "the exclusive situation created in favor of the inventor by the right provided to it, puts it in especially advantageous position in comparison with other producers".

According to Gavrilov E.P. "about protection of copyright speak when they are violated or can be broken, i.e. there is a threat of illegal invasion into the sphere of copyright belonging to a certain person (including the organizations). [28, p. 50].

Historically, intellectual property right shared on two main types: copyright and related rights and patent law. "The patent law, - according to Kaudyrov T.E. is a set of the norms regulating an order of registration or other registration, use, the order, protection of the rights for objects of industrial property".

Other subsection of institute of intellectual property right Kaudyrov T.E. calls copyright.

This formulation, certainly isn't applicable to protection of intellectual property rights, and in our opinion demands some completion since, specifies only certain narrow part of the public relations.

Besides, word "set" often applied in legal literature makes the sense consisting in biological interaction of live organisms therefore, in our opinion, replacement of the word "set" by the word "complex" in this connection, we offer the following formulation is more ethic:

The legislation on intellectual property represents a complex of the rules of law, regulating public legal relationship in the sphere of the intellectual property, arising in the course of creation, registration, realization, use, protection of intellectual property rights.

Thus, proceeding from the above, legal protection of intellectual property represents a complex of the rules of law, regulating public legal relationship in the sphere of the intellectual property, arising in the course of creation, registration, realization, use, protection of intellectual property rights.

Copyright – a complex of the rules of law covering public legal relationship in the course of creation, registration, use, protection of the rights for objects author's and the adjacent rights.

Patent law – a complex of the rules of law covering public legal relationship in the course of creation, registration, use, protection of the rights for objects of industrial property.

IETC 2014

Conceptualizing security measures on mobile learning for Malaysian higher education institutions

Farrah Diana Saiful Bahry[a], Norizan Anwar[a], Noraizan Amran[a], Riaza Perveen Mohd Rias[b]

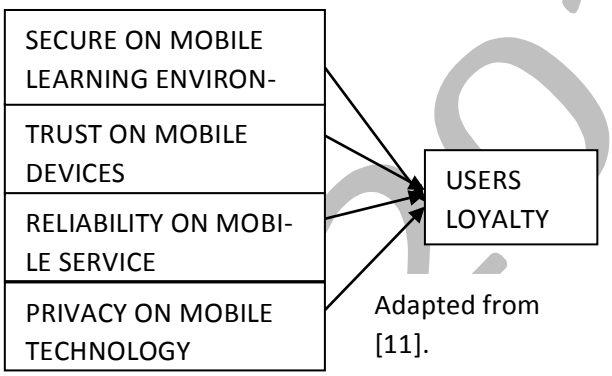
[a]*Faculty of Information Management, Universiti Teknologi MARA, Shah Alam, Selangor,Malaysia*
[b] *Faculty of Computer & Mathematical Sciences, Universiti Teknologi MARA, Shah Alam, Selangor,Malaysia*

Abstract

The paper examines the existing researchers view on security measures on mobile learning. In general, it discovers related measure on security which includes reliability, trust, privacy and security itself. Each measure is widely used as determinants in previous studies and its range in some environments and perspectives. Reliability and security determinants are widely adapted to measure in terms of the infrastructure of mobile learning environment, while trust and privacy mostly measure behaviours and perceptions from the user or human towards mobile learning. Furthermore, the study will also investigate the infrastructure and components of mobile learning itself in order to determine the security vulnerabilities that may involve in the mobile learning environment. Other security features that are discussed at glance include the key distribution and management, information confidentiality and privacy, secure routing, intrusion detection, data integrity, entity authentication and secure data aggregation. However, at the end of this study, mapping on the relevent security measures with each component of mobile learning will be formulated for further study.

Keywords: Secured Mobile Learning; Trust; Reliability; Privacy; Users Loyalty; Malaysian Higher Education Institution;

1. Introduction



Since in the year 2006, people were moving to webs 2.0, therefore teaching and learning were expanding towards the e-learning style. The birth of Y generation which hunger of online communication supporting with the existence of gadgets such smart phones and tablet PCs in the market also drive the trends of mobile learning to take in part. Malaysians nowadays are also accepting the new era of online communication and heading towards mobile computing. Thus, mobile learning is an initiative for Malaysians to have/engage lifelong learning especially for those who are employed and those who have anxiety in information seeking. The term M-learning approach is given to the delivery of learning materials by the means of mobile devices that can be accessed from anywhere at any time. Currently, some of the higher institutions use the Mobile Learning Systems (M-LS) as a complementary to obtain the aforementioned advantages. Due to the varieties and limitations of mobile devices, there is no conventional standard or specification to develop the M-LS. Thus, there are various types of M-LS using different specifications depending on the case study. Nevertheless, evaluation has been made according to their capabilities and services that they support using some of the indicators which are specified in (Dye and Torstein 2008; Attewell 2005; Evgeniya et al. 2005; Naismith et al. 2005; Riaza & Fazilah 2010). This include the types of supported mobile devices; availability of content; supported types of data and tools used; and types of information. (Devinder and Zaitun, 2006) have developed the M-learning application for wireless classrooms at the University of Malaya which aims to facilitate the educational opportunities of teaching in a real time wireless classroom using the Pocket PC, notebook and mobile phone as learning instruments on the Windows platform. Moreover, (Anang et al., 2006) have also developed the M-learning management tool in campus-wide environment by using the Microsoft.Net infrastructure which is the Windows platform. Learning theories have also been proposed to be included in the IDM. Amongst them include the

IETC 2014

Behavioral theory, Cognitivism and Constructivism. All these learning theories serve an essential part in the students' learning and understanding (Riaza and Halimah, 2011).

2. The proposed framework

The model below was conceptualized when studying existing literature on security and related variables. Based on the literature reviewed, we adopt the measures that cover the components of people, hardware, software, data and procedures that govern the mobile learning environment. (Rob, coronel, 2013) stressed in their database management book that in order to secure data in the database management system, we need to entirely secure the whole component of information system itself. Thus, elements secured on mobile learning represent the people's perception on mobile learning and the element of privacy will look at the data side or information privacy on the mobile learning framework, where trust on mobile device is associated in identifying how secured the hardware and software used in mobile learning are. In addition, the reliability indicator on mobile service will investigate the availability of the process flow (procedure) in mobile learning.

Adapted from [9], [10].

The dependent variable for the proposed study is selected based on the review and comparison of literatures on previous studies and it is named as the user's loyalty. This variable widely exists in the study on related areas of the marketing field. Most of the studies are related to loyalty no matter in the context of services, product or technologies as it is always associated with the element of trust (Zhou Dou, Hongxiu Li and Yong Liu, 2010) and (Roostika, Ratna, 2011).

3. Secured on mobile learning

The element of security plays a major role in any type of application. Higher institution members are concerned about the authentication and security of mobile learning. A secure mobile communication should possess the following security features: key distribution and management; Information confidentiality and privacy, secure routing, intrusion detection, data integrity; entity authentication and secure data aggregation. All of the above features must be provided if we want to have a fully secured transmission of learning materials by the means of the mobile devices mentioned as well as wireless computing. The two important security requirements - confidentiality and data integrity can be fulfilled by implementing simple link-layer security mechanisms that encrypt packets and employ message authentication codes. The Authentication is also an important security property as it ensures the receiver that the message did came from the originated or right sender.

(Catalin Boja et'al, 2011) proposed the Secure SMS Communications for the M-Learning Services in 2011 where the SMS communication delivers in real time different announcements, information, alerts,

tasks. Basically, the use of SMS is to define a mobile assessment architecture based on short quiz tests where students receive questions and submit the answers via SMS.

(B. Schneider,1996) briefs the transmission of encryption and decryption key through a secured channel. The Advanced Encryption Standard (AES) is also known as Rijndael. This is a standard algorithm for symmetric encryption, adopted as a standard algorithm by the US National Institute of Standards and Technology (NIST) which defines data security procedures in governmental institutions.

(Lirong He, Lisha He, Ian Rogers.) proposed a Network Assisted Authentication Protocol (NAAP) for the M-Learning in low cost computational, communication and storage requirements on mobile devices in an asymmetrical approach proving pear-to-pear authentication and key establishment. However, it has not been proven suitable for other security requirements like confidentiality and data integrity.

4. Trust on mobile devices

(Lu, June et al. 2008). described mobile trust as a complex social phenomenon that reflects technological, behavioral, social, psychological, and organizational interactions between various agents. It is further proven by (Mohamad Noorman Masrek, Nor'ayu Ahmad Uzir and Irni Iliana Khairuddin, 2012) in their study on the adoption of mobile banking which covered on the trusting belief in mobile technology, trusting belief in mobile devices and trusting belief in mobile services.

Hence, as this study is related to mobile learning, we will adopt a trust element for mobile devices (Choi, K. J. Kim and S. J. Ahn, 2012) which used 4 items. The two items selected will discover the smart phone application provider is reliable and trustable. Another two items constructed to know level of confidence towards application and security applications produce by smart phone provider.

5. Reliability on mobile services

Most literatures relate reliability of the technical aspect of the security such as the mobile applications reliability and network reliability: (Anang Hudaya, Ahmad Mahmud, Ahmad Izuddin, Miziani Abd Rahman, 2006), (Mahalingam, S., 2012) and **(**Wolfinbarger, M., Gilly, M.C., 2003). The reliability of network for example technically will study on secure routing, authentication, instruction detection, Access control and other network issues. On other perspective which involves human behavior towards the technology (Cho, Jin-Hee Cho, Swami Ananthram and Chen, Ing-Ray., 2011) in defining electronic retailer service quality have grouped reliability/fulfillment as involving accurate representation of the product, on-time delivery, and accurate as what have been ordered.

However, in this study, the reliability measure will look into mobile learning services that are used for obtaining and use of information available in the mobile learning environments for the purpose of learning process which includes learning discussion in forum threads, uploading assignments, online quiz or assessing scores and results and others. Thus, items that are appropriate to adopt are from (Du Jiang, Lu Jong, 2013) which generally cater for the objective of selected measures. The listed items are as follows: REL1: My mobile services quickly deliver what I order. REL2: My mobile service runs on reliable and secure networks and platforms. REL3: My mobile service makes services available for delivery within a suitable time frame. REL4: My mobile service insists on providing a long-term service.

IETC 2014

6. Privacy on information and mobile learning technology

The element of privacy is always related to data and information. (Parasuraman, A., Zeithaml, V.A., Malhotra, A., 2005) defined privacy as the Degree to which the customer believes the site is safe from intrusion and personal information is protected. Privacy become one of the measures in this study and can be leverage into three division of information privacy: personal information, credit card information and purchased information.

(Carlos Flavián, Miguel Guinalíu, 2006) provided an example on web commerce-related mobile users where over 40 percent of consumers feel that their privacy is jeopardized and that the government probably monitors their transaction through web filtering. In detailed, their study analyzes the effect of privacy and perceived security on the level of trust shown by the consumer in the internet which is includes honesty, benevolence and perceived competence. Instead, this study also tests the relationship between trust in a web site and the degree of loyalty to it.

In slightly differ perspective, (Parasuraman, A., Zeithaml, V.A., Malhotra, A., 2005) had studied on electronic services quality on web that process online purchase which include privacy as one of the measure. However, in this context of study it will use information as context and the selected items such as in the list: PRI1: It protects information about my mobile learning behavior. PRI2: It does not share my personal information with other sites. PR3:1 I feel like my privacy is protected at this mobile technology (Carlos Flavián, Miguel Guinalíu, 2006). PR4: I feel safe in my transactions with this mobile technology (Parasuraman, A., Zeithaml, V.A., Malhotra, A., 2005). PR5: This mobile technology has adequate security features (Parasuraman, A., Zeithaml, V.A., Malhotra, A., 2005). PR6: The mobile service has adequate security features (Cho, Jin-Hee Cho, Swami Ananthram and Chen, Ing-Ray., 2011).

7. Privacy on information and mobile learning technology

Loyalty has been widely measured in many perspectives and fields of studies. It is supported by (Hur, Y., Ko, Y. J., & Valacich, J., 2011). who mentioned that loyalty covers all the behavioral and attitudinal aspects which can also be expressed in many ways depending on the products/services and situations, such as retention, making re-purchase and financial/non-financial contributions. In web site perspective, (Insh, Andrea., 2008) the E-loyalty to a sport website was defined as a sport consumer's intention to revisit a sport website which contains both the conative phase and the action phase. Both phases are focused on to assess whether the consumer is expected to revisit the website and make decision whether to engage in purchasing behavior or vice versa.

In another context, loyalty is also associated with customer satisfaction and the term is widely used in the marketing field of study. (Yee, Beh Yin and Faziharudean, T.M, 2010) studied on the relationship between customer satisfaction, customer complaint and customer loyalty in the context of place satisfactions among Scotland city residents. Thus, for our study we decide to have a dependent variable of the user's loyalty in order to determine whether students in the Malaysian higher education will continuously use mobile learning.

In this article, we identify overall measures that should be including securing all components of mobile learning. We therefore proposed framework to be used as a predictive tool for assessment of secured mobile learning environment from the user's perspective. Next, we researcher plan to conduct a survey among the Malaysian local university located at Klang Valley area using the measures identified in the proposed framework. Then, an improved framework will be take place based on the findings gathered from the survey soon.

IECT 2014

8. Conclusion

In this article, we identify overall measures that should be including securing all components of mobile learning. We therefore proposed framework to be used as a predictive tool for assessment of secured mobile learning environment from the user's perspective. Next, we researcher plan to conduct a survey among the Malaysian local university located at Klang Valley area using the measures identified in the proposed framework. Then, an improved framework will be take place based on the findings gathered from the survey soon.

Acknowledgements

Greatest appreciation for Malaysia Ministry of Education formerly known as Ministry of Malaysia Higher Education for giving us support in term of fundings of this research (600-RMI/FRGS 5/3 (106/2012) and 600-RMI/DANA 5/3/RIF (707/2012). In addition, best recognition also given to UiTM Research Management Institute that managing our research flow and progress smoothly. Last. But not least big applauses also dedicated to committee of Faculty of Information Management especially Associate Professor Dr. Hj. Laili Hashim, Dean of Faculty of Information Management for their guidance and support. Not to forget our beloved family and colleague for their encouragement and understanding during the completion on this research.

Abstract

Between all of the professional education disciplines, architectural education is an interdisciplinary model that acquires a different character due to the transfer of design consciousness process and necessity of being carried out in a coordinated manner with other disciplines. As a result of differentiation, education and teaching process is getting a difficult situation, intellectual background for implementation of training intensity causes time issue. According to this fact, different methods in different schools of architecture are being tried even every faculty members are developing strategies that can be called subjective. Developed in different ways from each other, the common point of all this training strategies should focused on modern technology based student-centered education to increase the quality of education.

Restoration is one of many major fields of science, located under the discipline of architecture that transfers past to the future by reflecting the characteristics of its age and maintaining cultural continuity in history. Owing to the fact that restoration defines multi-dimensional, multi-faceted and very problematic area it needs collaboration of different disciplines such as architecture, urban planning, sociology, art history, archeology and engineering.

A successful restoration practice can be achieved by group of experts, well educated in their fields. Thence, restoration education should be given in this context. Documentation and building survey works, is at the basis of restoration practice and in our country carried out by conventional methods. The mentioned systems' excess of workload and the high error margin reduces the reliability of the documentation and survey works. Conversely revealing accurate, reliable and fast data with modern methods increase necessity of preference of these methods require. Due to education of the target audience is the generation of the technology era that gave birth to modern methods, the use of technological equipment for students interested in the course will increase the susceptibility of the education will ensure successful.

Erciyes University Faculty of Architecture is improving its "restoration training" in the light of this approach. Technological surveying methods have been examined, most compatible program packages for student knowledge and architectural education have been investigated and Tachycad, Point Cloud and Photoplan programs were preferred. Necessary background produced by getting trained on pointed programs and purchased technical equipment. Educational strategy, supported by the established background, has been used primarily in the education of graduate students and has been applied on the sample American College Building which located within the Social Establishments region of Erciyes University. Our faculty aimed at improve technology-assisted learning strategies on behalf of achieving accurate and reliable restoration practices and implementing this method in undergraduate education. With this proceeding, the implementation process performed and the necessity and practicability of these methods will be described and be presented.

Keywords: conservation, education, modern technology

1. Introduction

* Gonca BÜYÜKMIHÇI. Tel.: +90-530-228-82/30; fax: +90-352-437-65-54.
E-mail address: bmgonca@erciyes.edu.tr

Historic surroundings in which cultures are built that identify a process, a way of life and the development of society as the most obvious example of the level of production and significant savings should be handled down to future generations. In a globalized world in which cities have quickly begun to resemble each other, the distinguishing depicting of the history of mankind that makes it special and historic buildings and environments are now recognized as world heritage sites the conservation of which is managed by international decisions.

We cannot deny the role of notion in architectural practice which goes beyond designing and building process. In renovation studies concerning the maintenance, repair and protection of existing buildings, notion is meaningful when it is fed by knowledge which comes from practice, because the most important point is to preserve structures for the future without damaging their unique features. Determining, describing and documentation of the historical structure's plan and façade schemes in their own ratio in an accurate way is the most important phase of the conservation process.

The importance of the renovation phase, which can be defined as establishing the present situation of a historical structure and transforming it to drawings, is very significant in the total process. The simplest mistake made during this phase can cause major problems like miscalculating building ratios which cannot be fixed even if all the other phases are performed correctly. In this point we can clearly see the importance of the measuring process which forms the basis of renovation. The simplest mistake made while taking measurements will affect all the whole process in a negative way and cause waste labor and money. As can be understood from the explanation, conducting renovation work according to international standards is directly related with minimizing the error margin in renovation. In order to achieve more accurate results it is essential to use modern methods instead of traditional methods.

However in this point, we must not forget that to improve the quality of work in keeping with international standards the problems faced should be solved with instant decisions, responsibility, sensitivity and knowledge because every structure has its own unique problems. In the process the renovator chooses or combines the hardware and methods he/she will use.

2. The importance of survey studies and the methods used

Structures need to be protected and their close surroundings, which is defined as cultural heritage, is a process which exemplifies the lifestyles, education, technological levels, social, political, physical and economical conditions of civilizations which are in cultural persistence in a concrete way. While reflecting the mission of the period in which they existed, at the same time these structures also give information about that period's building materials and techniques. The historical formations which need to be protected as the most important treasures of nations are today not able to resist the effect of time and are losing their unique features which have been spoiled, by serious corruptions, even some are even on the point of destruction. In this context we can clearly see the necessity of protecting the monuments and documentation.

Survey is not only a part of protection; at the same time, it is also done so it can be used by documentation and scientific researchers. Thus, lots of researchers like Alby, Grussenmeyer, Perrina (2005) and Eruzun (1989) have stressed on the importance of cultural continuity and protection, introduction, archiving, etc. for in the purposes of documentation. It is possible that, with the potential of the students they have, universities can achieve documentation and inventory formation steps in a rapid and reliable way and create an open database for the use of researchers. Because of the impossibility of providing protection in the short term to our rapidly perishing historical heritages and also because of the risk of losing unique features while the restorations are being done, universities which only focused on scientific concerns far removed from budget and commercial pressures have to take a role in this field in a more effective and active way. In this way it would be possible to form extensive archives which other disciplines could use.

IECT 2014

The surveying methods used in survey studies are divided into two main categories, traditional methods and high technology supported methods, both of which are explained with their advantages and disadvantages below.

2.1. Traditional methods

Constructions built by using methods such as dividing in triangles, Cartesian coordinates methods and gridding, which are described as traditional methods, are measured by tape measure, plumb, compass, range rod, leveling rod, nivo, etc. The project planning is done by the drawing teams with these measurements. Because of problems like, working separately as surveying and drawing teams, processing the measurements taken on site to the plot, the coordination malfunction between the reader and writer while processing it on the plot, not stretching the steel measuring tapes enough on wide areas or shifting the zero point while stretching result in reducing the sensitivity of the work, and contribute to the error margin. We cannot talk about one hundred percent successes in the outcome in the measurements performed with these methods. A disadvantages of traditional methods, high error margin, the exponential increase in millimetric faults, damage to the accuracy of documents and generating a chain of problems by causing errors which are difficult to compensate in the outcome can be listed. However, despite of all these negative aspects, survey studies and training activities conducted at the universities in our country are mostly performed using traditional methods.

2.2. Advanced-technology assisted methods

Pakpen (2013) classified advanced-technology assisted methods as

- Tachometric and Laser Measuring Instruments
  - Laser meter
  - Line laser
  - Protractor
  - Advanced Nivos
  - Advanced Theodolites
  - Total Station
- GPS (Global Positioning System)
- Laser Scanning
  - Tellural Laser Scanning
- Geographical Information Systems and Photogrammetry
  - Sky photogrammetry
  - Tellural photogrammetry
  - Close up picture photogrammetry

In addition to this classification, Hanke and Grussenmeyer (2002) discussed architectural photogrammetry methods by classifying them in to basic theory, procedures and items. Turan (2004) however classified the architectural photogrammetry methods as,

- Single image (monoscopic) method
- Stereo image (stereoscopic) method
- Beam of rays (bundle) method

There are many methods, technical tools and equipments which named as advanced technological methods in today's terminology. However the program, hardware and methods which are used surveying structures will be mentioned. Advanced technology assisted methods are computer-aided methods which allow the progress of surveying and drawing process together. Survey studies with conventional methods, consists of roughly measuring and drawing teams. However the fact that both the office team is far away from the works done on the site and the measuring team does not have the necessary details for drawing results in increasing error margin, thus damaging credibility. In the survey studies done with advanced-technology supported methods, these methods prevent the teams from being divided and provide site and office collaboration, bringing the site to the office venue.

IETC 2014

The most important device to use with the advanced-technology based methods in survey studies, with positive properties like sensitivity, credibility and providing multiple purpose usage, is the laser scanner. The data obtained by this method, include documentation on the whole structure, provide the data like photographs, sections, plans and details which cannot be obtained with other methods.

Another advantage of using advanced-technology based methods is being able to position the devices which are going to survey at a definite distance to the area which is going to be measured and thus being able to take the measurements of places which are at risk of collapse or hard to reach in a correct and safe way. Using these methods also minimizes the error margin which is caused by taking measurements from a close distance with traditional methods and devices which have low sensitivity and they also protect the team from risky situations.

When the laser scan is completed with the laser measuring devices, with the gathered 3 dimensional data we can take positions from every point and create unlimited sections. Also in despite of their high initial investment costs, in documentation studies done with these methods less human power and time are required. Therefore in the long term there is a reduction in time and human effort however the most important thing that they provide information to scientists from different subjects with this real documentation. Gathering the documentation in a numeric way and which is digitized enables us to keep, store and update this information better when necessary and in an interdisciplinary context to utilize the documents in the most effective manner.

3. Restoration education at present

3.1. Restoration education in the architecture faculties in Turkey

Architecture is a special profession which involves engineering, design, art and social studies. The architecture education given has to be multi-dimensional, dynamic, varied and connected with technology. This situation is causing problems, for the students, who have learned lots of things in a short time, as they become overwhelmed and very often cannot use the necessary information he/she has learned, at the required place and time. Renovation art is one of the various disciplines in architecture and has its own rules and terminology. Using technological methods in protection applications, which need multi-partnered study platforms, is unavoidable. In fact in this context researchers like Taşlı, Pektaş and Erkıp (2006) declared the importance of using computers and programs in architecture education and their positive effect on productivity.

Table. 1. Restoration education programs of the top 10 government-run universities of Turkey.

University Name	Obligatory lessons (hours per week)	Obligatory lessons (total ECTS)	Elective lessons (total count)	Practical Traning (total weeks)
İstanbul Technical University	6	8	8	0
Middle East Technical University	3	4	6	0
Mimar Sinan Fine Arts University	2	2	10	15
Yıldız Technical University	4	3	8	0
İzmir Institute of Technology	0	0	4	6
Dokuz Eylül University	6	7	11	6
Uludağ University	7	9	5	0
Eskişehir Osmangazi University	0	0	0	6
Abdullah Gül University	6	6	4	0

When renovation education in licensed degree courses in Turkey is inspected overall it is seen that the education is given in a traditional way but when the students graduate and started to work in this field it is seen that they cannot use the knowledge they have learned in an effective way. The most important reason for this is that the professionals have forsaken traditional methods and continued their studies with advanced-technology supported methods.

IETC 2014

When the education programs and lesson contents of the top 10 government-run universities are inspected we can clearly see that restoration disciplines are not an offer in their curricula. The reasons for this maybe budget cuts and not having the necessary equipment and correspondingly, not offering these disciplines in the lessons available.

3.2. Erciyes university architecture faculty and renovation education program

The lessons on offer in Erciyes University Architecture Faculty's renovation departments include 9 hours of obligatory lessons and 23 elected lessons of 2 hours each. The first obligatory lesson, Protection and Documentation of Historical Environment I, involves 2 hours of theoretical and 3 hours of practical lessons making a total of 4 credits. Within this lesson framework students are given instruction in how to conduct renovation, survey, restitution, and classify monument types and to take measurements and make drawings in this context. The other obligatory lesson, Protection and Documentation of Historical Environment II, involves 2 hours of theoretical and 3 hours of practical lessons making a total of 3 credits. The content of the lesson involves taking measurements and making drawings of a structure or a whole street in a historical setting. Also there are 26 elected lessons offered at the renovation department which are in different subjects like New Functions for Old Structures, Design in Historical Textures, Architectural Elements in Traditional Textures, Material Protection in Traditional Textures and Protection Theory. In applications in this area, the targets are to protect cultural heritage, determine the historical structure stocks of Kayseri and its surroundings, make inventory studies, conduct archiving, protecting the present cultural heritages potential and bringing it to a more perceptible situation.

To avoid giving education in a traditional way in licensed degree renovation education, research has been conducted and funds provided. However, for reasons such as crowded classrooms, the equipment being expensive and the problem of providing this equipment to the students, instead of making it available to licensed degree students, it has been decided to use it with those who have architecture degrees, in graduate degree classes with fewer students. With the equipment and programs available, graduate students have the opportunity to learn advanced-technology supported methods using the example of the American College which is registered and used as the Erciyes University Social Facilities building. The training for reading the surveying data, program and survey devices is given by the "Kubit" company, from which the programs are obtained.

4. New searches in renovation, the american college experience

4.1. American college structures

At the present day, the structure complex used as the Erciyes University Social Facilities site is occurred from 7 buildings and is located in Kayseri's Talas district. The oldest structure of the campus, the dormitory building, was built in the 19th century and was used as a bond house until it was donated to the American Board foundation in 1889. The other buildings located on the campus were built after the agreement of the American Board Foundation and were used to meet of accommodation and sleeping needs of students. In the education break given because of World War I, the buildings were used as orphanage for children who lost their parents during the war and were returned to the foundation at the end of the war and used as a hospital. The complex continued as a hospital until the American Hospital was closed in 1972. In 1974 the structure complex was bought by Ankara Hacettepe University and transferred to Erciyes University in the same year.

With the feature of being the oldest structure on the campus, the dormitory building also gives an example of the traditional residences of the area. The structure, with its cross-like plan scheme, with additions on its left and right sides has a 480 m2 area of usage. Unique components like the stones used in

IETC2014

the exterior, the windows and top windows which form the façade, the wooden and stone ornaments in the structure, the dices, the marble basins and the 2 different caves which are entered from the basement are forming the characteristic features of the structure.

Fig. 1. (a) Entrance door from courtyard, (b) Main entrance

4.2. Renovation studies

The campus and the structures on the campus are used to show the graduate students the difficulty of taking measurements with traditional methods due to the structure's physical features. The increase in error margin and concern for ruining the work quality necessitated the use of advanced-technology methods. Of the advanced-technology methods, the laser scan, laser measuring devices and photographic methods, called multiple methods, were chosen and for use in survey studies. With the support of the university, which owns the area, the necessary equipment was bought and this made scientific research project possible.

The project started with the overlays taken with traditional methods and measuring studies using in different methods have started.

4.3. Laser scanner phase

With the laser scanner method, which was chosen to minimize the error margin in measurements because of the structure's unique details, a 3D model is prepared and transferred to digital media. Due to high prices of the devices we employ laser scanning services from a well-known and experienced firm. For 3D laser scanning a device, which can scan 360o horizontally and 320o vertically, is preferred and the sensitivity rate is set to 4mm-2mm. In the measurement process 360o panoramic photography is possible and dataset gathered from these photos is used. While applying the laser scanning method "Faro Focus 3D Laser Scanner" device and "Kubit Lupo Scan Pro" software to read the data are used. For the purpose of fitting the laser scan to a coordinate system on the campus "Focus 6 Total Station" is used. After accomplishing the measuring phase, the data are collected on computer with "Kubit Point Cloud Pro" software and "Kubit TachyCAD" software which works with the "Focus 6 Total Station" device.

IETC 2014

Fig. 2. 3D digital model of the building

At the end of the applied method, a 3D model of the structure which can be read in AutoCAD and fits the satellite coordinates, in other words the "point cloud" data and the "ortho-image" images formed in dots of black and white, in the scan of the façade, are provided. The laser scanning data which provide the transfer of the project area to digital media are read by "Kubit Point Cloud Pro" software which is attached to "Autodesk AutoCAD 2013" and with the same software plan, section and detailed drawings are done.

The laser scanning method, because of its advantages, is used for the dormitory building and the exteriors of the other structures in the area and for the layout plans of the near surroundings. For the interior measurements of the other structures the Total Station measuring method is used.

4.4. Surveying phase with laser devices (total station) method

"Kubit TachyCAD" software and "Focus 6 Total Station" are used to obtain the plan, sections, detailed surveys and its designated coordinates which are determined by laser scanning. In this phase of the renovation study, the team is supported by intern students of licensed degree level. During this phase the intern students are given training for the program and devices which will be used and have the opportunity to earn experience in using such a method.

With "Kubit TachyCAD" software, which allows the data to cultivate on "Autodesk AutoCAD 2013" software simultaneously, the distinction between the office and the site disappears. As a result all the team members participate in the measuring and drawing phase, the error margin which occurs while transforming information is avoided and at the same time drawing speed is increased, thus the time to achieve final product is reduced.

The measurements made with "Focus 6 Total Station" are done with the "Autodesk AutoCAD 2013" software where the "point cloud" is gathered by the laser scanning data of the structure. Documentation of the structure is done by studying 3D over one file and with this system both the plan and section data are gathered. However during the studies, in the measurement of organically formed caves traditional methods are applied because of the sensitivity of devices and the unsuitability of the working site for advanced-technology methods. This occasion shows us that traditional methods should not be discarded totally and there is need to use different methods together.

4.5. Photographic method

"Kubit Photo Plan Pro" software, which is also used in renovation studies performed with traditional methods in documentation with photography, is preferred for documentating the points which cannot be determined by the laser scanning method in a sensitive and detailed way.

Fig. 3. (a) Original image , (b) Flatten image with Photoplan software

The photos, which are taken with a high resolution camera, with the mediation of "Kubit Photo Plan" software in AutoCAD media, are transformed into planes and with this method; details like doors, windows, ceiling ornaments, syrup holders, and quick and reliable drawings of other unique components are realized.

IECT 2014

5. Result

The transition from one approach to another is always precarious and painful. It is possible to see people who affirming, object to or not embrace a measuring method and the programs related to this. At this point the most important thing is the editing of the chosen measuring methods which have a successor-premise relationship with each other by a person who is specialized in protection and renovation studies. The method and the program which will be chosen may be varied according to each structure's own attributions. In this context recommending an approach which is suitable for all structures is not a good idea. We must not forget that every method has positive and negative sides and the method or methods, considering the structure's attributions, must be determined by a specialist.

However the main point to be dicussed here is the position of universities, which need to be in touch with society in a more dynamic way and their qualifications. When the subject is protection and renovation programs it is obvious that the universities are looking in terms of both academic programs and technological hardware. On the subject of using up-to-date measuring techniques and technology, university renovation programs cannot compete with the private sector's speed while they continue to teach future architects with conventional methods. Universities, due to their autocratic approaches and temporal impossibilities, in terms of the new technologies and technologic hardware which are used and internalized by private sector have been, in application site can not compete with the private sector, nor they can achieve the same speed or success ratio. This situation has to be changed immediately and universities, which are created for producing knowledge and giving education, have to acquire the hardware to follow up-to-date developments.

A university which is not integrated with 21st century's instruments, methods, techniques and technologies, which does not claim responsibility for its own cultural heritage, which is lacking in the use of modern technology, techniques and methods, which cannot develope r&d studies and does not have a position between urban relations and have a active role in transformation and development decisions, may not perform its basic function and it cannot be considered as being in a successful position.

As understood from the arguements given above, protection the notion of and using technology connected to this notion in architectural education is an important area and our country has been unable to solve this problem completely. The main reason behind this is that notions like protection, urban identity and sustainability are not seen as problem of the community in general or as a priority. These notions, which are the concerns of a sensitive elit group, have a lack of support and substructure even in universities.

However, traditional structures, the symbol of social memories and local textures, are the most valuable assets of the countries which have to be protected as treasures. Until this fact will be understood and the norms become priority issues of the broad masses, built environments, which are away from notional background, non-creative and non-constructive, which can not use the possibilities of science and technology, which destroy, may be the most important feature of historical value, the orginality, which do not pay respect to the past, will continue to be produced. The qualified historical environments and urban spaces which obtained by the centuries of expenrience and knowledge, will be enforced while compared with the world's leading conservation practices.

Correlation between cultural perceptions, leadership style and ICT usage by school principals in Malaysia

Anantha Raj A. Arokiasamy[a*], Abdul Ghani Kanesan bin Abdullah[b], Aziah Ismail[c]

[a]*Quest International University Perak, Ipoh, Perak, Malaysia*
[bc]*Universiti Sains Malaysia, Penang, Malaysia*

Abstract

School leaders are key factors in implementation of information and communication technology (ICT) in schools. They need to understand the capacities of the new technologies, to have a personal proficiency in their use, and be able to promote a school culture which encourages exploration of new techniques in teaching, learning and management. However, there is less information about the current status of ICT use by Malaysian school principals. This paper investigated the extent to which secondary school principals use computers in Malaysia and determined factors related to level of computer use by principals (cultural perceptions and leadership style of principals). Initial report also highlighted analysis of a baseline data gathered from 520 secondary school principals in the state of Selangor and Wilayah Persekutuan, Malaysia. Findings indicate that school principals are using computers for instructional and administrative purposes and they have moderate competency in computer applications and spent a few times a week working on their computers. Also, cultural perceptions and transformational leadership contributed significantly to the level of computer use by principals. It is anticipated that the data obtained from the study will open new lines of inquiry about the crucial roles of school leaders in the adoption of ICTs and will contribute to decisions about future developmental needs because more will be known about their preparedness for change. Hence, policy makers must design professional development programs, such as leadership studies, in order to teach the components of transformational leadership; idealized influence, inspirational motivation, intellectual stimulation and individual consideration to future administrators.

Keywords: ICT; school principals;leadership style;cultural perceptions and Malaysia.

IETC 2014

1. Introduction

ICT industries have proven to be the backbone of national development in many countries. Malaysia as a developing country is also experiencing a similar trend. Malaysia's total ICT expenditure indicates that more and more local organizations are incorporating ICT into their business activities. The government has prioritized ICT as an issue of national importance and established new agencies and policy initiatives to accelerate its implementation and thereby transform Malaysia into a developed and knowledge-based country (Tipton, 2002). It also accelerates the economic development and quality of life of the society (Lu, 2001). The rapid development in the ICT sectors beyond the expectation has created a vacuum in the employment trend. The ICT industry in Malaysia has enjoyed highest employment growth of 27.9% in 2010 and is expected to register 31% growth in 2013 compared to other industries (Employment Outlook, 2012). Beaumont et al. (2004), however, reported that there is an increase in shortage of skilled workforce in the country despite the increased demand for qualified ICT employees as more and more organizations continue to rely on ICT for their effectiveness and competitive advantages (World Employment Report, 2011).

ICT has pervaded almost every facet of our society. Around the world, ICT is ubiquitous in the business world, the workplace and at home. To ensure that schools keep pace with these developments in the larger society and to tap the enormous potential of ICT in teaching and learning, many countries have invested considerable amounts of resources to integrate ICT into education. Malaysia, for instance had

invested RM1 billion between 1999 to 2005 to facilitate ICT integration in schools, spending mostly on hardware, software, infrastructure and training of teachers (Ministry of Education, 2001).

In discussion about the potential role of technology in education, Fiske and Hammond (1997) stated that instructional technology is considered to be a key to educational quality as we enter the new millennium. Many educators believe that computer use for instructional purposes can be employed effectively to enhance teaching and learning. In other words, computer technologies can change the teacher's role from information giver to facilitator, counselor, advisor, guide, coach, co-learner, mentor, resource and technology managers, and mediator to the students (Jonassen et al., 1999). Similarly, Attaran and Vanlaar (2001) pointed out that technology reduces record keeping time in schools and simplifies administrative tasks. Also, computer networking is creating a professional band between teachers and administrators. On the other hand, it offers teachers valuable methods of enhancing successful instructions. Besides, computer use assists students in meeting basic educational requirements and it fulfills an instructional need by individualizing the material to the competency level of the learner. In this way, computer use provides an active cooperative learning environment and offers the flexibility that is now mostly absent in the traditional classroom.

In addition, Otto and Albion (2004) reported that although ICT are now widely available in schools, it does not integrate fully into teaching and learning. In line with this idea, Sheingold and Hadley (1990) pointed out that integrating technology is not about helping people to use computers but it is about helping teachers to integrate technology as a tool for learning. In fact, in the ideal teaching and learning setting, technology should be as transparent a tool as a pencil. Therefore, technology integration in classrooms is more about teaching and learning than it is about technology (Mills & Tincher, 2002).

Unfortunately, the implementation of ICT into the Malaysian schools has not been guided by research. The "initiation stage" (Rogers, 1995), which demands information gathering and planning, has been overlooked in the urgency to implement ICT in schools. A key element that has been left out understands the cultural perceptions of the end-users toward these new tools. Such inattention to the principals' cultural perceptions may generate unforeseen repercussions for ICT diffusion in Malaysian schools. Many technology experts have pointed out that the integration of ICT in education should occur in the light of the cultural conditions of the country and the prevailing school culture (Watson, 1998; Harper, 1987; Thomas, 1987). Obviously, unless principals recognize the importance of ICT for their school and national cultures, they will not use it in their classes. This study is poised to investigate the extent to which secondary school principals use computers in Malaysia and determine the factors related to the level of computer usage by principals (cultural perceptions and leadership style of principals).

2.0 Literature review

2.1 Leadership style and integration of ICT at schools

Integration of ICT into education, as Eib and Mehlinger (1998) define it, is a procedure in which instructional technologies such as computers and software are applied regularly to support both teaching and learning across levels and subject matter. There has been a significant amount of research devoted to the integration of ICT in schools, its effects on student learning and attainment, and hindrances that prevent its successful use (Becker, 1993; Butzin, 1992; Cafolla & Knee, 1999; Cradler, 1999; Kozma & Croninger, 1992). While some researchers have indicated the benefits of integrating ICT into education (Holinga, 1999; Taylor, 1992; Wibur, 1997), others have found that applications of ICT in the classroom conferred little or no positive improvement in student attainment (Slavin, 1991; Stevens, 1992). Picciano (1998), on the other hand, observed that the benefits that ICT integration confers on student attainment are not uniform at all grade levels.

While Baily (1997) suggested that the focus of ICT application should be teaching and learning due to its potential use in the classroom, Levinson (1990) pointed out that in addition to providing support in teaching and learning, ICT may be used to alleviate common problems in school such as teacher shortage and high costs of education. Technology could also create new solutions to cope with the spect-

IETC 2014

rum of needs that arise in the classroom in this information age (Krajcik, Soloway , Blumenfeld, & Marx, 1998).

In the age of information, principals must be able to integrate ICT into their daily practice and to provide consistent and positive leadership for technology use in the teaching-learning process. In fact, they must be technology leaders. According to Hope, Kelly and Guyden (2000) technology leadership involves both understanding the technologies and how they can be applied to accomplishing tasks. In a study that examined the role of administrators in the integration of technology into the learning environment of three United States school districts, Gibson (2002) stated that school principals must focus their energies on ten technology categories: existing practice, planning, curriculum, resources, staff issues, communications, support, obstacles, staff development, and implementation. In this way, principals need to understand the capacities of the new technologies, to have a personal proficiency in their use, and be able to promote a school culture which encourages exploration of new techniques in teaching, learning and management (Schiller, 2003). Therefore, schools need leaders who can facilitate the change process and support a learning community for technology integration.

According to Fullan (2003), no successful large-scale change or school reform effort has advanced very far without the support of the school leaders. Similarly, Schiller stated that "principals have a key role to play in the facilitation of educational change" (p. 4). In his studies of the elementary school principal as a change facilitator for ICT, Schiller (2003) concludes that principals who take an active approach to innovation can foster an environment that has greater benefits for their students and staff. Hence, principals' awareness, understanding and use of ICT are essential for effective use of computers in the school (Smith et al., 1999). A school administrator needs to be familiar with ICT and know what to look for in the classroom if effective supervision, evaluation or support for a classroom teacher is to be made (Fleit, 2000). This view is supported by Hope, Kely and Guyden (2000) who noted that school leaders should use technology themselves, developing an awareness of how technology can be used and modeling the practice to the school staff. Similarly, Stegall (1998) stated that it is important for principals to use computers, to seek assistance and advice from experts, from a technology committee, visit other schools, brainstorm ideas and hire and train technology 'savvy' teachers. Therefore, successful ICT development within the school will require the leader to be aware of the possibilities and future development of technology and how the school might integrate these into teaching and learning.

Given the enormous potential of ICT to impact upon education, it is imperative that factors that influence the success of ICT integration efforts be explored. Many researchers have identified effective leadership as a key ingredient of, and vitally important to, the success of any innovation in education (Bennett, 1996; Fullan, 1993). In particular, Becker (1993) contends that leadership is even more critical for successful integration of ICT in schools today. Rieber and Welliver (1998) also recognize that effective leadership is needed to enhance the transformation of our education system by taking advantage of the potential of ICT. Others go so far as to say that the success or failure of integration efforts rests on the shoulders of school leaders (Salzano, 1992). Substantiating the view that leadership is a critical factor in ICT integration efforts, Lockard, Abrams, and Mary (1990) explain that ICT integration is an enormous task that entails considering many issues and making many decisions. Agreeing, Dede (1992) points out that as leaders influence, make decisions, provide support, and model behavior , the possible impact leadership can have upon successful ICT integration is obvious.

2.2 Transformational leadership

Transformational leadership is seen as a promising form of leadership for advancing educational institutions because it can cause essential change, resolve major concerns, and create new paradigms (Banerji & Krishnan, 2000). Such a leader supports open communication which creates team motivation. S/he also helps build the confidence of her/his team members by providing necessary training and encouraging team building. Dimmock and Walker (2000) too affirm the link between team motivation and goal-setting and visioning. Teamwork then, calls for participatory leadership and proactive support for change (Walker & Dimmock, 2000). To this end, a transformational leader possesses the necessary drive to initiate and maintain transformational processes within the organization. S/he must be capable of articulating a convincing and realistic vision and focus others towards a new critical path. If required, the organization may need to be redesigned to support the transformation (Banerji & Krishnan, 2000).

Charbonneau (2004) noted that the popularity and attractiveness of this leadership style stems at least in part, from its consistent association with superior performance in a range of organizations. Trans-

IECT 2014

formational leaders facilitate the thinking of old problems in new ways. They are often capable of communicating a vision and mobilizing the energy necessary for change. Their behaviors and traits include empathy, the need for power, good rhetorical skill, intelligence, and the consideration for others. The effect of this leadership style is that it inspires or motivates followers, gains commitment from followers, changes attitudes and supports the goals of the individual and organization.

According to Schein (1992), the most intriguing leadership role in culture management is one in which the leader tries to develop a learning organization that will be able to make its own continuous diagnosis and self-manage whatever transformations are needed as the environment changes. The learning leader must exhibit the self-confidence that active problem solving leads to learning and thereby set a suitable example for other members of the organization. The process of learning must eventually be made part of the culture and not seen as any given solution to any given problem (Schien, 1992).

Despite its limitations, there are certain elements of transformational leadership which do lend themselves to educational and ethical consideration. It appears to be very important for leaders and educators to have a clear vision of what they want to achieve and how they want to achieve it. Moreover, when its heroic implications are reduced or eliminated, transformational leadership can advocate for processes that involve the contributions of all parties, rather than being a matter of one person "doing leadership" to others (Bottery, 2004, p. 19). Future leaders will be their ability to instill a learning mindset into their organization. The upcoming generation of leaders will have to be a generation of learning evangelists by highlighting the importance of learning and establishing a context where employees want to and are able to learn. Corporate leaders will have to be more capable of strengthening their organizations for future challenges and increasing competitive and innovative abilities (Brown & Posner, 2001).

Educational professionals are being objectified and stratified into leaders and followers according to neo-liberal versions of the performing school. Leadership is being defined as particular tasks and behaviors that enable those who are responsible and accountable for learning outcomes and measures of school improvement. However, this objective definition of leadership does not float free of organizational and personal histories that also shape and enable agency, and how real people with real lives struggle within and through the contradictions that challenge their values (Gunter, 2001).

According to Northouse (1997), one of the best styles of leadership is transformational leadership that can change and transform individuals. Transformational leadership occurs when one or more persons engage with others in such a way that leaders and followers raise one another to higher levels of motivation and morality (Burns, 1978). An important goal of a transformational leader is to develop followers beyond their potential (Lee, 2005). Hence, transformational leaders try to develop and satisfy the higher-order needs of followers to gain their followers' commitment to the organization (Rowden, 2000).

The concept of transformational leadership has acquired wide popularity among leadership researchers during the past decade (Lowe, Kroeck et al., 1996) because of its qualitatively different approach to motivating followers as compared with other leadership styles (Howell & Avolio, 1993). Bass and Avolio (1994) described transformational leadership as being composed of four unique but interrelated behavioral components: inspirational motivation, intellectual stimulation, idealized influence, and individualized consideration. Several empirical and theoretical studies have found that leaders who display these four behaviors are able to realign their followers' values and norms, promote both personal and organizational changes, and help followers to exceed their initial performance expectations (Jung & Avolio, 2000). Therefore, transformational leader is noted as one of the most important factors affecting the integration of educational technology and has input into all the essential conditions that promote the integration of educational technology (Brooks-Young, 2002; Ross, McGraw & Burdette, 2001).

2.3 Transactional leadership

Transactional leaders focus on the interpersonal exchanges that occur between themselves and their subordinates. Bass (1998) argued that transactional leaders are motivated by what is easily identifiable and measurable. According to Bass (1985), transactional leaders are more reactive than proactive; less creative, novel, and innovative; more reforming and conservative; and more inhibited in their research for solutions. Yukl (1999) postulated that transactional leadership includes a diverse collection of mostly ineffective leader behaviors that lack any clear common denominator. Lowe and Galen (1996) reported that transactional leaders operate within an existing system, avoid risk, prefer effective answers

IECT 2014

and are less likely to support the status quo. Bass and Avolio (2004) delineated the following key aspects that include transactional leadership.

- Contingent Reward – providing others with assistance in exchange for their efforts; discussing in specific performance targets; and making clear what subordinates can expect to receive for their efforts and expressing satisfaction when subordinates meet expectations.
- Management by Exception (active) – focusing attention on irregularities, mistakes, exceptions and deviations from standards; closely monitoring failures and punishing subordinates for their failures; and anticipating problems and making changes before those problems become too bothersome.
- Management by Exception (passive) - failing to intervene until problems become serious; avoiding specifying agreements, clarifying expectations and providing goals;
- Laissez – Faire – showing a total absence of leadership ; avoiding getting involved when important issues arise ; being absent when needed ; avoiding making decisions ; and delaying response to urgent questions subordinates are given.

Burns (1978) espoused that transactional leaders motivate followers by appealing to their self-interests and needs. In order for this exchange to occur, goals and objectives, as well as contingency rewards and inducements; must be offered.

Researchers have sought to identify which leadership style or which elements of particular leadership styles can be linked to positive outcomes such as job satisfaction, follower motivation, and organizational performance. The body of literature in this field is vast; Judge and Piccolo performed a meta-analysis of 626 correlations from 87 sources to relate transformational, transactional, and laissez-faire leadership characteristics to the aforementioned outcomes (Judge and Piccolo, 2004). Their findings support a link between effective leadership and all dimensions of transformational leadership (idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration), as well as a single dimension of transactional leadership, contingent reward. Though transformational and transactional leadership are often presented as being at opposing ends of a spectrum, a combination of select elements from both leadership styles may yield the best results.

2.4 Cultural perceptions

In the headlong drive to incorporate educational technology in schools, the accommodation of the new tools has often taken precedence over the end-users' cultural perceptions toward the media. Many researchers have cautioned about the current lack of attention to cultural beliefs and their impact on ICT adoption in developing countries (Loch, et. al., 2003; Hill et. al., 1998). Researchers suggest that force-fitting the culture to the technology can create an unfavorable climate for the acceptance of ICT in different organizations in the importing country. In fact, Hill et. al. (1998) asserts that, unless taken into consideration, socio-cultural factors may put ICT transfer at risk in certain developing countries. Apparently, the changes developing countries are opting for cannot be attained by simply placing more computers in their schools. Martinez (1999) suggests that one of the major challenges facing developing countries is to make technology an essential part of the culture of the people. In fact, the reverence with which technology is held in technologically developed countries may be in contradiction to the perceptions of cultures that are relationship-oriented (Roblyer, Dozier-Henry & Burnette, 1996: p. 9). Harper (1987, p. 47) contends that cultural factors play an important role in creating negative perceptions toward computers: "One direct cultural cause is people's apprehension that life is becoming too mechanized, so they resist contributing to a "computer culture."

The study of cultural perceptions has been found essential for accounting for teachers' overall attitude toward ICT and for anticipating their future adoption of the new tools (Thomas, 1987; Harper, 1987). In fact, Chen, et. al. (1999) considers cultural perceptions among five main factors that may determine ICT adoption by educators. Unfortunately, however, only a few studies have tried to study the impact of cultural perceptions on the reception/rejection of ICT in education. Apart from the effect of the national culture on technological diffusion in schools, the micro-culture of the school itself may affect such diffusion (Hodas, 1993). Williams-Green, et. al. (1997) contends that the culture developed within an institution or within an organization can act as a barrier to change. For a new technology to be placed into an organization's culture there must be a match of organizational and technological values (Hodas, 1993). Within the school organization, if the technology is not received well by teachers, there must be a mismatch of values between the culture of schools and that of the technology. Watson (1998) found that teac-

IECT 2014

hers' inability to negotiate the role of the computer in their practice resulted in their resistance to its use in their classrooms. Therefore, he warned that the mismatch between the culture of techno centric mindedness and the teachers' pedagogic culture results in the alienation of the teachers from the use of technology. On the other hand, Coppola (2000) found that because the norms of school and community encouraged innovation and autonomy, teachers learned not only how to use computers in their teaching but also how to operate them within the constructivist framework. It seems that the integration of ICT in schools cannot be effective unless escorted by supplementary programs that would foster a culture of acceptance amongst teachers, students, and administrators.

From both theoretical and empirical perspectives, cultural perceptions seem to have a significant impact on teachers' adoption of ICT. Unfortunately, much of the early research on computer uses in education has ignored teachers' cultural perceptions toward the new machines (Harper, 1987). Studies focused on the computer and its effect on students' achievement, thus overlooking the psychological and contextual factors involved in the process of educational computerization (Clark, 1983; Thompson, Simonson & Hargrave, 1992). The delicacy of this situation calls for an investigation of teachers' cultural perceptions regarding the introduction of ICT into their schools and society at large.

3.0 The study

In view of the current state of the literature, this study explores how leadership affects the use of ICT in schools. Specifically, it determines the extent to which Malaysian principals use ICT in their schools and identifies their perceived ICT competencies and their leadership style. These are empirical questions, and we provide some preliminary findings for supporting the efficacy of our expectation.

4.0 Methodology

This was a descriptive study of an exploratory nature. Creswell (2003) suggests that exploratory studies are most advantageous when "not much has been written about the topic or the population being studied". The target population in this study was secondary school principals in the state of Selangor and Wilayah Persekutuan, Malaysia during the 2011-2012 school years. The list of school principals was based on the school principal's directory by Ministry of Education. In this study, a quantitative method was employed to collect data from the population of secondary school principals in Malaysia. Using a survey instrument, quantitative data were collected from a random sample of 520 secondary school principals. The questionnaires are divided into two parts. Part A measures the perceived level of computer use by principals. Part B measures the principal's characteristics; perceived computer competence; and leadership style (transformational and transactional leadership). Face and content validity of the instruments were established by the panel of experts. Moreover, Cronbach's alpha was used to measure internal consistency and calculated via the SPSS 19.0 statistical package. The Cronbach's alpha coefficients for these scales were: Cultural Perceptions Scale=0.611, Transformational leadership style Scale=0.812, Transactional leadership style Scale=0.596 and Level of computer use Scale=0.917.

4.1 Findings

Of the respondents, 42% were males while 58% were females. About 14% (n= 5) of the respondents were 41 or younger, 45% (n=13) were within the 42-47 age range, 33% (n=9) were within the 48-53 age range, 8% (n=3) were 60 or older. Participants' responses on their work experience showed that 38% of them had less than 19 years of experience, 42% were between 20 and 25 years, 17% had 26-31

IETC 2014

years and 3% had more than 32 years. More than half of the respondents (>70%) held bachelor degrees, 27% held Masters' degrees, and about 3% held a Doctorate degree. Nearly 90% respondents owned a home computer. Moreover, all of the respondents reported that they have had computer training.

5.0 Discussion

5.1 Computer use by principals

It can be seen from Table 1 that principals' perceptions of the level of computer use were moderate; with an overall mean score of 3.29. Also, findings showed that principals spent a few times a week working on their computers. It would seem that Malaysian principals need effective and extensive trainings to raise their proficiency in computer use and integrate technology into their schools. Training needs to be ongoing so principals can continue to learn how to use hardware and software applications within the context of their administrative and instructional responsibilities (Brown, 2001).

Table 1: Percentage, Mean and Standard Deviation of Computer Usage

Scale	Percent (%)			Mean	SD
	Low	Moderate	High		
Internet Use	10.1	44.2	46.7	3.49	0.78
Hardware & Software Use	11.7	49.8	43.2	3.27	0.67
Instructional Use	17.6	37.2	44.1	3.36	0.89
Administrative Use	17.2	49.1	36.3	3.19	0.93
Overall Computer Use	12.1	54.2	32.5	3.29	0.79

5.2 Leadership style

5.2.1 Transformational leadership

As a composite variable, transformational leadership (refer to table 2) received a mean rating of 2.79 (on a five-point likert scale). Bass and Avolio (1990) suggested that ideal ratings for the transformational variables should be greater than three (>3.0). Principals did not meet this benchmark. Moreover, we found that a representative sample of Malaysian secondary school principals provided fairly often some elements of transformational leadership. This result suggests that some professional development programs should be provided for principals. In fact, if Malaysian principals want to initiate and implement school change through the use of information and communications technology, they must be eager to model the transformational components of charisma (idealized influence), inspirational motivation, intellectual stimulation and individualized consideration in their schools.

IETC 2014

Table 2: Mean and Standard Deviation of the Transformational Leadership Style

Scale	Mean	SD
Idealized influence (attributed)	2.97	0.68
Idealized influence (behavior)	2.87	0.67
Inspirational motivation	2.69	0.79
Intellectual stimulation	2.56	0.83
Individualized considerations	2.86	0.71
Overall Transformational leadership style	2.79	0.62

5.2.2 Transactional leadership

Descriptive analyses revealed that the respondents (refer to table 3) have a mean score of 2.38 (SD=0.31). It seems that principals display sometimes some elements of transactional leadership. In other words, this result suggests that principals sometimes tend to focus on task completion and teacher compliance, rely quite heavily on organizational rewards and punishments to influence teacher performance, and emphasize work standards, assignments, and task-oriented goals (Bass, 1998).

Table 3: Mean and Standard Deviation of the Transactional Leadership Style

Scale	Mean	SD
Contingent reward	3.13	0.55
Management-by-exception-active	2.89	0.62
Management-by-exception-passive	1.12	0.59
Overall Transactional leadership style	2.38	0.31

5.3 Cultural perceptions

Participants were asked to respond to 10, likert scale type questionnaire dealing with their perceptions about computers' cultural relevance to and impact on Malaysian schools. Cultural perceptions were represented by a mean score on a 5 point likert scale where 5 (strongly agree) represents the maximum score of the scale and 1 (strongly disagree) represents the minimum score. Table 4 illustrates the frequency of respondents' feedback to the cultural perceptions scale.

Table 4: Frequency Percentages on the Cultural Perceptions Scale

IETC 2014

N	Cultural Perceptions Scale	SD (%)	D (%)	N (%)	A (%)	SA (%)
1	Computers will not make any difference in our classrooms, schools, or lives	23.3	50.7	17.3	7.9	0.8
2	Principals need to know how to use computers for their future jobs	1.1	3.3	9.7	60.6	25.3
3	Students prefer learning from teachers to learning from computers	2.8	28.3	39.1	23.6	6.2
4	Knowing about computers earns one the respect of others	0.5	13.7	21.3	48.9	15.6
5	We need computers that suit better the Malaysian culture and identity	2.5	3.4	8.7	63.1	22.3
6	Computers will improve our standard of living	2.5	6.1	8.7	50.4	32.3
7	Using computers would not hinder Malaysian generations from learning their traditions	0.5	3.3	8.2	59.7	28.3
8	Computers are proliferating too fast	16.7	31.1	29.7	16.1	6.4
9	People who are skilled in computers have privileges not available to others	1.3	12.9	21.3	48.9	15.6
10	The increased proliferation of computers will make our lives easier	0.5	6.1	8.7	53.5	31.2

Scale: SD=Strongly Disagree, D=Disagree, N=Neutral, A=Agree, SA=Strongly Agree

From a school culture perceptive, the majority of the respondents agreed or strongly agreed that school principals need to know how to use computers for their future jobs (85.9%), and that the increased proliferation of computer will make our lives easier (84.7%). Also, a high percentage of the respondents disagreed or strongly disagreed with the negatively stated item 1, indicating that computers will make difference in their classrooms, schools, and lives (74%). However, a high percentage of them (39.1%) were neutral about whether or not students prefer learning from teachers to learning from computers. From a national culture viewpoint, the majority of the respondents agreed or strongly agreed that knowing about computers earns one the respect of others (64.5%), contribute to improving their standard of living (82.7%), and computers would not hinder Malaysian generations from learning their traditions (88%).

As can be seen from Table 5, the overall mean on the cultural perceptions scale was 4.0, with a standard deviation of 0.53, indicating that principals' perceptions of the cultural relevance of computers were positive. In other words, principals had positive perceptions of the value, relevance, and impact of ICT as it relates to the cultural norms in Malaysian schools. So, principals did not feel ICT as a threat for Malaysian culture.

Table 5: Percentage, Mean, and Standard Deviation of the Cultural Perceptions

Scale	Percent (%)			Mean	SD
	Negative	Neutral	Positive		
Cultural Perceptions	0.0	26.7	73.2	4.00	0.53

IECT 2014

5.4 The relationship between the level of computer use by principals and the independent variables

The association between computer use and independent variables were explored by using the correlation analysis. The Pearson Product-moment was performed to identify independent variables that individually correlate with the dependent variable. The correlation matrix shows a number of significant relationships between level of computer use by principals and the independent variables (Table 6).

Table 6: Summary of the Correlation Matrix of Independent Variables and Computer Use

Variable	Pearson Correlation	Point-Biserial/ Biserial Correlation	Sig. (2-tailed)
Computer Use	1		
Cultural Perception	0.47**		0.000
Transformational Leadership	0.63**		0.000
Transactional Leadership	0.14		0.08

** p<.01; *p<.05

5.5 Cultural perceptions and the level of computer use

The relationship between cultural perception and the level of computer use was investigated using Pearson product-moment correlation coefficient. Preliminary analyses were performed to ensure no violation of the assumptions of normality, linearity, and homoscedasticity. There was a moderate and positive correlation between the two variables [r =0.47, n=520, p<0.05], indicating that as principals' perceptions of the value, relevance, and impact of computers as it relates to the cultural norms in society and school increase, level of computer use will improve as well. As shown in Table 6, the p-value was smaller than the alpha value (p = 0.0001 < 0.05) so it can be concluded that there was significant relationship between cultural perception and level of computer use at 0.05 level of significance. The study's results are consistent with Rogers' premise regarding the role of social norms in the diffusion of innovations, and also with Thomas's "Cultural Suitability" hypothesis, which posits that the acceptance of a new technology depends to a large extent on its compatibility with the existing culture. Specially, principals in this study acknowledged the importance of ICT for their educational system and society. It reflects the influence of their cultural norms on their perception of ICT.

5.6 Transformational leadership and level of computer use

According to Table 6, there was a moderate and positive correlation between the two variables [r =0.63, n=520, p<0.05], indicating that as the level of principals' transformational leadership increase, their level of computer use will improve as well. Also, the findings showed that the p-value was smaller than the alpha value (p = 0.0001 < 0.05) so it can be concluded that there was a significant relationship between transformational leadership style and level of computer use by principals at 0.05 level of significance. This result suggests that transformational leadership has a positive effect on the level of computer use by prin-

IECT 2014

cipals. In this way, the applicability of the transformational leadership to information technology projects was well supported by the results of this study.

5.7 Transactional leadership and level of computer use

The relationship between transactional leadership and level of computer use was investigated using Pearson product-moment correlation coefficient. Based on r = 0.14, there was negligible relationship between transactional leadership and level of computer use. This result implies that transactional leadership style cannot influence the level of computer use by principals. This result is consistent with Leithwood's (1994) arguments that transactional practices alone do not lead to systematic improvement and benefits in transactional leadership can only be seen when paired with characteristics of transformational leadership.

6.0 Conclusion

This paper raises some issues about the role of principals in technology integration, determines the extent to which Malaysian principals use ICT in their schools and identifies their perceived ICT competencies and their leadership style. Findings indicate that principals are using computers two or three times a week for a variety of instructional and administrative tasks. In fact, if Malaysian principals want to be successful for their new role as technology leaders, they must understand the role of ICT in their work life and acquire appropriate skills to use this knowledge. In other words, they must be proficient in utilizing the computer to assist in administrative and instructional functions. For example, they should understand word processing, how to construct and report from a data base, how to use a spreadsheet to solve financial problems, how to create reports and link them with a mail-merge package, how to create and maintain files on a disk, how to use hardware available in their district, and how to use specific applications programs in use in their school.

Hence, principals should use of technology and realize the role that technology can play in teaching and learning process. Successful adoption of computer is important for school principals who must use computers and model their use for their staff (Tiede, 1992). If this modeling is successful, the staff may then model the use of computers for students. In this way, principals who do not have positive expectations for computer use or do not instill or support a culture of technology use; integration is inhibited (Anderson & Dexter, 2000). Therefore, principals should have knowledge, skill and positive attitudes towards implementing ICT in schools and also they must know new administrative techniques to manage their schools effectively.

In the age of technology and information, Malaysian principals should become competent in using computers. They should use computers effectively to perform their daily responsibilities. In fact, their ability to use computers helps them become more effective managers in using and analyzing the information that is available to them. The effective use of the computer in management, communication, and decision-making can increase their accountability. Findings of this study indicated that Malaysian secondary school principals are lacking in proficiency on database, spreadsheet, presentation/ multimedia software, the Internet, and information seeking as compared with other technology competencies. Hence, school districts and principals' centers should provide professional development for principals to become proficient in all the competency areas. Also, they should implement an evaluation system that ensures school principals are working with the technologies at a proficient level.

It is also imperative that the Ministry of Education comes up with policies that will guide the use of ICT in schools. The government seems to be lagging behind because whereas computer studies has been introduced in secondary schools as part of the national curriculum, it has not kept up with the provision of the necessary infrastructure both physical and human resources. For example, there has been no

IECT2014

teacher training course with computer studies as a teaching subject. ICT therefore seems to have been left to the ingenuity of the schools. This may explain the low levels of ICT integration among classroom teachers and the apparent advantage that schools with a principal who has ICT knowledge have. The principals have therefore a professional responsibility and accountability to ensure that they are well trained in ICT and that their institutions have management strategies to enable them to achieve appropriate ICT integration in teaching and learning. At a time when information and communication technologies are being integrated into the classroom as learning tools, and when teachers are being asked to incorporate technology into their teaching practices, principals who are more competent in ICT are more likely to achieve success in their schools.

Attention to cultural beliefs and their impact on ICT adoption are very important in developing countries (Loch et. al., 2003) because socio-cultural factors may put ICT transfer at risk (Albirini, 2006b)."Duplicating strategies from other developed countries without any consideration about cultural adaptations of technologies might be less effective and successful" (Kousha & Abdodi, 2004, p.8). According to Awamleh and Gardner (1999), implementation of a new technology is not finished with installation of the technology and explanation of how to use it. In fact, the new technology should be accepted by the receiving society (Asemi, 2006). It must not contradict the values of society. Findings from this study indicated that principals had positive cultural perceptions of ICT in society and school. Such principals could use technology and create a suitable environment and culture to the integration of technology in schools. This cultural perception relates the principals' success to their individual ability to articulate and influence norms and values. Hence, understanding the cultural values is as important as understanding the technological benefits. Principals who are responsible for adopting and implementing technology in school must be aware of its societal and organizational cultural impacts.

7.0 Limitations

Although we have found several encouraging results, it is important to recognize that the current findings also have limitations. First, the sample size should be increased because using data from a larger number of respondents will permit more powerful findings. Second, participants of this study completed a self-reported instrument. Given the self-reporting nature of this instrument, it was quite possible that principals overrated their proficiency or underrated their proficiency. These ratings may not reflect the true proficiency levels of the principals. In spite of these limitations, this study will be useful for policy makers, providers of professional development programs for principals and for system level decision makers to support mechanism and strategies to assist principals to develop their knowledge, skills and their leadership style. Thus, principals will understand the critical role that they play in facilitating the implementation of ICT in schools to improve teaching, learning and administrative processes. Therefore, we need leaders, not bosses, who help us develop a clearer vision and shed light in the moments of dark confusion (Wheatley & Margaret, 1992).

Democratic Education and Administration

Dr. Muneera Alshurman*
Irbid 21163, Jordan

Abstract.

In any society education is assumed to be a basic welfare pillar. The society, culture and politics of a country greatly influence education in schools. On the other hand, the education also influences the society. Therefore, in order to turn in a well developed society it is essential to strengthen the foundation of education in schools, colleges and Universities .Almost the citizens of each country across the globe believes in democracy. However, for achieving a democratic society it is necessary to create awareness among people about democracy and its benefits. The best way to educate people about democracy is to incorporate democratic education and administration in schools. This research paper is an effort to develop an understanding of democratic education and administration and its significance in today's era. This research has focused on historical overview of democratic education and administration and recognized its importance in today's era. A mixed study design including primary research and secondary research was incorporated to conclude the results.

1. Introduction

Democracy as a respected system greatly influences the structure of societies as it provides an opportunity to place the individual person on a subject position of life. Moreover, democracy helps to transform the ideologies of many areas from law to economy and from reorganization of government to a routine life of a person. This attribute of democracy has led many societies to adopt a democratic environment. The main features of democracy include equality, social and political participation, freedom of decision via voting, the demise of violence method in the realization of social and political goals, the practice of compromise. In addition to includes the elementary value of human as a human being and a free atmosphere to ensure this value. Tolerance to cultural differences and the value of free thought also forms the democratic values. However, the democracy that has to be perceived as basic principles and way of life can only be achieved by effective education. Implementing the fundamental democracy values can only be achievable in educational institutes that incorporates democratic education practices and with a democratic administration. In this term, the management style of educational administrators in managing their organization plays a crucial role. It is vital that people who involved in the administration of any organization follow democratic principles because the implementation of these principals plays a major role in the success of an educational institute.

In order to achieve a democratic society it is crucial that students should be encouraged to practice their rights and be aware of their responsibilities. Democratic education helps to achieve the stated goals(Loflin, J. 2005) Democratic education is characterized by democratic policies, organizational structures, curriculum, and teaching methodologies that incorporate relevant content and present various opportunities to students to practice the concepts they taught carfully Moreover, this type of education system is concerned with the purpose of education that what people wish to achieve from their education sector. There are several questions raised by researchers and people to understand the fundamental goal of education. Some of these questions are: education simply a strategy to earn wealth or maintain a healthy economy? Is it simply a bridge that guides us towards our future profession? It is note worthy that these questions only highlight the sarcastic view about education. In the contrast, questions such as:

* Corresponding Dr. Muneera Alshurman. Tel +96277284483.
E-mail address: muneera_alshurman@yahoo.com

IETC 2014

Is education a mode to develop awareness about the importance of knowledge? Is it an approach that helps to build a realistic view of the world? and helps to understand the need of democracy in education.

2. Problem Statement

Democratic education and administration in educational institutes plays a significant role in building a democratic society. However, most of the educational institutes lack in incorporating democratic administration and providing democratic education to students. This paper aims to develop an understanding of democratic education and administration. It also creates an awareness of the importance of democratic education and administration in era today.

3. Research Aim

The aim of this research is to develop an understanding of democratic education administration and create awareness about its importance in today's era

4. Research Objectives

The objectives of this research are:

- Identify the building blocks of a democratic society
- Understand what democratic education and administration is?
- Create an awareness of the importance of democratic education and administration in today's era

5. Research Questions

Keep in mind the final goal of this research is to create an understanding of democratic education and administration in the era today, this study has focused on the following questions:

- What is democracy?
- What is democratic education?
- What role does a democratic education plays in creating a democratic society?
- What are various teaching methods used in most of the schools and up to what extent these methods fulfill the requirements of democratic education?
- What type of mode of communication is adopted between students and teachers in schools?
- What is the role of administration in an educational institute?
- How can a democratic administration contribute in the success of an organization?

6. Significance of Research

This research is tended to be equally imperative for the management of educational institutes and academic region since it has furnished an understanding of democratic education and administration and

IETC 2014

its importance. The comprehensive literature review on democratic education and administration will lead the educational institute to adopt democratic practices in education process and administration. Moreover, this research will also create awareness in students for their democratic rights. It will help them to understand the importance of studying in a democratic environment.

7. Literature Review

7.1 What is Democracy?

The word democracy might be familiar to the most people. However, the concept of democracy is still not clearly understood and often misused by single party regimes, military leaders or dictators in order to get large support of people which in turn leads them to a strong a political position (Biesta, 2007). Nevertheless, the power of democracy has succeeded to survive a long and turbulent history. Regardless of prevailing challenges, democratic government in many countries continues to grow and flourish. The word democracy was derived from a Greek word demos which means people. Democracy is defined as the existence of government that has been chosen by people. In some societies democracy can be practices by the citizens directly. On the other hand, nations with huge population democracy are practiced by people who are elected by the public (Parker, 2003). According to President Abraham Lincoln, democracy is the government of people, by people and for people. Frequently the words democracy and freedom are used interchangeably; however, these words are not synonymous. Democracy is certainly a set of principles and concepts about freedom. In other words democracy is the institutionalization of freedom. In addition, the democracy also includes the processes and practices that have been transformed throughout a long and turbulent history. It is essential for people who are living in a democratic environment to be the decisive guardian of their freedom. Freedom is characterized by recognizing one's intrinsic dignity and absolute rights in a society (Crick, 2002).

7.2 Importance of Democracy

As stated in the previous paragraph, democracy indicates the existence of the government that has been chosen by people, it provides numerous benefits to its citizens. A democratic government provides its citizens the best opportunities, maximum freedom and a happy life with greatest prosperity. So far it is considered as the most stable form of government. In a democratic environment the individual person is free to practice religion of his choice. Woman is free to choose spouse of her choice and even student are free to select the form of education they wish to achieve. In a democratic society a person has complete freedom, he can freely move around without getting anyone's permission, he is free to watch any movie or listening to any type of music. Moreover, in a democratic society minorities are given equal right of participating in politics and influence society as anyone else. They are provided with complete protection against violation and assault. In democracy, woman is presented with equal rights and opportunities as a man. They have equal right to get education, they were allowed to work in offices and they can enjoy maximum freedom as men do. Every person in a society desires for freedom and security and both of these are only possible in a democratic environment. Therefore, democracy should be encouraged everywhere and the best way to create awareness about democracy is to incorporate democratic education and administration in educational institutes (Lappé,2006).

8. Characteristics of Democratic Education

Democratic education plays a vital role in creating awareness about democracy therefore it should be open for all citizens of a democratic society. Apart from being open to everyone it is essential for a democratic education to make maximum efforts for providing best education to children. It helps to build healthy relationship between teacher and student (SIDA, 2001).An education system with democratic education should help increase freedom as power to select and in achieving satisfactory life. It should also encourage the intensification of individuality. Democratic education should extend the scope of student's interest. It should involve comprehensive knowledge on history, painting, literature, music and sciences as

IECT 2014

these are the basic tools that help in diminishing the barriers among classing and in turn developing a form for wider shared interests. Nevertheless, democratic education plays a major part in the development of habits that involves caring for others and notifying others needs before making any personal decisions. Democratic practice is characterized by the habit of taking into account other people's views and considering the consequences of an action and its impact on others beyond its advantage to the agent. In order to establish a flourishing educational system of personalized learning it is essential to consider the fact that providing each student with the opportunity to prove their talent is not the disloyalty towards excellence instead it is the accomplishment of it(Colville,Hall, 2000) .The phrase personalized learning indicates high teaching quality which is approachable to various ways that can facilitate students in accomplishing their best. It involves responding to individual students by establishing a mode of education and realizes the needs of the students and focuses on their interests, this type of approach has acquires strong moral and educational support.

9. Democratic Education's Historical Background

In order to understand , to prepare or to produce anything properly it is necessary to know about its ups and down, its future aspects as well as the little historical background of that particular thing that we are going to prepare or make, In other words we can say that happenings of today or future are directly dependent upon past. So due to this reason it is mandatory to have a brief discussion on historical background of democratic education. For the very first time in the world, the philosopher named "Plato and Socrates" made links between education and democracy. The idea of democratic education was alluded without precedent for Rousseau's and Dewey's writings(Dewey,1938).Rousseau belongs to the "romantics" of education (18th century) whose thought was to completely educate and instruct all citizens so that effective integration of individual in society is effectively achieved.. He had introduced the thought of 'social contracting' that ensures ones' opportunity and the right of others. According to him if everybody is included in the society, there is a state of accurate majority rules system or democracy. Rousseau's and Plato's analysis were putting all their efforts on policies, rules and regulations of education and politics in the education sector. Rousseau was inspired by Plato however; Rousseau's status contradicts Plato's perspective. Plato exerts pressure on thought that the principle point of education is to discover the skills of each person and spot them in a profession and in a position in society that everyone deserves. Thusly, he seems to be energetic about meritocracy, stratified groups as per the way of every person and stability in society. It was the opinion of Plato that each member of society should be completely provided with all the knowledge and information that is useful for an individual and in benefit of community. On the other hand, Rousseau believed that education should be fair for all because this would be helpful in the creation of a rigid and developed society. Moreover, it would also contribute in development of personality of each individual equally. There should be equal opportunity for everyone in the community or society. Everyone should be free from all limitation in order to explore his /her abilities and capabilities.

Democracy in any society is reflected by social freedom, while social freedom is considered as a warning element for a society because according to Plato, social freedom and mobility may alarm the disturbance in social order due to the human selfish nature. This unwanted disturbance may put a mark on discipline and respects of authorities of a community. Hence Rousseau and Plato both held conflicts in their view about contribution of social freedom in a society (Curren, 2007) in any perspective; democratic education adopts and takes in record both of the philosophies specified previously. The provision of elements of the philosophy of democratic education in a grade schools aims to join and pass democratic values to its students by using two ways. First, that the authorities responsible for education ensure that syllabus for students includes such subjects that diverges interests of students towards citizenship affairs and towards the role that an individual is responsible for in a society. In addition the curriculum should be designed in such a manner that students put interest in public matters and problems and in finding solutions to those problems. Secondly, by reflecting democratic system and environment in every process such as admissions, teaching, documentation and every other process involved in schooling of a student. School plays a role of micro society for young generation, so it should reflect democratic system. Therefore, this micro-society (school) should help the students to learn, practice and get them familiarized about the way of living in a democratic society. Obviously, this does not imply that there should be no discipline in educa-

IECT 2014

tional institutes or the instructors should play a role of a carefree member letting the students to perform experiments without any direction.

Proceeding onward to Dewey, the father of the American theory of education and a logician that depicted a finished idea of democratic education and in continuation connected these democratic plans and hypotheses in educating in practice with great success. Deway's ideas have thrown light on various aspects of education and learning along with the importance of fair education which have been discussed previously. The philosopher focuses on two aspects of constitution of democracy in a community. First, he give opinion to authorities to put efforts on the things which are mutually beneficial for all members of society rather for a certain group or special classes of people ,in order to maintain social order. And second, to establish interactions among social groups. He explained the links between political democracy and democracy in education, and also explained how political democracy effects democracy of education in various aspects.. Deway has explained the meaning of democracy more clearly than its definition, he explained democracy in its simplest form as thy way of living in a society peacefully ,according to him we cannot establish a real democratic education system unless and until we understand that in which type of society or social system we would like to establish. He also applied his views of democratic education practically by establishing "John Deway's Laboratory School" at Chicago University. Amy Gutmann, a theorist expressed her view that educational democracy is reciprocal to political democracy. She also supported theories of Deway and expressed her views that aims of democratic education is to make student ,a democratic citizen and that the student should understand the democratic perspectives, which they used to follow in their lives, while behaving as a good citizen. Amy felt that education must include such syllabus that creates sense of respect, love cooperation tolerance and peace and responsibility in a student. There are some other famous theorists who also concentrated their efforts on democracy in education such as Paulo Freire. He analyzed the relationship between student and teacher and concluded that course teachers are giving knowledge to students in an old and traditional manner without creating motivation and interests. Teachers should show some creativity and should change the methodology of giving education. They should give lectures according to level of an average student rather on their own level. Authorities should try to create friendly relation between teachers and students. Steps should be taken in order to improve communication between student and teacher because relationship between teacher and student is very important in order to establish a good and successful democratic education system in a society.

9.1 What is Democratic Education?

The definition of democratic education is bounded by three perspectives:

- Freedom to choose learning without any obligations.
- Democratic processes, civic values, citizenship and school governance.
- Global aspects and self-actualization.

Democratic Processes, Classroom/School Governance, Civic Education

Democratic education refers to the fact that all the individuals regardless of their economic status should get hold of civic values, knowledge and skills that are required to establish democracy in a society. In order to fulfill these requirements the educational institutes should incorporate a kind of education that actively engages students in activities that helps to build their personalities and develop skills. (ASCD, 2002). In a democratic education process students are allowed to participate actively in making decisions regarding the classrooms. These decisions involve making rules of a class, curriculums and assessment rubrics. Other features of democratic education include a bill of rights and responsibilities, daily or weekly class meetings (Gathercoal, 2000) and classroom constitutions. And all of these features encourage student's participation. In democratic educational institutes, participation of students can go ahead of traditions students' council where involvement in classroom decisions restricted to decisions regarding party menus, picnic arrangements or academic status. In contrast to traditional schools systems in the democratic schools the students are encouraged to participate in making school rules, in design effective core curriculum, in scheduling, in hiring decisions and in budgeting(Grandmont's ,2002)

Freedom to Choose, Learning Without Compulsion

In democratic education system in today's era students were given equal rights to make decisions regarding how, what, where, when and with whom they study. They were presented with equal right to decide how their education should run and which sanctions and rules are essential. This type of approach provides experiences to students who are unable to make their own decisions. Thus making decision

IECT 2014

themselves (Styles, 2001). Moreover, democratic education promotes the progressive development from a more dependant stage towards a self-directed learning stage (IDEC Resolution, 2005)

Aspects Emphasize Self-Actualization, Human Rights, And Environmental Awareness According to the ideology of democratic education, the primary purpose of education is to create a continuous learning process that accompanies person all over his lifetime. This ideology of democratic education is appreciated globally because such a process helps in multi-facet development of an individual's personality. It promotes freedom and legitimacy and encourages respect for human rights and increases environmental and social responsibility (Hecht, 2002).

9.2 Characteristics of Teaching for Democracy

In 2008, Sleeter has described a number of principal characteristics of teaching for democracy (Sleeter, 2008).These key characteristics include creating awareness in students regarding social issues for achieving public include. Allowing students to make democratic decisions related to class issues. Instructors engaging the students in different perceptions about a topic and in various sources of knowledge, instructors embedding content in critical thinking about factual issues (Perry, 2009).

9.3 Education for Democracy Is Education Freed from Authoritarian Relationships

The concept of democratic education fails if it does not take into account the actual purpose of schooling that is to form a community life and if it does not considers education as a social process .Schools should be considered more as a place that promotes learning (Cimer et al , 2010). On contrary the democratic system views educational institute as a community where deliberation and communication is flourished, according to Winch and Gingell in 1999, if an educational institute wants to encourage democratic values, they need to eliminate hierarchy. Education for democracy thus becomes education freed from authoritarian relationships (Winch, Gingell, 1999).

10. Pros and Cons of Democratic Education

Criticisms play a crucial role in determining the pros and cons of anything. Therefore in order to visualize and compare the pros and cons of democratic education it is necessary to state and analyze the criticism on this type of education system. The first criticism is regarding the absence of discipline in democratic education institutes. This criticism is based on the fact that students are studying in a democratic education system and they are not interested in their course and doing homework; instead they are more fascinated towards games. In the context of democratic education ideology that is being practiced today by several schools, the students are free to play. Keeping in view this ideology of democratic education the questions arise that Is freedom to play not a social dander for students? Will not these students regret the time which they have spent in playing instead of studying and in turn are not able to accomplish the goals and achieve the skill that other children of their age posses. Is it not the primary responsibility of the educational institutes to assure that all their students' progress with the same pace rather leaving on students to decide the time they wish to start studying? (Barlett, 2007).Furthermore other critic argue that the progressive approach adopted by the democratic educational institutes globally results in the decline of academic standards. Dyson and Cox had claimed that this type of situation was observed in the 60s era and it must not be repeated (1969, cited in Bartlett, 2007).This period was assumed to be the era of full employment in which majority of the individuals were only interested in enhancing their wealth. This increasing affluence showed a way of pleasure to individuals and resulted in the formation of laissez-faire society. However, it has led to the occurrence of many economic and social problems in 1970s.

11. Democratic Schools

IECT 2014

At present there are 208 schools across 29 countries and 85 schools were listed in 33U.S states and Puerto that practice democratic education and administration in their management (Education Revolution, 2000a). The characteristics that these schools exhibit include a student centered teaching approach that is characterized by maximum involvement of student in the learning process. In democratic schools there are communities that organize various activities to encourage student's participation. Moreover democratic schools also provide students equal share in decision making (Education Revolution, 2000b).

11.1 Democratic Administration

In the era today individuals are more concerned with getting rights, responsibilities and freedom at their work place similar to what they enjoy outside the work environment. This highlights the fact that workers of an organization must be treated as citizens. A person comes to his work place not only with his skills and knowledge but also with his feelings and social necessitates. And for this reason managers of today's era are obliged to manage the whole organization in a framework of values of democracy. Therefore it is essential to create a work space where workers are considered as a part of organization and free to exercise their view points. This type of work environment should also be practiced in educational institutes to promote democracy (Manville, Ober, 2003).In any type of organization; leaders have to make numerous decisions on daily basis. However, these decisions are not always subjected to choose between good and bad. Occasionally the decisions are subjected to select one of the two bad choices. In the view of the fact that solutions of these issues were not stated in policies, laws or any other guide lines, decision making can be really tough task (Duignan,2006).In such circumstances democracy plays a crucial role and indeed democratization of educational administration becomes essential. A robust management style in educational institute's management can be attained if the administrator takes into account other view points at the time of making decisions. This in turn promotes a democratic environment in schools.

Establishment of democratic administration will be possible in school only if the head of school follows the rules and regulation of democracy in the management activities. A true democratic head will take all decisions with justice and distribute the work equally according to everyone's ability and capability and distribute responsibilities according to it among student's workers parents in order to form the successful education system in school. He will consider every person related with school management equally important for and would provide equal opportunities for everyone working in school. Nowadays, it is very difficult to survive and maintain a reputable position in a society for an antidemocratic organization. Managements have to take some effective steps in order to influence human resources successfully, to achieve organizational objectives. These steps include development of the organizational structure, teamwork, beneficial use of information and technologies, leadership and involvement of employees into decision-making. This new organizational structure is more clearly open and simplest for innovations (Lawler, 2001). According to Lawler (2001) for organizations to be more productive, high officials and boss of the organization reflect elements of democratic leadership in their attitude with subordinates a brief and necessary behavior for a democratic school management are as follows:

- Employees should have rights to free express their views and share their thoughts with management with comfort.
- Environment should be provided in which management consider the appropriate ideas of employees, in benefit of both employees and management.
- Staff should be encouraged for taking initiatives, responsibility and risk issues.
- Rejecting the wrong rules and orders which accuses students, employees and parents,5)
- Establishing a cooperative culture, where the responsibilities are shared, support should be provided to staff in their hard times

Management should take effective steps to create a working environment in which respect, cooperation, and all possible assistance is provided within the organization, where the responsibility is shared, where the failure and success is not the responsibility and not depend upon any individual, where teamwork is appreciated, such steps will enhance the solidarity between the organizations' employees. Such steps will motivate employees even in difficult situations. As understood, certain conditions must be fulfilled in order to implement a democratic management approach educational organizations as implemented in the ancient Greek city-states where all of the citizens participate administration actively. The most important of them is the simplification of organizational structure, as bureaucracy-free as possible. The other most important need is to state a democratic leadership behavior in management department. Such

IECT 2014

educational environments in which elements and principles of democracy are fulfilled and every individual can survive successfully in today's competitive environment.

12. Methodology

This research is based on both primary resources and secondary resources. The primary data is obtained through semi structured question whereas; the secondary data is obtained through extensive literature review. The methodology that is used in the primary research to achieve the defined aim is qualitative data collection method that comprises of semi-structured questions which are used while interviewing teachers of randomly selected schools. Moreover, the framework of the selected educational institutes was analyzed deeply to support the results of the interviews. Semi-structured method was considered as the most appropriate method for tracing the democratic values in educational institutes. The questions of the interview are categorized into three sections:

12.1 Section 1

The first section includes the questions commencing the discussion regarding the topic:

- According to you what does democratic education mean?
- What are the pros and cons of democratic education?
- What is the importance of democratic administration in any organization?
- Do you categorize your school as an institute with a democratic character?

12.2 Section 2

In this section the judgmental form of questions are included in order to identify how well democratic values are integrated within classroom:

- According to you what academic method or practices are considered as democratic?
- According to you which democratic practices should not be exercised within a classroom? Why?
- How would you describe your relationship with your students?
- Is democracy practiced in your school's administration?
- What role is your institute's management playing in managing a democratic administration?
- In your point of view up to what extent does a democratic administration contributes in the success of an organization?

12.3 Section 3

This section comprises of general questions regarding democratic education and administration in today's era:

- Do you believe that globalization influence democratic education and administration? And if yes then up to what extent it does?
- What is your point view about the concept of democratic education and administration today?
- Why it is more important to incorporate democratic education and administration in educational institutes in this era?

A random sample of 10 teachers from each of the three schools was selected for interviewing. The interview was continued for 15 days and three different schools were chosen to assess that up to what extent people are educated about democratic education and administration and understand their importance in today's era.

12.4 Reliability

The reliability of data denotes that same methodology can be used for repeated results. However, the results and interviews are not considered as reliable if different results are obtained every time the research is conducted to trace the democratic values in the same schools. According to Barlett et al optimistic perceive reliability as repeatable outcomes to huge number of people interviewed (Barlett , Burton,

IETC 2014

2007).On the other hand interpretivists view it on whether the explanatory data of each person interviewed is reoccurring or not. It is noteworthy that a reliable data does not necessary have to accurate. According to Bryman the concept of reliability is more concerned with qualitative research as compare to quantitative one (Bryman,2008)

12.5 Validity

It highlights the accuracy of the research outcomes. It is essential for the research methodology to measure exactly what the researcher had claimed to be measured in his research design (Beach D. et al, 2003). As per the optimistic view consistency of data must occur using pilot test. Some interpretivists argue that validity of data is evident while observing the strength of the research power to guard the elucidation of the data. In order to achieve high validity, the research paper should provide extensive explanation about the methodology used to obtain the desired data. The second method that can be used to enhance the validity of results is triangulation method. The validity of this research greatly depends on the extensive literature incorporated and the detailed explanation of the research methodology.

13. Ethical Considerations

It is crucial that every action-research should carry out within moral framework of the respect of participant (BERA, 2003a). One significant ethical issue that different action researchers cannot avoid is the use they make of knowledge that has been generated throughout the analysis. For this essential moral excuse the principal of any study but particularly those carried out by action research should be transparent. The interviews that were conducted in the educational institutes are completely anonymous and neither the names of the education institutes nor the names of the participants are revealed in this research paper. All the draft notes, research diary and data that was collected is protected by the researcher .The results of the study are handled in such a manner that aim of the research and results are patent and cannot be utilized in different manner. Moreover, the researcher has ensured that impacts of this research on the respondents are null.

14. Data Analysis and Discussion

Thematic analysis method was used to analyze the data collected by semi-structured interviews. In thematic analysis the data is categorized according the research question, themes of topic and the content of the data. Thematic analysis supports the division of the most important parts of the data (Seidman, 2006).After the data was divided thematically it was analyzed and interpreted in the light of the literature discussed. The results interpret that democratic values are embedded in the schools visited. The results also highlighted that educational institutes are aware of the importance of democratic education and administration .They are effectively practicing democratic educational processes. The answers of the interview questions also perceived that a healthy relationship exist between teachers and students. Furthermore, the environment of the educational institutes and facilities were promoting the democratic education and presenting the students freedom to choose and be creative. Moving on to the negative aspects of integrating democratic education in educational institutes, this criticism was also supported by the answers of respondents. They claimed the democratic values are often misused by the students, teachers and parents. These stakeholders often take advantage of the democratic values and try to enforce their preferences in a non-democratic manner. Another negative consequence of democratic values was represented by the difficulties faced by the teachers while explaining the concept of democracy to young children .It was also argued by the teachers that democratic education leads to lack of discipline and decline in academic standards. Most of the respondents agreed to the fact that rights presented to the students must be limited to avoid violation of basic rules and regulations.

IETC 2014

15. Conclusion

The aim of this research paper was to develop an understanding of democratic education and administration and its significance in today's era. It has focused on historical overview of democratic education and administration and recognized its importance in today's era. Democratic education plays a significant role in building the personal characteristics of an individual and its way of learning. In this context, education is assumed to be an approach that leads to the development of self determination in an individual. It is also considered as the mean of encouraging self learning and creating self awareness in an individual which in turn helps an individual to recognize his values, personal needs and responsibilities. Democratic education also results in healthy minds and satisfaction with life. Furthermore, a democratic education system encourages the integration of a person in a society. Moving on to the importance of democratic administration, democratic administration promotes a human centered management approach in an organization. In terms of management, a democratic school should pay attention to participation of all associates to the important decisions. According to Bellingham (2003: 6), to create a democratic climate in the organization, the school leaders should be consistent, create trust, think in a long-term manner, be fair, respect for different thoughts, ensure the solidarity, share the power, be honest, give value to people and consider the issues in a broader perspective. It is clear that school administrators have a greater responsibility in creation of a democratic climate in schools. Democratic attitudes of school administrators will create a sense of confidence in school staff and students. This will increase the power of school administrator on influencing and binding people around a specific purpose. A mixed study design including primary research and secondary research was incorporated to conclude the results. The primary research was based on qualitative method; the qualitative method used for this research was semi structured interviews. A random sample of three educational institutes was selected for conducted interviews. The results of the interview show that educational institutes are practicing democratic values and promoting democracy.

Design a serious game to teach teenagers with intellectual disabilities how to use public transportation

Irma Alaribe, 2014
Montreal University, Department of Education, Canada

Abstract

Public Transportation supports independence and encourages social, educational and vocational inclusion. It is a sure means to gain access to the city, its services and activities, but using *fixed-route*[*] requires knowledge and know-how that all travelers do not master, such as people with intellectual disabilities. Indeed the many barriers in the *fixed-route* prevent accessibility for this service. Therefore, teaching them how to use this service is important. Our project aims to design a serious game for people with intellectual disabilities in order to support their learning of using the *fixed-route*. In this communication we will present the methodology use to design the serious game.

Keywords*:* intellectual disabilities, inclusion, *fixed-route*, travel training, Serious Game.

IETC 2014

Introduction

Public transportation supports independence and encourages social, educational and vocational inclusion. It has an impact on health, economics, vocational and social life of individuals (Markovich, & Lucas, 2011). It is a sure[*] Services include any transit service in which vehicles run along an established path at pre-set times. Trains, subways and buses are the most common examples of this type of service (ctaa.org). means to gain access to the city, its services and activities and it is often an alternative for those whom driving is not an option available (Wilson, 2003). In other words, Public Transportation promotes autonomy, independence and social participation (Chen Wu Y., 2011; Co-Operation, & al., 2009; Fisher G., 2002; Grönvall O., 2005; Koppa R.,

1998; Lambert H, 2011; Rosenkvist J., 2009; Venter C., 2002.). However, the use of Public Transportation in the *fixed-route* requires knowledge and know-how that not all travelers, such as people with intellectual disabilities, masters. In fact, the lack of accessibility of the *fixed-route* excludes people with intellectual disabilities from its services. Indeed, it seems that the fixed-route environment may present some obstacles that can affect these users during their journey. While for most of us, travel learning is done through personal experience, for people with intellectual disabilities there is a need for travel training in order to build up travel experience and confidence.

I- Fixed-route and intellectual disabilities

Questions around the use of Public Transportation arise from the deinstitutionalization. As a matter of facts, institutionalization without any chance to be active in the society has not encouraged neither the intellectual stimulation nor improves life quality for people with intellectual disabilities. Quite the contrary, institutionalization has promoted dependency (Ionescu, & al., 1990).

Deinstitutionalization has ended precarious livelihood and has also promoted inclusion of people with intellectual disabilities. However, all these years of institutionalization has not helped people with intellectual disabi-

lities to develop appropriate skills to function in society. Moreover, for the new generation, whom escape this poor and precarious lifestyle, it is difficult to evolve, learn and live in a world built by and for people without intellectual disabilities (Langevin, 1996). This is the reason why during the seventies a lot of initiatives were developed in order to learn social skills. Among those initiatives, we can find the learning of "communication skills", "pedestrian skills" (Laus, 1974 ; Melching & O'brien, 2010) and also "money management" (Lowe, & al., 1976 ; Langevin, & al., 1994), time management (Welch, & al., 1985 ; Boutet, & al., 2000) or even initiation of Public Transportation in *fixed-route* (Kubat, 1973 ; Laus, 1974 ; Certo, & al., 1975 ; Neef, & al., 1978 ; Welch, & al., 1985 ; Chen Wu, 2011).

Regarding the use of *fixed-route* system, interaction between the characteristics of people with intellectual disabilities and those of the environment often led them to experiencing disadvantages and failures, which can limit their use of this service. Indeed, because of the numerous instabilities (Langevin, & al., 2007) (semantic, morphological, procedure, etc.) and of diverse barriers (social, physical, cognitive, personal, etc.) the *fixed-route* appears to present a lack of accessibility, which may explain why it can be difficult for people with intellectual disabilities to use this service without a pedagogical support.

Consequently, setting up Travel Training in order to initiate people with intellectual disabilities to the use of *fixed- route* seems necessary.

II- Travel training

Travel Training is an answer for social inclusion approach and encourages the development of self-determination, which will influence fulfilment and sense of control among people with intellectual disabilities. Wehmeyer (1992), define self-determination as "the attitudes and abilities required to act as the "primary causal agent in one's life and to make choices regarding one's actions free from undue external influence or interference" (pp. 305). Travel Training is necessary, because apart from initiating people to the use of *fixed-route*, they also offer a rewarding experience in which they can develop many skills and have a better perception of themselves (self-esteem). However, Travel Training may present some constraints such as costs (Lewis, & Gerard, 2011), the fears of parents or caregivers related to safety (Davies, & al.), some dangerous situations in the practical training (Marsden, & al.,

2011) or even impossibility to experience in the real context a lot of scenarios. Therefore, proposing and encouraging innovative strategies in order to overcome those constraints is necessary. The use of a digital media such as Serious Game seems to be an interesting introductory tool for the initiation of the use of fixed-route and also to encourage the transition between the theory and the practice.

III- Digital media key challenges for people with intellectual disabilities: serious game case.

Several authors were interested to game as a cultural phenomenon and also as a useful mean for the intellectual and social development of children, thus fostering learning (Callois, 1958; Vygotski, 1967; Winicott, 1975; Piaget,1976). this is still accurate, nonetheless, the coming of New Technologies of Information and Communication (NTIC) noticeably changed the approach by learning with game, by introducing computer applications. It is the case for example with Serious Game. Serious Game is defined as "any meaningful use of computerized game/game industry resources whose chief mission is not entertainment" (Sawyer, 2007, p.12).

In Education, this media has shown different benefits when using them, such as encourage active learning, increase motivation and collaboration, encourage creative thinking or the adjustment of teaching strategies, etc. All those reasons make us think to the use of Serious Game with people with intellectual disabilities for the initiation of the use of *fixed-route* in order to enhance teaching strategies, facilitate learning and to overcome some constraints discussed in the previous paragraph.

However, there is little information currently regarding the use of Serious Game by people with intellectual disabilities and thus few data regarding their efficiency and also the main benefits of their use by this people. Nonetheless, some authors (e.g. Sik Lanyi, & al. 2009; Langone, & al. 2003; Melching, & O'Brien, 2010; Standen,

IECT2014

& al., 2009) have put forward with Serious Game the possibility to work with complex concepts and in safer environment, to live failure differently, to experience many solutions in the game with an immediate feedback and also improve choice decision and time reaction.

Researches on Serious Game and Intellectual Disabilities are at their beginning and even if these authors criticize their results (e.g. Small simple size, non-standardized tests, short intervention time, etc…) the conclusions seems promising and bring us to think that it would be interesting to generalize these results by proposing a design of a serious game for people with intellectual disabilities, which may answer the trainees and trainers needs. Therefore the research question for this project is: How to design a Serious Game, which may answer adequately to the needs of different users (trainees = people with intellectual disabilities and trainers)?

IV- Methodology

1. Participant

Participants of this study are 6 teenagers with mild intellectual disabilities aged between 14-21 years old as well as 1 trainer. Participants are recruited in a special needs school (Centre François Michelle). However, for the stage 1 of the Game Design Document (creating a library of problematic situation) we will work with 2 other trainers working in an association (CEREMH) in order to collect as much data as we can. The participation for this research is based on volunteering. The methodology we use is based on pedagogical engineering and video game design. This methodology of this research is organized in 3 stages describe in the following paragraph.

2. Needs analysis

The Needs Analysis is a necessary stage in any design project. According to Mayer, & al. (1991), the need is related to "physiological, psychological, spiritual, etc. (…). It may be linked to a problem, an absence, a deficiency, an insufficiency or just a temporary disturbance."(pp.95). In sum, it is a gap between the actual state and the desired state. Currently, Travel Training presents some constraints (e.g. costs, fears, etc…) which may limit their use for some individuals, this is the **actual state.** Therefore, for the desired state, the goal is to find strategies or tools which can overcome those constraints in order to enhance teaching strategies and facilitate learning. By introducing a Serious Game as a pedagogical tool, we are looking to reach the desired state. In order to determine the users' needs, a need analysis is necessary. Therefore, our analysis is focusing on the educational needs and more precisely on teaching needs and learning needs.

IETC 2014

- Teaching Needs: through interviews with trainers, the objective is to identify the difficulties they have to face during the training and also to identify the themes that they use more often with people with intellectual disabilities.

- Learning Needs : through the design of a Persona the objective is to identify the learning needs (in terms of knowledge, skills and attitude) in order to adapt the learning content to the characteristics of people with intellectual disabilities.

3. Functional Analysis

The functional analysis consists to determine the roles that we want for the Serious Game and identify the different costs that thereof will generate (e.g. financial costs, time costs, emotional costs, etc.). The roles characterization is done in view of trainees, trainers and the Serious Game in order to propose a functional analysis which will be complete and whose objective will be to propose an efficient tool which can answer the needs of everyone.

The functional analysis encourages specification of the development goals and it is also a pledge to objectivity and creativity. Our functional analysis will be carried out by a distinctive product analysis whose role is to identify the strength and weakness of similar game as the one we want to design. Therefore, an analysis of 3 video games (simulation, visual novel and adventure game) in order to understand the game mechanics and an analysis of 3

Serious Game to identify how to create a perfect harmony between the entertaining content and the educational content and also how the learning objective are included in the game will be carried out.

4. Game design document (GDD) elaboration: instructional design

For Ryan (1999) Game Design Document purpose is "to express the vision for the game, describe the contents, and present a plan for implementation" (pp. 1). In this research, the Game Design Document is composed of teaching scenarios, learning objectives and learning strategies (educational content) and game design (entertaining content). The elaboration of this document is structured by 4 steps:

- To create the problematic situation library: our goal is to collect from trainers the difficulties that the trainees have to face during the training and how do they manage the situation. All the data collected will be used to create a database of problematic situation which is going to help us built the story and also give the chance for the players to experience different ends in the game.

- To identify the learning objective and the learning strategies: identify learning objective for each skills to master at the end of the training and also to adapt strategies to the characteristics of the participants.

- To create the design content: this stage concerned the implementation phase. The problematic situation, the learning objectives and the learning strategies are brought through the gameplay and the mechanics of the game.

IETC 2014

- To verify the relevance and coherence of the design content: the story, the rules and the way to play are submitted to the trainers in order to verify the relevance, the coherence and also the flow.

Our methodology is part of a partnership work and aims at covering all educational and entertaining aspects in order to propose an optimal experience to the players. The next step of this research will be the data collection.

Design of a learning module for the deaf in a higher education institution using padlet

Dorothy DeWitt24, Norlidah Alias, Zainuddin Ibrahim, Ngu Kee Shing, Syar Meeze Mohd. Rashid

Department of Curriculum and Instructional Technology, Education Faculty, University of Malaya, Kuala Lumpur 50604, Malaysia

Abstract

Deaf students have communication and learning problems which is amplified when they attend higher education institutions which do not have facilities which cater to their needs. Padlet is a web application for interactions, may be used for communication among deaf students. This exploratory implementation study for the design of a learning module for deaf students used the Fuzzy Delphi technique among 27 experts. The prototype of the module was evaluated with data collected from observations and interviews of four deaf students. Findings indicate that Padlet could be used for communication among deaf students. However, further studies could be done to investigate its suitability in other contexts.

Keywords: Padlet; Web 2.0; Fuzzy Delphi technique; deaf learners; higher education institutions

IETC 2014

1. Introduction

The use of technology namely information communication technology (ICT) can facilitate teaching and learning. The National Higher Education Action Plan (NHEAP) (2011-2015), which steers the direction for the national higher education agenda to strengthen and enhance higher education institutions (HEIs). E-Learning is identified as one of the Critical Agenda Projects (CAPs) and a Key Result Area (KRA) for the government transformation program in the NHEAP. This is because learners are more active and responsible for their own learning when using ICT (MOHE, 2011). As a result, a national e-Learning policy was formulated, aimed at providing quality education at all levels of HEIs with equal and fair access for the people, and instilling a culture of innovation among the academic staff (MOHE, 2011).

In line with its commitment to ensuring better access to quality education, the government of Malaysia has passed several policies. People with disabilities should not be excluded from the formal education system on the basis of disabilities but should have equal access to vocational skills training and life-long learning programs under the education system (People with Disabilities Act, 2008). In addition, Salamanca Statement (2004) and Framework for Action on Special Needs Education states that schools should accommodate all regardless of their differences (UNESCO, 2013).

However, the implementation of the NHEAP seems to cater for the mainstream population and does not take into consideration special learners. Although the Ministry of Education Malaysia, (MOE) has a division to cater to the needs of special learners, the Special Education Division focuses on the needs of primary and secondary students. In Malaysia, there does not seem to be a concerted effort among the HEIs in addressing their needs, including those of the hearing impaired. Among the HEIs, there seems to be only

three polytechnics which cater for hearing impaired students (MOE, 2008). The use of technology namely information communication technology (ICT) can facilitate teaching and learning. The National Higher Education Action Plan (NHEAP) (2011-2015), which steers the direction for the national higher education agenda to strengthen and enhance higher education institutions (HEIs). E-Learning is identified as one of the Critical Agenda Projects (CAPs) and a Key Result Area (KRA) for the government transformation program in the NHEAP. The paragraphs continue from here and are only separated by headings, subheadings, images and formulae. The section headings are arranged by numbers, bold and 10 pt. Here follows further instructions for authors.

Chapter 2 Nomenclature

A	radius of
B	position of
C	further nomenclature continues down the page inside the text box

2.1. Structure

Files must be in MS Word only and should be formatted for direct printing, using the CRC MS Word provided. Figures and tables should be embedded and not supplied separately.

Please make sure that you use as much as possible normal fonts in your documents. Special fonts, such as fonts used in the Far East (Japanese, Chinese, Korean, etc.) may cause problems during processing. To avoid unnecessary errors you are strongly advised to use the 'spellchecker' function of MS Word. Follow this order when typing manuscripts: Title, Authors, Affiliations, Abstract, Keywords, Main text (including figures and tables), Acknowledgements, References, Appendix. Collate acknowledgements in a separate section at the end of the article and do not include them on the title page, as a footnote to the title or otherwise.

Bulleted lists may be included and should look like this:

- First point
- Second point
- And so on

IETC 2014

Ensure that you return to the 'Els-body-text' style, the style that you will mainly be using for large blocks of text, when you have completed your bulleted list.

Please do not alter the formatting and style layouts which have been set up in this template document. As indicated in the template, papers should be prepared in single column format suitable for direct printing onto paper with trim size 192 x 262 mm. Do not number pages on the front, as page numbers will be added separately for the preprints and the Proceedings. Leave a line clear between paragraphs. All the required style templates are provided in the file "MS Word Template" with the appropriate name supplied, e.g. choose 1. Els1st-order-head for your first order heading text, els-abstract-text for the abstract text etc.

2.2. Tables

All tables should be numbered with Arabic numerals. Every table should have a caption. Headings should be placed above tables, left justified. Only horizontal lines should be used within a table, to distinguish the column headings from the body of the table, and immediately above and below the table. Tables must be embedded into the text and not supplied separately. Below is an example which the authors may find useful.

Table 1. An example of a table.

An example of a column heading	Column A (*t*)	Column B (*t*)
And an entry	1	2
And another entry	3	4
And another entry	5	6

2.3. Construction of references

References must be listed at the end of the paper. Do not begin them on a new page unless this is absolutely necessary. Authors should ensure that every reference in the text appears in the list of references and vice versa. Indicate references by (Van der Geer, Hanraads, & Lupton, 2000) or (Strunk & White, 1979) in the text.

Some examples of how your references should be listed are given at the end of this template in the 'References' section, which will allow you to assemble your reference list according to the correct format and font size.

2.4. Section headings

Section headings should be left justified, bold, with the first letter capitalized and numbered consecutively, starting with the Introduction. Sub-section headings should be in capital and lower-case italic letters, numbered 1.1, 1.2, etc, and left justified, with second and subsequent lines indented. All headings should have a minimum of three text lines after them before a page or column break. Ensure the text area is not blank except for the last page.

2.5. General guidelines for the preparation of your text

Avoid hyphenation at the end of a line. Symbols denoting vectors and matrices should be indicated in bold type. Scalar variable names should normally be expressed using italics. Weights and measures should be expressed in SI units. All non-standard abbreviations or symbols must be defined when first mentioned, or a glossary provided.

IETC 2014

2.6. File naming and delivery

Please title your files in this order 'procedia acronym_conference acronym_authorslastname'. Submit both the source file and the PDF to the Guest Editor.

Artwork filenames should comply with the syntax "aabbbbbb.ccc", where:

- a = artwork component type
- b = manuscript reference code
- c = standard file extension

Component types:

- gr = figure
- pl = plate
- sc = scheme
- fx = fixed graphic
-

2.7. Footnotes

Footnotes should be avoided if possible. Necessary footnotes should be denoted in the text by consecutive superscript letters[1]. The footnotes should be typed single spaced, and in smaller type size (8 pt), at the foot of the page in which they are mentioned, and separated from the main text by a one line space extending at the foot of the column. The Els-footnote style is available in the MS Word for the text of the footnote.

Please do not change the margins of the template as this can result in the footnote falling outside printing range.

3. Illustrations

All figures should be numbered with Arabic numerals (1,2,3,....). Every figure should have a caption. All photographs, schemas, graphs and diagrams are to be referred to as figures. Line drawings should be good quality scans or true electronic output. Low-quality scans are not acceptable. Figures must be embedded into the text and not supplied separately. In MS word input the figures must be properly coded. Preferred format of figures are PNG, JPEG, GIF etc. Lettering and symbols should be clearly defined either in the caption or in a legend provided as part of the figure. Figures should be placed at the top or bottom of a page wherever possible, as close as possible to the first reference to them in the paper. Please ensure that all the figures are of 300 DPI resolutions as this will facilitate good output.

The figure number and caption should be typed below the illustration in 8 pt and left justified [***Note:*** one-line captions of length less than column width (or full typesetting width or oblong) centered]. For more guidelines and information to help you submit high quality artwork please visit: http://www.elsevier.com/artworkinstructions Artwork has no text along the side of it in the main body of the text. However, if two images fit next to each other, these may be placed next to each other to save space. For example, see Fig. 1.

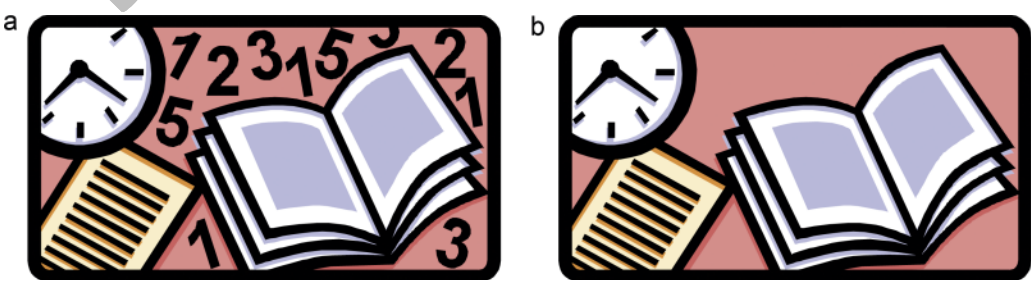

Fig. 1. (a) first picture; (b) second picture.

[1] Footnote text.

IECT 2014

4. Equations

Equations and formulae should be typed in Mathtype, and numbered consecutively with Arabic numerals in parentheses on the right hand side of the page (if referred to explicitly in the text). They should also be separated from the surrounding text by one space.

$$\rho = \frac{\vec{E}}{J_C(T = \text{const.}) \cdot \left(P \cdot \left(\frac{\vec{E}}{E_C} \right)^m + (1 - P) \right)} \tag{1}$$

4. Online license transfer

All authors are required to complete the Procedia exclusive license transfer agreement before the article can be published, which they can do online. This transfer agreement enables Elsevier to protect the copyrighted material for the authors, but does not relinquish the authors' proprietary rights. The copyright transfer covers the exclusive rights to reproduce and distribute the article, including reprints, photographic reproductions, microfilm or any other reproductions of similar nature and translations. Authors are responsible for obtaining from the copyright holder, the permission to reproduce any figures for which copyright exists.

IETC 2014

Acknowledgements

Acknowledgements and Reference heading should be left justified, bold, with the first letter capitalized but have no numbers. Text below continues as normal.

Appendix B. An example appendix

Authors including an appendix section should do so before References section. Multiple appendices should all have headings in the style used above. They will automatically be ordered A, B, C etc.

A.3. Example of a sub-heading within an appendix

There is also the option to include a subheading within the Appendix if you wish.

Designing a social network to support elearning activities at the department of communications, university of Žilina

Radovan Madleňák[a]25, Lucia Madleňáková[a], Eva Kianičková[a]
[a]*Department of Communications, University of Žilina, Univerzitná 1, Žilina, 01026, Slovakia*

Abstract

Internet communication is connected with social media and especially with social networks in the recent years. This phenomenon we can notice also in the sphere of education. The educational processes are significally impacted by this because social networks are slowly becoming part of teaching. The aim of this work is the research of possibilities of using social networks at Žilina University in Žilina, which primarily should serve for the communication between teachers and students

Keywords: Social network; Community; Teachers-students communication; Social groups

IETC 2014

1. Introduction

There are a lot of views and definitions that describe the concept of Internet social medias. Generally there are Internet media, the content is produced and shared by users of social networks and it is not possible to determine if the content is true or not (Janouch, 2010). Internet social media form part of new web technologies, which allow creating and distributing their content to the users. They replace traditional media like newspapers, television or radio, which are generally imitated sources of information, because users cannot provide their feedback like with Internet social media (Zarella, 2010).

Internet social media are divided according to their target to social networks, business networks, social bookmarker systems and sites where you can vote for the quality of their content.

1.1. Social networks

Social networks started to be the phenomenon that controls the Internet communication in the recent years. To create huge communities, to create their content ant it's shearing to other users is important for social networks. The terms social networks and social medias are often considered to be the same ones, but we should distinguish them. The agency ENISA (European agency for information and network security) says that social network is the on-line community which allows to its users to meet with other users of the social network, communicate with them, and share the information content by their accounts within a single space.

Generally there are three basic assumptions of social networks:

- The users themselves create the content,
- Users comment information content and create community groups

- Providers of social networks do not enter to the social networks respectively they enter but not significantly (Bednar, 2011).

Social network is the kind of subset of social media, because the term social media is larger and more complex. There are many social networks; they differ in appearance, functions or in other characteristics. Often they have common elements, but each one is unique. This is the reason why the breakdown of social networks is complicated and it is not possible to say that the certain social network is of only one type because it contents also functions and elements of another type of social network. This is the general division of social networks (Madlenak, 2007):

- *Professional* – this type is used mainly by companies, used for the communication among employees and employers, or even for the communication of the company and the customers. They are used also for carrer development or for looking for a job. They can be designed for professionals or they could be oriented to certain discipline or in another way. LinkedIn or SQL Monster may be considered as the examples.

- *Community* – this is the most widespread and the most known community of social networks. The users communicate with their friends, family and acquaintances. Facebook, Twitter, Google+ etc., may be the examples. Here we can include also networks that allow sharing multimedia like photos, videos and other contents, networks as Youtube or Flickr.

- *Information* – Information social networks are dedicated mainly to inform the users about daily problems. It includes SuperGreenME and DoItYourself.

- *Education* – They are used by students who used them to communicate among them for the study purpose of certain school. They are dedicated to a communication between teacher and student too. Students share and change the study materials or they can cooperate on diffrent school projects. These networks are normaly used by smaller communities and they are not so known. We can mention social networks Sophia or ePals as an example (Madlenakova, 2005).

-

1.2. Electronic support of education at the university of Žilina

University of Žilina use e-learning system "e-Vzdelavanie" for the electronic support of education. This system contents module Moodle, which we can call primitive social network because it can be used for the communication among users, but primarily it is used for provision of electronic study materials in on-line courses and for teaching tests. Of course, functionality of the system could be expanded by suitable application of plugins but this need is not accepted yet.

2. Objectives and methodology

The absence of University social network at University of Žilina and the lack of potential of IS e-learning "e-Vzdelavanie" is the basic problem that underlies this contribution. The basic research aims were established, which tried to solve this problem. The research aims were examination of student satisfaction with communication and providing information through the portal of "e-Vzdelavanie", detection of using the commercial social networking sites, comparison of the study information provided at social networks and in the environment of Moodle and finding the need to create the own social network. All these data are described in Table 1.

Table 1. Problem and objectives of the research.

PROBLEM	Absence of University social network and lack of using the potential of Moodle

IETC 2014

	in the environment of e-learning
OBJECTIVE	To examine the satisfaction of students with communication and sufficient amount of provided information dedicated to the study in Moodle.
OBJECTIVE	To find in which form the social networks are used for the needs of studying at University of Žilina.
OBJECTIVE	To compare the differences between information provided by commercial social networks and Moodle.
OBJECTIVE	To find the need of creation of private social network for the electronic support of education at University of Žilina.

2.1. Methodology and research

The suitable method of research for the needs of fulfillment of objectives was selected - a questionnaire survey. Data were collected from respondents in February and March 2013; they were collected by e-mail and social networking. The structure of questionnaire was formulated into two basic parts – the main part and the identification part. Identification part (4 questions) was dedicated to collect the information about age, gender, level of study and faculty and the main part (10 questions) was dedicated to collect information about the issue of absence of social network. Mainly closed and semi-closed questions were used for creating the questionnaire and options of verbal and numerical scaling types were used for answers (Madlenak & Strba, 2013).

Table 2. Methodology of research.

FACTOR	TYPE OF FACTOR
Type of research	Quantitative
Collected data	Primary
Methodology of collecting	Standardized data collection
Technology of collecting	Written and electronic data collecting

To determine the target sample of respondents was important. The essential conditions that they had to fulfill were:

- to be a student of Žilina University in Žilina,
- to use at least one commercial social network,
- to have experience with using the Moodle environment of e-learning.

These conditions had to be fulfilled together, it was important. If the potential respondent did not fulfilled one of the conditions he was excluded.

Calculation of the target sample was done by known mathematic formulas to calculate the size of the sample and to calculate the standard deviation.

The desired confidence interval expresses the reliability of the estimate, we have been working with 95% level estimate, according to the critical values of a standard normal distribution reflects the value of 1.96. Permissible margin of error h expresses the maximum estimation error, which we could make in the selection of the sample. We worked with the value of 10% of this quantity. Standard deviation expresses how the values are spreaded in the set. Proportion of the character p represents the proportion of the selected number of total value.

Set of hypotheses was formulated to find answers for the questions of the research and they were verified on the basis of the answers to questions of the questionnaire survey. The following hypotheses were determined:

- *Hypothesis n.1 - We suppose that at least 51% of respondents, regardless of gender, are not dissatisfied with the quality of provided information and communication of environment Moodle.*

IETC 2014

- *Hypothesis n.2 - We expect that the education level does not have statistically significant effect on using the groups of social networks for the educational purpose and communication dedicated to study.*

- *Hypothesis n.3 - We suppose that at least 60% of respondents gain study information primarily from groups created in commercial social networks.*

- *Hypothesis n.4 - We suppose that more than 50% of respondents would like to have own University social network, which is not statistically significant in terms of the degree of study.*

The statistical method χ^2 (chi square) test correlation, which is based on the Pearson distribution of a random variable was used for testing the hypotheses in the research.

3. Results and discussion

The research involved 238 respondents of the age from 18-29 years old. 111 (46.6%) of respondents were men and 137 (53.4%) were women. The significant part of the respondents was of the age from 22 to 25 years old. The most common respondent was woman of the age from 22-25 years old. 82 (total 34.5%) of the respondents were students of bachelor degree, 145 (total 60.9%) of the respondents were students of master degree and 11 (total 4.6) of PhD degree.

To know the representativeness of the survey was necessary to calculate the composition of the ideal sample of respondents on the basis of existing data. The values of standard deviations for all types of study degrees were calculated on the basis of the real data of the number of students of 1st, 2nd and 3th degree of study at Žilina University. The calculation of the required representative sample of respondents at 95% confidence interval value (value 1.96) and 10% of admissibility errors was done subsequently. From the calculations we found out that the needed number of respondents of bachelor degree with the noticed conditions was 43. The calculations of the number of needed respondents of master study (39 respondents were needed) and the number of needed doctoral students (10 respondents were needed) were done analogously. It means that in total 92 respondents were needed, in total 238 respondents were used to find the relevant results. The above calculations show that the sample of respondents was representative. Verifying the hypotheses was done at the end of the evaluation of the research. We tried to find if the real results match with the preconditions that were formulated in the hypotheses.

3.1. Verification of the hypothesis No.1

Hypothesis No.1 supposed that at least 51% of respondents (regardless of gender) are dissatisfied with the quality of provided information and communication in the environment of Moodle. This hypothesis was verified by 3 questions of questionnaire. Results found out that 56% of respondents visit Moodle regularly more times per week and also that 56% of respondents are dissatisfied with the quality of provided information and 75% are dissatisfied with the communication in the environment of Moodle. These facts confirmed the hypothesis.

The statistical method Chi-square was used to determine the independence of views of both sexes. Alternative hypothesis was formulated, which was opposite to the null hypothesis. This means that the alternative hypothesis expressed different views of both sexes. The relationship for the calculation of chi-square showed that individual measured and expected values do not differ so much. In the freedom stage 1 and the significance level of 5%, the critical values of the distribution have the value of 3.84, which means that both values of our test, which were provided study materials (0.11), and the quality of communication (3.04) are lower than the critical value. It shows that it was necessary to dismiss the alternative hypothesis and accept the original hypothesis. If the critical values of distribution would be higher than the measured values, we should accept the alternative hypothesis and reject the zero hypothesis.

Table 3. Verification of the hypothesis No.1.

IECT 2014

Study	Social networks	Measured number	Expected number	χ^2
Study materials - men	Satisfied	37	35.77	0.04
	Dissatisfied	59	60.22	0.02
Study materials - women	Satisfied	42	43.22	0.03
	Dissatisfied	74	72.77	0.02
TOTAL				**0.11**
Communication - men	Satisfied	10	14.46	1.38
	Dissatisfied	88	83.53	0.24
Communication - women	Satisfied	21	16.53	1.21
	Dissatisfied	91	95.46	0.21
TOTAL				**3.04**

3.2. Verification of the hypothesis No.2

We supposed that the level of study of the respondents does not have statistically significant impact on their membership in the groups for supporting the education in the environment of social networks. This was the reason why we determined the alternative hypothesis, in which we supposed that the level of the studies has statistically significant impact on the using the groups of social networks.

Table 4. Verification of the hypothesis No.2.

Study	Social networks	Measured number	Expected number	χ^2	TOTAL
Bachelor	Use	74	72.35	0.04	**82**
	Dont use/dont know	8	9.65	0.28	
Master	Use	129	127.94	0.01	**145**
	Dont use/dont know	16	17.06	0.06	
Doctoral (PhD.)	Use	7	9.71	0.75	**11**
	Dont use/dont know	4	1.29	1.83	
TOTAL			238	**2.97**	**238**

The calculated chi-square values are shown in table 4, which also represents various real and expected frequencies and results of the tests. The degrees of freedom in a given assay acquired value of 2, which means that with 5% level of significance the critical values of the distribution have the value of 5.99, which is more than 2.98, calculated by us. We can say that the true hypothesis is the zero one and we had to reject the alternative hypothesis. It means that the level of studies of the respondents does not have statistically significant impact on the using the groups at social networks within educational purpose.

3.3. Verification of the hypothesis No.3

We supposed that at least 60% of respondents primarily gain the study information from the groups of commercial social networks. We verified it by question 7 and 8 of the questionnaire. Evaluation of the question No.7 found out that 78% of respondents primarily gain information about their study from social

IETC 2014

networks but by the second question we found out that only 41% of respondents think that social networks are more rewarding than Moodle. Respondents still think that the best way to gain information is the combination of social networks and Moodle. We had to dismiss the hypothesis because we did not confirm that it is true.

3.4. Verification of the hypothesis No.4

We supposed that more than 50 % of respondents would like to have the own University social network and the level of studies does not have the statistically significant impact. The questions No. 9 and No.10 of the questionnaire did the verification of this hypothesis. The results say that 86% of respondents like the idea of creating their own University social network. 79% said that they would use the social network. In terms of statistical calculations using the formula for calculating chi-square we calculated the values at a significance level of 5% and degrees of freedom 2 the critical value of the distribution is 5.99, which is much more than the found value 1.08 (Table 5). It means that the zero hypothesis is the right one and the alternative hypothesis was dismissed. Analogously we found out that the formulated hypothesis No.4 is true.

Table 5. Verification of the hypothesis No.4.

Study	Social networks	Measured number	Expected number	χ^2	TOTAL
Bachelor	Use	68	65.12	0.13	**82**
	Dont use/dont know	14	16.88	0.49	
Master	Use	112	116.15	0.09	**145**
	Dont use/dont know	33	29.85	0.33	
Doctoral (PhD.)	Use	9	8.74	0.01	**11**
	Dont use/dont know	2	2.26	0.03	
TOTAL				**1.08**	**238**

4. Conclusion

We can summarized the results of verifications of the hypotheses in this conclusion:

- We consider that at least 51% of respondents regardless on gender are dissatisfied with the quality of provided information and communication in the environment of Moodle – *True hypothesis*.
- We expect that the level of the study does not have statistically significant impact on the using the groups of social networks for educational purpose and communication dedicated to study - *True hypothesis*.
- We believe that approximately 70% of respondents primarily gain the information for their studies from the groups created in commercial social networks – *False hypothesis*.
- We suppose that more than 50% or respondents would like to have the own University social network, which is not statistically significant in terms of the level of study - *True hypothesis*.

From the results of the realized studies we know that the respondents are dissatisfied with existing state of provided information in the environment of Moodle and there is no connection between the level of study and using of social networks. The assumption that more than 2/3 respondents use commercial social networks for gaining and changing the information about study was not confirmed. The most important finding was that more than one half of respondents would like to have own social network of University of Žilina. In terms of the results of the research we have suggested 2 main variants of realization of the social networks for the electronic support of education at University of Žilina.

IETC 2014

The first variant is the suggestion of using the social network Facebook in the combination with eLearning and with its application Moodle. Basically, the current status would be maintained, as it is apparent from the answers of questionnaire. Even 89% of respondents use the groups designed to promote education of social networks and 99% of them use social network Facebook for it.

The second one and the more interesting one for the implementation is the suggestion and creation of the new structure of social network only for the needs of Žilina University in Žilina. This new social network is available at http://fantasy.uniza.sk from August 2013 and it is designed for real users – students of he Department of Communications (see Fig. 1).

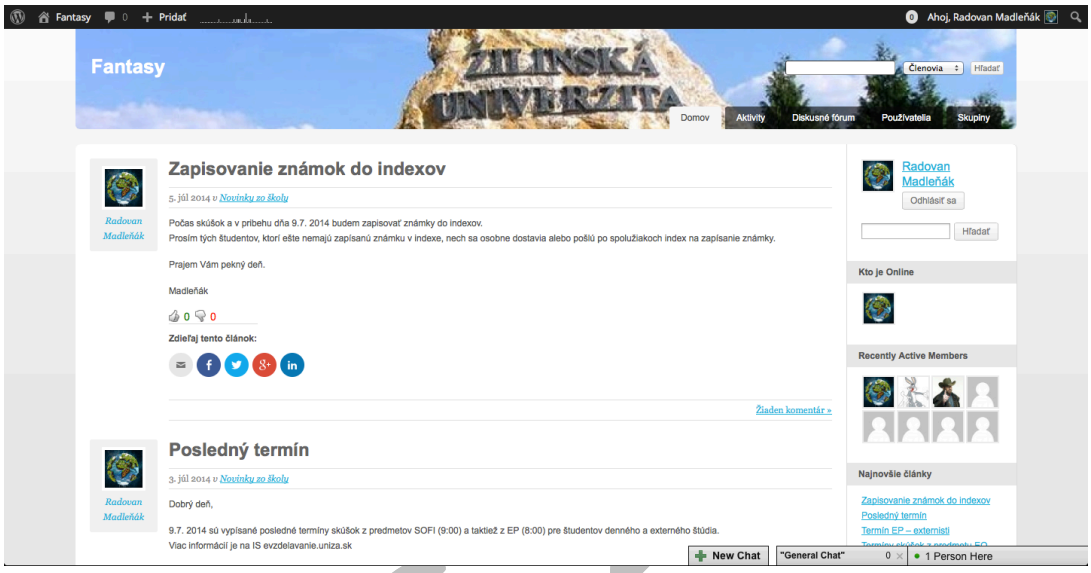

Fig. 1. Web page of social network fantasy.uniza.sk.

This network is closed and it is intended for students, teachers and administrators. 322 users were involved, including 315 students and 7 teachers until the 1st of July 2014 (see Fig. 2). This network is used only for educational and communication purpose not only among students but mainly for the relation student – teacher, educational and study material are still provided by University network based on IS Moodle.

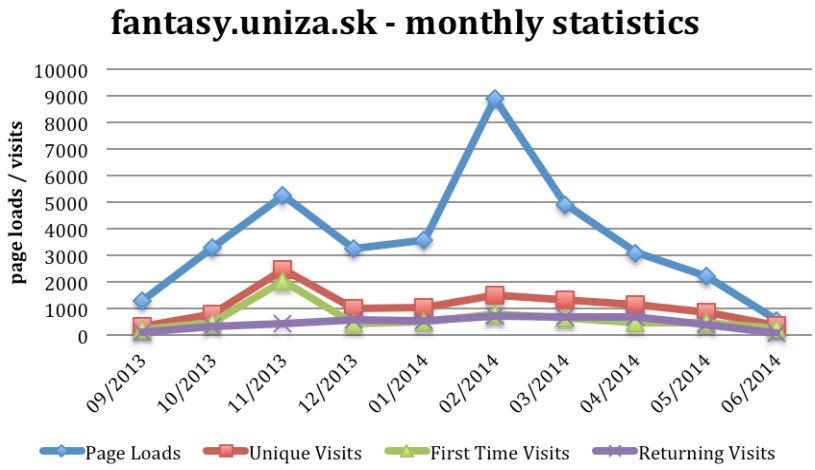

Fig. 2. Statistics of monthly visits of web page - fantasy.uniza.sk.

Designing tools for numerical integration

Marta Caligaris26, Georgina Rodríguez and Lorena Laugero
Grupo Ingeniería & Educación - Facultad Regional San Nicolás – Universidad Tecnológica Nacional
Colón 332 (2900) San Nicolás, Argentina

Abstract

Visualization, the ability of generating mental images from abstract concepts, is developed in students when technological resources are incorporated in teaching and learning processes, especially in mathematics. In this paper some tools for teaching numerical integration, developed by the authors, are shown. They are included in a set of customized applications designed for the issues studied in courses of Numerical Analysis at the Facultad Regional San Nicolás, Universidad Tecnológica Nacional, Argentina. With a simple interface, so as students can focalize on the concepts taught, these tools combine different semiotic registers in their design.

Keywords: Visualization; numerical integration; learning objects

1. Introduction

When teaching numerical methods, the emphasis is often placed on algorithmic developments and procedural and mechanical handling of the symbolic aspects of mathematical objects. In this way students do not achieve meaningful learning. Moreover, the numerical analysis has its own characteristics because the appropriateness of the use of different tools to solve a problem depends heavily on the context in which they are used. The emphasis on mechanical routine, plus the fact that understanding the essence of Numerical Analysis is usually a trouble for students, has resulted in various learning difficulties (Rodríguez, 2004).

The Virtual Laboratory of Numerical Analysis is a collection of personalized windows that let students work with all the issues included in the different courses of Numerical Analysis at Facultad Regional San Nicolás: resolution of nonlinear equations, resolution of linear equation systems, resolution of nonlinear equation systems, interpolation and curve fitting, numerical integration and resolution of ordinary and partial differential equations (Caligaris, Rodríguez & Laugero, 2010). Tools were initially developed in MAPLE, and later it was decided to use free software SCILAB. SCILAB is not symbolic software but it accomplishes the requirements of the designed tools, although there are some issues that are impossible to get, like derivatives or integrals. Therefore, all windows have been redesigned so as students can have access to them without restrictions. Also, some modifications that arose in their use were incorporated. Finally, some applications developed in MATHEMATICA were incorporated to the Virtual Laboratory of Numerical Analysis. These tools are CDF files that can be run in any computer, it is only needed the CDF player, which is freely available on Internet.

The objective of this paper is to present some customized windows developed to help students to understand the basic concepts and differences of numerical integration methods, where students can visualize and compare different approximations in different representations.

IETC 2014

2. Visualization

Visualization is a wide concept, in fact, it is a notion on which there are different conceptions on investigation in mathematics education. For example, Arcavi (2003) expresses that "visualization is the ability, the process and the product of the creation, interpretation, use of and reflection upon pictures, images, diagrams in our minds, on paper or with technological tools, with the purpose of depicting and communicating information, thinking and developing previously unknown ideas and advancing understandings". With visual arguments, students can conceptualize ideas. For Zimmermann and Cunningham (1991), visualization is a way for supplying depth and meaning to understanding, being a reliable guide to problem solving, and inspiring creative discoveries. In this sense, visualization cannot be isolated from the rest of mathematics; in other words, symbolic, graphical and numerical representations must be connected. From a didactical point of view, only those students able to perform conversions between these representations do not confuse a mathematical object with its representation and can transfer their mathematical knowledge to other contexts different from the one of learning (Duval, 1999).

Visualization is related with the ability of interpreting, transforming and understanding representations, generating mental images from abstract concepts. It is developed in students when technological resources are incorporated in teaching and learning processes. Therefore, it is possible that the use of graphical interphases in the learning process will not only help students to develop the ability to visualize, but also the dynamic interaction with them will let the different semiotic representations of mathematical object under study be connected, thus promoting conceptual learning.

3. Numerical integration and visualization

In Calculus, when teaching the concept of integration, the ability of visualization is used, even without technology. Some studies were performed, so as to identify the types of visual image students use when solving integral problems (Huang, 2013). Also, in Souto Rubio and Gomez Chacón (2011), the study of visualization processes from a cognitive point of view is presented along with a discussion of examples of empirical data relating to the concept of integral.

Rösken and Rolka (2006) analyzed an example from integral calculus focusing on visual interpretations emphasizing that visualization should be accompanied by reflective thinking.

The evaluation of integrals is required in many problems in engineering and science. But it is not always possible to find the exact value in an analytic way: here is where numerical integration arises.

There are two groups of numerical integration formulas. The first group is based on equally spaced points, these are frequently called Newton-Cotes formulas. The second group is formed by the Gauss-Legendre quadratures, which use points not equally spaced, but points that optimize the approximation, the roots of the Legendre polynomials. It is supposed that the integration formulas are known, that is the reason why they are only briefly described here (Burden & Faires, 2003; Mathews & Fink, 2000).

The first three Newton-Cotes formulas are the trapezoid rule, and Simpson`s 1/3 and 3/8 rules. The trapezoid rule is obtained by fitting a first order polynomial to two discrete points, Simpson`s 1/3 rule is obtained by fitting a second order polynomial to three discrete points and Simpson`s 3/8 rule is obtained by fitting a third order polynomial to four discrete points. Composite rules methods first subdivide the original interval in several subintervals and then apply the selected rule in each subinterval. When choosing n subintervals, different numbers of points are considered: for the trapezoid rule: n + 1 points, for the Simpson`s 1/3 rule: 2n + 1 points and for the Simpson`s 1/3 rule: 3 n + 1 points. As the amount of calculation increases with n, these numerical methods must be programmed so as to obtain good solutions.

Visual tools implementing these methods can be developed, so as to help students in the understanding of the concepts being shown. The main purpose of these applications is the fact that users may get a nu-

IETC 2014

merical solution for different mathematical problems with the corresponding methods, in a friendly graphical interface, without worrying about the commands needed for this solution.

In this way, students will not only focus attention on the object under study but, through visualization, they will also be able to compare the methods under study, analyze the pros and cons of applying them to discover math concepts, make generalizations; thus developing and promoting a different kind of mathematical thinking.

3.1. 3.1 Existing tools

Numerical integration formulas are easy to program. They are usually used as examples in programming courses in engineering careers. The appearance of symbolic software yielded better graphics and animations to visualize in a dynamic way, the convergence of the methods. For example, in the website of the University of Fullerton, California (mathfaculty.fullerton.edu/mathews//numerical.html) animations of different numerical methods are presented. These animations run directly in the Internet browser: no additional software is needed. In particular, for Newton-Cotes formulas these links are available:

- mathfaculty.fullerton.edu/mathews//a2001/Animations/Quadrature/Trapezoidal/Trapezoidalaa.html
- mathfaculty.fullerton.edu/mathews//a2001/Animations/Quadrature/Simpson/Simpsonaa.html
- mathfaculty.fullerton.edu/mathews//a2001/Animations/Quadrature/Simpson38/Simpsonaa.html

Also, Wolfram demonstrations (http://demonstrations.wolfram.com) is a collection of thousands of interactive demonstrations created using MATHEMATICA. These tools are CDF files that can be run in any computer, it is only needed the CDF player, which is freely available on Internet. Several tools explore numerical integration with Newton-Cotes quadrature formulas, comparing and analyzing the error. For example:

- http://demonstrations.wolfram.com/NewtonCotesQuadratureFormulas/
- http://demonstrations.wolfram.com/ComparingBasicNumericalIntegrationMethods/
- http://demonstrations.wolfram.com/NumericalIntegrationExamples/
- http://demonstrations.wolfram.com/NumericalIntegrationUsingRectanglesTheTrapezoidalRuleOrSimps/
- http://demonstrations.wolfram.com/NewtonCotesQuadrature/

Each of the links above was last visited on September 2014.

3.2. 3.2 Customized tools

Sometimes, the available tools do not satisfy the professors' requirements when preparing their classes. Since 2010 the authors have been developing graphical tools for the teaching of numerical analysis. Programs such as MAPLE, SCILAB and MATHEMATICA were used for this purpose (Rodriguez, Caligaris & Laugero, 2014). Some tools will be shown here, highlighting their potential. Others can be seen in www.frsn.utn.edu.ar/gie, by clicking the button corresponding to resources (Recursos). All the tools were developed in Spanish; the applications presented in this work were translated into English.

Figure 1 shows the application designed using Mathematica, which implements the first three Newton-Cotes formulas for numerical integration: the trapezoid rule, and Simpson`s 1/3 and 3/8 rules. To use this interface, the corresponding function, the integration interval and the number of subintervals to be considered in each method must be selected.

The number of points, the exact value of the definite integral and the approximate value for the rule, together with the graph of the function and the corresponding fitting polynomials, are shown for each Newton-Cotes formula. The red points are the endpoints for the subintervals and the green points are the interior ones.

IETC 2014

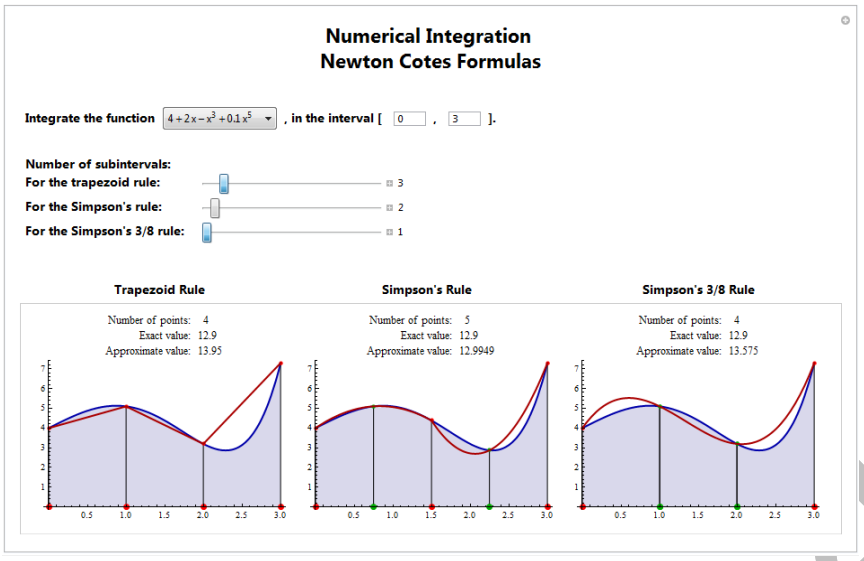

Fig. 1. Mathematica application for numerical integration.

Figure 2 shows other application designed using Mathematica. In this interface the first three Newton-Cotes formulas are also used, to analyze the error in the approximation formulas. The corresponding function and the integration interval must be selected, so as to obtain results.

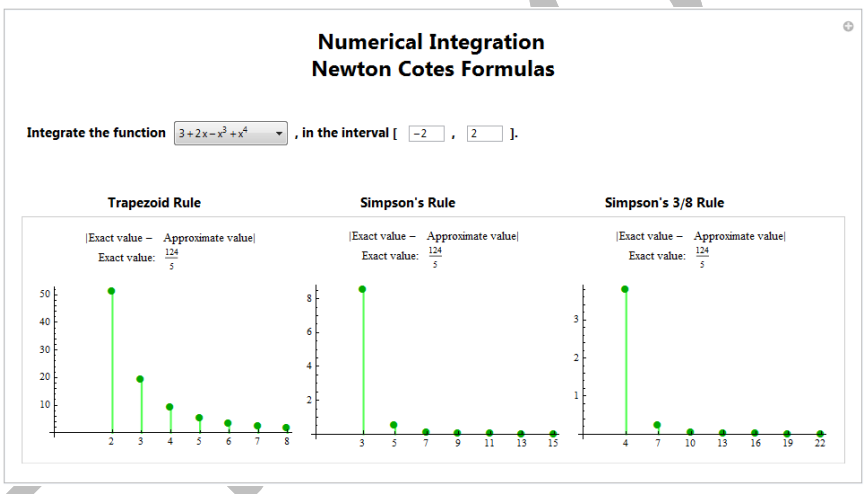

Fig. 2. Application for analyzing errors in numerical integration.

The exact value of the definite integral and the difference between this exact value and the approximate value for the rule, in absolute value, as the number of points increases, are shown for each Newton-Cotes formula, in the application shown in Fig. 2.

Numerical integration algorithms estimate an exact value by an approximation, having an error that depends on h, the distance between two consecutive points. Increasing the number of points, this error decreases. To make a proper comparison of quadrature methods, the same number of function evaluations in each method should be used.

Figure 3 shows the application designed using SciLab for working with numerical integration (Caligaris, Rodríguez & Laugero, 2013). It presents four different methods to achieve an approximation of a definite integral: the first three Newton-Cotes formulas and the Gauss-Legendre quadrature.

To use this interface, the corresponding function, the integration interval and the number of subintervals or points, as required, to be considered in each method must be entered. By pressing **Calculate**, each of the approximations is shown. With the **Graph** button, the function is plotted in the specified range.

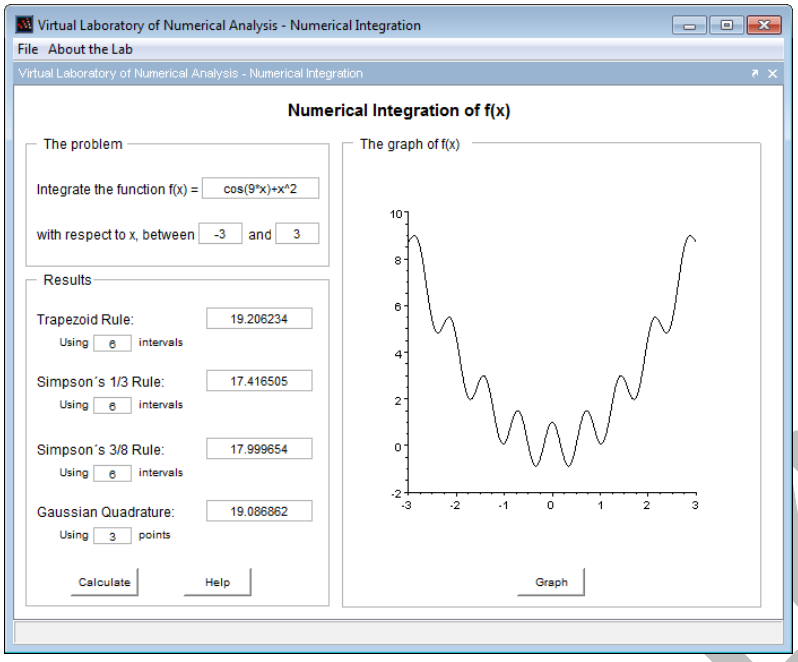

Fig. 3. SciLab application for numerical integration.

4. Conclusion

Nowadays, learning objects are becoming didactic resources for supporting learning & teaching processes. Some of the reasons exposed by Chan (2002) for integrating learning objects when teaching are: gradual change of the educational paradigm focused on teaching and learning-oriented, recognition of the need for flexible curriculum in educational institutions of higher education, greater acceptance of technology as a factor in educational innovation by teachers and, certainly, by students and pressure to continually updating the educational content because of the vertiginous technological advancement.

Programming this kind of tools either in Mathematica or SciLab is not an easy task, but there are many applications available that can be downloaded and used. In particular, the tools presented here are available at http://www.frsn.utn.edu.ar/gie/an/in, in Spanish.

However, it is not enough just to incorporate this type of learning resources in educational processes. It requires teachers to use and apply them at the appropriate time within didactic sequences.

Determination of the level of being cyber bully/ victim of eighth grade students of elementary schools

Dr. Kerim Karabacak[a*], Mustafa Öztunç[a], Dr. Subhan Eksioğlu[a], Duygu Gür Erdoğan[a], Songül Yar[a], Dilvin Ekenler[a], Kübra Selim[a]

[a]*Sakarya University, Education Faculty, Department of Education Science, Hendek, Sakarya, Turkey*

Abstract

The main aim of this research is to examine the cyber bullying and cyber victim which transforms into a big problem by extending more and more between young generations in 21st century. The research has been carried out related with general survey model to relationship survey model. The dependent variables of the research are cyber bullying and cyber victim, its independent variable gender. The population of the research is formed of Sakarya city Hendek province, the sample is formed of 80 female, 87 male totally 167 students being educated in three elementary schools in Hendek. Cyber bully/ victim scale which has been developed by Ayas and Horzum (2010) has been applied to the participants. The data taken from the measurement devices have been transferred to SPSS and descriptive analysis and free groups T test and regression analysis statistical procedures have been realized. It has been determined that the level of cyber bullying and cyber victim of the eighth grade students has been low. According to the gender when the level of cyber bullying and cyber victim has been examined, it is resulted that the boys have been more cyber bully and have been more cyber victim when compared with the girls. According to the regression analysis the results between cyber bullying and cyber victim, the student who face cyber bullying is more inclined to be cyber bully.

1. Introduction

The human beings can be exposed to bullying in different periods of their lives. Especially school bullying is frequent lived situation. School bullying is exposing a student to negative actions and behaviors continuously by more than one student in social life or in any activity. Traditional peer bullying has been explained by Olweus(1994) as physical, verbal, psychological attempts or threats which have been reviewed on the victim who is not able to defend himself as he is physically and psychologically weak . Olweus (1993) stated that bullying has two kinds. These are direct bullying in the form of verbal, physical attempts and indirect or relational bullying made in the form of social exclusion. The male children mostly use physical tyranny, female students use verbal bullying such as defamation or sexual commenting (Nansel, Overpack, Pilla, Ruan, Simons-Morton, Scheidt, 2001; Olweus 1993). Olweus (1993) determined in a study which includes 150.000 students between first classes and ninth classes in Norway and Swiss that %15 of the students are exposed to bullying events more than once as a victim or a bully.

IETC 2014

In a research made by Nansel and his colleagues (2001), 30% of 15.686 students stated that they mostly or frequently faced up with bullying 11% of these students have been victim, %13 of them have been bully and 6% of them have been both victim and bully. There has been meaningful relationships between violence and low ego respect, depression and negative psychological functions in the students who take place as a victim in bullying fact. Anxiety, loneliness idea, suicide, leaving school early, decreasing of learning ability are the other negative effects. (Craig, 1998; Hoover and Oliver, 1996; Rigby and Slee, 1999; Mason 2008).

Olweus (1994) states that the children of the adolescents who bully their friends have been generally physically older or stronger than their friends. Popularity, physical power, status, social rivalry power, self-trust, being extraverted, socioeconomic status properties have been effective on being dominant over the victim by the bully The victim is generally weaker as physically and power than his friends and has a lower ego and he is the person who has been tortured. (Limber 2002, Olweus 1993).

A new kind of bullying has been added to the kinds of bullying as cyber bullying between the students in parallel with the technological developments. Cyber bullying is also more than once like the traditional bullying, it includes psychological violence and is made intentionally (Dehue, Bollman and Vollink 2008). According to Patchin and Hinduja (2006) cyber bullying is a behavior of giving damage which has been realized intentionally or reviewed again by electronic texts.

Verbal bullying, emotional bullying and threatening bullying situations can be lived in Cyber bullying as it has been in traditional bullying (such as nicknaming, abasement, gossiping about the individual, joking , making bad jokes, exclusion from the group, abasement about the nationality. Emotional torturing, requesting his money, belongings or a copy of the homework, to request something by blackmailing, etc). Whenever cyber bullying reaches a moment that it cannot be stood, it transforms to the behaviors such as attacking, violence, etc as a kind of physical bullying by reflecting in private life (Manap, 2012).

In a research Juvonen and Gross (2008) made on the young people between the ages of 12-17 in America, 72% of the participants stated that they have been victim at least once in the last previous year. According to research results, it has been determined that 85% of the participants lived a victim experience at school and the bullying at Internet can be accepted as the continuation of the bullying at school. 2/3 of the cyber bullying victims who participated in the research stated that they knew the people who bullied them. Half of these at the same time are the people who bully at school.

In a study realized by Li (2007) in Canada, a questionnaire has been applied to 177 people of sampling who have been students at 7th grade , at the result of the research it has been stated that there is a meaningful relationship between traditional peer bullying and cyber bullying in the frame of being a victim and a bully. According to Li (2007) the ones who realize traditional bullying are more inclined to torturing by using electronic communication devices when compared to the ones who do not behaviors like these Dehue, Bolman and Wollink (2008) stated in his study which is realized with 1211 students with 11-12 aged students in Netherlands the students who participated in traditional bullying is also bullied in cyber environment , there is a meaningful relationship between two kinds of bullying.

In a study which 11-16 aged young people participated in England by Smith and his colleagues, they found that the young people who have been bullied traditionally are also being bullied in cyber environment or the ones who tortured others traditionally also tortured others in cyber environment. In a study realized with 360 students between 12-20 aged individuals at a school in Sweden, Slonje and Smith (2008) found that the ones who faced up with cyber bullying is 5,3% and the ones with traditional bullying is %10. The victims knew the ones who tortured them and they stated that these people were from the school. At the same time, the participants stated that as the cyber bullying has more followers in cyber environment, its effect has been more than the traditional one.

Ybarra, Diener-West and Leaf (2007) found in a study they made together that the rate of the ones who faced up with both cyber and traditional bullying has been %36. Wolak, Mitchell and Finkelhor (2007) on the other hand tried to show the similarities about bullying event realized on internet and outside in a study they made with 1500 young individuals between 10-17 ages. They stated that there are not standard definitions such as a revision of force inequality; attack in internet bullying events which have been existent in school based bullying.

The frequency of the existence of cyber bullying has been researched by many researchers. Kowalski and Limber (2007) found in a study they realized with 3767 students from 6th, 7th and 8th grades in America that 511 of the participants participated in electronic victim events as victim, 7% of them both as a

victim and a bully , %4 of them as a bully. Ybarra and Mitchell (2007) found in an interview they made with 1501 regular internet user between 10-17 ages that 19% of them were concerned with bullying events at internet, 4% of these were victims, 12% of them were bullies and 3% of them were both victim and the bully.

Patchin and Hinduja (2006) determined in a study they made that 29% of the participants lived bullying experiences such as being disturbed in internet, intentionally being teased, nicknaming, being scared , taking messages with sexual content, theft about their private life, 11% of them stated that they realized bullying to others. In a study realized by Moessner (2007), it has been stated that 43% of the young individuals between the ages of 13-17 told that they have been sent messages or posts with the aim of injuring or shaming them by mobile phones or and internet.

Dehue, Bolman and Völlink (2007) found in a study they realized with 1211 people from elementary and secondary school students that 16% of the participants bullied others with mobile phone messages or at internet, 22% of them have been at the role of victim. While 35% of the victims mentioned that they did not know the people who victimd them, the bullies stated that they participated in bullying events mostly when they were alone at home or when they were with their friends. According to the findings of the research, the mostly used bullying style is nicknaming and gossiping.

Li (2006) stated that one of the four students in Canada have been faced with cyber bullying in a study he made with 264 seventh and ninth grade students. Nearly half of the victim students told that they knew the ones who bullied them. 15% of the participants told that they bullied others by using electronic communication devices. Juvonen and Gross (2008) stated that 72% of the young individuals between the ages of 12-17 have been faced with bullying event at internet at least once a year.

At the result of a study which Aricak, Siyahhan, Uzunhasanoğlu, Sarıbeyoğlu, Çıplak, Yılmaz and Memmedov (2008) realized with 269 Turkish students between the ages of 12-19, they found that 36% of the students showed bullying behaviors in internet. 24% of the participants are at the role of both victim and the bully. 6% of the participants in the research are at the role of victim. %23,7 of the students stated that they have been disturbed by mobile phones. Aricak (2009) stated in a study which he realized with 695 university students that 19,7% of the students realized a bullying event at least once in their life,54,4% of them has been at least in the role of a victim, 17,7% of them has been cyber bully-victim .

1.1. The aim of the research

This study has been realized with the aim of determining the eighth grade students' situation of being bully/victim. The reply to the problems below has been searched to reach this aim:

1. What is the level of facing with cyber bullying of the eighth grade students?

2. What is the level of showing cyber bullying of the eighth grade students?

3. Does the level of facing with cyber bullying change related with the gender?

4. Does the level of realizing cyber bullying change related with the gender?

1.2 The importance of the research

The most important negative aspects of the technology is the behaviors including bullying. The situation named as cyber bullying causes serious problems in emotional and social lives of the individuals. Because of this reason the research is to be made on the subject of cyber bullying gains great importance in the frame of decreasing cyber bullying, giving information about this concept to the young people to gain them struggle skills and using technology in a more healthy way. It is observed that the research is on cyber bullying have been realized mostly at high school and university. However, the individuals who take place in younger group spend their time at internet environment. There is a need of making studies related to determination of cyber bullying/victim of elementary school students in the context of determining what they will meet at internet while spending time on it and taking precautions against the situations

IETC 2014

which can affect them negatively. Because of this reason, the situation of 8th grade students' being bully/victim has been tried to be determined with this research.

1.2. Limitations

1. This research is limited with 8th grade students who are being educated at Sakarya City Hendek Province in 2012-2013 period.

2. This research is limited with the scores in the applied scales.

2. Method

The research model, study group, collection of the data and data analyses information have been given in this section.

2.1. Research model

The research has been realized in survey model. Survey model is based on the revision of past and daily data related to object, fact, event, individual, etc.

2.2. Population and sample

The population of the research is formed of 8th grade students who are being educated at Sakarya City Hendek Province. It has been determined according to the sample aimed sample method. The sample of the research is formed of 167 students, 80(47.9%) girls, 87(52.1%) boys who are being educated at 8th grade 3 different schools in Hendek. Having a psychological consoler and permission of the authorities have been important at the schools which the application has been made.

2.3 Data collection instruments

Cyber bully/victim which has been developed by Ayaş and Horzum(2010) scale has been used. This scale is formed of 2 parallel scales named as "cyber bullying scale" and "cyber victim scale" and in the formed of asking the same items in different ways. This cyber bully/victim scale is formed of 19 items and 3 factors. The distribution of items in the scale according to the factors has been found as; 1., 2., 3., 4., 5., 6. and 18th items sexual bully and victim at cyber environment; 7., 8., 9., 12., 13., 14., 15. and 16th items bully and victim for prevention and damaging at cyber environment; 19., 20., 21. and 22nd items bully and victim of gossiping at cyber environment. 5 Liker type grading to state the participation level related to the items taking place in the scales has been used. This grading has been formed as "(5), frequently (4), Sometimes (3), rarely (2) and Never (1)". It is expected from the students to choose in which frequency they realized the actions taking place in the scale in cyber bully scale in which frequency they met these actions in cyber victim scale. The minimum score to be taken from cyber bully and victim dimensions of the scale is 19, the maximum is 95. As the score increase, the situation of being cyber and victim increases. (Ayas and Horzum, 2010).

2.4. Collection of the data

IETC 2014

Cyber bully/victim scale has been applied to the 8th grade students in Hendek province of Sakarya after the school management, teachers and students have been informed about the study and permission has been taken from the authorized people. It has been applied to only volunteer students after getting into contact with the school guidance teacher of the schools.

2.5. Analysis of the data

SPSS 17 package program has been used for the statistical procedures of the data analysis. Descriptive statistics analysis has been made with the aim of determining the level of students' being cyber bully and victim. T- test has been applied for the free groups with the aim of determining the difference between gender and cyber bully and victim.

3. Findings

The findings and comments about the analysis of the collected data take place in this section.

3.1. Sub-findings related to first sub problem

Table 1. Cyber victim level statistics

	N	$\overline{X}$	sd	V%
Total	164	25.4329	8.36009	32,87

Statistical data related to the level of cyber bullying of the students at the 8th level has been given in Table 1. According to the results of descriptive statistics taken from the data from 167 8th level students, averagely ($\overline{X}$) "25.4329", standard deviation (ss) "8.36009" and dependent change coefficient (V%) "32,87" have been taken. It can be stated that the level of being cyber victim of 8th grade students has been low according to this data. In case of dependent change coefficient is more than 25%, it has been determined that the students showed a different distribution from the average. In other words, the students do not have the same idea in the context of meeting cyber victimized.

3.2. Sub-findings related to second sub problem

Table 1. Cyber bullying level statistics

	N	$\overline{X}$	sd	V%
Total	163	24.0859	6.81719	28,30

Statistical data related to the level of cyber bullying of the students at the 8th level has been given in Table 1.According to the results of descriptive statistics taken from the data from 167 8th level students,

averagely ($\overline{X}$) "25.0859", standard deviation (ss) "6.81719" and dependent change coefficient (V%) "28.30" have been taken. It can be stated that the level of being cyber victim of 8th grade students has been low according to this data. In case of dependent change coefficient is more than 25%, it has been determined that the students showed a different distribution from the average. In other words, the students do not have the same idea in the context of meeting cyber victimized.

3.3. Findings related to third and fourth sub problems

Table 3. T-test results

Free variable		N	$\overline{X}$	sd.	t	df	p
Victim	Male	88	25.9091	7.45351	.784	162	.434
	Female	76	24.8816	9.32090			
Bully	Male	87	25.6092	8.34901	3.134	161	.002
	Female	76	22.3421	3.83163			

When being victim line is being examined in Table 3, it can be seen that being cyber victim level does not show a meaningful difference (t(162)=.784, p< .05) at 0,05 grade according to the gender. When being bully line is being examined, it can be seen that being cyber bully level does not show a meaningful difference (t(161)= 3.134 p<.05). It has been determined that being cyber bully level of male students is more than ($\overline{X}$ =25,6092) female students ($\overline{X}$ =22,3421).

4. Discussion, result and proposals

In this section, the discussion of the findings reached and results and proposals related to these take place.

4.1 Discussion

In case of researching whether there is a change in cyber bullying total points of elementary education eighth grade students related to the gender, it has been determined that there has been a meaningful difference between he genders, male students shew more cyber bullying than the female students, but there is not a meaningful difference between male and female student in the context of exposing to cyber bullying. It is also observed that there are different results between gender and cyber bullying/victim.

In this study, it has been determined that there is not a meaningful relationship between the gender of eighth grade students and the level of being cyber victim. This finding does not correspond with Batmaz's (2012) research result which he has made with 6th, 7th and 8th grade students. The result which Batmaz (2012) reached in his research is that male students have been more cyber victims than the female students, male students realized cyber bullying more than the female students. In the study which has been carried out by Batmaz with 6th, 7th and 8th grade students the finding of "male students realized cyber bullying more than the female students" shows a parallelism with the findings reached at the end of this

IETC 2014

research which has been made with 8th grade students. Williams and Guerra (2007) could not find a difference between males and females in the frame of participation in bullying in internet in their studies named as extensity and factors of bullying in internet.

Many researches state that there is not a meaningful relationship between the gender and cyber bullying. The research findings of Aricak (2009), Juvonen and Gross, (2008); Patchin and Hinduja, (2006); Slonje and Smith, (2008); Smith (2008); Wolak vd., (2007) show a parallelism in this direction. Aricak (2009) stated that there is not a meaningful relationship related to the gender in participating in cyber bullying in a study which he made with Turkish university students, but male students have a more bullying role than the female ones. In the same way, Juvonen and Gross, (2008), Patchin and Hinduja, (2006), Slonje and Smith, (2008), Smith and his colleagues (2008), Wolak and his colleagues (2007) could not find a gender difference in participation in cyber bullying. Topçu, Erdur-Baker, Çapa-Aydın (2008) stated there is not a difference between male and female students in Turkey in the frame of bullying and being victim in their studies in which they researched cyber bullying events.

Kowalski and Limber (2007) reached the result in their studies that 15% of the female students and 7% of male students have been victims in electronic bullying experience. In other words, they stated that there is a meaningful difference between gender and being cyber victim. Li (2006) has taken findings which correspond with this study in his study named as "cyber bullying and gender differences" in the study he realized at schools. According to Li (2006) 22% of males and nearly 12% of females have been cyber bully, but there is not a meaningful difference in the context of being victims between males and females.

4.2. Results

1. The level of being cyber victim of elementary school eighth grade students has been quite low.
2. The level of being cyber bully of elementary school eighth grade students has been quite low.
3. There is not a meaningful relationship between the gender of eighth grade students and being cyber victim.
4. There is a meaningful relationship between the gender of eighth grade students and being cyber bully. It has been determined that the level of being cyber bully of male students is higher than female students.

4.3. Proposals

At the result of this study which has been realized with elementary school 8th grade students, it has been reached that the level of being cyber bully of male students is higher than female students. Many researches which have been realized in Turkey gave the same result. The determination of this situation and studies related to preventing this situation should be made with the cooperation of parents and students.

Seminars and guidance activities for the parents and the school management should be realized and follow up studies should be made by concentrating on the studies related to being cyber bully/victim situations at schools.

This one and similar studies have been carried out by taking gender and school level into account. If the studies from now on is carried out by taking the marital status of the parents, the geography where they lived, their professions into account, the effect of these factors can also be searched on the level of being cyber bully/victim.

The reasons underlying that cyber bullying is more existent on male students can be searched by other researchers.

Abstract

This study is to develop a multimodal presentation software integrated with interactive whiteboard (IWB) as a multimodal presentation system (MPS) to support the classroom English learning in the elementary English as second language (ESL) course. It focuses primarily on techniques and tools to enhance the students' ESL learning achievement and learning satisfaction in the classroom setting. This paper utilizes the MPS, based on Mayer's cognitive theory of multimedia learning (CTML), to present the multimedia instructional materials in auditory and visual modalities. An experimental research designed was conducted. The results revealed that there were statistically significant differences between the students in experimental group and control group on measures of learning effectiveness (i.e., academic achievement and learning satisfaction).

Keywords: Interactive Whiteboard, Multimodal, Cognitive Theory of Multimedia Learning

IETC 2014

1. Introduction

English is regarded as a second language in Taiwan. Teachers usually present text-centered materials with little pictures on blackboards and the students read directly following the teachers. This blackboard teaching provides an inflexible presentation of teaching materials in the way of colors, styles, as well as multimedia formats. The language learning process is a complicated, intelligible and meaningful activity. Students are unable to effectively internalize language as parts of the cognitive system via mechanical exercises and repetitive operations. According to Mayer's (2001) cognitive theory of multimedia learning (CTML), learning from distinct channels leads to a general improvement in learning. Also, the modality principle of multimedia learning (Mayer, 2001) suggests that students learn better when words in a multimedia message are presented as spoken text rather than printed text. Since the last 20 years, e-learning has become a modern teaching method in using information technology within the classrooms. The e-learning includes all forms of electronically supported learning and teaching, by taking advantage of computer technologies and software, to enrich and improve the teaching and learning quality (Hussein, 2011). Recently, information technology has enabled an explosion in the availability of visual ways of presenting materials. Large amount of multimedia English learning materials and computer assisted language learning software have been developed to enhance the learning performance of English pronunciation, spelling, phonics, and word attack skills (Beatty, 2010; Lee et al., 2005; Towndrow, 2007). Therefore, many English

E-mail address: miswhhsiao@gmail.com

teachers have started to make use of technological tools to present teaching materials in multimedia formats.

Recently, interactive whiteboard (IWB) has been used to replace the traditional blackboard in the classroom. It provides medium to display teaching materials including files, educational software, web sites, and others for providing powerful multimedia/multimodal presentation (Ekhami, 2002; Isman et al., 2012; Jang, 2010; Smith et al., 2005; Türel & Johnson, 2012). Using IWB brings the change of linking technology and pedagogy in the classroom (Beauchamp & Kennewell 2010; Glover et al., 2005; Smith et al., 2005). Many studies related to the use of IWB in educational settings have shown that IWB technology can promote teacher-student interaction and student participation in classroom (Higgins et al., 2007; Kennewell et al., 2008; Schmid, 2008, 2010; Smith et al., 2005). For example, Smith et al. (2005) claimed that the pedagogical potential of IWB technology is to provide higher level of interactivity and participation over traditional blackboard. Also, some research on IWB prove the positive improvement of learning achievement (Digregorio & Sobel-Lojeski, 2009; Jang, 2010; Lewin et al., 2008; Slay et al., 2008; Thompson & Flecknoe, 2003). Although the aforementioned positive effect of IWB, there are some controversial point of view about IWB use. For example, Coyle et al. (2010) analyzed the influence of IWB technology on the language use of a primary school and revealed that the failure to promote verbal interaction for the group of non-native speaker (NNS) in an English language immersion classroom. In addition, in the claim of interaction improvement, many teachers tend to dominate the IWB lesson without inviting the students to interact with the board themselves (Levy, 2002).

Storytelling by adults is considered as a critical step that can facilitate comprehension and increase interest in teaching (Smith, 1988). Especially for language learning, storytelling is a practical and powerful teaching tool (Tsou et al., 2006). Chien and Huang (2000) claimed that predictable storybooks are effective in building ESL kindergarteners' oral and literacy development. Recently, storytelling as a way of teaching children English has been flourishing in Taiwan (Lee, 2012). In addition, researchers have demonstrated successful usages of computer assisted English learning in significantly facilitating teacher's storytelling and children's learning in ESL classrooms (Lee, 2012; Tsou et al., 2006). However, to the best of our knowledge, research of exploring the effectiveness of IWB in English vocabulary learning through storytelling teaching method is rare, and therefore this has become an important issue of research.

As a result, this study develops a multimodal presentation system (MPS) to present multimedia instructional materials and manage interactive learning activities in the classroom. More specifically, the MPS is used to support the verbal instruction materials (e.g., printed words, spoken words) and the corresponding visual instruction materials (e.g., illustrations, photos, video, and animation) in the interactive instructional activity. In addition, learning achievement and satisfaction are the major objectives of learning activities (Long, 1985; Lu et al., 2003), this study thus to explore the learning achievement and satisfaction of English learning activity by use of the MPS.

The remainder of this paper is organized as follows. Section 2 reviews pertinent literature on the research of Mayer's cognitive theory of multimedia learning (CTML) and learning effectiveness. Section 3 then describes the architecture of the multimodal presentation system (MPS) and section 4 presents the experimental design and process. Section 5 presents the experimental results, as well as discussion on the findings. Finally, Section 6 addresses conclusions, limitations and directions for future research.

2. Literature review

2.1. Mayer's cognitive theory of multimedia learning (CTML)

Multimedia is defined as the presentation of materials using both words and pictures and thus focused on the auditory/verbal channel and visual/pictorial channel (Mayer, 2001, 2003, 2005). Mayer (2001, 2003, 2005) presents a theory of multimedia learning in terms of an information-processing model, called cognitive theory of multimedia learning (CTML), by integrating Sweller's cognitive load theory (Chandler

IETC 2014

& Sweller, 1991; Sweller, 1988), Paivio's dual-coding theory (Clark & Paivio, 1991; Paivio, 1986), and Baddeley's working memory model (Baddeley, 1986, 1993, 1999).

The CTML provides empirical guidelines to promote instructional design to achieve meaningful learning (Mayer, 2001). Based on three main assumptions (dual channel, limited capacity, and active processing), seven principles (multimedia principle, spatial contiguity principle, temporal contiguity principle, coherence principle, modality principle, redundancy principle, and individual differences principle) are proposed in this theory. The modality principle suggests that as textual information, presented in an auditory mode, with concurrent visuals are displayed, students have greater knowledge acquisition (Ginns, 2005; Mayer, 2009). The visual information processing channel may become overloaded when students must process on-screen graphics and on-screen text at the same time. Van Someren et al. (1998) suggested that the educational representations should be developed to utilize this multimodality approach to allow learners to learn by exploring and linking different modalities. Also, some literatures show supporting evidence that presenting information in auditory mode with concurrent visual mode leads to deeper understanding (Mayer, 2003; Mayer & Sims, 1994; Paivio et al., 1998).

2.2. Learning effectiveness

In general, learning effectiveness can be measured using two variables: academic achievement (e.g., semester grade, test score) (Alavi et al., 1995; Shih et al., 2012) and learning satisfaction (Knowles, 1970; Maki et al., 2000; Piccoli et al., 2001). Correspondingly, the study of Huang et al. (2012) took academic achievement and learning satisfaction as two criteria for measuring student's learning effectiveness. Learning satisfaction can be regarded as the learners' feeling (Long, 1985; Tough, 1982), the learners' attitude (Long, 1985), or the learners' sense of pleasure (Johnson et al., 2000) toward their learning activities. Piccoli et al. (2001) and Maki et al. (2000) believed that learning satisfaction expresses learners' satisfaction derived from the learning process and learning results. Hence, learning satisfaction is a very suitable criterion for assessing learners' satisfaction with classroom learning. In summary, we can obtain better understanding of a student's learning effectiveness according to both academic achievement and learning satisfaction. As a result, academic achievement and learning satisfaction are considered as two important criteria for measuring student's learning effectiveness in this study.

3. The architecture of the multimodal presentation system (MPS)

In multimodal learning environments, students are presented content knowledge with a verbal representation and one or more corresponding visual representations. According to the modality principle of instructional design, learning outcomes will be optimized by presenting the verbal and visual representations of the knowledge in auditory and visual modalities (Moreno & Mayer, 2007). An interactive multimodal learning environment is the one in which the presented words and pictures depend on the learner's actions and the communication is multidirectional during learning. Figure 1 shows the architecture of the multimodal presentation system (MPS). The MPS in the environment consists of four primary components, which are Office Card Component, Media Card Component, Annotation Card Component, and Manager Card Component. This multimodal presentation software was designed to bring students to the interactive whiteboard, more directly involving them in the lesson.

IECT 2014

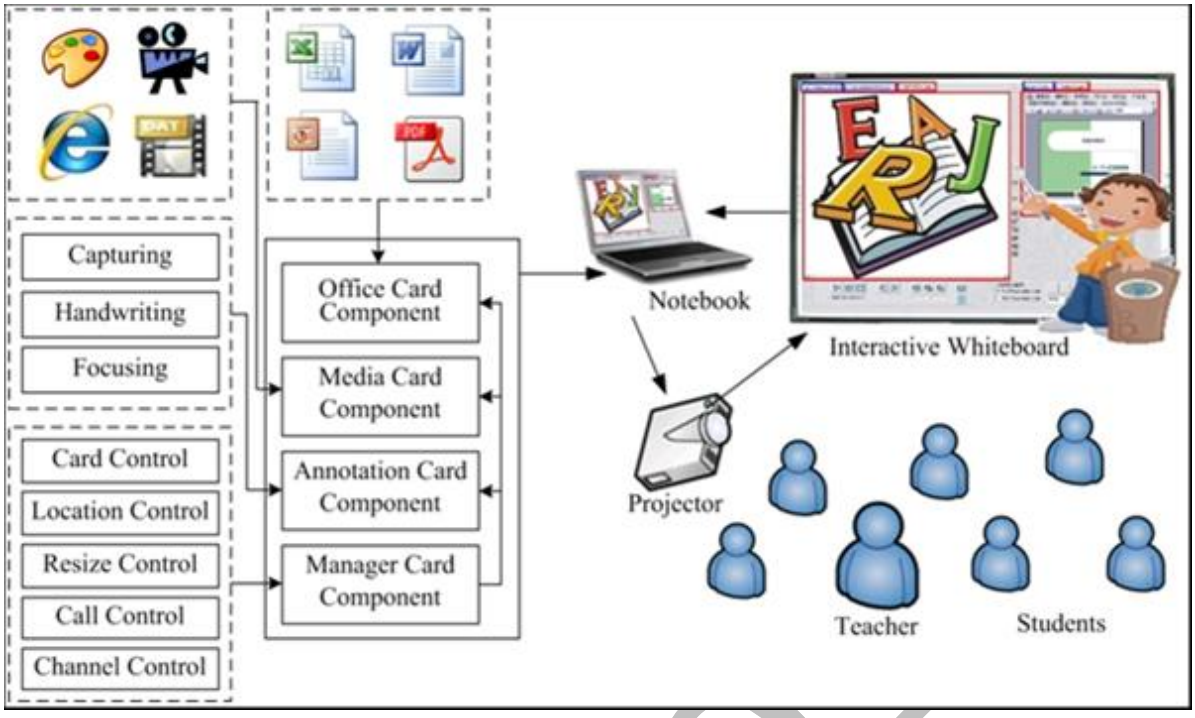

Fig. 1. The architecture of the multimodal presentation system (MPS)

Office Card Component is used to manage software applications simultaneously, especially for Microsoft Word, Excel, and PowerPoint software. Normally, for multiple PowerPoint presentations there is only one PowerPoint application can be activated at the same time. By using the functions provided by Microsoft OLE and COM Automations, Office Card Component is able to support the control of document, such as page up, page down, page jump, and change the view of document, etc.

Media Card Component is used to manage media object containers. For example, Digital Video is used to connect video devices and audio devices to display and record as a real-time streaming. Media Player Control provides scroll bar with play, stop, pause, etc. Browser Control and Image Control provides users with connecting Internet and image objects, respectively.

Annotation Card Component supports three major functions. Capturing is used to record screen operations and sounds into video movie files. Handwriting is used to support teacher's lecturing handwriting with notebook without electromagnetic digitizer. Focusing is used to emphasize the teaching materials by changing the background or frame color of the object containers.

Manager Card Component is used to manage authoring and presenting containers of materials. It includes five major control functions. Card Control is used to create, add, copy, rename, and delete the object containers. Location Control is used to move, switch, and arrange the location of object container. Resize Control is used to change the size of object container. Call Control can create the relation between related materials such as the major container and the child containers. It can record the numbers of object containers, show the previous pages of containers, and call the containers back to the primary monitor. Channel Control is used to present the object container to different monitors. Teachers can present instructional content in one or more columns scenario.

IECT 2014

4. Experimental design

4.1. Procedures

This study aims to evaluate the elementary students' learning achievement and satisfaction within classroom English vocabulary acquisition by utilizing the multimodal presentation system (MPS). At the end of the learning students took a post-test for measuring the learning achievement and questionnaires for measuring the learning satisfaction. Procedures of the experiment are are described as follows.Section headings

Section headings should be left justified, bold, with the first letter capitalized and numbered consecutively, starting with the Introduction. Sub-section headings should be in capital and lower-case italic letters, numbered 1.1, 1.2, etc, and left justified, with second and subsequent lines indented. All headings should have a minimum of three text lines after them before a page or column break. Ensure the text area is not blank except for the last page.

4.2. Participants

The participants were 134 pupils (72 boys and 62 girls) from six classes of two public elementary schools in Taiwan. All subjects, ranging in age from 11 to 12, were fifth-grade students. The instructional approaches were assigned randomly to six classes. The experimental group (68 students, 37 boys and 31 girls) was lectured with MPS and the control group (66 students, 35 boys and 31 girls) was lectured with blackboard. A summary table describing the distribution of participants is shown in Table 1. The experiment was held in the "English as a second language" course and lasted for two months from mid-March 2011 to mid-May 2011. Lectures were given twice a week, and each was taught for 40 minutes. Both groups were taught with the same learning materials by the same teacher. Although this type of experimental design is not completely followed by a randomized selection and assignment, it is often necessary in educational settings because intact classes are already constructed before the research is begun.

Table 1. The distribution of participants.

Groups	*Boy*	*Girl*	*Total*
Experimental group	37	31	68
ontrol group	35	31	66
	72	62	134

4.3. Three phases of learning

Step 1: The warm-up phase

Both groups were taught with the same story but provided with different tools for presenting the contents. In the learning setting of experimental group, the teacher presented the story in video media form with Media Player to guide the thinking of students about the learning vocabularies. In contrast, the teacher managed the storytelling and drew the learning contents on the blackboard in the learning setting of control group.

Step 2: The implementation phase

Both groups were taught with the same English vocabularies but provided with different tools for presenting the contents. In the learning setting of experimental group, the teacher presented the learning vocabularies and video media materials with the MPS. Also, while the teacher instructed, the whole teaching process on the IWB was recorded. This offered the students a chance to play back the recordings for refreshing their previous learning or inducing reflective learning.

Step 3: The application phase

In the learning environment of experimental group, the learning contents including text, videos and graphs were presented on the IWB. The MPS provided convenient ways for students to practice or discuss through pictures or videos. For example, the students could use the MPS to review the unfamiliar vocabularies, pictures, or videos that have been recorded. The teacher was required to make comments or suggestions while students were practicing or implementing. For example, if the students were ever in doubt, they could enquire the teacher about how the new knowledge is related to other course materials.

IETC 2014

4.4. Post-test

At the end of the three phases of learning the students took a post-study test of the vocabularies taught. The test score is used as the objective measurement of academic achievement, one of the criteria for measuring student's learning effectiveness in this study.

4.5. Satisfaction assessment

At the end of the post-test the students completed a self-questionnaire with regard to the learning satisfaction. A questionnaire, as shown in Table 2, was employed to understand the students' learning satisfaction. Particularly, our assessment of learning satisfaction is based on the questions proposed by Hui et al. (2008), with additional translations into Traditional Chinese to tailor the questionnaire to Taiwanese students in this study. Two professors were asked to pretest the questionnaire in order to ensure its clarity. Their feedback was incorporated into the final version. This questionnaire was composed of 6 items and each item was measured on a 7-point Likert scale where 7 indicated a strong preference and 1 indicated a weak preference for student's satisfaction. Internal consistency reliability, as represented by Cronbach's alpha, was 0.82, revealing an acceptable level of reliability (Chin, 1998).

5. Results and discussions

The t-test is used to test the null hypothesis that the population mean in each of the two groups is equal (Hair et al., 2010). Given the need to measure the differences between the experimental group and the control group in this study, regarding to the learning achievement and satisfaction, the independent samples t-tests were carried out.

5.1. Learning achievement

Table 2 shows the statistical results of the experimental group and the control group on measuring the post-test scores concerning learning achievement. The mean of scores was 79.78 (SD = 11.13) for the experimental group, higher than the 76.20 (SD = 8.61) for the control group. There is a significant difference between these two groups, t(125.794) = 2.087, p < .05.

Table 2. *t* test result of the test scores.

	Groups	*N*	*Mean*	*SD*	*df*	*t*	*p*
score	Experimental group	68	79.78	11.13	125.794	2.087*	.039
	ontrol group	66	76.20	8.61			

*$p < .05$

The empirical analysis results reveal that the students who used the multimodal presentation system (MPS), a multimodal presentation software integrated with interactive whiteboard (IWB), obtained a better result on average, implying that the system is able to lead students to significantly better learning achievement in English vocabulary learning, and is therefore useful. Previous studies of IWB (Digregorio & Sobel-Lojeski, 2009; Jang, 2010; Lewin et al., 2008; Slay et al., 2008; Thompson & Flecknoe, 2003) proved the positive improvement in developing the learners' learning achievement. The study of Lopez (2010) also indicated that a digital learning classroom project, using interactive whiteboard (IWB) technology, contributed to increase the English language learners' achievement, compared to those in traditional classrooms without IWB technology, in 3rd grade mathematics and 5th grade mathematics and reading.

5.2. Student satisfaction

Table 3 shows the statistical results of the experimental group and the control group on measuring the 6 survey items related to the learning satisfaction. The mean of overall satisfaction was 35.90 (SD = 4.91) for the experimental group, higher than the 25.91 (SD = 3.91) for the control group. There is a significant difference between these two groups, t(127.120) = 13.049, p < .001.

Table 3. Means (*M*), standard deviation (*SD*), and *t* value for learning satisfaction.

6. Conclusions

The purpose of this study was to develop a multimodal presentation system (MPS) to support the English learning in the elementary English as second language (ESL) course to enhance the students' learning effectiveness in the classroom setting. The results show that there are statistically significant differences between the students in experimental group and control group on measures of learning achievement and learning satisfaction. Here the mean of test scores was 79.78 (SD = 11.13) for the experimental group, higher than the 76.20 (SD = 8.61) for the control group. In addition, the mean of overall satisfaction was 35.90 (SD = 4.91) for the experimental group, higher than the 25.91 (SD = 3.91) for the control group. The MPS facilitates the ESL learning effectiveness at the interface of technology, providing high level of interactivity and multimodal presentation, which are critical to the improvement of the whole-class teaching and learning processes.

This study contains several limitations that suggest future research directions. First, this study does not completely follow a truly randomized selection and assignment. Although the instructional approaches were assigned randomly to classes, this study nevertheless is limited in the way that in educational settings the intact classes are already constructed before the research is begun. Efforts to replicate this study using a truly random design would be helpful. Second, this study evaluates the post-test scores concerning learning achievement. Further research should examine whether and the extent the MPS is able to help ESL students learn more materials in the same unit of time or learn a given unit of materials in less time than students in traditional classrooms. Finally, this study evaluates the learning effectiveness of elementary student in the context of ESL subject. Further research should investigate the potential of its use in other subject areas, such as art or math, or for students at other elementary grade levels or in higher education to generate empirical evidence with greater generalization.

Abstract

This paper examines the use of Virtual Learning Objects (VLO) in the teaching of differential calculus in the area of Management Sciences as a teaching strategy to improve the assimilation of the theoretical knowledge acquired in the classroom courses. This is accomplished by the construction of virtual pedagogical practices concerning to optimization problems through GeoGebra. It is free software that generates VLOs with an adequate contrast between the theoretical mathematical knowledge and its practical application in Management Sciences. Thus, different dynamic, algorithmic and heuristic processes are encouraged, being useful for logic and constructivist student training. The proposed methodology is based on the construction of VLOs (Virtual Learning Objects). It allows choosing variables in the GeoGebra software where students can interact with the formulation of mathematical problems applied to their curricula. So, they strengthen their knowledge and have a greater autonomy in the analysis of optimization problems in financial and management field. The results show how these teaching strategies facilitate the assimilation of the concepts of differential calculus in Management Sciences students. This allows a greater development of student skills in front of the understanding of the geometric behaviour of a curve.

Keywords: Virtual Learning Objects; Teaching practices; Management Sciences; optimization problems.

IETC 2014

1. Introduction

In differential calculus, the topics addressed can be arid and very disturbing when they are explained with traditional problems or situations. Indeed, there are available certain VLOs (Learning Virtual Objects) to make the learning process more pleasant and successful. An example of VLOs is GeoGebra, where it has established important dynamic interactions between student-machine to learn geometry, algebra or calculus.

This kind of tool can be very useful in the area of Administrative Sciences, where optimization problems often resources are discussed. For the differential calculus are important this kind of maximum and minimum exercises (Larson & Hostetler, 1989). In this way, these elements are appropriated to illustrate the learning process in software.

Furthermore, students can self-assess using these tools to solve lot problems with the same characteristics. As proposed by Stewart (1999), "In the solution of these practical problems, the biggest challenge is often convert the problem in words to a mathematical optimization problem, by setting the function to be maximized or minimized".

After knowing with more depth the basic characteristics of the software, it will set out examples of particular cases that can be addressed with this tool. Also, an explanation will be proposed by the teacher to convey to students through a video.

The GeoGebra aims to improve the teaching and learning of mathematics for all educational levels. It combines the dynamic and interactive forms of subjects such as geometry, algebra, calculus, analysis and statistic. This software was chosen because is dynamic, free, usable, didactic, and providing good mathematical basis. It is easy to create a dynamic and interactive website with incorporated applets, and wiki are available to share achievements with other users. These elements allow creating networking of collaborative knowledge that improves the learning process.

2. Virtual learning objects

With the development of different approaches in learning processes, contexts have been built to make them dynamic. Among these contexts, the constructivist trend has been one of the most prolific in research and proposals arising from the use of technology in the teaching-learning process of students. Literature has confirmed that the use of computing and new technologies provide a creative environment that improves student performance (Potter & Johnston, 2006 cited by Montagud & Gandia, 2013).

The emergence of internet, microprocessors, tablets and digital blackboards, friendly software and 2.0 have generated a change in the traditional model of teaching masterful character to another based on self-learning though learning objects and new educational tools LMS like Moodle, Dokeos o Sakai (Poveda, 2011).

Therefore, learning for digital media is characterized by the convergence of methods, technologies, applications and services oriented to facilitate learning process, that considerate as most fundamentals aspects: learning theories, skills development in the use of technological platforms, in didactic tools and learning objects (Garduño, 2006).

The Virtual Learning Objects (VLO) become as facilitators of learning processes in different levels of education. They emerge in 1994 by the need to share and reuse content in any area of knowledge. They are among the most widely used solutions to achieve reuse, accessibility, durability and interoperability of educational resources (Colomé, Estrada & Febles, 2012).

These objects are defined by Wiley (2000) as "digital or non-digital entities that can be used, reused or referenced during learning supported by technology" and extended by the IEEE (Institute of Electrical and Electronics Engineers) as "any digital resource that can be reused to support learning " (Chiappe, 2006). These objects guide at all times the student in his learning process, encouraging his autonomy with the management of his self-learning and facilitate the role of the teacher as a mentor, guide and evaluator of the teaching-learning process (Montagud & Gandia, 2013).

In this order of ideas, De la Torre & Dominguez (2012) emphasize that learning objects should have certain characteristics that allow the fulfillment of its purposes, among them are: reusability, interoperability, educability, durability, independence, flexibility, functionality, accessibility and adaptability.

In the same way, learning objects are classified according to their learning object as (De la Torre & Dominguez, 2012):

- Objects of instruction such as articles, workshops, seminars, courses, cases studies and others.
- Objects of collaboration such as forums, chats and on-line meetings.
- Objects of practices such as simulations, software, on-line labs, research projects and others.
- Objects of evaluation such as partial exam, final exam and certification 2.0.

IETC-2014

Considering that the development of learning objects is emerging as one of the fundamental tasks of online training, it is essential to define and identify the handling of messages in the content. Also, discriminate and structure them to integrate them with the suitable media to carry the content. In the development of these environments should be consider the course objectives, learning activities, the media, the possibilities of their reuse by teachers and students, and parameters of students evaluation (Garduño, 2006).

Learning objects have been designed to facilitate these learning processes in areas of knowledge such as: medicine, veterinary science, agronomy, mathematics, among others. Thus, it is proposed that technology is essential in teaching and learning of mathematics by improving student learning (NCTM, 2000). Taking this into account, it is designed a tool that helps students to gain a better understanding in this area of knowledge, oriented to solving problems and promoting mathematical experiments and discoveries in the classroom and at home. This software "was created by Markus Hohenwarter in 2001-2002 as part of his master's thesis on the teaching of mathematics and computer science at the University of Salzburg in Austria. In July 2006, GeoGebra continued been development in the Florida Atlantic University in the Norm National Science Foundation – NFS" (Hohenwarter & Preiner, 2007).

Hohenwarter & Preiner (2007) expose that GeoGebra is designed to teaching and learning Mathematics in middle school to higher education, providing basic functions in computational algebra systems, algebra and calculus. Additionally, this tool was developed on open source.

In order to develop this research, it is proposed the construction of VLO, allowing the choice of variables in the GeoGebra software, where students can interact with the formulation of mathematical problems applied to their curricular programs. So, they strengthen their knowledge and have a greater autonomy in the analysis of optimization problems in financial and management field.

3. Optimization problems modeling in field of management sciences

An approach to methodological design for mathematics learning is the heuristic. It consists of defining hypotheses supported by specific cases, rejecting or giving the key to justify it. Logical reasoning is used as a process of mathematical thinking, where students of the area of Administrative Sciences interact with the concepts and elements, helping to make decisions in real life (Politécnica, 2009).

In general, the student should evaluate each element of the problem situation, and depending on context, translates them into specific mathematical terms. Apply correctly derivation techniques, with its first and second derivatives and the theory of curve sketching with its points of maximum and/or minimum is useful for modeling optimization problems. For example with some data from a problem situation could maximize profit or minimize some costs.

The first step is to decide precisely what is wanted the optimization. The point is expressed as a function of a single variable (independent variable), the quantity to be maximized or minimized. It is convenient to choose a letter that is closely related to the amount, as I for incomes or A for area. Then, this function is derived respect to the independent variable and it is equalized to zero to find the critical values. To find out if these critical values are maximum or minimum, they are replaced in the second derivative. However, it is logical to think that critical value should be maximum or minimum by the nature of the problem (Haeussler & Richard, 1997). Figure 1 shows an example of maximum and an example of minimum.

IETC 2014

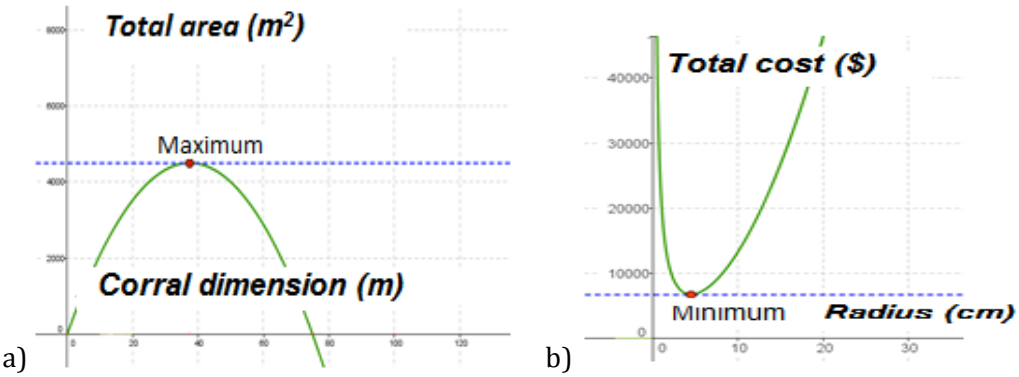

Fig. 1. (a) Maximum Problem; (b) Minimum Problem.

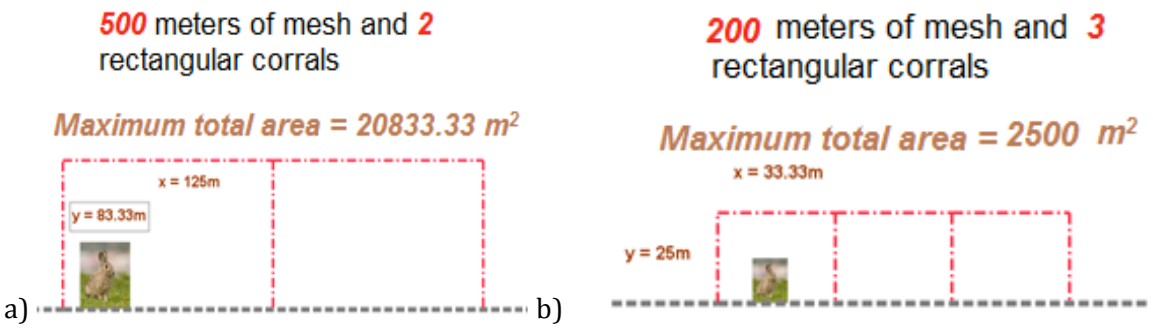

4. Methodology

One way to reach students, and teach using the VLOs is by audiovisual means. Ferrés (1988) proposes three important elements to enhance learning by these means: A video-lesson is a program in which some content in a systematic and comprehensive is exposed. It would be like a masterclass, but given for video. As video is a kinetic-audio-visual technology, video-lesson will be particularly suitable for the transmission of audio-visual-kinetic content, becoming a very effective method. Moreover, motivational program provokes, interpellates, questions and arouses interest. Video-lesson works with pedagogy of "during" and motivational program works with pedagogy of "after" (learning takes place thanks to the interest generated by the program). On the one hand, a good motivator program has two advantages: it ensures motivation (no motivation, no learning) and it is inserted into the frame of an active pedagogy. On the other hand, the video-support is a set of images that illustrate the verbal speech of the teacher. They are moving images that can elicit student participation during the viewing. The video-support can be used with informative, motivational, evaluative or research function (Ferrés, 1988).

For this particular case, it is very common to find optimizing problems of available resources. For this, an optimization example is presented to show the whole process through appropriate teacher explanation to transmit in an audiovisual manner.

Problem situation: "A student of cattle industries wants to start a sales business meat rabbits with "X" meters of mesh. He wants to use another mesh of 1000 meters in length, which already exists. To build "n" rectangular corrals of equal size, what should be the dimensions of these corrals to take the largest possible area? "

What is underlined in the above statement refers to boxes in windows of GeoGebra software. There, students should define the desired values that are logical with the modeling of the problem. To illustrate, Fig. 2 shows two cases where the statement is the same, but the values of each variable are different.

IETC2014

Fig. 2. (a) Model 1; (b) Model 2.

In the first model (Fig. 2.a), in the windows were placed "500" m of mesh to build "2" corrals. Immediately, the values of the side dimensions of the corrals appeared: x =125m and y= 83.33m. The same as the maximum total area=20833.33 m^2. In the second model (Fig. 2.b), in the windows were placed "200" m of mesh to build "3" corrals. Immediately, the values of the sides dimensions of the corrals appeared: x = 33.33m and y= 25m. The same as the maximum total area= 2500 m^2.

At first it seems simple, but the important thing is that the student solves the problem first with paper and pencil and then corroborates his answer with VLOs answer to know if he worked well or not.

In order to *promote* this learning behavior, it is desirable that teachers make a video where it is explained the manipulation of GeoGebra software and also how the problem is solved mathematically for the student do it by hand. A possible explanation to show in the video is:

"To learn to manage this VLO, we must identify with the reading of the situation problem that is an optimization problem. It is necessary to obtain an equation based on what will be maximum or minimum. In this case, it is necessary maximize the total area of lands. The total area is in function of two variables ("x" and "y") which is shown in Figure 3, but it should be in function of a single variable to be able to derive and equalize to zero, finding the critical value(s).

Fig. 3. (a) Dimensions of the land.

We have the equation:

$$A_t = 3xy \quad (1)$$

Then, we have to obtain another equation that relates these variables ("x" and "y",) to isolate one variable in function of the other, and replace it in the equation of the area (1). As we have the value the perimeter (200m), we can use it as well:

$$P = 200m = 3x + 4y, \ then \quad 200 - 4y = 3x \quad (2)$$

Replace (2) in (1), we have:

$$A_t = (200 - 4y)y, \ then \ A_t = 200 - 4y^2 \quad (3)$$

In this way we have the total area At in function of one variable. Then, it is possible to differentiate and equalize to zero, and finding the critical value(s):

$$\frac{dA_t}{dy} = 200 - 8y = 0 \rightarrow y = \frac{200}{8} = 25m \quad (4)$$

We find the second derivative and replace that critical value to corroborate that is the maximum:

$$A"(y) = -8, \ then \ A"(25) = -8 < 0 \quad (5)$$

As the second derivate is less than zero, y=25 is the maximum. To find the value "x" we replace y=25 in (2):

IETC2014

$$200 - 4 \times 25 = 3x \Rightarrow \frac{200 - 4 \times 25}{3}, \text{ then } x = 33.33m \quad (6)$$

To find the total maximum area, we replace y= 25m in (3):

$$A_t(25) = 200 \times 25 - 4 \times 25^2 = 2500m^2 \quad (7)$$

The idea is that you, as a student, just assume values to place in the windows and try to solve the problem with pencil and paper".

Finally, Figure 4 shows a comparison between the graph VLO and a curve where the maximum point is evidenced. Thus, the student can see the optimal result of a particular case, and simultaneously can realize a mathematical analysis of the obtained results.

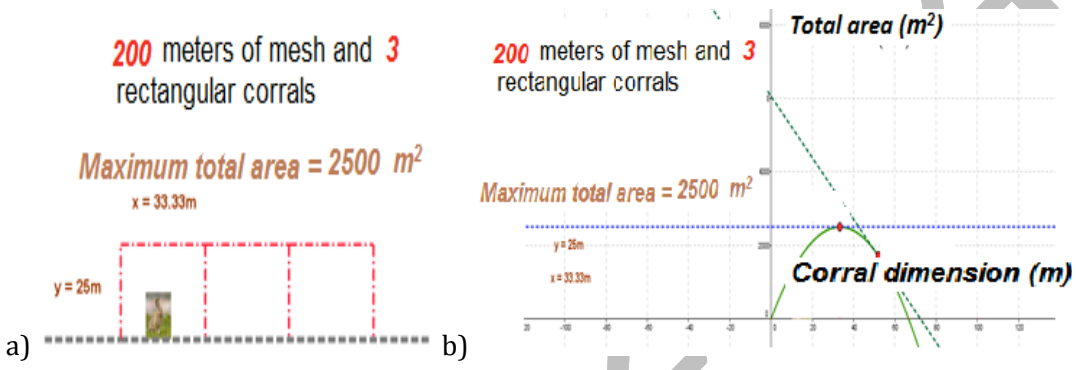

Fig. 4. (a) VLO graphic; (b) VLO curve.

5. Results

This article wants to show how easy it is to work with the free software specialized in mathematics: GeoGebra, where concepts are easier to understand. It is an environment where a heuristic dialogue is propitiated, not only between teacher and student but also student and the VLO. It motivates to research what can happen and the reason of each change that make in its interface.

They are diverse the experiences in international conferences and classrooms, where the authors of this article have worked VLOs with situations-problems in the area of Administrative Sciences. Different models have attracted the attention of the audience, wanting to learn how to model mathematical problems with this software.

One way to reach students and teach using the VLOs is by audiovisual means. Ferrés (1988) talks about how to integrate video into the school in video-lesson, motivating program and video-support. These elements act as a great motivator and as effective means for all students to learning, allowing expand the educational coverage in time and space.

6. Conclusion

The education should be improved to benefit students - and therefore the country, and institutions should have greater coverage. In this sense, it is necessary to renewal in teaching methodologies. The VLOs as GeoGebra are excellent tools that allow students to have an interactive and dynamic autonomous learning. Through the exercise proposed and explained by means of a video, student will become familiar with the software and acquire skills to treat resource optimization problems. Furthermore, with the increasing use of technological tools for the academic community, there is an incentive for updating and creating new projects for education and research.

Digital divide within the context of language and foreign language teaching

Assist. Prof. Dr. İsmail YAMAN29
Ondokuz Mayıs University, Samsun, Turkey

Abstract

Digital divide, the existence of which is commonly familiar but unknown as a concept, influence the lives of human beings to a notable extent. Access to information and communication technologies is one of the most significant indicators revealing digital divide. Within this framework, digital divide has a remarkable influence in various areas ranging from education to economy and from art to industry. In this paper, the links between digital divide and language and foreign language teaching are explained taking the cause-effect relationships into account. Under its links to language, the factor of "English" and multilingualism are emphasized. Under its links to foreign language teaching, subjects like teaching materials, language testing, multiple intelligences and learning styles, and foreign language education for physically-handicapped students are discussed.

Keywords: digital divide; language; foreign language teaching; information and communication technologies

IETC 2014

1. Introduction

Millenniums ago people lived on agriculture which took physical effort as its fundamental source. Everything was slower ranging from communication to transportation. Also, as a result of the very nature of conditions available at those times, the terms 'difference' and 'gap' cannot be said to have been in question within the framework of people's livings and relations to the extent it appears today. However, with the advent of Industrial Revolution in the late 1700s in England, the whole understanding of the world began to change and many practices in daily life from agriculture and manufacturing to communication and transportation turned out to have technical dimensions within only a few decades. Following this industrialization process, it did not take long to introduce the two most striking profiles for human beings: 'wealthy' and 'poor'. These profiles cut for 19th and 20th century people posed the core motive behind the most violent conflicts among human beings. Though, on the other hand this quite fast industrialization process was paving the way for a totally new era: Information Age.

In the late 20th century the world began to take on a completely different appearance. The term 'technology' initiated its reign and it has maintained its dominance at an increasing pace since then. This new age has turned out to be quite different from the preceding processes the humankind has gone through in that its speed of progress has been unbelievable. While a walkman was viewed as a great gadget approximately thirty years ago, the existence of pocket computers are taken for granted today. As a direct result of this characteristic of the new digital age, the gap among people around the world has undertaken distinct dimensions. Since such development of information and communication technologies

* Dr. İsmail Yaman. Tel.: 0362 312 19 19; fax: 0362 457 60 91.
E-mail address: ismail.yaman@omu.edu.tr

(hereinafter ICTs) has brought out the well-known 'globalization', everything throughout the world has become closely interlinked. Therefore this novel conjuncture and its direct and indirect reflections have introduced many positive and negative outcomes for almost every field from education and medicine to sports and transportation.

2. The term 'digital divide'

Being a quite novel concept, digital divide can be roughly defined as the gap between those having enough access to ICTs and those who do not have. It is defined by Mossberger et. al. (2003: 1) as "the patterns of unequal access to information technology based on income, race, ethnicity, gender, age, and geography". As it is clear from the definition, ICTs constitute the basic criteria for the measurement of digital divide. As for the scope of ICTs, television, phone (mobile and landline), computer and access to internet can be seen as the main determinants. Digital divide can show itself in different contexts resulting from various factors. Considering this multi-faceted characteristic of it, the methodologies formulated to measure digital divide are quite changeable. Therefore, while measuring it the aim should be specified clearly and the criteria should be selected accordingly.

2.1. Factors behind the digital divide

Digital divide is resulted or exacerbated by some factors that also shape the way people live. These factors can be counted as income level, literacy, age, geography, gender, language, population, disability, and so on. These factors are, in most cases, inherited characteristics or conditions on which people generally do not have a right, indeed, an opportunity of decision-making. It is just like being born into poverty or prosperity. What is worse, they are rather hard to improve due to the multi-dimensional nature of the issue.

2.2. Basic contexts for digital divide

One of the most striking gaps in terms of access to ICTs arises between countries. From a more general perspective, an apparent divide can be observed between continents. Secondly, digital divide can arise domestically, between regions, areas and even individuals. As the socio-economic and educational factors can vary with different regions and areas in a country to a notable extent, level of access to ICTs cannot be homogenous in every part of a country. Actually, the issue has its roots at the individual level. Everybody has their own socio-economic and educational background and the needs and routines of people vary radically even within families. Thus the manner of people in terms of ICT use poses differences ultimately leading to domestic digital divide. Finally, time is another important variable in terms of the way digital divide shows itself. Change of time directly means change of things and so the inevitable result is the change of life. Hundreds of years ago, the divide was characterized by possessing tools like ploughs for agriculture. Likewise, just a few decades ago, televisions pioneered a radical change after radios and the digital gap displayed itself under having or not having access to this novel technology. However, today the major context for digital divide is marked by access to computers and internet. After several decades, probably, the world will see new technological discoveries access to which will constitute the gap between people's lives. Actually, time resembles a magic tunnel; as you get ahead, you come across totally new and unusual things and conditions. It does not take long for new conditions to become solely a part of the near past. Similarly, digital gap throughout the world perpetually adopts different faces in accordance with the circumstances posed by the time.

3. Digital divide and language

IECT 2014

Language is a highly complex and multi-faceted system composing the essence of people's lives. That is the origins of language dates back to the origins of human beings. A number of languages have existed throughout the history. While some of these have become extinct, some others have been able to exist up to now. In addition, some of these living languages are spoken by billions of people like English and Chinese whereas some address solely to thousands like Abkhaz and Adige languages.

Since language is so included in our lives, it is also an indispensable part of ICTs. The use of ICTs almost always requires a language system. On this point the difference between the languages set in the electronic devices or sources and the language the addressees of these ICTs speak pose a problematic situation.

3.1. Dominance of English

After the beginning of American dominance in politics and technology around the world, English began to be used as the lingua franca almost everywhere. It is widely used even in many countries where it is not an official language. This "universality" of English has been blamed for killing local languages and corrupting local and intact cultures. As a matter of fact, many words of English origin belonging to fields like technology, medicine, botanic, etc. have invaded and tarnished the originality and image of languages like even German, Turkish and French. Because most people believe in the necessity to have a good command of English in our century, it is likely to see more and more controversies as to the debilitating effect of English on other languages and cultures.

The interference of English lexical items is not the only problem faced by users of other languages. English is widely seen and used as the most prestigious language of science. The status of English as a science language is consolidated by the fact that it is commonly used as a prestigious language of education. For example, Middle East Technical University and Bosporus University, which are among the most reputable higher education institutions in Turkey, are teaching in English. Consequently, new scientific findings, major scientific articles and proceedings are almost all communicated to the world via English. Publishing and presenting such studies in English are thought to enable researchers to address broader masses of people and such studies are viewed as "more scientific". Thus, attaining access to new scientific findings and so planning future roadmaps in accordance with them requires the knowledge and usage of English. As a result, in many cases, people who cannot speak English stay unaware of recent scientific and technological developments or at best they wait for the translation of the researches even if they are conducted in their home countries. Because science and technology are inseparable realms, people without English knowledge and countries which do not make effective use of English are drifted towards a more severe digital divide.

In addition to the above characteristics of it, English turns out as the most prevalent language under the framework of computers and internet. As access to internet is the most fundamental indicator in terms of digital divide of nowadays, the language factor gains more importance on this point. Considering the proportion of web-pages by language according to the data of 2007, 45 % of all internet media is in English and it is followed by other European languages like German (5.90 %), French (4.41 %) and Spanish (3.80 %) (http://funredes.org/lc/english/inicio/). Similarly, latest data from Internet World Stats (2010) indicate that English is used in the internet by 536 millions of people and it is succeeded by Chinese (444 millions) and Spanish (153 millions) (www.internetworldstats.com/stats7.htm). It can be apparently deduced from both researches that English has an overwhelming rule in the realm of internet. That is, non-speakers of English have a rather limited scope in the digital world and they are left in a necessity condition that they learn English and only then get access to the innumerable benefits provided by internet.

IECT2014

The problem is worsened by the fact that most software and hardware belonging to computers and related technologies are designed and formulated in English. Until new computer-related devices and programs become ready for the use of non-English speaker communities, they go through a challenging translation process. This relatively technical translation job not only retards the delivery of technology but also produces new problems. Since, most terms and concepts related with technology are of English origin and many other languages, particularly less spoken ones, do not have their equivalents. Moreover, words like format, update, wireless, etc. are preferred even in languages like Turkish which has their native equivalents. Therefore, components of key significance like user manuals and software instructions turn into an incomprehensible load of borrowed words and terms. The result is then a mounting digital divide again for less educated and those with a lower socio-economic status.

3.2. Multilingualism

The nature of human beings requires them to interact with each other. Throughout history, many nations, states, empires, colonies and communities have appeared in differing locations on Earth and members of these have all made use of a language system to communicate with each other and even to talk to themselves. Following the rise in interactions between people with activities like trade and war, it was understood that knowing only one language was not adequate. From this point on, the world began to see the cases of multilingualism and plurilingualism almost everywhere people live.

Even though multilingualism is a direct indicator of cultural and social wealth, it may become a disadvantage in dealing with digital divide in communities where the number of languages exceeds a few. While the rule of English is an undeniable case, it would be weird to expect that more than three languages in a country can receive equal shares in terms of technological developments. The existence of each more language means a new challenging translation process. Furthermore, every language in a multilingual system does not have the chance of being seen worthy enough for translation. In India and South Africa, for example, there are more than ten official languages and in addition to them dozens of other local languages. When a novel technological system or software enters into such countries, the official languages (even some of them may be neglected) are naturally given priority for the translation of related documents and systems. Thus, speakers of less common languages become digitally isolated and they are somehow forced to employ other prevalent languages in order to keep abreast of technology.

4. Digital divide and foreign language teaching

Each passing day brings a new paradigm and the conditions of effective learning are shaped in accordance with these new paradigms. The century we live in has introduced a number of facilities for the realm of education and most of these are closely related with the use technology. In the book "The World is Open" Bonk (2009: 51) lists ten openers that make learning more effective and prevalent in the 21st century:

Ten Openers: (WE-ALL-LEARN)

1. Web Searching in the World of e-Books
2. E-Learning and Blended Learning
3. Availability of Open Source and Free Software
4. Leveraged Resources and Open Course Ware
5. Learning Object Repositories and Portals
6. Learner Participation in Open Information Communities
7. Electronic Collaboration

IETC 2014

8. Alternate Reality Learning
9. Real-Time Mobility and Portability
10. Networks of Personalized Learning

These points listed by Bonk (2009) put a strong emphasis on the integration of technology and computers in to education. This clearly shows the extent to which internet and new technological developments hold potentials for learning in the 21st century. In the same direction, Warschauer et al. (2000: 7-8) state that the integration of the internet brings ALIVE (Authenticity, Literacy, Interaction, Vitality, Empowerment) to the learning process. However, the problem here is the identification of the extent to which learners have access to ICTs on an equal basis. As a mater of fact, digital divide remains as a serious threat in front of having equal learning opportunities. The results of a recent report by the World Economic Forum indicate that Turkey ranks 45th after Kazakhstan and Hungary in The Networked Readiness Index 2013 (http://www3.weforum.org/docs/GITR/2013/GITR_OverallRankings_2013.pdf). This statistical datum is simply related with the between-countries context and it shows that Turkey is not in a desirable place in terms of network readiness. Even developed countries face inequalities among students concerning access to ICTs (Castaño-Muñoz, 2010).

Foreign language teaching differs from second language teaching in many respects. First of all, learners do not have enough opportunities to have access to the authentic uses of the target language in foreign language contexts. This is mostly because of the fact that there are not enough native speakers around to practice and to be exposed to the target language to an adequate extent. Therefore, language learners and teachers need to exert extra effort to compensate for this disadvantage. Under this framework, the significance of making use of technological aids increases. If there is digital divide faced by the learners in different countries, regions, cities, schools, and even families it is hard to mention equal chances of developing foreign language skills. The importance of the use of ICTs for language learning and teaching purposes is discussed below under separate subheadings.

4.1. Instructional materials

The effective use materials is quite important in foreign language teaching. In order to raise the efficacy of the learning process, teachers can make use of internet, computers, smart boards, and projectors in the classroom. This is especially important in terms of raising the authenticity of the learning. Through internet, learners can have access to limitless authentic reading, listening, writing, and speaking activities and tasks. In disadvantaged schools, for example, listening activities are still done through cassette players, which challenges students due to factors like poor voice quality, the absence of a visual aid, and so on. However, a computerized listening activity provides the students with supporting visual aids, a perfect-like voice quality and even a script. Alongside their benefits to the improvement of language skills, the use of technological aids in the classroom can contribute remarkably to the motivation of the learners. Actually, this is not something completely related with the within-class conditions; on the contrary, these learning aids render learners autonomous and make learning free of time and place restrictions. The posh term, 'Computer-Assisted Language Learning (CALL)' puts a strong emphasis on this autonomy dimension with its direct reference of *learning* instead of *teaching*. Nevertheless, in order to benefit from these opportunities adequately, you have to possess these types of ICTs. A technologically-advantaged student, for example, can look up an unknown lexical item on a smart phone instantly while a technologically-disadvantaged student has no alternative than a paperback dictionary the use of which is relatively time-consuming compared with digital and online dictionaries.

4.2. Testing

Assessment is an integral part of all learning processes and language learning is not an exception within this context. Computerized systems enable language teachers to prepare more interactive and content-rich tests. However, the learning environments that suffer from digital divide are bound to paper and pen tests. Internet media do not only bring benefits for the teachers in terms of preparing quality tests, they also bring considerable contributions to the learners in the self-preparation process for the tests. Moreover, the international tests of English like TOEFL and IELTS are now carried out mostly on internet-based basis. If a learner is not familiar enough with computers and online systems, this constitutes a seri-

IECT 2014

ous disadvantage. Even if such students are good enough at language skills, their inadequate digital literacy may put them in a difficult condition.

4.3. The recognition of multiple intelligences and different learning styles

In a foreign language class, it is very important to understand the different intelligence types of the learners in order to address their different learning preferences. It is wrong to expect every learner to have the same sources of motivation to learning. Through the recognition of different types of intelligences and learning styles in a single classroom, the teachers can adapt the language and accompanying activities to suit the needs and intelligence types of the different language learners in their classes. The integration of technology can make teachers more powerful in addressing the distinct needs and expectations of their students. A video display, for instance, can enhance the motivation and learning performance of a visual learner while a nature-related video can contribute to both to learners with visual and natural intelligence. Every small addition will help the teachers touch more students in their classrooms and this holds a strong potential in enhancing the quality of learning. However, in a technology-deprived setting, teachers do not have many alternatives at hand in addressing the different expectations of the learners.

4.4. Foreign language teaching for handicapped students

A more crucial point as to the integration of computer and internet technologies into foreign language learning is the potential of helping people with disabilities by providing them broader range of opportunities during the whole process, thus ultimately assisting them in integrating more with life. Some specific websites and software that are specifically designed for the visually-impaired learners can be quite useful if there is a chance of having access to internet. Even screen readers can bring priceless uses to such disadvantaged learners in their foreign language learning process. The availability of a computer and access to internet can also save other physically-handicapped students from going and participating in language courses in person. Thanks to internet, they can benefit from the limitless language resources to develop different language skills in accordance with their own needs and preferences and even attend online speaking sessions. However, these are not so possible in settings where digital divide unfortunately shows itself.

5. Conclusion

In this paper, the term *digital divide* is covered within the context of language and foreign language teaching. After a general introduction with the basic factors behind and basic contexts for it, digital divide is linked to language under the titles of the dominance of English and multilingualism. Its relation with foreign language teaching is established under the titles of instructional materials, testing, the recognition of multiple intelligences and different learning styles, and foreign language teaching for handicapped students. It is obvious that digital divide is not something that can be ignored. In this paper we have looked at its apparent relations with language and language teaching, and it becomes clear that we all have to strive to bridge this gap in order to let language teachers and learners experience better and higher-quality processes. Technology is developing at an unbelievable pace and the benefits it brings hold a significant potential for everyone. However, if we cannot manage the struggle against digital divide, these invaluable benefits can easily turn into huge disadvantages for many people.

Digitalization of upbringing and education in relation to shifted socialisation of Polish students

Paulina Forma[30], Bożena Matyjas[31]
a Uniwersytet Jana Kochanowskiego w Kielcach, 25-369, Kielce, Poland
b Uniwersytet Jana Kochanowskiego w Kielcach, 25-369, Kielce, Poland

Abstract

The article discusses modern children's/students' space of life which is outlined by electronic media. They tend to determine the process of upbringing, education as well as socialisation. The above mentioned processes, including primary socialisation which is typically initiated by the family, are now influenced by media. Undoubtedly, mass media and hypermedia provide numerous educational opportunities. On the other hand, they may have negative implications for children since virtual reality, which is obviously different to the real world, tends to generate new threats or risks especially to psychological and physical development. Children might be put at risk of Internet abuse or addiction. The closing part of the article emphasises the necessity for media education such as learning media skills and competencies as well as raising the Internet awareness.

Keywords: mass media, hypermedia, socialisation of children and young people, opportunities and risks in upbringing and education, media education.

Introduction

Modern person's space of life is outlined by media which determine the process of children's upbringing and education as well as socialisation. Contemporary media involve among others television, films, advertisement or the Internet. Nowadays, mass media have become an integral part of our everyday life. They influence people's way of thinking, feelings and imagination. The importance of media cannot be overestimated, especially because young people devote a lot of time to the use of media. According to public opinion surveys, media have greater influence on young people's behaviours and attitudes than family, school or other socialising agents. It might be claimed that "traditional upbringing and education" does not meet modern life requirements concerning the young people's need to increase their awareness and experience (Cudowska, 2005, p. 180). New media have become recent and most influential social environment for all young people over the world and certainly those living in Poland, the country which also participates in transformation and globalisation processes. Media offer rich and axiologically diversified content which has a significant influence on children's/student's life, their upbringing and education at each level of development. It should be emphasized that media, in spite of their advantages, may threaten upbringing and socialisation processes.

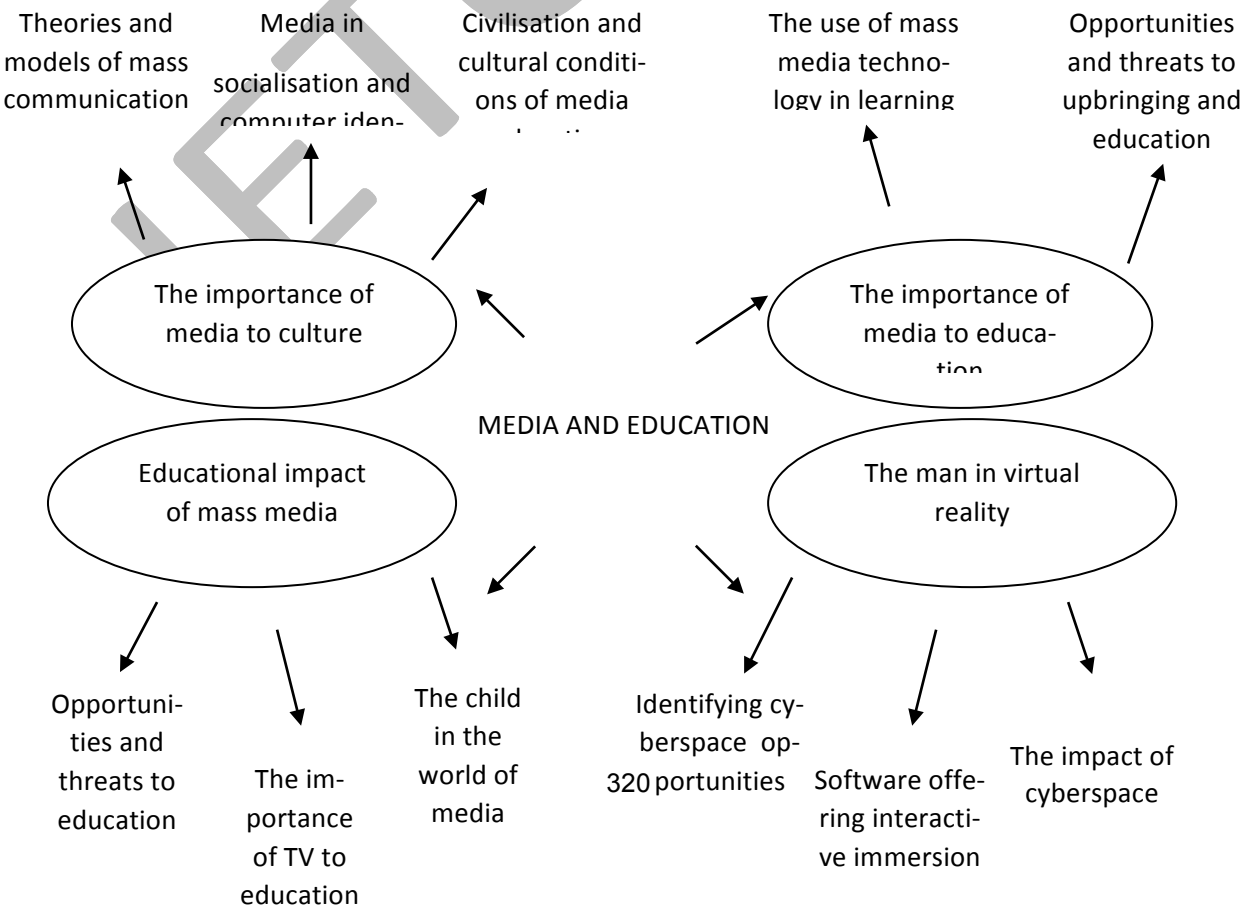
IETC 2014



Educational and upbringing opportunities offered by new media

It is worth noticing that the term "new media" means both mass media and hypermedia. However, there is a slight difference between these two types of new media. Mass media are the tools intended to reach large audience by mass communication; they provide direct contacts when broadcasting the content from the centre to the mass of the people. Hypermedia, whereas, are technical assets based on a computer with internet access which is connected to such hardware as a monitor, a DVD or a CD player, a scanner or a printer etc. This system enables users to gain access to the texts of different types as well as to create and process them via the Internet. (J. Gajda, 2003). As opposed to mass media which, as mentioned earlier, broadcast information from the centre, hypermedia have numerous sources and their senders - single persons - are able to send and receive information at any time. Hypermedia unlike mass media are active. Here, socialisation function of media must be emphasized since in both mass media and hypermedia the receiver is active and uses information transmitted by media intentionally, being driven by expectations concerning the content of media. The user is not directly influenced by media as they do not operate in isolation.

Media create great upbringing and educational opportunities, they facilitate education without borders. A. Cudowska (2005, p.174) indentifies four basic areas of interrelations between media and education: the importance of media to culture, the importance of hypermedia to education, the educational impact of mass media as well as the situation of a person in virtual reality. The details of the above-mentioned areas are included in the chart below.

IETC 2014

Figure 1. Map of essential issues concerning the analysis of media and education

From: A. Cudowska, Media i edukacja – wzajemne relacje (in): Dziecko i media elektroniczne – nowy wymiar dzieciństwa, Vol. I, ed. J. Izdebska, T. Sosnowski, Wyd. Trans Humana, Białystok 2005.

Among all the above-mentioned areas of correlation between media and education, pedagogists are mainly interested in the application of new multimedia technologies to learning. They also focus on opportunities and threats to the process of upbringing and education.

J. Gajda (2005, p.146) mentions the following upbringing and educational opportunities (chances) facilitated by media, which are visible:

- firstly: in a wide range of TV programmes offered by numerous, specialised TV channels which, as a result of competition for viewers, will meet requirements of different groups of people and satisfy various tastes;

- secondly: in possibilities for education in its broad sense, particularly in terms of axiology e.g. education for such universal values as the truth, good, beauty, love, freedom, tolerance etc.;

- thirdly: in higher level of education in Poland, which allows us to take an optimistic look at the reception of media content, according to the uses and gratifications theory, in a selective and critical way, resistant to different forms of manipulation and directed to higher standard of cultural content, as opposed to behavioural theories which assume passive attitudes of receivers who tend to be under the influence of media.

Let me refer briefly to the above-mentioned issues. As far as accessibility to media content is concerned, it should be noticed that there is a wide choice of different programmes which tend to meet children's and young people's requirements as well as to satisfy their needs and interests. TV programmes are available at any time since, thanks to recording equipment, TV or radio programmes do not have to be watched or listened to at the time of broadcasting. What is more, the receivers appear to be more creative in processing ready texts and creating new ones through the use of DVD technology or a computer connected to such hardware as a scanner or a printer. Hypermedia are interactive as they enable the users to establish interpersonal contacts. They also blur the line between senders and receivers.

Nowadays, computer has become an essential tool in our everyday life, for children and young people it offers a nice way of spending free time. Information providers enable receivers to establish contacts with other users, make them creative and even influence their way of thinking. There are a lot of valuable educational games and TV programmes, for instance "Sesame Street", a long-running children's TV series, which is known for its educational content relevant to almost all school subjects. With providing knowledge in an easy and nice way, such programmes teach children powers of observation, deduction skills and logical thinking (B. Siemieniecki, 2002).

Huge educational possibilities of mass media and hypermedia are applied to educate children with disabilities, particularly those who are deaf, blind, and chronically ill or socially disordered (educational, therapeutic, counselling games etc.). Electronic media are used in distant learning schools (e-learning). Thanks to numerous types of media multimedia programmes on DVDs or e-books are created.

Mass media and hypermedia facilitate not only pre-school and school education, but also beyond school, parallel education. Children watch programmes intended for them as well as programmes for adults, which may be also valuable for young people such as nature documentaries or programmes related to human existence. Such content is not usually offered by schools. Interesting and attractive form of passing information makes the process of acquiring knowledge occasional and unintentional. It is television which provides (may provide) children with information concerning different areas, encourages young people to develop their interests and passions, delivers entertainment and various forms of relax, influences attitudes, shows the meaning of life, teaches understanding and love to other people as well as stimulates imagination. In this sense, TV offers a great variety of programmes (see: J. Gajda, 2005, p. 148).

IETC 2014

Educational programmes are broadcast through numerous specialised and popular digital TV channels such as Discovery Channel, Animal Planet, National Geographic Channel, Travel Channel and sports or religious channels. Thanks to its special features, television (similarly to other mass media and hypermedia) is able to influence all aspects of people's lives (T. Purayidathil, 1998). TV programmes with educational content help children develop their cognitive skills, provide young people with information, teach them pro-social behaviours, encourage them to act constructively, develop interests and hobbies, influence children's attitudes and opinions. Therefore, they may facilitate socialisation and upbringing processes.

The Polish system of education (new core curriculum) offers relatively new area of education – "computer classes" which also involve the use of multimedia programmes. As a result, parents more and more frequently buy their kids computers with multimedia software. They hope that computer hardware and software will increase learning effectiveness, guarantee educational success and additionally fill up children's time when parents are absent (compensation function). Computer programmes are used in schools for almost all subjects: to teach mathematics, languages or science, among other subjects. They potentially increase teaching effectiveness as well as children's and young people's life chances, including educational ones.

Selected threats or risks to socialisation and upbringing associated with the use of media by children and young people

Dominating and constantly extending media, multimedia and ICT aspects of child's life provoke pedagogical and social reflections. The questions arise: what is happening to the child in the world of electronic media, who the child is becoming, how can the child benefit from media, what kind of destructive changes occur in the child's personality, when the variety and diversity of media content becomes a new educational chance and when media pose a threat to the child. Pedagogists notice negative impact of mass media and hypermedia, particularly television, computer games and the Internet on upbringing. According to J. Gajda (2005, p. 144),

1. Mass media and hypermedia present reality in a biased way through projecting a false image of the world: they exaggerate social pathology by excessive display of violence e.g. rape or terror scenes, they also overuse sexual content, without deep social analysis or convincing examples of any ways to prevent negative issues.

2. They promote and strengthen consumerism, encourage materialistic values and popularize brilliant careers of people with no moral values. The notion of success is limited to wealth.

3. Media make us indifferent to numerous problems. What is more, they decrease cultural standards, the level of arts and cultural tastes, through promotion of dominating pop culture.

Projecting false sense of reality tends to be extremely dangerous (see: B. Matyjas, 2008). Pedagogists are concerned about the scenes of violence and cruelty which appear to be the most devastating to upbringing and education. Electronic media such as TV or the Internet rushed into the child's life and disorganised it by reducing the amount of time devoted to learning, reading and other duties or hobbies. This means that media threaten family life and family education. As pedagogists and educators, we would

IETC2014

like to identify some risks or threats that arise from the use of media and hypermedia by children and young people. Negative impact of media involves:

- disorganisation of everyday life; media affect daily routine tasks and free time activities;

- harmful effects on health, physical and psychological development;

- family disintegration;

- performing care, educational and socialisation functions as substitute for parents (B. Matyjas, 2008, p. 96).

M. Wawrzak-Chodaczek's (1997) research reveal that television often enters children's lives to perform educational functions, and even wins over peer groups and other institutions. Children's and young people's everyday life is strongly influenced by multi-hour, frequent and regular TV watching. The way TV content is passed to the viewers stops children from active and creative thinking. To make matters worse, it favours passive attitude, and mental laziness as well as decreases ability to think creatively. Watching violent TV programmes strengthens violent and aggressive behaviour in everyday life.

TV or internet commercial which does not include educational content may also have negative influence of children and young people. Children are uncritical, credulous, they cannot judge or assess the TV content they watch. These make young people easy to manipulate by commercial producers. Advertisement creates the standards of mass consumption rather than individual tastes. In such conditions it seems to be difficult for young people to create their own lifestyle. Advertisement appealing to children's needs which due to different reasons cannot be satisfied appears to be particularly dangerous. This causes frustration, aggression and often desire to possess advertised items (e.g. clothes, electronic equipment) whatever the cost.

Computer and the Internet pose also a threat to socialisation and upbringing. P. Aftab (2003, p. 84) identified the following threats or risks:

- children may find unsuitable content online (pornography, hate, violence, deception, false or exaggerated information);

- easy access to instructions e.g. how to buy a house, how to construct a bomb, how to take drugs etc.);

- children may become restless, they may be exposed to hurtful, vulgar content and threatened by hackers, virus senders or other cyber offenders;

- it is risky to disclose personal information (e.g. while taking part in online competitions or completing online forms);

- young people might be deceived while doing online shopping (e.g. when buying software, music files, pictures, games etc.);

- children may be unaware of online stranger danger when invited to meet a stranger face to face in reality;

- risk of becoming addicted to the Internet.

Among other media-related threats computer games played by a lot of children and young people should be mentioned. There are games full of cruelty and violence that promote hate or cybersex. Pedagogists emphasise the fact that children are seriously hurt online. Different types of cyber crime include: cyber paedophilia, cyber pornography, cyber sex, cyberbullying, grooming and cyberstalking. Pornographic online content strongly influences children because it is mispresented and distorted in order to reach higher popularity and powerful effect. Children sexual abuse by paedophiles can result in long-term harm

IETC 2014

also for the child's parents who feel guilty that they were not able to protect their kids. The younger a victim is, the more serious psychological and social disorders will he/she exhibit.

Children are particularly threatened by cyber pornography or cybersex, especially in the areas of cognition, emotions, motivation as well as morals, which may lead to inner conflicts, fears and finally to personality disintegration. Sex therapists claim that cybersex and cyber pornography (similarly to above mentioned cyber paedophilia) pose a serious threat to proper sexual development of teenagers. The powerful impact of online sexual content results from the fact that it is mispresented and distorted. It occurs through the impression that people seen or met online appear to be interesting and they enjoy high standard of living. These make them easy to identify with. Internet users seeking sexual experience online want to get in touch with people characterised by strong personality so that they could imitate their attitudes, patterns of behaviour, the ways they talk or even dress. They are very realistically presented in films or photos, and therefore Internet users get the impression that it is possible to copy them in the real world. (W. Kornas – Biela, 1998). However, we should remember that the film or story content does not make us to condemn the characters for their actions. It is very important that these characters do not suffer any consequences of their actions (e.g. becoming infected or disappointed by a relationship). On the contrary, sexual contact is presented only as a source of sensual pleasure, satisfaction and the sense of fulfilment as well as success in life. Therefore, all these can have long-term, cumulative and subconscious effects on the child's psychological development that will affect his imagination, interests and moral values. The impact of strong stimuli influence as well as the fact that Internet users remain anonymous may hinder taking up normal sex life in the future (Ł. Wojtasik, 2003). It is emphasised in pedagogical literature that lonely children who are looking for new or different experience as well as kids who have difficulties in making friends in the real world or face problems with personal identity, those who lack adults' interest and love and young people with problems at home become an attractive target for criminals.

Proper socialisation and upbringing tends to be also threatened from cyberbullying, which is intended to harm or harass other people. N. Willard (http://www.cyberbullying, 2014) mentioned the following examples of cyberbullying:

1) flaming,
2) harassment or electronic mobbing,
3) denigration,
4) impersonation,
5) outing and trickery,
6) exclusion
7) cyberstalking.

Cyberbullying may enter through Instant Messengers (IM), e-mail, text messages, social communication services, chat rooms, blogs, websites, bash boards and online games. In virtual reality bullying often occurs within groups of peers who are developing antisocial and aggressive behaviour. According to A. Andrzejewska (2009, p. 148), the most common types of cyberbullying include:

- hacking of e-mail accounts or chats;

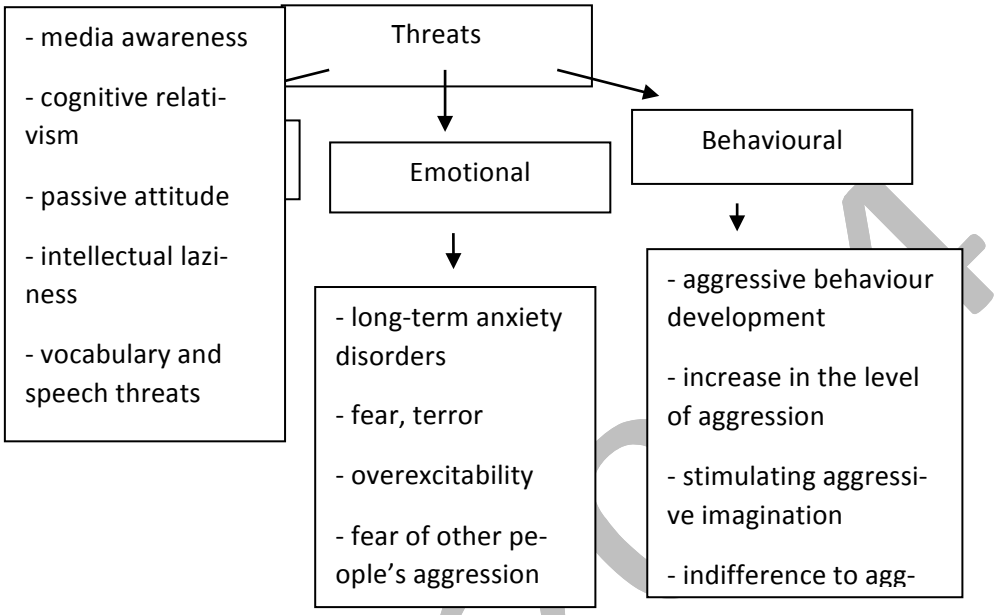
- creating humiliating websites;

- insulting and making a person the subject of ridicule in online forums;

- identity theft;

- blackmail and threats;

- mobile phone hacking and stealing personal information, addresses, text and multimedia messages' content which are then published or spread (e.g. at school) without the consent of the phone's owner.



Grooming and cyberstalking are other types of cyber crime which seriously threaten children's education. Child grooming is directly linked to cyber paedophilia, cyber pornography and cyber sex. Thanks to the Internet, sexual criminals are equipped with interactive communication technologies which help paedophiles achieve their goals. Sexual grooming is harmful and dangerous since the child is made to feel at fault or complicit in the abuse. This may result in neurotic reactions and premature sexual involve-

IETC 2014

ment which often leads to sexual obsessions. Cyberstalking, whereas, is the repeated use of electronic communications to harass or frighten other people. Children often become the victims of cyberstalking. The cyberstalker can be another child or someone motivated by revenge.

Online threats and risks may affect cognitive, emotional, behavioural aspects of children's and young people's development. J. Izdebska identified the following media-related threats:

Figure 2. Media-related threats to child development

Source: J. Izdebska, Dziecko w rodzinie u progu XXI wieku. Nowy wymiar dzieciństwa (in:) ed. H. Cudak „Roczniki Pedagogiki Rodziny" 2002, Vol. V, p. 77 quoted after: B. Matyjas, Dzieciństwo w kryzysie. Etiologia zjawiska, Wyd. Żak, Warszawa 2008, p. 97.

One of the computer and internet-related threats is netoholism (P. Forma 2009, p.31-38). Similarly to other disorders, Internet addition requires long-term therapy so as to "wean" children from spending a vast amount of time online.

J. Szafraniec (1997, p. 2-6) characterized the world of value presented in everyday media coverage and emphasized that this world does not reflect the rules, values and morals that should be commonly recognised and applied. On the contrary, it denies, distorts and ridicules the most important values through the content, images, attitudes and opinions presented in media. Value-illness, which results from living without values, is manifested by amorality, cynicism, helplessness or apathy and may lead to somatic disorders and illnesses. This "cool world" has negative impact on socialization and education processes which affect young generations of children and students. Therefore, young people should be educated how to use media and mass media properly as well as become aware of online threats and risks.

Media-based socialisation in education and upbringing

Generally speaking, socialisation refers to the influence of society on an individual which results in acquiring competencies to ensure full and effective participation in social life. (P. Forma, 2012, p. 25). Socialisation involves the process of influencing an individual by other members of the society. The influ-

ences occur in such socialisation and education environments as family (primary socialisation), pre-school and school institutions as well as mass media and hypermedia (secondary socialisation). The process of socialisation is determined by all above-mentioned environments characterised by interrelations of micro and macro worlds which influence children and young people's personality (J. Modrzewski, 2007, p. 121).

As mentioned above, media (mass media and hypermedia) are currently very important environment of socialisation, education and upbringing since they are present in children's and young people's everyday life. Unfortunately, they sometimes become dominant socialising environment when parents are pushed into the background. Hence, the term "shifted socialisation" emerges which denotes socialisation shifted from the family that is primary living environment and the source of traditional, relational and common upbringing to beyond-family environment such as media (e.g. television, the Internet). From pedagogical point of view, it is important that particularly parents, educators and teachers take under control the media and hypermedia-based influences which may bring both positive and negative results to children and young people. The diagnosis of media-related threats and risks, that is identifying and describing problems, should begin taking up preventive measures, such as media education intended not only for children and young people, but also for their parents and teachers. It seems to be essential to develop critical and discursive attitude towards media content. In our opinion it is one of the main tasks of modern education. Therefore, specialists should create emancipatory competencies for children, young people and other users of media concerning virtual world and media content. Media education ought to accompany an individual in their development so that a person becomes aware of media importance in everyday life. Media education involves the knowledge of relationships with media, associations of media with reality context as well as the awareness of the roles a person - an addressee of media content, takes in a sophisticated chain of communication (A. Cudowska, 2005, p. 181). Therefore, media education should be understood as pedagogical activity intended to develop a certain attitude, the way of thinking and acting in life, based on universal values. It is indispensable in the process of children socialisation (family, school) to develop media competence. In pedagogical literature parents may find useful guidelines concerning children safety in the Internet. They provide information that helps parents keep their kids safe online.

Conclusions

Modern life of children and young people is nowadays different from the life a dozen years ago. At present, a TV screen and a computer with Internet access tend to be important elements of life. Digitalisation of life occurs in all its aspects including education and upbringing as well as makes mass media and multimedia more influential than family. Media impact on young people, their personalities, attitudes, behaviours and opinions may be positive along with all educational, therapeutic or compensatory opportunities provided by media. On the other hand, media pose threats to intellectual, moral, emotional, physical and practical spheres of life. To prevent the above-mentioned threats media education addressed to parents, teachers, and primarily to children and young people should be introduced in order to develop media competencies as well as the awareness of opportunities and dangers that media pose to socialisation, education and upbringing.

Discovering Big Data Modelling for Educational World

Jyotsna Talreja Wassan *
Asstt. Professor., Maitreyi College,University of Delhi, New Delhi -21, India

Abstract

With the advancement in internet technology all over the world, the demand for online education is growing. Many educational institutions are offering various types of online courses and e-content. The analytical models from data mining and computer science heuristics help in analysis and visualization of data, predicting student performance, generating recommendations for students as well as teachers, providing feedback to students, identifying related courses, e-content and books, detecting undesirable student behaviours, developing course contents and in planning various other educational activities. Today many educational institutions are using data analytics for improving the services they provide. The data access patterns about students, logged and collected from online educational learning systems could be explored to find informative relationships in the educational world. But a major concern is that the data are exploding, as numbers of students and courses are increasing day by day all over the world. The usage of Big Data platforms and parallel programming models like MapReduce may accelerate the analysis of exploding educational data and computational pattern finding capability. The paper focuses on trial of educational modelling based on Big Data techniques.

Keywords: Big Data; NoSQL; Data Mining; MapReduce; Association Rule Mining,;MongoDB

1. Introduction

Today the horizon of education is expanding electronically. Various educational institutions are developing electronic learning modules, books, quizzes etc., to enhance understanding of concepts amongst students. They also provide assessment of students in systematic, real-time ways. Educational institutions are generating huge volumes of data, from grades or test scores to admissions or enrollment numbers while doing online evaluations and admissions respectively.

* Corresponding Author: Jyotsna Talreja Wassan Tel.: 011-26111102
** E-mail address:* jyotsna@maitreyi.ac.in, jyotsna.du@gmail.com

Futuristic approach emphasizes the scenario that many students will work on tablets or mini computers in educational e-classrooms, for example, in finding meaning of concepts from online repositories, generating assignments at a particular difficulty level that matches student's ability etc. Also the digital tools could help parents and teachers, understand student learning patterns, which is vital to educational attainment (Luján-Mora, S.,2006). Data mining and analytics software helps in identifying and applying pedagogic approaches to analyze large amounts of stored activity of students and teachers on the web server of an educational institution for visualizing and predicting student performance, generating recommendations for students, student modeling, developing courseware, planning and scheduling other activities (Bienkowski, M., Feng, M., Means, B., 2012). It may also provide feedback to students as well as to teachers about academic performance to support the scope for improvement (Nicol, D. & Macfarlane, D., 2006).

IETC 2014

But the online learning and educational modules are producing server activity that is reaching to terabytes. E-learning portals or online educational systems receive many hits in a month as numbers of students are increasing day by day. Standard analytical programs are slow to meet analysis requirements; as data requirements are exploding. Thus a need to use Big Data models has been realized to accelerate the analytical procedures. Today many NoSQL platforms like Hadoop, Cassandra, MongoDB etc. (Wassan, J.T., 2014) have emerged supporting MapReduce paradigm (Dean, J., Ghemawat, S., 2008). These provide a basis for a large number of parallel computations and analysis on educational data to extract relevant patterns. Educational institutions are gaining insights from approaches based on Big Data analytics tools, to make education better amongst heterogeneous large populations of student demographics**.**

2. Background

Online educational data help in analyzing student and teacher behaviors and generating recommendations for them. Many researchers have used the Social Networks Adapting Pedagogical Practice (SNAPP) to analyze student interactions based on educational forum postings (Bakharia, A., Heathcote, E., & Dawson, S., 2009). This software proved to be effective in benchmarking student progress and promoting activities of the pedagogical intent. Many educational institutions across the world; use eAdvisor system in which a learner can opt for courses under broad areas of study such as arts and humanities or sciences and engineering etc. The software identifies student's interest and sends them to an advisor for selecting a suitable course (Parry, M., 2012). A number of educational institutions have also developed dashboard software and data warehouses that allow them to track learning, performance, and behavioral issues for students (West, D.M., 2012). Since online education is in demand, it's useful to focus on approaches for analysis and visualization of large amount of educational data records.

3. Big Data in Education

With more and more online courses commencing at various websites such as Coursera, Udacity, etc. and with the increasing population of learners, vast amounts of data are getting generated. Many educational institutions are now providing more and more learning material online, giving rise to Big Data storage requirements. PSLC data-shop, one of the World's leading public repository for educational software interaction data; suggests that there is an approximate usage of more than 250,000 hours of students using educational software online with more than 30 million students' actions and annotations (Koedinger, K., Cunningham, K., Skogsholm A., & Leber, B., 2008). The Big Data is not just about huge data volumes; it's also about the diversity and heterogeneity of data, delivered at various speeds. Various online educational data sources deliver near real time data. Streams are the manifestations of the same. Educational data also are heterogeneous in terms of variety like videos, text, oral lectures, images, diagrams etc. Thus three V's: Volume; Variety and Velocity as depicted in Figure 1, have impacted the overall horizon of Big Data in education (Russom, P. , 2011).Two new V's: Veracity and Value have been added in today's Big Data world (Marr, B. , Feb 2014). It is good to access Big Data but is useful if it could be turned into value. The volumes often lead to lack of accuracy, trustworthiness and quality. Thus, it is important to add the feature of veracity to Big Data exploration for educational mining. The exploration of Big Data is beneficial for studying social, cognitive and emotional aspects w.r.t to both learners and the instructor, and supporting them in real-time. It is desirable to develop a model from which one can infer valuable aspects (like whether student will pass or fail the course), from data with some combination of variables already existing in the data. Various learning analytics methods are emerging for Big Data in education to improve the educational system and soft wares.

IECT 2014

Big Data platforms focus primarily on i) data storage that is schema-less and highly scalable, and ii) data analytics that deals with management, processing and distribution of data. Various NoSQL data stores like Hadoop, MongoDB, and Cassandra etc. are emerging to **acquire, manage, store and query** Big Data**.**

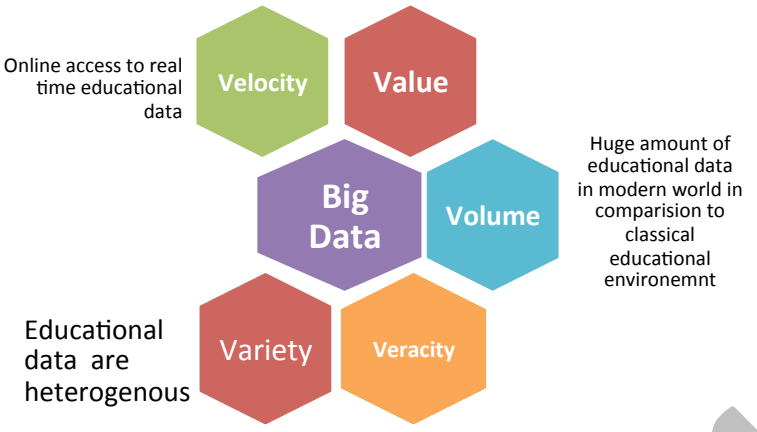

Fig1. V's of Big Data

3.1 Data Storage: Database supporting Big Data

NoSQL databases are inherently schema-less and highly scalable. These databases support frameworks like MapReduce, Dryad etc. for processing of large amounts of data in parallel fashion. The Map-Reduce framework deals with data mapped on distributed file systems, with intermediate data being stored on local disks and can be retrieved remotely by reducers. Google's proprietary MapReduce paradigm reads and writes to the Google File System i.e. GFS. But recently certain platforms like MongoDB, Apache Hadoop HDFS, Hive, Big Table, and HBASE etc. have emerged to store large amounts of data. (Russom, P., 2011, http://nosql-database.org). This section will discuss "MongoDB" that may prove useful for storing educational data.

MongoDB (from "hu**mongo**us") is a NoSQL, open source document-oriented database system developed by 10Gen Company. MongoDB stores structured data as JSON-like heterogeneous documents with dynamic schemas. MongoDB scales horizontally through sharding. It also has a functionality of querying database. MongoDB is suitable for storing educational data due to its scalability and flexibility in structural format for storage. The platform is useful for content management and delivery and is attractive due to features listed in Table 1 (Chodorow, K., 2013 & http://www.mongodb.org/).

Table1. Features of MongoDB

S.No.	Features
1	Data are stored in the form of JSON style documents and uses simplified Java Script engine.
2	It supports GridFS for storing data.
3	MongoDB is document database in which one collection (i.e. data store) can hold variety of documents. Number of fields, content and size of the document can be different from one document to another.
4	Conversion of application objects to structural format of database objects not needed.
5	No complex joins, as in traditional database systems.
6	MongoDB supports dynamic queries on documents using a document-based query language.
7	MongoDB is easy to scale.
8	Uses internal memory for storing the (windowed) working set, enabling faster access of data.

IETC 2014

9	Index on any attribute could be made and fast In-Place Updates on data.
10	It supports Replication, Sharding & High Availability

JSON objects are passed to MongoDB for storage. For example student profiling could be passed as a JSON to Mongo server from a mongo client with just a simple interface command for inserting. MongoDB supports basic CRUD (create, read, update, delete) operations on documents subject to a maximum of 16MB size (Chodorow, K., 2013, http://www.mongodb.org/).The JSON objects are exemplified as follows that store students and department information.

Student A =

{ "Student_id": "12356"

"Deptid": "DA1"

"Name": "John",

"Age": 18,

"Contact": [

"Address": "105, Park Street, LA venue, Mumbai, India."

"Email": "w_john@gmail.com"

"Telephone no": "091-98760569346"] ,

"Courses Opted": ["Programming in C++", "Machine Learning",

"Data Structures", "Computer Networks"],

"Tests Scores": [20, 80, 70, 10]}

Student B =
{ "Student_id": "12357"

"Deptid": "DA1"

"Name": "Mary",

"Courses Opted": ["Programming in C++", "Machine Learning", "Data Structures"],

"Extra Activities": ["short term course on Web Designing"],

"Tests Scores": [40, 80]

}

Department=

{ "Did": "DA1"

"Name": "Computer Science",

"University": "University of Delhi"}

To create the database for storing the above profiles, it's needed to give following commands on the Mongo Client.

db.studentrecord.save (Student_A);

db.studentrecord.save (Student_B);

db.studentrecord.save (Department);

The above sample java script objects reflect that MongoDB has the flexibility with storing documents and thus have dynamic schemas. Documents are not needed to have the same number of fields and the same basic structure. This helps in aggregating and storing student information in dynamic form enhancing portability and accountability. The CRUD operations on data stored in Mongo database can be performed easily. They are comparable to traditional SQL formats and are illustrated in Table2.

Table2. CRUD Operations in MongoDB

IETC 2014

Traditional SQL's in Relational World	**MongoDB CRUD Queries in NoSQL world**
CREATE TABLE STUDENT (Name String, age Number, Department_id Number, Score Number) CREATE TABLE DEPARTMENT(Id Number, Department_ Name String); INSERT INTO STUDENT VALUES("John",19,D105,90); INSERT INTO DEPARTEMENT VALUES(D105,"Computer Science") Schema Design for RDBMS student= { id: 100, Name: 'John' age: 19 Department_id: 105} Department = {Id: 105, Department_Name: 'Computer Science'}	db.createCollection(" student") Schema Design for MongoDB student = { Name: 'John', age: 19, Department: [Id:D105 name: 'Computer Science'], Score:90} db.student_entry.save(student) * MongoDB supports Embedded Objects unlike RDBMS and hence there is no need of join queries.
INSERT INTO STUDENT VALUES("Joy",18,D106,60); INSERT INTO DEPARTMENT VALUES(106,"Mathematics")	db.student.insert({'Name':"Joy",'age':18,{Department: ['Id':D106, 'Name': 'Mathematics']},Score:60);
SELECT * FROM STUDENT	db.student.find()
SELECT * FROM STUDENT WHERE Score>70AND Score<=90	db.student.find({'Score':{$gt:70,$lte:90}})
SELECT * FROM STUDENT ORDER BY Name DESC	db.student.find().sort({Name:-1})
SELECT COUNT(*) FROM STUDENT	db.student.count()
UPDATE STUDENT SET age=18 WHERE Name='John'	db.student.update({Name :'John'}, {$set:{age:18}}, false, true)
DELETE FROM STUDENT WHERE Name ="abc"	db.student.remove({Name :'abc'});

3.2 Data Analytics: MapReduce Modelling Supporting Big Data

MapReduce is a programming model used for processing large data sets with a parallel and distributed algorithm supporting simple computations in the form of Map () and Reduce () operations (Dean, J., Ghemawat, S., 2004). This hides messy complexities of parallelization, data distribution, load balancing, and fault-tolerance w.r.t to Big Data. The input to the model is a set of key/value pairs (Dean, J., & Ghemawat, S., 2008).

Map (k, v) → emit (k1, v1)

Reduce (k1, list (v1)) → v2 where (k1, v1) is an intermediate key/value pair. The output is the set of (k1, v2) pairs.

The key idea behind Map Reduce is to split the problem into a set of smaller problems that perform the same operations on a subset of the data in parallel (Map phase) and subsequently solutions from multiple Map phases are synthesized to get final results (Reduce Phase) , as depicted in Figure 2 (Dean, J., & Ghemawat, S., 2008).

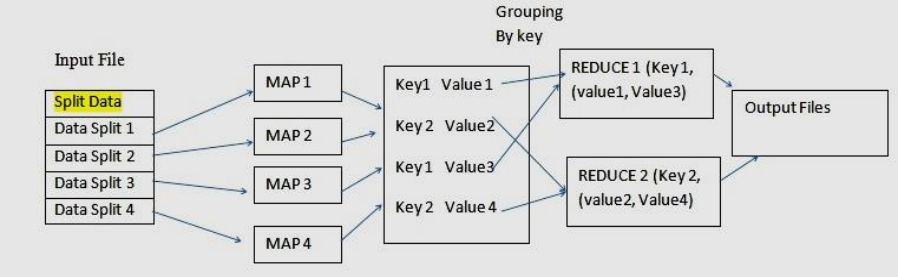

Fig2. Illustration of Map Reduce

MongoDB provides the mapReduce database command for MapReduce operations (Chodorow, K., 2013, http://www.mongodb.org/). mapReduce command takes two primary input functions, the mapper function and the reducer function. A Mapper reads the input data and tries to build a Map with required fields of interest and group them into one array based on the key. And then this key value pair is fed to a Reducer, which processes the values. The concept is illustrated with the help of an example discussed below.

Example: To count the number of students enrolled in each course (Mensuration, Calculus, Geometry, English, Physics, and Chemistry).

Mapper:
It emits a new key value pair for each course of a student with a count of 1 maintained for each student.

```
var mapper = function () {for (var i in this.course) {
      emit (this.course[i], 1);} }
```

Reducer:
It maintains a count of values for each course.

```
var  reducer = function (key, values) {
   var count = 0;
   for (index in values) { count += values [index];}
return count; };
```

Mapper and Reducer were run on simulated data stored in a collection "student_data.find ()" in MongoDB.

> db.student_data.find() #Sample Transactions

{"_id": ObjectId("53d8b432f27288795fec3f47"), "Stud_Tran_ID": 1, "Courses Opted": ["Mensuration", "Calculus", "Physics", "English"]}

{"_id": ObjectId("53d8b432f27288795fec3f48"), "Stud_Tran_ID": 2, "Courses Opted": ["Geometry", " Mensuration", "Chemistry", "English"]}

{"_id": ObjectId("53d8b432f27288795fec3f49"), "Stud_Tran_ID": 3, "Courses Opted": ["Geometry", " Mensuration", "Calculus"]}…… upto 10000 records

> db.student_data.mapReduce (mapper, reducer,{out: "result_student_data" });

The following results were displayed on running the simulation of mapReduce command over the sample database on a single node.

```
{  "result" : "result_student_data",
    "timeMillis" : 701,
    "counts" : {
        "input" : 10000,
        "emit" : 36679,
        "reduce" : 600,
        "output" : 6w },
    "ok" : 1,}
```

```
> db.result_student_data.find()
{"_id": "Calculus", "value": 6661}
{"_id": "Chemistry", "value": 3339}
{"_id": "English", "value": 6679}
{"_id": "Geometry", "value": 6660}
{"_id": "Mensuration", "value": 10000}
{"_id": "Physics", "value": 3340}
```

This reflects course on Mensuration is most popular amongst students and may be recommended to new users.

Mongo DB also supports aggregation pipeline is a framework for data processing. Documents may enter a multi-stage pipeline that transforms the documents into aggregated results. The aggregation pipeline provides an alternative to map-reduce in complex operations (Chodorow, K., 2013, http://www.mongodb.org/).

4. Data Analytics in Education

In recent years, there has been increasing focus on the use of data analytics to investigate scientific questions within educational domain research, termed as Educational Data Mining (also referred to as "EDM"/ "LA" i.e. Learning Analytics)(Bhullar, M. S., & Kaur, A. ,2012). EDM helps us to better understand students and their learning behaviors (Kulkarni, S., Rampure, G., Yadav, B., 2012). There are wide varieties of current methods popular within educational data mining like prediction/classification, clustering, association mining, and discovery with models etc. (Baker, R. S. J. d, 2011, C. Romero, S. Ventura, 2010).

Association Rule Mining (ARM) is a well-researched field based on relationship mining that helps to uncover hidden or previously unknown connections. A rule in the form of X=>Y denotes an implication of element Y by an element X i.e. how two items (X and Y) are co-related with each other. *Association rule mining* is useful for educational data also (C. Romero, S. Ventura, 2010,). This usually tries to find simple if-then rules in educational data set for formulating hypothesis to study further. The few sample rules are listed as follows:

- "Students learning activity is low" => "Students grades and performance is not so good."
- "Students who perform poorly in exams => "Fail the course"
- "Students who took a course" => "Took prerequisites for the course"
- "Teacher is putting good efforts" => "He/she will be promoted soon"

The goal of ARM modelling is to determine frequent item sets. The interestingness of each finding is assessed and used to reduce the set of rules and correlations causal relationships communicated to the data miner for analytics. In very large data sets, hundreds of thousands of significant relationships may be found.

IETC 2014

Interestingness measures like Support, Confidence, etc. (Agrawal, R., Imieliński, T., & Swami, A , 1993) may try to determine which findings are the most distinctive, useful and well-supported by the data, but we need supporting Big Data technologies to deal with large amounts of data that are increasing by leaps and bounds. The use of Big Data paradigms like MapReduce can greatly reduce the processing time with parallelization of tasks.

4.1 Map Reduce Paradigm for Association Rule Mining

The associated items can be paired with MapReduce (Moturi, C. A., & Maiyo, S. K., 2012) approach to find frequent item sets from Big Data sets. The proposed MapReduce functions are listed as follows.

Map Function

Map (key= educational data log file, value=courses offered)

{ for each line=itemno_1… itemno_n in courses offered

for (i=1; i<n; i++)

for (j=i+1; j<=n; j++)

Emit (<itemno_i, itemno_j>, 1)}

Reduce Function

Reduce (key= <itemno_i, itemno_j>, value = counts)

{ Total=0

for each count in counts

Total += count

If (total >= threshold [i.e. min value for interestingness measure]) Emit (total)}

The sample step wise simulation of MapReduce approach using a sample transactional set is discussed as follows. This simulation is to give an idea how the proposed modelling of ARM using Map Reduce will work when replicated in large datasets environment.

1. Courses Accessed Online recorded in sample transactional logs.
   t1: Geometry, Calculus, Mensuration

   t2: Geometry, English

   t3: English, Physics

   t4: Geometry, Calculus, English

   t5: Geometry, Calculus, Chemistry, English, Mensuration

   t6: Calculus, Chemistry, Mensuration

   t7: Calculus, Mensuration, Chemistry
2. Logged data are distributed to Mappers.
3. Pair of Items is structured in each Mapper
   t1 :< (Geometry, Calculus), (Mensuration, Calculus), (Geometry, Mensuration)>

   t2 :< (Geometry, English)>

   t3 :< (English, Physics)>

   t4 :< (Geometry, Calculus), (English Calculus), (Geometry, English)>……and so on
4. Data Aggregation/ Intermediate Step is performed
   (Key, <value>): (pair of items, list number of occurrences)

   ((Geometry, Calculus), <1, 1, 1>)

   ((Mensuration, Calculus), <1, 1, 1, 1>)

   ((Geometry, English), <1, 1>)…and so on

IETC 2014

5. Reducers will sum up the total number of occurrences.
   (Key, value): (pair of items, total number of occurrences)

((Geometry, Calculus), 3), ((Mensuration, Calculus), 4), (Geometry, English), 2) and so on

The number of occurrences of each course could be used to infer recommendations for the new students

Chapter 3 5. Conclusion and Future Proposal

The field of education is gaining insight from large volumes and variety of real time data known as *Big Data*. Educational institutions are generating huge volumes of data, from grades or test scores to admissions or enrolment numbers. With the advent of online courses offered by many universities, the amount of data available to educational officials and students has exploded. Various data mining approaches and analytical soft wares help in identifying relevant pedagogic approaches. The Big Data paradigms are needed in today's world to support data mining approaches for increasing the efficacy of educational institutions. The usage of MongoDB platform for data storage and MapReduce paradigm for analysing educational data is proposed in this paper. In future the usage of various Big Data platforms like Hadoop, MongoDB, Cassandra etc. and parallel programming models like Hadoop MapReduce, PACT etc., for various data analytics techniques could be explored to accelerate the analysis of educational data. This will help in building scalable models in the field of education and may provide a better scope of improvement in the field of educational analytics.

Acknowledgements

I dedicate my acknowledgment of gratitude towards the online course on *Big Data in Education* by Coursera held from Oct 2013 to Dec 2013. It was a free online class taught by Ryan Baker of Columbia University.

Distance education accounting students' perceptions of social media integration

Annelien van Rooyen32
University of South Africa, College of Accounting Sciences, Pretoria, 0003, South Africa

Abstract

Online student support is frequently used by distance education institutions worldwide, but in South Africa it remains a challenge to educators as not all students have access or can afford using the internet regularly. However, as most students at the University of South Africa (Unisa), a distance education institution, have mobile phones, opportunities emerge for academics to make use of social media. Accounting lecturers incorporated a number of social media applications into a second-year module and on the basis of the evidence provided it is evident that using social media can enhance the teaching and learning of Accounting.

Keywords: Accounting; BBM; distance education; Facebook; Holmberg's theory; MXit; social media; South Africa; student perceptions; Whatsapp

IETC 2014

1. Introduction

There is a crying need for professional accountants in South Africa. This has been confirmed in a study commissioned by the South African Institute of Chartered Accountants (SAICA) in 2008 who then estimated that South Africa was short of 17 000 accountants and 5 000 chartered accountants (CAs) (Enslin-Payne, 2011; Innocenti, 2009; PricewaterhouseCoopers, 2012). A CA candidate can qualify within seven years, but this is not the norm in South Africa as on average only one out of five students who start will successfully pass through university within the allotted timeframe (Van der Post, 2010). This results in an annual growth in the CA profession of only around 5% (Bates & Poole, 2003; Bates, 2005; Bean & Eaton, 2000:48; Enslin-Payne, 2011) which will definitely not ease the shortage soon.

Before a CA candidate can write SAICA's qualifying examination (QE) in South Africa, the candidate must obtain a BCom Accounting (CA stream) degree and pass a Certificate in Theory of Accounting (CTA) postgraduate qualification at an accredited university (Van der Post, 2010). These undergraduate and postgraduate qualifications are offered by most residential universities as well as the University of South Africa (Unisa), the largest distance education (DE) and open distance learning (ODL) institution in the country (University of South Africa, 2013). Although Unisa has been offering its undergraduate BCompt degree (the required BCom Accounting degree for the CA stream) and the CTA postgraduate qualification for many years, the number of Unisa students passing the QE examination has been low (2009–37.8%) when compared to residential universities (2009–62.2%) (Olivier & Bulman, 2009). There is thus an urgent need

* Corresponding author. Tel.: +27-12-4294539; fax: +27-12-4298109.
E-mail address: vrooyaa@unisa.ac.za

to increase the success rate of both the BCompt and the CTA postgraduate DE students at Unisa as this will inevitably help to alleviate the shortage of accountants and CAs in South Africa.

Research by a variety of scholars in the DE and ODL fields have established that students' success depends not only on the quality of the learning package, but also on the quality and scope of support given to these students (Bates, 2005; Birch & Volkov, 2007:291; Garrison & Vaughan, 2008; Simonson, Smaldino, Albright & Zvacek, 2012; Simpson, 2008:159; Waddoups & Howell, 2002:1). An important theory which focuses on students' support and success is Holmberg's theory of didactic conversation (Saba, 2003:4). Holmberg is of the opinion that if facilitators practice an empathetic approach in DE, their students' learning outcomes will improve (Bernath & Vidal, 2007:432; Simonson et al., 2012:48). Holmberg further argues that communication within a natural conversation can be understood and remembered easily and that the concept of conversation can be successfully translated for use by media and made available to DE students (Holmberg, 2003; Simonson et al., 2012). Holmberg's theory further states that this feeling of connectedness tends to promote study pleasure and motivation, particularly if well-developed instructional materials exist and two-way communication supports study (Holmberg, 2003; Simonson et al., 2012).

Two-way conversation is indeed necessary in the field of accounting studies, as students often struggle to understand different concepts and calculations. Although the use of computers and the internet have given DE a new dimension, this is not always the case in South Africa as many of the registered students at Unisa come from historically disadvantaged backgrounds and live in remote areas which have poor infrastructure and lack sustained electricity supply. Research conducted in the past confirmed that not all the students in a second-year Accounting course (FAC2602) have access to computers and to the internet (Prinsloo & Van Rooyen, 2007:59). If the FAC2602 lecturers thus want to increase communication between lecturers and students, they have to consider making use of a technology to which almost all students have access and which they can afford. As previous research indicated that most students have a mobile phone (Van Rooyen, 2010:47), the FAC2602 lecturers decided to make use of mobile phones and social media application software (apps) such as Facebook, Twitter, Blackberry Messaging (BBM), Whatsapp and MXit to assist students. The FAC2602 students registered during the first semester of 2012 were invited to make use of the apps to ask the lecturers questions and to communicate with other students via these platforms. This research project explored the possibilities of assisting these students in a more synchronous manner. Students were able to discuss problems with their lecturers during the day, at night and over weekends via these social media apps. Students also formed study groups and regularly communicated with other students on the same module. Limited research has been conducted on the use if social media to enhance student support through deductive conversation in the field of accounting education and more particularly in South Africa. The research project reported in this paper was part of a case study examining the impact of technologies on Accounting students' retention and success rate at Unisa. Obtaining both quantitative and qualitative data from students, this paper reports on Accounting students' perceptions on the possibilities of using social media apps to support them with their studies.

2. Research design and method

As explained previously, during the first semester of 2012, social media was introduced in the FAC2602 module to assist students with their studies. At the end of the first semester of 2012, these students were asked to provide feedback regarding their perceptions and experiences on the possibilities of using social media to assist with teaching and learning.

2.1. Research design

As part of a case study, this project used a mixed-method design which combined both qualitative and quantitative approaches for data collection and analysis. An online LimeSurvey questionnaire (LimeSurvey, 2014) with both closed and open ended questions was designed and the link to the questionnaire was send to all students registered for the FAC2602 module. In addition to a few demographic questions, the students were asked to give feedback on the following five questions:

IETC2014

a. With regard to the use of different technologies in the FAC2602 module, with which one of the following statements do you agree?

- I would prefer to study without technology interventions.
- I would prefer fewer technology interventions in the module.
- I would prefer the use of technology as is currently the case.
- I would prefer the use of more technologies in the module.

b. What are your perceptions with regard to the use of technologies in the FAC2602 module?
c. With regard to the use of technologies in a Unisa module, with which one of the following do you agree?

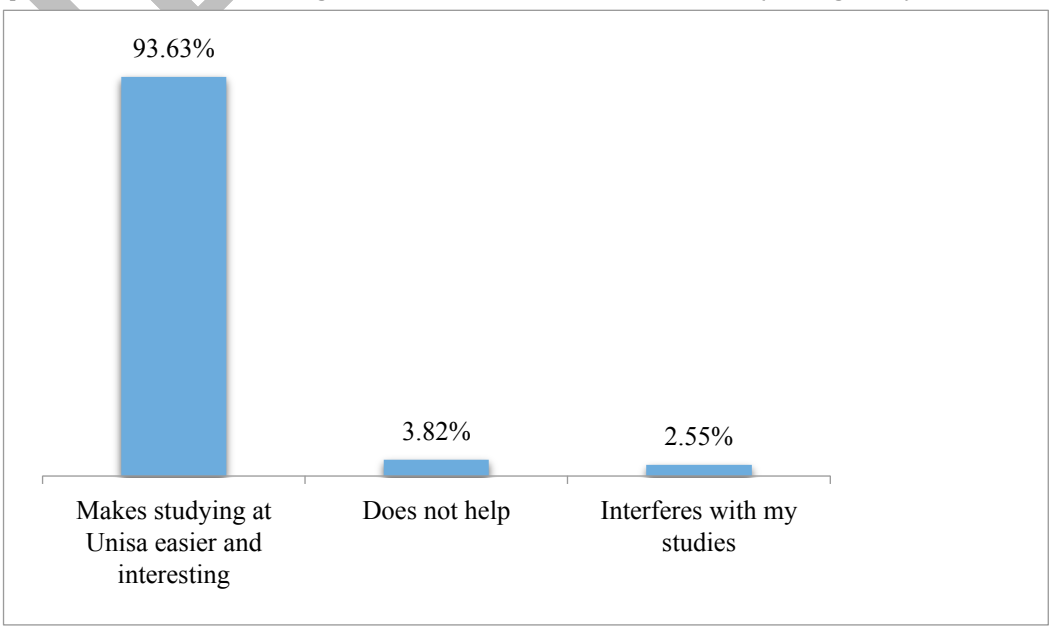
- I think the use of technologies makes studying at Unisa easier and more interesting.
- I do not think the use of technologies in Unisa modules is helping me.
- I think the use of technologies interferes with my studies.

d. What would you change with regard the use of technologies at Unisa?
e. What are your perceptions on the use of social media (Facebook, Twitter, BBM, Whatsapp, MXit etc) in academic support?

2.2 Participants

The participants in the study were the second-year Accounting students registered in die first semester of 2012. The link to the questionnaire was made available to students between 2 June 2012 and 6 August 2012. A total of 2 121 students were registered for the FAC2602 module during the first semester of 2012; 155 students completed the questionnaire which represents 7.3% of the registered students during that semester. Although this was a small percentage, the data obtained assisted the lecturers to plan future student support strategies.

2.3 Data analysis



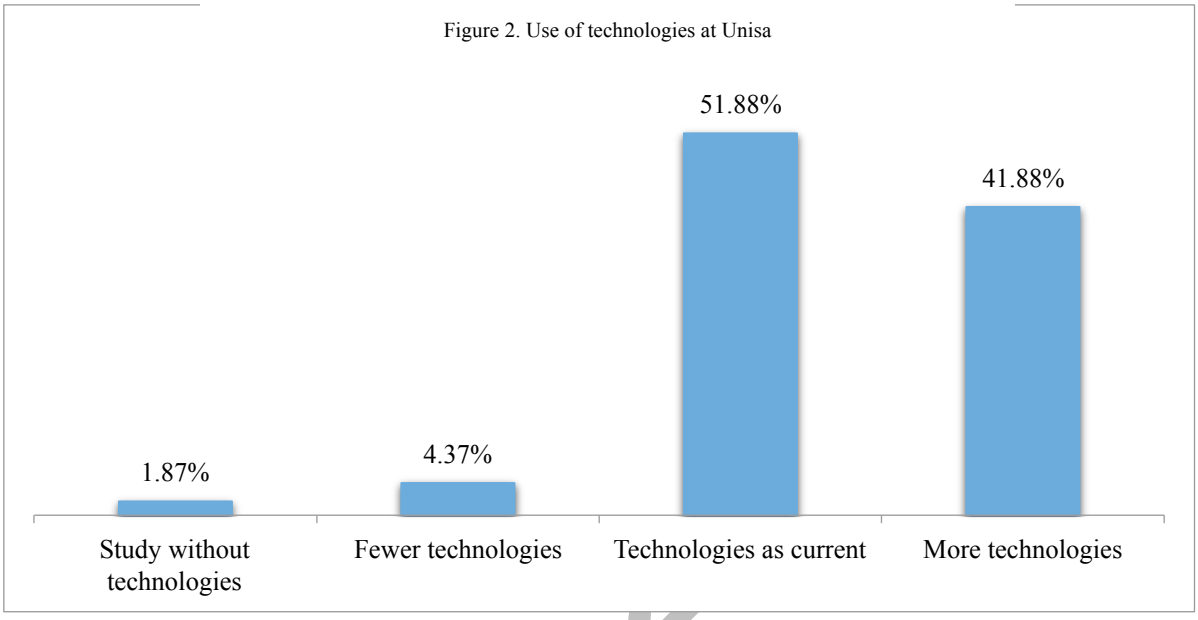
The quantitative data were analysed using SPSS Statistics version 21 and the three open-ended questions using Atlas.ti®. All data are reported anonymously, the extracts are direct quotes and grammar, punctuation and spelling errors have not been corrected.

3. Findings

Both quantitative and qualitative data were received from the FAC2602 students and are discussed below.

3.1. Results and discussion of the quantitative data

Feedback from the first question regarding the use of technologies in the FAC2602 indicated a large number of participants in favour of the use of technologies in the module. The fact that almost 94% of the participants supported the use of technologies in the FAC2602 module, created opportunities for lecturers to incorporate even more technologies into the module to assist students (See Figure 1).



IETC 2014

Figure 1. Use of technologies in the FAC2602 module

Subsequently, the participants were asked to indicate the effect the use of technologies had on their studies at Unisa. Once again a large number of participants (93.63%) said it made studying at Unisa easier and more interesting (See Figure 2).

Figure 2. Use of technologies at Unisa

IETC

3.2 Results and discussion of the qualitative data

The results from the open-ended questions are briefly presented here according to three main themes that emerged:

- Perceptions on the use of technologies in the FAC2602 module
- Perceptions on the use of social media for academic support at Unisa
- Possible changes regarding the current use of technologies at Unisa

It was evident from the feedback that most of the participants perceived the current use of technologies in the FAC2602 module positively. Many of the participants emphasised the greater access they have to study materials, as may be seen in the following responses:

The use of technologies in the FAC2602 module was very helpful and something I would like to see more of. It created greater access to more study material and tools.

as well as

It is helpful. Not everyone has access to all technologies. Therefore it is good to try and accommodate all technologies so that you can have access to those you do can use.

Some of the participants confirmed the problems they often encounter with online technologies but by using mobile technologies they could overcome some of these problems, for example

As a full time working student, I do not always have access to my e-mails, but with the mobile technologies, it was much easier, as I believe that 95% of all students have cell phones, so it is much more accessible.

and

Problems are solved anywhere and anytime students don't have to go home or cafe to access computers and internet.

Participants were of the opinion that students enjoy the use of social media, as expressed by one participant *Students always got smile when they get messages from their social media, this reduces the frustration and emotional tension not to able to access information as required .*

and others praised the incorporation of mobile technologies in the following manner

The world is fast becoming all online and it is enterprising of UNISA to try adapting and keeping up by making use of mobile technologies and social networks and cell phones, and I am sure many students appreciate this.

as they perceive this way of communication being effective at Unisa as is evident in

Mobile technologies are an excellent form of communication, as almost every UNISA students has a cell phone and it brings the students at different places.

On the other hand, there were also some negative comments from participants regarding the current use of technologies, as seen in the following responses:

using a mobile phone is not my preference to communicate with the lecturer or other student.

as well as

IECT 2014

Those would interrupt my studies. You can not seriously expect me to follow FAC2602 on twitter. Sorry I do not agree with that. Social media and studies do not go together.

Concerns regarding connectivity and access were once again emphasised, as one participant mentioned

internet and cell phone connectivity may not be available in the more rural area.

and another said

As much as the facilities are there on the FAC2602 but I do not have access to some always.

However, perceptions obtained from the participants regarding the use of social media for academic support at Unisa were generally positive, as may be seen from the following responses:

It is beneficial because the technology is within reach and can be accessed at any time.

and

Easier and cheaper form of communication and fast access. Much preferred.

Many of the participants also highlighted the fact that they use some of the social media apps already and are thus familiar with the apps, for example

I like it, especially BBM and Whatsapp, because I got access on them.

and

I found BBM very useful, and also found the group to be inspiring and supportive.

as well as

It is a great idea as some of us use it and some are cheaper most students can afford them. I Prefer BBM, Twitter and Whatsapp.

Participants were of the opinion that mobile technology can play an important role, as some of the participants emphasised

Well the use of mobile technologies is the way to go, because student and/or employees are working off their blackberries, ipads, smartphones.etc but what about the students who don't have access to these technologies.

and

I also think that more students have access to MXit, Facebook, etc. via their mobile phones than they have to a computer with internet connection, which also makes it a better form of communication.

and also

Mobile technologies are an excellent form of communication, as almost every UNISA students has a cell phone and it brings the students at different places.

IETC 2014

Once again some of the feedback reflected a less enthusiastic view on the possibilities of using social media for academic support, as some were saying

I hate chatting apps, especially blackberry, I do have Facebook but I hardly log on.

as well as

Some are a waste of time, I only use Whatsapp to communicate with my family and colleagues and the few close friend I have.

and

None - I am not on Facebook, Twitter etc. AND I do not want to be on it.

Regarding the changes participants would recommend on the use of technologies at Unisa, the following are ideas received from the participants:

I won't really change anything, and UNISA can certainly use technology to communicate with students as much as they can, just don't take away our good old fashioned hard copy study material!!!!

and

Great potential. Lecturers who can be actively (on a daily basis) be involved on something like a Facebook page for the module can build a relationship with the students in the same way public questions in a classroom situation can be addressed. Great potential there. Also build a student community feeling.

Some of the participants also want other modules to make use of these apps, as was seen in the following responses:

Facebook page per module will be useful. Students can have conversations on the page's wall post suggestions in the same way as the myUnisa forums, just with better usability.

and

I think it is a wonderful idea and definitely think the other modules should consider doing this as wel.

as well as

I would recommend the use of technologies in other modules, because it makes it easier, for student to stay encouraged and abreast with the module and schedule.

Three of the participants almost summarised the whole project by saying

Most of students almost all do have the mobile and social media you have mentioned so it for their convenience to have good quality of communication and clear contact with their lecturer. Whatsapp and Facebook are good two-way of communication, but not all students might have access to Whatsapp because certain type of cell phones can accept Whatsapp.

IETC 2014

and

Because most students have social media, and with Unisa being a distance learning institution; mobile technology plays an important role that serves a link between the lecturer and student. Firstly it's cheaper to write a message/comment/questions/clarity regarding the module, and the lecturer can then answer/advise, thus making it an interactive session.

and finally

Most students are more familiar with MXit, Whatsapp, etc., than with email - I think they also feel more comfortable using this type of media to communicate, which will give them the confidence to speak up if they struggle with a concept. I also think that more students have access to MXit, Facebook, etc. via their mobile phones than they have to a computer with internet connection, which also makes it a better form of communication.

4. Conclusion

In general, feedback received from the participants were positive regarding the possibilities of using technologies and more specific social media for academic support at Unisa. The fact that Accounting modules at Unisa need to increase students' success rates and the possibilities these social media apps now provide to lecturers, make this indeed an opportunity to explore more rigorously. These readily available and affordably technologies have the capability to increase didactic conversation, which is a critical ingredient for student success in the DE and ODL environment. Technologies are fast becoming a part of the instructional process and although the use of social media for academic support has only just begun, it can be a valuable tool as can be seen by the response of a participant who said *I have not used social media for academic support but I believe there is a place for it seeing that social media is part of our everyday life.* Therefore lecturers need to remind themselves that students are, as a participant correctly stated, *part of a generation that mostly communicates via mobile technologies.* Social media can indeed assist Accounting lecturers at Unisa to answer to the cry for more professional Accountants in South Africa.

Distance Education Applications and E- Learning The Viewpoint of Students for E- Learning in Turkey

Mihalis Kuyucu [a] [33]
[a] *Assist.Prof. İstanbul Aydın University , Turkey*

Abstract

Internet has changed all the World. Music industry has been transformed to mp3s from records. Video has gone to streaming on line instead of VHS. The specifications of web 2, 0 did not change only media but also the structure of all industries. One of these industries that had a big effect from internet technologies is education. Internet brought a new outlook to education. The 'new distance' of 'distance education' have killed all the 'distance' between the education institutions and learner. Distance education which had started with letters is now done with networks. These new networks created the steps of E- learning which brought speed, interaction and borderless specifications to education. E- Learning brings new opportunities to education. The learner is now out of the building. Everywhere and every time is possible for education with e – learning. The aim of this paper is to make a determination for the views of Turkish young learners for e-learning. In the first part of the paper there is a conceptual and historical explanation of distance education and the role of e-learning as a new subhead tool of distance education. The paper makes a research with a questioner applied to university and high school students about e-learning. The questioner aims to find out the view of learners for e-learning. In the conclusion of the paper there is a brief underline that internet is changing the demand of education as well as other industries. The learners believes that e-learning brings them freedom and better opportunities for learning in their education life.

Peer-review under responsibility of the Sakarya University

Keyword: New Media, Distance Education, E- Learning

IETC 2014

1. Introduction

The increased importance of knowledge in today's world caused a dramatic increase in the need for education. The inability of traditional educational institutions to meet this increased demand created the education deficit. This need led societies to seek alternatives to traditional education. Distance education has started to fulfill this need. While distance education was delivered through different means of communication such as mail, telegram, telex, radio and television in the past, today, it is usually offered via Internet. Developments in the Internet technologies contributed to the emergence of e-learning concept as a form of distance education. The developments in the Web 2.0 technologies, which made it easier to share audio and videos, gave rise to the multimedia-based e-learning. The developments in the Internet technologies have added a new dimension to education. With e-learning, the need for specific locations disap-

* *E-mail address:* michael@michaelshow.net , michaelkuyucu@gmail.com

peared and the limited education format between the student and the educational institution gave its place to an interactive education that continues 24/7.

2. The Concept of Distance Education

Distance education is defined as an economical and interactive form of education in which information technologies are used and which is independent from time and space (Gökçe, 2008: 2). İşman (1998: 18) explained the concept of distant education as a system of education in which students and teachers conduct the activities of learning and teaching through communication technologies and postal services. The U.S. Department of Education's Office of Educational Research and Improvement defines distance education as "the application of telecommunications and electronic devices which enable students and learners to receive instruction that originates from some distant location." (Çakmak, 2013: 264). According to another definition, distance education is a planned educational process in which the teaching is conducted by someone removed in space and/or time from the learner and which is achieved by bridging the physical distance between student and teacher by means of technology in a virtual classroom (Ertuğrul, 1999: 7).

As it can be seen from the definitions above, the fundamental characteristic of distance education is the separation of the teacher and learner. Most often, separation is in geographic terms—teachers are in one location and students are in another. Also the separation of teachers and students is in time. Other components of distance education are that; different communication technologies are used, equivalent learning experiences are provided to each student and it is an education system or model in which learning-teaching activities are conducted.

Distance education is a hypernym referring to different concepts used for any formal approach to learning in which the instruction occurs while the educator and learner are at a distance from each other. Correspondence courses, home study, independent study, external studies, distance teaching and distance learning are classified within the scope of this concept (Kaya, 2002: 9–13).

E-learning is a type of education that is positioned in the system of distance education. In this type of education, Internet networks are used to connect teachers and students who are separated in terms of location and/or time. This education system is supported with video, visuals, audio recordings and graphic design. As the students can access to the educational materials and data anytime from anywhere by using Internet, this education system is independent from physical space (Gökdağ, 1986: 11–13).

Distance education practices started with correspondence courses. In time, along with the developments in the technology, other tools, such as radio, television, telephone and computers were used in the delivery of education. Today, in addition to the media mentioned above, electronic mails, computer conferences and Internet are used to offer distance education (Kaya, 2002: 11). According to Holmberg, distance education methods are grouped as follows (Can, 2004: 2–3):

- Course planning
- Development of course material
- Establishment of education communication
- Student counseling

IETC 2014

- Course development, distribution of course materials, education communication and consultancy management
- Creating an organizational structure for distance education
- Functional evaluation of the system

3. Characteristics and Goals of Distance Education

Although there are some similarities between formal (traditional) education and distance education, there are also several differences among them. The major characteristics of distance education can be summarized as below (Kaya 2002: 13):

- During the course of the education, the learner is physically separate from the teacher.
- Planning and preparing the teaching materials, providing student support services
- Communication tools, computers, audio and visual recordings are used in order to connect students and teachers and to the deliver the content of the course.
- Heavy use of technology
- Teaching is individualized since the learner and the instructor are separated during the course of the education.

As it can be seen in the definitions the main goal of distance education is to allow the individual to receive education in any field that the learner wants, anywhere and anytime. Distance education systems use technology and have efficient systems in accessing and delivering information, therefore the student and the instructor can act free from time and space (Çiçekdağı and Tekin, 2014: 81).

In 2006, the U.S. Department of Education's Office of Postsecondary Education released a report in which the characteristics of a qualified distance education program were stated (Gökçe, 2008: 6):

- The mission statement of the distance education program should identify the purpose of the training;
- Distance education program should be under the supervision of the faculty delivering formal education;
- Faculty delivering formal education should actively take part in the content of the distance education course;
- Technological support should be provided 24/7;
- There should be academic advisers for distance education students and the course and programs of distance education should be assessed continuously

4. Methods of Distance Education

Distance education can be delivered through several different methods. In general, communication environments for distance education are print materials, audio devices, television and television technologies and information technologies. It is necessary to decide which technology to use when designing the distance education program. The compatibility of the technology and the education program and differences between different technologies should be considered carefully. Distance education programs can be efficient if only they are delivered via appropriate technology. Several factors such as; the communication technology appropriate for the education program, target audience's ability to access to this technology, the teacher's ability to use this technology in the presentation of the course, corporate technical infrastructure and its usability for the program, cost of the technology and budget of the program should be

IETC 2014

analyzed. If the technology were selected by considering these factors, it would contribute more to the education program. The advantages and disadvantages of using different technologies can be summarized as in Table 1.

Table 1. Distance Education Methods

Technology	Advantages	Disadvantages
Printed Materials	Mobile, cheap, easy to access, well-organized	There may be delays in the delivery of the materials. Low attention to the courses
Videotapes **(can be transferred to CD-ROM and DVD)**	Mobile, it contains motion video and audio. It allows the learners to easily review the content by using VCR devices.	The tendency for monotonous lecturing and presentation. It can be boring unless the content is interesting or supported with video
Video Conference	Synchronous and two-way communication is established between the instructor and the learners. Sufficient audio and visual quality can be achieved by using advanced technological systems	Expensive. It requires the preparation of a special environment. It allows interaction but this interaction should be supported. The image quality can be low if low-quality systems are used.
Steaming Videos or Presentations	It allows for image transfer or graphic and audio transfer. It can be watched with interest. The material can be viewed again. It can be updated without the duplication of the band. It doesn't take as much time as the video recordings to produce.	The tendency for monotonous lecturing and presentation. It can be boring unless the content is interesting or supported with video. It requires the teacher to plan the presentation. The students have to have a computer and internet connection that meet the requirements
Web	It is possible to access to the computer anytime and anywhere by becoming online. It encourages communication through different course management software (such as chat, bulletin boards)	It requires access to computer and some basic technical skills.
Online discussion tools, bulletin boards, chat sessions	Online connection with the teacher and other students. It could be synchronous (chat) or asynchronous (bulletin board). Discussions can be included.	Talks are limited. It requires fast and accurate use of keyboard.
Electronic Mail	It is easy to use and cheap.	It requires access to a computer and basic knowledge of computer technology.

Source: (Özkul, 2003: 19)

Distance Education Programs, which allow learners to choose when and where to learn and when and where to access instructional materials, help to, partially or completely, eliminate the restrictions in the delivery of education services with their flexibility and adaptability (Çiçekdağı, Tekin and Tekin, 2014: 83).

IETC 2014

Distance Education offers different education options to people and minimizes the inequality of opportunity. With distance education, mass education becomes easier, education programs are standardized and cost of education is reduced. It helps to increase the quality of education and gives freedom to the student. It offers an enhanced learning environment to the students and does not force them to study in a classroom setting. Distance education allows individual learning as well as independent learning, receiving information from the first source. In addition, more people can benefit from experts through distance education. Distance education, while massifying education, also individualizes it and eliminates the necessity of being in a specific, confined space at a specific time to receive education (Kaya, 2002: 21).

5. Development of Distance Education in the World

The history shows that advances in technology have promoted changes in distance education. It is accepted that the pioneer of distance education was Isaac Pitman who offered shorthand instruction via correspondence in 1840. In the 1850s language education books were published under the title of "Teaching letters for learning the French language" and in 1873 Anna Eliot Ticknor developed a system to encourage the education of women. In 1874, American university level distance education began at Illinois Wesleyan University (Negiz, 2014: 71).

In the 19th century, distance education emerged in Germany and Sweden as well. In Germany, the attempts of distance education that began in 1856 led to today's distance educational institutions of Telekolleg, Schulfernsehen, FernUniversitat and Deutsche Institut für Fernstudien. In 1886, H. S. Hermod, of Sweden, began teaching English by correspondence. Later he founded Hermod's, which would become one of the world's largest and most influential distance education organizations. The "distance education" term, mentioned in the 1892 catalogue of the University of Wisconsin, was used by William Lighty, a professor at University of Wisconsin, for the first time in an essay. Since the use of multimedia tools and presentation systems makes it difficult to define distance education in one, precise statement, different distance education definitions have been made (Uşun, 2006: 6).

It is accepted that there has been three stages in the development of distance education. The first stage was the correspondence study period, which took place between the end of the 19th century and the beginning of the 20th century. During this period, the education was based on a textbook and feedback was received through letters. Starting from the 1970s, in the second stage, radio, television, cassettes and tapes were employed in distance education. The use of the satellite technologies began with the 1980s. And, finally, with the development of computer-based distance education programs, the third stage started (İnan, 2014: 97).

With the use of computer networks and Internet technologies in teaching-learning activities, especially beginning from the late 1990s, the world witnessed an expansion in distance education. With the help of computer networks, major limitations and problems in distance education, such as limited interaction, slow updating, inability to access different resources, not being able to receive service at the requested time and place and inability to focus on personal differences, were largely resolved.

IETC 2014

Today, many educational institutions in the world offer internet-based distance education programs. Higher education institutions offer internet-based distance education associate degree, master's degree and certificate programs. Besides, in some universities some courses are delivered via Internet.

The Open University of the United Kingdom can be shown as the most important distance education institution of our century. It was founded in 1969 by Royal Charter. More than 2 million students have graduated from the Open University since the day it was established. As one of the most important and successful institutions of distance education, the Open University, in collaboration with BBC, broadcasts to the entire country. Today is it one of the top ten universities of the world.

6. Distance Education in Turkey

It was a short time after the declaration of the Republic that distance education was considered as an option as a result of the "Teacher Education Report" presented by John Dewey in 1924. In this report, Dewey suggested the use of distance education in the training of teachers (İşman, 1998: 34).

There have been several other proposals to establish a distance education system. In 1927, "education through correspondence" was considered to teach literacy. In 1933-1934, a proposal was made to start correspondence courses in 1933-1934. In 1950, it was suggested The University of Ankara, Faculty of Law, Bank and Commercial Law Research Institute to use distance education. In 1960, the reason for considering correspondence study as an alternative education method was to train the graduates of secondary vocational schools. Finally, in 1962, The National Education Council recommended the use of correspondence study in order to educate people who cannot attend schools but want to receive education (Alkan, 1996: 20).

The Ministry of National Education used "correspondence courses" in 1958-59 school year for the bankers, particularly living outside of Ankara. In 1960, Ministry of National Education founded Correspondence Education Center Council within the body of Department of Statistics and Publishing. The aim of the Center was to offer distance education (Özdil, 1986: 18).

After the 1960s, some other institutions attempted to establish distance education systems in Turkey; however, they couldn't be very successful due to political reasons and uncertainties. In 1960, in order to deliver vocational and technical training via correspondence courses, Correspondence Education Center was established. In 1974, this center offered courses to train teachers but these efforts didn't last long (Birkök and Vuranok, 2010: 430–431).

Center for Higher Education through Correspondence and Higher Teacher Education Schools were founded in 1974, however, since they fell short of the expectations, these institutions were closed in 1975. Non-formal Higher Education Institution, YAYKUR, was established in the same year as an alternative and began to deliver higher education services through correspondence in the fields of secondary education teaching and primary school teaching. However, since YAYKUR was not successful enough, it was closed in 1979. With Article No 2547 in the 1982 Constitution, the task of distance higher education was given to the universities (İşman, 1998: 43–45).

IECT 2014

Another attempt to establish distance education in higher education was made by Ministry of National Education in 1978. The goal was to establish an Open University, however, it wasn't successful (Gökçe, 2008: 3).

In 1982, Anadolu University Open Education System was established. In 1999, distance education was further developed with the "Distance Education Based on Information and Communication Technologies". After the establishment of Open Education system in Turkey, "distance education system infrastructure" was developed. First it was an activity of documentation, and then it became a "system activity" with the accreditation and system communication and TV broadcasts and was positioned as a non-formal educational activity that aims mass education. Non-formal education is a field of education that targets large masses. It is more planned and programmed compared to formal education and supported by formal education (Çiftçi, 1995: 109).

The use of mass communication tools for distance education purposes began with a radio program in 1941. The name of the program that targeted people living in the countryside was "Agricultural Calendar" and it was produced by TRT Ankara Radio. In 1952, another talk show for the same target audience, this time produced by TRT Istanbul Radio, was broadcasted. In 1954, the radio program "Hour of the Village", which was a collaboration of Radio Department and Ministry of Agriculture, was on air. Based on the legal regulations in the 1961 Constitution, TRT was reorganized in 1964 and as a result of this reorganization; there has been an increase in the educational broadcasts (İşman, 1998: 48). During this period, the medium of radio was used for the distance education. TRT's radio and televisions took an active part in the Literacy campaign held in the 1980s.

In the XV National Education Council gathered in 1996, the ways to meet the educational demands of the society were discussed. In Turkey, web-based distance education began with certificate programs and in-campus courses in 1997. Today, universities offer web-based master's degree, graduate's degree, associate degree and certificate programs (Türkiye Bilişim Derneği, 2004: 368).

7. E-Learning in Distance Education

The technological advances have changed and shaped our ways of communication in the 21st century. They also challenge the traditional approaches to the practice of distance education. The impact of technology on the forms of learning can be classified as follows (Digital Age, 2014:30):

- Extended audience: Today, it can be said that the entire world is the audience as a result of the emergence social media such as blogs, Twitter, Facebook and other online platforms.
- Changing Learning Materials*:* Historical boards and blackboards have already become history. Smart and interactive, multimedia boards are used in education. Learners don't have to carry their files and notes with them. A laptop computer or tablet can store thousands of pages of information. Furthermore, environments such as LiveBinders, which is a Web 2.0 tool, allow to create files in an online environment.
- Interactive Textbooks*:* With the development of the technology, Internet-based websites that contain materials like animations, videos and alike which help learning were created. Students don't have to carry those heavy textbooks with the advances in e-book technology. Thanks to the new communication technologies, student don't have to take notes on notebooks, instead they record their notes on their tablets or cellular phones digitally and share them with their friends.

IETC 2014

- Increase in the use of tablets: Tablet has become a powerful tool in education. The most important feature of tablets is that they make the learning experience of children with special needs (such as autism) easier.
- Extended class environments: Internet-based platforms like Edmodo help to extend the in-class activities of technology. Students and instructors can talk about homeworks and share them with each other using this platform. This helps them to communicate with each other on the projects they are working on.

- Development of Internet-based Libraries**:** Libraries are still in use today. But, the research is conducted via Internet.

The developments in the computer and communication technologies, the emergence and spread of Internet made it easier and faster to access information. Therefore, today, distance education and Internet are inseparable as they are the main elements in creating equality of opportunity in education, which is the fundamental purpose of distance education.

E-learning can be defined in different ways. E-learning is the education and learning activities that allow instructor and students to be located in different locations so that instruction and learning occurs independently of place and time via information – communication technologies

Technology-supported distance education, in other words e-education, is a broad process that involves the collaboration of computer-based learning, web-based learning, virtual classes and digital technologies. E-learning can be defined as a web-based education system presented through a platform on a network (Uşun, 2006: 118). Technology-supported distance education can be defined as a structure with high media technology in which the features and resources of Internet are used in order to create an educational environment that enhances and supports learning (Khan, 1997: 5). In short, e-learning, which is education in electronic environment, accelerates the speed of learning and information transfer by combining the best features of traditional class setting with technology. E-learning allows the delivery of synchronous and asynchronous education via satellite, video (live or recorded) and computer technologies (Internet, intranet, CD-ROM) (Uşun, 2006: 160).

Internet-based Distance Education is an overall approach, which involves all education models that use Internet infrastructure. Teleconference meetings that use Internet, electronic mails that replaced traditional mail, electronic books and periodicals, which present the alternatives for printed sources, are models, which have been used as a part of Internet-based Distance Education. Among all these models, Web-Based Distance Education (WBDE) is the one that is most widely used today (Al and Mardan, 2004: 263).

The systems used to offer distance education services through Internet are called Learning Management Systems. By assigning roles such as student, instructor, course opener, system administrator to users defined on these systems, the student-material-instructor interaction is created via tools like course content, homeworks, assessments, live video, chat rooms and message boards (Akdemir, 2011: 70).

E-learning can be synchronous or asynchronous. Asynchronous learning is self-paced meaning that it allows the student complete freedom in determining his or her own pace for the lecture while in synchronous learning a group of students and the instructor meet in a classroom setting in the computer environment at the same time (İnan, 2014: 98).

Internet-based education, known as e-education, takes place in an electronic environment. Its pedagogical outcomes are still examined. It can be used on its own or it can be a part of formal education or dis-

IETC 2014

tance education (Oral and Kenanoğlu, 2012: 70). Advantages and limitations of Internet-Based Education are as shown on Table 2.

Table 2. Advantages and limitations of Internet-Based Education

	Logistic	**Educational**	**Economic**
Advantages	Free of distance and time Convenience Ease of developing and storing the courses	Enhanced learning environments Student control Efficient Communication Supports formal and informal learning environments	Cost effective usability
Limitations	Solid technical infrastructure Planned preliminary preparation	Free of distance and time Convenience Ease of developing and storing the courses	Financial burden

Source: (Oral and Kenanoğlu, 2012: 70).

Web 2.0 technologies, which were developed especially in the 2000s, took e-learning systems one step further. Theoreticians and programmers continue to create new tools and systems in accordance with the developments in web technologies. These developments focus on e-learning. In traditional education, it is quite important for many educators to have a face-to-face interaction with the student. However, according to the results of the research conducted by Jahng, Krug and Zhang in which online distance education and face-to-face education was compared, there is not any significant difference in terms of the success of the students between these two systems (Soydal, Alır and Ünal, 134).

Today, e-education practices all around the world have a significant share in the market. This market covers many different areas of life from the university education to language learning and to obtaining vocational competence. The value of global e-learning market is about 56.2 billion dollars and 70% of this market is in the countries in the North America and Europe continents. Figure 1 shows the number companies offering e-learning services.

IETC 2014

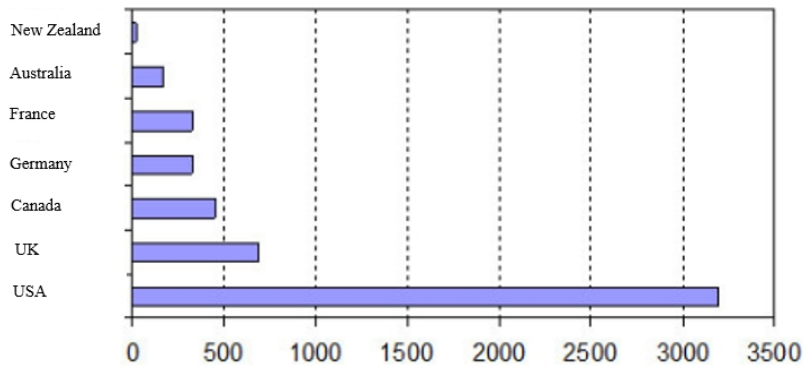

Figure 1. Number of Companies Providing E-Learning Services

Source: E-Öğrenme Pazarı, http://www.enocta.com/enocta/web/kurumportal/Content/e-ogrenme-pazari/1294/, (01.08.2014)

In "E-Learning Market Trends & Forecast 2014 - 2016 Report" published by DOCEBO, it was foreseen that the market will continue to grow all around the world. As it can be seen on the infographic below, the market will grow by 16, 9% in Eastern Europe, 17, 3% in Asia, 14,6% in Latin America and 15,2% in Africa in the next 2 years.

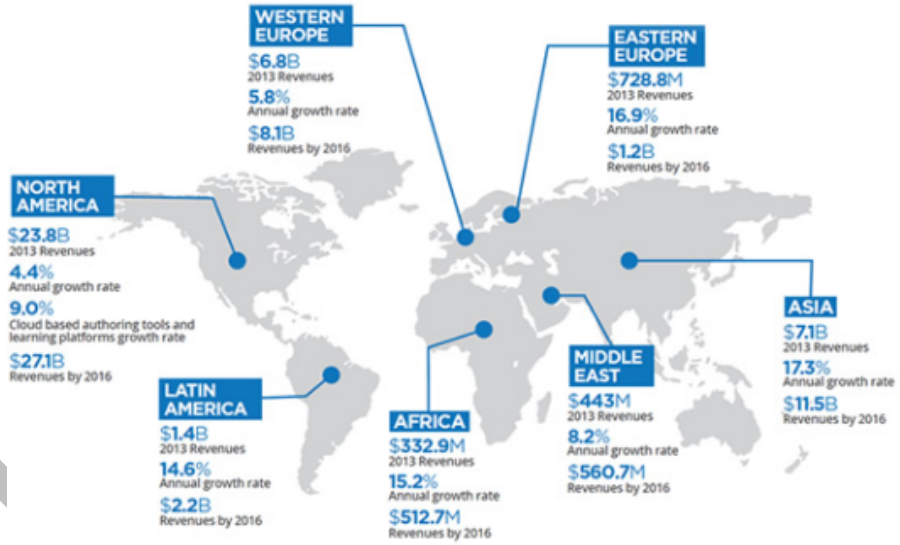

Figure 2. Geographic Distribution of E-Education

8. E-Learning Perception of Students Who Receive Education in Turkey

8.1 Method of the Study

The aim of this paper is to make a determination for the views of Turkish young learners for e-learning. The study made a research with a questioner applied to university and high school students about e-learning. The questioner aims to find out the view of learners for e-learning. In the first part of the questioner there are questions about exploring how the students gather information in their education. In the second part there is a scale of 14 questions exploring the views of e-learning in Turkey. The study conducted to 224 students living in Turkey in İstanbul. The sample was selected randomly from İstanbul high school and university students.

Chapter 4 8.2 Demographic Analysis
Chapter 5 Table 3. The Demographic Specifications of the Participants

Age	(n)	(%)
18 Year and Younger	120	53,57
19-24 Years Old	74	33,03
25 Years and Older	30	13,4
Total	224	100

Education Level	(n)	(%)
High School Students	110	49,1
University Students	114	50,9
Total	224	100

Sex	(n)	(%)
Male	126	56,3
Female	98	43,8
Total	224	100

8. 3 Analysis Regarding the İnformation Source of Students

In the first part of the questioner there are questions exploring the information source of students on their daily life and educational researches. According the answers that were collected students use internet and social media more than other media tools as an information source. The least used media is magazine and newspapers.

Table 4. The Information Source of Students

	(n)	(%)
Internet	108	48,2
Newspaper	19	8,5

IETC 2014

Magazine	5	2,2
Television	20	8,9
Social Media	72	32,1
Total	224	100,0

The 48, 2 % of the participants expressed that they have not gone to a library in the last six months. One interesting point is that there are also students who mentioned that they have never gone to a library for research.

Table 5. Last Time Visited Library

	(n)	(%)
1 Week Before	42	18,8
1-4 Weeks Before	34	15,2
1-3 Months Before	24	10,7
3-6 Months Before	16	7,1
6 Months Before	90	40,1
Never Go	18	8,1
Total	224	100

The students expressed that they use more search engines when they use internet as a research tool. The students expressed that they use Google more than other sources as research tool. They also expressed that Twitter is the most informative social media network in their researches. In that part of the questioner the students allowed to give more than one answer in two questions that's why the total responses are more than the sample size.

Table 6. Internet Use Method as a Research Tool

	(n)	(%)
I look in search engines	174	77,7
Directly I go to the web sites related to topic I search	38	17,0
I look at the social media networks	12	5.3
Total	224	100,0

Table 7. The Most Used Search Engines for Research

	(n)	(%)
Google	218	61,6
Yahoo	18	5,1
Yandex	112	31,6
Mynet	6	1,7

IECT 2014

Total	354	100,0

Table 8. The Best İnformation Social Media Network Source

	(n)	(%)
Facebook	48	17,8
Twitter	152	56,3
YouTube	58	21,5
Instagram	6	2,2
Other	6	2,2
Total	270	100

The 56,3 % of the students declared that they have never read an e-book and the 43,8 % read at least one time an e- book in their life. The 32, 2 of the participants have an experience of e-learning in their life but the 67, 8 % didn't have such an experience.

Table 9. Reading E-Book

	(n)	(%)
Yes I read at least one time in my life	98	43,8
No I Have never Read	126	56,3
Total	224	100,0

Table 10. Have You Ever Had Any E-learning Experience?

	(n)	(%)
Yes	72	32.2
No	152	67,8
Total	224	100,0

In the research it was asked the students the express the advantages of e- learning. They allowed to give free answers and also to say if they think there is no advantage. The answers were coded and compiled in table 11.

Table 11. Advantages of E- Learning

	(%)
Independence from Place	22,6
Cost Save in Finance	15,4
Transportation Advantage	5,3
Continuously Reach	6,6
Easy and Comfortable	11,7

Possibility of Repetition	18,7
Flexibility in Time	16,9
It has no advantage	2,8
Total	100

Chapter 6 8.4 Reliability Analysis

The reliability analysis of the 14 statements shows that this scale is reliable. Since the alpha Cronbach value is more than 0, 70 this scale is enough reliable. The alpha value of this scale is 0,880

Table 12. Reliability Analysis

Cronbach's Alpha	N of Items
,880	14

Chapter 7 8.5 Frequency Analysis

The frequency analysis of the scale is showing that the students confirm the advantages of e-learning and accepts it as future education method. Students accepts the reality that internet is the best source for them to make research with a very big frequency. Student feel free in e- learning and they think that this is also a cost method in education. They accept that transportation, education materials and such cost are lower in e – learning. One other point to be regarded is that students believe that they use time flexible in e – learning and this type of learning is more comfortable.

Table 11. Frequency Analysis

		I absolutely Agree	I Agree	I nor Agree Nei-ther Disagre	I don't Agree	I Absolutely Disagree	Total
A1	I Use internet as an information tool make my researches more easy	73,1	25,1	0	1,2	0	100
A2	The information that I gather from internet helps me to use my time of research better.	57	37,4	2,7	0,9	2	100
A3	I don't have any trust problem on the information I collect from the internet.	3,6	12,5	51,8	28,6	3,6	100
A4	The companies which supply e – learning takes my interests.	19,6	25,9	32,1	10,7	11,6	100
A5	I would like to have e- learning education in the future.	25	20,5	33	13,4	8	100
A6	E-Learning makes me feel more free.	39,1	23,2	16,8	9,4	11,5	100
A7	E- Learning helps me to use my scheduled time better.	28,8	25,2	20,6	17,6	7,8	100
A8	I believe that e – learning is more useful to learn new things and improve myself.	33,3	23,2	21,2	13,4	8,9	100
A9	E- Learning brings me advantage on the cost of my education transportation and educational materials.	46,4	22,3	13,5	10,7	7,1	100

IETC 2014

A10	E- Learning can never take the place of traditional class education.	8	8,9	13,4	31,3	38,4	100
A11	I believe that e-learning will take the place of traditional education in the future	32,1	27,5	12,3	21	6,5	100
A12	I would like to have my university education in a university which use e-learning 100%.	35,7	25,9	27,7	3,6	7,1	100
A13	I believe that a Multimedia based e- learning is more effective than the classroom learning.	25,8	41,1	14,5	10,5	8,1	100
A14	E- Learning give me the information more comfortable.	25,8	29,1	21,5	13,8	9,8	100

9. Conclusion

The changes and advances occurring almost in every part of life challenge the education systems and schools to change. Rapid developments in information and communication technologies led to an increase in the use of technology in the field of education. This requires redefining the concepts of school, teacher and student. Besides, education delivered via Internet has become the most common way of distance education.

Distance Education is, in its broadest definition, a planned and systematic educational activity;

a) that offers individuality, flexibility and freedom in terms of educational age, purposes, time, place, management and etc to the receivers of education,
b) in which the source and the receivers are in separate locations during the most of the teaching-learning process,
c) the interaction and communication between the source and the receivers takes place via interactive/integrated technologies that are based on television and computer.

As its seen in this research conducted to 224 students who live in İstanbul today learners prefer to use internet more for learning new things. Students believe that they can gather information more quickly and more flexible via internet and social media. Their first choice for gathering information is internet and search engines. They mostly use Google in search engines and Twitter in social media for collecting information. The students give more positive feedback to the statements that were prepared in the scale. According to them e-learning give more advantages and this is a future type of education which they would like to use more. According to the students e – learning has four important benefits in their education. These are:

a) gives them freedom and more independency in their education,
b) helps them cost saving in education cost materials, transportation,
c) gives comfortable education,
d) flexibility in time

Distance Education Applications and E- Learning The Viewpoint of Students for E- Learning in Turkey

Mihalis Kuyucu [a] [34]
[a] *Assist.Prof. İstanbul Aydın University , Turkey*

Abstract

Internet has changed all the World. Music industry has been transformed to mp3s from records. Video has gone to streaming on line instead of VHS. The specifications of web 2, 0 did not change only media but also the structure of all industries. One of these industries that had a big effect from internet technologies is education. Internet brought a new outlook to education. The 'new distance' of 'distance education' have killed all the 'distance' between the education institutions and learner. Distance education which had started with letters is now done with networks. These new networks created the steps of E- learning which brought speed, interaction and borderless specifications to education. E- Learning brings new opportunities to education. The learner is now out of the building. Everywhere and every time is possible for education with e – learning. The aim of this paper is to make a determination for the views of Turkish young learners for e-learning. In the first part of the paper there is a conceptual and historical explanation of distance education and the role of e-learning as a new subhead tool of distance education. The paper makes a research with a questioner applied to university and high school students about e-learning. The questioner aims to find out the view of learners for e-learning. In the conclusion of the paper there is a brief underline that internet is changing the demand of education as well as other industries. The learners believes that e-learning brings them freedom and better opportunities for learning in their education life.

Peer-review under responsibility of the Sakarya University

Keyword: New Media, Distance Education, E- Learning

IETC 2014

1. Introduction

The increased importance of knowledge in today's world caused a dramatic increase in the need for education. The inability of traditional educational institutions to meet this increased demand created the education deficit. This need led societies to seek alternatives to traditional education. Distance education has started to fulfill this need. While distance education was delivered through different means of communication such as mail, telegram, telex, radio and television in the past, today, it is usually offered via Internet. Developments in the Internet technologies contributed to the emergence of e-learning concept as a form of distance education. The developments in the Web 2.0 technologies, which made it easier to share audio and videos, gave rise to the multimedia-based e-learning. The developments in the Internet technologies have added a new dimension to education. With e-learning, the need for specific locations disap-

* *E-mail address:* michael@michaelshow.net , michaelkuyucu@gmail.com

peared and the limited education format between the student and the educational institution gave its place to an interactive education that continues 24/7.

2. The Concept of Distance Education

Distance education is defined as an economical and interactive form of education in which information technologies are used and which is independent from time and space (Gökçe, 2008: 2). İşman (1998: 18) explained the concept of distant education as a system of education in which students and teachers conduct the activities of learning and teaching through communication technologies and postal services. The U.S. Department of Education's Office of Educational Research and Improvement defines distance education as "the application of telecommunications and electronic devices which enable students and learners to receive instruction that originates from some distant location." (Çakmak, 2013: 264). According to another definition, distance education is a planned educational process in which the teaching is conducted by someone removed in space and/or time from the learner and which is achieved by bridging the physical distance between student and teacher by means of technology in a virtual classroom (Ertuğrul, 1999: 7).

As it can be seen from the definitions above, the fundamental characteristic of distance education is the separation of the teacher and learner. Most often, separation is in geographic terms—teachers are in one location and students are in another. Also the separation of teachers and students is in time. Other components of distance education are that; different communication technologies are used, equivalent learning experiences are provided to each student and it is an education system or model in which learning-teaching activities are conducted.

Distance education is a hypernym referring to different concepts used for any formal approach to learning in which the instruction occurs while the educator and learner are at a distance from each other. Correspondence courses, home study, independent study, external studies, distance teaching and distance learning are classified within the scope of this concept (Kaya, 2002: 9–13).

E-learning is a type of education that is positioned in the system of distance education. In this type of education, Internet networks are used to connect teachers and students who are separated in terms of location and/or time. This education system is supported with video, visuals, audio recordings and graphic design. As the students can access to the educational materials and data anytime from anywhere by using Internet, this education system is independent from physical space (Gökdağ, 1986: 11–13).

Distance education practices started with correspondence courses. In time, along with the developments in the technology, other tools, such as radio, television, telephone and computers were used in the delivery of education. Today, in addition to the media mentioned above, electronic mails, computer conferences and Internet are used to offer distance education (Kaya, 2002: 11). According to Holmberg, distance education methods are grouped as follows (Can, 2004: 2–3):

- Course planning
- Development of course material
- Establishment of education communication
- Student counseling

IETC 2014

- Course development, distribution of course materials, education communication and consultancy management
- Creating an organizational structure for distance education
- Functional evaluation of the system

3. Characteristics and Goals of Distance Education

Although there are some similarities between formal (traditional) education and distance education, there are also several differences among them. The major characteristics of distance education can be summarized as below (Kaya 2002: 13):

- During the course of the education, the learner is physically separate from the teacher.
- Planning and preparing the teaching materials, providing student support services
- Communication tools, computers, audio and visual recordings are used in order to connect students and teachers and to the deliver the content of the course.
- Heavy use of technology
- Teaching is individualized since the learner and the instructor are separated during the course of the education.

As it can be seen in the definitions the main goal of distance education is to allow the individual to receive education in any field that the learner wants, anywhere and anytime. Distance education systems use technology and have efficient systems in accessing and delivering information, therefore the student and the instructor can act free from time and space (Çiçekdağı and Tekin, 2014: 81).

In 2006, the U.S. Department of Education's Office of Postsecondary Education released a report in which the characteristics of a qualified distance education program were stated (Gökçe, 2008: 6):

- The mission statement of the distance education program should identify the purpose of the training;
- Distance education program should be under the supervision of the faculty delivering formal education;
- Faculty delivering formal education should actively take part in the content of the distance education course;
- Technological support should be provided 24/7;
- There should be academic advisers for distance education students and the course and programs of distance education should be assessed continuously

4. Methods of Distance Education

Distance education can be delivered through several different methods. In general, communication environments for distance education are print materials, audio devices, television and television technologies and information technologies. It is necessary to decide which technology to use when designing the distance education program. The compatibility of the technology and the education program and differences between different technologies should be considered carefully. Distance education programs can be efficient if only they are delivered via appropriate technology. Several factors such as; the communication

IETC 2014

technology appropriate for the education program, target audience's ability to access to this technology, the teacher's ability to use this technology in the presentation of the course, corporate technical infrastructure and its usability for the program, cost of the technology and budget of the program should be analyzed. If the technology were selected by considering these factors, it would contribute more to the education program. The advantages and disadvantages of using different technologies can be summarized as in Table 1.

Table 1. Distance Education Methods

Technology	Advantages	Disadvantages
Printed Materials	Mobile, cheap, easy to access, well-organized	There may be delays in the delivery of the materials. Low attention to the courses
Videotapes **(can be transferred to CD-ROM and DVD)**	Mobile, it contains motion video and audio. It allows the learners to easily review the content by using VCR devices.	The tendency for monotonous lecturing and presentation. It can be boring unless the content is interesting or supported with video
Video Conference	Synchronous and two-way communication is established between the instructor and the learners. Sufficient audio and visual quality can be achieved by using advanced technological systems	Expensive. It requires the preparation of a special environment. It allows interaction but this interaction should be supported. The image quality can be low if low-quality systems are used.
Steaming Videos or Presentations	It allows for image transfer or graphic and audio transfer. It can be watched with interest. The material can be viewed again. It can be updated without the duplication of the band. It doesn't take as much time as the video recordings to produce.	The tendency for monotonous lecturing and presentation. It can be boring unless the content is interesting or supported with video. It requires the teacher to plan the presentation. The students have to have a computer and internet connection that meet the requirements
Web	It is possible to access to the computer anytime and anywhere by becoming online. It encourages communication through different course management software (such as chat, bulletin boards)	It requires access to computer and some basic technical skills.
Online discussion tools, bulletin boards, chat sessions	Online connection with the teacher and other students. It could be synchronous (chat) or asynchronous (bulletin board). Discussions can be included.	Talks are limited. It requires fast and accurate use of keyboard.
Electronic Mail	It is easy to use and cheap.	It requires access to a computer and basic knowledge of computer technology.

Source: (Özkul, 2003: 19)

IETC 2014

Distance Education Programs, which allow learners to choose when and where to learn and when and where to access instructional materials, help to, partially or completely, eliminate the restrictions in the delivery of education services with their flexibility and adaptability (Çiçekdağı, Tekin and Tekin, 2014: 83).

Distance Education offers different education options to people and minimizes the inequality of opportunity. With distance education, mass education becomes easier, education programs are standardized and cost of education is reduced. It helps to increase the quality of education and gives freedom to the student. It offers an enhanced learning environment to the students and does not force them to study in a classroom setting. Distance education allows individual learning as well as independent learning, receiving information from the first source. In addition, more people can benefit from experts through distance education. Distance education, while massifying education, also individualizes it and eliminates the necessity of being in a specific, confined space at a specific time to receive education (Kaya, 2002: 21).

5. Development of Distance Education in the World

The history shows that advances in technology have promoted changes in distance education. It is accepted that the pioneer of distance education was Isaac Pitman who offered shorthand instruction via correspondence in 1840. In the 1850s language education books were published under the title of "Teaching letters for learning the French language" and in 1873 Anna Eliot Ticknor developed a system to encourage the education of women. In 1874, American university level distance education began at Illinois Wesleyan University (Negiz, 2014: 71).

In the 19th century, distance education emerged in Germany and Sweden as well. In Germany, the attempts of distance education that began in 1856 led to today's distance educational institutions of Telekolleg, Schulfernsehen, FernUniversitat and Deutsche Institut für Fernstudien. In 1886, H. S. Hermod, of Sweden, began teaching English by correspondence. Later he founded Hermod's, which would become one of the world's largest and most influential distance education organizations. The "distance education" term, mentioned in the 1892 catalogue of the University of Wisconsin, was used by William Lighty, a professor at University of Wisconsin, for the first time in an essay. Since the use of multimedia tools and presentation systems makes it difficult to define distance education in one, precise statement, different distance education definitions have been made (Uşun, 2006: 6).

It is accepted that there has been three stages in the development of distance education. The first stage was the correspondence study period, which took place between the end of the 19th century and the beginning of the 20th century. During this period, the education was based on a textbook and feedback was received through letters. Starting from the 1970s, in the second stage, radio, television, cassettes and tapes were employed in distance education. The use of the satellite technologies began with the 1980s. And, finally, with the development of computer-based distance education programs, the third stage started (İnan, 2014: 97).

With the use of computer networks and Internet technologies in teaching-learning activities, especially beginning from the late 1990s, the world witnessed an expansion in distance education. With the help of computer networks, major limitations and problems in distance education, such as limited interaction, slow updating, inability to access different resources, not being able to receive service at the requested time and place and inability to focus on personal differences, were largely resolved.

IECT 2014

Today, many educational institutions in the world offer internet-based distance education programs. Higher education institutions offer internet-based distance education associate degree, master's degree and certificate programs. Besides, in some universities some courses are delivered via Internet.

The Open University of the United Kingdom can be shown as the most important distance education institution of our century. It was founded in 1969 by Royal Charter. More than 2 million students have graduated from the Open University since the day it was established. As one of the most important and successful institutions of distance education, the Open University, in collaboration with BBC, broadcasts to the entire country. Today is it one of the top ten universities of the world.

6. Distance Education in Turkey

It was a short time after the declaration of the Republic that distance education was considered as an option as a result of the "Teacher Education Report" presented by John Dewey in 1924. In this report, Dewey suggested the use of distance education in the training of teachers (İşman, 1998: 34).

There have been several other proposals to establish a distance education system. In 1927, "education through correspondence" was considered to teach literacy. In 1933-1934, a proposal was made to start correspondence courses in 1933-1934. In 1950, it was suggested The University of Ankara, Faculty of Law, Bank and Commercial Law Research Institute to use distance education. In 1960, the reason for considering correspondence study as an alternative education method was to train the graduates of secondary vocational schools. Finally, in 1962, The National Education Council recommended the use of correspondence study in order to educate people who cannot attend schools but want to receive education (Alkan, 1996: 20).

The Ministry of National Education used "correspondence courses" in 1958-59 school year for the bankers, particularly living outside of Ankara. In 1960, Ministry of National Education founded Correspondence Education Center Council within the body of Department of Statistics and Publishing. The aim of the Center was to offer distance education (Özdil, 1986: 18).

After the 1960s, some other institutions attempted to establish distance education systems in Turkey; however, they couldn't be very successful due to political reasons and uncertainties. In 1960, in order to deliver vocational and technical training via correspondence courses, Correspondence Education Center was established. In 1974, this center offered courses to train teachers but these efforts didn't last long (Birkök and Vuranok, 2010: 430–431).

Center for Higher Education through Correspondence and Higher Teacher Education Schools were founded in 1974, however, since they fell short of the expectations, these institutions were closed in 1975. Non-formal Higher Education Institution, YAYKUR, was established in the same year as an alternative and began to deliver higher education services through correspondence in the fields of secondary education teaching and primary school teaching. However, since YAYKUR was not successful enough, it was closed in 1979. With Article No 2547 in the 1982 Constitution, the task of distance higher education was given to the universities (İşman, 1998: 43–45).

IECT2014

Another attempt to establish distance education in higher education was made by Ministry of National Education in 1978. The goal was to establish an Open University, however, it wasn't successful (Gökçe, 2008: 3).

In 1982, Anadolu University Open Education System was established. In 1999, distance education was further developed with the "Distance Education Based on Information and Communication Technologies". After the establishment of Open Education system in Turkey, "distance education system infrastructure" was developed. First it was an activity of documentation, and then it became a "system activity" with the accreditation and system communication and TV broadcasts and was positioned as a non-formal educational activity that aims mass education. Non-formal education is a field of education that targets large masses. It is more planned and programmed compared to formal education and supported by formal education (Çiftçi, 1995: 109).

The use of mass communication tools for distance education purposes began with a radio program in 1941. The name of the program that targeted people living in the countryside was "Agricultural Calendar" and it was produced by TRT Ankara Radio. In 1952, another talk show for the same target audience, this time produced by TRT Istanbul Radio, was broadcasted. In 1954, the radio program "Hour of the Village", which was a collaboration of Radio Department and Ministry of Agriculture, was on air. Based on the legal regulations in the 1961 Constitution, TRT was reorganized in 1964 and as a result of this reorganization; there has been an increase in the educational broadcasts (İşman, 1998: 48). During this period, the medium of radio was used for the distance education. TRT's radio and televisions took an active part in the Literacy campaign held in the 1980s.

In the XV National Education Council gathered in 1996, the ways to meet the educational demands of the society were discussed. In Turkey, web-based distance education began with certificate programs and in-campus courses in 1997. Today, universities offer web-based master's degree, graduate's degree, associate degree and certificate programs (Türkiye Bilişim Derneği, 2004: 368).

7. E-Learning in Distance Education

The technological advances have changed and shaped our ways of communication in the 21st century. They also challenge the traditional approaches to the practice of distance education. The impact of technology on the forms of learning can be classified as follows (Digital Age, 2014:30):

- Extended audience: Today, it can be said that the entire world is the audience as a result of the emergence social media such as blogs, Twitter, Facebook and other online platforms.
- Changing Learning Materials*:* Historical boards and blackboards have already become history. Smart and interactive, multimedia boards are used in education. Learners don't have to carry their files and notes with them. A laptop computer or tablet can store thousands of pages of information. Furthermore, environments such as LiveBinders, which is a Web 2.0 tool, allow to create files in an online environment.
- Interactive Textbooks*:* With the development of the technology, Internet-based websites that contain materials like animations, videos and alike which help learning were created. Students don't have to carry those heavy textbooks with the advances in e-book technology. Thanks to the new communication technologies, student don't have to take notes on notebooks, instead they record their notes on their tablets or cellular phones digitally and share them with their friends.

IETC 2014

- Increase in the use of tablets: Tablet has become a powerful tool in education. The most important feature of tablets is that they make the learning experience of children with special needs (such as autism) easier.
- Extended class environments: Internet-based platforms like Edmodo help to extend the in-class activities of technology. Students and instructors can talk about homeworks and share them with each other using this platform. This helps them to communicate with each other on the projects they are working on.

- Development of Internet-based Libraries**:** Libraries are still in use today. But, the research is conducted via Internet.

The developments in the computer and communication technologies, the emergence and spread of Internet made it easier and faster to access information. Therefore, today, distance education and Internet are inseparable as they are the main elements in creating equality of opportunity in education, which is the fundamental purpose of distance education.

E-learning can be defined in different ways. E-learning is the education and learning activities that allow instructor and students to be located in different locations so that instruction and learning occurs independently of place and time via information – communication technologies

Technology-supported distance education, in other words e-education, is a broad process that involves the collaboration of computer-based learning, web-based learning, virtual classes and digital technologies. E-learning can be defined as a web-based education system presented through a platform on a network (Uşun, 2006: 118). Technology-supported distance education can be defined as a structure with high media technology in which the features and resources of Internet are used in order to create an educational environment that enhances and supports learning (Khan, 1997: 5). In short, e-learning, which is education in electronic environment, accelerates the speed of learning and information transfer by combining the best features of traditional class setting with technology. E-learning allows the delivery of synchronous and asynchronous education via satellite, video (live or recorded) and computer technologies (Internet, intranet, CD-ROM) (Uşun, 2006: 160).

Internet-based Distance Education is an overall approach, which involves all education models that use Internet infrastructure. Teleconference meetings that use Internet, electronic mails that replaced traditional mail, electronic books and periodicals, which present the alternatives for printed sources, are models, which have been used as a part of Internet-based Distance Education. Among all these models, Web-Based Distance Education (WBDE) is the one that is most widely used today (Al and Mardan, 2004: 263).

The systems used to offer distance education services through Internet are called Learning Management Systems. By assigning roles such as student, instructor, course opener, system administrator to users defined on these systems, the student-material-instructor interaction is created via tools like course content, homeworks, assessments, live video, chat rooms and message boards (Akdemir, 2011: 70).

E-learning can be synchronous or asynchronous. Asynchronous learning is self-paced meaning that it allows the student complete freedom in determining his or her own pace for the lecture while in synchronous learning a group of students and the instructor meet in a classroom setting in the computer environment at the same time (İnan, 2014: 98).

Internet-based education, known as e-education, takes place in an electronic environment. Its pedagogical outcomes are still examined. It can be used on its own or it can be a part of formal education or dis-

IETC 2014

tance education (Oral and Kenanoğlu, 2012: 70). Advantages and limitations of Internet-Based Education are as shown on Table 2.

Table 2. Advantages and limitations of Internet-Based Education

	Logistic	**Educational**	**Economic**
Advantages	Free of distance and time Convenience Ease of developing and storing the courses	Enhanced learning environments Student control Efficient Communication Supports formal and informal learning environments	Cost effective usability
Limitations	Solid technical infrastructure Planned preliminary preparation	Free of distance and time Convenience Ease of developing and storing the courses	Financial burden

Source: (Oral and Kenanoğlu, 2012: 70).

Web 2.0 technologies, which were developed especially in the 2000s, took e-learning systems one step further. Theoreticians and programmers continue to create new tools and systems in accordance with the developments in web technologies. These developments focus on e-learning. In traditional education, it is quite important for many educators to have a face-to-face interaction with the student. However, according to the results of the research conducted by Jahng, Krug and Zhang in which online distance education and face-to-face education was compared, there is not any significant difference in terms of the success of the students between these two systems (Soydal, Alır and Ünal, 134).

Today, e-education practices all around the world have a significant share in the market. This market covers many different areas of life from the university education to language learning and to obtaining vocational competence. The value of global e-learning market is about 56.2 billion dollars and 70% of this market is in the countries in the North America and Europe continents. Figure 1 shows the number companies offering e-learning services.

IETC 2014

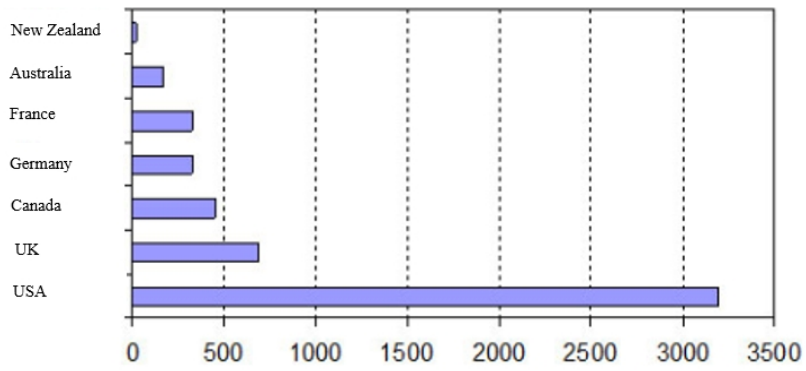

Figure 1. Number of Companies Providing E-Learning Services

Source: E-Öğrenme Pazarı, http://www.enocta.com/enocta/web/kurumportal/Content/e-ogrenme-pazari/1294/, (01.08.2014)

In "E-Learning Market Trends & Forecast 2014 - 2016 Report" published by DOCEBO, it was foreseen that the market will continue to grow all around the world. As it can be seen on the infographic below, the market will grow by 16, 9% in Eastern Europe, 17, 3% in Asia, 14,6% in Latin America and 15,2% in Africa in the next 2 years.

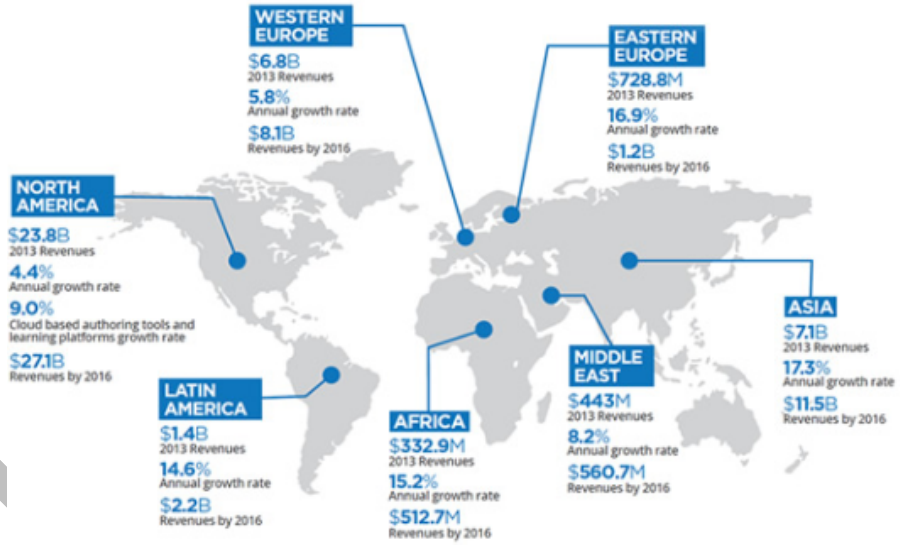

Figure 2. Geographic Distribution of E-Education

8. E-Learning Perception of Students Who Receive Education in Turkey

8.1 Method of the Study

The aim of this paper is to make a determination for the views of Turkish young learners for e-learning. The study made a research with a questioner applied to university and high school students about e-learning. The questioner aims to find out the view of learners for e-learning. In the first part of the questioner there are questions about exploring how the students gather information in their education. In the second part there is a scale of 14 questions exploring the views of e-learning in Turkey. The study conducted to 224 students living in Turkey in İstanbul. The sample was selected randomly from İstanbul high school and university students.

Chapter 8 8.2 Demographic Analysis
Chapter 9 Table 3. The Demographic Specifications of the Participants

Age	(n)	(%)
18 Year and Younger	120	53,57
19-24 Years Old	74	33,03
25 Years and Older	30	13,4
Total	224	100

Education Level	(n)	(%)
High School Students	110	49,1
University Students	114	50,9
Total	224	100

Sex	(n)	(%)
Male	126	56,3
Female	98	43,8
Total	224	100

8. 3 Analysis Regarding the İnformation Source of Students

In the first part of the questioner there are questions exploring the information source of students on their daily life and educational researches. According the answers that were collected students use internet and social media more than other media tools as an information source. The least used media is magazine and newspapers.

Table 4. The Information Source of Students

	(n)	(%)
Internet	108	48,2
Newspaper	19	8,5
Magazine	5	2,2
Television	20	8,9
Social Media	72	32,1
Total	224	100,0

IETC 2014

The 48, 2 % of the participants expressed that they have not gone to a library in the last six months. One interesting point is that there are also students who mentioned that they have never gone to a library for research.

Table 5. Last Time Visited Library

	(n)	(%)
1 Week Before	42	18,8
1-4 Weeks Before	34	15,2
1-3 Months Before	24	10,7
3-6 Months Before	16	7,1
6 Months Before	90	40,1
Never Go	18	8,1
Total	224	100

The students expressed that they use more search engines when they use internet as a research tool. The students expressed that they use Google more than other sources as research tool. They also expressed that Twitter is the most informative social media network in their researches. In that part of the questioner the students allowed to give more than one answer in two questions that's why the total responses are more than the sample size.

Table 6. Internet Use Method as a Research Tool

	(n)	(%)
I look in search engines	174	77,7
Directly I go to the web sites related to topic I search	38	17,0
I look at the social media networks	12	5.3
Total	224	100,0

Table 7. The Most Used Search Engines for Research

	(n)	(%)
Google	218	61,6
Yahoo	18	5,1
Yandex	112	31,6
Mynet	6	1,7
Total	354	100,0

Table 8. The Best İnformation Social Media Network Source

	(n)	(%)

Facebook	48	17,8
Twitter	152	56,3
YouTube	58	21,5
Instagram	6	2,2
Other	6	2,2
Total	270	100

The 56,3 % of the students declared that they have never read an e-book and the 43,8 % read at least one time an e- book in their life. The 32, 2 of the participants have an experience of e-learning in their life but the 67, 8 % didn't have such an experience.

Table 9. Reading E-Book

	(n)	(%)
Yes I read at least one time in my life	98	43,8
No I Have never Read	126	56,3
Total	224	100,0

Table 10. Have You Ever Had Any E-learning Experience?

	(n)	(%)
Yes	72	32.2
No	152	67,8
Total	224	100,0

In the research it was asked the students the express the advantages of e- learning. They allowed to give free answers and also to say if they think there is no advantage. The answers were coded and compiled in table 11.

Table 11. Advantages of E- Learning

	(%)
Independence from Place	22,6
Cost Save in Finance	15,4
Transportation Advantage	5,3
Continuously Reach	6,6
Easy and Comfortable	11,7
Possibility of Repetition	18,7
Flexibility in Time	16,9
It has no advantage	2,8
Total	100

IETC 2014

Chapter 10 8.4 Reliability Analysis

The reliability analysis of the 14 statements shows that this scale is reliable. Since the alpha Cronbach value is more than 0, 70 this scale is enough reliable. The alpha value of this scale is 0,880

Table 12. Reliability Analysis

Cronbach's Alpha	N of Items
,880	14

Chapter 11 8.5 Frequency Analysis

The frequency analysis of the scale is showing that the students confirm the advantages of e-learning and accepts it as future education method. Students accepts the reality that internet is the best source for them to make research with a very big frequency. Student feel free in e- learning and they think that this is also a cost method in education. They accept that transportation, education materials and such cost are lower in e – learning. One other point to be regarded is that students believe that they use time flexible in e – learning and this type of learning is more comfortable.

Table 11. Frequency Analysis

		I absolutely Agree	I Agree	I nor Agree Nei-ther Disagre	I don't Agree	I Absolutely Disagree	Total
A1	I Use internet as an information tool make my researches more easy	73,1	25,1	0	1,2	0	100
A2	The information that I gather from internet helps me to use my time of research better.	57	37,4	2,7	0,9	2	100
A3	I don't have any trust problem on the information I collect from the internet.	3,6	12,5	51,8	28,6	3,6	100
A4	The companies which supply e – learning takes my interests.	19,6	25,9	32,1	10,7	11,6	100
A5	I would like to have e- learning education in the future.	25	20,5	33	13,4	8	100
A6	E-Learning makes me feel more free.	39,1	23,2	16,8	9,4	11,5	100
A7	E- Learning helps me to use my scheduled time better.	28,8	25,2	20,6	17,6	7,8	100
A8	I believe that e – learning is more useful to learn new things and improve myself.	33,3	23,2	21,2	13,4	8,9	100
A9	E- Learning brings me advantage on the cost of my education transportation and educational materials.	46,4	22,3	13,5	10,7	7,1	100
A10	E- Learning can never take the place of traditional class education.	8	8,9	13,4	31,3	38,4	100
A11	I believe that e-learning will take the place of traditional education in the future	32,1	27,5	12,3	21	6,5	100
A12	I would like to have my university education in a university which use e-learning 100%.	35,7	25,9	27,7	3,6	7,1	100
A13	I believe that a Multimedia based e- learning is more effective than the classroom learning.	25,8	41,1	14,5	10,5	8,1	100

IETC 2014

A14	E- Learning give me the information more comfortable.	25,8	29,1	21,5	13,8	9,8	100

9. Conclusion

The changes and advances occurring almost in every part of life challenge the education systems and schools to change. Rapid developments in information and communication technologies led to an increase in the use of technology in the field of education. This requires redefining the concepts of school, teacher and student. Besides, education delivered via Internet has become the most common way of distance education.

Distance Education is, in its broadest definition, a planned and systematic educational activity;

d) that offers individuality, flexibility and freedom in terms of educational age, purposes, time, place, management and etc to the receivers of education,
e) in which the source and the receivers are in separate locations during the most of the teaching-learning process,
f) the interaction and communication between the source and the receivers takes place via interactive/integrated technologies that are based on television and computer.

As its seen in this research conducted to 224 students who live in İstanbul today learners prefer to use internet more for learning new things. Students believe that they can gather information more quickly and more flexible via internet and social media. Their first choice for gathering information is internet and search engines. They mostly use Google in search engines and Twitter in social media for collecting information. The students give more positive feedback to the statements that were prepared in the scale. According to them e-learning give more advantages and this is a future type of education which they would like to use more. According to the students e – learning has four important benefits in their education. These are:

e) gives them freedom and more independency in their education,
f) helps them cost saving in education cost materials, transportation,
g) gives comfortable education,
h) flexibility in time

Distance-education in foreign language teaching: evaluations from the perspectives of freshman students

Dr. Emrah Ekmekçi·
Ondokuz Mayıs University, School of Foreign Languages, Kurupelit Campus,Samsun, Turkey

Abstract

This study investigates distance education students' level of satisfaction and evaluations about distance English courses. To this end, a Likert-type questionnaire was applied to 72 students attending a distance education program. In addition, semi-structured interview was employed so as to verify the data gathered from the questionnaire. The results of the study revealed that a great majority of the students were satisfied with the distance education English course stating that the content, format, reading and grammar sections of the course were sufficient, but synchronous courses, listening, speaking, and writing sections were not satisfactory and sufficient both in quality and quantity.

Keywords: Distance Education; Distance Language Learning; Student Satisfaction;Educational Technologies; Synchronous Course

1. Introduction

The power of computers and the internet in the current century enables all learners to study at their home without having to attend a regular face-to-face course or school. In other words, recent developments in Information and Communication Technologies (ICT) have brought about various improvements facilitating people's lives. Learners who are unable to attend classes for one reason or another can study at their own pace independent from time and place. They can take various courses for a diploma, certificate, or a degree via distance education in a more flexible and interactive atmosphere. There is no doubt that these developments in educational technologies have spread to online or distance language learning and teaching field. Opportunities to learn languages through online or distance education are presented each passing day by private courses, colleges, schools, institutions, textbook companies, and universities. Accordingly, some of the universities in Turkey offer distance education programs in associate, undergraduate, and graduate degrees. A great number of students enroll in distance learning programs in all levels, and try to complete the programs successfully. In the process of distance education in different programs, students take various courses depending upon their majors. Actually, students' thoughts and perceptions about these courses and whether these courses meet their needs or not are of great importance for the success and motivation of the students. A number of research (Sampson, 2003; Beare, 1989; Hilgenberg and Tolone, 2000; Jones, 1992; McCleary and Egan, 1989; Garrison, 1990; Holmberg, 1989) highlights satisfaction of students about distance education programs. However, there is rare research (Lambert, 1991; White, 2006; Rashid, Khokhar and Tahir, 2013; Işık, Karakış, and Güler, 2010) on students' satisfaction and needs about language courses through distance education. This study, therefore, investigates students' satisfaction and needs about English course in a distance education program in the associate degree level offered in a state-funded university in Turkey.

2. Review of literature

2.1 What is distance education?

In a general sense, distance education, some call it open learning, mainly serves learners who cannot attend face-to-face courses or programs for one or another reason. Learners stay at home or office and follow the course, do the assignments, and interact with each other and the teacher via internet. In other words, they take the responsibility of their own learning, which means that learner autonomy is of great importance. Sampson (2003:104) defines distance learning as "... a mode of delivery (independent learning at a distance through the means of self-study texts and non-contiguous communication)". As Holmberg (1989:24) states, people prefer distance education for "the convenience, flexibility and adaptability of this mode of education to suit individual students' needs". Actually, distance education appears in the educational field as a new technique because of the increasing demand for these flexible and convenient aspects. Ohler (1991:22) emphasizes two aspects of distance education: "how it can change our approach to learning and how it can change us". In fact, what Ohler focuses on is related to innovation in education. Distance education mainly rises due to learners' needs for lifelong learning.

The rapid spread of distance education in the world not only offers learners and teachers great opportunities but also brings a lot of challenges. Learners are unsupervised, self-directed, independent, and expected to be more autonomous. This freedom brings many questions together such as Does it lead to low-quality education? Are the materials developed by specialized teachers used effectively as in face-to-face courses in distance education? Who controls the materials? and so on. Besides these negative opinions, some researchers state that students are not alone in the process, but they are in a constant interaction between teachers and their peers. Although there appears opposition to distance education, it seems to continue to catch the attention of educators, teachers, and learners in the future.

2.2. Relevant studies

Research about distance language education courses in general focuses mainly on the effectiveness of teaching language skills, technological aspects in language teaching, and autonomous learning. For instance, Sole and Hopkins (2007) contrast two approaches to distance language learning on the basis of providing practice in four language skills, designing appropriate assessment strategies, and learners' contribution to the educational context. They analyze distance educational philosophies of two universities clarifying some similarities and differences. They conclude that each university provide learners with good quality language courses, however, the writers point out that institutions wishing to carry out distance language courses need to reconsider their medium and long-term consequences about technology. Similarly, Lampert (1991) mentions the lack of innovative development in distance language courses and states that individual language learning needs remain unmet. He maintains that in order to compensate for these disadvantages, upper-level skill instruction should be attached importance, more flexible modules must be produced, and less commonly taught courses must be included in the distance education programs. In another study, White (2006) presents a critical overview of the distance language teaching and learning field. She states that distance language learning is conceptualized as the development of technology-mediated language learning opportunities. She maintains that there is a shift from the delivery of the content to facilitating transactions between, learners, teachers, and native speakers. She emphasizes the importance of independent learner concept, but this is also replaced by collaborative learning community through distance education.

Research on the attitudes of the students towards distance language learning is limited. Glisan, Dudt, and Howe (1998), in their study about two aspects of distance language learning: achievement and attitudes, found that distance programs could have a positive effect on achievement and attitudes. Similarly, Rashid, Khokhar, and Tahir (2013) analyze learners' attitude towards printed word in distance education. They conclude that the distance education makes the learner learn through the medium of the printed word and other technological tools. They maintain that the printed word provides real teaching by itself and it can be used as a substitute for the textbook. Another study which focuses on learners' attitudes towards distance learning is by Işık, Karakış, and Güler (2010). They examine post-graduate students' attitudes towards web-based distance learning. They make use of a questionnaire and a demographic survey to gather the data. The results of their study indicate that there is a general positive attitude towards distance learning. Female students' attitudes are found to be more positive compared to

IECT 2014

males. The researchers maintain that most of the students find feel more comfortable in distance learning although some express boredom during the activities on the web.

3. Method

3.1. Participants

The study was administered to 72 distance learning associate degree program freshman students attending a state-funded university in Turkey. They took all courses through distance education during 2013-2014 academic year. They had asynchronous courses for each lesson every week during the year. They also followed synchronous courses organized by the Distance Education Centre of the university. Synchronous courses were offered each week by the instructors of the lesson. English courses during the academic year were taught by four instructors who were specialized in their field.

3.2. Data collection and analyses

Data were collected through a Likert- type questionnaire including 20 items which would be answered by the students on the base of six quality descriptive words: 1- Excellent, 2- Very Good, 3- Good, 4- Fair, 5- Poor, 6-Very Poor. The questionnaire was inspired, compiled, and redesigned by the researcher from the course evaluation form available on the University of Washington web page. The data gathered through the questionnaire were entered to Microsoft Excell and then transferred to SPSS 20 package program. The reliability coefficient of the questionnaire was found to be ,736 for 20 items. Factor analyses of the questionnaire revealed 5 dimensions explaining 93,504 % of the total variance. In order to verify the quantitative data, semi-structured interview was administered to randomly selected 20 students and the results were quantitized with the help of categorization and coding systems.

4. Results

In this part, findings about the data gathered through the questionnaire and semi-structured interview are presented. Percentage of the students' attitudes towards the distance language learning course is given by employing the tables in the first section. The second section deals with the findings about the semi-structured interview with the help of the related graphs.

4.1 Results of the questionnaire

Students' attitudes towards the English Course are presented in Table 1 below. As it is emphasized below, the first statement was responded positively by almost all of the students. Their overall evaluations about the course range from good to excellent. The course content also was evaluated positively by all of the students. However, It is striking that the organization of the course was evaluated as 'Fair' by half of the students. This evaluation of the students indicates that proportion of the course components, asynchronous and synchronous parts need to be revised. Clarity of the course objectives were also criticized by most of the students as 'Fair' or 'Poor'. Effectiveness and usefulness of writing, listening, and speaking skills in the course were criticised negatively by most of the students. The reading sections were relatively perceived as positive and useful. These results show that the way of presenting language skills in the course should be improved to a great extent.

Table 1. Course Related Attitudes

IECT 2014

Statements	EX	VG	G	F	P	VP
1. The English course offered via distance education as a whole was:		25 %	50%	25%		
2. The course content was:		12,5%	25%	62,5%		
3. The organization of the course was:			12,5%	37,5%	50%	
4. Clarity of the course objectives was:			25%		37,5%	37,5%
5. Usefulness of reading sections in the course was:				37,5%	37,5%	25%
6. Usefulness of writing sections in the course was:				12,5%	12,5%	50% 25%
7. Usefulness of listening sections in the course was:				12,5%	25%	37,5% 25%
8. Usefulness of speaking sections in the course was:				12,5%	25%	37,5% 25%

EX: Excellent **VG:** Very Good **G:** Good **F:** Fair **P:** Poor **VP**: Very Poor

Table 2 deals with the findings about the instructor related attitudes. The contribution of the instructor to the course was evaluated as 'Good' or 'Very Good' by 87,5 % of the students. This result shows the confidence of the students in the instructor, which was verified with the results of item 13 as well. The feedback issue was evaluated as positive by half of the students and as negative by the other half. This finding also indicates the existence of a problem regarding providing feedback. The instructor's abilities and his/her approach to the students having different skill levels were also appreciated by most of the students.

Table 2. Instructor Related Attitudes

Statements	EX	VG	G	F	P	VP
9. The instructor's contribution to the course was:			37,5%	50%	12,5%	

IETC 2014

10. Feedback provided by the instructor was:	12,5%	37,5%	37,5%	12,5%	
11. The instructor's overall abilities of conveying information were:	12,5%	50%	12,5%	12,5%	12,5%
12. Tailoring of instruction to varying student skill levels was:	37,5%	25%	25%	12,5%	
13. Confidence of the students in instructor's knowledge was:	50%	50%			

EX: Excellent **VG:** Very Good **G:** Good **F:** Fair **P:** Poor **VP**: Very Poor

The following table indicates the attitudes towards the synchronous courses. As it is seen in Table 3, overall effectiveness and quality of these courses was appreciated by all students. This may be attributed to the nature of distance education programs since the students have the unique opportunity to meet and interact with the instructor and their peers during synchronous courses. This result was also verified with the percentage of the students' involvement in these courses. Item 16 deals with instructor's help during the synchronous courses. 62,5 % of the students thought that instructor was helpful during the process. The most interesting result of this dimension of the questionnaire is that a great majority of the students found the time allotted for the synchronous courses to be insufficient. This result indicates that the duration and number of the synchronous courses need to be increased.

Table 3. Synchronous Courses Related Attitudes

Statements	**EX**	**VG**	**G**	**F**	**P**	**VP**
14. Effectiveness and quality of the synchronous courses were:		37,5%	37,5%	25%		
15. Time allotted for the synchronous courses was:		12,5%			37,5%	25% 25%
16. Instructor's help during the synchronous courses was:		25%	37,5%	12,5%	12,5%	12,5%

IETC 2014

17. Your involvement in the synchronous courses was:	75%	25%

EX: Excellent **VG:** Very Good **G:** Good **F:** Fair **P:** Poor **VP**: Very Poor

The fourth dimension of the questionnaire was about assignments related attitudes. Half of the students thought that the assignments were not clear enough. 75 % of the students were not aware of their responsibilities. These results indicate that the assignments in this distance language course should be redesigned and revised. Since the learner autonomy in distance education courses is of great importance, students' responsibilities and requirements should be well-defined.

Table 4. Assignments Related Attitudes

Statements	**EX**	**VG**	**G**	**F**	**P**	**VP**
18. Clarity of the assignments was:				50%	37,5%	12,5%
19. Clarity of students' responsibilities and requirements was:				25%	50%	25%

EX: Excellent **VG:** Very Good **G:** Good **F:** Fair **P:** Poor **VP**: Very Poor

The last dimension of the questionnaire was about grading system related attitudes. The findings reveal that 85,5 % of the students were not content with the grading system. This may be attributed to multiple-choice exam type as summative assessment. The course does not allow formative assessment for instructors and this leads to students' displeasure at the grading system.

Table 5. Grading System Related Attitudes

Statements	**EX**	**VG**	**G**	**F**	**P**	**VP**
20. Grading Techniques were:			12,5%	25%	62,5%	

EX: Excellent **VG:** Very Good **G:** Good **F:** Fair **P:** Poor **VP**: Very Poor

4.2. Results of the Semi-structured Interview

IETC 2014

In the semi-structured interview, three main questions were posed to 20 randomly selected students. The findings about the interview are presented in the following figures.

Q-1: Did the course meet your expectations?

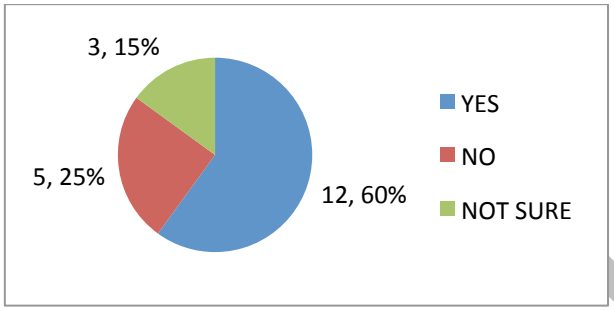

Figure 1. Interview Results about Course Expectations

As it is clear in Figure 1 above, 60% of the students thought that the course met their expectations. This percentage corresponds to 12 students in number. On the other hand, 25% of the students said 'No' stating that the course was not effective enough to meet their expectations. 15% of the students was not sure about whether the course met their expectations or not.

Q-2: What three things did you like most about this course?

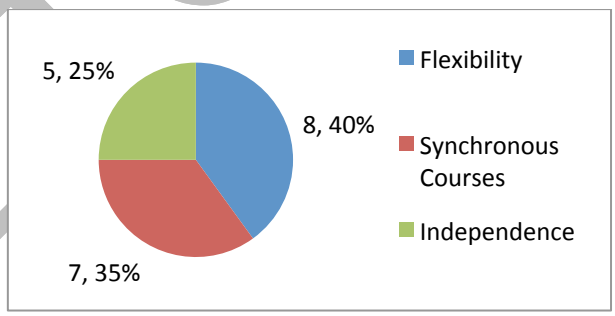

Figure 2. Interview Results about Students' Perceptions of the Course

In the semi-structured interview, students were expected to say three things they liked most about the course. 40% of the students thought that they liked 'flexibility' of the course most. 35% of the students stated that they enjoyed synchronous courses most, while 25% thought that they liked the notion 'inde-

IETC 2014

pendence' the distance course created. These results revealed that removing time and place limitations in the course seemed to please the students. Synchronous courses also had a positive impact on students.

Q-3: What three things did you like least about this course?

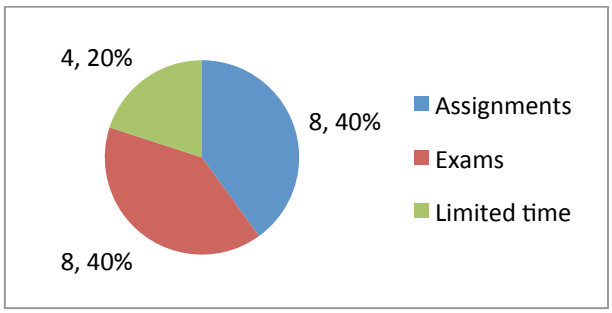

Figure 3. Interview Results about Students' Perceptions of the Course

As for the things the students liked least about the course, the figure above indicates the details. 40% of the students stated that they did not like the assignments in the course. Similarly, the other 40% thought that exams were among the things they liked least. 20% complained about time limitation in the synchronous courses. These results indicate that grading system and assessment techniques in the distance education English course need to be revised.

5. Discussion and conclusion

Both quantitative and qualitative findings gathered through the questionnaire and semi-structured interview indicate that distance English course generally meets students' expectations. However, some skills such as listening, speaking and writing are evaluated as weak parts by most of the students. It is considered that presenting and integrating language skills in face-to-face language courses needs to be planned well beforehand. When it comes to distance language learning courses, it is more challenging. The negative perceptions of students about effective teaching of language skills may be attributed to this challenge. Providing feedback is another issue which is negatively evaluated. This may be because of the time limitation in the synchronous courses as synchronous courses provide students with almost the only opportunity to get feedback from the instructors. Assignments, grading techniques and clarity of students' responsibilities are also criticized by most of the students. Semi-structured interview verifies these results since almost half of the students state that assignments and exams are among the ones they like least about the course. Actually, it seems to be difficult to organize assignments in distance language courses, but when it is planned well, the reactions will be probably better. The study yields not only negative aspects but also some positive findings about the distance English course. For instance, a great majority of the students enjoy distance English course since it enables them to follow the lesson independent from time and place. This flexibility can be regarded as one of the main strongest aspects of the distance course. This study deals with only one distance education program in a one state-funded university. A wider and more comprehensive study can be conducted by comparing two or three programs with more students in the further research. It is hoped that this case study will give some hints about the nature of distance language courses and their improvements for the following programs.

Abstract

This paper targets the need to change teaching methods when teaching math. This is important because mathematics is known to have a high failing rate in the university and low understanding in the basic levels. Even with the digital technologies in the classroom, the educational model continues to be *exemplification*. Taking software GeoGebra, as an example, we can see that the attitude of the students goes from being, from a *passive state* to *an active one*. This leads to learning by *Discovery*. The change not only depends on the support of digital technology but, also, on a good instructional model.

Keywords: Digital Technologies; Educational Mathematics; GeoGebra

1. Main text

This paper analyzes the changes in Educational Mathematics since the introduction of digital technologies, as a resource, to the classroom. It further reviews the changes derived from the usage of specialized software that transferred the static classroom models into dynamic models; using GeoGebra as a case of study.

Chapter 12 Nomenclature

A GeoGebra, specialised Software of dynamic Mathematics

Dynamic models as change enablers in Educational Mathematics

IETC 2014

UNAM is ruled by the freedom of teaching based on the Mexican constitution. This means that teachers are free to use the resources that they judge best available in order to fulfil the curricula.

Until the last decade, the model to teach science that has been more widespread is the transmission-exemplification. Also known as Traditional Model, it consists on a teacher in front of the class presenting exercises similar to the ones the students can solve with their cognitive level. In the present time a great number of teachers try to use digital technologies in the class room, but even, with the use of lap tops and projectors, the way the teachers give their lessons, still remains the same, transference and exemplification, the difference is the projector instead of the blackboard.

This is not incorrect by itself, the use of digital technology can improve the structure of each session in the class room, but it does not change the teaching paradigm.

However, multiple studies have concluded that a change of paradigm is needed since the current model fails even in well evaluated students.

Method, Study Case: The use of GeoGebra to change Educational Methodology

In January of 2002, Markus Hohenwarter from the Johannes Kepler university in Linz, Austria, launched the first release of the educational software GeoGebra under the license of creative Commons. It was a utility software both to teach and to learn which allowed a dynamic interaction of geometry, algebra, statistics and analytic resources. It is interactive mathematics software for learning and teaching mathematics and science from primary school up to university level. Constructions can be made with points, vectors, segments, lines, polygons, conic sections, inequalities, implicit polynomials and functions. All of them can be changed dynamically afterwards. Elements can be entered and modified directly via mouse and touch, or through the Input Bar. GeoGebra has the ability to use variables for numbers, vectors and points, find derivatives and integrals of functions and has a full complement of commands like Root or Extremum. Teachers and students can use GeoGebra to make conjectures and to understand how to prove geometric theorems. The software is introduced as a friendly model that can be used to exemplify the mathematical concepts ranging from the basic ones to complex applications like angular velocity.

With the application of this software in the classrooms, teachers have a didactical resource that allows them to work in different visualizations of mathematics through a projector. This represents a resource that can be taken to the classrooms at different educational levels. This also spawned several knowledge communities based on the software. Experts in different areas that converge into mathematics, make trans-disciplinary communities that allow information exchange, thus generating new knowledge.

Since the GeoGebra knowledge community grows exponentially in a virtual environment, the limitations that arose were not geographic but ethnographic. In order to overcome this, regional institutions were created to target specific needs of each community. In Mexico, the first institution was recognized in October of 2010. And, as a positive result, in 2014 there were five regional institutions recognized by the international organization.

1.1. Dynamic Mathematics as an educational model

Now that the resource became available, it is appropriate to change the educational model into one that is no longer by transmission. This will be possible by taking the necessary steps for training the people that will apply it.

Since 2011, in Mexico, specialized training has been offered to the teachers so they can achieve the skills needed to facilitate the transition into classrooms and workshops.

IETC 2014

This study documents the work of 23 teachers in a workshop that had the necessary resources (projector, one computer per participant, internet access and a blackboard). The sample had heterogeneous subjects/topics with participants from all six Mathematics disciplines that are taught in the senior high school and in the university: Algebra, physics, differential equations, numeric methods, calculus, etc. Most of them professors at the UNAM faculty of MAC (Bachelors in Mathematics).

In order to verify the results, the participants were requested to present an exercise in the subject they teach. Then analyze the way in which it would affect their class to create a change of paradigm.

1.2. The Implementation

For a period of 15 days, teachers were enabled to use GeoGebra. They started in the most basic levels of the cognitive model, from remembering to creating. This study was completed using Bloom's taxonomy for the digital era (Churches) as a guide to the methodological model to create knowledge.

1.2.1. Step 1 Remember

To start, participants were shown a lecture using the traditional model in order to show them how they usually teach a class. Then, they generated the same knowledge using GeoGebra with a model different from the transmission one.

1.2.2. Step 2 Understand

They were introduced to the tools and instructions that the software comes with, so that they could generate an educative model with that software.

1.2.3. Step 3 Apply

Once they were familiarized with the software, they were introduced to specific mathematical models from basic geometry to calculus maximums and minimums.

1.2.4. Step 4 Analyze

Throughout the study, it became clear that not all the topics could be taught using digital technology. A good instructional model was required to split some topics using digital technologies and others using additional materials, combining them to create significant learning.

1.2.5. Step 5 Evaluate

There was an evaluation of which material should be developed by the teachers using GeoGebra for the lecture and which should be developed by the students, to generate learning by discovery.

1.2.6. Step 6 Create

To conclude, all students had to create an example using GeoGebra of a topic in the curricula. Some of the models were so outstanding that they demonstrated the paradigm change in the teaching of mathematics.

Results

In the end, the participants presented the implementation aspects to use the software in the classroom which included:

a) Use the software to teach basic examples of the subject they teach, in order to get the students familiarized with it.
b) Provide the students with an instruction manual to allow them to start working.
c) Analyze feasible examples to develop with GeoGebra
d) Match the curricula with the examples that the teacher will develop and the ones that he can assign to the students. This way, they will have an active attitude in their learning.

IETC 2014

All these steps were recommended. However, all the teachers agreed that the most important part was to introduce a new strategy to the classroom, one that is based on a good instructional design.

Discussion & Conclusions

The main conclusion was that using a digital model does not change the educative model. There can still be a negative environment, one where the student looks to own the information, resulting in a model of belonging, and not learning.

The transmission model, using digital technologies, has positive factors in itself, such as the subject arrangement and time balancing. But this, itself, does not change the educative paradigm.

In order to prompt a change in the progress on learning, we have to change the methods of teaching using specialize software.

It is known from the constructive point of view, when someone execute an action, significant learning is held.

Acknowledgments

This paper couldn´t be obtained without the support of GeoGebra.org, and the International GeoGebra Institute at UNAM

Abstract

This paper describes the results of a preliminary evaluation of an educational multimedia app containing information and videos of some exemplary techniques in performing reading intervention towards children with dyslexia. The activities encompassed an evaluation with content expert, heuristic evaluation with courseware experts and a pilot study. The evaluation activities revealed some minor errors in the app and were used to make refinement. The pilot study was carried out to evaluate the effects of the app towards learners by employing a pre-test and post-test with a sample of target respondents (*n=30*). They were special education pre-service teachers who were in their fourth semester. Subjects were administered with two instruments about knowledge and self-efficacy belief in dyslexia literacy intervention, before and after using the app. The results revealed mean increase in subjects' knowledge and self-efficacy belief after receiving the treatment.

Keywords: dyslexia reading intervention, evaluation, Android app;

IETC 2014

1. Introduction

A preliminary evaluation of an Android-based educational multimedia app was conducted to evaluate it from experts' perspectives and to test its effect towards the target users. The purpose of the app is to portray some examples of techniques in performing literacy intervention towards children with dyslexia. The app could be used as supplemental material for university course in special education, particularly teaching strategy for children with dyslexia. Therefore, the target users are special education pre-service teachers. The app contains background information about each teaching strategy and exemplary videos that demonstrates the technique as employed by actual teachers who specialises in teaching children with dyslexia in learning to read.

Development of the app was underpinned by two theories namely the Cognitive Theory of Multimedia Learning (Mayer, 2009) and the Social Cognitive Theory (Bandura, 1986). The Cognitive Theory of Multimedia Learning (Mayer, 2009) postulates that the human information-processing system contains channels for processing visual/pictorial and auditory/verbal stimulus, in which each channel has restricted capacity for processing, and active learning requires performing suitable cognitive processing during learning. The theory views multimedia learning as a knowledge construction tool, which supports learner to actively make sense of the presented information, rather than as a passive receiver. The Social Cognitive Theory (Bandura, 1986) suggests that people can learn new information or behaviour by observing others. This process is also known as observational learning. In this view, observers are more likely to learn from a model that they perceived as having similar characteristics or as someone superior. By observation, the learners can acquire knowledge in the demonstrated behaviour without practising it. Therefore, the learners may in the future perform the behaviour when situation permits.

The development process was implemented according to the model of multimedia design and development (Alessi and Trolip, 2001). The model was chosen because it offers flexibility in designing instructions according to the needs and characteristics of the multimedia learning software. The model encapsulates the necessary steps in executing the planning, design and development phase. It incorporates three attributes which are standards, on-going evaluation and project management in the planning, design and development phases. Evaluation of the app was done at the end of development phase. The following sections contain some literatures pertaining to the study.

1.1. Dyslexia and reading intervention strategies

Dyslexia is a specific language disorder that causes problem in reading, writing and speaking (Richardson, 1992). It has been described as a specific learning disability that is neurobiological in origin and is characterized by poor word recognition, spelling and decoding abilities despite having higher cognitive abilities and receiving effective classroom experience (Reid, Shaywitz, & Shaywitz, 2003). Dyslexia is defined by the World Federation of Neurologist as 'a disorder in children who, despite conventional classroom experience, fail to attain the language skills of reading, writing, and spelling commensurate with their intellectual abilities' (Gomez, 2004). Strong evidence shows that children with dyslexia continue to experience reading problems into adolescence and adulthood (Shaywitz, et al., 1999; Shaywitz, et al., 2003).

Therefore, it is paramount to help dyslexic children to master the reading skills because if left untreated, they will develop low self-esteem and poor confidence (Abdullah, 2004). Furthermore, without effective intervention, a person could develop emotional problem because of inferiority and frustration (Wong, 2009). Spector (1995) in Muter (2004) has suggested early intervention program to include training in phonological awareness, that is by practising the sound of words, segmenting and blending sound in words and training phonics (letter-sound relationships). Echoing this, Thompson (2010) recommended that reading intervention for children with dyslexia should not only be phonologically-based, but incorporates the multisensory technique, involving complete utilisation of the children's visual, auditory and kinaesthetic sensory components to enhance memory and learning..

1.2. Multimedia learning for teacher education

Past research has shown the effectiveness of multimedia learning application in teacher education, for instance Levin and Matthews (1997) revealed multimedia has positively influenced the awareness, knowledge and attitudes of pre-service teachers toward gender-equity issues in elementary classrooms. Meanwhile, multimedia courseware embedded with exemplary videos and animations were able to promote positive attitudes towards learning and enhance motivation perceptions among learners, as compared to learners who learned without exemplars (Moreno & Ortegano-Layne, 2008). Furthermore, Goldman and Torrisi-Steele (2009) described a CD-ROM based courseware about human relationship education, which was designed as a teaching tool to replace lectures and tutorials, and as a revision tool for primary pre-service teachers. It was found that the courseware was able to enhance the pre-service teachers' learning about key concepts of the topic, and learners favoured the courseware since it allowed them to study at own pace. In addition, Fitzgerald, et al. (2011) concluded that multimedia cases helped bridge the gap between theory of teacher education and practice, thus enhancing the pre-service teachers' knowledge and skills in teaching students with emotional/behavioural disorders.

Considering the benefits of multimedia learning application towards learners, it was chosen as the technology to be utilised in developing supplemental material about dyslexia for pre-service teachers. In line with the concept of observational learning and modeling in Social Cognitive Theory, videos was chosen as modeling tool to be embedded into the multimedia learning application since it has the capability to portray real examples of behavior while it is performed in authentic setting. The video would demonstrate some strategies in employing multisensory techniques and phonics when teaching dyslexic children to read.

IETC 2014

2. Application of principles into the user interface design

The Principles of Multimedia Design (Mayer, 2009; Clark and Mayer, 2011) and the Usability Framework for m-Learning (Fetaji and Fetaji, 2011) were used as guidelines in designing the user interface and navigation. The principles of Multimedia Design (Mayer, 2009) were derived from the Cognitive Theory of Multimedia Learning. It supports instructional designers in the design of multimedia instruction that manage the cognitive load of the learners. The purpose of the principles are to ensure the multimedia learning environment is designed in such a way that it will promote deep and meaningful learning by supporting cognitive processes such as reducing extraneous processing, managing essential processing, and fostering generative processing. The extraneous processing involves processing of unrelated material during learning which is caused by poor instructional design. The essential processing is the processing of the essential material in working memory, while the generative processing aims to promote deeper understanding where learners make sense of the presented material.

One of the principles in managing essential processing is the segmenting principle. Mayer (2009) suggested that multimedia message be divided into smaller more manageable chunks that keep pace with the user rather than as a large continuous piece. When an essential material is too complex, it will overload the working memory of the learners, making it impossible to comprehend at once. Mayer (2009) asserted that in this situation, learner might be able to select only a few portions of the lesson, but unable to gain deep understanding. Ideally, with smaller segments that allow user control, learners could learn each at their own pace.

The segmenting principle was applied to the videos embedded in the app, in which a pre-recorded full-length video was divided into smaller but meaningful segments. Each video segment is accompanied with a player that consists of the Play, Pause, Stop and Slider buttons. This could allow freedom for learners to play, pause and stop at any time and watch the videos from any section that they prefer. Besides that, the background information for each intervention technique which mainly contained texts was also divided into smaller segments to support user-paced learning.

The intervention technique demonstrated in the app was made up of three steps, which were identifying letter-shape, identifying letter-sound and pronouncing syllables. For each step, its background information and video segments were presented in three tabbed screens namely Introduction, Preparation and Technique. The background information was described in the Introduction and Preparation tabs, while the video segments can be found under Technique tab. Figure 1 depicts the screen of pronouncing syllables.

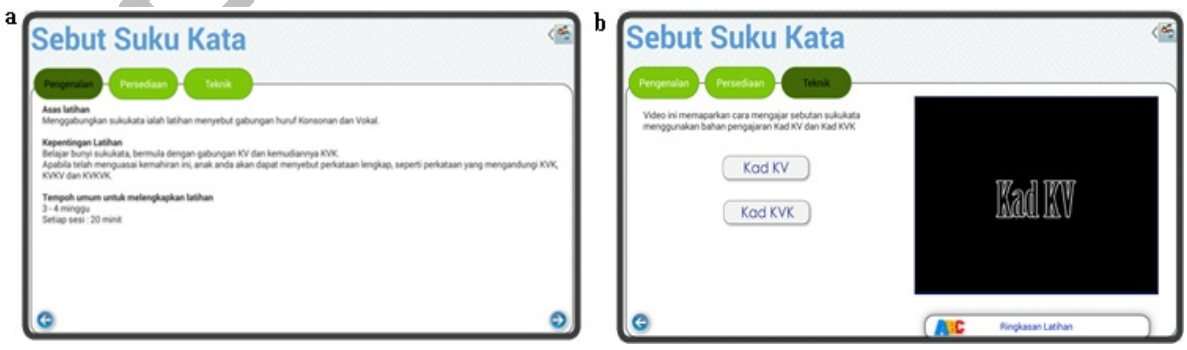

Fig. 1. (a) Pronouncing Syllables - Introduction; (b) Pronouncing Syllables - Technique

3. Evaluation process

The preliminary evaluation consisted of two activities which were evaluation by experts, followed by a pilot study with a small group of subjects. The evaluation by experts was crucial because it could elicit errors in the user interface and contents of the learning app. Thus, refinement could be made before it was used in a pilot study. The following sub-section provides description of the activities.

3.1. Evaluation by experts

The expert evaluation entailed quality review by a subject matter expert and multimedia experts. The subject matter expert was a senior lecturer in special education who has a Ph.D qualification and more than ten years of experience in the field. As such, it was deemed sufficient to perform initial evaluation with only one subject-matter expert. The expert evaluated the app contents using a courseware evaluation form which encompasses dimensions such as instructional design, learning contents, user control and technical issues. Among the items included for evaluation were the suitability of teaching strategy and method employed with the target users, sufficiency of interactivity in navigation, spelling and word structures, and suitability of the interface design with the users. Based on the suggestions made by the expert, minor corrections were made to the instructional design and learning contents to make it more comprehensible by the learners. According to the expert, the details for every intervention technique should be provided in succinct explanations. This is to avoid boredom among learners when they are forced to read long sentences in a small screen such as tablet. Therefore, certain sentences which were considered too long by the expert were reconstructed into concise statements. Additionally, the expert commented there should be a sentence to clearly state that the app portrays only some examples of reading intervention technique. This was a way to inform learners that many other possible techniques exist, which can be employed by teachers. In the area of interactivity and navigation, the expert recommended adding Back button on every screen to return to the previous page of the lesson. This would provide opportunity for learners to revisit preceding lesson and adequately learn basic but necessary knowledge before exploring more advanced lessons.

The multimedia experts evaluated the usability of the application using a heuristic evaluation form which was adapted from Nielsen's Heuristic (Nielsen, 1994). It is a type of inspection that enables the experts to compare the learning application against accepted usability principles. Therefore, usability problems on the user interface could be identified. Two senior lecturers in the field of multimedia, who have approximately eight years of teaching experience in the area were selected to conduct the heuristic evaluation. The experts were required to use the app from the beginning and inspect every screen thoroughly. They listed all usability problems that were detected into the evaluation form and described how the problems violated the heuristics. The recommendations made by the experts were taken into considerations. Thus, few elements on the user interface were modified, such as adding Home button on every screen to make it easier to return to the main screen. This flexibility in navigation could allow users to revisit the beginning of the lesson and jump to any screen afterwards. By performing the simple modification towards the navigation, it would enable complete user control and freedom as recommended in the usability heuristics. Beside that, every link for the videos was also added with label to indicate its duration. It was deemed important because it will enhance the visibility of the system status, which is also outlined by the Usability Guidelines for m-Learning (Fetaji & Fetaji, 2011). Initially, each video segment would be played within its pre-defined area on the screen. The experts commented that it was quite small; hence modification towards the video controller was made so that it could be run in full screen.

3.2. Pilot study

Upon completion of refinement towards the app, a pilot study was carried out with a small group of learners who were administered with the pre-test, treatment and post-test. 30 university students who were undertaking a degree in special education participated in the study. They were in Semester 4 and have undertaken an introductory course about learning difficulties. They will not be participating in the actual data collection. The purpose of the pilot study was to evaluate the effects of the learning app on the knowledge and self-efficacy belief of the subjects toward dyslexia literacy intervention. It also serves other purposes as outlined by Chua (2012), such as to ensure that the research procedures can be run smoothly in actual data collection, to identify any problem that might arise during actual study, and to make

IECT 2014

suggestions for improvement of the actual study. The process enabled the researcher to observe how learners use the application, the problems that they encountered while using the app, the time taken to administer every instrument and the procedure that could be improved as a preparation for the actual study.

The learning app has been pre-installed into each tablet. As such, there is no need for internet connection to download and install it during the pilot study session. Errors and problems with the application, especially the videos were also examined. It was observed that some participants encountered problem in loading certain videos after touching the links. Nevertheless, after performing inspection on the tablets that they were using, this was mainly caused by the processing capability of some tablets. The issue was recorded and resolved by ensuring the cache memory of each tablet be cleared prior to treatment session.

During the pilot study, the subjects were required to answer two instruments pertaining to their knowledge in dyslexia reading intervention, and self-efficacy in implementing reading intervention. They were administered with these instruments during pre-test and post-test. The instruments were developed by the researchers of the study in order to ensure that it measures only topics that have been covered in the learning app. The reliability tests for both instruments were conducted earlier; by employing the internal consistency procedure using Cronbach Alpha. The instrument to measure knowledge, which is Scale of Knowledge in Dyslexia Literacy Intervention, yielded an internal consistency of 0.936. It measures the subjects' knowledge in the learning difficulties and socio-emotional problems usually faced by children with dyslexia, as well as the knowledge in implementing literacy intervention towards children with dyslexia. It contains 30 statements and is divided into three sections, which are Reading Difficulties, Socio-Emotional Problem and Literacy Intervention.

The instrument to measure self-efficacy belief, which is Self-Efficacy Belief in Implementing Dyslexia Literacy Intervention, yielded an internal consistency of 0.935. The instrument contains 12 statements that measure the subjects' self-efficacy belief in implementing literacy intervention towards children with dyslexia. The statements are concerned with identifying the specific reading difficulties, preparing teaching aid and implementing the literacy intervention according to the correct strategies. Both Cronbach Alpha values were considered within excellent range, as described by George and Mallery (2003).

The study was designed by conducting a pre-test, followed by treatment through the app. The subjects were given 60 minutes to use the app. They were also provided with a user manual and were shown a demonstration about using the app. It was observed that the subjects could familiarize themselves with the app fairly quickly and used it smoothly. After the treatment, the subjects were administered with the same instruments again, but with items restructured. The result of the pilot study revealed that there was an increase in the mean score for knowledge and self-efficacy belief among the subjects after receiving the treatment via the learning app. Table 1 and Table 2 describe the results for knowledge and self-efficacy belief during pre-test and post-test.

Table 1. Result of Knowledge test

	Pre-test	Post-test
n	30	30
Mean score	126.57	132.93
Standard deviation	10.71	8.74

Table 2. Result of Self-efficacy Belief test

	Pre-test	Post-test
n	30	30
Mean score	45.13	50.73
Standard deviation	4.62	4.22

IETC2014

4. Conclusion

The preliminary evaluation which consisted of evaluations by experts in subject-matter and in multimedia has enlightened the researchers about some usability and contents flaws. Among the substantial ones found in the user interface were the navigation and content structures. The recommendations by the experts were used as guidelines in the process of making improvement towards the learning app. It was an essential step before employing the app as a treatment in a pilot study to test its effects towards learners. The outcome of the pilot study indicated that the app has successfully enhanced the knowledge and self-efficacy belief in dyslexia literacy intervention among the subjects. The pilot study provided a window of opportunity to test the research procedures and the effectiveness of the app on a small scale. In order to obtain a more reliable result concerning the effects of the app towards learners, the study will be extended with a larger number of subjects during actual data collection phase.

Abstract

Vinnytsia State Pedagogical University has taken significant steps in policy and practice toward democratization of education. However, many Ukrainian universities have failed to meet European standards required of the Bologna Process, intended to render Ukrainian higher education equal to leading European universities. Superficial changes have not eliminated corruption, poor educational quality, excessive administrative control, or a workload that leaves little room for research or creative work. This paper shares the VSPU experience integrating educational technologies to promote democratization of pedagogy, providing students and faculty with better opportunities for professional growth to become competitive in the educational market of our time.

Keywords: Democratization; Ukraine; Distance Learning; Technology; Web-Blended Learning; International Partnership

IETC 2014

1. Introduction

On May 19 2005 the Ukrainian Ministry of Education (MES) signed a letter of commitment to join the Bologna Process (Educational Portal 2013). At the time, the Bologna Process was viewed as a breath of fresh air, offering a ready-made, time-tested model of serving knowledge without corruption, and with a strong focus on the quality of educational practices to facilitate close cooperation between governments, universities, students, and faculty (Bologna Process, 2010).

Despite nearly 15 years of independence, attempts to modernize and democratize Ukrainian higher education away from the corrupt and highly bureaucratic system inherited from the Soviet Union had reached a stalemate. A university education was no longer free for all students, but educational costs continued to increase and the content of educational practices remained essentially unchanged, with the same pedagogies, governance structures and lack of technology, resulting in poor quality education. Consequently, Ukrainian diplomas were still not valid in any other country except the post-Soviet Union republics.

Joining the Bologna Process represented a serious attempt to break away from the approaches and practices propagated in the Soviet Union, which were rooted deeply in the minds and habits of teachers and

* Corresponding author. Tel.: 1-573-651-2409; fax:.
E-mail address: dpowell@semo.edu

administrators. Alignment with the goals of the European Higher Education Area promoted mobility and diversity, providing students and faculty from Ukraine with equal opportunities to grow deeper in professionalism through cross-cultural exchange, democratizing and enhancing the quality of education (Bologna Process, 2010).

2. Historical context

2.1. Official support for technology-based education in Ukraine

The Ukrainian government has struggled to integrate the technology necessary to upgrade and democratize education. In 2000, the Ukrainian President endorsed support for Internet access (Alekseychick, 2001) and the Ministry of Education and Science (MES) established the Ukrainian Distance Learning Center (Shunevych, 2002; EdNU, 2010). This initiative was expanded on April 17, 2002, by a Regulation of the President, creating a consortium of six universities to establish "a pedagogical experiment in distance learning." On January 21, 2004, MES Order #40 established official policies and practices for technology-based distance education. When Ukraine joined the Bologna Process in 2005, a five-year plan was developed, "providing all Ukrainian schools and colleges with modern computer equipment … establishing special regional centers of distance education and local internet networks in universities," (Government Portal, 2005). However, there were few new developments in policy or practice as follow-up.

Renewed interest in technology-assisted distance education re-emerged in 2011, as a way to optimize work plans and reduce "obsolete forms of work and themes." Training of teachers for informatics was identified as a priority (Government Portal, 2011), and in 2012 and 2013, there was a significant surge in official government support for distance learning (MES: October 17, 2012; January 18, 2013; April 19, 2013; April 23, 2013; June 12, 2013; June 17, 2013). On April 25, 2013, Order No. 466 "On approval of distance education," updated and superseded the 2004 law with extensive definitional and logistical support.

Official state announcements and practices in the field can be difficult to reconcile. Even the MES acknowledged in a press release on June 17, 2013, "For many years in Ukraine there was not a clear idea of distance learning" and "different approaches to its organization in different schools" resulted in negative and low-grade examples adversely affecting public perception. Many Ukrainian Internet sites claiming research or practice in distance learning are outdated or without substance. Many courses that do exist appear little different from correspondence courses or remote lectures via television or Skype, however there are as many as eight to ten institutions of higher education in Ukraine that are significantly involved in distance education (Powell, Kuzmina,Yamchynska, Shestopalyuk, & Kuzmin, 2013). Critical barriers to technology-based education include lack of funding (especially for smaller districts and institutions), lack of faculty experience designing technology-based courses, psychological unpreparedness for interactions via technology, lack of computer literacy, and lack of computer or Internet access (Shunevych, 2002; Valiliev, Lavrik& Lyubchak, 2007; Klokar, Benderets & Borbit, 2011; MES, January 18, 2013).

2.2. Corruption: The Dark Legacy of Ukrainian higher education

Ukraine has the eighth largest number of university students in the world, with more than 800 institutions of higher education, but none are in the top 1000 worldwide (Abramovich, 2012). According to the World Economic Forum, "the country's most important challenge is the needed overhaul of its institutional framework, which suffers from red tape, a lack of transparency, and favoritism" (2013, p. 31), all of which severely undermine democracy. Ukraine ranks 144th out of 175 countries in perceived corruption (Transparency International, 2014) in the form of bribes, kickbacks, deceptive contracts, patronage, and retroactive tenders (Abramovich, 2012). Fifty-two percent of students surveyed reported that engaging in corrupt practices was "the easiest and most reliable way to solve problems" in higher education (Osipian, 2008, p. 325). Such corruption is by definition a dis-equalizing force, creating hierarchies and favoritism that are inherently undemocratic.

In 2008, university admissions processes converted to independent external assessment to make the process of university qualification more transparent and democratic, but "loopholes" quickly emerged, including advance or bootlegged test copies stolen from poorly monitored testing sites. In 2010, the objectivity

of this new admission process was further undermined when several additional admission criteria were reintroduced, including grade point averages, credit for unsupervised academic awards, secondary school leaving certificates, and false documentation as a member of a minority or socially protected group (Zhuk, 2010; Abramovicy, 2012; USETI Alliance, 2011; Council of Europe, 2011). The net effect was a reversion to "business as usual."

According to Ihor Likarchuk, Director of the Ukrainian Center for Educational Quality Assessment, "teachers fake teaching and students fake learning" (2013, paragraph 5). Professors' wages are chronically so low that additional income is needed just to meet minimal living expenses. Oral end-of-year examinations have little regulation or oversight to monitor the marks received, so instructors accept payments to retake exams, raise grades, or use course books or notes during the examination. "Private lessons," gifts, extra services, or textbook purchases are common in exchange for academic favors (Osipian, 2009; Council of Europe, 2011; USETI Alliance, 2011; Waldie, 2014). There have even been documented "price lists" circulated with specified amounts for a grade of A, B, or C (Osipian, 2009; Council of Europe, 2011).

Education is a crucial leverage point for combating corruption in government services (Mylovanov, 2014). Merit-based grades and reward systems must be instituted to bolster student confidence in the validity of individual effort and trust in public institutions as a means to build personal and social welfare. Higher wages for teachers and administrators and independence from over-regulation and arbitrary supervision (but not from public accountability), impartial monitoring and transparency, and reliable prosecution for abuses would help to reinvigorate integrity and, in turn, bolster the perception and reality of democracy in Ukrainian education.

3. Democratization of education – theory and practice

Michel Foucault asserted that "every educational system is a political means of maintaining or modifying the appropriateness of discourses with the knowledge and power they bring with them" (Ball, 1990, p. 3). Denial of democratic community in the school is an anti-intellectual act which presupposes the inability of students to think on their own and make decisions (Lambert, 2006). To the contrary, education is a transformative democratizing influence that enables a person to have more choices, enhanced personal welfare, and improved productivity (Liqing, Berci, & He, 2011).

However, education as an intellectual act and education as a social and political institution have often been at cross-purposes. Many social educators argue that as schools have developed, they have become increasingly locked into bureaucratic strictures with top-down administrative and instructional paradigms that leave education so homogenized that it has little meaning to the individual (Lambert, 2006). Educational access and equity, including gender and class equity, have become fundamental issues of political and social change in modern culture, especially in regions of the world most affected by pressures of urbanization and growing demands of democracy on government and society (Liqing, Berci, & He, 2011).

Democratic education emphasizes open access and equal opportunity (Liqing, Berci, & He, 2011), "with freedom of choice and a fair chance of success" (Kanwar, 2012). Democratization of education has led to "explosive demands…for open admission to institutions of higher education" (Heydenrich, Higgs, & Van Niekerk, 2004, p. 91). Such democratization has also resulted in new styles of education management and governance, with shifts in ideology and values. As the costs of traditional education increase and open-access alternatives proliferate, there has been a remarkable boom in online provision of programs and resources (ICEF Monitor, 2012; Kanwar, 2012; Kolowich, 2014).

It is not enough to simply make educational opportunities more accessible. Accessibility must be combined with high quality materials, rigorous expectations and accountability for engagement, in order to cultivate autonomous, reflective thinking and decision-making (Liqing, Berci, & He, 2011). However, new technologies "can play a critical role in dramatically improving education quality" and "catalyze economic growth" through the democratization of knowledge (Starr, 2013). However, high-quality incentive-based content, student engagement, and the support of well-trained facilitators are critical to success, as is content personalization to meet individual users' needs and interests (Dorman & Fraser, 2009; Starr, 2013; Acemoglu, Laibson & List, 2014). Over the long term, web-based technologies can further democratize education by making the work of highly skilled lecturers and curriculum developers broadly available,

IETC 2014

improving the quality of courses for instructors who have less skill, experience, or access to resources, increasing the scholarly and economic value of their work.

The use of technology empowers students to direct their own learning, democratizing teacher-student and student-student learning relationships (Mentz, 2014). The teacher becomes a facilitator guiding students to define and solve their own learning challenges more effectively, rather than passively absorb the knowledge of others. Students working individually and in collaboration in a virtual learning environment are able to work without the physical limitations of time and space, teaching themselves and each other as well as seeking the guidance of qualified experts as facilitators.

4. VSPU initiatives in applied democracy

4.1. Alignment with the Bologna Process

Since 2009, VSPU has undertaken many initiatives to establish and foster a commitment to democratize education. Many of these originated in compliance with the national commitment to align higher education with the Bologna Process (VSPU, 2010-2014b). Programs were reorganized with European credit requirements and the addition of Specialist and Master's qualifications, making Ukrainian degrees compatible with those of universities outside the former Soviet sphere. A standardized credit module system was implemented with a redesigned grading and assessment process using a grade designation of A/B/C/D/E/F based on a 100-point scale instead of the subjective and somewhat arbitrary assignment of a 1-5 point course grade. A commitment to merit-based grading with transparent standards and content rigor compatible with the European system has served to not only update Ukrainian higher education, but to also "level the playing field" and reduce opportunities for favoritism.

4.2. Collaboration with international partners

At the same time, VSPU also began to actively pursue international collaboration both as an institutional priority and as a result of significant faculty initiatives (VSPU, 2010-2014a). This has provided a tremendous boost to democratic collaboration between administrators, faculty, and students with international partners around the world. Such collaboration has also opened many doors to enable the inclusion of technological and pedagogical expertise of skilled lecturers and veteran practitioners of distance learning, increasing the quality and range of course content and activities available to VSPU students.

In 2009-2010, a senior instructor from the VSPU Institute of Foreign Languages received a Fulbright grant as Scholar in Residence at Southeast Missouri State University in the United States. This opened the door for a long-term collaboration with annual meetings between senior administrators of VSPU and Southeast to negotiate a formal partnership agreement. A Memorandum of Understanding was signed by the President and Provost of Southeast in 2010, followed by a formal articulation agreement in the fall semester of 2013, approving the transfer of up to 18 credit hours from VSPU toward a Master's qualification in Teaching of English as a Second Language (TESOL) at Southeast. Since 2010, at least three to four VSPU students have been enrolled at Southeast every semester. The first VSPU student to graduate from Southeast received a degree in TESOL in May, 2014. Two graduate students from 2013-2014 are continuing their studies at Southeast with grants as graduate assistants.

The first Fulbright faculty exchange was followed by several exchange experiences involving professors from the Institute of Foreign Languages over the next five years. In fall 2011, VSPU hosted its own visiting Fulbright Scholar in Residence from Bradley University, which is located in the U.S. State of Illinois. In2012 and 2013, four VSPU professors enrolled via distance education as non-editing guest instructors in an online teacher education class at Southeast. In 2013 and 2014, several additional Ukrainian and international partnerships were established by other VSPU departments with universities in Poland, Germany, and Russia. In spring 2013, VSPU hosted another faculty exchange with a teacher education professor from Southeast for a two-week visiting lecture appointment. This visiting lecture tour included presentations and meetings with VSPU administration, faculty, and students, visits to local primary and secondary schools, and a meeting with the Vinnytsia Teachers of English Union.

IETC 2014

In fall 2012, a pilot web-blended course, "Teacher Candidate Preparation in U.S. Universities," was jointly taught asynchronously and in real time with several American professors from Southeast and Bradley University. This represented one of the first experiments with asynchronous learning in virtual space, opening opportunities to interact with faculty and each other outside of scheduled class times. There was even a face-to-face class held in real time with U.S. and Ukrainian teacher education candidates via Skype. Results of research on student evaluations of the web-blended course were then presented at international conferences in Sakarya, Turkey, and St. Louis, Missouri (Powell, Kuzmina, et. al., 2013; Powell, Kuzmina, Yamchynska, Shestopalyuk, & Kuzmin, 2014). This course was offered a second time in spring 2014, with refinements derived from the pilot project, including another joint class via Skype, several new lecturers from Southeast, and a new lecture by the Provost of Nagoya University in Japan.

4.3. Technology for democratic management of data and resources

The success of democracy in higher education depends in large part on a shift to less restrictive management and governance styles (Heydenrich, Higgs, & Van Niekerk, 2004). Accountability, transparency, and appropriate regulation of data management are essential, not only to overcome endemic corruption, but also to re-establish confidence in the fairness and equity of administrative processes (Mylovanov, 2014). VSPU has made a significant commitment toward the use of technology to establish a more transparent and accountable administration, exemplified by several initiatives undertaken in the past two years (Shestopalyuk, 2014).

In September 2012, VSPU began using the "Dean's Office" automated record-keeping system to digitize student records with password protection and electronic security protocols. This not only makes the process of recording and accessing student records much more efficient, it also limits access by unauthorized persons and provides a time-stamped login trail. Increased transparency in management of student records discourages tampering, especially regarding entrance exams for graduate school, and facilitates inspection for accountability audits. During 2013-2014, VSPU increased the scope of this initiative with a series of additional data management and statistical programs ("PC-Student-Web," "PC-Student Transcripts-Web", and "Academic Curriculum") for tracking student progress, ordering certificates, and attesting to student achievement.

The proliferation of data management demands has also led to the organization of a Web Department to set up and secure data management programs and protocols as well as recruit and train operators and programmers. This new administrative unit has been charged with the launch of "PC-Colloquial," which will use electronic monitoring of records to track student progress in real time to enable timely interventions, when appropriate, in order to improve student academic progress. To better manage data security, VSPU has recently adopted the "AC-VSPU-1" protocol to process information of limited access categories.

On May 15, 2014, The Information Processing Centre at VSPU was made a unit of the Office of Education and Methodology for Monitoring and Analysis of the Quality of Education. A pivotal task in implementing this status is the need to acquire software and integrate fragmented and compartmentalized data banks from various departments and institutes into a university-wide data management system.

4.4. Technology for democratic teaching and learning

Technology has also been identified as an important lever to democratize teaching and learning through critical factors such as open access and equal opportunity (Liqing, Berci, & He, 2011), "freedom of choice" (Kanwar, 2012), content personalization (Dorman & Fraser, 2009; Starr, 2013; Acemoglu, Laibson & List, 2014) and empowerment of students to direct their own learning (Mentz, 2014). In the last three years, VSPU faculty members have become increasingly innovative in the use of democratizing learning technologies both in and out of the classroom.

A growing cadre of faculty have committed of their own volition to the use of technology to enrich lectures and incorporate digital audio-visual resources into class activities. Smartboard presentations and activities with live Internet access are regularly integrated into face-to-face classes. Several professors are also experimenting with out-of-class applications such as blogs, communication via social networks such as VKontakte, and web-blended applications organized by the British Council.

IETC 2014

The introduction of computerized tests has streamlined assessment and made the recording of scores more efficient and more secure. Electronic manuals and digital syllabi have simplified communication of expectations and increased student access to course materials. The university administration has also committed this year to initiate the implementation of Ministry of Education recommendations to contract with the Microsoft IT Academy to provide teachers with licensed educational programs and resource materials, and to train the teachers in application of these resources.

Student response to the pilot web-blended class consistently highlighted the democratizing effects of technology use (Powell, Kuzmina, et. al., 2013). By a nearly two-to-one large margin, positive effects outweighed negative perceptions. In particular, students appreciated the ease and flexibility of access to class work (43%). They overwhelmingly cited the benefits of increased interaction (32%) and engagement (28%), especially with American professors and students, but also the increased ability to participate in discussion, to speak up and be heard in class activities. Many students (27%) reported that the course format was especially interesting, with many new and interesting topics that would not have been available in a traditional format. Because this was an English-language class, many appreciated the realistic language practice with native speakers (23%), both in oral conversation in face-to-face Skype sessions and in asynchronous discussion online. Finally, those who adapted well to the online format cited the positive value of independent time management (8%) made available by the flexibility of online access. However, those who did not adapt well found the necessity for independent time management a drawback (12%)

5. Recommendations

Ukraine has many challenges as a country, not the least of which are endemic corruption, lack of funds, lack of infrastructure, and lack of trust in government and administrative systems. Challenges to democratization are many. Higher education has been singled out repeatedly as one of the most corrupt segments of this overloaded and autocratic bureaucracy. Despite prevailing odds, VSPU has made remarkable progress "swimming against the tide." In large part this is due to the commitment of a forward-looking administration that is determined to push VSPU toward technological proficiency, transparency in management, and international partnerships in order to access up-to-date resources and expertise.

Many initiatives in democratization through technology-assisted education have been undertaken, largely piecemeal by innovative individuals. Each success has yielded a greater determination to continue to explore possibilities, building a synergy of positive results that is about to generate a critical mass of commitment and systemic adoption. The integration of data management into a secure university-wide system is critical to establishing and stabilizing the gains made by changes in administrative procedures. The establishment of a dedicated administrative department charged with developing and maintaining technology infrastructure will be essential to support any concerted movement toward systemic adoption of technology-assisted teaching and learning. Broadly available programs of training in technology-assisted pedagogies will be crucial to maximize the gains made by independent experimenters and early adopters. Continuing institutional and political support, especially financial support will, of course, be critical.

Educational technology for effective service delivery in educational training and research in Nigeria

A.M. Laleye (Ph.D.)

Department of Science and Technical Education, Faculty of Education, Adekunle Ajasin University, Akungba-Akoko, Ondo State, 340001, Nigeria

Abstract

In Nigeria, there is a need for a paradigm shift from the existing teacher–centred learning environment to a learner-centred instructional environment where learning is enhanced and students acquire the necessary 21st century knowledge and skills. Educational Technology create changes in all aspects of human endeavour especially in training and research as it provide resources for trainers and researchers leading to comprehensive learning as well as extend the learning process. This paper discusses how Educational Technology gadgets could be used effectively in educational training and also the constraints to effective use of the gadgets. The paper proffers recommendations to prospective trainers, researchers and the government on enhancing service delivery in educational settings by integrating Educational Technology.

Keywords: Educational Technology,Effective Training; Educational Research; Teacher-centred; and learner-centred environment.

IETC 2014

1.1 Introduction

Rapid changes in technology have resulted in new approaches in education (Strommen& Lineolin 1992 quoted in karal and Balicekapili, 2010). These changes manifest in all facets of human endeavour. They have brought about new ways of doing old things in both educational and economic life of the society. Nigeria, one of the developing countries in the African continent is striving to measure up with her counterparts in the area of technology. In every educational training, teaching –learning is inevitably involved in information passage; from the teacher or trainer who serves as the sender to the learner or trainee who serves as the receiver. In an average Nigeria classroom, especially in public schools, activities are still dominated with chalkboard and textbooks. Some private schools make efforts to integrate technology into their system to justify the exorbitant fees paid by parents and wards. Given the poverty level, very few people can access this opportunity. In some Schools, the gadgets are purchased and kept for window dressing and exhibition but not used in teaching –learning situations.

The quest for development now in Nigeria makes it imperative for trainers to shift from the existing method of teaching in schools to accommodate use of technologies. Other African countries like Tanzania, Kenya, Uganda and South Africa seems to have gone ahead of Nigeria in this regard. It is disheartening to note that Nigeria, with her abundance of resources - human and non- human cannot boast of being among the countries utilizing technology in teachings, school administration and management.

Technology may be defined as the systematic study of techniques for making and doing things. It can also be defined as the application of the arts, science, processes, ideas, tools and machines to solve human

problems. In essence, it refers to ways people use inventions and discoveries to satisfy needs and desires. Technology includes the use of both sophisticated (highly advanced) and non-sophisticated (simple) tools and methods to work effectively. In the past, service delivery in educational settings has been done through numerous means; from verbal communication to prints and use of instructional materials like pictures and charts. As technology is creating changes in all aspects of our societal life, it is also changing our expectations of what students learn, how they learn it and where they will learn it so as to function in the new world order(Abimbade,2005). According to Kirschner and Davis (2003), school learning and planning oscillates around technology as either core or complementary where they are seen as optional. Resources cannot convey information alone. It is the teacher that will supply the required information in a meaningful way where necessary so that with the aid of the resources, the student's mental horizon will be enlarged thereby allowing them to experience vigorously things they could not otherwise see.

Educational research according to Ogunleye (1999) is a systematic process of collecting information or data on matters concerning education in order to confirm, improve, modify or predict a particular learning environment. Generally, every man, animal or even inanimate (computers) is capable of learning. Since learning is a process of education, therefore all disciplines or fields of study carry out educational research of a particular kind. In Nigeria, Libraries are not many. Even those that exist are not readily accessible to users. Sometimes, available materials are not current and needed to be updated. It is mandatory that users must go to the library, no matter where it is for research instead of the library coming to them at will. Existing Nigeria Libraries tends to have limited access to international journals, current texts, periodicals and audio-visual materials. Teachers/ trainers need to carry out research to equip them for the proposed task.

Educational Technology has been defined variously by many scholars, for instance, the American-based Association for Educational Communications and Technology (AECT) defines it as a complex integrated process involving people, procedures, ideas , devices and organization for analysing problems and devising , implementing , evaluating and managing solutions to those problems involved in human learning.(AECT 1979,Agun and Imogie 1988, and Adeosun 1998).They also defined it as the study of ethical practice of facilitating learning and improving performance by creating, using and managing appropriate technological processes and resources (lever-Duffy McDonald,2011). It can be deduced from these definitions that Educational Technology is the integration of variables in order to find and solve problems and manage solutions to problem involved in all aspects of human learning. It is a far departure from only chart/cardboard teaching-learning situation.

1.2 Educational technology gadgets for effective training and research in Nigeria.

Education is the process of teaching, training and learning especially in schools, colleges or any organized setting to improve knowledge and to develop skills. Educational training takes place in Nigeria at the Nursery, Primary, Secondary and Tertiary levels. It occurs in any organized instructional setting where knowledge is impacted and learning is expected to take place. For more than two decades, Nigeria has experienced a continuing, debilitating crisis in education, including limited access to educational opportunities and resources, large-class size, poor implementation of planned curriculum, inadequate funding, poor management, lack of interest in the endeavour of learning, low number of qualified teachers, and low level of literacy and basic education skills (Onasanya, Ayelaagbe and Laleye 2012). This in turn leads to poor performance of students in examination and malpractices to have better results. Effective service delivery in Educational training depends on the technique or method used by the teacher in teaching the concepts, means of communication or his language of expression, material or media used during the process and nature of the learners in the instructional setting. Needless to say that teachers need to carry out research to gather facts and be current in their subject of specialization in preparation for effective service delivery. Educational Technology resources listed by AECT can be classified into Human and Non- human resources.

IETC 2014

1.3 Human resources

These are the different categories of personnel that provide different services in the teaching –learning process. Example of human resources are the subject teachers, other professionals like doctors, lawyers engineers, pupils, parents, donor agencies like non- governmental agencies or organization (NTI ,2010). The teacher is considered the most important resource person in achieving the goals of any curriculum. He engages in interactive behaviour with the students. His primary concern is to translate educational objectives cognitive, affective or psychomotor to bring about desired change of behaviour in the students. Effective teacher should be ready to learn and adopt different techniques of pedagogy to enhance learning and arouse the interest of learners. He must be able to use effectively, confidently and competently Educational Technology resources to achieve instructional goals and objectives. Presently in Nigeria, especially in public schools, most teachers impact knowledge conventionally. The use of suitable materials and tools in the teaching and learning will undeniably be helpful in making the process more meaningful.

1.4 Non- human resources

Non material resources when used by teachers will facilitate learning and encourage students to become productive members of the society. Educational Technology has yielded several new machines, materials, media men and methods which are interrelated and work together for the fulfilment of specific educational objectives (Aggarwal 2007). These new machines, materials and media have great potential for use in the educational enterprise if they are judiciously used with new functions and roles of educational personnel to bring about more efficient and effective educational training and research. Every sector of the school system ranging from the school administration, school and classroom management to the work of instruction which includes intellectual education, moral education and counselling and every field of specialization can explore educational technology resources for effectiveness.

The collectivises of the newly discovered inventions are referred to as emerging technologies. The major technologies that can be used for effective service delivery according to Aggarwal (2007) are: (1) computer, (2) Artificial intelligence(AI) ,(3) Computer Assisted Instruction, (4) CD-ROM (Computer Disc-Read Only Memory) ,(5) Dial Access , (6) Educational Television ,(7) EDUSAT (Educational Satellite) (8) Email(Electronic Mail ,(9) Teleconferencing (10) Tele-lecture (11) Tele-tutorial (12) Teleseminar (13) Video ,(14) interactive video (15) video-tex ,(16) Video-conferencing (17) Digital Resources (18) Virtual university; and (19) The internet.

The Technologies first emerged in the developed countries, which are primary initiators and producers before they are later sent to the developing countries. With the aid of the new technologies, knowledge could be transmitted to intended audience without their physical presence (Ortese, 2004). The National Policy on Education (2004) has made adequate provision for the adoption of such emerging technologies into the dynamic school setting and the work of the teacher. Section 8B (74) of the national policy on Education (FRN, 2004) noted inter alia: "Teachers Education shall continue to take cognizance of changes in methodology and in curriculum. Teachers shall be regularly exposed to innovations in their profession". However, combining new technologies with effective pedagogy has been a daunting task for teacher training institutions. Successful integration of Educational Technology in the school system depends largely on the attitude of teachers towards the role played by modern technologies in teaching and

IETC2014

learning. Most of the teachers believe in the old way of the school system and do not see the need for its incorporation in the curriculum. The new Technologies could be used effectively in the following ways:

Computers: The computer is the heart of Technology. They are useful aids in fast word processing of research documents. It is particularly much preferable to a typewriter because one can insert, delete, and copy any part of the previously stored data without having to retype all over again. Writing project reports, book or term paper is expertly processed by the Microsoft Word Disk Operating System (MS-DOS) which is capable of editing, spell checking and formatting texts (Shelly and Roger, 1981). Computers can serve as a database tool such that keep results of research findings and other information that are readily available to the user. Computers are very relevant in electronic libraries with hundreds of thousand users. According to Aggarwal (2008), it could be used by teachers to construct, score and analyse tests; keep record of student's performance and progress through courses; provide guidance to the students and advise them on the choice of next course module.

CD-ROM (Compact Disc Read Only Memory): This is a storing devise, a semi –conductor memory device whose storage is permanent in nature. The electronic books and encyclopaedia made information available to many users simultaneously without demand of the large-space requirements of massive hard copies. Only a single compact disk (CD-ROM or RAM) can house about 25 volumes of an encyclopaedia. It retains the stored data even when the power to the devise is off .It has a variety of applications in digital system such as implementation of combinational logic and sequential logic, character generation, look-up table, microprocessor programme storage (Aggarwal 2008).

Dial Access: Callers can use it to get access to a vast Library audio cassette. Students can use it to dial up lessons from the library. Instead of finding a room for students to meet, students in the tertiary institution can watch videotapes of the lecture individually. Also, instructors call for audio-visual material from a distribution centre.

Electronic-mail (E-mail): It comprises electronic mailboxes that enable communication between two people based at distant locations, and make the transfer of documents from one computer to the other faster, reliable and convenient. It supports person to person messaging and document sharing. It is the most widely used application of computer internetworking. Teachers and trainers can give assignments to their students and ask them to submit to his Email without necessarily seeing the teacher before submission. All they need to do is to know the teacher's Email address.

Artificial Intelligence: It can diagnose the student's learning deficiencies and tailor instruction to them. It is a computational technology that involves the symbolic representation and processing of knowledge. "The Artificial intelligence," an advancement; from robotics revealed that computer robots are capable of learning. That is, they can make intelligent decisions. This is because a previous exposure of the computer to a set of data, aid the recognition of such data in the future. The computers, unlike the human, have an infinitely larger memory capacity and the ability to correlate facts in seconds. These capabilities of computers are useful in 'neutral networking' (i.e. simulating human-neuron network of the brain) and the development of the "expert system" or "knowledge-based system". The neutral network coordinates stimuli more than the human brain and it has very high tolerance to faults. It is still capable of a high degree of accuracy even in the face of several network disconnections. (Howl, 1981).

Computer Assisted Instruction: This is a term given to instruction that is provided by a computer and is closely linked with the concept of mastery learning. It involves drill and practice as well as tutorials for

IECT 2014

effectiveness and efficiency, specific topics and programmes may be packaged for trainees to engage in drills and practice and for remediation.

Internet: This is a complex decentralized communications network .It is the network of computer system that communicates by sending messages to one another. E-mails are exchanged on the internet. Teachers can use the internet to conduct and mark tests .Olusanya and Oloyede (2003) confirmed that the internet is highly beneficial to research institutions and organizations in many ways. The benefits include reduced communication costs, fast access to reference materials and methods, accelerated distribution of knowledge and enhanced coordination and collaboration. It provides access to information and contains huge quantities of data on numerous topics. It removes the limitation of class size, time constraints, and restrictions on the learning pace. It supports schooling, continuing education, re-education and task-specific immediate education.(Aggarwal,2008).Learning process on the internet is interesting and interactive; it encourages creativity in learners.

Educational Television or Instructional Television {ETV): Television is an audio-visual media that an average family in Nigeria has access to and learns from. When television is used for learning purposes or instruction, it is known as Instructional Television. Educational programs are prepared and telecast. It provides functional, formal and non-formal Education. It provides a common experience to learners and viewers no matter their status. Most presentations and teachings on ETV are done by experts. ETV teachers can serve as role models to classroom teachers, stimulate new ideas and dispense more knowledge to them. It directs the attention of the students to the exact details and eliminates distracting surroundings. Different kinds of Educational Television are the Open Circuit Television (OCTV) which is the usual type of telecast by the commercial and non-commercial stations; and the Closed Circuit Television (CCTV).i.e the selective telecast which can be used only by specially equipped receivers and its range is limited to the length of the cable. It increases the range of instruction to one or more locations beyond the classroom of instruction to one or more locations beyond the classroom. It is pertinent to note that teacher's role in planning, preparation, presentation, production utilization and evaluation of the programs cannot be under-estimated (Aggarwal, 2008).

Teleconferencing or interactive television: It is a two-way electronic communication between two or more groups or individuals who are at separate locations; it combines traditional TV viewing with interactivity of the internet and personal computer. In educational training, it can provide professionals or experts instructors to local school, colleges, universities and offices and quality instruction is given over a wide area. Also unlike it learners can interact with the expert and with each other at the locations making learning to be learner- centred. Also, it permits hi-service training to workers without leaving their work place. Its types include Audio conferencing, videoconferencing, audio graphic, and teleconferencing and computer conferencing.

Tele-lecture- It is a one-way information transmission from the teacher to the students with limited opportunity of questions and comments from the students. It is usually followed by pre-telecast, preparation and follow-up. It is exactly like the normal lecture method of teaching but during its packaging in different forms of media, it takes into consideration the constraints of the particular where it will be used.

IETC 2014

Tele-tutorial- Tutorial class is where individual or group of individuals gather together to solve a particular learning difficulty by contacting the teacher at a distance with a request for help. It allow learners to solve problems and for teachers to re-explain or solve problems in areas that are not clear to students without necessarily coming together.

Tele-seminar- It involves small group of students and allows intensive participation of the members which lead to a much focused, in-depth discussion on the topic that has been previously taught.

Video: A video machine is is an audio-visual media that accepts videotape as its software and display the programmes on the screen, usually, television. The programme is recorded with images and sound as electronic signals on the tape using the Video Tape Recorder (VTR). The signals are converted to pictures and sound during playback.

Constraints to effective usage of non- human resources: These are the factors preventing proper integration of Educational Technology for effective teaching –learning and research in Nigeria. Despite the fact that Nigeria is willing to integrate Technology into all facets of the economy including education, the following factors serve as barrier: Inadequate human power; poor Internet accessibility and connectivity; Inadequate software packages for learning; varied Climatic and environmental factors; Shortage. inadequate and inadequate power supply: poor technological know-how of teachers; lack of the interest among the long –serving teachers as they are not ready to learn how to use new technologies talk less of incorporating them into service delivery and research; Inadequate facilities and equipment for conducting research and the Governmental budget which is becoming tighter does not take good care of this especially scientific research. Time factor and rigid time-table as time allocated to each subject and lessons are too short for teachers to integrate technology into classes of 35 minutes per period, Also teachers with little interest in research spend more time doing other things at the expense of academic activity and research.

2.0 Conclusions and recommendations

The computer systems no doubt, had assisted technological pursuits, saved costs, increased productivity but also increased the crime wave. Nigerian Universities are now incorporating use of computers in teaching research, tests and examinations due to its viability. Further improvements in computer usage were made possible through the development of, the optical disk technologies, knowledge-based systems, High Parallel Definition Television (HDTV), Microprocessor - controlled security system that managed the home (e.g. switch off heaters), video conferencing and fax machines. However, over-reliance on computer may demoralize man. Since all men may not have equal access to these educational, technological social amenities, the under privileged group may feel grossly inadequate. This may foster financial and political oppression that may destabilize the human population.

Serving teachers who were once teachers in training should make good use of information and communication technology so as to prepare themselves for the tasks at hand. They need to be more committed and develop interest in improving the quality of their service delivery and be ready to learn as learning itself is continuous and throughout life. This will not only transform the educational system but bring about tremendous changes on the teaching and learning system and this will help them to be firmly rooted professionally. In the National Policy on Education of the Federal Republic of Nigeria (2004), it was

IETC 2014

asserted that no nation can achieve economic, social and technological progress without a good system to sustain its achievements. Teachers' education is given prominence in the Nigerian education system. This states from the fact that "no education system may rise above the quality of its teachers" (FRN, 2004 P.39).

Also, teachers need to be given in-service training to make them relevant to contemporary knowledge age and thus acquire skills in the area of ICTs and for them to be able to husband the potentials of technologies in their teaching tasks. Such training should incorporate the four guiding principles identified by Hughes (2004). These are connecting ICTs learning to professional knowledge, privileging subject matter and pedagogical content connection, using technology to challenge professional knowledge and teaching many technologies. They will be able to model good use of technologies for students who are being prepared for tomorrow's work places, where technology will be indispensable.

Resource centres make readily available necessary technological materials and gadget required for effective teaching, learning and research in scientific and academic environment. Hence, there is a need to set up modern and viable resource centres at the federal, state and local government levels which should be easily accessible to trainers and researchers in the country. Also, each department, faculties and schools should have resource centres which are peculiar to their learning objectives attached to them.

Acknowledgement

My gratitude goes to the Management of Adekunle Ajasin University, Akungba-Akoko, Ondo State, Nigeria for granting me opportunity to partake in the conference.

Abstract

This study dealt with effective assessments of physics animations to upgrade college students' learning performance. All participants were taken from engineering departments who joined this physics course. All statistic results demonstrated that the physics animated instruction would be to enrich physics texts, to advance positive learning achievement, and to promote the validity of the revised physics instruction with regard to learning attitudes. Assessments of applied animations in this study contributed much to learning results of students' performance which uplifted students' physics concepts understanding and learning attitudes indicated by different variances of gender and dispositions.

Keywords: physics animations, college students, concepts understanding, learning attitudes

IETC 2014

1. Introduction

Many scholars have pointed out that students rarely build a complete physics knowledge because they underestimate the complexity and relationships between prior knowledge and new knowledge without interactive animations or signaling functions (Feltovich, Coulson & Spiro, 2001). Some physics instruction of promising strategies have already been successfully explored, such as visual animations for communicated environment (Tao, 2004; Su, 2008a, 2008b, 2013; Su & Yeh, 2014), in their advanced concepts of science history (Wang & Marsh, 2002) to help students achieve more effective physics learning. Several constructivists' strategies of integrated animations were included in the overall physics learning process, such as multimedia texts and hands-on inquiry experiences for students to learn fundamental physics conceptual developments.

1.1. Purposee

This research focuses on dynamic applications of physics assessments implemented by 2D animations highlighted with physics conceptions o. Three fundamental prospects of college students' physics learning purposes will be conducted as follows:

(1) Integrated physics animations will enhance students' learning conceptions for physics assessments.
(2) Effective assessments of integrated animations can improve students' physics learning performances.

2. Literature review

Many researches (Becerra-Labra, Gras-Martı & Torregrosa, 2012; Su & Yeh, 2014) reveal that college students' learning towards physics is declining not in their lack of interest, but in lack of integrated animations for instruction environment nowadays. Thus, efforts towards integrated animations are needed for positive physics learning concepts to increase students' interest and motivation. Many contemporary strategies of physics learning are based on constructive integrated animations related to the authentic nature of physics instruction. There are several potential advantages for this study to get effective assessments of rich integrated animations which closely parallel with new technologies of physics instruction. This study also offers physics teaching activities including integrated animations in the learning environment suitable for a constructive assessment of students' learning performances.

2.1. Construct physics learning performances

Constructivism would be an interactive epistemology which defined students' constant competence and demonstrates their understanding of real knowledge. Tenenbaum, Naidu, Jegede, and Austin (2001) presented seven key constructivist factors for students' physics learning environment: (1) dealing with arguments, discussions, debates; (2) meeting conceptual conflicts and dilemmas; (3) sharing ideas with others; (4) measuring targeted materials toward solutions; (5) organizing reflections and conceptual investigations; (6) fitting students' needs; and (7) making meaningful, real-life examples. All seven factors emphasized students' dynamic fulfillment that real knowledge was actively constructed in learners' mind step-by-step. For last few decades, the importance of the constructivist perspective has been stressed by educators for improving students' learning performances. Ausubel (1968) indicated that the fundamental principle of constructivist instruction was to assess what students knew and then to design activities and assessments of their performances accordingly. Constructivist principles had been interpreted in a variety of scientific ways ranging from information processing, interactive and social constructivist to physics instruction (Yore, 2001). Both constructivist principles and students' conceptual changes were influential in physics instruction, and they were inseparable from any physics instruction. This study explored the constructivist-based physics instruction which had been in accordance with the conceptual change models (Posner, Strike, Hewson, and Gertzog, 1982) to help students modify their misconceptions and develop better learning performances.

2.2. Technology enrichment physics learning environment

Students who face rapid changes in the modern world will be in great need of technological instruction with effective animated learning environment. More than one decade, Gilbert (1999) proposed a new strategy of integrated animations to enhance students' science learning environment. He said that much scientific learning was too abstract to interpret, and those complicated ideas would prevent students from constructing mental models and their subsequent learning performances. Several means of physics instruction had been dealt with, such as models, analogies, equations, graphs, diagrams, pictures, mathematical operations, and visual and action images (Lemke, 1998). All these could be functional with integrated animations for different effects of a single representation compared to multiple representations (Yore & Treagust, 2006). Several multiple representations (Spiro & Jehng, 1990; Paivio, 1971 &1991) could be in collation with Ainsworths' (2006) learning frameworks of the ubiquitous DeFT (design, functions, and tasks) for students' physics learning environment. A common justification for using multiple representations responded to the fact that they captured students' interest and, in doing so, played an important role in promoting animated environment for students' learning performances.

IETC 2014

2.3. Learning theory and physics animated environment

Verbal and visual inputs would construct multi-functions of dual-coding theory (Paivio, 1971 & 1991) in students' integrated animations of physics learning environment (Butler & Mautz, 1996). Both verbal and visual systems could be linked and inter-communicated for the cueing combination of one system to the other, which in turn facilitated students' integrated animations of physics instruction. Theoretical principles from this multimedia-orientated environment would offer fundamental presentations as texts and animated sequences which all interacted together to enhance students' learning performances (Mayer, 1997; Moreno & Mayer, 1999). The contiguity principles for computer-based instruction gave students effective impact when words and pictures were presented contiguously in time or space (Mayer & Anderson, 1991; Mayer & Sims, 1994).

3. Methodology

The overall research methodology was comprised of three effective assessments, including pretests, post-tests and questionnaire for non-major college students in the required physics courses.

3.1. Participants

Assessments of statistical samples for group surveys were taken from college students in the present researcher's physics classes. All participants (N = 193) were recruited as tentative samples from both civil engineering and mechanical engineering departments by a stratified procedure to eliminate voids in the sampling frames.

3.2. Tools

There were four major assessment tools in the data collection and analyses stages: namely, (a) pretests, (b) physics instruction of three integrated animation units, (c) posttests, and (d) a follow-up questionnaire. Several pretests and posttests appropriate to three integrated physics units were developed to assess students' learning achievements and learning attitudes. All tests with computer-based analyses were focused on three categories: knowledge, comprehension, and applications (Bloom et al., 1956). Both pretests and posttests for three physics units were administered by local physics professors of the Entrance Examination Center in Taiwan to assess different test validities. The reliability of students' achievement tests was analyzed in Cronbach's alpha coefficients for the pretests and posttests, which were 0.78 and 0.79 respectively. Kline (2005) posited that the α value up 0.70 was considered acceptable. The same test validities were combined together with pretests and posttests to detect students' differential physics learning performances. Effective assessments of students' learning attitudes in the questionnaire were devised by the author (Su, 2008a, 2008b, 2011). The Likert 5-point scale was used to evaluate students' physics learning attitudes. Each test item had five responsive categories, ranged from item 1 (strongly disagree) to item 5 (strongly agree). The questionnaire included six aspects as the following descriptions:

(S1) Learning Attitude towards Integrated Physics Units
(S2) Learning Attitude towards Physics Instructors
(S3) Learning Attitude towards Integrated Physics Learning Environment
(S4) Learning Attitude towards Students' Interactions
(S5) Learning Attitude towards Self-evaluations
(S6) Learning Attitude towards Integrated Physics Learning Results

Effective attitude assessments of the questionnaire were evaluated according to the content, constructive validity and internal consistency reliability. Three specialists were asked to set up the validities of the questionnaire content. Pilot versions of the questionnaire were examined using principle component factor analyses to verify the structure and alignment given the designed constraints. Reliability was explored in

IETC 2014

terms of Cronbach's α coefficient to determine the internal consistency of total subscales. The analyses of six subscales separately yielded different coefficients ranging from 0.92 to 0.96 (S1=0.96, S2=0.92, S3=0.93, S4=0.94, S5=0.94, and S6=0.96). Compared to the previous report of average reliabilities, this questionnaire had a higher reliability than statistical data by most other researchers (Katerina & Tzougraki, 2004).

3.3. Treatments

Three integrated physics units were conducted for effective learning assessments. These integrated physics units normally involved 3 hours of lecture demonstrations and 3 hours of laboratory hand-work each week. The lecture demonstrations programs were redesigned to be enriched with supplemental programs. The supplementary materials (such as animations and slides), lectures, and demonstrations all combined within an integrated learning environment in well-equipped facilities. These component programs were developed by the author drawn from the literature (Ainsworth, 2006; Yore and Treagust, 2006) and constructivist perspectives. Six integrated features of physics courses were covered in the instructional designs and computer animations as the following way:

1. Three integrated animation units were employed for specific visualizations of physics instruction.
2. The recognition of integrated environment determined the important priority of meaningful physics instruction.
3. Concrete creative images and mental assemblages facilitated students' memory and understanding.
4. Integrated interactions of physics learning between teachers and students were reinforced and encouraged in this study.
5. Guided learning with the integrated environment as a catalyst would achieve greater physics instruction goals and overcome students' learning obstacles.
6. Integrated physics presentations and demonstrations proposed opportunities and activities for students' real-life learning.

Three integrated animation units were produced in Flash MX (Macromedia Inc.), static visuals were made with Mathematica 4.2 (Wolfram Research, Inc.), and classroom demonstrations were presented by PowerPoint or e-plus software. The conceptions, ideas and dynamic processes were operated in Adobe Photoshop 7.01. Three integrated animation units were separately indicated from [Figure 1] to [Figure 3].

a) b) c) d)

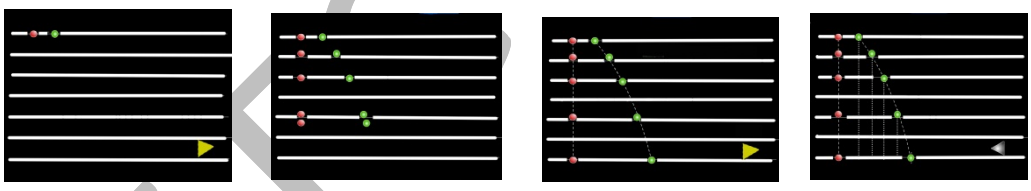

Fig. 1. Selected illustrations and corresponding conceptions from the integrated physics courses with kinematics animations conducted by Photoshop 7.01, as shown in the sequence from slides (a) to (d)

[Figure 2] indicated the passing movements of a ray from one medium V_1 into another medium V_2. The angle of refraction was different from that of incidence. This case would always be the same during reflections when the ray entered a medium at a speed less than the speed of light. Snell's law was the basic requirement of refraction derived from light theory. The sequence presentations of integrated animations, as seen from pictures (a) to (d) in [Figure 2] step by step, provided an effective domination for the conception of the incident wave and the refracted wave. Most students who came from a vocational school background did not have much advanced concepts of abstract physics and dynamic processes; therefore, these animated documents helped students build a sound, basic recognition of refractions and avoid the difficulty and confusion of physics geometric optics as encountered in their daily lives. The principal animations for the conservation of mechanical energy could be seen in [Figure 3] -- as a pendulum swung in a motion system, and the energy was transferred back and forth between kinetic energy K and gravitational potential energy U, as shown from pictures (a) to (f) in [Figure 3], with the sum K+U being constant, as shown in [Figure 3]. The slides indicated a vivid physics illustration of the conservation energy. Any energy that did not serve the intended purpose must be subtracted from the total sum in order to obtain the amount of useful energy. This physics application was very straightforward. This experiment of integrated physic mechanical energy saved students from the misunderstanding of interpreting the abstract conceptions of

IECT 2014

mechanical energy. These animations were available for solving conceptual problems related to the principle of the conservation energy.

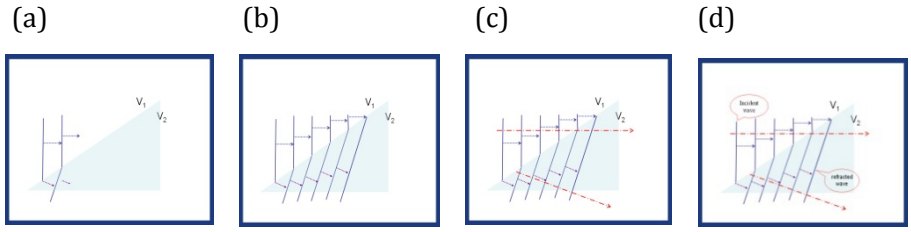

Fig. 2. Selected illustrations and conceptions from the integrated physics courses with corresponding animation arrangements and movements

for the ray passing from medium V_1 into medium V_2, conducted by Photoshop 7.01, as shown in different sequences from slides (a) to (d).

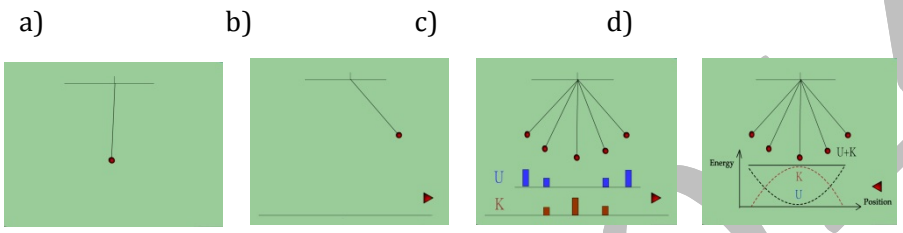

Fig. 3. Selected illustrations and concepts from the integrated physics courses with corresponding animations for the conservation principle of mechanical energy, conducted by Photoshop 7.01, as shown in sequences from slides (a) to (d).

3.4. Data management and analyses

All quantitative data were employed for statistical analyses functioned by the SPSS of Windows 10.0 software. Descriptive statistics (sample sizes, means, and standard deviations) were calculated for two comparative groups, and the significant levels for one-way analyses of covariance (ANCOVA) were set at 0.05 to examine main effects. In cases where *p*-values were less than or equal to 0.05, Scheffe's post hoc comparisons were conducted on different significant effects. Regarding students' changes in achievements and attitudes, the differential effects were explored and identified by the categories of blocking variables for the integrated physics learning.

4.Results

This study focused on three physics units with integrated animations available for Taiwan technical college students. Blocking variables for the data analyses corresponded to differentiated requirements of students' learning performances in implemented conditions and learning attitudes. The design principles and study developments had already been described in the above sections. Next this study examined students' learning performances before and after attending instruction tests in these integrated physics programs. Students' learning performances were documented and analyzed by means of pretests and posttests; the means and standard deviations were calculated by descriptive statistics, and improvements brought about by three physics units. Average performances throughout pretests and posttests for three physics units indicated students' different scores from 10 to 20 points. These scores corresponded to percentage improvements of 35.8% in the kinetic energy and work unit, 30.3% in the optics unit, and 16.5% in the kinematics unit. The total improvement for three physics units was 26.5%, and effect size found by one-way ANCOVA testing was $f = 0.279$, the above medium effect. The effect size was used as the factor or index to differentiate variations in students' learning behaviors. Cohen (1994) pointed out that the effect

IETC 2014

size had more research efficiencies than the *p*-value. The testing results of statistical significance revealed occurrence rates. The effect size put important emphasis on the measurements of the relative magnitude for the experimental results. Although both testing results of statistical significance and effect size showed the size of the experimental effect, effect size became especially influential when comparing the magnitude of experimental treatments to other experimental effects. Cohen noticed that, "the effect size of one-way ANCOVA was represented by $f = [\eta^2 / (1-\eta^2)]^{1/2}$, in which η^2 indicated Eta square to show different efficient, $f = 0.1$ as the smaller effect size, $f = 0.25$ as the medium effect size, and $f = 0.4$ as the higher effect size" (Cohen, 1988). Inspective results of students' attitude survey (with four subscales) indicated reasonable attitudes towards physics learning.

Detailed statistics of variances and covariances were analyzed to examine the differential effects of integrated instructions on civil and mechanical engineering students' physics learning achievements and attitudes. The main effects of the integrated physics courses for students' achievements (for the given variables) were tested by a series of ANCOVAs in which the pretest results were utilized as the covariances. All ANCOVA results revealed that when students' performances of posttests were adjusted by performances of pretests, different significant main effects appeared. The statistical parameters, *F*-ratios, *p*-values and effect sizes (*f)* for each of 12 ANCOVAs for gender, major, dispositions towards computers and orientation attendance (for each of three physics courses and four blocking variables). All ANCOVA results revealed significant main effects between mechanical and civil engineering students in kinematics ($F = 4.209$, $p = 0.044$, $f = 0.259$) and kinetic energy and work content achievements ($F = 22.100$, $p = 0.001$, $f = 0.593$), with above medium or higher effects, but not in the optical units ($F = 1.328$, $p = 0.254$, $f = 0.153$). Non-significant ($p > 0.05$) main effects were found for gender, disposition towards multimedia, and attendance at computer orientation classes for all three integrated physics units. All effect sizes were below the medium effect ($f < 0.25$).

The questionnaire results showed students' differential physics learning attitudes. The four survey subscales indicated positive attitudes toward integrated physics units, with the statistical mean responding > 4.00 for all learning attitudes. The descriptive statistical mean and standard deviations for students' learning attitudes (for six subscales and the total survey) were indicated in [Table 1]. Differential effects of the integrated physics units were explored for taking a variety of students' characteristics into consideration. The main effects of the integrated physics units (with six attitude subscales for the six blocking variables) were tested by a series of ANCOVAs. The final testing was done on the combined samples since each student had to complete the same attitude survey. [Table 2] provided a brief summary of the *F*-ratios, *p*-values and effect sizes (*f*) in 24 ANCOVAs for gender, major, disposition towards integrated physics courses, and students' attendance.

Table 1. Descriptive statistics for the mean scores (M) and standard deviations (SD) for students' integrated physics learning attitudes for six subscales and the total survey.

Scores	Attitude Measurement						
	S_1	S_2	S_3	S_4	S_5	S_6	Total
M	4.22	4.15	4.03	4.08	4.03	4.14	4.11
SD	0.17	0.20	0.07	0.17	0.16	0.24	0.33

The statistic ANCOVAs revealed significant main effects of gender on students' learning attitudes, favoring males over females (S_4) ($F = 3.885$, $p = 0.050$, $f = 0.143$), and self-evaluation (S_5) ($F = 4.621$, $p = 0.033$, $f = 0.157$). The effect sizes ranged between 0.1 and 0.2, indicating small and medium effects. Students demonstrated a non-significant gender effect of attitudes towards integrated physics units (S_1), attitude towards the physics instructors (S_2), attitude towards integrated physics learning environment (S_3), and attitude towards integrated physics learning results (S_6). These effect sizes were all below 0.14, only a small effect. Non-significant ($p > 0.05$) main effects were found for student's major (either mechanical or civil engineering) on all six attitude subscales.

The main effects of ANOVAs significance testing showed that students who attended the learning activities had a favorable attitude towards integrated physics units (S_1) ($F = 8.694$, $p = 0.004$, $f = 0.215$), attitude towards the physics instructors (S_2) ($F = 7.509$, $p = 0.007$, $f = 0.199$), attitude towards students' interactions (S_4) ($F = 4.590$, $p = 0.033$, $f = 0.153$), and attitude towards integrated physics learning results (S_6) (F

= 4.059, p = 0.045, f = 0.146); all effect sizes ranged from small up to medium. Non-significant (p>0.05) main effects were found for two other subscales: learning attitude towards integrated physics learning environment (S_3) and self-evaluation (S_5).

Significant positive main effects were found for dispositions towards integrated physics units for all attitude subscales: attitude towards integrated physics units (S_1) (F = 18.943, p = 0.001, f = 0.446), learning attitude towards the physics instructors (S_2) (F = 21.131, p = 0.001, f = 0.472), attitude towards the integrated physics learning environment (S_3) (F = 10.439, p = 0.001, f = 0.331), attitude towards students' interactions (S_4) (F = 12.067, p = 0.001, f = 0.357), attitude towards self-evaluation (S_5) (F = 14.741, p = 0.001, f = 0.393), and attitude towards integrated physics learning results (S_6) (F = 20.378, p = 0.001, f = 0.464). The effect sizes ranged between 0.331 and 0.472, indicating medium and higher effects. Scheffe's post hoc comparison results revealed that S_1, S_2, and S_5 students' attitudes reporting 'positive' were superior to those reporting 'neutral' and 'negative', and attitudes reporting 'neutral' were superior to those reporting 'negative.' The results of Scheffe's post hoc comparisons revealed the same integrated physics learning results that S_3, S_4, and S_6 students' attitudes reporting 'positive' were superior to those reporting 'negative', and attitudes reporting 'neutral' were superior to those reporting 'negative.'

Table 2. Summary of F-ratios, p-values and effect sizes (f) for each of the ANCOVAs

Blocking Variable	Analyses of Variance	Attitude Measurement					
		S_1	S_2	S_3	S_4	S_5	S_6
Gender (male, female)	F-ratio	2.718	1.642	3.771	3.885	4.621	3.133
	p-value	0.101	0.202	0.054	0.050*	0.033*	0.078
	f	0.119	0.095	0.139	0.143	0.157	0.128
Major (civil, mechanical engineering)	F-ratio	1.004	0.001	0.524	0.727	1.898	2.859
	p-value	0.318	0.977	0.470	0.395	0.170	0.092
	f	0.071	0.071	0.055	0.063	0.101	0.123
Disposition toward multimedia (positive, neutral, negative)	F-ratio	18.943	21.131	10.439	12.067	14.741	20.378
	p-value	0.001*	0.001*	0.001*	0.001*	0.001*	0.001*
	f	0.446	0.472	0.331	0.357	0.393	0.464
Attendance (yes, no)	F-ratio	8.694	7.509	1.652	4.590	3.286	4.059
	p-value	0.004*	0.007*	0.200	0.033*	0.071	0.045*
	f	0.215	0.199	0.095	0.153	0.132	0.146

Note: * $p < 0.05$

5. Conclusions

It would be a favorable strategic teaching for this research to integrate both animations and physics instruction into upgrading students' learning performances. The validity of this study exemplified many characteristics of integrated animations and animated environment in previous research results (Su, 2008a, 2008b, 2011, 2013; Kiboss, 2002; Tao, 2004), which contributed much to students' scientific learning competence and proficiency. As an effective integrated study, all the statistical physics learning results discussed above were consistent with most recent advanced researches (Tenenbaum, et al., 2001; Kiboss, 2002; Tao, 2004). In order to present students' better targeted programs of physics understanding and promote a more positive attitude towards physics learning, all ANCOVAs findings of students' characteristics such as gender, dispositions toward integrated physic courses, and attendance at the integrated physics learning programs had a major significant ($p < 0.05$) influence on their attitudes, with higher effect sizes than other variants considered.

Three major animation principles concerning the properties of physics learning environment such as kinematics, the movement of a ray and the conservation of mechanical energy (indicated in Figure 1, Figure 2 and Figure 3) gave students to organize reflections on the effective learning of physics conceptions. Based on the analyses of statistical responses, students were able to

IETC 2014

identify fundamental concepts between animations environment and physics learning. The integrated texts and physics learning environment helped to develop more unifying principles and meaningful higher-level skills which would enhance students' physics understanding and facilitate their learning performances. The integrated animations environment of physics learning provided a powerful means for fostering physic principles because it could illustrate multi-level physics conceptions (Galili, 1996; Kiboss, 2002). All results of three major animations supported and facilitated students' physics conceptions learning and attitudes.

The integrated statistic results of three animation units in this study were well-organized and helpful for most college students' effective physics learning. It would significantly make a positive contribution to students' physics learning attitudes. The results gave more reliable implications to previous researches (Barton, 2005; Tao, 2004; Kiboss, 2002) in relation to integrated physics materials and demonstrated applications which could encourage students to construct a better physics conceptual understanding. As stated by Ainsworth (2006), the DeFT (Design, Functions, Tasks) learning framework needed to integrate the cognitive representations and constructivist theories of education into multiple research programs. He proposed that the effectiveness of multiple representations could best be understood by considering three fundamental learning aspects: the design parameters that were unique to learning environment; the functions that supported integrated physics learning; and the cognitive tasks that must be undertaken by learners' interactions with multiple representations. All three major animations increased students' learning perspective and cultivated physics conceptions. Through the availability of three principal animation texts, students were capable of more effective performances for developing physics conceptions and learning environment.

Acknowledgements

The author would like to thank the journal editors and the anonymous reviewers of this paper for their kind assistances and helpful suggestions. A short but sincere thank must also be given to the patronage of the National Science Council, R.O.C. in Taiwan (under Grant No. NSC 101-2511-S-237-001 & NSC 102-2511-S-237-001). Without their help, this study could not have been completed in present form. Finally, thanks must also be given to all the instructors and students who participated in this research study.

E-learning study materials focused on projects from industry

Jakub Jirásko39, Zdeněk Raab, Jan Klepáček
[a]Univerzitni 22, 306 14 Pilsen, Czech Republic

Abstract

Theoretical knowledge and theoretically oriented study materials are always great advantage of education at universities. However, access to learning materials and know-how used in industrial practice is very limited. With regard to this issue the Faculty of Mechanical Engineering at the University of West Bohemia has launched a project in which example projects from practice are worked on. The outputs of each of the projects are e-learning pdf files. These study materials contain all important information which the designer normally comes into contact with in practice. There are tender dossiers, interactive 3D models, drawings, processes (welding, machining, assembly...). One of these projects is focused on a curing press, which will be used for a closer examination of the developed study materials.

Keywords: e-learning; study materials; machine design; design projects; CAD models; 3D models

IETC 2014

1. Introduction

Industrial companies have high demands on graduates of the Department of Machine Design, Faculty of Mechanical Engineering at the University of West Bohemia. These requirements could be divided into theoretical and practical knowledge. Theoretical knowledge and theoretically oriented study materials are always great privilege of education at universities. However, the accessibility of learning materials and know-how which are used in industrial practice are very limited. Another problem is the lack of practice and the offer of internships from industrial companies for students in technical fields which would balance the lack of these materials to a certain degree.

With regard to this issue Faculty of Mechanical Engineering has launched a project where the example projects from practice are processed. The individual projects are worked out by academics with the support of industrial companies. The output of each project is an e-learning pdf file. These e-learning study materials are comprehensive instructions for designers containing a tender dossier, interactive 3D models, drawings and processes (welding, machining, assembly etc.). One of these projects is focused on a curing press, which is supposed to be used as the example of the developed study materials.

Currently, the interest in studying technical branches is declining in the Czech Republic. According to the demographic distribution as presented in (Koucky and Bartusek, 2011) the number of university students is currently on its local maximum and for the future a decrease in number of students is expected. Although the overall number of university students is at its maximum the number of engineering students is decreasing. This applies not only for the Czech Republic, but also for the whole Europe. Only 15% of students would like to study technical and scientific fields. In Asia the phenomenon is reversed and up to

* Corresponding author. Tel.: +420 377 638 296
E-mail address: jirasko3@kks.zcu.cz

60 % of students there are interested in studying technical and scientific fields. By improving the quality of learning materials and applying modern teaching methods the attractiveness of these branches is believed to be increased to attract more students.

Various types of machines (such as hydraulic presses, manipulators of pipes, conveyors, lathes, milling machines, castings, molds, etc.) are processed within the whole developmental project. Each of these "branches" has its own specific features. These characteristics define the method of how the design documentation, technology etc. are carried out. This diversity allows students to recognize the differences between each branch. The overall concept of basic study materials is the same for all the projects. The study materials are different only according to the specifications of a processed branch of production.

2. Introduction to curing presses

Curing presses are machines where the final stage of production of tires takes place. Semi finished tires are inserted into the mold of the curing press and by treatment with a defined pressure and temperature they obtain their final shape and final mechanical properties. Nowadays curing presses are operated by a powerful control system, which ensures continuous operation and control of machine operation. Vulcanization is a chemical reaction taking place under high pressure and temperature while the vulcanizing agent changes the structure of the rubber composition.

Why a curing press? Curing presses have a long tradition of production in the Czech Republic and there are several manufacturers that export their machines all over the world. The tradition of engineering in the Western Bohemia, where the Faculty of Mechanical Engineering is situated, dates back to the beginnings of the development of Skoda factory. Emil Skoda who became the chief engineer at Waldstein Engineering in Pilsen in 1866 was responsible for the development of the Skoda factory. Three years later, he bought the company and soon changed the small factory with 33 employees into a great worldwide known company with 4000 workers and 200 engineers. He built gradually a new foundry, machinery, steel mill, blacksmith shop, railway track and an arms factory (Broz, 2004). Tire curing presses have been producing here since 1960.

Curing presses are classified as moderate weight machines in the range from 40 to 150 tons, depending on their size and design. Mostly they are produced individually or in small batches. One of the reasons why the curing press is used for these study materials is that this machine uses a wide range of components and principles commonly applied in other machines. This offers universality in the use of these study materials.

3. Requirements for the study materials

The developed study materials have to comply with commonly used standards used in the world. These criteria are intended to ensure the quality of the materials. They are also used to support the systematic effort to improve the quality of engineering education. These criteria meet the requirements in dynamic competitive environment of industrial companies.

These requirements are defined according to the Accreditation Board for Engineering and Technology (ABET, 2011). The requirements are similarly defined by the European Network for Accreditation of Engineering Education, which can be identified in (ENAE, 2008).

Requirements according to ABET (ABET, 2011):

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data

IETC 2014

- an ability to design a system, component, or process to meet desired needs within realistic
- constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- an ability to function on multidisciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in life-long learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

Leading experts of the Faculty of Mechanical Engineering at the University of West Bohemia, who have sufficient experience in teaching and practice in engineering, have defined additional requirements that complement or concretize the requirements defined for mechanical engineers. These requirements were published in (Hynek et al., 2013) and are as follows:

- an ability to use CAD software
- a knowledge of the mechanical design process
- a knowledge of manufacturing processes
- a knowledge of economic aspects of production
- experience with real applications
- an ability to express their thoughts unequivocally
- an ability to communicate in foreign languages
- technical creativity
- an ability to analyse and formulate technical problems
- a knowledge of total quality management principles

4. Study materials

The entire project of the curing press is divided into several parts. This division is shown in Figure 1. Each of these sections is a separate PDF file which contains the information relevant for the block. These study materials are available in PDF format which allows the use of these study materials at ordinary desktop computers as well as nowadays widespread tablets or smart phones. This eliminates the need for students to purchase student licenses for some of the CAD systems only to view 3D models.

Introductory information - Students get familiar with the basic information in this PDF file and are introduced to the problematic of curing presses. The basic functional principles of conventional curing presses are also clearly illustrated there. Students will also learn how to use all the functions of individual PDF files in this section.

Tender dossier - Tender dossier is a document which specifies customer requirements for the current bought machine. There are all technical specifications and performances. There is also a timetable and procedure for installation. The designer uses this document to create the design of the curing press.

The documentation for welding and system of validation - Welding technology is, along with the machining technology, the most common method of production of individual parts of tire curing presses. Students are introduced to the basic operations of welding in this document. The required documents for the welding process are listed there as well. The information in this PDF file is therefore generally applicable for the welding technology. The specific information about the process of welding of individual assemblies is mentioned in the PDF file which deals with the design of assemblies.

IETC 2014

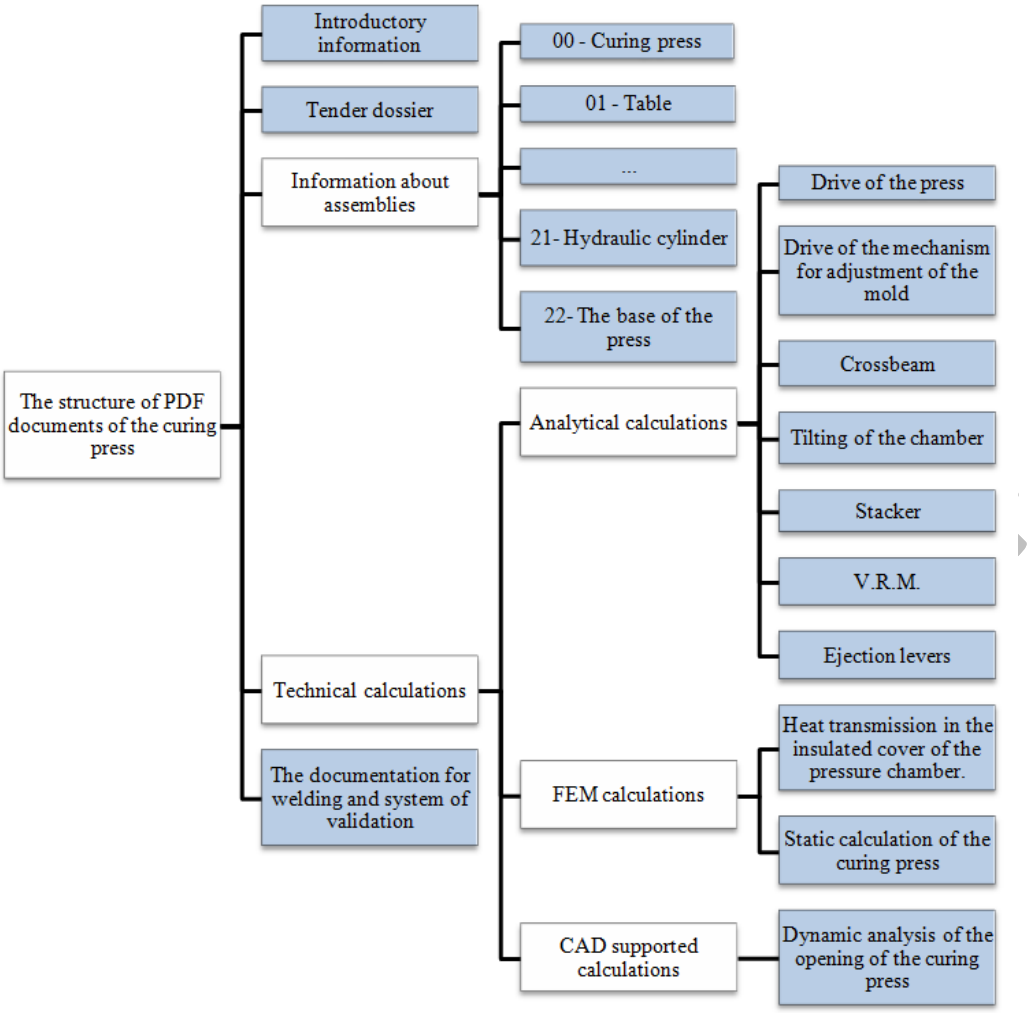

Fig. 1. Structure of PDF files of the curing press

Information about assemblies - This type of document has its fixed structure which is the same in the entire project (For example, in the lathe project, these documents look the same so students who learned to work with these documents can easily orient themselves in another machine or device project). There are all main assemblies of the curing press described in this document. There are explanations of features of specific parts and components and they are also identified and described. For example, see Fig. 2. Thanks to the technology of 3D PDF files there are 3D models which students can manipulate, rotate, hide, etc. For example, see Fig. 3.

Two colourings of components are used for the project of the curing press. The first colouring corresponds to the individual assemblies which allow students to orient themselves in the large number of parts. The second colouring has the technological nature where each part is coloured according to the machining technology. For example, see Fig. 4.

Another important part of the study materials is the complete drawing documentation. The drawing documentation contains all information necessary for the production of components such as dimensions, geometry, tolerances, surface treatment, welding, weight, information about assembling, parts list, etc. For example, see Fig. 5. The creation of drawing documentation is nowadays still the essential activity of designers and because its quality it is necessary to pay significant attention in this field. There are enclosed data sheets of purchased items in the final part of these study materials.

ASSEMBLY OF THE DRIVE OF THE CURING PRESS

- The base of this assembly is the drive shaft.
- Drive shaft is mounted in bearing houses.
- Drive of the shaft is ensured by the electric motor with worm gear.
- Worm gear is used because of the self-locking effect.
- Pin of the torque shoulder prevents the rotation of the gear unit against the press frame.

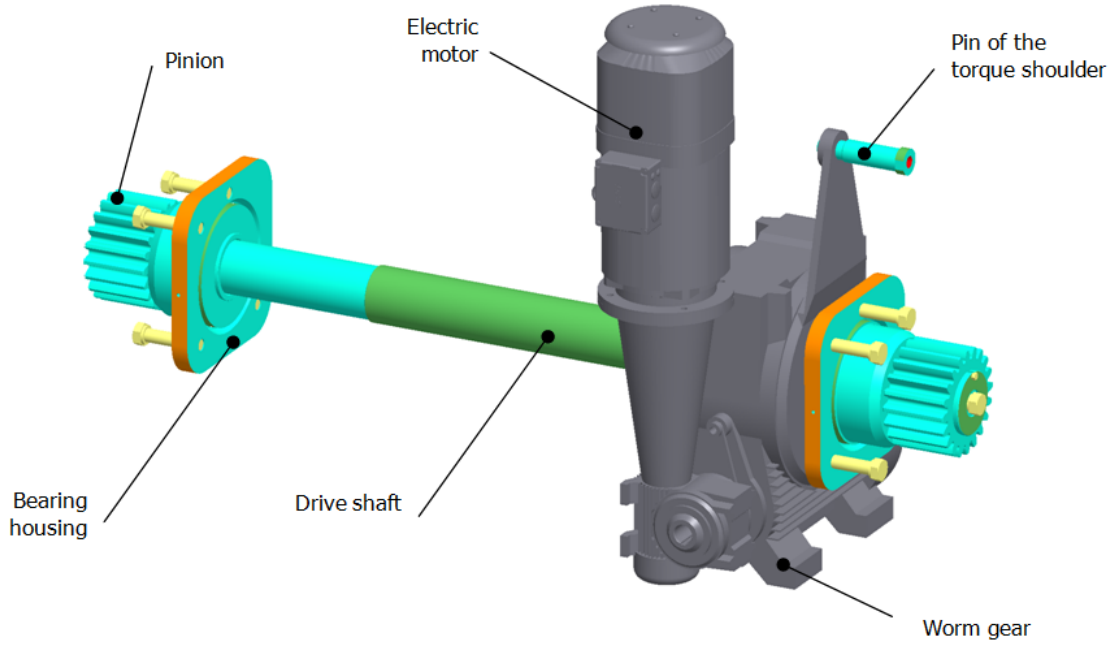

Fig. 2. Structured PDF - Description of the components of assemblies

Analytical calculations - These computational reports describe the design and check calculations of the individual components of the press. Especially there are the calculations of strength, toughness, lifetime, etc. These computational PDFs give students the overview of where and how to apply the theoretical knowledge acquired in subjects such as Mechanics or Mechanics of Deformable Solids.

FEM calculations - Advanced analysis has been done by using computer calculations with the final number of elements. These calculations include the calculation of the components whose analytical expression would be too complicated, inaccurate or impossible. There are two FEM calculations: the first calculation is the static calculation of the entire curing press and the second one is the calculation of the heat transmission in the insulated cover of the pressure chamber. For example, see Fig. 6. The temperature calculation of the insulated cover of the pressure chamber was not solved the same way as the calculations according to (Hynek and Votapek, 2013) which used the boundary layers in the heat transfer to the surrounding environment. This time only one heat transfer coefficient was specified which is more common in practice and it is easier to set the calculation.

CAD supported calculations – The calculation of the reactions in individual components of the curing press during the phase while the curing press was being opened was done by performing dynamic analysis. This analysis has been processed into a comprehensive calculation report.

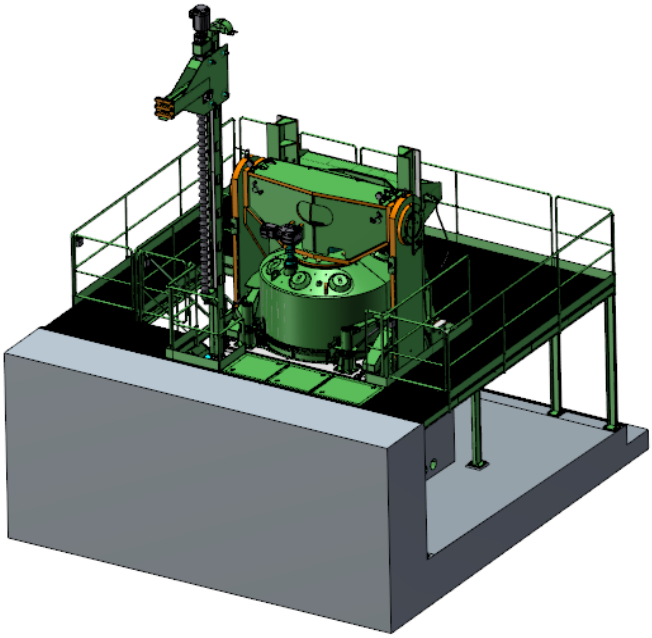

Fig. 3. 3D PDF of the whole curing press

GREY	(120,120,130)	Purchased parts	

Fig. 4. Colouring according to machining technology

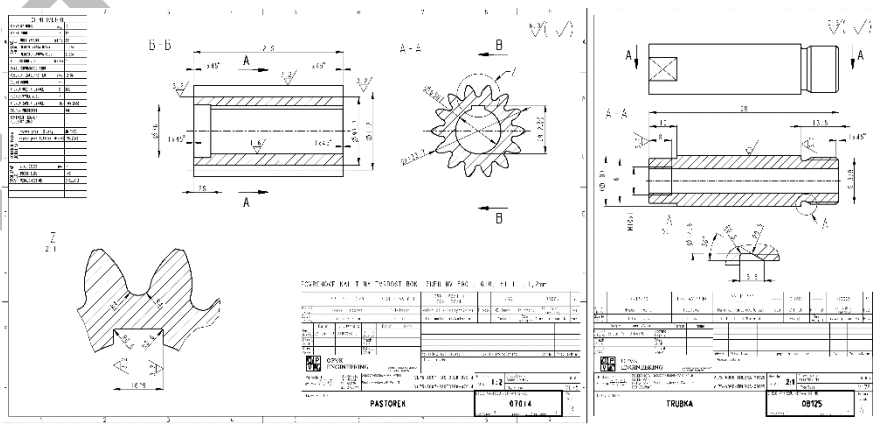

Fig. 5. Sample of the technical drawings

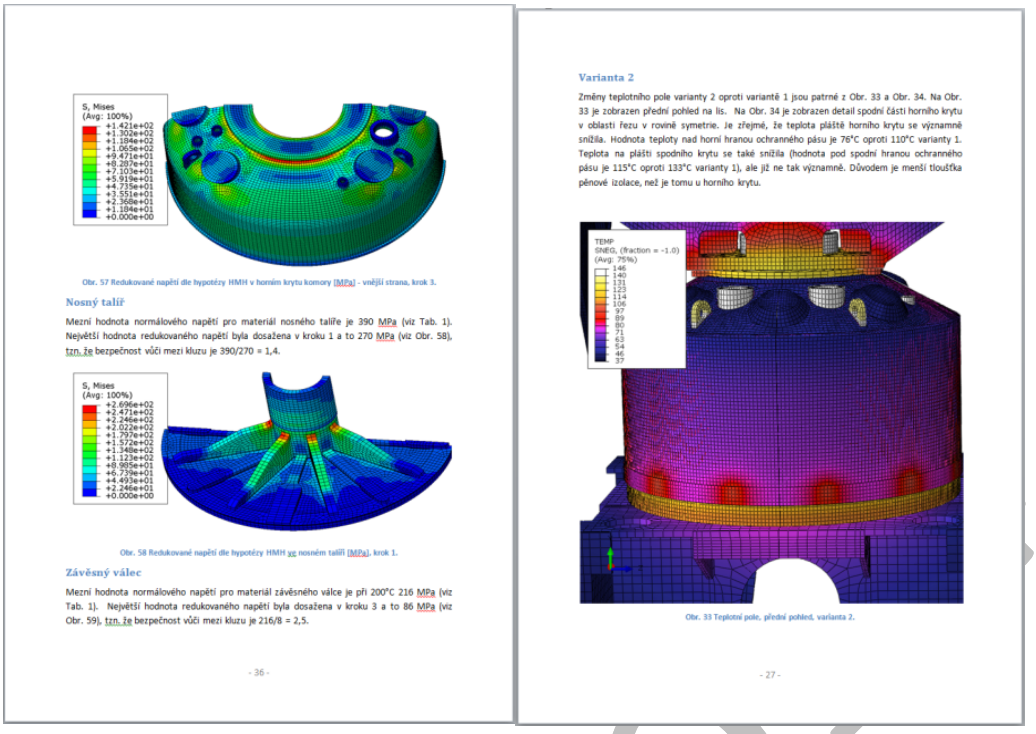

Fig. 6. Sample of FEM calculations

5. Contribution of the developed study materials

- Transfer of knowledge and practical experience from engineering practice into university study materials.
- High complexity of the study materials.
- The study materials have been developed in accordance with the current knowledge in the field of engineering using modern methods.
- Increasing the attractiveness of technical fields to attract more students thanks to high-quality learning materials and modern methods of teaching.
- Possibility to create tasks for the term design projects based on some parts of the machines (e.g. the task could be to modify or enhance the certain part of the machine).

To illustrate the extent of the project of the curing press there are approximate numbers of pages:

- 600 drawings (manufacturing, assembly, parts lists, format A4 - A0)
- 250 pages of analytical calculations
- 77 pages of FEM calculation reports
- 25 interactive 3D PDFs
- 200 pages of descriptive and informative parts

6. Conclusion

The main purpose of this paper is to introduce the form and the structure of the newly developed study materials. These study materials have been designed in accordance with the requirements applicable to

university education in mechanical engineering field. These requirements have been identified in this paper.

The primary reason for creating these study materials was the lack of practice-oriented study materials at mechanical engineering oriented universities in the Czech Republic. Thanks to the cooperation between academics and machinery companies it was possible to transfer practice skills and know-how into the study materials. The advantage of these study materials is their high complexity. They are not only excerpts of context which could be difficult for students to classify. These materials are the complete machine documentation beginning with the tender dossier and ending with the technical drawings.

The further optimization of the study materials will depend on the evaluation performed by students in the system for evaluating the quality of teaching at the University of West Bohemia in Pilsen or on individual responses of students conveyed to the teachers.

Acknowledgements

The presented paper has been undertaken within framework of the Project No. CZ.1.07/2.2.00/28.0056 'Exemplary developmental projects from industry for reinforcement practical knowledge of future mechanical engineers' cofinanced by European Social Fund and a state budget of the Czech Republic.

Electronic study materials for design of universal center lathes

Tomáš Keckstein
Univerzitni 22, 306 14 Pilsen, Czech Republic
[b]Second affiliation, Address, City and Postcode, Country

Abstract

This article describes the creation and application of e-learning study material at the University of West Bohemia in Pilsen at the Faculty of Mechanical Engineering in the Department of Machine Design. This project specifically deals with description, design, calculation and construction of a universal centre lathe. The study materials meet standards used in modern engineering practice and they are also appropriately structured for better understanding. All documents are created with the help of experts in this field.

Embracing the future: empowering the 21st century educator

Teresa J. Franklin40
**Gladys W. and David H. Patton College of Education, Ohio University, Athens, OH USA.*

Abstract

The world of education is different and you as an educator have probably been a part of at least some of the educational transformations occurring today. These have not been incremental changes but rather large encompassing changes to education, as we know it. This is a world in which education is moving from the industrial age to the *connected age* brought on by the increasing numbers of Web 2.0 applications. Humans are social beings with a desire to "connect, exchange, share, remix and reinvent" (Prensky, 2005) all of which can be accomplished with a few friends and technology.

Keywords: MOOC's; Mobile Learning; Pedagogy; Augmented Reality; Cloud

IETC 2014

1. Introduction

The world of education is different and you as an educator have probably been a part of at least some of the educational transformations occurring today. These have not been incremental changes but rather large encompassing changes to education, as we know it. Add the massive technological innovations; we now have an educational world that is vastly different from the education of our parents and ourselves (Bonk, 2009).

This is a world in which education is moving from the industrial age to the 'sharing age' brought on by the increasing numbers of Web 2.0 applications. When examined in context of human behaviour and technology, this was inevitable. Humans are social beings with a desire to "connect, exchange, share, remix and reinvent" (Bonk, 2009) all of which can be accomplished with a few friends and technology.

As educators looking to a sustainable future for our higher education institutions, secondary institutions and learners, the answers are not easy. Examining the higher educational issues noted online, within educational *think tanks* and in educational research journals can help educators begin to embrace the future, allowing for thoughtful and strategic planning that empower our educators and learners. The higher education issues to be examined in this paper are:

- Learn, Unlearn and Relearn – Big Ideas
- Going Mobile and the Cloud
- Learning Online – MOOC's for Everyone
- Virtual Learning Environments and Augmented Reality

Each of these new learning environments brings with it challenges in the pedagogical models educators presently use within higher education institutions. This is not a world for which we as educators were prepared for – we have to rethink how to work with students and in classrooms – no matter where the classroom exists. A decade ago, the faculty member was the sole source of information that a student needed to succeed in a career. Today's students seek information instantaneously through their favourite search engine on a smartphone. The ubiquity of technology has encroached on information acquisition from anywhere at any time, making it essential that we engage students by any means necessary in this new digital learning environment for teaching-and, ultimately, this new way of learning.

2. Learn, Unlearn and Relearn

Teaching must be transformed to better meet the needs of a digital learner (Prensky, 2005). Our fixation with order in our classrooms such that desks are in neat rows facing the instructor who dispenses knowledge must be replaced with a social-cognitive theory of learning for any reform in higher education to succeed in this technological age. The pivotal point of true reform of higher education lies in, "unlearning, old attitudes, acquiring new ones, accepting new responsibilities, trying the new and risking failure, unrealistic time perspectives, and expectations, limited resources, [and] struggles as a consequence of altered power relationships (Seymour, 1990). As educators begin this discussion of educational trends and big ideas, let us be reminded of how we each deal with change. Everett Rogers (Rogers, 2003) for over 30 years studied how communities deal with change by also examining an individual's ability to change. Full disclosure – Rogers began by studying agricultural change and then realized change was about the people in the community not the 'corn products' that he was trying to move the group to plant. He created Rogers' Innovation Adoption Curve to help identify the characteristics of adoption of an innovation (in this case, educational innovation). If we look at the list below, Rogers' (Rogers, 2003) found that most communities including education communities follow this pattern of adoption of innovation when identifying possible innovators and adopters: *Innovators* (2.5 %); *Early Adopters* (13.5 %); *Early Majority* (34 %); *Late Majority* (34 %); and *Laggards* (16 %).

Taking a moment to examine the definition of each of these, the innovators (2.5%) are viewed by their peers as brave people within the organization…pulling the change along. Communication is important to them. *Early Adopters* (13.5%) are respectable people, opinion leaders; try out new ideas in a careful way. The *Early Majority* (34%) are careful people; but accept change more quickly than the average. The *Late Majority* (34%) are skeptics and only change when the majority are using and is required and typically at the risk of loss of a position. The last group, the *Laggards* (16%) are traditional. They expect and want the old ways – will not change – do not waste time on these people when trying to innovate (Rogers, 2003). Each of these groups plays a role within an organization as it tries to innovate. Knowing this information can provide a guide to planning how an organization is going to deal with the members and what professional development, knowledge, skills and dispositions must be achieved for adoption of change.

3. The Need for Big Ideas

*"The illiterate of the twenty-first century will not be those who cannot read and write, but those who cannot **learn**, **unlearn** and **relearn**."…Future Shock*, Alvin Toffler, 1970.

This quote brings the educators to the topic of *Big Ideas*. Higher education classrooms must be the place where thinking occurs. The work of the classroom must be one of co-learning in which lessons are designed such that students *construct meaning and connect* in a networked environment. We have to move to a new model of Bloom's Taxonomy in which we teach conceptually and the students learn the skills as they work through the materials to learn the 'big' idea. The problems of today and tomorrow will need to be solved through big ideas. Ideas matter; big ideas are what excite, engage and motivate learners.

What if students were challenged to work in teams, collaborate with others around the world on math, science and health problems or historic events to analyze an important concept or content? Instead of starting at the bottom of Bloom's Taxonomy, what if the instructor started at the top? Rather than lecture (which includes PowerPoint presentations), use problem-solving teams and case studies in which the students are challenged to dissect the big idea and present the *analysis* process, *synthesize* the information, *evaluate t*he possible outcomes and in the process learn the *knowledge*, *comprehend* the magnitude of the problem, and *apply* a possible solution [(Halstead, 2011) Bloom's Taxonomy reversed!

In classrooms (both face-to-face and online) with the expectation of student-centered learning, students discover their own understanding of content, significant retention and understanding of content occurs with an increased interest in learning. Using open sharing of problem-solving solutions through the use of teams allows not only for in depth discussion by the team of problem solutions but allows for whole group discussion in which the instructor gives students the opportunity to thoroughly explain their thinking about the solution presented. Through probing questions the instructor can help students come to their own understandings and identify and rectify misconceptions in the process (Halstead, 2011).

What Web 2.0 applications might help the student and instructor in their collaboration on big ideas? Mind mapping (also called concept maps) in which students dissect the problem into component issues or concepts might be a place to begin. Popplet® (http://popplet.com/) allows for collaborative development in multiple locations in a multiplayer design within the cloud environment. Inspiration® (http://inspiration.com/) and Mindmeister® (http: //www. mindmeister.com) provide for web-based/cloud distribution of the content to multiple locations. These tools allow teams to build maps of their thinking as they plan for the analysis, synthesis and evaluate content. The mind map can act as a means for the instructor to assess the teams' activities and thought processes as they work through the problem with the mind map acting as a recording of the work of the team. Lastly, the mind map can act as an advance organizer or scaffolding mechanism for relearning material as a student prepares for projects or testing (Kazakoff, 2009). Wikis and blogs act as a foundation for participatory learning and allow students to interact and collaborated beyond the boundaries of the classroom without respect to place, time, and distance (Cunningham, 2009; Leuf & Cunningham, 2001; Warhurst, 2006). Social media software which includes, wikis, blogs, Twitter® and Facebook® to name a few have created a participatory culture and learning environment. In the digital world, traditionally passive learners have become active participants with connectivity and the social rapport sharing their expertise McLoughlin & Lee, 2007). Finally, Web 2.0 applications such as Evernote®, Dropbox®, and Google Drive® allow for student and faculty documents to be shared, again, with no respect to time and place for learning to occur.

Another instructional strategy involves the use of a *flipped* classroom in which instructors construct a new pedagogy to develop skills in critical thinking and problem solving. The flipped classroom as an instructional model reverses the common instructional approach (Tucker, 2012). The instructors do this by changing the definitions of homework and classroom practice. In a flipped classroom, students use non-class time to connect to the content that the instructor would typically teach instead of doing homework. Class time is used to actively engage with other students and the instructor to think critically about real-world problems and to apply the newly learned content knowledge to projects, lab experimentation and collaborative teamwork. The non-class time content is found online in a learning management system (LMS) and students are expected to go to the online site and *study*. As a teaching philosophy, the flipped classroom supports continued learning in which education does not stop when the class ends but there is an expectation that learning continues between class meetings. The flipped classroom model minimizes the time spent on *chalk and talk* and produces more teacher-student and student-student interactions in class. It produces more time for the instructor to organize collaborative activities, interact with students creating a very individualized instruction (Brunsell & Horejsi, 2011). As students learn to work in a flipped classroom environment, they come to realize that with the materials online, they can study at their own pace and schedule and that the responsibility for learning is owned by the student, not the instructor. Web 2.0 technologies are important in a flipped classroom as web-based instruction such as video and podcasting can be watched from multiple devices. As the instructor develops the online materials for the

IECT 2014

student, the instructor becomes a cognitive coach helping each student achieve his/her learning goal (Franklin, Sun, Yinger, Anderson & Geist, 2013).

Changing instruction to embrace big ideas, the use of technology to flip a classroom or connect students in participatory learning requires an educator that is willing to learn, unlearn and relearn new pedagogies for teaching, learning and moving higher education forward.

4. Going Mobile and the Cloud

The cloud technology poses and interesting economic issue for education. With more and more access needed to the Internet (i.e. the cloud), higher education institutions are in constant need of bandwidth. This is being future compounded by students that use multiple devices including smart phones, tablets and laptops, all mobile devices that seek to connect to content, information, games, video, movies and connect to friends 24/7. Add to this the need for apps (small software applications that complete only one task) and software that is delivered by the cloud, the costs to higher education for Internet access continues to climb. At this very moment, Microsoft® and Google® is delivering a new operating systems that will live within the cloud. Cloud connectivity will be used to deliver software and operating systems necessary for your device to work in much the same way your cell phone needs the Wi-Fi or G3 delivery. This cloud access is going to be the new way that businesses make money using the Internet as more and more devices go to a cloud delivery requiring subscriptions to connect you to your productivity software.

We have the development of the netbook to 'blame' for this change. The small, lightweight netbook now called an ultrabook led the way to the present smartphone industry. Once it was identified that lightweight mobile technology was highly sought after by the public, innovation to move to highly mobile devices such as smartphones, cells, flip cameras, and tablets were viable for businesses to produce and sell to the public. The lower price point of these items fueled the cell phone industry as they could now produce smartphones with similar capabilities at the same price or cheaper price. These highly mobile devices are now seen as indispensable to our daily lives (Franklin, 2011).

Always on – always on you is the mantra for today's learner. "With more than 6 billion mobile subscribers worldwide, 85 billion text messages sent per month, mobile texting usage is up 450% over the last two years, it's clear that mobility will overtake the Internet and television as the most ubiquitous form of communication" (Mobile Matters, 2011, para. 1). Here is what it means to be mobile:

- Like your car keys and your wallet, the mobile device is always with you including the ability to communicate in real-time, anywhere, anytime
- There is an every present audience by the use of Twitter™ and Facebook™
- Personalization is the name of the game – 'one size does not fit all'; direct and personal, takes little time to send a message or respond
- User has the option to 'opt out' so it is permission-based
- Messages on your cell phone tend to stay (stick) and can be forwarded to others at the chosen time and place
- Interactive on a 1:1 basis with the user deciding who, when, where and why to communicate (Mobile Matters, 2011, para. 3).

With mobile devices comes pedagogical complexity. Higher education faculty in general are somewhat resistant to the idea of an open system or world in which a student can *reach out and touch him/her*, which is the direction that mobile learning and cell delivery of content takes the learner. Smartphones and other mobile devices create a world in which 24/7 access makes locating experts, in this case faculty, for questions, discussion and collaboration an easy task. Through the use of their mobile device, our students can quickly *fact check* a class lecture, *find people* who may know more about the topic than the faculty member, *find students* who have completed the assignment last year and ask them for help – or *copy* intellectual

IETC 2014

property directly -- and *Facebook*® or *tweet* how bad/boring your class is – all while attending your 55 minute lecture.

Mobile devices increase the opportunity for student/faculty interaction. Text messages, Skype calls and constant email can become a 24/7 event for the faculty member. The expectations of a mobile-based learning will have to be negotiated such that both faculty and student are not invading each other's social and private spaces and time. Cell phone use, laptop use, social networks in the classroom will also have to be negotiated. Mobile devices have the potential of increasing faculty workload. Mobile technology and learning adds a complex layer in which the faculty member has to juggle websites, content, design, implementation and execution of technologies and the cloud. How does my content look on a mobile device? The answer requires repackaging of content, time to prepare and staff support that is often not available (Franklin, 2011).

There is great resistance in the ranks of our higher education faculty as many see these mobile devices as a distraction to learning. Students are often not willing participants either, seeing the use of tablets, laptops and cell phones as a means of making learning 24/7 and their responsibility. Mobile technology may be in the hands of students but it is primarily used to listen to music. Older adults returning to school may have no understanding or expertise with the technology – much less mobile technology (Franklin, 2011).

Going Online – MOOC's for Everyone

The higher education online course development process has become more competitive as more and more universities have created MOOCS. MOOCS is the term for *Massively Open Online Courses* and is the widely seen as an implementation by the universities Harvard, MIT and Stanford as a way to reach out to a worldwide audience of learners. MOOCS are appealing as they allow the learner to choose, when, what, how, where and why he/she wants to learn a subject. MOOCs often attract thousands of participants that are active in the discussions and complete the courses; while at the same time several thousand may *lurk* and read content rather than participate.

Connectivist pedagogy (Siemens, 2005) is the underlying principle behind the development of MOOCs. The Connectivist pedagogy supports a connected learning environment in which knowledge is distributed across a series of networks connections in which the learner must traverse these connections to learn (or in other words – connect to the learning). Knowledge is gained through the connections that from the learners actions or experiences.

Hence, in connectivism, there is no real concept of transferring knowledge, making knowledge, or building knowledge. Rather, the activities we undertake when we conduct practices in order to learn are more like growing or developing ourselves and our society in certain (connected) ways…This implies a pedagogy that (a) seeks to describe 'successful' networks (as identified by their properties, which I have characterized as diversity, autonomy, openness, and connectivity) and (b) seeks to describe the practices that lead to such networks, both in the individual and in society (which I have characterized as modeling and demonstration (on the part of a teacher) and practice and reflection (on the part of a learner)) (Downes, 2007).

MOOCs are built to provide access to the teaching of a world-class professor to thousands of students. The expertise of the professor behind the content isn't cheap and, in many cases, is unique to a particular university as the professor places the lectures, assessments and activities for a course online. A MOOC opens the door to the professor's classroom, often a very expensive classroom from a major Ivy League university.

IETC 2014

Last fall, more than 100,000 people enrolled in a free online version of the renowned Stanford roboticist, Sebastian Thrun's artificial-intelligence course. Many didn't finish. But some did, and among them, some performed just as well on the assignments and exams as the whip-smart students in Palo Alto who took the course in person. For this, the online students received no official academic credits of any kind (*The Chronicle of Higher Education*, September 3, 2012, para 6-7).

Because MOOCs are not bound by semesters or other traditional academic year arrangements, they allow for flexibility but not credentialing. The credentialing aspect of higher education and the role that higher education may or may not take will determine the impact of the MOOC on present pedagogy in higher education. The future of education one of universal access to free, high quality, impeccably branded online courses that their presence can be simply assumed. The interesting questions now revolve around financing, quality assurance, and—most important—credit (*The Chronicle of Higher Education*, September 3, 2012, para 9). The opportunity for a prospective student, alumni or casual student to enter a MOOC and then enroll in the university is a gamble that many US universities are taking in hopes of increasing enrollments and self-determining learners.

Virtual Learning Environments

Teaching and learning styles of yesterday's higher education classroom are no longer applicable in today's digital and technologically based world. Our students have been consumers of information in the past without producing or creating content that is new or relevant to them and their surroundings. The 21st Century requires a philosophical shift in educational practice with the adoption of technology and a more learner centered approach. Augmented reality (AR), also known as virtual reality (VR), is the final innovation to be discussed in this paper. At the core of virtual immersive environments is the changing pedagogy that places the student at the center of learning and as the *driver* of his/her own learning (Oblinger, 2011). Why are virtual learning environments significant?

These virtual environments have the potential to foster constructivist learning in which learners take ownership for their own learning processes. Digital learners are already comfortable with gaming and mobile communications. Virtual worlds bring together learners and challenge them to collaborate in problem-solving activities without explicit learning objectives and assessment. For many learners the avatar-to-avatar experience may seem as real as a face-to-face conversation. Opportunities arise for meaningful engagement in learning across a broad spectrum of students around the world. A virtual world as an educational medium requires reflection on how education has been conducted in the past. The virtual world allows for more interaction and more engagement for some students (Franklin, 2010, p. 196).

Many universities are experimenting with the use of augmented reality environments for teaching and learning and recruiting today's digital learner. From the recruiting aspect, several schools in the US are not using virtual campuses to invite future students to talk to advisors, meet the people in registration, and organize class schedules all within this virtual world (Hughes, 2011). Today's games are complex and require collaboration with others. Sixty-five percent of college students state they play online games on a regular basis. Games are very much a part of their mobile environment with games being played on tablets, laptops and smartphones all the while multitasking by visiting with friends, listening to music or completing assignments (Oblinger, 2006)..

Virtual learning environments are very complex learning constructs. When games come to the classroom, the instructor often views them unfavorably. Instructors in higher education have very little experience in these immersive worlds. Not realizing that these immersive worlds are designed to challenge the

IETC2014

learner in his/her decision making processes, test problem-solving capabilities, identify goals for success, and work with others to *win*, the higher education faculty determines these are not worth educational time (Franklin, 2010). Gesture-based computing, already in wide use in gaming and mobile devices, has the ability to transcend linguistic and cultural limitations by relying on natural human movements, which transcend culture (Oblinger, 2006).

The gaming aspect to the virtual experience supports the goals of educators by creating a motivation to learn. Learners see themselves in control of the world, in control of decisions and free to explore and experiment. Experiential learning within these virtual environments encourages conscious reflection and critical thinking as learners interact with content and master difficult concepts (Tekaat-Davey, 2006). Learners are often motivated and willing to invest large amounts of time and effort to master video games. Time is spent discussing strategies of the game, the characters in the game, the plot, interactions of players and characters and how to master the game. Motivation to play games has two elements, first the desire to play the game and second the desire to continue to play and persist when challenged by events within the game. This motivation and willingness to invest time in learning is a key element that educators seek to replicate in the classroom (Rieber, Smith & Noah, 1998).

Immersive environments offer the advantage of capturing the attention of the game player who in this instance is the student in the higher education classroom. Having grown up with game devices such as the Sony PlayStation®, the gaming experiences of digital learners may prove to be a motivating factor in learning within virtual worlds designed for higher education as they allow students to say *what if* and explore. Students in virtual worlds are allowed to make mistakes – an important part of learning (Franklin, Chelberg, Liu, 2009). While entrepreneurs and large corporations eagerly examine virtual environments for communication, workforce training and to secure a global presence, higher education has been slow to research the impact of such learning environments. Virtual immersive worlds have the promise of providing collaboration, simulations, and explorations in which learners gain a unique experience with a topic often unrealizable in the classroom. Virtual environments help learners visualize phenomena such as sub-atomic explorations, standing in the eye of a hurricane, experiencing the force of a tsunami or the shaking of the ground in an earthquake which are all virtual experiences that are abstract or impossible to observe in the typical classroom environment (Rieber, 2001).

With virtual learning environments, faculty can present lectures, have students discuss remotely thereby saving transportation fees and commuting time for students and interacting with students inside a virtual classroom as if they are physically gathered in one location. Students can conduct experiments using virtual instruments in virtual labs, which decrease the investment of lab instruments. Virtual worlds also provide places for educational activities such as group thinking and gallery walks to examine research completed and shared by experts.

Virtual environments can provide students with new and unique leaning opportunities that the students would not have access to in the traditional classroom environment. Interacting in virtual worlds allows students to explore a unique and powerful learning environment that model globalization and the way in which these digital natives will work, collaborate, and share information as opposed to today's classroom of demonstrative show, tell, and repeat pattern. This is in direct conflict with the fast paced world students will be engaged in their future work. Globalization of communication, entertainment, and information introduces students to a wider perspective, resources and talent expertise when placed in an ever-changing learning space such as an immersive virtual environment (Oblinger, 2006).

Virtual worlds are set to lead the charge for education into the twenty-first century. A co-mingling of the spheres of learning, work and play is creating a new learning ecology in which the ability to leverage knowledge assets though distributed learning systems to others online is creating virtual environments across the Web.

Conclusion

IETC 2014

Educators may become overwhelmed by the race of the technology and the challenge of the mobile world in which our students are comfortable and knowing, Mobile learning – it seems logical to both faculty and learner, as it allows content that should enhance learning. What educator does not want 24/7 access to content for learners? After all, isn't this the age of the digital learner – the independent learner that has technology at his/her fingertips? We are in a world in which there can be a global educational exchange for exponential change in our educational systems. Educators must prepare their students for unknown new environments upon graduation for P-12 or higher education. Our current educational system is obsolete and we as educators will become obsolete if we do not realize that we must embrace the changes that are upon us in how, where and why students learn.

Abstract

Recently there has been a push to put a ban on genetically Modified foods because many people believe that they are harmful to the health of the public but on the other hand with the world's population continuing to grow and many countries lacking enough food to support their populations. The balancing of possible risk verses benefits is critical because of the great quantities of food that Genetically Engineered Food can provide compared to unmodified foods, but with possible risk factors.

Keywords: Genetically Modified Organism(GMO); Genetically Modified Foods(GMF); Carrying Capacity; Selective Breeding; Genetic Mutation; Food and Drug Administration(FDA); Biotech industry; Lobbyist; Environmental Protection Agency(EPA); United States Department of Agriculture(USDA).

IETC 2014

1. Ethical issue

There has been a lot of debate in recent years about genetically modified foods and their safety. With the advance of technologies there has been great advances on how we grow our food, for example, there was recently a story on national news about a simple hamburger but what is so amazing about the hamburger is that the beef used in it was grown in a laboratory. This laboratory grown beef is an example of the technological advances that in the future could be of great benefit to the world.

These laboratory grown meats in the future could reduce the need for having large herds, which are actually a large source of Methane released in the atmosphere. Methane is one of the most harmful of green house gasses causing climate change with large herds of cows being the source of the Methane. The current cost of the portion of beef that has been created was priced at nearly $330,000 but with the advance of technology this beef will likely become cheaper than natural beef and be produced in greater quantities. The need for cheap foods is becoming more and more important as the worlds population continues to grow exponentially. It is estimated that the earth can support somewhere between two and fifty billion people depending on the average living conditions of the population. The lack of food in regions of the world such as Africa, could be a sign that we are approaching or surpassed the maximum carrying capacity of the planet.

Fig. 1 A picture of the laboratory grown beef.

2. Ethical framework

The main issue when it comes Genetically modified foods comes from Common morality, one must weigh the risks verses rewards, on one hand there is a risk with using Genetically Modified Organisms whether it be by contaminating crops or causing health problems, but on the other had if these Genetically Modified Organisms are not used then the cost and demand for food would rise and some might suffer from starvation because of this increased cost.

2.1 Risks

There is a substantial fear that a genetically modified organism might possibly take over and eradicate the original crop. This fear comes from the fact that some crops such as corn and wheat would be planted in a field an release there pollen into the air, this pollen would then travel to unmodified crops eventually taking over all the crops by breeding the unmodified crops out. As an example the Africanized honey bee was brought to North America because they could produce more honey than the native species, these Africanized bees then began to breed out the native species. Today the Africanized bee has nearly eradicated the native species of honeybee.

Fig. 2 A picture of a Genetically Modified species of corn on top compared to Un-Modified corn.

Possible risks to human health have been called into question in recent years by many independent studies. There have been links made between Genetically Modified Foods and immune problems, accelerated ageing, faulty insulin regulation, changes in major organs and gastrointestinal system and infertility. One study found that when lab rats were fed these Genetically modified foods regularly the fatality rates in the baby rats were over five times the rate of the rats fed un-modified foods, this can be seen in Figure 3.

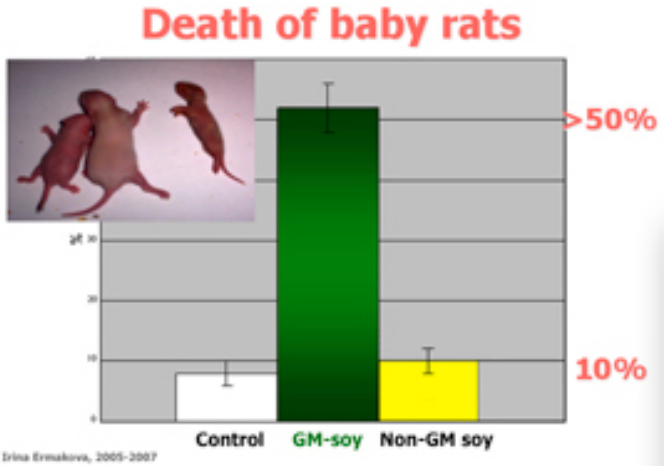

Fig. 3 The image above shows the fatality rates of baby rats that were fed a variety of un-modified and modified foods.

Many critics argue that selective breeding could have the same results as Genetic Modification without the risk of harmful genetic mutations.

Many ask "if genetically modified foods are so dangerous why are they not banned by the Food and Drug Administration(FDA)", some argue that this is be-

IECT 2014

cause political officials were persuaded by lobbyist working for companies to promote these Genetically Modified foods. This theory came about because in the early 1990's the Food and Drug Administration claimed that they had no information showing the Genetically Modified foods were unsafe in any way, however, internal memos were made public showing that department scientists were very concerned about how safe Genetically modified foods really were. Another concerning factor is the lack of regulation when it comes to Genetically modified foods since there are no long-term studies assessing the safety of the crops and these modified food are in many ways an anomaly that the Food and Drug Administration and Environmental Protection Agency(EPA) are not sure how to regulate properly. The unpredictability of modifying foods is concerning because when the DNA of the organism is altered scientist do not have a complete understanding of all the factors that modification could make.

The major rewards of Genetically Modified Foods are the increased yields at lower cost for farmers. This is done because the crops are altered to make them less susceptible to insects and weather conditions while increasing the amount of produce a single organism can produce. This increased yield per plant is very important because as the population grows there is an increasing demand for fertile soil for farmland. These lower prices are passed on to the consumer who is increasingly demand for less costly food, without these altered food crops more of the public would be less able to buy food and could be at risk of starvation especially in underdeveloped and poor countries and households in poverty.

2.2 Common morality

Common Morality dictates that one must help people and work for the greater good of humanity and to not do harm to others, this is hard to balance in this case. It is so hard to balance because Food and Drug Administration studies have found no link between Genetically Modified Foods and any harm to humans but independent studies seem to show differently, but the Genetically Modified crops are helping to feed the less fortunate and those suffering from starvation. By helping feed the impoverished and keeping them from starvation creates a major positive factor and need for Genetically Modified foods but if these foods cause harm for the less fortunate one must weigh if the risk from feeding the modified foods is worth the possibility of a portion of the public starving.

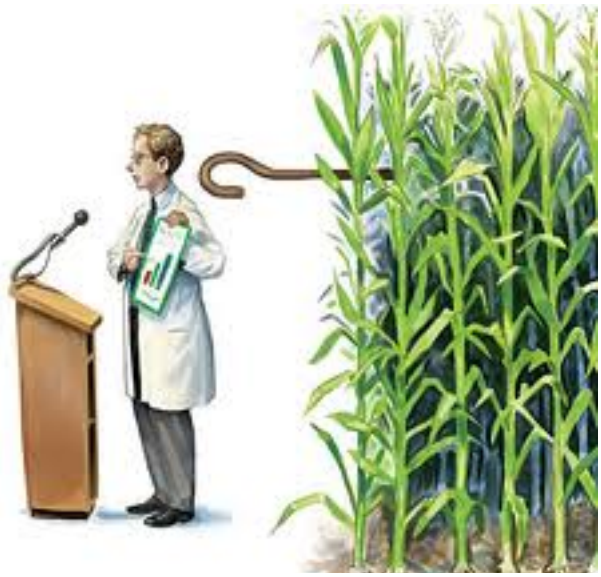

Fig. 4 Shows children in an impoverished region of Africa waiting to get food.

3. Steps for facilitating solutions to ethical issues

3.1 Preventing risk

With so many Independent studies showing the dangers of Genetically Modified foods there needs to be a temporary ban on the sale and large-scale production of the foods. The lack of information of possible harm that may be caused by the foods makes it difficult to assess how safe the foods are. The possibility of these modified crops contaminating the original crops is a big risk because if these crops were found to be harmful and have already begun to take over the original crops the entire crop species would then become inedible and causing the food shortage problem to become worse.

3.2 Research

IETC 2014

There needs to be more independent studies to assess the possible health and ecosystem risks posed by Genetically Modified Crops. The reason they need to be independent is because of the link made between government officials taking special considerations on behalf of the biotech companies. There is also evidence of this from President Barack Obama, the president took a critical stance on Genetically Modified foods in 2007 promising to mandate labeling for all Genetically Modified Products, however, he later signed in to law a bill to protect Genetically modified food and then appointed a biotech lobbyist as a high level official in the Food and Drug Administration. The possible bribery or grease payments by the lobbyist and companies likely influenced governmental decision making which is very troubling and a separate ethical issue in itself. There also needs to be long-term studies to assess the effects of long-term consumption of modified foods.

Fig. 5 Shows a political cartoon of the Biotech companies influencing the decisions of scientists.

3.3 Clarification

The Governmental agencies need to formulate a plan of action to deal with genetically modified foods and how to properly regulate them to insure a consistent safe product. This is an important step because the current policies do not properly deal with the anomaly that these crops are. This is also important because it also will close any loopholes that might be used by Biotech companies to get unsafe or untested products on the market.

Fig. 6 Shows another comparison between an organic tomato and a Genetically Modified tomato.

3.4 Possible outcomes

Depending on what the research concludes there will likely be two outcomes, either they are deemed safe or unsafe. If the modified products are deemed safe for the ecosystem and safe for human consumption they should be allowed to continue production of modified crops under the new clarified governmental polices. If they are deemed unsafe the production, sale, and consumption should be banned, and companies need to invest in new ways to supply the public with large quantities of cheap safe food.

4. Impact of ethical resolution

The Ethical Resolution to this problem rest only with the results of independent research. If the crops are deemed unsafe they should be banned from being produced, sold, and consumed. The Biotech companies should begin researching new possibilities that allow for large, cheap, and safe production of new crops to feed the public. Although there would be a greater need for food, I believe it better to not give the less fortunate harmful foods and knowingly be the cause of long-term harm. I would argue that letting environmental factors that are out of ones control dictate the future of the people is better than unintentionally causing harm from feeding them harmful foods. The better resolution would be that there is no harm found from the consumption of these foods especially since most people have been consuming them in some amount since the 1990's. This also ensures that the supply of food would be stable and the less fortunate would be kept farther from starvation. This also opens the door for further development of crops so the prices of foods will go down and be more plentiful and still being safe.

IETC 2014

Fig. 6 Shows the top ten most common Genetically modified foods.

5. Conclusion

I believe there is enough evidence by independent research to warrant the halting of at least a portion of the Genetically Modified Foods. There is a major lack of proper unbiased research done especially long-term research to definitively prove the safety of the products. I also think that during the period when these crops are banned it will allow for alternative research on other possible ways to increase agricultural productivity.

Fig. 7 Shows President Barack Obama in a speech about passing a mandate for labeling on all Genetically Modified Products.

6. Acknowledgment

The Author of this article would like to thank the entire Engineering Department at the University of West Florida especially Dr. Rashid for there guidance and teaching in the writing of this article.

The Author would also like to thank Dr. Nicholas Power at the University of West Florida for the teaching and guidance in the area of Ethics in Contemporary Society.

8. Author's Short Biography

I Jimmy Kocher was Born on March 7, 1992 in Fort Walton Beach, Florida. From an early age I was always interested in the fields of science and engineering. When I entered high school I began developing an interest in health sciences and I believe that this is why I chose this topic for my report. In my senior year of high school I began struggling to figure out what I wanted to major in because I enjoyed my physics classes which made me strongly consider the fields of physics and engineering, however, my interest in health sciences made me also consider pre-professional biology and exercise science. I eventually made up my mind that year that my combined interest in computers, science, and physics would make Computer Engineering the best choice for me.

Enhancement of teaching design of CNC milling machines

Antonín Max41, Václava Lašová, Šimon Pušman
Machine Design Department, Faculty of Mechanical Engineering, University of West Bohimea in Pilsen, Universitni 22, Pilsen 306 14, Czech Republic

Abstract

This paper presents a new approach to teaching which is focused on designing CNC milling machines in the Department of Machine Design at the University of West Bohemia in Pilsen. It is aimed at creating guidelines for students with the following main priorities: find and unify information in one place and in a simple manner for students. For this purpose, 3D models are created in Catia, NX, etc. and converted into a 3D pdf which has lower hardware requirements, no special program and students can still rotate and move the models and make them visible/invisible. The parts are described including their functions.

Keywords: Type your keywords here, separated by semicolons ;

IETC 2014

1. Introduction

The field of Machine Design at the University of West Bohemia in Pilsen is a promising specialization for students who want to apply for a career in construction after graduating. Unfortunately during their studies and after graduation students face several obstacles. One of them is the scope of knowledge required.

Already the definition of the word 'engineering' implies that it is an extensive specialization: 'The creative application of scientific principles to design or develop structures, machines, apparatus, or manufacturing processes, or works utilizing them singly or in combination; or to construct or operate the same with full cognizance of their design; or to forecast their behavior under specific operating conditions; all as respects an intended function, economics of operation or safety to life and property' (ECPD 1941). Each machine is composed of several elements and creates a complex whole. For this reason, designing a machine often involves several people and therefore the engineers with the experience and skills to lead people also lead a project. For graduates without practice it is very difficult to start in the field of construction. They must face the problem of working on an extensive project and collaborating with other people who are designing their own part of a machine. These study texts were created to show students the issues of designing complex machines and prepare them for working in a team and thus to reduce the time taken to incorporate them into practice.

But every study text will fail without proper presentation and availability to students. Although the University of West Bohemia owns a large library with many specialized texts the students seldom use the library for searching for answers. Rather they obtain information from the internet where some of the information is often wrong or incomplete. According to many studies and technical articles (Šolc 2012 D. Benta 2014) the right way is to educate students by utilizing the benefits of e-learning. Therefore these

* Corresponding author. Tel.: +420-377-638-296.
E-mail address: antoon@kks.zcu.cz

study texts are provided to students through the university "Courseware" portal as a part of e-learning. The students have access to the portal constantly and they can easily and quickly study the issue during the study period.

2. Study materials requirements

According to the Accreditation Board for Engineering and Technology (ABET 2011) and the European Network for Accreditation of Engineering Education (ENAEE) the abilities required by design engineers as the European-stipulated outcomes (ENAEE 2008) were defined as follows:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- an ability to function on multidisciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in life-long learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

Based on these requirements a list of abilities was created from the point of view of Machine Design. These abilities need to be developed in students through study texts. But some of them cannot be obtained only by learning theoretical principles. This problem was solved by consultation with experts in the field and incorporating their experiences into text. The abilities are:

- an ability to use CAD software
- a knowledge of the mechanical design process
- a knowledge of manufacturing processes
- a knowledge of economic aspects of production
- experience with real applications
- an ability to express their thoughts unequivocally
- an ability to communicate in foreign languages
- technical creativity
- an ability to analyse and formulate technical problems
- a knowledge of total quality management principles

3. Study material

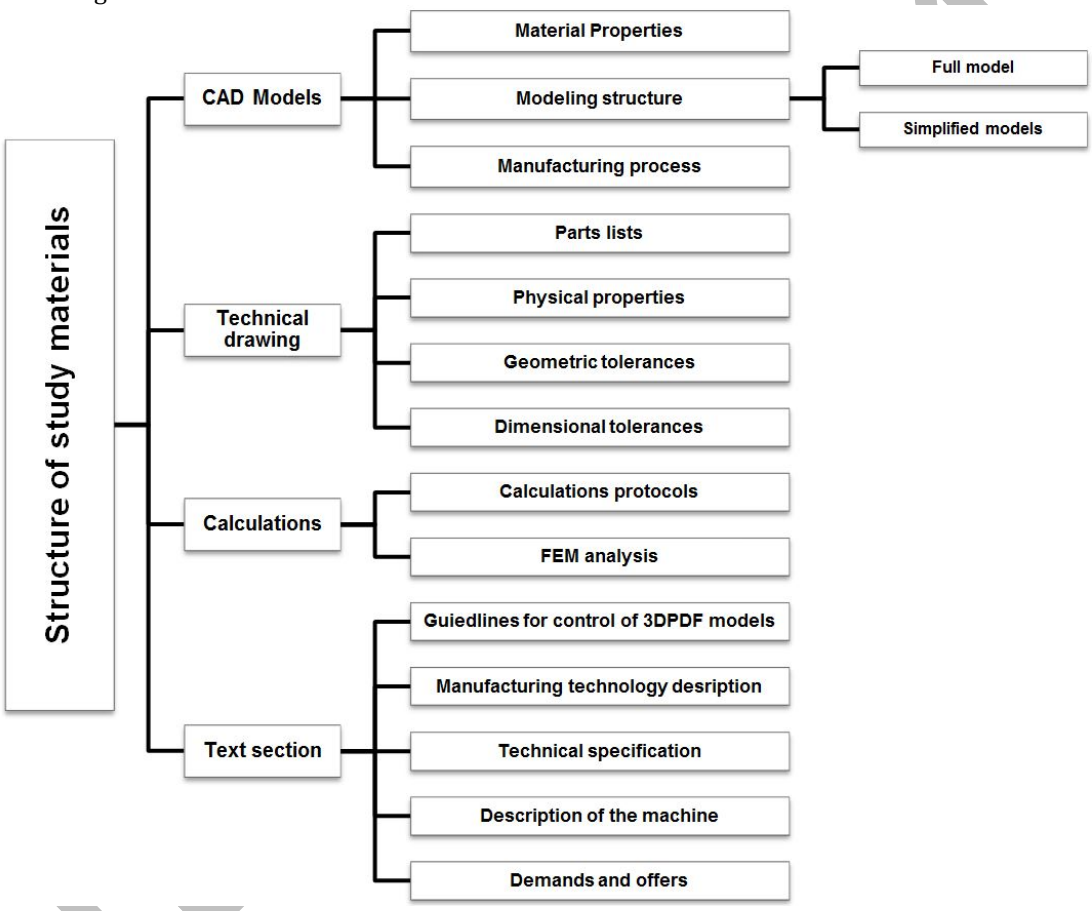
Already in 1952 engineers knew too well the benefits of numerically controlled machines (Scientific American Sep, 1952). Since that time there has been great progress in their construction and design. Connections were made between several sectors such as design, electronics, ergonomics, quality, economics, etc. This resulted in creating a multifunctional milling center. Besides performance milling centers must achieve universality, high security, reliability and cost effectiveness. By combining all these properties, it

IETC 2014

is certain that the machine is constructionally very complex. And this is why it is a good example from practice to show students the difficulties with the complexity of construction of milling centers.

3.1. Structure of study materials

The study material is composed of several parts. The first most important parts are CAD models and assembly. After that the models are converted to a 3D-PDF. The models are created with certain rules that facilitate students to understand the assembly and principle of machining parts. In parallel with the creation of 3D models the calculation reports are written for all major machine parts. After modeling of the overall assembly the technical drawings are created again with pre-established rules. The last part is documentation containing a description of the structure of the study materials, the rules and description of controlling 3D models in PDF, description of the important parts of the machine, calculation reports and examples of demands and offers for purchased parts. The overall structure of the learning materials is depicted in Figure 1.



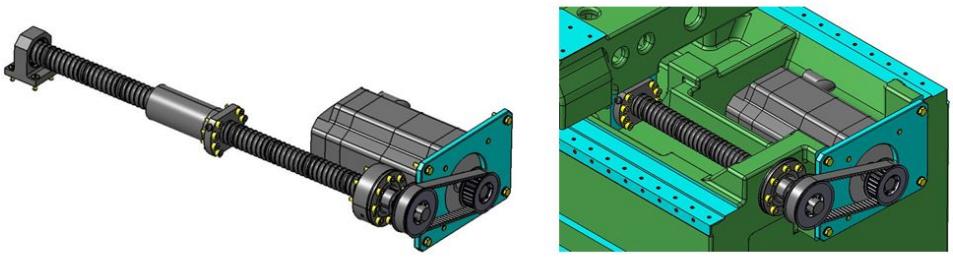


Figure 9 Structure of study materials

3.2. Form and content of study materials

Crucial for good technical study materials is their form. The study materials presented here take the form of a publication. The text is divided into blocks. In the block there are pictures and a description of function, principle of mounting, design process, etc. A sample of the form of the study text is shown in Figure 2.

ASSEMBLY OF BALL SCREW DRIVE

- Electric motor is mounted to plate by four screws. The plate is mounted to main frame by four screws. Using a toothed belt and two driving pulleys is transmitted torque between electric motor and ball screw. Driving pulleys are attached by clamping sleeves.
- On one side of ball screw is a radial-axial bearing housing. On the second side is a simple radial bearing 7205 mounted to bearing housing. Bearing houses are rigidly connected to the main frame. Both bearings are lubricated by long-life grease. Between the bearings is placed double flanged nut DDB. The ball screw nut is lubricated automatically from a central lubrication system.
- Tensioning the toothed belt is made by loosening the plate on which is mounted an electric motor and adjusting the slots. The belt is pretensioned force 252N. Proper belt tension is checked 100N force at which the deflection should be 2.9 mm.

DOUBLE FLANGED NUT DDB

Figure 10 Form of study materials

Figure 2 is an example of the description of an assembly of a ball screw drive. The information helps students to understand the fixing of the assembly to the frame and information about pretension of the tooth belt. After this block you can see the next headline "DOUBLE FLANGED NUT" It is a subheading and under it is a description focusing only on information about a single part (ball nut).

3.3. CAD models

With the advancement of today's technology all technical products are designed by special programs for creating three-dimensional computer-aided design (CAD) models. It is a simple method for designing parts. Models can be easily viewed, rotated and zoomed. In addition the assembly can be shown in cross-section, some parts can be set as transparent, two or more parts can be checked for collision, etc. The next important property is the possibility of adding technical information (part number, assembly number, materials, author name, quantity,...) directly into the models. This information can be found in the drawings and even in the 3D-PDF.

All CAD models are modeled according to strict rules which are described to students in the first few pages of our study materials. One of the rules is the coloring of models. Coloring of models is divided into two methods. The first method is used for coloring of purchased parts. Figure 2 gives an example of coloring of purchased parts. On the left side of the figure is a color palette and on the right side is shown a colored sample of an assembly.

COLORS		RGB	DESCRIPTION
YELLOW		(255,255,0)	Standard parts (screw, nuts, parts according to norms)
GREY		(126,126,126)	Catalog parts (parts purchased under name of the manufacturer)

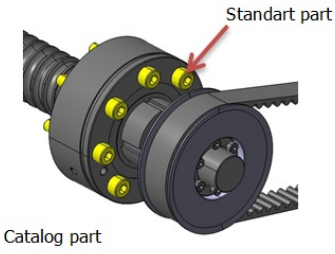

Figure 11 Coloring of purchased parts

The second method of coloring is for manufactured parts. The color palette is based on different manufacturing processes and technologies. Figure 3 gives an example of the second method of coloring. On the

left of the figure is a color palette and on the right is shown a colored sample of the part. All machined surfaces are one color, and there is no difference between turning, milling, etc.

COLORS		RGB	DESCRIPTION
GREEN		(90,190,90)	Non-machined surfaces of manufactured components
ORANGE		(255,128,0)	Material cutting (water jet, resistance wire, cutting, ...)
CYAN		(0,255,255)	Machined surfaces (including 3D dimensional surface)
RED		(255,0,0)	Drilled holes (under Ø50mm)
WHITE		(255,255,255)	Machined grooves
BLUE		(0,128,255)	Moulding surfaces

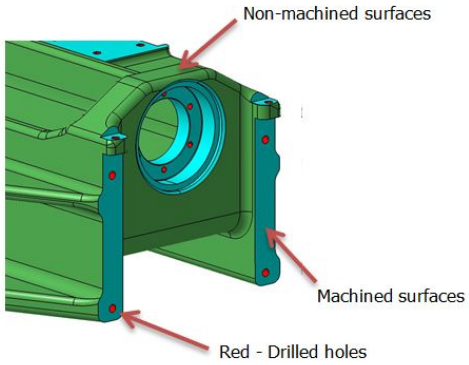

Figure 12 Coloring of manufactured parts

3.4. Technical drawings

As mentioned above, CAD models have many good qualities. But not all parts are transformed into this method. For this reason it is important to show students the rules for creating drawings and teach them to read these drawings.

3.5. 3D PDF

CAD models are a great source of mechanical engineering knowledge for students of Machine Design. Unfortunately programs for creating CAD models are licensed and are not freely available. Of course, these programs are available in the classroom, but students cannot study at home or anywhere else on their laptop. Fortunately, along with the progress of technology to create CAD models, there is the development of converting and viewing models in a universal program in PDF format. In this way, students can take advantage of CAD models (rotation, zooming ...) in the free program. Figure 4 shows how a page of 3D PDF looks. On the right of the figure is the converted model. The left side of the figure is divided into three sections. The upper section represents a structure of the assembly of the CAD model. In the middle are predefined views and at the bottom are shown the parameters obtained from the CAD model.

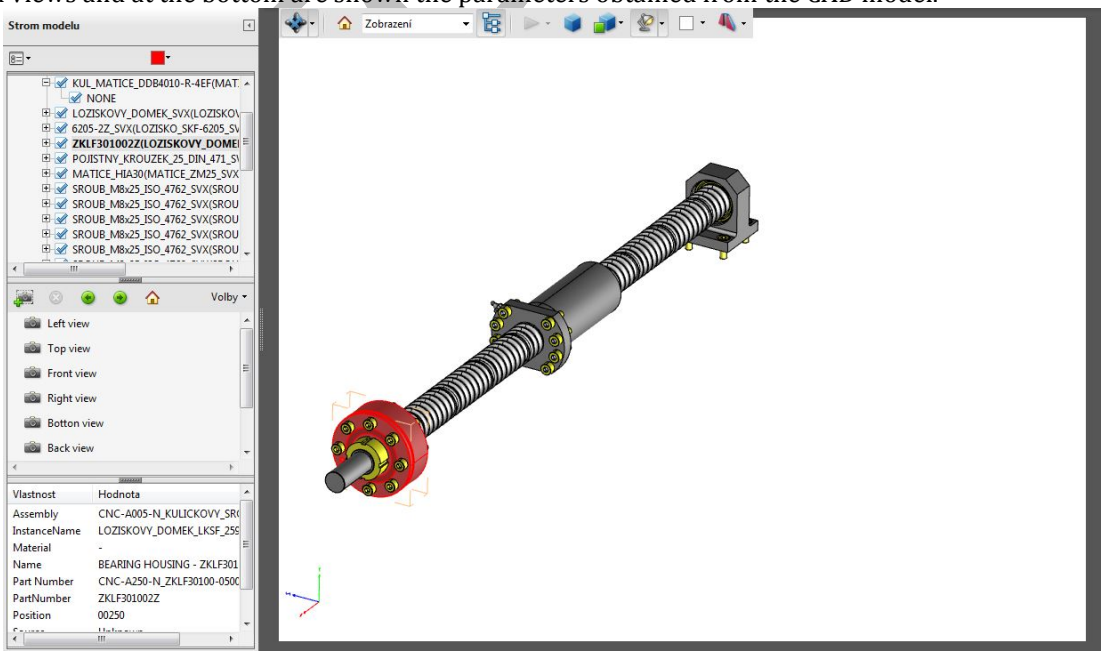

Figure 13 Page of 3D PDF

3.6. Calculation protocol

One part of the study text gives the calculation protocols for components such as the ball screw, linear guiding, parallel keys, screws, etc. The protocols are written based on theoretical calculations, practical experience and the manufacturer's catalog. Figure 6 gives an example of one page of a protocol. The protocol is divided into two columns. In the first column are defined formulas and constants. In the right column is a description of formulas and constants.

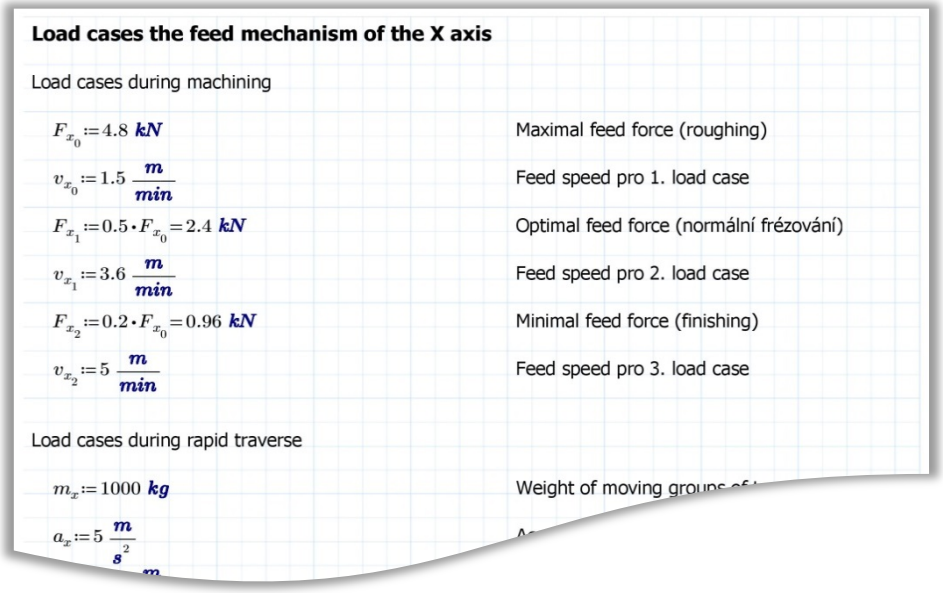

Figure 14 Calculation protocol

4. Conclusion and future work

It is clear that progress cannot be stopped. For this reason it is important to keep step with progress and provide students of Machine Design the latest know-how from industry. Therefore, the Faculty of Mechanical Engineering at the University of West Bohemia is concentrating on enhancing the teaching process and is trying to provide students with demonstrations of real projects. For this reason a new concept of study materials was developed which combines theoretical principles, experience from practice and the advantages of available technology.

The study materials are helping students to understand the obstacles faced when designing a large machine. They use a simple method, the color palette, to recognize purchased parts or machined parts and also to recognize manufacturing processes of machined parts. The next part of the study texts helps students to understand calculation of simple standard parts (parallel keys, screws ...) and also complicated calculations of linear guides, ball screw, etc.

Because all the materials are available to academics, they can modify specifications and provide them to students in the form of a new task. With the original specifications as a pattern, the student can create a new design and understand the obstacles faced when changing specifications and traceability of other changes in the structure.

Of course, a new concept of study materials must be followed up by feedback. For this reason we created questionnaires for students with questions focusing on the advantages and disadvantages. After evaluation, disadvantages will be eliminated and the entire evaluation will be performed again.

Acknowledgements

The presented paper has been undertaken within the framework of the project No. CZ.1.07/2.2.00/28.0056 'Exemplary development projects from industry for reinforcement practical knowledge of future mechanical engineers' co-financed by the European Social Fund and the state budget of the Czech Republic.

Ethical conflicts in stem cell research and education

Berrin Okka42

Necmettin Erbakan University, Meram Medical Faculty, Dept of Medical History and Ethics, 42080 Konya, Turkey.

Abstract

Stem cells are neither differentiated nor specialized cells, which carry the potential to become any body tissue that one can think of. Differentiation of the cells occurs when a single fertilized egg follows the process of becoming a fully grown human. Stem cells can be stimulated under laboratory conditions to transform into specialized cells with specific functions, such as heart muscle cells, blood cells, or nerve cells when required. Researchers claim that it carries the potential to deliver beneficial treatments to a large portion of diseases where cells have been damaged. The ethical discussion relating to stem cells is closely linked with the way they can be obtained. The aim of this study is to evaluate stem cell research in ethical vision.

Keywords: stem cell; research; health law; moral status of embryo

IETC 2014

1. Introduction

When the medical history is examined, it is evident that human beings have been in a desire to live a long life in a healthy manner and have always been in a constant effort to do so. Amongst these efforts, the thought of means for regaining the functions of a damaged organ as well as the organ regeneration has always been a topic of discussion. It is known that there is a constant formation of new cells to replace the old and dying ones in our body. The first and foremost foundation of all the cells in the living body is called "stem cell" which are cells capable of transforming into other cells with various roles.

Stem cells have the remarkable potential to develop into many diverse cell types in the body during early life and growth. In addition, in many tissues they serve as a sort of internal repair system, dividing essentially without limit to replenish other cells as long as the person or animal is still alive. Stem cells carry the characteristic properties of being plasticity, self-renewal and stems.

Stem cells are neither differentiated nor specialized cells, which carry the potential to become any body tissue that one can think of. Differentiation of the cells occurs when a single fertilized egg follows the process of becoming a fully grown human. In this process, cells divide into becoming hundreds of other cell types with a specific job in the body. In return, they no longer can change their special status yet most lose their ability to divide again (Peter, 2006). Having not lost this capacity, stem cells can be stimulated under laboratory conditions to transform into "specialized cells with specific functions, such as heart muscle cells, blood cells, or nerve cells" when required (Maienschein, Sunderland, Rachel, Ankeny & Robert, 2008). Hence, researchers of stem cells claim that it carries the potential to deliver beneficial treatments to a large portion of diseases where cells have been lost or damaged, namely the Parkinson's disease, Alzheimer's, heart or muscle related injuries and so forth (Peter, 2006).

1.1 The history of stem cell

Since the 19th century, scientists from all over the world have studied stem cells, from plants, to mice, to patients in search of a cure for their diseases (Ramalho-Santos, Willenbring, 2007).

In 1868 German biologist Ernst Haeckel uses the phrase stem cell to describe the fertilized egg that becomes an organism. William Sedgwick uses the term "stem cells" to describe the parts of a plant that grow and regenerate (Richardson, 1998).

Leroy Stevens performing cancer research in mice, find the tumors, known as teratomas, contained mixtures of differentiated and undifferentiated cells, including hair, bone, intestinal and blood tissue in 1953 (Stevens, Little, 1953).

Ernest McCulloch and James Till perform experiments on the bone marrow of mice and observe that different blood cells come from a special class of cells. This is one of the first pieces of evidence of blood stem cells in 1963 (McCulloch, Till, 2005).

In 1981 Kaufman and Martin Evans at the University of Cambridge in England and Gail R. Martin in America were the first to derive embryonic stem cells (ES cells) from mouse embryos (Evans, Kaufman, 1981) (Martin, 1981).

Dominique Bonnet and John Dick discover that leukemia comes from the same stem cells that make our blood cells in 1997 (Bonnet, Dick, 1997).

A team at the University of Wisconsin, Madison, led by James Thomson and Jeffrey Jones, reports the creation of the first batch of human embryonic stem cells (1998), which they derived from early embryos (Thomson, Itskovitz-Eldor & Shapiro, 1998) .

President George W. Bush signs an order authorizing the use of federal funds for research on a limited number of existing human embryonic stem cell lines in 2001 (The White House, Fact Sheet on Embryonic Stem Cell Research, 2001).

South Korean scientists have used therapeutic cloning to create 11 stem lines that match their donors, one year after reporting the creation of the first human stem cells with this method in 2005 (Hwang, Roh, Lee & et al, 2005).

In 2007, three independent teams in Japan, Wisconsin and Boston, led by Shinya Yamanaka, James Thomson, and George Q. Daley**,** respectively, explained that they have created human Induced Pluripotent Stem (IPS) cells (Yu, Vodyanik, Smuga-Otto & et al, 2007).

Geron Corporation announces the FDA's approval for a limited phase I trial of Geron's new treatment for spinal cord injuries. This was the first FDA approval of a clinical trial for a therapy based on human embryonic stem cells in 2009 (Geron Corporation, 2009).

IETC 2014

President Barack Obama signs Executive Order 13505 to repeal some of the restrictions on human embryonic stem cell research funds placed by the previous administration in 2009. The order requires the "National Institutes of Health" to draft new guidelines for federal funding policies within 120 days (Executive order, 2009).

1.2 Turkey and stem cell: research and legal status

In Turkey, although legal arrangements were made within the recent years in order to ensure compliance with the rest of the world about stem cell research and application, there still exist ethical gaps albeit with problems arising out of the implementation of the legislation.

Our country is a party to the "Convention on Human Rights and Biomedicine - Oviedo Convention" and hence, embryonic stem cell research, including the research aimed at creating embryos, is prohibited in the "Assisted Reproductive Treatment Centers".

Ministry of Health (2005), with the purpose of providing an extensive coverage on matters that are in dispute has prepared and published towards the end of 2005 the "Assisted Reproductive Treatment Centers Regulation". Under the regulation, embryonic stem cell research has been prohibited, although no prevention was brought to the research conducted on adult stem cells. This is due to the fact that adult stem cell treatment was being used in patients with leukemia at the time.

On 04 May 2006, the Ministry has published the "Non-Embryonic Stem Cell Study Guide" for clinical purposes. According to this guide, non-embryonic stem cell research can only be conducted for clinical studies with the permission of "Stem Cell Transplantation Scientific Advisory Board", established by the Ministry of Health, in scientific centers which have been approved by the Ministry. These centers, when applying to the scientific board to conduct stem cell research, need to prove that they possess the necessary ground knowledge, skills and equipment and should be able to provide the evidentiary data when needed (Rep. of Turkey Ministry of Health, 2006) (Türkiye Biyoetik Derneği, 2009).

Published in 2009, "Stem Cell Coordination Center Working Principles and Guidelines" permitted the establishment of cord blood banks and organized the methods of hematopoietic stem cell treatments (Rep. of Turkey Ministry of Health, 2009).

In 2013, the Ministry of Health and the Turkish Red Crescent commenced a study about patients waiting to be treated through stem cell transplantation. It was later decided that "Voluntary Donor Centers" were to be built by the Red Crescent to find donor candidates who are willing to donate either bone marrow or peripheral blood stem cells to "Bone Marrow Bank", the institution established under the body of "Turkey Stem Cell Co-ordination Centre" (TÜRKOK, 2013), for patients in need of hematopoietic stem cell transplantation therapy.

Despite these regulations with regards to stem cells in our country, legal gaps continue to exist. The Assisted Reproductive Treatment Centers Regulation has limited the penal sanction for the violation of any of its regulation articles to the extent in which the wrongdoing center's activities are ceased by the Ministry of Health. On the other hand, the Turkish Penal Code, whilst not having an article on this topic, has not

IETC 2014

been subject to an amendment by a special law to impose a punishment for any violation of the Regulation's provisions.

2. The views about stem cell research

One of the ethical and religious concerns relating to stem cells is closely linked with the way they can be obtained. Although stem cells can be acquired through various sources (including bone marrow or cord flow), it has been claimed by the scientists that much more promising stem cells must be harvested from the embryo itself (Cruzer, 2010). A consequence of this is the fact that embryos cannot survive this procedure and a research in the prevention of these losses from happening has so far been unsuccessful. Hence, how much value then an embryo must have has been on a subject of debate (Maienschein, Sunderland, Rachel, Ankeny & Robert, 2008). Secondly, a controversy exists in the field of cloning which is the technique that carries a potential to provide a "source of tailored" stem cells for the personalized medical treatments. The main question that is positioned in line with this is, through the extent of gene manipulation of human beings, whether the scientists are trying to "play God" and that in return, whether this may have serious risks to our society (Peter, 2006). Lastly, whether the allowance and the increase of stem cell research without proper regulation would lead to the increase of egg donation and the exploitation of women remains a concern to many. Nevertheless, these claims do not come without their opposing sides to them and the balance that must be placed in the ethical ambit of the stem cell research will be explained below.

The initial point of our discussion starts with the fact that Human Stem Cells (hESC) are difficult to isolate and establish a culture. Nevertheless, scientists have been able to obtain these cells from stem cell lines taken from embryos up to 4 or 6 days old – which later cannot survive. These stem cell lines allow cells to be divided without being specializing into any type of adult cell (Maienschein, Sunderland, Rachel, Ankeny & Robert, 2008). Almost all of these aforementioned embryos are created originally to be a part of in-vitro fertilization (IVF) treatment in health clinics to aid patients who cannot have successful pregnancies (Hug, 2006). Despite this, not all of them get implanted and hence, surpluses of unused embryos occur. If legal circumstances permit, couples no longer in need of this treatment can later donate their stored embryos for research purposes (Maienschein, Sunderland, Rachel, Ankeny & Robert, 2008). Although it is not illegal to destroy these embryos, controversy amongst the philosophers and religious clerks exist, since it is not yet clear whether they carry a personhood – whether they are deemed to be human beings with a moral status or not. If so, beliefs as to when this personhood begins to differ. Unfortunately, there exists no arbitrary point or a significant dividing line in "the continuum of physical growth" between an embryo to that of a developed human being (Hug, 2006). What this means in short is that one cannot assess as to when exactly the personhood has begun to exist. Therefore, it might sound logical to state that individuals are deemed to have this moral status both at their embryonic stage as well as after their development stage (Rickard, 2002). Opponents to stem cell research claim that, since each of us have come to life as an embryo and that our lives are worthy of respect and value, so must our lives be in earlier stages. The personhood according to them starts right from the conception (Maienschein, Sunderland, Rachel, Ankeny & Robert, 2008). This view has been favored in a number of religious sects, including Roman Catholic and Conservative Protestant Churches. Under their view, an embryo carries the status of a human being and that any intervention on the embryo would be the violation of that right. Hinduism too rejects animal research as well as the destruction of embryos since injuring sentient beings is prohibited (Sullivan, 2004).

Contrarily, Sandel (2004) rejects this argument and supports his view by challenging it with an analogy. In this, he points out that although every oak tree was an acorn, it cannot make sense to conclude that every acorn is an oak tree. Hence, the loss of an acorn cannot be seen as the loss of a fully grown oak tree. Thus the mere fact that embryos can have the potential to become a developed human being does not make them one by default. In fact, as pointed out in previous paragraph, the research take place on embryos which are less than 6 days old and that at this stage of development, they would not be able to have a

IECT 2014

moral status. They do not have psychological, physical, intellectual or emotional characteristics as one would be able to associate with personhood (Rickard, 2002). Embryos can also be split to form twins up until the 14th day after fertilization. Further, a scientist can divide a five cell embryo into five embryos or can contrarily fuse them into one. After the 14th day, however, twining becomes no longer possible and that the life of one recognizable individual begins to exist (Knoepffler, 2004). The nervous system also begins to form at this period and this might play a role in finding the point in where the life of the embryo becomes solid (Hug, 2006). For these reasons, it can be argued that an embryo used for research purposes at its earliest stage (4-6 days old), since the cells they cannot deem to be individualized enough to have a moral weight of personhood, to be ethical. This view has been favored in a number of religions being; Islam, Judaism, Buddhism and the less conservative Protestant Churches. In Judaism, as long as the embryo is less than 40 days old, research on stem cells can be allowed. This is further illustrated with a view that the God has given us the power to create new technologies and that with the goal of saving lives; the research can be allowed (Peter, 2006). Thinkers in Islam follow a similar approach and they give the reason that the soul is "breathed" into an embryo when it reaches the 40th day, thereby making it sacred. The personhood, thus, is acquired after this period when voluntary movements would appear (Aksoy, 2005). Buddhism and the less conservative Protestant Churches also state that stem cell research before the 14th day of conception can be allowed.

The cloning controversy has begun to exist after the birth of Dolly the sheep in 1997 which was produced wholly by the techniques in cloning (Peter, 2006). Although these techniques have been used in animals models, human embryos can be cloned too via "somatic cell nuclear transfer" (SCNT). With this, eggs can be taken from a woman and then the nucleus of it can be extracted. What is left behind is the cytoplasm (Maienschein, Sunderland, Rachel, Ankeny & Robert, 2008). A nucleus is then obtained from the body cell of a person and then inserted into this cytoplasm. In end, the resulting embryo will have the same genetic material with the donor of the nucleus. The reason why cloning is important comes from the main target of the stem cell research itself. Since the current aim is to allow for the replacement of damaged tissues or organs with the organs grown from stem cells, precautions must be taken to minimize the rejection of this transplantation by the patient's immune system (Curzer, 2004). Cloning aids in preventing this from happening since the stem cells that will be used in the therapeutic medical treatment will share the same characteristics with the DNA of the patient. When a new patient walks in to the clinic, however, all the pre-existing cells from the previous patient would then need to be destroyed.

Nevertheless, reproductive cloning faced high amounts of criticisms from an ethical perspective and was seen as a threat to human "individuality, identity and dignity". Scientists have been seen as trying to play "God" by acting contrary to nature via playing with our genomes. Some scientists state that in pursuit of medical benefits, we risk the value of human life to an extent that the risks outweigh the benefits (Ramalho-Santos, Willenbring, 2007).

Further to this, the UN has adopted a resolution in 2005 to prevent all kinds of human cloning with the reasoning that they are "incompatible with human dignity and the protection of human life" (UN Human Cloning, 2005). This resolution, however, has not been accepted by many (35 states) since it was silent to make a differentiation in between reproductive cloning and non-reproductive cloning. Although as Bowring puts out that the distinction in between is hard to maintain and be difficult to keep an eye on, (Bowring, 2004), a short explanation of this be that: in reproductive cloning, the main aim is to produce a cloned embryo and then implant it into the womb to produce a pregnancy and later a cloned child but in non-reproductive cloning, the clone is constructed solely for research purposes and is destroyed at an early stage (Maienschein, Sunderland, Rachel, Ankeny & Robert, 2008). In the latter version, some countries have even made it legal (New Zealand, Korea), and some have permitted it to be done under a licence (UK, China, etc). From religious perspective, similar to what is mentioned above; the conservative Christians have not moved away from their strong positions towards stem cell research and have prohibited all kinds of cloning. Other beliefs have stood more in line towards the non-reproductive cloning and have not gone against the use of cloned stem cells for both research and also for medical aid purposes (Sullivan, 2004).

IECT 2014

Since the stem cell research has enormous reliance on the donation of fertile eggs from women, concerns exist as to whether potential donors might be subject to both economic and emotional pressures and that exploitation might occur. This would not be of surprise considering the fact that the "infertility industry" in the US alone was $6.5 billion for-profit business even in the year of 2007. Many young women choose the path in becoming donors after seeing the ads in online platforms, college newspapers or the social media and the offer can start from the tempting amount of $5,000 to $100,000 per extraction. If the increase in research cells is not regulated properly, there would be an enormous increase of women donors with low incomes who is not fully aware of this concept nor the health risks that it can bring. For instance, there exists no requirement to check up on the donor after the operation and that they are simply forgotten after they donate their eggs (Schneider, 2008). Other risks of this can be for the donor to loss her fertility or have ovarian torsion, blood clots, kidney disease, premature menopause, ovarian cysts, chronic pelvic pain, stroke, reproductive cancers, and in some cases, death (Giudice, 2007). Due to this many countries do not permit payment exceeding the medical expenses to prevent the concerns highlighted above from happening. However, more protection is required in clinics that do stem cell research and these protections should be governed by law. Thus, the main ethical concern here seems to suggest the need for a legal protection. In line with this, the more liberal views existing i.e. in China, the UK, USA, Belgium, Korea, and Israel is likely to lead the advancement of the law implementation (Giudice, 2007). Hence, the probable exploitation of stem cell research would be legally managed in the future.

3. Conclusion

In conclusion, stem cells carry the potential to bring era opening developments to the medical field. Although scientist can provide the cure for many diseases which exist in today's world, diseases such as Parkinson's disease, Alzheimer's, heart or muscle related injuries still remain to be a problem in which the regenerative medicine cannot provide the sufficient aid to. In line with this, they also remain as being subject to a number of ethical and religious concerns since this area has not yet settled properly with adequate laws or regulations. Once that happens, as highlighted above, most of these concerns would eventually mitigate.

Table2. The Analysis of subfactors in TAM Scale

	N	Mean	Std. Deviation
Anxiety	510	2,66	1,01
Perceived usefulness	510	3,22	,70
Perceived ease of use	510	3,43	,75
Attitude	510	3,13	,68
Subjective norms	509	3,30	,72
Perceived behaviour control	510	3,40	,67
Satisfaction	510	3,27	,69
Continued intention	510	3,02	,80
Self-efficacy	510	3,51	,81
Facilitative conditions	510	3,82	,76

Analyzing the subfactors, the mean of anxiety level to the e-learning is 2,67 out of 5. It is understood that participants have somewhat anxiety to the system though it is not high. In addition, among the subfactors, facilitative conditions have the highest mean (X= 3,83). Also, it can be stated that the mean of self-efficacy of the participants are the other subfactor which has a high mean (X=3,52). The mean of attitude of the participants to the system is 3,14.

Table3. The Correlation among the variables

	2	3	4	5	6	7	8	9	10	11
1. achievements	-,540*	,188	,696*	,552*	,163	,404*	,133	,184	,539*	,115
2. Anxiety		,123-	,304 -	,162	,047-	,170	,029	,124-	,195	,025
3. Perceived usefulness			,346	,489	,394	,416	,443	,392	,312	,104
4. Perceived ease of use				,302	,226	,251	,277	,250	,473	,111
5. Attitude					,353	,225	,374	,351	,209	,104
6. Subjective norms						,348	,231	,203	,275	,035
7. Perceived behavior control							,243	,341	,228	,118

8. Satisfaction	,306,205	,105
9. Continued intention	,365	,146
10. Self-efficacy		,285
11. Facilitative conditions		1

Table shows the correlation among the variables. According to the table, there is a correlation between variables and course documents.

6. Discussion and Conclusion

This is an empirical study aiming to understand the attitude of Turkish EFL learners towards technology and to determine role of these factors in the academic achievement of the participants. According to the results of the research, most of the participants have a facebook account and a personal computer. In addition, each participant goes online every day and spends at least 1-5 hours online. Moreover, e-language learners spend most of the time studying course documents. The present study also reveals that some of the TAM factors have effects on the academic achievement of the e-learners. It is understood that while anxiety towards e-learning has a negative effect on academic achievement; perceived ease of use, attitude, satisfaction and self-efficacy have a positive effect on the academic achievement of e-learners. These findings indicate that Turkish EFL learners can be considered at the third phase of Rodger (1995) Innovation Decision Process theory. In other words, participants have a positive attitude towards technology and they are at the stage to make a decision to adopt or reject the technology.

The findings of this study were not in line with Saade and Kira's research (2007). The results of their study revealed that anxiety did not play a mediating role on the impact of computer experience and perceived ease of use. In addition, contrary to the findings of the present study, Raaij and Schepers' results (2008) indicated that perceived usefulness had a direct effect on Virtual Learning Environment use. Perceived ease of use and subjective norm had only indirect effects through perceived usefulness.

Ngai et al's findings (2007) were partly in accordance with the results of the present study. They found that perceived ease of use and usefulness were the significant factors influencing the attitude of students using WebCT.

On the other hand, Lee's findings (2010) were partly in line with the results of the present study. His study revealed that satisfaction had the most significant effect on users' continuance intention, followed by perceived usefulness, attitude, concentration, subjective norm. However, perceived behavior control was found as significant but weaker predictors.

The findings of Cheung and Vogel (2013) were not in consistent with the present study. In their study, they found that the subjective norm showed a significant effect on behavioral intention to use technology.

The results of Tzeng's (2011) research were in consistent with the findings of the present study. His study also indicated that attitudes had the strongest significant effect on usage intentions.

IECT 2014

The findings of Sang et al (2010) were in accordance with results of the present study. They also found that computer self-efficacy and more favorable attitudes toward computer were the strongest predictor of prospective computer use.

Availability and Effective Utilization of Electronic Media in Social Studies Teacher Training Colleges

Abubakar ALIYU
Federal College of Education, Kano - Nigeria[43]

Abstract:

Social studies as a discipline in the school curriculum and also being an integration of various disciplines, must use varieties of instructional methods in dispensing it's curricular contents to learners, these methods includes the use of Electronic media in teaching. Teacher education in Nigeria generally, is aimed at producing not only large number of Teachers, but qualitative teachers that are well equipped, well versed and up to date that are able to cope with the challenges of the modern globalized and more challenging society of modern science and technology. Teachers that can compete with peers from all over the world, hence the attention on Social studies teacher training colleges in North Western Nigeria. The region being an educationally disadvantaged state compared to other regions, need pragmatic approach to be able to compete favorably, hence the research to find out the available electronic media devices and how effectively they are employed in the teaching process in the teacher training colleges. The research shall also try to find out sources of the available resources and reasons for the lack of resources. Attempt will also be made to find out why teachers can not apply the resources available effectively, possible solutions and suggestions will be proffered.

Key words: Effective utilization, Electronic Media

IETC 2014

Introduction

The use of Electronic media facilities has become a necessity for improving quality in teaching and learning. This has been emphasized by the Federal Ministry of Education (FME, 2010), as it contributes to meeting the Millennium Development Goals, (MDGs) and Education For All, (EFA) both of which Nigeria is a signatory. While it is a fundamental human right of children, youth and adults to basic education of relevance and quality, Universal Basic Education is an unfulfilled dream in many countries in the world. To achieve Education for All (EFA) goals, 'improved teaching and learning' implies quality education for all learners, and not only the best education for the best few. Towards this EFA goal, improved access and equity can be made the precondition for the first principle of quality education

In recent times the integration of information and communication technology (ICTs) in teacher training programs has been the topic of much debate because educational systems around the world are under increased pressure to use the new Information and Communication Technology (ICTs) to teach students knowledge and skills they need in the 21st century. Teacher education institutions are faced with the challenges of preparing a new generation of teachers to effectively use the new learning tools in their teaching practices (UNESCO, 2002). Thus, teacher education programme have been affected by the penetrating influence of information and communication technology (ICT). The fact that ICT has impacted on the quality and quantity of teaching, learning, in educational institutions around the world cannot be overemphasized.

It is practical that despite efforts by government to establish valuable and effective teacher education programs in Nigeria to help in the preparation of competent teachers, it has a fundamental problem which has incapacitated its development. The basic skill of reading a book has been taken away by the use of electronic media. Today, almost all homes in the world have at least one type of electronic media, whet-

* Corresponding author. Abubakar Aliyu Garba
E-mail address: agzur65@yahoo.com

her it is a radio, video game, computer or television (Gulbahar & Guven, 2008). The school and the family share the responsibility of preparing the young in a world of powerful images, words and sound.

Despite the fact that Electronic Media is accepted globally as a major factor in pedagogical issues, where many western countries have made it compulsory for all Teachers to undergo Information and Communication Technologies (ICT) certification, regardless of their subject area, as reported by Begho (2012). Furthermore the policy is geared towards ensuring the attainment of qualitative education for the enhancement of sustainable socio-economic development, global competitiveness and the individual's ability to survive in the contemporary environment. This can lead to the production of graduates of the education system that can survive in the contemporary society, sustain national development and can compete globally. (FME2010). The interactivity can enable a global out reach for sharing of knowledge, materials and data bases, quickly and cheaply over long geographic distances using online resource. Dewey's word in the previous century has linked this argument thus, "if we teach today as we taught yesterday, we rob our children of tomorrow" (Dewey, 1916).

Chalk and talk had been applied in the teaching process centuries ago; today the emergence of Electronic Media should be used not only to supplement teaching, but to take over as medium of passing out information and the entire pedagogical issues, at least in a phase by phase process. Electronic Media technology serves the diverse learning styles of students and educates them for a wider range of intelligence.

1.1. **Problem of the study**

Advances in technology have brought instructional materials especially the projected and electronic materials to the forefront as the most radical tools of globalization and social development which have affected the classroom teaching/learning situation positively. With them both teaching and learning become very pleasant experiences and less stressful. The teachers should take advantage of the opportunities to procure excellent films and recordings covering a wide range of subject matters in social studies curriculum. While acknowledging that the issue of instructional materials may not be easily resolved, it is important to remark that teachers should not use lack of instructional materials as an excuse not to teach well.

Current obvious reality is that, most teachers depended mostly on textbooks and chalkboards as instructional materials while other relevant instructional materials such as maps and charts, overhead projectors, televisions, improvisation, computers and pictures etc were sparingly used. Okobia (2011) noted other problems associated with the use of instructional materials in most parts of Nigeria, including cost of manufacturing and maintenance of instructional materials. The research is therefore aimed at; identifying the types of Electronic Media that are available in the Colleges of Education in the study area, and assess the extent to which what is available is qualitative and effectively applied in a classroom situation.

1.2. Research questions

i. What are the types of Electronic Media resources available for teaching Social Studies in colleges of education in North-West Geo-political zone of Nigeria?
ii. How qualitative are the Electronic media for teaching Social Studies in the Colleges of education in North-West Geo-political zone of Nigeria?

2. Review of Empirical studies on usage of ICT in Nigeria

Duru and Ozoji (2011) investigated the utilization of ICT and its applications in teaching computer studies in secondary schools in Owerri educational zone. Part of the findings revealed that, computer teachers in secondary schools do not utilize computer hard ware and internet applications in lessons; that teachers lack the required skills to operate these resources; secondary schools lack the necessary infrastructures required for utilization of the resources and applications.

IETC-2014

Chinedu, Nwanna-Nzewunwa and Michael, (2005) researched on electronic media as instructional materials in social and business studies and as instruments of social change: empirical evidence from Nigeria. The study found out that, radio is the most potent instructional material in achieving teaching efficiency and generating desired social change. Computers, projectors, and internet facilities were found to have inherent capabilities of aiding teaching effectiveness that could lead to the attainment of desired social change.

Ebeniza and Oluchi, (2011) in a research titled; Availability of ICT in teaching and learning of English language in secondary schools in Okigwe educational zone, Imo state. The result of the findings shows that, the ICT facilities found in the schools were very few, except for hand-sets. The study also revealed that the available ICT facilities are to a great extent used by the teachers in the schools. The study also confirms that teachers acquire the skills of manipulating the ICT equipments but do not exhibit the skills in classroom pedagogy.

Muideen (2011) also undertook a research titled an Assessment of student's usage and availability of ICT facilities in colleges of education: problems and prospects. The study found out, ICT facilities are widely used in instruction. Students had access to ICT facilities. There were also problems encountered by the students in terms of electricity supply.

Okobia (2011), conducted a research on Availability and Teachers' Use of Instructional Materials and Resources in the Implementation of Social Studies in Junior Secondary Schools in Edo State, Nigeria. The results showed that instructional materials and resources available were grossly inadequate. It was also observed that there was no difference in the use of instructional materials between specialist social studies teachers and non-specialist teachers. It is therefore recommended that instructional materials and resources be made available for the teaching of social studies.

The results of various surveys on College of Education staff on the level of availability, use of and perception of the impact of ICT on teacher education in Nigeria revealed and suggested a low level of usage of ICT gadgets; non availability of ICT equipment and that the respondents were disgruntled with the sluggish use and integration of ICT. Of all the reviewed empirical studies, none was undertaken to cover any part of North Western Nigeria, most of the research summarized actually discussed the availability or nature of utilization, and none combined availability and effectiveness of the resources in teaching and learning of social studies in the teacher training colleges.

3. Methodology

3.1. Population and Sample

The study population consisted of two hundred and thirteen (213) Social studies Lecturers in the Colleges of education within the study area. There are 14 Colleges of Education in North-west Geo-political Zone of Nigeria, located in Jigawa, Kaduna, Kano, Katsina, Kebbi, Sokoto and Zamfara states Out of the 14 colleges, 4 are Federal, 9 are State owned while 1 is privately owned. Out of a total number of Two hundred and thirteen (213) Lecturers, One hundred and ninety-three (193) representing ninety percent (90%) of the Lecturers' population was the sample of the study.

3.2. Instruments

The research instruments used for the study were checklist, and questionnaires. The questionnaire consists of seven sections A-C harmonized into single questionnaire. Section A focused on the demographic information. Section B, the check list, contains twenty-two (22) items on types of electronic media for teaching. Section C- consists of items that answer research questions utilization and proficiency of electronic media.

4. Results and Discussion

IETC2014

able 1: Opinions of the respondents on the available electronic media for the teaching and learning of social studies in the colleges

Availability of electronic media	Available / good		Available / not good		Not available		Decision
	Freq.	%	Freq.	%	Freq.	%	
Electronic board	17	15.3	16	14.4	78	70.3	NA
Overhead projector	32	28.8	30	27.0	49	44.1	A
Opaque projector	22	19.8	23	20.7	66	59.5	NA
Slide projector	30	27.0	21	18.9	60	54.1	NA
Filmstrip	26	23.4	20	18.0	65	58.6	NA
Pc projector	24	21.6	26	23.4	61	55.0	NA
Multimedia computer	26	23.4	23	20.7	62	55.9	NA
Computer system	63	56.8	30	27.0	18	16.2	A
Internet/web environment	46	41.4	28	25.2	37	33.3	A
Television	69	62.2	20	18.0	22	19.8	A
Video	60	54.1	20	18.0	31	27.9	A
Radio	54	48.6	27	24.3	30	27.0	NA
Cassette recorder/player	56	50.5	21	18.9	34	30.6	A
Video camera/still camera	42	37.8	18	16.2	51	45.9	NA
Microphone/speaker system	55	49.5	27	24.3	29	26.1	A
Telephone/intercom	32	28.8	17	15.3	62	55.9	NA
Fax machines	23	20.7	10	9.0	78	70.3	NA
Any other	13	11.7	10	9.0	88	79.3	NA

Of all the electronic media devices indicated in the table, Electronic board, Overhead projector, Opaque projector, Slide projector, Filmstrip and PC projector were all not available. This is indicated in the table with high percentage scores by both groups. However, Multimedia computer, Computer system, Internet/web environment, Television, Video were said to be available by the respondents. But electronic media devices like the Microphones and speakers system, Telephone/intercom, Fax machines and other such electronic devices were not available. In all it could be said that most of the electronic media devices required for the teaching and learning of social studies in the Colleges were not available and where they were available, they were not fully functional for effective usage.

Table 2: Opinions of the respondents on the quality of available electronic media for the teaching and learning of social studies in the colleges

Sn	Quality of available electronic media	Very high		High		Low		Very low		Mean
		Freq.	%	Freq.	%	Freq.	%	Freq.	%	
	Organization of information contained in the electronic medial	23	20.7	33	29.7	29	26.1	26	23.4	2.48
	Quality of the sound production of electronic media	15	13.5	42	37.8	30	27.0	24	21.6	2.43
	Acquiring of information contained in the electronic media	12	10.8	44	39.6	34	30.6	21	18.9	2.42
	Appropriateness of the information contained in the electronic media	14	12.6	39	35.1	36	32.4	22	19.8	2.41
	Clarity of projection of the electronic media	17	15.3	31	27.9	41	36.9	22	19.8	2.39
	Accessibility of the information contained in the electronic media	17	15.3	28	25.2	43	38.7	23	20.7	2.35
	Ability of the electronic media to appeal to the interest of the students	14	12.6	29	26.1	43	38.7	25	22.5	2.29
	Durability of the electronic media device	17	15.3	33	29.7	38	34.2	23	20.7	2.40
	Accuracy of the information contained in the electronic media	20	18.0	39	35.1	34	30.6	18	16.2	2.55

IETC 2014

Irretrievability of the information contained in the electronic media	18	16.2	36	32.4	35	31.5	22	19.8	2.45

In terms of the quality of the organization of information contained in the electronic media, both groups were of the view that the quality of the sound production by the electronic media available for teaching and learning of the subject in the colleges was low. These deduced form the frequencies percentage scores for low and very low in the table as well as the mean scores for the first two items of the table. The respondents were of the opinion that the process of acquisition of the information contained in the electronic media was low and that the information contained in the electronic media could not be termed to be very appropriate. Apart from these limitations, the clarity of the projection of the electronic media available in the colleges was not considered well enough for the teaching and learning of the subject.

The quality of access to the information contained in the electronic media was also considered to be very poor and as such the available electronic media are not considered to have much appeal to the interest of the students. The durability of the electronic media devices were considered to be very low by the two groups of respondents and this is translated into their poor rating of the qualities in relatively mean scores. However, the staff were of the view that the accuracy of the information contained in the electronic media were of relatively high quality but the students did not share this opinion as indicated by their mean scores of 2.55 and 2.21 for staff and students respectively for item 9 in the table. But both staff and students were of the view that the information contained in the electronic media for the teaching and learning of the subject in the colleges were not easily retrievable. From the expressed opinions of the respondents, it could not be said that the available electronic media for teaching and learning of social studies were of high quality in the colleges.

5. Summary of Findings

The summary of the major findings are as follows:

1. The study revealed that ICT resources like computers, smart boards, data projectors, digital camera, fax machines, television, radio, etc are fairly available in Federal Colleges of Education in Nigeria.
2. The study revealed that the quality of available electronic media for teaching and learning of social studies in the colleges is poor.

6. Conclusions

The essence of the research is to find out the actual problem that hinders the application of electronic media in teaching and learning process, despite the fact that it is imbibed and recognized despite the importance they placed on computers as tool for enhancing schools related activity. This could be probably due to teachers' inability to relate Electronic Media devices to classroom situation. Most teachers that are interested in applying Electronic Media might be concerned with two major obstacles, either they do not have them, or they lack the skill to handle such in the classroom.

Availability of online learning tools and the readiness of teachers and students towards it in Adekunle Ajasin University, Akungba-Akoko, Ondo State, Nigeria

Akingbemisilu Abiola Afolabi

Department of Science and Technical Education, Faculty of Education, Adekunle Ajasin University, Akungba-Akoko, Ondo State,340001, Nigeria

Abstract

This study was carried out in Adekunle Ajasin University, Akungba Akoko Ondo State, Nigeria to verify the level of availability of Online learning tools and to find out the level of readiness of both the teachers and students toward using it. Three research questions and three hypotheses were raised and tested for the study. Descriptive survey research design was adopted for the study. A sample of one hundred and twenty five respondents participated in the study. The research instruments were questionnaires; one designed for the teachers and the other for the students, both were tested for reliability using Cronbach Alpha formula and the reliability co-efficient of each yielded 0.82. The instruments were checked for face, content and construct validity by three experts in computer education and educational technology before administration. Data obtained were analyzed using simple percentage and chi square statistical tools.

Findings from the study revealed that online learning tools are available at Adekunle Ajasin University Akungba-Akoko but the practice has not begun. Students and lecturers are equally ready to use online instructional method whenever it is introduced into the university system. Recommendations were made as follows: The management of Adekunle Ajasin University Akungba-Akoko should introduce On-line instructional method into the school's curriculum also the Nigerian government should ensure that students are taught about the use of Online instruction right from their secondary school.

*Keywords:*Online, Learning, Tools, Availability, Rediness, and Ad ekunle Ajasin University, Nigeria

1. Introduction

To initiate the change to an online system of course delivery, it is important to assess the readiness of the various stakeholders," Kaur, K. & Abas, Z. W. (2004) among whom are students, teachers and administrative staff.

To put ICT to effective use, a country must be "e-ready" in terms of infrastructure and accessibility of ICT to the population at large, and the effect of the legal and regulatory framework on ICT use (CIPESA, 2005).

The trend of using e-learning as learning and teaching tool is now rapidly expanding into education. Many educators and researchers had high hopes for e-learning, believing that it would provide more access to information and communication, and would ultimately lead to a new revolution in education.

Relevant to the success of an e-learning implementation is the assessment of an organization's readiness for e-learning, Aydın and Tasci (2005), an online readiness assessment measures the ability of an

organization to take advantage of online learning tools available in such organization as it is being looked into for Adekunle Ajasin University, Akungba Akoko, Ondo State, Nigeria in this study.

1.1 Statement of the problem: The challenges experienced in Nigeria are not unlike those experienced elsewhere. Despite the current popularity of online instruction, does it have any limitations? Studies have found out that learners are moderately lacking in computer proficiency and, since online learning is centred on computer technologies usage, it is a barrier to those learners without good computer skills.

The following challenges in teaching and learning with technology are considered germane to necessitate this study:

1. Lack of sufficient level of knowledge and skills for the use of multimedia, internet and web technology on the part of its users for online instruction.
2. Non-availability of online environments that promote active teaching and learning process, critical thinking, collaborative learning, and knowledge creation.
3. Non-adoption and innovation of online method into teaching and learning process by faculties.

1.2 Research questions

The following research questions were formulated for the purpose of this study:

1. Are online learning tools available in Adekunle Ajasin University Akungba-Akoko?
2. Are teachers ready to introduce online methods as one of the ways for their course delivery in Adekunle Ajasin University Akungba-Akoko?
3. Are students ready to adapt to the change if online method is introduced and implemented in Adekunle Ajasin University, Akungba-Akoko?

2. Methodology

Descriptive survey research design was adopted for the purpose of this study.

3.Sample and sampling technique

Simple random sampling technique was used for the purpose of this study in which lecturers and students were randomly selected from the five faculties of the university. The samples used for this study includes twenty students from each faculty as well as five lecturers from each faculty. This makes a total of one hundred students as well as twenty five lecturers which makes a grand total of one hundred and twenty five samples. Faculty of Arts, Faculty of Education, Faculty of Science, Faculty of Social and Management Science, and Faculty of Law were the faculties used for this study.

IETC 2014

3.1 Research instrument

Two forms of questionnaires were designed for the purpose of this study; one was designed for the lecturers while the other was used for the students. These questionnaires consist of four sections namely: Section A, B, C and D. Section A sought information on the respondents' personal information, Section B sought information on the availability of internet and online tools within the institution and personal acquisition by lectures and students. Section C sought information on the level of possession of basic Information and Communication Technology (ICT) skills, while section D sought information on the respondents' readiness towards the use of online method of instruction. Both draft questionnaires were given construct, face and content validation by experts, and their reliability index yielded 0.82 each using Cronbach Alpha reliability method.

3.2 Data analysis technique

The information obtained and data collected were processed and analyzed using descriptive statistic of simple percentage and Chi square.

4. Results

The results are presented based on the research questions and the hypotheses.

4.1 Research question 1: Are online learning tools available in Adekunle Ajasin University, Akungba-Akoko?

In answering this research question the researcher collated the responses of the respondents to ten items in Section B of both the lecturers and students' questionnaire and subjected the responses to simple percentages. Majority of the respondents (Lecturer and Students)(74.48%) are of the view that online learning tools are available in Adekunle Ajasin University, Akungba Akoko, Ondo State while 25.52% disagree with the statement.

4.2 Research question 2: Are teachers ready to introduce online methods into their teaching process in Adekunle Ajasin University, Akungba-Akoko?

In answering this research question the researcher collated the responses of respondents to fifteen items in section C and D of the questionnaire for lecturers and subjected the responses to simple percentages.

Majority of the respondents (Lecturers) (85.87%) are of the view that they are ready to introduce e-learning methods into their teaching process in Adekunle Ajasin University, Akungba-Akoko, while others (14.13%) disagreed with the statement

4.3 Research question 3: Are students ready to adapt to the change if online method is been implemented in Adekunle Ajasin University, Akungba Akoko?

IETC 2014

In answering this research question the researcher collated the responses of the respondents to fifteen items in Section C & D of the questionnaire for students and subjected the responses to simple percentage.

Majority of the respondents (Students) (83.07%) are of the view that they are ready to adapt to the change if e-learning is being implemented in Adekunle Ajasin University, Akungba-Akoko, while others (16.93%) disagree with the statement.

4.4 Hypothesis 1

$H_0$1 – Online learning tools are not significantly available in Adekunle Ajasin University Akungba-Akoko.

In testing the hypothesis 1, Chi-Square (X^2) was used and its result presented in Table 1

Table 1: Summary of Chi-square showing if e-learning tools are available in Adekunle Ajasin University, Akungba-Akoko, Ondo State.

RESPONSES	O	E	O-E	$\bar{X}$	Df	X^2	P
Strongly Agree	437	312.5	124.5				
Agree	535	312.5	222.5	1.93	3	60.280	<0.05
Strongly Disagree	214	312.5	-98.5				
Disagree	64	312.5	-248.5				
Total	1250	1250	0				

The hypotheses were tested with the use of Chi-square (X^2) statistics at 0.05 level of significance. The result obtained was significant. [X^2 = 60.280; and $p<0.05$]. The null hypothesis **($H_0$1)** is hereby rejected. This implies that e-learning tools are available in Adekunle Ajasin University Akungba Akoko.

4.5 Hypothesis 2

**$H_0$2 –** There is no significant indication in the readiness of teachers at the introduction of Online learning method into teaching process in Adekunle Ajasin University Akungba-Akoko. In testing the hypothesis 2, Chi-Square (X^2) was used and it presented in Table 2

Table 2: Summary of Chi-square showing the teachers ready to introduce e-learning methods into their teaching process in in Adekunle Ajasin University

RESPONSES	O	E	O-E	$\bar{X}$	Df	X^2	P
Strongly Agree	125	93.75	31.25				
Agree	197	93.75	103.25	1.88	1.73	7.89	<0.05
Strongly Disagree	53	93.75	-40.75				
Disagree	-	93.75	-93.75				

IETC 2014

Total	375	375	0

This hypothesis was tested with the use of chi-square (X^2) statistics at 0.05 level of significance. The result obtained showed significantly that the teachers are ready to introduce e-learning into teaching process in Adekunle Ajasin University. [$X^2 = 7.89$; $p<0.05$]. The null hypothesis **($H_0$2)** is hereby rejected.

4.6 Hypothesis 3

**$H_0$3 –** There is no significant indication in the readiness of students at the introduction of Online learning method in Adekunle Ajasin University Akungba-Akoko. Chi-Square (X^2) was used in testing the hypothesis 3 and it presented in Table 3

Table 3: Summary of Chi-square showing that students are ready to adapt to the change if e-learning is been implemented in Adekunle Ajasin University

RESPONSES	**O**	**E**	**O-E**	$\bar{X}$	**Df**	**X^2**	**P**
Strongly Agree	644	375	269				
Agree	602	375	227	1.93	2.6	47.4	<0.05
Strongly Disagree	199	375	-176				
Disagree	55	375	-320				
Total	1500	1500	0				

This hypothesis was tested with the use of Chi-square (X^2) statistics at 0.05 level of significance. The result obtained showed significantly that students are ready to adapt to the change if Online learning method is been implemented in Adekunle Ajasin University. [$X^2 = 47.4$; $p<0.05$]. The null hypothesis **($H_0$3)** is hereby rejected.

4.7 Discussion of the findings:

(a) *Availability of Online learning Tools*: Findings from this study revealed that, online learning tools are available at Adekunle Ajasin University, Akungba-Akoko, Ondo State. This is in accordance with the research done by Wole and Opesade (2008) on the e-readiness assessment of University of Ibadan. Also this finding is in concordance with the research of Liverpool, Marut, Ndam and Oti (2009) on University of Jos ICT Maths Initiative.

(b) *Access to internet connectivity*: Findings of this study revealed that the level of access to the university's internet connection is very low. This is in concordance with the research of Renu, B. & Sameer, S. (2002) on Evaluating E-learning Readiness in Higher Education Institutions.

A critical look at this finding revealed that online learning tools are available in Adekunle Ajasin University, Akungba-Akoko, Ondo State, and both the Teachers and students are well skilled to participate in online instructional method when introduced. This mirrors the research of Krishnakumar and Rajesh as cited by S. Boondao, S. Komlayut and W. Punnakan (2010) on the Attitude of Teacher's of Higher Education towards e-learning.

IETC 2014

As touching the readiness of students to adapt if online learning method is been introduced, Majority of the participants of this study know what online learning is, though some agreed that they have not been a part of any online course before, however, most of them agreed that they have made personal enquiry on how to use online learning tools. Majority of the respondent also agreed that they would be comfortable using a computer several times a week to participate in an online course: and that they should be able to take notes when watching a video on the computer, and that they will understand calculation and equation related course when such are presented in video format.

5.0 Conclusion

From the finding of this study, the following conclusions were made;

1. Online learning tools are available in Adekunle Ajasin University, Akungba-Akoko,
2. Both the Teachers and students have required basic ICT skills to implement online instruction.
3. Both the Teachers and students are ready if online learning method is introduced into the schools' curriculum by the school management.

5.1 Recommendation:

Based on the findings of this research and the conclusion drawn, the following recommendations are made;

1. The management of Adekunle Ajasin University, Akungba-Akoko should introduce online learning method into the school's curriculum.
2. The management of Adekunle Ajasin University, Akungba-Akoko should make the school's internet connection accessible to both the lecturers and students.

For easy implementation of online learning in tertiary institutions, Nigerian government should ensure that students are been taught about online instruction and how it is being used from their secondary school level.

Bir iletişim dili olarak fotoğraf

[a]Ayşe Derya KAHRAMAN

[a] *Practical Arts, Graphic Departmant*
K.T.O. Karatay Üniversity, Karatay-Konya and 42020-Turkey

Abstract

Fotoğrafın icadı, gelişim süreci ve ilk dönem ressamların fotoğraftan faydalanmaları ile fotoğraf sanat olarak kabul edilmiştir. Fotoğraf modern sanat akımlarının grafik tasarımla birleşmesinde önemli bir yere sahiptir. Fotoğrafın gelişimi geleneksel süreçten sayısal sürece geçişte hızlı bir ivme göstermiştir. Bilim ve teknolojinin birbirine parelel olarak gelişmesi ile ortaya çıkan yeni iletişim ortamları fotoğrafı bir iletişim dili haline getirmektedir. Kitle iletişim araçlarının etkin kullanıldığı günümüzde iletişim dünyasının en önemli öğelerinden biri haline gelen fotoğraf ile tüm bilgi ve belgeler kayıt altına alınmakta ve arşivlenebilmektedir. İletişim dilinin gelişmesinde en fazla katkıyı sağlayan fotoğrafın teknoloji ile birleşmesi ile manipülasyon teknikleri ile sayısal fotoğrafın önemi ortaya çıkmıştır. Bu araştırmada fotoğrafın gelişimi fotoğraf ve toplumsal algı, İletişim nedir, fotoğrafın iletişimde bir grafik tasarım ifade aracı olarak kullanılması, İletişim dili olarak fotoğraf irdelenerek fotoğrafın evrensel bir dil olduğu irdelenmiştir. Bu araştırmanın alan yazında araştırmacıların fotoğrafı tanımalarına yardımcı olacağı düşünülmektedir.

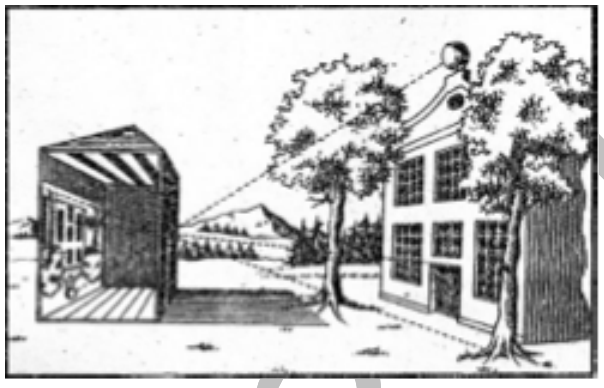
Keywords: Fotoğraf, İletişim, Tasarım.

1. Introduction

Fotoğrafın tarihsel gelişimi, fotoğraf ışığa duyarlı emülsiyonlar ile kaplı bir kağıt üzerine pozlanan şekillerin bazı kimyasallar kullanılarak görünür hale getirilmesidir. Bu işlemler için insanlar 19. yy. boyunca rastlantısal bazı işlemler sürdürmüşlerdir. İsa'dan sonra 965 ve 1038 yılları arasında yaşayan İslam bilgini Basralı Ebu Ali El Hasan İbn-i Heysem ilk fotoğraf makinesi olarak bilinen Obscura'yı kullanan kişi olarak bilinmektedir(Arı, 2013: 5).



1452-1519 tarihleri arasında Leonarda Da Vinci'nin bir eserinde siyah beyaz oda tanımı geçerken çağdaşı olan Albert Dürer'de karanlık oda tabirini nesnelerin perspektifini doğru çizebilecekleri bir aygıt icat olduğundan söz ediyordu. Jerome Cardan 1550 yılında karanlık oda deliği üzerine yerleştirdiği mercek ile kadraja denk gelen mevcut görüntünün küçük kağıtlar üzerine yansımasını gördü. 1697-74 yılları arasında Almanya'da Altdorf Üniversitesinde Profesör olan Schulse bir şişe içerisine koyduğu tebeşir, gümüş ve nitrik asit karışımının sallanıp yere bırakıldıktan sonra ışığa bakan tarafının karardığını keşfederek, bu karışıma karanlıklara getiren manasındaki "scotophore" ismini vermişti(Ergin, 1989; 7-9).

Fotoğraf yaygınlaşmadan önce gazeteler önemli olaylarını ressamlardan çalışmalarını beklerdi. Harpers Weekly 1863 yılında Gettybury savaşının fotoğraflarını çizmesi için Alfred Maud isimli ressam ile çalışmıştır (Arı, 2013:10).

IETC 2014

Fotoğrafın icadından sonra gazete ressamlarına ihtiyaç kalmamıştır. Fotoğrafın tarihsel gelişiminde karanlık bir odanın duvarına bir iğne deliği açılmış dışardaki cisimlerin görüntüsü duvara ters olarak düşmüştür. bu fiziksel olaya "camera obscura" denilmektedir(Demirkol, 2007:8).

Daguerre Niepce'nin başlattığı denemeleri geliştirerek fotoğrafçılıkta belli bir yol kat etmiştir. Fotoğraf makineleri uzun sürede belli şekilde yol değiştirmiştir. Karanlık oda kalkmasa da neredeyse yok denecek kadar az kullanılmaya başlanmış, ışığa duyarlı film yerini yeni bir teknoloji ile değiştirmiştir. Pozlama ve ışık ölçüm sistemlerinde değişiklikler görülse de film üzerinde görüntü sabitleme mantığı aynı şekilde devam etmiştir. Filmlerin yapısal olarak ışığa duyalılıklarının artması, görüntü kalitesinin yükselmesi, görüntünün duyarlı yüzeye aktarılması, film öncesi dönemde bakır plakalar ile sağlanmaktadırlar. Sonrasında filmin yüzeyine aktarılması günümüze kadar devam eden uzun bir süreçtir (Kılıç, 2005:195).

Şekil 1- Kamera obscuranın çalışma biçimi

1.1. Fotoğraf ve toplumsal algı

Toplumsal ve kültürel hayatta fotoğraf yaygınlaşması ile birlikte temel algılarda bazı değişikliklere sebep olmuştur. Bütünlük oluşturduğu düşünülen görüntülerin bozulabildiği bunun yanında yeni oluşan formlardan yeni görüntü biçimleri oluştuğu görülmeye başlanmıştır. Fotoğrafın icadı ile kent yaşamındaki olgular birer şok olarak algılanmaya başlanmıştır. Her olay kendi içinde değerlendirilerek diğer olaylardan bağımsız algılanmakta ve yorumlanmaktadır (Göknar; 2010:22).

İnsanlığın var olması ve gelişmesi ile birlikte duyularında gelişmesi ve algılama biçimi değişir ve gelişir. Bu sebeple algılamayı sağlayan duyular doğal koşullarla birlikte tarihsel gelişime de bağlıdır(Benjamin, 2002, s. 56).

19 yy. Dan itibaren resim, heykel ve edebiyatın gelişimi ile birlikte imgelerin gücüde artmıştır. Bu dönemde edebiyat yeni bir kimlik olarak "sanat" kimliğini edinir. Diğer sanat dalları ile etkileşim içine girer. 19 yydan itibaren sanat gözleme ve izleme etkinliği ile birlikte güzelin, iyinin ve doğruyu sanatçının belirlemesini sağlar. Aynı zamanda sanatçının dışında olan ve ilerleyen klasizm ve milimetrik ilkeler terk edilmeye başlar(Baudelaire, 2009, s.41).

1.2. İletişim nedir

İletişim insanın anlam arama çabasıdır. İnsanın kendisinin başlattığı iletişim süreci kişilerin değişen gereksinimleri karşılayacak şekilde ayırt etmesini sağlayan bir edim olarak düşünülebilir. İletişim genel olarak bilgi, fikir, duygu ve becerilerin simgeler aracılığıyla da iletişimidir denilebilir. İletişimin esası olan simgeler bir kişi, yada gruptan diğerine fikir, tutum yada duygu olarak iletilir. İletişim sözlü olarak varlıkla, iletişim sözsüz olarak eylemle, yazılı olarak da belge ile ilgili olan bir süreçtir(Yalçın, 2005: 54).

IECT 2014

1.3. Fotoğrafın iletişimde bir grafik tasarım ifade aracı olarak kullanılması

Artan ideolojik isteklerin yanı sıra, sosyal politik olaylar 20. yy ile birlikte artarak çoğalmıştır. 1910'dan sonra üretim ve tüketim toplumunun gereği olan sanayileşme sürecinin geliştiği de görülmektedir. Bu sebeple görsel iletişime verilen önem teknolojinin de gelişmesi ile kitlesel iletişimde önemli rol almıştır. Dönemin tasarımcıları modernleşme ve sanatsal akımların etkisini fotoğrafta ve grafik iletişim unsurlarında görmekte, uygulamakta ve geliştirmektedirler. Tasarım sürecinde yenilik tipografi, renklerin simgesel kullanımı, sloganlar olarak sayılabilir. Etkili bir tasarım elemanı olarak fotoğrafı ele alırsak; fotoğraf hazır görüntüdür, renksel müdahele ve kadraj değişikliklerine uygundur. Değişik ölçülerde büyütülüp küçültülebilir. Çeşitli şekillerde karanlık oda da yeni görsel biçimler elde edilir. Ayrıca fotoğraf istenilen tasarım alanlarına uygulanabilir(Yigin, 2011 s:67-68).

1.4. İletişim dili olarak fotoğraf

Fotoğraf kişinin kendi dışında gelişen olaylar ile ilişkisini bir müdahale olmadığı sürece olduğu gibi yansıtır. Fotoğraf yazı ya göre daha betimleyici bir anlatım şekli olup; fotoğraf içindeki nesneler de ışık gölge ve farklı malzemeler aynı andalığı yaşamaktadır. Bu sebeple fotoğraf evrensel kodları içerisinde barındırmaktadır(karaca;2011: 51). Fotoğrafın icadında gerçeği belgeleme fikri bulunmaktadır. Bu sebeple fotoğraf anı belgelese yada kurgulansada var olanı gösteren niteliğindedir. Bu sebeple fotoğraf illüstrasyonların(savaş belgeleme) yerini almıştır(Yigin: 2011;11).

Fotoğraf dünyada diğer ülkeler ve kültürler arasında ilişki kurar. Tek bir dil olarak insanların arasında iletişim kurar. Fotoğraf için herhangi bir dil bilmek gerekmez çünkü fotoğrafın kendi dili bulunmaktadır. Fotoğraf toplumsal koşullar hakkında bilgi verir. Aynı zamanda teknolojiyi de iyi kullanılarak fotoğrafla birlikte gelen düşüncenin de hızla yayılması sağlanır. Tüm bu yapılanmalardan ötürü fotoğraf yüzyılımızın et etkili aracı olarak düşünülür Sanat bir dil konuşurken, fotoğraf hem hayal gücünü besler ve bir kaç dil konuşur(Karadağ, 2004; 50).

Fotoğraf makinesinin denklanşörüne basıldığı andan itibaren an durur. Ronalt Bartes fotoğraf için "o fotoğrafın görüntüsü ölümdür" demektedir(Yigin: 2011;11). Fotoğraf bulundukları yerlerden kesilerek kolaj çalışmalarında da kullanılmıştır. Bu sebeple hazır görüntüdür.

Fotoğraf doğanın bir tekrarı ve anı olarak düşünülse de fotoğrafta farklı anlatım dilleri bulunmaktadır. Fotoğrafla sanatçı görünenin güzel olanın ve estetiğin kaygısını ön plana çıkarır. Fotoğrafın dolaylı ve direkt olarak anlatım dilleri bulunmaktadır. Fotoğrafın dili çekilen kadrajda nesnelerin görüntüsünün boyut değiştirmesidir. Fotoğrafta görünen ve yorumlanan birleşerek yön değiştirir. Bu şekilde imgeler biçimler ile ifade edilmiş olur(karadağ, 2004: 127).

Fotoğrafın etkili bir iletişim dili olması için bir fikre dayalı olması gerekir. Kadraj içine dahil edilen öğeler anlamı belirlemektedir. Fotoğrafta iletişimin temeli algıdır. Algı hedef fikre atıf yapsa da, algıda bireysel farklılıklar olabilir. Barbara Krugerin fotoğrafta anlam inşaası konusundaki yorumu şöyledir:

"Ne zaman bir eserin ne anlam geldiğini sorsalar, anlamın inşaasının kişiden kişiye değiştiğini söylüyorum"

(Karaca; 2011: 54/58).

IETC 2014

Fotoğraf gerçeğin bir yorumudur. Gerçekten yola çıkan bir iz, anı yakalamadır. Fotoğrafın biçimle örtüşmesi ile ortaya çıkan iletişim fotoğraf çekimi sırasında fotoğrafçının maruz kaldığı psikolojik durumu da yansıtır(Karaca; 2011: 54/58).

2. Reseaech Methods

It has been a research in the survey model and has been prepared with documentary survey method, the research is the total of scanned documents, paintings, pictures, voice records, plaques, equipment , sculpture belonging to the past and in addition to these it also includes every kind of reports, encylopedias, books, statistics and minutes.(Karasar, 1999: 183).

3. Conclusion

Fotoğrafın icadı ile birlikte gelişen tasarım süreci ile sanatçılar ve tasarımcılar sayısız çalışmalarında fotoğraftan faydalanmışlardır. Bilim ve teknolojinin birbirine paralelle gitmesi, ile gelişen fotoğraf ile belgeleme işlemi ivme kazanmıştır. Fotoğrafın evrensel bir iletişim dili olmasını yanı sıra toplumda da fotoğraf ve fotoğrafçılık algısı oluşmaya başlamıştır. Bir iletişim dili olarak fotoğraf kadrajdan çıkmasına rağmen renkli bir algı sağlamaya sebep olmaktadır. Bu sebeple pek çok tasarım alanında kullanılmaktadır. Fotoğraf aracılığı ile bazen kişisel ve bazen de toplumsal konular görsel iletişim olarak sunulmaktadır. Bu sebeple fotoğraf etkili bir görsel sanatlar dalı olarak, aracı olduğu sanat eserleri ayrı olmak üzere, kişisel ve kitlesel mesaj verebilme yeteneğinden ötürü en etkili iletişim araçlarındandır. Bu araştırmada fotoğrafı anlamak ve etkili kullanımını sağlamak amacı güdülmüştür. Bu araştırmanın alan yazında araştırmacıların fotoğrafı tanımalarına yardımcı olacağı düşünülmektedir.

Bring cs2013 recommendations into c programming course

Lingling Zhao[a]44, Xiaohong Su[a], Tiantian Wang[a]
[a]*School of Computer Science and Technology, Harbin Institute of Technology, P. R. China*

Abstract

Computer Science Curriculum 2013 has become the guidance of computing education since it was released in 2013by the ACM/IEEE-Computer Society. This paper analyzes the CS curriculum development trend, trying to dig the programming-related core from CS2013 with respect to the knowledge areas, topics, organization of teaching, and the building of students' capability. Considering the characteristic of our local institution and undergraduates, we present an updated teaching curriculum and lab curriculum for C Programming Language course in relation to CS2013 recommendations, which highlight the development of the students' abilities on programming, problem-solving, self-regulated learning, and computational thinking. Finally, we present and assess the implementation of the resulting curriculum.

Keywords: CS2013, C programming course, CS curriculum planning, CS major;

IETC 2014

1. Introduction

The ACM and IEEE Computer Society jointly sponsored the development of Computer Science Curriculum 2013 (CS2013) (http://ai.stanford.edu/users/sahami/CS2013, 2012). Since released, it has become the guidance of computer science major and received the widespread attention. With the sequential publication of the strawman, the ironman and the final version, researchers, educators and teachers have made a wide range of discussion on its guiding ideology and content (Mehran Sahami, Steve Roach, Ernesto Cuadros-Vargas, Richard LeBlanc, 2013). To follow this advanced education principle and bring it into C programming course for Chinese undergraduate CS majors, we design a lab syllabus for C programming course to meet the requirement of undergraduates.

As an important part of CS major, programming course is always being concerned about how it trains students to solve problems using a programming language in practice. This is again emphasized in CS 2013, but it's still lack of concrete and practical guidance for practice stage. Therefore, how to make the practice and the knowledge units in the CS2013 match is a key challenge. This paper discusses the problem and gives some recommendations and examples for other instructors to use as references in developing and teaching similar courses in the CS curriculum.

2. Program design courses in cs2013

In CS2013, the body of knowledge in computer science has been updated and divided into 18 Knowledge areas (http://ai.stanford.edu/users/sahami/CS2013, 2012), including：

* Corresponding author. Tel.: +086-045186412824
*E-mail address:*zhaoll@hit.edu.cn

- Algorithms and Complexity (AL)
- Architecture and Organization (AR)
- Computational Science (CN)
- Discrete Structures (DS)
- Graphics and Visual Computing (GV)
- Human-Computer Interaction (HC)
- Information Assurance and Security (IAS)
- Information Management (IM), Intelligent Systems (IS)
- Networking and Communications (NC)
- Operating Systems (OS)
- Platform-Based Development (PBD)
- Parallel and Distributed Computing (PD)
- Programming Languages (PL)
- Software Development Fundamentals (SDF)
- Software Engineering (SE)
- System Fundamentals (SF)
- Social and Professional Issues (SP)

From the perspective of knowledge units, programming Language and Software Development Fundamentals are related to the programming courses. The detailed knowledge units composing these two knowledge areas are listed in table 1.

IETC 2014

Table1. Knowledge areas and their knowledge units related to programming design course

Knowledge area	Knowledge unit	hours
Software Development Fundamentals	Algorithms and Design	Core(11,0)
	Fundamental Programming Concepts	Core(10,0)
	Fundamental Data Structures	Core(12,0)
	Development Methods	Core(9,0)
Programming Languages	Object-Oriented Programming	Core(4,6)
	Functional Programming	Core(3,4)
	Event-Driven and Reactive Programming	Core(0,2)

3. Objective and requirement of "c programming" lab syllabus

By being familiar with the basic syntax and programming practice in a type of programming language (such as C or C++), help students to understand the process of software design and development, master the basic methods of constructional and object-oriented programming, and in-depth understand the computational thinking on how to describe and solve specific problems by computers, as well as the foundational methodologies of software system design and implementation.

Students are required to be familiar with some types of integrated development environment (IDE) as well as the common algorithms when solving problems by computers. Furthermore, it is necessary for students to utilize constructional and object-oriented programming methods to solve some practical problems, which cultivates their program analysis, design, coding and debugging abilities and helps them to get into a habit of good programming style.

4. Organizations of labs

In our syllabus, we provide 5 required labs and 2 elective labs as well as 2 projects. For required labs, we put emphasis on the training of students' fundamental programming skills, such as debugging, common algorithms and problem-solving strategies. For elective labs, higher requirements are brought in so that students need to flexibly apply their knowledge to solve some complex problems, additionally, they will face some new methods in software development such as incremental testing, which enhances their programming skills as well as computational thinking (Jeannette M. Wing, 2006). Here we list the main content of labs and projects designed for undergraduates.

4.1. Labs

Lab 1: Basic control structures (required)

Design and implement a number-guessing game step by step to master how to program by sequence, selection and loop structures.

(1)A user guesses an integer between 1 to 100 which is randomly chosen by a computer, if the user gives the right answer, the computer outputs "Right!" , otherwise, it outputs "Wrong!" and reports that the hidden number is higher or lower than the number that was guessed, then the game is over; (2) Based on task(1), modify the program to allow the user to continue to guess until he/she offers a correct number; (3) Based on task(2), limit the times that the user can repeat(for instance, the user can guess 10 numbers at most). Furthermore, if the user hasn't provided the correct number within the given times, the game is over; (4) Based on task(3), modify the program to enable it to offer multiple numbers at one running, and the game continues until the user inputs 'Y' or 'y'; if the user hasn't guessed the correct number in the given times, then skip the current number and make the user continue to guess the next number.

Lab 2: Functions (required)

Calculate the greatest common divisor (GCD) of two integers by exhaustion, iteration and recursion respectively to master how to define and call functions and how to pass parameters into and return values from functions. Comprehend the process of function invocation, especially the recursive function invocation. Master problem-solving strategies and the defensive programming methodology.

Lab 3: Arrays and pointers (Required)

Design and implement a menu-driven student score management system to master how to use one-dimension arrays, two-dimension arrays or pointers as function parameters and some common algorithms related to arrays, such as sorting and searching algorithm. Furthermore, comprehend the role of algorithms in the problem-solving process, apply the module programming methodology and debug programs using a modern IDE.

Assume there are m students who take n examinations(the value of m and n are from user's keyboard input), write a program to realize the following functions: (1)Record student ID, name and all courses' scores for each student;(2)Calculate total scores and average score of each course and each student;

IETC 2014

(3)Sort by total scores of all students in descending order and ascending order respectively; (4) Sort by student ID in ascending order and by name in lexicographic order respectively; (5) Search a student's ranking and scores by student ID and name.

Lab 4: Structs and files (Required)

Based on Lab 3, employ structure arrays or singly linked list to rewrite the code of Lab 3 and introduce the file processing (write each student's score table into a file; or read and print each student's score table from the file). Through this lab, master how to use the structure arrays or structure pointers as function parameters, and observe the advantages of structure arrays and linked lists in the field of database management instead of arraysof primitive types. At the same time, grasp the basic file operations, master in-depth module programming methodology, unit testing and incremental testing methodology.

Lab 5: Object-oriented programming

Rewrite the code of Lab 3 or 4 in the way of object-oriented programming. In this lab, understand the essential differences between object-oriented programming and structured programming, meanwhile observe the advantages of object-oriented programming. Further master the fundamental concepts of object-oriented programming, such as the definition and implementation of classes, and the creation as well as the application of objects. Be familiar with some modern IDEs.

Lab 6: Grand prix grading system (Elective)

Design and implement a grading system for Grand Prix to master in depth the application of some common sort and search algorithms and how to choose the appropriate data structure to solve practical problems by programming.Assume that there are n athletes participating in the grand prix and m (m>2) judges grading all athletes. The grading rules include: delete the highest and the lowest score from every athlete's m scores graded by judges, take the average score of the rest scores as the final grade of the athlete. Sort the final grades of all athletes in descending order to determine the awards list and assess the accuracy of each judger's grading.

Lab 7 A survey system for quality of food and beverage service (Elective)

Design and implement a survey system for quality of food and beverage service to master in depth the application of some common sort and search algorithms and how to choose the appropriate data structure in order to solve practical problems by coding.

Assume that one university invites some students to assess the food and service quality offered by campus restaurant; the range for access marking includesome levels; meanwhile they can propose their comments and suggestions. Implement the following functions: (1) Show the survey result in the form of histogram with respect to each marking level; (2) Given a specific marking level, find and output the number of students grading this marking level; (3) Calculate the average mean, median and mode of the total marking levels; (4) Keep records of the comments and suggestions in a file for future use.

4.2. Projects

Project 1: Contacts system

Implement a menu-driven contacts system by programming to master the top-down and stepwise refinement modularity programming methodology. In this project students should be able to utilize multiple knowledge units including functions, arrays, pointers, structs, files, and some common sorting and searching algorithms. Furthermore, this project trains students to improve their abilities of system analysis, design, programming and debugging.

Project 2: Gluttonous snake game

Utilize the basic knowledge on object-oriented programming and realize an extended gluttonous snake game which could help users to learn English and recite words. This project contributes to help students

IETC 2014

to master the methods of object-oriented programming, and enhance their abilities of system analysis, design, coding and debugging.

(1)User's account management
(2)Game management
(3) Word-reciting management

Table 2. Knowledge coverage

Knowledge area	Knowledge unit	Topics covered	Lab/Project
SDF	Algorithms and Design	The concept and properties of algorithms (Informal comparison of algorithm efficiency, e.g., operation counts); The role of algorithms in the problem-solving process; Problem- solving strategies(Iterative and recursive mathematical functions, iterative and recursive traversal of data structures, divide-and-conquer strategies); Fundamental design concepts and principles (abstraction,program decomposition , encapsulation and information hiding, separation of behavior and implementation)	Lab 2, Lab 3, Lab 4, Lab 5, Lab 6, Lab 7, Project1, Project 2
SDF	Development Methods	Program correctness; Debugging strategies; Documentation and program style	Lab1, Lab 2, Lab 3, Lab 4, Lab 5, Lab 6, Lab 7, Project1, Project 2
SDF	Fundamental Programming Concepts Development Methods	Basic syntax and semantics of a higher-level language; Variables and primitive data types; Expressions and assignments; Conditional and iterative control structures; Simple I/O. Testing fundamentals.	Lab1
SDF	Fundamental Programming Concepts; Development Methods	Functions and parameter passing; The concept of recursion. Defensive programming.	Lab 2
SDF	Fundamental Data Structures; Development Methods	Arrays; Strings and string processing; Pointers (References and aliasing). Debugging strategies.	Lab 3, Lab 6, Lab 7, Project 1
SDF	Fundamental Data Structures; Development Methods	Records/structs; Linked list;Strategies for choosing the appropriate data structure; file I/O. Unit testing.	Lab 4, Lab 6, Lab 7, Project 1
PL SDF	Object-Oriented Programming; Development Methods	Object-oriented design; Definition of classes: fields, methods, and constructors. Unit testing; Debugging strategies;Modern programming environments.	Lab 5, Lab 6, Lab 7, Project 2

5. Conclusion

Based on the analysis of the CS curriculum development trend, we firstly extract the programming-related core of CS2013 with respect to the knowledge areas, topics, organization of teaching, and the building of students' capability. Considering the characteristic of our local institution and undergraduates, we reorganized and redesigned the lab curriculum for Program design course, which highlights the development of the students' abilities on programming, problem-solving, and computational thinking.

E-tutors' teaching readiness in distance learning companion project in Taiwan

45Eric Zhi Feng Liu, Chun Hung Lin, Yi Hsuan Lin

[a]*Graduate Institute of Learning and Insruction, National Central University, No.300, Jhongda Rd., Jhongli City, Taoyuan County 32001, Taiwan (R.O.C.)*

Abstract

E-tutors play an important role in after-school distance learning project. This study focused on developing the readiness instrument for evaluation of the e-tutors, and hoped to assist the mentor to understand the teaching e-tutors well. Teaching readiness index scale was used as research instruments. Besides, qualitative data was also collected for analysis in the study. Distance Learning companion project started from October 22, 2013 to January 9, 2014. Forty four e-tutors participated for one hour and a half a course, twice per week. The results indicated that at the beginning of distance learning companion project, forty-two e-tutors showed high job readiness and high psychological readiness (R4), and two e-tutors showed low job readiness and high psychological readiness (R2). After a semester of teaching and training, 44 were high job readiness and high psychological (R4). According to the results of the study, job readiness was improved and the psychological readiness was maintained. In the study, it was found that the content of the training workshop mainly focused on job readiness, but neglected psychological readiness. In the future, more content about psychological readiness should be designed in the training workshop to support the e-tutors.

Keywords: Distance learning companion; readiness; situational leadership theory; e-totur

IETC 2014

1. Introduction

Due to the development of technology and Internet, it brings new opportunities for education. Through online learning platform, students can learn and acquire knowledge regardless of the limitation of the time and space. For educator, providing equal education opportunity is always important. Students in rural area usually didn't receive as much educational resource as students in the cities (Huang, Liu, Lin, & Chang, 2011). Fortunately, online tutoring provides a channel to deliver the educational resource to the students in need (Huang, Liu, Sung, 2011). Ministry of Education in Taiwan initiated the distance learning companion project in 2006 to apply the platform, Joinnet, to deliver online tutoring to the students in rural area. In 2013, the project served more than 1000 students in rural area. More and more e-tutors participated in this project, and ensuring the e-tutors teaching readiness and providing them suitable support is important (Yang, Liu, Lin, Hu, Cheng, Wu, Cheng, & Chang, 2010).

Hersey and Blanchard (1993) proposed the idea of readiness in situational leadership theory, and readiness indicated the degree to which the individuals' ability and willingness to take on the task. The purposed of this study is to investigate the e-tutors' teaching readiness in the distance learning companion project.

2. Methodology

2.1. Experimental design

A single group pretest-posttest design was applied in this study. In the beginning of the semester, the e-tutors filed the questionnaire for the pretest. After the online tutoring last for a semester, the e-tutors filed the questionnaire in the end of the semester (Fig. 1).

Figure 1. The study design of this study

2.2. Participants

44 undergraduate students participated in this study, and all the participants joined the distant education program, and take the role as e-tutors. 23 e-tutors were male, and 21 e-tutors were female. Among the e-tutors, 5 were freshman, 12 were sophomore, 11 were junior, 7 were senior, and 9 were graduate students.

2.3. Instrument

Teaching Readiness Index Scale(TRIS) was designed based on the readiness concept in situational leadership theory proposed by Hersey and Blanchard (1993). Two dimensions were included in TRIS: Work readiness (7 items), Psychological readiness (3 items). The scale was designed in 8 point Likert scale style. According to the score in the two dimensions, we could divided the tutors into four categories: Low readiness (R1): Work readiness and psychological readiness scored from 1 to 4; Mid-low readiness (R2): Work readiness scored 1 to 4 and psychological readiness scored from 5 to 8; Mid-high readiness (R3): Work readiness scored 5 to 8 and psychological readiness scored from 1 to 4; High readiness (R4): Work readiness and psychological readiness scored from 5 to 8. The result of reliability analysis indicated that the Cronbach's alpha of working readiness was 0.85 and the Cronbach's alpha of psychological readiness was 0.82. The Cronbach's alpha of total scale was 0.90. The result indicated that the Teaching Readiness Index Scale have suitable reliability.

3. Results

3.1. Teaching readiness of e-tutors in the beginning and the end of the semester

Moreover, it was found that in the beginning of the semester, 42 e-tutors were high readiness and 2 were mid-low readiness, and all the 44 e-tutors were high readiness (Fig. 2). The result indicated that the e-tutors' teaching readiness were significantly improved during the online tutoring.

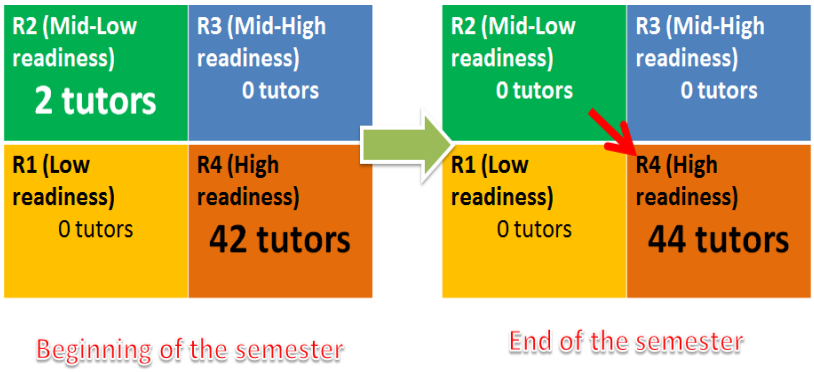

Figure 2. The e-tutors' teaching readiness in the beginning and the end of the semester

Moreover, the result indicated that the e-tutors' working readiness were significant improved in the end of the semester (t=6.25, p<.001), however, their psychological readiness did not significant in the end of the semester (Table 1).

Table 1. The t test of e-tutors' teaching readiness

Dimensions	pretest		posttest		T
	M	SD	M	SD	
Working readiness	5.27	.97	7.30	.70	6.25***
psychological readiness	6.80	.69	7.03	.88	1.64

p<.001

4. Conclusion

In this study, we develop a Teaching Readiness Index Scale (TRIS). It was found that most of the tutors have high teaching readiness when they join the distance education program. Providing teacher training courses and experience sharing seminars for the tutors is important. However, in this study, we found that e-tutors' psychological readiness did not significant improved in the end of the semester, and it may be the lack of the related training course in the training workshop during the semester. In the future, more training course to enhance e-tutors' psychological readiness and examine the effect of the training course on e-tutors' teaching readiness.

Abstract

This study involved the development of a literacy pedagogy for the indigenous people in Malaysia. The Developmental Research Approach was used where insights about the indigenous people and their lifestyle were gathered and analysed for content in developing a literacy pedagogical module. Several principles emerged from the data collected and these principles formed the basis for the module. The module encompassing a digital story was implemented in two schools for indigenous students situated in Peninsular Malaysia. The Stake Countenance model was used to analyse and conclude the evaluation of the module. Both teachers and students who participated in the module implementation were directly involved in the evaluation process. Findings showed that there was strong engagement between the Indigenous students and the lessons in the module. The teachers found that the module was able to respond to the needs of the indigenous students. This paper will discuss the evaluation process in detail and present the findings with reference to educational needs of the indigenous students in the country as a whole.

Key words: Responsive Pedagogy; Indigenous Learners; Literacy pedagogy; Developmental Research Approach.

IETC 2014

1. Introduction

Literacy practices among children today are embedded in textual environments which are complex (Healy, 2002). This is due to the dynamic development of multi-literacies and multimodalities which have a profound impact in the lives of young children today. Text is no longer associated with written messages and symbols alone. Transformation in digital technologies has expanded the definition of text to include various other multi modal features (Larson, 2009). Research in the area of literacy and technology indicates that there is significant difference in the way readers approach digital texts as compared to printed texts (Bailey, 2006, in McVee, Bailey, & Shanahan 2008; Healy, 2002; Tseng, 2008). This is attributed to several reasons; first, the textual artefacts and accompaniments of digital technology make a difference to the ways in which text is read (Healy, 2002). Healy explains that electronic texts are composed of info-graphic structure with the integration of image, sign, and audio. This makes the text rich and non-linear in structure which also requires the reader to use multiple strategies when reading. Next,

meanings in multimedia text are not fixed and additive (the word meaning plus the picture meaning) but multiplicative (word meaning modified by image context, image meaning modified by textual context), making the whole far greater than the simple sum of its parts (Bailey, 2006, in McVee et al., 2008).

Given this development in literacy, there is a great implication on literacy pedagogy. ELT methodology has to embrace this development or face the risk of being irrelevant to a society made up of different layers of communities whose cultures and life experiences differ from one another. In Malaysia, the indigenous group is a particular community that is of concern for the government. It has been noted that the literacy level and learning achievement among the Indigenous children is low in Malaysia (UNICEF Malaysia, 2008). The illiteracy rate among the Indigenous children is also alarming. Redzuan and Gill (2008) reported that the illiteracy rate among this group is 49.2% compared to 6.4% at the national level. Another serious problem of the Indigenous people is the high dropout rate. About 62% of Indigenous children drop out of school every year and 94.4% do not complete secondary school (Kamarulzaman Kamarudin & Osman Jusoh, 2008). The percentage of passes among the Indigenous children in Year 6 is between 43% to 59% compared to 78% at the national level. This calls for serious attention and the government of Malaysia has taken several initiatives in addressing the issue.

The National Education Blueprint 2013-2025 has specified various efforts to provide equal facilities and education to both rural and urban schools. It is crucial that steps are taken to improve the standard of education among the Indigenous students. One such effort is to look at ways to increase their literacy by making reading materials effective and relevant to their context. This paper discusses an initiative to design a literacy pedagogy to facilitate literacy among indigenous learners. This paper will present findings from a research carried out with a group of indigenous people in Malaysia. The Developmental Research Approach was used where insights about the indigenous people and their lifestyle were gathered and analysed for content in developing a literacy pedagogical module. Several principles emerged from the data collected and these principles formed the basis for the module. The module encompassing a digital story was implemented in two schools for indigenous students situated in Peninsular Malaysia. The Stake Countenance model was used to analyse and conclude evaluation of the module. Both teachers and students who participated in the module implementation were directly involved in the evaluation process. Findings showed that there was strong engagement between the Indigenous students and the lessons in the module. The teachers found that the module was able to respond to the needs of the indigenous students. This paper will discuss the evaluation process in detail and present the findings with reference to educational needs of the indigenous students in the country as a whole.

2. Theoretical framework

The present study was guided by the schema theory. The schema theory describes comprehension as a process of interaction between the text and the reader's background knowledge (Carrel & Eisterhold, 1983). Carrel and Eisterhold (1983) argued that text by itself does not bring meaning but it is the reader who relates the text to the existing acquired knowledge to construct meaning.

Text comprehension as a process is based on the principle that every input is mapped against some existing schema which should be compatible with the input. The schema or schemata is organized from the most general at the top to the most specific at the bottom. This organization helps to explain the two modes of information processing: bottom-up and top-down processing. Bottom-up processing involves the bottom level schemata and the incoming data. This stage is called data-driven. The top-down processing involves higher level general schemata where the system makes general predictions and searches for more detailed information from the specific schema to fit in the general idea. This stage of processing is called conceptually driven. Both the bottom-up and top-down should be occurring at the same time, one facilitating the other.

Brown (2001) describes two types of schema; content schema and formal schema. Content schema includes knowledge about people, the world, culture and the universe. Formal schema is knowledge about the discourse structure. Content schema refers to understanding of the text and the cultural elements

IETC 2014

needed to interpret it. This cultural element is a major aspect that influences the understanding of a text (Carrell, 1983, in Ahmad, 2006). Carrell suggests that reading teachers should ascertain that the reading text matches the student's culture.

In view of the schema theory, Coady (1979) in Carell et al. (1996) described reading as an interpretive process. Coady explained how the reader's background knowledge interacted with their conceptual abilities and process strategies in comprehending the text. Readers are able to understand better because they can take the text beyond its graphic representation and assign the task to the knowledge and concepts already stored in the memory. This is further supported with the attitude and beliefs the readers bring to the text. Therefore, Coady suggested that the linguistic ability together with the knowledge of the world enables the reader to comprehend the text. This interaction can be seen in Figure 1.

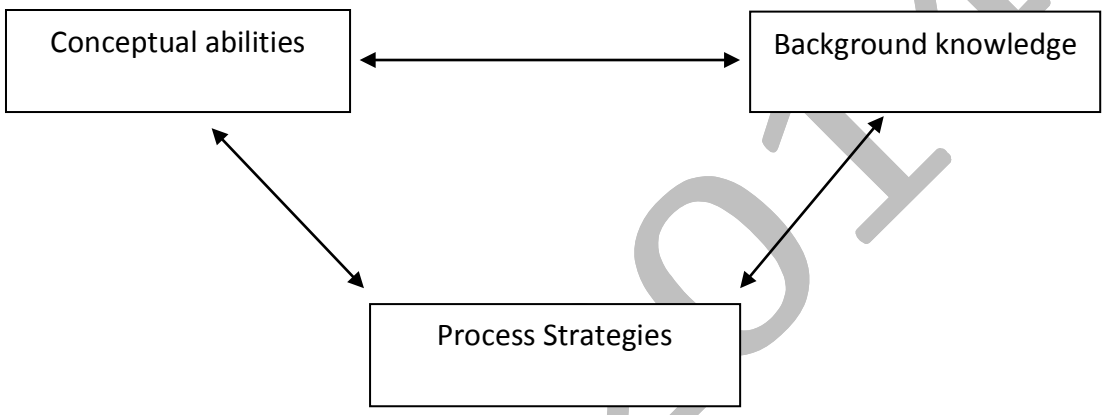

Figure 1. Coady's (1979) model of the ESL Reader.

Content knowledge of a second language learner is often culture-specific (Carrell & Eisterhold, 1983). Thus, it is important to provide text familiar to the learner and to which the learner can relate. One method of maximizing learners' cultural schema is by using the students' own ideas and words in the reading text as proposed by the Language Experience Approach (Rigg, 1981, in Carrell & Eisterhold, 1983). The other method is by developing reading material with the local settings and specialized low frequency vocabulary. This method is important for learners with low proficiency who need facilitation in vocabulary. Finally, previewing is another activity that helps to activate the prior knowledge (Carrell & Eisterhold, 1983). Showing familiar pictures and vocabulary, for instance, helps the reader in understanding the text.

McVee, Dunsmore, and Gavalek (2005) reviewed the influence of cultural perspectives on learners' schema. Reviewing the work by Bartlet (1925), McVee et al. pointed out that one's schema or understanding of the world is formed through transactions with the outside world. This transaction includes the cultural practice of the learners. In fact, schema is defined as formed within individuals, in the head (McVee et al., 2005, p. 556). In explaining the origin of schema, McVee et al. stressed that schemas or cognitive structures emerge or transform as a result of transactions with the world through material and ideational means.

3. Methodology

The study adopted the Developmental Research design which has a clear outline of design strategies, systematically divided into several phases. Van Den Akker (1999) has outlined three major stages in the developmental research approach. In the present study, phase 1 involved inquiry into the needs of the Orang Asli students in relation to reading comprehension in the English language. The participants in the needs analysis phase were ten English language teachers from Orang Asli schools. Classroom observations were carried out to gain information on the current pedagogy in reading comprehension as well as to identify the needs of the Orang Asli students with regard to reading comprehension. Phase 2 was the design and the development phase where the DS pedagogical module was designed and developed. This involved interviews with experts from various related fields such as from the Orang Asli context, the teaching of English language and the use of technology in education. Observation of everyday events in the context of the Orang Asli community were also were integrated in the module. Upon completion of the module development, a team of experts reviewed the module. Finally phase 3 was the module implementation and evaluation. The module was implemented in two contexts with the same population of Orang Asli, the Temuan community. The Stake Countenance model was used to evaluate the module.

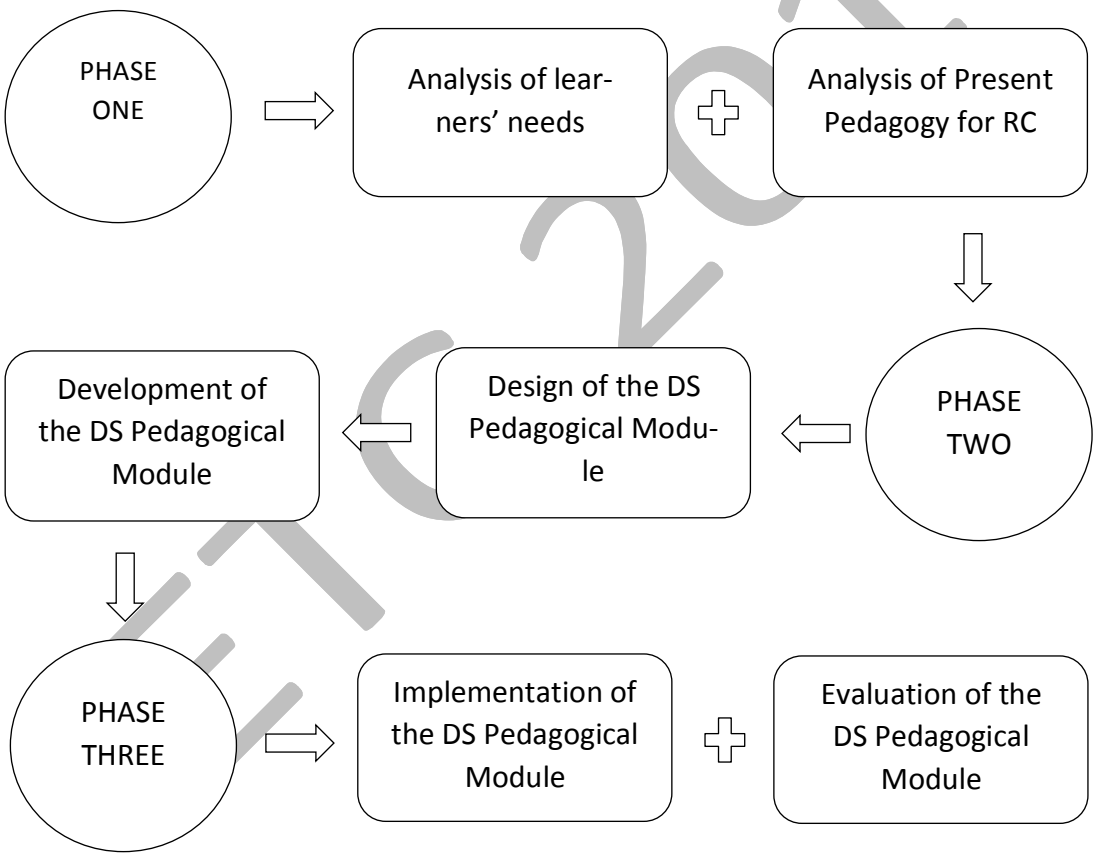

Figure 2 Summary of phases in the present study.

4. Research questions

The research questions which guided the third phase of the study were:

1. What is teachers' evaluation of the DS pedagogical module according to the Stake Countenance model?

a) What are teachers' expectations of the DS pedagogical module before its implementation?

b) What are teachers' opinions of the DS pedagogical module after its implementation?

c) What is the congruence between teachers' expectations before the implementation of the module and teachers' opinions after implementation?

5. Description of the stake countenance model

The Stake Countenance model is often used as a framework for evaluation. This model involves two major operations or countenances which is complete description and judgement of the program. The Stake model provides a framework for evaluators in collecting, organizing and interpreting data. The framework has three components which are antecedent, transaction and outcome. Antecedent is the condition existing prior to instruction. Transactions refer to successive engagements in the process of instruction and outcomes are the effects of instruction. The present study was evaluated based on this model where two teachers were interviewed before and after the module was implemented. An analysis of congruence between the two phases of interviews was carried out to obtain judgement regarding the use of the module in facilitating reading comprehension. Description of the lessons through observations as well as student response was done and this explained the transaction process as depicted in the model. Figure 3 is a description of the Stake Countenance Model used in the present study

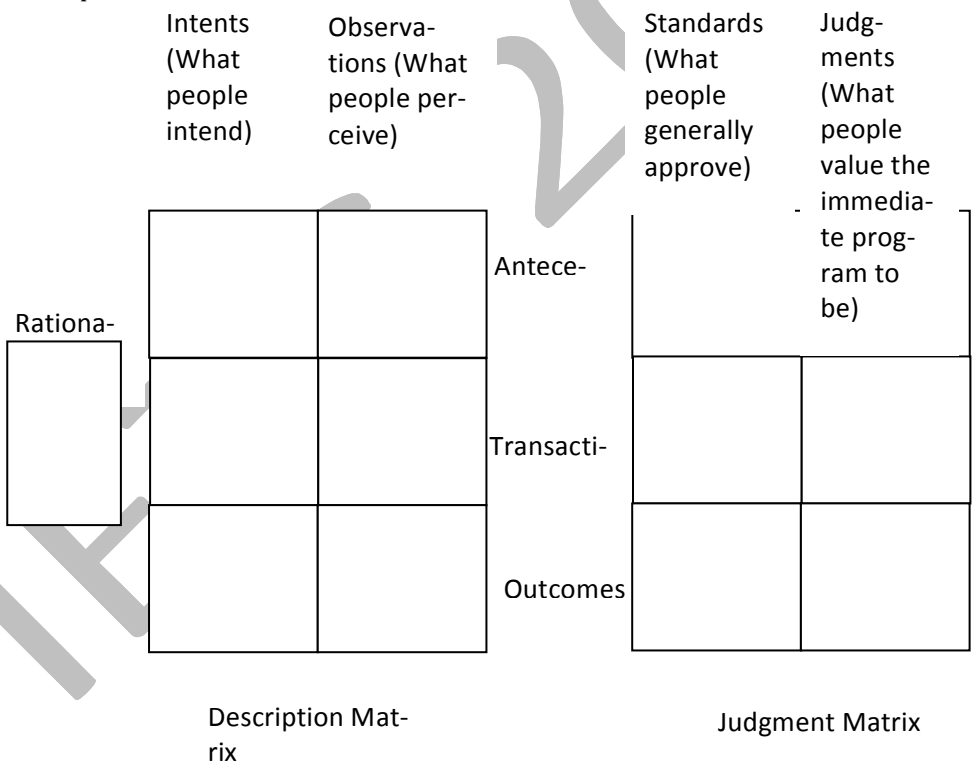

Figure 1.2. Stake Model for Collecting Data to be used in evaluating an Educational Program.

The Stake Countenance Model is appropriate for the present study because the model provides space for description that reflects the fullness, the complexity and the importance of a program (Stufflebeam & Shinkfield, 1985). This description is necessary to evaluate the usability of the DS pedagogical module.

6. Findings from the evaluation phase using the stake countenance model

The evaluation phase consisted of interview sessions which were categorized into six aspects: reading text, content, language, comprehension strategy, comprehension task and teaching as well as learning instruction. There were two rounds of interviews: the first round was conducted as antecedent data while the second round was after the transaction where the module was implemented. This section discusses the analysis of congruence between teachers' expectations before and after the module implementation.

Teachers' expectations before and after implementation of the DS pedagogical module

Interview sessions were carried out with both teachers from context A and B to seek information on their expectations and views of the DS pedagogical module. The teachers' expectations were analyzed according to five **c**ategories found in the DS pedagogical module

The following Table 1 describes the findings before and after the module implementation.

Table 1: Teachers' Views Before and After Module Implementation

Categories	**Teachers' expectation of the module before the implementation of the module.**	**Teachers' views after the implementation of the module.**
Type of text	In the form of a story In the electronic medium Should have a lot of colorful pictures. The story should have illustrations to aid comprehension. Should have digital effects such as sound effects, 3D effects and authentic material.	text of the digital story was interesting and relevant to the students in the context of the study. text had been presented in an interesting manner.
Content	The themes should be related to the Orang Asli life. Should include some cultural elements which reflected the context of the Orang Asli community. The setting should be like their home. Should include songs and music.	suitable and relevant to the students the story as realistic and within their context. the content was context specific and the students were able to make connection with the text. cultural element in the digital story which was related to the Orang Asli way of life the culture of staying in the jungle for a period of time to find things. This culture could be seen in the digital story. subject about their culture helped the students in understanding
Language	Should be simple and relevant to the context of the Orang Asli students. The vocabulary should be at lower level. The dialogue should be a mix of English	The language was simple and the students were able to understand the story The meanings had been translated into their language. This facilitated the

IETC 2014

	language, Bahasa Melayu and the Temuan language. The sentences should be in the simple form and not too complicated.	understanding. Language was simple. The students could understand the story.
Reading Comprehension Task	The task should be interesting and relevant to their needs. The task should also emphasize a lot of repetition. The text should have reading task in the form of games and activities. Interactive activities using the computer will be good.	The activities were relevant and useful in helping the students in comprehending the text. The students could respond very well on the task A lot of activities, interactive and related to the text and students were able respond well. Instructions for the teaching and learning activities were clear. The bamboo task was connected to their lifestyle. There was a difference in the way the students responded to the lesson…they were active and interested.

An analysis of the congruence between the expectations before the implementation and teachers' opinion after the DS pedagogical module was implemented in the two schools was done. Analysis was focused on the same five areas: type of text, content, language, comprehension strategy and comprehension task.

7. Implications of the study

1) Material production for Orang Asli primary school students.

Indigenous students learn better with indigenous material. Rushton (2007) proposed this notion after working with several cases of indigenous students in New Zealand. The reading text was based on the cultural context of the indigenous students and this improved students' learning. Rushton concluded that familiarity of a text is important as it gives the learners opportunity to participate and understand better.

'Familiarity' is a concept related to the schema of the learners and research has proven the positive role of learners' schema or background knowledge in reading comprehension (Ahmad 2006; Brown, 2001; Carrell et al. 1983 & Holliday,1997). The content schema of a learner includes knowledge of the learners' context and experience. In reading comprehension, this knowledge must be activated and the reading text has to allow this to happen. Therefore, content of the text should be related to the learners' background knowledge. In the present study, the reading text was designed based on the Temuan students' context which included their environment, experiences and issues. The digital story has the forest and their environment as the bigger theme as well as how they lived close with nature. When they were given a reading task based on the use of bamboo, the students were able to relate so much of information as bamboo hunting was part of their cultural experience. This experience is part of their schema and it facilitated their response.

Apart from the content, the language was carefully used to facilitate their understanding of the text. Simple sentences and vocabulary from the context are used in the story. Furthermore, the Temuan language at word level was also included to aid meaning. All these elements of language as suggested by the experts were integrated in the DS pedagogical module to facilitate comprehension of the digital story. Findings from the evaluation of the module do show that the students were able to comprehend the digital

IETC 2014

story. As such, it is important that reading text for the indigenous students should be designed based on their context.

2) The need for a culturally responsive pedagogy.

A culturally responsive pedagogy recognizes cultural knowledge, prior experiences and values of the community concerned (Jazadi, 2003 &Johnson, 2011). It has the learner's context and experience playing a central role in the learning process. Research in this area has proven that instruction through responsive pedagogical model has positive impact on students' knowledge and skill (Allen et al., 2002& Janzen, 2009). The present study has involved not only the context of the Temuan students in the digital story, the students themselves have played the role of some of the characters in the story. This participation has created excitement and motivation among the students during the reading lessons. As noted by the teacher, the students were able to understand the reading text because they were part of the story and the context was familiar to them.

3) Digital text to facilitate comprehension.

Meaning making in a multi modal text involves more than words; a variety of semiotic structures such as the visual, auditory and kinesthetic is needed (Eisner, 1985 in Sithamparam, 2005). Sithamparam, 2005 also suggested that alternative forms of representation should be used to aid the meaning making process in a text. A digital text has positive impact on learners' involvement in the reading process (Gordon,2009; Grabe,1996 & Grabinger,1996).

In this study, a digital text was designed to teach reading and the findings show that the Temuan students enjoyed reading the text as well as were able to comprehend the story. The students mentioned that they liked reading the story as they could see the character climbing trees, swimming, playing and so forth. The story was presented as a movie with narration and music as well as sound effects. This caught the students' attention. They were able to recapture the story with the details in the reading task. Thus, as this study has proven, more digital text should be designed to teach reading. Effort should be taken to include multiple forms of structures in ways that can facilitate comprehension.

8. Conclusion

This research has proven that a culturally responsive pedagogy recognizes cultural knowledge, prior experiences and values of the community concerned. The learner's context and experience play a central role in the learning process. The present study involved the indigenous learners and community as a major part of the content creation. This participation created excitement and motivation among the learners. The use of the Stake Countenance Model to evaluate the DS module was most appropriate and accurate in capturing teachers' needs and expectations. The evaluation process was conducted systematically and analysis of findings was managed appropriately. It is highly recommended that other impact study specifically in the education field utilizes the Stake Countenance model.

Evaluation of e-learning courses using communicative and cooperative tools

Martina Maněnová
Institute of Primary and Preprimary Education, Faculty of Education, University of Hradec Králové, Rokitanskeho 62, 500 03, Czech Republic

Abstract

In the contribution are presented the results of research directed at evaluation of e-learning course with help of specific tools, particularly for communication and cooperation are presented in this study. The research was drafted as pedagogical experiment and for data collection the knowledge test and nonstandard questionnaire aimed at the subjective course evaluation were used. We extended the e-learning courses for the experimental group about discussion forum, chat, and wiki. We followed evaluation of course in dependence on application of the introduced tools and further even on frequency of the approach to courses in both groups. In closing of the project discussions with students were realized and we obtained immediate subjective reaction on possibilities of implemented tools in the frame of the experiment.

Keywords: ICT in education; communication tools ; pcooperatinsupils with special needs

IETC 2014

1. Introduction

Among frequently discussed disadvantages of e-learning belongs insufficient motivation of students disability of independent work and its organization or even independent learning. Individual study is a common practice in e-learning. The student could feel in cyberspace isolated, lonely. The teacher could not be always at his disposal, when the student needs him, it could make deeper student´s loneliness and helplessness (Zounek, 2012), communication „face to face" is absent, etc. Individual study lacks elements of cooperation, which is considered as an important part not only of education, but even of successful „function in teams" (working and private).

We found out during informative preparation of the project, in process of problem study that existed researches in this area of e-learning bring especially quantitative approaches and are mainly directed on perception of the course as a whole without specific directing on the tools of communication and cooperation. The tools exploited in the frame of e-learning course and quality of communication from student´s view was investigated by David Bremer and Rueben Bryant (2004), Michael Machado and Eric Tao (2007). Clayton R. Wrighta compiled evaluation criteria of e-learning courses, Kearsley (2000), Benigno., and Guglielmo Trentin (2000) and Barbera (2004) were also engaged in this problem.

2. The project

We came out, in the frame of monitoring the condition of LMS Moodle, from the analysis of the tools used in the courses formed in the given environment. We directed our attention to a fact, if the course contains this tool and at the same time is actively used by student and teacher. The courses of Institute of primary and preprimary education Faculty of Education of University Hradec Králové were selected for the analysis of e- learning courses. In total 132 courses from Institute of primary and preprimary education Faculty of Education of University Hradec Králové were analyzed.

It follows from the analysis that:

- the most common part of e-learning courses are teaching materials determined for self-learning – the tool set (100 %), task aimed at independent work of students – tool task (60 % on the average), parallel respective completing tests (73 % on the average) and URL references (48 % on the average).
- Communication tool chat is used on an average from 4 %
- Communication tool Forum is used on the average from 48 %
- The tool for cooperation WIKI is used on the average in 1 %
- The tool of research is used on the average from 2 %

In the frame of separate courses were not used the tools as dictionary, public inquiry, questionnaire, lecture, workshop, book, unit and page.

According to our opinion e-learning courses drafted this way (i.e. courses, which contain tools, sets, tasks, tests, URL references) do not consider the important aspect of learning as communication, cooperation and mutual interaction of the participants of learning in the virtual space and do not exploit the potential, which is offered by the systems for conducting of learning.

2.1. Aim and methodology

Main aim of the research was to find out, if application of the tools for communication and cooperation in LMS Moodle influenced subjective evaluation of e-learning course from the standpoint of the teachers of the 1st level of primary school. The following partial aims ensued from the main of the research:

- to compare subjective evaluation of e-learning course of classic type, i.e. without application of specific instruments and e-learning course with exploitation of specific tools namely in the frame of the students of each faculty and then mutually

- to find out the application of specific Moodle tools by means of internet statistics of Moodle especially in the frame of students of each faculty and then mutually

- we determined, on the base of research aim formulation, research problem and research questions, following hypotheses:

H 1: We suppose that the students, who will work in e-learning course with the tools for communication and cooperation will have better results in knowledge test than the students, who worked in the course without application of these tools

H 2: We suppose that e-learning course with the tools for communication and cooperation will have positive evaluation than e-learning course without application of the tools

H 3: We suppose that the students, who use e-learning course with the tools for communication and cooperation would attend more frequently the course than the students, who have for disposal the course without application of the tools

As a design of research we selected mixed designs, where the fundamental quantitative research method was determined by pedagogical experiment, which was subsequently completed with discussion (qualitative method). Total number of 97 students of teaching for the 1st level of primary school took part in the research. The students were divided by toss up in the control and experimental group. They subsequently passed teaching one whole semester in the selected groups. Teaching was conceived as a blended learning (Poulová, Šimonová, xxx).

IECT 2014

2.2. Research results

To fulfill the basic requirements of the pedagogical experiment to from the same entering parameters in the control and experimental group, the students passed the pretest. For satisfying of entering parameters of pedagogical experiment, hypothesis on the results of pretests was tested.

We came out in hypothesis formulation from zero hypothesis:

H 0 There is no statistically significant difference between the average number of points in the entering test of the control and experimental group.

The results of tests are introduced in the table 1. It was confirmed that there is not statistically significant difference between the results of entering tests at the control and experimental group of the students of Faculty of Education of University Hradec Králové.

Table 1. Comparison of the entry

	Mean	T-Value	Z-Value	H_0
C control group (Cj_vs_K)	50,4	-0,4623	-0,5342	Accept
C experimental group (Cj_vs_E)	51,1			

In conclusion of the course the students of all groups passed the output test – posttest aimed at the knowledge. On the basis of obtained data we could tested the first designated hypothesis"

H 1: *We suppose that the students who will work in e-learning course with specific tools (communication and cooperation) would have better results in the knowledge test that the students, who worked in the course without application of these tools*.

For testing we came out from zero hypothesis:

H10: *We do not suppose statistically significant difference between the resulting score of tests of the experimental and control group*.

The test results (T-test and nonparametric Mann-Whitney tests) are given in table 2.

Table 2. Comparison of the output

	Mean	T-Value	Z-Value	H_0
C control group (Cj_vys_K)	79,7	-3,4568	-2,4519	Reject
C experimental group (Cj_vys_E)	95,6			

It follows from the results that zero hypothesis was not confirmed and thus we are inclined to a fact that there was statistically significant difference between the results of tests at control and experimental group.

We were further interested in the subjective course evaluation on basis of non-standardized questionnaire. We started out from generally formulated hypothesis H2:

H 2: *We expect that e-learning course, in which specific tools will be used (communication and cooperation) will have more positive evaluation that e-learning course without application of these tools*.

Table 3. Questionaire T-tests

		Mean	T-Value	Z-Value	H_0
General information	C control group	118,8	0,4489	-0,8812	Accept
	C experimental group	119,9			
Communication	C control group	41,8	-1,9984	2,5323	Reject

IETC 2014

	C experimental group	46,2			
Cooperation	C control group	14,3	0,3567	-0,5208	Accept
	C experimental group	14,7			

How we can observe in table 3, statistically significant difference was not proved in total evaluation of control and experimental group. Only at evaluation of the course from view of communication, zero hypothesis was rejected and we can conclude that there is statistically significant difference between subjective evaluation of possibilities of communication and cooperation in the frame of e-learning course.

The object of our interest was comparison of approach frequency to courses. We came out of the hypothesis:

H 3: *We suppose that students using e-learning course with specific tools, spend in this course more time than students, who use course without application of these tools*

We formulated zero hypothesis for our own testing of the number of approaches:

H30: *There will not be statistically significant difference between the number of approaches to e-learning courses at experimental and control groups*.

Control and experimental groups were tested. The fundamental characteristics of tested variables are introduced in table 4. The results of testing are summarized in table 5.

Table 4. Described characteristics

	Mean	Standard Deviation	Minimum	Maximum	Median	Modus
C control group	144,5	63,72	35	262	162	-
C experimental group	177,2	44,73	80	266	179	-

Table 5. Results of T-test and Mann-Whitney test for H30

	Mean	T-Value	Z-Value	H_0
C control group	143,5	-2,2156	2,0836	Reject
C experimental group	178,1			

It is obvious from the results that zero hypothesis was not confirmed between control and experimental group. We can conclude that the students of the experimental e-learning courses entered the e-learning courses more often on the average. We were also interested in spreading of the approaches, if the students used the courses continuously during the semester or in certain periods. In graph 1 spreading of approaches to all courses is visible, which were applied for the purpose of pedagogical experiment.

IETC 2014

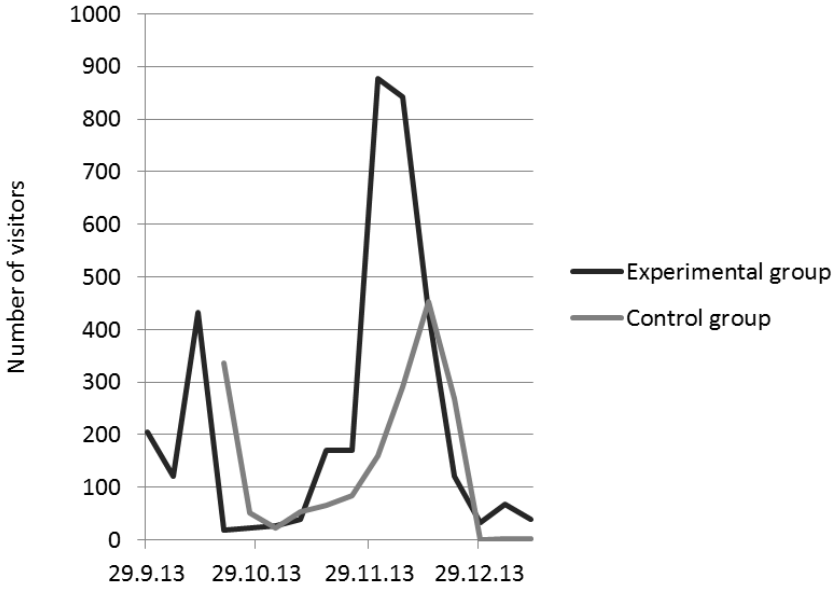

Fig. 1. Spreading of approaches at control and experimental groups during semester

Discussion in the focus group was used as an quantitative research method. Our aim was to obtain student´s reflection to newly introduced tools. E-learning courses usually include basic learning materials supplemented by references, self-tests, tests and tasks (see course analysis). Students are used to work regularly with these materials and evaluate them positively: "we have materials in hand, we need not to search anything for a long time".." we can print the material and insert in our notes, draw off the needed texts from reference." The self-tests are less exploited, mostly before credit test:" Sometimes I do the self-test, - I go through self-test before paper, it is before credit test – It is super – I try to tap the test on computer, then I feel more experienced in the credit test. If the lector uses tests regularly, the reactions are more inconsistent: "Test every week is a little bit stressing „if we must write the test regularly, it pushes us to stand attention all the time...I got used to tests during semester, it presses us to learn regularly... in the course of the semester one must think on it, not to forget it, but at the credit it is about one test less.

Commitment of the tasks – seminary works does not make any trouble – I loaded up the set without any problem, but at the beginning I lack certainty if I loaded it correctly, – but now it keeps me calm."

Forum as a tool for discussion is rather well-tried at Faculty of Education UHK. Students use it for practice reflection from the first year of study, then especially in the fourth year. Students are used to evaluate openly their practice even the approach of the faculty teachers, they work regularly with Forum, sometimes they enclose photo documentation from the practice – interesting situation in the class or photography of pupil´s work. Opinions on the use of the tool Forum were positive: "I quite enjoy to discuss on Forum, I got used to that even the teachers answer".. "it is not so informal as facebook, but I like to read the viewpoints of my classmates and their experience"....." I think that it is important to get used to discuss and express ones meaning. "

Chat was applied as a tool, which has not been used at any faculty. Students are accustomed to usage of facebook and to other social nets. For chat in Moodle they took up rather critical standpoint: "Chat in Moodle is seen by teacher, chat on facebook nobody could see, therefore we prefer facebook, where we arranged special group. I do not like to go to Moodle as I know that it is connected with school, when I click I know that only work is waiting for me, but on facebook it is combination of duties, work with entertainment "on social nets we have our friends and environment, which is close to us, it is the reason that combination of work, e.g. on facebook together with informal chat is pleasant"

Wiki – the tool for cooperative teaching has not been yet used in Moodle at Faculty of Education UHK. Generally cooperative teaching is not common. We tried to introduce this type of teaching in the frame of experiment by means of e-learning environment. It is true that students fulfilled the task, worked out wiki pages, but their reaction was confused ".we met and settled that one of us would fulfill the task"...."Maybe

that we did not comprehend that it should have made our work easier", ".I think that we should learn to work with it, try it on some informal topic", ."I know from practice that children enjoy cooperative teaching, but somehow we did not catch the strategy".

We were also interested in the student´s recommendation for learning improvement supported with e-learning course. We partially awaited their opinions and it was instructive for us when it was heard:

- "education as long life trend should not be differentiate – now I better myself for school and now I better myself for life.", "LMS should take it in consideration and be more tempting and enable combination of private and school life"
- "as Moodle is exploited at school now, the teacher should show it already from the 1st year, how we could use it for communication and cooperation – not only "here you have materials and tests and it is all ", "we should be shown how to work with Moodle in each subject – now, after long time in the fifth year we have to retain the log-in for Moodle, which we input long time ago"
- "In the same way we had schooling about information system in the 1st year, we should have schooling about Moodle, i.e. as a part of entry. Moodle should be more utilized by teachers not to lost the continuity and not forget log-in, improve the style of work."

Our aim was to catch opinions and relation of the respondents in the focal group to e-learning course, especially specific tools used in the subject Didactics of information and communication technologies. In a short resume we mentioned that all questioned teachers had positive attitude to e-learning course as a support of teaching and consider it already as an inseparable part of teaching. They also take into consideration the conditions, which should be fulfilled to make work effective in their course. It follows from their opinion that the specific tools must be introduced from the 1st year already, as a inseparable part of the course, students must only „touch them" get used to apply them.

3. Conclusion

The level of output knowledge of control and experimental group was tested and statistically significant difference was confirmed (experimental group reached better results). We could presume that application of the tools for communication and cooperation could evoke greater interest about subject in the students and they developed greater study effort. From the viewpoint of the course evaluation influence of used tools for communication and cooperation was not proved. It followed from the discussion with students that application of the specific tools except Forum was novelty for them, they did not meet with this tool in any course till now and it was the main reason for subjective evaluation of the course as a whole and its part. Chat is used by students in different style, its application in the course could be influenced by teacher´s presence. Students in discussion mentioned that the tool could be more satisfying for them, if chat, in some cases, could be opened only for students. Further phenomenon occurs from the results – students from experimental group joined the course significantly more frequently. This finding corresponds with that they were involved in discussion forum. Applied chat and formed seminary work in the frame of wiki. Frequency of approaches was similarly spread in both groups, students most often entered the course at the beginning of the semester and the highest frequency of course attending was in closing of the course.

In spite the fact that we did not prove effect of the tools for communication and cooperation on e-learning course evaluation, we considered their implementation as beneficial for pedagogical practice in general.

Exploring Students' Learning Style at a Gulf University: A Contributing Factor to Effective Instruction

Dawood Al Hamdani
Sohar University, Sohar, Oman

Abstract

Analyzing learners' characteristics is an important preliminary step in learning and teaching design. Specifically it aids in the selection and adoption of suitable teaching method/s and developing appropriate learning materials. Learner background, learning preferences and learning styles are examples of these characteristics.
Because each learner has individual characteristics, adjusting instruction (learning and teaching) to meet these characteristics would help each learner excel in his/her study. In other words, recognizing a learner's learning style would enhance the quality of education, making it more appropriate for that individual learner. Learning style can be defined as the way in which a learner perceives and processes information.
Academic literature identifies several learning styles. Visual, Auditory and Kinesthetic (VAK) styles are commonly used to classified learners as Visual learners, Auditory learners or Kinesthetic learners.
At Sohar University (SU), one of leading private universities in Sultanate of Oman, little consideration has been paid as regards to the importance of learning style as a factor to improve the educational experience of learners. Most lecturers use traditional passive approaches to course delivery. Nowadays, however, the university is in the process of encouraging a shift to active learning. This requires more individualization of instruction.
The purpose of this study is to explore SU students' learning styles, and determine what types of learners they are, Visual learners, Auditory learners or/and Kinesthetic learners. This study will also determine related factors (hand use, gender, and study streams) and their impact, as well as make recommendations to improve teaching and learning at the University.

Keywords: Visual, Audio, Tactile Learning; Dale Cone; Active Learning

IETC 2014

1. Introduction:

Analyzing learners' characteristics is an important preliminary step in learning and teaching design. Specifically it aids in the selection and adoption of suitable teaching method/s and developing appropriate learning materials. Learner background, learning preferences and learning styles are examples of these characteristics.

Because each learner has individual characteristics, adjusting instruction (learning and teaching) to meet these characteristics would help each learner excel in his/her study. In other words, recognizing a learner's learning style would enhance the quality of education, making it more appropriate for that individual learner. Learning style can be defined as the way in which a learner perceives and processes information.

Academic literature identifies several learning styles. Visual, Auditory and Kinesthetic (VAK) styles are commonly used to classified learners as Visual learners, Auditory learners or Kinesthetic learners.

The aim of the study is to explore students' learning styles and factors influencing these for a purpose of suggesting effective instruction model.

2. The Country and the University Context

Oman, with a population of only two million people is a small but nonetheless progressive and developing nation in the Middle East. With fossil fuel reserves dwindling in the foreseeable future the government has decided to strive to attain a knowledge-based economy to reduce dependence on the current resource based economy. By far the biggest factor currently holding us back is the lack of a well-grounded educational system in the country. The public school system in the country has only been in existence for the past forty years. Before that Oman only had three primary schools.

At Sohar University (SU), one of leading private universities in Sultanate of Oman, little consideration has been paid as regards to the importance of learning style as a factor to improve the educational experience of learners. Most lecturers use traditional passive approaches to course delivery. Nowadays, however, the university is in the process of encouraging a shift to active learning. This requires more individualization of instruction.

3. Study Design and instrumentation

The study aims to explore SU students' learning styles (visual learning style, auditory learning style and kinesthetic/tactile learning style) using the VAK learning styles inventory. 287 SU students participated in the study, 75% female and 25% male selected at the convenience (incidental or accidental sample). The participants were asked to read 24 short scenarios and make their appropriate responses from three selections on each scenario.

The study addressed two main questions:

1. What is the dominant learning style (Visual, Auditory OR Kinesthetic) is favored by Sohar University students?
2. Do personal characteristics such as gender, hand-use and study streams have an impact on learning styles?
3. Is there any correlation three types of learning styles and students' academic performance?

4. Findings

4.1. Dominant Learning Styles

The table (1) shows that the students' responses: 36% Visual, 35% Auditory and 29% kinesthetic/ tactile.

Table 1. Students Dominant Styles

IETC 2014

Type of Learning Style	Students' Responses
Visual Learning Style	36%
Auditory Learning Style	35%
kinesthetic/ tactile Learning Style	29%

4.2. Factors Influencing Learning Styles:

4.2.1 Gender influence

Table (2) shows that means for (male and female) responses to the three types of learning are very close. Table (3) illustrates no significant differences of gender impact on the learning styles with a p-value greater than 0.05.

Table 2. Students Styles and Gender

Learning Style	Gender	N	Mean	SD
Visual	Male	74	8.55	3.3
	Female	213	8.76	2.95
Auditory	Male	74	8.42	3.05
	Female	213	8.19	2.6
kinesthetic/ tactile	Male	74	6.66	2.75
	Female	213	6.87	2.71

Table 3. T Test Students Styles and Gender

T Test	T	df	Sig (2-tailed)
Visual Learning Style	-0.503	285	0.61
Auditory Learning Style	0.616	285	0.57
kinesthetic/ tactile Learning Style	.0616	285	0.53

4.2.2. Hand-use impact

IETC 2014

There is no significant difference in responses of left hand students and right hand students with a p-value greater than 0.05 (See table 4). However, it seems that left hand students are more visual learners as can be seen from table (5).

Table 4. T Test Students Styles and Hand-use

T Test	T	df	Sig (2-tailed)
Visual Learning Style	-.888	285	0.375
Auditory Learning Style	018	285	0.986
kinesthetic/ tactile Learning Style	.399	285	0.690

Table 5. Students Styles and Gender

Learning Style	Use hand	N	Mean	SD
Visual	Right	246	8.64	2.99
	Left	41	9.10	3.33
Auditory	Right	246	8.25	2.66
	Left	41	8.24	3.08
kinesthetic/ tactile	Right	246	6.84	2.73
	Left	41	8.24	3.08

4.2.3. Study streams

In table and table 6, it is interesting to note that science students are visual students with a p-value less than 0.05 and Art students are tactile with a p-value less than 0.05. However, there is no significant difference with regards Auditory style to study stream with a value is greater than 0.05. (See table7)

Table 6. Students Styles and Study streams

Learning Style	Study streams	N	Mean	SD
Visual	Science	163	9.07	3.0
	Arts	124	8.23	2.9
Auditory	Science	163	8.09	2.7
	Arts	124	8.46	2.6
kinesthetic/ tactile	Science	163	6.54	2.6
	Arts	124	7.18	2.7

IETC 2014

Table 7. T Test Students Styles and Study streams

T Test	T	Df	Sig (2-tailed)
Visual Learning Style	2.360	285	.019
Auditory Learning Style	-1.134	285	.26
kinesthetic/ tactile Learning Style	-1.982	285	.048

4.3. Learning styles and student s' performance

Table 8 shows there is not significance correlation between students' GPA and their learning styles with a p-value greater than 0.05.

Table 8. Students Styles and GPA

	Pearson Correlation	Sig. (2-tailed)
Visual Learning Style	-.053	.573
Auditory Learning Style	.091	.335
kinesthetic/ tactile Learning Style	.010	.913

5. Learning Style Models

A number of learning style models have been proposed to improve learners' understanding and retention in a better way for the learners reflecting on preference learning styles , such models as Klob (1984), Honey and Mumford (1986) and Vermunt (1994). Although each model has a different perspective on how learner processes information, i.e., how better learns, the models agree learners have individual preferable way/s to learn things. Therefore, learners need to be provided with learning situation/s that can accommodate their different learning styles.

Visual, Auditory and Kinesthetic (VAK) learning styles model is a widely used in the education history to reflect on importance of identifying learner's characteristics to enable effective education. The model is based on Howard Gardner' multiple intelligences theory which proposes that people actually display intelligence in eight ways: visual-spatial, bodily-kinesthetic, musical, interpersonal ,intrapersonal, logical-mathematical, verbal-linguistic, and naturalistic (Jeral 2010). VAK model identifies three types of learners based on how learner learns more effectively: (1) visual learners are those who learn things best through seeing them, (2) auditory learners are those who learn things best through hearing them and (3) Kinesthetic/ tactile learners those who best when physically involved with the environment, such as by playing games or performing demonstrations (Sousa, 2006).

Research on VAK model shows discrepancies on the dominance of each learning style and learner's individual preference. For example, in the study carried out by Nouryia in Saudi Arabia shows that the dominant learning style is visual followed by Kinesthetic and Auditory. While Jeral (2010) study concludes that a few students who had a strong preference for learning in one specific modality, 43% of the students

IETC 2014

were a mix of two or three learning. In their study, Deeb and Hassan (2011) show that the learning style preference is a blend of all three or even two styles.

Effective instructional activities mean involving learners actively in learning practices whereby they use their higher-order thinking skills (in Bloom's Taxonomy: analysis, synthesis, evaluation and creating). This means learning is a process of actively constructing knowledge by integrating experiences into the learners' prior knowledge; the learner plays an active role in building his/her knowledge. Learners also need learning experiences which promote higher-order thinking skills (HOTS). Dale's Cone of experience can provide a model of types of experiences supporting different thinking skills.

In addition, there is also a need to assess learners' learning preferences in order to excel in their learning. According to Junko (1998) learners having different learning style preferences would perceive, interact, and respond to the learning environments differently. One approach of assessing learners' learning preference is Visual, Auditory and Kinesthetic (VAK) model.

This study shows there is no influences of learning styles over students' performance and also there is no a preference to a single learning style, but a combination of the three types of learning styles. According to the VAK theorists, there is a need to present information using all three styles. This allows all learners the opportunity to become involved, no matter what their preferred style may be" (Clark, 2000).

Fig. 1. Model for Effective instruction

Based on Dales' Cone, Bloom's taxonomy and VAK model, the suggested model (fig. 1) presents wide range instructional activities. Active instructional activities can be described as hand-on, real experience, collaborative. Such activities as hands-on task, field trip, team project

6. Conclusion

The study sheds light on learning styles and factors might influence these styles. The study show three different learning styles are presented in sample of the study, and there is no dominant learning style. The study shows catering for students' learning styles would improve their learning and understanding and

based on the results of the study, a model of effective instruction is suggested. The model is designed to promote active learning and enhance students' learning regardless to their discrepancies.

Factors influencing administrators' empowerment and financial management effectiveness

Belinda Sanchez Villegas46
Ateneo de Davao University, E. Jacinto St., Davao City 8000, Philippines

Abstract

This study determined the relationship between the identified factors of Administrators' Empowerment based on the Integrated Clarity (IC) framework of Miyashiro and Rosenberg (2007) on Identity, Life Affirming Purpose, Direction, Structure, Energy and Expression and Financial Management effectiveness on Planning, Budgeting, Monitoring and Evaluation.

The identified factors on Administrators' empowerment and the functions of financial management effectiveness are significantly reinforced by Integrated Planning, Budgeting and Monitoring System (IPBMS) principles and to some extent in relation to the Length of service and financial management training and preparation under the Administrators' characteristics. The findings served as bases for a proposed empowerment and financial sustainable development plan.

Keywords: Financial Management effectiveness, Integrated Clarity (IC), Integrated Planning, Budgeting and Monitoring System (IPBMS)

IETC 2014

1. Introduction

The focus on value maximization emerges as a non-negotiable element in the beginning of the 21st century. Learning the art of managing the finances of any organization is a vital discipline for creating and maintaining financial sustainability. This study attempts to explore and affirm that Integrated Clarity (IC) and Integrated Planning-Budgeting-Monitoring (IPBMS) frameworks work best if all key players who have been entrusted with power to influence the strategic plans and financial decision making, are convinced that stewardship, active participation, accountability and commitment to the goals and aims of an educational organization are the necessary conditions in order that effective organizational interventions and changes can be introduced with greater results at least cost and wastage. The purpose of this study is to identify the factors that may influence administrator's empowerment and financial management effectiveness and in the process determine how these two factors are correlated with each other in order to propose an Empowerment and Financial Sustainable Development Plan.

2. Theoretical and conceptual framework

* Corresponding author. *E-mail address:* bsvillegas@addu.edu.ph

The research of Amalia Ifanti (2011) on schools' empowerment issues over the last three decades, School Empowerment: Discourse and the politics of the Federation of Secondary School Teachers in Greece, affirmed greatly the importance of school empowerment. While empowerment is not new, framing it using the Integrated Clarity (IC) as suggested by Marie Miyashiro and Marshall Rosenberg spells out the difference since IC Framework helps organization to discover and articulate its needs critical to its sustainability in a way that benefits the whole system and the people by subscribing to six (6) universal organizational needs essential to the institution's existence. These are (1) Identity refers to the vision statement, (2) Life-Affirming Purpose refers to the mission statement, (3) Direction refers to the strategic plans, means, thrusts and priorities of the organization; (4) Structure refers to the articulation of the organizational structure, policies and functions, (5) Energy focuses on the effectiveness of operational management, control and financial sustainability, and (6) Expression refers to the growth as a natural by-product of reaching and serving people or it conveys a specific contribution of the organization on the industry or society (Holman, Devane, et al, 2007). In this study, the aforementioned six (6) universal organizational needs are assumed as the factors influencing school administrators' empowerment and are considered as the **independent variables** (x).

Achieving institutional financial sustainability for Catholic schools in the Philippines is both a goal and a challenge for its economic survival. The Sacred Congregation for Catholic Schools (#81) cited that many Catholic schools has considerably improved their financial condition while initially receiving various public or private grants but later began to enter into agreements, conventions, contracts, etc. which guarantee both the preservation of the special status of the Catholic school and its ability to perform its function adequately. The Pastoral Letter of Archbishop Jose Palma, President of Catholic Bishops Conference of the Philippines on the occasion of the 400 Years of Catholic Education in the Philippines (2012) affirmed the same point: The Catholic schools assist the government in providing education to the rest of the citizens who opt for Catholic education as well as those who cannot be accommodated in public schools. Brigham and Houston (2012) mentioned: All important organizational decisions have financial implications. According to Patricia León (2001) financial sustainability is its capacity to generate resources in response to a demand, in order to maintain productive processes at a steady or growing rate in order to produce results and obtain some savings. In the day to day operations of the school, administrators are entrusted the task to plan, direct and control operations of an organization (Ballada and Ballada, 2012). In order to succeed effectively and efficiently in this regard must require adherence to the four (4) financial management functions specifically, (1) planning refers to the formulation plan of actions or programs in order to attain the objectives or goals; (2) budgeting which completes the program planning because financial resources are committed to achieve the planned activity or program; (3) controlling ensures that actions conform to the plan and efforts are made to monitor its progress; and finally, (4) evaluating that becomes a tool to measure the success of the plan. If these functions are performed optimally and strategically, decision makers will help maximize the values of their organization and contribute to the welfare of clients and employees (Brigham and Houston, 2012). In this study, these four (4) financial management functions are regarded as the **dependent variables** (y).

As cited earlier, the role of the school administrator is crucial and he must be prepared to adapt to the changing environment. In this study, there are **supporting variables** (z) that may enhance his/her efficiency and effectiveness grouped as (a) administrator's characteristics such as: (1) length of service as administrator; (2) financial management training and preparation; and (3) administrative experiences and (b) the principles of Integrated Planning-Budgeting and Monitoring System (IPBMS) such as: (4) participatory, involvement of all levels of management in the processes of planning, decision making and execution based on their competencies and authority; (5) stewardship, the wise use of resources entrusted to the administrators' care and to manage it responsibly; (6) accountability, the obligation of an administrator to account for its activities, accept responsibility for money or other entrusted property, and to disclose the results in a transparent manner; (7) transparency, the full, accurate and timely disclosure of information which enables people to support each other in accomplishing the work to be done; (8) autonomy and solidarity, shown through the exercise of independence at the same time interdependence in relation to the common objective and thrust of the organization; (9) systemic, the implementation of each phase affects the whole system; and (10) Management by Objective (MBO) requires that all the unit plans must have specific results; target dates to accomplish, and has identified persons who are responsible and ac-

IECT 2014

countable for each activity. Finally, through the interplay of the above variables and structures of interrelationships together with a built in control mechanism, the application of funds and its corresponding performance is ensure to be consistent to the strategic plan (Schermerhorn, 2008). The use of Integrated Clarity as a tool offers new elements in enhancing the school's financial management effectiveness and cultivating new ways of empowering the school administrators. Figure 1.1 showed the interrelationships among independent variables (x), dependent variables (y) and supporting variables (z).

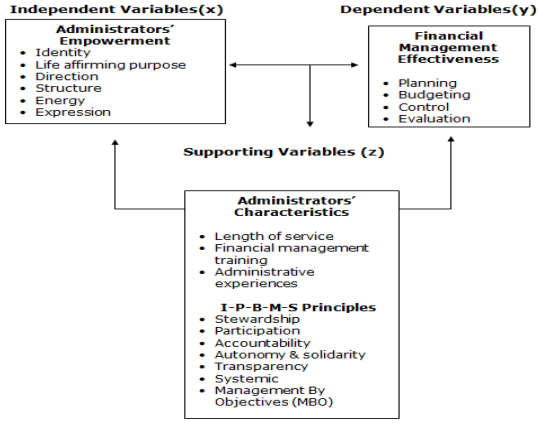

Figure 1.1 Conceptual Framework

3. Research questions

This study determined the relationship between the identified variables of administrators' empowerment and financial management effectiveness among the selected nine (9) participating Catholic Schools in Davao city (6), Digos city (1), Iloilo city (1) and of Quezon city (1). The findings served as bases for a proposed empowerment and financial sustainable development plan. Specifically, this study answered the following questions:

1. What is the level of influence of the identified factors on administrators' empowerment as perceived by the research subjects?

2. What is the level of influence on the identified functions of financial management as perceived by the research subjects?

3. What is the level of influence of the identified supporting variables on administrators' empowerment and financial management effectiveness as perceived by the research subjects?

4. Is there a significant relationship between the

4.1 supporting variables and factors influencing administrators' empowerment and financial management effectiveness; and

IETC 2014

factors influencing administrators' empowerment and financial management effectiveness?

5. Is there a significant difference in the perceptions of the research subjects on the factors influencing administrators' empowerment and financial management effectiveness when grouped according to schools?

6. What are the perceived factors that may influence the administrators' empowerment and financial management effectiveness?

7. What empowerment and sustainable financial development plan can be proposed based on the findings of this study?

5. Methodology

This study employed quantitative, non-experimental research design using descriptive correlation. It utilized statistical analytical tools such as: mean chi-square, Pearson-r correlation and One-way Anova. A customized survey questionnaire was designed and supported by Focused Group Discussions in order to verify the results and findings draw insights and reinforce especially the qualitative aspects of this study. This research was conducted in nine (9) selected participating Catholic schools located in Mindanao, Davao City (6) and Digos City (1), Visayas in Iloilo City (1) and in Luzon, Quezon City (1). Figure 1.1 shows the geographical locations of the research subjects and number of participants in each school.

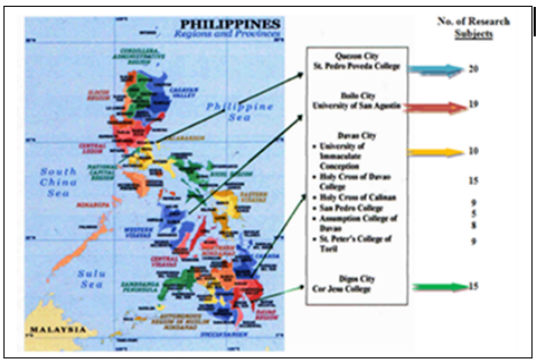

Figure 1.1 Geographical Locations and Number of Research Subjects

6. Summary of findings, conclusions and recommendations

6.1 Profile of the research subjects

IECT 2014

The total 110 research subjects were composed of academe (68) and non-academe (42). With respect to Gender and Civil status, majority were female (69%) and married (59%) while the rest were male. In terms of Age, majority fell from ages 30 to 49 years old (66%). On the educational attainment, majority had master's degree (65%) while 25% of them finished their doctoral degree. Further, the length of service in school, 51% of the administrators served the school from 10 to 19 years while in terms of the length of years in position held, 68% had been in the position for less than 5 years. Further, 101 out of 120 had assumed various administrative tasks but unfortunately, 84of them had not undertaken any formal training on financial management.

6.2 Levels of influence on the identified factors on administrators' empowerment, functions of financial management and supporting variables as perceived by research subjects

Figure 1.2.A presented an over-all level of influence of "very high" on six (6) identified factors, of which 3.78 was rated by administrators from the academe and 3.76 by the non-academe. Examining the details, the factor on Direction got the highest score whereas Expression was rated the lowest. Further, Figure 1.2.B earmarked an overall descriptive rating of 'very high' on the four (4) identified functions of financial management effectiveness. The average means were 3.79 and 3.81 from the academic and non-academic research subjects, respectively. Planning got the highest mean responses while Control was rated the lowest. Finally, Figure 1.2.C indicated a descriptive rating of 'very high' on the identified Supporting variables of which an equal rating of 3.61 came from both the academe and non-academe administrators. Moreover, Transparency got the highest mean responses and administrative experiences was rated the lowest. Finally, as perceived by both academic and non-academic research subjects, the most rated administrative characteristics was Financial management training and preparations while Accountability was marked as the most important Supporting variable under the IPBMS principles.

Positive significant correlations at varying p values existed between the identified factors on Empowerment (x) and Supporting variables (z) as shown in Table 5.1. To wit: between Identity or vision statement with all the principles of Integrated Planning, Budgeting and Monitoring System (IPBMS) on Participatory, Autonomy and solidarity, Accountability, Stewardship, Transparency, Systemic and Management by Objectives (MBO); between Life affirming purpose or mission statement with Accountability, Transparency, Stewardship and MBO; between Direction or Strategic plans, goals, priorities, thrusts and objectives with Participatory; between Structure with Participatory, Autonomy and solidarity, Accountability, Transparency and Systemic; between Energy or operational management, control and financial sustainability with Stewardship, Accountability, Transparency, Systemic and MBO; lastly, between Expression or unique contribution and place in the market environment with all IPBMS principles except Stewardship. Moreover, a no significant correlations existed among the identified factors on Administrators' Empowerment(x) with Supporting variables (z). To wit: between Identity or vision statement with all the three (3) Administrators characteristics on Length of service, financial management training and preparation and administrative experiences; between Life affirming purpose or mission statement with all the three (3) Administrators characteristics and IPBMS principles on Participatory, Systemic and Autonomy and solidarity; between Direction or strategic plans, goals, etc. with all the three (3) Administrators characteristics and IPBMS principles except Participatory; between Structure with all the three (3) Administrators characteristics and IPBMS principles on Stewardship and MBO; between Energy or operational management, control and financial sustainability with all the three (3) Administrators characteristics and IPBMS principle of Autonomy and solidarity; and between Energy or unique contribution and place in the market with all the three (3) Administrators characteristics and IPBMS principle of Stewardship.

Moreover, Table 5.2 showed positive significant correlations among the identified functions on Financial Management Effectiveness (y) and Supporting variables (z) as shown in Table 5.2 on the following: Participatory and Management by objectives. Further, varying positive correlations exist with Supporting variables with Planning such as: Financial management training and operation; Transparency; Accountability and Stewardship; with Budgeting the variable of Autonomy and Solidarity; with Control were Length of service, Accountability and Systemic; and finally, with Evaluation were variables of Systemic, Accountability and Transparency.

Table 5.3 summarized the significant correlations at varying p values which existed between the four (4) functions of Financial management effectiveness (y) of Planning, Budgeting, Control and Evaluation and Supporting variables (z) of Administrators characteristics and IPBMS principles specifically between Planning with Financial management training and preparation and IPBMS principles except Autonomy and solidarity and Systemic; between Budgeting with IPBMS principles on Participatory, Autonomy and solidarity and MBO; between Control with Length of service and IPMS principles except Stewardship and Transparency; and between Evaluation with IPBMS principles except Stewardship and Autonomy and solidarity.

In addition, a no significant correlation existed between Planning with Length of service, Administrative experiences and IPBMS principles on Autonomy and solidarity and systemic; between Budgeting with all the three (3) Administrator's characteristics and IPMS principles on Systemic, Accountability, Transparency and Stewardship; between Control with Financial management training and preparation, Administrative experiences and IPBMS principle on Transparency; and finally between Evaluation with all the three (3) Administrator's characteristics and IPBMS principles on Stewardship and Autonomy and solidarity.

Finally, a significant correlation existed between the identified factors on Administrators' Empowerment(x) and functions on financial management effectiveness (y) on the following: between Life affirming purpose with all the four (4) functions of Financial management effectiveness; between Identity, Structure, Energy and Expression with Budgeting, Control and Evaluation; and finally, between Direction with Planning, Budgeting and Control.

IETC 2014

6.4 Difference in the Perceptions of the Research Subjects on the Identified Factors on Administrators' Empowerment and Functions on Financial Management Effectiveness when Grouped According to Schools

Table 6.1: Difference in the Perceptions of the Research Subjects on the Identified Factors on Administrators' Empowerment and Functions of Financial Management when Grouped According to Schools

Factors	Means	Critical Value	Decision on Ho	Interpretation
Identity	3.72	0.42	Do not reject Ho	No Significant Difference
Life-affirming purpose	3.84	0.14	Do not reject Ho	No Significant Difference
Direction	3.94	0.66	Do not reject Ho	No Significant Difference
Structure	3.70	0.57	Do not reject Ho	No Significant Difference
Energy	3.70	0.37	Do not reject Ho	No Significant Difference
Expression	3.60	0.20	Do not reject Ho	No Significant Difference
Planning	3.96	0.84	Do not reject Ho	No Significant Difference
Budgeting	3.79	0.59	Do not reject Ho	No Significant Difference
Control	3.63	0.18	Do not reject Ho	No Significant Difference
Evaluation	3.74	0.11	Do not reject Ho	No Significant Difference

A 'very high' descriptive rating on the perceptions of the research subjects on identified factors on Administrators' Empowerment when grouped based on the nine (9) selected schools was rated. But when testing the difference in the perceptions, a no significant difference existed on Direction, Energy, Expression, Identity, Life-affirming purpose and Structure as the identified factors on Administrators' empowerment (x).

6.5 Perceived Factors that may Influence Administrators' Empowerment and Financial Management Effectiveness

The common themes on other perceived factors mentioned during the Focused Group Discussions (FGDs) were categorized as follows: (a) core values, charism or directives and corporate Identity of the school; (b) leadership style that adheres the processes of consultation, participation and shared decision-making; (c) mutual trust that the person delegated does the task effectively and efficiently; (d) transparency as mutual sharing of expectations and desires; (e) coordination and team-working referring to the harmonious interactions among academic and non-academic administrators and personnel; and (f) honing the administrator's skills through constant training and updating.

Whereas, the common themes the on other perceived factors on Financial management effectiveness were (a) Planning-Budgeting-feedbacking; (b) participatory Budgeting; (c) enhancement in the Evaluation; and (d) tracking and inventory of assets.

6.6 Conclusions

Based on the findings of the study, the following conclusions are drawn:

The profile on Gender connects with Life affirming purpose. In this study, the female research subjects outnumbered the male administrators. This data may have influenced the result.

Further, Organizational structure correlates with Planning as a function of financial management effectiveness which means that the clearer the structural design specifically on the lines of authorities and accountabilities, distribution of roles and responsibilities, and flow of communications, the better equipped are the research subjects or administrators to engage in institutional strategic visioning and planning.

Administrators' empowerment is enhanced when identified factors such as Identity, Life affirming purpose, Direction, Structure, Energy and Expression are complemented with Supporting variables under the principles of Integrated Planning, Budgeting and Monitoring System (IPBMS) arranged according to

IETC2014

frequency of importance from Accountability, Transparency, Participatory, MBO, Systemic, Stewardship, Autonomy and solidarity.

Effectiveness and efficiency in financial management are heightened as the identified functions of Planning, Budgeting, Control and Evaluation are complemented by IPBMS principles arranged according to frequency of importance from Participatory, MBO, Accountability, Systemic, Transparency, Autonomy and solidarity and lastly, Stewardship. Based on the outcome, as institutional Planning and Budgeting advanced, administrators' Length of service and Financial experiences and preparations are factors that reinforced financial management effectiveness.

The Life affirming purpose or mission statement of the Catholic institution is significantly enhanced as the processes and dynamics of Planning, Budgeting, Control and Evaluation are developed and improved. Direction which signifies strategic plans, goals, priorities, thrusts and objectives of the institution are better pursued when Planning, Budgeting and Control mechanisms and systems are installed and supported by well-articulated measures of standards of performance leads to clearer institutional identity and better contribution to society at large. It can be concluded from the study that financial management effectiveness on Budgeting and Control are considered important in all the identified factors of Administrators' empowerment, this further means that the schools understudied tend towards the aspects of operational management, control and financial sustainability rather than on long term strategic planning.

In order to harness the strengths that are intrinsically present in each of the identified factors of Administrators' empowerment and the functions of Financial management effectiveness, the administrator is challenged to make a paradigm shift from the traditional way of managing the school's finances to an integrated and systemic manner of doing things backed up by the basic IPBMS principles as its foundation. He/she is further confronted to make a major decision inherent to his/her function to consider Integrated Clarity (IC) framework and IPBMS as priority thrust and program in setting the new direction of the school. Active participation of the members of the school community is necessary since the strength of the IC framework and so with IPBMS lies on its people. While, monitoring, review and impact assessment are essential mechanisms and tools in order to measure the attainment of the institutional strategic plans, goals, programs and objectives in an efficient and effective manner. Moreover, a well-defined set of standards and policies must be timely communicated and harmoniously coordinated leading to better results.

The perceptions on the identified factors on Administrators' empowerment and Financial management effectiveness of the research subjects when grouped by schools point to the same direction, unified expectations, shared understanding and common convictions in relation to the interactions of these two variables understudy, as strategic pillars of any educational system.

On the whole, the research subjects highlight other perceived factors that may influence Administrators' empowerment such as the institutional core values and identity, mutual trust among those delegated with authority to govern and lead, transparency, shared responsibilities, coordination, consultation and delegation as a style of leadership to name a few. Whereas, aside from the four (4) functions of Financial management effectiveness, an effective and efficient exercise of plan-budget-feedback mechanisms, evaluation and review techniques, capital expenditures (CAPEX) inventory system just to name a few are the added elements.

6.7 Recommendations

IETC 2014

Based on the findings and conclusions of the study, the following are recommended:

1. Implement the Proposed Empowerment and Sustainability Development Plan in the two (2) major areas of concern: Administrators' Empowerment and Financial Management effectiveness, in order to improve the financial net-worth of the Catholic school.

2. Conduct regular financial management operation's evaluation as a built-in mechanisms complemented by benchmarking strategies.

3. Conduct similar studies in other Catholic schools and non-sectarian schools using the identified significant predictors.

4. Specifically, for St. Pedro Poveda College and University of San Agustin conduct an interim financial management operation's audit and impact implementation of Integrated Planning, Budgeting and Monitoring system (IPBMS) and draw best financial management practices to be shared to other Catholic educational institutions or other non-sectarian schools as one of their unique contribution in the field of educational administration and management.

6.7 Proposed empowerment and financial sustainability development plan

Table 6.2 Proposed Empowerment and Financial Sustainability Development Plan

Areas of Concern	Objectives	Strategies	Person Involved	Evaluation Criteria
1. An increased administrators' empowerment is perceived to exist when identified factors under the Integrated Clarity Framework.	To conduct an organizational needs assessment using the Integrated Clarity Framework To re-visit and review the strategic development plan.	Organizational needs assessment conducted. Set up unified organizational needs as spring board for empowerment. Strategic plan re-visited and reviewed.	School Administrators Academic Non-academic Consultants	90-100% increase organizational needs assessment and planning improvement.
2. As institutional planning & budgeting advanced, administrators need updating and training in financial management	To train and hone skills in financial management.	IPBMS training modules implemented.	School Administrators Academic Non-academic Consultants	100% participated in all the sessions
3. Effectiveness and efficiency in financial management through planning, budgeting, control and evaluation.	To institutionalize the Integrated Strategic Planning, Budgeting and monitoring system (IPBMS) as a tool.	IPBMS orientation conducted. Customized a Computer-based IPBMS program	School Administrators Academic Non-academic Consultants	90-100% willingness to participate in all the sessions
4. Significant correlation between Over-all financial status and Energy which refers to management operations, control and financial sustainability.	To initiate and engage in income generation and fund sourcing activities. To establish systems for inventory and maintenance of capital expenditures	Creation of endowment and trust funds. Diversification of funding through local and foreign fund sources. Promotion of income/revenue generating initiatives and activities, joint ventures, re: business activities Establishment of systems for CAPEX and inventory /maintenance.	School Administrators Academic Non-academic Consultants	70-80% increase fund sourcing and economic activities

The findings of the study revealed that effectiveness and efficiency in financial management increases as the functions of planning, budgeting, control and evaluation are complemented by factors influencing administrators' empowerment taken from the Integrated Clarity (IC) framework such as: direction, energy and life affirming purpose and supported by financial management training and preparation on the Integrated Planning, Budgeting and Monitoring System (IPBMS) and its underlying principles of management by objectives, transparency, participatory, accountability, autonomy and solidarity, stewardship and systemic processes.

The Life affirming purpose articulated clearly in the mission statements of these nine (9) participating Catholic schools is significantly enhanced as the processes and dynamics of planning, control and

evaluation are advanced. While Direction which signifies the strategic plan, thrusts, priorities and goals of these schools are better pursued when systems and processes of planning, budgeting and control mechanisms are installed. Moreover, an increased awareness on the need to enhance its institutional identity and rediscover its unique contribution in society would require reviewing the measures and standards of performance set and to do benchmarking as an aid for enhancing institutional relevance. As institutional planning and budgeting advanced, there is a need for administrators to be trained in multi-faceted areas of school management including managing change, of financial management, organizational development, stewardship and leadership and other aspects that may increase and enhance best administrative practices.

Achieving institutional financial sustainability for Catholic schools in the Philippines is both a goal and a challenge for its economic survival. According to Patricia León (2001) financial sustainability is its capacity to generate resources in response to a demand, in order to sustain productive processes at a steady or growing rate in order to produce results and to obtain a savings.

Faculty's perceived integration of emerging technologies and pedagogical knowledge in the instructional setting

Chunfu Charlie Lin[a], Weichieh Wayne Yu[b]47, Jenny Wang[a], Mei-Hsin Ho[b]
[a]*National Formosa University, Taiwan*

[b]*Chang Gung University of Science & Technology, Taiwan*

Abstract

This study was designed to examine faculty's perceived integration of emerging technologies and pedagogical knowledge in the instructional setting. Understanding the relationship between learning theory and technology was considered important because educational practices are rationalized based on proven learning principles and processes. Participants were 313 full- and part-time nursing teachers in a nursing institute during the 2012-2013 academic year in southern Taiwan. The results of the study revealed that many of the faculty members who took part in this study believed in using learning theories as a foundation for selection technology for instruction. However, a great number of teachers felt they did not sufficiently matched learning theories with their selection of instructional technology. In addition, a proportion of the respondents acknowledged that they did not consider pedagogical principles such as learner's pace, design of activities, evaluations, etc. when planning for instruction using emerging technologies. Teaching professionals need to recognize that the heart of good technology integration lie with the recognition of the relationship between technology and pedagogy. The findings of the study aims to provide data to technology trainers and specialists to help them develop appropriate professional training materials and address teachers' needs during technology profession training in a way that connects pedagogical knowledge and the use of emerging technologies in instruction.

Keywords: Emerging Technologies, Pedagogical Knowledge, Nursing Education

IETC 2014

1. Introduction

Schools and scholars readily agree that infusing technology in both educational contents and methods of delivery is highly necessary in order to prepare students for industrial and business workplace skills. Therefore, it has become imperative to train and equip teachers with technological skills and methods including techniques to use technology to deliver instruction. The recognition of the importance of technology infusion has led to the demand to provide teachers with current technological skills have given rise to the acquisition of various hardware and software technologies. However, sometimes the knowledge of pedagogy upon which technology integration is rationalized is not properly addressed. This is critical because emphases on technology integration in teachers' training programs might not have received adequate attention among some of the segments of teachers, especially the older teachers. While teachers may receive faculty development training periodically, such training may not adequately address the theoretical framework that guides the selection of instructional strategies and methods upon which technology integration is based.

Pedagogical and technological knowledge mainly refers to the understanding of the processes and methods including practices through which teaching and learning are conducted, managed and assessed (Shulman, 1986). Koehler & Mishra (2008) have attained that effective technology integration practice was to understand content pedagogy which describes the subject discipline to be learned; pedagogical knowledge which deals with the strategies, principles and processes of learning. It also refers to technological knowledge which addresses teachers' ability to select and apply suitable technologies for specific instruction taking into consideration the need of the learner and lesson objectives of the lesson; including the understanding of how the learning contents and technology interact and influence each other. Technology is a fluid infrastructure which transforms with constant rapidity and complexity. The rapid transformation and changes in educational technology tend to put teachers at a disadvantage, particularly teachers who were trained before technology became a buzz word in educational establishments. Koechler and Mishra (2009) observed that:

Many teachers earned degrees at a time when educational technology was at a very different stage of development than today. It is, thus, not surprising that they do not consider themselves sufficiently prepared to use technology in the classroom and often do not appreciate its value or relevance to teaching and learning. Furthermore, teachers have often been provided with inadequate training for this task (p. 62).

The argument is that the understanding of the relationship between technology infusion and pedagogical knowledge represents the foundation and a road map through which technology integration can be successfully implementation. According to Honey & Moeller (1990), the vital aspect of technology integration is teachers' understanding of the pedagogical principles to address technology integration. Also, Hasselbring, Barron & Risko (2000) remarked that teachers may desire to use computers for instruction and may gain sufficient computer literacy but remain deficient in the acquisition of the pedagogical knowledge required to effectively use technology to facilitate instruction. Whestone & Carr-Chellman (2001) maintained that teachers acknowledged that computers are important in supporting teaching and learning, however, they fail to realize the necessity of implementing technology integration using pedagogy as foundation knowledge. Also, Pierson (2001) echoed the idea that technology integration involves the utilization of technological skill and pedagogical knowledge to support and facilitate instruction.

The focus of this study is on how emerging technologies, such as mobile technologies, cloud technologies, etc. chosen by the teachers, to play a role in today's class and make technology integration a proven reality. Two fundamental questions under study were: Have teachers mastered and consolidated the skills in these emerging technologies in a manner that creates confident in a manner that helps them to use in the instructional setting? Are teachers able to integrate emerging technologies into teaching and learning using pedagogical principles as a base for making appropriate and suitable selection of technology based on the instructional objectives?

Piaget's definition of effective learning is incremental, from the simple to the complex. While it is neat to make effort to embrace emerging technologies which just cannot exclude social and interactive media, it is vital that teachers master basic technologies that are used for personal and for business. Yet, teachers seem to be less confident in using them and teaching students how to use them. As succulently stated by Gunter & Baumbach (2004), technology integration "requires a good foundation in computer literacy, information literacy and integration literacy…" (p.194). Koc & Bakir (2010) maintained that the availability of technology in the classroom does not ultimately suggest that technology integration is being implemented; the authors believed that teachers need training. It appears that teachers need training not only on more sophisticated type of technology but also on the basic literacy skills because teachers need a thorough understanding of the processes of pedagogy to guide technology integration.

1.1 Pedagogy & emerging technologies

IECT 2014

Emerging technologies such as mobile and cloud technologies, or Internet technology in an conglomerate term have become a great tool for teaching and learning. But are teachers able to use these resources to truly enrich their teaching materials or to use different technologies to transform their classroom into virtual authentic classroom? Proper use of the emerging technologies will allow teachers to explore the world as a learning community and to create awareness of current issues in a global scale. A good teacher is required to keep abreast of news and information as they emerge to educate his/her students on the new developments on the disciplines of interest, including emerging research knowledge. Part of the effort to integrate technology into instruction is to be able consolidate the technology skills that have been acquired and being able to infuse it into teaching and learning using pedagogy as well as the ability to enrich classroom instruction using the internet. While there is an increase in the use of computer and the World Wide Web (WWW) for assignment, record keeping and assignments; "less than 10 percent of teachers reported using computers or the internet to access model lesson plans or to access research and best practices (US Department of Education, Office of educational Research and Improvement, 2000, p.1). The findings of a study carried out by Limayem & Hirt (2000) revealed that teachers in their study tend to introduce technology to learners and leave "students to their own devices," the authors claim that this "will not be sufficient" (p. 7). This further illustrates that some teachers may not have the ability to use digital resources readily at hands to enrich teaching and learning in a way that is profitable to be teachers and students. Although, technology has been introduced into education for decades now, yet as Koc (2005) pointed out that " majority of teachers do not feel well prepared to integrate technology into their teaching" (p. 3). The observation of Vannatta & Beyerbach (2000) in Koc (2005) delineated the problematic nature of technology integration among teachers by stating "that technology integration must be connected to course content, objectives and assignments, and addressed much earlier in the teacher education programs" (p. 12). Unfortunately, most technology professional development programs do not adequately address the importance of pedagogical principles in technology integration training. Therefore, the problem of this study is that teachers' understanding of the importance of using pedagogical knowledge as foundation for using emerging technologies to support instruction remains unclear; such uncertainty does not inspire confidence among teachers. Internet resources can improve teaching and expand learning materials, nevertheless, teachers have shown less enthusiasm to use internet resources properly to enrich instruction as well as provide opportunity to engage in exploratory learning with their student. The following research questions were developed to guide this study:

1. What percentage of teachers believes that they consider the use of pedagogical theories as a foundation for selecting technologies to support instruction?

2. Are there any differences among teachers based on years of teaching experience in their perceived ability to use pedagogical knowledge as a base for using emerging technologies to support instruction?

2. The study

The purpose of this study was to investigate teachers' perceptions toward the relationships between pedagogical use of emerging technologies and classroom technology infusion. Understanding the relationship between learning theory and technology was considered important because educational practices are rationalized based on proven learning principles and processes. The goal is to provide data to technology trainers and specialists to help them develop appropriate professional training materials and address teachers' needs during technology profession training in a way that connects pedagogical knowledge and technology. The idea was to identify participants' weaknesses and address those weaknesses during professional development training. Quite often, most technology professional training is carried out without addressing specific needs of the trainees.

2.1. Methodology

IETC 2014

In this study, a self-reported questionnaire was used to gather data from the accessible population for the study was approximately 313 full- and part-time nursing teachers in a Taiwanese Nursing Institute during the 2012-2013 academic year. The faculty taught primarily undergraduate classes and possessed necessary knowledge and skills in seven (7) specialized areas in nursing practices: Fundamental Nursing, Clinical Medicine, Internal Medicine/Surgery, Intensive Care, Public Health/Palliative Care, Psychiatrics, and Obstetrics, Gynecology & Pediatrics. The researchers used a convenient sampling technique to select the subjects for the study. In the end, 313 teachers participated in this study. As seen in Table 1, the participants varied in their age, gender, positions, as well as their experience of using computers for instruction. The questionnaire was validated by professors with expertise in pedagogy and technology integration. The internal consistency of the instrument was established using Cronbach's alpha and it stood r = 85, p. ≤ .05. The primary purpose of the 5-point Likert scale questionnaire administered to the participants was to assess participants' understanding of the use of pedagogical principles as a base to implement technology integration including assessing teachers' use of the emerging technologies to expand instructional materials. Data for research questionnaire was collected using a 5-point Likert scale namely, "SA" for strongly agree (5-point), "A" for agree (4-point), "N" for neutral (3-point), " D" for disagree (2-point) and "SD" for strongly disagree (1-point). Percentages, means and standard deviation were employed to analyze teachers' responses. Correlational statistics were used to seek if relationship existed among teachers in their responses to questionnaire items based on their demographic, independent variables of gender, age, years of teaching experience salary and type of school where teachers taught.

3. Findings

Table 1: Distribution of Teachers by Demographic Variables and Percentages

Demographic Variables	Frequencies	Percentages
Gender		
Male	92	29%
Female	221	71%
Age		
20-25 years	36	12%
26-30 years	6	2%
31-35 years	40	13%
36-40 years	53	17%
40-45 years	33	11%
46-50 years	38	12%
51-55 years	52	17%
56 and above	55	18%
Experience		
5 years or less	109	35%
6-10 years	52	17%
11-15 years	44	14%
16-20 years	29	9%

IETC 2014

21-26 years	35	11%
27 years and above	44	14%

Research Question #1: What percentages of teachers believe that they consider the use of pedagogical theories as a foundation for selecting technologies to support instruction?

Frequencies and percentages for each scale were calculated to determine the distribution of teachers for each Likert rating scale as shown in Table 2 below. In questionnaire item #1, 56 or 18% of the participants strongly agreed that they use learning theories as a foundation for selecting technology for instruction; 133 or 42% agreed with this statement. However, the results showed that 83 or 27% were not sure (undecided) regarding whether or not they consider learning theories as they make instructional decision for their students. Also, 31 or 10% teachers disagreed and 10 or 3% strongly disagreed with the statement in research questionnaire #1. In questionnaire item #10, only 88 or 28% of the respondents strongly agreed, whereas 155 or 50% agreed that they use technology for teaching in a manner that could be used to solve real problem; 49 or 16% remained undecided, 15 or 5% disagreed with the statement contained in questionnaire #10. Moreover, 87 or 28% of the participants strongly agreed with the statement #11 in the questionnaire, while 136 or 46% of the faulty members agreed, 55 or 18% undecided, 27 or 9% disagreed and 8 or 3% strongly disagreed.

Table 2: Frequencies & percentages of teachers' perceptions of the use of pedagogical theories as a foundation for selecting technologies to support instruction

Questionnaire Items	**SA**		**A**		**N**		**D**		**SD**	
	f	***%***	***f***	***%***	***f***	***%***	***f***	***%***	***f***	***%***
Q1: I use learning theories as a base for applying technology into instruction.	56	18	133	42	83	27	31	10	10	3
Q2: I consider lesson objectives when I select technologies for instruction.	107	34	159	51	23	7	18	6	6	2
Q3: I do not consider instructional methods as I select technology to support instruction.	4	1	18	6	36	12	143	46	112	36
Q4: I do not consider learning styles when I choose technology for instruction.	2	1	18	6	26	8	141	45	126	40
Q5: I consider students' pace of learning when I select technology to support instruction	99	32	165	53	30	10	12	4	7	2
Q6: I consider methods of evaluation when I choose technology to support instruction.	98	31	148	47	41	13	18	6	8	3
Q7: When I select follow-up activities, I do not consider the type of technology to match the follow-up activities.	10	3	17	5	48	15	150	48	88	28
Q8: I consider students' developmental stage when I select technology for instruction	105	34	11	4	32	10	11	4	154	49
Q9: When I choose software for instruction, I do not consider if it is user friendly	10	3	19	6	41	13	120	38	123	39
Q10: As I plan for instruction, I consider how the technological skills taught will be used to solve real life problems.	88	28	155	50	49	16	15	5	6	2
Q11: As I teacher, I use technology as a tool for teaching problem-solving skills.	87	28	136	43	55	18	27	9	8	3

F= frequencies

IETC 2014

Research Question #2: Do differences exist among teachers based on years of teaching experience in their perceived ability to use pedagogical knowledge as a base for using emerging technologies to support instruction?

Out of the 11 questionnaire items, statistical significant differences were found to exist among the respondents in four of the questionnaire items based on the teachers' years of teaching experience. In questionnaire item #1, *I use learning theories as a base for applying technology into instruction* (Table 3), significant differences were found among teachers, $F(10, 303) = 3.119$, $p < .01$. Further tests were conducted using Tukey HSD and the results showed that teachers who had between five years or less years of experience (M = 4.22), including those teachers who had between six and10 years (M = 4.25) and those teachers with 11-15 years of teaching experience (M = 4.30) as well as those with 21-26 years *agreed* with statement contained in questionnaire item #1. However, teachers with 27 years teaching experience and above were undecided (M = 3.70) regarding questionnaire item #1. In questionnaire item #4, the result of the ANOVA tests revealed that significant differences existed among teachers with different years of experience, $F(10, 303) = 4.650$ $p < .01$. Post Hoc tests were used to locate where the differences were found and the findings indicated that teachers who had five years or less experience, six to 10 years of experience and 21 to 26 years of experience were *undecided* (M = 3.67) with the statement: *I do not consider learning styles when I choose technology for instruction.* But teachers with 27 years and above *agreed* (mean score 4.65).

In questionnaire #6, the result of ANOVA showed a significant differences among those participants involved in this study, $F(10, 303) = 3.615$, $p < .01$. Teachers with five years of teaching experience or less (M = 4.17); teachers who had experience 6-10 years of experience (M = 4.20); teacher with 11-5 years of teaching experience (M = 4.14) *agreed* with the statement recorded in questionnaire #6 but teachers with 21-26 of experience and 27 and above were *undecided* concerning the statement in questionnaire item #6.

There were statistical significant differences in teachers responses to research questionnaire item #10 (Table 6), $F(10, 303) = 4.151$, $p. < .001$. The result of the Tukey HSD tests indicated that teachers who had worked for five years or less including those teachers with 6-10 years of experience, 11-15 years of experience and those teachers with16-20 were *agreed* (M = 4.13) that as they *plan for instruction, they consider how the technological skills taught will be used to solve real life problems.* But teachers with 27 years of experience and above were undecided (M = 3.75) regarding questionnaire item #10.

Table 3: ANOVA results of teachers' pedagogical knowledge as a base for using emerging technologies to support instruction based on teachers' years of teaching experience

Questionnaire Items (Dependent Variables)	**Groups**	**Sum of Squares**	**df**	**Mean Squares**	**F**	**Sig.**
Questionnaire Item #1: I use learning theories as a base for applying technology into instruction.	Between Groups	13.101	10	2.620	3.119	.009
	Within Groups	250.343	303	.840		
	Total	263.444	313

	Within Groups	198.271	303	.662		
	Total	211.987	313			

4. Discussion

The results of the study revealed that many of the teachers who took part in this study believed in using learning theories as a foundation for selection technology for instruction as demonstrated in Table 2. Nevertheless, a substantial number of teachers were not sure that they used learning theories to inform their selection of basic software technology for instruction. Also a reasonable proportion of teachers acknowledged that they did not consider learning principles as the based for applying software applications into instruction. The findings revealed that the use of basic software applications to support instruction still remains problematic. In research questionnaire item #1, only 18% recorded strongly agree response while 28% agreed with the statement in questionnaire item #1. Twenty-seven percent of the participants were unsure; 31 or 10% of the teachers disagreed. When the number of teachers who were not sure about their practice in using learning theories as a base for selecting emerging technologies to facilitate instruction and those teachers who acknowledged that they did not consider learning theories, it became apparent that teachers in the school system needed help in implementing basic technology integration. This could represent one of the problems with technology integration because some teachers do not consider learning theories which could provide them with the rationality for choosing and using technology to support teaching and learning. Selecting technology for instruction arbitrarily or in a vacuum would definitely hinder technology integration. This finding mirrors the result of a study carried out by Mouza (2011) who argued that teachers did not possess pedagogical content knowledge to implement technology integration. Littrell, Zagumny, and Zagumny (2005) pointed out that teachers still lacked the skill to use technology to promote teaching and learning in a meaningful way. Koehler & Mishra (2009) maintained that the heart of good technology integration lie with the recognition of the relationship between technology and pedagogy. Unfortunately, a sizeable proportion of the teachers who were involved in the resent research did not seem to recognize such relationship.

Formative research in higher education: some reflections

Jackeline Valencia[a], Jackeline Macias[b], Alejandro Valencia[c]48
[a] *Instituto Tecnológico Metropolitano, Semillero de Investigación de Mercados Tecnológicos, Medellín, 050013,Colombia*
[b,c]*Instituto Tecnológico Metropolitano, Grupo de Investigación en Ciencias Administrativas, Medellín, 050013,Colombia*

Abstract

Research is considered fundamental in the formation process of students in higher education institutions (HEI). It has been positioning pedagogic strategies to promote its development such as formative research. It represents an effective alternative that allows the stimulation of students' skills improving the quality and structure of the research and professional profile of the student training. In this paper is presented the role and importance of formative research in professional training qualification. It considers how it is understood the concept of formative research, mentioning some techniques or strategies that have enabled in its development as a pedagogic activity in School or HEI.

Keywords: formative research; virtuality; hotbed of research; teaching; higher education.

IETC 2014

1. What is formative research?

Formative research is understood as the learning process in the development of a research culture in the student beyond obtaining concrete scientific results (Facundo et al., 2007). Its aim is to stimulate the student's abilities and interests in relation to the research, in order to strengthen their professional abilities. It is achieved by a series of activities that do not necessarily involve a specific research project, but other measures to potentiate the analytical and critical skills of students (Tejada, Tejada, and Villabona, 2008).

The developed processes in the formative research seek to familiarize the students with the scientific and research culture. It is accomplished when process, methodologies and techniques useful in the training process are recognized and applied in different contexts of the subject's life students (Tejada et al., 2008). The concept of formative research is understood as a pedagogical strategy in professional training. The developed where the aim is to stimulate their research abilities so that may be applicable in their context, such as problem solving, analysis of a situation, the application of methodologies to recognize deficiencies or situations and implement improvements from various perspectives that allow to understand the phenomena of their field of knowledge (Lemos and Sánchez, 2009).

It is necessary to recognize what is the difference between formative research and research training, to establish clarity in their use. As noted above, formative research can be understood as a pedagogical strategy to form students in research abilities, oriented to their professional training. On the other hand, research training is properly understood as the research exercise in strict sense of the term. It is put into practice the knowledge acquired to conduct research project (Parra, 2009). Nevertheless, it is important to note that both concepts are not far from each other. The combination of these two elements is necessary for the consolidation of the research function, composed by the research teaching and pedagogical

E-mail address: jhoanyvalencia@itm.edu.co

training from research (Parra, 2009). The integration of them with others gives value and recognition of Higher Education Institutions (HEIs). It is also important to recognize that research is the core idea of all this dynamic interaction and it should be understood as a social process where the collective construction of knowledge is its basis. The research must be set out through dialogue and discussion in groups and scientific communities. The diversity of ideas and points of view provides a complete training that encouraging formative research (Restrepo, 2002).

Interaction, dialogue and practice of research in a social context are necessary in formative research, but the student is who consolidates his intellectual and professional profile. Then, formative research is recognized as a process that occurs in the student's autonomy (Macea, 2008). In this regard, it is important to understand the formative research as a knowledge network that is nourished by the collaborative work and dialogue (Ramírez and Morales, 2011). Techniques and strategies should be developed in the classroom or academic groups by different actors in order to promote and facilitate access to knowledge, developing skills, habits and attitudes, but the most important, to felt the research spirit, that quality that combines the senses towards finding answers and solutions to the situations of the context in which the professional or student in training is located (Landazabal y Ortiz, 2010). Understanding the formative research as a pedagogical strategy helps to the learner in his research path due to the research is assumed as a transverse hub at training process of student, helping to manage the expertise of his area in practice and theory.

To some extent, hotbeds of research in Colombian universities have become a strategy to contribute to the training of professional research elements. In business and work environment, it has taken a great value and has become a plus that unlike other students who do not have the opportunity to belong to a group, and to develop or stimulate applied research capabilities to their field. Thus, there are many universities that include in their academic curriculum aspects oriented to formative research, with strategies as hotbed of research, motivations as an alternative extracurricular that manage, encourage and promote the research spirit in its students. To help to the dynamics of these exercises, the use of guidelines and methodological tools are really exploited, and generate additional value to the student's professional education (Macea, 2008).

Furthermore, the formative research contributes to the purpose of teaching. It helps training students to acquire a set of attitudes, abilities and competencies that enable the appropriation of theoretical, practical and technical knowledge necessary to the professional or academic exercise. In this sense, formative research is necessary in the teaching profession to develop and stimulate the complex and basic mental processes. First one related to analytical, critical, proactive and relational thinking and second one with observation, description and comparison (Parra, 2009).

One of the values generated by formative research is the ability to achieve the interaction between teacher disciplinary knowledge and experimental background of the students. According to Macea (2008), this allows for a combination of knowledge, given from the experience and training acquired, allowing to explain a circulating reality or answering to the interests of the area or the particular profession, helping in some way to understand certain situation, analyze it, being critical, and besides, being proactive (González, 2009). All this happens in a classroom with interactions between students and the teacher, enabling a complete education, dialogue of knowledge that is nourished by motivations, interests, thoughts, attitudes, beliefs, values, and rational and emotional intelligence expressions.

Thus, formative research has been positioned in the academic and training activities of universities. It has greatly impacted the teaching processes, and as beforehand indicated, contributing to the generation of added value in the acquisition of competences by undergraduate students from the qualification of acquired knowledge (Ramirez, 2009). Also, formative research is considered as an alternative to facilitate the appropriation of research as a matter of passion, and make this a first step to have an appropriation and continuity in research exercise that occurs in universities or specialized centers (Macea, 2008).

Then, a series of actions and techniques are presented to manage the processes of research training developed in universities and HEIs. For example, theoretical essay with research scheme in order to generate ideas and arguments regarding specific topic, being the basis for the initiation of an academic and thorough discussion. Other is the magazine club that consists of follow a trail of information, categorizing and getting an overview of a specific area of knowledge. There are also seminars as a way to facilitate the

IECT 2014

meeting and reasoned discussion on certain issues. They are usually recommended to be approached from different perspectives and are supported by documentary studies (Parra, 2009).

Other exercises recommended by Parra (2009) are those employing PBL (Problem Based Learning) method. This method is used primarily in the health sciences, but it can be applied in other areas too The intention is to follow the methodology that set out for research, where a problem is delimited, a hypothesis is generated, data are seeking to support the hypothesis and the information found in function to respond or validate the hypothesis analyzed. Finally, another mechanism suggested is the formulation of preliminary research projects on specific topics of a subject. Its aim is to help students to acquire the ability to develop theoretical and practical problems in a particular discipline or profession. It is important to clarify that the use of this technique is not intended to accomplish the preliminary research projects, but it sets out a research process to familiarize students with the logical, systematic and methodological requirements involving the research process.

Diversity of methods are then observed to stimulate the student from the formative research, the required competencies within his professional environment or area of knowledge, being universities responsible for this process of formative research seeking to be nourished by competencies, knowledge and experience of his teachers, which ultimately generate a proper environment to encourage his professional training in research spirit (Hernández, 2003). Therefore, thinking in formative research as a teaching process requires the active participation of institutions. They facilitate spaces and tools for the student to develop a critical, analytical, and reflective thinking that allow him to be independent and proactive in his field work or professional practice (Benjumea and Sánchez, 2011). However, one of the great challenges facing HEIs is the deficiency in its formative research processes (Jaimes, 2007). They have no clear indicators to recognize the achievement of the proposed objectives in areas such as information processing, contrasting, induction, deduction and other required topics in the research process. It has made the rigor of the process is lost, besides the loss of institutional commitment to the issue of formative research.

Contemporary research trends are aimed to promote the collaborative work and teamwork. The individuality of the student is fundamental to recognize his interests, experiences and work dynamic that can vary from individual to individual, but that individuality and differentiation must take shape from teamwork, dialogue of knowledge and research discussion (Jaén, 2006). Moreover, articulated and collaborative work facilitates a more comprehensive view of reality to have a broader perspective of several variables that are analyzed from different or complementary visions. All this becomes in a process of mediation and collective interpretation, encouraging student capabilities such as: teamwork, consensus and dissent, the possibility to debate and defend a thesis, or facing a problem and manage it from his field of knowledge (Ramirez and Morales, 2008).

Finally, the formative research is understood as a pedagogical strategy that instructs necessary actions and attitudes for the training student, which are essential to make him a comprehensive professional (Macea, 2008) prepared to respond to dynamics of his environment, being critical, reflective, propositional and proactive.

2. Role of research hotbeds in higher education

One strategy that has been developed as a hub of formative research in HEIs is the research hotbeds. They are meeting spaces for training in research methodologies involving in the professional field of student. Research cannot be considered a matter of teachers or certain fields of knowledge (Hernández, 2003). Research today is a key in professional dynamic. Therefore, implementation of formative research is needed within the educational models in order to form a comprehensive professional, and it can be supported by the development and consolidation of research hotbeds in Higher Education Institutions.

First, it is necessary to define hotbed. It means etymologically "a place where planting and breeding, where is saved and preserved, origin and principle of" (Facundo et al., 2007). If hotbed is applied to the

IETC 2014

research, it is the space for cultivating student and professional talent through research. Its objectives are to facilitate generational change, improve the quality of teaching, research and social work. In that sense, the hotbeds have been considered as spaces to guide and go in depth in knowledge related to the field of knowledge which belongs from research (Guerrero, 2007).

Structurally, the hotbeds are generally composed by students and teachers who are interested in learning: how to learn in a voluntary, autonomous and extracurricular way. In most cases they are coordinated or directed by teachers, who play the role of tutors and counselors in the process of formative research (Parra, 2009). As indicated in the previous section, these spaces are enriched not only by the knowledge and wisdom of teachers, but the dialogue between teachers and students, where the experience of both contributing to the consolidation of the hotbed as a private space for formative research and also as a pedagogical strategy.

It is fundamental be clear about the role of research hotbeds. The hotbeds are part of that educational strategy which responds formative research, and in that sense it is proper to think that most of the graduates of these spaces won't make the research as a part of their professional life, because these areas respond more to a space of training that reinforces their own knowledge of professional training, which is important to denote that student should have abilities in research if the application of this knowledge in their work is necessary (Miyahira, 2009).

The research hotbeds are framed within a context of formative research. It is established as a space to strengthen the student learning, where in most cases he is there by his own decision and interests, in order to go in depth in knowledge to know different perspectives, approaches and methodologies of their field of knowledge (Macea, 2008). In this sense, the hotbeds encourage scientific research activity within HEIs and contribute to the consolidation of a scientific culture in the academic community (Benjumea and Sánchez, 2011).

Usually, the hotbeds develop their research activities through seminars, workshops, forums, roundtables, lectures and discussion sessions and group activities that encourage collaborative work, argumentation, debate, reflection and proposition, which today are necessary competences in professional training. Methodological research processes are formed by developing works such as document review, reading, writing generation, schema design, prototyping and development of research projects, activities that are consolidated from the presence and work sessions group (Miyahira, 2009).

Research hotbeds have been established as one of the first stages of the research. The hotbeds have become in many HEIs in the first spaces for discussion, reflection and construction of social issues or research problems in response to the interests that each student has. Autonomy is the key in these spaces, because the student must to have the freedom to pursue topics that address their own professional brand or interests with respect to his knowledge field. Thus, many universities have included in their academic curriculum the research as a key issue for quality construction and autonomy, seeking the avant-garde in new research methodologies such as the plurality, interdisciplinary, and the training and practice (Macea, 2008)

Therefore, the networking of hotbeds is important in the formation process of the student, because it encourages interdisciplinary work, the meeting of knowledge and explaining work. Then, it is possible to affirm that since the hotbeds through networking, the learning communities and collective formative research are established (Correa, 2011). Also, it is acquired the strengthening of abilities as a professional training, where spaces like hotbeds are themselves the place to implement the knowledge, manage and encourage them, in order to contribute to the formation of a comprehensive professional.

In turn, the hotbeds have become a filter for many academic units of universities, as the beginning of young researchers. They nourish groups and research centers and contribute to ensure a renewal in these spaces with the generation of new ideas and reflections and giving sustainability at the same time, from the generational change that was discussed in previous sections (Rojas, 2010). Besides the abovementioned, students who are in research hotbeds, unlike those who are not, are formed in abilities for learning to learn, reference, search information, key elements to generate knowledge and the train students in the workplace (Benjumea and Sánchez, 2011).

IECT 2014

The research hotbeds have contributed to the consolidation of a scientific culture and formative research that occurs in universities. Although, this is not guarantee to the institutional support which in turn generates in some students feels of motivation to participate in these spaces. Additionally, maybe there are problems in the field of teaching and learning, and the work that the same tutors make, who from the subjects of the research area can generate dislike, disinterest and lack of motivation in students by their participation in these training spaces (Benjumea and Sánchez, 2011).

Consequently, it is important that HEIs from the same administration begin to mediate processes that enable the creation of a true research culture, and not a half formative research, which might cause aversion or disinterest in students. In that sense, ICTs are currently a key tool in this process of formative research because many young people are involved with these technological scenarios that can promote interactivity, intercommunication and collaborative network from virtually, promoting time and space (Ramírez, 2011).

3. Conclusions

Formative research, as indicated by (Arakaki, 2009) is essential for the professional formation with critical, reflective and proactive thinking, since it stimulates the ability to ask and respond to environmental problems or situations that no have been resolved. Formative research is constituted as a pedagogical strategy by the teacher in the classroom or in student. This strategy stimulates and goes in depth the knowledge acquired in the training field of student.

The role of teachers in the processes of research training should be to guide, advice, and provide the basic abilities to encourage the student's investigative skills in his field of knowledge. In these formative research processes, the teacher must to be a strategist to encourage young to participate in the research stages and appropriates of these spaces, it also enable the consolidation of scientific culture and the relationship between the institution and students in spaces such as research hotbeds.

The hotbeds of research have become a meeting place for socializing, discussion, reasoning and collaborative work, which in most cases is mediated by teachers or institutional representative. Then, they are a teaching strategy that allows the strengthening of research as a mechanism to promote generational change in research groups or as it has been indicated, provide to professional training of student attitudes and skills of their field of knowledge, because today the ideal is to make research a transversal issue in the curricula offered by universities.

Finally, the importance of mediating formative research processes through virtually, since ICT currently occupies an important place in social processes. Virtualize many of the formative research process allows for example, greater process efficiency, autonomy and flexibility in the proposed activities, being important to monitor the maintenance of content and education quality, and making possible the reasoning, discussion and knowledge construction in a collectively way.

Abstract

Considering the long lasting phase of low economic growth in which the Italian economy has been trapped, the subject of innovative start-ups and how to support their development is a crucial one. The so-called "business incubators" are one of the possible solutions considered in the economic literature and are in fact implemented in several countries, in order to develop new businesses with strong innovative components. The research will focus on the development of "business incubators", namely the "incubator" "Sardegna Ricerche". A further aim of the study is to apply Everett Rogers' theory on the "diffusion of innovation" on the data collected by "Sardegna Ricerche".

Keywords: incubator; innovation; diffusion;

IETC 2014

1. Foreword

The diffusion of the technology is an articulate and complex subject. There are several social processes that influence the way in which it becomes part of the individuals' daily life. The everyday life is the fundamental context in which the relationship between technology and society can be analyzed in its various nuances, requiring a deep analytical skills, capable of embrace both the *micro* and *macro* dimension of the social experience.

If it's true that technology is spread in the social world thanks to economic processes that are controlled by market dynamics, then it is also true that the design, the diffusion, the inclusion in the people's lifestyle and the success (or the failure) of a given technology are subject to complex trends that refer to deep social and cultural frameworks.

Today as never before, we are realizing that innovation and the capability to overcome problems with non-traditional solutions are the most efficient tools to survive this critical phase the global economy is facing.

Innovation diffusion is a very large and multidisciplinary field of study. It varies from the study of new consumption goods to the analysis of new productive processes, from the new organizational structures to scientific and cultural novelties in their wider meaning.

According to Schumpeter (1942), an economy is capable to survive only if the entrepreneurs keep on innovating, thus contributing to the global competitiveness; in this way the processes of diffusion of tech-

* tola@uniss.it . Tel.: +39-079-213-001; fax: +39-079-213-002.
*E-mail address:*tola@uniss.it

nologic innovations (Rogers 1962[50]) can influence in a relevant way on the enterprises and on the whole economic system.

This is where the importance of business incubators comes from; an organization that speeds-up and systematizes the enterprise creation and start-up process, providing them with a large choice of integrated services i.e. physical space (offices, meeting rooms, labs etc), business support services and integration and networking possibilities (European Commission Enterprise Directorate General, Benchmarking of Business Incubators, Centre for strategy and evaluation services, February 2002).

In this field, business incubators are proposed by the economic literature as one of the solutions and are implemented in most advanced and emerging countries, although in different ways. In Italy this matter came back to the public attention thanks to the recent legislation passed by the government (Decree n. 179/2012 converted into Law n. 221 of 17 December 2012), which recognize to innovative start-up companies their important role for the economic development and the increase of employment, especially of young workers, and support the business incubators.

Within this study we will see how, on one side, the adoption and the diffusion of speficic innovation trajectories tend to become dominant with time, and, on the other side, how the scientific research, the institutions and the innovation supply tend to coagulate around the development of an entrepreneurial environment through business incubators.

The study, after examining the diffusion theory, will aim to study the different types of incubators active in Italy and their respective institutional goals, the services they offer to enterprises, their level of involvement in the different phases of the SME development. Furthermore, the study will carry out a specific analysis of the incubator's activities implemented by the Sardegna Ricerche Tech park for the development of new enterprises.

2. Theory of diffusion

The diffusion processes of technologic innovation can influence in a very strong way the organizations and the economic system.

Since 1940 the American researchers started studying the way in which the innovative ideas and practices were diffused within the agricultural communities.

One study on the diffusion of hybrid corn among Iowan farmers became a milestone of this kind of research. Since then, the foundations for innovation diffusion studies were laid and numerous studies from all around the world started to be published.

Sociologist Everett Rogers (1962), summed up those studies in a collection of generalizations that shaped the model of diffusion currently used worldwide in both industrialized and developing countries. He illustrated the process of diffusion through the familiar "bell-shaped" curve.

IETC 2014

[50] Rogers E.M.(1962), *Diffusion of Innovations*, (3rd ed. 1985)New York: Free Press;

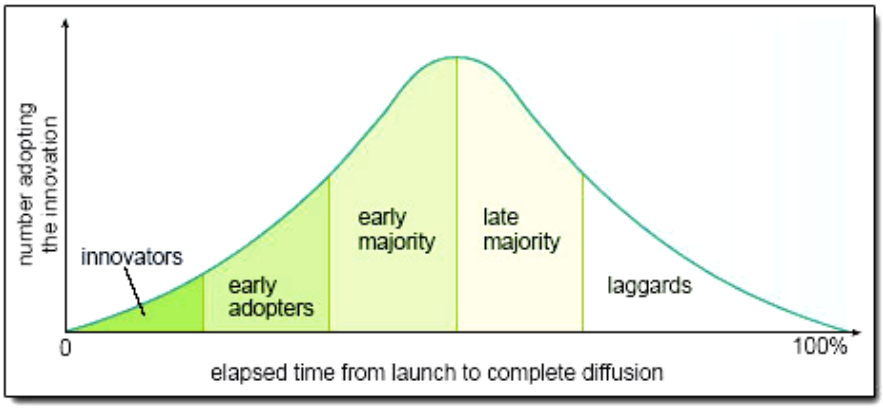

Fig. 1. Rogers Curve, theory of diffusion. Source: Rogers, Diffusion of Innovations, 1985

The curve is divided in five segments which represent five distinct groups of people: the first one is the group of *innovators*, highly educated and risk oriented people, control over funding sources, specific skills that enable them to understand and apply technical knowledge and exposed to several information sources; the second group will include the *early adopters*, with high levels of education and reputation in their communities, the capability to achieve social leadership and with successful experiences in their personal history; the third group is called the *early majority*, made by people that have strong interactions with their peers; they often occupy leadership positions and have the tendency to follow a deliberative process before adopting a new idea; the fourth group is the so-called *late majority*, a group that includes usually skeptical and traditionalist subjects with a low status. The components of this group are usually very careful and suffer the social "pressure" that the other group members put onto them; the *laggards* are the last group. Its made by usually isolated and suspicious subjects with none or little external social interaction (only neighbors and close relatives), a very slow decision making process and little resources.

Rogers (1983) states that the diffusion is the process by which an innovation is passed through time among the members of a social system through certain channels. In fact, following the theories of Tarde[51] and Ryan & Gross[52], he demonstrated empirically how the early adopters[53] and those that were part of the early majority were more introduced in the local communication mechanisms and had a higher capability to take over the role of opinion leader. Rogers pushed this demonstration further to identify the process of diffusion as a fundamentally communicative [54], where personal characteristics and tendencies come into play.

In Roger's vision, diffusion is essentially a communication process, heavily influenced by personal information and the media.

By reprising the theories of Lazarsfeld[55] (1963), Rogers observes how the personal influence is much more relevant than the one exerted by the media. The latter have, in fact, the power to inform, but their power to persuade is much more weaker than the one exerted by personal communication. However, the communication channels through which the innovation is transmitted cannot be separated the social system in which they are embedded.

When determining the level of diffusion both the prevailing social rules (for instance, the ones upheld in an organized system), and the presence of opinion leaders that influence the decisions are important.

[51] Tarde G., Parsons E.W.C. (1903) The laws of imitation, New York: Holt

[52] Ryan and Gross typology indicates empirical studies carried out during the forties by B, Ryan and N. Gross (1943) on the diffusion of hybrid seed corn in Iowa which confirmed Tarde's thesis. Ryan B., Gross N. (1943), The diffusion of hybrid seed corn in two Iowa communities, in *Rural Sociology*, 8(1)

[53] Early adopters are considered by the companies and the service providers as an essential resource for their product's fine tuning and their qualitative evaluation. The definition was used the first time by Everett M. Rogers in Diffusion of Innovations (1962)

[54] Communication is described as a linear process composed by six main elements: (1) a broadcaster, which intends to communicate, (2) a message, (3) a channel through which the message is conveyed (4) and a receiver. The impact generated on the receiver is called (5) effect or audience response, whether it's translated into an improved knowledge or a change in the behavior or in the decision-making skills or not. The effects is, finally, verified by the(6) feed-back

[55] Lazarsfeld P.F., Menzel H. (1963), Mass media and personal influence, in Schramm W., *The Science of Human Communications*, Basic Books, New York, 1963

The presence of "change agents" and "change aides" is also important. Those are subjects that take on the burden of pushing forward the innovation within the social system by carrying out different functions as supporting the need for change, favoring the circulation of information, identifying the problems that may be solved through innovation and supporting a stabilization of the adoption process.

Rogers' thesis had and still have a predominant role in the field of innovation diffusion.

The diffusion model is a product of the western industrialized world, it reflects the social, cultural, economic and communicational conditions of the early 20th century, where agriculture is the object of the studies for the implementation of economic policies. Farmers had a modest level of education and their chances to access information on new agricultural technologies were limited. Farming technology originated by empirical experiments on the field and by science was relatively simple and, in most cases, did not require high capitals for investments. Finally, the large majority of farmers shared the same mixed models of production.

In present days the situation is different. Firstly the agricultural production is not the only sector where it's required to proceed with innovation diffusion; research, as well as the life conditions and social interactions, has changed.

The Universities and other research institution produce, nowadays an increasingly wider and more sophisticated knowledge. The technology that arises from the research and experimental activities becomes every day more complex and requires higher investments. Production, in general, is becoming more and more specialized. Shared production schemes are rarely found; on the contrary, it varies noticeably from company to company.

If the 1960s model of diffusion was developed as a function of a consultancy service that found its reason in the technology transfer to farmers. Nowadays, such function can be described in a wider and punctual way, embracing all sector of economic activity.

The different social, economic, historic, cultural and territorial dimensions have changed with time and so did the models of diffusion of technologic innovation for the development of the relevant sectors.

In the beginning the agricultural production was the only sector in which the innovation diffusion was required. At a later stage, the change in the needs of society gave to the Universities and other institution the power to increasingly influence on the technology diffusion processes within the SMEs, giving birth to customized research and experimental activities, designed on the single company's requirements.

3. From the tech park to the business incubators

In order to diffuse innovation, the first Scientific Technologic Park (STP) "Stanford Research Park" is created in 1951 in California. In the park, for the first time, university professors, researchers and alumni could translate their research results into industrial products. It's a spontaneous process stimulated by the research carried out in the universities. The Stanford Research Park initial objective was not to create new businesses but to research on innovation.

Today, the goals that push the STP promoters towards its realization are found in this model's recognized capability to optimize the strategic assets' organization in order to consolidate the development of an advanced economy area, restart industrial areas struck by crisis or stimulate lagging areas.

In this way, STP that aim to offer services for innovation and technology transfer to SMEs are born in certain developing areas.

The incubators differ from STPs because they are created to support companies in their start-up phase. Most of the research centers and STPs do not offer to SMEs technical assistance services, that are the trademark of a business incubator programme. Nevertheless several research centers and STPs host incubators.

IETC 2014

Companies introduced in the incubators can be newly created companies or pre-existing companies in a transformation phase. The goal is to promote entrepreneurship and economic development in disadvantaged areas of the country. In particular, the "Società per la Promozione e Sviluppo Imprenditoriale[56] (SPI)", a state-owned company has played a fundamental role in the creation of the first business incubators in the shape of the Business and Innovation Center (BIC), following the recommendations of the European Commission (1984) and focused primarily on the manufacturing and hi-tech sectors.

From the end of the eighties STPs started to promote incubation programmes[57] in order to support the development and the creation of new innovative enterprises. This kind of incubators was created and it's currently funded by public resources.

In the late nineties university incubators, offering similar services were developed, although with a stronger aim to transfer technology from the academic world to the business environment.

Table 1.Business incubator activities in Europe. Source: Authors' Elaboration, 2014

1970s	**1980s**	**1990s**	**From 2000 until now**
Transition phase that marked the evolution from a traditional industrial economy to an economy increasingly based on ICT.	Incubators are considered as an instrument of economic policy to withstand the macroeconomic changes and to stimulate entrepreneurship and the creation of jobs after the recession phase. This is possibly the most dynamic and relevant phase of the evolution of incubators with an increase not only in the number of initiatives but also in the amount of money invested by a variety of agents as governments, academic institutions and businesses	The development of the biomedical sector and ICT have stimulated the growth of the so-called "sector incubators", focused on the emerging technologies in these fields. A quick diffusion of scientific parks, that gave a relevant impulse towards the creation of new business incubators, is noted during these years.	In recent times a quick increase years of a new type of privately-owned incubator , was recorded. It can be considered as an hybrid between a sector incubator and a venture capital fund.

A new kind of incubator, developed in the first years of 2000 is privately-owned. It acts as an incubator but adds the role of the venture capital fund; these incubators are mostly specialized in web related activities.

In the early phases the aim of the incubators was to create a fertile micro-environment for new companies by offering physical spaces and supporting services capable to guide the enterprise through the start-up phase. Subsequently the focus of these incubators was moved towards intangible services with higher value added, such as tutoring, mentoring, and networking activites or fundraising initiatives, in order to promote the economic development and the creation of new jobs through talent integration, diffusion of technology, know-how and capital within a network that supports the new companies' development.

These services, the shared costs and the scale economies increase the survival chances of the companies hosted in the incubator.

Through the years some methodologies that characterize the different stages of incubation have been devised. Three different categories of incubators can be identified: there are "generic" incubators that host any type of enterprise, "specialized" that discriminate according to the sector and "high-tech" if the hosted companies belong only to this family of activities.

[56] SPI - Società per la Promozione e Sviluppo Imprenditoriale S.p.A (Society for the promotion and entrepreneurial development) was an Italian publicly owned company that was created to implement programmes and policies of promotion and industrial development, and in particular the creation and internationalization of SMEs. It was founded on April 20th, 1954 with the name of *Isap - Istituto per lo sviluppo delle attività produttive S.p.A (*Institute for the productive activities development) with the aim to develop the southern Italian economy. In May 1970 becomes *Spi - Promozione e sviluppo industriale S.p.A* and in 2000 is merged into Sviluppo Italia.

IETC 2014

New enterprises can be hosted in the incubator's structures for a time span of two to five years. Within the structure several common services are available (hardware, training, secretaries) in exchange for a rent fee.

The incubator makes possible the realization of scale economies, a tight cooperation among the enterprise workgroup and the interaction with the other hosted entrepreneurs.

When the businesses have reached a proper level of development they leave the incubator and they access more appropriate premises capable to assist the development of the production activities. This environment can be provided by the tech park.

Table 2. Business incubator activities in Italy. Source: Authors' Elaboration, 2014

1980s	**1990s**	**From 2000 until now**
The Technologic and Scientific Parks (STP) started to implement incubators in order to support the start-up phase of innovative enterprises.	The university incubators start to spread: those entities offer similar services as the ones provided by STPs and BICs but they are oriented towards technology and knowledge transfer from the academic world	Private incubator are born. They are specialized in the new economy and web based enterprises. They also take part in venture capital operations.
Since the eighties the development of the different kinds of incubators is associated to a certain evolution of their functioning models. While the initial scope of the incubators was to provide logistic and physical assistance to the start-up companies, they increasingly evolved towards intangible and high value –added services as tutoring, mentoring e networking and fundraising.		

The Bank of Italy conducted a study in 2012 on the Italian business incubators. Fifty-three active incubators were found, the elder established in 1984; over half of the Italian incubators were created between 2003 and 2009.

The first notable element of the research is a certain geographical fragmentation of the incubators: 10 are established in the north west of the country, 18 in the north east, 17 in central Italy and 13 in southern and insular Italy.

Table 3. Incubators that took part in the survey, by region (absolute value and percentages). Source: Authors' elaboration, 2014

Region	**Incubators**	**Privately owned (quota %)**	**Public (quota %)**
Piedmont	3	0	100
Lombardy	7	71	29
Trentino	2	0	100
Veneto	4	50	50
Friuli Venezia Giulia	3	33	67
Emilia Romagna	9	50	50
Tuscany	10	30	70
Umbria	1	0	100
Marche	2	50	50
Latium	4	75	25
Abruzzo	3	0	100
Molise	1	0	100
Campania	3	50	50
Apulia	2	0	100
Sicily	2	0	100

IETC 2014

Sardinia	2	0	100
Italia	**58**	**36**	**64**

Over two thirds of the incubators are publicly owned. This puts Italy within the European average. Over three quarters of the incubators are not for profit.

Table 4. Geographic distribution of private and public incubators in Italy (percentage values) Source: Authors' elaboration, 2014

Area	**Public**	**Private**	**Total**
North West	50	50	100
North East	59	41	100
Center	59	41	100
South and Islands	91	9	100
Italy	**64**	**36**	**100**

The no profit condition coincides almost constantly with the public incubators while the private incubators are equally split between profit and no profit institutions..

Table 4. Geographic distribution of profit and not-for-profit incubators in Italy (percentage values) Source: Authors' elaboration, 2014

Area	**No Profit**	**Profit**	**Totale**
North West	71	29	100
North East	67	33	100
Center	73	27	100
South and Islands	100	0	100
Italy	**74**	**26**	**100**

The Italian incubators are mostly public in the south, mainly private in the north west. The north eastern incubators are mostly oriented to profit while center based incubators are mostly not for profit.

Almost three quarters of the Italian incubators are linked with universities or research centers, the rest have no relationship whatsoever with such entities; from this it can be inferred that the incubator's activity can be carried out with no direct links with the academic world.

It is interesting to note how the absence of links with the universities is mostly found in the profit-oriented incubators.

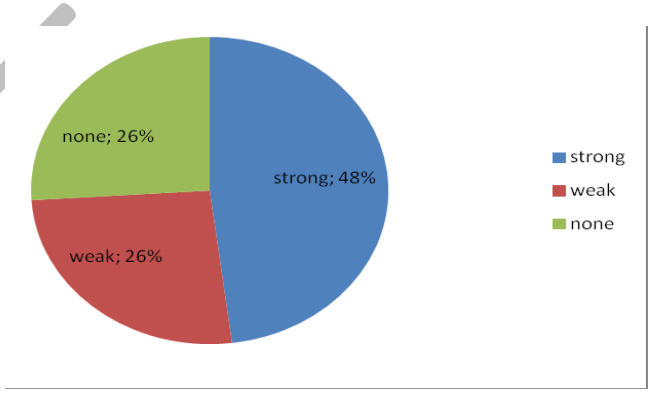

Fig. 2. Incubators and intensity of their relationship with universities and research institutes. Source: authors' elaboration, 2014

The incubators analyzed in this research have an average of 16 people in staff, mostly employed as a direct support to the hosted enterprises. Only a few of them are actually in staff to the incubator itself.

IETC 2014

Moreover, the private and the profit-oriented incubators tend to have a slightly higher number of personnel in staff. The employees of smaller or average size incubators are usually assigned to the different tasks in an homogeneous way.

The services offered to companies are mostly of logistic nature, while the other services are less frequent. On a territorial level the north western incubators tend to offer more high added-value services than their southern homologues, in which the logistic services are prevalent.

The selection of the startup companies to include in the incubator is usually a continuous process: 82,5% of the incubators state that they tend to select the hosted companies on the basis of their business idea as soon as they are submitted to them.

The sectors more frequently hosted are the services/professional activities, internet and energy. The companies that have started their incubation period are usually active in sectors that do not require a high level of startup investment (i.e. services and internet based companies) or those sectors where a lean business plan with low risk can be implemented in the startup phase. Such companies have normally limited growth perspectives because they usually provide a relatively simplified service mix. This fact showcases the general dynamics of creation of technologic companies in Italy. These companies suffer some basic weaknesses of the economic and financial structure of Italy, as the ones related to the scarcity of venture capital funds and low average innovation propension of the businesses.

The research also shows how the services sector, the computer science and the bio sciences sectors are mostly represented in the public incubators while internet services, nanotechnologies and aerospace are mostly hosted by private incubators. The profit oriented incubators tend to host more enterprises from the internet, ICT, electronics, services and aerospace sectors, while computer science, nanotechnologies and the bio sciences sectors are more often found in the not for profit incubators.

The Italian incubators are mostly involved in the preliminary phase of the business idea. After the company makes its debut on the market their level of involvement diminishes. This is usually confirmed by the same companies in the field enquiry, from which we also understand that the most frequently used services are the logistic ones, coherently with the incubators' offer. The field enquiry, while showing some limits regarding the size and representativeness of the population, indicates also that the role of the incubators is deemed useful but not fundamental for the success of the startup company by most of the enterprises.

The entrepreneurial team of the incubated companies is usually made by engineers and experts of scientific disciplines, while business management and legal competences are less frequently found; this could indicate possible weaknesses in the management skills of the startup entrepreneurs. At the same time, it appears thatlittle attention is given to the management aspects of the enterprise.

Most obstacles to the incubated businesses growth can be found in the overall difficulty to "create business" in Italy, because of the high taxation and the bureaucracy. The financial restrictions are also relevant for a large (but not the majority) of the companies. This shows that these limitation do not appear to be the higher obstacle for the creation and development of new companies in Italy; the part played by specialized intermediaries (business angel, private equity and others) regarding the acquisition of venture capital is relatively small but not irrelevant.

IECT 2014

4. Sardegna Ricerche

The technology and scientific park of Sardinia was established in 2003 and it comprises a wide range of advanced infrastructures, innovation and development services and services for the industrialization of research. It is managed by Sardegna Ricerche, a regional agency, and has two branches (Pula in the south of the island, and Alghero, in the north). It hosts over 60 companies and it's one of the largest STPs in Italy, the first one for the number of incubated biotech companies (Assobiotec- Ernst & Young report "Biotechnologies in Italy 2010").

The tech park is specialized in: ICT, biotechnology and bio computer science, renewable energies. It also has technology platforms. It promotes the regional economic development through technologic innovation and knowledge. Its activities are mostly dedicated to enterprise, research centers and other entities that wish to introduce research and experimental activities in their fields. In particular, it's open to entrepreneurs and researcher that wish to create new enterprise or to carry out innovative projects starting from their research results. In order to do so, it provides multifunctional spaces, labs, reception and logistic services and services for technologic development. Within the park there are two operational incubators. The bio-incubator of Pula (province of Cagliari) dedicated to initiatives in the field of life science and the incubator based in Alghero (province of Sassari) dedicated to food technology and biotechnologies for health and environment.

Both incubators aim to support new technologies, software and industrial applications by supporting newly established companies and young entrepreneurs and helping to translate into economic value the results of research and knowledge.

The incubators generate a dynamic system where the good ideas become business, thus overcoming the traditional deficit of the entrepreneurial system (gap between research and SMEs, scarcity of innovation services, low technology transfer, difficulties in fundraising in the startup phase, inadequateness of the traditional finance system to answer quickly and properly to new business ideas).

Since 2004 several initiatives were implemented which helped, through different start up development programmes, to increase the number of Sardinian-based innovative businesses.

Table 5. Innovative Start up programmes (2005-2011) source: Authors' elaboration from Sardegna Ricerche data, 2014

Sector	Period	Number of Companies	Development plan costs	Public contribution	Private contribution
Biofarm 2004/2005: start-up and HR for bio computing and personalized medicine– APQ	2004/2005	11	475.000,00	475.000,00	0
Start up programme: Digital content	2007	1	88.900,00	80.000,00	8.900,00
Start up programme: Medical devices	2007	2	133.000,00	119.700,00	13.300,00
Research spin off companies creation – Regional Operational Plan(EU structural funds) 16 Development plans and 3 R&D projects)	2007/2008	16	2.276.734,00	1.886.435,00	390.299,00
New businesses for young graduates – Regional Operational Plan	2007/2008	16	1.603.820,00	1.443.438,00	160.382,00
Spin off companies creation POLARIS	2007	2	200.000,00	180.000,00	20.000,00
Start Up Incentive POLARIS	2010	3	449.000,00	338.000,00	111.000,00
Total		**49**	**4.777.454,00**	**4.184.573,00**	**592.881,00**

The final goal of these programmes is to support the creation of new enterprises and to make possible their success on the markets.

Out of the 49 companies created thanks to the initiatives of Sardegna Ricerche, some have achieved very important results and acknowledgements. Bioecopest srl, a Start up developed in the Alghero incubator won the National Prize for innovation in 2009 and the regional "start Cup". Prossima Isola srl, a start up company established thanks to the 2008 innovative businesses programme was a finalist in the 2010 edition of the Mind the Bridge competition; Karalit srl and Elianto srl, two Spin-off companies of the CRS4 incubator (Pula) were funded by the innovative start up programme 2007/2008, got their first round of funding on the market; Xorovo srl another spin-off company of Cagliari University was acquired in 2011 by the international group Applix.

Based on our research, if we apply the Rogers Curve to these companies, we can state that they can be included in the early majority group.

IECT 2014

5. Conclusions

The Everett Rogers theory implies that some individuals are more open to innovation and adaptation towards new technologies than others. This has some consequences that impact on the chances of success of the new scientific innovations.

If we observe the theory of diffusion bell curve (see paragraph 2), we will note that, a part of the classical product life cycle, there is also a segmentation of the curve. This segments represents the different types of subjects widely described earlier: innovators, early adopters, early majority, late majority, laggards.

There's nothing particularly interesting until we understand that there is a great gap to be filled in order to shift from the early adopters sector to the early majority. The gap is an ideological and social one, and it discriminates the different approaches towards innovation adopted by a very small and a very large market share, the latter being very relevant in terms of size and capable to determine the success of a new product.

Many companies have introduced new and performing technologies on the market without being capable to win over the market. Furthermore, sometimes it has occurred that the same technology was reprised later in time by other companies that managed to achieve good results with a different approach.

It is a widespread opinion that the time to market is one of the most important drivers of success. Nevertheless, the first mover is not automatically sure to be successful. Unfortunately, it happens quite often that the innovator isn't able to enjoy the benefits of his ideas. Sometimes he has the function of a mere tester while the market approach problems will be analyzed and solved by other companies that will take the new technology to success.

Some other times the failure to introduce a new technology is linked to an immature market. This is why we analyzed the diffusion of innovation and technologies by focusing on the role of the incubators and STPs.

The diffusion of innovation is crucial for economic development and competitiveness. STPs, Incubators and private-public partnerships are the most important "actors of innovation". The channels through which the innovative processes and technologies are conveyed are multiple and have different characteristics according to the territorial needs, traditions and situation.

The diffusion model of the sixties was developed, as we explained, as a function of a consultancy service that identified itself as an agent of technology transfer to farmers, while nowadays this function can be extended to all the economic sectors.

The diffusion of innovation is not anymore a matter for farmers-entrepreneurs, as this function is now embraced by tech parks and business incubators.

The positive conclusion of a business incubator programme increase noticeably the chances that the start up company stays in business in the long run of the economic scenario, placint itself in the most profitable segment of the Rogers Curve: the early majority.

ABSTRACT

In recent years, many schools in Malaysia attach importance to teachers' professional learning community (PLC) to improve both teachers' development and students' achievement. This research has been designed to investigate the implementation of teachers' professional learning communities in primary schools and secondary schools in Johor Bahru, Malaysia. A questionnaire was administered to 224 participants in six schools. The study investigated how gender and school type influenced teachers' perceptions of the five dimensions of professional learning communities. This study found that gender and type of school were not significant in influencing teachers' perceptions of professional learning communities. The PLCs were found to be effective in enhancing teaching and collaboration.

Keywords: Professional Learning Community, Teachers, Primary and Secondary Schools, Success Factors, Implementation, Classroom

IETC 2014

Background of the Study

In recent years, the topic of professional learning community has become important and significant in educational research. Although previous researches related to this topic have achieved great progress, the continuous study is encouraged to contribute more information in this field.

Professional learning communities emphasize the process of learning together with the questions of what to learn, how to learn and where to learn for improving schools. Huffman and Jacobson (2003) mentioned that professional learning community is a way for school members to devise solutions to help students progress. According to DuFour (2004), educators should have clear dialectical awareness of professional learning communities to build up the model that can arouse creativity of professionals in the learning community which is significant for educational development.

Huffman and Jacobson (2003) deemed that professional learning community plays a key role in professional development and is an important strategy for instituting change in education. This is the big problem, and all the educators should face it. They should understand this is the requirement of school reform and the goals are to develop teaching but most important to help achieve great progress in the whole school and students' learning.

In the professional learning community, as the participants, teachers have positive impacts on student learning. Vescio, Ross, and Adams (2008) in their study indicated that when teachers belonged to the professional learning community, their students' would achieve better learning outcomes. In conclusion, the teacher members of professional learning communities have close relationship with students' learning improvement. As mentioned by Richardson (2003), two main elements influence teachers' learning and teaching: their conceptions, and past experiences (Opfer & Pedder, 2011). Many researchers (DuFour, 2002; Senge, 1997) considered that Professional Learning Community is the foundation for teachers to pay attention to student learning together as the main part of the educational process. Newmann (1994) posited that teachers who worked in PLCs promoted their students' learning. Professional learning communities make teachers improve in collecting ideas and perceptions of teaching and learning which make students attain sufficient clear information; these continual clear information develop school's quality and capacity to shape high competitiveness to win students' interests; by sharing visions and ideas teachers are guided to solve the problems of specialized subject knowledge and physical changes in the process of teaching which are useful for helping students successfully overcome difficulties in their learning (Scribner, Hager, & Warne, 2002). Besides that, technology also plays a key role in the success of professional learning communities.

The PLC concept is relatively new, having grown out of the work in the mid-1990s to reculture schools. Since then, schools have shown much enthusiasm for the potential of PLCs for increasing teacher professional knowledge and enhancing student learning. Although research is just starting to emerge, much has been written about PLCs. In education circles, the term learning community has become commonplace. It is being used to mean any number of things, such as extending classroom practice into the community; bringing community personnel into the school to enhance the curriculum and learning tasks for students; or engaging students, teachers, and administrators simultaneously in learning -- to suggest just a few.

Professional learning communities pay attention to teachers' perceptions of themselves in the roles of both teachers and learners. As learners, based on teachers' conceptions of sharing understanding with students, the main common ways are interviews and observations. Through these ways, teachers build up the conception of student learning, academic success and social development. Teachers understand they need sustained learning of both teaching skills and their students' background of family and living environment. These can help teachers learn about students' needs including the areas of academic, social development and emotion. In addition, teachers also need improve their skills of dealing with problems at work. Teachers also should learn how to share the moral commitment with their students in the deep level. The appearance is shown by students to have motivations to teachers' behaviors to meet the requirements of students to express strength and resilience. In the professional learning community, teachers build up the close relationship for sharing knowledge, discussing their universal goals and learning teaching skills from each other through others' classes.

As learners, teachers have their own perceptions of learning which not only support the individual's learning but the whole organizational learning. Teachers should understand how to maintain the balance between their personal learning aims and organizational aims. If one teacher does not care about an individual's demands, he or she will do not understand the academic and professional needs of the college or school. In the context of school improvement, Professional Learning Communities (PLCs) shift the focus of school reform from restructuring to reculturing. The PLC concept is misused or implied to describe a committee or any weekly meeting in which the participants undertake data-based decision making often. However, a PLC is much more than that. It is an ongoing process used to establish a school-wide culture

based on a fundamental belief in building teacher leadership in school improvement efforts. Through participation in PLCs, teachers enhance their leadership capacity as they work as members of ongoing, high-performing, collaborative teams that focus on improving student learning.

Background of the Problem

As we know, the independence of Malaysia brought about transformation in Malaysian education. The old system and model of education changed to meet the requirements of national issues and economic development and Malaysia attained great progress in these years by continued attention and educational reform (Phaik-Lah, 1997).

With the sustained improvements of education in Malaysia, more and more schools are paying attention to the new topic of professional learning community in recent years. Professional learning communities have already become the subject of international studies on academic issues.

The PLCs emphasize the role of teachers in professional learning community of school; professional learning communities can promote the relationships between teachers' professional learning and teachers' immediate demands. More important, teacher professional learning communities have the direct positive influence on student achievements. The teacher professional learning communities support developing teachers' teaching and school performance improvement.

Teachers attain advantages by learning from each other and learning together. These actions of teachers help schools improve to become learning organizations. The professional learning community make teachers get together to collect their conceptions, ideas, perceptions, and suggestions in every area of school life that can reflect most of teachers' interests, demands, and enthusiasms in different levels.

With the depth of exploring the professional learning community in school, teacher's role is in new perceptions. As the entity of professional learning community, schools should make teachers have the responsibilities to learn the community's visions and carry out the actions in their classrooms (Cormier & Olivier, 2009; DuFour, 2004).

DuFour and Eaker (1998) emphasized teachers' basic responsibilities of changing their roles in professional learning communities: considering learning more important than teaching; paying more attention to student engagement; using instructions to guide the results; applying feedback to assess students' performance; doing the actions which help form the professional learning community. Teachers should have clear awareness of changing their roles from instructors to agents for helping students to learn.

Statement of the Problem

IETC 2014

This research has being designed and applied to investigate and measure the situation and implementation of teachers' professional learning communities in primary schools and secondary schools in Johor Bahru, Malaysia. In the whole process of professional learning community of school, the main participants are teachers.

Objectives of the Study

The objectives of this research are:

1. To determine whether professional learning communities has been implemented in primary and secondary schools in Johor Bahru?
2. To determine the differences from teachers 'perceptions based on their gender and type of schools in Johor Bahru.
3. To determine the most and least of professional learning communities facets the implantation based on teachers' perceptions in primary and secondary schools in Johor Bahru.
4. To determine what are the factors that can maintain the stability of teachers' professional learning communities in primary and secondary schools in Johor Bahru.
5. To determine what are the important factors have the negative influences on professional learning communities in primary and secondary schools in Johor Bahru.

Significance of the Study

The factors which facilitate and hinder the professional learning communities development in Malaysia will be investigated. The results of this study will contribute to those wishing to establish professional learning communities, namely the teachers and school leaders.

Research Design

This survey has close relations with some important studies that have significant guiding meanings in the area of professional learning community. DuFour and Eaker argued that the PLC model indicated the general perceptive system on school changes but did not describe the stylized rules (Stuewe, 2012). The PLC model required that teachers and school leaders begin to search for new ways to solve the key problems in teaching and learning (Stuewe, 2012).

Stuewe (2012) completed the deductive research of professional learning community which has the influence on students 'achievements in middle school mathematics. Stuewe (2012) emphasized students' achievements or results which are the criterion to test the professional learning community's positive influences in the middle school that applied the PLC department in one year.

The location of this study is within primary schools and secondary schools in Johor Bahru, Malaysia. The towns selected in Johor Bahru are Skudai and Kulai. Those towns were selected due to their location

IETC 2014

which is near to Singapore, the educational philosophy has a positive impact and they are in the progress of developing. Therefore, there are numerous schools in the above named cities with well-established teachers.

Generally, this research has utilized quantitative research strategy. Through the utilization of this strategy, research questions and objectives would be better understood. The technique used to collect data was through distribution of the questionnaires. The questionnaires have been sent to teachers of primary schools and secondary schools.

INSTRUMENTS

Some 224 questionnaires have been sent out to all the teachers in Johor Bahru of Malaysia. In order to collect the data, a questionnaire was developed, which consisted of 42 items, and had been designed to seek information and opinions about the perception of the teachers in Johor, Malaysia regarding professional learning community. The questionnaire was distributed to the teachers and collected from them after 30 days. The responses were analyzed and interpreted on percentage basis. Data were collected from the teachers and administrators of primary and secondary schools of Johor, which was made up of a total 224 respondents with 93 male and 131 female respondents.

The questionnaire is divided into two major sections as shown in the next sub section. This questionnaire assesses teachers' perceptions about the principal, staff, and stakeholders based on the five dimensions of a professional learning community (PLC) and related attributes. The questionnaire contains a number of statements about practices that occur in some schools. Respondents read each statement and then use the scale to select the scale point that best reflects their personal degree of agreement with the statement.

Section A of the questionnaire elicited demographic information of the respondent such as: name, age, sex, position in the school, working experiences, school location, and others.

Section B determined the factors which facilitate the professional learning communities function in Malaysia. In section B, problems relating to the application of determining the factors which facilitate the professional learning communities function in Malaysia have been listed and respondents were required to rate them . Besides that, the importance of determining the factors which facilitate the professional learning communities function also have been asked in this part.

Research Interview

In this research, the research instrument that is suitable to be used to collect the primary data is questionnaire and interview.

Firstly, a discussion with the supervisor has been conducted to ensure the questionnaire is focused on the research objective. During the design state of questionnaire, some open ended questions were set up to allow input of respondents' answer which differs from predefined answers.

IETC2014

Secondly, the appropriate qualitative interview was conducted. A total of 20 teachers who registered in the schools including different age, different sex, different race, different education background, different working experience and different major.

The quantitative research questions, as well as the corresponding data analysis approaches are listed in the following tables.

FINDINGS

Hypothesis: Ho 1

There is no significant difference in teachers' perception regarding Professional learning community on the basis of gender.

Table 1: Group statistics

Gender	N	Mean	Std. Deviation
Male	93	3.0077	.37969
Female	131	2.9291	.35924

Table 2: Independent sample *t*- test

		Levene's test for equality of variance		T-test for equality of means	
		F	Sig.	df	Sig. (2-tailed)
PLC assessment	Equal variances assumed	.958	.329	222	.117
	Equal variances not assumed			191.389	.120

A *t*-test was used to assess the perception of teachers about Professional Learning Community based on gender. The participants in this study comprised of 93 male and 131 female. The group statistics reveal that the magnitude of the difference between two mean and standard deviation is minimum (Table 1).

In Table 2 independent sample test, according to Levene's test for equality of variances the significant value is .329 which is greater than .05. Since we know that a value greater than .05 means that the variability between the two conditions is about the same. It means that the variability in two conditions (male or female) is not significantly different. In the independent sample test result the significance value also refer that the focal row for the decision making is the top row. From the top row it is also evident that the sig (2 tailed) value, which is also called *p* value, is .117. Hence the *p* value is greater than .05 and we can conclude that there is no significant difference between teachers' perception based on gender regarding professional learning community assessment.

Hypothesis: Ho 2

IETC 2014

There is no significant difference between teachers' perception toward PLC on the basis of types of schools.

Table 3: Group statistics

Type of school	N	Mean	Std. Deviation
Primary schools	122	3.0265	.36276
Secondary schools	102	2.8842	.36326

Table 4: Independent sample *t*-test

		Levene's test for equality of variance		*t*-test for equality of means	
		F	Sig.	df	Sig. (2-tailed)
PLC assessment	Equal variances assumed	.029	.866	222	.004
	Equal variances not assumed			214.922	.004

The number of participants from the primary and secondary school is 122 and 102 respectively. The mean for primary and secondary school is 3.03 and 2.89 (after rounding) respectively. However the standard deviation is almost same in both the cases (Table 3).

In Table 4, from the Levene's test for equality of variance it is revealed that the Sig. value is greater than .05. The *p* value (0.004) is less than .05 reflecting the existence of a significant difference in teachers' perception regarding professional learning community assessment on the basis of type of school. It can be concluded that teachers' perception regarding professional learning community assessment varies according to the type of school.

Hypothesis: Ho 3

There is no significant difference between gender and teachers perception of PLC towards the aspect of supportive and shared leadership; shared values and vision; collective learning and application; shared personal practice and supportive conditions. The independent sample test was used to determine the teachers' Perception by gender towards five dimensions of PLC. The findings are displayed in Table 5.

Table 5: Teacher perceptions of the Five Dimensions of PLC by gender

Aspect of perception	*F*	Sig.	df	Sig. (2-tailed)
supportive and shared leadership	.952	.330	222	.055
shared values and vision	3.975	.047	222	.182
collective learning and application	.107	.744	222	.067
shared personal practice	.328	.567	222	.509
supportive conditions	.284	.594	222	.376

Table 5 indicates the result of teachers' perception regarding five dimensions of PLC based on gender. Results show that there is no significant difference between the teachers' gender towards supportive and shared leadership dimension (*F* = .952; Sig. = .330; df = 222; sig (2-tailed) = .055). There is also no significant difference between the teacher's gender towards dimension of shared value and vision (*F* = 3.975; Sig. = .047; df = 222; sig (2-tailed) = .182). Outcomes also indicate that there is no significant difference between the teachers' gender towards collective learning and application (F = .107; Sig. = .744; df = 222; sig (2-tailed) = .067). Likewise the result also reveals that there is no significant difference between the

IETC 2014

teachers' gender towards shared personal practice dimension (*F* =.328; Sig. = .567; df = 222; sig (2-tailed) = .509). The result also demonstrates that there is no significant difference between the teachers' gender towards dimension of supportive conditions (*F*=.284; Sig. = .594; df = 222; sig (2-tailed) = .376). These findings show that there is no significant difference between teachers' gender towards the five dimensions of PLC.

Hypothesis: Ho 4

There is no significant difference between types of school and teachers' perception of PLC towards the aspect of supportive and shared leadership; shared values and vision; collective learning and application; shared personal practice and supportive conditions. The results of independent sample *t*-test are illustrated in Table 6:

Table 6: The independent sample test was used to determine the teachers'Perception by types of schools towards five dimensions of PLC

Aspect of perception	*F*	Sig.	df	Sig. (2-tailed)
supportive and shared leadership	1.780	.183	222	.002
shared values and vision	.600	.439	222	.033
collective learning and application	1.526	.218	222	.007
shared personal practice	.190	.664	222	.112
supportive conditions	.127	.722	222	.010

Table 6 indicates the result of teachers' perception regarding five dimensions of PLC based on types of schools (primary and secondary schools). Result shows that there is significant difference in teachers' perception based on type of school towards supportive and shared leadership dimension (*F* = 1.780; Sig. = .183; df = 222; sig (2-tailed) = .002). There is also significant difference in teachers' perception based on type of school towards dimension of shared value and vision (*F* =.600; Sig.=.439; df = 222; sig (2-tailed) = .033). Outcomes also indicate that there is also significant difference in teachers' perception based on type of school towards collective learning and application (*F* = 1.526; Sig.=.218; df = 222; sig (2-tailed) = .007). Likewise the results also reveal there is no significant difference in teachers' perception based on type of school towards shared personal practice dimension (*F* = .190; Sig. = .664; df = 222; sig (2-tailed) = .112). The results also demonstrate that there is a significant difference in teachers' perception based on types of school towards dimension of supportive conditions (*F* =.127; Sig. = .722; df = 222; sig (2-tailed) = .010). These findings show that there is significant difference in teachers' perception based on types of school towards the dimensions of supportive and shared leadership, shared values and vision, collective learning and application, and supportive conditions. Only one exception is that there is no significant difference in teachers' perception based on type of school for the dimension of shared personal practice.

DISCUSSION AND CONCLUSION

This research investigated teachers' perception towards the five dimensions of professional learning community namely: supportive and shared leadership, shared value and vision, collective learning and application, shared personal practice and supportive conditions. This study also explores the challenges

IECT 2014

and complexities teachers face in developing a PLC. The research also tends to report the benefits teachers experienced and anticipated they would experience in such a learning community.

A survey method was utilized. The study was carried out using questionnaire administered to randomly selected teachers of primary and secondary schools. Some 350 questionnaires had been distributed, but 224 questionnaires were returned.

The data were analyzed using the Statistical Package for the Social Sciences (SPSS) version 16.0. The reliability test on the items had shown a Cronbach's alpha value of .949. In order to determine the means of teachers' perception regarding five dimensions of PLC descriptive analysis was used. To determine teachers' perception based on gender and types of schools, independent sample *t*-test was used.

The researcher analyzed the collaborative behaviors provided by the data in relation to the collaborative behaviors identified in the PLC.

- Supportive and shared leadership: The supportive and shared leadership dimension addresses information regarding sharing and decision making, authority and responsibility, and commitment and accountability of a PLC. The teachers had continuous accessibility to key information of the school. Respondents confirmed that teachers faced no obstacle in accessing information. Some participants in the survey perceived teacher involvement and commitment to student learning as problematic. Multiple survey participants indicated strong disagreement with only one statement.
- Shared values and vision: The collected data indicated the presence of a collaboratively developed vision and shared values that support teaching and learning behavior norms. The respondents' answers to the survey do reflect minimally the perception that pressure to perform on standardized tests negatively influences the focus on student learning. The data collected supports the identified characteristics of this dimension in the PLC at implementing or sustaining phases.
- Collective learning and application: The dimension of collective learning and application reflects collaboration, planning and problem solving as well as knowledge, skills and strategies. The research reveals that the PLC team used collaboration to solve problems, demonstrating their focus on the vision during this process. The collected data supported the identified characteristics of this dimension in the PLC at implementing or sustaining phases.
- Shared personal practice: The shared personal practice dimension addresses observation, review and feedback, sharing outcomes of practice, and mentoring and coaching. The respondents shared data describing a commitment to change and willingness to share. The schools demand reflective practice and focuses on team improvement rather than individual blame. The survey data identifies teachers' perception of their PLC's to be least aligned with the PLC in this dimension.
- Supportive conditions: The supportive conditions (relationship) dimension reflects trust and respect, behavioral norms, and caring school relationships. The supportive conditions (structures) address resources and systems in place to monitor and adjust practices for improved student learning. The data reveal the introduction of norms or standards focused on the vision and accountability measures to ensure their use. Process implementation ensures opportunities for developing trust and skills leading to empowerment. Developing collaborative skills largely depends on team trust.

DISCUSSION

IECT2014

PLCs develop over time. The primary and secondary schools recognized this fact and focused on building a collective capacity of collaboration through continuous skill development process. The researcher found the interdependency of processes, trust and accountability and teacher empowerment as influential factors for developing collaboration in the PLC. The processes helps teachers to develop their skills; teachers also contribute to improve processes as they systematically learned to collaborate effectively for student learning. Introducing accountability practices allowed the team members to develop trust on each other and understand their collective capacity.

The PLCs helped teachers in leadership development and thus all teams developed and introduced standards for meetings. The processes helped them in conflict resolution and thus contributed to empowering them and willingness to correct practices as needed. The data also revealed that teachers should have access to key information to make decisions and resolve possible conflicts.

Teachers' perception regarding benefits from PLC

The teachers reported a number of benefits of initiating a Professional Learning Community (PLC). They perceived that time saving through integration of subjects is a major benefit. Sharing ideas and techniques was also perceived as beneficial as the meetings provided teachers with alternative ideas to choose from while dealing with issues in the classroom. Other teachers can know about new ways of handling situations as teachers tend to share their personal experiences.

Professional development was a big benefit in the view of the teachers as the schools cannot always provide them many opportunities for professional development. According to them, the PLC provides them with opportunities for a personalized form of professional development.

The PLC also helped the teachers to map out further development of their teaching and professional activities.

Through participating in PLC, teachers got to know each other better. Some of the teachers met each other first through participating PLC. The PLC enhanced socialization among the teachers and reduces isolation. The respondents reported that they became more socialized after joining the PLC through sharing and expressing their thoughts. Respondents were able to exchange their views regarding teaching and learning as they came to know others perspectives regarding teaching and learning. The respondents shared their personal class room experiences and thus learned more about their colleagues experiences about particular class room situations.

Most of the teachers replied that they experienced change in their attitudes after participating in PLC. They became more open minded towards new practices of teaching and more student-centered. PLC meetings and group discussions made the teachers more conscious about their teaching practices and methods.

Challenges faced by the professional learning community

IETC 2014

The study considers both the benefits and challenges of participating in PLC. One of the challenges was teacher unwillingness to provide peer feedback related to instructional practices. This finding supports that of Bolam et al. (2005). When we asked about sharing thoughts regarding institutional practices, a good number of the respondents were reluctant to provide feedback. Challenges also include the level of collaboration in the schools as a result of the PLC initiative. The teachers in schools were not accustomed to collaboration. Although some teachers do seek advice from their colleagues, it was not the norm of the schools.

The school culture was found to be a challenge for teachers participating in PLC. Poor school culture and lack of trust and collaboration are all barriers to creating a PLC. The schools' culture described by the participants indicated that outstanding achievements are not recognized by the institutions, no time was provided for collaborative work and the institutions did not promote collective learning and shared practice.

Changing the school's culture would require a major effort by the teachers and administrators.

Another challenge is that most of the institutions focus mainly on test scores and grades of the students rather than student learning. Such practice may bring good result for the institution but is not sufficient to develop the students as good human being and asset for the society. It has been said that the schools culture reflects the society's culture, which means that there need to bring changes in attitudes form people outside of the school as well.

Practical Implications of the Study

The findings of the study have implications for practitioners, including both teachers and administrators.

Implications for teachers

The respondents reported that they benefitted by participating in the PLC through building trust within the group and sharing their successful practices. Teachers saved time by reducing repetitive teaching of topics that had already been taught in different subject areas. It was also found that teachers can save time by sharing worksheets and splitting up their planning tasks.

Teachers need leadership to enjoy these benefits. This leadership may emerge from the group, but if not, then they have to get a facilitator outside of the school to attain these benefits.

IETC 2014

Implications for Administrators

Administrators will also be benefitted from PLC through developing level of trust in sharing practices among them and increasing and enhancing their teaching practice to benefit the student of the school which will in turn increase the possibilities of improving students learning and grades in exams. The presence of administrators in the PLC may limit the open discussions among the teachers, but they may be able to provide external facilitators to initiate the PLC.

Including administrators in the PLC will contribute in bringing changes to reduce challenges and problems faced by the teachers as they have the authority in doing so. Moreover, by sharing leadership in the school, the administrators will be able to delegate more responsibilities to other senior teachers which can eventually make the teachers more self-directed in their professional learning.

Implications for Schools

The institution will also be benefit from PLC through improvement in both teaching and learning at the schools. Students will be aided by the various teaching techniques learned by the teachers from their colleagues and from the fact that teachers work together for the students' development.

Theoretical Implications

Many studies on professional learning communities have been conducted in recent years and most of the studies aimed at better understanding the characteristics of PLCs. This study adds to the research by looking at the teachers' perception regarding the dimensions of PLC and thus identifying the benefits and challenges from the teachers' viewpoint. This study also provides research in a culture different from the USA, Canada and the United Kingdom and the other more familiar contexts. The study is unique in that it shows the teachers perception regarding PLC and their significant development in teaching and attitudes after participating in PLC. It is not the static representation of a PLC that appears in many other studies.

Suggestions for Future Research

Two of the limitations of the study were the use of teachers' perception data in measuring teachers' improvements and absence of student development data. Conducting a similar study incorporating additional measures of teacher development and student development data would reinforce the claims regarding PLC effectiveness. Student achievement data will help to investigate whether PLC structure contributes to improving student learning and teaching practices, which would provide a more concrete support for implementing or not implementing the PLC model. The process of implementing PLC begins with a need

IETC 2014

to change to improve student quality. The teachers and administrators accepted the task and focused on their vision and utilized processes to collaborate. They established empowerment and ensured growth through the process. As teams continue to develop trust and empowerment, more complications are easy to resolve. A question for future research: can variable goals contribute teachers to collaborate beyond teams and school to ensure PLC sustainability and improved student learning?

It is evident that administrators have a role to play in developing, implementing and sustaining the PLC by influencing different leadership styles as the PLC develops. The PLC needs a structural process that can be relatively inflexible at the beginning, but it needs more autonomy as it develops. As the PLC develops over time, the teams increase in skills and confidence and they demonstrate their ability to lead themselves. Future research could consider how leadership styles affect PLC sustainability.

Although the teachers experienced benefits from this professional learning community, they also faced challenges. Many of the challenges were problems they faced in the school that could hinder the proper functioning of a professional learning community. Despite the challenges, these teachers are in favor of PLC.

PROFESSIONAL LEARNING COMMUNITY IN SCHOOL BASED SETTING

SECTION A

Demography

All information given in this questionnaire will be kept confidential. Please give brief information or indicate with a tick (√) in the box that describes you.

Age: _____ years old

Gender: Male ☐ Female ☐

Types of School : Primary schools ☐ Secondary schools ☐

Race: ☐ Malay ☐ Indian

☐ nese Oth ☐ _____

Years of services in school: _____ years

PROFESSIONAL LEARNING COMMUNITY ASSESSMENT

Directions:

This questionnaire assesses your perceptions based on the five characteristics of a professional learning community (PLC) and related attributes. Read each statement and then use the scale below to select the scale point that best reflects your personal degree of agreement with the statement. Be certain to select only one response for each statement.

Scale: 1 = Strongly Disagree (SD)
2 = Disagree (D)
3 = Agree (A)
4 = Strongly Agree (SA)

STATEMENTS		SCALE			
Supportive and shared leadership		**SD**	**D**	**A**	**SA**
1.	Teachers are consistently involved in discussing and making decisions about most institution issues	1	2	3	4
2.	School leader incorporates advice from teachers to make decisions.	1	2	3	4
3.	Teachers have accessibility to key information	1	2	3	4
4.	School leader is proactive and addresses areas where support is needed.	1	2	3	4
5.	Opportunities are provided for teachers to initiate change.	1	2	3	4
6.	School leader shares responsibility and rewards for innovative actions.	1	2	3	4
7.	School leader participates democratically with staff sharing power and authority.	1	2	3	4
8.	Leadership is promoted and nurtured among teachers.	1	2	3	4
9.	Decision making takes place through committees and communication across grade and subject areas.	1	2	3	4
Shared values and vision		**SD**	**D**	**A**	**SA**
10.	A collaborative process exists for developing a shared sense of values among teachers.	1	2	3	4
11.	Shared values support norms of behavior that guide decisions about teaching and learning.	1	2	3	4
12.	Teachers shares visions for institution improvement that have an undeviating focus on student learning.	1	2	3	4
13.	Decisions are made in alignment with the school's values and vision.	1	2	3	4
14.	A collaborative process exists for developing a shared vision among teachers.	1	2	3	4

IETC 2014

15.	Institution goals focus on student learning beyond test scores and grades.	1	2	3	4
16.	Policies and programs are aligned to the school's vision.	1	2	3	4
Collective learning and application		**SD**	**D**	**A**	**SA**
17.	Teachers work together to seek knowledge, skills and strategies and apply this new learning to their work.	1	2	3	4
18.	Collegial relationships exist among teachers that reflect commitment to institution improvement efforts.	1	2	3	4
19.	Teachers plan and work together to search for solutions to address diverse student needs.	1	2	3	4
20.	A variety opportunities and structures exist for collective learning through open dialogue.	1	2	3	4
21.	Teachers engage in dialogue that reflects a respect for diverse ideas that lead to continued inquiry.	1	2	3	4
22.	Professional development focuses on teaching and learning.	1	2	3	4
23.	Teachers learn together and apply new knowledge to solve problems.	1	2	3	4
24.	Teachers are committed to programs that enhance learning.	1	2	3	4
Shared personal practice		**SD**	**D**	**A**	**SA**
25.	Opportunities exist for teachers to observe peers and offer encouragement.	1	2	3	4
26.	Teachers provide feedback to peers related to instructional practices.	1	2	3	4
27.	Teachers informally share ideas and suggestions for improving student learning.	1	2	3	4
28.	Teachers collaboratively review student work to share and improve instructional practices.	1	2	3	4
29.	Opportunities exist for coaching and mentoring.	1	2	3	4
30.	Individuals and teams have the opportunity to apply learning and share the results of their practices.	1	2	3	4
Supportive conditions		**SD**	**D**	**A**	**SA**
31.	Caring relationships exist among teachers and students that are built on trust and respect.	1	2	3	4
32.	A culture of trust and respect exists for taking risks.	1	2	3	4
33.	Outstanding achievement is recognized and celebrated regularly in your institution.	1	2	3	4
34.	Time is provided to facilitate collaborative work.	1	2	3	4
35.	The institution schedule promotes collective learning and shared practice.	1	2	3	4

IETC 2014

36.	Fiscal resources are available for professional development.	1	2	3	4
37.	Appropriate technology and instructional materials are available to staff.	1	2	3	4
38.	Resource people provide expertise and support for continuous learning.	1	2	3	4
39.	The institution is clean, attractive and inviting.	1	2	3	4
40.	The proximity of grade level and department personnel allows for ease in collaborating with colleagues.	1	2	3	4
41.	Communication systems promote a flow of information among teachers.	1	2	3	4
42.	Communication systems promote a flow of information across the entire school community including: central office personnel, parents, and community members.	1	2	3	4

Improving the speaking skill using reading contextual internet-based instructional materials in an EFL class in Indonesia

Konder Manurung 58*
Tadulako University, Palu 94118, Central Sulawesi, Indonesia

Abstract

The aim of the study is to solve speaking problems of students in an EFL class using contextual internet-based instructional materials. The study employed Classroom Action Research design in a speaking class at an English Education Department at a university in Indonesia. The study consisted of two cycles. Each cycle consisted of planning, implementation, observation and reflection. The criterion of success was that ≥ 80% of the students must gain speaking score of ≥75. The results of cycle 1 revealed that less than 80% of the students achieved the criterion; consequently the revised plan for cycle 2 was implemented. The results of cycle 2 revealed that more than 80% of the students gained score ≥75 and therefore the cycle was stopped. The design and development process of the instructional materials are discussed and the steps in implementing teaching integrated reading and speaking in EFL teaching and learning (TIRS) are proposed.

Keywords: speaking skill; contextual internet-based instructional materials; integrated teaching

IETC 2014

1. Introduction

Speaking as one of the language skills becomes important topics to discuss in language teaching. The discussion topics can be related to the instructional techniques, the instructional materials, the instructional media, the language teachers, the language learners, and even the speaking components. The instructional techniques hold an important role to motivate and activate learners, the instructional materials play the role to contextualize the language usage and to meet language learners' needs, instructional media bring the teaching into real life situation, the teachers facilitate and ease the learning process, the learners manifest and produce meaningful and appropriate utterances as an indicator of the instructional success, and the speaking components relates to which components of the speaking to be the emphasis in a speaking class activities. In addition, success in studying a language is often measured by learners' ability to speak in the language being learned. More importantly, Harmer (2007) argues that language learners use all language they know when they speak. Therefore, research is always needed and recommended to improve the teaching and learning techniques to improve the speaking skills that enable learners to communicate.

The ability to use the language as a means of communication often judges one's successfulness in speaking class in language learning. This success is detected when a language learner can use the language to express his ideas, feeling, and thought in the form of monologue or dialogue or the success can be simply seen when language learners are able to express their purposes or when language learners are able to make a conversation with others. Nunan (1995) argues that speaking is an important aspect of language learning whether it is as a second or a foreign language and the success is measured by the ability of lan-

* Corresponding author. Tel.:+ 62-81342722328; fax: 62-451-422844.
E-mail address: kmanurung@hotmail.com

guage learners to carry out conversation in the language being learnt. This is in line with Richard's (2008) viewpoint that speaking is an important skill in language learning that enable language learners to communicate not only in expressing view point but also in giving responses. It is also agreed that speaking as a productive skill is related to the ability of language learners to process information during the conversation (Harmer, 1991; Burns and Joyce, 1997; Brown, 2001). It implies that speaking deals with the ability to process messages so that utterances produced are appropriate with the context of the conversation and hence the produced utterances meet the purpose of the conversation.

Improving the speaking skill of students in English as a foreign language (EFL) or English as a second language (ESL) becomes an issue. Quite a few EFL teachers expect their students to be able to speak accurately after the teaching learning process. On the other hand, most learners find it difficult to express grammatically correct sentences due to the significant differences in the grammar of the native language of the students and that of the EFL and consequently they prefer to put emphasis in fluency rather than on accuracy during the speaking activities. Cultural difference is also considered to contribute to the difficulties of EFL learners to use English in their daily conversation (Richards and Rodgers, 1986; Ho, 2009) and in appropriate social interaction (Schumin, 2001; Efrizal, 2012). Despite the faced problems in the teaching and learning of speaking, Heaton (1988) proposed that in the teaching of speaking learners must master the three components of speaking; fluency, accuracy, and comprehensibility or apropriacy. It means that there must be efforts to choose effective techniques in teaching speaking and willingness to create and design interesting instructional materials that facilitate the achievement of the three speaking components.

Techniques in teaching speaking holds important role to improve the speaking skill. The teaching of speaking must open up wide opportunities for learners to practice. Harmer (1991) suggests that the importance of presentation, practice, and communication/production during the teaching of speaking in order to meet the real purpose of the teaching cannot be neglected. Widiati and Cahyono (2006) highlight the importance of techniques in selecting classroom activities in a speaking class. More importantly, Jones (2007) suggests that language teachers as well as the instructional materials guide students, manage students activities, and direct learning during the language teaching and learning process. Therefore, the role of the EFL or ESL teachers are not only limited to the choice of effective techniques but also on creativity and innovation to design and develop instructional materials.

Well developed instructional materials help language learners improve language mastery. The choice of speaking instructional materials is influenced by the techniques employed in teaching and learning process. Widiati and Cahyono (2006) reveal the importance of materials for communicative activities to make students ready to speak. They analyze and report the results of studies in speaking in relation to the choice of the teaching materials in Indonesia. Their conclusion is that the teaching materials can be either prepared by language learners or language teachers. Manurung (2012) also highlights that effective instructional materials contain task and activities that promote not only cognitive skills but also psychomotor skills. However, the teaching materials prepared by the language learners bring about memorization of utterances, while the teaching materials prepared by the teachers underpin spontaneous utterances. This is in line with Richards (2001), Richards and Renandya (2002), and Moore (2005) viewpoints that instructional materials should be based on the needs, interest, or even the problems experienced by the language learners to allow fluent and appropriate speech. This supports what have been believed in language teaching that language teachers and instructional materials create efficient and joyful learning (Lewis and Hill, 1985). This has been the main concern of this study where contextual internet-based instructional materials are used to improve the speaking skill of university students in Indonesia.

The speaking skill of the students at English Education Department at the Faculty of Teacher Training and Education at Tadulako University needs to be improved. It is observed that the achievement of the students in the speaking classes has not been satisfying. Many of them still find it difficult to begin monologue and dialogue, to keep a conversation going on continuously, and to sum up and conclude monologue and dialogue. It is also noted that the students are not active in the speaking class, and more importantly the students are reluctant to ask questions during discussion sessions. This research intends to overcome those problems and therefore the question to be answered is *how does the implementation of contextual internet-based instructional materials improve the speaking skill of the students?* The findings of this research will contribute to the improvement of the techniques in the teaching of speaking and the development of the instructional materials in speaking classes.

IETC 2014

2. Method of the research

This research employed classroom action research (CAR). The steps of the CAR; planning, implementation, observation and reflection were implemented. The research was conducted in two cycles where each cycles consisted of four meetings. The setting of the research was at the English Department Faculty of Teacher Training and Education, Tadulako University in Indonesia. The subjects were 29 students who enrolled in the *Speaking IV class* 2013/2014 academic year. The data were collected by scoring individual oral presentation and participation in each cycle. Field notes and observation were also conducted. The field notes were based on the classroom situation and interaction and the observation was based on the way individual students speak and respond during the class.

3. Results and discussion

3.1. Results

3.1.1. Cycle 1

Cycle 1 consisted of four meetings. In the planning phase, the lesson plan was prepared based on the syllabus and the previously identified problems. The identified problems are; difficulty to begin monologue and dialogue, difficulty to maintain a conversation or dialogue, difficulty to sum up and conclude monologue and dialogue, hesitation to be active in the speaking class, and reluctant to ask questions during the discussion session. The instructional objectives were used as the basic of the selection of the possible instructional material topics. The topics were planned and chosen based on the student's real experiences in learning the language skills and the language components. Each group was assigned to discuss either their problems in one of the language skills or one of the language components during their English study period. The assigned topics also related to the same case faced by other EFL learners reported in journal articles or any other popular writings posted in the internet. It was decided that the scoring system was based on the individual active participation during the speaking class. In the implementation phase, the three phase technique, pre-activities, while activities, and the post activities, was implemented. During the pre-activities, the purpose of the study and the instructional objectives were introduced. The students were divided into group of four to five so there were seven groups. The placement of the students into group was done based on their attendance list. It was decided that group one discussed their problems in listening, group two in speaking, group three in reading, group four in writing, group five in grammar, group six in vocabulary, and group seven in pronunciation. In the observation phase, individual active participation was check-listed in the column that has been previously prepared and notes were jotted down based on the classroom situation during the four meetings implementation phase. Two groups did the topic presentation in each meeting. The presentation lasted for twenty minutes and it was followed by thirty minutes question and answer session among the groups. Around five to ten minutes were planned to conclude or to sum up the presentation. In the post-activities phase, it was time for students to express their point of view of the presentation and to summarize what they have got after the discussion. The class was ended up by highlighting how to begin, to keep a conversation goes on continuously, and to conclude or sum-up a monologue or a dialogue. The achievement of the set criterion in cycle 1 is graphed in figure 1.

IETC 2014

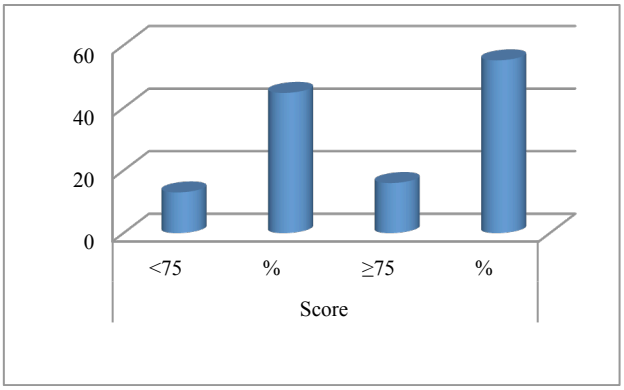

Figure 1. The results of cycle 1

The figure indicates that there are still quite a few students who have not passed the set criteria. The results are also presented in the percentage table as can be described in Table 1.

Table 1. Results of cycle 1

	Score			
	<75	%	≥75	%
Cycle 1	13	44,8	16	55,2

The data indicate that there are still 13 or 44.8% of the subjects who have not passed the set criteria. Since the criteria of success was planned based on the individual active participation and presentation, the results of the observation on the students active participation are graphedin figure 2.

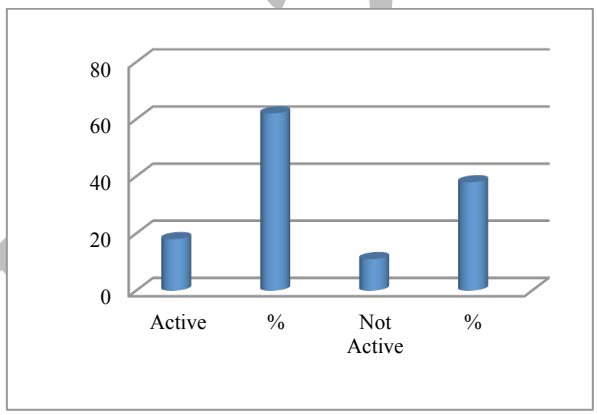

Figure 2. The results of the observation in cycle 1

The figure indicates that there are many students who are not active during the discussion and meetings in cycle 1. The number and the percentage of the students who are not active are presented in table 2.

Table 2. The results of the observation

	Active	%	Not Active	%
Cycle 1	18	62,01	11	37,9

In the reflection phase, it is concluded that the criterion of success has not been achieved and that the revised plan must be prepared. Consequently the research has to continue to cycle 2. The results of the reflection indicate that there must be improvement in the choice of the discussion or presentation topic, in

IECT 2014

the pre, while, post activities during the implementation, role of the group member, and the conclusion or the sum-up session.

3.1.2. Cycle 2

Cycle 2 consisted of four meetings. The member of the group in cycle 2 was the same students as the member of group in cycle 1. In the planning phase, the revised plan, the discussion or presentation topic for each group was revised. Each group freely chose and decided a contextual internet-based topic or issue based on the interest of the group. The topics or issues were downloaded and printed out from any website. Before the classroom meeting and discussion, every member of the group was assigned to read the chosen topic individually and then discuss the topic or issue in their small group discussion. The group discussed the topic or issue and decided the role of each member for the classroom meeting; a member of the group who introduced and began the presentation, who explained or described the chosen issue, and who concluded the presentation. The member of the group was only allowed to bring clues or keywords during the classroom presentation. The implementation phase in cycle 2 was the same as the one in cycle 1; pre-while-post activities. However, the pre-and post-activities were revised. In the pre-and post activities, it was reminded the importance of using beginning and closing expressions in speaking both in monologue and dialogue. The results of cycle 2 are graphed in figure 3.

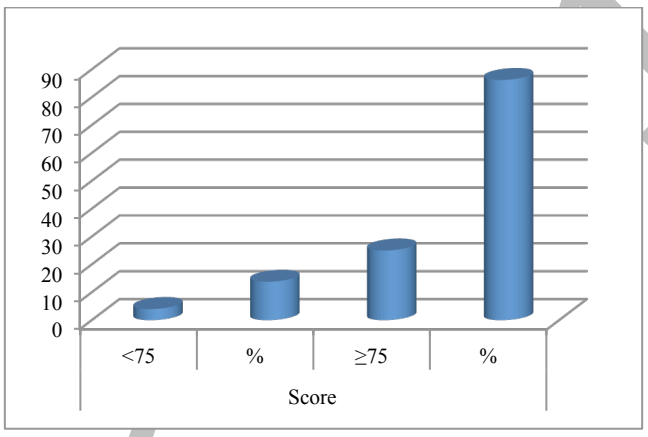

Figure 2. The results of cycle 2

The data in figure 3 indicate that only few students who get lower than the set criterion and the ones who achieved the set criterion increased. The number and the percentage of the students who have achieved the set criterion are presented in table 3.

Table 3. Results of cycle 2

	Score			
	<75	%	≥75	%
Cycle 2	4	13,8	25	86,2

The data in table 3 indicate that 25 out of 29 or 86.2% have achieved the criteria of success and only 4 out of 29 or 13.8% who have not passed the set criterion. The active participation of the students in cycle two was also observed. The data of the active participation are graphed in figure 4.

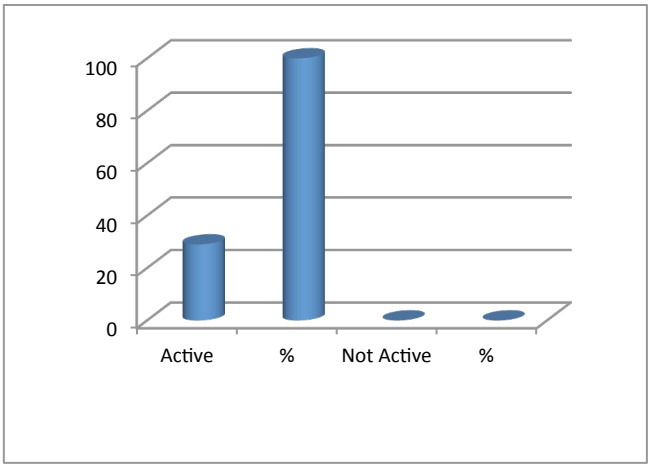

Figure 4. Participation of the students in cycle 2

The data in figure 4 indicate that all of the students are active. It can be seen also in Table 4 that 29 or 100% of the students are active.

Table 4. Active participation

	Active	%	Not Active	%
Cycle 2	29	100	0	0

The data in table 3 indicate that all of the students participate actively during the classroom meetings and presentation in cycle 2. Since the criteria of success has been achieved and that all of the students have been active during the classroom meeting and presentation, the cycle was stopped.

In the reflection of cycle 2, it is noted that the students' achievement increase from cycle 1 to cycle 2. The improvement is graphed in figure 5.

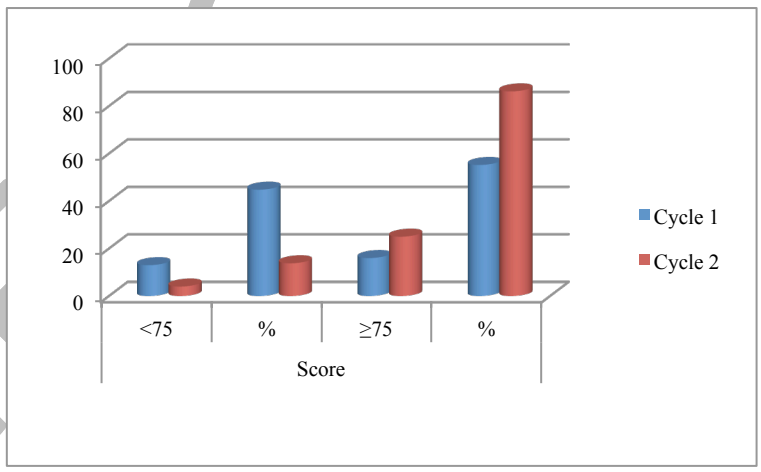

Figure 5. The comparison of the achievement of cycle 1 and 2

The data in figure 5 indicate that the students who passed the criteria increase significantly from cycle 1 to cycle 2. The same case applies to the improvement in the student's active participation during the class meeting and presentation. The improvement in the student's active participation between cycle 1 and cycle 2 is graphed in figure 6.

IEC 2014

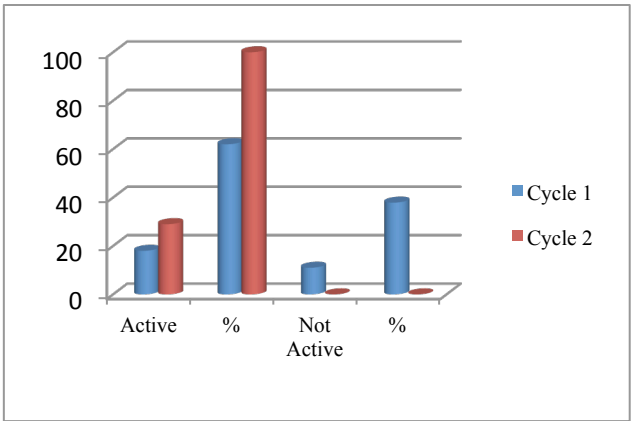

Figure 6. The comparison of the active participation in cycle 1 and cycle 2

The data in figure 6 indicate that all of the students who are not active in cycle 1 become active in the classroom meeting and the presentation in cycle 2. The improvement of the students' speaking skill achievement and the improvement in the active participation during the classroom meeting and presentation are believed to be affected by the implementation of the revised plan.

3.2. Discussion

The research question has been answered during the implementation of cycle 1 and cycle 2. The speaking skills of the students get improved by using contextual internet-based instructional materials in the speaking class in two cycles. There are at least two potential factors that have been implemented during the cycles to overcome those problems, the first is the way to choose instructional materials for the group discussion topic and the second is the integration of the reading and speaking activities in the instructional procedure.

3.2.1. The discussion topic selection

Referring back to the previous identified problems in the speaking class; difficulty to begin monologue and dialogue, difficulty to maintain a conversation or dialogue, difficulty to sum up and conclude monologue and dialogue, hesitation to be active in the speaking class, and reluctance to ask questions during the discussion session, it is noted that the way to select instructional materials particularly the discussion topics in cycle 1 holds important role. The change of the way to assign the discussion topic in cycle1 and in cycle 2 provides the students with opportunities to choose topic in which they are interested in. The opportunity to freely choose topics from any website in internet opens up wide possibility for the students to choose topic which is contextual and based on their interest. This technique seems potential to create efficient and joyful learning to overcome the problems of the students in speaking and to improve their speaking skills in the following ways; Firstly, the topic that the students is interested in motivates them to read and discuss with others; Secondly, the students should have got previous knowledge and experiences related to the topics and consequently there have been at least stock of vocabularies related to the topics; Thirdly, when the topic is contextual the students get opportunities to hear or even to listen to the topics in their daily encounter and hence help them broaden their understanding of the topics; and finally, since the topics is internet-based, it can be read and downloaded from different websites or sources that can enrich their data and ideas of the topics. Since the students are assigned to download and print out the discussion materials they have more opportunities to read and reread the topics in their own spare time and on their own phase.

3.2.2. The instructional procedure

The second potential factor that has contributed to the way to solve the problems in speaking and the improvement of the speaking skill is the instructional procedure. The instructional procedure helps solve the speaking problems of the students in the following ways; firstly, the pre-activities process. The introduction and presentation of the way to begin, to keep and maintain monologue and dialogue or conversation, and to sum up speaking activities prior to classroom discussion and presentation build self-confidence of the students. The students are also guided to work on the chosen topics particularly to as-

IECT 2014

sign each member of the group to play a role in the real classroom presentation. The assignment of the individual students to download and read the chosen topic prior to attending small group discussion in the pre-activities encourages each group member to prepare for the discussion. Secondly, the integration of reading and speaking helps students make notes by writing down clues or keywords that help them build up self-confidence in the classroom meeting and presentation. These techniques also help students to maintain their explanation or description of topics and lengthen the period of the discussion and presentation. More importantly, this techniques allow the students to implement scanning and skimming techniques in reading by making notes on personal names, place, time, and location while reading which are used as a guide during the classroom discussion and presentation. Third, the assignment of the group member to play role motivate them to get active during the classroom meeting and presentation. Finally, the scoring system which is based on the active participation during the classroom discussion and group presentation encourages students to take part; describing or explaining the topics, arguing, commenting, answering or responding, or even asking for clarification. In short, the implemented teaching and learning procedure in this CAR proposes the introduction and implementation of TIRS (Teaching Integrated Reading and Speaking). The steps can be briefly proposed as follows; 1) Freely choose a topic for a small group; 2) Read the topic individually before small group discussion; 3) Make individual clues or keywords; 4) Bring the individual clues and keywords to small group discussion; 5) Revise the clues or keywords in the small group discussion; 6) Decide role of each group member before classroom meeting and presentation.

4. Conclusion

The implementation of contextual internet-based instructional materials improves the speaking skill of the students. The improvement in the speaking skill is seen in the individual student active participation in explaining or describing the chosen topic, the ability to play the assigned role in the classroom meeting and presentation, the ability to ask questions, the ability to answer or respond questions, and the ability to comment and argue during the discussion. There are two ways on how the improvement is achieved using the contextual internet-based instructional materials; The first is the procedure in the selection of the discussion topic which is contextual and based on the interest of the students found in website in the internet motivates students to actively participate in the classroom meeting and presentation; The second is the instructional procedure which allows the students to actively participate in the classroom meeting and presentation. The implementation of the three phase techniques in the instructional process allows the students to read the chosen topic individually and then in the small group prior to classroom meeting and presentation. The findings imply that TIRS potentially improve the speaking skill of the students in the Speaking class in EFL teaching at the university level.

IETC 2014

Acknowledgment

I would like to thank the students enrolled in speaking IV class in 2013/2014 academic year at English Department of Teacher Training and Education Faculty Tadulako University Palu Indonesia who have participated in the study.

IETC 2014

Increasing efficiency of the learning process by an active cooperation between universities and industry

Martin Kendra[59], Juraj Čamaj, Jaroslav Mašek, Ján Ponický
University of Zilina, Univerzitna 8215/1, Zilina, 010 26, Slovakia

Abstract

Education at the technical universities has demanding requirements for the technical laboratory equipment and a high level of teaching staff knowledge. The use of laboratory exercises in the education process increases the efficiency of the learning process and prepares the graduates of technical universities for their real job. Effective cooperation between technical universities and companies from the industry synergistically increases the knowledge and the level of practical skills of the graduates and their rapid adaptation for the job. Employers can use the laboratories at the technical universities for further education of their employees as well. The paper describes the experiences of cooperation between University of Zilina and railway companies in the railway transport laboratory and at the technical practices and excursions.

Keywords: : cooperation; education process; transport laboratory

IETC 2014

1. Introduction

University of Zilina is the only university in Slovakia which is specialized in the all means of transport in research. The original name of university was the University of Transport and Communications. Nowadays the University of Zilina consists of seven faculties. Six of these faculties are directly oriented on transport problems in the sphere of operation and economics, mechanical engineering, electrical engineering, civil engineering, informatics and solution extraordinary situations. Practical knowledge of the graduates of the University of Zilina is at a very high level, because of a very good long-term cooperation between the university and the industry. Students from the Department of Railway Transport from the University of Zilina are a good example of this cooperation. The Department of Railway Transport can be found at the Faculty of Operation and Economics of Transport and Communications.

2. Didactic principles

By their experiences the teachers have found out that upon applying some principles in education process, their students reach better results. The basic didactic principles are an outcome of these principles summarization. The teacher has to apply these didactic principles at education process.

The basic didactic principles are (Špánik, 1998):

[59] Corresponding author. Tel.: +421-41-513 3429; fax: +421-41-565 5816.
E-mail address: martin.kendra@fpedas.uniza.sk

- principle of consciousness,
- principle of scientism,
- principle of gradualness,
- principle of activity,
- principle of visualisation,
- principle of adequacy,
- principle of systematic,
- principle of never-ending.

Applying these principles is no simple process. It is necessary to apply these principles by the different forms of teaching process to make the education process more effective. The basic teaching forms at the university are:

- lectures,
- computing exercises,
- laboratory exercises,
- technical practice,
- excursions.

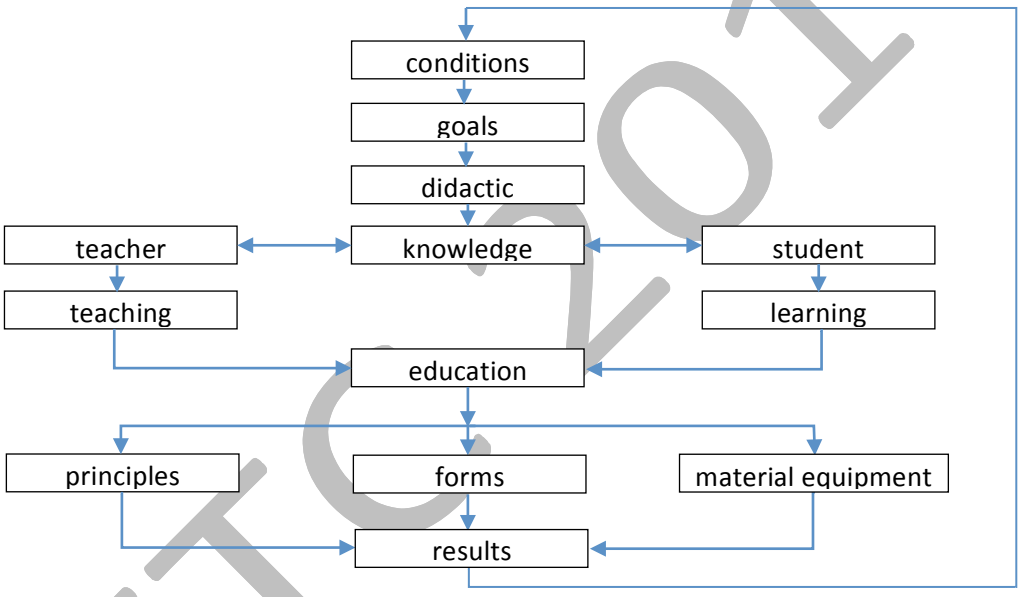

Fig. 1. Didactic system of the technical subjects (Pavlásek, 1998)

We can reach synergistic effects by an appropriate combination of all these principles and forms in the education process to make knowledge more attractive, understandable and memorized for a longer time.

Most of these didactic principles are applied by the education process in the transport laboratory for students from Department of Railway Transport.

IETC 2014

3. Application of the didactic principles at department of railway transport

3.1. Transport laboratory – a simulation tool for transport operation

At the Department of Railway Transport there is a transport laboratory available with an arrangement of train lines simulation model for student laboratory exercises. This transport laboratory is unique and the only such one in Slovakia. It is possible to make simulation of the transport process operation in the

railway stations and at the track lines with different type of signalling systems (Nedeliaková, E., Dolinayová, A., Nedeliak, I., 2013).

The lab provides a modern arrangement of train lines with a total length of 100 m of tracks. The design of the tracks forms a simple oval with the area of 50 m x 2.5 m. There are five railway stations.

Fig. 2. Scheme of railway model in transport laboratory

The scale of model is H0 (1:87). The equipment of the transport laboratory allows to make an almost ideal simulation of the real railway transport operation. The students are able to learn how to operate with different types of railway station and track line signalling systems which are used in the Slovak Republic and in some other countries in Europe.

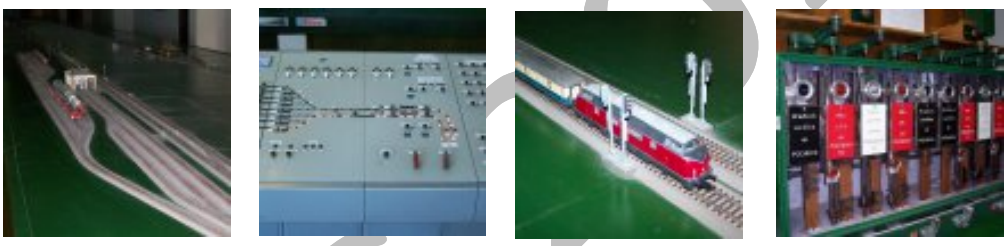

Fig. 3. Equipment in transport laboratory

The main advantages of the railway transport simulation model are (Barta, Mruzek, 2014):

- the work environment is identical with the real workplace,
- the research and education processes run at different type of operation places (including the most modern ones),
- the theoretical research and tuition is complemented by practicing the model transport situations with stochastic processes,
- management of the transport processes in real conditions is trained,
- extraordinary transport situations, errors etc. may be trained.

An application for modelling logistic centres is also projected in the area of the transport laboratory. It is possible to make a simulation of a logistic centre, consisting of the following three different modules and their combinations (Meško, Gašparík, Lalinska, 2012):

- module of a marshalling yard,
- module of an intermodal terminal,
- module of a warehouse.

Each of these modules can be rendered in a different window. To create a new model of a logistic centre, the user of the simulation model will choose which modules will be used in the model.

IECT 2014

3.2. Education process in the transport laboratory

The transport laboratory of the Department of Railway Transport provides also laboratory exercises for the students in the fourth semester of the bachelor degree course. During the first three semesters the students get theoretical knowledge of the transport management and operation, necessary to make the railway transport continuous and safe, by the means of lectures and computing exercises. In the fourth semester they continue with their practice in the transport laboratory. These laboratory exercises are obligatory for them.

Fig. 4. Education process in transport laboratory

Each of the students has to pass 13 obligatory laboratory exercises, for two hours each. They have to prove their ability to practically operate every type of the signalling systems. The education process itself is arranged in such a way that every student is able to make practice at each work place with different signalling system minimal two times through the semester within a short time gap. It is very important to have a chance to repeat it for the student, as he or she gets a better understanding and a chance of a long-term remembering of the new knowledge and skills.

The students can continue with the laboratory exercises in the transport laboratory in the fifth and sixth semesters, too. They can develop their knowledge and skills in the management of the railway transport operation under extraordinary situations, accidents, operation closures and under difficult working conditions.

3.3. Usage of the transport laboratory by students from secondary schools and people from the industry

They are not only university students who can use the transport laboratory. It is open also for students from technical secondary schools for practical exercises (especially from schools with an interest in the railway transport), as well as for the new employees in the railways companies for trainings, excursions for public etc.

The new employees of the railway infrastructure manager in Slovakia (Železnice Slovenskej republiky, ŽSR) employ the transport laboratory the most. They employees are engaged in regular laboratory exercises after passing the theoretical exams but before being allowed to operate the railway transport independently.

Students of technical secondary schools are also frequent visitors of the transport laboratory. One of the advantages of this cooperation is also promoting the university in the public area. Many students, who visited the transport laboratory during the secondary school, continue their study at the Department of Railway Transport as well.

IETC 2014

3.4. Cooperation between the university and the industry

The laboratory exercises are by no means the only opportunity for the students of the Department of Railway Transport to get new practical skills. The Department of Railway Transport have a very good long-term cooperation with the railway infrastructure managers, railway operators, forwarders and other companies from the railway business in Slovakia and in the Czech Republic. The students are able to take advantage of this cooperation and may take part at:

- additional lectures with the industry experts,
- technical excursions,
- obligatory technical practice,
- optional technical practice.

Additional lectures with the industry experts are usually organized for each technical subject at the end of the semester. The lecturers are often former students of the University of Žilina who have become successful managers in the railway or forwarding business. The students are very interested in these lectures although they are not obligatory.

The technical excursions are provided for all the students through the whole academic year. The focus of these excursions is in those areas which are not possible to practice in the transport laboratory. For example the technical excursions are organized in the areas of:

- production of rails,
- unconventional transport systems,
- forming of trains in the railways yards,
- loading, fixing and unloading of goods,
- logistics,
- testing of the railway vehicles,
- operation of undergrounds,
- and others.

Each student has to pass obligatory technical practices. It is realised at the railways stations and at the workplaces which ensure the railway transport. Each student has to pass a technical practice at different workplaces for 13 weeks. For every week, a minimum of four hours of the technical practice is obligatory.

In case that the student is interested in the technical practice for a longer time, he has an opportunity to do it individually. The Department of Railway Transport has signed bilateral agreements with the railway infrastructure manager in Slovakia (ŽSR) and with the passenger and freight railway operators (ZSSK and ZSSK Cargo), where the students are able to pass their technical practices.

3.5. Final works of students

The very good cooperation between the Department of Railway Transport and the industry reflects also in preparing the students' final works. Many final works become topics inspired or directly brought from the industry. The students solve therefore specific problems for a specific railway or forwarding company in their final work. The students are able to apply all the theoretical knowledge and practical skills in their final works. The feedback from these industry companies is very positive. Some students continue a job directly in these companies, immediately after the final state exams.

The practical skills of the graduates from the Department of Railway Transport are significantly better after establishing the technical excursions, technical practice and the laboratory exercises in the transport laboratory. The graduates are more adaptive in their jobs for practical solving of problems. The demand

IETC 2014

for graduates from the Department of Railway Transport is therefore constantly increasing, and there is nearly zero unemployment among them.

4. Conclusions

Applying the didactic principles in education process is very important. The students remember 10% of reading, 20% of hearing, 30% of seeing, 40% of combined seeing and hearing, and 90% of their practice (Špánik, 1998).

Educating the competent experts for the railway transport involves necessarily gaining both the new theoretical knowledge and the practical skills. The Department of Railway Transport allows for achieving these important goals. Specifically it publishes study literature for the students, organizes laboratory exercises in the transport laboratory, additional lectures, technical practices and excursions. All this is possible only thanks to the very good long-term cooperation between the Department of Railway Transport and the industry. This way, firm conditions for educating top-level experts with complex theoretical knowledge and practical skills are established.

Increasing practical lessons and inclusion of applied examples to motivate university students during programming courses

A. Ramirez-Lopez[*a], D. F. Muñoz[a].

[a]*Department of Industrial & Operations Engineering, Instituto Tecnológico Autónomo de México. Rio Hondo # 1, 01080 México City, Mexico.*

Abstract

This study investigated the influence of increasing practice and the inclusion of applied examples (exercises with a direct application or related to real problems) during programming and numerical analysis courses. The results obtained from this experiment demonstrated that examples related to students engineering careers have a very positive impact on learning and awaked up the student interest on programming courses; in comparison with students who just follow examples from a textbook as in an ordinary course. The conclusions of this work were obtained from the analysis and comparison of the statistical information of the students' performance during 2 programming courses and an additional mathematical course (numerical analysis). Finally, a questionnaire (at the end of the courses) about the methods used for teaching was applied in order to investigate students' opinion.

Keywords: Increasing practical lessons; Teaching/learning strategies; Real-life examples; Programming courses.

IETC 2014

1. Introduction.

Programming and computational methods have been developed to create very friendly and interactive virtual environments for all users of digital services like computers and cell phones, internet and TVs programs. Nevertheless, people often forget how these gadgets and software were created and just enjoy about; people usually do not think about the work behind. Maybe this is the reason why programming and computational courses, (including some mathematical courses like numerical analysis) are frequently considered only as complementary courses during the university student formation. Students who take these courses (including students in sciences and engineering) frequently ask themselves if it is required to take them or if they have any application on their corresponding career. They frequently ask themselves why I have to learn to program in any programming language. May be there is a software already developed to do it in somewhere or it is possible to download an app; thus they decline importance to these courses. They think that it is more important to pay attention on other courses, for example, mechanics, aerodynamics, chemistry, engines, thermodynamics, technology, etc.

Some authors have been working on the development of new and more efficient techniques and methods to improve learning using new technologies or creating didactical software (Depradine et al. 2004, Smith et al. 2006, Ellis et al. 2006 & Doornekamp et al. 1993), some of them developed support learning materials and implemented evaluation systems for students and the methods used to teach and learn, some others have studied the student behavior towards computers (Donker et al. 2007, Lang et al. 1992 & song et al. 1997), others have studied the ability of the students in different school levels to use computer equipment and accessories like keyboards, mouse etc. and assessed their response to the use new technologies in the classroom, including the use of graphical and interactive tools in order to help the students to un-

derstand some problematic courses like physics, mathematics or chemistry, where the use of audio-visual material is widely recommended for students on high schools and universities (Donker et al. 2007 & Henning et al. 1993). All these studies have been providing important information about the way to improve the teaching and learning processes using new technologies. Nowadays the contact with computers, virtual environments & electronic devices has been increased since the students were children. Undergraduate and graduate students were born at the end of 80's or at the beginning of 90's. They are between 17 to 26 years old. They belong to a new generation. Nevertheless many of them have trouble understanding programming courses and others related to mathematical, chemical and physics topics because the notation and the concepts are abstracts and new (Du Plessis et al. 1995, Rowe et al. 1999 and Cox et al 1994). Thus this work was focused on investigating the influence of new methodologies that includes the solution of some real-life problems and increasing practice during programming lessons in order to motivate the students for learning about programming and feasible applications (Hietala et al. 1993).

2. Programming and numerical courses.

Two samples of engineering students for each of three courses were considered to participate in this study. They were enrolled in the following courses:

1 Programming course I

2 Programming course II

3 Numerical analysis

The contents of the courses are described next:

A first programming course is elementary to get the students feet wet, they learn the basics of a programming language and are introduced to the integrated development environment (IDE) of the corresponding programming language. Then, they continue learning how to define data types and they learn about the language basic capabilities and management. Subsequently, the students are involved on the language syntax, they study the difference between expressions and statements and the use of punctuators and operators; so that students learn about the use of functions, classification and work modes, their importance and applications. At the end of the course the students make their own programs using advanced concepts like arrays management, loops nested commands and routines. Students learn to employ instructions and create their own routines and subroutines to be included in a main function. Finally the students develop their own header files too. Although the programs developed during this course are very easy to program, not all of the students finish in satisfactory terms.

Nowadays university students are strongly influenced by video games and Internet that they think that this kind of programs are older, ambiguous and bored, and their interest on programming is frequently missed. This is the reason why motivation is a very important factor for a better student performance.

In the second course (programming course II), students receive information about hot new rapid application development (RAD). These applications are used in visual programming languages that allow them to take advantage of object-oriented programming (OOP). Students can write Windows programs more quickly and more easily than ever possible before thanks to the new programming languages. They can create complex applications with Win32 GUI (graphical user interface) programs. In other words they can

IETC 2014

create the user interfaces to a program (the user interface means the menus, dialog boxes, bottoms, pop ups, windows, etc.) and so on using drag-and drop techniques for true rapid application development. They can also drop controls on forms to create specialized programs such as Web browsers in a matter of minutes. After this, they have the ability for modifying the component properties and events of their programs. At the end of the course students learn about the basic instructions to initialized graphical process on the screen.

Numerical analysis is the third course; this is especially difficult for all the students, because it is necessary to have a good knowledge of mathematical and programming concepts. A very good understanding of loops and nested loops is desirable in students because these are platforms to develop the iterative routines to find mathematical solutions with numerical methods. The use of graphics is also recommended for a better understanding, for this reason, the authors have included the use of some mathematical software such as Excel, Matematica, MATLAB, MAPLE, etc. in addition to the traditional routines and flow charts developed for programming languages in order to show a new way to learn these themes. The numerical analysis course is divided in 4 stages during which the students must learn to implement different numerical methods as is shown in Table 1. Every stage is focused on teaching a different mathematical aspect of numerical analysis.

Table 1. Stages, themes and particular topics of the numerical analysis course.

Stage	Theme	Particular topics
1	Solving Nonlinear Equations	Newton's method. Method of false position. Muller's method.
2	Solving set of equations	Matrix notation. The elimination method. Gauss and Gauss-Jordan methods. Determinants and matrix inversion.
3	Interpolation and curve fitting	Lagrangian polynomials. Interpolation with a cubic spline. Bezier curves & B spline curves. Euler & Heun methods .
4	Numerical Differentiation & Integration	Extrapolation techniques. Simpson's rule. Trapezoidal rule. Gaussian quadrature.

IETC 2014

3. Participants (samples and students).

Six groups of undergraduate (engineering) students were considered in the present work. They were classified in 2 samples (A and B) for each of the 3 previously mentioned courses. Their designation and corresponding populations are shown in Table 2. Students in any course were randomly assigned to group A or group B. Their school records, previous formation, social status are also variables, and these factors were not considered in this work. Nevertheless some of them had a previous experience on programming due

to their formation as computer technicians that help them to obtain a better performance than students who did not have. The population of the original groups was reduced for numerical analysis courses because some students did not approve the programming courses and, in consequence, they were not authorized to take the last course. All of the participants received the same courses with the same containing but some differences were implemented during teaching process to the students of samples as is described next.

4. Teaching methodologies.

Professor for sample "A" only followed the textbook examples and no additional information was provided to the students. All the topics were treated as traditionally. Nevertheless, a good way to motivate the students was to increase the contact with them during practical lessons for groups of sample "B". A brief explanation of the topics was taught in theoretical lessons and examples related to their career (aeronautical engineering) were included. The programs and exercises solved by students were developed profiting the professor's personal and professional experience.

Table 2. Population of samples and groups.

Sample	Group	Students Original groups	Students for numerical analysis course	Students with a previous programming formation	Students without a previous programming formation
A	1A1M	30	22	10	20
	1A2M	25	21	8	17
	1A3M	25	20	8	17
B	1A4V	27	25	10	17
	1A5V	30	28	9	21
	1A6V	29	27	8	21

Programming courses I and II are taught weekly in 4 lessons of 90 minutes each. Students of sample "A" had 2 theoretical and 2 practical lessons, but students of sample "B" had 1 theoretical and 3 practical lesson. Numerical analysis course is taught in a similar way in 4 lessons weekly of 90 minutes although due to the complexity of the mathematical topics 2 lesson are dedicated to theoretical topics; here the students learn the nature of the methods and solve some cases using only calculators pen and paper. The other 2 lessons are practical; here the students run programs for the corresponding numerical method.

5. Evaluation of the student performance.

Student assessment is the result of 4 partial evaluations for the programming and the numerical analysis courses every one is 25% of the final assessment. The first 3 of them are partial evaluations referred to the stages of the course. Every partial evaluation consists of a pair of tests, one is theoretical and the other is a practical test. The same test was applied to all the students in both samples; and for the final stage, the students developed a final project; then they had to work in groups of 4 students and create a computer program. The students of the samples were randomly divided forming teams according with the group populations in order to develop their project. In the first course the projects were very simple but for the

second course students of sample "B" decided to create a personal version of software to sell and print tickets for a virtual airline, including options to select different airplanes and different departures and arrivals, some teams used national destinations and others employed foreigner destinations.

During the development of the final project for the programming II course, students employed their imagination and knowledge to create useful software. They created an environment where the user can select a flight with a departure and a destination. Every team designed different airplanes sketches (some of them were Boeing 727, 747, 757 & DC10) using graphical instructions to be displayed on the screen. Registration of the passengers and seat assignation were done by using arrays and then stored and saved in new files. In addition, routines to change and correct information for passengers and reprogramming flights were included. Although the programs could not be placed on a web site or generate a database, they were good examples for students who had to develop their own routines without downloading Internet files. While for the final project of the numerical analysis course students of sample "B" decided to develop as a final project a computational display for calculating the position of an airplane. This project involved the creation of reading data routines to define the initial position and the new conditions of the airplane for every attitude change. The airplane was treated as a simple particle; so that the movement was obtained from a simple integration method as a function of a step time (Δt) that controls the finest of the graphical display and the precision during the simulation; and some aeronautical quantities were calculated like the True air speed, the real air speed and vertical speed. Graphical routines to calculated and display the airplane updated position (displacement on the air & the on ground) were also programmed. The main screens for the final projects that were developed by students of the sample "B" are shown in Fig. 1 and Fig. 2, respectively. These programs are not complex or sophisticated as a professional simulator, but they are interesting examples of possible situations for the students to apply the knowledge learned.

In contrast, students of sample "A" were free to develop the project whatever they wished. Unfortunately, they had many problems. They did not know how they could use their programming techniques. It was difficult for them to find an application to their knowledge. Another disadvantage was their shorter practical time. These factors limited the examples and exercises treated in class. In consequence the quality of the projects presented by students of sample "A" was considerably inferior.

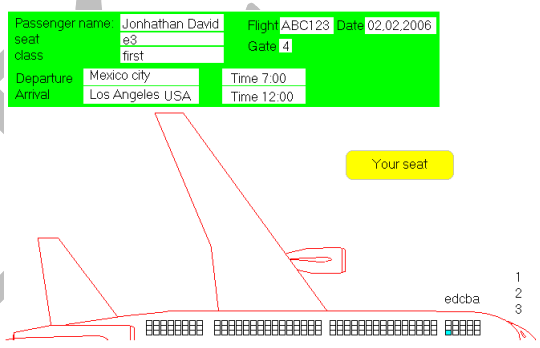

Fig. 1. Main screen of the project developed by student of sample "B" at the end of programming course II.

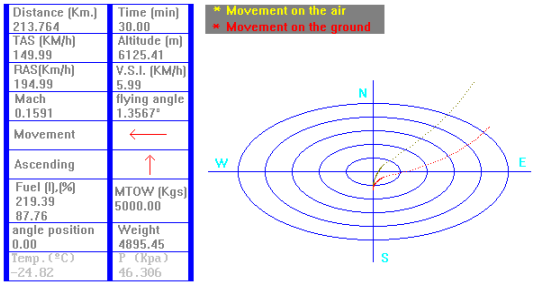

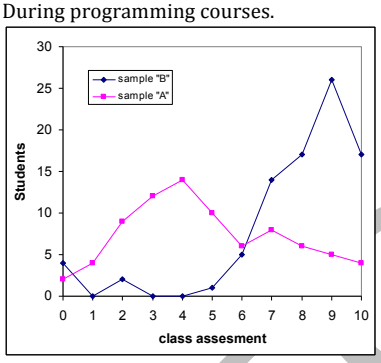

Fig. 2. Main screen of the project developed by student of sample "B" at the end of Numerical analysis course.

6. Student Assessments, Analysis and Results.

Some aspects like student attendance, and their performance during the courses were taken as parameters to evaluate the effectivity of the methods used to teach. The number of practical lessons was increased for student of sample "B" they had a (75%) of the course time in practical lessons; in contrast students of sample "A" only received (50%) of the total lessons working on programming practices. Fig. 3 shows a comparison between the class assessment obtained by the students of the 6 groups analyzed. It is clear that students of sample "B" got the best assessment during all the courses. While Fig. 4 shows the average of the class assessment obtained by every group of the sample "B" during the 3 courses. The final assessment scale goes from zero to ten. Six is the minimum required to approve a course. Statistics of the total approved, non-approved students and their corresponding average assessment during the 3 courses are shown in Fig. 5 and tables 3 to 6. As can be noticed, the average of class assessments for students of sample "B" was considerable superior than those of sample "A" in every participant group. This difference is increased if the students who did not approve the course are considered. In addition, the percentage of non-approved students in sample "B" was reduced considerably in comparison to students of sample "A".

a) during programming courses

IETC 2014

b) during numerical analysis course

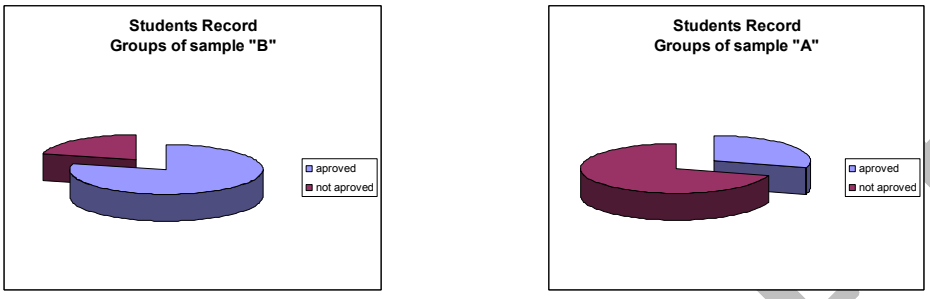

Fig. 5. Comparison about the performance of the student of samples "A" & "B".

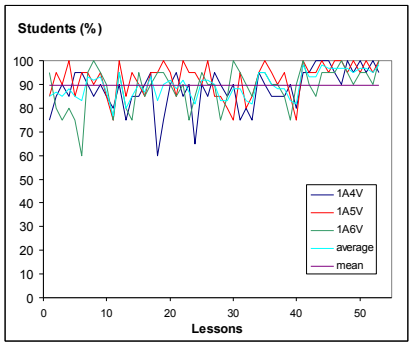
Numerical analysis is considered the most difficult course, the performance and class assessment was lower than for programming courses, as is shown in Fig. 3 and Table 5, including for students of sample "B". Nevertheless the performance of these students remained better than students of sample "A". The percentage of unauthorized students to take this course was 21.25% (of the original population) for sample "A" in contrast to only 6.98% of the students for sample "B".

In addition, the students' class attendance was considered as another good indicator to evaluate the students' interest on the course. Fig. 6 shows the statistics from classroom attendance for students of sample "A". It can be noticed that attendance remains almost constant during the courses. In Fig. 7, a comparison between the 2 samples is shown. Attendance of the students in the 2 samples remains nearly constant at the begging of the courses. Nevertheless it was observed for the 3 courses that after the second evaluation, students of sample "A" had a lower performance. Unfortunately some of them missed the possibility to approve the courses and therefore attendance was considerably lowered during the last stages, and the final average assessment of these groups went down. Many students missed interest in the course. In contrast students of sample "B" had a better performance in practice and theoretical tests. The student presence remained (80-90%) until the final due to they remained motivated about the topics of the course because they had the opportunity to develop a project related with their career.



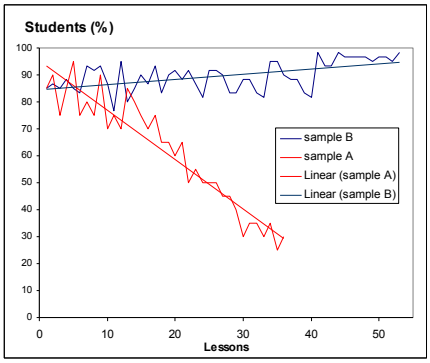


Fig. 6. Presence records for students of the sample "B" during programming courses.

a) During programming courses.

b) During numerical analysis course

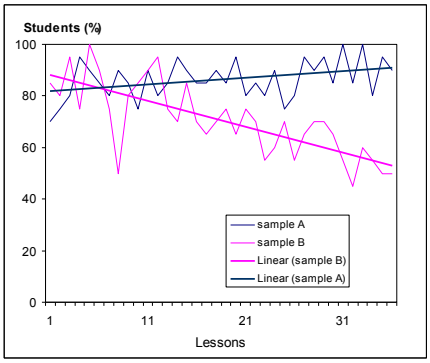

Fig. 7. Comparison of presence records between students of the samples "A" & "B".

7. Students Opinion.

The students who participated during programming courses I and II were classified in 2 classes as it was shown in Table 2, some of them with and some others without a previous programming formation or experience in computers and programming. Students who had received a previous formation as a programming technicians in High School found the course interesting, they commented that the tests applied were easier to solve than they expected; in contrast, students without a programming formation found more difficult to understand the programming courses, nevertheless at the end of the courses, students of the sample "B" commented that programming was not very difficult at all. These students concluded that they had not imagined the possibilities of programming development with an aeronautical application. Finally they told, felt happy to have found a connection between the course and their university studies.

It is important to illustrate that, for the sample "A", 83% of the total approved students were students with a previous background in programming, only 17% of the students without a previous programming background approved the courses; unfortunately 4% of the students who had a previous background did not approve the courses. In contrast, all the students with a previous background approved the courses of sample "B". The percentage of students without a previous background who approved the courses was also increased as is shown in Table 7 and Fig. 8.

IETC2014

Table 7. Population of the groups in second generation.

Professor	Method for instruction	Group	Students Original groups	Students for numerical analysis course	Students with a previous programming formation	Students without a previous programming formation
A	Traditional	1A1M	30	22	12	18
	New	1A2M	28	26	11	17
B	Traditional	1A3V	27	20	10	17
	new	1A4V	30	27	12	18

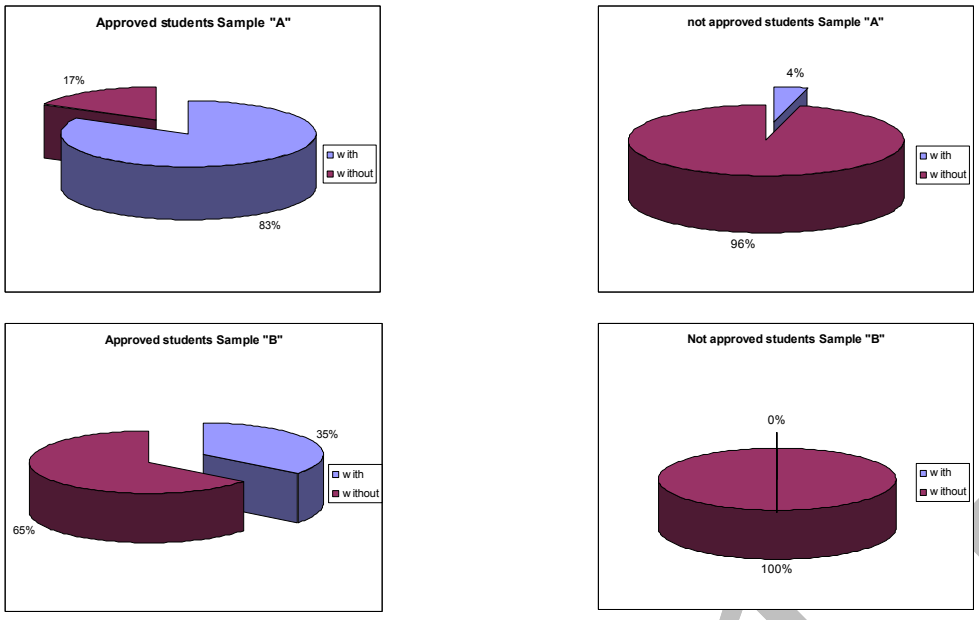

Fig. 8. Compassion between approved and non approved students during programming courses as a function of their previous formation (with or without pervious computational studies).

During the numerical analysis course, nearly 70% of the students had troubles understanding the topics of the course, including students of both samples and students with or without a previous programming background.

Mathematical courses are always difficult for the students; for numerical analysis it is necessary to know the basic concepts of geometry and calculus. Numerical methods request to understand and repeat a procedure in order to obtain the solution.

The students answered the following questionnaire after they concluded the 3 courses. The questions were designed to know the students' opinion about the teaching methods used by professors; a little modification on question "9" was required because of the differences in the methods used.

The results obtained from the questionnaire are shown in the graphics of Fig. 9. Students of sample "B" considered that the examples used by the professor in lessons were more appropriate than those used by the professor of sample "A", many students of sample "B" considers that they really learned about programming and numerical analysis. They think that these courses really can help to solve problems in the future or in a real workplace.

During lessons the students of sample "B" considered as good the communication with the professor and many of them said that they had paid attention and feel motivated. In the other hand students of sample "A" considered that they felt frustrated and unhappy due to the absence of a relation with the rest of knowledge acquired.

The result of the question (9) is shown separately in Fig. 10 to evidence the student feelings. They think it was a good idea to increase practice time during programming and mathematical courses for a better understanding.

IETC 2014

Difficulties in terminology, definitions, and introduction to topics related to computer science are examples of frequent problems, which difficult the students' understanding of programming topics during the courses. Some authors have studied this situation (Asai et al. 1991, Woodhouse et al. 1983, & Brusilovsky et al. 1997) and have developed some methods and techniques to improve the way to introduce the students to programming. An example is the mini-languages approach. The main idea is to design a small simple language to support the first steps in learning programming. Many of the mini-languages have been developed as tutorials and use an actor to guide the users, they are considered as a powerful tool to introduce students to programming. Tutorials and interactive guides are good ways for a better learning during programming courses; these works develop the student intuition, (Baldwin et al. 1999, Rocchi et al. 1998, Dagdilelis et al 2001 & Milne et al. 2002). The promise of multimedia learning is that students can learn more deeply from well-designed multimedia messages consisting of words and pictures than from more traditional modes of communication (Van der Meij et al 2006, Schmitz et al. 2006 & Summers et al. 2007). Nevertheless the application of programming in sciences is wide; thus it is required to develop particular tutorials for students of every career. A good option is to profit the professional experience of the professors; and begin to create personalized exercises, tutorials.

1.- Were appropriated for the courses the examples employed by the professor?

a) yes b) sometimes c) no

2.- How do you consider your courses?

a) interesting b) bored c) without purpose

3.- do you think you learn programming in the courses

a) yes b)enough c) a little bit

4.- The project developed really helped you to apply your knowledge?

a) yes b) partially c) no

5.- Do you think these course will help you to solve problems in the future?

a) yes b) maybe c) never

6.- How do you consider it was the communication (student-teacher)?

a) good c) regular d) bad

7.-How did you feel in the classroom?

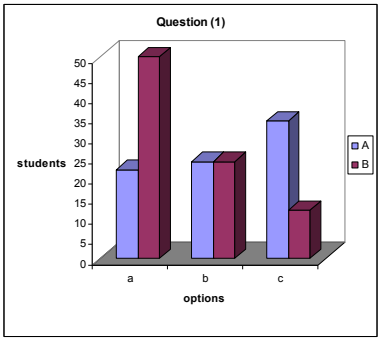
a) motivated b) bored c) uncomfortable

8.- Did the professor help the students if they were in problems or during lessons?

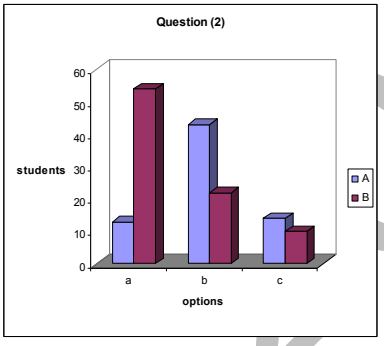
a) yes b) sometimes c) no

9.- Do you think it cold be good to increase the practice time and reduce theoretical lessons and include examples with direct or real application on the course?

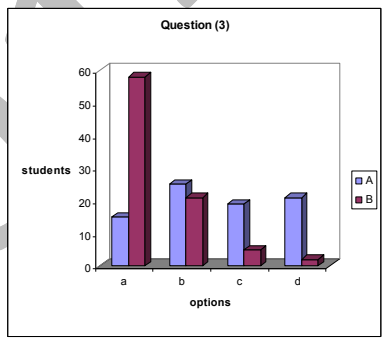
A



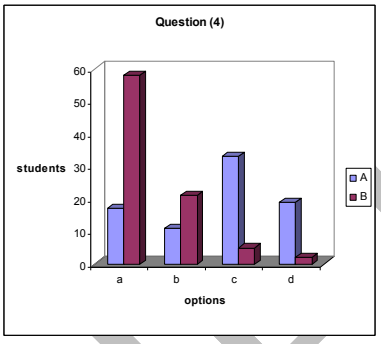
a) yes b) no



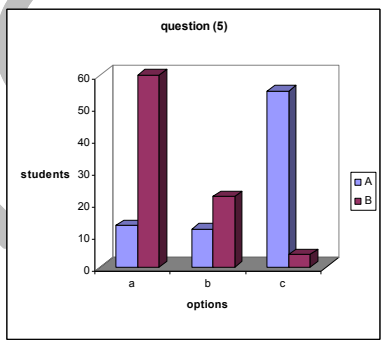
IETC 2014



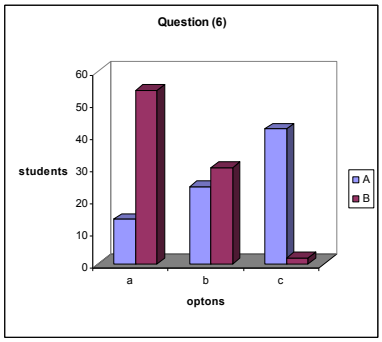
9.- Do you think it was good to increase the practice time and reduce theoretical lessons? B

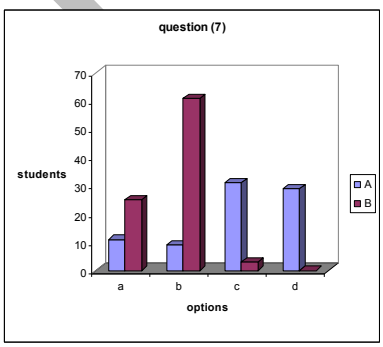


a) yes b) no



Additional comments:





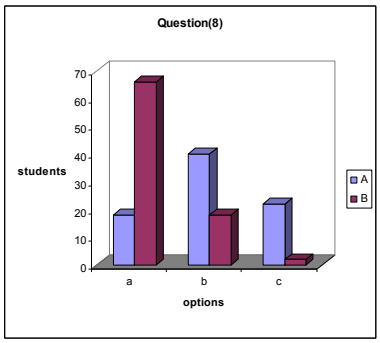


Fig. 9. Results for the questions answered by students on the questionnaire.

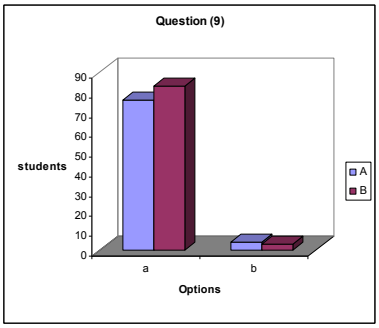

Fig. 10. Results for the question (9) answered by students on the questionnaire.

8. Conclusions & comments.

It is possible to make the following conclusions & comments about this work.

New student generations demand new methods to teach and learn.

Motivation is one of the most important factors that influence the effectiveness of explanations and understanding on students, especially in classes where the topics are abstract or difficult to explain like mathematics and programming.

Increasing the practical lessons was a good idea to avoid students were bored or upset on the classroom.

Examples related with real problems and situations or with direct applications are learned easily by students.

Final projects helped the students to find a direct application of their new knowledge. They discover that they are capable to create interactive tools for solving problems related with their careers.

Programming is an opportunity for the students to develop their abilities to treat a problem.

Increasing of practical lessons helps the students to develop abilities and criterion.

Professors with teaching experience and professors with industrial experience must work together in order to develop more interesting examples and better methods for teaching.

Influence of assessment in the teaching-learning process in the higher education

M. Isabel Prieto Barrio[a], Alfonso Cobo Escamilla[a,] 60, M. Nieves González García[a], Esther Moreno Fernández[a], Pilar de la Rosa García[a]

[a]*Polytechnic University of Madrid, Escuela Técnica Superior de Edificación, Avda. Juan de Herrera, 6. 28040 Madrid, Spain*

Abstract

The new European Higher Education Area (EHEA) involves a change in the way of understanding learning and the teacher's work. In this field, assessment is a very important aspect in education. It influences determinedly in the process of helping and encouraging the students to learn and understand their progresses in learning. This paper shows, from the results obtained in the subject "Concrete as a Structural Material", of fourth grade in Building Degree, the factors which affect the teaching-learning process through assessment.

Keywords: assessment; motivation; autonomous learning; significant learning.

IETC 2014

1. Introduction

In the new European Higher Education Area (EHEA), the teacher and the student acquire new roles different to those they had before. In the new context, the teacher helps the student to learn, with the intention that the student not only acquires contents but also builds them. The new student, apart from learning contents, has to have initiative, oral and written communication skill, ease to work in team and ease to adapt to the new situations that the current job market demands (Álvarez, González & García, 2007). This has led to suppose a change in the way to guide the teaching, departing from specific and general objectives, which allow training professionals, as of general and specific skills which the student has to be able to develop and some learning results that the student has to demonstrate.

One of the most important facets in the teaching is assessment (Hannan & Silver, 2005). Contreras proposes a very complete definition to this term: *Assessment is a process that involves obtaining reliable information concerning the students' commands (objectives, knowledge, aptitudes, skills, behaviors, etc.), establishing judgments of value (acceptable, suitable, good, good enough, etc.) and making decisions (to accept, to pass, to recommend, to promote, to release, to recognize, etc.)* (Contreras, 2004).

What would be ideal is that assessing and grading intertwine benefiting the learning and relating to the planned objectives and the obtained results (Ames, R. & Ames, C., 1991). In assessment also affects, apart from the used method, the human factor, what is to say the perception the student has about the assessment method, whether it is appropriate or not (Bain, 2004).

* Corresponding author. Tel.+34 91 336 76 13
E-mail address: alfonso.cobo@upm.es

Despite there are many researches that relate objectives and assessment (Contreras, 2004; Alonso Tapia, 1997; De Miguel, 2004), in this paper we try to study the factors that take part in the teaching-learning process through assessment, analyzing the human factor (the student and the teacher's skills) and the student's perception of the subject, as the force that increases their interest and motivation.

2. Approach to work

2.1. Stages of the research

The objective of this paper is to study the factors that take part in the teaching-learning process through assessment, in students who have studied the compulsory subject "Structural Concrete" of fourth year and with 6 ECTS credits, during the year 2013-2014. The factors which are going to be studied are: the student's ability, the student's valuation of the subject, the valuation of the type of assessment and the valuation of the teacher, in order to study how these factors affect in the teaching-learning process.

In the subject there are two different ways to pass, through continuous assessment or through a final test.

Continuous assessment lies in:

- Four partial tests, without a minimum score, done along the semester, which are equal to four points in the final score. Each test involves a particular part of the contents different from the other tests.
- Class practices, homework, group work, etc., done along the semester, which are equal to two points.
- A global test, done at the end of the semester, which contributes to the final score with two points. In this test, which is global and concurrent to all students, regardless of their group, all the contents of the subject are included and it is necessary to obtain a minimum mark of 3 out of 10 in order to pass the subject.

Final assessment lies in a final and global test which is the only reference to grade the student.

In order to be able to know how the student's ability affects the learning, the basis with which the students start to study the subject has been studied, taking data whether the students have passed the subjects from previous years or not which are considered as basic to study the subject "Structural Concrete" or whether they have passed or not the subjects related to structures from previous years (construction structures and geotechnics and materials resistance).

In order to know how the student's perception of the subject affects the teaching-learning process, data of the correspondence of the spent hours with the ECTS credits that the subject has been assigned in the education program, the methods and means used in the teaching and his valuation of the reached objectives have been taken.

In order to know how the student's perception of assessment for purposes of motivation, interest and feedback affects his results, we have obtained data of his valuation of the type of assessment used, its usefulness to detect weak points and to work on them, the motivation it creates and the perception of the relation between the obtained scores and the effort and of the acquired knowledge.

Finally, we have also studied the influence of the teaching activities of the teacher in the teaching-learning process.

IETC 2014

2.2. Data gathering strategy

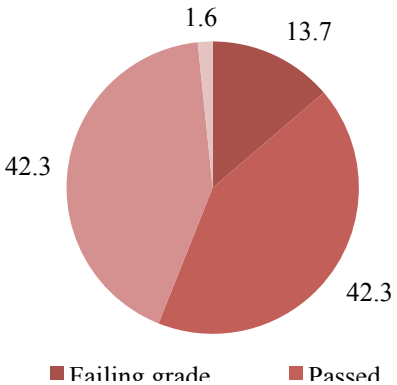
In the data gathering the following documents have been taken into account:

- The students' scores, which are in the database of the teachers who teach this subject.
- The obtained data of the students, which have been provided by them through a datasheet fulfillment. This datasheet was fulfilled individually in the classroom, three months after having started the classes, but without having done the fourth partial test and the global test, in order to avoid that the obtained score could affect the valuation of the subject. All the valuations were made in a scale from 1 to 5, in this way: 1-strongly disagree; 5-strongly agree. The sheet was divided into four large blocks, which allowed the data gathering in the following aspects: The call in which they passed the basic and fundamental subjects for the understanding and the learning of the subject, the student valuation of the fulfillment of the learning objectives planned in the subject, the method of assessment used and the effectiveness of the system of assessment concerning the learning and the encouraging.
- The students' valuation of the teaching activities was done by the School of Building, in an anonymous way. These results were afterwards provided to the teachers.
-

3. Results

The global analysis of the gathered data from the students for this research is detailed below:

- The number of students to whom we have made the research is 182. 105 of them have passed all the basic subjects (57.7%) and 122 students have passed the two subjects related to structures from the previous years (67.0%).
- The average valuation of the students about the subject is 3.9 out of 5.
- The average valuation of the students about the assessment done is 3.8 out of 5.
- The average valuation of the teaching activities is 4.54 out of 5.
-



Firstly, we show the obtained results of the scores in both assessment systems (continuous assessment (Fig. 1) and final assessment (Fig. 2)), in the subject "Structural concrete" in the year 2013-2014.

In the continuous assessment method, the percentage of students who failed the subject is 13.7%. The percentage of passed students is 86.3%. This shows that many students pass the subject through continuous assessment because it is a very practical method and it is based in the continuous work (Fig. 1).

Fig. 2 shows the results obtained by the students through final assessment. As it can be seen, the students who are assessed by this method obtain much worse results. Only the 8% of the students have passed through this method.

Next we show the results obtained by the students depending on their abilities, tested by their ease to pass the subjects from previous years indispensable for the comprehension of this subject.

IETC 2014

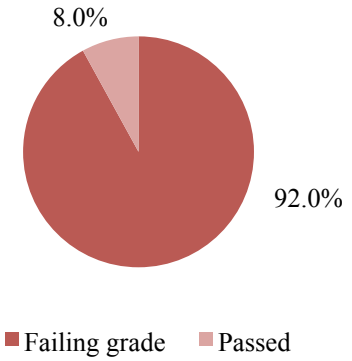


Fig. 1. Percentages depending on the scores in continuous assessment. Fig. 2. Percenteges depending on the scores in final assessment.

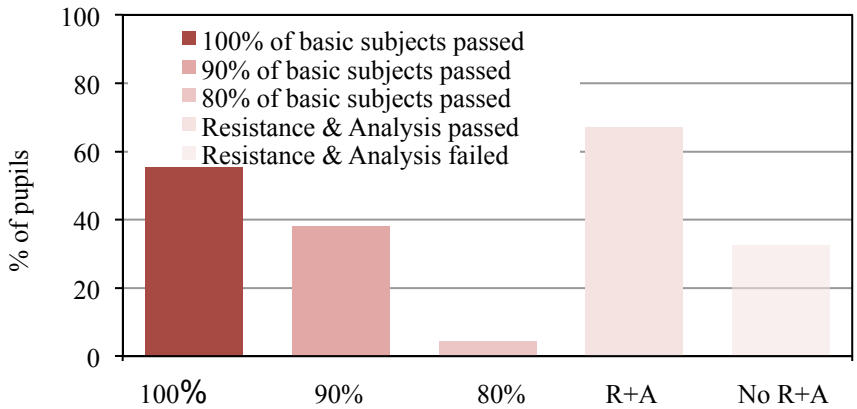

Fig. 3. Base of knowledge of the students.

Fig. 3 shows the knowledge base that the students who study the subject structural concrete have, through the percentage of students who have passed the subjects from previous years considered as basic (Mathematics I, Physical mechanics, Mathematics II, Facilities physics, Statistics and Technical projects) and as essentials (Materials resistance and elasticity and Construction structures and geotechnics).

As can be seen, 57.7% of the students have the base of knowledge necessary to confront the subject and the 67% has passed the subjects from previous years considered as essentials.

Next the students' valuation of the different aspects of the subject (Fig. 4) and of assessment are shown. All of them valuable between 0 and 5 points (0-strongly disagree; 5-strongly agree) as explained in section 2.2.

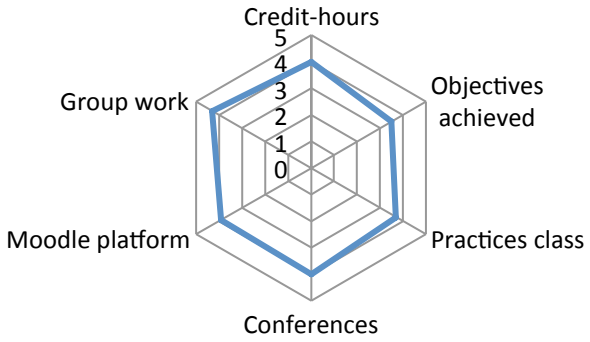

Fig. 4. Students' valuation of the different aspects of the subject.

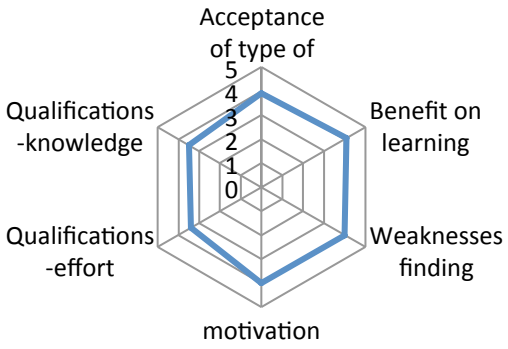

Fig. 5. Students' valuation of the different aspects of assessment.

Regarding the valuation of the subject, all the items are above 3 points, valuing the students in an especial way the usefulness of the conferences as support to the regulated teaching, the use of the computer platform "Moodle" and the group work and its usefulness to learn how to work in groups properly, as information searching and as possibility to explain orally their

The student's valuation of the assessment done is very satisfactory also, especially valuing its feedback and weak points searching capacity and therefore, its benefits regarding the learning and the personal motivation.

Fig. 6 shows the student's valuation of the teaching activities, in which can be seen his satisfaction, reaching all the items valuations above 4 points in the different variables of the teaching-learning process.

4. Results analysis

In this section we are going to show how the variables, whose results were reflected in the section 3, affect the scores and therefore, the teaching-learning process.

Fig. 1 and 2 analyses show how a teaching-learning method based in the continuous work and continuous assessment improves the performance and the results of the learning in the students.

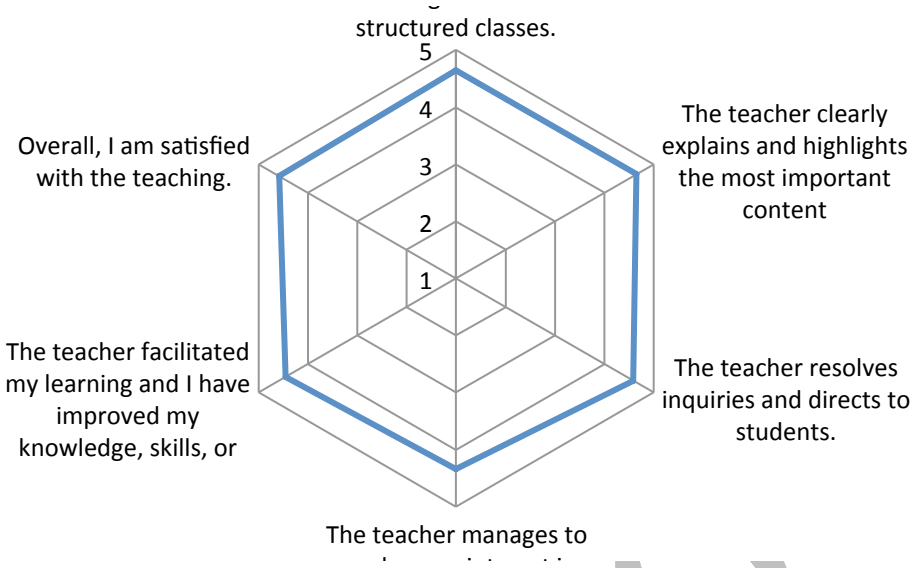

Fig. 6. Students' valuation of the teaching activities.

Fig. 7 shows the relation between the scores obtained by the students and the base of knowledge they had when they started to study the subject. Fig. 8 shows the relation between the scores obtained by the students and the fact of having passed or not the subjects considered as essential. As can be seen, the number of passed is higher in the students who have passed all the basic subjects, as in the students who have passed the two subjects considered as essential and therefore, the intrinsic ability of the student in the teaching-learning process is very important.

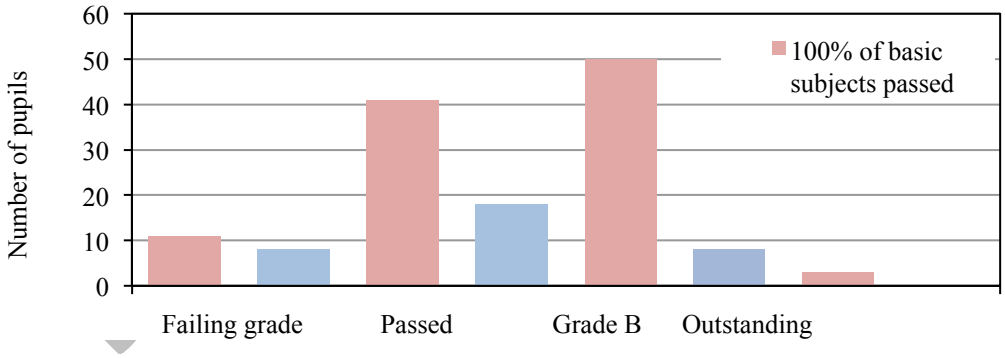

Fig. 7. Relation between the scores and the basic subjects passed.

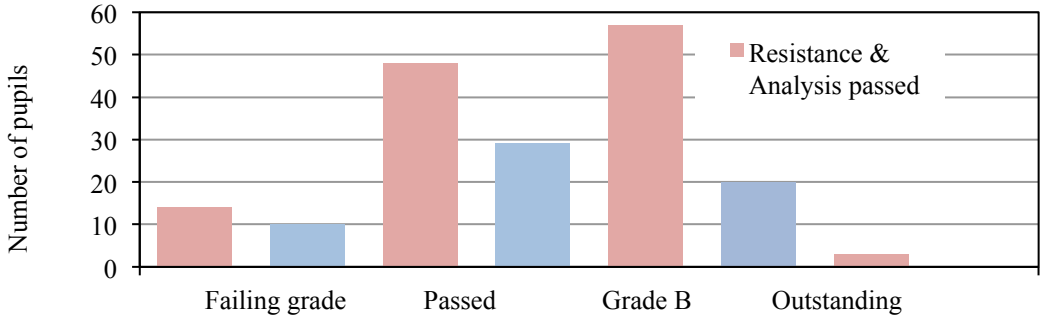

Fig. 8. Relation between the scores and the essential subjects passed.

Fig. 9 shows the relation between the scores obtained by the students and their perception of the subject. As can be seen, a good perception of the subject favors the student's answer, obtaining better scores the students with better valuation of the subject and therefore, it is important to interest the student in the contents of the subject, as make them active part of the teaching-learning process in the classroom and through the new technologies.

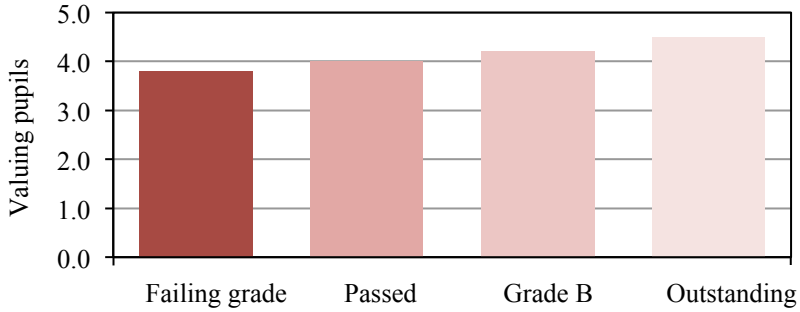

Fig. 9. Relation between the scores and the perception of the subject.

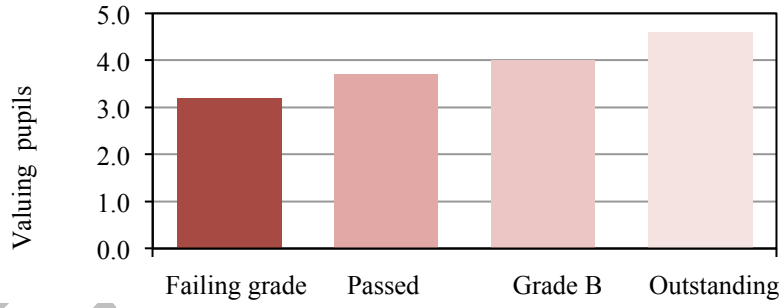
Fig. 10 shows the relation between the students' perception of the type of assessment used and the obtained scores. As can be seen, the students who obtained better results also had a better perception of the type of assessment. Because of this, it is fundamental that the assessment encourages the motivation and the feedback, in order to help the student to see it as one more part of the teaching-learning process.



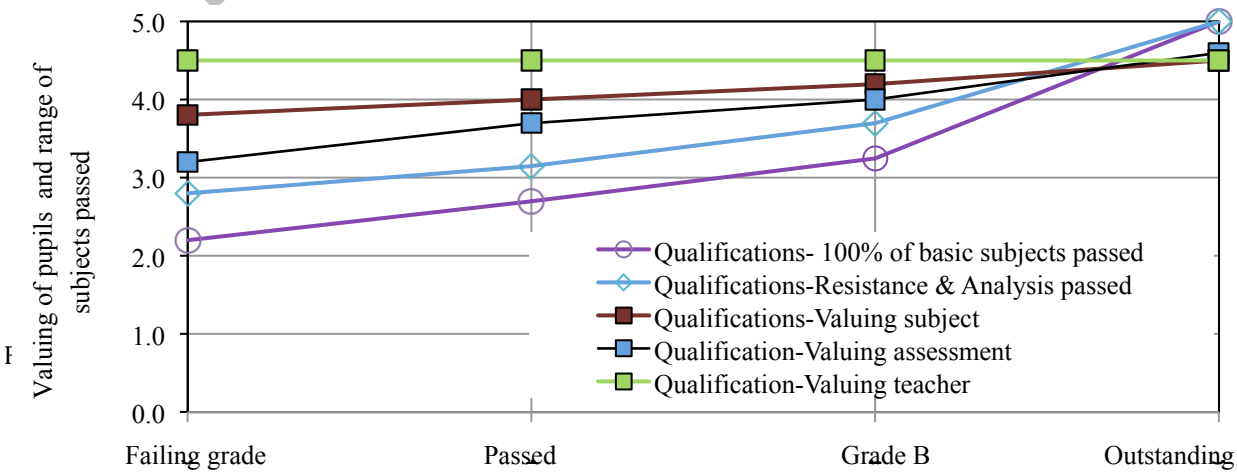


Fig. 10. Relation between the scores and the perception of the assessment.

Finally, Fig. 11 connects all the variables studied before (base knowledge of the students and their perception of the subject, assessment and of the teacher) with the obtained scores.

As can be seen in figure 11, except the valuation of the teacher, which is anonymous and therefore cannot be related to each group of students, all the other lines are ascendant from the passed to the outstanding. This indicates clearly that the analyzed variables affect directly in the level of learning reached by the students and therefore can be used as orientation to guide our efforts as teachers.

It can also be seen how even being positive all the valuations, the one related to the teaching activities is better, followed by the one related to the valuation of the subject and the assessment valuation one.

5. Conclusions

As a response to the objective of the research, the conclusions are detailed below:

- Continuous assessment improves the performance and the results of the learning in the students, encouraging their work in a continuous way, the easiest way to acquire the necessary skills.
- The overcoming of basic and fundamental subjects from previous years affects, clearly, the marks.
- The student perception of the subject is a determining factor in his motivation, obtaining better results the students who have a more positive valuation of the subject.
- It is fundamental that the assessment benefits the learning, encouraging the feedback, the motivation and the comprehension ability of the student of his own learning process. This way, the students will assimilate it as one more part of their learning process and they will improve their results.
- The valuation of the teaching activities affects in an important way the teaching-learning process and our knowledge of its perception has to give us hints to know how to improve continuously.
- Despite the students' valuation of the subject "Structural concrete" was very positive we want for the next year to improve the usefulness of the practices done in the classroom and influence in a better achievement of the planned learning objectives.
- As a general conclusion it can be affirmed that the student's ability and his perception of the subject and its teacher affect in a determining way in the teaching-learning process.

Infusing mobile technology into undergraduate courses for effective learning

Bilquis Ferdousi[a], Jamal Bari[b] 61
[a]*University of Cincinnati Clermont, Ohio, USA*
[b]*Eastern Michigan University, Michigan, USA*

Abstract

The number of courses higher education institutions are offering online, blended, or web-enhanced traditional classroom setting, continues to grow exponentially. At the same time, there is an upsurge of mobile technology that has multiple capabilities to support different instructional strategies. Among all adult groups, undergraduate students' use of mobile technology in everyday life is relatively highest. This paper identifies the impact of infusing mobile technology in undergraduate course instruction for effective and quality learning. The paper also discusses the benefits of using mobile technology in undergraduate students' learning process.

Keywords: Mobile Technology; Effective Learning; Web-enhanced; Undergraduate Course.

IETC 2014

1. Introduction

Integration of emerging mobile technology is now inevitable in every sphere of life. This phenomenon has led to tremendous interest among educators (Godwin-Jones, 2011). Mobile technology and how they are being used in education has evolved in such a way that the achievement of learning objectives is no longer limited to personal computer, but extended to the use of mobile devices that provide a greater range of applications. As developments in mobile technology progress, more opportunities for mobile technology supported learning environment emerges, enhancing the role of mobile technology as learning platform (Asselin & Moayeri, 2011). Mobile technology with its power to change the instruction and learning method are new instrument for education in higher education. The mobile-based learning pedagogical method provides many possibilities (Razaque & Elleithy, 2012). Many educational opportunities are made possible because of unique characteristics of mobile technology and its positive impacts on instruction and learning process. As a result, increasing numbers of higher education institutions are integrating these innovative technology as instructional tools (Musawi, 2011).

Mobile technology refers to the wide range of web-based tools and devices with Apps. Mobile technology in learning, as defined in this paper, involves the mobile digital devices within and between pedagogically designed learning environments or contexts. That is, mobile devices are used as tools to mediate a wide range of learning activities and facilitate collaborative learning environments (Cochrane, 2010). The freedom of time and location is related to the concept of anytime and anywhere access that

* Corresponding author. Tel.: +0-000-000-0000 ; fax: +0-000-000-0000 .
E-mail address: author@institute.xxx

represents the two main characteristics of mobile technology - mobility and reachability. A mobile learning device could be laptop, Tablet (iPad, Android), e-Reader (Kindle, Nook), and even Smart phone (Godwin-Jones, 2011). Many of these tools provide constant access to learning resources allowing extensive communication and collaboration that are changing instruction and learning environment (Abrantes & Gouveia, 2010).

The *effective learning* process: (1) enables active learning by allowing students to learn anytime, anywhere; (2) facilitates cooperation and teamwork by providing functions such as virtual collaboration; (3) improves learning by facilitating teamwork and group projects, and (4) provide knowledge or information from real world (Sheng, Siau, & Nah, 2010). With its advancement, mobile technology has become more versatile, user friendly, and cost effective. Thus, mobile technology can provide pedagogically designed learning contexts, facilitate learner-generated content (both individual and collaborative) while providing personalized and global social connection (Zhao, Waldman, Perreault, & Truell, 2009). Research found that student centered approach is fundamental to the success of learning process (Male & Pattinson, 2011).

2. Significance of mobile technology as learning tools in undergrad courses

A primary reason for infusing mobile technology in undergraduate courses is students' interest. Today's typical college students have grown up with and been exposed to all different kinds of mobile technology in almost every aspects of their lives. On a daily basis they use laptop, online social media, social networks, cellphones, text messages, RSS feeds, wikis, blogs, online learning tools, and much more. How students integrate these instruments into their lives has been the focus of much attention in research (Labach, 2011). According to a research finding, 92% of undergraduate students are mobile wireless (laptop or cellphone) users – the highest percentage among all adult groups who are using mobile technology in their everyday life (Rainie, 2011). A number of mobile devices are being used in learning environment are: laptop, net book, E-reader (i.e. Kindle, Nook), Tablet (iPad, Android), Smart phone (iPhone, Android, Windows), etc. Being familiar with mobile technology such as Web 2.0, students can find and use information; produce content in various formats such as post, blog, or video; and push content to recipients by various media such as smartphones or laptops (Cassidy, Britsch, Griffin, Manolovitz, Shen, & Turney, 2011, Diaz, 2011).

As the advent of mobile technology has deeply impacted the educational environment and mobile technology is becoming a valuable tool for learning, it is important for educators to know how to keep up with rapid growth of this technological development. Educators need to be adaptable to this emerging technology, as the majority of their students are the generation who grow up and living in the world of mobile technology. The development of mobile technology has generated a considerable amount of excitement among practitioners and academics because it results in shifting the academic environment from traditional settings to mobile learning settings. Increasing number of institutions of higher education offer courses using mobile technology as alternative teaching and learning tools (Razaque & Elleithy, 2012). However, despite the significant potential of mobile technology to be used as powerful learning tools in higher education, its current use appears to be predominantly within a didactic, instructor-centered paradigm, rather than a more general learning environment. Although, mobile technology has been identified as emerging tools to enhance teaching and learning, but the use of mobile technology in education is in its infancy at best (Cochrane, 2010).

Given that mobile technology for education is a new phenomenon that is gaining popularity, the values of using mobile technology to support education need to be further researched and better understood. In this context, the purpose of this paper is to identify the impact of infusing mobile technology in undergraduate course instruction to ensure effective and quality learning. The paper will also focus on the benefits of using mobile technology in undergraduate students' learning process.

IETC2014

3. The role of mobil technology in improving learning effectivenes

The literature on mobile technology-based education points to a variety of benefits that mobile technology could have on the learning environment. Empirically, the impacts of mobile technology on educational outcomes that are identified in the literature can be classified into two broad categories. Mobile technology impacts learning outcomes by improving access to education while maintaining the quality of education delivered. In addition, mobile technology impact learning outcomes by facilitating alternative learning processes and instructional methods (Cochrane, 2010).

Mobility and Accessibility - The most publicized advantage of mobile technology is mobility, which enables anytime, anywhere learning removing time and space constraints in accessing learning materials. Mobility also enhance capabilities for communication, coordination, collaboration, and knowledge exchange. Students who work full time or travel a lot, can use mobile technology to catch up with school work, lectures, or assignments at their convenient time and place.

Personalized learning - The benefits of mobile technology are not merely limited to increased access to educational services. Mobile technology can enable personalized learning, which is learner-centered and allow students to learn at their own pace. The greater availability of educational resources provides greater opportunity for students to discover and construct new knowledge. Learning using mobile technology can be particularly appealing for those students who have not succeeded in traditional learning environments. Mobile technology presents an appeal simply by presenting something new and exciting for a great array of new generation students. Thus, mobile technology can attract those students who are not encouraged or interested by traditional generalized learning approaches. Providing immediate feedback, mobile technology can ensure continued motivation for those students who are not motivated by traditional educational settings. Mobile technology facilitate designs for personalized learning that encourage diversity in the learning process (Sheng, Siau, & Nah, 2010).

Collaborative learning - The ability of mobile technology to enable any place and any time communication can provide more opportunities for students to interact with instructors, as well as collaboration among students. Students can communicate and interact with peer students, instructors, and experts even when they are traveling. They can work on group assignments in a flexible and efficient way without the need to meet face-to-face. Collaborative learning is a process in which students develop higher-order thinking skills by creating an environment where knowledge is shared among learners in an effort to achieve common learning goals (Brindley, Walti, & Blaschke, 2009). As collaboration is key to learning in today's educational environment, mobile technology has tremendous potential in supporting and improving collaborative learning.

Situated learning - Mobile technology can also facilitate changes in the character of learning modalities that in turn impact learning outcomes (Sheng, Siau, & Nah, 2010). Facilitating alternative learning processes and instructional methods mobile technology can ensure effective learning. Mobile technology facilitate designs for situated learning by providing learning during the course of the activity. For example, using mobile device a botany student can learn in the field, or an engineering student can learn in the workshop. Thus, mobile technology facilitates designs for authentic learning that targets real-world experience involving relevance and interest of learner (Renes & Strange, 2011).

Communication - The importance of communication between students and instructor in supporting positive learning outcomes is well-documented. The incomplete or ineffective communication is a barrier to effective learning (Hart, 2012). Instructor's quick and timely response and prompt feedback to assignments assure students and promote active learning (Heyman, 2010). Research findings emphasize on communication because good communication among peer students, and students and instructor results in improvement of instructional and learning processes. The greatest benefit derived from mobile technology is the communication that deliver effective learning ensuring collaboration among students

IECT 2014

and instructor. Mobile devices with learning Apps can ensure this communication. Even if smart phones do not have as many learning capabilities as laptops or tablets have, they provide instructors and students communication opportunities. Consequently, some instructors have begun to use smart phones in teaching because those can facilitate advanced learning environments with even faster response speeds.

4. Conclusion

Mobile technology is changing the way educators think about education. Mobile technology has multiple capabilities to support different instructional strategies and provide an efficient way of delivering course material and improving learning comprehension. Unlike traditional method, mobile technology can enhance student learning by instantly updating vast number of additional learning resources that are easily accessible and provide a low-cost educational solution to the students. Thus, mobile technology has become major resource for teaching and learning in higher education. The most important advantage of mobile technology is its accessibility from anywhere using mobile devices with wireless connection. Mobile technology can also deliver personalized and collaborative learning for students. Almost all undergraduate students are now using mobile technology in their daily life. Consequently, the infusion of mobile technology into undergraduate courses can revolutionize the processes of learning and teaching by changing the educational environment.

Innovative approaches to education in natural sciences at the Charles University in Prague

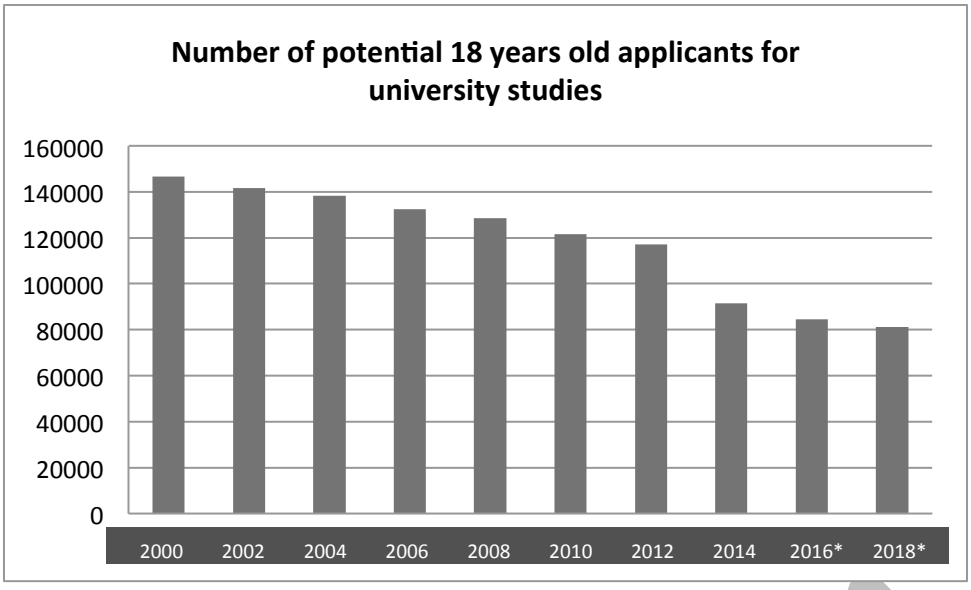
Ivan Dvorak/[a], Katerina Ciharova/[a], Hana Kosova/[a,b], Jiri Valach/[b],

/[a] ILA s.r.o., Zubateho 295/5, Prague 5, 150 00, Czech Republic

/[b] Charles University in Prague, Ovocny trh 3-5, Prague 1, 116 36, Czech Republic

Abstract

Number of students in natural sciences in the Czech Republic decreases steadily each year. Without proper intervention this trend would soon despoil the pool of human resources necessary for sustaining and further enhancing country technological competitiveness. To reverse this unfavourable trend, Charles University in Prague implements various methods of collaboration with both basic and high schools. The paper presents some innovative approaches focused on raising pupils´ interest in natural sciences and on change of teachers´ attitude in order to teach both in an understandable and attractive way.



Keywords: education in natural sciences; innovation; Charles University in Prague

1. Objectives

The results of the Analysis performed to illustrate the acute necessity to solve the lack of interest in natural sciences in the adolescents group proved that the number of individuals interested in the scientific work is steadily decreasing. This trend is visible not only in the field of natural sciences, but in the interest in research as such. This negative aspect is even more stressed in the regions outside the capital. Besides, the overall numbers of potential university students are also diminishing which even worsens the situation for the years to come.

Chart 1: Number of potential 18 years old applicants for university studies (* - forecast)

IETC 2014

Source: CSO (Czech Statistical Office)

Having in mind the necessity to assure competitiveness of the Czech economics supported by the results of science and research turned into innovative approaches we must consider the contemporary situation as unbearable.

On the other hand the results of the Analysis also proved, that there exists a cohort of pupils and students in grammar, secondary and higher specialized schools rather interested in R&D results. These selected individuals should be encouraged to continue their professional education in this area to reverse this unsatisfactory trend. Their support should be done through interactive methods as well as via modern media, which play a substantial role in the lives of this target group.

New tools have to be developed to enhance the interest of the young generation in science to make the scientific achievements accessible through modern attractive methods as audio-visual materials, webinars, communication via social networks, visits of interactive multimedia labs and intense systematic work with teachers, lecturers and students, including wide-scope offer of out of class voluntary activities for pupils and secondary-school students led by "real scientists" i.e. university and academic research staff.

Charles University in Prague with the total number of 17 faculties, more than 53 000 students and 7 900 employees (out of them 4 500 being academicians and researchers) is the largest university in the country offering the potential to effectively promote research oriented education. The goal is not only to attract the future students, but to involve them in the research activities to the extent that the science and research remain their life-long hobby and mission. This is rather not easy, as in the Czech Republic the social position, reflected also by the low financial evaluation of scientists, lags behind those of many other professions as e.g. economists, lawyers, entrepreneurs and others.

To fulfil the goals of the Europe2020 strategy we have to support strongly the process of technology and knowledge transfer from the academic sphere to the commercial one and enhance thus the competitiveness of the small and medium enterprises having their headquarters in our region. The commercialization process has the potential to bring more investors into the technology firms located in the Czech Republic and support its economic growth.

IETC 2014

To tackle the problem of lack of interest in natural sciences among the young ones the Czech Ministry of Education, Youth and Sports published in the framework of Structural Funds - Operational programme Education for competitiveness - a call focused on popularization of science. More than € 7 270 000 are being spent to perform 24 projects during the period of 16 months (starting from March 1, 2014). We are referring herewith to one of the interesting projects being implemented by Charles University in Prague.

2. Concept and approach

At Charles University the necessity of the systematic presentation of scientific results has been underestimated until recently. The contemporary comprehensive approach is ambitious, conceptual and strategic. While the past activities have been rather accidental and fragmented, usually focused just on the interests of an individual faculty, the innovative aspect lies in an overall centralised concept of popularisation published on one web-site and promoted via modern methods. The important role is played by the interdisciplinary attitude, so as a large involvement of partners outside university – not-for-profit organisations, SMEs, as well as industrial bodies. We are building on traditional aspects of work with schools and public, but new methods are being used to address wider audience and enable deeper cooperation. The faculties have suggested visits of their labs and fellowships where the participants are able to put their hands on and be totally involved into the process. Such an experience brings more interest into the studied discipline than just a passive acceptance of information. For those coming from distant regions the interactivity will be processed via internet presentations, webinars and e-learning. The Open days and meetings with scientists secure the space for face-to-face discussions offering the possibility to better understand the specific terminology and sense of science.

Lectures for academicians aim at fostering their capability to communicate the complicated research and scientific issues to public, to lay-men and even children. The easy description of their work is in most cases by far not easy and should be learned systematically.

3. Ambition

The Czech largest university together with the other partners in the project consortium offers a wide range of experience and contacts to fulfill the goal of natural sciences´ propagation through the science oriented education. The systematic work of all stakeholders will increase the number of individuals willing to spent their productive age in research and thus strengthen the human resources available in this area. New research facilities which are now being opened in different regions of the Czech Republic will have the chance to find enthusiastic persons with a real expectancy and understanding what the science and research is about.

4. Methods

4.1 Partners

IETC 2014

Besides Charles University in Prague, the main body participating in the project, another 8 partners are involved in the activities of natural sciences promotion, each of them having a specific role in the game:

- **Association TEREZA** is focused on work with primary and secondary schools integrating the science oriented education into the daily praxis. The education in natural sciences is more attractive and interesting when such an approach is applied. The model of systematic support of individual lecturers (mentoring) has been introduced with sharing the experience within regional group located around focal schools playing the key-role in the network. An important aspect is also the feed-back for the scientists giving them insight into their activities – whether they are understandably presented and correctly interpreted by the mentored persons. Participating lecturers as well as students are naturally involved also in other activities performed in the project. Foundation for future close cooperation between schools, university and other partners is being built in this way.

- **Association ARACHNE, o.s.** is a civic society which builds on its past activities and wants to extend them by more practical training in the framework of scientific workshops and courses. Arachne aims preferably on biology and organises a two-week long training camp in summer, where lectures are combined with excursions and practical training in labs. Lecturers come from different faculties of the university, most of them being from Faculty of Natural sciences. Those coming from Czech Academy of Science and/or other scientific institutions are invited as well. Shorter field visits are being held in spring and autumn. After arrangement with the scientists students can also anytime visit their research laboratories.

- **BRITISH COUNCIL** will organize a conference named "Popularisation of Science" and is preparing a course, where the foreign experts share their knowledge in this field. It is responsible for keeping the level of courses corresponding to the international standards. This partner is also responsible for the international contacts of the whole consortium and cooperation with media on both national and international levels.

- **EDUCATIONAL CENTER TURNOV, o.p.s.** is a not-for-profit organisation which will prepare a set of educational materials used in the courses organized for gifted children. The materials will be distributed among other schools involved in the regions Turnov and Liberec. As a motivation for children participating on the courses, the possibility for the best ones to take part on the workshops organized by the university has been offered.

- **INSTITUTE OF PHYSIOLOGY AS CR, v. v. i.** offers to the secondary students attendance of so-called "Memory Park" and individual fellowships. The persons interested may apply through the on-line reservation system of the university enabling also the combination of complementary visits of different laboratories enhancing thus the interdisciplinary approach which is a must in the contemporary research. Within the Memory park 5 half-day workshops are being organized where the students can test their memory, orientation and thinking (standardized cognitive tests and software used by the Department of neurophysiology of brain) followed by analysis of the results. This gives a good example how science can be used in practical life. Besides, the scientific workers of the Institute are offering 300 hours of individual consultations, which are tailor-made to the interests of participants. Sessions can be focused on questions of nutrition, diabetes, obesity and other civilisation problems.

- **Secondary school and Vocational school Jilemnice** have a long tradition of collaboration with The Charles University in Prague. The Faculty of sports measures the performance of students in Jilemnice within a longitudinal study focused especially on the cross-country skiing. Data collected are further analysed and used to support the interest of other schools in physical efficacy and sports from the professional point of view.

- **Secondary school of Josef Jungmann** cooperates with the faculty of Mathematics and Physics. It will participate on most of the activities running in the project and give a valuable feed-back of the impact of individual actions realised. The students and teachers of this school are testing the new interactive educational materials and amend them from their practical point of view.

IETC 2014

- **ILA, s.r.o.** is a private SME active in innovations which facilitates the activities among faculties and partners. Its goal is to disseminate the results of the project via the web-portal www.inosfera.cz. The role of ILA is also to analyse sources of inspiration for further development of activities, especially case-studies and examples of good practice. ILA offers to the participants in the project the meeting premises where the webinars and on-line broadcasted seminars can be attended. E-learning based on long-term experience with this form of education is a domain of this partner as well.

4.2 Key activities to promote natural sciences (KAs)

KA 1: Science in praxis for teachers, academic workers and selected pupils/ students

KA 2: Science oriented education in regions

KA 3: Production of educational materials for lecturers in natural sciences (reflecting science oriented education and interdisciplinary approach)

KA 4: Production of educational aids for individuals interested in scientific and research work (students at primary, secondary and vocational schools)

KA 5: Efficient ways of popularization of natural sciences in media, usage of modern tools for transfer of knowledge, experience and attitudes

KA 6: Strengthening of professional capacities in scientific camps and workshops organized for students interested in research work

KA 7: Bootcamps for lecturers of natural sciences focused on science oriented education

KA 8: Popularization of research work through education using examples of civilisation illnesses (obesity, DM)

KA 9: Even the sport is a science

5. Expected impact

The aim of the Ministry of Education, Youth and Sports is to change the low interest of young generation in science through the money invested into the projects similar to ours. Although the number of university students is increasing, the involvement of alumni in further doctoral education is far behind satisfactory rates. The number of doctoral students is more or less the same during the last years, and compared to total number of tertiary students it is decreasing steadily, as shown on the Table 1. Taking into account the fact, that the numbers of potential university students in the future are also diminishing, the situation with human resources in the Czech science seems to be almost critical.

Table 1. Tertiary education – alumni in the school-years 2003/4 – 2010/11

Students in tertiary education	2003/4	2004/5	2005/6	2006/7	2007/8	2008/9	2009/10	2010/11

The systematic work with students and their lecturers will deepen the interest of this target group in science and research. Based on presentations, discussions, practical trainings, on-line courses as well as

IETC 2014

using other new modern means of communication as webinars, teleconferences, social networks (Facebook, Twitter) will make the information more attractive and digestive for the young generation. Also the lecturers will be taught how to teach effectively. The academicians will get the information on the best way of communication with lay-men.

The target group will get new knowledge either in a selected specific topic or in the transdisciplinary area giving thus the chance to find out the specific field of interest for each individual.

The activities performed are developed to cover a wide-range of potential participants corresponding to different age groups and knowledge levels. They are scalable not to overwhelm the listener.

We hope in influencing most of the students taking part on the training in their decision about future studies and their professional career. Newly opened research facilities will have a chance to find in them enthusiastic and dedicated scientific workers in the future.

The pedagogical workers at different schools (basic, secondary and vocational) will be acquainted with recent findings in science and will get valuable contacts with academic milieu to be used even in their future work. The researchers will learn how to communicate better and in more understandable manner their special expertise.

6. Conclusion

The activities focused on popularization of science and research should lead to increased numbers of persons involved in R&D in the Czech Republic. The interdisciplinary approach to science is essential not only in natural sciences. The activities of the presented project therefore cover many faculties of the university, as well as many experienced partners, and are using modern innovative tools for learning and communication such as: videos, e-docs, tablets and smart-phones´ applications, webinars, on-line games and competitions etc. Besides the more traditional methods of teaching many practical experiments, personal contacts in labs, workshops and camps are integrated into the project. This should lead to positive changes of attitudes of the teachers in order to enable the target group to gain real hands-on experience with science and raise their natural curiosity and interest in the subject and motivation to become life-long researchers.

Abstract

The purposes of this study are to 1) synthesize an instructional design framework from the three instructional design theories, and 2) create an instructional design framework for educational media, and 3) study students' opinions for educational media. The synthesis was first made through the Delphi technique with 17experts to identify their perspectives on the three instructional design theories. The sampling group was 42 undergraduate students of Rajamangala University of Technology Thunyaburi, Thailand. The instruments were educational media according to Instructional design framework; an achievement test; and a questionnaire to assess students' opinions toward the developed educational media. Statistical procedures for data analysis included the E_1/E_2, mean, standard deviation, and t-test. The results revealed that the framework provides excellent potential for development and evaluation. The study confirmed that for instruction to be successful, various aspects of the environment should be considered such as application of domain knowledge, conceptual theory, and evaluation of the overall quality of the designed environment. Educational media had the efficiency at the 82.5/80.5 efficiency criteria, students were learned from the packages achieved significant learning progress at the .05 level and their opinions were at the highly agreement level regarding the appropriateness of the instructional media.

*Keywords:Instruc*tional Design; framework; Educational Media; Synthesis; Delphi technique.

1. Introduction

One of the most useful applications of the World Wide Web (WWW) integrated with information technology is for education use as the web-based, distance, distributed or online learning to maximize student learning, providing learners and educators a wide range of new and interesting learning experiences and teaching environments different from the traditional classroom context of education. Electronic media technology-enhanced and student-centred learning environments can facilitate the learning and understanding of abstract concepts since students can notice graphically displayed changes of concrete experience (Hannafin & Land, 1997; Alexander, 2001). Effective e-learning environments allow students to work socially with each other. To achieve it, the core elements are the presence of the teacher, the availability of printed resources and the purposive interaction with the computer by students (Phillips, 2005).

Although education medias are widely used in all educational levels, it should be known that vocational education needs both academic and practical approaches. Each approach requires different instructional design frameworks. Therefore, the instructional design for education media which this paper are discussed in behavior learning, creative thinking learning, and organization learning, with their were tree psychology theories framework were as a guide for create and development a questionnaire to submit to educational experts. Based on the Delphi technique, these three synthesize were in order to create a new method for process learning via instructional of education media, which may be applied to both online and offline in education media and teaching of vocational level.

The researchers used the Delphi technique so that experts were able to express their opinion on what they agreed in order to create an instructional framework that complies with psychological principles according to an instructional design framework for autonomy. This framework will help learners achieve their learning objectives effectively and efficiently, as well as help learners to understand in a faster and more stable way (Sangsawang; Jitgarun; & Kaittikomol, 2006,). Theoretical frameworks provide a myriad of ways in which instructional design framework for education media practicums may be used, based

upon the instructional and pedagogical needs of the vocational course. The development of instructionally effective online learning environments that meet these pedagogical needs requires the application of appropriate instructional design principles. In designing an online instruction, the underlying pedagogical philosophy and application of learning theories, including constructivism and constructionism influence decisions regarding what instructional strategies may be adopted (Dick, Carey & Carey, 2005). Furthermore, the relationships between the design process framework and the effectiveness of the instructional design framework for education media environment are discussed.

2. Literature review

This study develops a framework based on three theories which include learning theories in behaviourisms, creative thinking, and organization learning. Each of the theories involves the psychology of learning as follows -:

2.1 Behaviourism's Theories.

Cognitive processes and the ways in which thoughts occur and the ways in which behaviourism arises from them are the subject of considerable study. This particular study looks at how learning is affected. It is believed that instructional design needs to be applicable to cognitive, behavioural, and attitudinal learning so that the strategies work together to create understanding (Taylor, 1996), to be applicable (Merriam &Caffarella,1991), to create cognition and elements of situated cognition, to build on cognitive or mental phenomena (Lynch & Bogen, 2005), to create cognitive activity (Jetin, 2006), and cognitive organizers (Tan, Dawson, &Venville, 2008), and to operate processes of memory. Therefore, taken as a micro theory, it sets out a set of procedures which can be followed for each instructional event that can enhance learning. A nine step procedure was developed by Gagné and these steps work together with the cognitive strategies learning theory (Kruse, 2000). In the instructional design framework the first principle is 'attention', which follows the cognitive strategies learning theory, and the second principle, 'announcing the objectives further focuses the trainees' attention The recall of what has been previously learned brings the memory into action. The nine step procedure of instruction is examined in more detail later, with additional information coming from the relevant sections of social learning theory (Blanchard & Thacker, 2007), and the way in which an instructional event corresponds with a learner's internal mental process is also explained. How the interactive content in an e-learning course can keep the learners' attention is described in Gagné's nine step procedure of instruction (Muzio & Mundell, 2002).

IETC2014

Table 1. Gagné's nine events of instruction (Kruse, 2002)

Instructional Event	Internal Mental Process
1. Gaining attention.	Stimulates and activates receptors.
2. Informing learnersof objectives.	Creating level of learning expectation.
3. Stimulation ofthe recall of prior learning.	Retrieves and activates short-term memory.
4. Presenting the content.	Selective perception of content is formed.

5. Providing learning guidance".	Leads to semantic encoding of long term memory.
6. Eliciting Performance(practice).	Responding to questions which enhance encoding and verification.
7. Providing feedback.	Reinforcement and assessment of correct performance.
8. Assessment of performance.	Retrieval and reinforcement of content for final evaluation.
9. Enhancing retention and transferring to thejob.	Retrieval and use of learned skill in newsituation.

2.1 Creativethinking Theories.

Learning by doing is the most popular and effective process of learning ever adopted by psychology, and it is based on practical training in order to create vocational skills the trainees gain experience in group participation in techniques or technology learning. The focus is on constructivist learning theory, the ways of doing and thinking, (Piaget, 1972), and humanist activities in which thoughts occur (Merriam &Caffarella, 1991). Most agree that learning by doing, which focuses on knowledge construction based on the learner's previous experience, is a good fit for e-learning (see Harman &Koohang, 2005; Hung, 2001; Hung &Nichani, 2001; Koohang& Harman, 2005).Theories advanced by Dewey (1916), Piaget (1972), and Bruner (1990), state that the constructivism learning theory is based on a learner's prior experience (Koohang, Riley & Smith, 2009). Woolfolk states, 'the key idea is that students actively construct their own knowledge: the mind of the student mediates input from the outside world to determine what the student will learn. Learning is active mental work, not passive reception of teaching' (Koohang, Riley & Smith, 2009). Honebeins proposed a target to aid the design of constructivism in learning settings in which there were seven goals. These were: to provide experience with the knowledge construction process; to provide experience in and appreciation of multiple perspectives; to embed learning in realistic and relevant contexts; to encourage ownership and voice in the learning process; to embed learning in social experience; to encourage the use of multiple modes of representation and to encourage self-awareness in the knowledge construction process (Honebein, 1996).

2.2 Organization learning Theories.

There is a focus on constructionism (Papert, 1991); knowledge-building, situating constructionism, society and situation (Bandura, 2000 & Merriam &Caffarella, 1991), situated learning, social negotiation (Baptista&Fowell, 1996), social constructionism and constructivism, and social contexts. These theories rest upon the supposition that there must be a social context in which the learner can build and develop his ideas (Kafai& Resnick, 1996). Ideas cannot be transmitted by a teacher, peer, or book-they must be created. A person comes up with an idea, and constructionism then adds to this fundamental notion that knowledge is built up more effectively when a person is engaged in an activity which means something to him. In constructionism, both the effect and the gaining of knowledge are equally important, so when used for vocational Internet-based training, the curriculum must be set out to ensure that the learner becomes part of it and gives him the desire to proceed further. Online-training should make the trainee interested in building his/her own meaningful online tools, otherwise, he/she might become unresponsive, and socially, an instructional design model should have the objective of preparing learners for the world of workthat influences students to work hard and achieve academically. Students to be in a state of flow engagement in learning tasks. It is also predicted that being in a state of flow will contribute to high academic performance. (Muzlia, Eliasb, Noahb, and other., 2010)

2.3 Educational media.

Electronic learning media in technology-enhanced and student-cantered learning environments can facilitate the learning and understanding of abstract concepts now that students can notice graphically displayed changes of concrete experience (Hannafin& Land, 1997; Alexander, 2001). Effective e-learning environments allow students to work socially with each other. To achieve it, the core elements are the presen-

IECT 2014

ce of the teacher, the availability of printed resources and the purposive interaction with the computer by students (Phillips, 2005). The e-learning in high schools and academic performances were evaluated through several assignments designed by the IT course instructors affect tostudents were indicated that computer skill levels did have a direct correlation with a student's academic performance level. The database was further parsed based on demographical factors,resulting in a set ofcommendations to enhance the effectiveness of e-learning. (Pardamean&Suparyanto,2014). Therefore, In parallel with the technological developments dominating usage of digital tools in science and education, the traditional education methods which are still using in many design school, the endeavor indicates that determine the appropriate learning method by considering individuals different cognitive style. The cognitive styles mean classify individuals according the way of perceive information and process it. Through this way, as subjects of the study, students categorized in respect to their cognitive styles whether field dependence or field independence, and then the relation between their cognitive style and spatial knowledge acquisition from virtual environment was observed. While defining digital tools in design education, the need of differences related to cognitive styles should be considered, this is supported by the data from this study which are indicating the increase of students' spatial knowledge in different scale of virtual environments. (Yildrim& Zengel, 2014) and the effect of screen reading and reading from printed out material on student success and permanency in Introduction to computer lesson is investigated. Learners were showed that reading from printed out material is more efficient than screen reading. (Tuncer&Bahadir, 2014).

Chapter 13 2. Objective of the study

This study aims (1) to synthesize an instructional design framework from the three instructional design theories, (2) to create an instructional design framework for education media, and(3) to study students' opinions for education media.

3. Research approach

3.1 Sample

The sample was seventeen experts were chosen through the purposive sampling method. Seven experts were qualified in educational psychology and ten in educational technology. They all had a doctoral degree and had worked for over five years in at least the position of assistant professor. Sampling group was 42 undergraduate students of Rajamangala University of Technology Thunyaburi.

3.2 Tools for data collection

1. Semi-structured interviews:Semi-structured interviews (Patton, 1990, p. 339) were used for first round: brainstorming was related to the framework Behaviourism's Theories andCreative thinking Theoriesand organization learning Theories.

2. Questionnaire I: Questionnaire I was used for the second round: the evaluation of the experts' ideas on Behaviourism's Theories andCreative thinking Theoriesand organization learning Theoriesconcerning an instructional design model for self-regulated, online learning at the vocational level. Questionnaire I for evaluating 17 experts on Behaviourism's Theories andCreative thinking Theoriesand organization learning Theories concerned an instructional design model for self-regulated, online learning at the vocational level and used a five-point Likert scale.

IETC 2014

3. Questionnaire II:After questionnaire I had been returned, the responses were synthesized and developed through a diagram chart (as shown in chapter 4 and figures 4.1 - 4.8) and then categorized into: similarities and differences. Questionnaire II used a five-point Likert scale (Likert, 1932; Verhagen et al., 1998; Linacre, 2002) (1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = moderately agree, 5 = strongly agree).

4.Questionnaire III:After questionnaire II had been returned, the responses were identified, categorized and condensed into major themes and suggestions and sent back to all experts for review and consensus for the fourth round. Questionnaire III was used to check the content validity by 17 experts based on 'yes' or 'no, 'unsure'.

5. Pre-test - Post-test: Learner was do Pre-test before learn with education media, after that they was do Pros-test for a questionnaire to assess students' opinions toward the developed education media. Statistical procedures for data analysis included the E_1/E_2, mean, standard deviation, and t-test.

6.Questionnaire IV: Questionnaire for student' appraisal, Instrument for data collection was a questionnaire regarding student's self-appraisal for education media.

3.3 Data analysis

1.The data was analyzed by using frequency, percentage, content analysis, and Mind Manager application.
2.The operation was done by using three types of tools (1) brainstorming, (2) evaluation, and (3)re-evaluation.
3. Data analysis was done using SPSS/FW (Statistical Package for Social Science/for Windows) software. The part I with selection items was analyzed using frequency and percentage. The part II with five scales was analyzed using mean ($\overline{x}$), standard deviation (S.D.) and correlation.The levels of agreement from respondents were as follows: Average Score of 1.00–1.49 means strongly disagree whereas average score of 4.50 – 5.00 means definitely agree.
4. Collection Data was collection opinion of teachers at vocational education for confirms using an instructional design framework for education media.Study students' opinions for education mediawasundergraduate students of Rajamangala University of Technology Thunyaburi.

3.4 Method

The data were collected through the Delphi technique. There were four rounds for the data collection as follows:

First Round: Brainstorming

The first round involved brainstorming from the experts through semi-structured questionnaires based on behaviourism's theoriesandcreative thinking theoriesand organization learningtheories, all of which focus on cognitive processes, the learning by doing approach, and social context. The first round of data collection proceeded as follows:

1. Connected with/contacted/called 17 qualified experts by phone to request their agreement to participate in the study using the Delphi technique.

2. When all 17 qualified experts had agreed, the researcher issued official letters of invitation to invite experts.

3. Appointments were made with all qualified experts on the date and time preferred.

IETC 2014

4. Eight experts allowed the researcher to meet them in person. The questionnaire was handed to all experts at the appointment. Three experts wrote comments on the questionnaires in front of the researcher. Five experts gave opinions while the researchers were making notes.

5.Nine experts preferred to fill out the questionnaire by post and they were returned to the researcher. There were no other comments from these experts.

6. Answered questions and explained the purpose of the questionnaires.

7. The researcher separated the replies into similar and different categories to get a majority opinion.

8.The data from the interviews based on the semi-structured questionnaire were grouped and arranged to draft Questionnaire I concerning teaching and learning design based on the three psychology theories, Behaviourism's Theories andCreative thinking Theoriesand organization learning, which focus on cognitive processes, the learning by doing approach, and social context. The researcher who prepared Questionnaire I followed Likert's five rating scale. Data analysis used frequency and percentage. The part with five scales was analyzed using mean (*M*), standard deviation (SD) and correlation. The levels of agreement from respondents were as follows: average score of 1.00-1.49 means strongly disagree whereas average score of 4.50-5.00 means definitely agree.

Second Round: Evaluation of the experts' ideas

The second round evaluated the ideas using the Likert five-rating scale in questionnaire II.

1. Connected with/contacted/called 17 qualified experts by phone to request their agreement to participate in the study using the Delphi technique.

2. When all 17 qualified experts had agreed, the researcher issued official letters of invitationto invite the experts.

3.Appointments were made with all qualified experts on the date and time the experts preferred.

4. Eight experts allowed the researcher to meet them in person. Questionnaire II was handed to all experts at the appointment. Three experts wrote comments on the questionnaires in front of the researcher. Five experts gave opinions while the researcher was making notes.

5. Nine experts preferred to fill out the questionnaire II by post and it was returned to the researcher. There were no other comments from these experts.

6. The researcher then processed the new data from the first round open-end questionnaire to check for a consensus. The researcher selected the items from the results of the semi-structured interview questionnaire.

7. The results of synthesis of similarities and differences led to diagrams, "Work well for decision trees", (Strawbridge, 2007, p. 640)

8. The data collection from 17 experts and was conducted through the post or by interview.

9. The values: median, mode, and interquartile range in each question item were measured.

10.The data regarding the similarities and the differences based in three psychology theories regardingbehaviourism's theories andcreative thinking Theoriesand organization learning Theories; all three theories focus on mental processes, learning by doing approach, social contextwere synthesized. After that, the researcher created an instructional model of learning process theories for self-regulated education media, online - offline learning at vocational education.

IETC 2014

Third Round: Re-Evaluation

In the third round the 17 experts were required to respond 'yes' or 'no' and 'unsure' to the questionnaire III.

1. Selected the items from the results of Questionnaire II. These included all principles, teaching-learning activities strategies, teaching-learning environments, and stages of instructional sequence which make up mental processes, learning by doing, and social context.

2.The findings were pooled together as similarities or differences. The similarities meant that most of the 17 experts agreed while the differences meant the reverse. The results of the synthesis were used to develop Questionnaire III.

3. Appointments were made with all qualified experts on the date and time the experts preferred.

4. Eight experts allowed the researcher to meet them in person. Questionnaire III was handed to all experts at the appointment. Three experts wrote comments on the questionnaires in front of the researcher. Five experts gave opinions while the researcher was making notes.

5. Nine experts preferred to fill out the questionnaire III by post and it was returned to the researcher. There were no other comments from these experts.

6. Created an instructional model of learning process theories for self-regulated online learning in vocational education.

7. After the researcher concluded Questionnaire IV, the framework for an instructional model of learning process theories for self-regulated online learning in vocational education was developed.

Fourth Round: Solution-Report

In the fourth round, the experts came to a resolution and made a report since the feasible ideas had been identified. Furthermore, the experts would acknowledge all the group's opinions with the ideas or strategies and details of implementation.

4. Findings and discussion

4.1 Delphi technique

First round: In the brainstorming session, the researcher focused on Behaviourism's Theories andCreative thinking Theoriesand organization learning Theories, covering cognitive processes, learning by doing, social context, and the results from this analysis was used for the framework for the semi-structured interviews. The questionnaire was sent to a group of 17 experts who were given two to two and a half weeks to complete and return the first round of questions. After the responses were received, the answers were categorized, synthesized, and developed into another questionnaire I.

Second round:This was the evaluation of the experts' ideas phase and consisted of the evaluation of the experts' responses by using a Likert five-rating scale (Likert, 1932, p. 1-55). In round two evaluations,

IETC 2014

Questionnaire I was used for the management of the experts' ideas on Behaviourism's Theories andCreative thinking Theoriesand organization learning Theories concerning an instructional design model for self-regulated, online learning at the vocational level.

Third round:In this re-evaluation stage, the selected items from the results of questionnaire I included all principles, teaching-learning activities/strategies, teaching-learning environments, teaching-learning models frombehaviourism's theories(cognitive processes) andcreative thinking theories (learning by doing) and organization learning theories(social context) concerning an instructional design model for self-regulated, online learning at the vocational level were pooled together as similarities or differences.The similarities meant that most of the 17 experts agreed, while the differences meant the reverse. The results of the synthesis were used to develop questionnaire II (using a five-point Likert scale) which was sent to the experts for the third round.

Fourth round:By this round, the feasible ideas had been identified, resolved and reported. The experts would acknowledge all the group's opinions with the ideas or strategies and details of implementation.

4.2 Brainstorming

The researchers conducted semi-structured interviews with 17 experts for the first round: brainstorming of experts' opinions would be related to the framework developed frommental processes, learning by doing approach and social context.

The researchers analysed the interviews of the experts' opinions about each idea. The details interview form was in fourparts as follows: key ideas and principles, teaching- learning activities, strategies, instructional environments and stages of the instructional sequence.

The researchers synthesized the first round of opinions of the experts using a Likert five point rating scale. Following this step, an instructional design framework was prepared covering Behaviorisms Theories and Creative thinking Theories and organization learning Theories.

4.3 Evaluation

The ideas gained from the experts were evaluated using Likert, a five-point rating scale, questionnaire for the second round as shown in the evaluation of the 17 experts' ideas on cognitive processes, creative learning, and organization learning concerning an instructional design framework for education media.

The items from the results of questionnaire I were selected. This meant that all key ideas, principles, teaching-learning activities, strategies, instructional environments, and stages of instructional sequence comprising cognitive processes, creative thinking, and organization learning were pooled together as similarities or differences. The similarities meant that most of the 17 experts agreed while the differences meant the reverse.

The results of the synthesis of similarities and differences led the researchers to develop a diagram chart. Then, the 17 experts were required to respond "Yes" or "No" to questionnaire II.

4.4 Re-evaluation

The researchers selected the items from the results of questionnaire II. These included all key ideas and principles, teaching-learning activities, strategies, instructional environments, and stages of instructional sequence comprised fromcognitive processes, creating thinking, and organization learning.

After the researchers concluded questionnaire III, the framework for instructional design framework for education media was developed.The results of this research focus on three clusters that help create the

IETC 2014

framework for the theories and also include aspects of the learning process. The study allowed for the expression of experts' opinions, and similarities and differences could be described in the framework.

Re-evaluation was found teaching-learning activities/strategies for education mediaframework
that instructors are able to apply the results of this research in developing both education media and online media learning or offline media by using instructional design framework for education media with there were psychological principles via multimedia, preparing the suitable content for instructional design for education media, learning by themselves, designing the approach for online learning which suits learners most and understand the problems arisen from online learning so that learners can integrate ideas, build up body of knowledge by themselves and self-appraisal.

4.5 Self-Appraisal for education media.

Phase I : Students' Self-Appraisal for education media.

In order to obtain the data concerning students' self-appraisal for education media, the researchers developed a semi-structured questionnaire regarding to student's self- appraisal for education media. The questionnaire focuses on the effectiveness of online learning. After collecting the data from the sampling group of 100 Rajamangala University students in the academic year 2014 by random sampling method, the following self-appraisal for online learning from students were: 1) To make online learning effective, there must be appropriate materials supporting information resources, 2) Instruction must improve learner's learning skills, 3) Instructors must update data to students with electronic learning, and 4) Education learning on one's own must be convenient and easy for students.

Phase II : Online Learning Model as Perceived by Learners.

From the responses of the questionnaires regarding Online Learning Model, it was found that: 1) Most students look forward to learning new skills, but they would rather have face-to-face interaction and need faculty to constantly remind them of due dates and assignments, 2) Most students can go to campus anytime, and the amount of time they have to work on an online course is less than that for a class on campus; therefore, online learning is a personal interest that could be postponed, 3) As of other items, most students need reminding to get things done on time, classroom discussion is sometimes useful to them, they try to follow the directions on their own, then asking for help as needed, and sometimes need help to understand the text.

Phase III: Online Learning Model as Perceived by Instructors.

5. Conclusion

In this article, the researchers have offered a framework and design process for education media environment. The implementation of the internet-based involves several steps including a consideration of various aspects of information, conceptual development, theories of psychology and an evaluation of the overall quality of the system environment. In particular, the research aims to improve the design process and usability of the Internet-based environment. The study also confirms that for GCC Framework for

IETC 2014

education media to be successful, various aspects of the online environment should be considered. These include the application of domain knowledge, conceptual theory, theories of psychology and an evaluation of the overall quality of the design process.This is presented in the two parts that follow as in part Iin Figure 1: key idea and principle and part II: in Figure 2:GCC frameworks.

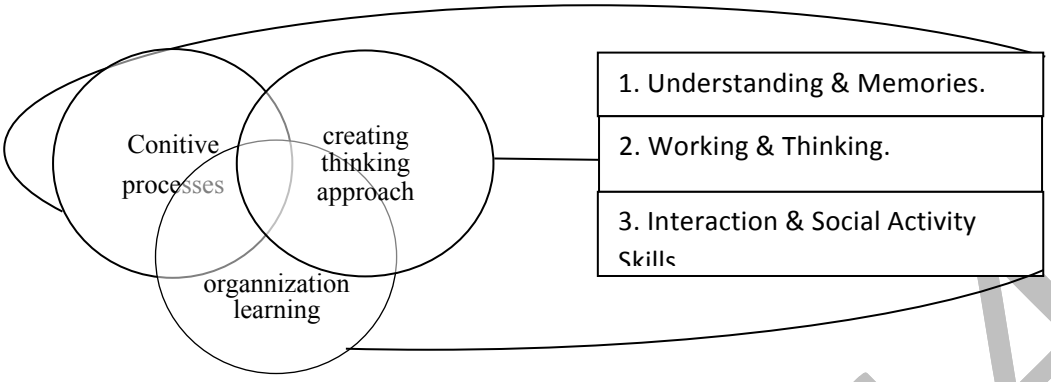

Fig. 1.Key idea and principle

Stages of instructional sequence of three theories

Table 2: Stages of instructional sequence according to mental processes, learning by doing and social context as follows: (Thosporn, 2006)

Cognitive processes	Creating Thinking	Organization Learning
-Instructors create stimuli to activate receptors.	-Learners rethink to activate pre-knowledge.	-Learners and instructors share thoughts and build their own self- knowledge.
-Instructors create level of Expectationfor learning.	-Learners find questions.	-Learners and instructors build structures to construct their own -self- constructionism
-Instructors build retrieval and activation of short-term memory.	-Learners perform self-regulated learning by doing theirtasks.	-Learners and instructors construct knowledge - building communities.
-Instructors select perception of content.	-Learners share activities together.	-Learners and Instructors discuss and construct knowledge organization.
-Instructorscreate semantic encoding forstorage of long-term memory.	-Learners share understanding of knowledge with instructors.	-Learners and Instructors share and construct information to manage knowledge.
- Instructors guide how learners respond to questions to enhance encoding.	-Learners share regulating activities to transfer knowledge.	-Learners and Instructors construct and collaborate on their tasks.

IETC 2014

-Instructors create verification, (reinforcement and assessment of correct performance).	-Learners present activity.	-Learners and instructors combine experiences to develop their own self.
-Instructors create retrieval and reinforcement of content as final evaluation of learning, and retrieval and generalization of learned skills for learners to build new situation		

4.5 GCC framework

In this section, the researchers present Instructional Design Framework for education media or researcher called GCC framework that there have got it's from experts' congruence of selected psychology theories, namely cognitive processes, creative thinking learning, and organization learning classified by "Teaching-learning models."The researchers created an instructional design framework for education media. The research involved a framework with the sample for the study consisting of 100 instructors who developed electronic media (such as e-Books, and e-Learning, WBI, and CAI) in the vocational education fields of electrical engineering, electronics, civil engineering, and mechanics from several faculties of technical education in universities in Thailand.The teaching-learning activities/strategies for education mediaframework thatit's call GCC framework as show in picture1, there have three parts such as stages of instructional sequence; teaching-learning environments; Students' self-appraisal for education media.

Stages of instructional sequence of GCC framework

These frameworks have stages of instructional sequence for teaching and learning6 steps.The core components as follows:

Step 1: Creating conditions for internal mental learning process as in insight information. Instructors provide on operating conditional learning, giving information, signal learning, objectives, expected outcomes,benefit from learning and activities and create teaching criteria to suit the learners with external conditions.

a) Chaining: Instructors provide events of learning as well as a step-by-step process of learning.
b) Verbal association: Instructors use a process learning and instruction model.
c) Discrimination: Learners learn through testing and feedback.
d) Concept learning: Instructors create tasks and conditional learning as a method and stages of learning process for learners.

Step 2: Creating processing memory.Learners learn how to achieve the objectives of learning and to meet conditional learning and created rule learning by them own.

Step 3: Perception knowledge andInformation.Instructors provide programmed instructions, tutorials, simulation, games and drill as well as practice and test for learners. They were solving problem by them self.

Step 4:Providingsituated cognition, a teacher was created content and activities learning.Learners are encouraged to recognize and understand reflective thinking and thinking initiatives. They can be them creative thinking.

Step 5:Performing,processes access. Teacher was designed Drills and practices.Learners can plan, set assumption, investigate and solve problems by themselves. They should use simulation and gaming media by themselves, self-learning.

Step 6:Supporting construction of knowledge.

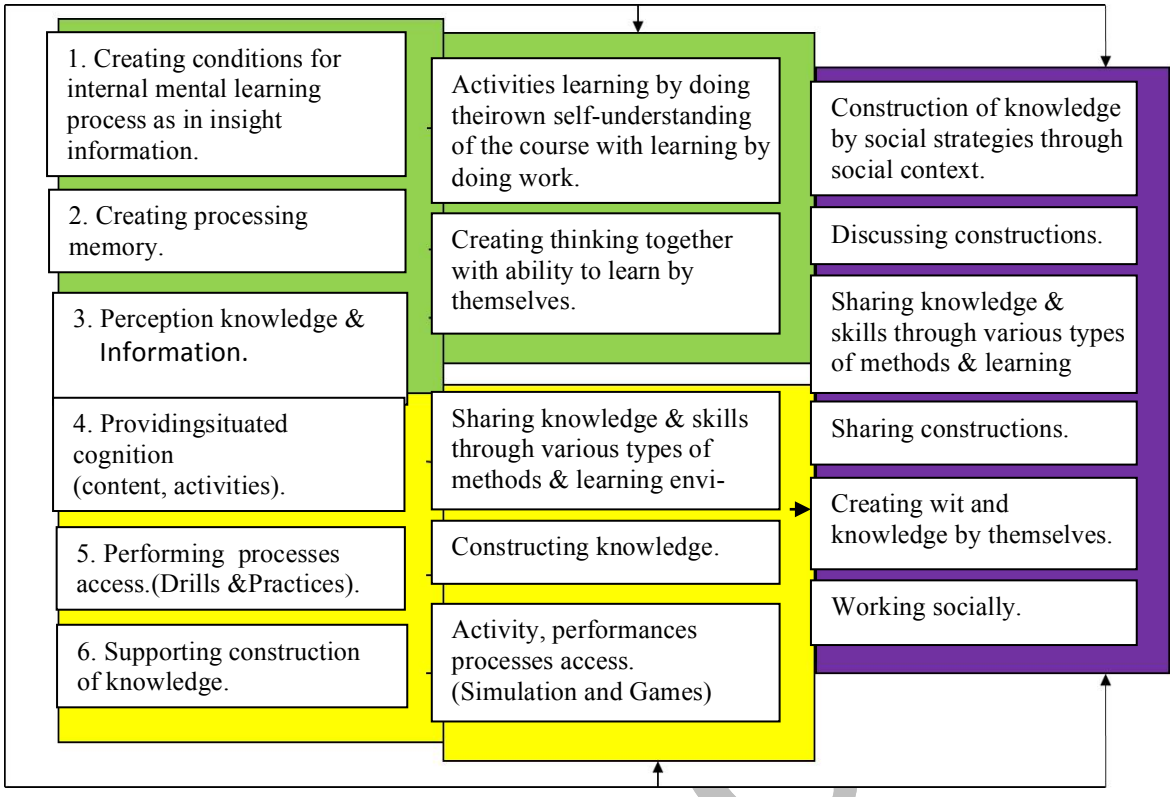

Fig. 1. GCC framework

Activities/ strategies

1. Learner's activities/strategiesstep 1 to step 3, Learners should be activities learning by doing theirown self-understanding of the course with learning by doing work and creating thinking together with ability to learn by themselves.In prat,step 5 to step 6, Learner should be sharing knowledge & skills through various types of methods & learning, Constructing knowledge, Activity, performances processes access.Simulation and games)

2. Instructor encourages to learners cognitive.Teacher should be give signals learning; chaining;verbal association; discrimination learning; concept learning; rule learning; problem solving; creative thinking; reflective thinking; thinking initiatives.

3. Learner created thinking by them self. Teacher should be encourage to leaner by self-learningCo-operative learning; Project-based learningProblem-based learning;Situation learningGroup InvestigationInquiry method; New knowledge Simulation and Gaming.

4. Instructor and learner should be creating teaching-learning typeswithorganization learning together by learner dobrainstorms for project based; planning their own learning; learning by doing; presentation; learning assessment; modifying actions.

Innovation and Attributions

Instructor was correlatedwith learners for creating innovation. The core components as follows:

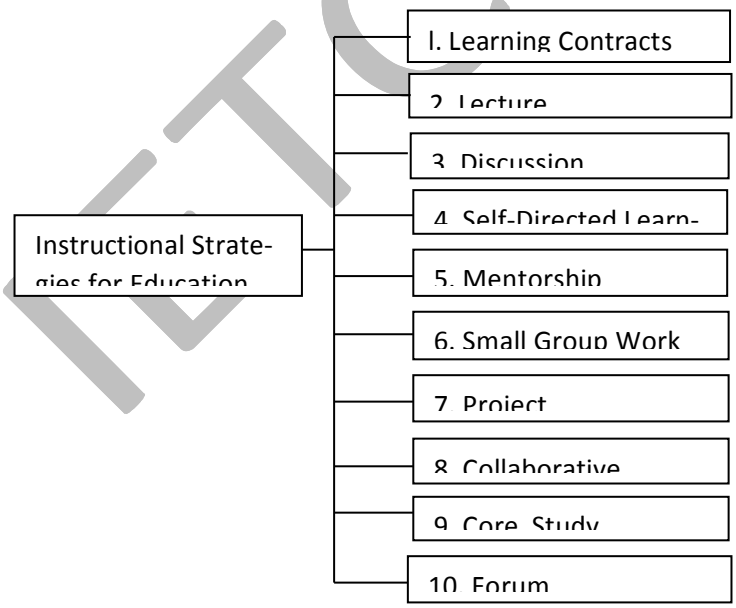
a) Construction of knowledge by social strategies through social context.
b) Discussing constructions.
c) Sharing knowledge & skills through various types of methods & learning
d) Creating wit and knowledge by themselves.
e) Working socially.

Teaching-learning environments.

Learning environments according to cognitive processes, learning by doing approach, and social context.

a) The cognitive processes should be using education media,concept map**,** spider diagram, Fishbone, Structured**,** T-chart.

b) Creating thinking should beusing action, activities and environments;sharing knowledge & skillsthrough various types of social activities; Activity/ opportunities to develop meta-cognitive knowledge about persons; Tasks; Strategies to evaluate their learning as part of the total experience.



c) Organization learningshould beusing interaction with social constructionists, Experiential learning; Perceptions of experience from their own understanding; Construction of their own thinking of it as "learning- by-making"; Actions their working socially; Interaction and cognitive processes.

Students' Self-Appraisal for education media

From the course designed for self online learning, it was found that the course began with designing appropriate contents in accordance with the curriculum and objectives. Learners and instructors have their roles in learning together as well as expressing opinion, analyzing, and solving problems on their own. Instructor is just a mentor. Learners will succeed if an instructor provides them with appropriate learning strategies for online learning. Those are:

1) Learning environment under supervision from instructors in online learning in accordance with the course objectives.
2) Collaborative learning should be used for online learning.
3) Instructional strategies need tools to design online learning with ease under 10 teaching commandments, which are often used in classroom and could be used in online learning as well. Ten teaching commandments are: (a) Learning Contracts,(b) Lecture, (c) Discussion, (d) Self-Directed Learning, (e) Mentorship, (f) Small Group Work, (g) Project, (h) Collaborative Learning, (i) Case Study, and (j) Forum.

According to instructors' opinions, online learning can be included with instructional strategies as shown in Mind Map or Figure 3:

IETC 2014

Fig.3.Students' Self-Appraisal for education media

From the research results, the discussions could be as follows:

1) Most students look forward to learning new skills, but they would rather have face-to-face interaction and need faculty to constantly remind them of due dates and assignments. The probable causes for this finding were given by Northover (2002). There are fourmajor barriers to students' participation in online activities: (1) Lack of convenient access to technology and low technological literacy, (2) Students' immaturity and genuine eagerness to learn, (3) Language confidence – poor students are likely to have an extra disadvantage, and (4) Learning style – both individual learning preference and the experience of previous education systems. It is within the capacity of the tutor to have an effect on some of these possible barriers, more than on others.

2) Most students can go to campus anytime, and the amount of time they have to work on an online course is less than that for a class on campus; therefore, online learning is a personal interest that could be postponed. Normally, instructors are the main characters in classroom. Every learner depends on instructors. However, for online learning, learning resources and information are the center of this approach in order that each learner can search for new knowledge and information regarding the instruction. Without instructors, some learners get lost and do not know what to do. This type of learners is called by Annette Vincent and Dianne Ross "perceptive students". They often postpone doing an assignment until the very last minute. It is recommended to divide a complex project or paper into a series of sub-assignments and providing deadlines for each sub-assignment. The deadlines keep the perceptive students on target. The sub-assignments provide for continuous feedback.

3) Most students need reminding to get things done on time. Classroom discussion is sometimes useful to them. They try to follow the directions on their own, then ask for help as needed, and sometimes need help to understand the text. This is in accordance with Musaw(2000) in that learners are satisfied with learning by themselves but they still need to depend on instructors since they are accustomed to learning with instructor in classroom.

4) Suggestions from students' self-appraisal for education media were as follows: (1) New technology tips and tricks need to be regularly updated; (2) Lecturers should be available when learners need advice; (3) Due date for task is required and learners must be reminded but learning time should not be limited; (4) Portfolio should be a requirement to track students' progress; (5) Discussion should also be held in class where instructors facilitate each learner in building up his/her own body of knowledge. From students' self-appraisal for online learning, learners would like to be able to apply knowledge in solving problems in daily life. However, Dabbagh&Kitsantas (2005) had already pointed out the difficulties of online learning in their paper. Their analyses of qualitative data collected revealed that Web-based Pedagogical Tools were highly effective in activating the use of Self-Regulated Learning processes necessary to support specific types of learning tasks required for completion of course assignments only. Therefore, the researchers would like to suggest course developers and providers to offer learners with various kinds of online learning in order to satisfy the demand and the skills of each learning style.

Therefore, All education media level which is focused on teaching both theory and practice, instructors create operational conditional learning. When learners learn by doing it leads to self-discovery. All of education media might be said to be the teaching of procedural knowledge, in contrast with declarative knowledge, usually used in education in the broader scientific field, and which concentrates on the theoretical and abstract conceptual knowledge which is characteristic of tertiary education. Vocational education can be taught at the secondary or post-secondary level and can interact with an apprenticeship system, and increasingly it is recognized in terms of prior learning and partial academic achievement. However, it is rarely considered to meet the traditional definition of higher education. Motivation in the learn-

IETC 2014

er is strongly dependent on the learner's confidence in himself or herself and his or her feelings of competence and belief in his or her potential to solve new problems is derived from first-hand experience in the mastery of problems in the past and these are much more powerful than motivation or knowledge obtained from any outside source. The successful completion of challenging tasks helps learners gain confidence and understanding and achieve learning objectives with effectiveness and efficiency, as well as helping them understand in a faster and more stable way. This reflects the National Education Act 1999, which reads: "In organizing the learning process, educational institutions and agencies concerned shall provide training in thinking process, management, how to face various situations and application of knowledge for obviating and solving problems." That view of learning sees learners as active participants who can construct their own understanding of the world around them. Using past experience and knowledge, learners can make sense of the new information that they have assimilated. In addition, constructivist theory also asserts that meaningful learning occurs within an authentic situation with authentic learning tasks and that learning is facilitated through social interaction, shared thought, and decision making. This is a system which will make Thai learners capable of developing themselves and able to compete in the world's knowledge-based economy.
