Acknowledgement

Dear Guests…

Welcome to the 11th International Educational Technology Conference IETC-2011.

"The International Educational Technology Conference (IETC)" series is an international educational activity for academics, teachers and educators. This conference is now a well-known educational technology event and the number of paper submissions and attendees increase every year. It promotes the development and dissemination of theoretical knowledge, conceptual research, and professional knowledge through conference activities, the conference proceeding book, and the Turkish Online Journal of Educational Technology (TOJET). Its focus is to create and disseminate knowledge about the use of instructional technology for learning and teaching in education. This year, IETC-2011 received almost 500 applications. The conference academic advisory board accepted 350 applications.

The first of "The International Educational Technology Symposium (IETS)" and the second of "The International Educational Technology Symposium (IETS)" were held at Sakarya University in Turkey in 2001 and 2002. The third one was at Eastern Mediterranean University in the Turkish Republic of Northern Cyprus in 2003, and the fourth one at Sakarya University in Turkey in 2004. The fifth International Educational Technology Conference (IETC) was organized at Sakarya University in Turkey in 2005.The Sixth International Educational Technology conference was held in Turkish Republic of Northern Cyprus. In 2007, the seventh conference was organized at Near East University in the Turkish Republic of Northern Cyprus. After then The 8th International Educational Technology Conference was held at Anadolu University in Turkey in 2008. The 9th International Educational Technology Conference was organized at Hacettepe University in Turkey in 2009. IETC-2010 was organized at Bogazici University in 2010. IETC-2011 conference organized at Istanbul University in 2011. IETC-2012 will be organized at Tsinghua University, Beijing, China in 2012.

The International Educational Technology Conference aims to diffuse the knowledge and researches among academicians and lead to development in educational technology and instructional technologies.

Without the authors and participants, IETC-2012 would, of course, have been impossible. We would like to sincerely thank all of you for coming, presenting, and joining in the academic activities. We would also like to thank all of those who contributed to the reviewing process of the “IETC - 2012” conference papers, which will be also published in TOJET. And finally, we would like to thank Sakarya University, İstanbul University, organizing team and The Turkish Online Journal of Educational Technology (TOJET) for successfully organizing and hosting “IETC-2011” in Istanbul, Turkey.

We have lots of participants from 28 different countries. Should you have any enquiries regarding IETC conference, please do not hesitate to contact with us for any additional information you may require.

Finally, we would like to wish you all a pleasant stay in Istanbul-Turkey and safe return back home. I hope that IETC-2011 will be a meeting you will pleasantly remember.

I hope we will meet again at the 12th International Educational Technology Conference - IETC-2012.

Thank you...

Prof. Dr. Aytekin İŞMAN

General Coordinator & Founder of IETC

Editor in Chief of TOJET

ÖNSÖZ

Bilişim teknolojilerini, eğitimin her alanında özellikle de sınıf içerisinde etkin olarak kullanabilmek için yoğun bir çaba içinde olan Milli Eğitim Bakanlığı her türlü yenilik ve gelişmeyi, okul yöneticileriyle ve öğretmenlerle buluşturmayı amaç edinmiştir. Her çocuğun özgünlüğünü koruyarak, kendini geliştirmesi, kendisinin farkında olması, özgün ve lider bir kişi olarak yaşamını sürdürmesi hiç kuşkusuz verilen eğitimin niteliği ile yakından ilgilidir. Bakanlığımız, son yıllarda en değerli varlıklarımız olan çocuklarımıza sunulan eğitimin niteliğini en üst seviyeye çıkarmak için çok yönlü çalışmalarla birçok projeyi hayata geçirmeye devam etmektedir. Yürütülen bütün bu projelerin temel amacı; okullarımızı iyileştirmek/geliştirmek, öğretmen, okul ve eğitim yöneticilerinin etkililiğini artırmak ve çocuklara sunulan eğitim imkânlarını en üst noktaya çıkarmaktır. Bir başka ifade ile eğitimde yapılan her türlü reform ve çalışmaların temel amacı; çocuklarımızın kendilerini tanımaları, ifade etmeleri ve kendi potansiyellerini keşfetmelerinin zeminini oluşturan olanakları sağlamaktır.

Bakanlığımız, dünyadaki değişmelere paralel olarak daha iyi bir gelecek için bilişim teknolojilerini merkeze alan, e-Türkiye, e-meb e-toplum, e-eğitim, e-okul, e-gelecek kavramları altında, bilişim teknolojilerini bir amaç değil, milli eğitimimizin temel hedeflerine ulaşması için bir araç olarak görmektedir. Bu bağlamda bilişim teknolojilerinin eğitim ve okul yaşamının her alanında etkin olarak kullanılması temel amaçlarımızdandır.

Bilişim teknolojilerinin eğitimde etkin kullanılması bağlamında önemli projelere ilham kaynağı olan ve gerekli kurumsal bilgileri sağlayan Bakanlığımız ile İstanbul Üniversitesi ve Sakarya Üniversitesi işbirliğinde 25-27 Mayıs 2011 tarihleri arasında İstanbul Üniversitesinde düzenlenen 11.Uluslararası Eğitim Teknolojileri Sempozyumudur. Bu bağlamda bilişim teknolojilerinin öğrenme ve öğretme süreçlerinde etkin kullanılması için akademisyenler ve öğretmenlerimiz tarafından bildiriler sunulmuştur.

Sempozyuma katkı veren, Bakanlığımız çalışanlarına, başta İstanbul Üniversitesi ve Sakarya Üniversitesinin akademisyenlerine, Sempozyum kurullarında yer alan herkese katkı ve katılımlarından dolayı teşekkür eder, başarılarının devamını dilerim.

ABSTRACT

The main aim of this study is to compare the problematic internet use and its relation to loneliness among two nations' prospective teachers, Turkey and South Korea. Five hundred and ninety five prospective teachers from three universities, two from Turkey and one from South Korea participated in the study. Generalized Problematic Internet Use Scale 2 and UCLA Loneliness Scale were used to collect data. Some of the major findings are as follows: a) No differences were found between the problematic Internet use of Turkish and Korean prospective teachers; b) Male Turkish prospective teachers found to have more problematic use of internet than female counterparts on the other hand no differences were found among South Korean prospective teachers by means of sex; c) Positive but low correlations between problematic Internet use and loneliness levels of prospective teachers of both nations.

Key words: Problematic internet use, internet addiction, prospective teachers, comparative study

In today's world technology has been prevalently used in almost all spheres of life and as a consequence the personal ownership ratio of computer and internet is rapidly increasing each year. According to a research on Information Technologies Use employed by Turkish Institute of Statistics, the ratio of computer use and internet access in enterprises was 88,7% and 85,4% in January 2007 whereas in January 2008 these rates respectively increased to 90,6% and 89,2%. In January 2010, the ratio of internet access was 90,9% (Turkish Institute of Statistics, 2011).

Meanwhile, statistics (2011) from the Korea Communications Commission, which is a Korean government organization, show household's computer possession ratio was 80.4% and Internet access ratio was 79.8% except enterprises in 2007, and it was 93.2%, 83.4% in 2010, which was increased 12.8%, 3.8%, respectively. In addition, the subscription ratio of broadband Internet access system has been rapidly increased since 2005. As of 2010, the number of broadband Internet access system's subscribers is estimated that about 37% of the nation's population is exploiting the broadband Internet access system, and the ratio has been sharply increased.

A survey of Internet usage shows the ratio using Internet within recent a month was the average 1.9 hours a day in 2007's statistics and 2.3 hours in 2010, which is analyzed as an increase of 0.4 hour. Especially, as of 2010, average Internet use period of Internet users over age 3 of the Korean is 85.2 months, and the case using Internet for more than 7 years is also founded as 55.1%. Examining the changes of average usage for each year, the case using 'more than once a day' was 77.2%, 'more than once a week' was 21.0% in 2007. Average weekly Internet usage was 13.7 hours, and the case using for more than average 14 hours a week (average 2 hours a day) was also founded as 50.2%. In the 2010's survey, the case using Internet 'more than once a day' is 78.4%, 'more than once a week' is 21.8%, and the average weekly Internet usage is founded as 13.9 hours, which shows it gradually increases.

The reason accounting for this quick rise in internet use is certainly related to the services it provides and its easy access. Internet has been widely used for a variety of purposes in several domains. As stated by Deniz and Coşkun (2004) as an educational tool internet lets access to inexpensive, global, interactive and intensive computer communication and it also enables the student to improve his/her learning experience. Online users can easily access internet from a bunch of locations including their homes, workplaces, houses, school, internet cafes etc. The researches also put forth that (Ceyhan, Ceyhan and Gürcan, 2007; Deniz, 2001, 2007; Deniz and Coşkun, 2004; Tutgun ve Deniz, 2010) most of the students reported to have easy access to computers and internet.

The principal functions of internet are increasing the means of researchers, facilitating the communication and enabling data share however the uncalculated rise of internet use started to introduce several problems as well. Some individuals manage to limit their internet use within the required time whereas certain people face problems at school, work or social life since they fail to draw the boundaries and excessively use the internet. The term internet addiction was introduced for the first time by Goldberg (1996) in a forum website and a list of symptoms was defined. Right after that, incredible numbers of people from the whole world sent their complaints to this forum site regarding internet use. Hence a global research domain emerged and a good number of researchers and clinicians started to conduct studies on internet addiction. The earliest indicators of internet addiction were developed by Goldberg (1996), DSM-IV (Diagnostic and Statistical Manual of Mental Disorders) parallel to the diagnosis measurements of alcohol addiction, subsequently, for internet addiction and internet misuse Young (1996b) developed certain criteria in line with diagnosis measurements of Pathologic gambling presented in DSM-IV (American Psychiatric Association, 1995). Following the cases exemplified by clinicians, a new dispute emerged; whether the internet caused addiction or excessive usage of internet was simply a behavioral indicator of already- existing psychological problems that were manifested through internet (Keser Özcan and Buzlu, 2005; King and Barak, 1999). Further studies employed several new concepts like internet addiction, internet dependency, problematic internet usage, pathologic internet usage, internet behavior addiction and cyber addiction.

Young (1996b) favored the term internet addiction and drew a parallel between internet addiction and drug or alcohol addiction since they all brought about academic, social and professional losses. In subsequent researches, Young (1996b) described “Problematic internet usage” based on “Pathological gambling” criteria (Young and Rogers, 1998; Young, 1996b). According to Young (1996a) problematic internet users who spare little time for real people in life prefer to spend time alone on computer and the same finding is demonstrated in several other researches as well (Deniz and Tutgun, 2010; Kraut, Kiesler et al., 2002). Kandell (1998) defined internet addiction as a psychological addiction which particularly affected teenagers and he emphasized that excessive usage of internet was likely to introduce problems related to health, social relations and time management. The researches covering young population, university students in particular, have manifested rather critical findings and revealed that university students formed the most risky group (Ceyhan, Ceyhan and Gürcan, 2007; Deniz and Tutgun, 2010; Kandell, 1998; Lavin, Marvin et al., 1999; Morahan-Martin and Schumacher, 2000; Tutgun and Deniz, 2010; Young, 2006).

As put forth by Caplan (2005) Problematic internet usage is a multi-dimensional syndrome composed of cognitive and behavioral symptoms causing negative social, academic/professional outcomes. According to this perspective, the term internet addiction on its own is not encompassing enough hence the terms pathologic or problematic have also found place in literature. Afterwards based on the generalized problematic internet usage developed by Davis (2001), Caplan (2010) developed a multi dimensional measurement tool named as Generalized Problematic Internet Use Scale 2 (GPIUS2) according to cognitive-behaviorist model and indicated that people’s self expression habit on internet which is connected to their lack of self trust brought about significant numbers of negative consequences on their lives. In present study too, the measurement tool developed by Caplan (2010) has been used after adapting into Turkey and Korea.

Studies of Problematic Internet Usage in Turkey

Studies of Problematic Internet Usage in Turkey fall short in describing pathological dimensions of internet addiction and researchers relate its causes to several different reasons. Gönül (2002) puts forth that addiction is not to internet but its context and the means it provides. On the other hand the clinicians studying this field in Turkey note that internet addictive users have additional clinical findings (Köroğlu, Öztürk et al., 2006; Odabaşıoğlu, Öztürk et al., 2007; Öztürk, Odabaşıoğlu et al., 2007).

While investigating the causes of problematic internet use, the researchers also attempted to develop measurements tools to determine the problematic internet usage. In Turkey since the measurement tools detecting problematic internet use in particular are limited, these researches have been given priority.

In Keser Özcan and Buzlu's (2005) research, the validity and reliability of Online Cognition Scale developed in 2002 by Davis to detect problematic internet usage amongst the sampling of university students has been examined and adapted into Turkish. The research has been carried out among 148 university students who spent at least two hours online in a week. 73% of students were female (n=108), 27% were male (n=40) and age average of the group was 21.01. 35% of students were (n=53) from social sciences, 27,7% were from (n=41) physical sciences and 12,2% were (n=18) from technical sciences departments.

At the end of this research, parallel to the original scale an Online Cognition Scale with 36-item four-factored (loneliness-depression, lessened motivation control, social support and distraction) has emerged. According to research results, average internet usage of students is 3,17 years; 49,4% connected internet from home, they spent maximum (72.1%) 2-5 hours online in a week, 44% used internet at most between hours 16.00-22.00 and 52,24% spent time on the net for data search mostly, 43,97% made researches for educational purposes and mostly used the net 46,62% for e-mail check. According to the validity and reliability analysis results of the research, validity and reliability data of online cognitive state scale covering Turkish university students are credible enough to be used in researches however due to the restricted use of scale, it is deemed beneficial to analyze the scale among different samplings.

Ceyhan, Ceyhan and Gürcan (2007) in their research have developed a measurement tool to detect problematic internet usage amongst university students. In the research four separate study groups trained at formal programs at Anadolu University have been analyzed. In these four study groups total 2491 university students were present. The research has been executed together with students attending a variety of faculties and colleges. At the end of study, the researchers detected that 5 Likert type scale consisted of total 33 items and in the development stage of scale they manifested that according to the data gathered from 1658 university students, the scale was composed of three factors. Amongst these three factors, the first factor alone named as the negative consequences of internet constituted 25,36% of the variance and second factor alone named as social benefit/ social comfort constituted 14,62% of the variance, third factor alone named as excessive usage explained 48,96% of the variance hence was created the scale termed as Problematic Internet Usage Scale. The specific scale has no objective of diagnosing people with internet addiction by measuring problematic internet usage but aims to exhibit the healthy and unhealthy usage levels of internet.

Kayri and Günüç (2009) conducted a study to detect structural validity and internal consistency coefficient of the Turkish adaptation of Internet Addiction Scale originally developed by Nichols and Nicki (2004). Internal consistency coefficient of the original scale (cronbach alpha) was detected as .95 and explained variance of the scale was found to be 46.50%. The specific scale was executed amongst 233 university students and it aimed to detect internet Internet addiction levels of individuals. Turkish adapted scale consisted of 30 items which were all positive and was scaled with 5 Likert type grading. In Likert form the attitudes were graded as 1- Never 2- Rarely 3-Sometimes 4-Frequently and 5- Always. Certain gaps and Internet addiction levels have been determined according to the scores obtained from scale. Accordingly the ones receiving above 90 scores were categorized as internet addicts. In the same research, 31 university students were grouped as internet addict.

As reported by Öztürk, Odabaşıoğlu et al. (2007) this addiction type comes to surface when the person fails to limit internet usage, keeps staying online despite the social or academic losses or feels deep anxiety when faced with a restriction on internet usage. This addiction type, diagnosed with above-mentioned symptoms, has been extensively analyzed in psychiatry literature since the mids of 1990s. The clinical pictures of excessive internet usage put forth that a typical internet addict spend 40-80 hours a week online and can stay online 20 hours straight. Those patients whose sleep routine is diverted may start to use stimulants, drink excessive amounts of coffee or Coke and as a consequence of lessened physical activity they may face obesity, carpal tunnel syndrome, backache and posture disorders.

In Odabaşıoğlu, Öztürk et al.'s (2007) research case studies have been presented and student groups with different complaints have been examined. The research findings demonstrate that internet addiction that is widely common among teenagers in particular spoils the mental and physical development of patients, adversely affects social relations and academic success as well. As the case studies in research present, age average of 9 male 1 female patient was 14,9, 3 patients were diagnosed with depression, 1 patient

with depression and social phobia, 1 patient with conduct disorder and 2 patients with attention deficit and hyperactivity syndrome. According to the research, there is a 1,5 year period of time changing between 6 months to 3 years prior to misuse or addiction of internet. As the time spent online a week is examined it is found that there is an average of 7-8 hours changing between 4 to 20 hours.

Furthermore in almost all patients the negative academic effects caused by misuse of internet were rather evident, additionally social losses and elevated familial conflicts were the noteworthy consequences of internet addiction. It was further emphasized in the research that internet addiction was equally risky as drug addiction since it also caused social problems so it is likely to become a psychiatric diagnosis in future. As all case studies above are investigated it is detected out that internet addiction, accompanied by many other psychiatric disorders, is likely to exist among young population in particular or in certain cases, although controversial, it is alleged to form a base for the emergence of such disorders.

Tutgun and Deniz (2010) have examined problematic internet usage of prospective teachers in Education Faculties with respect to certain variables (gender, department, university, daily use etc.). The research has been executed among 686 prospective teachers from two universities (Marmara University and Boğaziçi University). Demographic data have been compiled via Personal Information Form and additionally Problematic Internet Usage developed by Ceyhan, Ceyhan and Gürcan (2007) has been used. It has been detected in the research that problematic internet usage of prospective teachers was in medium level. The rest of the findings revealed that with respect to gender, male and female prospective teachers differed in terms of problematic internet usage level.

As the level of daily internet usage rose so did problematic internet usage level and prospective teachers describing themselves fully competent computer users were, compared to the ones feeling less competent, more oriented towards problematic internet usage. Another research finding showed that freshmen students were, compared to senior students, more oriented towards problematic internet usage. The comparison with respect to department indicated that prospective teachers in the Department of Computer and Teaching Instructional Technologies were more inclined to problematic internet usage than the prospective teachers in other departments (Science-Mathematics, Fine Arts, and Social Sciences).

In a different study Deniz and Tutgun (2010) analyzed the relation between loneliness levels and problematic internet usage of prospective teachers. In this study Personal Information Form and Problematic Internet Usage Scale developed by Ceyhan, Ceyhan and Gürcan (2007) as well as Turkish version of UCLA Loneliness Scale adapted by Demir (1989) was employed and the research finding demonstrated that there is a correlation between loneliness levels and problematic internet usage of prospective teachers studying at education faculties. Taking into account the fact that that if a prospective teacher who is expected to be a professional role model in many aspects for students is trapped in problematic internet usage and faces academic, social and familial losses present research signals even more significance to take necessary precautions with no delay.

Odacı and Kalkan (2010) in their research analyzed problematic internet usage among college teenagers and particularly focused on the relation between cognitive states of problematic internet usage and loneliness and flirt anxiety. Additionally internet usage patterns of university students were also examined. The research included 493 students attending Karadeniz Technical University, Fatih Faculty of Education. Research data were compiled via Online Cognitive State Scale, Flirt Anxiety Scale and Personal Information Questionnaire. Research finding put forth that there is a positive and meaningful relation between problematic internet usage and loneliness and flirt anxiety. One-way variance analysis was conducted to detect if or not problematic internet usage varied with respect to internet usage length and it was determined that those spending more than five hours a day online had significantly higher levels of problematic internet usage than the rest.

Chi-square results of the emotional state of students deprived of internet usage and internet usage lengths demonstrated a meaningful relationship. As the problematic internet usage with respect to gender was analyzed it was found out that problematic internet usage of male students was significantly higher than female students.

Studies of Problematic Internet Usage in South Korea

This study shows that it have been actively studied on the Internet addiction at national level as well as general researchers since 2002 in Korea, known as the information technology (IT) is developed throughout the world. In particular, led by the government, the Internet addiction level of the nation for

general people and youths has been analyzed to make public the result every year since 2002. Most of the university hospitals have run rehabilitation programs related to Internet addiction based on the result since 2010. Furthermore, this study found that legislation is recently promoted at the national assembly regarding treatment and improvement for various digital addiction including game addiction as well as Internet addiction.

According to 'Actual condition survey on Internet addiction of Korean in 2010' that is conducted through door-to-door interview methed for the entire people by the Korean government and released in March, 2011, the Internet addiction levels (IALs) of age 9 ~ 39 among the Korean, who use Internet more than once within recent a month, is represented as 8.0% (Ministry of Public Administration and Security, 2010). In the survey for each age group, the numbers of Internet addicted elementary, middle, high school students are 13.7%, 12.2%, 10.0%, respectively, and adult's IALs is estimated 8.0% for 20s, 4.0% for 40s.

Furthermore, the IALs survey conducted according to the home environment for reflecting in the welfare policy shows the IALs is also different depending on income. Regardless of age groups, the IALs survey for each household's income shows the IALs of households below the middle class is the highest of 11.9%, and the case of above the middle class is only 6.6%.

On the other hand, the IALs of the poor reaches 11.1%, in particular, a high-risk group[1] for Internet addiction in this class is as many as 3.7%. Moreover, the high-risk group of one-parent families (7.3%) is more than 2 times than both-parent families (3.0%), and the IALs of multicultural families (37.6%) is high more than 3 times than the average families (12.3%). This result shows the social low-income and neglected groups are likely to be exposed to the risk of Internet addiction more than the above middle class.

Especially, a serious problem is that the entire IALs of youth groups is decreased, however, the number of high-risk youths with a high immersion level of Internet is 3.1%, which shows 3.1% of increase comparing to 2009. In addition, the mobile phone's IALs conducted first in this survey is 11.1%. Therefore, the need of diversified studies is presented according to a qualitative problem of Internet addiction and an introduction of new platforms.

A positive aspect obtained from this result is that the IALs of the entire people has been gradually decreasing from 2004 when the survey was begun. The IALs of the entire people is indicated as the decrease from 8.5% in 2009 to 8.0% in 2010. The IALs of youths is also lowered from 14.4% in 2007 to 12.8% in 2009, 12.4% in 2010. The report says that this is a result from systematic and scientific actions of Korean government and schoolteachers. Therefore, considering the importance that students of their adolescence are in self-formation ages related to a collective-efficacy and self-efficacy for their studies and society, it could be said that a systematic study is very important for PIU dependencies of school teachers including would-be teachers.

However, it is indicated that the high-risk group concentrated in the low-income class is increased from 2.6% in 2009 to 3.1% in 2010. The IALs of elementary school students rises by 2.9% over last year, so it is analyzed that the addiction age group is tend to be lowered. Accordingly, this report suggests an active interest of parents and a necessity of systematic education from kindergarten stage.

Improvements presented in this report by Korean government are active curative measures such as connected implementation of counseling-treatment for high-risk people, training experts for counseling-treatment, expansion of professional counseling organizations for Internet addiction, opening of 'Internet shelter school' using vacation-weekend, provision of mobile counseling services for a neglected class etc., and a necessity of systematic researches and development of a scale according to new technologies such as mobile phones.

Suggestions of active solutions to the problem by Korean government originate from studies' results provided by numerous scholars in the meantime. Studies of scholars performed from 2004 to 2010 in Korea are divided into studies on addiction related to platforms such as Internet, mobile phones, digital

[1] The meaning of the high-risk group noted in this study is a case that the Internet addiction level is at a serious condition requiring counseling treatment based on the scale presented by the medical profession in Korea.

games, portable game players etc. and mixed studies associated with various fields of study such as counseling, legislation etc. Especially, it have been provided the results of studies related to platforms such as mobile phones, portable game players, PMP, MP3 etc. as well as Internet addiction and systematic studies such as rehabilitation treatment program etc. from 2005.

As a result of analyzing top 10 papers with a high quotation index selected from Internet addiction related studies published from 2007 to March, 2011 in Korea through an academic database, most studies for age groups of middle, high school students are represented more than 90%. Recently, the direction of studies also tends to expand into a field of professionals.

Studies could be divided into comparison of Internet symptoms (Lee & Lee, 2004a), pattern analysis of excessive Internet users (Lee & Lee, 2004b), recognitive characteristics according to recognition levels (Chung & Kim,2008), analysis of addiction tendencies related to stress and depression (Park & Park, 2009), development of diagnostic criteria. Generally, it is used the similar measurement scales as cases of general international studies as well as Turkey. However, what's remarkable is that the government and scholars have jointly developed to use independent diagnostic sheets suitable to the Korean sentiment from 2002. Arguably, Even though a platform is the same, there is a slight difference in the use form etc. depending on the racial sentiment (Teo et al., 2008). Accordingly, a supplemented sheet was also developed to release in 2010 (National Information Society Agency, 2010).

Most studies had used the diagnostic scale based on Young's DSM-IV even in Korea before 2002. However, some studies presented a result that most students with high Internet dependencies were under excessive pressure for examinations or homework, and did not manage the study hours efficiently. In other words, as a result, a need is presented to develop an Internet addiction measurement scale (IAMS) reflecting group's characteristics such as occupation, and home environment etc. Based on these studies' results, the Korean government developed a formalized diagnostic scale suitable for the Koreans' characteristics to publish it in 2002 (National Information Society Agency, 2002).

The Korean scale developed by the National Information Society Agency. in 2002 was completed by reflecting the online cognition scale (OCS) of Kim (2001), Davis (2001), the diagnostic scale of Goldberg (1999), results of the National Information Society Agency's study (2002) (National Information Society Agency, 2009). This scale was completed through a standardization procedure of preliminary inspection tables by integrating cases reported by the Internet addiction counseling center, patients, and various mass media (National Information Society Agency, 2009).

Later, the Korean government additionally developed an adult IAMS together with university's institutes in 2005. This measurement scale is subdivided into Internet self-diagnostic scale (A) and observers scale (B) Most people could easily diagnose their own condition by themselves by using this scale. This IAMS is subdivide into general user group (A group), potential risk Ⅰ group, potential risk Ⅱ and high-risk group (D group,) so that they could easily measure by themselves to which group they are belonged (National Information Society Agency, 2009).

In addition, a problem, which the diagnostic sheet of 2005 is too long and complicated, was improved in 2007 to announce development of a simplified self-diagnostic scale for Internet addiction and a practical interview form for field representatives of schools, hospitals, government offices. Furthermore, a nationwide preliminary interview was implemented for the field professionals such as teachers, doctors and the general public to actively reflect the field's demands in 2010. In addition, it was modified the propriety of description methods for questions or ambiguous questions in meaning.

Especially, what's remarkable about development of the diagnostic scale in 2010 is that it developed a scale presenting the standard score for easily classifying into high-risk, potential risk, general user levels of Internet addiction according to the score by everyone through a standardized inspection (National Information Society Agency, 2010).

RATIONALE OF THE STUDY

Internet is commonly used by young population for a variety of purposes. Particularly at universities easy access to internet, the need to study courses or contact with course instructor, desire to contact freely with the opposite sex etc. make the internet use a favorite activity amongst university students.

As relevant literature also puts forward, comprehensive research on the problematic internet usage among university students, points to the gravity of situation. Furthermore university students are more inclined towards developing excessive internet usage-related problems on accounts of various factors containing developmental problems (Ceyhan, Ceyhan and Gürcan, 2007). The tendency of college students to establish close relations with the opposite sex makes the internet usage attractive in their eyes. Besides psychological and environmental factors in university students' lives may drive them to experience internet addiction. It is inevitable that college students with low social skills end up being socially isolated. Internet is a favorite social communication tool for those students feeling lonely; however it is even harder for such students to provide control on the internet. According to Erikson (1998) the principal developmental task of college students is to establish close relations with peers in the same or opposite sex. It is only natural that college youngsters failing to develop social skills in natural social environment end up with familial and business problems in particular as they grow up. The social and academic failures individuals experience due to problematic internet usage that comes to surface during university life may constitute the base for the future loneliness and social isolation and losses in business and family relations. Certain professions, particularly teaching, require social communication skills. A teacher is a role model for students at all times. A teacher who goes through professional and social problems due to uncontrolled internet usage cannot be expected to provide a healthy data transfer to students or be a good role model. Hence further analyses are required to discuss problematic internet usage of prospective teachers studying at faculties of teaching. In that way the problems shall be detected and comprehensive studies to take relevant measurements be conducted.

Due to the restrictions on the researches about problematic internet usage and measurement tools present study employed Turkish and Korean adaptation of the Generalized Problematic Internet Use Scale 2 (GPIUS2) developed by Caplan (2010) and enabled the use of this scale for both countries. Furthermore this study bears additional significance since it analyzes the topic from a cross-cultural perspective by determining internet usage characteristics of the two different countries. As indicated by Caplan (2005) Problematic Internet Usage is a multi-dimensional syndrome. Knowing no bounds in internet usage and consequent problems may vary with respect to age groups, different professional groups, psychological state of individuals, internet usage characteristics etc. Hence it is possible to come across a variety of problematic internet usages with respect to different demographic structures in different countries and also there may be a relation between different characteristics of internet usage and problematic internet usage. Problematic Internet Usage is a prevalent problem all throughout the world. From this point of view it is a must to conduct comprehensive studies covering different cultures and detect whether the responsible causes vary with respect to cross-cultural characteristics. Such researches shall be beneficial in clarifying the factors related to problematic internet usage and also enable to detect characteristics of internet users from different countries and their cross-cultural diversities.

In the present study Turkey and South Korea have been focused in terms of the problematic internet use and its relation to loneliness. Turkey and South Korea are two different countries in many ways, such as economic, cultural, demographic, and geographic and so on. For example in Turkey there are approximately 32,187,000 internet users which consist of 44% of the population while the number and the percentage are remarkably higher in South Korea, respectively 41,363,000 and 84%. This remarkable gap shows itself in the world ranking of these two countries in percentage of internet users in respect to population (Euromonitor International, 2011a, 2011b). South Korea is in the ninth place whereas the Turkey is the fortieth (Internet World Stats, 2011). Network Readiness Index shows that South Korea is one of the best countries (tenth rank) to use ICT effectively as a tool for the structural transformation of South Korean economy and society (World Economic Forum, 2011). Turkey is in the seventy first rank in this index among one hundred and thirty eight countries. In short, although Turkey is supposed to be an emerging market with power of its young and dynamic population it seems to have a digital gap between two countries. Based on these facts a comparative study between Turkey and South Korea about the problematic internet use would help to understand the structure of the topic deeply.

PURPOSE OF THE STUDY

The present study mainly attempts to compare the problematic internet use and its relation to loneliness among two nations' prospective teachers, Turkey and South Korea. Three major research questions were examined to realize the main goal:

1. What are the main characteristics of prospective teachers of both nations in relation to having computer facilities and purpose of using Internet?
2. Are there differences in problematic internet use by prospective teacher characteristics (such as sex, age etc.) within and between the nations?
3. Is there any relationship between problematic internet use and loneliness levels of prospective teachers of the both nations?

METHOD

Participants

Participants were 595 prospective teachers from three universities, two from Turkey and one from South Korea. Marmara University Atatürk Faculty of Education is one of the well known teacher training faculties in Turkey, which is located in Istanbul. The faculty has twenty departments and its prospective teacher (student) population is over seven thousand. Maltepe University is a foundation (private) university located in Istanbul too. The third university from South Korea is Chung Ang University. The ages of the participants ranged from 17 to 37 (M: 21.07; SD: 2.16); and % 68.2 were females in total.

Table 1: Distributions of participants by universities and departments

Departments	Name of Universities			TOTAL
	Maltepe University	Marmara University	Chung Ang University	
English Language Teaching	35 (18.0)	74 (38.1)	85 (43.8)	194 (100)
Early Childhood Education	14 (50.0)	-	14 (50.0)	28 (100)
Educational Sciences	62 (42.5)	48 (32.9)	36 (24.7)	146 (100)
Home Education	-	-	28 (100)	28 (100)
Special Education	19 (100)	-	-	19 (100)
Physical Education	-	-	44 (100)	44 (100)
Primary Mathematics Education	22 (31.9)	47 (68.1)	-	69 (100)
Music Education	-	24 (100)	-	24 (100)
Turkish Language Teaching	-	43 (100)		43 (100)
TOTAL	152 (25.5)	236 (39.7)	207 (34.8)	595 (100)

Data Collection Instruments

Demographic form. A demographic form of 16 questions was used to get data about the some individual characteristics of the sample (sex, age etc.) and some preferences and states in relations to computers (having a computer, time spend using internet etc.)

Generalized Problematic Internet Use Scale 2 (GPIUS2). GPIUS2 developed by Caplan (2010) was used to collect data about the problematic aspects of Internet use of prospective teachers. GPIUS2 has five sub scales, preference for online social interaction (POSI), mood regulation, cognitive preoccupation, compulsive internet use, negative outcomes. GPIUS2 has 15 items and all the items are on a scale ranging from 1 (definitely disagree) to 8 (definitely agree). The higher points show more problematic use. As Caplan indicates (2010, p.1093) GPIUS2 scale can be used in two different ways, as a set of separate sub-scales or as an overall composite index of GPIUS. In the present study the use of composite index of the scale was preferred. The scale's internal consistency reliability was found α= .91 by Caplan. In the present study internal consistency reliability was found α= .89 (α= .89 for Turkish and α= .90 for South Korean participants) which is as high as the original value.

GPIUS2 was translated English to Turkish and Korean in both countries by the experts of language and the field who has studies in computer/internet attitudes. After the translation, the scales were applied to the bilingual (Turkish/English and Korean/English) prospective teachers for test re-tests in three weeks intervals. High correlations and no differences were found (r: .75, p<.001; [paired group] t: .34, df: 25, p>0.05 for the Turkish sample and r: .98, p<.001; [paired group] t: .15, df: 26, p>0.05 for the Korean

sample) between both applications of the Turkish and Korean prospective teachers. The results showed that the language equivalence and internal consistency reliability of the scale was approved for Turkish and Korean versions of GPIUS2.

UCLA Loneliness Scale. The scale developed by Russell, Peplau, & Cutrona (1980) has 20 items on 4 point scale ranging 1 (never) to 4 (often). The reliability and validity of the scale was done by (Demir, 1989) for the Turkish sample. In the present study the internal consistency of the scale was found α= .86 (α= .84 for Turkish and South Korean participants separately).

FINDINGS

The first main research question is to investigate the main characteristics of prospective teachers of both nations in relation to having computer facilities and purpose of Internet use.

Table 2: Having own computer by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Yes, I have	323 (83.2)	183 (88.4)	506 (85.0)
No, I don't have	65 (16.8)	24 (11.6)	89 (15.0)
TOTAL	388 (100)	207 (100)	595 (100)

Table 2 shows that higher percentages of the prospective teacher have computers of their own in both nations.

Table 3: Time spend for chatting in a day by nation

	Turkey	**South Korea**	**TOTAL**
	f (%)	f (%)	f (%)
Never	36 (9.3)	95 (45.9)	131 (22.0)
Less than 1 hour	217 (55.9)	70 (33.8)	287 (48.2)
1-3 hours	114 (29.4)	33 (15.9)	147 (24.7)
4-5 hours	15 (3.9)	7 (3.4)	22 (3.7)
6-8 hours	6 (1.5)	1 (0.5)	7 (1.2)
More than 8 hours	-	1 (0.5)	1 (0.2)
TOTAL	388 (100)	207 (100)	595 (100)

Table 3 shows that 45.9% of South Korean prospective teachers reported that they never used Internet for chatting with someone else while the proportion is 9.3% for Turkish prospective teachers. It is clearly seen that the proportion of Turkish prospective teachers using internet for chatting are remarkably higher than South Korean prospective teachers.

Table 4: Time spend for meeting with new people in a day by nation

	Turkey	**South Korea**	**TOTAL**
	f (%)	f (%)	f (%)
Never	241 (62.1)	158 (76.3)	399 (67.1)
Less than 1 hour	119 (30.7)	40 (19.3)	159 (26.7)
1-3 hours	23 (5.9)	6 (2.9)	29 (4.9)
4-5 hours	4 (1.0)	2 (1.0)	6 (1.0)
6-8 hours	-	1 (0.5)	1 (0.2)
More than 8 hours	1 (0.3)	-	1 (0.2)
TOTAL	388 (100)	207 (100)	595 (100)

Table 4 shows that, parallel to the results of Table 3, higher percentage of prospective teachers (Turkey 62.1% and South Korea 76.3%) from both nations reported that they have never used internet for the purpose of meeting new people. But the distribution among both nations shows that Turkish prospective teachers tend to use internet more hours to meet with new people than South Korean prospective teachers.

Table 5: Time spend for searching for homework in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	22 (5.7)	2 (1.0)	24 (4.0)
Less than 1 hour	180 (46.4)	31 (15.0)	211 (35.5)
1-3 hours	171 (44.1)	115 (55.6)	286 (48.1)
4-5 hours	14 (3.6)	40 (19.3)	54 (9.1)
6-8 hours	1 (0.3)	9 (4.3)	10 (1.7)
More than 8 hours	-	10 (4.8)	10 (1.7)
TOTAL	388 (100)	207 (100)	595 (100)

As seen in Table 5, majority of Turkish prospective teachers spend less than one hour for searching for their homework while majority of South Korean prospective teachers spend 1-3 hours period. Based on the distribution of the data it is clearly said that South Korean prospective teachers seem to spend more time for searching for their homework than Turkish prospective teachers.

Table 6: Time spend for surfing the Internet for new information in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	18 (4.6)	2 (1.0)	20 (3.4)
Less than 1 hour	193 (49.7)	89 (43.0)	282 (47.4)
1-3 hours	154 (39.7)	87 (42.0)	241 (40.5)
4-5 hours	19 (4.9)	16 (7.7)	35 (5.9)
6-8 hours	4 (1.0)	7 (3.4)	11 (1.8)
More than 8 hours	-	6 (2.9)	6 (1.0)
TOTAL	388 (100)	207 (100)	595 (100)

Table 6 shows that very few number of prospective teachers do not use internet for searching new information. The majority of the prospective teachers of both nations spend up to three hours of time for seeking for new information.

Table 7: Time spend for surfing the Internet for reading news in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	58 (14.9)	13 (6.3)	71 (11.9)
Less than 1 hour	232 (59.8)	102 (49.3)	334 (56.1)
1-3 hours	85 (21.9)	72 (34.8)	157 (26.4)
4-5 hours	12 (3.1)	11 (5.3)	23 (3.9)
6-8 hours	1 (0.3)	6 (2.9)	7 (1.2)
More than 8 hours	-	3 (1.4)	3 (0.5)
TOTAL	388 (100)	207 (100)	595 (100)

As seen in Table 7, majority of students in each nation spend less than one hour to read news.

Table 8: Time spend for playing gamble in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	340 (87.6)	199 (96.1)	539 (90.6)
Less than 1 hour	29 (7.5)	5 (2.4)	34 (5.7)
1-3 hours	15 (3.9)	2 (1.0)	17 (2.9)
4-5 hours	3 (0.8)	-	3 (0.5)
6-8 hours	1 (0.3)	-	1 (0.2)
More than 8 hours	-	1 (0.5)	1 (0.2)
TOTAL	388 (100)	207 (100)	595 (100)

As seen in Table 8, playing gamble is not the focus of interest for the majority of prospective teachers of both nations. On the other hand Turkish prospective teachers seem to spend slightly more time playing gamble compare to South Korean prospective teachers.

Table 9: Time spend for searching porno sites in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	344 (88.7)	190 (91.8)	534 (89.7)
Less than 1 hour	36 (9.3)	13 (6.3)	49 (8.2)
1-3 hours	3 (0.8)	4 (1.9)	7 (1.2)
4-5 hours	-	-	-
6-8 hours	1 (0.3)	-	1 (0.2)
More than 8 hours	4 (1.0)	-	4 (0.7)
TOTAL	388 (100)	207 (100)	595 (100)

Table 9 shows that, as in Table 8 for gambling, searching porno sites reported no focus of interest majority of prospective teachers. The rest of the distributions seem to be in balance for both nations.

Table 10: Time spend for playing interaction games in a day by nation

CHATTING	Turkey	South Korea	TOTAL
Never	274 (70.6)	149 (72.0)	423 (71.1)
Less than 1 hour	83 (21.4)	35 (16.9)	118 (19.8)
1-3 hours	24 (6.2)	18 (8.7)	42 (7.1)
4-5 hours	5 (1.3)	2 (1.0)	7 (1.2)
6-8 hours	-	2 (1.0)	2 (0.3)
More than 8 hours	2 (0.5)	1 (0.5)	3 (0.5)
TOTAL	388 (100)	207 (100)	595 (100)

As seen in Table 10, approximately 30% of prospective teachers in each nation spend an amount of time to play interaction games. The majority of the student teachers among the players reported that they spend less than one hour for playing interaction games.

Table 11: Time spend for downloading music in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	101 (26.0)	67 (32.4)	168 (28.2)
Less than 1 hour	183 (47.2)	107 (51.7)	290 (48.7)
1-3 hours	89 (22.9)	24 (11.6)	113 (19.0)
4-5 hours	11 (2.8)	4 (1.9)	15 (2.5)
6-8 hours	2 (0.5)	-	2 (0.3)
More than 8 hours	2 (0.5)	5 (2.4)	7 (1.2)
TOTAL	388 (100)	207 (100)	595 (100)

As seen in Table 11, half of the prospective teachers of each nation spend less than one hour on internet for downloading music. Turkish prospective teachers reported that they slightly more time for downloading music than South Korean counterparts.

Table 12: Time spend for downloading photos in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	121 (31.2)	61 (29.5)	182 (30.6)
Less than 1 hour	207 (53.4)	114 (55.1)	321 (53.9)
1-3 hours	54 (13.9)	20 (9.7)	74 (12.4)
4-5 hours	3 (0.8)	7 (3.4)	10 (1.7)
6-8 hours	2 (0.5)	1 (0.5)	3 (0.5)
More than 8 hours	1 (0.3)	4 (1.9)	5 (0.8)
TOTAL	388 (100)	207 (100)	595 (100)

As seen in Table 12, majority of prospective teachers of both nations reported that they spend less than one hour for downloading photos. The rest of the distribution seems to be balanced for Turkish and South Korean prospective teachers.

Table 13: Time spend for using e-mail in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	24 (6.2)	16 (7.7)	40 (6.7)
Less than 1 hour	259 (66.8)	148 (71.5)	407 (68.4)
1-3 hours	86 (22.2)	23 (11.1)	109 (18.3)
4-5 hours	14 (3.6)	13 (6.3)	27 (4.5)
6-8 hours	3 (0.8)	4 (1.9)	7 (1.2)
More than 8 hours	2 (0.5)	3 (1.4)	5 (0.8)
TOTAL	388 (100)	207 (100)	595 (100)

As seen in Table 13, very low percentages of prospective teachers in each nation seem not to spend time using e-mail correspondence. Majority of prospective teachers reported that they spend e-mail less than one hour a day.

Table 14: Time spend for downloading films in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	174 (44.8)	42 (20.3)	216 (36.3)
Less than 1 hour	118 (30.4)	91 (44.0)	209 (35.1)
1-3 hours	66 (17.0)	61 (29.5)	127 (21.3)
4-5 hours	22 (5.7)	9 (4.3)	31 (5.2)
6-8 hours	3 (0.8)	3 (1.4)	6 (1.0)
More than 8 hours	5 (1.3)	1 (0.5)	6 (1.0)
TOTAL	388 (100)	207 (100)	595 (100)

Table 14 shows that 44.8% of Turkish prospective teachers reported that they have never spent time for downloading films compare to 20.3% of South Korean prospective teachers. South Korean prospective teachers seem to spend more time in internet to download films than Turkish prospective teachers.

Table 15: Time spend for producing/developing web sites/blogs in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	334 (86.1)	90 (43.5)	424 (71.3)
Less than 1 hour	38 (9.8)	87 (42.0)	125 (21.0)
1-3 hours	10 (2.6)	22 (10.6)	32 (5.4)
4-5 hours	6 (1.5)	5 (2.4)	11 (1.8)
6-8 hours	-	-	-
More than 8 hours	-	3 (1.4)	3 (0.5)
TOTAL	388 (100)	207 (100)	595 (100)

As seen in Table 15, majority of Turkish prospective teachers (86.1%) are not interested in spending time for producing/developing web sites or blogs. On the other hand more than half of the South Korean participants reported that they spend some amount of time, mostly less than one hour, for web site or blog production/development.

Table 16: Time spend for shopping on line in a day by nation

	Turkey	South Korea	TOTAL
	f (%)	f (%)	f (%)
Never	286 (73.7)	32 (15.5)	318 (53.4)
Less than 1 hour	82 (21.1)	119 (57.5)	201 (33.8)
1-3 hours	16 (4.1)	41 (19.8)	57 (9.6)

4-5 hours	4 (1.0)	9 (4.3)	13 (2.2)
6-8 hours	-	2 (1.0)	2 (0.3)
More than 8 hours	-	4 (1.9)	4 (0.7)
TOTAL	388 (100)	207 (100)	595 (100)

As seen in Table 16, 73.7% of Turkish prospective teachers reported that they don't spend anytime for shopping online while only 15.5% of South Korean prospective teachers reported in the same way. The data clearly shows that South Korean prospective teachers spend more time than Turkish prospective teachers.

Second main research question is to find out the differences of problematic internet use of prospective teachers by their demographic characteristics. First of all, the data obtained from two main scales of the research, GPIUS2 and UCLA, were analyzed.

Table 17: Problematic Internet Use By Nations

	n	Mean	sd	df	t	p
Turkey	388	39.56	19.36	593	0.33	n.s.
South Korea	207	40.08	16.09			

As seen in Table 17, no differences were found between the problematic Internet use of Turkish and Korean prospective teachers. The means also shows that problematic internet use of the participants is below average which means the Internet is not a problematic medium for both nations' prospective teachers.

Table 18: Loneliness by Nations

	n	Mean	sd	df	t	p
Turkey	388	31.76	9.33	593	11.80	0.000
South Korea	207	40.66	7.55			

Although loneliness, alone, is not the major investigation of this study, results of the Table 19 shows us that there is a significant difference between Turkish and Korean prospective teachers. South Korean prospective teachers were found to be in higher levels of loneliness than Turkish counterparts.

Table 19: Correlation between problematic internet use and age

Problematic Internet Use vs. age	**n**	**r**	**p**
Turkey	388	- 0.12	0.02
South Korea	207	- 0.09	n.s.

As seen in Table 19 the results indicate a negative and low correlation between problematic Internet use and age only in Turkish prospective teachers. The result means that as the age grows up the level of problematic Internet use drops down. It can be explained by being mature as the years pass in relation to proper use of Internet. But on the other side no relationship found for the South Korean prospective teachers. This can be, probably, explained by the age difference of both groups. South Korean participants' age has been found statistically higher (Mean age/Turkish: 20.51, Mean age/S. Korean: 22.13, t: 9.28, $p<0.001$) than Turkish prospective teachers. The way of this difference would be an explanation of the contradictory result.

Table 20: Problematic Internet Use By Sex

	Sex	n	Mean	sd	df	t	p
Turkey	Male	120	43.70	20.31	386	2.84	0.005
	Female	268	37.72	18.67			
South Korea	Male	69	41.75	17.53	205	1.05	n.s.
	Female	138	39.25	15.33			

Table 20 shows that there is a significant difference between male and females in relation to problematic internet use only among Turkish prospective teachers. Male Turkish prospective teachers found to have more problematic use of internet than female counterparts.

Table 21: Problematic Internet Use by Computer Sufficiency

	Sufficiency	n	Mean	sd	F	p
Turkey	Never	8	40.38	24.89	2.09	n.s
	Few	159	36.70	17.72		
	Quite	196	41.35	19.79		
	Completely	25	43.56	22.84		
	TOTAL	388	39.57	19.37		
South Korea	Never	4	36.50	4.65	0.21	n.s
	Few	58	39.40	16.10		
	Quite	121	40.17	15.99		
	Completely	25	41.96	18.30		
	TOTAL	207	40.09	16.10		

Table 21 shows that there is no difference between problematic internet use in relation to computer sufficiency levels of prospective teachers in both nations.

Table 22: Problematic Internet Use by Internet Using Place

	Place	n	Mean	sd	F	p	Difference
Turkey	Home	280	41.03	19.89	3.23	0.02	Home> Internet café Home> Library
	Internet cafe	23	31.74	14.53			
	Library	20	30.85	14.24			
	Other	65	38.72	18.86			
	TOTAL	388	39.57	19.37			
South Korea	Home	157	38.65	15.96	1.96	n.s	
	Internet cafe	3	37.67	19.66			
	Library	27	45.37	17.64			
	Other	20	44.60	12.98			
	TOTAL	207	40.09	16.10			

As seen in Table 22, ANOVA results put differences between problematic internet uses in relation to mostly preferred internet using place among Turkish prospective teachers. The post-hoc LSD analysis revealed that home users seem to have higher problematic levels compared to internet café and library users in Turkey. No differences have been found in South Korean participants.

Table 23: Problematic Internet Use by Time Spend on Internet in a Day

	Time	n	Mean	sd	F	p	Difference
Turkey	Less than 1 hour	141	30.46	13.21	26.56	0.000	Less than 1 hour<1-4 hours Less than 1 hour<5-8 hours Less than 1 hour<+8 hours 1-4 hours<5-8 hours 1-4 hours<+8 hours
	1-4 hours	213	42.70	18.58			
	5-8 hours	26	57.96	24.95			
	+ 8 hours	8	56.75	31.73			
	TOTAL	388	39.56	19.37			
South Korea	Less than 1 hour	23	26.78	11.73	7.16	0.000	Less than 1 hour<1-4 hours Less than 1 hour<5-8 hours Less than 1 hour<+8 hours
	1-4 hours	134	40.82	15.35			
	5-8 hours	36	43.36	15.35			
	+ 8 hours	14	46.50	20.86			
	TOTAL	207	40.09	16.10			

As seen in Table 23 significant differences found between problematic internet uses of prospective teachers in relation to time they spend on Internet in a day. The results show that heavy users have more problematic in Internet use in both Turkish and South Korean prospective teachers. If the analyses have been investigated in details, South Korean prospective teachers who spend less than one hour on Internet in a day have less problematic in internet use than the other heavy users. On the other hand, in Turkish prospective teachers the differences were found between not only among less than one hour and the other heavy users but also 1-4 hours users and the others.

Table 24: Problematic Internet Use By Number of Years Using Internet

	Time	n	Mean	sd	F	p
Turkey	Less than 1 year	9	28.67	10.94	0.92	n.s.
	1-3 years	53	39.26	20.43		
	4-5 years	124	38.98	17.83		
	6-8 years	132	40.98	20.49		
	+8 years	70	39.59	19.78		
	TOTAL	388	39.56	19.37		
South Korea	Less than 1 year	2	25.00	2.83	0.89	n.s.
	1-3 years	6	33.33	14.51		
	4-5 years	17	42.94	20.39		
	6-8 years	39	41.28	13.51		
	+8 years	143	39.92	16.32		
	TOTAL	207	40.09	16.10		

As seen in Table 24 no significant differences found between problematic internet use in relation to the number of years using Internet of prospective teachers in both nations.

Third main research question is to investigate the relationship between problematic internet use and loneliness levels of prospective teachers.

Table 25: Correlation between problematic internet use and loneliness levels of prospective teachers by nations

Problematic Internet Use vs. loneliness	n	r	p
Turkey	388	0.11	0.02
South Korea	207	0.29	0.00

Table 25 shows that there are positive but low correlations ($p<0.05$) between problematic Internet use and loneliness levels of prospective teachers of both nations.

CONCULISION

First, prospective teachers were examined by computer ownership and the purpose of Internet use. The findings show that South Korean prospective teachers have slightly higher percentages (88.4% - 83.2%) of having their own computers. Although this slight difference in favor of South Korean prospective teachers it can easily seen that majority of prospective teachers have computer in both nations.

The purpose of Internet use of Turkish and South Korean prospective teachers shows some differences in many cases. The most remarkable cases are the ones which are related with social interactions. Turkish prospective teachers reported that they spend more time for chatting and meeting with new people than South Korean counterparts. Another difference can be caught in online shopping. Higher percentages of Turkish prospective teachers (73.7%) reported that they have never used internet as an online shopping medium while 84.5% of Korean prospective teachers use some amount of time. Playing gambling and searching porno sites have been reported very low in percentages for both nations' prospective teachers.

The second main research question is to investigate the possible differences on problematic internet use of Turkish and South Korean prospective teachers. No significant differences were found between the problematic internet use of Turkish and South Korean prospective teachers. The level of problematic internet use was also found below average. Male Turkish prospective teachers have significantly higher scores than females while there is no difference in South Korean side by sex. There is a significant

difference ($p<0.000$) between hours spend online in a day and problematic internet use in both nations. On the other hand no differences were found between number of years using internet; computer sufficiency and problematic internet use.

Problematic internet use was positively and significantly ($p<0.05$) related to loneliness. But the levels of the correlations were low. Although it is not the main concern of the present research the loneliness levels of both nations' prospective teachers have been found statistically different. South Korean prospective teachers' loneliness levels were found higher than the Turkish counterparts. It is hard to guess the reasons of this difference but the low percentages of using internet for chatting and meeting new people by South Korean prospective teachers compare to Turkish counterpart should be taken into consideration to make an evaluation of this case.

As the last word, when all the findings evaluated altogether, it would be clearly said that the problematic internet use of Turkish and South Korean prospective teachers seem alike in terms of level and related factors although two countries have been reported (World Economic Forum, 2011) in different technological (network) readiness levels.

It is natural to have some limitations of conducting and interpreting this research as it is the first comparative study in its field between Turkey and South Korea. Further researches should be done to understand the state and effects of information communication technologies on different samples and by using different research methodologies, such as qualitative ones.

yunnus2001@yahoo.com

Abstract

Due to various factors, countries begin to have different levels of information and communication technologies (ICT) and they have their own unique culture of ICT usage. This case appears interesting especially when we consider university students' proficiency, attitudes and satisfaction in use of ICT.

The purpose of this study is to examine the similarities and differences of university students in Turkey, EU candidate, and in Poland and Czech Republic, new members of EU, in terms of their proficiency, attitudes and satisfaction in use of ICT.

The data of this study, composed of open-and closed-ended questions, were collected from students studying at departments of social and computational sciences. Statistical analyses of data collected were performed by SPSS 17, statistical package program.

Results showed that a) despite the fact that Turkish students use computer for a shorter time than Polish and Czech students, there is no statistically significant difference between them, b) in terms of attitudes toward computer and their satisfaction, there is no difference between students studying at social departments whereas there is a statistically significant difference between students studying at departments of computational sciences.

Keywords: ICT competency, ICT attitudes, ICT satisfaction, ICT literacy

Introduction

One of the basic roles of education is to prepare students to information society. This preparation is the most important source of future economic and social development (Hakkarainen et al., 2000). Some instructors argue that learning can be developed and students can be effectively prepared to business areas by integrating technologies and learning processes (Butzin, 2000; Reiser, 2001, Hopson, Simms, & Knezek, 2002).

Nowadays, rapidly increased information has created some important cultural riches in society. Learning and the way how to learn information literacy take an important place in the realization of this richness (Durmus & Kaya, 2010). Reaching information and increasing information literacy are directly related to ICT use, in other words, ICT literacy (ICTL). Although not theoretically clear, researchers and instructors have different descriptions of ICTL and competency which are considered by governments in recent years as an important factor in economic growth and development (Ololube, 2006; Luu & Freeman, 2011). Educational Testing Service (2002) defines ICTL as the ability to use digital technology, communication tools and also the ability to use technology as a tool to research, organize, evaluate, and communicate information. For Katz et al. (2004), ICTL is the ability to use technology as a tool to research, organize, and communicate. Drenoyianni (2004) argue that ICTL is more than the ability to operate a computer system and that ICT literate has to reach, organize and evaluate information.

Despite ICT is considered nowadays as consisting of computer and internet use, ICTL and computer literacy (CL) are two different concepts. Because CL measures skills of computer use whereas ICTL deals with the way how individual reaches information using tools such as computer and internet.

In early years, CL was specifically defined as programming or reprogramming but with newly developed technologies. This definition has to be revised. Even though CL is briefly described as the ability to use computer (Korkmaz & Mahiroğlu, 2009), other definitions exist as well in literature such as "the ability to

control computer and programs in order to attain some goals"; "the ability to use computer for information retrieval, communication and problem solving" (Akkoyunlu, 1996). A good computer literate is expected to turn on computer, to know logic of computer work, its components and how to effectively use computer programs in order to reach information (Walsh, 2007). CL is not considered as a unique domain but divided into sub-domains such as basic computer literacy, programming literacy. Taking into account these definitions, CL can be defined as the ability to do operations relevant to his/her purpose.

In literature, there are several studies researching ICTL and CL. One of these most important and detailed studies is PISA studies, a set of research by OECD (2005, 2006, 2007, 2009). In these studies whose data were collected from developed and developing countries, both national and transnational ICT use was examined, but these studies do not seem to have data regarding students' self-efficacy, attitudes or satisfaction in ICT and computer.

Germany, Poland, Netherlands and Czech Republic are countries having most student exchange programs with Turkey. Among these countries, Poland and Czech Republic, two developing countries like Turkey, are more relevant to conduct a comparative study concerning ICT. Below are presented ICT situations in two countries.

With the reform of the Polish national education system in the school year 1999-2000, ICT has been integrated into almost all school subjects and students began to be prepared to use computers and software in other subjects during separate ICT lessons. Thanks to this reform, ICTL and CL have increased compared to the year 2000 (Gurbiel, Hardt-Olejniczak, Kolczyk, Krupicka, & Syslo, 2005).

As in Poland, some arrangements have also been realized in Czech educational system to become an EU member, special importance has been given to ICT lessons at schools. But ICTL and CL levels did not differ from the previous level as did in Poland.

In Turkey, studies concerning the integration of computer courses in the curriculum began on 1984 but the integration of computer courses in the curriculum from primary school could not be possible until the year 2000 (Er & Güven, 2008). Many studies conducted in Turkey indicated that students had medium or low levels of ICTL and CL (Korkmaz & Mahiroğlu, 2009; Dinçer, 2011). Results also showed that students had low levels of CL due to their lack of personal computers and dissatisfaction about their courses (Dinçer, 2011).

Finally, as a research question, we wished to examine similarities and differences between students in EU candidate Turkey and new EU members Poland and Czech Republic in terms of ICT competency, attitude and satisfaction.

2. Method

2.1. Participants

440 students studying at universities in Turkey, Poland and Czech Republic participated in this study. Students continuing their education at departments of computational sciences in Turkey were compared with students at same departments in Czech Republic; students studying at departments of social sciences in Turkey were compared with students at same departments in Poland. Descriptive statistics related to participating students were given in Table 1.

Table 1 Descriptive statistics of students

	Turkey's Social Students	Poland's Social Students	Turkey's Science Students	Czech's Science Students
Male	32 (7.27%)	30 (6.82 %)	46 (10.45 %)	43 (9.77 %)
Female	113 (25.69 %)	115 (26.14%)	29 (6.59 %)	32 (7.27 %)
Total	145 (32.96 %)	145(32.96 %)	75 (17.04 %)	75 (17.04 %)

2.2. Data Collection and Analysis Procedures

The data of this study were collected from a survey which consists of four parts with open-and closed-ended questions. The first part elicits demographic data; the second part concerns computer and Internet use; the third part examines attitudes toward computers and the final part concerns computer competency.

The survey was administered to volunteer students in Turkey, Poland and Czech Republic during spring semester of the academic year 2010-2011. It was carried out in participants' native language and then was translated into English by translators. Independent-samples t-test and Pearson product-moment correlations were performed using SPSS 17 software, statistical package program.

The computer and Internet use variables were chosen from students survey which encompassed satisfaction (1 = satisfaction, 2 = dissatisfaction); computer ownership (1 = yes, 2 = no); students' experiences with computer and Internet (ranging from 1= "less than one year" to 4= "five years or more") and students frequency of computer and Internet use (ranging from 1 = "almost never" to 5 = "four or more hours a day"). Data concerning students' attitudes toward computers were acquired from attitudes toward computers section in the survey (ranging from 1= "strongly disagree" to 4= "strongly agree"). Computer competency data were gathered from the section "computer competency" in the survey (1= "I don't know what this means"; 2= "I know what this means but I cannot do it"; 3=" I can do this with help from someone"; 4=" I can do this very well by myself"). Other data were collected by open-ended questions.

3. Results

Findings of this study showed that all students studying at departments of social sciences both in Turkey and Poland had informatics courses containing only basic computer topics while a great majority of students studying at departments of computational sciences in Turkey and Czech Republic, besides informatics courses, had other courses such as database, computer hardware, programming, operating system and graphic design.

Students were asked if they have a personal computer and if they are satisfied with computer-related course(s) taken in the university, if not, for what reasons they are dissatisfied. They were also asked how long they have been using computer and Internet, how much time they spend using computer and Internet and for what purposes they use computer and Internet. They were asked about their attitudes toward computers and their computer competency too. An independent-samples t-test was performed to determine if there were statistically significant differences between students. Results are given in Table 2 below.

Table 2 Differences in students' ICT use, competency, attitude and satisfaction

	Social Students								Science Students							
	Turkey			Poland			Difference		Turkey			Czech			Difference	
	N	M	SD	N	M	SD	t	p	N	M	SD	N	M	SD	t	p
Lesson Satisfied	129	1.29	0.46	111	1.16	0.37	2.43	0.16	74	1.35	0.48	68	1.07	0.26	4.22	0.00
Reason of Dissatisfied	32	4.93	1.52	17	2.18	1.01	6.71	0.00	22	3.27	1.03	3	4	1.73	-1.06	0.30
Computer Ownership	145	0.77	0.43	145	0.99	0.08	-6.32	0.00	75	0.99	1.12	75	0.96	1.97	1.01	0.31
Computer Experience Period (year)	145	3.03	1.05	145	3.85	0.57	-8.29	0.00	75	3.49	0.70	75	3.84	0.55	-3.37	0.00
Internet Experience Period (year)	145	2.88	0.99	145	3.86	0.57	-5.98	0.00	75	3.35	0.72	75	3.84	0.53	-4.78	0.00
Computer & Internet Use (hours/week)	145	10.75	5.79	145	14.74	5.62	-5.95	0.00	75	19.01	8.08	75	26.68	7.45	-6.04	0.00
Purpose of Computer & Internet	145	5.78	1.71	145	6.53	1.43	-4.06	0.00	75	6.45	1.73	75	6.31	1.95	0.49	0.63
Computer Attitude	145	2.23	0.62	145	2.13	0.60	1.34	0.18	75	2.60	0.57	75	2.39	0.54	2.35	0.02
Computer Competency	145	3.33	0.39	145	3.42	0.49	-1.69	0.09	75	3.67	0.29	75	3.59	4.43	1.49	0.14

As we see in the table, Turkish (M=1.29, SD=0.46) and Polish (M=1.16, SD=0.37) students studying at departments of social sciences were satisfied with computer-related courses and there was no statistically significant difference between them regarding satisfaction (t (238) = 2.43, p = 0.16). Turkish (M=1.35, SD=0.48) and Czech (M=1.07, SD=0.26) students studying at departments of computational sciences were satisfied with computer-related courses but there was statistically significant difference between them concerning satisfaction (t (140) = 4.22, p = 0.00, p < 0.05).

When students dissatisfied with computer-related courses were asked for what reasons they are not satisfied, a statistically significant difference was found in Turkish and Polish students' reasons for their dissatisfaction (t (47) = 6.71, p = 0.00, p <0.05). However, no statistically significant difference was observed in Turkish and Czech students' reasons for their dissatisfaction (t (23) = -1.06, p = 0.30). While 52.60 % of Turkish students studying at departments of social sciences and being dissatisfied with computer-related courses, told as reasons of their dissatisfaction some hardware problems they confronted in laboratories (computers not working, old hardware, etc.), 38.88 % of Polish students said that they were not satisfied with computer-related courses due to little information. Of all Turkish students studying at departments of computational sciences and being dissatisfied with computer-related courses, 34.63 % showed teachers as reason of this dissatisfaction while little information and newer use are two other factors of dissatisfaction (23.08 % for each). As to Czech students, % 40 of them thinks that little information is the main reason of their dissatisfaction.

When we look at the fact that students participating in this study have or not have personal computers, a statistically significant difference was found between Turkish and Polish students studying at departments of social sciences (t (288) = -6.32, p = 0.00, p < 0.05), but no significant difference was observed between students studying at departments of computational sciences (t (148) = 1.01, p = 0.31). Almost all Polish students (M=0.99, SD=0.08) have a personal computer whereas only three fourths of Turkish students (M=0.77, SD=0.43) have personal computers, which may explain the reason of this difference. Almost all Turkish (M=0.99, SD=1.12) and Czech (M=0.96, SD=1.97) students studying at departments of computational sciences have at least one personal computer.

Findings related to computer experience period showed that there were statistically significant differences both between Turkish and Polish students studying at departments of social sciences (t (288) = -8.29, p = 0.00, p < 0.05) and Turkish and Czech students studying at departments of computational sciences (t (148) = -3.37, p = 0.00, p < 0.05). When we think about the reasons of these differences, we found that Polish students studying at departments of social sciences (M=3.85, SD=0.57) use computers for a longer time than Turkish students (M=3.03, SD=1.05); Czech students (M=3.84, SD=0.55) studying at departments of computational sciences use computers for a longer time than Turkish students (M=3.49, SD=0.70).

Findings regarding Internet experience period indicated statistically significant differences both between Turkish and Polish students studying at departments of social sciences (t (288) = -5.98, p = 0.00, p < 0.05) and Turkish and Czech students studying at departments of computational sciences (t (148) = -4.78, p = 0.00, p < 0.05). When we reflect on the reasons of these differences, we see that Polish students studying at departments of social sciences (M=3.86, SD=0.57) use Internet for a longer time than Turkish students (M=2.88, SD=0.99); Czech students (M=3.84, SD=0.53) studying at departments of computational sciences use Internet for a longer time than Turkish students (M=3.35, SD=0.72).

Findings with respect to weekly computer and Internet use also revealed statistically significant differences both between Turkish and Polish students studying at departments of social sciences (t (288) = -5.95, p = 0.00, p < 0.05) and Turkish and Czech students studying at departments of computational sciences (t (148) = -6.04, p = 0.00, p < 0.05). When we consider the reasons of these differences, we observe that Polish students studying at departments of social sciences (M=14.74, SD=5.62) use computer and Internet for a longer time than Turkish students (M=10.75, SD=5.79); Czech students (M=26.68, SD=7.45) studying at departments of computational sciences use computer and Internet for a longer time than Turkish students (M=19.01, SD=8.08).

Concerning for what purposes students participating in this study use computer and Internet, a statistically significant difference was noted between Turkish and Polish students studying at departments of social sciences (t (288) = -4.06, p = 0.00, p < 0.05) but no significant difference was observed between students

studying at departments of computational sciences (t (148) = 0.49, p = 0.63). 36.60 % of Turkish students stated that they use computer and Internet for academic purposes and 27.60 % for social websites. 36.60 % of Polish students explained that they use computer and Internet for social websites and 27.60 % for surfing on diverse websites. A clear majority of Turkish and Czech students studying at departments of computational sciences (about % 58) use computer and Internet for surfing social and diverse websites.

Findings about students' attitudes toward computers showed that no statistically significant difference was found between Turkish and Polish students studying at departments of social sciences (t (288) = 1.34, p = 0.18) but a significant difference was detected between students studying at departments of computational sciences (t (148) = 2.35, p = 0.02). Results also indicated that Turkish students (M=2.60, SD=0.57) at departments of computational sciences had higher attitudes toward computer than Czech students (M=2.39, SD=0.54). Concerning Turkish (M=2.23, SD=0.62) and Polish (M=2.13, SD=0.60) students studying at departments of social sciences, we found that they have computer attitudes at medium level.

When we analyze CL of students participating in this study, we found no statistically significant differences between students studying at departments of both social (t (288) = -1.69, p = 0.09) and computational (t (148) = 1.49, p = 0.14) sciences. This may be explained by the fact that a great majority of students (% 89.01) had high level of CL.

The Pearson product-moment correlations test was performed to determine if there was a connection between CL levels and personal computer ownership. Results indicated that there was a positive but low relation between CL levels and personal computer ownership (r (438) =0.26, p < 0.01).

4. Discussion and Conclusion

CL levels have increased in parallel with rapidly developing technology (Varol, 2002; Geçer & Dağ, 2010). Correspondingly, societies with high information literacy levels become stronger than other countries in economic, political and scientific fields (Kaya, 1995; Çakmak, 2008). In developed and developing countries, we observe many studies being carried out to enhance information literacy. Generally, the most of these studies aim at increasing ICTL with basic computer courses at educational institutions.

Today, because accessing to electronic information became widespread and local libraries have been replaced by Internet, ICT use was identified with computer and Internet use; ICTL and CL have a linear relationship (Zhang & Espinoza, 1998; Gross & Latham, 2007). Therefore, to comment ICT use competency, attitudes and satisfaction regarding computers, we think it is a good starting point to study computer competency, attitudes and satisfaction about computers.

Although a great majority of students participating in this study indicated that they were satisfied with computer-related courses taken in the university, 16.82 % of them expressed their dissatisfaction. As reasons of their dissatisfaction, Turkish students highlighted computers not working in laboratories, unskilled teachers and some programs they have to take in the curriculum and they will never need in real life while Polish and Czech students said that they were not satisfied with computer courses due to insufficiency of information about computer subjects. As we examined dissatisfaction reasons in Turkish students within hardware problems, we observed computer maintenance problems at universities and increased number of students per computer. We also found out that in basic computer courses, they received standard course content and that, in addition to basic computer courses, they asked for a computer course with contents peculiar to their professional fields (Dinçer, 2011).

Since the cost of information and communication technology has declined, computer and Internet access has become common. It is not wrong to say that students using ICT at home have more ICT experiences (Luu & Freeman, 2011). We believe that this affirmation is verified by the fact that a great majority of students participating in this study had personal computers and that they had a high level of computer competency, and that there was a positive but low relation between computer competency and personal computer ownership. Previous studies also indicated that, for students, being deprived of using computer at home posed a more serious obstacle than being deprived of using computer at school (Moos & Azevedo, 2009), which strengthens this affirmation.

Although Turkish students began to use computer and Internet later than Polish and Czech students, no difference was seen between them regarding their computer competency. It is pleasing to see that Turkish students were as competent as Polish and Czech students despite their late use of computer and Internet.

When we look at findings with respect to weekly computer and Internet use, we observe that Turkish students use computer and Internet for a shorter time than Polish students but for a longer time than Czech students. We note that these differences are associated to fields rather than to countries because Turkish students studying at departments of social sciences use computer and Internet for academic purposes while Polish students use computer and Internet for social websites and for surfing on diverse websites. Reasons of computer and Internet use in computational fields vary. Turkish students, like Polish ones, use computer and Internet for surfing on diverse websites and for social websites. We think it should be useful to associate these differences to social structure and to study students 'social life in accordance with their countries and departments.

Finally, no difference was detected between students regarding their attitudes toward computers. However, we should note that, compared with Polish and Czech students, Turkish students have high attitudes toward computers. But, reasons of theses higher attitudes could not be explained.

As students participating in this study could not easily understand open-ended questions, we suggest, for further studies, collecting data by these questions rather quantitatively. We suggest especially reconsidering reasons of computer and Internet use in connection with countries' socio-economic structures.

Acknowledge

I would like to thank Dr. Filip Nalaskowski and Mb. Přibyslava Hoffmannova, Nuray KUTLAR and Hüseyin DEMIR for their great assistance in the realization of this work. Special thanks go to Dr. Mustafa MAVAŞOĞLU who has served as a continuing source of advice, help, patience, and support.

The rapid changes and growth in information and communication technologies (ICT) provide significant opportunity to share information resources and knowledge. These developments in the couple of last decades have also led to a valuable contribution for a wide range of learning applications. By increasing usage of internet, e-learning has become an ideal and modern way of distance education. Moreover, distance education is preferred as a valuable way of learning for lifelong learning. At this point, e-learning design is an important issue for better education service. The institutions, which deliver e-learning service via the use of computer and internet, are responsible to choose the most suitable e-learning service provider for effective distance education. Therefore, e-learning provider selection process is essential to increase the e-learning service quality. In this study, fuzzy logic-based quality function deployment (QFD) is employed to identify the e-learning design requirements and to select the most suitable e-learning provider.

Keywords: E-learning Design, Provider Selection, Fuzzy Logic, Fuzzy - Quality Function Deployment, House of Quality, Lifelong Learning.

1. INTRODUCTION

E-learning has become an acceptable and modern way of distance education that is delivered via the use of computers, internet and multimedia presentation (Lau, 2000). According to the Internet World Stats (2010), the growth rate of internet usage in the world is 444.8 % from 2000 to 2010. Since the number of internet users is rapidly increasing with each passed year, e-learning is often identified with web-based learning. The QFD process requires various inputs which are also in the form of linguistic data (human perception, judgment, and evaluation on importance of customer requirements or strengths of relationship between customer requirements and technical attributes) that is quite vague and subjective (Chen et al., 2006). Although it is really important to overcome the vagueness and imprecision in human thought for operative judgment and decision making, most of the input variables in traditional QFD are represented with crisp numerical values that also cause precise judgments. In this study, fuzzy logic based QFD is employed to deal with the vagueness of human thought for selection of e-learning provider.

2. THE CONCEPT OF ONLINE EDUCATION FOR LIFELONG LEARNING

As an education expert in lifelong learning, John Field defined lifelong learning as a “relative new concept” although it has traditionally been known as adult education (Field, 2003). Lifelong learning is also meant to symbolize a second chance for individuals to update their skills and qualifications. Higher education institutions have an important role to develop and provide learning opportunities for individuals. E-learning indicates a radical change in learning paradigm (Lee et al., 2007). Furthermore, in comparison to traditional learning process in e-learning process participants need to have several characteristics, such as self-motivation and self-discipline that contribute to success in e-learning process (Bose, 2003). These features make e-learning a viable learning option for lifelong learning.

3. METHODOLOGY

3.1. Fuzzy Set and Linguistic Variables

In order to deal with the vagueness of human thought, Zadeh (1965) first introduced the fuzzy set theory, which was oriented to the rationality of uncertainty due to imprecision or vagueness. Especially in group decision-making process, there is also an internal uncertainty based on distinctive characteristics of the all individual decision makers. A major contribution of fuzzy set theory is its capability of representing vague data. In fact, the fuzzy set theory is a generalized form of the classical set theory that has membership functions with values in [0, 1]. A fuzzy set is a class of objects with a continuum of grades of membership. Such a set is characterized by a membership (characteristic) function, which assigns to each object a grade of membership ranging between zero and one. A tilde "~"is placed above a symbol where the symbol represents a fuzzy set. A triangular fuzzy number is denoted simply as $(\frac{\alpha}{\beta},\frac{\beta}{\gamma})$ or (α, β, ɣ). The parameters α, β and, ɣ respectively denote the smallest possible value, the most promising value, and the largest possible value that describe a fuzzy event (Kahraman et.al., 2003). To aggregate all individual decision makers' opinions, a common measure is needed. Therefore, the fuzzy linguistic variables are used to represent the different aspects of human language. It also allows us to use the fuzzy linguistic variables for human words and sentences with numerous linguistic criteria, such as very low, low, medium, high, very high. The linguistic terms and corresponding fuzzy numbers are shown in Table 1.

Table 1 Linguistic Term and Corresponding Fuzzy Numbers

	Linguistic Term	Fuzzy Number
(VH)	Very High	(8,9,10)
(H)	High	(6,7,8)
(M)	Medium	(4,5,6)
(L)	Low	(2,3,4)
(VL)	Very Low	(0,1,2)

3.2. Defuzzification Method

Defuzzification is a process which needs to evaluate that a fuzzy number is characterized by its shape, spread, height, and relative location on the x-axis (Opricovic & Tzeng, 2003). In this study, the CFCS (Converting Fuzzy data into Crisp Scores) defuzzification method is executed through fuzzy aggregation procedure. The CFCS defuzzification method was first proposed by Opricovic and Tzeng (2003). By determining the left and right scores, the CFCS method provides fuzzy max and fuzzy min of fuzzy numbers. According to the membership functions of the fuzzy numbers, the total score is computed with a weighted average. If $\tilde{z}_{ij}^{d} = (\alpha_{ij}^{d}, \beta_{ij}^{d}, \gamma_{ij}^{d})$ is given for the fuzzy evaluations of decision maker d (d = 1,2,…,n) about the degree to which the criterion *i* affects the criterion *j*. The CFCS defuzzification method includes five-step algorithms described in Fig. 1:

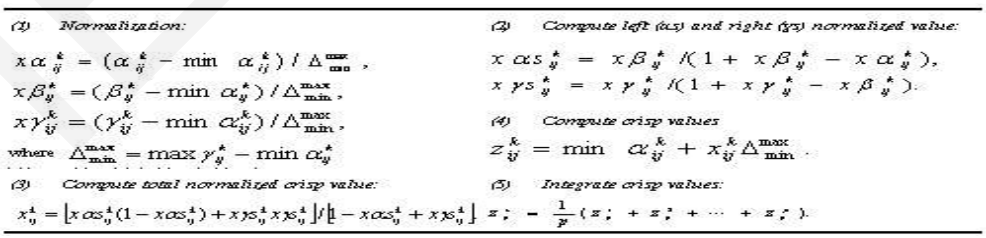

Figure 1 CFCS Deffuzzification Steps

3.3. Fuzzy - Quality Function Deployment

Quality Function Deployment is a useful tool for total quality management to develop new products and services. Furthermore QFD helps to improve the features of existing products and services. It was developed in late 1960s in Japan, by Yoji Akao (Akao, 1972). QFD charts are filled through various inputs such as questionnaires, interviews and focus groups. This increases the uncertainty in the quantification of the information. The linguistic variable is useful in dealing with situations that are

identified in quantitative expressions (Wang and Chuu, 2004). In order to decrease the uncertainty in the data collected, fuzzy logic can be used (Bouchereau and Rowlands, 2000). To address the ambiguity in QFD process, there are some researches are conducted-Temponi et al. (1999) Bevilacqua et al. (2006), and Wang (2010). The QFD process contains four phases. The house of quality matrix is usually called as the phase one matrix, or the planning matrix (Hauser and Clausing, 1988) that is shown in Fig. 2. The HOQ is described and its process following approaches suggested by Brown (1991), and Griffin and Hauser (1992).

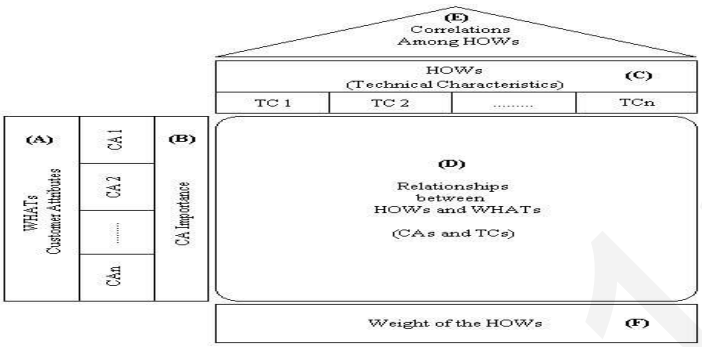

Figure 2 House of Quality

Step 1-*Identifying process of the WHATs:* In this step, the process includes the determination of customer needs, the assignment of priorities to customer attributes (CAs), and the evaluation of the customer's perception are needed (Temponi et al., 1999). The wanted benefits in a product or service in the customer's own words are customer needs and often called (CAs) or "WHATs" area (A) in Fig. 2. This step depends on expertise of the team members (Griffin and Hauser, 1992).

Step 2-*Determination process of the HOWs:* Technical characteristics (TCs), which are also called measurable requirements, are stated as the "HOWs" of the HOQ. TCs are determined by a multidisciplinary team and located on the area marked as (C) in Fig. 2.

Step 3-*Preparation of the relationship matrix:* TCs, which impact on which CAs, are judged by a team. Likewise, it is really important to identify the influence degree of TCs. This relationship between TCs and CAs is shown in the area identified as (D) in Fig. 2.

Step 4: *Elaboration process of the correlation matrix:* The physical relationships among the technical requirements are specified on an array known as "the roof matrix" and identified as (E) in Fig. 2.

Step 5: *Action plan:* The weights of the TCs, identified as area (F), are placed at the base of the quality matrix. The weights are one of the main outputs of the HOQ, and are determined by:

$$Weight(\mathrm{TC})_i = V(\mathrm{TC})_{i1} \times Im(\mathrm{CA}_1) + \ldots + V(\mathrm{TC})_{in} \times Im(\mathrm{CA}_n), \quad (1)$$

where $V(TC)_{in}$ is the correlation value of TC_i with CA_n, and $Im(CA_n)$ represents the importance or priority of CA_n.

4. APPLICATION – CASE STUDY

In this study, an illustrative case is presented. An educational institution, which aims to provide online education for lifelong learning program, is described figuratively. Otherwise, as e-learning service providers, 5 firms (A, B, C, D, and E) which have operations in the e-learning service industry, are selected. The e-learning provider selection model is identified by the following steps:

4.1. Selection of the Decision Makers

In this study, decision makers are selected for data collection according to their expertise in related industry. Most of the decision makers are managers/executives of e-learning users at the institutional

level. 10 potential decision makers were selected and sent the invitations for this research. Moreover, in order to help the identification process of HOWs and WHATs, a broad literature research is served (Bevan, 1999; Brajnik, 2001; Signore, 2005; Li et al., 2009).

4.2. Determining the Linguistic Terms and Corresponding Fuzzy Numbers

To aggregate each decision makers' opinions, the linguistic variables in Table 1 are employed. These variables are Very High (8;9;10), High (6;7;8), Medium (4;5;6), Low (2;3;4) and Very Low (0;1;2).

4.3. Identifying WHATs

In this step, to identify WHATs, as mentioned above, a wide-range literature review is condensed and each decision makers are asked to identify which quality characteristics should be used in this research. After each decision makers' evaluation, 10 attributes are identified and shown in Table 2a.

Table 2 Identified WHATs and HOWs

(a)

WHATs		
1	AE	Aesthetics
2	FC	Functionality
3	RL	Reliability
4	US	Usability
5	EF	Efficiency
6	MT	Maintainability
7	PR	Portability
8	RC	Rich Content
9	CS	Customer Support
10	CT	Cost Effectiveness

(b)

HOWs		
1	CE	Certificated Education
2	TC	Technical Capability
3	QC	Quality Certification
4	RP	Reputation
5	FS	Financial Stability
6	EI	Experience in the Industry
7	QDT	Qualified and/or Experienced Design Team
8	QSS	Qualified Support Service Staff

4.4. Identifying HOWs

In order to identify HOWs, each decision maker is asked to determine which factors are important to meet the CAs for evaluating e-learning service providers. Identified HOWs are shown in Table 2b.

4.5. Calculating the Importance Degrees of WHATs

In this step, each decision maker is asked to evaluate the importance degrees of WHATs. By using the arithmetic mean method, importance degrees of WHATs are calculated. The importance degrees of each WHAT are shown in Fig. 3.

4.6. Identifying the Correlation between HOWs and WHATs

To identify the correlation between HOWs and WHATs, each decision maker is asked to evaluate the impact of each HOW on each WHAT. An evaluation example of a decision maker is shown in Table 3. Calculated correlation values are shown in Fig. 3.

4.8. Measuring the Correlation of HOWs

In this step, each decision makers are asked to evaluate the correlations of HOWs. The result is shown in the roof matrix in Fig. 3.

4.9. Determining of E-learning Providers' Influence on the TCs

To determine of e-learning providers' influence on the TCs, each decision makers' opinions are collected according to the relationship between TCs and providers. Aggregated values for each provider are given in Table 5.

Table 5 E-learning Providers' Influence on each attribute

	CE			TC			QC			RP			FS			EI			QDT			QSS		
	α	β	χ	α	β	χ	α	β	χ	α	β	χ	α	β	χ	α	β	χ	α	β	χ	α	β	χ

C	1,33	1,83	2,33	1,67	2,17	2,67	1,33	1,83	2,33	1,67	2,17	2,67	1,33	1,83	2,33	1,33	1,83	2,33	1,33	1,83	2,33	1,67	2,17	2,67
D	3,67	4,17	4,67	3,00	3,50	4,00	3,67	4,17	4,67	1,67	2,17	2,67	3,67	4,17	4,67	3,33	3,83	4,33	3,67	4,17	4,67	3,33	3,83	4,33
E	2,67	3,17	3,67	2,00	2,50	3,00	2,67	3,17	3,67	1,67	2,17	2,67	1,67	2,17	2,67	2,33	2,83	3,33	2,33	2,83	3,33	2,33	2,83	3,33

4.10. Converting Fuzzy Scores to Crisp Scores for Ranking Each E-learning Provider

In order to rank each e-learning provider (Pr), CFCS defuzzification method is employed as mentioned above. Then, each provider weight is calculated by using the following equation. The scores and rank of each e-learning provider are shown in Table 6.

$$Weight(P)_i = V(Pr)_{i1} \text{ x } Im(TC_1) + \ldots + V(Pr)_{in} \text{ x } Im(TC_n)/P_n \quad (2)$$

Table 6 Scores and Rank of E-learning Providers

Providers	SCORE	RANKING
A	50,714	1
B	38,251	4
C	32,537	5
D	48,581	2
E	42,827	3

5. DISCUSSIONS AND CONCLUSION

According to the evaluations of each decision maker, e-learning provider A is estimated as the best choice, but the other provider C is seen as the worst choice. By using this proposed method, an alternative way of provider selection is described.

ABSTRACT

Constructed Response items are open ended, short answer questions that measure the application level of cognitive skill and content knowledge. Although constructed response items can provide a lot of students' information, the high cost required in manually grading the constructed responses.

The aim of this study is to develop an on-line assessment system with constructed response items in the context of elementary mathematics education. The system can record the problem solving process of constructed response items, and then it can transfer the process to response codes. An inference mechanism based on artificial intelligence is implemented in the system and it can help to diagnose the bugs in the problem solving process automatically. The test of "Multiplication of Fraction" unit in the primary school mathematics is constructed to evaluate the performance of this system. One hundred and fifty-eight sixth graders were chosen from classes of elementary schools. The mean of classification rates of the system is 97%. The results show that the proposed system can diagnose the students' bugs accurately. In addition to the diagnostic information, a high-order item response theory (HO-IRT) is applied to estimate the overall and domain abilities.

Keywords: constructed response item, computerized test, diagnostic assessment, high-order item response theory

Introduction

Constructed response (CR) items that elicit students' higher-level constructs are beneficial to evaluate complex concepts or skills such as problem solving. Students' responses are multiple problems solving process, sometimes including explaining the reasons about how to get the answer. The responses will be classified to many types, and then given the scores according to the performance. Each constructed response item has a unique rubric.

The constructed response items have been used by some large-scale assessments, such as NAEP, PISA and TIMSS (National Assessment Governing Board, 2005, Olson, Martin, & Mullis, 2008, OECD, 2005). The NAEP example items can be found on the website. (http://nces.ed.gov/nationsreportcard/itmrl sx/search.aspx?subject=mathematics). The scoring method scored the responses with its completeness into five scores, extended/satisfactory/partial/

minimal/incorrect, and each level has clearly descriptions. The scorers must be trained to make sure the response can be scored consistently, and the training processes are costly and time-consuming. Although constructed response items provide a lot of information, the high cost required in manually grading the constructed responses.

Furthermore, there are some computerized tests with automated scoring system like Figure 1 as an example. The variations in items are limited to the complex scoring method, and also cannot record the problem solving process. The aim of this study is to develop an on-line assessment system with constructed response items. The system records the constructed response item responses completely and analysis the learning bugs (error patterns) automatically. And the overall and domain abilities will be estimated simultaneous by higher-order item response theory.

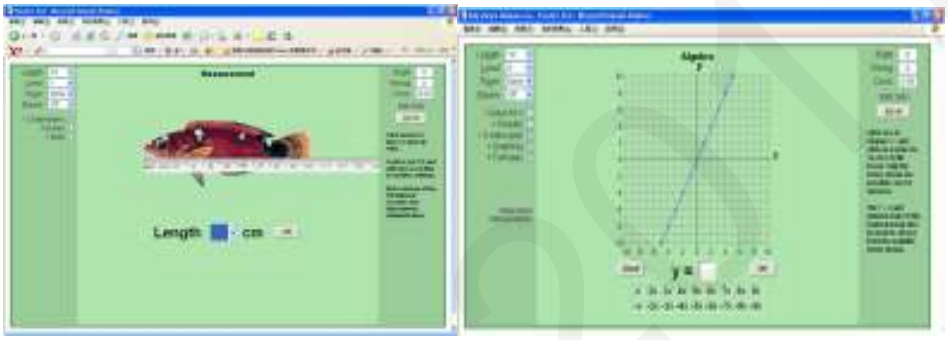

Figure 1 Computerized constructed response items

(Thatquiz, http://www.thatquiz.org/)

METHOD

Computerized Test Development

The figure 2 and figure 3 show the test interfaces of multiple choice and constructed response items, respectively. The responses, like the equations or the fractions, can be input by using the tool which the system provided adaptively for each CR items. The inputted equations will be displayed in the response area, and they will be recorded by LaTeX format. Table 1 shows an inputted equation and the corresponding codes in the database.

Figure 2 Interface of multiple choice items

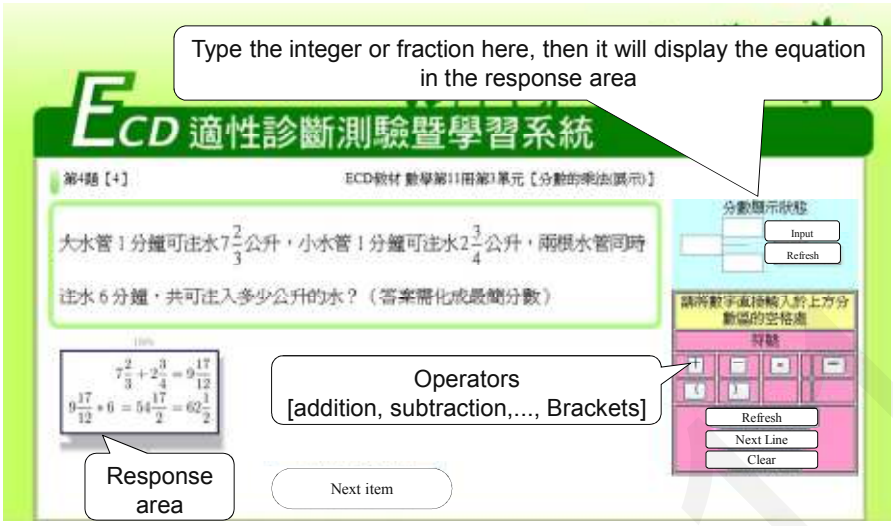

Figure 3 Interface of constructed response items

Table1 an example of the response format

Response pattern	$12\frac{8}{15}\times 1\frac{1}{4}=\frac{180}{15}\times\frac{5}{4}=\frac{45}{3}=15$
Database	12\\frac{8}{15}* 1\\frac{1}{4} = \\frac{180}{15}* \\frac{5}{4} = \\frac{45}{3} = 15\\frac{}{}

The analysis of constructed response item

One of the purposes of this study is to develop an automatic analysis process for CR items, which allows the diagnosis of error patterns. There are two parts in the analysis process; first, some rules are used to build a decision tree and to classify the responses into several types. Second, the prototypes of error patterns will be compared to responses of the participants by using the block-based matching analysis.

For example, in item 27, three rules are involved in the decision tree (see Figure 4)

Rule 1: check the status of the response area. If the response area is blank, then code 99 will be given,, otherwise, rule 2 will be applied

Rule 2: examine the appropriateness of the first equation in the participant's response by comparing with the correct equations preset in the system. If the first equation is correct, then apply to Rule 3a; otherwise apply to Rule 3b

Rule 3a: check the correctness of the final answer. If the student's final answer is correct, then the system will record the correct answer of the student; otherwise the block-based matching is applied to the best fit error pattern from the prototypes of Bug1 to Bug9.

Rule 3b: if the error is occurred due to fraction addition instead of fraction multiplication, the block-based matching will refer to the best fit error pattern, the prototypes of Bug10 and Bug11. Otherwise, this implies that the student did not understand the problem, and then the system will refer to

Bug 12.

The first step of block-based matching analysis is to decompose the student's response into blocks without operators, then compare these blocks with bugs' prototypes and find the best fit error patterns.

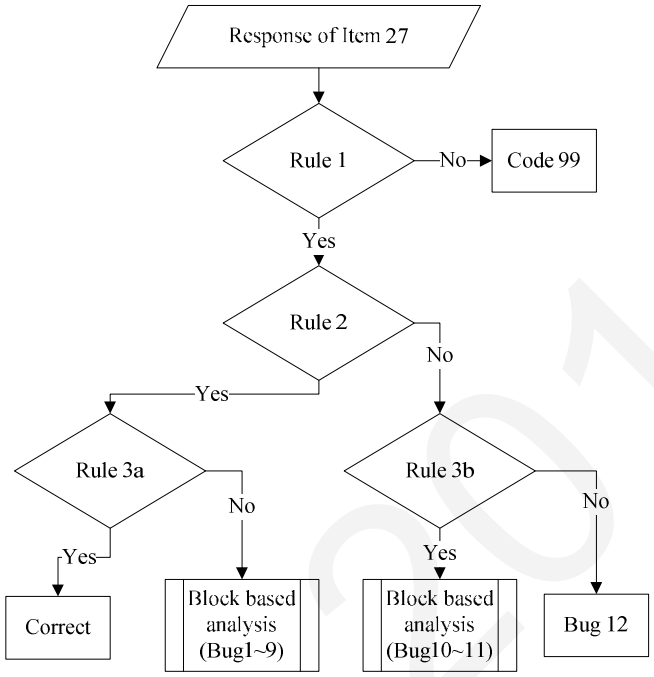

Figure 4 Analysis flow chart of item 27

Higher-Order Item Response Theory

A hierarchical structure of the higher-order item response theory (HO-IRT) framework involves he overall ability on the top and multiple domain abilities at the lower levels. This framework has been well adopted at large-scale assessment settings. de la Torre and Song（2009）estimate the overall and multiple domain abilities and their correlations simultaneously using the Markov chain Monte Carlo (MCMC) methods in a hierarchical Bayesian framework. Each domain is considered to be unidimensional, and a domain-specific ability $\theta_i^{(D)}$ accounts for the performance of examinee i on domain d, where $d = 1, 2, ..., D$. The correlations between the different domain abilities are accounted for by positing a higher-order overall ability θ_i. Specifically, the domain abilities are linked to the overall ability via the linear function $\theta_i^{(d)} = \lambda^{(d)}\theta_i + \varepsilon_{id}$, where the $\lambda^{(d)}$ is the latent regression coefficient of the domain ability d on the overall ability, and ε_{id} is the error term which follows a standard normal distribution.

In the present study (as shown in figure 5), the mathematical ability (overall ability) was assessed by the three domain abilities, in which conceptual knowledge was measured by MC item 1-4, procedural knowledge was measured by MC item 5-14, and problem solving was measured by MC 15-26 & CR 27-30.the test measured the mathematical ability and three domain abilities, conceptual knowledge, procedural knowledge and problem solving.

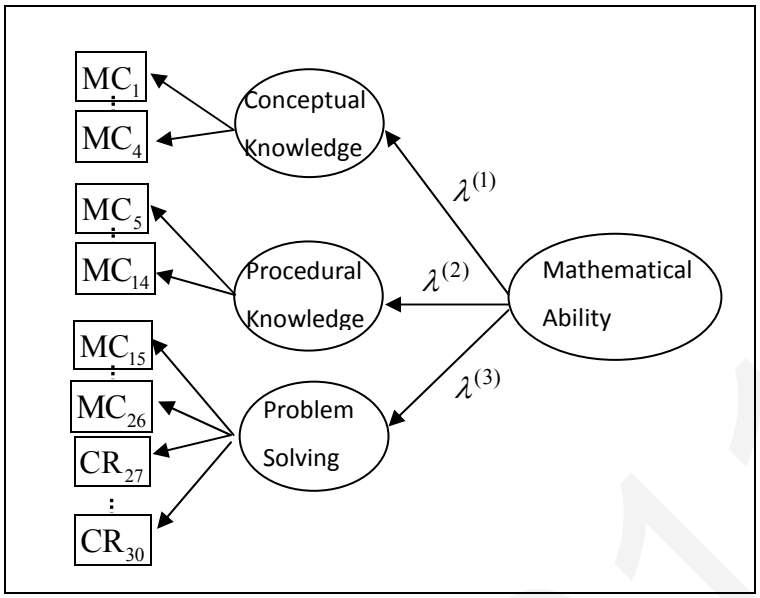

Figure 5 assessment framework of HIRT

Participants

A test of "Multiplication of Fraction" was developed based on the mathematics curriculum in Taiwan. One hundred and fifty-eight six graders were recruited from 4 elementary schools in Taiwan. There are 30 items in the test, including 26 multiple choice (MC) items and 4 constructed response (CR) items.

RESULTS

The effectiveness of the error pattern diagnosis was examined by comparing the automated scoring results of the system to the expert scoring results. Table 2 shows the percentage of correctly identified error patterns by the system and human (classification rates). The classification rates of constructed response items ranged from 94.94% to 99.37%, which means that the system diagnosed student's error patterns as effective as human raters.

Table 2 Classification rates of learning bugs

CR items	Classification rates	# of learning bugs
27	99.37%	12
28	98.73%	11
29	94.94%	10
30	95.57%	9

Table 3 shows the estimated results by using the MCMC method. This result shows that the three domain abilities and the overall mathematics abilities were highly correlated.

Table 3 The regression coefficient of the domain abilities

variable	$\lambda^{(CK)}$	$\lambda^{(PK)}$	$\lambda^{(PS)}$
Mean of posterior	0.947	0.948	0.979

Table 4 shows the correlations between the abilities and the number of learning bugs. The number of error patters were highly correlated with the overall mathematics ability (r = -0.901), whereas the correlations between the number of error patterns ranged from r =-0.896 to -0.907. The results show that the more error patterns the student had, the lower the mathematic ability was. Therefore, the results provide evidence that the proposed system successfully and effectively identify students' error patterns.

Table 4 Correlations between the abilities and the number of bugs

	Domain			
Variable	MA	CK	PK	PS
The number of Bugs	-0.901	-0.896	-0.907	-0.898

Note: MA= Mathematical Ability; CK= Conceptual Knowledge; PK=Procedural Knowledge; PS=Problem Solving.

CONCLUSION

The present study developed an on-line assessment system with constructed response items. The results show that the current system effectively and efficiently identifies student's error patterns. Moreover, the utility of the system in the real class settings is observed.

Although the CR items provided more information than MC items in the system, answering a CR item cost much more time than MC item's. This was caused the proficiency of the system, although we had training lesson before the test. Maybe the computer skills can be considered in the experiment.

zkamisli@anadolu.edu.tr

Abstract

The variety of open and distance learning (ODL) programs contributes to the personal development of learners. Today, different institutions around the world offer different ODL programs. E-certificate programs are one of these ODL programs that help lifelong learners to enhance their personal and career development. At this point, which institution and/or program to choose is becoming an important decision problem for the learners. In this study, the analytic network process (ANP) which is a multi criteria decision making methodology is used to help learners to choose an appropriate e-certificate program. Discussing a decision problem with its both tangible and intangible and also interdependent criteria simultaneously is the advantage of the ANP. The ANP model established here, examines the ODL e-certificate system structure with its criteria in detail. In addition, it offers a structure that may help institutions in determining their educational policies.

Keywords: Analytic Network Process, Lifelong learning, Multi criteria decision making, Open and distance learning, e-certificate

1. INTRODUCTION

In recent years, the variety of open and distance learning (ODL) systems has been increasing around the world. These systems may have the programs based on high school diploma, bachelor's degree, master degree, doctorate diploma, and/or e-certificate programs. Today's competitive environment increases the importance of certificate programs day by day. Individuals updated their knowledge and skills by completing certificate programs. A certificate helps lifelong learners to plan a career in line with their interests. People in very different age and occupational profiles can participate to certificate programs. Therefore, the e-certificate programs suited for this learner profile.

After making the decision to participate in an e-certificate program, the learner selects an appropriate e-certificate program that suits for his/her expectations. There're different criteria affecting this selection. From this point, selecting an ODL certificate program becomes a multi criteria decision making problem.

We faced with various MCDM problems in every day like school selection, portfolio optimization, supplier selection, which course to register, which house to buy, and so on. In MCDM theory the general assumption is to assume that the criteria are independent. This makes optimal MCDM solutions less useful than they could be and a decision maker who accepts an optimal solution from the model cannot be sure that he has made the correct tradeoffs among the objectives. In the literature it is widely recognized that in many decisional problems criteria are interdependent (Öztürk, 2006). And also the weights of the criteria and the priorities of the alternatives change from person to person. At this point, the MCDM methodologies of the Analytic Hierarchy Process (AHP) and the Analytic Network Process (ANP) are come into prominence with their properties of evaluating conflicting criteria also with a group of decision makers at the same time.

According to Ertugrul and Karakasoglu (2007), in future studies multi criteria methods like AHP can be applied to multi criteria decision problems of the universities. There are some related studies that use MCDM techniques for distance and open education problems in the literature. Poonikom et al. (2004) has proposed a systematic framework using ANP for the selection of universities that offer undergraduate program in engineering. Chao and Chen (2009) propose an AHP model to weight the factors in an e-learning program or system and then evaluate the overall e-learning effectiveness. Sadi-Nezhad et al. (2010) evaluate three e-learning systems in Iran by using ANP and fuzzy preference programming. Girginer et al. (2007) developed an ANP model to select a courseware development platform for distance education systems. Ozkul et al. (2007) developed an AHP model to evaluate distance education implementation models. Shee and Wang (2008), proposed an adjusted AHP from the perspective of learner satisfaction to support evaluation-based activities taking place at the pre- and post-adoption phases

of the web-based e-learning system (WELS) life cycle. Zhao and Shao (2010) discussed the application of ANP in evaluating assets management of the institution of higher education through establishing evaluation index system and confirming the weight of every index. Chen and Chen (2010) have combined DEMATEL, fuzzy ANP and TOPSIS approaches to develop an innovation support system. Lesmes et al. (2009) applied ANP to establish weights in order to re-accredit a program of a university. Wang and Hsu (2010) proposed twenty-five criteria to assess the quality of e-learning by The AHP.

Depending on the today's technology and information oriented age individuals try to enhance their personal and career development. Based on this concept of lifelong learning, some ODL institutions offer different types of e-certificate programs. These programs are the alternatives of this study. The purpose of this paper is twofold. The primary objective is to develop an ANP model to determine the criteria of the ODL systems based on e-certificate programs and to determine weights of the alternative programs. Secondly, this paper identifies and structures a framework to evaluate and/or to develop an open and distance institution's education strategy. With this framework institutions can review their open and distance programs.

The paper is organized as follows. In Section 2 firstly, the Analytic Network Process (ANP) approach is briefly summarized. Then in Section 3, the ANP model is developed and according to the model a group of learners make comparisons to select the appropriate program. Finally, the conclusions are discussed in Section 4.

2. METHODOLOGY: ANALYTICAL NETWORK PROCESS (ANP)

In decision making in particular and life in general, one cannot rely on any one thing exclusively. All things -judgment, experience, reasoning, logic intuition- are fallible at times. It is therefore necessary to make use of a structure within which one sort through, and give relative weights to relationships, values, and the strength and direction of those relationships (Saaty, 2001). A person may not be schooled in the use of numbers but still have feelings and understanding that enable him or her to make accurate comparisons. Such judgments can be applied successfully to compare stimuli that are not to disparate in magnitude. The Analytic Hierarchy Process (AHP) provides us with the way to derive from observer's quantified judgments, a set of weights or priorities to be associated with individual stimuli (Sağır Özdemir, 2003). The AHP is a theory that depends on the values and judgments of individuals and groups. It is used to derive ratio scales from both discrete and continuous pairwise comparisons in multilevel hierarchic structures.

In most real life problems, not only does the importance of the criteria determine the importance of the alternatives as in a hierarchy, but also the importance of the alternatives themselves determines the importance of the criteria. Therefore, the Analytical Network Process (ANP) was developed as generalization of the AHP. The ANP model structure becomes a network substituted for hierarchy in the AHP. The ANP is a theory of measurement generally applied to the dominance of influence among several alternatives with respect to an attribute or a criterion. ANP is also applied to evaluate the dominance of criteria with respect to a higher criterion and it is applied to evaluate alternatives with respect to a governing criterion (Saaty, 1996).

The ANP is the first mathematical theory that makes it possible for us to deal systematically with all kinds of dependence and feedback. The reason for its success is the way it elicits judgments and uses measurement to derive ratio scales (Saaty, 2002). This fundamental scale of absolute values for representing the strength of judgments is from 1 to 9.

The process of ANP comprises four major steps (Meade & Sarkis, 1999; Saaty, 1996). In the first step, the problem should be stated clearly and decomposed into a rational system like a network. The structure can be obtained by the opinion of decision makers through brainstorming or other appropriate methods. The pairwise comparisons are done then and the priority vectors are obtained in the second step. Decision elements at each cluster are compared pairwise with respect to their importance towards their control criterion, and the clusters themselves are also compared pairwise with respect to their contribution to the goal. Pairwise comparison is made in the framework of a matrix, and a local priority vector can be derived as an estimate of relative importance associated with the elements (or clusters) being compared by solving the related equations.

In the third step, the *Supermatrix* is formed. To obtain global priorities in a system with interdependent influences, the local priority vectors are entered in the appropriate columns of a matrix, known as a supermatrix. The supermatrix is raised to limiting powers to calculate the overall priorities, and thus the cumulative influence of each element on every other element with which it interacts is obtained (Saaty & Vargas, 1998). Finally in the fourth step, the best alternative is selected. If the supermatrix formed in Step

3 covers the whole network, the priority weights of alternatives can be found in the column of alternatives in the normalized supermatrix. On the other hand, if a supermatrix only comprises of components that are interrelated, additional calculation must be made to obtain the overall priorities of the alternatives. The alternative with the largest overall priority should be the one selected.

3. THE ANP MODEL OF THE PROGRAM SELECTION PROBLEM

In a selection problem, there may be both tangible and intangible criteria. In the study, the determined criteria are the criteria that also affecting the ODL systems. In an attempt to provide a pedagogical foundation as a prerequisite for successful e-learning implementation, there are some studies like Govindasamy (2002) and Ong et al. (2004) that discussed the e-learning critical success factors. Here, the ANP model is constructed to analyze an ODL system and the critic factors affecting the system are determined. By the constructed model, the programs can be evaluated and also the relative priorities of them will be obtained.

3-1. Definition of Main and Sub-criteria

The proposed ANP model is applied to fourty lifelong learners. Here, the alternative five e-certificate programs are selected from the e-certificate programs of Anadolu University. They are listed in alternatives cluster as: (1) Marketing, (2) Entrepreneurship, (3) Business Administration, (4) Management and Organization, and (5) Financial Management.

After the literature review and experts' opinions, the main criteria that must be considered are determined as *learning media*, *evaluation*, *support services*, *learner*, *instructor*, *administration*, and *alternatives*. Each criterion has some sub-criteria that also affect the system and the alternatives. All criteria and their sub-criteria are briefly explained as follows:

Learning media: The learning media has to provide efficient and effective learning environment. So, the program's various learning media types becomes one of the important issue at the program selection stage. The learning media sub criteria are defined as follows: (1) e-book, (2) e-television, (3) e-practice, (4) e-exam, (5) e-audio book, and (6) e-facilitator.

Evaluation: The following evaluation types can be used with different ratios in an ODL system: (1) E-portfolio, (2) Paper based examination, (3) Online examination.

Support services: Although the importance of time and space independency feature of open and distance systems, physical facilities have also a substantial role along side of e-support services. Based on these issues the sub criteria are determined as follows: (1) Local centers (2) Regional centers, (3) Computer and technology centers, and (4) e-support.

Learner: In the field of learner, the open and distance program is directly related to some learners' properties. Besides these criteria interaction between the learners and learning platforms and/or instructors is also affecting the learners' success. So, the learner criterion has two main criteria as interaction and properties. The related platform must include the components that satisfy the interaction of the learners. Also, some online courses have one or more prerequisite requirements. The sub criteria related to the learner are defined as (1) Working status (2) Academic background, (3) Age distribution, (4) Facility usage, (5) Cover the expectations, and (6) Interaction.

Instructor: Considering the instructional activities, the sub criteria of instructors are determined as: (1) Instructional designing, (2) Response time, and (3) Know how.

Administration: ODL systems refer to the use of technology intensively. So, it's crucial for administrators to keep pace with the technology. Beside the technological issues, the prestige of the institutions plays an important role in the selection phase. Another issue is about the validity. The validity of a certificate may be called into question by potential employers if it is not received from an accredited educational institute. Finally, number of learners gives some hints about the programs. Therefore, the sub criteria related to administration are given as follows: (1) Validity, (2) Prestige, (3) Technology, (4) Number of graduates, (5) Student fee, and (6) Educational policy.

When the definition of the main and sub criteria is completed all connections among them are determined. In Figure 1, the model structure constructed in Super Decisions software is given. In the figure, an example is given when the mode to examine the connections is selected for *interaction* in the *Learner* cluster. The elements framed in bold color in other clusters are those defined as the influencers of the selected criterion. The arcs between the clusters indicate the outer dependence of elements in one cluster on the elements in an another clusterwith respect to a common property. Also the loop in a cluster indicates an inner dependence of the elements in that cluster.

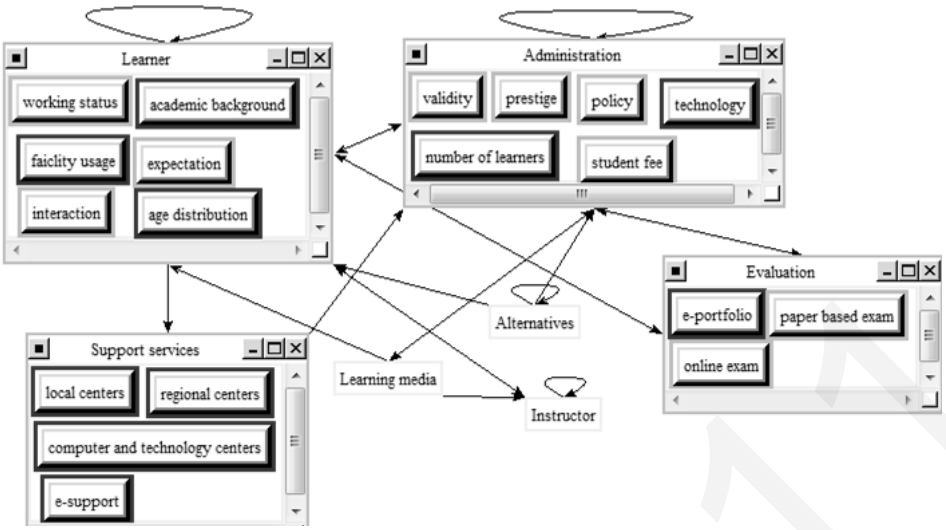

Figure 1. The ANP model

3-2. Pairwise Comparisons

To set the priorities among the five alternative e-certificate programs, the pairwise comparisons are performed by entering judgments including all clusters and nodes. The estimated weight of each criterion and alternative programs are obtained in the Super Decisions environment. The evaluation is carried out by a group of 40 senior class industrial engineering students and industrial engineers from different working areas (banks, hospital, industry and tourism). The learners made the pairwise comparisons and these comparisons are converted to the local weights. Finally, the judgments of each learner are synthesized using the geometric mean approach.

Pairwise comparisons for the nodes in each cluster—that belong to a parent node—are carried out for all the parent nodes in the model. In the comparisons firstly the criteria are compared with respect to each alternative. Here, two types of questions are asked: (1) Which of the alternatives satisfies a criterion more? (2) Which of the two criteria is more characteristic of a given alternative? The preference levels for the criteria change from one learner to another. Naturally, if a criterion is more *desirable* or *positively affects* the learner, it will take a higher weight. Also, the clusters that have any links to their elements from the elements in a given cluster must be compared for their impact on the given cluster.

As an example for the comparisons Figure 2 gives a screen view of the pairwise comparisons of clusters. For the given cluster "Learning media", it's asked that *which of the two clusters has more effect on e-certificate programs, and how much more*? And the first answer is given as *Administration* is 3 times much more affecting the cluster than *Instructor*.

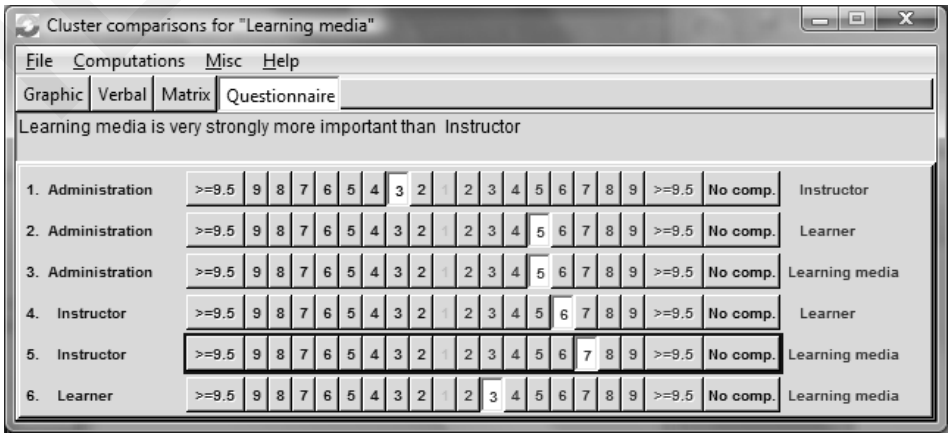

Figure 2. Pairwise comparisons of clusters

3-3. Numerical Results

According to the consistency calculations, all pairwise comparisons are consistent in this study. The learners determined the educational *policy* imported by the administration as the most influential decision criteria in the ODL system e-certificate program selection process. Table 1 lists the priorities from the limit matrix. The most important criterion for each cluster is written in bold. For the support services, local, regional and technology centers have no weights. The learners give the all importance to the e-support services. On the learning media side, the e-facilitator has a greater weight than the other media.

Table 1. Relative weights of the criteria

Cluster	Element	Priority
Instructor	Instructional designing	0,00913
	Know how	0,01364
	Response time	**0,01852**
Learner	**academic background**	**0,10071**
	age distribution	0,03206
	facility usage	0,03165
	interaction	0,01842
	expectation	0,05092
	working status	0,08217
Learning Media	e-book	0,00700
	e-television	0,00539
	e-practice	0,01609
	e-exam	0,00882
	e-audio book	0,00271
	e-facilitator	**0,01782**
Administration	number of graduates	0,02643
	prestige	0,02376
	student fee	0,16470
	technology	0,07805
	validity	0,14345
	policy	**0,19611**
Support services	**e-support**	**0,00582**
	local centers	0,00000
	regional centers	0,00000
	computer and technology centers	0,00000
Evaluation	e-portfolio	0,00727
	online examination	**0,00823**
	paper based examination	0,00245

The priorities of the alternatives are given in the second column of Table 2. According to the decision model, the *Business Administration* is selected as the most appropriate ODL e-certificate program. As mentioned before, these results are given by a group. The weights are changing from one learner to another. For instance, according to 7 learners Marketing is selected as the most appropriate program while Entrepreneurship is the best for 6 learners.

Table 2. Overall outcome

Alternatives	Limiting	Normalized priority (normalized by cluster)	Rank
Business administration	0,018242	0,237245	1
Financial management	0,017413	0,226465	2
Entrepreneurship	0,015748	0,204815	3
Marketing	0,014994	0,19426	4
Management and organization	0,01055	0,137215	5

4. CONCLUSION

This study employs a MCDM approach to select an appropriate e-certificate program for lifelong learners. In a selection process, it's crucial to reflect the interdependencies between the criteria and alternatives. The ANP is the first mathematical theory that makes it possible for us to deal systematically with all kinds of dependence and feedback. This paper applies group decision making to determine the interdependencies. Because of the fact that the degree of importance is varied according to decision maker, group discussion is more reflects the realities.

The proposed decision framework has identified and weighted ODL systems' criteria and alternative e-certificate programs. All the defined criteria are significant but the learners also prioritize the criteria according to their judgments. Based on these judgments beside the selection process, the criteria weights may be a guide to institutions to determine an educational policy like widening access to the learning media.

ABSTRACT

Large, multinational IT organizations with complex business processes have multi-dimensional, complex learning and knowledge requirements, which cannot be fulfilled via conventional training techniques. There is need to innovate and streamline training processes using technology tools, more so as learning needs are very dynamic in an IT firm and depend a great deal on industry environment and client dictates. This paper delves into various technology and process innovations which bred success in Tata Consultancy Services Ltd. (TCS), Asia's largest IT services company with more than 200,000 employees across 42 countries worldwide. TCS has applied and integrated learning and knowledge management technologies including learning management systems, e-learning and open platforms to deliver a seamless skill building experience, given its wide scope of operations.

Key words: Knowledge Management, Skill Building, Technology Tools

INTRODUCTION

In the new corporate world order, the "haves" and "have nots" are increasingly being differentiated in terms of their knowledge and skills. Those with the requisite knowledge and skills being demanded by customers can hope to survive and flourish. This is essential for the following reasons:

- Understanding the changing environments
- Understanding the new linkages and relationships that define the environment
- Getting the skills necessary to operate in relation with the company and also in relation with clients
- Gathering the inputs required to step up the ladder in a changed environment
- Getting the requisite inputs to compete and define goals that suit

The scenario is even more complex in a large IT organization due to multiple learning and skill requirements. An IT organization need just not focus on developing the required IT knowledge to sustain its operations but also client sector knowledge. Learning in such environment is a continuous process as conditions keep evolving – this would mean perhaps a lifelong learning process. Companies know that investment in learning is a must if they are to meet their goals. According to an old, yet highly relevant article in the New York Times (2002):

> "Shares of companies that spend the most on employee training and development outperform those that spend the least, a study found. …a company's success depends greatly on the collective skills of its employees—its human capital. Companies that invest more in developing that capital should fare better."

The article also says that companies that were in the top 20% of training and development expenditure outperformed the stock market by an average 16.2% between 1997 to 2001. Hence the company's bottom line is directly affected by investment in education.

NATURE OF OPERATIONS IN AN IT FIRM

If we look at IT companies specifically, the range of services they offer clients is huge across services, outsourcing and consulting serving several industry verticals. Some of these include Banking and Financial Services, Healthcare, Manufacturing, Transportation, Government. Client-orientation is a driving force in IT companies and it's the key for business growth. For an employee in the sector, IT learning is a constant need as it's the core for their job and there is need to be updated on new versions and acquiring new technical skills. However, employees also need to have the requisite business skills and the client business domain knowledge.

Importance of Business Domain Knowledge

Client surveys have revealed for most IT companies that they fare well in terms of technology but lack where business knowledge is concerned. An IT project can take several forms – software development, a new solution, updation of an existing solution and even maintenance. To be able to do this, IT employees need to have an intimate understanding of the client business, processes and interactions, without which project delivery may be jeopardized. In fact, several projects fail mainly due to lack of understanding of client business and needs.

Hence, even before they award projects, clients are seeking proof of training programs in their business area and testimonials to the effect. In addition, IT companies want a big pool of skilled consultants who would help them in identifying new opportunities, innovative with existing solutions and help develop new solutions - all towards gaining a competitive edge and gaining market stronghold.

Therefore, multiple kinds of training are required, which is very challenging in an IT environment, as the focus is not just full time learning. Employees are expected to devote their full working hours to the project and also apply their minds to the underlying technologies, business skills and the business domain of client. This kind of a scenario requires multi-tasking and a high level of "juggling" skills. Interestingly, by the time an employee learns all this and applies to a specific business domain, it's time for a change.

CHALLENGES FOR A LEARNING STRATEGY

Typically, growth of an employee in an IT firm depends on capabilities in multiple skills, projects and domains. Hence, people prefer to move internally among various projects every two to three years, as this also prevents monotony and saturation. This has a lot of significance to the corporate knowledge and learning strategy:

- Firstly, the need to capture the knowledge of people leaving a project, both explicit and implicit
- Secondly, the need to impart skills and business domain knowledge for the new project

The task is monumental, as this kind of learning and relearning occurs every couple of years for thousands of employees. In addition to this, the organization has to factor in new joinees who need to be sensitized to organizational culture plus also made "employable".

As per the Confederation of Indian Industry and the Boston Consulting Group, India would face a "talent gap" of more than 5 million by 2012, as existing educational institutions do not impart employable skills. Just 20% of the engineering graduates are employable. A McKinsey report finds only 25% engineers, 15% finance graduates and less than 10% of the other graduates to be employable.

Thus, new joinees fresh out of engineering colleges need a separate learning process, aiming to make them "project" resources. This means training them on the technologies employed by the company at client sites, systems used internally and the basic etiquette and soft skills. To complicate this further, these people are geographically dispersed in varying time zones.

TECHNOLOGY FOR MEETING THE CHALLENGES

Traditional learning techniques such as the classroom setting may not suffice. The tried and tested method of classroom environment would have to make way for a new strategy. Technology, in the form of web-

based learning and knowledge/competency management systems would have to be used in an innovative, user-friendly manner. This would have multiple benefits to support a multi-dimensional learning strategy:

Apart from the obvious capabilities of global reach, technology and e-learning systems offer a number of other advantages:

- Ability to scale up capacity
- A modular approach for adding new programs
- Easy report generation possibilities
- Manpower rationalisation
- Operational efficiency
- Option for access control
- Ease of database creation and maintenance
- Feedback mechanisms and discussion capabilities

The interaction facilitated by e-learning systems would help improve a learning/knowledge department's offerings and create programs that meet account requirements. Further to an e-learning system, an organization requires a knowledge management solution that can map an employee's knowledge when he/she leaves a project. This should help others in the project. And an efficient e-learning system needs to integrate with this knowledge management solution, thus creating a "one-stop" learning environment.

THE LEARNING SYSTEM AT TCS

Tata Consultancy Services Ltd. (TCS) is one Asia's largest IT services company, with close to 200,000 employees spread across 42 countries worldwide. TCS is ranked 6th in FinTech 100, which is an annual ranking of technology services providers to the financial sector. TCS is the highest ranked Indian IT firm on this annual list. TCS has been listed in Forbes' sixth annual 'Asia's Fabulous 50 companies'. This is the third time TCS has featured in this list. TCS was also the winner of the 'Golden Peacock Innovation Management Award for the year 2011' for innovative culture in a learning organization.

As one of the global IT leaders, Tata Consultancy Services (TCS) has always been traditionally strong in the area of employee training. There are a number of initiatives at the organizational level as well as at the practice level to ensure there is comprehensive learning culture. Particularly, as TCS has a young workforce with average age of 27 years and keeping them interested and honing their skills is a real task. There is an exclusive unit devoted to learning, which designs, develops and deploys training programs on a regular basis, often in a classroom setting.

All the learning programs are mapped to competencies and address learning needs at different proficiency levels. To help in this, TCS has implemented a competency management system which helps associates and their leaders to plan the learning and hence career progression of the associates. The competency management system looks at an employee's current competencies and suggests a learning path for the employee to scale up to. The learning path suggests various training programs both web-based as well as instructor led. The employee can add such programs to learning calendar and on completion, his/her competency gap is closed and the system reflects the new skills of the employee. An employee can also search for various programs being offered based on his or her own interest.

In addition, there is a knowledge repository portal which pools all information, articles, papers and learning assets. This helps an employee grasp the required information in a short span of time. Specifically, it is important when an employee wants to know what is going on in a project. Also the system has the capability to record all project related information in terms of client presentations, project resources, data and technical documentation and training material.

The focus of these systems has in the past, been technical domain…however, there was a lack of uniform, standardized approach for delivering business domain training. Hence, Financial Technology Centre (FTC) came into being in July 2005 piloting for the banking and financial services sector as a precursor for TCS Business Domain Academy ("Academy"). Academy would serve all the industries TCS was active in. Given the typical environment in the large company, FTC decided to adopt e-learning practice to deploy planned training programs. FTC created a pilot banking and finance certificate program, which had extensive learning material as chapters and exams at the end of each chapter and a final exam. On passing

these exams, the candidate would be given a certificate. The intake of this program was beyond expectations and FTC soon followed up with several more BFS programs.

All these programs filled a huge gap in learning programs as external parties were unable to meet the company specific requirements. More so, as FTC was willing to develop specific customized programs on demand. In addition, these programs were TCS IPR assets and free of cost to the employees. This was particularly attractive to other industry units including all the non-BFS ones. They started demanding extension of FTC programs to other business domains as well. Hence, in 2008 the TCS Business Domain Academy ("The Academy") was born.

Following are counted among the Academy's unique selling propositions (USPs):

- A central location for business domain training
- A supplement to projects and the Learning and Development team
- Initiatives to "Train the Trainer" leading to Multiplier effect
- A dedicated team built to meet domain demands of our associates and projects
- A centre that can be tapped for pre-sales activity
- Expertise used in RFP responses and consulting assignments
- A unit that has proven to be invaluable in meeting specific customer demand
- Called upon to develop special learning programs which may not be available externally or internally
- Unique certification strategy complete with exams and soft copy certificate
- Innovative program delivery methods including Videoconferencing, Digitization, etc
- Auto generation of e-certificates for successful associates

The greatest contribution of the Academy has been in creation in a large volume of Copyrighted assets, which are upgraded annually in July to reflect the changing trends and business conditions. The Academy initiatives can be clubbed in the main categories of: Online Certification Programs; Customized Training Programs; Portal Management and Innovation; Research Activities, Pre-Sales Activities, Consulting and Content Development.

The Technology Platform

There are several e-learning systems worldwide – proprietary as well as open source. In a large environment, open source platforms would be ideal, as there is scope for large number of additions as also customizations. In addition, the learning system managers can learn from experiences of large number of such administrators and system professionals worldwide.

There are several open source platforms available for e-learning, of which the ones often used and in demand are – Moodle and Sakai.

Internally, the Academy implemented *Modular Object-Oriented Dynamic Learning Environment* (MOODLE) as the core Learning Management System (LMS). The original software platform did not have some features required as per the Academy requirements, so the technical team customized the platform, as follows:

1. Registration page:
    a. introduced CAPTCHA (**C**ompletely **A**utomated **P**ublic **T**uring test to tell **C**omputers and **H**umans **A**part)
    b. Email restricted only to TCS email id
    c. Password according to TCS policy
2. Restriction on changing email ID field – enabled only form the e-learning technical administrator
3. Customized appearance of academy e-learning portal to reflect company logo and tag.
4. Enforcing certain courses as pre-requisites as per the Academy learning management system policy.
5. Systematic Course navigation – Academy certification programs comprise chapters grouped into modules, and module wise quizzes. The quizzes need to be completed in a sequential order and

cannot be attempted until a module has been completed. There should be a minimum time gap of 12 hrs between the quiz attempts. The final quiz can be given after 7 days from the date of enrollment.

6. Quiz evaluation - Negative marking was introduced for each wrong answer.
7. Enforcing the feedback survey after course completion and on completion of the survey only certificate would be generated.
8. On successful completion of feedback survey, associate gets an automatically generated certification on the site itself listing the course name as well as the grade obtained.
9. Participants who completes the course gets certified and the certificates are sent to them automatically. We have customized the template of the certificate.
10. Report generation: A utility to pull the records of the participants and reports can be generated individually for participants, courses, categories, verticals periodically.
11. Unenrolment: Course completion is set for 90 days and after this time the participant gets unenrolled from the course automatically.

The Moodle platform has been serving the purpose of Academy excellently, and the technical team has been able to make notable contributions. These are being shared with global learning community.

Integration of the Knowledge and Learning Systems

TCS undertook a three tiered technology strategy for proper integration of knowledge and learning. It employed three systems the competency and proficiency mapping tool, the knowledge management system, and Business Domain system. All the three systems are integrated, so that TCS can have a ready pool of skilled employees, who can be easily tracked, monitored and put into suitable roles. The Academy builds the base level business skills and knowledge through various tools such as e-learning, and integrated learning using the web-audio-video systems in sync. These skills get reflected in the competency system, which gives the learning roadmap, while creating a database of skillsets in TCS.

Often, material from the competency management system is linked to specific project repository on the KM system, so that projects can directly access the information required by them. The KM system recommends the technical learning available in the competency system. Thus, there is comprehensive integration in these two systems. The Academy is also integrated with these two systems. The KM system directly links to the Academy portal, so that employees can look up and enroll into certifications of their domain. Also, whenever an associate completes a program in Academy portal, it gets updated in the competency management system. Thus, employees are able to get the best from all the systems and gain the maximum information and knowledge.

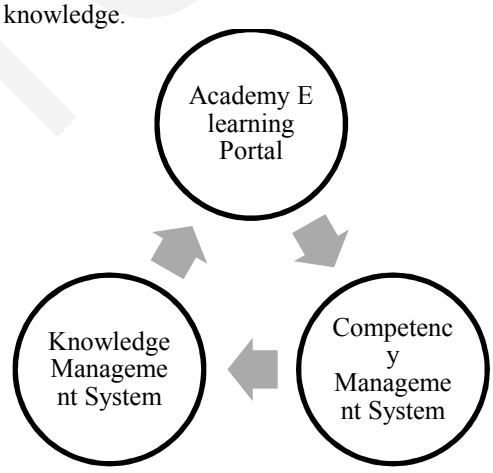

Figure 1: Integration of Systems in TCS

CONCLUSION

As has been said time and again, knowledge is indeed power. But the knowledge gained while creating this knowledge cannot be underestimated. The Academy's experience and learnings from the IT environment can be applicable to any other industry and even the academic world:

- e-learning on its own cannot guarantee success, unless it is proactive, integrated with project requirements and is user responsive.
- Some amount of blended environment is necessary – a person needs a person to voice his/her opinions to and feel appreciated.
- Learning needs commendation – only highly motivated individuals take to learning for its benefit alone. Hence, the Academy certificates make sense and also the recognition in their appraisal process.
- Challenge motivates people – the quizzes and forums challenge candidates to do better and score.
- Keep it open – learning programs do well when the candidate has an open choice. The Academy never curtails its candidates – they can pick and choose their programs and not necessarily of the domain they belong. This satisfies their curiosity for other subjects and meets their aspirational goals.
- Be responsive – Unless queries and questions are replied to, the candidates will tend to loose interest. The Academy team responds to queries either sent to them through email or discussion forums within 24 hours. Also, feedback and inputs are respected and inculcated where possible.
- Finally, standalone learning systems never work – integration across other organizational systems give them greater visibility and credibility.

Another important lesson is that most freshers or new joinees lack the requisite skills for a corporate environment. In such situation, academic linkages with the corporate sector in developing a combined virtual learning system can help address the deficiencies to a large extent. Then the new joinees can come "pre-equipped" with the skills required for the job. This option can be explored further to create a win-win situation for the universities and corporate entities.

Finally, technology enabled learning using e-learning, audio and video tools go a long way towards saving our environment. For example, as per estimates for 26,000 participants, the Academy saved a total CO2 footprint of 4115.47 tons, which would amount to 339,545 trees prevented from being axed!! This saving was taking into account travel, lodging and paper costs.

Hence, a multi-dimensional strategy that uses technology not only to attain maximum reach but also integration across systems would provide an appropriate solution to learning challenges in an IT environment. Plus, it would benefit the society on the whole with ability to link with learning communities, academia and potential employees. Finally, technology would help contribute towards the greater good of environment.

ABSTRACT

In this study, we develop an interactive AR Learning System based on Augmented Reality and interactive touch-screen. The learning content knowledge is about conservation of fish in the system. The system combines the game by the concept of AR book, AR book allow children to learn about the importance of conservation of fish, with its mechanisms to verify whether the game about AR book for their educational messages. Whole mechanism is an interactive game using touch screen to interact with the rod as a tool to get rid of the shackles of the past, keyboard and mouse, showing a more realistic interaction. According to the evaluation results that we find the interactive AR Learning System has positive usability.

INTRODUCTION

Background

The concept of conservation is popular presently in Taiwan. First, we must come to understand and learn about the basic information of fish. There are six kinds of Taiwan endemic species fish have been extinct and nine kinds of endangered Taiwan endemic species fish (Baskin, 1994; Wang, 1999). The cause of impact includes ecological changes in habitat, alien species invasion, river fish poisoning and electrocute and so on. Conservation of fish is not only their responsibility but all the people of Taiwan have the responsibility. The river conservation action must be taken from daily life.

Motivation

The technology hardware has continued to update and popularize in recent years. The Augmented Reality system development does not spend expensive equipment and cost. We develop a conservation species learning system through the AR technology. In AR, through the combination of virtual objects and real scenes, learners are able to interact with virtual fishes, getting the sense of excitement to improve their learning effect, and finally have an interesting learning.

Recently, the rivers have been serious polluted and damaged by human's illegal hunting, abandon alien species, land development without planning, and so on in Taiwan. It causes endanger of Taiwan endemic species of freshwater fish. The environmental consciousness is popular currently. People really start to

work on the conservation. However, we want to let people have a better understanding of Taiwan fish conservation issue and alert.

LITERATURE REVIEW

Augmented Reality

Augmented Reality (AR) is the extension of Virtual Reality (VR). By setting up the scene via Computer Graphics, VR can simulate objects in the real world and create the environment where users can interact with these objects. Moving one step further, AR is the images, objects or scenes generated by the computer that blend into the physical environment to strengthen our visual feelings. That is, it augments the overlaying virtual, visual representation of the physical environment on the computer by adding virtual objects to the representation. An AR environment should encompass three characteristics, namely, the combination of virtual objects and the real world, real time interaction, and 3D space only (Azuma, 1997; Azuma, et al., 2001). Presently, AR is applied very extensively to multiple domains such as education, medical technology, military training, engineering, industrial design, art, entertainment and so on (Hsieh & Lin, 2010; Hsieh, et al., 2010).

Touch Screen Technology

There are resistive touch screen, capacitive touch screen, SAW touch screen, optical touch screen, and electromagnetic digitizer. In this study, we use optical touch screen as system interactive interface. The comparison of touch screen as follows (Sears, 1991; GTouch Groovy Technology, 2011).

Resistive touch screen, capacitive touch screen: The advantages include fast response and high accuracy of recognition. But, its reflectance is higher and the material fatigue easily. Therefore, it is not long life to use. Those are shortcomings of resistive touch screen and capacitive touch screen. Capacitive touch screens are specifically designed to improve the shortcoming of low scratch resistance with resistive touch panels. Optical touch screen, SAW touch screen: It installs easily and is not affected by panel size, but it is non-linear combination of distortion. Hence, the software must calibrate and response speed is slower. SAW touch screen technology overcome the flaws inherent in capacitive touch screens. Capacitive touch screens are susceptible to interfere by signal noise and static electricity. Electromagnetic digitizer: Electromagnetic digitizer operates based on electromagnetic sensing; it involves the use of an electromagnetic pen that functions as a signal transmitter while the electromagnetic board acts as a receiver. It is stable, reliable, high-accuracy rate, low reflectivity, locating accuracy, and movement sensitivity. It belongs to linear structure of the touch panel.

System Development

Augmented reality enables users to see the real world with virtual objects superimposed upon it. In this study, we develop an Interactive Augmented Reality Learning System (IARLS). The system development

divided to hardware and software. The hardware use touch screen and the software use Virtools Dev 4.0 and 3D Max 9 to develop. The part of augmented reality of the system combined ARToolKit and Virtools to integrate. Figure 1 shows system operation flowchart.

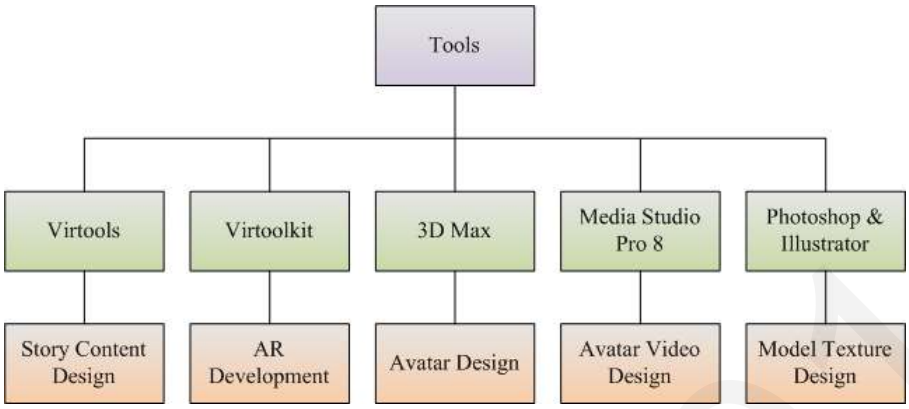

Figure 1. System development tools.

All of the avatars in the system, we design conservation of fish, alien species fish, and river pollution objects, describe as follows.

(1) Conservation of fish: We design three kinds of conservation of fish to let learner select in system of learning game. There are Oncorhynchus masou (see Figure 2), Macropodus opercularis (see Figure 3), and Varicorhinus alticorpus (see Figure 4).

(2) Alien species fish: The river brings in alien species from elsewhere is also a factor that causes to die. It includes Gambusia affinis (see Figure 5) and Oreochromis mossambica (see Figure 6).

(3) River pollution objects: The factors related to harm the fish live environment that there are discarded fish hook (see Figure 7) and garbage in system.

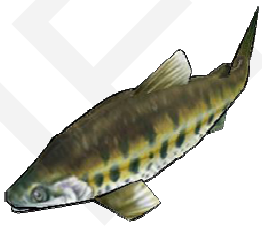

Figure 2. Oncorhynchus masou.

Figure 3. Macropodus opercularis.

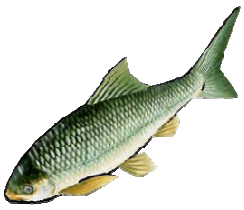

Figure 4. Varicorhinus alticorpus.

Figure 5. Gambusia affinis.

Figure 6. Oreochromis mossambica.

Figure 7. Discarded fish hook.

The system development includes five steps.

Step 1: Building avatars, objects and 3D scene. The avatars, objects and 3D scene in the system are used 3Ds Max to build.

Step 2: Drawing texture and of avatars and scene. We use Potoshop CS3 and Illustrator CS3 to draw texture of avatars and scene. Also, use it to design system surface.

Step 3: Designing video of system introduction and avatar video. The video of system introduction and avatar video are recorded by The Media Studio Pro 8.

Step 4: System coding of augmented reality. In this part we use Virtools SDK and ARToolkit as system development environment.

Step 5: Finally, we utilize Virtools as system building platform and integration.

System Operation

Learner must understand the domain knowledge of Taiwan endemic species of freshwater fish by AR Book. The teach video that superimposed upon AR Book. The system will force learner to learn. The game will start when learner learns Taiwan endemic species of freshwater fish by AR Book until last page. The game based on bonus point criterion. The 3D model objects have Taiwan endemic species of freshwater fish, alien species fish and garbage. The alien species fish and garbage could endanger Taiwan endemic species of freshwater fish. It means that the alien species fish and garbage are hazards. Consequently, learner needs to use fishing rod angling those hazards. The game will add bonus point when the learner uses fishing rod angling them. Oppositely, the game will subtract bonus point when the alien species fish and garbage endanger Taiwan endemic species of freshwater fish or learner carelessness angling Taiwan endemic species of freshwater fish. When the bonus point up to caps it represents learner successfully pass the game level. The system operation flowchart shows in Figure 8. The Figure 9 shows Taiwan endemic species of freshwater fish information sketch of AR Book and System presentation sketch shown in Figure 10.

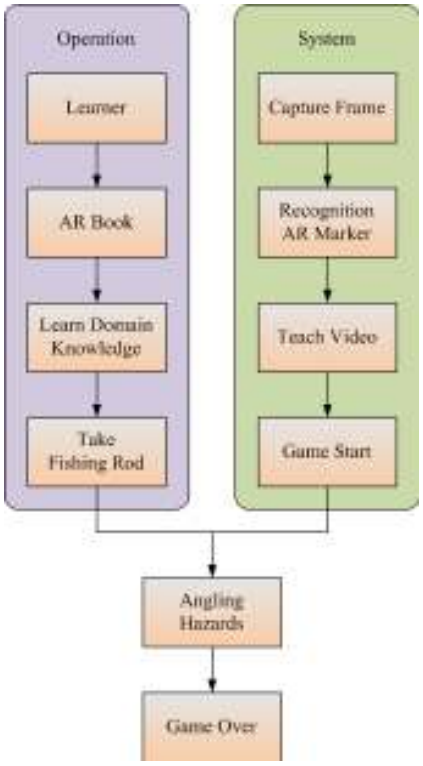

Figure 8. System operation flowchart.

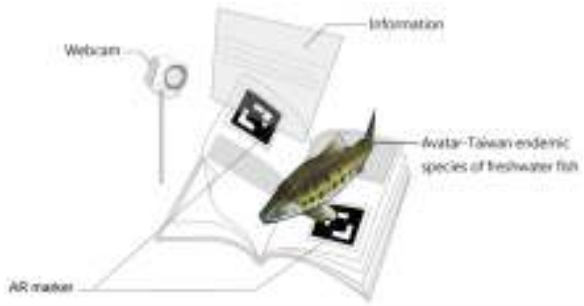

Figure 9. Taiwan endemic species of freshwater fish information sketch of AR Book.

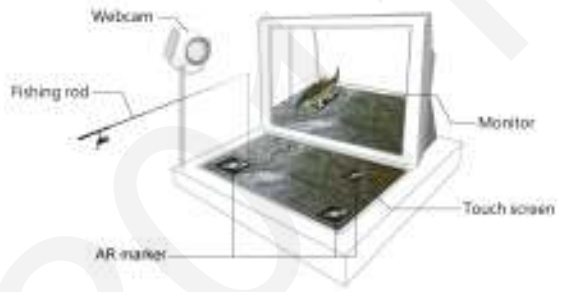

Figure 10. System presentation sketch.

The peripheral hardware of the system operation includes webcam, monitor, fishing rod, and touch screen. The webcam is capture marker of AR Book. The monitor is display game scene. The fishing rod angle hazards by learner. The touch screen shows virtual river, and there are hazards in it, the learner can interactive with it by fishing rod. There are two markers under the touch screen in order to locate avatars in the virtual river.

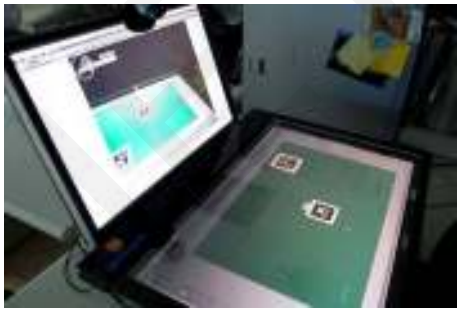

Figure 11. System presentation.

Figure 12. System operation of the subject use fishing rod.

System Evaluation

We utilize System Usability Scale (SUS) as our framework for evaluating the system usability. Subjects are 33 undergraduate students and they take information technology and e-learning courses. SUS is a questionnaire of Likert Scale to estimate users' subjective feelings of the system and further know their

degrees of satisfaction (see Table 1). In the aspect of system usability evaluation, the SUS is an efficient, time-conserving, and labor-saving way of subjective estimate. At present, it is widely applied in the system usability. After users finish answering ten questions, the scale offers a formula which transfers the subjective feelings of users into the objective data information for analysis. That is, the score of SUS is used to evaluate usability of the system. The SUS has a formula that can calculate the score for each item. The range of estimate score is from 0 to 100. The higher the score is, the more useful the system is and the more easily users can interact with it (Brooke, 1986).

Table 1: SUS questionnaire

System Usability Scale
1. I think that I would like to use this system frequently
2. I found the system unnecessarily complex
3. I thought the system was easy to use
4. I think that I would need the support of a technical person to be able to use this system
5. I found the various functions in this system were well integrated
6. I thought there was too much inconsistency in this system
7. I would imagine that most people would learn to use this system very quickly
8. I found the system very cumbersome to use
9. I felt very confident using the system
10. I needed to learn a lot of things before I could get going with this system

Subjects finish operating the system and fill out the SUS questionnaire. As summarized in Table 2, the mean SUS score is 78, the median is 66, the maximum is 89 and the minimum is 57. These scores indicate that the AREVLS system is usable. We have interviews with these subjects on their ideas about IARLS after they finish operating the system and filling out the SUS questionnaire. Subjects said that this idea is very foresight. The system may be less than perfect and that is not too much learning effectiveness. Some of the learners themselves had been used relevant augmented reality system. The system could let people understand basic concept of conservation of fish in Taiwan and achieve learning by doing.

Table 2: SUS scores descriptive statistics

	N	Mean	Median	Min	Max	SD
Stat	33	78	66	57	89	11

Subjects give some comments for us that it will be able to enhance learning effectiveness for learner if the system of the fluency was more smoothly and more stable. And so, there are some reasons we must improve for system through analysis of SUS questionnaire as follows.

The system has a little bit complicated: Subjects feel that using the system has a little bit complicated procedure. Subjects who operate system need taking AR Book and look at the teach video with

superimposed upon AR Book at the same time. Then, subjects must pick up the fishing rod and operate game. It leads to a simple and interesting learning system, but the procedure is complicated.

The system somewhat difficult to use: The system is not perfect. Sometimes it cause crash occasionally during subjects operate procedure. If the system crash, it must restart and lead to the subjects learn again. For this reason, Subjects feel some trouble.

Need the assistance of technical staff: Although subjects have taken information technology and e-learning courses, only a handful of contact with augmented reality. However, there are some subjects do not know how to operate the system and marker of AR Book. As a result, most people will meet the same results when they use it. Thus, we will add the operation manual or instructions that users read it before operation system.

CONCLUSION AND FUTURE WORK

In this paper, we proposed augmented reality with an interactive touch-screen technology on learning of Taiwan endemic species fish. The system has been complete preliminary test and evaluation currently, but there are still many parts of the system to improve. In the future, we will improve the feedback of subjects and do expert evaluation of Heuristic Evaluation in system. And so, we hope to applied to exhibition after improve and expert evaluation. We find that the evaluation results show that IARLS has positive usability.

A PROPOSAL FOR IMPLEMENTING ONLINE ASSESSMENT IN OPEN AND DISTANCE LEARNING PROGRAM

Yusup Hashim
Arafeh Karimi
Nurziyanty Khan
Asia e University
Malaysia

Abstract

In distance learning, planning and selecting appropriate methods of online assessment is a common problem faced by most online course providers. Unlike conventional face-to-face mode, instructional designers have to be careful about the types of online assessment methods selected and the assessment distribution (percentage) allocated for the course. This paper discusses the implementation of online assessment in open and distance learning program, using blended learning mode at Asia e University Malaysia. The topics include the definitions of assessments, differences between formative and summative assessment, identifying different assessment methods practised in different schools, compare present and future online assessment methods and discuss benefits of doing online assessment. The paper ends with some suggestions and thoughts of improving and implementing the current online assessment,

INTRODUCTION

In distance learning where learners are separated from the instructor, interaction and interactivity between learner and teacher and learner and learner using online communication and collaborative tools such as email, forum, discussion board and video conferencing will enhance learning and teaching. The more interaction the learners have, the more experience they are expected to bring into their learning. According to Baath (1981), a distance learner instructor who gives more exercises in his/her learning materials or actively engage learners in learning activities may not have to prepare intensive assessment at the end of the course. The process of learning happens while doing the learning activities and taking the assessment. So a systematically design assessment perhaps would provide the opportunity for the learners to be actively engaged in learning. A study done by Meichun Lydia Wen & Chin-Chung Tsa (2006) showed that online assessment did not actually assess the process of learning but more towards facilitating the management of online assessment.

Assessment is vital for improvement in learning and teaching and accountable to students, parents, stakeholders and public and to seek accreditation. Designing effective assessment techniques is an essential part of effective learning and teaching in conventional or online environment. As educational institutions are increasingly held accountable for student learning (Association of American Colleges and Universities 2004) assessment represents an important way to respond to such accountability. However, student assessment geared solely for accountability reasons does not necessarily lead to learning and performance. Educators need to consider the purpose of assessment, the criteria being measured, and the intended outcomes before meaningful assessment methods can be achieved (Gaytan & McEwen, 2007). The main purposes of assessment are to monitor student learning, improve academic programs, and enhance teaching and learning (Chappuis, Stiggins & Chappuis, 2005) The main purposes of evaluation are to facilitate student learning and to improve instruction. Teachers make judgments about student progress based on information gathered through a variety of assessment strategies. This information assists teachers in planning or modifying their instructional programs, which in turn helps students learn more effectively. Evaluations are also used for reporting progress to students and their parents, and for making decisions related to such things as student promotion.

EDUCATION ASSESSMENT DEFINED

Education assessment refers to the process of documenting, usually in measurable terms, knowledge, skills, attitudes and beliefs. The purpose is to measure student learning in a particular unit of study and overall aims of the programme and the qualities of the graduating student (Suskie, 2009)

Assessment sometimes known as evaluation consists of formative and summative evaluation. As teachers or trainers, anytime you assess your students, either in classroom face-to-face or at a distance using online technologies, you may either use summative or formative assessment. Formative assessment is constructed to measure the ability of the students at a particular unit in the course so as to enable them to identify the strengths and weaknesses to prepare them for the final exam. In formative assessment, students receive feedback from teacher or engage themselves in discussions to enable them to learn and perform better. It is typically intended to generate feedback to improve and accelerate student learning (Sadler, 1998). Students do not get any grade but are given assistance to help them to improve learning or performance. Formative assessment is also known as "continous assessment" (Erickson, 2007), or "dynamic assessment" (Shepard, 2000).

On the other hand, summative assessment is constructed to measure students overall performance and grade is usually awarded as in written examination. In summative assessments, you tell your students their scores or the final results usually at the end of a lesson, unit, week or semester. Summative assessments are conducted during examination week for example multiple choice or essay type questions.

RE EXAMINATION OF ASSESSMENT METHOD (CONVENTIONAL FACE-TO-FACE METHOD)

Asia e University is an Open and distance learning university, established in 2007 under the Asia Cooperation Dialogue consisting of 31 member countries in Asia. The university practised blended learning, a combination of Face-to-Face mode and online learning. In 2010, AeU Assessment Committee re examined the post graduate assessment component in the courses offered by the Schools and to suggest appropriate methods for the face-to face mode as well as the online mode. The rationale for re examination of assessment was to react to students complaint about the workload and types of assessment. Currently, there are two types of assessment offered by 4 schools: formative and summative evaluation. The Schools administered formative evaluation to post graduate students during the first half of the four-month semester and later followed by summative evaluation at the end of the semester. The current assessment distribution is 60% formative assessment allocated for the assignment and 40% summative assessment for the final examination. Both assessments are graded. Two assignments are given to students before they sit for the final examination and they are graded on the basis of 60% distributed equally or proportionately (20% 40%). The 60% marks are accumulated from the minimum two written assignments assigned to students. The assignments can be in the form of project, case study, essay and presentation and are predominantly face-to-face type (Figure 1) Each School decides on the types of assignment based on learner characteristics, program objectives and learning outcomes of a particular course. The assignments are designed to measure the ability of the students to solve real world problems involving higher order thinking and meta cognition. There is no online assessment in the courses offered even though the course is blended. About 12 hours or 20-30 % of the course are allocated online where students are expected to interact with the instructor using asynchronous forum available in the Learning Management System, email and instant messaging through mobile technologies. In other words there is no synchronous or asynchronous online learner–instructor interaction to execute the online assessment. From previous experience instructors observed that students may not be able to take online test due to Internet accessibility as well as the reliability of the test.

Figure 1: Assessment Distribution Offered By Schools

School	**Assessment Distribution**	**Online Assessment**
School of Management	• Assignment 1 30% • Assignment 2 30% • Final Exam 40%	No

School of ICT	• Assignment 1 30% • Assignment 2 30% • Final Exam 40%	
School of Education and Cognitive Science	• Assignment 1 20% • Assignment 2 40% • Final Exam 40%	
School Of Graduate Studies	• Capstone 100%	

In Doctoral Programme by research, capstone evaluation involving formative and summative evaluation is administered. The formative evaluation begins with writing of proposal, collecting literature review, collecting and analysing data, reporting the findings and making recommendations. The summative evaluation starts with presentation, oral-viva and final submission of thesis/dissertation (Figure 2)

Figure 2: Assessment Distribution For Doctoral Program
(By Research)

Assessment Type	**Total**
Presentation	100%
Oral-Viva	100%
Online-Asynchronous	100%
Online- Synchronous	0
Thesis /dissertation	100%

LEVELS AND TYPES OF ASSESSMENT

In the post graduate program (Coursework type), most of the students are working adults or experienced people and the kind of assignments given to them may consider their working experiences and interest in their related fields. This is the kind of flexibility practised in most open and distance learning program. The assignment component measures the ability of the students to analyse, synthesise and evaluate theories and concepts. It covers the higher levels of Bloom's Taxonomy. On the other hand, the examination component will measure students' ability to understand, comprehend and apply basic theories and concepts. It covers three levels of Bloom's cognitive learning hierarchy. The questions are in essay form and to be answered in three hours. However, in certain courses students are allowed to take open book test. In this situation the examination questions are constructed to measure the ability of the students to apply, evaluate or construct new knowledge. Figure 3a and 3b shows the levels of assessment and types of assessment for present and future programs, respectively.

Figure 3a: Assessment Levels Based on Bloom's Taxonomy
Masters in Business Administration (MBA)

	PRESENT PROGRAM		**FUTURE PROGRAM**	
	Assignment	Exam	Assignment	Exam

Percentage	60%	40%	60%	40%

ONLINE MODE: ASSESSMENT METHOD

As a distance learning university, using blended mode the recommended course to be offered online is more than 70% online and 30% face-to-Face (Allen & Garrett, 2007). At AeU, the courses are offered online in the form of self-instructional modules parked in university Learning Management System. Learners interact independently with the digital modules (SIM) for 16 weeks doing the learning activities and formative assessment. No grades are recorded in this learner-module interaction. To supplement the 70% online learning, students attend the face-to-face tutorials three times in a semester. To make up the 10 hours online interaction between lecturer and students, online forum and online quiz are recommended. Both assessment is instructor-led not peer assessment. The AeU Learning Management System (LMS) has two online collaboration features which may be used by blended students to enhance their learning:

- Forum and quiz to be utilized by academic facilitators and full time students enrolled in online learning or blended learning.
- To award 5% as part of the total assignment distribution (60%) for forum interaction
- No mark is given for quiz. It is an online exercise (Formative evaluation) to ensure learners' mastery of every chapter/learning unit (Knowledge and comprehension level) especially for the Undergraduate program
- To set up multiple-choice question banks
- Thesis/Dissertation: Capstone Evaluation (100%): Summative Evaluation

THE BENEFITS OF ONLINE ASSESSMENT

Many studies indicated that online assessment has an impact on learners' critical and creative thinking skills. Forums and quiz are two useful tools that can be used to encourage students to participate in online assessment

The advantages of using forum are:

- To have one-to-one or group discussion (Collaborative dialogue) as well as interaction to facilitate students' engagement and prevent isolation.
- To substitute the face-to-face component especially for fully online students
- To nurture critical thinking skills and problem-based learning such as analysis, synthesis (create) and evaluation using web 2.0 social media
- May generate ideas which may not arise during real-time classroom discussions.,
- Elicits responses from quieter students who shy away from speaking up in class by providing a more comfortable discussion venue in which to contribute.
- Provides individual points, as well as whole online discussion threads, that can be referenced in class, enriching the discussion and acknowledging thoughtful ideas.
- Student comments can be read and validated fairly quickly, showing that students are invested in their ideas.
- Students expand their personal knowledge-base through the back-and-forth engagement and interaction with other classmates sharing insights, perspectives, points-of-view, as well as their personally held information and knowledge.
- Student learning and behavior is affected by and often led by assessment requirements (McLoughlin & Luca, 2001).
- Effective flexible learning regimes require assessment to be appropriately designed to match the new learning environments and diverse clientele (Booth, Hartcher & Hyde, 2002).
- Developing expertise and capabilities in online assessment can provide market opportunities. Many industries, particularly larger ones, have a major challenge managing skill development of employees and a lot are now developing their own in-house training programs (Anderson, 2001).
- Assessment for online is underpinned by the same principles of validity, reliability, flexibility and fairness, and uses many of the same strategies used in traditional face-to-face teaching (Booth, Clayton, Hyde, Hartcher & Hungar 2002).
- What differs mostly is the context of the assessment, the interactions between assessor and those being assessed, and collection and administration processes.

For quiz, the benefits are:

- To evaluate student knowledge and comprehension level (Bloom's Taxonomy) at the end of a chapter/learning unit
- Provide immediate feedback and grading
- Randomized question order,
- Item analysis of the questions, and obtaining the scores immediately after the exam.
- To keep up with materials covered within each course

PROPOSAL FOR ONLINE ASSESSMENT

Online assessment needs to be carefully planned and be instituted as an e-learning policy in higher education. It also requires a strong commitment from the stakeholders, lecturers and students to

implement online assessment. AeU suggested the following procedures to implement the online assessment.

Forum and quiz are the two most common online tools used to assess student learning in an online environment. To activate the forum interaction between lecturer and student, the following steps are recommended:

- Facilitator shall prepare at least one discussion topic for each three weeks. So for a 14 weeks semester, there should be not more than 5 discussion topics to be posted on the discussion forum for each course.
- Students will be given a timeline to discuss the topic. If students do not response within the stipulated period, the discussion topic will be deleted and no marks will be awarded.
- For every discussion topic, 1 mark is given by the instructor
- Marks will be assessed on the number of responses or hits and the substance of the discussion. No peer assessment recommended at this initial stage
- Facilitator shall monitor and track the students' responses once in every two-day basis and response to students' questions.
- To develop a program that can monitor and track students participation

To activate the quiz online between lecturer and student, the following steps are recommended:

- Academic facilitator shall prepare one quiz for every chapter. The number of questions shall be between 5 to 10 questions for each quiz.
- Since the questions are picked randomly by LMS, it is recommended that more questions to be created in the question banks.
- The marking of quizzes will be done by LMS. Facilitator will only need to view the progress reports. Mastery will be based on criterion-referenced test.
- Students should be allowed to take the quiz again if they do not achieve the criteria set.
- There must be a team to develop question bank

SUGGESTIONS FOR IMPROVEMENT ON ASSESSMENT

Based on the observation and feedback from the students, the AeU Assessment Committee has recommended the following suggestions to improve the online and the conventional assessment:

- To improve assessment activities in self- instructional module to enhance formative evaluation.
- To focus on learner-centered learning process with informal scoring as a form of motivation for learning.
- Systematically designed using ID.
- To activate and improve online formative assessment based on teacher-centered learning (TCL) and learner-centered learning (LCL).
- To improve capstone assessment protocol in doctoral research-based program, Supervisor-supervisee pre assessment session is recommended before oral defense (formative assessment online using video conferencing or face-to-face
- To standardize assessment structure using Table of Specifications in which levels of Learning outcomes (using Bloom's Taxonomy) and weightage will be specified.
- To establish standard operating procedures (SOP) for fully online Academic Faciliator (assessment procedure)
- To provide incentives for Academic Facilitator in blended mode and fully on online participation and assessment.
- To treat formative assessment as a process (Popham, 2008)

CONCLUSION

Effective online assessments should include a wide variety of assessment methods depending on the

learning outcomes. Appropriate assessment methods such as projects, portfolios, forum with immediate feedback, timed tests and quizzes, and asynchronous type of communication using the discussion board. Feedback is also a critical component on online assessment. It must be meaningful, timely, and should be supported by a well-designed rubric when possible. The assessment value of e-mail messages, quiz, and discussion board postings should not be ignored as they provide opportunities for the instructor to know whether the students understand the instruction and are correctly interpreting the assessments. On line Learning technologies will support T & L either in the conventional mode or online environment. Studies showed that online learning can improve achievement and provide rich enviornment for learning. The assessment tool, if carefully designed may help to facilitate and improve learning particularly in the ODL mode.

ABSTRACT

The study aims at evaluating the perceptions of 8th graders towards the use of information technologies ranging from the internet and multimedia tools in socio-cultural perspective of creativity while they are doing their homework in the light of the National Education Ministry's regulation related to elementary and secondary school students' extra-curricular activities. The population of the research that was realised by data collected through survey method consists of 8th grade students in elementary and secondary schools in Istanbul. Randomly chosen 435 students from five schools in Istanbul make the sample of the research. In terms of students' perceptions, results of the study show that regardless of gender, students enjoy discovering and exploiting online and offline resources through problem solving skills especially when they have the opportunity to do this on their own, which also shows that they think they feel more confident, mobile and creative in cyber but socio-cultural reality.

Keywords: homework, creativity, information technologies, multimedia

ÖZET

Bu çalışmada, ilköğretim 8.sınıf öğrencilerinin ödev yaparken Milli Eğitim Bakanlığının "İlköğretim ve Ortaöğretim Kurumlarındaki Öğrencilerin Ders Dışı Eğitim ve Öğretim Faaliyetleri Hakkında Yönetmeliği" ışığında sosyo-kültürel yaratıcılık bağlamında internet ve çoklu ortam araçları gibi bilişim teknolojilerini kullanımlarına yönelik algılamalarını değerlendirmek amaçlanmıştır. Anket yöntemi ile elde edilen verilerden oluşan araştırmanın evrenini, İstanbul ilindeki ilköğretim okullarında öğrenim gören 8. sınıf öğrencileri oluşturmaktadır. Araştırmanın örneklemi ise, beş ilköğretim okulundan tesadüfi örnekleme ile seçilen 435 ilköğretim 8. sınıf öğrencisidir. Araştırmanın sonuçları, öğrencilerin, algılamaları açısından cinsiyet gözetmeksizin çevrimiçi ve çevrimdışı kaynakları kendi başlarına kullandıklarında problem çözme becerileri ile keşfetmekten ve tüketmekten hoşlandıkları, bunun da sanal ancak sosyo-kültürel gerçeklik bağlamında kendilerine daha fazla güven, hareketlilik ve yaratıcılık sağladığını göstermiştir.

Introduction

Technological advances make us reconsider and ascertain whether new instructional methods modify or even magnify children's learning styles. Some studies report change in learning style as a function of computer-assisted learning. As the internet and other computer-based communication tools become prevalent in homes and schools, students' use of these tools for their homework will rise. As a result, the new trend in doing homework has also been under great changes and influences from past to present. The issue bears essential focal points to study in terms of students' changing perceptions and attitudes towards homework along with the importance attached to it. In this respect, style of new homework trends especially with young learners would be of greater concern to examine.

In addition, homework is a powerful tool that can contribute to the advancement of children's education and knowledge. Homework is a kind of out-of-school learning that has not yet received the serious

attention that it merits in the research literature. School systems need to give serious attention both to increasing awareness of homework motivation and preferences in children and in parents and to providing them with the information and techniques required to accommodate homework assignments to these preferences as well as their motivation levels and sources (Milgram. 2000). Schools that can meet similar needs are more likely to promote a better understanding of homework.

When we talk about homework, we assume that homework should reflect a productive and participatory aspect of learning in which learners' involvement is the most significant element. Using today's technological instruments as facilitators, a well-assigned homework is meant to stimulate students' creativity and the need to communicate and share with his or her peers in rich learning environment. In this respect, creativity is conceived as a product of two different types of mental processes. First some processes are used in the generation of cognitive structures (memory retrieval, association, mental synthesis, mental transformation, analogical transfer and categorical reduction). The second type of processes cover those used to explore the creative implications of the structures (attribute finding, conceptual interpretation, functional inference, contextual shifting, hypothesis testing and searching for limitations). According to the socio-cultural perspective, understanding creative people and objects demonstrates that artistic innovations emerge from joint thinking, exchanges among people, which emphasizes the role of social dimension of creativity. In the socio-cultural perspective creativity relies on experience, needs and interests in which needs are expressed (Decortis & Lentini, 2009).

Creative individuals are generally very good problem solvers and enjoy a variety of experiences. They have an ability to read a book or look at a situation and each time the book or situation is revisited, a new idea or approach is developed. Creativity thrives on emotion and is process driven rather than focusing on the end result. School is very goal oriented. Although we may like to think that students should learn 'for the sake of learning, the reality is that the goal of most schools is to have the students perform well on the exam. For a student to do well in this system, the student needs to be driven by wanting to complete a goal. Students should view assignments as part of a process and not as end result. (Weiner, 2010).

Thus, an educational system that is based on creativity encourages the creativity and works for achieving creativity. It is too necessary to educate and train the people who can develop the society towards the best, who can use their creative capabilities and take the responsibilities of competitive changing world on the national and international basis. The doubling of knowledge is taking place in less time while we are advancing forward. This cumulative knowledge only can be learned just by an educational system that depends on aiming creativity and using methods of creativity. The basis of development and improvement is formulated by advanced technology. Technology is a product of creative works and is a very wide and fertilized area for creativity (Rıza, 2001). By using technological aids in homework preparation process, it should not be wrong to look for the ways of improving and reinforcing creativity with other personality traits from socio-cultural perspectives.

Literature Review

The use of technology in the classroom to enhance student achievement is a timely topic that pervades educational literature today. However, the literature is practically devoid of evidence for the uses of technologies to enhance both short- and long-term homework assignments. Teachers often assign homework to provide extra practice to students without regard to individualized needs for such practice. In turn, homework is often viewed by students as nothing more than "busy work" and therefore inconsequential to their learning. Technology can be used to change these three types of homework from paper-and-pencil "chores" or "busy work" to motivating learning opportunities that extend classroom learning into the home. Emphasizing a student's individual abilities and interests with regard to homework has been a daunting task in the past. Not many teachers had the time or energy to assign individualized homework assignments to meet student needs. In fact, the same assignment—one that all students could complete—was often given to all students regardless of their individual instructional needs, thus resulting in the "busy work" perception. Using technology, teachers can now move from the

role of "assigner and designer" of the homework assignment to "facilitator" for the homework reinforcement process. Rather than requesting that all students complete a specified generic assignment, the teacher can ask students to use technology to practice the skills or display the knowledge learned. Extending the use of technology to the home by assigning meaningful homework accomplishes three goals. First, it encourages meaningful homework assignments designed to meet the individual reinforcement needs of students. Second, it provides practice of valuable technology skills that will serve students well beyond the completion of the homework itself. And third, it provides students with homework activities that are engaging and fun (Zisow, 2000).So homework can be considered as a fruitful tree with numerous branches to hold on.

Homework is intended to be a positive experience that encourages children to learn; assignments should not be viewed as punishment. Research on homework during the last decade began to focus on the relationship between homework and student achievement, and has greatly strengthened the case for assigning homework. Although there are mixed findings about whether homework actually increases students' academic achievement, many teachers and parents agree that homework develops students' initiative and responsibility, and fulfils the expectations of students, parents, and the public (Milbourne, Linda A. - Haury, David L., 2000). On the other hand, how to realizes this still remains to be an issue of various discussions in the literature.

Homework, without any support and guidance especially for young learners, can go no further than being just a "mission impossible" for both learners and families. For that reason, traditional understanding of homework and its prerequisites need revision or second thoughts so that a more creative, collaborative and supportive approach can be developed to enhance learners' performance and enthusiasm. In that sense, technology and learners' perceptions of its role are issues that have different reflections on the tasks and responsibilities taken up during the learning process. Human beings as social creatures blended with culture are forced to state a purpose and take a position in this very digital age. Learners are no exception to this rule; neither can they be exempted from it.

Method

The study aims at measuring the relationship between the perceptions of socio-cultural perspective of creativity of 8th graders and the use of information technologies while doing homework. In addition, variables such sharing, cooperation, researching, problem solving, entertainment, self-confidence and communication were studied within students' socio-cultural creativity while organizing their homework in the light of the Turkish Ministry of National Education's regulation related to elementary and secondary school students' extra-curricular activities. For data analysis, frequency analysis and t-test were used.

Findings

Frequency Analysis

In the study, 48, 7 % of participants were male and 51, 3% were female. The character traits (CT) question regarding which aspect they think doing homework by using the internet and computer tools reinforce had six choices: 1) Sharing 2) Cooperation 3) Researching 4) Self-confidence 5) Creativity 6) Communication. The frequency data for each choice has the following results:

92,2 % of the students think that using the internet and computer tools while doing homework helps them regain self-confidence followed by 88,7 % for cooperation, 82,1 % for communication, 78,4% for sharing, 75, 9 % for creativity. 16, 1 % of students reported that the internet and computer tools did not help them develop their research skills.

As to whether students discuss the homework topic online, 59, 1 % reported they did so. While 58, 6 % of students discussed it with their friends, 25, 4 % with family members and 16 % with their teachers.

Concerning the most frequent tool they used for discussing homework topics was chat programs by 56,1 %, which was followed by e-mail (20%), face to face (17,8 %) and telephone (5,3%).

While doing their homework on the internet and computer, by 43, 9 %, students stated that they preferred to do it on their own and 34, 7 % with their friends.

Finally, as to the question whether they benefited from the internet and computer tools about experiments, observations and inventions included in their homework, by 85,5 % students responded " Yes" and by 14, 3 % " No"

t-Test

As a result of the t-test that was applied to see whether there is a significant difference among female and male students related to the answers given to the questions as to whether they think that they gain problem solving skills (PS) research opportunities (R) and they entertain themselves (E) while doing homework by using the internet and computer tools, following findings were obtained:

Table 1: Descriptive Statistics

	Sex	N	Mean	Std. Deviation	Std. Error Mean
PS	Male	211	2,2512	1,10774	,07626
	Female	222	2,1712	1,00112	,06719
R	Male	212	1,8349	1,01930	,07001
	Female	222	1,9099	1,00271	,06730
E	Male	212	1,6557	1,15579	,07938
	Female	221	1,5294	1,00240	,06743

The above Table shows that there is no significant difference between the averages and standard deviations of the related answers given to the three questions (PS, R and E) by 211 male and 222 female students.

As a result of the t- test that was applied to see whether there is a significant difference between female and male students related to the answers given to the questions PS, R and E, no significant difference was found at 5% significance level. (Significance values > 0, 05 were highlighted).

Table 2: t-Test for Differences between the Genders

		Levene's Test for Equality of Variances		t-test for Equality of Means				
		F	Sig.	t	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference
PS	Equal variances assumed	2,317	,129	,789	431	**,430**	,08001	,10138
	Equal variances not assumed			,787	421,328	,432	,08001	,10164
R	Equal variances assumed	,166	,684	-,773	432	**,440**	-,07500	,09707
	Equal variances not assumed			-,772	430,314	,440	-,07500	,09711
E	Equal variances assumed	4,331	,038	1,216	431	,225	,12625	,10385
	Equal variances not assumed			1,212	417,084	**,226**	,12625	,10415

As a result of the t- test applied to see whether there is a significant difference between the answers given to the questions PS, R and E and the answers given to the questions whether they benefit from a single source (SS) or multiple sources (MS) while doing their homework on the internet and computer, following results were obtained:

Table 3: Descriptive Statistics

	SS and MS	N	Mean	Std. Deviation	Std. Error Mean
PS	From a single source	53	2,3019	1,15334	,15842
	From multiple sources	380	2,1974	1,04034	,05337
R	From a single source	53	2,1111	1,16013	,15787
	From multiple sources	380	1,8395	,98432	,05049
E	From a single source	53	2,0000	1,35873	,18664

	SS and MS	N	Mean	Std. Deviation	Std. Error Mean
PS	From a single source	53	2,3019	1,15334	,15842
	From multiple sources	380	2,1974	1,04034	,05337
R	From a single source	53	2,1111	1,16013	,15787
	From multiple sources	380	1,8395	,98432	,05049
E	From a single source	53	2,0000	1,35873	,18664
	From multiple sources	380	1,5342	1,02547	,05261

The above Table shows that while 53 students benefited from a single source, 380 students benefited from multiple sources while doing homework on the internet and computer. No significant difference was found between the averages and standard deviations of the answers given to the three questions by students in both groups.

Table 4 : t-Test for difference between SS and MS

		Levene's Test for Equality of Variances		t-test for Equality of Means				
		F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference
PS	Equal variances assumed	1,880	,171	,676	431	**,499**	,10452	,15464
	Equal variances not assumed			,625	64,358	,534	,10452	,16717
R	Equal variances assumed	1,168	,280	1,854	432	**,064**	,27164	,14653
	Equal variances not assumed			1,639	64,304	,106	,27164	,16575
E	Equal variances assumed	12,141	,001	2,966	431	,003	,46579	,15707
	Equal variances not assumed			2,402	60,538	**,019**	,46579	,19391

As a result of the t-test applied to see whether there is a significant difference between " benefiting from a single source" and " benefiting from multiple sources" related to the questions PS, R and E, no significant difference was found for questions PS and R at 5% significance level and similarly for the students in both groups (sig. values>0,05). On the other hand, in parallel with the answers given to question E, a significant difference at 5% significance level was found between the students in two groups. (Sig. value <0, 05).

Related to the answers given to the questions PS, R and E, in order to find whether there is a significant difference regarding the question whether students discuss (D) the homework topic or not while doing their homework, following results were founds as a result of the t-test applied.

Table 5: Descriptive Statistics

	D	N	Mean	Std. Deviation	Std. Error Mean
PS	Yes	257	2,0817	,99860	,06229
	No	170	2,4000	1,10620	,08484
R	Yes	257	1,8288	,97721	,06096
	No	170	1,9474	1,06419	,08138
E	Yes	257	1,5798	1,06912	,06669
	No	170	1,6000	1,10083	,08443

The above Table shows that while 257 students discussed the homework topic, 257 of them did not so. While there is no significant difference between the averages and standard deviations of the answers given to the questions R and E by the students in two groups, it was observed that the averages differentiated in question PS (yes:2,08 no:2,4)

Table 6: t-Test for D

		Levene's Test for Equality of Variances		t-test for Equality of Means				
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference
PS	Equal variances assumed	6,608	,010	-3,088	425	,002	-,31829	,10308
	Equal variances not assumed			-3,024	335,879	**,003**	-,31829	,10525

R	Equal variances assumed	,720	,397	-1,186	426	**,236**	-,11857	,09995
	Equal variances not assumed			-1,166	342,645	,244	-,11857	,10168
E	Equal variances assumed	,213	,645	-,189	425	**,850**	-,02023	,10695
	Equal variances not assumed			-,188	354,557	,851	-,02023	,10759

Related to the answers given to the questions PS, R and E, as a result of the t-test applied in order to find if there is a significant difference between whether students "discuss the homework topic" and "not discuss it" (question D), no significant difference was found between the two groups of students for questions R and E at 5% significance level (sig. values>0,05). On the other hand, in parallel with the answers given to the question PS, a significant difference at 5% significance level was found between the two groups of students.

Conclusion

As specified in the related parts of the National Education Ministry's regulation related to elementary and secondary school students' extra-curricular activities, homework, an essential tool in education, is meant to serve as a basic socio-cultural educational medium that helps student develop and improve personal and academic skills. Our results regarding socio-cultural perceptions of 8th graders' creativity show that young learners feel freer, more confident and secure while they are using the internet and computer tools while doing homework. Although most children like participants in our study feel more comfortable with the use of online and offline tools in their engagements, it should be kept in mind that apart from their enhanced efficiency, computer technologies alone should not be prescribed as a unique cure for extra-curricular educational activities such as homework. Our study is meant to shed light on how students in the study perceive computer mediated homework performance and preparation techniques in terms of socio-cultural creativity in comparison to what is stated in the school regulation. Obtained results in general put forward a positive but still attentive approach concerning students' use of computers and the internet tools in doing homework. The line between education and homework is so delicate that objectives and tools stated in the Ministry's regulation regarding homework can change lines depending on how computers and the internet enter the scene. We hope that this study has managed to draw attention to highlighted theory and changing practice of students' productivity and creativity perceptions from both social and cultural perspectives for the present and future applications.

A Usability Study of Interactive Web-based Modules

Tulay Girard, Penn State Altoona
tug1@psu.edu

Musa Pinar, Valparaiso University
musa.pinar@valpo.edu

ABSTRACT

This research advances the understanding of the usability of marketing case study modules in the area of interactive web-based technologies through the assignment of seven interactive case modules in a Principles of Marketing course. Using a survey instrument, the study examines student perceptions of how useful the interactive modules are in students' learning the selected marketing concepts, how difficult/easy for students to use the modules, and how helpful the module assignment were in receiving a better course grade. The results indicated that students perceived that the modules were easy to use and useful in learning of the marketing concepts. The number of completed modules increased students' actual course grade and module assignment grade. On an average, students indicated that the ideal number of interactive modules was seven in a semester. Students' class attendance was positively correlated with their grades. Females achieved a higher module assignment grade than males did.

Key Words: Interactive modules, Web-based technology, Usability

INTRODUCTION

Case studies provide an important tool to help students develop analytical thinking and problem-solving skills through applied construction of reality (Henson, Kennett, and Kennedy 2003). In a Principles of Marketing course, for the first time many students are faced with having to organize, categorize, and solve the problems at hand, and may be overwhelmed with the process. Often, in a Principles of Marketing course, students decide to become marketing majors. In the past, it has also been reported that while there has been a decline in marketing majors, there has also been a decline in the quality of students interested in marketing (Hugstad 1997; Newell, Titus, and West 1996). Although marketing educators debate this idea, many surveys also show a decline in students' interest in reading text books. Following target market trends, publishers of major marketing text books are downsizing texts by creating interactive text books as well as magazine-like texts (See Pearson/Prentice Hall and Thompson Learning for examples).

The latest demographic research suggests that the current student is part of a Nano Generation which is multi-task oriented, multi-modal, and has an attention span of about five minutes. As marketing educators face a changing student demographic, it is important to consider whether or not the pedagogies used in the past still foster student learning (Karns 2005), and how computer technology might aid in knowledge transfer of productive pedagogies. It is imperative, given such trends, that marketing educators seek to promote constructive discourse regarding ways to contemporize existing pedagogies as well as add new learning activities to the mix to meet the needs of a changing student profile that include learning styles and habits that differ from previous generations.

Computer-aided interactivity appears to be an established method that can be used in the marketing classroom as a tool to match the marketing student's learned aptitude and comfort with computer technology with traditional marketing pedagogies in order to learn marketing concepts. Jaffee (1997, p. 268) defines interactivity as "regular interaction between teacher and students, among students, and between students and the learning environment." Computer-aided interactivity uses computer programs to enhance learning with activities that users can respond to (Pickett et al. 2000). Although much has been written about how computer-aided interactivity enhances the students' learning process, there is little empirical evidence about

how students learn with technology (Close, Dixit, and Malhotra 2005). Furthermore, Achenreiner (2001) suggests that more studies are needed that match existing pedagogies with technology interfaces.

With this concern, this study compares and reports student outcomes and perceptions of Principles of Marketing case studies in a web-based format for individual students. It advances the understanding of the value of technology as a tool for learning how to solve case studies and describes the student perceptions of using web-based case study modules. Studies about student perceptions in traditional classrooms (face-to-face courses) that also use computer-mediated communications (CMC) are limited (An and Frick 2006).

Because marketing educators may not have the time or resources to develop web-based, computer-aided case study assignments, they may choose to use the web-based interactive case study modules that accompany textbooks to supplement their lecture-based teaching methods. The authors believe that computer-aided teaching methods are useful in student learning if implemented effectively. Research suggests that CMC may be preferred by diverse learners because they can interact with case study materials on-line and have time outside of the classroom to review and comprehend the materials. Furthermore, students are not expected to communicate verbally and process non-verbal communications at the same time. Given our diverse student profiles, including students with disabilities, students who learn English as a second language, or students who are shy to speak in public, it has been suggested that CMC may be useful in helping students focus on the case study information at hand more effectively (Berge and Collins 1993; Harasim 1990; Leasure, Davis, and Thievon 2000). Finally, CMC has been found to equalize participation between participants by providing a virtual façade that allows students to be themselves (Hiltz, Johnson, and Turoff 1986; Kiesler, Siegel, and McGuire 1984; Phillips, Santoro, and Kuehn 1988).

LITERATURE REVIEW

Marketing educators are challenged with how to integrate technology into their courses to enhance student learning of marketing concepts and prepare them for careers in marketing. Hannaford, Erffmeyer, and Tomkovick (2005) report that most educators have integrated technology into traditional courses through an "infusion approach" (p. 68). Infusing technology into the classroom has evolved over the last decade. In a study of student outcomes using electronic tools, Clarke III, Flaherty, and Mottner (2001) confirm that technology created portals for learning and enhanced the learning experience. Close, Dixit, and Malhotra (2005) state that while technology and the Internet "facilitate" and "enhance learning" (p. 91), there is little known about how students learn with technology. Strauss and Frost (1999) suggest that it not only enhances learning but that it increases skills needed in marketing careers.

Studies regarding technology's effectiveness in the marketing classroom are limited (Close, Dixit, and Malhotra 2005). Malhotra (2002) points out that while there are many advantages to using technology; educators need to maintain a balance between traditional and electronic methods. Karns (2005) finds in a study of marketing student perceptions of learning activities that using technology generates a positive response by students if they are real world based. Karns (2005) states, "Students' willingness to engage fully in learning through a particular pedagogy is an important element in a pedagogical approach's ability to foster learning" (p. 165). Marshall and Michaels (2001) point out educators should use technology that is driven by the course's focus and content. Furthermore, there are few pedagogical studies about how technology interfaces with different approaches to learning, such as case studies and problem solving and this is one area that needs further examination (Achenreiner 2001).

Web-based delivery systems are popular electronic tools that have been effectively used in diverse marketing courses. Its overall advantages over traditional course methods for students include interactivity, real-time communication, and self-motivated learning. Furthermore, it supports multiple data formats such as audio, video, and graphics, and can be updated when necessary (Kaynama and Keesling 2000). However, research on the effectiveness of web-based delivery systems for different learning approaches is limited and marketing educators wonder if technology actually adds to student learning of marketing concepts (Close, Dixit, and Malhotra 2005).

Case studies are a traditional pedagogical tool used by marketing educators to build marketing problem-solving skills, gain real world knowledge, and develop marketing concepts. Traditionally, case studies have been taught by using textbooks or paper cases such as Harvard Business School case studies. Various studies have been conducted to demonstrate the value of web-based cases versus paper cases. Mabrika (2003) uses an online case study which contributed to learning about the impact of multimedia in improving higher-order cognitive skills with marketing students. Liebowitz and Yaverbaum (1998) demonstrate that web-based cases are more enjoyable than paper cases with information systems students.

Given a student's cumulative experience with problem-solving, it is unclear whether or not a positive or negative experience with case studies impacts his/her choice of a major in business. In a study of students' decision-making processes in selecting a business major, marketing students rated the need for interesting course content and variety the highest on their attribute importance scale (Newell, Titus, and West 1996). Furthermore, (Newell, Titus, and West (1996) find that marketing students felt that their quantitative skills are lacking.

Therefore, this study investigates whether interactive case study modules for Principles of Marketing students are easy to use. The study further investigates whether the number of interactive case study modules completed lead to a higher overall course grade, and an overall module assignment grade. In addition, the study examines whether students' semester standing and class attendance percentage are positively correlated with their perceptions of ease of completing the modules; lastly, whether gender and student's option make significant difference in the overall module assignment grade and course grade. The research objectives are as follows:

RO1: Students will find that web-based interactive case studies are easy to use. More specifically, their perceptions will be higher than being neutral.

RO2: The number of modules completed will positively correlate with students' course grade and overall module assignment grade.

RO3: Students' semester standing and class attendance percentage will positively correlate with their overall course grades and module assignment grades.

RO4: Differences exist in the overall module grades based on gender and student's option. More specifically, females and students of marketing/management option will receive higher module assignment grade and course grade.

METHODOLOGY

The web-based marketing case modules were provided for marketing students by the publisher, McGraw Hill Irwin, of the *Marketing* textbook by Grewal and Levy (2010) at the publisher's web site: https://cms.psu.edu/section/content/default.asp?WCI=pgDisplay&WCU=CRSCNT&ENTRY_ID=C3869829D49C48829AE1E2EF3B4FD375. The students were asked to complete seven module assignments as part of their course requirement throughout a semester at a large university in the United States. After the completion of seven interactive case modules, a voluntary participation in a survey was offered in order to investigate the objectives of the study. A total of 96 students who registered for a Principles of Marketing course participated in the study. As an incentive, one bonus point credit was offered for a voluntary participation in the survey and was counted toward students' in-class participation grade.

In order to test the usability of the web-based interactive case modules, fourteen scaled-questions were asked. In addition, actual course grade, overall module assignment grade, number of modules completed, student's class attendance percent, and student's semester standing were captured from the students' course grade sheet.

RESULTS AND DISCUSSIONS

The sample profile indicated that 69.5 percent of the students were males and 30.5 percent were females. Students of the marketing/management option comprised 48 percent of the sample, finance 12 percent, accounting 17 percent, entrepreneurship 3.4 percent, and other options 11 percent. Almost 8 percent of the students were undecided regarding their option.

A Principle Component Analysis with Varimax rotation revealed three dimensions with 60 percent variance explained. The item, "How clear was the language?" loaded on two dimensions. Because this item did not show clear measurement of a specific dimension, it was removed. The loadings are shown in Table 1. To examine RO1, one sample t-test with the test value of 3 (mid-point) is used and the means and standard deviations of the statements measured on a 5-point scale were examined. All of the means of the statements were significantly higher than the mid-point at $p < .01$ level (Table 1). This indicates that students perceived that the modules were easy to use and useful in learning of the marketing concepts. The reliability analysis revealed Cronbach's Alphas ranging from .61 to .86.

TABLE 1: Usability and Usefulness of Modules

Usability Items	Measurement Scale	Mean	S. D.	t-value	Loadings		
					CA=.86	CA=.74	CA=.61
1.While completing the modules, did you:	1= Feel completely lost; 2= Feel a little lost; 3= Neutral; 4= Know what to do most of the time; 5= Always know what to do next	3.78	.81	**9.3*** **		**.59**	
2.Compared to what you expected, did the tasks go:	1= Much slower; 2=Slower; 3=Neutral; 4=Faster; 5=Much faster	3.6	.76	**7.7*** **			**.82**
3. How easy/difficult was it to understand the tasks asked of you?	1= Very difficult; 2=Difficult; 3=Neutral; 4Easy; 5=Very easy	3.74	.84	**8.5*** **		**.81**	
4. Overall, how easy/difficult was it for you to complete required phases?	1= Very difficult; 2=Difficult; 3=Neutral; 4Easy; 5=Very easy	3.78	.81	**9.3*** **		**.61**	
5. How easy/difficult was understanding the information presented in the modules?	1= Very difficult; 2=Difficult; 3=Neutral; 4Easy; 5=Very easy	3.64	.77	**8.1*** **		**.55**	
6. How relevant were the graphics to the content?	1= Very irrelevant; 2=Irrelevant; 3=Neutral; 4=Relevant; 5=Very relevant	4.01	.89	**11.0*** **	**.57**		
7. How clear was the language?	1=Very unclear; 2=Unclear; 3=Neutral; 4=Clear; 5=Very clear	3.97	.83	**11.4*** **		.47[a]	
8. Overall, how easy/difficult was using the modules?	1= Very difficult; 2=Difficult; 3=Neutral; 4=Easy; 5=Very easy	3.99	.75	**12.8*** **			**.71**
9. Overall, how useful was the modules' content to your learning?	1=Very useless; 2=Useless; 3=Neutral; 4=Useful; 5=Very useful	3.47	.85	**5.3*** **	**.81**		
10. I completely understood the material:	1=Strongly disagree; 2=Disagree; 3=Neutral; 4=Agree; 5=Strongly Agree	3.46	.89	**5.0*** **		**.71**	
11. Working with the interactive modules was fun	1=Strongly disagree; 2=Disagree; 3=Neutral; 4=Agree; 5=Strongly Agree	3.37	.96	**3.8*** **	**.68**		
12. How helpful were the modules for you in learning specific course materials?	1=Not helpful at all; 2=Not helpful; 3=Neutral, 4=Helpful; 5=Very helpful	3.46	.89	**5.0*** **	**.79**		
13. Completing the modules helped me get higher grades on exams	1=Strongly disagree; 2=Disagree; 3=Neutral; 4=Agree; 5=Strongly Agree	2.72	.92	**-2.9*** **	**.77**		
14. Would you recommend the modules be used in future Principles of Marketing classes	1=Definitely no; 2=No; 3=Neutral; 4=Yes; 5=Definitely yes	3.78	1.0	**7.6*** **	**.81**		

****** p < .01***

[a] Deleted

To investigate RO2, a Pearson correlation analysis was performed. The number of completed modules was significantly correlated with students' actual course grade (.63) and module assignment grade (.98) at $p < .01$ level. The actual course grade and the module assignment grade was also significantly correlated (.66) at $p < .01$ level. On an average, students indicated that the ideal number of interactive modules was seven in a semester. In addition, the number of completed modules was not significantly correlated with any of student perceptions regarding the usefulness and ease of use of the modules.

In examining RO3, student's attendance record was positively and significantly correlated with both module assignment grade (.30) and overall course grade (.62) at $p < .01$ level. However, while students'

semester standing was not correlated with module assignment grade, it was negatively and significantly correlated with their actual course grade (-.30) and their class attendance record (-.33) at $p < .01$ level.

For RO4, a t-test was performed to see if females scored a significantly higher module assignment grade than males did. The course grade was not significantly different; however, females' module assignment grades (mean=93, n=29) were significantly higher than those of males (mean=86, n=66) with t= -2.17 at $p < .05$ level. Student's field of study (option) did not have significant relationship with their module assignment grade; however, the students with an option in finance (mean=93.7) had significantly higher course grades in the Principles of Marketing course than those with other options such as Accounting (86.5), and Entrepreneurship (80.9) option.

LIMITATIONS

This study used a convenience sample, and was limited to two sections of Principles of Marketing at one large university. Therefore, the study cannot be generalized to all Principles of Marketing students. Student's comfort level with technology and prior experiences or expertise with Web-based tools were unknown. Furthermore, some students may have technical difficulties using the modules during the submission process (incompatibility between Mac vs. Windows-based programs), which may or may not have biased the survey responses.

Time constraints also limited this study. If students underestimated the amount of time they needed and waited until the last minute to complete the module, this may have biased both student performance and survey results. Indeed, there were always a few students who submitted their answers at the last minute, right before the deadline.

Future research may include providing greater interactivity such as working in groups rather than individually and allowing students to collaborate and discuss the case while working on the module.

CONCLUSIONS

The findings from this study correspond with Pickett et al. (2000) that computer-aided interactivity enhances learning. Overall, students' feelings about the interactive case modules were positive; however, they did not feel that the modules helped increase their grades on exams. This is expected because the modules focus on specific concepts while exams assess a broad area of knowledge. This study found an interactive web-based case module helped the learning marketing concepts and were easy to use. Clarke III, Flaherty, and Mottner (2001) state that although there is no empirical evidence that it helps students learn, electronic interaction between students should be encouraged. The findings of this study are also consistent with those of O'Connor and Girard (2006) study that indicated modules made learning of the marketing concepts easier.

The number of completed modules was positively correlated with the module assignment grade and the course grade. This means students are encouraged to complete as many modules as possible to better their course grade. Student's attendance record was also positively and significantly correlated with both module assignment grade and overall course grade. However, while students' semester standing (e.g., freshman, sophomore) was not correlated with module assignment grade, it was negatively and significantly correlated with their actual course grade and their class attendance record. This finding warrants further research to understand why students with a higher semester standing have difficulty receiving higher course grade and attending the classes more frequently than their counterparts with a lower semester standing.

The study also found that the course grade was not significantly different between males and females; however, females' module assignment grades were significantly higher than those of males. This may result from the differences in learning styles between male and female students as documented in the literature (Karns 2006). Student's field of study (option) did not have significant relationship with their module assignment grade; however, the students with an option in finance had significantly higher course grades in

the Principles of Marketing course than those with other options such as Accounting, and Entrepreneurship option. This finding should be verified by looking at a larger sample and in various courses to be generalized.

In conclusion, marketing educators are encouraged to use tools that will motivate students to engage in the marketing process and learn the marketing concepts. If marketing education is to continue to effectively prepare students for employment and life, educators must understand the ways that technology and other educational methodologies inspire students (Clarke III, Flaherty, and Mottner, 2001). Therefore, infusing traditional pedagogy with technological advancements through survey methods and experiments and making the results available to educators can only advance the research on this topic.

ALGOBASE, A SYSTEM FOR ASSESSING ALGORITHMS

Rym AIOUNI *
*Laboratory of Computer Serch (LRI), University Badji Mokhtar Annaba, Algeria
aiouni.rym@gmail.com

Abstract
An algorithm is a consequence of logical instructions that, once executed, reduce to a result and it is not always evident to good understand its functioning.
The progression of the technologies of information and communication and its availability in the teaching and in the learning offer the possibility to put at the disposal of the learners the tools that facilitate their learning. The algorithmic is a very important field in computer science; it is currently studied using different intelligent environments for human learning dedicated to each discipline.
Algobase, is an Environment for assessment algorithms and learning resolution with decomposition of tasks. This is an editor that offers the learner opportunities to create, modify, evaluate algorithms and view mistakes. The assessment in this Environment is done through a matching of solutions.
Keywords
Algorithmic, Matching, Organigram, Assessment, Environment…

PROBLEMATIC

The algorithmic is discipline that used for long time but in a naïve way (Caignaert, 1988), without particular formalism. This discipline is often source of problem for both the teacher and students. For the teacher, because he must find adequate methods to let the students grasp some of the abstract aspects that are in their beginning level. For students, the problem is much bigger. In testifies the rate of failure or dismissal from the initiating level in programming in the first cycle of the university vary from 25 to 80% worldwide (kaasboll, 2002). Works in cognitive psychology directly involves the nature of the taught discipline. These studies have identified the major axes of the intrinsic difficulties related to algorithmic:
• In the algorithmic, unlike other sciences such as physics, the beginning student has no model “naïf” of computer that might serve as a basis for building more sophisticated models. In opposite to, his experience with it seems to favor a modeling "anthropomorphic" which did not explain the sudden feedback which it is faced early in his practice of algorithmic (Guibert, 2005).
• Another specific difficulty in algorithmic is the abstraction of the task: the learner must factorize in the algorithm, the overall behavior of the task. The result is a "syndrome of the white page, highlighted in particular by Kaasböll (kaasboll, 2002). According to the students: "... when the problem is presented ... it breaks it down like that, like it like that. Everything seems simple and logical, and that's you and Ouch! Where do I begin? Perhaps it is easy, but the problem is that you do not know where to start when it should solve the problem.... ".
The following essential question arises:

- With witch pedagogic methods and tools could we improve the algorithmic learning?

Since some years, the integration of the technology of information and communication (TIC) has boosted the improvement of the quality of teaching and learning of different knowledge (Amerein, 1998). We support that appropriate use of TICs with innovative teaching methods and tools appropriated to the context, could be the solution to the problem of learning algorithmic.

The TLE has been known since some time considerable improvement efforts. Whatsoever in the manner of describe, to index pedagogic content but also to script pedagogic activities, formalisms imposed. In this evolution, evaluation is the poor relative. There is no particular formalism to specify the evaluation of learners. The evaluation, crucial dimension of the pedagogic activity, in its certificative role, formative, summative or normative, is widely found mistreated in the TLE.

This is in large part caused by difficulties of evaluation itself. Several tools and methods have been devoted but they are either ineffective (doubtful) or dedicated (they can't be applied to any field) (Daubias, 2003), (Allal, 2005), (Charle, 1977), (Labat, 20O2), (Benabbou, 2007).
Furthermore, the algorithmic activities of evaluation are among the most delicate, especially in a TLE, because the algorithmic is characterized by the multitude of solutions for a given problem. This feature increases the difficulty of evaluation in learning environments: the expert of the field finds difficulties in finding all possible solutions for a problem to integrate them into the database solutions. The localization of mistakes is an important fact of the progression of learners, is another problem caused by this feature. This makes the complex realization of these systems.

OUR PROPOSAL

To simplify the complex tasks, we need to decompose them into less complex ones and repeat this process until reaching a level of decomposition including basic operations and / or elementary ones. The algorithm solving the problem will be a composition of the late operations (basic and elementary). The number of levels of decomposition depends on the complexity of the problem: the more it's complex, the more the number of steps would be considerable.
This method of refining successive (also called top-down approach) allows a progressive movement with maximum chance of success, from the abstract description of the solution of problem (per a complex operation) to the algorithm that would allow its resolution. The algorithm is in the last level of refining when it contains only basic operations, elementary ones and the control structures.
We define a basic operation as being a known operation in algorithmic such as sorting an array, whereas, the elementary operation is a simple algorithmic one (e.g. assignment).
Thus, in the first level, the problem is decomposed into a set of basic operations, elementary ones and operations that can be decomposed, related by controlling structures. The number of levels depends on the complexity of the problem. Going down in levels, only decomposable operations are decomposed and the decomposition stops when we reach a level in which the constituents are only basic and elementary operations.
This approach prevents the learner to be drowning in the details at the outset and gradually reduces the complexity of the addressed problem. In addition to that, the learner can freely express its solution, without any influence or restriction, which favors the autonomy.
Our objective by this approach is to evaluate algorithmic solutions. However, the essential fallout is the learning by the learners of the decomposition. In fact, this is a bond-holder passage for the learner in the formulation of his solution.

VALIDATION OF THE SOLUTION

Recall that our objective is to reach a reliable evaluation for algorithmic solutions. Thus, when the learner has completed its decomposition problem that has been proposed, its solution is compared to those of the expert grouped into a plan of solutions.
A plan of solutions is a set of paths representing the different possible ways (solutions) for the one exercise. That can contain wrong and correct solutions. It is constituted by an expert and includes solutions judged pedagogically interesting.
This plan could suffer from an exhaustive problem of completeness of expected solutions. It was solved as the following, every unrecognized solution; its evaluation will remain pending until a human expert would add it to the plan of solutions. This progress in the plan of solutions guarantees an evaluation whatever the solution suggested by the learner is. Thus, by time the deferred evaluation will decrease to the benefit of the direct evaluation.

RECOGNITION OF SOLUTIONS

To measure the similarity between two solutions, it is necessary to establish a correspondence between their components. More specifically, the point is to find the best possible matching: one that put in

correspondence the components that are the most similar, the similarity of the components is being based on the features they have in common. A first important point of similarity measure we use in relation to existing measures is that is not only quantitative (evaluating the degree of similarity of two solutions) but also qualitative (explaining in what the solutions are similar and in what they are different).

A second important point of our measure is that it allows to define the relative importance of features, relative to each other and therefore to introduce knowledge in calculating similarity**.**

The matching method AMAS (Automatic Matching Algorithms Solutions)

To automate the comparison of the process of learning with those of the expert (plane solutions), and drawing on the works of Sorlin (2006) on the measurement of multi-labeled graphs, we propose a method for matching algorithmic solutions (Figure 1)

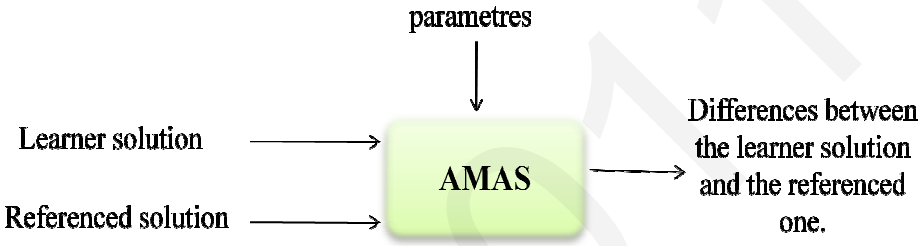

Figure 1: The matching method

This method involves comparing the solution of each learner with the expert solutions to measure the similarity between them. It is composed of two sequential steps (Figure 2):

1. Generate the description of the solution of the learner.
2. Measure the similarity between the solution of the learner and the solution referenced

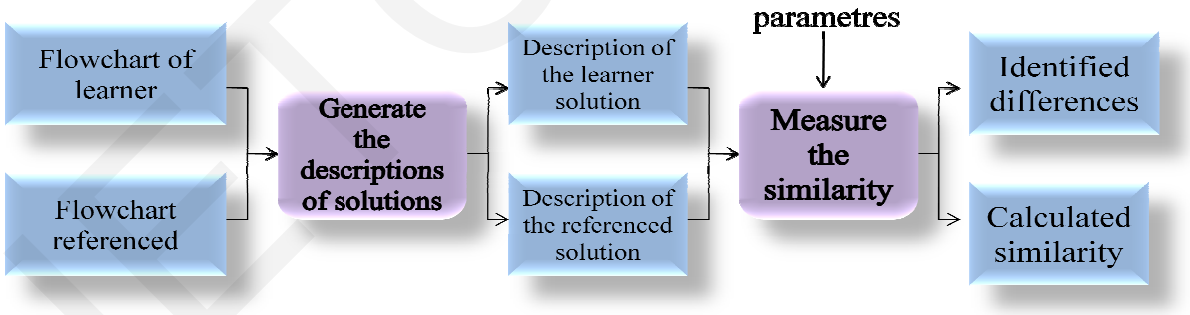

Figure 2: Steps of matching method AMAS.

ALGOBASE, A SYSTEM FOR ASSESSING ALGORITHMS

Our environment offers the learner a number of activities.

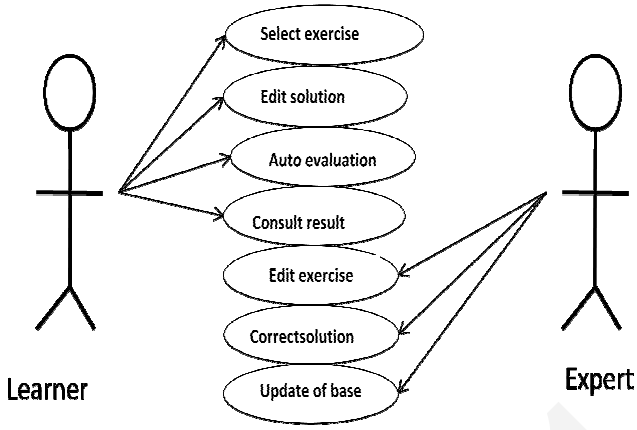

Figure 3 : Use case Diagram of AlgoBase

Starting by our objectives, we decided to distinguish two main actors in our system: the learner and the expert (teacher).

The expert's role is to manage the databases, making changes on the evolution of exercises and evaluate solutions when necessary.

The learner can consult existing exercises to select one. It can edit exercises in flowchart form. He is also invited to make self-assessments to confirm and read his annotations in the form of notes or summaries.

Both actors can access various activities throughout the environment

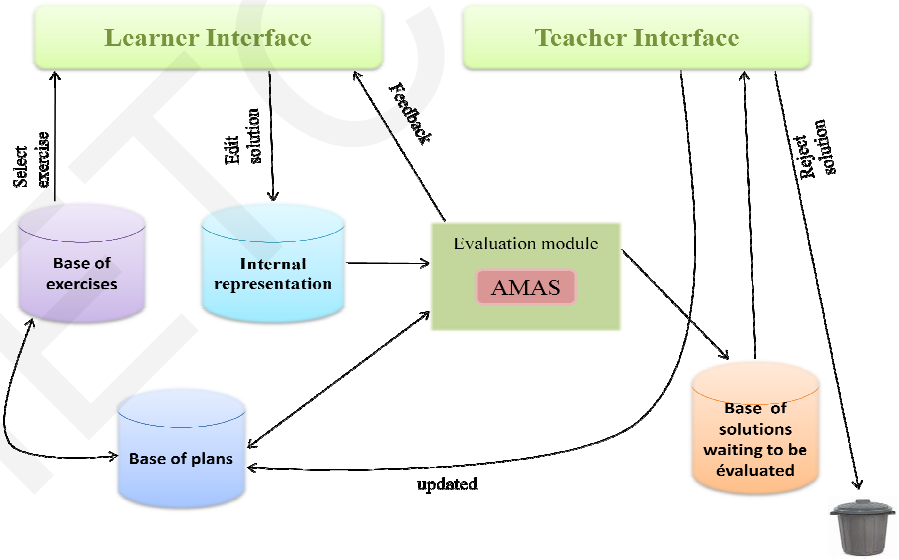

Figure 4 : Architecture of AlgoBase

Algobase editor of solutions.

This Editor offers the learner the opportunity to build its solution in flowchart form, it has at its disposal a library of operations and control structures.

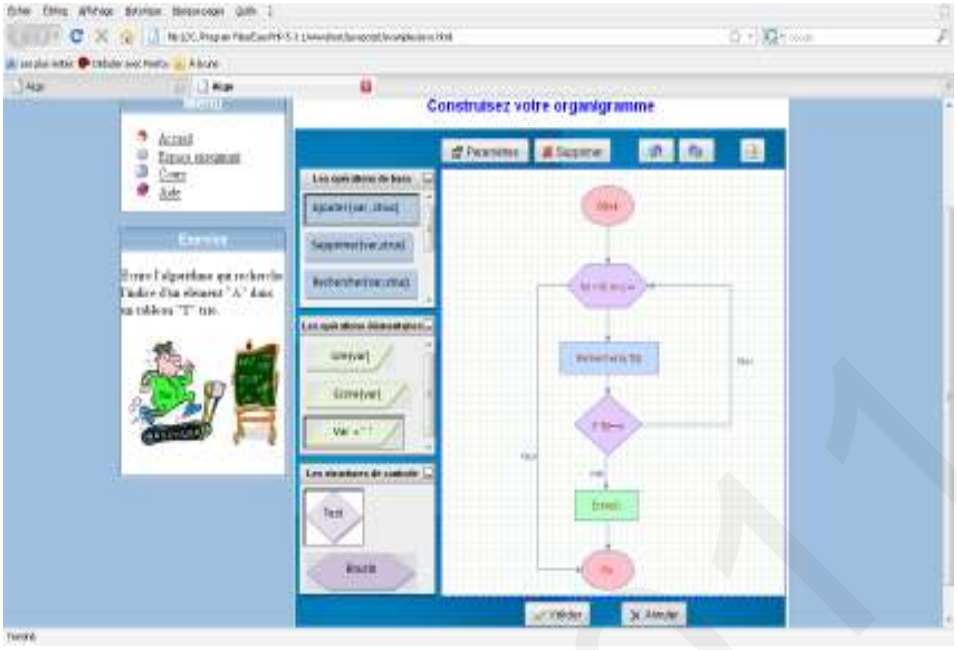

Figure 5 : interface of editor

CONCLUSION

The method of evaluation that we propose imposes, by its nature, to the learners to decompose his problem so that its solution is evaluated. This would *oblige* them to perform the decomposition.

This method is, in the other hand totally adequate for the field taught. As the result, it's trustful and not given in other suggested systems of evaluation of algorithmic, that are generally based on methods totally inadequate (MCQ...).

The feedback provided by the plan of solutions of a recognized solution is itself a source of learning. Thus, in addition to being summative, this evaluation is also formative.

Currently, a prototype is being tested with students from 2nd year LMD. The objective is to see after how much time the system acquires stability. By stability we mean reducing the maximum response of the human expert.

An Analysis of Internet Addiction Levels of Individuals according to Various Variables

Cengiz ŞAHİN[1]

Abstract

The concept of internet addiction refers to the excessive use of internet which in turn causes various problems in individual, social and professional aspects. The aim of this study was to determine internet addiction levels of internet users from all age groups. The study used survey model. Study group of the study consisted of a total of 596 people from all age groups. "Personal Information Form" and "Internet Addiction Scale" were used for data collection. Arithmetic mean, standard deviation, independent sampling and t test, ANOVA and LSD tests were performed on collected data. The findings of the study revealed that the individuals had low levels of internet addiction both in sub-scales and in the general of the scale according to age groups. It was found that there was a significant difference between internet addiction scores of the individuals who belonged to the age group of 19 and below and 30 and below. There was a significant difference between the internet addiction scores of students and other professional groups. It was found that internet addiction levels of males were higher than those of females. The results of the study were discussed together with the results of different studies and suggestions were made.

Keyword: Internet, Addiction, Individual

INTRODUCTION

During the years of Cold War, United States of America supported all kinds of inventions to fulfill their military objectives. To achieve this aim, Advanced Research Projects Agency (ARPA) was established in 1958. Today's internet was developed as a result of long studies carried out in ARPA (Musch, 2000). The World Wide Web (WWW) was developed and began to be widespread in 1991 (Hecht, 2001). While number of wide band internet users in Turkey was 18.604 in 2003, it reached 8.7 million by the end of 2010 (Information Technology and Communication Institution, 2011).

Rapid development of computer technology in information society and particularly the invention and advancement of internet led to major changes in human life. Today, thanks to internet, it is possible to shop from virtual stores, to meet new people and make new friends via social networks, to easily access information and sources required for any subject or to be informed about any event that takes place anywhere in the world (Çalık, Çınar, 2009). In addition to many positive effects, it is possible to discuss negative effects of computers, particularly of internet on individuals and society (Çalık, Çınar, 2009; Khasawneh, Al-Awidi, 2008; Kelleci, 2008: Weiner, 1996). Internet addiction might be listed among these negative effects (Chou, Condron, Belland, 2005).

The concept of internet addiction, which was first used by Goldberg in 1995, has recently turned out to be a phenomena, which is tried to be defined through various terms such as "net addiction", "internet addiction", "on-line addiction", "internet addiction disorder", pathologic internet use" and "cyber disorder" (Eichenberg & Ott, 1999). Although there is not a standard definition for internet addiction yet (Chou, Condron, Belland, 2005) the most basic symptoms can be listed as inability to restrict internet use, to continue internet use despite social or academic hazards and feeling a deep anxiety when access to internet is restricted (Öztürk et al, 2007).

Internet addiction is not still defined as a disorder in "Diagnostic and Statistical Manual of Mental Disorders" (also known as "DSM-IV-TR") published by the American Psychological Association in 2000. It was suggested that pathological gambling disorder was viewed as most akin to internet addiction (Köroğlu, 2001; Öztürk et al., 2007). Young, who first introduced the definition of internet addiction and determined the first diagnosis criteria concluded that "pathological gambling" under the title of impulse control disorders in DSM IV was viewed as most akin to internet addiction. Internet addiction does not involve misuse of any substances (Greenfield, 1999: Cited by. Arısoy, 2009).

The concept of internet addiction refers to the excessive use of internet which in turn causes various problems in individual, social and professional aspects. In other words, the concept of internet addiction refers to experiencing various problems in individual, social and professional aspects due to excessive use

[1] Assist. Prof. Dr., Ahi Evran University, Faculty of Education, Department of Educational Sciences, Division of Guidance and Psychological Counseling, csahin@ahievran.edu.tr

of internet. Internet addiction recently began to be analyzed as a psychological problem in association with various psychological problems in the academic world. Particularly educators, psychological counselors, psychologists and psychiatrists tended to carry out various researches on internet addiction (Zimmerl, 1998; Eichenberg and Ott, 1999; Morahan-Martin and Schumacher, 2000; Young, 2006; Ayaroğlu, 2002; Bölükbaş, 2003; Orhan and Akkoyunlu, 2004; Cengizhan, 2005; Esen 2007; Turnalar Kurtaran, 2008). These studies generally investigated the relationship between excessive use of internet and loneliness, depression, having antisocial values and low emotional intelligence, the relationships with the family, particularly with mother and friends, playing online games, searching and shopping, depressive symptoms, decreased social interaction, psychological well-being of the individual, social, verbal and academic functions.

The literature contains only a limited number of studies which investigated internet addiction levels of different age groups. For this reason, this study aimed to determine internet addiction of internet users from different age groups and thus to produce concrete and applicable solutions to overcome this problem. It is believed that this study differed from other studies in the literature from these aspects.

The main problem of this study was to determine the levels of internet addiction which cause excessive use of internet by the individuals from different age groups and in turn leads to experiencing various problems in individual, social and professional aspects.

Aim of the Study

The aim of this study was to determine internet addiction levels of individuals from all age groups in terms of various variables. To achieve the aim of the study, the following questions were tried to be answered:

1. What are the internet addiction levels of the individuals?
2. Do internet addiction levels of the individuals vary according to age group?
3. Do internet addiction levels of the individuals vary according professional group?
4. Do internet addiction levels of the individuals vary according to gender?

METHOD

Study Model

This is a descriptive study which used survey model. As it is known, survey models aim to indicate an existing situation as they are (Karasar, 1999). In this framework, we tried to determine internet addiction levels of the individuals from all age groups.

Study Group

Population of the study consisted of the individuals living in Kırşehir province of Turkey. Among random sampling methods, simple random sampling method was used to determine the study group. Study group of the study consisted of a total of 596 individuals from different age groups living in Kırşehir city center. Of the individuals in the study group, 284 (47.7%) were male, 312 (52.3%) were female. As for the distribution of the study group according to age groups; a total of 109 (18.3%) belonged to the age group of 19 and below; 98 (16.4%) belonged to the age group of 20-29;155 (26.0%) belonged to the age group of 30-39; 141 (23.7%) belonged to the age group of 40-49; and 93 (15.6) belonged to the age group of 50 and above. As for the distribution of the participants according to professional status, it was found that 191 (32.0%) were students; 221 (37.1%) worked in various professions; 39 (6.5%) were unemployed; 119 (20.0%) were housewives and 26 (4.4%) were retired.

Study Instruments

"Personal Information Form" and "Internet Addiction Scale" were used for data collection.

Personal Information Form: This form consists of four questions on the data about the independent variables of the study.

Internet Addiction Scale (IAS): The scale, which was designed by Hahn and Jerusalem (2001), aims to determine internet addiction levels of the individuals. The original title of the scale is *"Skala zur Erfassung der Internetsucht"*. The scale was adapted into Turkish by Şahin and Korkmaz (2011).

The scale contains 19 items and 3 factors. The first factor is "Loss of Control-LC"; the second factor is "Tolerance Development-TD" and the third factor is "Negative Consequences for Social Relationships-NCSR"

Kaiser-Meyer-Oklin (KMO) and Bartlett test analyses were performed to test structural validity of the scale. KMO= 0,919; Bartlett test value was x2= 6087,383; sd=171 (p=0,000). It was found that the items within the scale concentrated on three factors and explained 68.095% of total variance. Confirmatory factor analyses showed that the model had an acceptable adaptation. To calculate discriminative power of items, the correlations between the scores obtained from each item and the scores obtained from the factors were calculated and it was found that each item had a significant and positive relationship with factor score. Internal consistency analyses were conducted to calculate internal consistency of the scale. Analyses revealed that internal consistency coefficients of the factors varied between 0.887 and 0.926 and that internal consistency coefficient for the general of the scale was 0.858.

Data Analysis and Interpretation

Each of the items in internet addiction scale was scaled as Never (1), Rarely (2) Sometimes (3), Generally (4) and Always (5). In parallel with the structure of the scale, for three sub-factors, averages of the response of the individuals to five-item Likert type scale were calculated severally. High averages indicate high level of internet addiction while low averages indicate low addiction levels. The scores obtained from the responses of the individuals to five-item Likert type scale did not show a standard character due to the differences in number of items in the sub-factors. For this reason, obtained raw scores were converted into standard scores (minimum 20; maximum 100).

The levels corresponding to the scores obtained from sub-scales can be summarized as follows: low internet addiction (20-51), mean internet addiction (52-67), high internet addiction (68-100).

In this framework, internet addiction levels of the individuals were analyzed using arithmetic mean, standard deviation, t test, ANOVA and LSD analyses. $p<.05$ level was considered as adequate for the significance between the factors.

FINDINGS

In this section, the findings of the study were presented and evaluated in tables.

1. Internet Addiction Levels of the Individuals

Table 1. Internet Addiction Levels of the Individuals

Variable	N	M	SD	Min	Max	Levels (f/%)					
						Low		Medium		High	
Loss of Control-LC	596	32,61	17,67	17,14	100,00	510	85,6	38	6,4	48	8,1
Tolerance Development-TD		32,84	17,92	20,00	100,00	511	85,7	46	7,7	39	6,5
Negative Consequences for Social Relationships-NCSR		27,01	14,01	17,50	100,00	538	90,3	43	7,2	15	2,5
Internet addiction (Total)		30,30	10,37	18,95	71,58	570	95,6	24	4,0	2	0,3

Table 1 indicates that the individuals in different age groups had a low level of internet addiction in sub-scales and in the general of the scale.

2. Internet Addiction Levels of the Individuals according to Age Groups

Table 2. Means, Standard deviations and Variance Analysis Results of the Internet Addiction Levels of the Individuals according to Age Groups

Age Groups	N	Loss of Control-LC		Tolerance Development-TD		Negative Consequences for Social Relationships-NCSR		Internet addiction (Total)	
		M	SD	M	SD	M	SD	M	SD
>19 age	109	47,31	22,85	31,74	17,46	26,67	14,48	35,35	10,26
20-29 age	98	33,24	17,27	34,69	18,91	29,26	14,78	31,87	10,10
30-39 age	155	28,02	12,70	31,45	17,38	25,32	11,59	27,61	9,33
40-49 age	141	29,99	15,53	34,36	18,67	26,33	13,64	29,37	10,35
50 < age	93	26,39	10,68	32,20	17,13	28,87	16,44	28,66	10,26
Genel Ortalama	596	32,62	17,67	32,84	17,92	27,01	14,01	30,30	10,36

Variable	Source of Variance	Square Total	Degree of Freedom	Mean Square	F	p	Significant difference (LSD)
Loss of Control-LC	Between groups	31436,163	4	7859,041	30,089	,000	the age group of 19 and below – other age groups
	Within groups	154366,330	591	261,195			
	Total	185802,493	595				

Tolerance Development-TD	Between groups	1130,806	4	282,702	,879	,476	--
	Within groups	189973,682	591	321,444			
	Total	191104,488	595				
Negative Consequences for Social Relationships-NCSR	Between groups	1337,159	4	334,290	1,710	,146	--
	Within groups	115538,040	591	195,496			
	Total	116875,199	595				
Internet addiction (Total)	Between groups	4513,296	4	1128,324	11,224	,000	the age group of 19 and below – other age groups
	Within groups	59410,652	591	100,526			
	Total	63923,947	595				

Data in Table 2 revealed that internet addiction levels of the individuals who belonged to the age group of 19 and below were higher than those of the individuals who belonged to the age group of 20 and over. An analysis was made to determine whether these differences were significant. The results showed that there was a significant difference between TD ($F(4-591)= .879$, $P>0.05$) and NCSC ($F(4-591)= 1.710$, $P>0.05$) scores. It was found that there was a significant difference between LC ($F(4-591)= 30.089$, $P<0.01$) and IA general total scores ($F(4-591)= 11.224$, $P<0.01$). LSD test was performed to determine the groups which caused difference. LSD test results revealed that there was a significant difference between the internet addiction scores of 19 and below age group and other age groups.

3. Internet Addiction Levels of the Individuals according to Professional Groups

Table 3. Means, Standard deviations and Variance Analysis Results of the Internet Addiction Levels of the Individuals according to Professional Groups

Professional Groups	**N**	Loss of Control-LC		Tolerance Development-TD		Negative Consequences for Social Relationships-NCSR		Internet addiction (Total)	
		M	**SD**	**M**	**SD**	**M**	**SD**	**M**	**SD**
Student	191	41,45	21,95	34,63	19,14	28,63	15,13	34,62	10,35
Worker	221	30,20	14,88	34,16	17,69	27,20	14,09	29,77	9,85
Unemployed	39	30,03	11,72	29,87	15,28	22,69	6,62	26,90	7,19
Housewife	119	25,06	10,65	29,62	17,49	25,88	13,99	26,36	10,15
Retired	26	26,70	10,34	27,69	13,13	25,00	11,61	26,19	8,31
Total	596	32,61	17,67	32,84	17,92	27,00	14,01	30,30	10,36

Variable	**Source of Variance**	**Square Total**	**Degree of Freedom**	**Mean Square**	**F**	**p**	**Significant difference (LSD)**
Loss of Control-LC	Between groups	24150,221	4	6037,555	22,073	,000	between the students and other professional groups
	Within groups	161652,272	591	273,523			
	Total	185802,493	595				
Tolerance Development-TD	Between groups	3266,126	4	816,532	2,569	,037	housewives, students and professional groups
	Within groups	187838,362	591	317,831			
	Total	191104,488	595				
Negative Consequences for Social Relationships-NCSR	Between groups	1498,583	4	374,646	1,919	,106	--
	Within groups	115376,616	591	195,223			
	Total	116875,199	595				
Internet addiction (Total)	Between groups	6353,119	4	1588,280	16,305	,000	between students and other professional groups
	Within groups	57570,829	591	97,413			
	Total	63923,947	595				

Table 3 indicated that internet addiction scores of the students were higher in terms of sub-scales and IA general when compared to other professional groups. An analysis was conducted to determine whether these observed differences were significant. Analysis results showed that the difference between NCSC($F(4-591)= 1.919$; $P>0.05$) scores of the individuals according to professional groups was not significant; while the difference among LC ($F(4-591)= 22.073$; $P<0.01$) and TD ($F(4-591)= 2.569$; $P<0.05$) and IA ($F(4-591)= 16.305$; $P<0.01$) total scores was significant. LSD test was performed to determine the groups which caused difference. LSD test results showed that there was a significant difference between the students and other professional groups in LC sub-dimension; among housewives, students and the individuals who were working in TD sub dimension; between students and other professional groups in IA general total.

4. Internet Addiction Levels of the Individuals according to Gender

Table 4. t Test Results according to Gender of the Individuals

Variable		N	M	SD	DF	t	p
Loss of Control-LC	Male	312	31,98	17,97	594	-,913	,362
	Female	284	33,31	17,33			
Tolerance Development-TD	Male	312	29,15	16,15	594-	5,396	,000
	Female	284	36,90	18,88			
Negative Consequences for Social Relationships-NCSR	Male	312	24,76	12,15	594	-4,148	,000
	Female	284	29,47	15,46			
Internet addiction (Total)	Male	312	28,35	9,95	594	-4,916	,000
	Female	284	32,45	10,39			

It was understood from Table 4 that internet addiction scores of males were higher from those of females in sub-scales (LC, TD and NCSC) and in the general of the scale. An analysis was performed to determine whether these observed differences were significant. Analysis results showed that the difference between internet addiction scores of males and females according to LC subscale was not significant (t(594)=-.913; P>0.05); DFO (t(594)= -5.396),. However, it was found that the difference between internet addiction scores of males and females according to TD (t(594)= -5.396), NCSC (t(594)=-4.148) sub scales and IA general total (t(395)=-4,916) was significant

RESULT AND DISCUSSION

It was found that the individuals had low level of internet addiction in sub-scales and in general of the scale according to age groups. This finding is consistent with literature data. The literature contains various studies carried out in different societies which reported significantly low number of individuals with internet addiction (Saville et al., 2010; Chaw, Black, 2008). Similar studies found that the majority of the individuals had a low level of internet addiction (Niesing, 2001; Hahn and Jerusalem, 2001).

It was found that internet addiction levels of 19 and below age group was high. It was observed that there was a significant difference between internet addiction scores of the individuals who belonged to the age group of 19 and below and 30 and below. Similarly, Choi et al., (2008) reported that internet addiction was more common among young people, and for this reason, young people should be permanently monitored. Öztürk et al., (2007) reported that internet addiction turned out to be a serious risk factor particularly for 12-18 age group. Hahn and Jerusalem (2001) reported that the individuals belonging to the age group of 20-29 used internet more, while internet addiction scores of the individuals belonging to the group of 19 and below was higher than other groups and that this situation varied according to gender.

It was found that there was a significant difference between internet addiction scores of the students and other professional groups. The study of Seville et al, (2010) conducted on high school students reported that internet addiction of the students who recently started high school was higher than that of other students. Sunny et al., (1999) reported similar results.

Internet addiction levels of males were found to be higher than those of females. These findings are supported by the findings of various studies in the literature. In a study carried out by Choi et al., (2008) it was reported that the case of internet addiction was more common in male students when compared to female students. Karaman and Kurtoğlu (2009) found that male pre-service teachers were more addicted to internet than female pre-service teachers. Hahn and Jerusalem (2001) reported that males used internet more when compared to females; however internet use levels of females increased in years.

This study is limited in two respects. It aimed to determine internet anxiety levels of the individuals in different age groups living in Kırşehir city of Turkey and analyzed whether certain variables were effective on internet addiction. For this reason, analysis of larger groups will facilitate making generalizations.

AN INTERNATIONAL DIMENSION OF THE STUDENT'S ATTITUDES TOWARDS THE USE OF ENGLISH IN WEB 2.0 TECHNOLOGY

Filiz Yalçın TILFARLIOĞLU
Gaziantep University Faculty of Education
Department of English Language Teaching,
fyalcin@gantep.edu.

ABSTRACT
Web 2.0 changed the way people used Web in the field of education and especially in foreign language learning.Since its emergence in 2004, it has gained great attention of teenagers and university students. Educators regard Web 2.0. as a language learning/teaching tool. According to International Federation of Accounts(IFAC)report 2000 and beyond(1996)it has been informed that a key goal of accounting programs should be to teach students to learn on their own. The purpose of this research was to determine undergraduate and high school students' attitudes towards the use of English in Web. 2.O technologies. This study was mainly based on quantitative design that involved 534 students out of randomly selected 550 participants from 6 different universities and 3 high schools in Turkey and Iraq . The potential of Web 2.0 was determined as creating formal and informal learning environments.Within the context of the study, the students' attitudes were revealed and recommendations were developed for language teachers and educators. It has been found that Web 2.0 technologies serve as a good learning tool in which the learners find the opportunity to practice language in a real-like atmosphere: **the new medium**.

Key Words: Web 2.0 technologies, foreign language learning, English language teaching.

INTRODUCTION

English, "by far the most widely used of all living languages", is taught as foreign language at schools of most nations (Broughton, Brumfit & Brumfit, Flavell, Hill, Pincas, 2003), but it has been recently accepted that language students have started using communication tools via English. This attempt starting with CALL continues to be popular with Web 2.0 nowadays. The increasing popularity of Web 2.0 technologies in almost every field of daily and academic life has promoted researchers to consider whether and to what extent such educational tools can be benefitted from. The study conducted by İşman (2008) proves that the improvements in communication tools have had a direct influence upon education. Web 2.0 can be defined as Web based applications and services that provide users visual, textual, audial communication, interactive information, shared content, collaboration, authenticity and digital literacy (Haythorthwaite & Kazme 2004; O' Reilly, 2005; Giustini, 2006; Maness, 2006; Miller, 2006; Price, 2006; Richardson, 2006; Mcloughlin & Lee, 2007; Lankshear & Knobel 2007; Boyd & Ellison, 2008; Thomas, 2009; Motteram & Sharma, 2009). The types of Web 2.0 used in education include "blogs (Facebook, Twitter etc.), wikis, multimedia sharing services, content syndication, podcasting and content tagging services" (Anderson, 2007). Particularly in foreign language learning, many researchers have shown that Web 2.0 can be utilized as an effective educational tool since it enables a variety of collaboration, communication and interaction (Fullan, 1993; Pica, 1997; Jonassen, Peck and Wilson, 1999; Lee, 2005; Munoz, 2009, Warschauer, Shetzer, & Meloni, 2000; Sykes, Oskoz & Thorne, 2008; Kayri & Çakır, 2010). In addition to being collaborative, interactive and communicative tool in education, Web 2.0 also has an undeniable effect on the enhancement of writing skills for learners (Mason & Rennie, 2008, Vijayakumar, 2011). The more there is an emphasis on learner autonomy, the more Web 2.0 tools have gained significance by enabling facilities for independency (Crook, 2008, Cooker, 2010). Moreover, the study conducted by Lam (2000) revealed that Web 2.0 tools increased the motivation of learners. However, these tools may be disruptive if they aren't implemented carefully into classroom practice (Godwin-Jones, 2005, Mason & Rennie, 2008). On the contrary, they might be more disadvantageous because of exploitation, lack of confidence, privacy and control (Merchant, 2001; Livingstone, 2002; Patchin and Hinduja, 2010). The importance of Web 2.0 tools in education have been emphasized a lot in most studies. Even if there are few studies (Chun and Plass, 1996 ; Warscahauer and Kern, 2000) exploring the practices of

Web 2.0 tools in foreign language education, there is almost no study focusing on students' perceptions upon the use of Web 2.0 tools in foreign language learning, though. Hence, this study tries to reveal the most recent perceptions and implications by investigating the roles of Web 2.0 tools in foreign language education. Furthermore, it gives some clues about how to make the efficient use of Web 2.0 tools by providing some practical implications for teacher education and training. In order to achieve these aims, the following are the research questions of the study:

1. What are the perceptions of foreign language learners in using Web 2.0 technologies?
2. Do students regard Web 2.0 as an opportunity for English language learning?
3. Do socio-cultural differences affect the students' views about the use of Web 2.0 in foreign language learning?
4. Can the use of Web 2.0 contribute significantly to English language learning?

METHOD

In this study, a descriptive analysis was carried out. After the analysis of the questionnaires, semi-structured and focus group interviews were made.Ten students were chosen randomly from the institutions located in Turkey.The questionnairre allowed gathering information about students' perceptions of themselves in using English regarding the following items: using blocks,use of a different language except English,writing status messages, sharing videos, sharing writings, joining groups,creating groups, joining groups to learn English, playing games, learning vocabulary through games, using applications, linking to fun pages, commenting on photos, commenting on videos, commenting on status messages, making foreign friends, chatting on line, feeling confedence in courses,enhancing vocabulary knowledge,enhancing speaking skill, enhancing listening skill,enhancing reading skill, enhancing writing skill,using to learn vocabulary, wasting time on internet. The cronbach's alpha reliability factor of the pilot study was found to be .82 in the first application.Additionally, it was calculated as .89 in the second pilot study, that is quite reliable and valid for Likert-type attitude scales (Nunan, 1997). The items in the questionnaire were analysed using the Statistical Package for Social Sciences (SPSS). For every item, frequencies and percentages were calculated. Chi-square tests were applied in order to find the significance of the distribution of the answers.

SETTING AND PARTICIPANTS

The study was conducted at Adıyaman University(N=50, M=17, F=33, A=19-27), Gaziantep University (N=47, M=33, F=14, A=18-24), İnönü University (N=50, M=29, F=23, A=18-25), Erbil Ishik University at which students' mother tongues are Kurdish and Arabic (N=50, M=27, F=23, A=18-20), Gazikent University(N=50, M=32, F=18, A=18-24), Zirve University(N=30, M=17 ,F=13 ,A=18-21), Besni Vocational High School(N=50, M=18, F=32, A=17-35), Sabahattin Zaim Social Sciences High School(N=40, M=17, F=23, A=17), Ishik Hawler Secondary School in which students' native languages are Kurdish and Arabic (N=50, M=50, A=13-16) and Barak Primary School(N=54, M=26, F=28, A=13-14). The participants were placed at appropriate levels from beginner to pre-intermediate level at the beginning of the academic year. The age of the participants vary from 13 to 35 years old.228 of the participants were female and 293 were male at total. For the identification of interview participants, criterion sampling was used (Patton, 1990).

FINDINGS AND RESULTS

In Table 1. to analyze the data frequencies, percentages, means, standard deviations and chi-square results were employed. It was observed that the mean score of Gazikent University was the highest when compared with Adıyaman University and Gaziantep University .The socio-economical level of private university students' are higher than the government institutions. These findings were parallel to the data in Barak Primary School and Sabahattin Zaim Primary School when compared with private institutions at the same level. Chi-square results show that learning is increased by use of technology. All of the findings were similar except the college in Iraq which indicates the importance of culture. This preference is related with their family background and strict rules in schools. These findings suggest that one of the main role of the EFL teacher is to motivate the learners to use English in different contexts.

The analyses of the first question that is about using Web 2.0 tools shows that in high schools over half of the students "usually" or "always" use Web 2.0 tools on internet. The results are similar when compared with the universities while % 15 of the all university students "never" or "seldom" use Web.2.0 tools. Technology-

driven tools help learners to guide their own learning process. The analyses of the second, third, thirteenth, fourteenth and fifteenth items that are related to students' producing language on internet, 47 % of university

students "usually" or "always" prefer commenting on photos, videos and status messages and using their

native language in writing while only 74 % of high school students "never" or "seldom" prefer doing these. The process of globalization is important in educational, political, cultural, economic and environmental aspects makes learning English a vital need. The fourth, fifth, sixth, seventh, eighth and sixteenth items that are sharing videos, writings, joining and creating groups and joining groups to learn English and making foreign friends on internet can be categorized as active participation of students. 49 % of all the university and high school students "never" or "seldom" use applications on the internet actively while a small portion of them "usually" or "always" prefer it. Learning is increased by use of technology. Through Web 2.0 tools foreign language learners develop motivation and increase the amount of national knowledge. (Clauss-Ehlers 2006) As for the activities on the internet entertaining the students, the results of the ninth, eleventh, twelfth, seventeenth and twenty- fifth items that are related to it show that 39 % of all the students "never" or "seldom" play games, like fan pages, chat online and waste their time on internet while over half of the students "usually" or "always" entertain themselves on internet. Web 2.0 tools are effective on the performance of foreign language learners. (Pegrum, 2009) For the activities students do for improving themselves, the analysis of the tenth, eighteenth, nineteenth, twentieth, twenty-first, twenty-second, twenty-third and twenty-forth items about learning vocabulary through games, feeling confident in courses, enhancing vocabulary knowledge and skills of speaking, listening, reading and writing, and using internet to learn vocabulary, 60 % of all the students "never" or "seldom" use applications to improve themselves while only 25 % of the students benefit from it. The way the language is grammatically and meaningfully constructed can shape the way people think and use the language in certain contexts. (Deutscher, 2010; Halvorsen, 2009)

DISCUSSION

While there are several studies in the literature indicating that Web 2.0 tools have a good impact on education, most all of these studies had limitations such as being held in one specific area, having only teachers' perspectives and not designed specifically for language education. Thus, conducting a study in public and private institutions in Turkey and Iraq would help us to answer some questions about the extent of applicability of Web 2 tools in language education in various socio-cultural environments.During the interviews conducted in Turkey, all the participants reported that they were familiar with the use of Web 2.0 tools. The results of both questionnaire and the interviews revealed that the need of the students will increase towards technology and English.

Results show that there are differences in students' perceptions about using Web 2.0 tools in language learning. No matter how various perceptions students have, the most important thing that may affect their perceptions is the implementation of these tools into classroom. Therefore, deficiencies in practice may hinder the beneficial wash back. There might be a lot of reasons for it. First of all, lack of awareness in both teachers and students reduces the efficacy of Web 2.0 tools. That students regard Web 2.0 tools as beyond game and free time activity could only be possible when teachers and students value Web 2.0 tools in foreign language education. However, when the classroom practices are evaluated, it can be easily said that the role of Web 2.0 tools has been underestimated. A recent and dramatic example of that is Dynet which is a Web-based program developed to teach English. But, English language teachers regard it time consuming and a big burden. As well as awareness, teachers need a good background knowledge about these tools to implement it effectively, which raises the question whether English language teaching departments provide good basis in teachers' education and technology courses fulfill theoretical and practical needs for application. It can be concluded that if teachers were educated in the field, the use of Web 2.0 could contribute significantly to English language learning .Thus, regarding Web2.0 tools as an opportunity for English Language learning will be inevitable for the learners of the 21st century: **the new medium**.

ABSTRACT

This study is purposely conducted due to find out the internet access activity among teenagers within Klang Valley, Malaysia.The main focus is on teenagers aged between 12 to 25 years old around Klang Valley, which is located between Kuala Lumpur and Petaling Jaya. This empirical research is done due to acquire a current and flexible data that can directly adapt to the research problem. 400 sets of questionnaires have been distributed to respondents around Klang Valley within March to June 2006. The discussion of research analysis are classified into two main features comprises of respondents' background and educational level analysis and also Internet usage analysis. Within respondents' background and educational level analysis, the analysis focuses on respondents' age, gender and their highest educational level. Whilst for Internet usage analysis, the Internet usage level among respondents comprises of Internet usage frequency, preferable activity when surfing Internet, most used search engine and also obsession to advertisements are briefly analyzed.

Keywords : Internet, Internet Access Analaysis

INTRODUCTION

The emergence of Internet in Malaysia roused in 1990 when Malaysian Institute of Microelectronic Systems (MIMOS Berhad) has launched Joint Advanced Integrated Networking (JARING) as a pioneer in an Internet access provider or normally known as Internet Service Provider (ISP). Dr. Mohamed Awang-Lah, is the person responsible in introducing and implementing, hence developing JARING, also acts as a Deputy President of MIMOS Berhad at that moment. Dr. Mohamed Awang-Lah says that Internet in Malaysia started at Faculty of Electrical/Electronic Engineering, University of Malaya where he, himself has taught and conducted experiment with BSD Unix System. When he joint MIMOS, part of government entity, he has developed a small computer network known as RangKom under Malaysia's Fifth Plan (1986 – 1990). RangKom provides four dialup lines to Australia, United States of America, Netherlands and Korea. This JARING Project has been launched as a continuity of RangKom that promoting information exchange and database development through internet access. JARING is connected to Internet via satellite installation between Malaysia and United States of America in 1992, hence providing access to Internet over 140 countries for its users in Malaysia. In July 1996, Malaysia's' second ISP has been launched by Telekom Malaysia, formerly known as TMNet yet still being fully operated in November, 1996 as a completion to JARING. In December 1997, TMNet leaded with 2% compared to JARING which are 51% and 49% respectively from overall Internet users in Malaysia [1]. TMNet and JARING are still remain two of the most popular ISP giants in Malaysia even though exist competitors from at least 70 other providers that providing access to Internet such as TimeNet, Maxis, Celcom and others[2].

An overall research conducted by St. Bernard Software in Jun 2004 comprises of 200 respondents leads to an important decision making in schools within 41 states in Philadelphia. These respondents proposed a strict actions or drastic steps that need to be taken in preventing Internet misused in schools. The research report is as follows[3]:

- 48% stated that students in their school surf Internet at least 2 hours a week within school period.
- 59% reported that exist incidents where students accessing inappropriate web site.

- 45% given examples of web sites surfing is to play games.
- 39% given examples of web sites surfing among students is to search for pornography resources and so forth.

Research done by Timothy Rumbourgh in 1999 to 600 students from Bloomsberg University indicates that 33% students have accessed pornography web sites [4]:

- 11% surfing web sites related to illegal drugs production.
- 8% accessing web sites that disseminate information on producing illegal weapons.
- 93% implementing Internet for educational purposes.
- 15% manipulating Internet resources to cheat in accomplishing assignments given by lecturer.

METHODOLOGY

This research is conducted primarily to acquire respondents' personal detail and educational background consists of age, gender and highest educational level. Besides that, it is also implemented to indicate Internet usage level among respondents comprises of Internet usage frequency, preferable activity when surfing Internet, most used search engine and also obsession to advertisements among teenagers within Klang Valley. This field study is conducted to acquire current and flexible data that can be used directly into problems analyzed [5]. A survey is selected as a research strategy type purposely to acquire as much as information about some population and can give descriptive picture or general interconnection of causes and effects [6]. A group of samples fulfilling the features or population behaviors that can represent or give a picture of the whole selected population are randomly selected. The strength of random sampling selection is due to the fairness / equality of every member in population to be chosen as respondents and the selection is not interfered with any members in the population [7]. Thus, teenagers that always hanging up at cyber café are totally neglected / rejected to be respondents in order of preventing from being influenced by teenagers that are computer literate and Internet literate. About 400 questionnaire forms being disseminate to respondents within Kuala Lumpur Shopping Complex (KLCC), Jaya Jusco Wangsa Maju, Carrefour Wangsa Maju, Medan Mara, Pertama Complex, National Library, Taman Tasik Titiwangsa, Tesco Mutiara Damansara and Ikea Damansara since these are well known and most visited area for teenagers. From the total of 400 questionnaire forms being disseminate, only 381 forms are returning back.

Respondents are randomly selected limiting to age 12 years old to 25 years old. Questionnaire form is the main research instrument in acquiring data comprises of 21 questions that should be filled up by respondents. To ensure respondents' privacy, personal details such as name are not included, thus preventing of fear ness or uncomfortably amongst respondents.

RESEARCH ANALYSIS

The discussion of research analysis are classified into two main features comprises of respondents' background and educational level analysis and also Internet usage analysis. Within respondents' background and educational level analysis, the analysis focuses on respondents' age, gender and their highest educational level. Whilst for Internet usage analysis, the Internet usage level among respondents comprises of Internet usage frequency, preferable activity when surfing Internet, most used search engine and also obsession to advertisements are briefly analyzed.

Respondents' Background and Educational Level Analysis

The analysis on respondents' background and educational level focuses on respondents' personal detail and educational background consists of age, gender and highest educational level.

Table 1: Respondents' Age

Table 3.2 shows that 381 respondents have returned back the questionnaire forms consists of 35.7% (136 persons) respondents aged between 12-15 years old, 33.3% (127 persons) respondents' aged between 16-19 years old, and 28.3% (108 persons) respondents' aged between 20-25 years old. The differentiation divide of respondents' aged are quite small, thus helping the researcher to get a quite similar overall respondents of these three age levels. There are 2.6% (10 persons) respondents aged over 25 years old and this is perhaps due to researchers' judgment fallacy during questionnaire distribution. These 10 respondents aged over 25

years old are rejected from this research analysis, thus total it up to only 371 analyzed respondents.

Table 2: Respondents' Gender

Table 3.3 displays number of respondents based on gender. Total of female respondents are 49% (183 persons) and total of male respondents are 51% (188 persons). Differs of male and female respondents are only 2 percents. The small differentiation on gender helped researcher to get an accurate and precise statistic findings, thus unbiased to any genders.

Table 3: Tabulation of Respondents Based On Age, Gender and Higher Education Level

Table 3.4 presents the tabulation of respondents' age divided into aged between 12-15 years old, 16-19 years old, 20-25 years old where each are classified based on gender, either female or male. The percentages of female respondents aged between 12-15 years old are 19.9% (74 persons), aged between 16-19 years old are 15.4% (57 persons) and for aged between 20-25 years old are 14% (52 persons). Whilst for male respondents aged between 12-15 years old are 16.4% (61 persons), aged between 16-19 years old are 18.9% (70 persons) and aged between 20-25 years old are 15.4% (57 persons). The age percentage tabulation based on gender for female respondents are between 14% to 19.9% and for male respondents are between 15.4% to 18.9%. The small differentiation among this percentage tabulation has helped in producing more accurate and precise data, thus unbiased within gender. This is an important random method features as each of members in population have similar chances to be chosen as respondents and respondents selection are not influenced by any members within the population.

Table 3.4 also indicates higher educational tabulation of respondents that are classified into four consists of primary school level, secondary school level, college level and university level. Percentages of respondents with primary school level as their highest educational background are 3 % (10 persons represented by three females and seven males). The percentages involving female respondents aged between 12-15 years old represented by three respondents and there are no female respondents aged between 16-19 years old and aged between 20-25 years old respectively. Whilst for the male respondents aged between 12-15 years old contributed by four persons, aged between 16-19 years old comprises of two persons and a person aged between 20-25 years old. Respondents with secondary school as their highest educational level are 57 % (213 persons represented by 102 female respondents and 111 male respondents), thus contributing to the largest number above of overall respondents. These percentages are classified by female respondents aged between 12-15 years old represented by 71 persons, aged between 16-19 years old comprises of 23 persons and only eight persons aged between 20-25 years old. Whilst for male respondents, there are 57 persons aged between 12-15 years old, 41 persons aged between 16-19 years old and 13 persons aged between 20-25 years old. Respondents with a college level as their highest educational background are 19 % (69 persons represented by 31 female respondents and 38 male respondents). There are no respondents aged between 12-15 years old. Female respondents aged between 16-19 years old are represented by 20 persons and for aged between 20-25 years old consists of 11 persons. Differs for male respondents, there are 19 persons aged between 16-19 years old and 20-25 years old respectively. As for university level as their highest educational background are formed by 79 respondents comprises of 47 female respondents and 38 male respondents contributed to 21%. There are no female and male respondents aged between 12-15 years old respectively. Female respondents aged between 16-19 years old are 14 persons and 33 persons aged between 20-25 years old. Whilst for male respondents aged between 16-19 years old are represented by eight persons and for aged between 20-25 years old consists of 24 persons. This tabulation directly summarizes that respondents aged between 12-15 years old implies to primary and secondary school as their highest educational level with no college or university level. Hence, this is precisely suits Malaysias' educational system for this syninomly aged level. While for respondents aged between 16-19 years old and 20-25 years old, their highest educational level start from primary to university level.

Internet Usage Analysis

Internet usage analysis discovers Internet usage level among respondents comprises of Internet usage frequency, preferable activity when surfing Internet, most used search engine and also obsession to advertisements among teenagers within Klang Valley.

Table 4: Internet Usage

Table 3.7 shows that from the total of overall respondents, 73% (271 persons) respondents always used Internet compared to respondents that seldom used Internet represented by 26% (95 persons) respondents and the rest of 1% (5 persons) respondents have given no answer.

Table 5: Age, Higher Educational Level and Internet Usage

Table 3.8 shows the tabulation of Internet usage due to respondents' age and educational level. Number of respondents that always used Internet aged between 12-15 years old are 21.3% (79 persons) represented by a person with primary school level and the rest of 78 respondents with secondary school level. Whilst for respondents that seldom used Internet aged between 12-15 years old are 14.6% (54 persons) contributed by four respondents with a primary school level and the rest 50 respondents with secondary school level. Respondents that have not given any answer aged between 12-15 years old are 0.5% (2 persons) represented by two respondents and no secondary school level respondents.

Respondents that always used Internet for aged between 16-19 years old are 28.8% (107 persons) represented by 50 respondents with secondary school level, 23 respondents with college level and 35 respondents with university level. Respondents that seldom used Internet aged between 16-19 years old are 5.4% (20 persons) contributed by two respondents with primary school level, 14 respondents with secondary school level and the rest of four respondents with college level. While for the respondents that have given no answers, aged between 16-19 years old are 0.5% (2 respondents) represented by two respondents with college level.

Respondents that always use Internet by aging of 20-25 years old are 22.9% (85 persons) represented by eight respondents with secondary school level, 35 respondents with college level and 54 respondents with university level. Respondents that seldom used internet by aging of 20-25 years old are 5.7% (21 persons) contributed by 13 respondents with secondary school level, five respondents with college level and three respondents with university level. Respondents that have not given any answers aged between 20-25 years old are 0.3% (1 person) with primary school level.

Table 6: Total Hours of Internet Usage

Table 3.9 presents the total number of Internet usage due to total hours. From an overall of 371 respondents, 36.9% (137 persons) have given no answers. Only 0.8% (3 persons) of respondents used Internet less than an hour. About 14.3% (53 persons) respondents spent an hour each time when surfing internet whilst 25.1% (93 persons) respondents used Internet for two hours. About 12.4% (46 persons) respondents have used Internet for three hours and 2.4% (9 persons) respondents have used internet for four hours. Respondents that used Internet for five hours are represented by 3% (11 persons) respondents, 1.1% (4 persons) respondents have used it for six hours, 0.8% (3 persons) respondents for eight hours and the rest of 3% (11 persons) respondents have used Internet more than 10 hours.

Table 7: Activity During Internet Surfing

Table 3.10 shows activities done by user when surfing Internet. Each of activities involves overall respondents which is 371 respondents. The most popular activity during Internet surfing is email where 50% (185 persons) respondents used it when surfing. Searching articles or journals are the second most popular activity contributed by 43% (160 persons) respondents. The third activity that also being done by 39% (146 persons) respondents are online chatting whilst the fourth most popular activity are downloading or online gaming represented by 31% (115 persons). About 12% (43 persons) respondents surf Internet unpurposely and 6% (23 persons) respondents done other activities such as meeting new friends, songs searching, work-related, sports, programming code searching and interaction using specific web pages such as Friendster and Myspace.

Table 8: Current Search Engine

Table 3.11 shows the most popular search engine used by respondents consists of Yahoo, Google, Netscape and Altavista contributed by 86.8% (322 persons) respondents compared to search engines such as Dogpile and Mamma which only represented by 1.9% (7 persons) respondents and other search engines used are only 0.3% (1 persons) whilst 11.1% (41 person) respondents given no specific answer.

Table 9: Attractiveness to the Advertisement Displayed Within Web Pages

Table 3.12 displays that 29.9% (111 persons) respondents attracted to the advertisements displays on web pages and have clicked on it. About 63.6 % (236 persons) respondents are not attracted to any advertisements within web pages and the rest 6.5% (24 persons) given no answer at all.

Table 10: Ever Surf Pornography Web Page

Table 3.13 presents the tabulation of respondents that surf pornography web pages. About 35.8% (133 persons) respondents ever surf pornography web pages whilst 61.7% (229 persons) respondents have never surf pornography web pages and the rest 2.4% (9 persons) respondents have given no answer.

CONCLUSION

The Internet usage level from this research has shown that 73% respondents always used Internet. The highest percentages of Internet usage are 2 hours representing by 25.1% respondents. The most popular activity during Internet surfing are email where 50% respondents used email when surfing Internet. The second most popular activity is searching for articles or journals contributed by 43% respondents. Whilst for the third activity falls to online chat (chatting) which is 39% respondents. Downloading or online gaming (online games) falls under fourth most popular activity contributed by 31% respondents, 12% respondents accessing website without purposes/reasons and the rest 6% respondents used it for other activities such as meeting new friends, songs searching, work-related, sports, programming code searching and interaction using specific web pages such as Friendster and Myspace. The most popular search engines used by respondents are Yahoo, Google, Netscape and Altavista represented by 86.8% respondents. About 29.9% respondents admit the attractiveness to advertisements displayed within web pages and have clicked on it. This research indicates that majority of respondents are equip with Internet usage skills and do multiple activities regarding to their needs. Part of respondents also influence by advertisements within web pages and indirectly becoming the causes of surfing pornography web pages.

Analysis of Teacher-Student Interaction in the Topobo course

Han-Chuan Feng, and Eric Zhi-Feng Liu, Chun-Hung Lin
Graduate Institute of Learning and Instruction
National Central University, No.300 Jung-da Road, Chung-Li City, Taoyuan
TAIWAN
Chuan1130@gmail.com, totem.ncu@gmail.com, sjohn1202@gmail.com

This study used creative thinking spiral proposed by Resnick (2007) as the framework of the Topobo course. The teaching-learning process included five elements: imagine, create, play, share and reflect, and we analyzed the patterns of teacher-student interaction behavior. One student and one teacher participated in this study. The student was a five-year-old child, and a preschool teacher. The course topic is "Adventure of Monster Island". Chi square test was used to compare different types of the teacher-student interaction behaviors.

The result showed t that the occurrence of different teacher-student interaction behaviors were significantly different (X^2=87.94, p<.001). After comparing different teacher-student interaction behaviors, it was found that the behavior occurred most frequently is student's "play" (N=108, 25%), the second one was student's "share" behavior (N=83, 19.21%), and the third one was teacher's "guide" behavior (N=80, 18.52%). The result indicated that in the Topobo course, "play" was the most frequent behavior during the teaching-learning process. Through playing the tangible bricks, Topobo, students learned to express and share their ideas and experiences with others. Moreover, in this course, the teacher did not directly provide possible solutions, but tried to guide the student to fine out his own the possible solution. In the future, the lag sequential analysis method could be applied to further investigate the interaction pattern between teacher and student.

AN EXAMINATION OF PREDICTOR VARIABLES FOR PROBLEMATIC INTERNET USE

Assoc. Prof. Dr. Nergüz BULUT SERİN
Cyprus International University, Faculty of Education,
Nicosia-North Cyprus
nserin@ciu.edu.tr

ABSTRACT

This study examines problematic Internet use among university students in terms of gender, while also gauging the impact of personality traits, life satisfaction and loneliness variables on problematic Internet use. A total of 411 university students studying Education in North Cyprus participated in the study. The participants were selected using quota sampling; 64 percent (n=263) of the participants were female and 36 percent (n=148) were male. Data was collected using the Online Cognition Scale (OCS), UCLA Loneliness Scale, Life Satisfaction Scale (LSS) and Eysenck Personality Questionnaire Revised-Abbreviated Form (EPQR-A), and was analysed using "t-Test" and multiple regression methods. Findings suggest that problematic Internet use shows significant variation depending on gender. Predictor variables (neuroticism, extraversion, psychoticism, lie, life satisfaction, and loneliness) meaningfully predict problematic Internet use.

Keywords: Problematic Internet use, personality traits, life satisfaction, loneliness, university students

INTRODUCTION

With recent technological developments, computers and the Internet have become crucial communication channels. While making life easier, however, these technologies have brought with them new risks. For over a decade, problematic Internet use has attracted unparalleled attention and has been widely researched. Researchers have sought to better understand problematic Internet use (Eldeleklioğlu, 2008; Griffiths, 1996; 1997; Kaltiala-Heino, Lintonen, Rimpela, 2004; Kim, LaRose & Peng, 2009; Morahan-Martin, 2007, 2008; Tahiroglu, Çelik, Uzel, Özcan & Avcı, 2008; Özcan, 2004, 2006; Özcan & Buzlu, 2005; Yellowlees, & Marks, 2007; Young & Rogers, 1998; and Widyanto & Griffiths, 2007).

Even though problematic Internet use is often labelled as a type of pathological behaviour, healthy people may also suffer from its symptoms. It was suggested that problematic Internet use as well as negative cognitive, emotional and behavioural consequences are caused by multidimensional interpersonal relationships and life challenges (Caplan, 2002; 2003; 2005; Chak & Leung, 2004; Davis, Flett & Besser, 2002; Leung, 2004; Morahan-Martin & Schumacher, 2000; Young, 1998; Young & Rogers, 1998). Studies conducted in Turkey primarily focus on Internet addiction and pathological Internet use (Bölükbaş, 2003; Gönül, 2002; Öztürk, Odabaşıoğlu, Eraslan, Genç & Kalyoncu, 2007). However, more research needs to be done.

The relationship between psychosocial wellbeing and Internet use is an established area of research interest, with studies on obsessive Internet use suggesting the negative influence of uncontrollable Internet use on health variables such as depression and loneliness (Koç, 2011; Moody, 2001; Morahan-Martin, 2007, 2008; Whang, Lee & Chang, 2003). Whang, Lee, and Chang (2003) report that people obsessed with the Internet are oversensitive to disappointment resulting from interpersonal relationships and show increased anxiety when communicating with people they do not know well. When compared with the control group, Internet addicts were found to have higher levels of depression and compulsive tendencies (Özcan, & Buzlu, 2005; Öztürk et al., 2007).

Psychosocial disorders such as loneliness and depression are also associated with problematic Internet use. Studies suggest that such disorders can result in problematic Internet use (Caplan, 2007; LaRose, Lin & Eastin, 2003; Sanders, Field, Diego & Kaplan, 2000). To understand why people suffering from psychological disorders develop a tendency for problematic Internet use or how problematic Internet use leads to psychological problems, some theories on the topic need to be examined. Personal issues arising through problematic Internet use could be mitigated by identifying factors of problematic use that the user finds appealing (Griffiths, 2000). A number of theories have been suggested to explain the reasons for Internet use. Cognitive-behavioural theory (Davis, 2001), the social skill model (Caplan, 2005), and social-cognitive theory (LaRose, Lin, & Eastin, 2003) could be employed.

Davis (2001) uses cognitive-behavioural theory to explain problematic Internet use as a psychiatric condition characterized by incompatible thoughts and pathological behaviour. Cognitive-behavioural theory does not define problematic Internet use simply as a behavioural addiction, but also as a cognitive-behavioural condition with serious negative impacts on one's life. According to Davis, people suffering from obsessive thoughts start to accept the Internet as a 'friend,' and this in turn triggers problematic behaviour (Yellowlees & Marks, 2007). Grohol (1999) explains Internet addiction using the cognitive-behavioural approach. Rather than examining the nature of the addiction, he focuses on the 'compulsive behaviour' and its 'treatment' (Özcan & Buzlu, 2005). Problematic Internet use is defined as a multidimensional condition leading to negative social, academic and professional outcomes and manifesting cognitive-behavioural symptoms (Caplan, 2005). Cognitive-behavioural theory concentrates on 'irrational beliefs' and possible changes in these beliefs. The individual finds excuses to spend more time online. Classic conditioning, an aspect of behavioural theory, argues that even though the Internet does not have much meaning in the beginning, it can become a pleasure the user wants to repeat when s/he starts to have positive experiences with online games and chat. Operant conditioning, on the other hand, argues that reaching information quickly using the Internet and engaging in virtual relationships are reinforcing activities (Beard, 2005; Serin, 2011).

Research shows that personality traits and psychological disorders play an important role in developing Internet addiction, particularly in adults; it also demonstrates that Internet addiction leads to a decrease in psychosocial wellbeing for adults. These findings support the view that there is a two-way relationship between Internet addiction and mental health (Ceyhan, 2008; Morahan-Martin, 2007; Whang, Lee & Chang, 2003). It is possible to find users suffering from Internet addiction in different cultures, where adults are also reported as being most at risk (Ceyhan, 2008; Kim, Namkoong, Taeyun & Kim, 2008; Ko, Yen, Chen, Chen, Wu, & Yen, 2006; Lin, & Tsai, 2002; Yen, Ko, Yen, Chen, Chung, & Chen, 2008). An increasing number of adults show symptoms of Internet addiction or pathological/unhealthy Internet use, and their daily life, academic success and social relationships are influenced negatively (Ceyhan, 2008).

Davis (2001) states that psychosocial disorders such as loneliness and depression are indirect results of problematic Internet use. Caplan (2005) argues that these users prefer online communication because they find it much less risky than face-to-face communication. Involuntary Internet use, on the other hand, causes negative outcomes such as low grades, absenteeism, and reduced social interaction. Social-skills theory (Kim, LaRose & Peng, 2009) argues that individuals observe people around them and tend to exhibit behaviours that they feel are appropriate for the social context. Socio-cultural theory, on the other hand, focuses on the familial, social and cultural dynamics that lead to compulsive Internet use. For instance, for users who use the Internet to escape family-related problems, the Internet can turn into an addiction (Beard, 2005).

Lake (1990) suggests that lonely people often show symptoms of depression and anger while also demonstrating a tendency to misunderstand people. Loneliness can be described as the inner emotional reflection of interpersonal losses, needs and incompetence. The increase in loneliness is mirrored by the increase in depressive symptoms (Pretorious, 1993). Young (1982) argues that to prevent loneliness, irrational beliefs of lonely people need to be addressed. Killen (1998) has investigated loneliness within the sociocultural framework. This view states that the individual who has problems complying with social norms feels lonely in his lack of conformity. Scholars have described young people as deprived of social skills and pessimistic about relationships with other people (Demir & Tezer, 1995; Deniz, Hamarta, & Arı, 2005; Jones, Hobbs, & Hockenbury, 1982; Marcoen, Brumagne, 1985). Brage, Meredith, & Woodward (1993) found that older adults are lonelier than younger adults and that there is a significant correlation between loneliness and depression. In a study investigating loneliness in university students, Demir (1990) found that 15.4% of the research sample suffered from loneliness. There are also scholars who study the correlation between loneliness and Internet use (Caplan, 2002; Eldeleklioğlu, 2008; Kim, LaRose & Peng, 2009; Morahan- Martin & Schumacher, 2000; Özcan, & Buzlu, 2005; 2007; Whang, Lee & Chang, 2003).
Life satisfaction is defined as the extent to which an individual accomplishes set targets (Koç, 2001) and as the positive evaluation of one's life with regard to set targets (Diener, Emmons, Larsen & Griffin, 1985). Life satisfaction refers to the state of wellbeing expressed by different positive emotions such as happiness and morale as well as feeling positive with regard to everyday relationships. Recently, an increase was observed in the number of studies investigating the variables that influence the degree of life satisfaction among university students (Bulut Serin, Serin & Özbaş, 2010; Bulut Serin, Aydınoğlu & Aysan, 2010; Çivitçi, 2007; Deniz, 2006; Gündoğar, Gül, Uskun, Demirci & Keçeci 2007; Çeçen, 2008). However, no study was found on the correlation of life satisfaction and problematic Internet use.

Problems faced by university students, such as adaptation difficulties and underlying psychological problems, cause problematic Internet use (İşbulan, 2011; Koç, 2011; Şahin, Balta & Ercan, 2010; Toprakçı, 2007). Kandell (1998) highlights that in comparison to other age groups, Internet addiction is a bigger problem among university students. Being away from home, using spare time badly, and use of the Internet for educational reasons are listed as some of the reasons for increased risk for addiction for this group. However, these studies have not sufficiently set forth the reasons for problematic Internet use. Studies focusing on the reasons for problematic Internet use in Turkey are scarce, as is the case

around the world. This study aims to investigate both the correlation between gender and problematic Internet use and the impact of personality traits, life satisfaction and loneliness variables on the problematic Internet use among university students. Within this general framework, answers to the following questions were sought:

a. does problematic Internet use among university students show significant difference in terms of gender?
b. to what extend do personality traits, life satisfaction and loneliness variables predict the levels of problematic Internet use?

RESEARCH METHODOLOGY

Research Design

This study uses a quantitative descriptive design to explain the correlation between levels of problematic Internet use among university students and personality traits, life satisfaction and loneliness variables.

The Sample

The research sample is comprised of 411 students studying in the Faculty of Education at a private university in the Turkish Republic of Northern Cyprus, selected using quota sampling. 64 percent (n=263) of the participants are female and 36 percent (n=148) are male. Prior to data collection, students were provided with information about the study and only those who volunteered to take part were chosen.

Data Collection Methods

Data was collected using Online Cognition Scale (OCS), Revised-Abbreviated Eysenck Personality Questionnaire Form (EPQR-A), Lie Satisfaction Scale (LSS) and UCLA Loneliness Scale. Each is explained below.

Online Cognition Scale (OCS): Developed by Davis, Flett, & Besser (2002), to assess Problematic Internet Use along with its four sub-dimensions (loneliness/depression, diminished impulse control, distraction, and social comfort), the scale is made up of 36 items on a 7-point Likert scale. The Online Cognition Scale was adapted for use in Turkey by Özcan with a test-retest reliability determined as r=.90 and the standardized alpha .93 (Özcan, 2004). Reliability is high with Cronbach Alpha of .89.

Eysenck Personality Questionnaire Revised-Abbreviated Form (EPQR-A): Upon revising the 48 item Eysenck Personality Questionnaire, Eysenck, Eysenck & Barrett (1985) created the Eysenck Personality Questionnaire Revised-Abbreviated Form. The questionnaire is made up of 24 items and examines identity using three main factors: (a) extraversion, (b) neuroticism, and (c) psychoticism. Additionally, a lie sub scale is administered to prevent possible bias and to check validity. Each of these factors is examined through 6 items and participants are asked to answer each of the 24 questions 'yes' (1) or 'no' (0). For each personality type, participants are scored from 0 to 6.

Life Satisfaction Scale (LSS): The Life Satisfaction Scale was developed by Diener, Emmans, Larsen and Griffin (1985). It is made up of 5 items on a 7-point Likert scale and measures subjective wellbeing. Internal consistency ranges from .80 to .89. Cronback Alpha reliability was .84.

UCLA Loneliness Scale (UCLA-LS): UCLA Loneliness Scale was developed by Russell, Peplau and Cutrona (1980); the validity and reliability of its adapted version is tested by Demir (1989). The scale measures the overall feelings of loneliness in individuals through a self-report Likert-type scale comprised of 20 items. 10 of these items are positive statements and the rest are negative statements. The scale reports range from 20 to 80 where higher scores mean a higher degree of feelings of loneliness. Reliability of the scale is reported as .96. In this study, Cronbach Alpha reliability is found to be .93.

Data Analysis

Multiple regression analysis was used to identify the main predictors of problematic Internet use while t-Test analysis assessed the correlation between gender and problematic Internet use. Data was analysed using SPSS. A significance level of .05 was accepted.

FINDINGS

This study examines problematic Internet use in terms of gender variables. Table 1 reports the mean scores, standard deviation, and t-values of female and male students in relation to the Online Cognition Scale.

Table 1. Mean scores, standard deviation, and t-values of problematic Internet use according to gender

Variables	Gender	n	Mean	SD	t_{409}	p-value
Social support	Female	263	28.866	13.835	3.604	.000*
	Male	148	33.932	13.397		
Loneliness-depression	Female	263	12.304	6.843	3.827	.000*
	Male	148	15.135	7.789		
Reduced impulse control	Female	263	22.836	10.853	3.747	.000*
	Male	148	26.966	10.495		
Distraction	Female	263	17.418	8.659	2.823	.005*
	Male	148	19.932	8.678		
Problematic Internet use	Female	263	81.425	36.390	3.933	.000*
	Male	148	95.966	35.244		

*p<.05

In Table 1, the differentiation of levels of problematic use among students is examined using t-Test analysis. The independent variable is gender. A statistically significant differentiation can be found between the mean for levels of problematic Internet use (t=3.93<.05) and sub-dimensions of social support (t=3.60; p<.05), loneliness-depression (t=3.82; p<.05), reduced impulse control (t=3.74; p<.05), and distraction (t=2.82; p<.05). As Table 1 demonstrates, mean scores of males with regard to problematic Internet use and its sub-dimensions are higher than those of female students.

Correlations of scores for the Online Cognition Scale, Eysenck Personality Questionnaire Revised-Abbreviated Form, and UCLA Loneliness Scale are given in Table 2. It was found that the scattering diagram, which was designed for standardised residual values and predicted values, identifies a linear relationship, and points tend to be collected around an axis. arithmetic mean, standard deviation and correlation values about predictors (neuroticism, extraversion, psychoticism, lying, life satisfaction, loneliness) are given before regression analysis. When the scattering diagrams and correlations based on the partial relationships between predictor variables and problematic Internet use are examined, there is a positive and linear correlation between problematic Internet use and neuroticism, extraversion, psychoticism and lying. When Table 2 is examined, it is apparent that the correlation of dependent variables is not high enough to cause multicollinearity problem. During multi regression analysis a linear relationship was observed between predictors and problematic Internet use, as well as normal distribution.

Table 2. Arithmetic Mean, Standard Deviation and Correlation Martix Values of the variables used to predict problematic Internet use.

Variables	1	2	3	4	5	6	7	Mean	SD
Neuroticism (1)	-							3.260	1.763
Extraversion (2)	-.495**	-						3.669	1.792
Psychoticism (3)	-.092*	.122*	-					1.712	1.086
Lie (4)	-.119*	.119*	-.134*	-				3.785	1.561
Life Satisfaction (5)	-.070	.148*	.003	.341**	-			24.815	6.297
Loneliness (6)	-.003	.160*	-.162*	.192**	.198**	-		57.747	9.785
Problematic Internet use (7)	- .787**	.544**	,117*	.223**	.258**	.032	-	86.661	36.611

**p< .01 *p< .05

Multiple regression analysis relating to predictor variables of neuroticism, extraversion, psychoticism, life satisfaction and lying, and prediction of problematic Internet use. Results of the analysis is provided in Table 3.

Table 3. The variables that predict Problematic Internet use according to multiple linear regression analysis.

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Correlations		
	B	Std. Error	Beta			Zero-order	Partial	Part
(Constant)	89.047	7.853		11.339	.000			
Neuroticism	-13.737	.655	-.674	-20.983	.000	-.787	-.722	-.581
Extraversion	4.256	.779	.179	5.464	.000	.544	.262	.151

Loneliness	-.152	.110	-.041	-1.388	.166	.032	-.069	-.038
$R= .831$ $R^2=.690$ $F_{(6, 404)}=150.211$ $p=.000$								

Predictors: Neuroticism, extraversion, psychoticism, lying, life satisfaction, loneliness
Dependent Variable: Problematic Internet use

Examination of Table 3 reveals a negative correlation at a high level (r= -.79) between neuroticism and problematic Internet use when the binary and partial correlations between predictor variables (neuroticism, extraversion, psychoticism, lying, life satisfaction, loneliness) and the dependent variable (problematic Internet use) are examined. However, when other variables are examined, it appears that the correlation between two variables is r= -.73. The analysis also reveals a positive meaningful correlation at a medium level between extraversion and problematic Internet use. However, when the other five variables are examined, it appears that this correlation is calculated as r=.26. A positive correlation at a low level (r=.22) is perceived between lying and problematic Internet use; however, when this is compared with other variables, the correlation between two variables becomes r= -.13. Similarly, there is a positive correlation at a low level (r=.25) between life satisfaction and problematic Internet use. When this is compared with other variables, the correlation between two variables becomes r= -.26. Along with extraversion, psychoticism, lying, life satisfaction, and loneliness, neuroticism has a strong meaningful correlation with problematic Internet use among university students ($R= .831$, $R^2 =.690$, $p<.01$). The six variables examined here explain 69 percent of total variance in problematic Internet use. According the standardised regression coefficient (B), predictor variables can be ordered relative to their importance in problematic Internet use as neuroticism, extraversion, psychoticism, lying, life satisfaction, and loneliness. When t-Test results about the significance of regression coefficient are examined, neuroticism, extraversion, lying and life satisfaction variables appear to be significant predictors for problematic Internet use. On the other hand, psychoticism and loneliness are not significant predictors of problematic Internet use. According to regression analysis, the regression equation of problematic Internet use prediction is as follows: Problematic Internet Use = 89.047 – 13.737 Neuroticism +4.256 Extraversion, +1.242 Psychoticism, +1.709 Lie, + .839 Life Satisfaction, - .152 Loneliness.

From scatter diagrams that are based on the partial relationships of predictor variables (neuroticism, extraversion, psychoticism, lying, life satisfaction, and loneliness) with problematic Internet use, it is seen that there is a linear positive correlation between problematic Internet use and extraversion, psychoticism, lying and life satisfaction. It was also found that there is a linear and negative correlation between problematic Internet use, neuroticism and loneliness.

DISCUSSION

This section discusses the findings derived from the statistical analysis with reference to the relevant literature.

In this study problematic Internet use and its sub-dimensions of social support, loneliness, depression, decreased impulse control and levels of distraction showed significant variations in terms of gender among university students. Male students were found to suffer more from problematic Internet use. These findings are consistent with the relevant literature (Balta & Horzum, 2008; Choi, 2001; Li & Chung, 2006; Tahiroğlu, Çelik, Uzel, Özcan, & Avcı, 2008; Weitzman, 2000). Possible interpretations of this data are that in comparison to male students, female students have better communication skills, or that male students prefer the Internet to face-to-face communication. On the other hand, Ceyhan (2007), Kim, Namkoong, Taeyun & Kim (2008), Oğuz, Zayim, Özel & Saka (2008) did not find any significant correlation between gender and problematic Internet use. Other studies have found a correlation between problematic Internet use and impulse control disorder (Beard & Wolf, 2001; Davis, Flett, & Besser, 2002). It was suggested that the majority of Internet users engaged in problematic Internet use suffer from impulse control disorder, have a history of addiction disorder, and express this as a deviant behaviour using salient online activities (Yellowlees & Marks, 2007).

The study has also found that neuroticism, extraversion, psychoticism and lying variables are meaningful predictors of the problematic Internet use variable. Neuroticism was found to be the best predictor followed by extraversion, psychoticism and lying. Examination of the relevant literature shows that these findings are consistent with the previous studies. In their studies of adults, Cao & Su (2007) found that those suffering from Internet addiction received higher scores on the neuroticism, psychoticism, and lying sub-dimensions of Eysenck Personality Questionnaire Revised-Abbreviated Form. Adults with neurotic personality traits use the Internet for interpersonal communication and entertainment whereas extraverts use it solely for interpersonal communication (Wolfradt & Doll, 2001 cited in Ceyhan, 2008). Another study found positive correlations between game addiction and high narcissistic personality traits, higher degrees of aggression, and low self-control (Kim, Namkoong, Taeyun & Kim, 2008).

Life satisfaction was found to predict problematic Internet use at a low level. Studies focusing on the correlation between problematic Internet use among university students and life satisfaction are highly limited. Studies concentrate on the impact of personality as an internal factor on subjective wellbeing (Diener, Oishi & Lucas, 2003). Deneve & Cooper (1998) found that personality is a strong predictor of life satisfaction and happiness. In a study on Taiwanese adults, Ko, Yen, Yen, Lin & Yang (2007) investigated the extent to which personality traits, self-esteem, life satisfaction, mental health, and family functions predict Internet addiction. Research shows that personality traits and mental health disorders, particularly in adults, play an important role in developing Internet addiction and Internet addiction leads to a decrease in life satisfaction and social wellbeing (Koç, 2011; Moody, 2001; Morahan-Martin, 2007, 2008; Whang, Lee & Chang, 2003).

Loneliness was also found meaningfully to predict problematic Internet use at a low level. There is research showing that those who are suffering from high levels of problematic Internet use also have high levels of loneliness (Ayaroğlu, 2002; Ceyhan, 2007; Caplan, 2002; Eldeleklioğlu, 2008; Kim, LaRose & Peng, 2009; Kurtaran, 2008; Morahan-Martin & Schumacher, 2000; Morahan-Martin & Schumacher, 2003; Sanders, Field, Diego & Kaplan, 2000; Özcan, & Buzlu, 2005; Whang, Lee, & Chang, 2003). In a study on university students, Koç (2011) concluded that Internet use leads to an increase in psychological disorders such as depression and loneliness. Furthermore, Internet addicts who lack social support look for online solutions to their problems, and this leads to further psychological problems and symptoms of anxiety.

CONCLUSIONS AND RECOMMENDATIONS

This section makes informed suggestions about Internet addiction using the findings of this study.

This study concludes that males are more at risk than females in terms of problematic Internet use. Social support programs as well as individual and group work could be suggested for both male and female students that are at risk. Personality traits, life satisfaction and loneliness are significant predictors of problematic Internet use among students. Precautions need to be taken for university students to develop healthy personality traits, to enhance positive feelings and happiness, and to form social support networks.

It was observed that university students are the group most at risk in terms of developing problematic Internet use (Nalwa & Anand, 2003). That the Internet is always available, and is fast and free, are given as reasons for the problem. Researchers who argue that the Internet addiction is formed cognitively believe that cognitive behavioural therapy is a viable treatment (Davis, 2001; Yellowlees, 2001). These treatment strategies suggest a cognitive reconstruction regarding the Internet applications users often use, along with behavioural exercises and therapies. Students who manifest a high degree of problematic Internet use could be treated by cognitive behavioural therapy provided by psychological consultants working in counselling and guidance centres. Additionally, seminars, conferences and activities could be organised to highlight the negative consequences of problematic Internet use.

This study has some limitations. It examines solely problematic Internet use, personality traits, life satisfaction and loneliness and the correlation among these factors. With regard to the methods, the main limitation of the study is its being a descriptive study and as such not being able to identify causal linkages among the factors it investigates. Another limitation of the study is that it was carried out only in one university with no consideration of the socio-economic conditions of the participants. It would be appropriate to conduct quantitative and qualitative studies with a larger and more heterogeneous sample. These are the serious limitations of this study. However, studies focusing on the impacts of the Internet within the context of Northern Cyprus are very new and highly limited. It is believed that the findings of this study can help decrease the negative consequences of problematic Internet use.

ASSESSING THE EFFECTIVENESS OF MULTIMEDIA IN PHYSICS AT UNDERGRADUATE LEVEL

Popat S. Tambade
Prof. Ramkrishna More ACS College, Akurdi, Pune, India
pstam3@rediffmail.com

ABSTRACT

In this study, the effects of interactive multimedia package investigated in classroom on students' achievement in physics. Two groups – one control group and one experimental group of students at second year undergraduate level were studied to determine the role of computer simulations and animations in the development of functional understanding of the concepts of displacement, velocity, and acceleration. To investigate students understanding a diagnostic test on oscillations was administered to the students. The difficulty and discrimination indices of the test are found to be 0.40 and 0.498 respectively. Multimedia package was used in the classroom for experimental group while for control group the topic was revised by traditional method. The experimental group showed significant change in achievement as compared to control group. The results of this study strongly support that the multimedia assisted instructions in classroom learning help students confront their cognitive constraints and foster a functional understanding of physics.
Keywords : Multimedia, Simulations, Physics education, Oscillations.

INTRODUCTION

Over the three decades, physics educators have begun to look more closely at what their students understand about physics concepts. Physics education research (PER) differs from the traditional education research. In PER, the emphasis is on the student understanding of science content rather than educational theory or methodology (McDermott, 2001). Significant amount of efforts have been put by physics education researchers to explore the students difficulties in understanding physics concepts They found that many students taught traditionally, in a lecture based format, lack a solid conceptual understanding of physics, that many students also have trouble with quantitative problem solving and other skills, and their epistemologies are often different than the epistemology of a scientist(Meltzer, 2005; Maloney et. al., 2001, Thacker, 2003). PER has demonstrated that traditional lecture, recitation, and lab instruction is not helping many students in introductory physics classes to develop a functional understanding of physics concepts (Saul, 1998). Researchers in physics education have reported that interactive- engagement teaching methods are effective in conceptual learning of students as compared to traditional instructional method (Hake, 1998; Meltzer & Manivannan, 2002).

The use of computer technology in teaching environment provides wide-range of alternatives to students such as visualization of abstract concepts that will foster student understanding. Such alternatives would be complementary to traditional teaching (Fraser et. al., 2007). Computer simulations seem to be one of the most effective ways to use computers in physics education. A variety of visual representations in the computer simulations make concepts visible that are otherwise invisible to students (Finkelstein et. al. 2005). They encourage students to carry out the processes used in physics research: to question, predict, hypothesize, observe, interpret results etc. (Holec, Spodniaková Pfefferová, & Raganová, 2004). Computer simulations provide students the opportunity to isolate and manipulate parameters and therefore help students to develop an understanding of the relationships among physical concepts, variables and phenomena (Jimoyiannis & Komis, 2001).

Computer simulation when used as an instructional material in teaching physics, motivates and cultivates students' interest in learning physics, and can heighten the individualized instruction by allowing students to proceed on their own pace and are able to go back to master the skills (Ubiña & Patricio, 2007).

Computer animations offer the potential for increased learning when there is a need for external visualization and when the content depends on an understanding of motion (Dancy & Beichner, 2006).

The present study aims to investigate whether computer assisted instruction is more effective than traditional instruction in increasing student success in physics. The topic of "Oscillations" was selected for instructions since it is hard to understand and at the same time suitable for animation and simulation in computer environment. Students have difficulty to visualize the change in velocity, acceleration along the path of oscillator. By providing animations and simulations through computer assisted instructions (CAI) to students, it was aimed to help better understand the physical processes without entirely depending on the mathematical definitions (Gonen, Kocakaya, & Inan, 2006). For this purpose Interactive Multimedia on Oscillations is developed.

RESEARCH OBJECTIVES

Objectives of this study were to develop and evaluate an interactive computer based animation and simulation package on Oscillations and to provide second year undergraduate students of University of Pune with an interactive means of self-learning and evaluation.

RESEARCH QUESTIONS

To identify students' difficulties authors had set following points for this study.

1) Student's ability to interpret equations
2) Student's ability to interpret graphical representations
3) Student's response to the questions posed in different representations
4) Consistency in conceptual understanding.

MATERIALS AND METHODS

Subjects : The subjects of this study were second year undergraduate students (aged 18 to 19) from Prof. Ramkrishna More College, Pune affiliated to Pune University in the second semester academic year 2008-09 and 2009-10. The students were randomly selected for two groups, Control group (N = 23), Experimental group (N = 23).

Instruments : For data collection, an Oscillations Concept Test (OCT) which is composed of 20 items of multiple choices was administered to subjects. The items in the OCT were selected from 28 items following expert's advice on the basis of level of difficulty and the indexes of defined differences. OCT covers the instructional objectives for the unit of Oscillations. Students had to choose correct alternative for each item as well as give justification for the same. The reliability constant of the test has been determined according to Kuder-Richardson method and has been identified as 0.924.

Treatment : The traditional instruction was conducted over 12 lecture hours. The pretest was administered to 58 students at the end of traditional instruction. Students' difficulties were identified in the pretests on the basis of responses and justifications. The average difficulty index and average discrimination index of the test are 0.40 and 0.498 respectively. The instrument is moderately difficult and excellent discriminator.

After the pretest the students were two groups viz. Experimental Group and Control group formed on the basis of random selection. During the experiments any data related to students who did not attend all activities, has been excluded from further analysis. As a result only data of 30 students' have been included in the analysis with each group of 15 students.

In Control group, instructors used traditional method for revision of topics. The topics were revised in four lecture hours. During the revision instructors also solved some additional problems which included some conceptual and qualitative problems.

In Experimental group, Multimedia package was used to revise the topics of Oscillations for four lecture hours. Also students from this group were allowed to use the package in the laboratory for two hours. For this purpose subgroups each of three students were formed.

When the instructions have been completed, a posttest has been carried out.

Multimedia Package on Oscillations: The Interactive multimedia package applied in experimental group has been prepared with the help of Microsoft PowerPoint®, pictures, video clips and C programming. The content of the Oscillations have been organized in the presentation which is in the form of four modules viz. Equilibrium, Linear SHM, Lissajou's Figures, Angular SHM. The text content in the PowerPoint slides is static as well as dynamic. Cognitive enhancement was maintained by using animations to figures and graphical representations to teach concepts that were inaccessible through the textbook due to the lack of the textbook's ability to show motion. Forward and backward button facilities have been used in each slide. Simulations have been hyperlinked at appropriate positions in each module. Multiple choice questions and quizzes have been added at the end of each module. The multiple choice questions are different than that used in OCT. Screenshot of PowerPoint slide is shown in Figure 1 and screenshot of simulation on spring-mass system is shown in Figure 2.

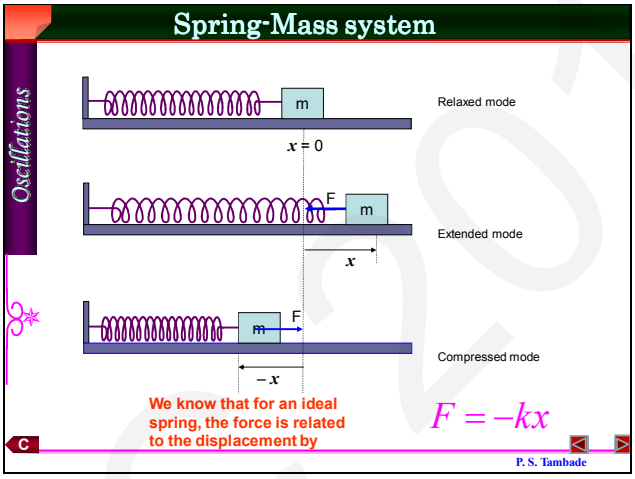

Figure 1: Screenshot of PowerPoint slide.

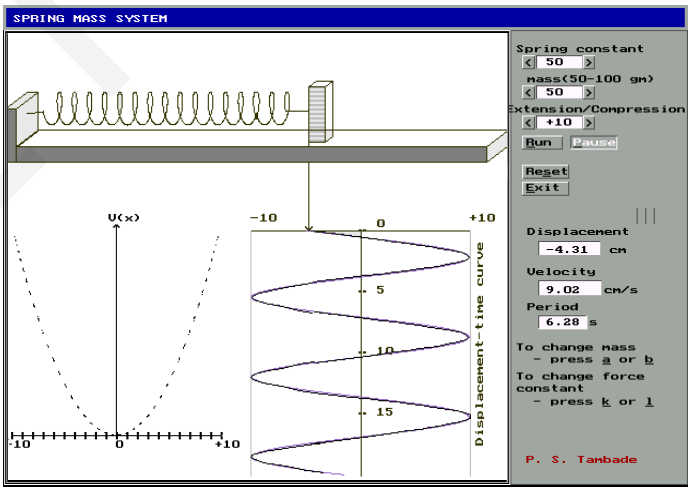

Figure 2: Screenshot of simulation of spring-mass system

RESULTS

Evidence for the effectiveness of teaching effectiveness aimed at producing conceptual change may be provided by initial and final assessments of students' conceptual understanding. Based on the data obtained by OCT, the students' mean and standard deviation for pre and posttest scores for two groups were obtained. The pretest scores are presented in Table 1. The independent sample t-test was used to determine whether there was a statistically significant mean difference between two groups for the pretest at 0.01 levels.

Table 1: t-test analysis of pre-test findings of two groups

Group	N	Mean Score	Standard Deviation	t (0.01)	p	d
Control	23	40.67	11.78	0.268	0.395	0.081
Experimental	23	39.67	13.43			

Table 1 shows t-test results of two mean scores of Group-1 and Group-2 at 0.01 significance level. Effect Size (d=0.081) and critical significance level $p > 0.01$ values indicates that there is no significance difference between mean scores in the pre-test. These results indicate that the subjects in the two groups that have participated in the research are equal in terms of knowledge according to their t-test results.

In order to investigate the effect of Multimedia approach on students' achievement on conceptual understanding about oscillations, a normalized gain g for each student was obtained by using the equation

g = **Hata!**

Class average normalized gain <g> with standard deviation was obtained for each group(Hake, 1998). According to Hake R. (1998), the treatment given to be interactive, if <g> is greater than 0.3. To determine whether there are any differences between two groups based on the average normalized gains, the calculated gains have been subjected to t-test analysis.

The post-test scores and average normalized gains are presented in Table 2.

Table 2: Post-test findings of groups

Group	N	Mean Score	Standard Deviation	<g>	S
Control	23	55.33	11.57	0.253	0.093
Experimental	23	75.00	14.88	0.604	0.201

(S = standard deviation for normalized gain for g)

The results of the analysis have been provided in the Table 3.

Table 3: t-test analysis of post-test findings of control group and Experimental group

Group	N	<g>	S	t – value (0.01)	p	d
Control	23	0.253	0.093	7.59	7.84×10^{-10}	2.29
Experimental	23	0.604	0.201			

Table 3 shows t-test results of class average normalized gains of control group and experimental group at 0.01 significance level. Effect Size (2.29) and critical significance level $p < 0.01$ values indicates that there is significance difference between normalized gains in the pre-test and post-test comparison.

This research showed the result that multimedia package in physics was pretty much more effective than traditional teaching in students' achievement in physics. The average normalized gain for Experimental group is greater than that of Control. Thus the treatment used for Experimental group is interactive and produces significant change in the conceptual understanding of students.

DISCUSSION

Present study found that many students have profound and meaningful difficulties with fundamental ideas and concepts not just in Oscillations but also of general ideas and approaches of physics that are often taken for granted in physics instruction yet which students must learn in our class. For example, many students were unable to functionally describe the meaning of a stable equilibrium and unstable equilibrium. Many students were unable to functionally describe the relationship between force and potential. Confusion between angular velocity and angular frequency, misinterpretation of instantaneous velocity and acceleration are some hurdles in the understanding of basic concepts in Oscillations. Many students have difficulty in differentiating between graphs of distance, velocity and acceleration with time and equate them all with a generalized idea of motion. When working with graphs students think that the graph is a literal picture of the situation and they confuse the meaning of slope of a line and the height of a point on the line (Saul, 1998).

It is observed that animations and simulations in the Multimedia environment helped the students to understand the graphical representations of displacement, velocity, and acceleration (Ubiña & Patricio, 2007). In simulations, students were able to change the variables and observe the effect. Using spring-mass system simulation and simple pendulum simulations, students were able to observe the change in velocity along the path of oscillator. Simple pendulum simulation helped the students to study effect of large angle oscillations on the period of simple pendulum.

Investigations showed that the students in Experimental group were better placed in interpretation of verbal, graphical representations, and diagrammatic representations in oscillations as compared to Control group. They are also more coherent in conceptual understanding as compared to their counter parts. It has been observed that multimedia improves student's success as well as develops high level of thinking abilities. Students learn the concepts by comprehension rather than memorizing (Kara & Yakur, 2008).

The results of this study shows that teaching of "Oscillations" performed with multimedia in the scope of Computer Assisted Instruction with cooperative learning is a more productive approach than the teaching performed with traditional methods in terms of improving the student success and concept understanding (Gonen, Kocakaya, & Inan, 2006).

CONCLUSIONS

This study found that the significant proportion of students in investigated sample had serious conceptual confusion to basic concepts in Oscillations, even though they had instructions in previous class also. These results are specific to the investigations in Oscillations, but the manner in which author found students unable to build a coherent conceptual and functional understanding of physics may cause problems in many other subjects.

In conclusion, present study has shown that computer-assisted instructions are an excellent way to focus students' understanding of principles in Oscillations. The use of the CAI improved the students' ability to make acceptable predictions and explanations of the phenomena in physics. The simulations used in the study are found to be good pedagogical tool as students could vary the variables and observe the effect. Findings of this study strongly support the fact that Computer animations and simulations may be used as an alternative instructional tool, in order to help students confront their cognitive constraints and develop a functional understanding of physics.

ABSTRACT

The study sought information on teacher professional development in the use of Information Communication Technology in teaching Mathematics. The population comprised secondary school teachers and r students in the study area. The sample consisted eight (8) secondary schools (three private and five public schools) using random sampling technique. Ten (10) teachers were purposively sampled from each school, which made up 80 Mathematics teachers while 122 students were randomly selected. The data collected were analyzed using frequency count, percentage and t-test statistics. The results revealed amongst others, that there was awareness among teachers and students on the use of Information Communication Technology (ICT) in teaching Mathematics at the secondary schools. There was no significant difference between the students mathematics achievement in both private and public secondary schools. Based on the findings, it was recommended that mathematics laboratory should be provided in the secondary schools to enable teachers and students improvise instructional materials that may not be readily available.

Key Words: *Profession, Teacher professional development, Ejigbo, Nigeria, Teacher Education, Information Communication Technology(ICT).*

INTRODUCTION

It is not an overstatement to say that mathematics is an indispensable tool in the march towards technological breakthrough. Mathematics cuts across all the fields of human endeavours in its wide application and mind development. However, despite its wide applicability, many students still could not find their feet in the subject. Governments and educational systems around the world recognize the need for students to be skilled, creative and confident users of a wide range of Information Communication Technology (Charalambous & Karagiorgi, 2002), of which the knowledge of Mathematics is required. To acquire the appropriate knowledge and skills required by students, teachers' professional development, have significant roles to play in the authentic application and sustenance of ICT in schools. It is imperative therefore, that due consideration be given to the nature of programmes, pre-service teachers are exposed to in their teacher education courses. The importance of ICT in national development cannot be underestimated. The ICT are electronic devices and techniques used in collecting, storing, retrieving, processing, presenting and transmitting data (Oxford Mathematics Dictionary, P.56). Similarly, the ENCARTA world English dictionary (2009) described ICT as the use of technologies such as computers,

electronics and telecommunication processes that distribute information in digital and other forms. Also, Thorpe, (2010) referred to ICT as the use of digital media and the internet. In the same vain, Ogunlade (2008), submitted that, the adoption of ICT in education would arouse a new interest among students, educators and educationists and possibly influence, if not change the attitude of teachers and students to learning. ICT in education would also promote global interaction and sustainable development.

The greatest challenge confronting the contemporary Nigeria society is the rapidly changing technology which requires adequate knowledge of mathematics. This is because without mathematics there is no science, without science there is no modern technology and without modern technology there is no modern society. (Ale & Adetula, 2009).Maduakolam and Bell (2003) revealed that the problem militating against the use of existing and emerging technologies by pre-service and servicing teachers is the inability of the training institutions to integrate the required knowledge and skills into instruction and across curricula. This justifies the reason for adequate training of teachers on the use of ICT-based instructional strategy because it is one of the new teaching approaches that have been proven to be effective in the area of learners' active interaction with the learning material. Thijs, (2002) identified the benefits of ICT-based instructional strategy against the traditional method among others as: (i) a medium that provides learners the opportunity to work with people from different cultures, thereby helping to enhance learning and communication skills as well as their global awareness. (ii) Encourages interaction and cooperation among students, teachers, and experts regardless of where they are. Also, Greece, (2010) affirmed that ICT-based instruction promotes student-centered learning. It was further explained that it focuses on students' needs, abilities, interests, and learning styles with the teacher as facilitator of learning.

In Nigeria, more have to be done in the area of professional development in the use of ICT among secondary school teachers. Teachers have not been given expected opportunities, only few of them have been going through self development in ICT, some of them that cannot afford the exorbitant cost of training, have indirectly resulted to fate which should not be. The quality or value of teachers could be determined by their abilities to cope with innovations in teaching and learning. It is therefore imperative to occasionally ensure teachers' personal development and career advancement both in their subject disciplines and in teaching profession. This informed the assessment carried out by the present study on professional development of teachers in Ejigbo in their use of ICT in teaching Mathematics.

THE PROBLEM

The rapidly changing technology has implication for teaching and learning since education is the only channel through which the beneficiaries can get awareness. The knowledge of mathematics is required by all users of technologies and that is why it is one of the core subjects at the primary and secondary school levels of Nigeria education system. In spite its importance, the annual chief examiners' reports on students' achievement

in mathematics had not been favourable. Table 1 shows the trend of achievements for six consecutive years.

Table 1: Trend of students' achievement in West African School Certificate Examinations from 2005-2010.

Year of Entry	Total Entry	Total Sat	Pass at Credit level	Ordinary Pass	Failed
2005	1080133	105453	402982	267600	363055
		97.11%	38.20%	25.35%	34.41%
2006	1170137	1249028	584024	357325	286826
		98.33%	46.75%	31.09%	24.95%
2007	1270136	1249028	584024	333844	302774
		98.33%	46.75%	26.72%	24.95%
2008	1292890	1268213	726398	302266	218618
		98.09%	57.27%	23.83%	17.23%
2009	1373009	1348528	634382	344635	3369511
		98.22%	47.09%	25.56%	23.79%
2010	1351551	1351557	534841	677007	139709
		99.94%	39.51%	50.09%	10.34%

Table 1 show that less than 50% of the examinees made a credit pass in mathematics and are qualified for admission into the university or other tertiary institutions. The only remarkable year with 50%credit pass was 2008 which is still worrisome when compared with the previous and subsequent years. The question is that; what happens to the remaining larger percentage?

Figure 1: Graphical representation of students' achievements in West African School Certificate Examinations from 2005-2010

Figure 1 show the bar graph of the % that registered, the % that sat for the examinations, the % that passed at credit level, those with ordinary pass and failure in each year respectively over a period of six years (2005-2010). The bar chart also indicated the highest percentage of students that passed at credit level in the year 2008.Research reports have identified teachers' methods of delivery as one of the major responsible factors for inadequate performances in the subject. The traditional didactic method is no longer adequate to meet the demands of mathematics education (Salman, 2010). Replacing the traditional mode of instruction with the use of computer and the internet source provider would widen students' access to topics and scope to learning (Wikipedia, 2010). It is the recognition for the use of electronic devices for teaching and learning of mathematics to enhance performance and cope with the technological advancement that led to the introduction of computer education in to the secondary school Mathematics curriculum. Chong Checkeong, Saraf Horani and Jacob Daniel (2005) reported that after the Malaysian Ministry of Education had implemented the use of Laptops in the teaching of Mathematics and science since 2003, it was observed that teachers are not fully utilizing these facilities in their teaching. This may be due to the ministry's failure to ascertain the teachers' professional development in the use of laptops.

In the same vein, three states (Kwara, Kano and Kaduna) in Nigeria embarked on three (3) years project from 2007 to 2011 on Professional Development of which Teacher Professional Development (TPD) is a component. The main purpose of the Teacher Professional Development was to improve teaching and learning in schools by encouraging teachers to adopt "Learner-centered" approaches in their classrooms. Series of workshops were organized for the following people: supervisors and inspectors; head teachers and principals; and finally classroom teachers drawn from the basic level of Nigeria Education System. There were face-to-face workshops, school visits and cluster workshops on teaching of English (First Year), Mathematics and science (2nd year) and social studies (3rd year). The use of ICT was not emphasized in the subjects' modules; include Mathematics in the professional development but how learners can be actively involved in class activities. In the same vein, secondary school teachers in Ejigbo, between 2004 and 2007 took part in workshops on professional development, specifically on ICT. Though only few of the teachers took part in the workshops. The present study therefore, sought information on whether or not the professional development opportunity on the use of ICT for instruction enjoyed by secondary school teachers in Ejigbo, Nigeria, had impact on the performance of their students in Mathematics.

STUDY PURPOSE

The major thrust of this study was to assess secondary school teachers' professional development in the use of information communication technology Mathematics in Ejigbo, Nigeria. Specifically the study focused on the following:

1. Awareness of secondary school teachers' professional development in the use of ICT for teaching Mathematics.
2. Professional development skills of teachers in the use of ICT for teaching Mathematics
3. Teachers use of ICT in public and Private Secondary Schools
4. Compare students' achievement with Teachers' professional development skills in the use of ICT for teaching Mathematics.

RESEARCH QUESTIONS

Based on the purpose of the study, the following questions are raised

1. Are secondary school teachers in Ejigbo aware of the use of ICT in teaching Mathematics?

2. What is the assessment of secondary school teachers' professional development skills in the use of ICT for teaching Mathematics?
3. Is there any difference in teachers use of ICT in public and Private Secondary Schools
4. Does teachers' professional development in the use of ICT for teaching mathematics have impact on students' achievement in Mathematics in private and public secondary schools?

HYPOTHESES

Research questions 3 and 4 are now Hypotheses one and two.

Ho_1: There is no significant difference in teachers' use of ICT for Mathematics teaching in secondary schools in Ejigbo.

Ho2: There is no significant difference in achievement of students taught with the use of ICT for teaching Mathematics in private and public secondary schools in Ejigbo

LITERATURE REVIEW

It has been observed that every field of science and technology has substantial mathematics content though of different degree. Okereke (2006) described the functional role of mathematics to science and technology as multifaceted and multifarious that no area of science, technology and business enterprise can escape its application. Okigbo and Osuafor (2008) attributed the poor performances to the fact that the most desired technological, scientific and business application if it cannot be sustained. Also Marwaha (2009) identified teaching mathematics as an abstraction, removing it from application, treating it as a subject not relevant in other school subjects, placing much emphasis on symbol and manipulation with little attention to problem solving, as reasons why students do not fair well in mathematics. In the same vein, Srinsvasa (1978) and Ogunkunle (2000) identified non-use of laboratory approach which is practical oriented and also involve the use of computer and the internet (ICT) as major factors that contribute to poor achievement in mathematics particularly by secondary school students. The integration of ICT to the teaching of Mathematics is a great challenge to secondary school teachers in Nigeria because the teacher training institutions that are supposed to be driving force towards the implementation of ICT in teaching school subjects are not adequately professionally empowered in effective utilization of ICT.

METHODOLOGY

Research Type

The study was a descriptive survey which involved administration of questionnaire to the respondents and assessment of students' performance in Mathematics. It involves prepared questionnaire and performance test which were used to collect data.

Sample and Sampling Techniques

The population of the study comprised all the secondary school Mathematics teachers and their students in Ejigbo Local Government area of Osun State, Nigeria. Eight (8) secondary schools were selected as sample through simple random sampling technique. Eighty(80) teachers and One hundred and twenty two(122)students were chosen from the sampled schools through purposive sampling technique. Table 2a shows the selection of teachers based on qualification and subject specialization.

Table 2a: Frequency count of respondents according to qualification and subject specialization

	Subject Specialization		
Qualification	**Mathematics**	**Others**	**Total**
N.C.E	10	15	25
B.Sc., Graduate/ H.N.D	20	25	45
M.Sc./M.Ed.	-	10	10
Total no Selected	30	50	80

Table 2b: Frequency count of selected schools

School Type	Number
Private	52
Public	70
Total	122

It is indicated in table 2a that out of the eighty teachers purposively selected; only 30 were specialized in Mathematics while the remaining 50 were not experts in Mathematics but were asked to teach the subject. This has strong implication for students' performance in the subject.

INSTRUMENT

Researchers-designed questionnaire and a performance test were used as the main instruments for the study. Oral interview and checking of relevant materials in the schools also provided additional information. The instruments were designed to assess the awareness of ICT, availability of ICT materials for mathematics teaching and learning and utilization of ICT in teaching mathematics. Each questionnaire was divided into 3 sections. The first section sought information on students' and teachers' personal data, section 2 consisted Yes/No responses from teachers and student for teacher use of ICT to teach mathematics. The last session contained open ended questions for teachers and students separately to check for awareness of ICT for teaching mathematics and professional development. The performance test was administered on the students.

VALIDATION

The questionnaire was given to educators, experts in mathematics education and educational technologists, research methods specialists for comments and guidance. The questionnaire forms were given to experts also for validity, 20 questionnaire copies were administered in some schools outside the sample to test for reliability. The reliability was thus tested through test re-test method using spearman rank correlation. The correlation value of 0.98 was obtained.

ADMINISTRATION

The researchers administered the questionnaire in the 8 selected schools (Private and Public). The administration of the questionnaire was done by the researchers to ensure prompt response and high rate of outcome. All the 80 copies of the questionnaire given to mathematics teachers were filled and returned to the researchers. Also the 122 copies of the tests administered to students were also returned.

DATA ANALYSIS AND RESULTS

The data obtained from the questionnaire was analyzed using frequency count and percentage, while t-test analysis was used to test the null hypotheses generated.

Results

Research Question One: Are secondary school teachers in Ejigbo aware of use of ICT in teaching Mathematics.

Table 3 Teachers awareness of ICT

Table 3: Frequency counts and percentages on teachers' awareness of ICT

Items	Statement	No of Yes Responses	% of Yes Responses	No of Responses	% of No Responses
1	I have been aware of ICT	50	62.5	30	37.5
2	I have no knowledge of ICT	35	43.75	45	56.25
3	I am not aware that ICT is an instructional strategy for teaching Mathematics	36	45	44	55
4	I am aware that computer is a component of ICT	50	62.50	30	37.50
5	I have attended series of seminars which increase my knowledge of ICT	10	12.50	70	87.50
6	I am aware that palmtop performs the same function with desktop.	10	12.5	70	87.50

On Mathematics teachers awareness of ICT 62.50% of the teachers claimed that they have been aware while 37.50% have not been aware. Also on the knowledge of ICT, 43.75 claimed to have the knowledge while 56.25% have not acquired the knowledge. Result also showed that 45% were aware that ICT is an instructional strategy for teaching Mathematics, 55% were not aware of such fact.62.5 respondents claimed that they were aware that computer is a component of ICT while 37.5% were not. Among the sampled teachers 12.50% of them had attended seminars which increased their knowledge of ICT, 87.5% were on the negative. Moreover from the same table, majority (87.50%) claimed that they were not aware that palmtop performs the same function with desktop, which implies that mathematics teachers' awareness would have to be worked on.

Research Question Two: What is the assessment of secondary school teachers' professional development in the use of ICT in teaching mathematics? This question was answered using frequency count and percentage. Table 4 shows the responses of Teachers on use of ICT in teaching Mathematics.

Table 4: Frequency counts and percentages on teachers' use of ICT and related Instructional materials

Items	Statement	No of Yes Responses	% of Yes Responses	No of Responses	% of No Responses
1	Do you use ICT- based materials in teaching topics in mathematics?	52	65	28	35
2	Are the textbooks used for your students in teaching mathematics adequate such that you don't need ICT tools?	35	43.75	45	56.25
3	Is your school library well equipped with the latest ICT Tools for use in the preparation of lesson?	36	45	44	55
4	Do you normally use computer to teach your students?	20	25	60	75
5	Would you allow the use of calculator in your mathematics class?	50	62.50	30	37.50
6	Do you give your students assignment on the internet?	10	12.5	70	87.5
7	Is there any mathematics laboratory where you engage your students in practical activities?	15	18.75	65	81.25
8	If there is a mathematics laboratory in your school are they well equipped with ICT tools?	10	12.5	70	87.5

On the use of ICT related materials in the teaching of mathematics 65% of the teachers claimed that they were always using them. Also on the adequacy of the available textbooks used for mathematics teaching, the result showed that they were not adequate because 56.25% gave negative response. On item 3, 55% of the respondents, claimed that schools in Ejigbo lacked well equipped library where they can lay their hands on relevant ICT tools. On the use computer for Mathematics teaching, 75% of the respondents claimed that they have not been using such for teaching Mathematics. Also 62.50% indicated that there was nothing like use of calculator in their mathematics classes. On the use of internet, 87.5% indicated, that they were not giving their students assignment on the internet. In item 7, 81.25% claimed that their schools had no mathematics laboratories. Finally, 87.50% of the sampled teachers indicate that the available laboratories were not well equipped with ICT tools. This implies that mathematics teachers would have to teach the students without relevant ICT tools in the schools.

HYPOTHESES TESTING

Ho_1: There is no significant difference between the teachers' use of ICT in both public and private secondary school. This hypothesis is equivalent to research question 3. This was analyzed using t-test

Table 5: t-test analysis on teachers' use of ICT for teaching Mathematics in Private and Public Secondary Schools. In Ejigbo

School	Mean	SD	N	df	t_{cal}	t_{tab}
Private	62.55	9.77	40	120	0.17	1.67
Public	62.18	10.27	40			

The t-calculated of 0.17 is less than the table value of 1.67. It means that there was a significant difference in teachers' use of ICT for teaching Mathematics in private and public secondary schools at 0.05 significant levels. Hence, the hypothesis was hereby rejected.

Ho2: There is no significant difference in performance scores of students taught Mathematics with the use of ICT in private and public secondary schools in Ejigbo

This hypothesis is also equivalent to research question 4.This was tested using t-test statistic.

Table 6: t-test analysis on the impact of ICT on students' achievment in Mathematics

School	Mean	SD	N	df	t_{cal}	t_{tab}
Private	19.13	7.94	52	120	8.34	1.98
Public	17.79	7.37	70			

Table 6 shows t-test analysis on secondary school students' mathematics achievement scores. The null hypothesis (Ho_3) postulated that there is no significant difference in students' mathematics achievement scores in private and public secondary schools. It is indicated in the table that the calculated value of 8.34 is greater than the critical or table value of 1.98. In other words there no was significant difference in the achievement scores of students in private and public secondary schools in Ejigbo at 0.05 alpha level of significance.

DISCUSSION OF FINDINGS

The findings from the study reveals that out of the 80 secondary school teachers that participated in the study, thirty (30) teachers specialized in mathematics while 50 teachers were in other areas of specialization but their school authorities allowed them to teach mathematics. In the selected schools, only 37.50% of the teachers indicated that there was mathematics laboratory in their schools which would have assisted the use of ICT. Also, a reasonable number affirmed that they have not been having opportunities of attending seminars and workshops on ICT which would have increased their awareness of ICT. An important observation made by the researchers in the scoring of students' answer scripts was the in ability to correctly interpret word problems into equivalent equations. This is consistent with the finding of Marwaha (2009) who reported that teachers place emphasis on numerical problems that involve the use of symbols and manipulations, with little attention to problem solving involving word expressions.

It was also revealed that the secondary school teachers under study were aware of ICT tools and its use for teaching mathematics but there was a significant difference in its use by teachers in private and public secondary schools. The teachers expressed their concern about the high cost of ICT tools which they are not capable of purchasing except the government can subsidize. In other word, teachers at the secondary school level are still lagging behind in modern technological modes of instruction. The significant difference in the use of ICT by teachers in private and public school could be attributed to efforts by private school to adequately equip their schools for purpose of patronage. The non significant difference in the achievement of the students implies that the use ICT for teaching Mathematics did not have impact on their achievement. For effective use of ICT for teaching and learning both the teachers and the learners must be cognitively and affectively prepared to embrace the innovations in teaching and learning particularly in the use of ICT for classroom instruction.

CONCLUSION AND RECOMMENDATIONS

Effective integration of technology in the classroom stimulates students and teachers in attempting more complex tasks and materials. Mathematics teachers may want to use technology in this manner to develop higher expectations for their students ICT will equally enable students to engage in content areas, activities that are challenging and also collaborative, cooperative and interdisciplinary studies.

Based on the outcome of the research the following recommendations are considered relevant: As confirmed in the present study, the value for the use of ICT in schools in Nigeria is still limited to private and unity schools and few public secondary schools. For all schools irrespective of the type, to go on ICT-based instructional strategies, a lot of money would be required because it is capital intensive.

Awareness of its importance should be created for mathematics teachers in public secondary schools in particular and teachers in general through organized workshops. The effective use of ICT in teaching Mathematics at the secondary level requires human ware such as: Computer operators, programmers, analysts, engineers and trainers that would assist in training and retraining of mathematics teachers who will impart knowledge and skills to learners. The government should give necessary financial support required to get the required human ware and the necessary materials.

Pre-service and service mathematics teachers should be sent on intensive training course of one year or six months or three months on ICT knowledge and skills.

Mathematics laboratory should be provided in secondary schools to enable teachers and students improve on teaching and learning respectively particularly in the practical use of ICT tools.

Institutions responsible for curricula development and teachers' development should collaborate on the alignment of teacher development programmes and integration of the use of ICT in mathematics and science education.

Curriculum developers of programmes teacher education should develop instructional plans across board and the applications, to facilitate the integration of the use of ICT in teacher professional development in mathematics.

The relevant Government should be ready to provide ICT tools and ICT training for teachers so that mathematics teachers will be able to have positive influence on their students.

BACKGROUND KNOWLEDGE ON NATURAL DISCIPLINES IN TEACHING COMPUTING DISCIPLINES

Ahmet Babanli
Faculty of Engineering and Architecture,
Istanbul Aydin University, Istanbul,Turkey
e-mail: ahmetbabanli@aydin.edu.tr

ABSTRACT In an undergraduate teaching/learning process of computer disciplines, the role of background knowledge of students on natural disciplines (especially on mathematics) is fundamental. In developing countries, such as Turkey, in many cases its level is quite lower than those of the developed countries because of different causes (traditional, local, high school education characteristics etc). As a result students have difficulties in understanding of the teaching material, designing algorithms and programs. The weaker the background knowledge of the students the higher the negative effects of the diversity to the learning process. Attempting to promote the background knowledge can allow to lessen this effect. One way to improve on a background knowledge is to include the main concepts of related mathematical (physical, chemical) topics into the lecture material of a computing topics for recalling purposes. This can allow students to fit this gap at least partially in their background knowledge and cause the learning process to be more effective. This paper considers these problems and describes the results of the experiments held at the Anadolu University, Turkey.

KEYWORDS : engineering education, computing disciplines, teaching of programming, mathematics in programming languages.

1. INTRODUCTION

Programming is a fundamental discipline in the study of Computer Engineering at Higher Education Institution worldwide. How to teach programming is well known – necessary material fits into a course over two or three semesters (the term “programming” hereby means some introductory computing material such as Introduction to Computer Engineering, First Programming Language, Data Structures). Usually the teaching programmes are oriented towards a student with a generelized mid-level background that in many cases is not rightly defined and founded. This is so for developed countries. In developing countries, such as Turkey, the same teaching programmes are used as they are in developed countries or with little modifications. But a mid-level background knowledge of students on natural disciplines is quite low in these countries compared to developed countries. Following the same programmes, lecturers are typically faced with situations of difficultes in teaching and learning processes. Because of their weak theoretical background, students usually have difficulties in selecting a suitable mathematical method in designing an algorithm to solve a given problem. To fill this gap, it will be useful to recall the related mathematical items briefly (in many cases items are simply forgotten) before the programming topic is taught. In this paper these problems are discussed and some thoughts are provided on how the changed lecture content might affect the quality of the learning process.

2. ON UNDERGRADUATE PROGRAMMES IN COMPUTNG

Two of the expected outcomes for an undergraduate curriculum in software engineering according to [1] are that graduates of this programme must be able to

-understand and be able to apply current theories, methods and models that provide a basis for software design and development;

-learn new models, techniques and technologies as they emerge.

But this is not sufficient, it also requires students to utilize concepts from a variety of other fields, mainly from mathematics. Computer engineering students must learn to integrate theory and practice, be able to select The theoretical and conceptual foundations of computer science play the main role to satisfy these requirements. corresponding mathematical concepts, methods, techniques and convert them to a form suitable to solve specific problems, to recognize the impotance of abstraction and modeling, to be able to acquire specific domain knowledge beyond the computing discipline to support development in specific domains of application.To maintain these and other requirements a set of recommendations are performed in the undergraduate programmes in computing [1]. Generally the software engineering curricula concentrates on the knowledge and pedagogy. The term "knowledge" is used here to represent the wide spectrum of content for the discipline, such as terminology, methods, models, practices, literature etc. Education knowledge is organized hierarchically into three levels: areas, units and topics.The area represents a particular subdiscipline of software engineering that is generally recognized as a significant part of knowledge that an undergraduate should know. Units are a smaller divisions of an area which represent individual thematic modules. Each unit is further subdivided into a set of topics, which represent lowest levels. Here is an example:

Area: Fundamentals.

Unit: Computing foundations.

Topic: Programming language basics.

Then it is tried to define a metric that establishes a standart of measurement to judge the actual amount of time required to cover a unit. An hour is taken as an unit that corresponds to the actual in-class time using in a traditional lecture-oriented format. But there are some doubts to the usage of lecture hours as a measure. The time in hours assigned for each unit in some cases is not enough to enable students perform the learning objectivies for that unit. It is always appropriate to spend more time on a unit than the mandated minimum. In the following chapters of the text we will discuss one approach to argue this assumption.

3. MATHEMATICAL TOPICS IN PROGRAMMING

In computer engineering programmes in many universities around Turkey and in another countries, the teaching of mathematics has generally been traditional for many years: the main focus is on analytical solutions to simplified mathematical problems [2] without explanations on how they can be used in practice. In many cases lecturers are from mathematical departments and they are teaching engineering students in the same way as students of their own departments. In these courses much more teaching time is usually spent to prove theorems and to solve simplified numeric examples by hand. Many mathematical topics that are necessary when teaching an introductory programming course are taught at a high school or are taught in parallel with programming disciplines in the beginning semesters at a university. As a result, the knowledge is either forgotten or is not completely understood yet. Students are faced with difficulties in selecting a mathematical method or using it when designing a particular algorithm.

A corresponding mathematical topic can be taught briefly before a programming topic is taught. And the structure of a teaching material and pedagogical approach can not be the same as in the case of mathematicians. Here a computer lecturer can use his/her own pedagogy and teaching manner focusing on applications of the methods.These are done not for all topics of a programming language but for a special set of topics defined by a lecturer based on an existing background knowledge of a particular student group.This will require an additional lecture time of about 20-30 min.

4. COMPUTING TOPICS AND RELATED MATHEMATICAL TOPICS

Some topics of mathematics directly influence the learning process at the beginning stages of an introductory programming teaching. Recalling related mathematical concepts – their formulas, rules for manipulating, knowledge about their application areas etc. enables students use them efficiently in designing algorithms and programs, and causes them to deal with mathematical textbooks to search for the best methods and formulas, which increases the amount of the background knowledge. Which topics should be taken and which details should be recalled depends on the level of the existing background knowledge of a particular group of students, and can be defined by a lecturer. The following topics would be useful in many cases when students have a weak background knowledge in mathematics.

. Series

Having a good knowledge on mathematical series is necessery for computer engineering students both during their university lifetime and in their postgraduate activities.Recalling and memorizing the following items are desireable when teaching/learning iterative control structures of a programming language:

- the general form of the summation formula: $\sum_{i=1}^{n} a_i$, basics of divergent and convergent series, manipulating and bounding summations;
- types of series: arithmetic, geometric, harmonic, telescopic;
- how to deal with a difficult summation when defining boundaries that describe the running times of algorithms;
-basics of the mathematical induction techniques when designing algorithms to evaluate complex series.

. Relations and functions

A subprogram mechanism is one of the fundamental concepts of a programming language that can be understood and learnt attentively. The background knowledge on mathematical relations and functions can have a good contribution here. Items are:

- philosophy of relations, binary relations, equivalence relations and partitions, orderings;
- functions and function types (relational, exponential, logarithmic, trigonometric etc);
- function notations (prefix, infix, postfix);
- functions in a complex computing.

. Algorithms

Before starting to learn how to program a student must have sufficient representation on conceptual and theoretical foundations of algorithms. The following questions are important here:

- what is a computational procedure (well-defined and others);
- what is the role of algorithms in the problem solving;
- methods to represent algorithms (natural language, mathematical and graphical forms);
- algorithm correctness and ability to solve a particular problem;
- algorithm complexity basics, importance of understanding hard problems;
- basics of algorithm design techniques.

5. EXPERIMENTS

In the educational year 2007-08 at the Computer Engineering Department of Anadolu University, Turkey, for the group of 32 students the traditional teaching process was slightly modified using ideas descussed above for four topics of two computing disciplines. Two topics were from the introductory programming language C, and two other – from the course Data Structures and Algorithms. The related mathematical topic (topics) was recalled before a computing topic was started to be taught. Recallings included a brief explanation of the analytical foundations of the topic, and how the formulas could be converted into a discrete form suitable for use in algorithms. The computing topics and the related mathematical topics were:

1. Iterative control structures : Arithmetic, geometric and harmonic series, nature and features of Taylor and Maclaurin series. The principles of mathematical induction techniques when designing algorithms to evaluate complex series were explained later when working on homeworks.
2. Functions: Mathematical relations and functions, notations for representation, types of functions, role functions in programming.
3. Linear data structures: Nature and notations to represent linear relations, equivalence relations and partitions, ordering techniques.
4. Nonlinear data structures: Graphs as an abstraction to represent complex problems, notations, simplest graph types, basics of graph representation and searching strategies.

The results of the experiment appear in Table 1.

The table contains the results of the final exams for two consecutive educational years for four topics discussed. In the 2006-07 year computing topics are taught in the traditional way whereas in the 2007-08 – using lectures with modified contents. The experiment was provided for two groups each of 32 students assuming that estimated values of the general characteristics (a level of background knowledge on natural disciplines, features of motivation and aptitude etc.) were nearly the same for both groups.

We observed the exact differences between results of two years: the total number of students with FF-grades is decreased (-37%), the number of students with CC-grades are approximately the same (+8%), and for AA-grades there is the significant growing trend (+63%).

Table 1. Exam results of two student groups in 2006-07 and 2007-08 years.

FF stands for the grades of 0-50, CC- for 51-70, and AA- for 71-100.

	2006-07			2007-08		
Topics	FF	CC	AA	FF	CC	AA
1	14	15	3	8	16	8
2	12	13	7	7	16	9
3	11	12	9	8	12	12
4	15	14	3	10	15	7
Avg	13	13.5	5.5	8.2	14.7	9
%				-37	+8	+63

For students of the 2007-08 year the following positive observations was also recognized:

- to have a need to look at the mathematical textbooks frequently;
- to have an interest whether is there another method to solve a particular problem;
- to wonder which technique is more suitable for solving the problem in terms of algorithm understandibility and program simplicity.

During the educational year it was also possible to use more complex problems in laboratory trainings and homeworks.

6. CONCLUSIONS

There is a vast amount of research on educational process, but we generally know little about how students are learning. It is clear that different students learn in different way [3] . So- called “surface learners” simply scrape the material without carrying out any deep processing, whereas “deep learners” make a serious attempt to learn a material completely, understand its details and turn the ideas into their own knowledge structure.

Some another factors also influence the learning process. They are related to the student diversity factors: physical (age, gender, ethnic bacground), a prior educational experience (learning skills, preferred learning styles, “life skills”), expectation, motivation and aptitude [4]. Dealing with such diversity, different strategies and methods (pedagogical, experimental etc.) can be used to organize teaching/learning processes. And for different disciplines these strategies and methods can also be different.

For computing disciplines one factor – students’ background knowledge on fundamental disciplines (especially on mathematics) plays the leading role: the weaker the background knowledge of the students, the higher the negative effect of the diversity to the learning process. Attemts to promote the background knowledge can allow to lessen this effect at least partially. One way to improve on a background knowledge is to include related mathematical topics into the lecture material of a computing topic for recalling purposes. The term “recalling” here means to repeat briefly (or to teach if the topic is not taught before) analytical basics of a mathematical topic focusing on its application posibilites and formats necessary for using it in algorithms. And the amount of

lecture time will last for about 30 minutes. The experiments held at the Computer Engineering Department at the Anadolu University show that the general characteristics of a teaching/learning process are improved. Experiments will be continued for other computing disciplines. Modifying the contents of recalling topics, developing suitable pedagogical approaches are among the problems to be examined in the future investigations.

BEST OPPORTUNITIES IN PATIENT EDUCATION

Khalib Abdul Latiff MD
Health Promotion Unit
UKM Medical Center
Kuala Lumpur, Malaysia
khalib@ppukm.ukm.my

Patient education is about empowering patient with a relevant health knowledge and skills to carried out certain practices to avoid diseases and its possible consequences. It is not about identifying and delivering the best educational tool, it is about the appropriateness of the tool in relation to its users. It is a dynamic process that should be centred at enabling patient to gain further insight about his or her health. The task of educator is to sense and response appropriately towards that. Failure to sense those cues means failure to make use of the opportunity. Therefore the strategy in patient education is not about "what's needed by the educator", but more towards "what's needed by the patient". This paper highlights some of the educational-learning opportunities in hospital setting where the educators are given the best chance to enter and to influence their patient's mind.

INTRODUCTION

Education is about empowerment - empowering people with a relevant knowledge and skills to conduct certain favourable practices (Newbold PA, 2010). In patient education, it is about empowering patient with a relevant health knowledge and skills to carried out certain healthy habits in order to avoid diseases and its possible consequences and more importantly is to narrowing the gap (Khalib Al and Farid AR, 2010). According to Eriksson M and Lindstrom B. (2008), it is a favourable "salutogenestic" flow from health knowledge to healthy practice and biological wellness - a fundamental principle of an effective health education and health promotion activities.

Failure to achieve this task, it may indicates the failure of the educational-learning activities (Armstrong AW, 2010). Obesity for instance, it is not about overeating of unhealthy food or lacking of engaging with physical activity, it is about failing of empowering people with an appropriate knowledge and skills about avoiding overeating or participating in physical activity. Untreated obesity may result with other sequences such as hypertension, diabetes, coronary heart diseases, stroke, heart failure or even premature death (Geetha L et al, 2011 and Cha E et al, 2010).

If education is assumed to be the best strategy to avoid diseases or to reduce prevalence of the diseases, then its methodologies and activities need to be properly instrumented and managed. It is not about identifying the best educational tool to be used, it is about the appropriateness of the tool in relation to its users. It is important that all parties be sensitive to the educational need of its client and always careful when making a prescription (Tarn DM and Flocke SA, 2011).

In medical field, health education should not be instrumented at the level of awareness only, it should be advanced beyond that. It is a dynamic process that centre at enabling people as well as patient to gain further insight about his or her health. Thus, its final outcome should be adopting or conducting certain healthy habit to avoid certain related diseases, to minimize certain related consequences and promoting the healthy outcomes (Von Ah D et al, 2004). As an educator, a comprehensive approach is needed. All educational opportunities must be observed and be utilized towards patients' real empowerment.

Strategy in Patient Education: The True Meaning

Laterally, strategy in patient education can easily be understood as communication methods. It can be direct communication method – the conventional method that commonly associated with face-to face and its related educational process, counselling, consultation, health talk, bed-site education and instruction session; or indirect communication method or via the mediator - the use of media, educational technology, relatives or others influence people.

The philosophy of patient education is not about free delivering of the available strategies and/or communication methods, it is more towards how the best available method be instrumented to the given opportunity. It involves identifying the most appropriate opportunity, selecting and managing the best communication method (direct or indirect) and transmitting the best educational content (see **figure 1**).

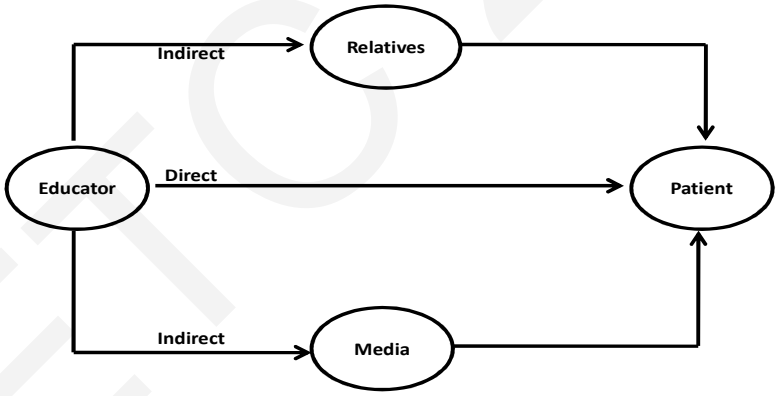

Figure 1:

Patient education is about selecting and managing direct and indirect educational methodologies for the healthy practices

Opportunity is about its capability to exhibit an entrance for an education. As there are a lots of favourable opportunity in the hospital system, then it is the duty of the educator to differentiate of those considered the most appropriate and those considered the least. Therefore the strategy in patient education is not about "what's needed by the educator", but more towards "what's needed by the patient". Failure to sense those cues means failure to make use of the opportunity.

THE BEST OPPORTUNITY

The best opportunity is defined as any pleasing condition that can facilitate an educational-learning activities. It is an occasion where the educator cum the manager is given the best chance to influence their patient educationally. The good educator should not only capable to identify those cues but more importantly he/she should also be able to choose the most appropriate method to transmit an educational input into the patient's mind.

There are at least three main opportunistic areas can be focused namely the patient's situation, the timing of consultation and/or the setting.

a. Patient's Situation

This is about various opportunities that are existed or displayed within patient. It is the best chance where an educational advice is essentially easy to complied. Good example is the stage of the disease. Many studies have proven that adherence and compliance to treatment is correlated strongly with the stage of the disease. The more advance the disease, the more likely patient is adhered to the educational input. This can easily be understood as the need to get out of the illness and confidence about curing is quite overwhelmed (Lau-Walker M, 2006).

Patient's socio-demographic characteristics is another most notably opportunity as there are already proven perquisites in any educational approach. It reflects their underlying literacy level. Evidences have explicitly supported that certain socio-demographic characteristics are quite responsive to change. For instance, women are generally more receptive compared to men (Furuta M and Salway S, 2006). In fact, the different may also be seen among rural folks against urban citizen, educated versus non educated patients, old people against youngsters, marital to single and patient from developed countries against developing world. When it is in combination, the opportunity to educate is much more easier.

With regards to psychomotor aspect, which is about stage of patient's emotional feeling that is normally swinging as a result of patient perception about their illness, the responses are varied. It depends on the stage the emotion is being portrayed. It indicates the readiness for education. According to Lee F, (2007), patient tends to comply and will not complained when they are satisfied. Energetic listening, participating in communication viz providing feedback and questioning, smart dressing, freshness presentation, serious looking, punctuality, and positive attitude change may indicates of favourable emotion are all the cues of emotionally ready. Those who are appearing pleasing, are normally quite receptive compared to those who are emotionally unstable.

Other areas such as the existing of disease and co-morbidity are also proven situation and thus a good detrimental for education.

b. The Timing of Consultation

Consultation or counselling is known the best opportunity for education. It is an intimate moment where both patient and doctor (as an educator) are ready to interact

reciprocally. It is the time where patient is in great need to be cured and get out their suffering. Patients are normally easy to be persuaded just through a very simple approach and using the emotional touch.

It is more evidenced in the procedure room where some form of light communication moment can also be incorporated to ease the phobia. Time of examination and monitoring activities in the laboratory, radiological examination room, delivery or labor room, gastroscopic center and other hospital facilities are good opportunity for the educator to passed its educational message to the patient (see **figure 2**).

Opportunity to educate is also effective when patient is in great comfort (Lee F, 2007). This is obvious when patient is still fresh in the morning and lonely in the evening. Extra care must be exercised not to disturb patient when they are exhausted, physiologically uncomfortable such as hungry, full bladder, sleepy and specifically for women, their "embarrassment" moment, such as excessive wet of having heavy period and period pain.

Figure 2:
Mammogram procedure is the best timing to educate patient about breast cancer

Sometimes the unplanned meeting moment such as in the cafeteria, gymnasium and other communal places can also be a best timing to transmit an educational message. Through a very simple talk and joke, the message can easily be passed out in a very friendly conversation.

c. The Hospital Setting

This is about the existing facilities in the hospital system that potential to be upgraded as an educational media. Those facilities include the communal places such as hospital entrance, lobby, prayer room, the comfort room, elevator, staircase, gathering corner, cafeteria, gymnasium, parking bay etc. This is the place where patients use to come, resting and having a social meeting.

As time spent are usually lengthy, it is recognized to be the most suitable venue to place the educational material or media on various theme. Thorough examination of the educational needs must be done before introducing the best media, the best content to fill up the places. Through little bits of creativity, the whole hospital complex can also be comprehensively reoriented and improved to be the credible educational media or hub (Botney M, 2006). The gates, roof, floor, the inside streets, the ambulances, the buses, the wall, the garden, the street light and other settings, all can easily be transformed to transmitted certain educational health messages.

CONCLUSION

The success of medical treatment is a mutual efforts of both medical team and the patient. To patients, it is about their willingness to cooperate with the medical advices, and to medical team, it is about their skills of convincing patients to adhere and comply to the medical advices. In patient education, it is not about selecting the best educational method, it is about identifying the best existing opportunity to communicate the content or the healing message of any education.

CALL for Teaching English Children's Literature: Hot Potatoes Framework in Taiwanese EFL Classrooms

Hsing-chin Lee
Department of Applied Foreign Languages
National Taipei College of Business
Taiwan, R.O.C
hsingchinlee@gmail.com

Abstract

This study explores some CALL programs using Hot Potatoes framework to respond to the text as an unfolding process and to familiar with the everyday routinized utterances in unabridged English literary works in the context of Taiwan. Lexis competence is an important aspect of English language learning in assisting the conversation flow. The emphasis is on the use of online collaborative activities and CALL programs based on the unabridged novel to enhance students reading skills and vocabulary size in an online learning environment. The potential disadvantages of relying too heavily on the use of electronic media was long ago indicated by the 'United Kingdom Electronic University' (Times High Education Supplement February 2005 THES), in which online technology was emphasized rather than the methodology. It suggests that teaching on the web alone cannot fulfill the purpose of education. This paper aims at justifying the use of technology in creating teachers' own material using CALL programs. The need and theories behind using online teaching activities, two types of Collaborative On-line Learning activities, namely sound Clips on the Web and Hot Potatoes online exercises are introduced. Feedbacks of students on the activities and their learning are discussed. The pros and cons of the Hot Potatoes Tool in reading concordance lines are also stated.

Introduction

The potential disadvantages of relying too heavily on the use of electronic media was long ago indicated by the 'United Kingdom Electronic University' (Times High Education Supplement February 2005 THES), in which online technology was emphasized rather than the methodology. It suggests that teaching on the web alone cannot fulfill the purpose of education. Nevertheless, Lee (2009, pp. 157-162) in his study finds that learners are more willing to ask questions during the learning process in an online learning environment. Carter (1997, p. 161) also emphasizes that "Process-based approaches are learner-centred and seek to encourage students to respond to the text not exclusively as a complete artifact or finished product but rather more to the text as an unfolding process in which the relationship between form and meaning is shown to be central." In view of Lewis' slogan, "Words carry more meaning than grammar" (Lewis, 1993, p.38), the Author makes good use of the online pedagogical approach to help students communicative effectively in a second language.

Within such an approach, teacher and learner factors play an important role because in Taiwan, the teacher is the one who decides how the lesson is structured and what materials and activities are used. Some CALL activities are designed to teach an English children's book using Hot Potatoes framework. This paper

describes the elements incorporated in the Collaborative Online Learning approach, which will be elaborated later.

It is argued that the software or material designers are often not teachers and thus it leads to the need of English teachers creating their own teaching materials for their own collaborative learning purposes. The Author puts forward the idea of integrating English children's literature in her teaching, using data from Arthur Ransome's (1930) *Swallows and Amazons* as source materials. The linguistic justification for choosing *Swallows and Amazons* over any other potentially more suitable text was made by applying five CALL programs based on the corpus of Arthur Ransome's children's books to the EFL learners in Taiwan and found the result desirable (Johns, Lee & Wang, 2008, pp 503-504).

The Collaborative On-line Learning (COL) Approach

Changing views on language learning in the 1970s and 1980s resulted in the emergence of CLT 'Communicative Language Teaching' (Widdowson 1978). It is opposed to the traditional approaches of the 1950s and 1960s, which regarded language as 'a system of rule-governed structures hierarchically arranged' and language learning as 'habit formation' (Nunan and Lamb, 1996:14), CLT defines language as 'a system for the expression of meaning' (Richards and Rodgers, 1986:71) to emphasize interaction and communication. Various approaches such as, 'Data-Driven Learning (DDL)' (Johns, 1991b; Johns & King, 1991; Johns et al. 2008; Lee, 2011), 'Collaborative on-line learning (COL)' (Dillenbourg 1999) can be regarded as variations on the CLT approach (see discussion later).

The three approaches of CLT, DDL and COL have similar implications for the roles of learners, teachers and materials. Learners are no longer considered 'passive recipients of interpretations generated by a teacher or assimilated from books of literary criticism' (Carter & McCarthy 1995: 304) but active participants who explore and discover knowledge of language by themselves, and whose perceptions, including both cognitive and affective responses to the materials taught, can provide valuable feedback to material developers. Teachers, on the other hand, take on the role of *communication facilitators* (resources) instead of stuffing students with information. With the changed role of students as "language detectives" (Johns 1991), this, in effect, has led to a learner-centred approach in language teaching. A great deal of research focuses on re-examining and re-defining the process of teaching and learning from a learner-centred point of view (Stevick 1976; Nunan 1988; Tudor 1996). A learner-centred approach promotes the idea of helping learners "deepen their understanding of language learning, and to acquire the knowledge and skills they need in order to pursue their learning goals in an informed and self-directive manner" (Tudor 1996:37). A learner-centered approach can also activate students' creative thinking and therefore helps them solve problems creatively.

Inspired also by Widdowson (1985, p.186) well-stated comment: "a pedagogy should be developed to guide learners towards an independent ability to read literature for themselves, as a precondition for subsequent study; a capacity for the understanding and appreciation of literature should be developed as a mode of meaning, rather than the accumulation of information and ideas about particular literary works," the Author proposes the idea of integrating the COL approach with the teaching of English children's literature. The COL stresses constructivism-in-context as general theory in making teaching materials. She emphasizes experience-based and learner-centred learning, which involves the strategy of reconstructing meaning and real-world problem solving. The COL suggests that the teacher's role be a facilitator or resource. Based on the idea of learner-centred approach, the COL approach emphasizes not only the role of teacher as resource but a traditional role of an instructor.

Stevick (1976) emphasizes that language learning methods should take account of the attitudes of both learners and teachers toward language teaching, so as to achieve the goal of effective learning. He establishes his ideal of the success of language learning not by 'methods' but by the instructor and learners' personal factors and learning strategies.

Theory behind using Online Teaching Activities: Collaborative On-line Learning (COL) in Teaching English Children's Literature

A situation is collaborative if students are at the same level, perform the same activities, have a common goal and interact in a collaborative way (Lee, 2009, p. 87). Yeh (2007, p.830), proposing a synchronous scaffolding environment on collaborative technical writing, states that "collaborative learning helps students use their own prerequisite knowledge to go beyond what they currently think." Constructivism plays an important part in collaborative on-line learning (Florea 1999:161-164). Vygotsky (1978) proposed that collaborative language learning puts up the principles of social constructivism. It is to meet the requirements of an efficient and motivating learning process. Therefore, "[t]he goal is active exploration, construction, and active learning rather than the passive attendance at lectures or textbook reading" (Norman & Spohrer 1996, pp. 24-27). Dillenbourg (1999, pp.1-12) uses Roschelle's & Teasley's (1995, p. 70) definition of collaboration: "a coordinated, synchronous activity that is the result of a continued attempt to construct and maintain a shared conception of a problem". He characterizes collaborative learning in terms of four criteria – "situations, interactions, processes and effects". On-line teaching activities introduced in this paper integrate also the demonstrations of visualization and sound (e.g., the Canadian teacher's tape recording on the web (http://ms.ntcb.edu.tw/~hsingchin/) under the activity category of *Story*), creative problem-solving (JCross), process-observing (for example, JMix), and assessment of acquired knowledge (e.g., JMatch; JCloze; JQuiz) during the learning process (under the activity category of *Exercises*).

The language in the *Swallows and Amazons* (Ransome, 1930), though used in the 1930s, is well-structured and adaptable, which suits her students' language level and their imaginative development. Most of the language used in the book is English spoken in everyday life. It is also culturally relevant to Taiwanese students as Taiwan is an island yet many Taiwanese young people do not have the opportunities to play with water. The book serves as a good source for students to use their imagination of going adventures and exploring island life. Although the language is from the 1930s, much of it is still serviceable. The activities in this paper are classified in terms of learning through the analysis of the story, the lexical and grammatical realization, making predictions and summary writing and describing the process of doing things. The Author intends to encourage "digital natives" (Prensky 2001), create authentic conditions for language learning and heat up classroom discussion.

Two types of COL Activities

Review and preview, discussion of the content of the text, linguistic realization and the use of Chinese translation

are used in Traditional teaching strategies in Taiwan EFL classrooms. The teaching materials were designed for putting emphasis on reading skills (finding content clues, the characters, the process of doing things, etc) and in relation to other aspects of language learning (listening, speaking, and writing). Within this framework, activities were used in the teaching to:

(1) provide an extended introduction to the literature materials through the online reading of the story, summarizing and making predictions,
(2) help lexical and grammatical realization through (a) lexical focus, such as the study of verbs and the effect of collocation on meaning, and
(3) to help them with the use of translation and English-Chinese parallel texts to solve problems in understanding the texts they read through online exercises.

Sound Clips on the Web

The Author created a website: http://ms.ntcb.edu.tw/~hsingchin/ for online exercises, including listening to the story, identification of glossary and 5 types of online exercises developed using the Hot Potatoes framework. The material for listening to the story includes 31 unabridged chapters, each containing a number of sound clips (click on the story icon on the screen shot of the website). There are four features in the presentation of the online sound clips (see Fig. 1):

Fig. 1 Screen shot of the sound clips

(1) the presentation of English texts with icons to identify the sound clips within the text in every paragraph,
(2) the presentation of both English and Chinese texts on the same screen,
(3) the display of the chapter number of 31 chapters and
(4) the presentation of highlighted phrases or difficulty words both on English and Chinese texts to be matched.

The clips were normally one paragraph in length. Having selected a particular chapter from the list at the foot of the screen, the students clicked on the screen button in the margin of the English text to identify the section to which they wished to listen. Finally students asked for the translation of any word or phrase highlighted in the English text or the Chinese text. The book was presented on screen chapter by chapter with both Chinese and English parallel texts (see Fig. 1), so the students could not read the text of the following chapter which was used as the basis for the prediction exercise. In the unabridged text presented on screen as a preview, certain words (e.g., *a wild surmise*, *hedge* in Fig. 1) were highlighted (bold-font and underlined in the example in Fig.1).

Hot Potatoes Online Exercises

The Hot Potatoes suite is an authoring tool created by the Research and Development team at the University of Victoria Humanities Computing and Media Centre for the purpose of producing web pages for graduate language learning (Arneil and Holmes 1999, p.12), and is marketed by Half-Baked Software. Within the "Hot Potatoes" suite of software are six separate programs, namely JBC (multiple choice answer quizzes), JMix (Reordering Exercises), JQuiz (Quiz Exercises), JCross (Crossword Exercises), JMatch (Matching Exercise) and JCloze (Cloze Exercises) with a shared interface for producing a number of different exercises in a web-page format. The online Hot Potatoes exercises including Put in Order, Crossword, Cloze, Quiz, and Match are designed using the framework of Hot Potatoes Software for students to practice asynchronously. In the synchronous mode, collaborative learning is achieved either between the student and the tutor or the students themselves, whereas in the asynchronous mode, the students do the online exercises in pairs and follow their own pace without having to take account of the progress made by other pairs. The relationship between the integration of online exercises and the teaching of *Swallows and Amazons* is described below:

The Online crossword was designed to teach vocabulary in 'Swallows and Amazons'.
The Online match was designed to help students match the dialogue and the characters.
The Online Mix was designed to help students notice the process of doing things.
The Online quizzes were designed to help students' reading comprehension.
The Cloze was designed for guided summary.

Five screenshots (JMatch, JMix, JCrossword, JCloze and JQuiz) from the Hot Potatoes exercises in the Author's teaching website (http://ms.ntcb.edu.tw/~hsingchin/) are presented as follow:

Fig. 2 Interface of Hot Potatoes Exercises

JMix (Put in order)

The dialogues between the characters on describing the process of doing things are also good resources for creating the exercises. They are based on the events in each chapter to help students internalize their knowledge of English.

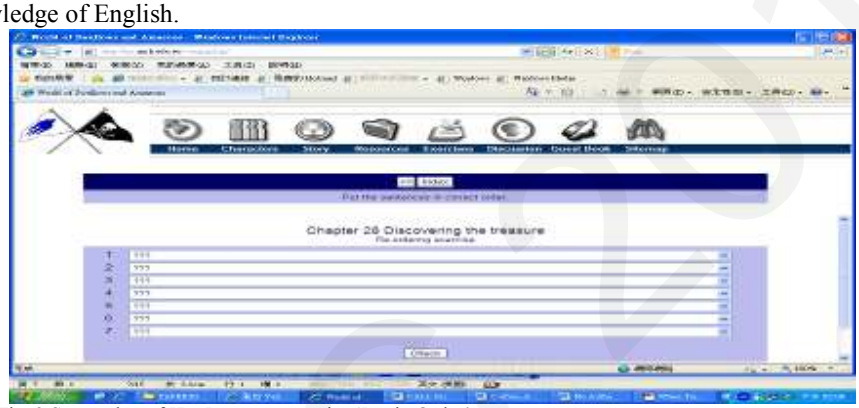

Fig. 3 Screenshot of Hot Potatoes exercise 'Put in Order'

JMatch

The Author used Hot Potatoes framework (JMatch) to create online Matching exercises. An exercise of remembering who says what also tests students' comprehension of the development of the story.

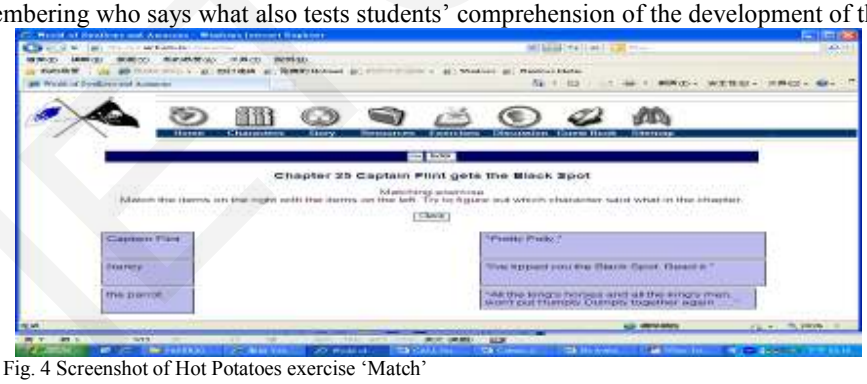

Fig. 4 Screenshot of Hot Potatoes exercise 'Match'

JCloze

The Author created gap-filling exercises. The great limitation of the Hot Potatoes Cloze is that it does not provide 'logging', which may serve as a very important pedagogical purpose for the teacher to analyze students' mistakes. CALL programs which keep 'log' are discussed in Johns, et al. (2008, p.489).

Fig. 5 A Screenshot of Hot Potatoes exercise 'Cloze'

JCross

The Hot Potatoes framework for JCross allows the Author to create crossword puzzles by making good use of vocabulary or language of immediate interest.

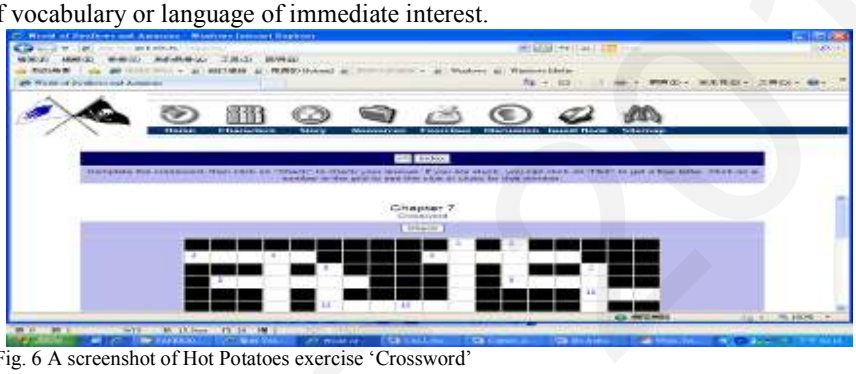

Fig. 6 A screenshot of Hot Potatoes exercise 'Crossword'

JQuiz

Four possible correct answers are provided in each exercise. In other words, teachers who wish to create their online exercises do not need to have any expertise of programming.

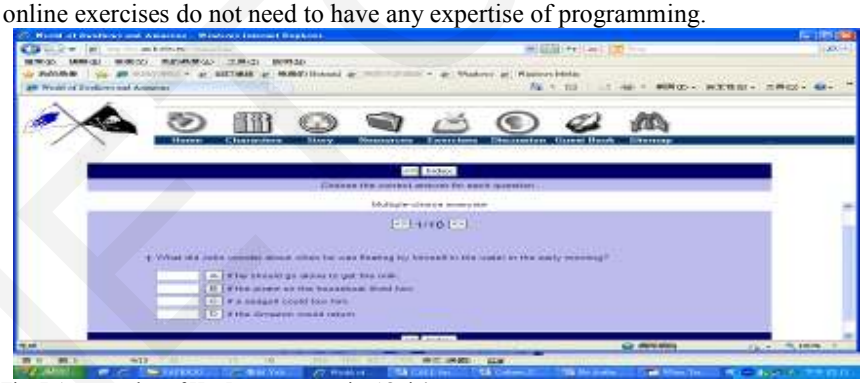

Fig. 7 A screenshot of Hot Potatoes exercise 'Quiz'

Pros and Cons of the Hot Potatoes Tool

In respects of being effective in an online environment, "Hot Potatoes" has its advantages. The most beneficial advantage of Hot Potatoes is to make online exercises possible. Warschauer (1996) states that the instant 'right and wrong' answer checking and individual attention have a positive influence on learners' motivation. Despite the fact that the Hot Potatoes exercise has the disadvantage of its one click right/ wrong feedback system, it is by far the most convenient authoring tool available.

Another advantage of the Hot Potatoes is its potential for student-generated materials because of the simplicity of the interface and authoring applications. Hot Potatoes online exercises help students familiarize

with the teaching materials in self-access time because it ensures that students' cognitive processes are engaged in doing the exercises. Winke & MacGregor (2001) emphasize the positive interactions between the online exercises and the learners. Yeh (2002) also encourages students to use JCloze, JCross and JMatch to design exercises in creating an English learning website.

Yet, there are drawbacks in using the program. For example, unlike the CALL programmes described in Johns, et al. (2008), there is no 'logging' system for analysing the process of students' doing the exercise. Take JMix (Put in order) exercise for example: if the program generates a log file, it will give the teachers an overview of students' performance.

After trying the online exercises, the Author found that the students did increase their English in reading the book. These CALL exercises do draw students' interest. They also serve the purpose of another kind of 'drilling' with meaningful, organized and customized context for students to feel safe and think they are doing what they are used to be doing. How effective the Hot Potatoes exercises are to improve students' English grades needs to be further studied.

Evaluation and Findings

An evaluation was carried out at the end of this study with the 19 aspiring EFL students. The results of the evaluation indicate that after reading at least 15 chapters of a continuous novel, students felt sense of achievement simply because they were capable of reading a long continuous novel. The teaching of vocabulary and grammar had long stood the test of EFL teaching and is proved to have a positive effect on reading comprehension. However, reading comprehension requires not only that knowledge but also reading skills. In case of teaching reading, top-down skills are more effective than the bottom-up skills because the top-down approach helps students to abandon the habit of consulting the dictionary.

The evaluation procedure revealed approval of the CALL activities, with mean scores on a 5 point Likert scale ranging from 4.81 to 4.38. The overall impact of using the CALL exercises is indicated by the fact that the students were extremely *keen to recommend the activities to a friend* (Item 8 Mean 4.81). This might be because the online exercises are different from traditional drills and students felt less stress and much playful when working on them.

In terms of the students' feedback on learning, the survey suggests that the students *enjoyed the course* (Item 1 Mean 4.69), *got practice reading English* (Item 2, Mean 4.63), found *online Hot Potatoes exercise interesting* (Item 3, Mean 4.69) and *liked working with friends* (Item 4 Mean 4.5). Indeed, most students classified *doing Hot Potatoes exercises* as *effective* (Item 5 Mean 4.5), and *the range of activities being motivating* (Item 6 Mean 4.44). Taking the wider view the participants therefore *reported experiencing a feeling of success* (Item 7 Mean 4.44). These results provide considerable scope for satisfaction considering the fact that most of the students are shy, rather inhibited side prone to oral anxiety – as is often the case in Confucian Heritage Countries (CHC) where language teaching tends to be traditional.

Conclusion

This paper discussed the design of a number of activities for language learning. The activities are classified in terms of learning through the reading of the story, the lexical and grammatical realization, making predictions and summary writing and describing the process of doing things. The CDDL methodology is used to design materials for teaching literature in EFL classrooms in Taiwan. It is hoped that the teaching activities applied in this study can help EFL teachers look at the positive side of making their own teaching materials by integrating CALL activities with English children's literature in EFL teaching. The study of lexis through English literature is inseparable from the learning of a foreign language. If employed effectively, the application of the children's literature in EFL classrooms will have great pedagogical value. It can develop learner autonomy, create authentic conditions for language learning and heat up classroom discussion. It is hoped that these materials can motivate students as well as teachers in reading extended texts.

Can assistive technology help improve early literacy skills of young children with disabilities?

Abstract: Though the use of Assistive Technology is strongly recommended in teaching preschool children with disabilities. However its implementation is early childhood settings is still limited. Factors such as lack of teachers' training programs and sufficient funding to provide such technologies in the classroom are hindering its use. This article seeks to make the case for using assistive technology with young children with disabilities. It provides a discussion of its benefits and gives suggestions for a better implementation.

Introduction

Life in the 21st century is impeding the use of technology in all the aspects of life which forces young children to start using literacy skills in an earlier age. Parette, Hourcade, Boechmann and Blum (2008) states that the availability of computers and technologies offers a great potential for the enhancement of early literacy skills in young children by providing them with contemporary learning styles. However, although the use of AT in the classroom is widely recognized and encouraged with school children, it is rarely investigated in pre-school children. Floyd, Canter, Jeffs and Judge (2008) states that during their attempt to locate studies that investigated the use of AT with pre-school children, they found that throughout the last eleven years there were only eleven studies. This study is seeking to shed a light on the importance of using AT with pre-school children with disabilities.

The Study

Early childhood intervention is defined as attempts by government agencies or other organizations to improve child health and development, educational attainment, and economic well-being (Karoly, Greenwood & Rydell, 1998). The UNICEF Priorities for Children 2002-2005 support providing early childhood intervention programs for children with disabilities (UNICEF Website, 2010). NICHCY, National Dissemination Centre for Children with Disabilities, describes early intervention services as specialized health, educational, and therapeutic services designed to meet the needs of infants and toddlers, from birth through age two, who have a developmental delay or disability, and their families. At the discretion of each State, services can also be provided to children who are considered to be at-risk of developing substantial delays if services are not provided. Whereas, services for preschool children is called "special education preschool services" (http://www.nichcy.org, 2010).

Early identification of disabilities has been recognized by many studies as playing a key role in helping children achieve future success. Federally mandated special education services for pre-schoolers with disabilities calls for the application of appropriate assessments and providing required services to children at risk.

Many researchers have agreed on the importance of early intervention programs. A child's early learning provides the foundation for later learning, thus the sooner a special program of intervention is begun, the further the child is likely to go in learning more complex skills (Bricker & Bailey, 1986). A report by the National Joint Committee on Learning Disabilities [NJCLD] (2006) states that the purpose of early identification is to determine which children have developmental problems which may be obstacles to learning or that place children at risk. Peltzman (1992) states that early identification and intervention provide a foundation for later learning and could thereby foster later academic success.

Many previous studies have shown strong links between early literacy skills acquisition and children's reading and writing abilities throughout the elementary years (Beard, 2003; Whitehurst & Lonigan, 1998). Increasing evidence shows that the quality of early childhood programs can determine

children's social, language, and cognitive progress and school readiness skills (Coleman, Buysse & Neitzel, 2006). Few studies have measured the impacts of early learning on high school graduation, but those with the largest samples reported statistically significant positive impacts (Barnett & Boocock, 1998). Competence in pre-academic and academic skills is a key outcome that affects many areas of a child's life. Children who have strong pre-academic skills in early childhood are more likely to succeed in academic skills once they enter school. Catts (1996) suggests that literacy and pre-academics can be taught to pre-schoolers if presented in a "developmentally appropriate" way.

Though most studies agreed theoretically on the importance of early intervention in helping young children overcome future failure, they did not agree on the nature of the intervention and its length and intensity. Lowenthal (1998) suggested providing developmentally delayed children with the required early intervention which is aimed at improving their pre-academic skills which are the prerequisites of school readiness skills. However in many cases children's individual needs are left unidentified till they start failing. Karoly, Kilburn and Cannon (2005) states that as disadvantaged children do not progress at the same rate as other children, the gap between them widens by times. A study by Abbott-Shim, Lambert and McCarthy (2003) found that children attending early education programs Head Start have sustainable benefits in the areas of receptive vocabulary and phonemic awareness and had more positive health related outcomes. Catts, Fey, Zhang and Tomblin (2001) and Snowling, Gallagher and Frith (2003) report that letter knowledge, phonological awareness, short-term memory, rapid serial naming speed, pesudoword repetition, and expressive vocabulary are the best predictors of later reading performance.

It is known that young children learn better through interactive teaching, rather than traditional, lecture-type teaching (Willis, 1993). Children could benefit greatly from high-quality preschool programs that target literacy skills development and conceptual knowledge (Neuman & Dickinson, 2006). Floyd, Canter, Jeffs and Judge (2008) highlights that due to the mounting emphasis on early literacy skills, early childhood educators should give high consideration to implementing effective, early literacy instruction into the curriculum. Educators should be concerned with developing early intervention programs for preschool children who are experiencing developmental delays. Such programs should be concerned with enhancing children's developmental abilities using all the required means including assistive technology.

Assistive technology is a type of technology that offers compensatory resolutions to the challenges presented by these children (Judge and Parette, 1998). Assistive technology is defined by IDEA as "any item, piece of equipment or product system, whether acquired commercially off the shelf, modified, or customized, that is used to increase, maintain, or improve the functional capabilities of children with disabilities. The term does not include a medical device that is surgically implanted, or the replacement of such device (Authority 20 U.S.C. 1401(1)). Parette and Stoner (2008) states that the above mentioned definition concentrates on the compensating nature of AT. In other word, AT is supposed to help children and adults with disabilities to act independently at schools and community. Parette and Peterson-Karlan (2007) assures that AT is not used merely to grant young children access to educational settings but to provide them with equal opportunities to accomplish success in both school and life.

As the result of the mounting emphasis on literacy skills, young learners who have developmental delays or are at risk for school failure could have more effective teaching of basic emergent literacy skills by using AT in the classroom (Parette, Hourcade and Blum, 2011).

Floyd et al. (2008) identifies three types of AT used in the classroom. First no- technology solutions which is using methods and strategies to help children accomplish the required skills. No-technology includes strategies such as additional time, color coding, using cards in matching and using manipulatives. Second low-technology solutions which includes pencil adapters, voice announcers, raised-line paper and step-by-step picture schedules. The third type of technology used in the classroom is high-technology solutions which includes the use of computers, computer software or the use of high technology compensating devices. Parette and Stoner (2008) assures that if AT is effective in helping children develop the required skills for success, then it would be a welcomed addition to early childhood classrooms.

A study by Turbill and Murray (2006) suggests that the implementation of a computer-based software that has figures and presentation which are familiar to the children in the curriculum could have

the potential to enhance children's early literacy skills. Parette, Wojcik, Stoner and Watts (2007) reports that programs such as Microsoft PowerPoint is a useful tool for the development of emergent literacy skills. Parette and Stoner (2008) recognizes three benefits of AT for children with disabilities in the classroom. Firstl the immediate improvement in children's attending behaviour which is a prerequisite for all learning. Second a reduction of problematic behaviour which is noticed by children obedience to classroom rules. Third the development of better expressive and receptive communication skills.

Peterson-Karlan, Hourcade and Parette (2008) assures that incorporating technologies into writing instruction has the potential of improving the writing skills of children with physical and educational disabilities. Caverly (2008) identifies four conditions that would make using AT interventions for writing effective. The first condition is to have access to AT. The second is to have assistance to choose the most suitable technology. The third is to be adequately trained to use this technology. The forth is educating families on how to use and support their children in using the assigned AT.

Though the established benefits of AT in helping young children accomplish future success in developing literacy and independence skills its use in the classroom is still limited. Parette et al. (2011) identifies the cost of providing technology and training teachers to use it as the main obstacles that hinder using AT in the classrooms. A survey by Smith and Kelley (2007) of AT and teacher's preparation programs for individuals with visual impairments showed that teachers lack the needed experience in dealing with AT for visually impaired children.

Conclusions

This paper tried to shed a light on the use of AT in early childhood programs. It concludes that using AT is strongly recommended in classrooms of preschool children with disabilities. Its benefits are well documented in helping young children with disabilities develop early literacy skills which are prerequisites for future success. However such goals are hindered by the lack of sufficient funding to provide such technologies in the classroom and appropriate teacher preparation and training to help them deal with day to day usage of such technologies.

3Mechatronics Technical Teacher, muratturhan34@hotmail.com

Abstract
In addition to the fact that university life is a period when students acquire basic knowledge regarding their future professions, students also need guidance and explanations in relation with concerned professions during this period. Informative meetings should be held in the course of university period in order to inform students of places where they can work as well as working conditions, responsibilities, steppingstones, etc. If they aren't informed of these subjects, graduate students encounter certain difficulties after starting a professional activity and they can't develop themselves consciously in their professional lives. In this context, the objective of this study is to determine to what extent students graduated from Mechatronics Department are informed of possible job opportunities during their university education period as well as their need for career guidance. For this reason, researchers prepared a "Career Guidance Questionnaire" in order to determine career guidance needs of graduates and 52 graduates were contacted in total. According to obtained findings, it is understood that most of graduate students need career guidance and that they aren't sufficiently informed of this matter during their university period.

INTRODUCTION

In our day, scientific and technological advancements, social and political shifts, competition bring along important changes in social and economical environments, particularly in organizational structures. Change of organizational structures with the influence of such concepts as globalization, technology, change and information society as well as developments in education and expectations of individuals change also the meaning of career. Although until recently career was used to mean professional advancement, now it is no longer possible to define the career concept only by advancement. In our day, career means a job restructuring process which is meaningful and psychologically satisfying for individuals. In this process, knowledge acquisition and self-development are more important than professional advancement. In our day entitled as the information age, such concepts as lifetime job opportunities, functional titles and continuous advancement increasing the income left their place to the need for lifetime learning, continuous self-development and staying always employable (Osipow; Fitzgerald, 1996).

Career development starts as early as individuals' childhood and becomes serious in secondary education years. After choosing their profession and entering into a university, individuals are occupied with professional advancement opportunities.

According to Ginzberg et al. (1951), career choice is a development process. This process is defined as the irreversible decision process which is made as a result of desires and opportunities of an individual and which develops during the whole life. Roe (1956) puts forth in her career choice theory that the environments in which the childhood is lived and personality traits developed during the childhood have important roles in career choice. And Donald Super (1953) contributed very much to the theory of career choice aimed at development. According to Super, the individuality formed as a result of interaction of individual with its environment during development process influences the career choice of the individual. Career choice is seen as a compromise between the individuality of persons and socioeconomic factors (Brown, 2003: 33). Tiedeman and O'Hara (1963) define the career development as an identity development and claim that the formation of individuality concept continues for the lifetime. (Pilavcı, 2007).

Career concept has been evaluated in different ways since 70s and researches have been carried out on this subject. We see that studies conducted are concentrated rather on such subjects as career movement, career and job stagnation as well as such related subjects as career plateau, career balances and socialization. It will be useful to understand these concepts briefly in order to explain career planning and career methods applied in enterprises. Career movement indicates a person's professional activity in different organizations or in different positions in the same organization in relation with his/her career. Whichever is the case, the main focus of career movement is continuous promotion. Career stagnation

means stagnant periods of individuals during their career life. Stagnation periods are important for individuals in order for them to develop their competences regarding their career, to put their family-professional relations in order and to stock both physical and psychological energy for future works (Diken, 2006).

As it is explained before, career is a development process. Individuals experience different processes in relation with career development during various age periods. These processes are as follows:

1. Pre-employment Period: In this period, individuals receive formal education in relation or in possible relation with their future careers. Security, safety, physiological requirements have priority. This period ends around the age 25. (Can et al.,1995:164). This period is the time when one proves oneself and evaluates alternatives (Aytaç, 1997:63).

2. Employment Period: In this period, persons start to work in a job. This is the beginning of career. Individuals' priorities are security and safety. This stage is completed in a five-year period.

Acquiring new skills and developing attitudes change the motivation of personnel. After feeling that they have skills in the field that they have chosen, individuals are sure of themselves for searching new job opportunities and working fields. This is a period when new conflicts are formed between the way their time is spend in the workplace because of increasing competition and their increasing responsibilities toward their families. (Uygur, 1998:129).

3. Career Developing Process: This process can be defined as the career path to be taken after obtaining a certain level of experience and knowledge. In this phase, employees may face a career dilemma and enter in a process of questioning. In this phase, they may take such decisions as changing working field or setting up their own business.

4. Career Protection Process: Individuals enter into a career plateau which is defined in general as stress or boredom. Reactions of individuals entering in this period exhibit responses and variations. During this period, certain physical and logical processes start to slow down naturally (Uygur, 1998:13).

5. Retirement Period: In general, retirement happens between ages 55 and 65. With the arrival of retirement, people complete their careers. Some people plan their retirement while some others stay within the organization and want to present their experience acquired until then to the service of organization and do consultancy (Aytaç, 1997:70-71).

It is clear that guidance services aimed at informing students of career opportunities are important during their university education period. In our country, guidance activities are rather concentrated on primary and secondary education levels but they are also quite important at university level. Guidance definitions vary depending on applied education levels.

Brown defines the guidance as one of many branches of human resources development and describes it as "a process where an experienced individual helps or guides another person who is inexperienced in the field" (Appelbaum, 1994).

Studies have shown that guidance is as popular for employees as it is strategically important for organizations (Gibb, 1994: 33). If an organization applies guidance, it means that this organization pays attention to its employees and the success of the organization is based on the loyalty and skills of the whole labor force.

METHODOLOGY

In this research, career guidance needs of individuals graduated from Mechatronics Education Department are investigated within the framework of prepared questionnaire. Since this research demonstrates a situation as it is, it is a scanning model research (Karasar, 2006). Study group of the research consists of 51 individuals graduated from Mechatronics Education Department of Marmara University, Technical Education Faculty.

In order to obtain data, "Personal Information Questionnaire" and "Career Guidance Questionnaire" were prepared by researchers. The said personal information questionnaire consists of 6 questions prepared in order to obtain personal information of students (sector of activity, whether the realized activity is related to the department from which they are graduated, satisfaction level of expectations regarding the department from which they are graduated and realized activity, satisfactory level of economical conditions of their professional activity, their position at working place and to what extent they were informed of job opportunities while they were students in university).

"Career Guidance Need" questionnaire is also prepared by researchers and results were evaluated by an expert in order to insure validity and reliability. A draft version was prepared firstly for the questionnaire and it was shown to expert professors. According to their recommendations, final version of the questionnaire was formed. "Career Guidance Need" questionnaire consists of 20 statements. These statements were prepared in order to investigate "to what extent" graduates of Mechatronics Department

were informed of career opportunities while they were students in the university. Application data was analyzed with SPSS statistics software. Frequencies and percentage values with regard to data analysis were given within tables.

FINDINGS

1. Findings Regarding Personal Information of Mechatronics Education Department Graduates

Table 1. Findings regarding responses of research participants to "Your Sector of Professional Activity" question

	Frequency (F)	Percentage (%)
Jobseeker and unemployed	30	58,8
Quality Systems	1	2
Automation	7	13,7
Machinery and construction fittings	2	3,9
Mechatronics	3	5,9
Education & Consultancy	2	3,9
Master's Degree	1	2
Technical proofreading-documentation	1	2
Robotics	1	2
Production-Manufacturing	1	2
Software	1	2
Electronic instruments trade	1	2
Total	51	100

When we examine the findings regarding the question "Your Sector of Professional Activity", we can see that 30 (58,8%) of research participants seek job or they are unemployed, that 1 (2%) of them works in quality systems, 7 (13,7%) of them in automation, 2 (3,9%) of them in machinery and construction fittings, 3 (5,9%) of them in Mechatronics, 2 (3,9%) of them in education & consultancy, 1 (2%) of them in master's degree, 1 (2%) of them in technical proofreading-documentation, 1 (2%) of them in robotics, 1 (2%) of them in production-manufacturing, 1 (2%) of them in software, 1 (2%) of them in electronic instruments trade fields. Accordingly, majority of research participants consists of "students, jobseekers and unemployed persons". Other than this majority, most of remaining persons works in "automation" sector.

Table 2. Findings regarding their responses to "Were You Informed of Job Opportunities While You Were Student in the University?" question

	Frequency (F)	Percentage (%)
Yes	13	25,5
Partly	23	45,1
No	15	29,4
Total	51	100

When we examine the findings regarding the question "Were You Informed of Job Opportunities While You Were Student in the University?", we can see that 13 (25,5%) of research participants select yes choice, 23 (45,1%) of them select partly choice, 15 (29,4%) of them select no choice. Accordingly, majority of research participants were informed of job opportunities while they were student in university as "Partly".

2. Findings Regarding the Questionnaire Prepared in order to "Determine Career Guidance Needs" of Mechatronics Education Department Graduates

Table 3. Findings regarding their responses to "I Was Informed of My Legal Rights Regarding My Field of Activity" statement

	Frequency (F)	Percentage (%)
Yes	6	11,8
Partly	9	17,6
No	36	70,6
Total	51	100

Table 4. Findings regarding their responses to "I Was Informed of Job Interview Techniques and How to Act in a Job Interview" statement

	Frequency (F)	Percentage (%)
Yes	3	5,9
Partly	9	17,6
No	39	76,5
Total	51	100

When we examine the findings regarding the question "I Was Informed of My Legal Rights Regarding My Field of Activity", we can see that 6 (11,8%) of research participants select yes choice, 9 (17,6%) of them select partly choice, 36 (70,6%) of them select no choice. Accordingly, majority of research participants weren't informed their legal rights regarding their field of activity.

When we examine the findings regarding the question "I Was Informed of Job Interview Techniques and How to Act in a Job Interview", we can see that 3 (5,9%) of research participants select yes choice, 9 (17,6%) of them select partly choice, 36 (70,6%) of them select no choice. Accordingly, majority of research participants weren't informed of job interview techniques and how to act in a job interview.

Table 5. Findings regarding their responses to "While I Was Receiving My Education, I Was Informed of How to Plan My Career after Starting to Work in a Workplace" statement

	Frequency (F)	Percentage (%)
Yes	2	3,9
Partly	12	23,5
No	37	72,5
Total	51	100

Table 6. Findings regarding their responses to "I Was Informed of Resources Which Will Help Me Follow Innovations in Relation with My Field" statement

	Frequency (F)	Percentage (%)
Yes	5	9,8
Partly	26	51
No	20	39,2
Total	51	100

When we examine the findings regarding the question "While I Was Receiving My Education, I Was Informed of How to Plan My Career after Starting to Work in a Workplace", we can see that 2 (3,9%) of research participants select yes choice, 12 (23,5%) of them select partly choice, 37 (72,5%) of them select no choice. Accordingly, majority of research participants weren't informed of how to plan their career after starting to work in a workplace while they were receiving their education.

When we examine the findings regarding the question "I Was Informed of Resources Which Will Help Me Follow Innovations in Relation with My Field", we can see that 5 (9,8%) of research participants select yes choice, 26 (51%) of them select partly choice, 20 (39,2%) of them select no choice. Accordingly, majority of research participants were informed of resources which will help them follow in

Table 7. Findings regarding their responses to "There Were Clubs, Establishments and Similar Organizations at University in Relation with My Field of Activity and I Was Oriented" statement

	Frequency (F)	Percentage (%)
Yes	12	23,5
Partly	19	37,3
No	20	39,2
Total	51	100

Table 8. Findings regarding their responses to "Activities Aiming at Developing Professional Creativity Were Organized" statement

	Frequency (F)	Percentage (%)
Yes	6	11,8
Partly	16	31,4
No	29	56,9
Total	51	100

When we examine the findings regarding the question "There Were Clubs, Establishments and Similar Organizations at University in Relation with My Field of Activity and I Was Oriented", we can see that 12 (23,5%) of research participants select yes choice, 19 (37,3%) of them select partly choice, 20 (39,2%) of them select no choice. Accordingly, majority of research participants weren't informed of clubs, establishments and similar organizations at university in relation with their field of activity.

When we examine the findings regarding the question "Activities Aiming at Developing Professional Creativity Were Organized", we can see that 6 (11,8%) of research participants select yes choice, 16 (31,4%) of them select partly choice, 29 (56,9%) of them select no choice. Accordingly, majority of research participants weren't organized activities aiming at developing professional creativity.

Table 9. Findings regarding their responses to "I Received Trainings with the Aim of Developing Communication Skills" statement

	Frequency (F)	Percentage (%)
Yes	2	3,9
Partly	15	29,4
No	34	66,7
Total	51	100

Table 10. Findings regarding their responses to "I Was Informed of Ethical/Legal Characteristics of My Field of Activity" statement

	Frequency (F)	Percentage (%)
Yes	1	2
Partly	15	29,4
No	35	68,6
Total	51	100

When we examine the findings regarding the question "I Received Trainings with the Aim of Developing Communication Skills", we can see that 2 (3,9%) of research participants select yes choice, 15 (29,4%) of them select partly choice, 34 (66,7%) of them select no choice. Accordingly, majority of research participants didn't provided trainings with the aim of developing communication skills.

When we examine the findings regarding the question "I Was Informed of Ethical/Legal Characteristics of My Field of Activity", we can see that 1 (2%) of research participants select yes choice, 15 (29,4%) of

them select partly choice, 35 (68,6%) of them select no choice. Accordingly, majority of research participants didn't informed of ethical/legal characteristics of their field of activity.

Table 11. Findings regarding their responses to "I Received Trainings in order for me to Develop My Teamwork Skills" statement

	Frequency (F)	Percentage (%)
Yes	16	31,4
Partly	14	27,5
No	21	41,2
Total	51	100

Table 12. Findings regarding their responses to "I Was Informed of Such Subjects as Prestige of My Profession, Its Economical Return, Working Conditions, etc." statement

	Frequency (F)	Percentage (%)
Yes	10	19,6
Partly	34	66,7
No	7	13,7
Total	51	100

When we examine the findings regarding the question "I Received Trainings in order for me to Develop My Teamwork Skills", we can see that 16 (31,4%) of research participants select yes choice, 14 (27,5%) of them select partly choice, 21 (41,2%) of them select no choice. Accordingly, majority of research participants didn't provided trainings in order for them to develop their teamwork skills.
When we examine the findings regarding the question "I Was Informed of Such Subjects as Prestige of My Profession, Its Economical Return, Working Conditions, etc.", we can see that 10 (19,6%) of research participants select yes choice, 34 (66,7%) of them select partly choice, 7 (13,7%) of them select no choice. Accordingly, majority of research participants were informed of such subjects as prestige of their profession, its economical return, working conditions as "partly".

Table 13. Findings regarding their responses to "I Was Informed of Characteristics of Workplaces Carrying Out Their Activities in the Same Field as Mine" statement

	Frequency (F)	Percentage (%)
Yes	5	9,8
Partly	24	47,1
No	22	43,1
Total	50	98

Table 14. Findings regarding their responses to "I Received Trainings in order for me to Develop My Problem Solving Skills" statement

	Frequency (F)	Percentage (%)
Yes	6	11,8
Partly	23	45,1
No	22	43,1
Total	51	100

When we examine the findings regarding the question "I Was Informed of Characteristics of Workplaces Carrying Out Their Activities in the Same Field as Mine", we can see that 5 (9,8%) of research participants select yes choice, 24 (47,1%) of them select partly choice, 22 (43,1%) of them select no choice. Accordingly, majority of research participants were informed of characteristics of workplaces carrying out their activities in the same field as theirs as "partly".
When we examine the findings regarding the question "I Received Trainings in order for me to Develop My Problem Solving Skills", we can see that 6 (11,8%) of research participants select yes choice, 23 (45,1%) of them select partly choice, 22 (43,1%) of them select no choice. Accordingly, majority of research participants were provided trainings in order for them to develop their problem solving skills as "partly".

Table 15. Findings regarding their responses to "I Received Trainings in order to me to Develop My Entrepreneurship Skills" statement

	Frequency (F)	Percentage (%)
Yes	4	7,8
Partly	15	29,4

No	42	82,4
Total	51	100

When we examine the findings regarding the question "I Was Informed in Detail of Sectors related or Close to My Profession", we can see that 5 (9,8%) of research participants select yes choice, 18 (35,3%) of them select partly choice, 28 (54,9%) of them select no choice. Accordingly, majority of research participants weren't informed in detail of sectors related or close to their profession.
When we examine the findings regarding the question "I Received Trainings in order for me to Develop My Risk Taking Skills", we can see that 2 (3,9%) of research participants select yes choice, 7 (13,7%) of them select partly choice, 42 (82,4%) of them select no choice. Accordingly, majority of research participants weren't provided trainings in order for me to develop their risk taking skills

Table 19. Findings regarding their responses to "I Was Informed of Such General Guidance Subjects as Self-Confidence, Motivation Increase, Stress Management, etc." statement

	Frequency (F)	Percentage (%)
Yes	2	3,9
Partly	15	29,4
No	34	66,7
Total	51	100

Table 20. Findings regarding their responses to "While I Was Studying, I Received Trainings In Relation With Conflict Resolution in Workplace" statement

	Frequency (F)	Percentage (%)
Yes	3	5,9
Partly	5	9,8
No	43	84,3
Total	51	100

When we examine the findings regarding the question "I Was Informed of Such General Guidance Subjects as Self-Confidence, Motivation Increase, Stress Management, etc.", we can see that 2 (3,9%) of research participants select yes choice, 15 (29,4%) of them select partly choice, 34 (66,7%) of them select no choice. Accordingly, majority of research participants weren't informed of such general guidance subjects as self-confidence, motivation increase, stress management, etc.
When we examine the findings regarding the question "While I Was Studying, I Received Trainings In Relation With Conflict Resolution in Workplace", we can see that 3 (5,9%) of research participants select yes choice, 5 (9,8%) of them select partly choice, 43 (84,3%) of them select no choice. Accordingly, majority of research participants weren't provided trainings in relation with conflict resolution in workplace while they were studying.

RESULT AND RECOMMENDATIONS

In the light of obtained data, it can be seen that Graduates of Mechatronics Department didn't get in general healthy career guidance. Given the fact that graduates responded almost all statements negatively, this finding is clear.
Under the framework of obtained findings, it can be seen that students need to be informed and oriented regarding their professions while they receive university education. In this context, we think that it is important to found certain establishments within the body of university for each department in order to carry out such informative activities. Characteristics, steppingstones, working conditions and opportunities of each department are different from each other. For this reason, we think that departments need to plan field-specific and informative guidance activities. Instructors may be appointed in order to realize these activities. It is clear that it is important to plan such activities as sectoral visits, special presentation days with field experts, field-specific career days, etc. and to spread them to the whole university education period in order to respond to career guidance needs.

Abstract: This paper examines the challenges of delivering tertiary education to Asian students from an Australian university campus based in Singapore. A study of fifty students from China, India, Indonesia and Myanmar was carried out in 2010 who were enrolled in undergraduate and postgraduate programmes. The aims of the research were to investigate the implications of teaching and learning approaches, and to gauge the expectations of both the education provider and international students. The main conclusions were that students, coming from a non-Western background with diverse educational systems, were ambivalent about the different approaches to learning and the difficulties in meeting academic standards, and, their low level command of the English language compounded the problems. From the perspective of the university, academics assume that students have adequate English language proficiency and that they adopt Western learning conventions expeditiously and any problems that arise can be solved by teaching and learning support.

Introduction

Australian universities in Singapore with about twenty thousand students, enjoy the largest proportion of enrolments among other foreign institutions. These twenty Australian higher learning institutes have either tie-ups with local universities and polytechnics or physical campuses. Taking advantage of the English language as the 'lingua franca', of its leadership in education and of neoliberal economic globalization (Pennycook, 1999a, 1999b), Australian universities have seen an exponential growth in transnational (or offshore) higher education. Benefitting from its leadership position, Australian higher education remains attractive to foreign students. This is based on several factors. Firstly, to ensure quality and international standards, the Australian Commonwealth Register of Institutions and Courses for Overseas Students (CRICOS) aims to protect the interests of foreign students, while keeping a close watch on Australian education's international quality and reputation. Second, by establishing the Education Services for Overseas Students (ESOS), Australia has ensured the legal protection of international study, thus guaranteeing high quality service to the student. Third, by offering worldwide recognised qualifications which are part of the Australian Qualifications Framework (AQF), Australian universities offer a seamless transition into higher education for their international students. Instead of relocating to Australia, a considerable number of students prefer to study at one of the Australian off-shore campuses in Singapore for several reasons: overall, Singapore offers lower living costs, proximity to home country and similarities to culture, ease of adaptation and the possibility to graduate one year in advance, thus reducing living and studying expenses. Nonetheless, the transition from a non-Western education is not trouble-free. In this paper, the term transnational student refers to overseas students studying for a degree in an Australian university in Singapore. UNESCO and the Council of Europe (2001), describes 'transnational' higher education as education provided by an institution located offshore (not in country of origin but in a host country) to students coming from different countries. Western or Anglo-Saxon education is used interchangeably and denotes English-speaking education.

Previous research focusing on Asian students studying at Western Anglophone universities (Britain, Australia and the U.S.) has denoted that there are several factors impeding their academic achievement such as, language, culture, educational background, financial pressures and emotional issues (Huang & Klinger, 2006). Also, most past studies have been limited to subject areas and, to either staff or

Chinese students' perspectives. However, the challenges are complex for the provider of language and academic literacies support in a transnational setting, across all programs located in two different campuses to a population of over two thousand three hundred students. Thus, the purpose of this study is to investigate the implications of Western teaching style and non-Western learning approaches, academic staff and students' expectations, and located at the crossroads of these expectations in the context of teaching and learning. This study was undertaken to identify the issues by focusing on specific problems and giving a perspective across the stakeholders in an Australian institute offering higher education in Singapore.

Context

Whether based in Australia or offshore, one of the entry requirements to Australian universities is English language proficiency. Unless a student has a previous degree taught in English, a student wishing to study at an Australian university must have an International English Language Testing (IELTS) score of 6.0 or equivalent for general entry to undergraduate studies and a score of 6.5 for postgraduate studies. This implies that students who have obtained that score have the ability to cope linguistically with their chosen course of study. This erroneous belief leads many transnational students to assume that since they have met the university's entry requirements, they can manage their studies without further help. Those who do not meet the criteria can start their higher education studies after completing a two-semester foundation programme. However, regardless of their previous studies or English language proficiency scores, the majority of foreign students enrolled in Australian degree programs in Singapore require English language and academic skills development and support throughout the course of their studies.

The majority of international students studying in Australian offshore campuses in Singapore are of Confucian Heritage Culture (CHC) a term coined by Biggs (1994) and of Non-English speaking background (NESB). One dominant issue facing these students is English language proficiency. The degree of difficulty is further exacerbated for CHC students of Chinese origin as the cross-linguistic transfer is very low. This is based on the fact that there is no positive transfer, namely, transfer of metalinguistic knowledge between their first language (L1) and second language (L2) which inhibits overall comprehension (Huang, 2004, 2005; Liu, 1994, Zhong, 1996). They use a face saving communicative strategy, and adopt an indirect writing style. Coming from a collectivist culture, CHC NESB students have been exposed to a different educational learning style and differ from Western students who, from an early age, learn to be analytical and voice their views. Students coming from China, Myanmar, India and Indonesia are taught to learn by listening, not arguing or questioning for the sake of harmonious and respectful relationship building. These students' linguistic politeness and face saving strategy reflects their attitude towards creating a non-threatening environment where each individual is acknowledged and respected (Chuah, 2010). This positive face stance fits squarely in Brown and Levinson's (1987) model of politeness. Hence, most will not ask questions or publicly state that they do not understand for fear of losing face and rely heavily on lecturers' instructions (McLoughlin & Oliver, 2000). These students are not ready to learn abstract and complex concepts and the discourse and conventions of the disciplines. The manifestation of interference from native language can be easily observed in students' writing, and an error analysis offers significant insight into the nature of difficulties in writing faced by most students. It is quite clear that they are using discourse patterns embedded in their own language as well as culture, such as repetitiveness occurring in essays. This is a strong characteristic of semitic pattern discourse used for emphasis such as in Arabic and Farsi (Miller, 2007). As for oriental discourse (also known as Asian discourse) the lack of connection between the main idea and details (spiralling and indirect) is one of the major problems in students' English writing (Gudykunst, 2004). Most CHC NESB students are unaware of the fact that they are using a discourse style inappropriate to English academic writing conventions.

Partly due to their inadequate English language skills, students' lack of active participation in class discussion and hesitance in communicating impedes their learning (Huang, 2005). In addition, international students are not given adequate time to adapt to the standards of Western academic culture, expectations and scholarly conduct. In a very short period of time, while lacking sufficient vocabulary to understand key content and concepts, they have to figure out how to synthesize new information, critically analyze and argue. These academic skills are alien to them and generate more lecturer and tutor dependency. For the Asian learner the "teacher is the final authority" (Ladd & Ruby, 1999; Tin, 2008). Chung, Kelliher and Smith (2006) further expand this notion to non-CHC countries such as India and

Indonesia. On the other hand, most academics have pedagogical assumptions in terms of their students' metalinguistic awareness (MA) and knowledge (Bialystok, 2007). Bialystok, Luk and Kwan (2005) offer further evidence that alphabetic writing systems have an impact on the level of cross-linguistic transfer, namely, the transfer between L1 and L2 (Cicero & Royer, 1995; Durgunoglu, Nagy & Hancin–Bhatt, 1993). Academics as non-language experts, have limited understanding of core language issues and expect students to have the ability to present an argument and to provide evidence from literature in support of their own views, thus trapping the students into a 'cut and paste' situation in an attempt to disguise their deficiencies (McGowan, 2005). Another problem is that for the students, altering 'paraphrasing' authorities' words is for the students a sign of disrespect as knowledge should be conserved and transmitted 'ad verbum', hence plagiarism becomes a serious issue. These core Western concepts are completely alien to them and lecturers are ill equipped to deal with students' needs while at the same time keeping academic standards and quality (Ryan & Carrol, 2005).

For most Asian students who leave their homeland to study at an Australian university they rarely raise their hands to ask questions out of respect for their lecturers and for fear of looking ignorant. Furthermore, in Singapore they feel excluded by local student groups and feel more comfortable and confident when they are with students from their own country. These feelings of isolation and frustrations are further exacerbated when lecturers appear to be uncaring and reluctant to guide them every step of the way. They expect teachers to take the role of their parents (Chuah, 2010) and when their needs are not met, they turn to teaching and learning support to take responsibility for their learning and success. However, the lecturers' approach is to foster independent learning which collides deeply with the Asian teaching style that cultivates a nurturing style. It is not surprising then, that Asian international students expect to be told what to do 'exactly' (Huang & Rinaldo, 2009) and appear in their lecturers' eyes as needy of 'spoon-feeding'.

Method

This study aims at investigating the impact of culture, language and educational background of international students in an Australian university's offshore campus based in Singapore. It explicitly explores staff's teaching and students' learning approaches and their expectations. As the main objective is to add richness and depth to this research, semi-structured interviews included discussions related with their experiences in the host country. The study collected data from 50 Asian students enrolled at an Australian University based in Singapore. To add credibility to the study (Gay & Airasian, 2003), a group of fifty international students from China, India, Indonesia, and Myanmar, and of various age groups, gender and study programmes were randomly selected. The voluntary participants were 13 males (26 percent) and 37 females (74 percent) aged from 19 to 22 representing four countries. They were 22 Chinese (44 percent), 9 Indian (18 percent), 17 Indonesian (34 percent), and 2 Burmese (4 percent). Of the 50 students, 10 (20 percent) were postgraduate students and the other 40 (80 percent) were undergraduates. This study draws on the semi-structured, face-to-face interviews and students' reflections conducted at an Australian higher education provider in Singapore between February and November 2010. The results of the study show significant similarities in the negative factors affecting their studies. To ensure anonymity and confidentiality, the institution and individuals have been de-identified. The hand recorded interview data were analysed based on Jonassen and Rohrer-Murphy (1999) activity theory framework. The responses were grouped and analysed according to the issues identified. The first set of questions focused on the participants' education background and the problems adapting to a Western tertiary education. The second set looked at time and financial factors; the third tried to identify the emotional factors and lastly, analysed the implications for teaching and learning support.

Results and Discussions

Following the analysis of the interviews, the most pressing concerns affecting these students were: first, linguistic competence, second, educational background and cognitive factors, third, time constraints and financial factors, and lastly, emotional factors. These factors and academic staff's attitudes and perceptions are further highlighted in the discussions.

Linguistic Competence

There were many common responses concerning English language competence. Except Indian students, 91 percent of the participants indicated their lack of English language proficiency as a

significant factor impeding their studies and progress. A Burmese, student made the following comment: "In my home town, I had English as one subject in high school and never wrote an academic essay in English language before coming here." All Chinese students interviewed indicated their poor vocabulary; this was echoed by the seventeen Indonesian students; "My vocabulary is insufficient to understand content and concepts." Their limited language competence also hindered their active participation during lectures and tutorials. In contrast, the Indian students felt more at ease with their language proficiency and strongly emphasized that their English language skills were adequate for their studies, further indicating "the teachers are not telling us what we are supposed to do. We are all confused and many times we asked the lecturer for help. But, she doesn't give us answers and I could not find them in my textbook. She says we have to do research to find the answers. I don't know what to do." The most frequently reported confusion regarding their English language proficiency is the fact that while getting good grades in one subject, they fail in another based on their language proficiency issues.

Educational Background and Cognitive Factors

Another factor affecting negatively students' tertiary education is based on their inexperience in academic literacy. As one Indonesian student notes: "I have difficulties in the following areas during lectures and tutorials: It is difficult to listen and understand other students' answers; for example, when lecturers ask questions, we don't understand the student's response and we all hope that the answer is wrong so that the lecturer can give the correct answer." And another Chinese student's response: "We don't understand what the lecturer is saying; he often goes off topic and doesn't give examples." When asked whether she tried to contact the lecturer for further explanation, she answered: "I don't know if I'm allowed to see the lecturer." After analysing all the participants responses, it became apparent that they could not apply what they were learning (theories) to authentic situations, they simply could not see the link, and everything remained relatively disconnected. In the final question of this section, students were asked how academic staff could help them. The key responses were: "I wish the teachers would give us a sample of the work they want from us. It is very difficult to work out what the lecturer wants." And "I wish our lecturers could provide all students sample essay/exam questions with answers to guide students on how to answer." "Why do they (lecturers) ask me to write my own opinion? How can I do that? They tell me, 'You cannot use '*I*'. Why should I have my own opinion? They should tell us what we need to know so that we can pass the exams. But they don't do that." Which, according to Tait (2010) is "a surface approach to learning brought about by a desire to do no more work than is needed to pass" (p. 264). On the other hand, Miller (2007) grouping all Asian languages in the oriental rhetoric, explains that 'Asian writers work to present details without explanation of the connections between them or their connection to a main idea" (pp. 5-6). One Indian MBA student rightly stressed: "I can't find the answers for my essay question in my textbook and the lecturer is not indicating the passage in which we can find the answers. I think this lecturer does not know the answers either". Chuah (2010) clearly identifying the problem, wrote "[…] they expect the lecturer to tell them exactly which page to read in exactly which books, exactly what to include in an essay or exactly how to structure the essay." All the students involved in the interview said that their only concern was to get their degree and that obtaining a pass was good enough. One Chinese student commenting on grades said: "Nobody looks at my grades: employers will look at my degree and if it is a Western one, then I will climb the career ladder quickly". On the other hand, following discussions with teaching staff there emerged common views regarding their international Asian students: they described the students as passive, completely disengaged, lacking English language skills and concluded that therefore, they could not comprehend the basic requirements of academic writing. This Asian student passivity and lack of engagement has been widely explained in literature (Chuah, 2010; Gupta, Williams & Leslie, 2006; World Trade Press, 2010). Instead of "addressing students' academic learning skills themselves" (Tapper & Gruba, 2000, p. 56), the students who show signs of deficiencies are sent to see an academic skills adviser, in other words, they are sent to the "...crash repair workshop where welding, panel-beating and polishing ... takes place" (Chanock, 2007, p. 273).

Time Constraints and Financial Factors

The third reported factor was lack of time and financial pressures. For many Asian students, having a recognised Western degree is highly valued as it will give them a head start in life. Therefore, families will often stretch their budget to provide a good Western education as guarantee for a better future. All the students originating from India indicated that they would bring 'shame' to their own families if they did not succeed. During an interview, one outspoken MBA student said: "My friend failed one MBA unit last year and his family asked him to return back home immediately." He further

explained that for many wealthy Indian parents failure was out of the question indicating "If I don't pass all my units, I will have to go back home, I am really terrified. Everybody will identify me as a good-for-nothing. I need to... I have to pass, otherwise, I'm finished". Quite clearly, failure for this student meant the end of the world. Eighty-seven percent of the students reported of their fear of failing a subject and thus bringing shame to their families. These views, namely, that education correlates with a better career and future for themselves and families are particularly relevant (The Economist, 2003). The pressure of performing well in an alien environment has deep emotional effects on these international students, however, they will not seek help unless they are in a safe and trusted environment. As well, the results indicate that students need time to adapt to their new learning environment and all participants indicated that they were overwhelmed by the demands of their studies.

Emotional Factors

Whilst most students identified the need for more support and understanding from their lecturers, they also indicated that they felt lonely and isolated from other ethnic groups. The feelings of exclusion and isolation were particularly felt by all female participants. Male participants, although acknowledging factors of exclusion by other ethnic groups and especially by local students, did not feel too strongly about it. One female respondent said "I think the local students don't want us because we don't speak good English, so for group work they avoid us or ignore us if we are in the same group. They think we will lower their grades." One Chinese student bluntly said "Nobody cares about us." Another student (Indonesian) highlighted the fact that some tutors paired students from the same culture but, facing the same difficulties, they could not help each other. All female students voiced their feelings of loneliness and homesickness whereas male students did not feel that this was a serious issue. Only the Burmese students were fearful of being sent back home.

Despite the consequences and factors impeding their learning journey, notwithstanding the large sums they have to pay to obtain a Western qualification, these students remain respectful towards their lecturers and tutors.

Challenges in Teaching and Learning Support

Whether located onshore or offshore, Australian universities offering teaching and learning support to their international students are numerous. The number of academic skills advisers providing support in any given Australian institution depends on many variables such as the number of its students, financial priorities (for further explanation, see Avirutha, Bui, Goodstone, Reid, Rendon & Johnson, 2005; Marginson, 2002) and the perceived value of teaching and learning support. These academic support advisers need more than just their areas of specialised expertise to meet the educational and personal needs of the diverse student population and culture. Regardless of what the student is studying or the level of difficulties encountered, teaching and learning support must be flexible, expert in academic literacies and carry a multitude of roles (Gremmo, 1995). They need to have excellent communication and interpersonal skills to work with undergraduate, postgraduate, local and transnational students across the disciplines and offer individual consultations as well as workshops, as in the case of this study. These workshops should ideally include academic language and writing conventions, research, time management, exam preparation, presentation skills, critical reading and writing. Chanock (2007) has rightly stressed that despite 60 percent of advisers in Australian universities are considered 'academics' (the remaining 40 percent are classified as 'teachers' or 'general staff'), their "teaching loads are typically heavier than those of academics in the disciplines." (pp. 272-273).

In the eyes of the students, they are seen as a "quick fix" (Stevensson & Kokkinn, 2007, p. 48) 'problem-solving aid', 'pressurizer' and even as 'companion' (Pemberton, Toogood, Ho & Lam, 2001). However, the challenging tasks faced by many are to 'diagnose' and 'fix' problems 'repair' malfunctions, 'rectify' misunderstandings, and are viewed by academics as a 'cure-all' for academically 'dysfunctional' students. Their professional status is undermined as they are placed at the periphery of academia. Teaching and learning support is seen as a 'panacea' to 'treat' and eventually 'cure' all academic learning 'ills', whether it be linguistic, cognitive or affective. The expectations are boundless: they should know all types of academic discourse and conventions of all disciplines.

Conclusion

Mapped out by the contextual and theoretical frameworks, several key issues are identified in this research. Whilst the challenges faced across Asian culture and various study programs were based on interviews with international students, the results have a good fit with the literature and research. The complexities and multi-layered nature of difficulties experienced by international students are more

intense for particular cultures and most feel similar pressures and share the same fears. These views are further supported by Pedersen, Draguns, Lonner and Trimble's findings. (1996). Likewise, as Bradley (2000) indicates "The majority of students said relationship problems, feelings of isolation, homesickness, academic pressures, finance and accommodation were likely to contribute to difficulties." (p. 425).

This study explores the linguistic and non-linguistic features negatively affecting the progress of transnational students, the attitudes and expectations of academic teaching staff and the challenges teaching and learning support is facing in an Australian university campus based in Singapore. The results of this study indicate that there are no major differences between the Chinese, Indian, Indonesian and Burmese learner. This study highlights the need for Anglo-Saxon universities operating offshore to recognise that the viability of their programs and the academic success of their students depend on several factors. First, the need to understand the pedagogical and cultural challenges students are facing. Second, that there is a positive correlation between English language competence and academic success. Third, that first year students in particular are struggling in meeting the demands of their academic subjects. NESB students need a range of academic skills to help them overcome their lack of competency especially, in understanding key concepts and to transmit their knowledge in written and oral forms.

This study looks at the major issues facing an Australian university campus delivering transnational higher education in Singapore. What is needed is an appropriately conceived and developed training program, especially for local academic staff with qualifications from a non-Australian education system, to change the one-dimensional view of their students' learning issues. Further training can lead to a better and improved teaching approach that addresses the needs of a multi-cultural student population. Additionally, to "bringing the foreigners up to speed" (Haigh, 2002, p. 37) more work needs to be done such as offering an academic literacies bridging programme to ensure a smooth intercultural transition of Asian students into a Western education system. Lastly, the multi-dimensional work academic literacies and language advisers working in the context of teaching and learning support, calls for a better understanding of what they are expected to provide and the construction of their roles.

Acknowledgment

The authors wish to thank all participants in this study for their willingness to reflect on and share their experiences.

CHEATING AND THE USE OF TECHNOLOGY BY HIGH SCHOOL AGE STUDENTS

David E. Whale, Ed.D.
Associate Professor
Central Michigan University
Mt. Pleasant, MI 48859
whale1de@cmich.edu

Abstract

Technology continues to advance and young people tend to be early adopters of technology. This is a potent combination on a number of levels, including the combining of cheating with technology, a subject that has garnered increased attention and has increased importance and relevance. Beyond the schoolhouse, it seems cheating has become endemic in the corporate world and government. But it is wise to remember that big cheaters were once little cheaters, most likely starting as school aged children who did not get caught or did not receive proper and ethical guidance from role models. This paper explores reasons high school students cheat, how they use technology to do it, what constitutes cheating, and how educators can lessen cheating in schools. A literature review is supplemented by personal observations of the author and his experience over 35 years as an educator and researcher.

Introduction

I chose to study the phenomenon of cheating in schools, especially as it incorporates technology, for the following three reasons:

1) The rapid increase in technology and its use in daily life by young people.
2) The harm that is done to society by cheaters.
3) My belief that large scale cheaters started out small and it is to the benefit of all to nip them in the bud.

Let's start off with a straightforward question: What is cheating? The word cheating is a derivative of the word *escheat*, from the Old French meaning "to fall to one's share" combined with *es*, used in French to designate "escape." The original use referred to a situation if a person died with no heirs. In such a case the property of the deceased reverted to the crown. In the eyes of some this was a confiscation by the government of undeserved assets which, understandably, relates to our current understanding of what it means to cheat. Another common and current definition of cheating is "a deception for profit to yourself."

Cheating has been around as long as mankind and as you might expect has received scrutiny from some notable sources. Well known utterances about cheating abound, as evidence by these from between 200 and 3,000 years ago: "He'll cheat without scruple, who can without fear." (Benjamin Franklin, American statesman, 1706-1790); "Bread of deceit is sweet to a man; but afterwards his mouth shall be filled with gravel." (Proverbs 20:17); and, lastly, "I would prefer even to fail with honor than to win by cheating." (Sophocles, Greek tragedian, 497-406 BC). These statements show that cheating is not a new topic and has been a concern for centuries.

A primary lesson that may be deduced is that human behavior really does not change over time. Here is one more last quote before moving on to modern times: "The children now love luxury. They have bad manners, contempt for authority, they show disrespect to their elders. They contradict their parents and are tyrants over their teachers." While many people would ascribe those words to any current day exasperated parent, they were uttered by Plato, 2,500 years ago.

Next we will examine some current literature on the subject of cheating and technology, followed by the gray area of cheating and trying to determine when students cross the line. I will then list 17 reasons that students cheat and close with some suggestions on what school leaders can do to lessen cheating in their buildings.

Literature Review

There have been many studies about cheating in high school, the methods used, the role of technology, and the disposition of the cheaters. Lathrop and Foss (2000) reported three reasons why young students chose to cheat: (1) Cheating is easy with technology such as the Internet; (2) The odds of being caught are low; and, (3) Those who are caught do not receive severe punishment (p. 1).

The Pew Internet & American Life Project (http://www.pewinternet.org) found in 2005 that while there is "agreement among teens and their parents about the role that the internet plays in teens' education (88% of online teens believe that the Internet helps teenagers to do better in school and 83% of parents of online teens agreed with that proposition, there is more of a disagreement when it comes to use of the internet for cheating on schoolwork. Some 37% of teens said that "too many" teens today use the internet to cheat on schoolwork. That compares to 27% of parents who say the same thing." This may indicate that as is often the case with parents and children, the youngsters are ahead of the curve.

Another large-scale contributor to the field is the Josephson Institute (http://www.josephsoninstitute.org). Among its key findings on the topic at hand are:

(1) Teens 17 or under are five times more likely than those over 50 to hold the cynical belief that lying and cheating are necessary to succeed (51% v 10%);
(2) Regardless of current age, people who cheated on exams in high school two or more times are considerably more likely to be dishonest later in life;
(3) High School Cheating: Those who admitted cheating on exams in high school are three times more likely to misrepresent or omit facts in a job interview than those who did not cheat (12% v. 4%); and
(4) The vast majority of respondents of all ages believe that young people lie, cheat and steal more than previous generations but teens and young adults are considerably more likely to believe this than older adults.

Methodology

There were two methods used in this exploration and status report: (1) A literature review; and (2) anecdotal conversations and observations. The literature review was comprised of academic papers and, especially, surveys, such as by the Pew Internet & American Life Project and the Josephson Institute. The anecdotal contributions come from 35 years of working with teachers, students, and principals by the author.

Findings

The motivations for cheating and the role of technology in it are varied. Obvious reasons include "to get a better grade" and the ubiquitous "everyone does it." But it goes far beyond that. My research and observations have resulted in 17 different reasons why students cheat. Principals, teachers, and students also report multiple motivations on why secondary schoolers cheat. My contact has been primarily with educational leaders at the secondary school level and in traditional public American schools.

Why Students Cheat

The ultimate goal of cheating in a high school situation normally, but not always, is to get a better grade on a test or project. But as noted, the reasons are varied:

1) Pressure to get good grades to get into a "good" college.
   Students are often under pressure to gain admittance to an elite university. This pressure can come from peers, "society," and quite often, parents. One of the primary criteria for gaining entry to these institutions is grade point average (source). Hence, students who may fall short may turn to cheating.

2) "Everyone does it."
   There is sometimes a perception that something is more common than perhaps it is. Young people who hear the refrain "everyone does it" may be more apt to succumb to cheating than they would be otherwise.

3) Too much work due at the same time.
   This is a logistical problem. Students report and principals confirm that there is often not a coordinated testing schedule at the high school level. In other words, students may find several projects due the same week or tests on different subjects the same day. As a result they turn to cheating.

4) Grown-ups cheat and lie, especially in business and politics (so it's OK that we do, too).
   Large-scale cheaters and scammers like Bernard Madoff and scores of politicians on all levels of government have been exposed. These individuals are who young people read about and see on television.

5) Don't care about the subject.
   The thinking here is "I don't care about this subject at all. I'm going to take the easy way out."

6) It's just so easy – crimes of opportunity.
   As with #3 above, this is something of a logistical problem, plus a lack of training and awareness by teachers and other school leaders. If the barn door is left open and the horses wander out, is anyone surprised?

7) Ignorance, the rules are not clear.
   Especially with the advent of increasingly sophisticated Internet resources, opportunities, and utilization, this becomes a hard area, what actually constitutes cheating?

8) Prone to cheat and/or lazy.
   We cannot leave this one out. Some people just seem to be born this way. I am not saying a criminal disposition is the same thing as laziness, just that these are two constructs or traits that some people seem to have as part of their genetic makeup.

9) Low self esteem – lack of confidence that passing is even possible.
   Unfortunate students who have had little success and otherwise low self-esteem may resort to cheating to make up for this.

10) To maintain athletic or other eligibility.
    Athletic and other extracurriculars often require a maintenance of certain academic standards. In order to keep eligibility, cheating can be a tool used.

11) Poor teaching.
    This is probably not the first reason for cheating that comes to mind, especially for educators. But some students report that if the teaching quality had been higher, the incidents of cheating would be lower.

12) Esteem is *too* high--I don't need this.
Some people seem to have a sense of entitlement, that working hard to obtain an honest grade is simply below them.

13) To cover a disability.
A student may resort to cheating to cover a disability, such as a vision problem or learning disability.

14) For the thrill of it.
There can be a level of excitement related to cheating that some find hard to resist.

15) Peer pressure.
Related to #2 above, but more specific. In this case it is cohorts who put the pressure on someone who may or may not otherwise be prone to cheating.

16) "Better to cheat than repeat."
If the choice is to cheat or repeat a class, cheating may be the option of choice.

17) The challenge (technologically) of it.
As discussed elsewhere in this paper, the world of technology has opened many avenues for "creative" cheating. Just as some people find a challenge in developing applications or hardware, others find their challenge in discovering new ways to cheat.

Technology and Cheating

Yesterday's technology for classroom deception may have involved "crib" notes written on the palm of a hand or on a piece of concealed paper. In some ways, while the dizzying pace of technological progress can seem overwhelming, the basic precepts and methods are still the same. For example, while only a small amount of data could be concealed on a hidden piece of paper, the same idea today can results in access via a smart phone, for example, to absolutely uncapped amounts of information. Same idea, different conduit.

Wireless devices, especially cell phones, are often tools of choice for today's young cheaters. The typical smart phone has capabilities that many veteran teachers simply are unprepared for. This includes cameras, memory capacity, speed, Internet connections, and, of course, communication abilities (to and from other students in or outside the classroom, for example).

With the stakes higher than ever for young people, especially in areas such as standardized tests, where scores can determine the quality or status of college for which a student may be accepted, students may be more susceptible to using inappropriate technologies than they may otherwise be.

Adding to the problem are (1) the rampant use of technologies such as YouTube that students utilize for cheating strategies and tips; and (2) web sites dedicated to helping students circumvent their academic duties, including http://www.schoolsucks.com and http://writework.com. A quick search of YouTube, for example, identified short videos intended to help students cheat titled "how to cheat on any test," "how to cheat on a test final," "how to cheat in a test using a coke bottle," "how to cheat in exams," and "how to cheat on any test easy" as only a handful of many choices. One contributor identified as HouseholdHacker seemed to almost corner the market on cheating videos and was among the most popular with a signature video that had been viewed 6,598,727 (as of May 2011) times.

When Does the Student Cross the Line?

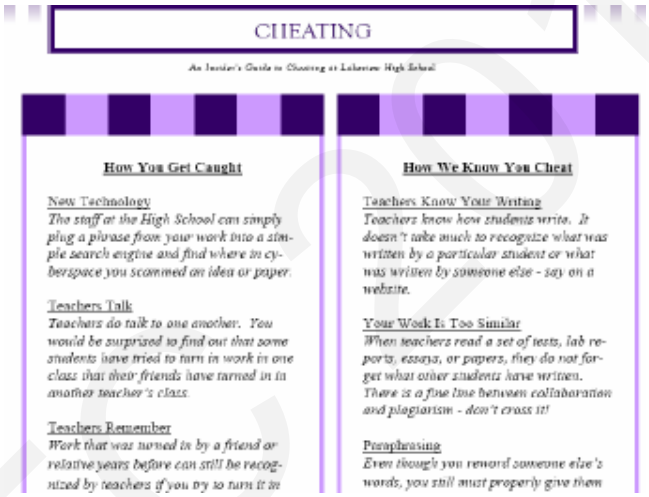
Regarding technology in general and the Internet specifically, it can be confusing for young people to understand and know when they have "crossed the line" from legitimate reporting of research to something that falls into a gray area or even something considered unethical. The most simple example of this is the

common practice of "cutting and pasting" for reports. In days gone by, this was done by lifting passages from previously written papers. Today, of course, with the Internet the possible sources for papers have exponentially expanded as have the abilities to lift verbatim.

It is my opinion that young people often do not realize that they are, in effect, cheating. There are two main ways to combat this, both basically involving education: (1) The use of a good style manual, such as the Publication Manual, 6th edition, of the American Psychological Association, and (2) a clear student handbook in the high school setting.

One example of clear language from a high school handbook can be found in the Lakeview (Michigan) high school handbook.

Figure 1
Lakeview (Michigan) High School Student Handbook



CHEATING

An Insider's Guide to Cheating at Lakeview High School

How You Get Caught

New Technology
The staff at the High School can simply plug a phrase from your work into a simple search engine and find where in cyberspace you scammed an idea or paper.

Teachers Talk
Teachers do talk to one another. You would be surprised to find out that some students have tried to turn in work in one class that their friends have turned in in another teacher's class.

Teachers Remember
Work that was turned in by a friend or relative years before can still be recognized by teachers if you try to turn it in

How We Know You Cheat

Teachers Know Your Writing
Teachers know how students write. It doesn't take much to recognize what was written by a particular student or what was written by someone else - say on a website.

Your Work Is Too Similar
When teachers read a set of tests, lab reports, essays, or papers, they do not forget what other students have written. There is a fine line between collaboration and plagiarism - don't cross it!

Paraphrasing
Even though you reword someone else's words, you still must properly give them

Student handbooks are a frontline tool to combat unethical behaviors such as cheating. Most students receive handbooks at the start of the school year and they are discussed at that time. It is common for parents to receive the handbooks, as well, and often parents and students are asked to sign for them indicating that they have read and understand key school policies and procedures.

How School Leaders Can Lessen Cheating

I strongly believe there is much that can be done to lessen cheating by young people and that the technological "advantages" they have can be muted. Methods schools can use to lessen cheating include:

1) The most powerful method of all: Communication. By modeling and explaining what constitutes honest and ethical behavior school leaders and teachers can have a profound impact on student behavior.

2) Awareness. Teachers need to be cognizant of how students use technology to cheat and the reasons that they cheat. This does not have to be overly complicated. Limiting access to cell phones, for example, can go a long way to lessen cheating. Walking around the room by the teacher has lessened cheating since classrooms were first organized.

3) Employ technology. On a slightly more advanced level, "jamming" technology to prevent communication can be employed. For papers and written projects, sophisticated software applications such as http://www.turnitin.com and http://www.respondus.com/products/lockdown.shtml, which allows more secure online testing.

4) Punishment. Research shows that consistent enforcement of policies can lessen cheating.

5) Clear expectations. Related to communication above, the setting and embedding of clear expectations for academic honesty help to establish a culture where ethical behavior among students is more of a norm.

Conclusion

Cheating is epidemic and more technologically sophisticated than ever. This is true in high schools and society at large. While the situation may be discouraging in some respects, there is reason for optimism as well. The primary way to stop cheating is communication, teachers explaining and modeling ethical behavior. Other powerful methods include using technology to identify and prevent cheating, old-fashioned teacher awareness and proactive stances such as walking around the room and carefully reviewing work, and punishing cheaters.

In my opinion, the greatest area of need for school leaders and anyone concerned with cheating is the lack of understanding of the motivations for this behavior. Expectations, communication, punishment, and prevention all have important roles. But understanding motivation for cheating is an underdeveloped tool that can be improved and lead to better behavior and a more satisfying teaching and learning environment.

ABSTRACT

The purpose of this research was to compare the impact of teaching by virtual teacher and real teacher on students learning in a classroom. the research method was experimental .The population was all of the students of Islamic Azad University of Marvdasht which was 13158 persons in year 88-89.The sample(80 persons) was selected by cluster random sampling and devided to 2 different group with the size of 40 persons . one group was control group and the other was treatment group. A researcher made test with 40 question was used to conduct this research. Pre- test , post –test and test of stability of learning was performed for both group and the results were analyzed by using T – test. Based on the results of this research , we can use virtual teacher where there is no access to real teachers, the quality of learning in teaching by virtual teacher(online teaching) was as the same of learning by real teacher, in real classrooms we can use virtual teachers instead of real teachers, and the stability of learning in both methods of teaching was the same.

INTRODUCTION

There are two types of virtual- trainings category according to communication: the first type: inside- school planning that is about the method in which students are trained by internet in education place as collective and under responsible observation. And the second type: outside- school planning (which is more common). In this method, people are connected to internet and trained in their houses or even in their work place.

Sarmadi (2005)stated that virtual- based teacher training is a kind of education and learning in which teacher and student are separated geographically. Therefore, it is lied on computer and internet to give educational services by means of assisted- training and electronic tools such as printed texts. It is hard and- in certain cases- impossible to provide expert and skilled professors typically for remote university from related centers due to various reasons such as to be New and old some educational fields inside of country or complexity of some lessons.

So that it isn't provided these majors and units or theses are taught by professors who are not specialist in these majors.

In any case, these cause to make scientific harms in country's universities. Frank (2000) showed that all teachers who are participated in virtual training, they consider virtual learning as element to power and enable students; and they account its advantage as active learning, critical thought, cooperation, self-steam and accustom to permanent learning.

(Mehrpoya, 2004) stated that inside- school remote training plans are applied to support education in schools where there aren't any learning materials. These plans can be also applied in place where teachers don't have formal abilities or to support schools where have few students that it is impossible to organize traditional education.

Now, Is it observed any difference between training via virtual teacher or genuine one as learning quality?

Can be used on-line virtual teacher in university's actual classrooms instead of genuine teacher in respect to existing developed technology of computer sciences typically Internet high- speed lines in country's universities? In another words, can be use virtual professors to eliminate lack of expert professors? These are problems which are contained in this study.

Baras and oven(2000)believe the increasingly growth of today's technology and science want new learning and teaching methods. use of teacher viewpoint, the only wise of teaching scene, as another old and despicable ideas. Students must play more active role in learning and teaching and teacher should changes into guidance person, facilitated, arbitrator and educational designer. It is hard to realize in a physical class with fixed space and determined time and conditions of traditional education. Live training based on classroom will make high expense. Then in electronical training, the people are able to learn their required information in each hour of day and in throughout the week. In electronic training, it is decreased traffic expenses and ones related to professors and consulters, and it is prevented to waste time. Hence, it seems necessary to study the possibility in create these types of educations about efficiency and effectiveness of these training.

Miller (1993), who is one of theorists in curriculum plan, has identified four long- time procedures in remote education in universities. He has predicted observed changes in remote training in global level. These cases are included: coincide diversity and convergence of technology with outcomes to design course, design curriculum, organizing policies of resource investment and etc, variant relations with students by more emphasis on collective relations, alteration of time control, study speed and place, variant relations between institutes by make some consortium to share resources, degrees provisions and national programs, specialized national universities or university plans. New- found main flow means that remote- training shows more extensive changes in educational paradigm; this is place where educational institutes are corporate with social evolve currents, and New substructure of technology and alterations in main learning- teaching communications.

Keegan (2000) outlines virtual educational features as follow:

Extrication from scheduled classes; escape from closed places; extrication from time limitations; escape from join to educational groups in order to learn; training for house- keepers and training for hospitalized, shift, passengers and jails individuals.

Kashiha,and Kashiha(2006), According to quick evolution in information arena human knowledge, hasting knowledge production current and flow of obsolesce present knowledge, emphasize that curriculum must focus on purposes about how to learn and teach permanently more than before. So that, the students should be architecture and designer and designer of growth and development flow, and it must be noticed to active presence of students.

Mehr Mohammadi,(2004) mentioned that the learning isn't just confined to whatever is done in class. Use of technology in order to expand and develop training and education will be resulted in huge attack of numerous advantages for all people.

Gits (1999)stated that if learning means change in person's potential and ipso facto behavior, then it will be done by better technology. Yaghma, (2009) believes that educational technology bases (such as virtual training) is base on behaviorism psychology. In training technology, it is considered amplification and depth of prior taughts, self- evaluation and reflection receive, discover required information, laboratory activities performance in virtual environments, knowledge production and creative performance, by use of electronic tools and also communication with scientific centers inside and outside of country.

Noroozi, zandi and Moosavi Madani (2006) try to study the research as title of ranking of information technology application method in school learning – teaching process, and by purpose of study various procedures in use of information technology in learning process, and they concluded that suitable method to apply information technology in learning process- in public course- is utilization of self- study multimedia softwares and their simulations. While there are internet- based methods for academies and high- school course.

Talebzadeh (2006) in research as title of: "effectiveness study of remote counters and their curriculum in high- school level in through out the country in 84-85 concluded that remote- training activities adjust to defined purposes and issued ones via education ministry.

Esfijani (2003) performed the research as title of: "the study of education and training effect by help of in formation media on educational motivation of girl students in second- grade of guidance school level in Tehran education fourteen region. In this research, He has compared two groups of students (experiment and evidence) by use of two- group experimental research method with pre- and post-examination. Experiment and evidence groups are trained by virtual training via Network, and by

traditional method, respectively. The results showed that Network- based training is successful and it has positive effect on students educational Motivation.

Marinyo Marinsko‹ youvrl Marinsko and Nikoula pap vi cae (2008) concluded below results in research as title "viewpoint about local training and remote one by aid of computer. Use of computer in order to train has become more obvious in educational contents and learning process; and it as stated as a substitute for classic viewpoint which its purpose is presentation of individual training instead of collective training. Based on this, internet has given very strategies and fundamental substitute cases which have substitution capability with classic training systems. This means to have noticeable advantage in the field of remote training system, so that it has been prepared actual development to complete or even to substitute professors due to extensive equipments in order to save information in Large archive files.

Vilhm (2003) has performed one investigation as title of: "virtual learning in term of university students at lova states. He demonstrated that most of students have had positive experience from virtual classes and they stated that learning has been optimum in virtual classes like traditional common classes.

Nafisi,(2004) concluded below results in research as title of: "educational innovational experiences based on information technology". This suggest that educational responsible can utilize various tools of information technology such as computer, local Network, internet in any conditions to improve learning-teaching process. And this require that they believe the role of "guidance at the side, no wise in the scene."

RESEARCH PURPOSES

the main purpose of this research was to compare the impact of teaching by virtual teacher and real teacher on students learning in a classroom. The partial purposes are included:

1- the study of possibility to establish actual classes by use of virtual teacher with optimum quality in learning process.

2- comparison study of learning quality via virtual teacher training with personal teacher.

3- study of virtual teachers applications instead of real teachers.

4- comparison study of learning permanent rate resulting from virtual training with learning from traditional education.

Research hypotheses:

1- it can be used online virtual professors to eliminate lack of expert professors in university units.

2- Learning quality resulting from online virtual teacher is equal with their learning via real teacher.

3- it can be used virtual teacher in educational spaces instead of real teacher.

4- the rate of resistance in learning from virtual training is equal with that of traditional training.

RESEARCH METHOD

based on statistical population of this research, all university students of lslamic Azad university of Marvdasht are 13158 people (in educational year 2008-2009), who 80 people were selected as sample by random sampling method from students in various educational levels and fields.

since the purpose of this research is to access applicable and operative outcome in the field of innovation of typical sort of education named virtual training as concentrated one, so that this is applied research. And since it has been used organized randomly method to choose trials and whereas in experimental and dummy environment, it is controlled variables and studied trials, so that it is kind of experimental research. Also, because its results are obtained after changing variables i.e in future; as a result, this is providential research. So this research generally is experimental, applicable, and providential research.

When these groups are located in two separate classes, it was tested a teacher made test with 40 questions performed for them . Then, at the same time, the control and experimental groups classes are trained by traditional method and on line video conference in another class, respectively. Then it was tested second exam on both groups by teacher made test. After two weeks it was tested learning stability exam in order to study trials learning stability and then datum were analyzed by statistical methods. In this research, it has been used pre- and post- examination project with control group from actual experiment research project. So that it is compared the rate of trials knowledge rate in experimental and control groups before and after independence variable on experiment group.

As a result, it is known the rate of independence variable effect on experiment group.

The design of pre- and post- examination with control group.

Data collecting instrument:

3-teacher- made 4-choices tests used to conduct this research with guidance of expert professors . Chronbach Alpha for tests were .87, .85 and .81 .

data analysis methods:

In description statistical level:T test for independent groups were used to analyze datum

RESERCH FINDING

first hypothesis:

it is applied on line virtual professors to eliminate lack of expert professors in university units. It has bee used t- test of independent groups to study this hypothesis. It is observed that the amount of t becomes equal to 32/22 which this amount is at 0.0001 significant level, as score average of post- exam in experimental group is higher than score average of pre- exam in this group, so this hypothesis has been admitted .

Table number 1

group	Number	Average	Standard deviation	T	df	Significient level
Pre-test	40	6/95	3/75	32/88	39	0/0001
Post-test	40	13/5	5/85			

Second hypothesis:

learning quality of students resulting from training via online virtual- based teacher is equal with their learning by actual teacher. In study of this hypothesis test, the amount of t is equivalent to 9026 and it is significant at 0.0001 level and as this difference due to post- test cores average dominance relative to pre- test in experiment group, them this result suggest to approve this hypothesis.

Table number 2

group	Number	Average	Standard deviation	T	df	Significient level
Pre-test	40	6/55	1/25	9/26	78	0/0001
Post-test	40	4/2	0/99			

Third hypothesis:

it can be used virtual teacher in educational spaces instead of actual teacher. It has Been used independent groups in order to study this hypothesis form t-test . It is observed that the amount of it becomes equal to 32/88 and it is significant at 0.0001 level and according to post-exam scores average in experiment group which higher than pre-exam ones in this group, so this hypothesis approved .

Table number 3

group	Number	Average	Standard deviation	T	df	Significient level
Pre-test	40	6/95	3/75	32/88	39	0/0001
Post-test	40	13/5	2/85			

Fourth hypo thesis :

The stability of learning of virtual learning is equal to learning resulting form traditional training .

In study of this hypothesis , it is observed that the amount of t is equal to 1.04 an it isn't significant at 0.29 level. This shows that there isn't any difference in stability of taught rate of both group. As a result , the rate of stability is equal in both procedure so this hypothesis is accepted by.(table 4).

Table number 4

group	Number	Average	Standard deviation	T	df	Significient level
Pre-test	40	-2	0/81	1/04	78	0/29
Post-test	40	-2/52	3/06			

DISCUSSION AND CONCLUSION

This research has been performed by main purpose of comparing the effect of virtual training teacher (on line) with personal teacher training on students learning in actual classes.

Based on finding of this research , it can be used on line virtual professors in order to eliminate lack of expert professors in university units . This result is according to baras and aven ideas .

They believe that increasingly growth of modern science and technology want new learning and teaching methods . The students must play more active role in learning and teaching process and the teacher should be changed into guidance in scene aside , facilitator , arbitrator and educational designer . Its realization in one physical class with fixed space and determined time and traditional training condition is very hard .

Live based-classroom educations will make high expense for performers . So in electronic training , the people are able to learn their required information in any hour of day and in throughout the week .

In electronic training , it is decreased traffic expenses and these of related to professors and is prevented to waste time . Hence , it is necessary to study the possibility of creating this kind of education about efficiency and the effectiveness of training .

In second hypothesis , we concluded that the quality of student learning resulting form training via virtual teacher (on line) is equal to their learning via actual teacher . Vilhm (2003) in similar results showed that most of students have positive experience form virtual classes .

They stated that the learning has been optimum in traditional common classes like virtual classes . Esfijani (2003) , in a research , demonstrated that training via network is also successful and it has had positive effect on educational motive .

In third hypothesis : It can be used virtual teacher in educational spaces instead of actual teacher .

Nafisi (1383) concluded similar result by doing one research . It is suggested that education technology such as computer , local network & internet to improve learning teaching process in any condition .

This required that they believe role of 'guidance at the side, no wise in the scene'.

And fourth hypothisis means that rate of permanency in learning form virtual training is equal to traditional training . According to Yaghma (2002) which is stated in training technology magazine : Bases of training technology (such as virtual training) is on the basis of behaviorism psychology . In educational technology , it is considered reinforcement dud support of previous taught , self-evaluation , receive reflection , discovery of required information ,experimental-workshop activities performance in virtual environment , knowledge production and creative presentation by use of electronic instruments and also communication with scientific centers inside and outside of country .

RECOMMENDATIONS

based on research finding it is recommended that:

1- In respect to rate of resistance in optimum learning in this training , all universities and educational centers are equipped to necessary facilities in this field,

2- It can be used virtual teacher to teach in respect to lack of expert professors in certain majors in order to participate in class ,

3- Various groups use one lesson at the same time,

4- the teacher teaches several class in one time and in several place in order to decrease in traffic expenses and waste time.

COMPUTER SELF EFFICACY: TEACHER READINESS IN ACCEPTING MALAYSIAN EDUWEBTV

Dr. Mohd Arif Ismail
Noraini Mohamed Noh
Faculty of Education
Universiti Kebangsaan Malaysia, Bangi

Dr. Rosnaini Mahmud
Faculty of Educational Studies
Universiti Putra Malaysia, Serdang

Abstract

The role of Library and Media Teacher (LMT) as a catalyst for the implementation to the technology programs conducted in schools is a challenge to the LMT which is to be more open and innovative towards innovations introduced in schools from time to time. This study is to determine the level of computer self-efficacy (CSE) of the Library and Media Teacher (LMT) and to see its relations with the acceptance of EduwebTV a new innovation that has been implemented. The study involved 546 LMT randomly selected from four states in Malaysia The findings showed that the level of computer self-efficacy (CSE) of the LMT to use the EduwebTV is moderate compare to their confidence to disseminate the EduwebTV innovation. The analysis also showed a positive correlation to the perceived ease of use and perceived usefulness in acceptance of EduwebTV innovation. From these findings we can conclude that the computer self-efficacy of teachers may help to influence their perception of ease of use and usefulness of EduwebTV where it is important in this process of innovation acceptance.

Keyword: *Computer Self Efficacy, Innovation acceptance, EduwebTV, Library and Media Teacher*

INTRODUCTION

Changes in information and communications technology (ICT) will bring great challenges to the teaching profession. Teachers should be willing to increase their knowledge and skills to use the computer technology in teaching and learning and to replace the conventional approach which is low in technological innovation. In this era of information and communications technology, several changes and innovations have occurred in the education sector. Learning paradigm based on the usage of source material as a source of reference has been changed to take advantage of electronic information resources as an alternative in school. In line with this development, the teachers need to be more open and willing to accept renewals of educational technology, introduced to schools such as SchoolNet project, School Internet Access Center, Learning CDs and EduwebTV. However, ICT program in teaching and learning in schools will be more easily implemented with the emphasis on the mastery of technology among teachers (Muhyiddin, 2010). Teachers need to be more receptive to reform and adapt to changes particularly teaching with technology. The important thing is that teachers must have the need to

change and want to change but if teachers do not adapt to change, not much of incentive will be able to change them.

BACKGROUND

EduwebTV innovation has been introduced by the Ministry of Education (MOE) especially in the effort to diversify the sources of materials for teaching and learning on March 2008. This technology is a renewal of the education TV program that was implemented in schools for nearly 36 years, from 1972 to 2008. This innovative is in the form of web portal and has eight (8) channels of News, Academic, Articles, Interviews, Curriculum, Interactive, Direct Broadcast and Directory. EduwebTV presence through this site is actually to overcome the problems often faced by teachers when using this media in teaching that have been broadcasted by Malaysia television broadcasting stations. Such broadcast program schedule is not consistent with class schedules, lack of television sets, broken television sets and many more. Thus this innovation bring comfort and more effective for learning through the web which allows teachers and students to access a range of information without the limitations of time and place, as well as Internet facilities available in schools. Hence its presence is an effort to increase more schools using information technology (IT) in daily activities and can help to reduce the digital gap between urban, suburban and rural area.

In the context of the diffusion of innovations in schools, the Education Ministry Circular KP (BS) 8591/J1d.XVII (6) dated July 28, 2003, has directed that technology equipment provided in schools, should be used to the maximum in the process of teaching and learning in the classroom. However, we realize that the diffusion of an innovation can not happen in a short time, according to Rogers (2003) the role of change agents can help to speed up the diffusion of innovation in the social system of an organization. Havelock (1995) also asserted that there are four important roles of the agents of change in helping innovations acceptance process, including its role as a catalyst for innovation, problem solver, an assistant to the process and as a link source. Certainly a change agent must have knowledge of an innovation that enables them to influence the results of his client to accept the innovations introduced. For the purpose of diffusing the EduwebTV innovation in school, Library and Media Teacher (LMT) has been introduced and exposed to EduwebTV by the ministry in an early launch hoping they can promote this innovation to the teachers and students in schools and willingly provide technical assistance if requested at any time while using the EduwebTV. Thus, the spreading is easily occurring. LMT role is not only managing resource materials (books), but their role is wide and challenging because resource materials that were introduced in schools are not only printed but also in form of electronic and Internet.

LMT should be able to serve as a catalyst in the implementation of innovative programs especially related to the use of media and technology. According to Yusof & Razmah, (2006) LMT role in schools is important because they help to the implementation of innovations, a problem solver and a link of source. Therefore, the LMT should be aware of a product to be promoted in advance or in other words they must be ready and confident to be in the category of "early adopters" which mean being an early user of EduwebTV compare to other teachers at the school and as individuals referred to concerning the EduwebTV innovation. According to Noraini et. al (2009) in the context of the diffusion of media materials in schools, the role of LMT is not only as an agent for promoting EduwebTV innovation but they are also consumers of EduwebTV especially in teaching and learning in the classroom. In fact, the LMT should be act as;

1. User of EduwebTV
    - Teachers who teach subjects in the classroom where they have the opportunity to provide students with experience using EduwebTV
2. Role model practically using the EduwebTV
    - Teachers' consistency in the practice of using EduwebTV as teaching aid in teaching can help diffusion occurs - when there is imitation of behaviour among members of the social system in schools
3. Catalyst in the process of accepting EduwebTV
    - Confidence to communicate about EduwebTV. Diffusion may occur through the communication (storytelling) word of mouth because they are considered individuals who can be consulted.
    - Confident in promoting and providing opinion on EduwebTV to customers (teachers and students). This is consistent with his role as an individual who referred to.

Computer Self-Efficacy as a basic need for acceptance of computer technology

In this study, the researcher refers to a model that is often used to describe the acceptance of technology that is *Technology Acceptance Model* (TAM). TAM model was introduced by Davis et al. (1989) and developed from psychological theory that explains how the behaviour of technology user is influenced by the belief, attitude, intention and link to user behaviour relationship (Abdalla, I., 2005, Lee, Y ., Kozar KA, & Larsenm, K.R.T, 2003). TAM has grown and become one of the most effective models to predict the acceptance of information technology. Many researchers have adopted TAM and have showed it has high validity (Chau, 1996.2001; Adams et al., 19 992; Igbaria et al., 1997; Venkatesh & Davis, 2000; Moon & Kim, 2001). According to Davis et al. (1989) there are various external factors to understand why people accept or reject the technology. Apart from that, they also propose individual characteristics or organizational features as external factors. Pedersen (2003) found that self-efficacy is one of the external factors in TAM contributing to technology acceptance in which self-efficacy can be viewed as an individual self-confidence in the ability to use a innovation to achieve a behaviour. In TAM, there are two variables i.e. perceived ease of use and perceived usefulness that will influence the behaviour of individual acceptance. Igbaria & Iivari (1995) explains that there is a strong relationship between self-efficacy and the perceived ease of use and perceived usefulness. Therefore, this study will examine the relationship of self-efficacy with the perceived ease of use and the perceived usefulness. Self-efficacy is defined as an assessment of the capability to manage and implement the choices in the actions required by the type and level of performance specified in the task (Bandura 1982, 1986).

In the process of accepting innovations related to information communications and technology, some teachers may feel that a method which was introduced is being renewal or regenerate, and can provide opportunities and inject some energy into education (Jones & Kelley 2003), but there are other teachers who see decision to accept and to use technology as an obligation that need to implement or respond to instructions from the organization (Ebersole & Vorndam 2003; Jones & Kelley 2003). According to Bandura (1977) self-efficacy can influence thinking, behaviour and actions of individuals, the quality of effort given by a person based on an activity and perseverance while facing obstacles or adverse situations. Individuals with high self-efficacy see a difficult task as a challenge that needs to be overcome and not trying to avoid it. They are intrinsically strong and totally focused on the activities, will set goals and challenges of maintaining a strong commitment to these activities.

According to Bandura (1989) the self-efficacy of confidence is a specific domain in which a question will arise that is; can I do this? Therefore, measuring self-efficacy should test the sole

criteria that need to be tested. In this theory, the self-efficacy is the antecedent to the use of technology. Copping emotionally like perception and anxiety are affected by the self-efficacy. Thus attitude with confidence and high efficacy can help the process of acceptance and use of technology in teaching and learning. Compeau and Higgins (1999) have used models based on cognitive theory developed by Bandura to test the influence of computer self-efficacy, expectations of result, interest or attention, and anxiety on the use of computers. Hence, higher self computer efficacy can help the ease process of acceptance and use of ICT in teaching and learning.

Many studies have focused on the impact of computer self-efficacy in the context of management information systems and have been proven to affect users of technology acceptance (Venkatesh 2000, Ramayah et al. 2004, Ramayah & Bushra 2004). According to Torkzadeh and Dyke (2002), self-efficacy construct is very useful as the basis for measuring the development of individual self-acceptance and measuring the ability in the use of Internet in teaching and learning. In fact, it is also expected to affect the determination and strength in doing assignments and can demonstrate the interest and level of difficulty chosen to do something (Gist 1987). Albion (1999). Moersch (2001) found that teachers' confidence, especially teacher self-efficacy is a significant factor in determining the ability of teachers to integrate technology in teaching. Teachers who have low self-efficacy usually choose the method that is easy to implement, but individual with high self-efficacy tends to be interested in the difficult tasks and view it as a challenge that can be measured and not a threat that should be avoided (Orpen 1995; Pajres 1996). Albion (1999) suggests an ideal way to enhance teachers' efficacy on the use of ICT by providing training in ICT skills.

STATEMENT OF PROBLEMS

As any other innovation projects, EduwebTV is probably being accepted or rejected and may be the acceptance pace may takes a very long time. The successful implementation of an innovation in education depends on teachers, who ultimately will determine how they use it in class (Albirini (2006). Teachers negative attitude towards the use of computer technology are important factors that may prevent teachers from receiving and integrating the use of computer technology in teaching and learning. The effect of such attitude, contribute to the very low usage of computer technology among teachers in most schools (Cuban, 2001; Zhao et al., 2002).

This is very serious if the LMT who is also a catalyst for change is having less confidence in attitude of using computer technology (Pelgrum, 2001), perceived that computer technology does not improve the performance of learning (Yuen and Ma, 2002) and always thought that computer technology is complicated and difficult to use (Cox et al. 1999). To ensure the successful diffusion of EduwebTV in school, LMT should be the model where they need to become a leading consumer of EduwebTV in teaching and learning, a consultant to other teachers on EduwebTV and able to convince the other teachers on the ease of use and usefulness of EduwebTV to teachers and students. In other words, the LMT need to be more innovative and confident to face the variety of educational innovations introduced as an effort to promote, persuade and convince other teachers at the school. LMT also need to be the first as an early adopters and users of innovation compared to other teachers in their schools. The question is whether the present LMT have high level of computer self-efficacy on the acceptance of EduwebTV innovation? What is the perception of the LMT toward the acceptance of EduwebTV? Do they have the confidence to use and diffuse EduwebTV to teachers and students in school?

RESEARCH OBJECTIVES

The research is to;

- Identify the level of computer self-efficacy among Library and Media Teacher (LMT)
- Know the relationship between computer self-efficacy perception of ease of use and the usefulness perceptions in acceptance of EduwebTV innovation.

RESEARCH METHODOLOGY

This research uses descriptive quantitative method. A survey technique used for this review was found appropriate to the purpose of this study that is to describe teacher self-efficacy status on innovation acceptance. This study was conducted in the existing situation without any manipulation of the subject. The population is Library and Media Teacher for the primary and secondary schools in four selected states of Kedah, Terengganu, Selangor and Johor which amounted to 3148 people. The sample was selected using a systematic random sampling technique because this technique is effective to obtain information from each of the states (Sekaran 2000). This technique is used to ensure that each state has enough representatives to be studied. Besides, this technique can control the internal validity of the sample. In this study, a total of 546 LMT have been selected to ensure sufficient data for analysis, including those who are graduates and non graduates. Data analysis is done by using descriptive analysis to obtain mean values and standard deviation. While the inferential analysis was chosen to examine the relationship that exists between the two types of variables studied.

INSTRUMENT

A set of questionnaire administered to the Library and Media Teacher. The teacher's questionnaire was used to obtain feedback on the acceptance of EduwebTV innovation and computer self-efficacy. Self-efficacy instrument was developed based on the modification of the computer self-efficacy instrument (CSE) by Compeau and Higgins (1995). The self efficacy instrument contains 16 items and represents the scale of confidence in using the innovation (10 items) and the scale of confidence in diffusion of innovation (6 items). In this instrument all the items began with the statement "I believe I can use…" This is to show that the statements items in the form of self-report about self-confidence (Murphy et al. 1989) for aspects related to the computer. Instrument on acceptance is modified from the Technology Acceptance instruments by Davis (1996), which emphasizes five main variables based on the Technology Acceptance Model (TAM) that is the perception of usefulness, perception of ease of use, attitudes toward technology, a desire to use and the actual use. In this study, researchers will examine the relationship of computer self-efficacy on perceptions of ease of use and perceptions of usefulness of EduwebTV.

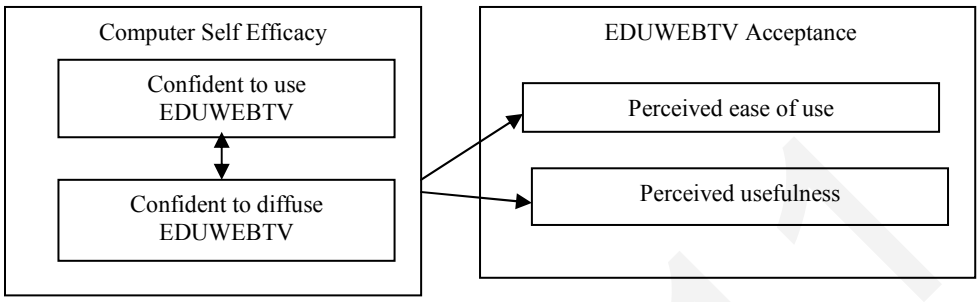
Cronbach Alfa test is used to determine the reliability index of the instrument. Cronbach Alpha value for both instruments is high. Cronbach Alfa reliability index for Computer Self Efficacy instruments is between 0.732 - 0.899. Meanwhile, the Cronbach Alpha reliability index for the instrument of acceptance is between 0.757 - 0.898. The higher Cronbach Alpha reliability index shows that the items are consistent and reliable.

Table 1: Sample of Questionnaire instrument

Area	Example of Item
Perceived ease of use	I found that it is easy to learn to use EduwebTV
Perceived usefulness	I can fulfil the task of preparing teaching and learning materials faster
Computer Self efficacy (Confident to use EduwebTV)	I believe I can use EduwebTV innovation without recommendations from friends.
Computer Self efficacy	I believe I can show my friends how to use EduwebTV

(Confident to diffuse EduwebTV)	

Figure 1: Research Model



RESEARCH FINDINGS

a. The level of computer self-efficacy of the Library and Media Teacher in the acceptance of EduwebTV innovation

Based on Table 2, a total of 166 (30.2%) LMT were at high confidence level in using EduwebTV innovation. A total of 330 LMT (60.4%) were at medium level of confidence, and only 13 LMT (9.3%) had low confidence to use EduwebTV innovation. The results showed that the mean range of confidence in using the innovation is between 3.11 and 3.36. Overall mean for the confidence in using the innovation is moderate (m = 3.27, SD = 0.67). For the confidence scale of diffusion of EduwebTV, the analysis shows that the majority of the teachers i.e. 216 persons (39.5%) have low confidence while a total of 161 teachers (29.5%) are moderately optimistic, and 169 teachers (31%) have high confidence level to diffuse the EduwebTV innovation. The range of mean for confidence scale of innovation diffusion is between 2.88 and 2.94. The overall mean for confidence scale of innovation diffusion is moderate (m = 2.88, SD = 0.62). The range of the mean for computer self-efficacy is between 2.88 and 3.36. Thus the level of computer self-efficacy among the LMT is moderate (m = 3.11, SD = 0.62). LMT is relatively more confident in using EduwebTV compared with the confidence to diffuse the innovations to others.

Table 2: Mean score, frequency and percentage of LMT computer self efficacy

	Frequency and percentage			Mean Score	Level
Scale	Mean Score >2.33 (Low)	Mean Score 2.34-3.66 (Moderate)	Mean Score < 3.66 (High)		

Efficacy of using EduwebTV innovation	13 (9.3%)	330 (60.5%)	166(30.2%)	3.27	Moderate
Efficacy of diffusing EduwebTV innovation	216 (39.5%)	161 (29.5%)	169 (31%)	2.88	Moderate
Computer self efficacy (overall)				3.11	Moderate

b. The level of acceptance in terms of the ease of use and usefulness

From the aspect of acceptance in terms of ease of use, 348 teachers (63.7%) were at high levels where they were confident that EduwebTV is not difficult to use. A total of 190 teachers (34.8%) were at the moderate level where teachers feel that it was slightly difficult to use EduwebTV. However, only about 8 teachers (1.5%) felt EduwebTV is very difficult to use. The result shows that the range of mean for acceptance scale is between 3.53 and 3.79. The overall level of acceptance of EduwebTV innovation is high (m = 3687, SD = 0.52). This shows that the majority of the LMT can accept that EduwebTV innovation is not difficult to use. The level of acceptance in terms of usefulness shows a total of 221 teachers (40.5%) were at high level of acceptance of EduwebTV innovation. This group of teachers were confident that EduwebTV is very useful and can help to simplify the process of teaching and learning. A majority of 303 teachers (55.4%) were at medium level, where teachers are not sure how EduwebTV innovation can facilitate teaching and learning. However, a total of 22 GPM (4%) had a low level of acceptance in terms of usefulness. This shows that this group is not confident that EduwebTV innovation can facilitate teaching and learning. The result shows that the range of mean of acceptance scale is between 3.40 and 3.57. Overall the level of acceptance of innovation in terms of EduwebTV usefulness is moderate (m = 3472, SD = 0.52). This shows that the LMT is less confident that the EduwebTV innovation can facilitate teaching and learning

c. Teachers' computer self-efficacy correlations between the confidence in using EduwebTV and the confidence diffusing EduwebTV

The analysis of inter-scale correlation between the scale of confidence in using the EduwebTV with the confidence of diffusing EduwebTV shows a strong correlation (r = .761, n = 546, p <0.01). This correlation is positive and significant at P < 0.01. This analysis explains that Library and Media Teacher is confidence in using EduwebTV innovation and confidence to share their knowledge and experiences about the usage of EduwebTV to another person. Therefore the confidence of using EduwebTV and the confidence to diffuse the EduwebTV can determine Library and Media Teacher level of computer self-efficacy.

Table 3: Correlation between the confidence of using and the confidence of diffusing the EduwebTV

Variable		Confidence of diffusing EduwebTV
Confidence of using EduwebTV	Pearson Correlation(r)	**0. 761**
	Significant	0.000
	N	546

d. Teachers' computer self-efficacy correlations for the acceptance of innovation in terms of EduwebTV ease of use for teaching and learning.

The findings of Pearson correlation between computer self-efficacy and the perceived ease of use of EduwebTV shows that there is a strong positive relationship among the Library and Media Teacher (r =. 511, n = 546, p <0.01). This positive relationship suggests that the population of this study feels that teacher's computer self-efficacy is important to influence the perception of EduwebTV particularly in terms of ease of use for teaching and learning

Table 4: Correlation between the computer self efficacy and the perception of ease of use of the EduwebTV

Variable		Perception of ease of use
Computer self efficacy	Pearson Correlation (r)	0.511
	Significant	0.000
	N	546

**Significant at $p < 0.01$

e. Teachers' computer self-efficacy correlations for the acceptance of innovation in terms of EduwebTV usefulness for teaching and learning.

Table 5 shows the relationship between computer self-efficacy and the perceived usefulness. Pearson correlation test showed that there was a moderate positive relationship between computer self-efficacy and the usefulness perceptions among Library and Media Teacher (r = .426, n = 546, p < 0.01). This positive relationship suggests that the population of this study believe that computer self-efficacy is important for teachers to influence the perception, particularly from the aspect EduwebTV usefulness in teaching and learning.

Jadual 5: Correlation between the teachers' computer self efficacy and the perception of usefulness of the EduwebTV

Variable		Usefulness perceived
Computer self efficacy	Pearson Correlation (r)	0.426
	Significant	0.000
	N	546

** Significant at $p < 0.01$

DISCUSSION

The results show that the overall level of self-efficacy of the LMT is average (m = 3.26), aspect of use (m = 3.27) and diffuse (m = 3.25) of the EduwebTV. This study also shows that there is a strong positive relationship between teachers' computer self-efficacy and the perceived ease of use and usefulness of the EduwebTV. This shows that teachers' computer self-efficacy is important when an innovation is introduced. This confidence can affect individual acceptances of EduwebTV as the individual will develop a perception of ease of use and usefulness of the EduwebTV. Although there are many factors that contribute to individual acceptance of technology, such as the characteristics of an innovation, individual innovativeness and encouragement individual. However, research on computer self-efficacy will give some contribution to the literature in the acceptance of technological innovation among Library and Media Teacher. The level of computer self-efficacy LMT is moderate. This means that they still feel less confident in their ability to perform the duties of users of EduwebTV and facilitators of EduwebTV for other teachers. Apart from that, computer self-efficacy has a strong positive relationship to the perception of ease of use of the EduwebTV and the perception of usefulness of the EduwebTV. This means that the higher computer self efficacy of a teacher, the more easy they accept the EduwebTV. Hence the computer self-efficacy can be regarded as the basic needs of technology acceptance as it can provide positive control of the stimulus (EduwebTV).

CONCLUSION

This research is expected to provide preliminary information of the importance of computer self-efficacy of Library and Media Teacher in Malaysia's education. It is will inject confidence to the LMT to perform as a catalyst in the process of dissemination of technological innovation to the teachers and students. To enhance self-efficacy in the present LMT, the relevant parties are to provide exposure and training from time to time, especially on the usage (ICT) and ensure that the LMT is competent users of technology. According to Bandura (1989), self-efficacy may be owned or developed through intervention programs, such as attending courses, seminars and workshops.

COMPUTER-BASED VERSUS PEN AND PAPER EFL WRITING: A COMPARATIVE STUDY OF WRITING ASPECTS AND FINAL PRODUCT

Dr. Erifili Roubou (eroubou.gmail.com)
Aristotle University of Thessaloniki, Greece

ABSTRACT

Although popular EFL examinations are now offering their computer-based counterparts, not all contexts have been researched yet with respect to the benefits of computer-assisted test-taking. Considering that extensive research has not yet been carried out with Greek learners it is necessary to examine the extent to which this tool can make a difference to L2 students' writing proficiency. This paper reports on a comparative, year-long study which aimed at investigating the performance of students writing on the computer against those writing with pen and paper. The participants were two groups of upper intermediate learners who would sit for popular B2 level EFL examinations. Although mixed results were yielded in relation to different aspects of writing, overall, there were statistically significant differences in the quality of writing between the two groups suggesting that the word processor can both encourage and enhance the writing process and product.

INTRODUCTION

Second language writing remained a heavily neglected skill until the early 70s when the influence of cognitive researchers in the field became prominent. Writing emerged as a complex, demanding and recursive process in need of separate attention as a skill rather than as a medium of practicing grammatical structures.

At the same period, personal computers became widely available and researchers argued that the most prominent writing tool offered, the word processor, could possibly encourage the writing process and facilitate recursiveness. Meta-analytical reviews seem to favor the role of the word processor on writing quality (Bangert-Drowns, 1991; Goldberg et. al., 2003) suggesting that writing produced on the computer is of higher quality compared to writing produced by hand. Although different studies discredited such finding favoring handwriting, the emergence of CBT has given rise to a renewed interest in the two modes of writing and the extent to which writers can benefit from each.

RATIONALE OF THE PRESENT STUDY

The present study has been motivated by a number of reasons. First, despite the abundance of research in the field, the results produced remain largely inconclusive (see Roubou, 2008). In addition, not only is research on L2 learners fairly limited compared to L1 learners, but the target group of this study (ages 13-15) has almost not been investigated at all worldwide as most studies tend to focus on academic writers. Yet, this is the target group that represents most CBT test-takers. A third reason was the need to produce context-specific research that would reflect the present situation as well as the actual needs of learners. Finally, the recent introduction of CBT testing in Greece in a way dictates the need for up to date research on this tool.

RESEARCH QUESTIONS

The following research question is addressed in this article:

1) Will the overall quality of students' writing on the computer improve more than that of students writing by hand?
   If so, what specific aspects will improve?

CONTEXT AND PARTICIPANTS

English is considered an international language and therefore adequate knowledge of the language is a prerequisite for the workplace. Although the language is taught at Greek schools, instruction remains limited and the majority of students resort to private language schools to help them master the language and obtain a qualification that proves proficiency in the language.

The participants in the study were two groups, each consisting of ten Intermediate-level or B1 level students according to the Common European Framework (CEF). Students at the B1 level typically

receive six hours of instruction per week and exposure to all four language skills. This being a comparative study, there was a handwriting (control) group and a computer (experimental) group.

PROCEDURE

The data collection lasted three school terms, which make up a whole school year. Prior to the study, the computer group received three-week training in using computers and in particular the word processor.

In the first writing class, the teacher- researcher asked both groups to handwrite the first topic so as to check if the groups were comparable in terms of writing performance. The same amount of time was allocated to both groups (1 hour) for every writing task and this remained the same throughout the year. Classes continued following the course book and from the second unit onwards until the end of the year, the computer group wrote only with the word processor. Students in the computer group moved to the computer lab to complete their tasks while the handwriting group remained in their classroom and went on with the task.

COMPOSITION SCORING

The ESL Composition Profile by Jacobs et al. (1981) was used for scoring students' compositions. This guide to composition scoring employs a holistic approach to composition evaluation, that is, readers make subjective judgments as they respond to the whole text. In its present form, the ESL profile consists of five categories, each representing an important aspect of written communication: content, organization, vocabulary, language use, and mechanics. The scores can range from a maximum of 100 to a minimum of 34. It must be noted that before compositions were marked, they were typed on the computer so that the scorer would be blind to the writing medium used and thus, it would be ensured that the grades assigned would not be affected by preconceived ideas or bias against one medium or the other.

RESULTS AND DISCUSSION

This part presents the results of the statistical analysis for students' scores for the first handwritten task and the final writing they produced, and examines whether there was improved writing quality for any the computer group as a result of using the word processor to compose. The analysis starts with the total scores which served as a basis for the comparison of overall quality between the two groups. Further analysis includes the scores produced for each aspect of the Jacobs et al. (1981) ESL composition profile: content, organization, vocabulary, language use and mechanics.

Overall quality

With reference to the comparison of writing quality, statistical analysis revealed that the computer group outperformed the handwriting group. Examining the first baseline writing task that was handwritten by both groups, the independent t-test revealed that students' differences in writing quality were far from being significant (t = -.236, p = .816).

Statistical analysis using ANOVA was carried out in order to examine whether the scores assigned for both occasions were significant for any of the two groups. Table 1 reports on the results obtained:

Table 1 Descriptive statistics and ANOVA for overall quality

	Descriptive			**Inferential**	
Effect		M	SE	F	p
prepost	Before	68.000	2.961	14.605	.001
	After	75.150	2.702		
Between Groups	Exper.	73.450	3.784	.491	.492
	Control	69.700	3.784		
Interaction (before/after & between groups)	Ebefore	67.300	4.187	7.577	.013
	Eafter	79.600	3.821		
	Cbefore	68.700	4.187		
	Cafter	70.700	3.821		

As table 1 indicates, the analysis revealed that the computer group significantly outperformed the handwriting group since the interaction including the scores of both groups for both occasions was p=.013. Considering that students in both groups produced writing of comparable quality on the first occasion, and that the instruction they received as well as the materials and the writing tasks they completed were

identical, such improvement in performance may be attributed to the effects of the word processor on the writing process.

This argument becomes stronger as it is the outcome of a longitudinal study that lasted three terms. It could be argued that this vast time span allowed students to develop their writing skills and to produce writing representative of their level of competency. Such findings parallel similar studies that found that the word processor helped students score higher and outperform the control groups writing by hand (Russell et al. 2002; Gresens, 2006).

ESL Profile aspects of writing quality

Following the examination of the total scores, this section examines which writing aspects of the ESL profile contributed to the significant difference between the two groups.

Table 2 presents the statistical data obtained through a two-way mixed ANOVA analysis for the five aspects of writing quality: content, organization, vocabulary, language use and mechanics.

Table 2 ANOVA for writing quality

Writing category:	Type of comparison:	F	p
Content:	prepost	7.845	.012
	group	.329	.574
	interaction	.872	.363
Organisation:	prepost	4.811	.042
	group	1.415	.250
	interaction	5.771	.027
Vocabulary:	prepost	15.978	.001
	group	.199	.661
	interaction	3.995	.061
Language Use	prepost	10.652	.004
	group	.471	.501
	interaction	15.610	.001
Mechanics	prepost	7.949	.011
	group	.016	.901
	interaction	1.642	.216

The data presented in table 2 start with the main effect which involves a pre and post comparison for the first and second occasion that includes all students form both the experimental and the control group. “Group” refers to a within group comparison and finally, the third statistic reported presents the interaction between both groups and both occasions. Significance for all results is interpreted mainly according to the statistics yielded by the interaction.

Content

In the first baseline writing, both groups were assigned comparable scores for content. The main effect reported in table 2 suggests that on average students in both groups improved in this aspect. Significant improvement for most students was anticipated since this was the result a longitudinal study which involved learning English and in particular, practising writing for a whole school year. Nonetheless, the interaction between the two groups and occasions revealed no significant differences for content (p= .363). This finding contradicts previous studies which discovered that students writing on the computer received higher analytic ratings in this category as they exhibited more thorough development of the content of their papers than the control groups writing on paper (Friedlander & Markel, 1990; Li & Cumming, 2001). The findings of this study seem to be more in agreement with Lam and Pennington’s (1995) study dealing with secondary school L2 learners who discovered that content was an aspect where the word processing group did not actually perform better than students writing by hand.

In the present study, lack of improvement could be attributed to the actual length of the writing tasks students were asked to perform. The instructions limited students to a maximum of 120 words and as a result, there was not enough room for great development of content. However, as this limitation applied to both groups, it seems that the word processor did not help students work more on this aspect of their compositions.

Organization

According to table 2, the pre and post comparison denotes that all students improved in organization. Similarly to content, it was expected that improvement would take place since these results reflect changes that took place over the course of a whole school year of instruction. Interpreting the interaction, we notice that the result produced is significant (p= .027). It is speculated that students used the word processor to effortlessly move from one part of their text to the other and to organize their ideas effectively and meaningfully.

This outcome is in agreement with previous studies where students using the word processor received higher analytic ratings in this category (Snyder, 1990) while it contradicts studies that have shown that the word processor gave students in the computer group no advantage in structural aspects of writing such as organization, as they failed to show improvement (Piolat, 1991). Commonly in word processing literature this finding is attributed to the fact that the small amount of text that appears on the screen at a time prevents students from attending to higher level concerns such as the organization of their texts. This issue is not pertinent to this study due to the length of the writing tasks. As already mentioned above, students were limited to 120 words per task and this amount of text could appear on the screen all at once. Therefore, the effects of screen on organization, although they may have influenced the writing process and the composition scores produced in previous research, did not constitute a variable in this study.

Vocabulary

The slightly higher ratings scores the computer group received were not statistically significant in comparison to the handwriting group as the interaction obtained was p= .061. Therefore, vocabulary was the second aspect that the word processing group failed to show improvement in. A possible reason that could account for lack of improvement is that writing took place in the lab and paralleled writing in exam situations. As a result, students in both groups were not allowed to use the resources provided by the word processor or the computer, such as dictionaries and thesauruses, or even to access similar sources of information online. The rationale behind this decision was that in this way the experimental group would not be given an advantage over the control group and thus, the comparison would be more valid.

In addition, it does not seem fair to expect that students should improve their use of vocabulary just because they compose with the word processor. This writing tool has the potential to facilitate the revising process because of the ease it offers for making changes, or even to free writers from some of the cognitive load associated with composing and allow them to attend to higher order concerns. Yet, this should not lead us to expect that the word processor on its own could help students improve their vocabulary. Many researchers have argued that it is mainly the teacher or the instruction provided that can positively influence such aspects of writing and that word processing alone cannot lead to dramatic improvement (Hunter et al., 2001).

Language Use

Language use was the second aspect of the ESL Profile in which students in the computer group showed significant improvement (p = .001). The compositions of the computer group received higher scores as they exhibited more correct and more complex uses of language elements such as tense, word order, agreement, prepositions etc. Similar results were obtained by Wallis and Howcroft (2006). Yet, what differentiates the present study is that students managed to improve their use of language without being allowed to use any of the proofing tools commonly available in such research. As all proofing tools were deactivated prior to the intervention, the automatic underlining provided by spelling and grammar-checkers, as well as the list of alternative options they provide, were not available. Deactivating all proofing tools was considered essential as the computer group should not be given an advantage over the handwriting group. Furthermore, this was in a way dictated by the specific exam-oriented context in which writing in class parallels exam situations.

In addition, the findings of this study support previous research related to revising that found that word processing encourages and facilitates surface-level editing which mainly refers to grammar (Phinney & Khouri, 1993; Li & Cumming, 2001). One of the arguments put forward in relation to this, has to do with the effects of the screen on composing. Many authors have claimed that increased focus on surface level editing can be attributed to the small amount of text that can fit on the screen encouraging students to perform local changes, often at the expense of macrostructure, global revising which involves larger parts or even the text as a whole (Pennington, 2003, p. 290). This does not refute the argument that the fact that all the text can appear on the screen at once encouraged revising the organization of texts. Rather, the fact

that students produced limited writing all of which appeared on one page, allowed them to attend both to structural aspects like organization and to surface editing as well.

It must be stressed that although macrostructure revising reflects more complex and advanced ways of revising, and has been linked to the revising processes of experienced writers (Graham & Harris, 2000; McCutchen, 2000), the importance of surface level changes should not be dismissed. Such kinds of changes may be limited to specific operations and parts of the text but still, they have the potential to improve the quality and even the comprehensibility of a text. The fact that accurate use of language can contribute to the improvement of overall quality of a piece of writing becomes evident in the findings of the present study which revealed that even though students scored significantly higher only in organization and language use, still, they were able to obtain significantly higher total scores overall. Finally, it should be stressed that investigating an EFL exam-oriented context, it would be difficult to discard the value of proper language use as it is the basic element that is always tested in all levels of English language exams.

Mechanics

Mechanics include spelling, punctuation, capitalisation, and paragraphing. Similarly to all other aspects of the profile, on average, students in both groups improved in this aspect. The interaction though suggests that no group improved significantly in mechanics than the other ($p = .216$). In order to account for this, similar arguments as with vocabulary can be raised. Since both groups received similar instruction, we should not expect the word processor on its own to help students improve in this aspect more than the comparison group. This finding contrasts with Lam and Pennington's (1995) and Kehagia's (2000) study which reported significantly higher performance for the computer group. Caution is needed though when comparing the results of other studies to the present study as proofing tools are not always deactivated for those interventions.

CONCLUSION & FUTURE RESEARCH

The word processor as a writing tool has been neglected in recent research despite exams turning into their computer-based counterparts. The results of the present study suggest that this writing tool has the potential to facilitate the writing process and enable students to produce writing of superior quality compared to writing produced by hand. In terms of future research, it would be interesting to examine the effects of the word processor on writing quality in both Greek and English and try to identify and justify similarities and differences in the results.

ABSTRACT

Attention is a concept that refers to how we actively process specific information present in our environment. It has also been accepted as the allocation of processing resources. It is one of the main factors—age, intelligence, the general state of arousal and anxiety, motivation, psychology, physiology, environment, and the sensory system— which intervene in the learning process. Getting the attention of student to course content and sustaining this attention are considered as the important processes to make the learning occur. Therefore, the attention should be measured and the learning experiences should be organized by taking such measures into consideration. Attention as one of the basic cognitive processes can be measured by using various neuropsychological tests. Cancellation Test is one of the tests developed in this context and is used to measure the ability of sustained attention. This test was first developed by Weintraub and Mesulam (1985), and standardized for Turkish population by Karakaş and Başar (1993). The paper and pencil version of this test was conducted in many research studies, but computerized version in Turkish form has not been conducted in any study yet. This study is about the design, development and validation of computerized version of the Cancellation Test. This computerized version consists of four sub-tests (organized letters, random letters, organized shapes and random shapes) and administration panel where only researchers can access. The test was designed and developed according to universally accepted interface design principles. The test was formatively evaluated by administering to a small group of university students and was accordingly revised. The final version of the test was validated on 15 Bahçeşehir University students and the results were discussed together with the design and development processes.

Key Words: neuropsychological tests, Cancellation Test, sustained attention, computerized tests, learning

INTRODUCTION

One way the cognitive processes are used in our daily lives is with learning. Some of these cognitive processes, which play important roles in individuals' learning, are attention, perception, repetition, automation and recalling. Attention has a key role in information processing system. Attention is the mechanism by which we restrict information processing to only a small fraction of the possible amount of information. Attention includes both conscious processes and unconscious processes. There are different type of attention, such as sustained attention (vigilance), signal detection, selective attention, divided attention, and search. Sustained attention can be defined that the ability to maintain a consistent behavioral response during continuous and repetitive activity. Vigilance also refers to the ability to attend to a situation for an extended period of time.

Due to the fact that the learning materials are developed and the learning atmosphere is designed ideally according to the differences of individuals' cognitive processes, the measurement of such unobservable processes provides valuable information for teachers and cognitive psychologists who might benefit from, and the best ways for any individual to learn.

* Adapted and reproduced by special permission of Prof. Dr. Marsel Mesulam.

Neuropsychological tests are used for measuring the cognitive processes that are not directly observable and explaining the behavior that results from these processes (Karakaş & Başar, 1995; Karakaş, 2006). The Cancellation Test is one of the well-known neuropsychological tests measuring the sustained attention and requiring individuals to simultaneously locate some stimuli (targets) while ignoring others (distracters). The Cancellation Test was first developed by Weintraub and Mesulam (1985) and measures the audiovisual perception, searching, sustained attention and reaction time (Karakaş and Kafadar, 1999). Cancellation Test consists of four A4 sized sub-tests that are composed of organized and random letters, and organized and random shapes. There are some necessary materials for administration: Four recording sheets, four answer sheets, two sample cards including target letter and shape, at least six colored pencils with different colors, an eraser; scotch tape, and a stopwatch (Karakaş, 2004).

There are 60 target stimuli in each sub-test. The targets located on the each quarter of the page with an order that there will be 15 ones in each part. The target stimuli for organized and random letter sub-test is letter 'A', on the other hand a shape look like a sun (see Figure 1) is target stimuli for organized and random shapes sub-test (Karakaş, 2004). The targets are distributed in a special order and scattered randomly in organized and random sub-tests respectively, but their locations remain the same in each sub-test (Kılıç et al., 2002).

Figure 1. The target stimulus for random and organized shapes sub-test.

A sample card is used before a person passes from one sub-test to another sub-test of the Cancellation Test. The original forms are not used for sampling of the target. During administration, the forms should be fixed on the tables according to the participant's view. The color of the pencil must be changed in each 10th cancellation for both letters and shapes. The stopwatch starts at the beginning of the test and stops when the participant finishes all the forms; then this time period is recorded. The highest score is 60 for *Number of Correct Target Detection* for each sub-test. The time of administration is approximately 20 minutes (Karakaş, 2004).

The paper-pencil version of Cancellation Test has been used in many studies (e.g. Bailey, Riddoch & Crome, 2004; Byrd et al., 2004; Laurent-Vannier et al., 2006). This test was translated and standardized into Turkish by Başar and Karakaş (1993). The standardization project was done on adult population by Karakaş, Eski & Başar (1996). The nine months test-retest reliability analysis showed that the reliability coefficients were .80 - .81 for Total Time for Completing scores, were .32 -. 57 for Number of Correct Target Detection, Number of Omission Errors, Number of Commission Errors, and Number of Total Errors scores *(*Karakaş, Eski & Başar, 1996). The Turkish adult form was used in different studies (e.g. Cantez et al., 1996; Çağlar & Koruç, 2006; Karakaş, Eski & Başar, 1996; Karakaş & Kafadar, 1999; Kılıç et al., 2002; Küçük et al., 2009). Results of these studies were support psychometric properties of the test. Also, Children *version of* Cancellation Test was completed by Kılıç et al (2002). The test-retest time interval was two months. Results showed that reliability coefficients were .45 - .83 for all sub-tests. As a results these two projects indicated that both adult and children version of the Cancellation Test has acceptable psychometric skills for Turkish culture.

Given computers' increasing influence demands for data collection, researchers and educators are being asked to utilize them in psychological measurement and data collection. Computerized data collection systems offer eight key benefits relative to traditional, time-consuming paper-and-pencil methods: (1) less missing data, (2) accurate data recording, (3) more timely transmission of data, (4) less need for post-collection editing and coding, (5) immediate and objective feedback, (6) less use of test materials, (8) easy management and grading, and (7) ongoing monitoring of data quality (Barak & English, 2002; Cernich et al., 2007; Hadwin, Winne & Nesbit, 2005; Huang & Wang, 2005; Lichtenberger, 2006; Mandell & Sackett, 2008; Paul et al., 2005).

Regarding such benefits, some neuropsychological tests-Chinese version of Cancellation Task (Wang, Huang, & Huang, 2006), Line Orientation Test and Enhanced Cued Recall Test (Aşkar et al., 2010) are computerized

as well. The aim of this study was to develop a computerized version of the Turkish version of Cancellation Test. In this context, the design, development and formative evaluation of computerizing process were also discussed.

METHOD

Instrumentation

1. Development of The Software
1.1 Visual Conception

The computerized test has main screens: Instructions, sub-tests and results.

1.1.1 Introduction

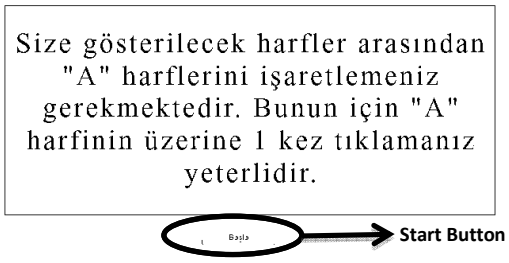

Figure 2. Instruction Screen

In this part, general information about the planned operation is given to the participant. There is a button to start test for the participant just under the instruction (see Figure 2).

1.1.2 Sub-Tests

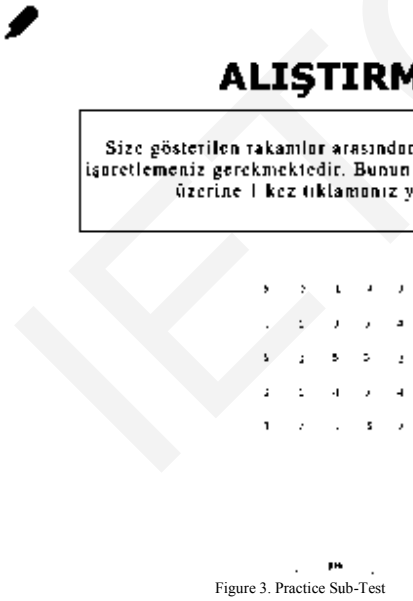

Figure 3. Practice Sub-Test

There are 5 Cancellation Test sub-tests one of which is the example for practice. In the practice sub-test (see Figure 3), characters different from the original sub-tests are used. The aim of this sub-test is to introduce the system to the participant and explain the planned operation clearly.

The other four sub-tests (see Figure 4) are the main sub-tests of the Cancellation Test and each of these is designed exactly the same as the original traditional version. Shapes and the letters are created one by one by

the help of the Flash program's drawing tools and components; and located on the screen regarding the original location in paper and pencil version. There are eight pencils with different colors at the top of the forms, which are used by the participant during the test.

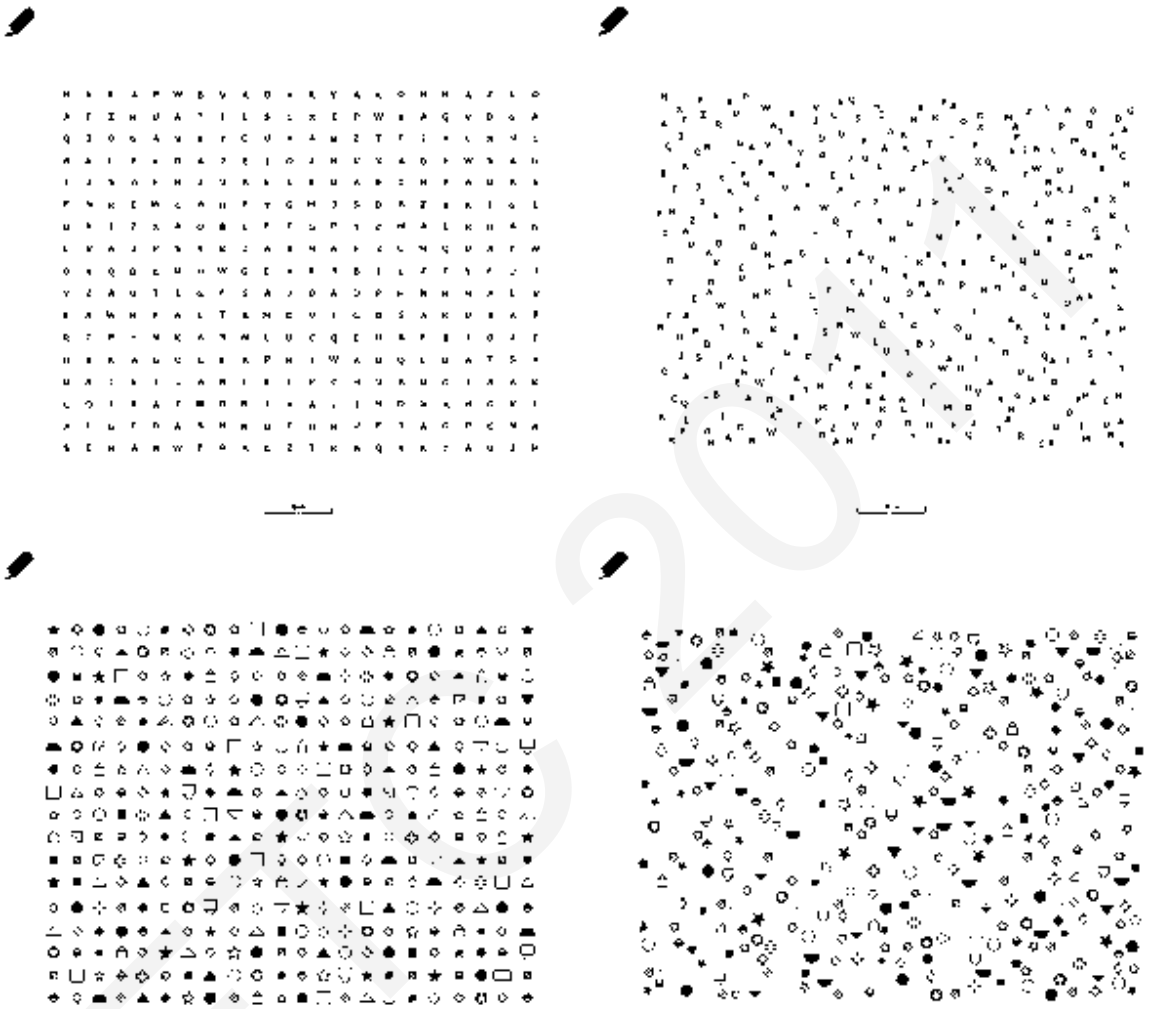

Figure 4. Sub-Tests: Organized Letters, Random Letters, Organized Shapes And Random Shapes

1.1.3 Results

In this screen, the results in tabular form for all participants are displayed (see Figure 5). The following information is given in this table for the each sub-test: Total Time for Completing in milliseconds, Number of Correct Target Detection, Number of Commission Errors and the image of the completed test for each participant with their nicknames. The completed images of each sub-test done by the participants can be reached via the "Göster" button here. The table header contains the total number of participants together with the three buttons having functions: Printing the whole table, starting a new practice, and exiting from the Computerized Cancellation Test (see Figure 6).

Figure 5. Results Screen

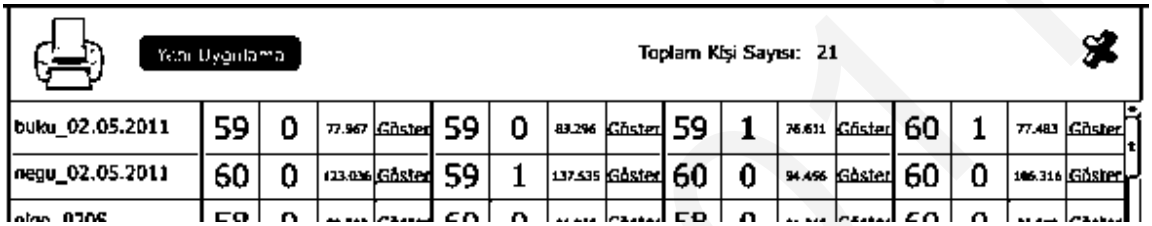

Figure 6. The Menu of Results Screen

1.2 Encoding of The Computerized Version

1.2.1 The platform

The Cancellation Test was designed and coded in Adobe Flash CS5 platform with Action Script 3.0 (AS3). The Flash applications are the ones, which provide for mixing the coding and visuals, and can run on every operating system.

Procedure

The developed test was put into practice to the participants one by one in a laboratory. And while the participants answered the questions of the test in a testing proof room, their monitors were analyzed.

1.2.2 The Operations

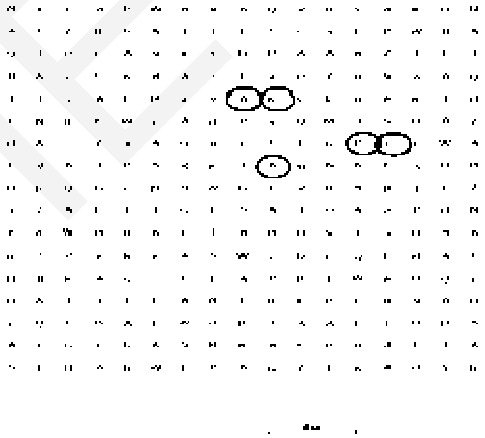

Figure 7. Circled Targets

The test starts when the participant clicks the button just under the instruction. The expected action by the participant is to click on the correct target. When the participant clicks any target, it will be circled. There is no feedback to show that the participant has made a commission error (see Figure 7).

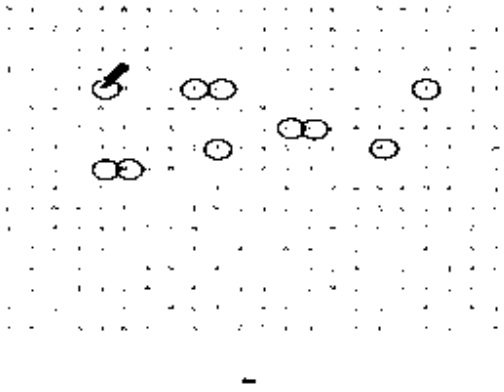

Figure 8. Pencil Changing

After each 10th cancellation, the pencil color changes. The following pencil comes to the place where cursor has been (see Figure 8) and the participant must click on this pencil to continue to the cancellation, which makes participant feel the reality of the test in virtual atmosphere.

Because the participant can do up to 20 commission error, there are 8 pencils.

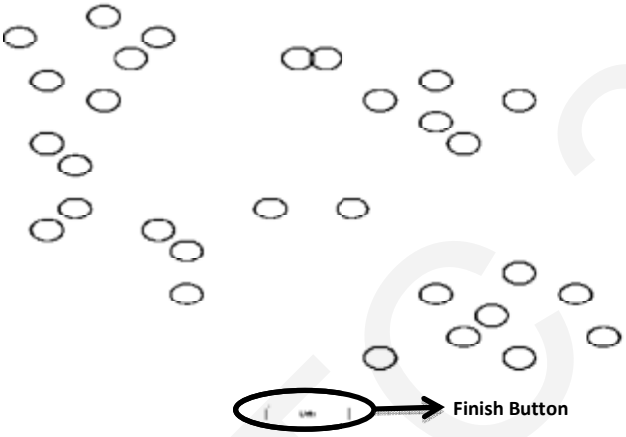

Figure 9. The End of The Sub-Test

The test continues until the participant clicks the finishing button just under the form (see Figure 9).

Research Participants

The studying group was 15 volunteer students from Department of Computer Education and Instructional Technology, Faculty of Arts and Science of Bahçeşehir University. Their age range is 18 – 25. The tests were administered to these 15 students. For the anonymity purposes, different nicknames were assigned to each user.

RESULTS

In this study, the all four sub-tests of the Cancellation Test were computerized. The Computerized version of the test has more advantages than the paper-pencil one. It can make accurate and faultless measurement and it provides time saving because it can put into practice to lots of participants at lesser time. For instance total administration time for computerized version is approximately 10 minutes. On the other hand, as mentioned above this administration time is 20 minutes for paper pencil version. Finally the other advantage is that it provides to show the simulators and audiovisual animations. Because of these all advantages, it is considered that computerization of neuropsychological tests will be useful.

Abstract

This paper proposes a design for a cutting-edge English program in which learners of English in elementary school English classes have lively interactions with a teaching assistant robot, thus integrating the idea of learning with technology (including computer assisting teaching, digital learning, and internet instruction) with functionality of an intelligent robot. The goals of this study are to increase the students' motivation to study English through the development of a human-robot interactive English program, and in doing so, to elevate the four English skills of the students -- speaking, listening, reading and writing by (1) adopting a vivid, enjoyable teaching approach; (2) creating practical, interesting learning materials; and (3) promoting a natural, enjoyable learning context. This paper provides a set of guidelines and directions that other researchers can use to create an innovative and enjoyable English classroom that employs an interactive robot as an assistant for the purpose of building a solid foundation for future English acquisition while reducing the pressure and teaching load of the English instructors.

Keywords: teaching assistant robot, Communicative Language Teaching, Storytelling Approach, interactive English leaning environment

Introduction

The English curriculum in elementary school emphasizes building a natural and enjoyable language learning environment in order to raise student learning motivation and basic communication ability. The ideal teaching strategy is implemented by (1) adopting vivid, enjoyable teaching approaches; (2) creating practical, interesting learning materials; and (3) promoting a natural, enjoyable learning context. Shi & Zhu (1999) also pointed out that English teaching in Taiwan's elementary schools should create an authentic and natural English learning environment, enhance understanding of local and international cultures, raise the student's learning motivation, and assist the student to develop basic English communicative skills. Teaching methodologies should employ lively classroom activities and authentic teaching materials should be used to stress varied, practical, real-life subjects. However, traditional teaching methods, such as rote memorization, cramming for examinations, and grammar translation methodologies cannot address the optimum curriculum design requirements for language learning in elementary schools. On the other hand, new learning and teaching systems like Robot-Learning and r-Learning provide the opportunity for revolutionary English teaching methodologies. Today, an intelligent robot can be programmed as a teaching assistant, making r-Learning a valuable new classroom resource for English learning in the classroom. The teaching assistant robot employed in this study integrated modern technology learning

methods including Computer Assisted Instruction (Computer-Aided Instruction), e-learning (e-Learning), and online teaching (Web-Based Instruction) to provide r-Learning functionality, provided an irreplaceable 3D visual experience, and engaged students as a result of its novel appearance, (Han and Kim, 2009). Therefore, the advantages and special characteristics of the teaching assistant robot enabled the teachers to achieve highly effective language teaching. The upper part of the robot employed in this study was android in nature, with a head, face, ears, and arms, whereas the lower part of the robot was wheeled, to make it easily mobile. The upper part of the body was able to imitate all kinds of human actions as well as perform a variety of teaching activities. The teaching curriculum embedded in the robot interface database was designed by the researchers in accordance with Taiwan's *Scheme for Grade One through Grade Nine curriculum* and was designed to mesh with the text books previously adopted by the elementary school. The English instructors, Communicative Learning Theory (CLT) and Storytelling Approach were all resources and concepts applied to the design of the teaching database and lesson plans. Fifty students in one elementary school in Yunlin County (Taiwan) were selected to participate in this study as the experimental group and interact with the teaching assistant robot. Quantitative evaluation was adopted as the methodology to be applied to data analysis in order to measure the effectiveness of this English program. The experimental results showed that teachers and students all found the robotic assistant teaching technique to be effective. The researchers hope that the findings of this study will enable them to produce a commercialized version of the teaching assistant robot in quantity in partnership with industry in order to advance the development of the robots in Taiwan, an art which is still in its infant stage.

Literature review

Research into robot assisted teaching is still in its initial stages and more and more researchers are joining in the exploration of this field. Japan and South Korea are the most active countries, at present, in researching educational robotics. The current international research status of robot-assisted language teaching is described as follows.

In recent years, many researchers have applied the principles of robotics to education (Klassner, 2002; Ryuey et al., 2008; Weinberg and Yu, 2003). However, only a few researchers have focused their attention on implementations of robotics by which "the robot is applied to language teaching in elementary schools", (Chang et al., 2010). For example, the Korea Institute of Science and Technology (KIST) developed the English teacher robots "Inky" and "Mero" which attracted much attention from the New York Times, CNN, and Time magazine (TIME). "Inky" and "Mero" were listed as being among the 2010 world's best 50 inventions by Time magazine on November 11, 2010. "Inky" and "Mero" were a new implementation of r-Learning, (Korea.net website, 2010) and continue to be used as language teaching assistant robots and assistant teachers for English teaching in Korean elementary schools. The experimental results have demonstrated that the oral ability of students using "Inky" and "Mero" shows significant progress, (Lee et al., 2010). Meanwhile, Chang et al. (2010) have proposed five kinds of teaching programs which employ

their “Spencer” humanoid robot in elementary school settings as a second language tutor. The humanoid robot "Robovie", with communication and interaction ability, has also been applied to elementary school settings as a foreign language tutor and learning partner, and the experimental results have received positive affirmations, (Kanda & Ishiguro, 2005). Hur & Han (2009) have verified that teaching assistant robots can be considered an effective tool for language education, and that robots can improve English teaching effectiveness through an interactive storytelling methodology.

Chang et al. (2010) proposed seven features defining an ideal Teaching Assistant Robot – repeatability, flexibility, digitization, humanoid appearance, body movement, interaction, and anthropomorphism. Anthropomorphic robots have been found to be the most popular and appropriate design for teaching assistant robots, whereas zoomorphic robots are the second most popular design and are particularly well suited for students in elementary school students (Ryu et al., 2006, 2007). Goetz et al. (2003) also pointed out that humanlike robots are more suitable for service and social contexts, as opposed to machinelike robots. Humanoid robots designed to assist teaching must be provided with listening and speaking capabilities (Shih et al., 2007) and such humanoid educational robots promote user engagement and enjoyment of learning (Xie et al., 2008).

Research Methods

The following teaching theorems and teaching assistant robot design strategies were employed in this study:

Language Teaching Theorem

The teaching database development of the teaching assistant robot in this study was based on the following theories: Communicative Language Teaching (CLT), Teaching Storytelling, and the Total Physical Response (TPR) Teaching Method.

Communicative Language Teaching

The teaching purpose of CLT is to enhance the learner's communication ability (Savignon, 2001), that is, the goal of learning a second language is to enable the learner to use the target language to engage in meaningful communication. Instruction on grammar, pronunciation, and vocabulary are only used to empower learners to conduct meaningful communication and to understand real life documents. CLT can motivate the learners to improve their speaking and writing skills in the following ways--(1) exploring the meaning of such documents and interactions on their own as a result of their language learning, (2) deciding on their own what their practical knowledge requirements are, and (3) successfully using the language for the desired communicative purpose. In contrast, traditional learning methodologies focus on increasing reading and listening skills by the mechanism of learning only that information specifically selected by the teachers (Savignon, 2001).

Teaching Storytelling

Egan (1986) proposed an assessment model of objectives-content-methods which encouraged teachers to think of teaching their English courses and delivering lectures to their to the students as storytelling. The American English Teachers' Committee (AETC) defines the storytelling method as an approach in which the content of the course is a narrative which is conveyed to the audience through voice and action. Storytelling includes "Story + Tell + ing", that is the story, presentation, and interaction (Ryan, 2004). Hur & Han (2009) propose a storytelling method which uses digital technology to deliver the story and their digital storytelling methodology integrates film, video, music, narrative, and voice. Profound dimensions and vivid colors are employed in the roles, situations, and experiences of the story.

Total Physical Response

The TPR teaching method is suitable for students just beginning to study English at the elementary school level and can enhance the student's interest in learning through saying and reacting or learning language through physical activities, (Asher, 1982). Asher (1982) also stressed that the TPR approach uses full body reactions with computer game-like body movements while learning the language such that learners are able to effectively reduce nervousness and pressure and thus enhance learning.

The researchers were cognizant of the above conceptual framework as they developed the teaching database for the teaching assistant robot used in this study, (1) The TPR approach was applied in databases of English character teaching, making use of entertaining body movements, singing, and dancing in order to help students internalize their lessons, (2) The CLT approach was used in the development of databases for the teaching of self-introduction, conversation teaching, and teaching via storytelling, (3) The storytelling approach was used in preparation of the database for teaching via storytelling.

Design of Method of Teaching Assistant Robot

Hardware Design

The physical design of the teaching assistant robot was based on the need for an external appearance that was human-like or cartoon-like robots, with the following specific criteria: (1) The appearance of the robot must be appealing and interesting in order to attract the attention of children; therefore, the researchers chose a humanoid structure with various cartoon-like elements appropriate to the needs of the curriculum (see Figure 1); (2) A 7" touch-panel needed to be set on the robot's chest to show multimedia teaching content and to interact with students such that it would increase the students' attention and motivation; (3) The upper part of the robot needed to imitate all kinds of human actions as well as perform a variety of teaching activities; (4) The robotic hands with cupules needed to easily hold teaching materials and English character cards to enhance the concentration of students; and (5) The price of this robot, should it reach commercial production, needed to be reasonable for general classroom and family use.

Figure 1 Teaching assistant robot

Robotic Teaching Databases Design

Robotic teaching databases were designed to be congruent with the English curriculum content of the classes attended by students in the experimental group, as well as the need for an enjoyable learning environment in elementary school, opinions of teachers, the capabilities of the robot, as designed, and the three teaching theories. Details of the databases were as follows:

1. English characters teaching--The teaching assistant robot was designed for use by beginning English learners in elementary school. The 26 English letters were included first in the robotic teaching databases to enhance student ability to internalize the listening, speaking, reading and writing of English characters. The robot was able to repeat the correct pronunciation of the 26 letters (in the voices of men, women, and children) and display the related word cards to students. The screen incorporated in the front of the robot displayed the correct way to write the letters and the robots then sang the vocabulary words while dancing with the students to allow the students to learn kinesthetically. The English letters, words, songs, and dance motions were all components of the robot's database.
2. Self-introduction teaching--The robot was able to use simple English and Chinese sentences with playful and lively actions to introduce itself to the students, and those sentences were also displayed on the touch-panel at the same time. Next, students introduced themselves, their families, and friends to the robot, with assistance from the teacher.
3. Body movement teaching--The robot pointed at various parts of its body, said the English words, and displayed words for body parts on the touch-panel, so that students could relate the words to their own bodies. The database also incorporated dances and aerobics for instruction on the body parts.
4. Conversation teaching-- Lee et al. (2010) pointed out that when a teaching assistant robot is used in English teaching it help students to improve speaking ability. In this study, the robot also had instruction of English conversation incorporated into its database.
5. Storytelling teaching –The visual appearance of the robot was designed in accordance with the protagonist of the story. The robot played the various characters in the story by using different

voices. The robotic storytelling achieved the most dramatic presentation by using various role voices, plentiful music, multimedia background, and subtitles to attract the attention of students, such that students fully engaged in the story and got maximum learning effect.

Experimental Results

The teaching assistant robot was used to enrich English courses in the third and fourth grade classes (a total of 50 students) of Huwei elementary school of Yunlin County, Taiwan in Oct., 2010. Five robotic teaching sessions of about 50 minutes each were given to students. The actual implementation of robot teaching assistant is shown in figure 2.

Figure 2 Real teaching implementation of the teaching assistant robot

After the courses, a simple questionnaire was administered to students and teachers. The survey showed that the students' assessment was very positive with the majority of students indicating that they believed that robot assistant teaching could enhance their motivation to learn English, they were satisfied the interactive functionality and the user interface of the robot, and they also said they would be willing to use robots again as teaching assistants in the future. Teacher assessments are also very positive for the teaching assistant robot. Two teachers indicated that the robot could really give them positive help and share the pressure of teaching English and they said they wanted to use the robot as their teaching assistant again in the future. The operation and interface of the robot was very simply and friendly, they said, but they perceived a need to further strengthen the teaching content. The data collected from the teachers and students, respectively, showed that the acceptance of the robot was very high for both of teachers and students. The operational functioning and teaching effectiveness of the robot was satisfactory to the teachers, but they perceived a need for further strengthening of the teaching content in the databases of the robot.

Abstract

In contemporary world, developments in technological field caused the emergence of new instruments and techniques in the fields of education and teaching. With the use of some general purpose technologies primarily internet in the field of education, distance education method emerged, which developed rapidly. In this framework, the concept of distance education, the functions of distance education management and administration in higher education become hot issue in academic agenda. Significantly, the practice of distance education and how it could be effective in management and administration aspect beside the pedagogical implications needs to be discussed and further solutions need to be set.

Key words: administration, distance education, model, pedagogy

Introduction

In the current age we live in, technology has become an important component. Every day there is some new gadget or software that makes lives easier and improves on the technology and software that already exists. Making lives easier is not, however, the only role technology plays in our lives. With these improvement distance education applications has become vital part for the information society.

Distance education, has been defined a number of different ways in the literature. Generally, when the definitions of distance education are examined, five specialties of distance education reveal. In this respect, distance education can be defined as both instructors and learners stand at different places during learning process, influence of an educational organization, use of media to link teacher and learner like video, audio, and computer, two way exchange of communication, learners as individuals rather than grouped, educators as an industrialized form.

Distance education has traditionally been defined as instruction through print or electronic communications media to persons engaged in planned learning in a place or time different from that of the instructor or instructors. The traditional definition of distance education is slowly being eroded as new technological developments challenge educators to reconceptualize the idea of schooling and lifelong learning.

At the same time, interest in the unlimited possibilities of individualized distance learning is growing with the development of each new communication technology. Although educational technologists agree that it is the systematic design of instruction which should drive the development of distance learning, the rapid development of computer related technologies has captured the interest of the public and has been responsible for much of the limelight in which distance educators currently find themselves. Although the United States has seen rapid growth in the use of technology for distance education, much of the pioneering work has been done abroad (Keegan, 1996).

Distance education has gained a permanent, highly visible place in the worldwide higher education community. A practice that a few years ago held only a niche role now is an indispensable element of many institutions' curricula, success, and overall reputation. From working adult learners to full-time students living on and off campus to dedicated educators, individuals are increasingly taking advantage of synchronous distance education opportunities such as virtual lectures and mentoring, as well as asynchronous distance learning offerings such as digital online courses, flexible content creation and distribution, and built-in assessment tools (Meyer, 2002).

Considering distance education applications with its pedagogical structure and implications is not enough to drive quality and reputation in higher education. Therefore, there is a potential need for in-depth investigation and attention how

pedagogical models and implications foster organizational knowledge and development (Aksal A, 2009; Gazi A, 2009).

Method

This paper stands on general literature review in the field of distance education. In this respect, documentary analysis was applied to reveal the importance arguments for the research focus. In addition to this, the paper proposes a model and view points for the distance education applications as regards the literature.

Critical reflection from the literature

With a growing acceptance of distance education and widespread technology integration, almost all higher education institutions face particular challenges such as technological, organizational, pedagogical, and cultural, etc. to delegate institutions adapt to current changes (Hawkins, 2001; Khaktar, 2001; Oblinger, Barone, 2001). According to Khan (2001), new developments in learning provides opportunities to create well-designed, learner-centered, engaging, interactive, affordable, efficient, easily accessible, flexible, meaningful, distributed, facilitating distance education environments and designing distance education requires thoughtful analysis and investigation of how to use the internet's potential. In addition, Salmon (2002) put forward to the learning platform of distance education as it is flexible, learner centered and disciplined to enhance skills of the learners within a framework of life long learning philosophy. Although Salmon (2002) derived successful model to the pedagogical aspect of the distance education applications, McPherson and Nunnes (2006) filled the gap on the necessity of considering management and administration in online context. However, all these contributions stay partial because of not reflecting harmony about pedagogy and management in distance education based on empirical evidence (Aksal A, 2010; Gazi A, 2010). In this respect, here is the proposed model to consider both pedagogy and management. In following, figure 1 was drawn based on the harmony of distance education pedagogy and management in respect to Salmon (2002) and Khan (2001).

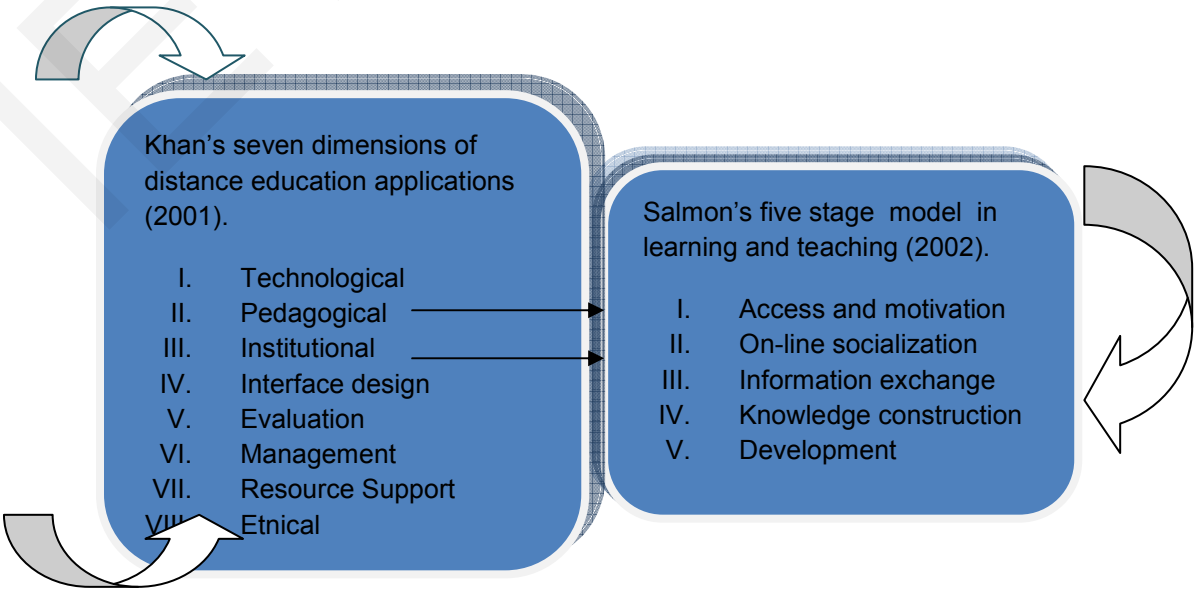

Figure 1. Two view points to distance education applications

Khan (2001) proposed eight dimensions and sub-dimensions of the distance education which are technological, pedagogical, institutional, interface design, evaluation, management, resource support and ethical aspects for qualified distance education practices.

The institutional dimension is concerned with issues of administrative affairs (e.g., organization and change, accreditation, budgeting, and return on investment, information technology service admissions, graduation, and alumni affairs); academic affairs (e.g. faculty and staff support, instructional affairs, workload, class size, compensation, and intellectual property rights); and student services (e.g., pre-enrollment services, course and program information, orientation, advising, counseling, financial aid, registration and payment, library support, bookstore, social support network, tutorial services, internship and employment services, and other services) related to distance learning.

The pedagogical dimension of distance education refers to teaching and learning. This dimension addresses issues concerning goals/objectives, content, design approach, organization, methods and strategies, and medium of distance education environments. Various distance education methods and strategies include presentation, demonstration, drill and practice, tutorials, games, story telling, simulations, role-playing, discussion, interaction, modeling, facilitation, collaboration, debate, field trips, apprenticeship, case studies, generative development, and motivation based on constructivist approach.

The technological dimension of the framework examines issues of technology infrastructure in distance education environments. This includes infrastructure planning, hardware, and software. The interface design refers to the overall look and feel of distance education programs. Interface design dimension encompasses page site design, content design, navigation, and usability testing. The evaluation for distance education includes both assessment of learners and evaluation of the instruction and learning environment. The management of distance education refers to the maintenance of learning environment and distribution of information. Further to this, the resource support dimension of the framework examines the online support (e.g., instructional/counseling support, technical support, career counseling services, other online support services) and resources (i.e., both online and offline) required to foster meaningful learning environments. Significantly, the ethical aspect is related to social and cultural diversity, bias, geographical diversity, learner diversity, information accessibility, etiquette, and the legal issues (e.g., policy and guidelines, privacy, plagiarism, copyright).

Khan (2001) put forward to think overall compontents of the distance education applications in order to have quality and development in this platform. Further to this, Salmon (2002) provided an argument how learning and teaching in terms of pedagogical aspect of distance education applications can be effective based on five stage model. The five stage model of Salmon (2002) have been practiced in higher

education institutions to enhance teaching and learning process which covers access and motivation, on-line socialization, information exchange, knowledge construction and development. Salmon (2002) supported the argument that Khan (2001) underlined, there is intensified need for technical ability and infrasturacture, institutional support to foster qualified teaching for meaningful learning. At this point, here is the new argument can be raised that Five Stage Model of Salmon (2002) can be also productive for management and adminsitration aspect of distance education to create organisational knowledge and development based on participative management and team work culture. Therefore, it is highly intensified to feed administrative and institutional practices with this model beside the pedagogical practices. In addition to this, while considering this model within administration and organisational knowledge, there is also significant to consider the dimensions of distance education applications as Khan (2001) proposed. In this respect, two view points for distance education applications can be proposed for higher education institutions while constructing or reconstructing their distance education applications. In summary, these two view points are: 1. Integrating Five Stage Model of Salmon (2002) into institutional development process 2. Considering dimensions of distance education applications as Khan (2001) stated while teaching and learning online. These two view points may help enhancing the quality in distance education not only for learning and teaching process, also for the intercconected bond with the administration.

CS 101 CONSIDERED HARMFUL: PEDAGOGICAL TECHNIQUES FOR ENLIVENING A REQUIRED COURSE IN COMPUTER SCIENCE

Marlin Thomas
Samuel Rudin Academic Resource Center
Department of Computer Science
Iona College
New Rochelle, NY USA
MThomas@Iona.edu

ABSTRACT

Faculty teaching a computer science courses that is a graduation requirement for all students face the twin obstacles of the affective indifference and the intellectual complacency of students. The indifference is a consequence of its nature as a required course. The complacency derives from the students' perception that they already know the subject matter. The result is a course that is endured not embraced. The empirical studies presented here, however, suggest that these obstacles can be overcome. Indifference is countered by physical and cognitive engagement, and complacency is combated by extending the reach of the subject matter beyond the givens of the textbook and laboratory manual. Especially important is the centrality of problem solving. Examples of classroom exercises and assignments illustrate the innovative elements of the course, and rudimentary statistical assessments demonstrate the effectiveness of those innovations.

INTRODUCTION

A preponderance of colleges and universities in the United States require that all students, irrespective of their major, complete at least one course in computer science. Students pursuing scientific or technical degrees, such as computer science, mathematics, or biology, most typically complete a course in computer programming that includes an introduction to data structures. Other students complete a less technically rigorous course that combines some programming and computer applications, a brief history of computing, major terminology and concepts, and ethical issues. This latter course, generically referred to as CS 101, poses such problems for faculty and students alike that it can be considered harmful. The harm, however, can be mitigated by innovative teaching that leverages student involvement, both cognitive and physical, with problem solving.

COURSE DESCRIPTION

The specific instance of CS 101 dealt with in this paper is offered at Iona College, New Rochelle, NY. Iona is a private, historically Roman Catholic institution that draws a majority of its approximately 3,000 undergraduates from the greater metropolitan area of New York City. The official title of the course is Computers, Technology, and Society, and it has six enumerated learning objectives. By the end of the course students will:

(1) understand the components of a computer system and its functions;
(2) understand the software development and the problem solving process;
(3) understand the social and ethical issues engendered by computers;
(4) understand computer terminology and the technology of the computer age;
(5) envision the future use of the computer in the student's career;
(6) understand how this foundation can lead to more advanced courses in computer science.

These learning goals are measured by a survey administered to faculty and to students. The student survey is administered anonymously. The objectives are achieved primarily though teaching spreadsheets using MS Excel, databases using MS Access, Web page design with HTML, and programming using Python, each of which is encapsulated within individual instructional modules. The mode of instructional delivery is two lecture periods and one laboratory period, each of an hour, per week for sixteen weeks.

THE PROBLEM

CS 101, as are many required courses, is not popular because it is a graduation requirement, and it is especially plagued by affective indifference and intellectual complacency. Students enter the course thinking that their level of computer familiarity nullifies the value of the course. For students conversant with Facebook, Twitter, and text messaging, the course, often uncomfortably, moves students from using the computer as an appliance to using it as a tool for inquiry.

PHYSICAL MOVEMENT

Indifference is countered by physical and cognitive engagement, and the complacency is countered by extending the reach of the subject matter beyond the textbook and laboratory manual to emphasize current developments. Evidence indicates that emphasizing student participation in the class can have a positive effect on student commitment to excellence and appreciation of other students' contributions to the learning experience (McCurran, 2006). Computer science is an especially apt place for physical engagement because physical movement underlies all computer operations, so a key component of revitalizing the course is to engage the students in physical movement. Physical movement divides into two categories, geographical relocation and dramatic enactment. This entails, for example, dividing the class into groups of four or five and having the groups meet outside the class to work on a problem. The more innovative and engaging type of physical movement is dramatic enactment. To teach the relative efficiency of two sorting algorithms—for instance, bubble sort and selection sort—the classroom becomes the computer, some students become the data, some the controller, and others the arithmetic-logic unit. The sorting of, say, six integers is physically enacted and then discussed. Six chairs are numbered zero through six, and six students hold pieces of paper with single digit. The students sit in the chairs randomly, and another student has them stand up, move around, and then sit down again in accordance with the sort algorithms. The other students record the actions. The division of labor allows introverts and extroverts to play roles calibrated to their personalities. In dramatizing the two algorithms, it becomes clear to students how inefficient bubble sort is. The difference is more sharply realized than in a chalk and talk or MS Powerpoint presentation because the students become the algorithms. A similar enactment is used to teach adding two integers on the assembly-language level, which dramatically illustrates that addition is not an atomic operation.

An innovation related to physical movement is that of the discovery day. Twice during the semester, students are given an assignment that must be completed within twenty-four hours. A regularly scheduled class is canceled, but the instructor shows up to answer questions and is readily available in person and electronically during the period. The goal of the discovery days is to force students to work outside the classroom on a subject so current that it is not covered by the textbook and to motivate them with the thrill of discovering the leading edge. Topics include providing advice on which laptop to purchase, describing the problem of eWaste, and discovering new ways to present data. The appendix presents condensed discovery day assignments.

MULTI—DIMENSIONAL PROBLEM SOLVING

As indicated above, CS 101 familiarizes students with such general purpose applications as word processing, spreadsheets, and databases as well as HTML and programming in sealed modules that do not communicate with other. Moreover, problem solving is also taught discretely. A consequence is that students do not understand the relative strengths and weakness of the software, nor do they develop problem solving skills.

A multi-dimensional approach to problem solving tightly binds problem solving to more than one application. It forces students to solve the same program using multiple means, and it reveals the power and liability of different implementations of the solution. It also helps them to decide which problems are best handled by computer and which are not. For a teacher, the key is to select problems that lend themselves to solution by various methods.

The monkey and doors problem provides a rich example:

> There are 100 doors, all closed. In a nearby cage are 100 monkeys. The first monkey is let out, and runs along the doors opening every one. The second monkey is then let out, and runs along the doors closing the 2nd, 4th, 6th, … all the even-numbered doors. The third monkey is let out, and he attends only to the 3rd, 6th, 9th, 12th, … doors (every third door, in other words), closing any that is open and opening any that is closed. The fourth monkey does the same for the 4th, 8th, 12th, 16th, … doors, opening the closed ones and closing the open ones. The fifth monkey does the same to the 5th, 10th, 15th, … doors, and so on. After all 100 monkeys have done their work in this way, which doors are left open? (Derbyshire, 2002)

In addition to evoking a visually arresting image that can be dramatized in a classroom on a small scale, the problem is conceptually deep. If presented in a classroom situation, the first step is to ask the students to provide an intuitive answer. Some will say all the doors will be open, others that they will be all closed. Allowing the students to think about the problem and to visualize it yields the intuition that only doors with prime numbers remain open. This is an encouraging response because it indicates that some students have understood that the problem has something to do with division and that open doors will be associated with some set of numbers with a special quality regarding division.

The next step is to ask to test the intuition by using general methods for solving the problem. Invariably, one student will suggest working out the problem by hand, iterating through each step and recording the results. Then the results are examined to determine if a pattern emerges. This brute force method can be implemented in more than one way. Several implementations can be presented and evaluated. The first is literally by hand and by paper and pencil, but this is laborious, time consuming, and error prone. These deficits can be reduced but not eliminated by using general computer applications such as those bundled in MS Office. Several candidate applications can be considered. Using MS Word removes some of the tedium, but the tasks required, writing out a sequence of integers from 1 to 100 and recording the status of the doors after each pass, do not yield much to automation. The second candidate is a spreadsheet, which can considerably reduce the labor and the errors. A third candidate is a database, which can be quickly rejected for the brute force method because it provides few of the accounting resources needed. The final candidate is using Python to go through the problem.

Students quickly realize that the brute force method can be replaced by a reduce and conquer algorithm—perform brute force on a manageable subset of the problem and see if a pattern emerges. Reduce and conquer can be physically enacted in the classroom by handing out sheets with integers ranging from one to the class size. Initially, the students hold down all the sheets. The instructor then has the students raise or lower their sheets corresponding to which monkey comes through. At the end of twenty-five iterations, the numbers 1, 4, 9, 16, and 25 are clearly visible. Then students are asked to describe the pattern and the underlying reason for the pattern. They discover that perfect squares, numbers that have an odd number of factors, are left open.

The final level is to discuss how to automate the solution by determining, using software, which numbers are perfect squares and which are now. The problem for the students is, Which software application works best? The best way to engage students here is to divide them into groups based on software. One group analyzes using MS Word, another MS Excel, and so on. Each group must then present to the class the benefits and deficits of using the software assigned to them, and each must present an attempted but not necessarily a fully realized solution. The Ms Word group quickly abandons a simulation. The assignment provokes students to investigate data types and tables in MS Access in a way that goes beyond the standard examples contained in

the text and lab manuals. Some students even manage to discover SQL and macros. The group assigned to MS Excel learns how to create user-constructed functions. The Python group discovers how to write a function to test any particular number, and it quickly learns something about passing values into and out of functions. The competition among the groups accelerates their learning.

Outcomes

Tables I, II, and III present student assessments of all CS 101 sections and innovative sections. The assessments reveal the positive results gained from the innovations. The base line for assessments is Fall 2007. In that semester, the pre-innovative sections were assessed close to all other sections. Innovations were instituted Fall 2008, and they resulted in markedly better assessments. The mean for the innovative sections, 3.69 on a scale of 1 to 4, was 0.72 higher than the other sections, nearly one standard deviation (0.76) above the mean for those sections. Another dramatic contrast is revealed in comparing two sections from Fall 2008 in the innovative group. See Table II. One section used the innovative methods from the beginning, and the other did not implement them until mid-semester when the original instructor was replaced because of illness. The semester-long course was uniformly assessed better than the half-semester course. Strikingly, the full-semester course received perfect scores on two of the six objectives. This means that all twenty-two students gave the highest rating to the achievement of those two objectives.

Often, innovations yield significant but transitory gains. Table III illustrates that the gains in CS 101 are as long-ranging as they are dramatic, even though the initial games surpassed those in subsequent semesters. For the five semesters after the innovations, all sections declined to 2.96 from 3.04, but the innovative sections increased to 3.36 from 3.08.

Conclusions and Future Directions

The innovations described can materially advance the engagement of students in CS 101, and they can increase their knowledge of computer science. The outcomes have been such that two junior faculty have sat in on the innovative sections and have begun to adopt those innovations. Results from student surveys are not yet available, but the faculty members have had an increased in personal engagement and enjoyment of the course. Also, an objective measure of the success of meeting the course objectives will be instituted Fall 2011. All final examinations will include questions assessing those objectives.

Table I
Student Assessment of Objectives
Semester Prior to Innovations vs. Semester Immediately Following Innovations

Objective	Fall 2007 All Sections	Fall 2007 Pre-Innovative Sections	Fall 2008 All Sections	Fall 2008 Innovative Sections
1	3.04	2.90	3.00	3.65
2	2.87	2.94	2.90	3.60
3	3.04	3.24	2.90	3.60

Appendix

Condensed Samples of Discovery Day Assignments

Purchasing a Laptop Computer
I am planning to purchase a portable computer, and I am enlisting your support in this effort. In fashioning a recommendation, you should learn something about computer hardware. I want a computer that is mobile and costs less than $1,500. The primary applications are word processing, Web browsing, and Powerpoint. Video and audio are not high priority. The computer must run a current version of MS Windows, but a big plus would be a computer capable of running Leopard. In fashioning the recommendation, please consider clock speed, speed of the front side bus, hard-drive capacity, hard-drive type, system memory, communications capacity and expandability.

eWaste
A recent report calculated that a single search on Google generates as much carbon dioxide as boiling a kettle of water for a cup of tea. The Basel Action Network has warned that Microsoft has done little to mitigate the e-waste generated by the release of Vista, its latest operating system. More than 500,000 personal computers arrive in Lagos, Nigeria, every month from Western countries, and the 75% that do not work are dumped on sites that spread toxins to children. These facts and others dispel the myth that electronic technology has a minimal impact on the environment and on human beings.

Select one or more of the hardware components of a computer system. The component can be major or minor, central or peripheral. Learn about its function in the computer system and its internal construction.

Learn what materials are used to build it and how those materials are obtained. Find out what happens to the component when its useful life has ended. Draw some conclusions about what you have learned.

Presenting Data
Transforming raw data into a meaningful form is an important skill that can be realized either through verbal or visual means. That skill is as rare as it is valuable. It is especially important now because massive amounts of data require interpretation and presentation. This special project will increase your ability to present data in a meaningful way and to critique the presentation of data. It will also allow you to consider the relationship between presentation and interpretation. Email to me or hand in a presentation that includes
(1) an exemplary visual representation of data;
(2) A short , one or two paragraph, explanation of what the visualization says and why it is exemplary;
(3) A failed visual representation of data;
(4) A short , one or two paragraph, explanation of what the visualization tries to say and why it is a failure.

You can use the resources below or any other resource that you deem appropriate. You may work alone or in teams.

ABSTRACT

The purpose of this paper is to explain the related theoretical framework towards motivating the society in identifying Autism symptoms at the early stages by using multimedia learning. In order to achieve this objective, it requires solid foundation on theoretical philosophy on which explains the relationship of cognitive thinking particularly in learning theories and multimedia principles that can increase their level of awareness and motivations. The relationship of Cognitive Load, Constructivist Learning Environment and Motivations Theory and Multimedia Principle theory will be discussed thoroughly in this paper to strengthen researchers' assumption that autistic characteristics can be identified by using personalization multimedia learning. This paper will cover the current practice of identifying autistic characters in Malaysia and current problems faced by many society. The findings from this paper will lead to the proposal of Interactive Multimedia Learning Awareness (IMLA) tools so that it can help to perceive the awareness and motivation of preventing autism. This tool will also be used as an important aid by the parents who have autistic child and society in identifying the early characteristic of their children in future.

Keywords – *Cognitive Learning; Multimedia; Creative; Autism Characters;*

INTRODUCTION

Autism is a development disorder characterized by impairments in three areas namely communication, social and limited imagination resulting in very narrow interests and repetitive behaviors. Autistic symptoms normally affect between 1 to 3 years of ages and many parents do not know the basic symptoms as normally their characters are vary between them. During childhood, autistic children may fall behind their same aged peers in the areas of communication, social skills, and cognition. In addition, dysfunctional behaviours may start to appear, such as self-stimulatory behaviours, self-injury, sleeping and eating problems, poor eye contact, insensitivity to pain, hyper active and attention deficits. As reported in [2] (Jasni, Wan Ahmad Jaafar & Toh, 2010), the lack of awareness among society was the main factors of why autism is not well understood by the society. [6] (Mansor, 2010), supported that in view of the lack of knowledge and exposure, especially in Malaysia; autism is often misconstrued as mental illness. Consequently, these children are mostly kept at home, hidden from the outside world. Due to this, most of them do not have any chances like others such as in obtaining education, which is the basic human rights; and access to health care hence, we must take that decisive step forward and educate those around us on autism. We need to spread the awareness on autism. We need to teach the parents about the symptoms to look out for if they suspect their children could be suffering from autism. And we need to assure them that it is not the end of the road nor are they alone if their child is diagnosed as being autistic. At the same time, we could also encourage their autistic children to take care of themselves, so that they are able to contribute significantly to the society in the future. Melaka Tengah Autism Association (MTAA) president Ng Kek Kuan mentioned in [5] (Lai, 2010), autism is treatable and early intervention is crucial. She added parents should be aware of warning signs and symptoms of autism so that they can bring their child for diagnosis. Follow up with the necessary treatment right away. They must not wait and expect the child to catch up later or outgrow the problem. The more they know about autism spectrum disorder, the better equipped they will be to make informed decisions for their child.The main questions here is to what extend normal society can easily understand the symptoms of autistic children since this disorder behaviour are quite different between autistic children This paper will try to formulate the best approach of how

theoretical framework and multimedia principle can work together to form an alternative approach so that society can learn basic symptoms of autistic characters in the future.

CURRENT SCENARIOS

The biggest issues currently faced by Malaysia is shortage of health specialists such as physiotherapists, speech therapists and psychiatrists. Human Resource Minister revealed that Malaysia is short of physiotherapists and needs to produce more than 19,000 by 2020. This figures showed to us that the lack of expertise will resulting the less support needed by the parents in raising their autistic child's. The only hope for the parents to get the consultation is to send their child's to NGO's such **Nasional Autism Society(NASOM)** and **Resource and Education for Autistic Children(REACH)** where these center are providing one stop center in helping autistic child's. But most of these agencies are run without making any profits and they just rely on the grant given by the government. On the other hand, the facilities to support autistic children are vey limited especially in the government hospital and most of the cases of autism cannot be detected early as there are no proper facilities to diagnose the symptoms. To get a consultation from the government hospital, the autistic children always need to wait for weeks and may even get to see them once in three month. Other issues is that, not many doctors or specialists are interested in working with children with special needs especially autistic children. The situation might be related to the lack of incentive or not enough informations given by the authority. There are many attemps and approaches have been applied into the research and development to help the autistic children but most of them are too technical and only focus on to the autistic children only. None of the approaches cater for parents especially to increase awareness on how to identify the characteristic of autistic children. So the proper research on how to study the relationship on human behaviour using certain learning and multimedia theories are crucial in enhancing awareness among parents. So the needs for some kind of approach that can help shortening the identifying process will be developed and it requires some mechanism on how to educate parents to take extra steps in learning autistic behaviour. The formulations of suitable learning theories and multimedia principle will be used to design specific tools that help parents to increase their awareness regarding autistic children.

LEARNING THEORIES

Awareness

In order to increase the lack of knowledge, younger societies need to be aware with this issues and they need to have a new ways in learning Autism symptoms in general. Awareness as defined by [1] (Dictionary, 2010), is the state or ability to perceive, to feel or to be conscious, objects or sensory patterns. In this level of consciousness, sense data can be confirmed by an observer without necessarily implying understanding. More broadly, it is the state or quality of being aware of something. Awareness implies knowledge gained through one's own perceptions or by means of information. There are three prosess involved in order to achieve awareness as stated here; **Perceive**, **Identify** and **Relate**. This process will lead to the perception which includes feelings, emotions, seeing, watching and making distinctions without judgment or reaction towards surrounding. As stated in [9] (Sciences, 2008), the study of self awareness is traced by **Shelley Duval** and **Robert Wicklund's** where at a given moment people can focus attention on the self or on the external environment. When self-focused, people compare the self with standards of correctness that specify how the self ought to think, feel and behave. The process of comparing the self with standards allows people to change their behavior and to experience pride and dissatisfaction with the self. The sense of awareness is important in learning characteristic of autistic child since it's related to the cognitive load theory of human as mentioned in below sentences.

Cognitive Load Theory (Sweller)

Cognitive load as stated by the [12] (Wikipedia, 2010), is a term that refers to the load on working memory during instruction on human brain. Instruction may be aimed at teaching learner's problem skill, thinking and reasoning skills. People learn better when they can build on what they already understand(known as schema) but the more a person has to learn in a shorter amount of time, the more difficult is to process that information in working memory. [10] (Sweller, 1998), developed cognitive load theory (CLT) which he proposed that learning can be enhanced by presentation of information. The theory assumes a limited working memory and a virtually unlimited long-term memory. Sweller suggested instructional designer should limit cognitive load by designing instructional materials like worked-example or goal-free problems. There are 3 main types of cognitive load; ***Intrinsic***, ***Extraneous*** and ***Germane*** Cognitive Load.

Constructivist Learning Environment (Jonassen)

In relations with cognitive thinking, to develop effective learning instructions requires the effective learning environment. Constructivism learning environment is a theory of knowledge that humans generate knowledge and meaning from an interaction between their experiences and ideas. [3] (Jonassen, 1999) proposed a model for designing constructivist learning environment. Since the epistemological belief of the constructivism that knowledge cannot be transmitted, the design puts the emphasis on providing learning experiences that facilitate knowledge construction and in meaning making. In the constructivist learning environment, learners are encouraged to engage **exploration**, **articulation** and **reflection** and instructor will encourage providing instructional supports.

Behavioral Changes (Prochaska, Norcross & DelClemente)

In order to motivate learners to learn certain instructions, behaviour of humans need to be studied to facilitate the learners to be aware and and manipulate the learning instructions easily. As stated in [11] (Toh, 2005), James Prochaska and his colleagues, John Norcross and Carlo DiClemente (1994) identified stages of behavioral change in a model that deserves consideration by instructional designers. The Stages of Change model postulates that there is a course of successful change comprising of six well-defined stages, namely **Pre-contemplation**, **Contemplation**, **Preparation**, **Action**, **Maintenance** and **Termination.** Each stage has specific tasks, which must be completed before moving on to the next stage. Most interestingly, the model claims that changes cannot be skipped for successful, sustained changed. Each stage requires different kinds of activities, and achievement before one can successfully lead to the next stage.

Elaboration Theory (Reigeluth)

In developing learning instructions project, the style of instructions level needs to construct in sequence. As supported by elaboration theory introduced by [8] (Reigeluth, 1992), is a strategy for conceptual presentation in which concepts are organized and presented in increasing order of complexity. Instructions should be organized in increasing order of complexity for optimal learning. For example, when teaching a procedural task, the simplest version of the task is presented first; subsequent lessons present additional versions until the full range of tasks are taught.

Motivation Theory (Keller)

After the completion of the learning process, learner will get an experience of how the multimedia learning can motivate themselves and they will be aware with the symptoms of autistic child in future. As stated in [4] (Keller, 2006), motivational design consists of a set of categories of motivational concepts and strategies that are derived from a synthesis of the research on human motivation combined with a review of successful motivational practices. According to Keller there are four major categories of motivational strategies that can help learners to increase motivation. They are Attention - The most important aspect of the ARCS model is gaining and keeping the learners' attention. Keller's strategies for attention include sensory stimuli (as discussed previously), inquiry arousal (thought provoking questions), and variability (variance in exercises and use of media).

Personalization Principles (Mayer)

The success of instructional design in this research will solely depend on the use of multimedia principle which in this study the personalization principle will be used as the main independent variable to increase awareness of autistic symptoms. [7] (Mayer, 2005d), defined the multimedia principle as an approach of people learn better when multimedia messages are designed in ways that are consistent with how the human mind works and with research-based principles. The use of Mayer personalization principles in this research is related with the theory of behavior of change from the Prochaska in term of building up the relationship of how human behavior react toward learning. This change of behavior is crucial in motivating the learner to take the early prevention of identifying the symptoms of autistic children. Normally, learning instruction is designed in formal way and the information presented to the learners was too formal. Under this theory, one personalization principles will be used as an independent variables, they are Infomal Conversational. Personalization principle will be effective when any processes to create or select e-learning courses that include some spoken or printed text that is conversational rather than formal are involved. According to cognitive theories of learning, humans strive to make sense of presented material by applying appropriate cognitive processes. People work harder to understand material when they feel they are in a conversation with a partner rather than simply receiving information. In other words people will be more comfortable when the information received came from source that are not too formal and they feel easy to adapt the sources. Instructional information is often written in a formal style in which the author seems invisible.

THEORETICAL FRAMEWORK

The theoretical framework as proposed at Figure 1, explained the overall structured and expected outcome of the research. This research will focus on knowledge acquisition of how human knowledge generated by memorizing the instruction given. The acquisition of empirical knowledge, which begins the process of filling the tabula rasa, is thus by means of the experience of sensation and perception. Perception is the retention of a group of sensations transmitted through the sensory system(s), which gives the knowing subject the ability to be aware. So this research will focus Knowledge Retention and Informal Conversation to be as Independent Variable and the expected outcome from this research will be to increase the perceiveness of Awareness and Motivations levels. The selection of the Cognitive Thinking and Age will be used as moderator variable. The next stage of development will be the the use of Allessi & Trollip in the development of the project and also the process of evaluating the data.

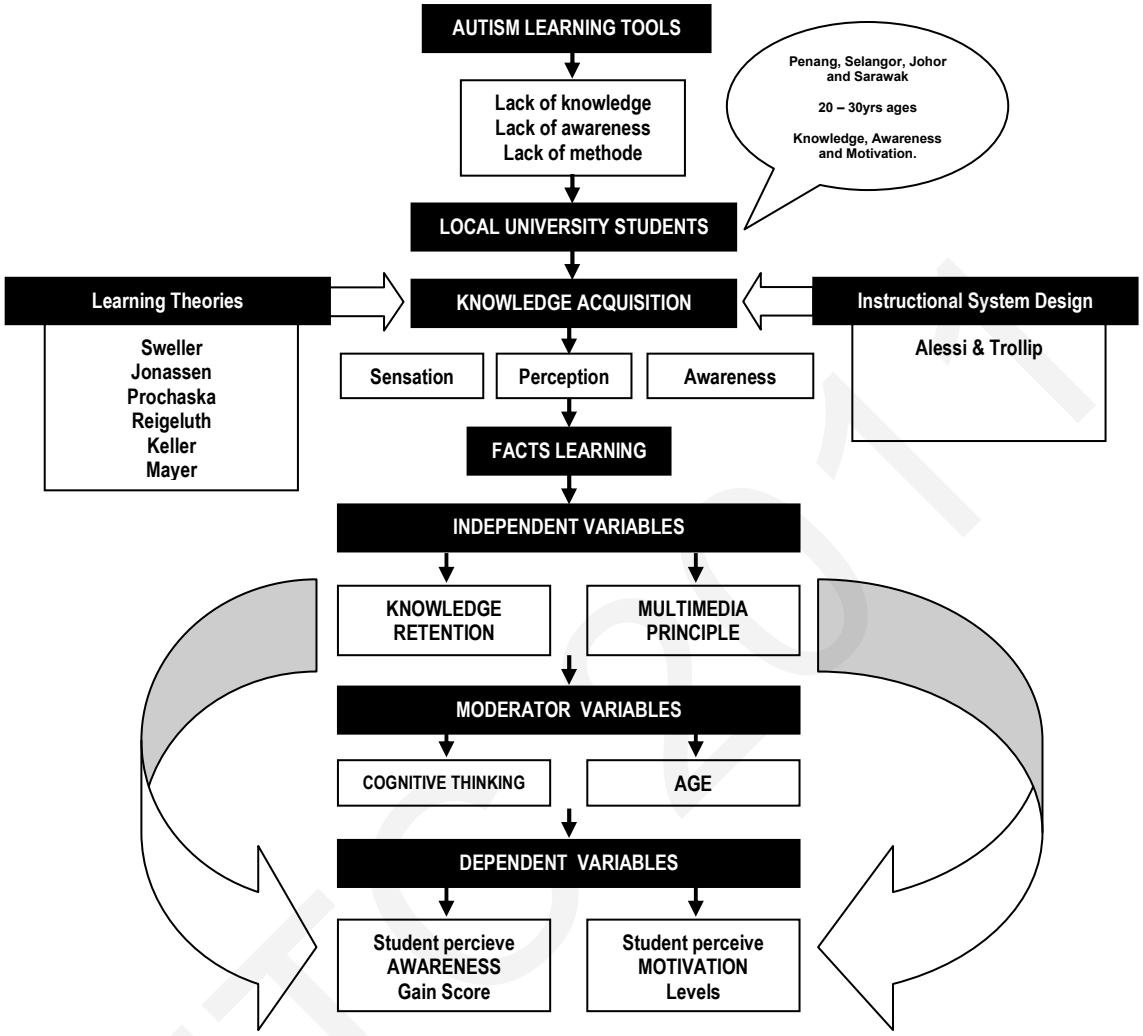

Figure 1: Theoretical framework of the Interactive Multimedia Learning Awareness (IMLA)

CONCLUSION

Based on aboved literature reviews, learning theories and multimedia principle, it shows that the awareness and motivation can be achieved if the proper theories and principles be implemented soon. The implementation of this theoretical framework is important because it will map all the theories and multimedia principle together to form a solid pathway for the development of the Interactive Multimedia Learning Awareness (IMLA). Another reason is to strengthen researchers' hypothesis of certain learning theories and multimedia principle could create an awareness of learning through proper multimedia learning approach. The selection of learning theories and multimedia principles in this research was done carefully in order to achieve the outcome which is to perceive awareness and motivation. Awareness is not something that we can achieve in one day since the characteristic of autistic children is different from child to child. With continued research and support from various parties it will help the awareness toward autistic children become norm and live it up amongst themselves. Once awareness is achieved it will help the society to be prepared, conscious and aware mentally and physically on how to deal with this autistic child if they are given one by God. With the current advances of ICT technology, such as multimedia learning, society will have greater access to learn, identify, recognize and consult with expert in lesser time than before.

DESIGN A VIRTUAL ITEM BANKBASED ON IMAGE PROCESSING TECHNIQUE

Wen-Wei Liao and Rong-Guey Ho
Graduate Institute of Information and Computer Education, National Taiwan Normal University
abard@ice.ntnu.edu.tw,hrg@ntnu.edu.tw

Abstract

One of the major weaknesses of the item exposure rates of figural items in Intelligence Quotient (IQ) tests lies in its inaccuracies. In this study, a new approach is proposed and a useful test tool known as the Virtual Item Bank (VIB) is introduced. The VIB combines image processing theory with the concepts of figural tests and Computerized Adaptive Testing (CAT). It is believed that this tool will assist in improving traditional figural tests – in terms of solving previous issues relating to item exposure and allowing a figural test to be more easily developed.

Keywords: Virtual Item Bank, Image Processing, Item exposure, CAT, IQ

INTRODUCTION

With the development of technologies, the computer has evolved into a tool that can improve the accuracy and efficiency of tests. In effect, computers have largely transformed the way in which testing has been conducted over the years. Computer-Based Testing (CBT) has been adopted both in Taiwan and overseas. Examples of CBT include the On-line Computer Basic Competence Test of High School and Vocational School Students (http://www.onlinetest.org/), the Graduate Record Examination (GRE), the Graduate Management Admissions Test (GMAT), and Test of English as a Foreign Language (TOEFL).

In comparison to the CBT, the Computerized Adaptive Testing (CAT) is a more complex form of testing. A CAT system chooses items for a given examinee based upon the examinee's responses to earlier items, as well as estimating one's ability according to his/her responses. As a result of the reduction in both testing time and testing items, many studies have since focused on the application of CAT (Steven & Barbara, 1989; Ho, 2000). Nevertheless, the problems associated with the development of item bank still remain unresolved, primarily due to manpower, budget and time constraints.

Figural tests are comprehensive mental ability testing tools for children and the illiterate. However, it is acknowledged that building a figural test can be rather challenging (Cronbach, 1990). There are at least eight figural test development steps, including designing test specifications, editing items, collecting pre-test data, analyzing items' parameters, revising items, selecting an appropriate scoring method, formal testing, and assessing the overall success of the test (Kingston & Stocking, 1986; Cronbach, 1990).

Item exposure rate is one of the most important factors that influences the security of a figural test. The most common way of reducing this risk is to impose a maximum exposure rate (r). Several other methods have also been proposed in line with this aim (Sympson & Hetter, 1985; Revuelta & Ponsoda, 1998; van der Linden & Veldkamp, 2006). All of these methods establish a single value of r throughout the test. In

this study, we present a new method, known as the Virtual Item Bank (VIB) method, which creates an item bank with unlimited items. We will attempt to describe the implementation of VIB and evaluate it's performance with an empirical experiment. In this way, item exposure rate is always 0. Hence, the problems associated with item exposure can be resolved.

LITERATURE REVIEW

Computer Figural Testing

Computer-based figural testing has been widely employed across various institutions, such as the Online Testing Center (http://www.onlinetest.org/), the center of Applied Psychology at Beijing Normal University (http://www.bnufr.com), and commercial web sites like IQTest (http://www.iqtest.dk/). These organizations provide useful computer-based figural testing tools and analytical (analysis) tools for researchers. However, only online versions are provided.

Lin (2001) has researched computer adaptive figural testing since 1998. His researches are based on the analysis of Raven's Advanced Progressive Matrices (APM) test structure, besides being responsible for the development of the New Figure Reasoning Test (NFRT). NFRT contains two main systems: the automatic item-generation system and the online testing system. The online testing system based on IRT theory is just an interface for collecting and evaluating the ability of examinees. The point of this study is an automatic item-generation system which contains an item generation algorithm and an item-generation engine based on APM.

Content-Based Image Retrieval

Generally speaking, figural tests were more difficult than text tests. In the selection verification, examinees paid full attention to the accuracy of the selection and the problem introduced by the option. As multimedia technology advances, this study would use data mining to help examinees solve the problem of selection verification.

Image comparison has been applied in many fields such as identity authentication, surveillance, human-computer interface, multimedia etc. In this research, content-based image retrieval techniques in image processing would be employed. Also, the main parts of the figure would be identified in order to perform data mining. The concepts and methods of content-based image retrieval are described below:

1. Formula without considering colour characteristics:

The characteristic vector is used in the computation to represent the figure, as shown below:

$f^{I}=(i_1, i_2, i_3, \ldots. i_n)$ ……(i)

f is the characteristic vector of the figure, and *n* is the code for the content characteristic.

The similarities of two figures are obtained by computing the Euclidean distance of the characteristic vector (as shown in Formula i). The smaller the value, the more similar the two figures and vice versa.

$$d(Q,I)=\sqrt{\sum_{j=1}^{n}(f_j^Q-f_j^I)^2} \quad \text{.....(ii)}$$

while $d(Q,I)$ is Euclidean distance of the characteristic vector of figure I and Q.

2. Formula that considers colour characteristic:

Mehtre, Kankanhalli, and Lee (1998) proposed a solution to consider the figure colour and shape together to calculate the figure similarity. The formula for the colour distance is shown in Formula iii. While clustering 400 x 400 figure colour, the minimum threshold of the colour distance between each cluster was set to 50.

$$\text{Colour distance}=\sqrt{(\Delta R)^2+(\Delta G)^2+(\Delta B)^2} \quad \text{.....(iii)}$$

Formulas that consider the colour instead of colour characteristics helped generate suitable answers in this study.

METHODS

The objective of this study is to propose a new concept – Virtual Item Bank, and to show how this concept is used in the figural test. The following is a discussion on the problems and the demands of item bank generation we encountered in addition to the development of the research tools.

DEVELOPMENT OF THE RESEARCH TOOL

This research has developed two research tools: 1. Virtual Item Bank System; 2. CAT system. The system structure and functions of these two tools are described as follow.

Virtual Item Bank System (VIBS):

In VIBS, the item database no longer stores large amounts of items; instead, it saves two elements to replace the traditional items:

1. Basic figure element

This system no longer requires saving a large amount of figural items. Instead, items were built upon three basic figure types: line, circle and multilateral. Not only does this lower the memory space requirements, but it also reduces the probability of item exposure.

2. Solution Processes

The examinees' solving processes and abilities were defined by specialists and converted to mathematical formulas which could be manipulated by computers and stored in the hypothetical item database. Using this data along with the basic figure elements, the computer can produce mass items and lower the work load for test preparation.

The VIB which replaces the traditional item bank is illustrated by the flow chart below.

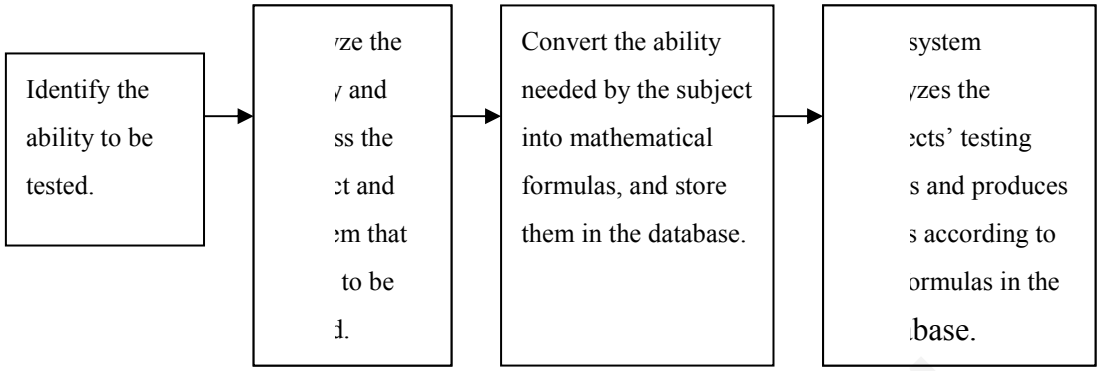

Figure 1. Flow chart of VIB

CAT System

The main function of CAT system is to select appropriate items for examinees and evaluate examinees' ability based on IRT model. In producing items, CAT system is only an application interface, and does not perform image process, item design or retrieval. These tasks are done by VIBS, and the results are sent back to CAT system to administer tests. In terms of ability evaluation, this system uses IRT to process. The psychometric model includes Rasch model, Two-parameter models (2PL model), and Three-parameter models (3PL model).

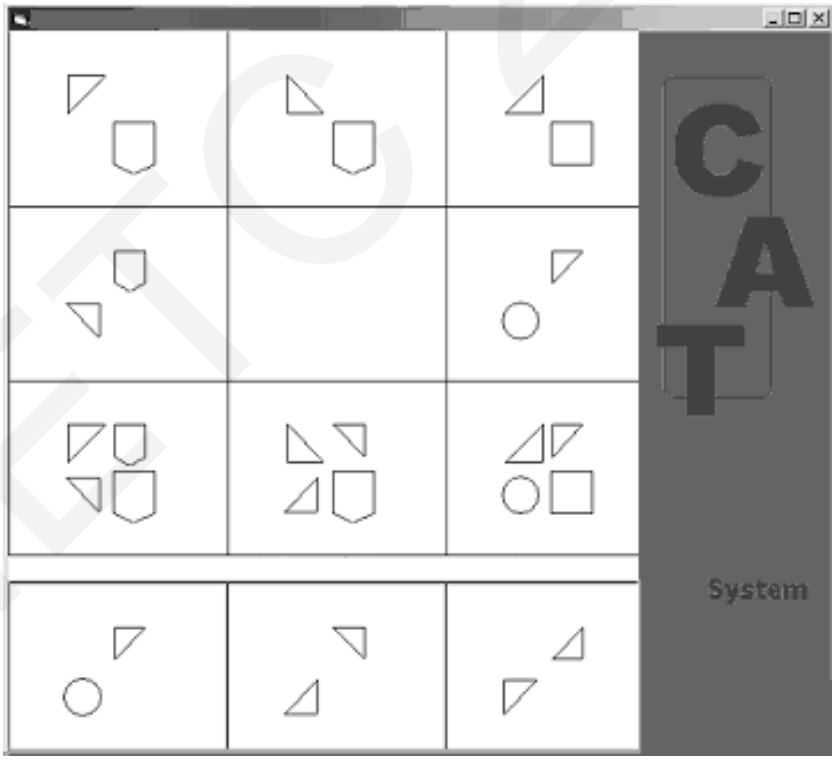

Figure 2: CAT system

The figure above represents the issues of the problem and demands of item bank generation, in addition to the development of research tools. The research tools helped test editors to solve the problem of the item exposure rate. A simulation of the item overlap rate will be discussed and proved in the following section.

RESULTS

The Item Rule Definition

In this study, a VIB has been built specifically for figural testing. This VIB contains 48 rules. Each rule is composed of an image processing operation and a problem-solving process.

Parameter Estimation

The primary parameter of this study was item difficulty parameter. An experiment deploying an online CBT system was designed to collect and estimate the items created by the VIB. 310 elementary school students participated in this experiment. The results of this experiment are presented in table 2. The structure of the CBT system and the results of the estimation are discussed in the following paragraphs.

An online CBT system is use to collect data of the item-generation rules in the VIB. An instruction example of this system would show to examinees before testing start. When examinees finished the test, the results would be transfer to the server and be analyzed in a short time.

Table1. *Results of item difficulty parameters generated by the rule A, B, C*

Rule A	Difficulty	Rule B	Difficulty	Rule C	Difficulty
A-1	0.63	B-1	0.5	C-1	0.28
A-2	0.69	B-2	0.5	C-2	0.39
A-3	0.67	B-3	0.56	C-3	0.41
A-4	0.7	B-4	0.53	C-4	0.38
A-5	0.73	B-5	0.59	C-5	0.34
A-6	0.72	B-6	0.52	C-6	0.16
A-7	0.72	B-7	0.52	C-7	0.25
A-8	0.64	B-8	0.59	C-8	0.42
A-9	0.81	B-9	0.59	C-9	0.34
A-10	0.72	B-10	0.48	C-10	0.38

Table 2. Standard deviation of difficulty parameter of rule A, rule B, and rule C

Rule A	Rule B	Rule C
0.051218	0.04158	0.082226

The VIB generated items with similar item difficulty parameters by the same rules. The result indicated that the item difficulty parameters created by the same rule were closed to each other, which meant that the VIB is a powerful tool, and it can solve the problem of item exposure.

The Item Overlap Simulation

In this study, an item overlap simulation was conducted. According to the item overlap rate (given in formula ix), when max length of the test = 48, subjects = 30000, the simulation results are as follows.

Table 3. *Results of the item overlap rate simulation*

Item overlap rate (R)	2.43488E-10
Mean of test length	36.5078
Mean of Theta-Estimated	-0.106
Mean of SE	0.4023

CONCLUSION

From the results of item overlap simulation, it is obvious that the VIBS can resolve the problem of item exposure efficiently. Every examinee got different items on the same test. This allows the VIB to be used not only in measurement but also in practice. The results of the experiment showed its evident effects in practice.

In the VIB, the item was generated dynamically. It was however difficult to apply it in the CAT system. In order to solve this problem, two CBT testing systems were designed to collect the item difficulty parameters of the item generation rules. Table 3 and table 4 demonstrate that the items generated by the same item generation rule have approximately the same item difficulty parameters.

These results show that a CAT system can contain a VIB; however, there are still many different types of tests needed to be analyzed which will be the focus for the future work of our research.

ABSTRACT: A major challenge in developing systems of distance learning is the ability to adapt learning to individual users. This adaptation requires a flexible scheme for sequencing the material to teach diverse learners. This is where we intend to intervene to model the personalized learning path to be followed by the learner to achieve its educational objective determined. Our modeling approach of sequencing is based on the pedagogical graph which is called SMARTGraph. This graph allows to express the totality of the pedagogic constraints under which the learner is submitted in order to achieve his/her pedagogic objective. SMARTGraph is a graph in which the nodes are the learning units and the arcs are the pedagogic constraints between learning units.

We shall see how it is possible to organize the learning units and the learning paths to answer the expectation within the framework of individual courses according to learner profile or within the framework of group courses. During the learning process, the system generates, for each learner, the set of specific learning units according to his/her profile and to the selection criteria (objective, cognitive style, language, configuration, rate).

To implement our approach we used GraphML (Graph Markup Language) to define the graph structure and SVG (Scalable Vector Graphics) to describe the visual properties.

Keywords: E-learning, pedagogical graph, adaptability, profile, XML, GraphML, SVG

1. INTRODUCTION

The sequencing of the course has a direct impact on the effectiveness of learning, so it is present in several areas of research. In the context of Adaptive Hypermedia systems applied to distance learning, sequencing of content should be carefully designed so that the learner does not get lost in hyperspace (De Bra , Houben and Wu ,1999). The content to be presented to learners must be selected to adapt in terms of presentation and navigation. The sequencing of content has also a vital part in the Intelligent Tutoring Systems (ITS) (Brusilovsky and Vassileva, 2003) which are developed under the hypothesis that computer systems can model human learning and in selecting the best scheduling strategy learning for each learner. The objective of the majority of ITS is to adapt their training offer, in a dynamic way, according to pedagogical rules but also depending the reactions of the learner (Brusilovsky and Peylo, 2003).

In parallel with this research on sequencing, considerable effort has been devoted to developing standards to enable systems-based learning on the web to find, share, reuse, and export content in a standardized way (ADL, 2004). The function of the sequence was included in the specifications of the standard IMS Simple Sequencing (IMS, 2003). This feature provides the learner the sequencing of content in order to guide the learning space. IMS Simple Sequencing is based on the strategy already established by the designer of the content.

In our approach the teaching course/path was designed to allow each learner to express its capacities as well as possible, and to build assets in agreement with its pedagogical objectives. The course is composed of learning units (LU) and which are interrelated by pedagogic relations. It is up to the pedagogic sequencing to define these relations. It will have to determine which LU will be presented to the learner and when it will take place. It must also allow not only the conditionally branch from one learning resource to other learning resources, according to whether the learner has carried out certain stages or obtained a sufficient note, but also the fact that this last is permitted to subscribe in a LU. The pedagogic sequencing is the result of the application of composition techniques which can be, for example, the browsing of the tree structure in a linear way from a LU to another. A more complex pedagogic sequencing can be based on the achievement of certain LUs, as prerequisite LUs, on the learner preferences or on the evaluation results.

SMARTGraph is a pedagogic graph which is included in this perspective of the pedagogic sequencing modelling. It is a pedagogic graph where the nodes represent the LUs, and the arcs represent the pedagogic relations between these LUs.

2. THE GRAPH OF PEDAGOGICAL PROGRESSION

The pedagogic graph SMARTGraph is used for implementing the sequencing. In SMARTGraph the nodes represents the learning units and the arcs (links) are the pedagogical constraints between learning units. In order to express the pedagogic constraints, we use the prerequisites formalism. A prerequisite of a LU is the set of the knowledge necessary to follow this LU in order to achieve a defined objective (Elouahbi and Outtaj, 2003).

In order to express the sequencing, we use the prerequisites formalism. A prerequisite of a LU is the set of the knowledge necessary to follow this LU in order to achieve a defined objective. Using this formalism, the notation used to express that the LUi is a prerequisite of the LUj is as follows: Pr(LUj)=LUi. The table below summarizes the logic operators used in the prerequisite based formalism.

Symbol	Meaning	Example	Graph
NULL	No prerequisite	Pr(LU1) = NULL There is no LU required to follow LU1	
	A simple prerequisite	Pr(LU2) = LU1 The learner can follow LU2 if he/she has followed LU1. It is equivalent to an unconditioned sequencing between two LUs of a graph.	:c	A prerequisite with a condition	Pr(LU2) = LU1 : C1 The learner can follow LU2 if he/she has followed LU1 and satisfied the condition C1. It is equivalent to an conditioned sequencing between two LUs of a graph.	&	A LU with many prerequisite LUs	Pr(LU3)= LU1& LU2 The learner can follow LU3 if he/she has successfully followed LU1 and LU2.	|	Choice between many LUs	Pr(LU3)= LU1| LU2 The learner can follow either LU1 or LU2 to consider that the group LU1, LU2 has been done.	()	Evaluate first	Pr(LU4)= LU1& LU2| LU3 The learner can follow LU4 if he/she simply has followed LU3 or (LU1 and LU2) But if we add () like this Pr(LU4)= LU1 & (LU2|LU3) The learner can follow LU4 if he/she has successfully completed LU2 or LU3 and the LU1.	$[]_{n/m*}$	Choice of n LU among m with constraint on the followed order as prerequisite	$[LU1, LU2, LU3, LU4]_2$ 2 LUs of the group are sufficient to consider that the group has been done, but the order must be respected.	{}n/m	Choice of n LU among m without any constraint on the followed order as prerequisite	Pr(LU5) = $\{LU1, LU2, LU3, LU4\}_3$ 3 LUs of the set LU1, LU2, LU3, LU4 are sufficient to allow access to LU5.	
Then, once the course is generated, the learner starts the first part, and at the end of this part, the system must take into account the learner interactions during this learning unit. The learner will then have to access to a specific learning unit if necessary with a modified profile. The transition from an educational sequence to another is then made according to an educational approach.

The total graph is deduced starting from the prerequisites expressions, because each definition of prerequisites makes it possible to deduce a portion from the pedagogical graph. This made, the fusion of the whole of under graph makes it possible to reconstitute the general graph. The following expressions formalize the pedagogic graph of figure 2.

1) Pr(LU1)= NULL
2) Pr(LU2)= LU1 | LU2 : C1
3) Pr(LU3)= LU2 & LU6
4) Pr(LU4)= LU3
5) Pr(LU5)= LU3
6) Pr(LU6)= LU1
7) Pr(LU7)= LU6 : C2
8) Pr(LU8)= LU7 & (LU4 | LU5)

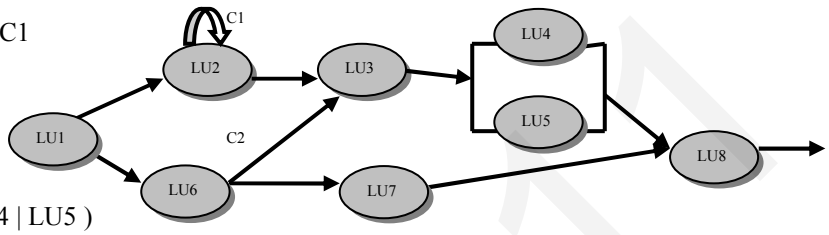

Figure 2: Example of SMARTGraph

3. IMPLEMENTATION

Our objective is to provide an adaptive sequencing across pedagogical sequence, need for a good definition and structuring of the course documents is obvious for a comprehension of this structure and this definition by the system in order to extract some information targeted to provide a course sequencing adapted to each learner profile (conf figure 3).

In the search for a solution to our needs, our choice was made on XML to describe the structure of course and SVG (Scalable Vector Graphics) a modularized language for describing two-dimensional vector and mixed vector/raster graphics in XML (W3C, 2011), to describe and represent the pedagogical graph. Indeed the automatic generation of the course was facilitated by the use of XML parsers, SVG Parser, SVG Generator and the SVG DOM, etc.

The adaptation of the course sequencing according to the user profile (IMS LIP, 2001) is made possible using XSLT. It will first of all be necessary to adopt a structure defining the relationship between the course and the profile.

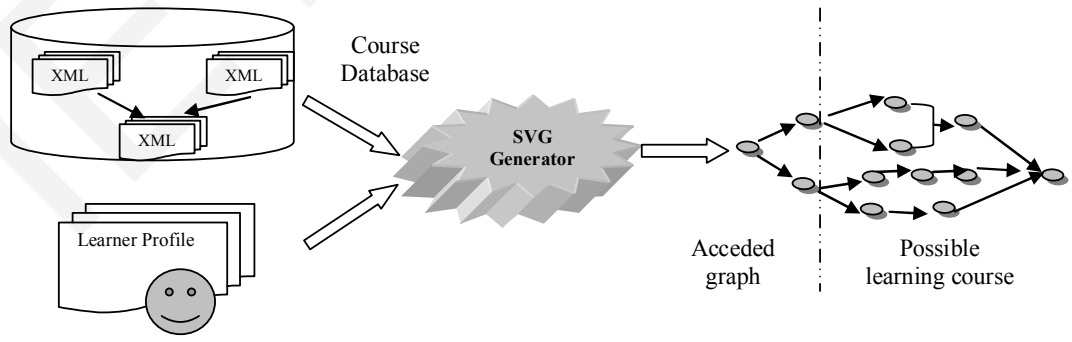

Figure 3: Implementation of SMARTGraph

The generation process consists in generating the already accomplished course by learner in the first part of the graph and all the others possible courses in the second part. The continuation of learner the course will be done according to its personal choices, and especially to his profile evolution.

3.1. Generation Process

As showing in figure 4, starting from the list of the expressions of the prerequisites described in the prerequisite xml file, we generate generic GraphML (GraphML, 2001) corresponding to the total pedagogical graph via an XSLT transformation.

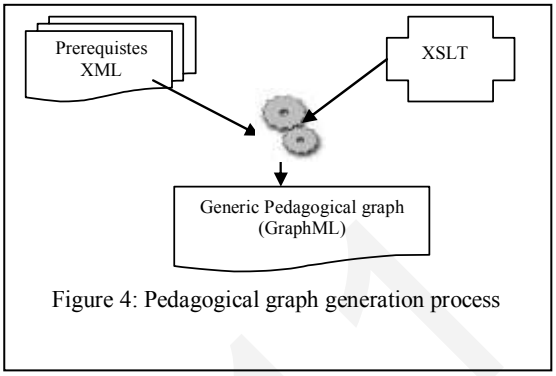

Figure 4: Pedagogical graph generation process

Example 1:

Prerequisites XML file

```
<prerequisites>
<prerequisite idLU = "chapter3">
<operator type="and">
        <LU id = "chapter1"/><LU id = "chapter2"/>
</operator></prerequisite>
<prerequisite idLU = "chapter4">
<operator type="simple">
        <LU id = "chapter3"/></operator>
----------
</prerequisite>
</prerequisites>
```

Example 2:

Generic GraphML file

```
<graph edgedefault="undirected">
<desc>A GraphML file</desc>
<node id="chapter1"/><node id="chapter2"/>
<node id="chapter3"/><node id="chapter4"/>
-----------
<node id="chapterN"/>
<edge source="chapter1" target="chapter3"/>
<edge source="chapter2" target="chapter3"/>
<edge source="chapter3" target="chapter4"/>
-----------
<edge source="chapterY" target="chapterZ"/>
</graph>
```

3.2. Adaptation Process

As showing in figure 5, knowing that each learner has a profile which is brought to change constantly during all the learning process, it is unimaginable to envisage all possible XSLT transformations being able to be applied to the pedagogical graph. This led us to choose on the solution of a generic XSLT file containing a certain number of parameters which have a direct relationship with the profile. Thus the parameter setting of this generic XSLT by the profile item will dynamically give a specific XSLT according to this profile (Conf example 4). The transformation of the generic XSLT into specific XSLT will be done by using XML parser.

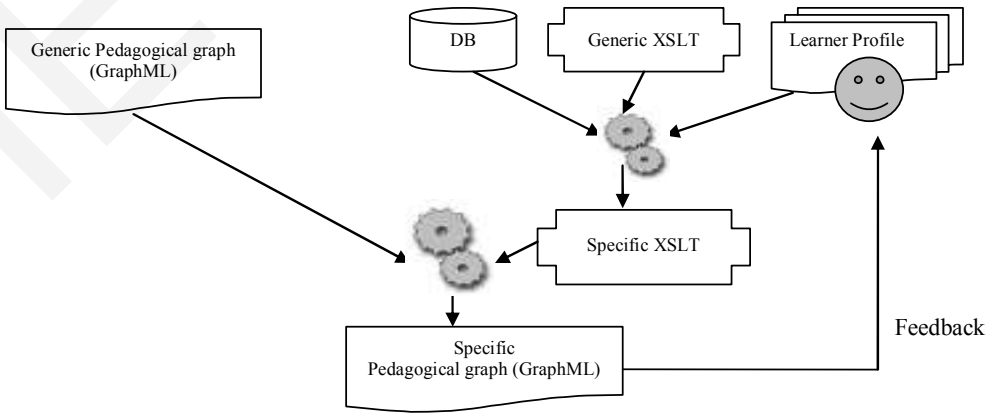

Figure 5: Adaptation process

Example 3:

Fichier XSLT générique

```
<xsl:transform
xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
version="1.0">
<xsl:variable name="Language" select="""/>
<xsl:variable name="List_LUs" select="""/>
<xsl:variable name="Obj_Pedag" select="""/>
        <xsl:template match="/">
                <xsl:for-each select="Graph">
                        <xsl:choose>
                        ----------------------------
```

Applied to the values of the following profile:

Pedagogical Objective	Engineer
List of achieved LUs	chapter1, chapter2
Language	French

Give the specific XSLT above:

Example 4:

Fichier XSLT specifique

```
<xsl:transform xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
version="1.0">
<xsl:variable name="Language" select="french"/>
<xsl:variable name="List_ LUs " select="chapter1, chapter2"/>
<xsl:variable name="Obj_Pedag" select=" Engineer ""/>
        <xsl:template match="/">
                <xsl:for-each select="Graph">
                        <xsl:choose>
                        -------------------------
```

Thus, to generate the GraphML graph specific to a profile, it is necessary to apply to the generic pedagogical graph GraphML XSL transformation specific to this profile. Applied to the specific XSLT of example 4 gives the Specific pedagogical Graph (GraphML) below:

Example 5:

Specific GraphML file

```
<graph edgedefault="undirected">
<desc>A GraphML file</desc>
<node id="chapter1"/><node id="chapter2"/>
<node id="chapter3"/><node id="chapter4"/>
<edge source="chapter1" target="chapter3"/><edge source="chapter2" target="chapter3"/>
<edge source="chapter3" target="chapter4"/>
</graph>
```

3.3. Visualization Process

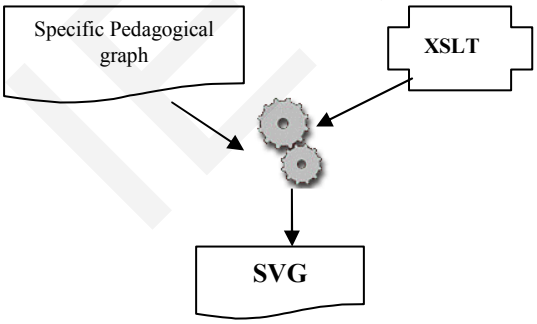

Figure 6: Visualization process

The Specific teaching Graph (GraphML) being obtained, it is necessary to apply a style sheet XSL to him to transform it in SVG format (Jolif, 2003) which can be visualized in a navigator having the suitable plugging (Adobe, 2011) (conf example 6).

Example 6:

Specific SVG file

```
<svg width="8in" height="11in">
<defs>
<marker id="arrow" --- markerHeight ="10" orient="auto">
<path class="edge" d="M0 0 10 5 0 10z"/></marker></defs>
<g>
<circle id="chaptre1" cx="200" cy="50" r="50" fill="lightgrey"/>
<text text-anchor="middle" x="190" y="50">chapter1</text></g>
<g>
<circle id="chaptre3" cx="400" cy="200" r="50" fill="lightgrey"/>
<text text-anchor="middle" x="395" y="205">chapter3</text></g>
<g>
<circle id="chaptre2" cx="200" cy="350" r="50" fill="lightgrey"/>
<text text-anchor="middle" x="200" y="345">chapter2</text>
</g>
----------------------
</svg>
```

4. CONCLUSION AND PERSPECTIVES

SMARTGraph allows the real-time modeling of the choice and the succession of the courses, or the parts of a course, that a learner operates during his/her training. This modeling consists in presenting the pedagogic relations between the different parts of a course, or a cursus, by the mean of algebraic operators. These operators are used, in this sense, as constructors of the sequencing of the parts of a course for a learner's profile at a given time. In this way, this sequencing allows or not to specify access instructions according to the operators result. By basing us on standard technologies such as XML, XSLT, SVG, GraphML in our system implentation, we proved the relevance of the concepts which we defined. Moreover, we will plan thereafter to apply verification techniques on the graph in order to produce a course that is coherent, consistent, and which does not present problems of infinite looping or deadlock.

DETERMINING PROSPECTIVE ELEMENTARY SCIENCE TEACHERS' AGRICULTURAL LITERACY WITH e-DIALOG JOURNALS

Hasan Celal AKGUL
Esra MACAROĞLU AKGUL
Sakarya University

Abstract

Data from several research studies displayed misconceptions in agriculture. Agricultural literacy and environmental awareness of young individuals have an undeniable effect on the life of next generations. This research study explores prospective science teachers' understandings about agriculture and proposes dialog journal model for determining agricultural literacy among participants. Thirty prospective elementary science teachers participated in this research study. A questionnaire, developed by the researcher, on agricultural literacy was administered to participants at the beginning of the semester. The model used in this research includes six-week activity sheets and each activity sheet has a case to reflect. Research participants were asked to keep dialog journals, which are e-journals, for each activity sheet. Researcher analyzed participants' reflections in journals qualitatively, and integrated with the quantitative analysis of questionnaire. An assertion with 3 subcategories was formed to explain agricultural literacy of the participants.

Keywords: agricultural literacy, environmental awareness, agricultural education, prospective elementary science teachers

Introduction

High rate of increase in population, lack of foods for well nutrition, changes in seasons and many other factors related to the environment we live, lead us put more emphasis on agriculture to continue our life. Knowing and understanding of agriculturally related scientific and technologically-based concepts which were included in the processes required for personal decision making, participation in civic and cultural affairs, and economic productivity is known as agricultural literacy. The roots of agricultural literacy can be traced to instructional efforts in public and private schools beginning in 1821 in the world as cited in Birkenholz, Frick, Gartin, Hoover, Jewel, Terry, Bishop, Steward (1992). Basically, Wright, Stewart and Birkenholz (1994) related individual's knowledge about agriculture to their agricultural literacy. Individual's agricultural literacy is affective on their attitudes and actions in producing a public policy about the issue. Frick, Birkenholz, and Matchmes (1995) pointed out that agricultural literacy is based on the premise of "every person should possess a minimum level of knowledge of the industry which produces food needed for human to survive".

Literature review about agricultural literacy displays no consensus on definition of the term. Philosophical, political and epistemological differences among specialists were cited as reasons of this situation (Powell, Agnew, Trexler, 2008). Wright et al.(1994) linked agricultural literacy and agricultural awareness in their definitions of the term. They defined literacy as an attitude toward the world. Based on this definition of agricultural literacy, agricultural awareness was defined as having positive attitudes and association with agriculture. While Wright et al. (1994) defined the term as attitude, Frick et al.(1995) defined agricultural literacy as not an attitude but knowledge and perception regarding agriculture, food and national resources.

Based on the philosophical, political and epistemological differences among specialists, there are three approaches to agricultural literacy reported by Powell et al. (2008) as programmed agricultural literacy (deductive model), emergent agricultural literacy (inductive model) and agriculturally literate value judgment (evaluative model). Perceived lack of utility outside the agriculture field, timing and opportunity and a dichotomy of purpose regarding agricultural literacy within education are cited among the barriers to development of a shared vision for agricultural literacy (Powell et al, 2008). Several research studies addressed the definition and benefits of agricultural literacy and collaboration between science and agriculture teachers (Wright et al., 1994; Frick et al., 1995; Knobloch, Ball, Allen, 2007; Thompson, Warnick, 2007; Stephenson, Warnick, Tarpley, 2008; Cannon, Broyles, Anderson, 2009). Knobloch (2008) argues elementary students' need for authentic learning and issues like food, agriculture and natural resources in elementary classrooms bring learning to life. Therefore; elementary school teachers need to be well informed and equipped about these issues to generate authentic learning environments. It is also a known fact that

individuals' philosophies and epistemologies effect their beliefs and mental images which reflect their attitudes and practices in classroom (Knobloch, 2008). Do elementary teachers have a chance to be well informed about agriculture in their undergraduate years? Based on the literature review cited above, prospective elementary science teachers' knowledge and understandings about agriculture, which refer to their agricultural literacy, were examined in this research study.

Method

This is a mixed method research study designed with the purpose of answering the following research questions:

1. What is the overall agricultural literacy level of prospective science teachers?
2. What is the participants' level of understandings with regard to the components of agricultural literacy?

Participants and the Context

Research participants were thirty prospective elementary science teachers volunteered to participate in this research. Participants were attending "environmental science" course during Spring 2011 semester in a big scaled university located in Marmara region.

"Environmental science" is a 3-credit theoretical course, which includes agriculture and environment relations in its chapters. The researcher was the course instructor. The course was designed in a technology-integrated way. Therefore; PowerPoint presentations and shared social networks were the fundamental issues of the course. An e-group called "agricultural literacy" was formed and all participants were asked to keep a journal within the framework of this e-group. Journals kept by the participants let them share their views and understandings both with each other and the researcher.

Data Collection

At the very beginning of the Spring 2011 semester, the researcher developed a questionnaire to understand participants' understandings about agriculture and its effects. The questionnaire consisted of 15 likert-type items prepared within the framework of seven agricultural literacy concept areas defined by Frick et al (1995). Three of these areas were emphasized in the questionnaire. Seven areas of agricultural literacy, mentioned above, and related item numbers in the questionnaire is presented in table 1.

Conceptual areas of agricultural literacy	Item numbers in questionnaire
1. Societal and global significance of agriculture	5,6,7,8,9,10,11,12,15
2. Public policy in agriculture	5,6,8,12,13
3. Agriculture's relationship with environment and natural resources	1,2,3,4,13,14
4. Plant science	no item
5. Animal science	no item
6. Processing of agricultural products	no item
7. Marketing and distribution of agricultural products	no item

Table 1: item numbers and conceptual areas of agricultural literacy represented in the questionnaire

Questionnaire was the primary data source used to answer the first research question. e-dialogs were the second data collection technique developed and used by the researcher in order to get prospective science teachers' understandings about second research question. The e-group, agricultural literacy, was formed within a famous social network, facebook. Then, three scenarios, based on the three areas of agricultural literacy, mentioned in table 1, were written with the purpose of understanding participants' knowledge and understandings in details. The researcher shared a scenario per two weeks throughout the semester. Each scenario has a question to reflect. Participants' reflections to these questions formed the secondary data source.

Data Analysis

Data collected with the questionnaire were analyzed quantitatively with the basic descriptive statistics. Participants' overall and in detailed descriptive values, frequencies and mean values, are listed in table 2 as follows.

Item number	N=30		Mean values for each item
	Frequency of Acceptable answers (f)	Frequency of unacceptable answers (f)	
1	29	1	4,36
2	28	2	4,26
3	25	5	3,90
4	22	8	3,90
5*	11	19	2,93
6*	19	11	3,76
7*	18	12	3,40
8	26	4	4,16
9*	10	20	3,06
10	25	5	4,10
11	28	2	4,46
12*	16	14	3,50
13	28	2	4,13
14*	12	18	3,46
15	26	4	4,16

Table 2: basic descriptive values for items

Participants' mean values for each conceptual areas of agricultural literacy are presented in table 3 below.

Conceptual areas of agricultural literacy	Mean values
1. Societal and global significance of agriculture	3,72
2. Public policy in agriculture	3,70
3. Agriculture's relationship with environment and natural resources	4,00
4. Overall questionnaire	57,60

Table 3: mean values for conceptual areas of agricultural literacy

Table 2 and 3 display a general overview and detailed basic statistical information about the areas of agricultural literacy mentioned in table 1.

Based on the data gathered, secondary data sources, scenarios, were qualitatively analyzed. Each scenario has a question to be reflected at the end and each scenario represents different areas of agricultural literacy. Therefore; for each area, participants' reflections to questions were analyzed separately. The analysis corresponds open-coding and codes from open-coding were grouped to get categories. Then, categories from the codes were again grouped to form assertions about participants' agricultural literacy level in different conceptual areas. Qualitative analysis of participants' reflections to scenarios, presented via internet, was introduced in the following findings and discussion section.

Findings and Discussion

This section includes research findings with respect to research questions.

- What is the overall agricultural literacy level of prospective science teachers?

Participants' mean value for questionnaire was 57, 60 as presented in table 3. The lowest and highest points that a participant can get from the questionnaire were 15 and 75 respectively. Table 4 shows point intervals and how they were described.

Point interval	Description
15-44	Undesired level
45-60	Moderate level
61-75	Desired level

Table 4: point intervals and descriptions

According to point intervals in table 4, participants' mean value for questionnaire display that participants were at the moderate level in agricultural literacy. Although research participants could be counted as having moderate level of understanding in agriculture, some items presented with star in table 2, display that half of the participants had lower level of understandings about the issues represented in these items. These items were 5,6,7,9,12,14 numbered ones. Data analysis for these items will be presented within the second research question as follows.

- What is the participants' level of understandings about the components of agricultural literacy?

Quantitative data analysis gives an overall view about participants' understandings and knowledge about agriculture. Participants' level of understanding may change when data examined according to subareas of agricultural literacy presented in table 3. Following table 5 presents mean values and descriptions for each subarea.

Mean values	Description
1,00-3,00	undesired
3,01-4,00	moderate
4,01-5,00	desired

Table 5: mean values and descriptions for subareas of agricultural literacy

When table 3 was examined under the light of information given in table 5, mean values for each subarea are consistent with participants' overall level of understanding. Mean values change between 3,70-4,00. Therefore; this also shows that participants are at the moderate level in subareas of agricultural literacy.

Qualitative analysis of data explains and exemplifies participants' understandings about the subareas of agricultural literacy. It also supports the findings presented in this section. At the end of qualitative data analyses, following assertions were formed.

Assertion A: societal and global significance of agriculture

Prospective elementary science teachers, participated in this research study, do not have adequate understandings about the societal and global significance of agriculture.

Although table 3 shows 3, 72 as the mean value for this subarea, participants' reflections to scenario one display inadequate knowledge and understanding about the issue. Scenario one was emphasizing societal problems like hungry, drought and obesity in different regions of the world. In the question at the end, participants were expected to relate these problems and their solutions, to some extent, with agriculture. Almost none of them phrased agriculture, and most of them relate the problems with economy. Excerpts from the participants' reflections, presented below, exemplify the point.

"…people eat a lot in one place and some struggles with hunger. This is not adequate… rich people may eat less and save some money…well…then they may share this money with others…I think the money solves all…" (P1).

"…it is something related to the budget that a country allocates for peoples' health…countries like US may save some money from consumption and send it to other countries like Africa…" (P7).

The excerpts above display inadequacy of participants' knowledge and understanding. Participants' mean values for the questionnaire items, listed in table 1 to represent this subarea, also show this inadequacy. Item 7 argues that agricultural production in the world is sufficient to feed the world's population. Item 9 asks for the self sufficiency of knowing agriculture and its effects. 18 out of 30 participants gave desirable answers to item 7. That is, more than one third of research participants (12) were not aware of the fact that agricultural products were not sufficient to feed the world's population. Additionally, 10 out of 30 participants gave desirable answers to item 9. That is, two third of the research participants (20) had low self evaluation about their knowledge on agriculture and its effects.

Assertion B: public policy in agriculture

Although almost all participants believe the importance of knowing and understanding agriculture and its effects including the necessity of sustainable agriculture for the life of next generations, they do not have adequate understanding about the good agricultural policies.

Table 3 shows 3,72 as the mean value of this subarea of agricultural literacy, which can be counted as moderate level. Careful examination of questionnaire items 5,6,8,12,13 imply the fact that almost all participants, (26 out of 30 participants) believe that all individuals in society need to have an adequate understanding about the agriculture and its effects (item 8). They also mostly (28 out of 30 participants) believe the necessity and importance of sustainable agriculture for the life of next generations (item 13). This results show that participants hold desirable beliefs about the importance of agriculture and its effect on the lives of societies. But, participants' reflections to other items related to the same subarea, 5,6, and 12, imply their inadequacy in agricultural policy. Item 5 argues that a true agricultural policy requires widening the agricultural fields in order to increase the income of farmers. Only one third of the participants (11 out of 30) gave desirable answers to this item by emphasizing their disagreement with the sentence. Consistently, for item 6, which states that

industrialization has much more importance than agriculture for the societies, and item 12, which states that changing in society from productive to consumer ones, around two third (19) and half (16) of the participants gave desirable answers to the items respectively. Low levels of disagreements to these items support the information given in the assertion B above.

Participants' reflections to scenario two do not completely support the findings for item 5 and the assertion. Scenario two is about the strawberry fields that farmers would like to widen through the forest in their village. The question at the end of the scenario asks for the participants' ideas of taking forest into strawberry fields. The following excerpts represent participants' reflections.

"I am not sure….forests need to be protected. Without trees, there would be erosion and this will decrease the efficiency of the land… this also causes to lack of flora and animals… not good for the environment…" (P,5).

"…widening the land is not the only way to increase the production and income…using appropriate amount of chemicals and non-chemicals, and determining the type of good compost needed for the soil may help more than increasing the size of the land…" (P,12).

Participants' reflections for the question display that widening the agricultural fields is not the way to increase the income of the producers. The amount and type of chemicals and compost might help more than widening the area. It is good that in their reflections, participants were aware of the important balance between agriculture and the environment. The issue is presented in the next assertion C.

Assertion C: Agriculture's relationship with the environment and natural resources

Prospective elementary science teachers, participated in this research study, have adequate understanding about the agriculture's relationship with the environment and natural resources. But, although they define animal husbandry as included in agriculture, they do not count fishing as part of it.

The agricultural literacy subarea mentioned in the assertion above, is represented with items numbered as 1, 2, 3, 4, 13, and 14 in the questionnaire. Mean value for this subarea is listed as 4, 00 in table 3. Research participants' had desired reflections for items listed above, except for item 14. Therefore; they have adequate level of understanding and knowledge about what agriculture is and how it effects the environment and natural resources by giving desired responses to items asking duty of an agricultural expert (29 out of 30 participants), genetically differentiated organisms and their effects on the environment (22 participants), and necessity of sustainable agriculture (28 participants).

Item 15 in the questionnaire defines agriculture as an area including animal husbandry. Almost all of the participants (26 of them) reflected to this item in a desired way. Although it is the case, research participants did not count fishing as animal husbandry and responded item 14 in mostly undesired way (18 out of 30 participants). That is, more than half of the participants think that fishing by trawls does not negatively affect the sustainable agriculture. Scenario 3 focuses on fishing by trawl and its effects on the environment. Participants' reflections to question at the end of scenario 3 imply that they do not appreciate trawlers. The following excerpts display that issue.

"…the purpose of fishing is to protect the sources not destroy them..I think trawl does it..I mean destroy it. Kind of trawl is also important in fishing..but anyway the fisherman needed to protect the resource he used…" (P,24).

"…using trawl…cause the change in ecosystem I think…which [change in ecosystem] is not good. Trawl takes the eggs also and this makes lack of fish in long run…" (P, 16).

Although research participants very well know that fishing by trawl is not good for the environment and ecosystem, they do not make the connection with sustainable agriculture. Therefore, participants need to revisit their definition of agriculture. Theoretically they may define it as in item 14, but scenario 3 reflected that they do not practically integrate husbandry to agriculture.

In conclusion; prospective elementary science teachers' knowledge and understandings about agriculture and its effect on the environment and natural resources seem at the moderate level according to the questionnaire used to determine the issue. The qualitative part of the research study underlines some inconsistencies like the one mentioned above. Participants' moderate level of agricultural literacy is not a case specific to our country. Hubert, Frank, Igo (2000), reported some research studies and underlined the fact that as countries develop and move to more urbanized societies, individuals' basic knowledge and understanding of the natural environment and its interrelated systems appears to have declined. Therefore; as part of the curriculum in elementary science, there needs to be courses focused on agriculture in relation with science education for prospective science teachers

ABSTRACT
In India the Ministry of Youth Affairs and Sports engages rural youth in national development activities through the Nehru Yuva Kendra Sangathan. Adolescents are organized into Teen Clubs. A review by UNFPA (New Delhi) found that Teen Club members needed to be given new opportunities to engage them in an interactive way, impart relevant age appropriate information and develop life skills to enable them to make informed decisions and be responsible citizens. Department of Development Communication and Extension, Lady Irwin College, University of Delhi (India) was assigned a project to develop the prototype of a game for Teen Club members. A colourful flipbook game with pull out panels and informational Fact Sheets was designed in an innovative format. The game leads adolescents into several creative activities at the end of a gaming session. The game was finalized after field testing in Teen Clubs of villages in two states of India. It was highly appreciated by the adolescents, village elders and the field staff of Nehru Yuva Kendra Sangathan in both the states as a media for 'edutainment'. This game can serve as a template to develop several other forms of learning materials in print or digital format.
Key Words: Game, Adolescents, Life skills, Innovation, Edutainment

INTRODUCTION

Adolescents constitute a large section of India's population. Adolescence is a period of transition from childhood to adulthood marked by perceptible physical, social, psychological and emotional changes. These changes bring them a sense of curiosity, adventure and experimentation. Therefore they become susceptible to peer pressure and risk taking. They also face a number of questions related to the growing up process.

Lack of an appropriate space and opportunity to get the correct information makes the adolescents look for answers to their questions from either their friends or peers or from the media. The information they receive from these sources may not be accurate or adequate making adolescents vulnerable to risky behavior.

Therefore it becomes imperative to reach out with information on growing up and enable them to make informed choices in real life situations. This will also enable them to realize their potential and raise their health status. Further, adolescents also comprise an important part of the reproductive age group and are expected to play a significant role in determining the future size and growth of the country's population. With the increase in age of marriage, increased mobility and negative peer pressure, adolescents become vulnerable to unsafe sexual behavior.

Provision of accurate information, an enabling environment and supportive services can empower adolescents to make informed decisions regarding their health and personal safety, thus contributing to their overall well being.

Presently UNFPA (New Delhi, India) is providing assistance to "Support the Adolescent Health and Development" Project being implemented under the Programme of Collaboration with the Ministry of Youth Affairs and Sports, Government of India for Teen Club members of Nehru Yuva Kendra Sangathan (NYKS). Under the project, Teen Clubs have been setup in several Districts across nearly all the States of India for creating a space for adolescents to meet and share experiences. UNFPA's experience of engagement with these Teen Clubs indicated that they need to be made more vibrant and that activities should be made more interactive and interesting to sustain the interest of the adolescent members.

It was concluded that in order to make learning more interesting in the Teen Clubs, the activities that were presently being conducted in the Teen Clubs needed to be revamped. There was a need to develop material that promoted life skills through experiential learning among the Teen Club members. A game was identified at the most appropriate media to achieve the desired objective. Further, it was decided to explore the concept of 'engaging youth (University post graduate students specializing in development communication and extension) to prepare a prototype game for youth' (Teen Club members).

The Department of Development Communication and Extension, Lady Irwin College (University of Delhi) undertook the assignment of developing a prototype of the above referred life skills based material in the form of a Flip Book Game for adolescents. The project was sponsored by UNFPA (New Delhi, India).

OBJECTIVES

1. To design a prototype of a life skills based game for adolescents in Teen Clubs.
2. To field test the game with Teen Club members.
3. To reflect on the model of 'engaging youth (university students) to prepare a game for youth (rural Teen Club members)'.

GUIDELINES FOR PREPARING THE GAME

The Game was prepared keeping in mind the following premises:

- young people should themselves be involved in designing the activities and the prototype material for young people,
- Learning should be fun and edutainment based,
- young people should be able to relate to information and graphics to ensure accurate learning and build on their experiences,
- game session should enhance life skills,
- there should be an element of challenge and discovery in the activities and outcomes,
- a gaming session would involve participation of a group of adolescents at one time,
- the activities and outcomes should be based on issues and themes that adolescents are comfortable with and choose willingly,
- each activity would generate discussion and clarifications on issues and themes selected, and
- the game should be simple to play, easy to handle and maintain and low cost. It should be easy to send to remote parts of the country. It should be able to withstand frequent handling.

PROCESS OF GAME DEVELOPMENT

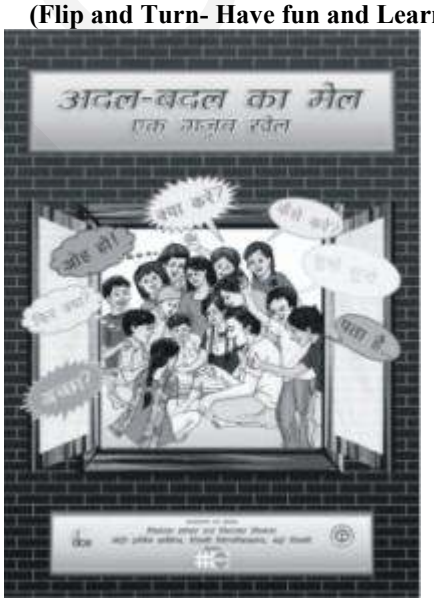
The Game development team comprised of fourteen postgraduate students specializing in Development Communication and Extension under the supervision of two faculty. The game was a result of three months of intensive efforts of the entire team.

Following is a brief description of the methodology used for developing the Game.

- Students were briefed about the project, time plan and its outcome.
- The entire project was divided into tasks and sub tasks and students were assigned these keeping in mind their interests and skills.
- Several brainstorming sessions were held to finalize the format of the game with students, Resource Persons and illustrator to research and review the different formats possible. It was decided to avoid game design in the form of playing cards or a board game with coins, tokens, markers or dice and other small parts. As a loss of any one part would make the game useless. Therefore, a flipbook format using a story telling approach was found most appropriate. The game was designed in the form of eight panels cut horizontally with the two central panels with pull out option to add more characters into the game. The panels were to represent a location, an issue and several characters.
- The group identified a series of illustrations by reviewing existing games, books and internet. Visuals representing rural lifestyles in India were listed for further review and selection keeping NYKS Teen Clubs in mind.
- A number of artists, book designers and publishers were identified through online search and personal contacts.
- Sample illustrations were invited from them and their previous projects were reviewed. One artist and one printer with computer aided graphic designing facilities were finalized.
- Brainstorming sessions were held where the project team screened the various illustrations and short-listed several characters and locations in a village. These were then described to the illustrator for designing. Emphasis was laid on making the illustrations very simple and realistic. Focus was to be laid on showing the facial expressions of each character to convey at first glance emotions like happiness, fear, anxiety, anger, curiosity, interest, humor, sadness etc.

- The locations selected were from common places that adolescents are likely to visit in and around their village. These include a farm, training centre, health centre, bus stand, village fair, pond, class room, health centre, approach road, a house, a lane, etc.
- As it was decided to use minimal text in the game emphasis was paid to individual expressions of each character so that the characters could speak for themselves.
- Dialogue bubbles were inserted with questions marks, exclamation marks and dots to give visual cues to adolescents and motivate them to fill dialogue boxes with their own comment, experiences and observations.
- Six detailed Fact sheets were prepared on key issues of concern for adolescents: (1) Life skills, (2) Physical changes in adolescent boys, (3) Physical changes in adolescent girls, (4) Behavioral and emotional changes in adolescents, (5) HIV and Aids and (6) Substance Abuse. These Fact Sheets contained all the important and useful information that is required to be disseminated amongst the adolescents on the issues in simple spoken English first. Initially the fact sheets were developed in English. Books and web sites were referred to ensure the adequacy and accuracy of the contents. To further supplement the information, reference material for the Fact Sheets was also collected from: UNFPA, WHO, UNICEF, NYKS, Niranter, National AIDS Control Organization and Hindi (the local language) books in Home Science. The Fact Sheets were translated in Hindi.
- Visuals of various characters and locations were identified and communicated to the illustrator.
- A draft Flip Book Game was prepared on the computer using original illustrations and Fact Sheets along with the instructions for playing the Game.
- The draft game developed was field tested by the 14 students and faculty with adolescents of NYKS Teen Clubs from villages in two states- Haryana (Sirsa district) and Rajasthan (Udaipur district). To take feedback of the Teen Club members two questionnaires were prepared. One inquiring about the opinion of the adolescents about the game and the other on the information contained in the Fact Sheets.
- Findings of the field testing were incorporated in the Game.
- The final prototype Game was discussed with experts and, approved by the team and there after designed and printed.
- All the students formally submitted the game to UNFPA (New Delhi, India) along with a project report in February 2010. They made computer presentations and performed role plays to share their learning from the project.

CONCEPT OF THE GAME: '*ADAL BADAL KA MEL- EK GAZAB KHEL*'
(Flip and Turn- Have fun and Learn)



This game has been designed for adolescents to engage them in an information sharing and learning process using an interactive approach. Through this game adolescents can discuss and analyze their growing up issues and concerns in the context of life skills required to negotiate this phase of their life.

Format: The game uses a flip book format in which adolescents are required to form a group, select a leader, select some characters, places and issues from various colored panels and pull out strips in several combinations. Adolescents are required to determine the behavior and actions of these characters in the context of the overall situation or scene that emerges in reference to the issue selected. They are subsequently encouraged to share their experiences regarding the situation and initiate a discussion on the same. They may also together make stories, write poems, perform puppet shows or enact role plays on the basis of the discussions on the issue.

An element of challenge and discovery has been built in the Game by incorporating pull out panels which enable the players to add new characters and places. This can further help in building up the discussion and story. The characters are placed in 'windows' and the game layout promotes the players to peep into the lives of other people and think about what they could be saying, doing, thinking, feeling, etc in the context of the situation and issue selected.

The game encourages adolescents to think, to recall their experiences, identify characters with their roles, freely expressing their own views and opinions about people, places and issues, to imagine and find relations amongst the various elements of a situation. The discussion process in a group inculcates traits like communication skills- verbal, and non-verbal (listening, thinking, etc), interpersonal relations, team spirit, leadership and negotiation. Used in this manner the Game helps the adolescents in developing an understanding of the issues and people's behavior and reactions regarding the same.

Fact Sheets: Fact Sheets are enclosed at the end of the Game to provide information on selected issues in simple spoken Hindi without unnecessary jargons. Adolescents can read these aloud in a group to facilitate understanding by all in the right perspective. The Game has been designed in a way that it can be used by adolescents not only in a group but even when they are alone.

Record Forms: A one page Record Form was enclosed at the end of the game. At the end of a gaming session the game leader is expected to use the Form to record the attendance of the Teen Club members, the issue, characters and locations selected, experiences, discussion points, stories generated by the players.

FIELD TESTING OF THE DRAFT FLIPBOOK GAME

For the field testing of the prototype Flip Book Game the group was divided into two, each group had 7 members. Field testing was done at two sites- Sirsa district in Haryana and Udaipur district in Rajasthan over a period of three days in November 2009.

Field testing at Sirsa district in Haryana State

The field testing was conducted at three identified sites namely, Government School at Bapp Village, a private school at Bapp Village and a NYKS Teen Club at Khera Kalan village of Sirsa District in Haryana. NKYS District Sirsa Coordinator introduced the team to the teachers, students and trainers. All children were from the local community.

At each village field testing began with a short introduction about the purpose of field testing of the game. All the adolescents were divided in groups of 15-20 students and were requested to sit in a circle, facing each other. The flip book game was handed over to them and one of these adolescents was asked to read out the instructions of the game in the group. As part of the game, each group had to identify a group

leader. Leader was asked to read the instructions carefully and explain the game to the participants. It was observed the concept of game was new for the adolescents and required some guidance in terms of how to play.

The adolescents selected some characters, a location and an issue. After the selection of issue, they were asked to build up a story or carry-out a discussion on the issue by sharing their experiences. They were also suggested to use Fact Sheets appended at the back of the game for reference. Issues like emotional changes in adolescence, substance abuse and physical violence were selected for the game.

Once the discussion was over, the group-members were asked to build stories using the selected characters and locations on the topic and reading information from Fact Sheets. Some of the groups were able to make good stories whereas some were not able to relate well as they wanted to play the game once more. With support from project team members, all groups were able to build up a story line. Each of the group found this game new, innovative and interesting. At the end of a session, the adolescents were given a questionnaire schedule to give their feedback on the game.

Field testing at Udaipur district in Rajasthan State

Field testing was carried out in Rundera Village of Udaipur with nearly one hundred and twenty adolescents. On first day, field testing was carried out with nearly sixty adolescents from two Teen Clubs. Each group was taken to a separate room to field test the game. The first group selected Physical Changes in boys and girls as an issue for playing the game. Both boys and girls sat separately for playing the game. The second group selected Emotional and Social Changes and HIV and AIDS as the topics for playing and discussing. In this group both girls and boys sat together for discussion. All the five topics were field tested with both the groups.

On the second day, one hour session was taken with another Teen Club which had around sixty teenagers. In this session, a brief introduction about the game was given and they were asked to select any one issue. A group of adolescent boys and girls together performed a role play on substance abuse and then a small discussion was held on this issue.

The Title of the game '*Adal Badal Ka Mail- Eak Gazab Khel*' (Flip and Turn- Have fun and Learn) was found to be very appropriate and appealing by all the adolescents at both the field testing sites. The adolescents could easily identify all the locations shown in the game. The visual of mela (village fair) was liked the most. New visuals of a classroom, teen club meeting under a tree and party scene were suggested by the Teen Club members. The adolescents found the game very interesting and the Fact Sheets very useful. They wanted to keep the game to explore it further.

Few Adolescents wanted information on issues like: nutrition during adolescence, reproductive health, superstitions prevailing in the society, hygiene and sanitation, importance of education in the family, communicable diseases, etc.

A few adolescents suggested that the information and knowledge given in the game could be used in making their folk songs, and short films which they could further share with others. Through puppets they could make stories, which was also an innovative idea to use this book.

REFLECTIONS ON THE MODEL: 'ENGAGING YOUTH TO PREPARE COMMUNICATION MATERIAL (FLIPBOOK GAME) FOR YOUTH'

The concept of engaging youth to prepare a flip book game for youth (adolescents of NYKS Teen Clubs) was very successful. This model can be replicated in future projects.

The post graduate students (specializing in Development Communication and Extension) had ample previous experience of designing and using similar communication materials. They immediately understood the project outline given by UNFPA. The project team could prepare the structure of the game in the first fifteen days of the project. The field experiences of the students during their academic course work had given them enough understanding of grassroot communities. With suitable guidance, they were able to prepare illustrations and Fact Sheets.

Field testing of the game helped the students to access the game designed by them in a practical and unbiased manner. The lacunae were easily attended to in the review meetings held after field testing the game.

The present format of the game is an outcome of experiences and insights gained by the students and faculty during the course of the project.

Other beneficial outcomes of the project for the students were:

- students were able to enrich their classroom learning and reinforce concepts by practical hands on experience,

- students were able to gain an experience of negotiating with project sponsors, experts, commercial illustrators, book designers and printers,
- students gained expertise in content writing and graphic design and computer aided designing,
- students were able to travel independently to visit rural areas and understand grassroot realities, needs and perceptions of the client group (rural adolescents),
- students were able to enhance their life skills, oral and visual communication skills, leadership problem solving, negotiation, decision making, time management and training skills,
- students were able to develop expertise as Master Trainers in explain the concept, purpose and correct use of the flip book game.

The role of UNFPA (New Delhi, India) in promoting this innovative flipbook game design and model of game development, having faith in the capacity and commitment of youth is path breaking and highly commended by the faculty teaching Development Communication and Extension at Lady Irwin College, Delhi (India). Such vision and far sightedness should be emulated and promoted by other development agencies.

RECOMMENDATIONS AND BEST PRACTICES FOR FUTURE PROJECTS

- The format of preparing a flip book game with eight cut-panels and pull-out panels was very new and innovative. This format offered the option of making innumerable new combinations of the panels for the players. This made every game session new and exciting, thus reducing boredom and fatigue. Further the game could have several outcomes (stories, poems, songs, plays etc.) as per the choice and creativity of the players.
- The stories prepared by adolescents during game sessions could be converted into short plays, posters, comics, poems and films. They could be encouraged to perform their plays as street theatre or puppet shows in their community on special occasions. This would give them a forum to express themselves, share their experiences and talent with a wide audience.
- Existing visuals can be used to prepare other self learning material to disseminate information to the adolescents. These may include: Playing Cards, Board Games, Flip Books (in other innovative formats), Flash Cards, Information Cube/Dice, Floor Games (on flex material). Book Marks, Calendars (different formats) and Stickers with key messages can be prepared. Digital stories and Comics (in Wall Poster and Booklet formats) can be prepared based on the stories generated by the adolescents. Interactive Computer and Mobile Phone Games can be designed using the same visuals to offer another platform for the adolescents to engage.
- The game can also be developed in the digital format using a multimedia approach through computers, mobile phones and internet. The advantages and appeal of ICTs can be drawn in the e learning and m learning mode with far reaching prospects in a quick and cost effective manner transcending the boundaries of class, caste, gender, income, regional and geographical barriers.
- Similar games can be made on issues like communicable diseases, health and sanitation, government development programmes and services, etc.
- Selected NYKS Teen Club and Youth Club members should be trained as Master Trainers and facilitators to train other young members in the correct method of playing the game. This would enable adolescents to derive maximum learning out of the game. Thus, fulfilling the objective of edutainment.
- The game can be used as a template and translated in other languages to reach adolescents, youth and adults all over the country and beyond.
- The concept of 'engaging youth (university graduates) to prepare a game for youth (adolescents of NYKS Teen Clubs)' was very successful. This model can be replicated in future projects.
- The Game can be used as an innovative and appealing self learning material for students studying in distance education mode. With some design modifications, the game can be made on many topics from the course work in different subjects offered by the open school system. These students can set their own pace for playing, learning and clarifying concepts in a stress free environment or in the privacy and comfort of their home environment at their convenience. They may be encouraged to involve their family and friends in a game session.
- In print format it can be put in mass circulation in a cost effective manner. It can be used as an activity with groups of students during Contact Programmes under the supervision of a Counselor. It can encourage them to introspect, speak up, share experiences, listen to others, clarify fact, remove misconceptions and at the same time engage in creative activities to promote learning.

DEVELOPING ONLINE ELT TRAINING PROGRAMS IN HIGHER EDUCATIONAL INSTITUTIONS OF GEORGIA

Izabella Petriashvili, Nona Popiashvili
I. Javakhishvili Tbilisi State University, Ilia State University, Tbilisi, Georgia
izabellapetriashvili@yahoo.com, nonpopiashvili@yahoo.com

Abstract

Online teaching and learning is gaining popularity very rapidly, consequently online teacher training courses are widely used to advance the quality of English language teaching throughout the world. The paper deals with the research conducted in Georgia to find out the attitudes and disposition of pre-service and in-service teachers towards online courses in comparison with traditionally delivered courses. Data collected during the study showed that teachers have positive perception and attitude towards online education and professional development. Their satisfaction with online learning environment is strongly related to several factors, such as: the amount of active interaction with other learners, the opportunity to enhance their professional skills at an accelerated pace and relatively low cost. The study addresses, identifies and provides examples of multiple variables that can influence students' online learning experiences. These include prior experience with computers, peer interaction, teacher/student interaction and instructional support. The article sums up the survey results and provides guidelines and recommendations for educational instructors in Georgia to create effective online teacher development course for pre-service and in-service teachers.

Key words: distance education, online teaching, Web-based instruction, teacher development

Introduction

Development of internet-based technology has brought challenges and new opportunities to education and training, in particular through online instruction. For many, this type of instruction is perceived as a major breakthrough in teaching and learning because it facilitates the exchange of information and expertise while providing opportunities for learners in distant or disadvantaged locations (Aragon, S.R. et al, 2001). Online instruction has emerged as an alternative mode of teaching and learning. The number of distance education and training courses is increasing worldwide and ELT online courses are gaining more and more popularity. There is a great demand on training and retraining of ELT teachers. The need for skillful English language teachers has increased in Georgia as the Government and State Policy emphasized the importance of teaching foreign languages and in particular English language in schools. The ELT programs offered by education faculties of Georgian Higher Educational Institutions are mainly maintained in conventional way. The studies conducted in different countries prove that online training programs are more convenient and have a number of advantages over the traditional teacher training. The main reason of the popularity of online teacher training courses is the busy schedule of in-service teachers. Using this mode of training they can develop professionally and "get what they need, when they need it, in a way that is accessible to them". In line with professional development in computer-assisted language learning (CALL) environments, language teachers need to understand instructional aspects of the Internet and know how to use Internet effectively for teaching purposes. Our aim was to find ways how to integrate web-based teacher training into a formal professional development course for language teachers and provide guidelines and recommendations for creating effective online teacher development courses.

Problems of the research

Educational administrators, teachers, and public need to know that online distance training is a valid and proven instructional method. They also need to know what to expect when planning, operating and teaching/ learning in an online course. Educators need to ensure that the quality of instruction is not overlooked, as well as address such issues as students' attitudes and perceptions of online instruction and how these issues may or may not influence their motivation and achievement in a course. Online teacher

training is absolutely new in Georgia and there has been no study conducted in this field. On the other hand, the demand for online training is increasing especially after some of the teachers participated in online courses offered by foreign projects or universities. The very first opportunity provided to Georgian teachers of English is ETTO – an online teacher training course, which has been designed and initiated by the ELT experts in the British Council Turkey office. The course virtually connects teachers from the Black Sea region – Georgia, Turkey, Armenia, Azerbaijan and Ukraine. This completely innovative project, that gives Georgian teachers opportunity to improve their practical teaching skills through online programs and assignments, began in 2009. 19 teachers completed the course in 2009 and currently 48 Georgian teachers are participating in it. Some Georgian teachers have also done online courses in different American and European universities.

Methodology of Research

Teachers enrolled in ETTO and other online training courses were the main population of the study. We have examined two sources of information collected over four month time period. These were the reflections written by some of the teachers who participated in ETTO and survey which included 12 close-ended items emailed to Georgian teachers of English (approximately 70) who have done any (at least one) online teacher training course. We have identified several variables that can affect students'/teachers' attitudes and perception of online instruction as well as the quality of the course itself. The variables included teaching methods, instructional support, peer interaction, student/teacher interaction, and prior experience with computers.

Results of Research

The results of the research proved that the perception and attitude towards online teacher training courses are positive. Many conditions support the need for distance learning. Teaching methods used in online courses foster learner centered approach, teamwork and cooperative effort. The respondents evaluated each of the items in the questionnaire either good or very good, only some of the respondents evaluated a few items as average. One of the questions was the participants' prior experience with computers to state the correlation between the experience with technology and course satisfaction and success.

Teaching methods

Online education is widely accepted as student-centered education. The learner decides when, what and how to learn. While the instructor can provide the environment for a collaborative and interactive learning experience, the learner is ultimately in control (Hura Gerri, 2008). The courses investigated in the study are asynchronous, where the learner is completely independent. The role of an instructor in online education has become more of a facilitator than a traditional professor. The role of the virtual instructor is to select and filter information for student consideration, to provide thought-provoking questions, and to facilitate well-organized discussions (Kettner-Polley, 1999). One of the objectives of the study was to find out relationship between teaching methods of online courses and learner achievement. All the interviewees indicated that teaching methods were the main factor that highly stimulated their interest.

Prior experience with computers

In order to enroll in any online course candidates need to have experience with computers, including MS Office, navigating the Internet, using emails to send, receive, attach or download messages and word documents. Some teachers in the study had additional or advanced skills in using different software. The teachers with less experience with computers had problems in the course, especially at the beginning. More skillful teachers tended to be supportive and helpful towards less experienced peers. On the other hand, participants with advanced technology skills proved themselves as more creative and in most cases had better results. The data collected for this study appears to support notion that students' prior experience with computers can boost positive performance of online learning, as noted by other researchers (Huang, 2002).

Peer Interaction

One of the main factors that determine students' satisfaction with online learning environment is the amount of active interaction with other learners, noting that different group activities, assignments, or projects can stimulate learning motivation. Creating a safe learning environment through positive social relationships can support these interactions (Ivers, K. S. et al, 2001). Data collected during this study supports this notion. This positive attitude towards peer interaction was described in teacher reflections collected for the study. Their special favorites included social posting threads, group assignments, group discussions, chats and face-to-face meetings.

Everybody emphasized the importance of relationships between the participants and participants and instructor, sharing experiences, ideas and prior knowledge. A very strong social network was built among the teachers and this is still maintained via private emails. In spite of the fact that positive interactions and relationships may contribute to learners' satisfaction toward online learning, only half of the teachers interviewed stated that the most meaningful learning came about through their interaction with others. This result supports the idea that collaborative interaction among students does not necessarily increase learning achievement. The results of the study can not be generalized because the teachers were not selected as representative sample, but our aim is to indicate the importance of peer interaction while creating a teacher training course. It is obvious that only interaction with peers can help to develop a sense of community that itself determines the interests and motivation of learners.

Teacher/Student Interaction

Success of online courses is linked with teacher (instructor)/student interaction. While online education is learner centered the role of the instructor still seems very significant. Participants of the study noted that challenging, motivating tutors increased their interest. The timeliness and the quality of the feedback provided by the instructors seemed vital as well. It is worth mentioning that generally teachers' perception of instructors' contribution to and involvement in online courses were positive. In there reflections almost all the teachers pointed the importance of feedback in online programs. In Georgia learner-centered approach is considerably new as in most post Soviet countries. In traditional teacher-centered approach learners were not encouraged to work more actively and cooperatively. The results of the data show that teacher/student interaction increased the motivation of the participants. Instructors can positively impact students' motivation, course engagement and learning achievement in many ways. Brent Muirhead in his article 'Encouraging Interaction in Online Classes' cites Palloff and Pratt (2001) "the key to success in our online classes rests not with the content that is being presented but with the method by which the course is being delivered" (p.152). He states that instructors need to foster a secure online setting that affirms diversity of thought and critical enquiry into the subject matter. One of the aims of an instructor is to provide students with flexibility in order to make the learning experiences more individualized. Data collected also suggests that instructor has the crucial role to engage learners in the course. Positive feedback is encouraging and motivates them to learn more and to achieve even more.

Institutional Support

Data collected indicate that participants found the online delivery of the majority of the courses taken by them very appealing and extremely beneficial; in the reflections collected they connect the overall satisfaction with the course with the ease of navigation and institutional support (e.g. technical support, interface, etc.). This means that one of the most important issues while creating any online teacher training course should be adequate institutional support, otherwise participants can suffer from frustration and stress.

Conclusions and Recommendations

The data collected in the survey enables us to conclude that overall perception and attitude towards online teacher training courses is highly positive in Georgia. The experience of western universities and numerous studies conducted about online and distance education ensures that online teacher education should be integrated in traditional curriculum at education faculties of higher educational institutions. Administration and faculties of major universities in Georgia express their readiness to implement these challenges. Only collaborative course development process can produce online courses that implement new technologies effectively, provide adequate interaction among learners, and present an online curriculum that meets the criteria for quality online education. We plan to work collaboratively with

educational instructors, university administrators, faculty support staff and faculty peers to develop and administer meaningful online learning experiences for in-service and pre-service teachers with different learning styles and knowledge levels.

Table 1: Questionnaire items

If you have taken on-line teacher training courses, how would you rate for each of the following:
1. The course as a whole
2. The extent to which teaching methods stimulated your interests
3. Degree to which the course trainer encouraged you to interact with other participants
4. Timeliness of course trainer response to questions, assignments, posts
5. Relevance of required reading, activities and assignments
6. The degree to which communication components of the course (chat, discussion board, email, announcements, etc) added to the interaction between participant to participant or participant to course trainer
7. The ease of course navigation
8. The quality of your experience with the technical interface
Would you like to take an online course
From what location did (do) you access your course most of the time
Please indicate the extant of your agreement or disagreement with the following item: Online courses contribute to professional, educational, or personal development

Abstract:
In university education, a flexible academic environment (FAE) is advantageous compared to the rigid one because of its ability to handle student friendly flexibilities. However, implementation of FAE is hindered by the challenges in maintaining the databases to keep track of the students' academic progress. These challenges can be overcome by designing and using systematic processes and software support. This paper presents the design and implementation of the processes, divided in to various phases viz. Pre – Registration, Registration and Post – Registration phases. The process of development and use of corresponding software modules viz. PReMO, ReMO, PRoMO using software tools such as MySQL, J2EE, JDBC, HTML, CSS, JavaScript etc., is also presented. It has been suggested that with suitable modifications, the presented processes/software support may be used to implement FAE in any university.
Keywords: Flexible academic environment, registration, performance evaluation, software development

1. INTRODUCTION

With respect to the registration and performance evaluations of university students, the current academic environments in the countries like India may be categorized in to (a) rigid academic environment (RAE) and (b) flexible academic environment (FAE). The RAE, because of its simplicity, has been prevalent in many of the universities even though it has several disadvantages due to its rigidity. In RAE, student after enrollment undergoes a fixed set of courses, term after term in accordance with a rigid framework, till graduation. With its rigidity, RAE does not provide any flexibility to students to (a) choose courses, teachers, timings, (b) repeat already completed courses (c) accelerate or decelerate program (d) with draw a course or substitute a course with another course (e)) transfer from one program to another program in the same/another tier (E.g.: another under graduate/graduate/ Ph. D program) (f) do another program in the same tier along with the current program (E.g.: a dual degree).

On the other hand, FAE offers a lot of flexibilities hence overcomes almost all the above mentioned disadvantages of RAE. While FAE provides a wide spectrum of flexibilities to students, it poses a lot of challenges associated with upkeep and maintenance of databases to (a) keep track of the courses being done by individual students (b) arrive at performance indices for every completed term (c) ensure transfers/dual degree/graduation requirements. These challenges are easily met when there is less number of programs/students/structured courses (SC) and other inter disciplinary courses OIC). For such a situation, a simple process aided by trained office staff shall be sufficient to implement FAE. On the other hand, meeting these challenges in the case of a university (with large number of programs/students/SCs and OICs) becomes a herculean task. This task can be simplified by designing systematic process and making use of a software support developed for this purpose. This paper presents an outline of the work undertaken for the design of process and development of software of support for effective implementation of FAE in a university, where the first author is currently working.

2. PERIPHERAL DESIGN OF PROCESSES

The peripheral design of processes encompasses (a) identifying key players responsible (b) developing important documents for implementing FAE (c) identifying the key processes for designing the entire FAE (d) identifying the key resources for development of software support.

In a more generic sense, the key players are the Administrator of FAE (AFAE), the facilitators and the students. While AFAE is responsible for conceptualization, development, maintenance of entire FAE, facilitators shall aid AFAE to implement FAE. The facilitators include (a) academic decision making authorities (b) officers/faculty responsible for implementing the decisions and to provide necessary advices to students (c) office staff. Students are end users of the entire FAE facility.

The three essential documents to implement FAE are (a) Academic Regulations (AR) (b) the master course list (MCL) with details on all the offered courses in the university; description, number of units, pre requisites for each course etc., (c) the timetable (TT) with details on teachers handling each course/sections and the timings etc. The AR contains the information on all the flexibilities that university intends to provide, associated rules and regulations etc. The MCL, once prepared is to be updated as and when new courses are floated. TT is prepared fresh before every term. For a detailed understanding on contents of AR and MCL, the readers may refer BITSAR (2010) and BITSB (2010).

The key processes for designing the entire FAE is "registration" during which the student "registers" for the courses (s)he wishes to do in a particular term. The entire process of blending all the flexibilities within the frame work of FAE revolves around this "registration" which is to be done at the beginning of the every term. "Detailed outline of registration" is as given in Figure1. Once the registration is completed, the registration data shall be the input for arriving at the performance indicators.

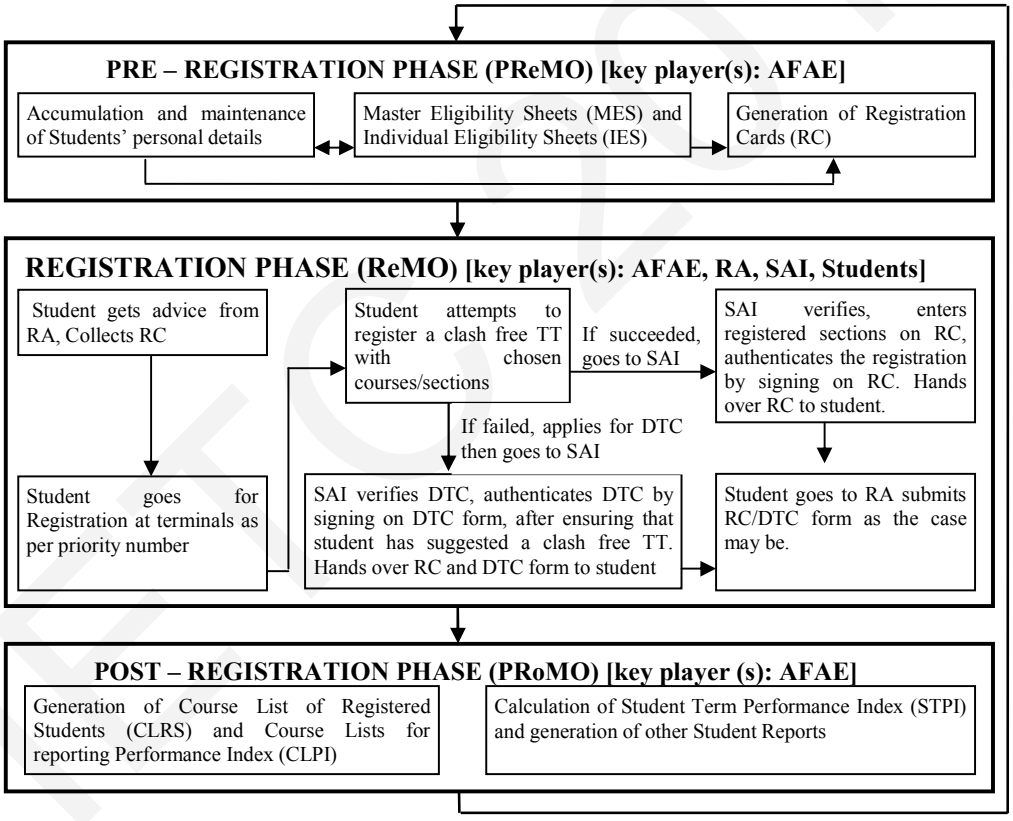

Figure1: Outline of various phases/modules of ReAPES frame work in FAE

While at the front end, registration is done by the student, at the back end, FAE should facilitate the entire process. This requires frequent, efficient and timely exchange of lot of data/information among all the key players/processes. In a university set up, where there are large number of courses/students/programs, software support becomes essential for this information exchange. For design & operational conveniences, these back end arrangements are divided in to three sub-phases namely Pre–Registration, Registration and Post–Registration phases with associated software modules as PReMO, ReMO and PRoMO respectively. With all the modules/phases together, the framework/software is called as Registration and Performance Evaluation

System, ReAPES. Figure 1 depicts the flow of information, the activities that are to be performed through various phases/modules of ReAPES. The process of software development may be outsourced to external professional software experts. However, it would be more appropriate to involve the interested faculty and students since (a) both are exposed to live challenges behind implementing FAE and (b) students have greater scope for learning.

The basic requirement to develop ReAPES is to develop a centralized database which captures all the data required by various processes. Database design is very critical as the entire performance of the software interface, a client server model, solely depends on the data retrieval time. Of all the available database management systems (DBMS), Relational Database Management System (RDBMS) is the most appropriate for the task in hand. Various open sources available to implement RDBMS are MySQL, PostgreSQL, Oracle, MS SQL etc. For the problems like the present one, MySQL is prominently used due to its advantages viz. (a) speed (b) robust nature (c) good feature set (d) higher reliability (e) higher portability (f) effective security (g) sophisticated privilege system (h) the wide variety of sockets which can be used to connect to the database and scalability. One additional advantage it carries is that it is a freeware. These advantages of MySQL outweigh its limitations associated with maximum size of table (8TB); maximum number of indices per table (32); maximum number of parts of columns in an index (16); maximum index width (500 bytes). For the development of user interface and programming logic implementation, MySQL is highly compatible with languages like J2EE, PHP. J2EE is widely used because of its scalability, reusability, security and it can be easily integrated with existing modules. PHP is another programming language which is no less than J2EE in either its features or in security provided. Besides these, HTML, CSS are also best candidates to develop user interface and JavaScript to incorporate the necessary validations. In the recent past, detailed descriptions on advantages, disadvantages and relevance of these tools for the problems like the present one are presented by Shudhalwar Deepak & Khanale Prakash (2010), Andy Oppel (2010), Chris Snyder et al. (2010), Gilbert Held (2010). Design of sub–phases/modules and the software implementation are presented in the subsequent sections.

3. DESIGN OF PROCESSES AND SOFTWARE FOR PRE - REGISTRATION PHASE

Pre registration phase refers to all the processes that are prior to the registration. This phase involves design and implementation of processes and sub module PReMO of ReAPES to generate and maintain (a) databases (b) eligibility sheets (c) registration cards. Salient features of these activities are presented in the following sections.

3.1 Accumulation and maintenance of Students' personal details

Students' details such as ID number of the student; the program in to which (s)he is admitted; name of the student; and other personal details like addresses, gender, date of birth etc., being the basic information required, a database is to be designed such that PReMO facilitates authorized personnel to enter/alter the details as and when required. Salient features of this module are as mentioned in Table 1.

3.2 Master Eligibility Sheets (MES) and Individual Eligibility Sheets (IES)

IES is a consolidated statement containing all the academic information of a particular student. It contains (a) all the courses the student has done so far along with performance index (PI) in each course; (b) the courses to be done (c) possible term in which the student is eligible to register for these etc. This necessitates design of MES for each and every program being offered by university. Based on these MES, IES shall be prepared at the beginning of every term. IES provides the basic input for generating the lists of courses to be offered in a particular term which in turn is useful in preparing the TT. A copy of the IES shall be given to every student before registration. ES module of PReMO is designed to generate and update MES and IES as and when required as per the AR and MCL governing the academic program(s). Salient features of this module are as mentioned in Table 1. The process flow is as follows. : 1. Enter ReAPES as Administrator; 2. Enter PReMO; 3. Enter ES Module; 4. Choose batch and discipline to generate IES for a group of students or Enter ID Number to generate IES for individual students; 5. Repeat step 4 as per the requirement; 6. Logout.

3.3 Generation of Registration Cards (RC)

Another instrument that is to be generated at the beginning of every term is RC which consists of the all the SC the student may register at the beginning of a particular term. This RC with provisions for signatures of all persons (including student) responsible in "registration", serves as the authenticate document with the AFAE regarding student's registration in that particular term. In order to provide equal opportunity for all the students to chose his/her choice of section(s)/course(s), registration is done based on a random number (called as priority number) generated and assigned for each student. This priority number and the student specific password to access ReMO are also printed on RC. Additionally, RC contains necessary provisions to record the amendments to the original registration which may arise because of withdrawal from a course or substitution of a course with another course. RC module of PReMO facilitates all these. Salient features of this module are as mentioned in Table 1. The process flow is as follows. : 1**.** Enter ReAPES as Administrator; 2. Enter PReMO; 3. Enter RC Module; 4. Choose batch and discipline to generate RC for a group of students who are eligible to register in that term (eligible students' list is obtained from designed database) or Enter ID Number to generate RC for individual students; 5. Repeat step 4 as per the requirement; 6. Logout.

Table1. Salient features of various software modules of PReMO, ReMO and PRoMO

Phase	Module	Input	Output	End users	Technology used
3.1	Database development	Student details	Centralized database	All software interfaces	MySQL
3.2	ES module	Student details and MCL	IES of all students (Printable document)	AFAE	MySQL, J2EE, JDBC, HTML, CSS, JavaScript
3.3	RC module	Student details	Printable word document of all RCs	AFAE	MySQL, J2EE, JDBC, HTML, CSS, JavaScript
4.1	RA module	Student details	Registration details	RA	MySQL, PHP, HTML, CSS
4.2	Student module	Student details and their eligible courses	Registration	Students	MySQL, PHP, HTML, CSS
4.3	SAI module	Registration details	Confirmed TT/DTC	SAI	MySQL, PHP, HTML, CSS
5.1	PI module	Details of registered sections	Students' lists of courses viz. CLRS and CLPI	Teachers of courses, AFAE	MySQL, PHP, HTML, CSS
5.2	STPI module	Students lists with PI's uploaded	STPI Reports/ printable word documents	AFAE	MySQL, J2EE, JDBC, HTML, CSS, JavaScript

4. DESIGN OF PROCESSES AND SOFTWARE FOR REGISTRATION PHASE

On the front end, Registration Advisors (RA), Section Allotment In charge (SAI) and students are the key players in Registration. The process is outlined in Figure 1. Sometimes the student might not be able to register to a clash free timetable when quotas of certain section/course are exhausted, which usually happens by the time almost all the students are registered. Such a case is termed as a Difficult Timetable Case (DTC). Such DTC are to be cleared by AFAE. Salient features of design of the processes and development of sub modules of ReMO are presented in the following sections. In view of the importance of the activity, even though the ReMO is made in to different sub modules viz. RA module, student module, SAI module, the AFAE shall have the administrative control over the entire ReMO. Hence the ReMO is designed to facilitate the AFAE to (a) have administrative access to all modules (b) add/delete the courses/sections and enter/modify the corresponding timings (c) enter/modify the quotas for courses/sections (d) deregister already registered student(s) (e) debar certain student(s) from registration (f) generate various reports with registration statistics.

4.1. Registration advising by Registration Advisor (RA)

RAs are the senior faculty of the university who are very well aware of the various eligibility clauses of AR, the breadth and depth of contents of the courses being offered in a particular term. With these qualities, RA plays the important role of advising the student on what courses (s)he can register for the term. In order to facilitate the better use of RA, the Registration phase is designed as outlined in Figure 1. In addition to the activities mentioned in Figure 1, RA, assisted by appropriate personnel, is also responsible to (a) keep track of

the RCs/DTC/unregistered students and (b) report these details/documents to AFAE. RA module of ReMO facilitates all these. Salient features of this module are as mentioned in Table 1. The process flow for RA to use this module is as follows. : 1**.** Enters RA module of ReMO of ReAPES using appropriate login and passwords; 2. views the list of allotted students for advising; 3. Chooses ID No; 4.Updates RC taken status after RC is given to student; 6. Updates the RC submitted status once the student submits back the RC; 7. Repeats 3, 4, 5, 6 till all the students are completed; 8. Generates reports; 9. Logs out

4.2. Registration by students

The student after collecting RC from his/her respective RA, has to register to a clash-free timetable for the term as per his/her choice of courses, teachers and timings. These courses may include SC, OIC that (s)he is eligible to register, already completed course(s) which (s)he wishes to repeat and so on. Hence student module of ReMO is designed to facilitate the student to visualize his/her eligible courses for registration once (s)he enters the ReMO. Since the software is required to give the corresponding and correct set of eligible courses for each student in a user friendly manner, this portion of the software development is very critical. The requirements to make student module of ReMO ready are (a) list of students eligible for registration with their ID No, name, password, list of courses being offered, list of sections for each course, their capacities. Salient features of this module are as mentioned in Table 1. The process flow is as follows. : 1. Student enters ReMO with ID No and the password specified on RC (The student shall be able to enter ReMO only after collecting RC from RA); 2. Student chooses his/her courses (s)he wishes to register(these courses are to be from a the displayed list of his/her eligible SC/OIC and repeatable courses); 3. Student chooses sections/teachers; 4. Depending on his/her requirement, student shall repeat 2 and 3 to get a clash free time table; 5. Student registers a clash - free time table if successful else applies for a DTC; 6. Student logs out

4.3. Students' registration/DTC verification by Section Allotment In-charge (SAI)

The SAI is a faculty member of the university. The role of SAI is as mentioned in Figure 1. SAI module of ReMO facilitates all the activities to be done by SAI. Salient features of this module are as mentioned in Table 1. The process flow for SAI to use this module is as follows.: 1. Enters SAI module of ReAPES with appropriate login and password details; 2.Enters the ID No of the student when the student comes to him after registration; 3. Confirms the displayed TT/DTC registered by the student; 4. Repeats the steps 2 and 3 till all the students are completed; 5. SAI logs out

4.4. Clearance of Difficult Time table Cases (DTC)

The meaning of DTC is explained earlier and the process of applying for DTC is explained in Figure1. Taking the suggested sections as one of the inputs, the AFAE makes arrangements to resolve the DTCs without hampering other students' choices/preferences. This is done by (a) using various clauses /regulations of AR and or (b) adjusting the quotas in less sought after sections/courses. After the DTC is cleared student is allowed to register for clash free TT with suggested sections/courses. The registration process is same as that of regular registration. Registration of the DTC students is done immediately after regular registration.

5. DESIGN OF PROCESSES AND SOFTWARE FOR POST - REGISTRATION PHASE

The activities that follow the registration are (a) generation & distribution of registered students lists of each course (b) allowing for other flexibilities (c) collection/calculation/reporting of performance indices of registered students (e) generation of various end term reports etc. The generated indices/reports shall be the inputs for next term registration. Hence all the databases are to be updated as and when each of the above activities is completed. Salient features of design of the processes and development of sub modules of PRoMO, that facilitate the above activities are presented in the following sections

5.1 Generation of Course List of Registered Students (CLRS) Course Lists of Performance Index (CLPI)

Post – registration, the immediate activity is to generate the registered students' lists of all the individual courses, called CLRS. These CLRS of each course is used for regular monitoring of the course and hence

should be made available to respective teachers of the course. As per prescribed time schedules, the AFAE allows the students to make use of the flexibility of withdrawal/substitution of courses. Accordingly, the registration of individual student is amended, databases are updated, CLRSs are modified and are made available to all the concerned. At the end of the term, based on CLRS, CLPI are generated and are made available to the teachers of each course. As defined in AR, this PI could be marks/grade/report obtained by a student in that particular course. At the end of term, the teacher of the individual course shall fill in the PI column for each student with corresponding PI, and submit this filled in CLPI to the AFAE. All these activities are facilitated by PI module of PRoMO, salient features of which are presented in Table 1. AFAE uses this module to generate the lists and update the databases where as teachers use it to download and upload the CLRS and CLPI.

5.2 Calculation of Student Term Performance Index (STPI) and generation of Student Reports

At the end of term, the PIs of each student in all his/her registered courses are to be aggregated so as to arrive at STPI. This STPI could be a simple average of marks obtained in all the courses or a cumulative grade point average, CGPA. The method of calculating STPI should be clearly spelt out in AR. In addition to the computation of STPI, the FAE is to undertake the process of generating the student wise reports for STPI, student term performance card , STPC; student courses index for graduation, SCIG; student units' index for graduation, SUIG; student courses index for transfer, SCIT; student units' index for transfer, SCUIT and so on. STPC is a student specific report containing PI of each course, STPI etc. Other reports are also student specific and are to be generated to decide on the students' eligibility for graduation or to permit to use flexibilities like transfer. While STPC is distributed to the respective students, all other reports are used by AFAE for their intended purposes. Subsequent to this, the FAE should facilitate updating of student records such as IES with latest PI in all courses, STPI and other relevant data so as to make them ready for "registration" in the next term. All these activities are facilitated by STPI module of PRoMO, salient features of which are presented in Table 1. The process flow for AFAE to use this module is as follows:1. Enter STPI of PRoMO of ReAPES as administrator; 2. Chose a course; 3. Confirm the PI of individual students by reentering the PI of individual students in the courses; 4. Repeat the step 3 till all the PI entries are done for all the courses; 5. Evaluate STPI and all other indices either by selecting individual student or the whole batch of students; 6. Repeat step 5 till STPI is generated for all the registered students; 7. Generate STPC and all other reports either for individual student or for a batch of students; 8. Repeat step 7 for all registered students; 7. Logout.

6. Conclusions

Through the comparison between a RAE and FAE, it can be identified that FAE is more advantageous, especially for university education, since it provides opportunities for broad based learning in a student friendly manner. However, there are several challenges that are to be met to implement FAE in a university. As demonstrated in this paper, these challenges can easily be overcome by appropriately designing the processes and by developing software support using appropriate technological tools. With slight and suitable modifications, the designed processes and software may be used for effective implementation of FAE in any university.

Abstract. In today's world, Web-Based Distance Education Systems have a great importance. Web-based Distance Education Systems are usually known as Learning Management Systems (LMS). In this article, a database design, which was developed to create an educational institution as a Learning Management System, is described. In this sense, developed Learning Management System consists of basis of Virtual Education Institutions. In this study, a fully relational database design has been realized in compliance with SCORM standards and got ready to be used as Virtual Education Institutions. This system can be used for any required education institute and it can be run within the same interface. In LMS that will be generated, a faculty or institute can be defined and academic and all administrative processes of the defined institute can be managed with the designed system. Proposed database design has been used in a LMS of Afyon Kocatepe University. In this system, many processes like indexing, uploading, downloading, production and editing of web based learning materials can also be performed easily and safely.
Keywords: Distance Education, E-learning, Web-Based Distance Learning Systems, SCORM, Relational Database Design.

1. INTRODUCTION

In today's modern age, changes are observed people's life style. Development of mobile communication systems and mobility of the people play the most important role about this issue. People's daily activity programs are divided into many different type activities. The main concern in education is that how classical education institutions will establish education environment of increasing active population. The purpose of mobile education is to move today's stable education environment to a virtual, flexible education environment of the future [16].

Today, there is a growing interest in online learning all over the world [6]. Electronic learning plays important role not only in academic institutions but also in small and medium-sized enterprises, which have the will to renew knowledge and experience of their staff. E-learning provides practical solutions to the students, who did not participate in the past education processes [14]. At this point, scientists have emphasized on customization, interaction and control [13]. An e-learning program should be especially prepared for all students with the integration of different objects, past experiences and also these students should increase their own activities [4, 5, 9].

E-learning trusts in current information and communication technologies for distribution of learning contents. Learning process or its ambiance is organized according to either synchronous or asynchronous method. E-learning, which has been developed as a learning solution, represents the distance education with the flexibility of educational software and process covering synthesis of different technologies [15].

Increasing internet using rate and developments in the infrastructure of today's internet have caused many improvements in web-based software and services. As a result of these improvements, education activities have begun to be performed by using the internet and network technology. Many technological tools like electronic books, electronic mails and conference environments have also taken active parts in these kinds of education activities. Due to increasing rate in using these tools and related education methods, a special education system has appeared. The whole education system is called as "Web-based Distance Education System" (WBDES). Today, distance education systems are established in many universities and education-teaching activities are performed via these systems. One of the big reasons in increasing using rate of Web-based Distance Education is requirements to these kinds of systems in parallel with developments in the information technology.

One of the most important advantages of WBDES is being able to provide asynchronous education within a virtual education environment. In a WBDES, students can easily access to the educational contents, which was transferred by educators to the system and take advantage of these sources by using different educational tools. Because of its advantages on costs, WBDES is also preferred to be used rather than other models or systems [3]. Today, the most important reason in increasing the number of WBDES and to be

accepted by students is their independent working mechanism from time and location [2]. It has been an important preference reason for the people who suffer shortage of time and can not take active part in the location where education activities are performed. Generally, Web-based Distance Education Systems are called as Learning Management Systems (LMS). Factors and methods, which are considered in designing LMS, have been examined in the literature from various perspectives [7, 8, 11]. When they are evaluated in terms of cost, it is seen that the cost of WBDES is approximately half of a typical traditional and formal education cost. On the other hand, interactive education feature of WBDES and up-to-date content presenting function should also be considered [1].

In this study, a database model, which was designed and developed to be used for Learning Management Systems, is described. The database model was developed in a relational structure and designed to be suitable for LMS, which are in compliance with SCORM standards. Additionally, the developed model has a portable, easily accessible and easy-to-manage structure and can be used in long-term studies. With this database model, a virtual education institute can be established and published via required interface structures. In the related Learning Management System, a faculty or institute can be defined and all academic and administrative processes of these institutes can be managed with the help of developed database model.

2. SCORM STANDARDS

SCORM is a Content Management System Standard and can be defined as "Shareable Content Object Reference Model". SCORM includes a framework for running lesson contents. SCORM standards are interested in publishing rather than teachable features of the lesson content [10, 12].

While explaining the content management aspects of distance education systems, SCORM standards must also be examined in every respect. While applying SCORM standards, some factors, which belong to SCOM standards, must be stated. These factors are;

1. *Interoperability:* Merging contents from different sources for interaction and to be able to run in different systems and communicate with other systems.
2. *Re-usability:* The situation that defines re-usability for information and objects, which consist of e-learning content (script, graphic, sound, animation, video, code…etc.) and turning into a different education object, which includes all of these objects.
3. *Manageability:* Monitoring the information, which belongs to the user or content management system.
4. *Accessibility:* To be able to access a learning object at any time.
5. *Durability:* A technological development, which describes generating new versions for the tools requiring re-design and coding.
6. *Scalability:* Being able to change according to quantity of users, number of the technology, number of courses or content.

If SCORM standards are taken into consideration, the developed system or model can be used for a long time and updated easily. System or model contents can also be accessed easily from any location.

3. RELATIONAL DATABASE MODEL FOR A LEARNING MANAGEMENT SYSTEM

Database design is a detailed study, which must be overviewed plenty of times in the period of analyzing performance. Tables and properties of these tables must be examined in any module structure during the analyzing and designing process. Because of some processes like information filtering or information access, the database model should have an integrated structure. In every phase of the analyzing process, features and functions of a typical relational database must also be considered. Moreover, handicaps appeared by relation scenarios can jeopardize information integrity and also information security. So, these factors must also be considered.

Database structure of a typical distance education system presents a relational and complex structure. Different user types, authorization features and behavior rules also requires a relational database model. For instance, if a new user is added to the system, the necessary space, which this new user will need should be arranged automatically according to the user type. Different information depend on a user is kept in different tables like exams, personal information and course lessons in the distance education system. A relational model is also required to ensure a flexible model, which provides needed spaces for each new user added to the database. Congruently, the model can also remove related information and records automatically when a specific user is removed from the database.

MS SQL Server – Database Management System has been used in designing the LMS database structure. Before designing the database structure, an analyzing performance has been performed and structure of the education system has also been adjusted. At this point, the features, which will be needed in the LMS, are considered. Designed LMS system consists of 38 main modules and 153 tables. Each module includes an integrated sub table structure.

While realizing the association process, a semantic scenario among database tables has been generated and according to this scenario, 14 different associated groups were created.
These groups are: Application, Users, Financial Services, Workshop, Test, Menu, Academic Information, Chat, Group, Forum, Other Applications, Course, Demo and Survey

Each module in the system is an integral structure within itself. Additionally, a module is also an integral relation scenario at the same time. So, there is only one module in a provided relation scenario.

4. TABLES AND RELATION SCENARIOS

The first module of the developed model is named as the Application module. Users who want to benefit from the system (administrators, students or lecturers) take part in the database structure of this module. The Application module tables and relation scenarios are presented in Figure 1.

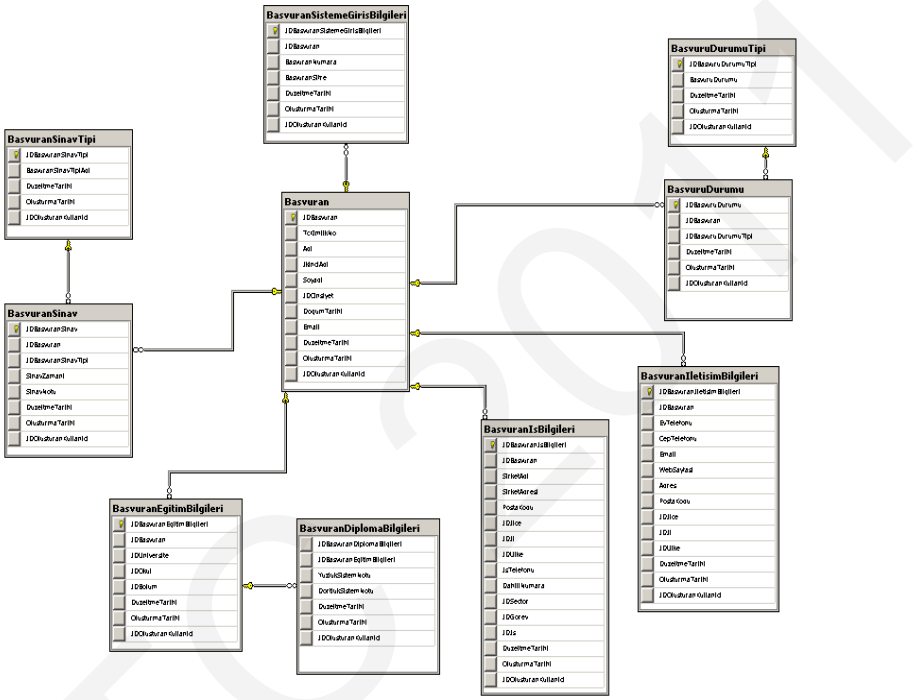

Figure 1. Application module tables and relation scenarios.

User tables relation scenarios are given in Figure 2. The user module is one of the most important modules of the LMS module. All necessary information about system users (from administrators to course students and lecturers) is stored in this module.

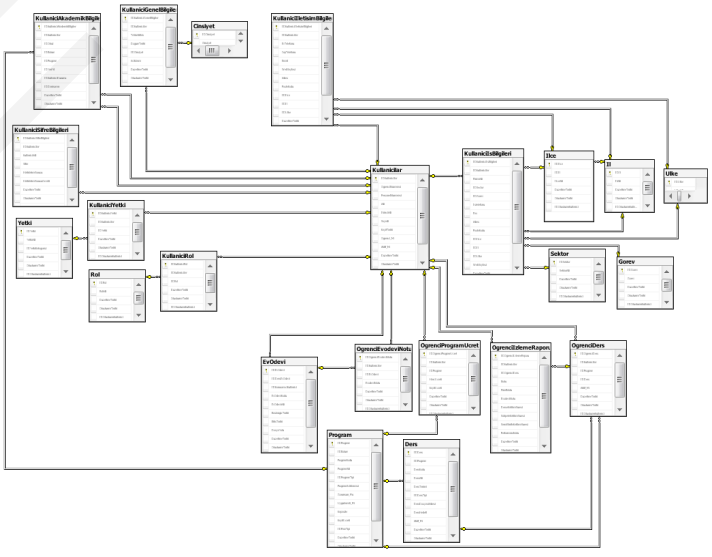

Figure 2. Users module tables and relation scenarios.

Financial transactions scenario and its LMS module are shown in Figure 3. In this module, students' registration fees, incomes from additional courses and basic expenses like financial transactions are tracked.

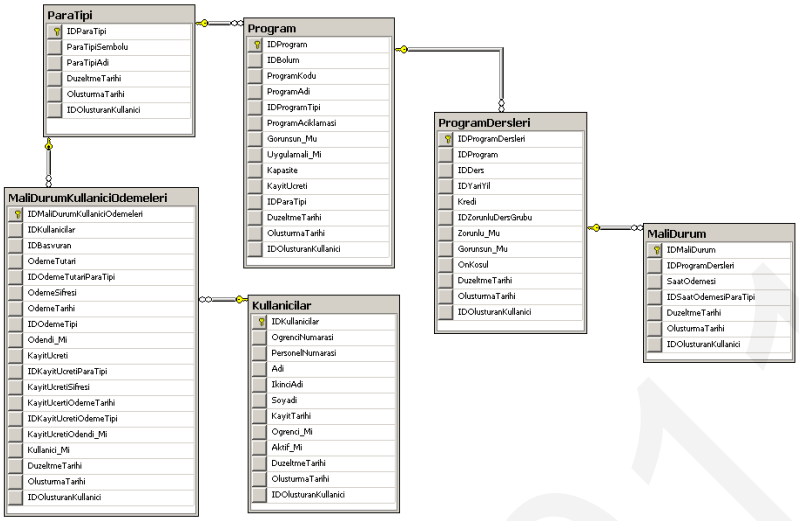

Figure 3. Financial services tables and relation scenarios.

Workshop module was developed to be used for course activities, which can be performed by visitor users. With this module, special education sessions like training seminars can be performed easily. For instance, a general “Photoshop” training can be organized with the help of this module. Users, who participate in this module, are evaluated in similar conditions with other course students. Workshop module and relation scenarios are presented in Figure 4.

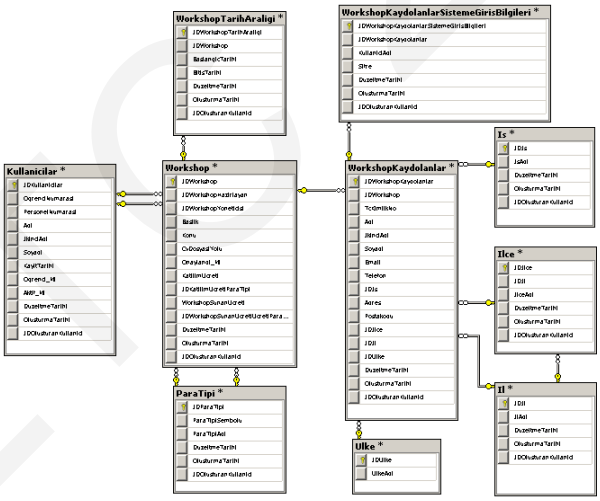

Figure 4. Workshop module tables and relation scenarios.

Exam module and relation scenarios are shown in Figure 5. The developed module is suitable to be used for special exams like visa and final examinations. As it can be seen from the table structure, various information like examination branch or class, examination type, examination date, examination starting and ending time, examination questions and examinations results can be stored in the database.

Menu structures, which can be seen by administrators, students and lecturers, are organized by using the Menu module and its database features. At this point, features of provided menu interfaces are changed according to the user type as “student” or “lecturer”. These menus are organized according to user roles and privileges. Due to the page restrictions about papers, other figures will not be given in the paper. In Academic Information module, a structure, which can be used by each education institute to fulfill its academic functioning, has been formed. With this module, different information like students’ personal information, registration details, system sections, branches, courses and payment information can be kept in a relational structure and many different actions associated with the mentioned information

can be defined easily. Chat module has been developed to ensure text-based and auditory conversation sessions among students and lecturers on specific dates and times. Only lecturers and students can perform chatting activities mutually.

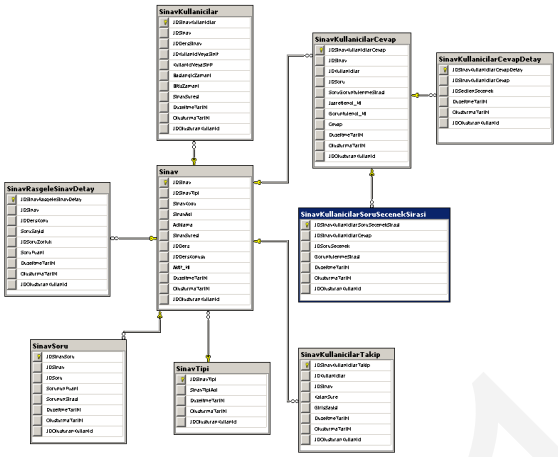

Figure 5. Test module tables relation scenarios.

In Group module, authorization descriptions and related functions are adjusted for the registered users. In this aim, new role or authority descriptions can be added to the system and authorization or role assignments can be performed easily for each registered user. It is also possible to define new user groups, which are allowed to access specific areas. A discussion forum has been consisted in to ensure information sharing among lecturers and students. This module is associated with the user login system and so each user can participate in information sharing activities at the same time.

LMS functions are not limited to only modules explained before. Many different modules are also combined under "Other Applications" tables and relation scenarios. Some of the related modules are: Personal Calendar, Academic Calendar, Transcript, Performance Tracking, News, Personal Notes, Dictionary, Virtual Classroom, FAQ, Private Message and Meeting modules.

Courses module is used for defining the courses, which will be provided in the system. In this module, some information about prepared courses (related course codes, descriptions for courses, course lesson contents…etc.) are defined easily. By using the Courses module, it is also possible to create different types of courses and define different features (course assignments, course examinations, descriptions for added course lesson contents…etc.) for the stored courses. Demo module was developed to be used for showing system features and functions to the people who are not fully registered and want to review the whole system. With this module, user can only examine using features and can not make any changes in the system. Survey module was developed to be used for performing survey activities in the system. With this module, it is possible to define survey questions and show them to user via system interface. Added surveys can also be removed automatically at specific times. Additionally, statistical information about added surveys can also be shown to users or just kept as confidential.

5. THE LMS APPLICATION

Designed database is currently used in a LMS developed at Afyon Kocatepe University. The LMS is named as Afyon Kocatepe University Distance Education Center (@KU-DEC). It runs efficiently on the web address: www.uzem.aku.edu.tr. It is not possible to explain the whole system features and functions here. So, it will be explained briefly. Developed LMS has all the features that a typical LMS must employ. The system allows creating a virtual campus easily and provides different activity environments for administrators, students and lecturers. It has a modular structure and so system modules can be added, removed or updated by using the provided tools. Each user has a username and user password to login to the system via login page. After logging in to the system, users can view Frequently Asked Questions (FAQ) section, explanations for using the LMS and an academic calendar provided on the homepage. Administrators have some authorities like creating entity, department or course and tracking both lecturers' and students' activities on the system. They also have authority to examine lecturers' and students' activity performances. Finally, administrators can also communicate with other users at any time as individually or collectively.

Lecturers can prepare weekly lesson contents and add new weeks by using the content preparation module provided in the system. Additionally, they can communicate with students via

synchronous and asynchronous communication modules, which can be used as text based, verbal and visual. They can also prepare surveys with the present survey module to take students' opinions about lessons. By creating question banks over the system, assessments like quiz and homework can be prepared and provided to students as online. In the system, students can join a course lesson, track both synchronous and asynchronous lessons and perform all kinds of activities based on office operations (transcript, school report, student certificate or identity card request…etc.). They can also communicate with administrators, lecturers or other students by using e-mail, forum and petition functions.

6. CONCLUSIONS AND SUGGESTIONS

In this study, a relational database model, which can be used within web-based distance education systems, is described. The developed model provides fully relational design, data integrity and security for large-scale Learning Management Systems. Relation scenarios was arranged to be suitable for a Learning Management System and got ready for a management system interface. The system has also been prepared in compliance with SCORM standards. Prepared database model is used in a LMS, which was developed to be used as distance education infrastructure of Afyon Kocatepe University (@KU-DEC). The developed system has been tested since at the beginning of 2009. Up to now, no disruption has been observed in both system and the database. Any educational institution, which uses this database design, can be integrated to the developed system easily. This function is helpful for especially researchers who try to develop a new LMS. In this way, wasting time on database analysis and creating education scenarios can also be prevented.

ABSTRACT

The design of Jawi and Quranic Courseware for Preschools (JQAP) is intended to assist preschool students in learning *Jawi* characters and basic, simple *Quranic* verses due to their ability and adaptation. This paper focuses on interactive design in this learning aid tool to create a motivated learning environment. JQAP is a self-access learning tool, aims to train children in independently learning, as well as to assist teacher in conducting and helping the children when needed. The aim is on the effort to fulfill variety of individual's need with supportive environment and learning condition. This approach is based on perception that only children can optimally accomplish it by themselves and determine the best learning strategy that suits him/her. Result shows that the respondents in this study have agreed with the presentation aspect and overall look of this product is able to attract children' attention to learn the *Jawi* script and Quranic verse using it. JQAP development is not only intended to upgrade students' skill in understanding *Quranic* verses, but as well as promoting the *Jawi* character heritance.

Keywords-preschool students; Jawi characters; self-access learning; learning strategy.

INTRODUCTION

Interactive courseware is one of electronic based learning materials, resulting from evolution of information and communication technology (ICT) in education. As Avril and Viv (2001) said, ICT in education is the electronic network that assists teaching and learning (T&L) process. David, Rob and Graham (2001) also stated the use of ICT in T&L process can support learning process in classroom, as well as self-learning. Meanwhile, ICT in children's world helps the way they think, change the way they learn and know how to interact better with other (Clements, 1999). The use of computer among children enable them to socially interact, work in group, increase self-confidence, appreciate their surroundings and enhance their language and interpersonal communication skill. Clements and Samara' study (2003) discovers that ICT learning material is crucial in supporting children learning through exploring and solving problem creatively. This study is supported by Noor Azli (2009) which affirmed that habitually children love fun games; hence the use of computer in *Jawi* learning can motivate preschoolers and cultivate good values among them.

PURPOSE OF STUDY

This paper aims to discuss whether the content of JQAP courseware can motivate the preschool's learning of *Jawi* script/letter and Quranic verse. *Jawi* is an adapted Arabic alphabet for writing the Malay language. It is one of the two official scripts in Brunei and Malaysia as an alternate script for the Malay language (Wikipedia, 2011). In depth, JQAP courseware focuses on learning and reading principle, as well as experiencing learning through identifying and combining the *jawi* script in a motivated learning environment. Jawi Script is derived from the Arabic Script, but then changed its name to *Jawi* because in Jawi Script there are six more new letters being added to it, in order to represent the six Malay phonemes

which are not found in the Arabic Language (Amat Juhari, 2008). This interactive multimedia courseware is purposely developed as an alternative teaching aid in learning Islamic Education for preschoolers. Based on the *Modul Panduan Guru Kurikulum Pendidikan Islam Pra Sekolah* (2009) published by Division of Publishing, Yayasan Dakwah Islamiah Malaysia (YADIM), transformation of Islamic and Moral Education for Preschool curriculum is lead to a better direction.

There are five (5) integrated contents in it, which are; belief (*akidah*), worship (*ibadah*), history (*sirah*), manner (*akhlak*) and basic of *Quran* and *Jawi*. Development of JQAP is also considered based on Curriculum Development Center (*Pusat Perkembangan Kurikulum*) (2001) which stated in Figure 1.

5.1.7 Identify the sound of *huruf* based on the mark (*tanda baca*):
- *Baris atas (fathah)*
- *Baris bawah (kasrah)*
- *Baris hadapan (dhommah)*

Figure 1 Excerpt of Preschool Islamic Education Curriculum (*Kurikulum Pendidikan Islam PraSekolah)* (Source*: National Preschool Curriculum(Kurikulum PraSekolah Kebangsaan),* 2001)

METHOLODOGY

In developing this courseware, ADDIE model is chosen as the methodology. ADDIE, stands for Analysis, Design, Develop, Implement and Evaluate, consists of five (5) phases in completing the task. Every phase executed will be observed and assessed. If the task is poorly done, the phase will be repeated until it is completely accomplished.

During analysis phase, analysis was done towards user needs, prior knowledge, awareness of using computer and openness to use courseware. Then, during design phase, interface, information flow and storyboard were designed to explain the framework of the courseware. Meanwhile, on development phase, the courseware interface is developed with interactivity taken into consideration. During implementation and evaluation phase, the courseware is nearly completed and is used to be tested by the user. Evaluation of the courseware consists of two (2) levels, which are alpha testing (internal) and beta testing (real user). Test upon the understanding of content and courseware usability, as well as market potential are conducted, in order to fulfill commercialization need.

INTERFACE DESIGN

The interface design of this courseware is being developed as simple as it can, so that the targeted users (preschool children) will encounter no error or only at minimal level. JQAP is organized to suit the method of reading *huruf* and Arabic phrase/sentences. At early stage, the structure of *huruf* and marker (*tanda baris*) is represented by using phrases. The structure of *huruf* is introduced, so that user will easily understand. Figure 2, 3 and 4 below are the examples of interface in JQAP courseware.

Figure 2 Main interface for JQAP Courseware

Figure 2 is the main interface for this product. Children have three (3) menus to be selected, which are;

i) Topic 1: learning Arabic language
ii) Topic 2: learning *Jawi* letters
iii) Topic 3: reciting short 'surahs' or verses.

Figure 3 Main interface for Topic 1

Figure 3 is the main interface for Topic 1, Learning Arabic Language. In this topic, children can either choose to learn or to play. In learning, they can manage to recognize each *Jawi* letter in the lesson. Meanwhile, in playing, they can play two (2) types of simple games, which are 'matching' and 'drag-and-drop'.

Figure 4 Main interface for Topic 2

Figure 4 is the main interface for Topic 2, Learning *Jawi* Letters. In this topic, children can also choose to learn or to play. In learning, they can learn to write the *Jawi* letter in the proper direction, or listen to the story inside it. While in playing, they can try to joint the letters in the correct way.

Figure 5 Main interface for Topic 3

Figure 5 is the main interface for Topic 3, Reciting Short 'Surahs' or Verses. There are also two (2) choices for children, either to learn or play. They can learn to recite the 'surah' or verse correctly; in this case, we start with 'Al-Fatihah' verse. In playing option, children can choose to play two (2) types of simple games, which are 'surah' arrangement and 'surah' quiz.

PRODUCT FUNCTIONALITY TESTING

In order to test and detect unexpected error (if any) during design and development phase, the prototype was then tested among a group of users with multimedia background. The test is all about the product usability during this alpha testing. Some of the withdrawals reported are such as below:

a) too much animation on the interface
b) display of duration is quite fast, this has caused difficulty for children to follow the reading
c) there was noise effect on the prayer recitation audition.
d) audio should be put on every instruction.

All the comments stated have been improved so that children will face minimal difficulties when using this product. Formative and summative evaluations have been done on the final prototype. Checklist form has been used for this purpose, meanwhile observation upon the users while using the courseware has been taken into consideration. Result shows that the respondents in this study have agreed with the presentation aspect and overall look of this product is able to attract children' attention to learn the *Jawi* script and Quranic verse using it.

CONCLUSION

As a conclusion, JQAP can be a self-assessment learning to train the children to learn by themselves. Teacher can guide and assist students where needed. This courseware also focuses on the effort to fulfill different individual requirement compare to the environment and conducive learning environment. This approach is based on the perception that only children can optimally accomplish it by themselves, as well as decide the best learning strategy that suits him/her. The development of JQAP is not only to establish the skill in understanding the Arabic language for Al-Quran, but also to promote the *Jawi* character heritance.

ACKNOWLEDGMENT

We would like to express our appreciation to Research Management Centre (RMC), Universiti Pendidikan Sultan Idris (UPSI) for the University Grant on this project.

ABSTRACT

Teachers have a pivotal role to play in preparing a quality of young generation. They have to be effective, must draw upon a broad range of teaching skills, as well as to have empathy, patience and humility especially in dealing with slow learners' issues. In order to teach the slow learner students effectively, teachers have to learn and try to treat their problem individually. Motivated by this requirement, this research focuses on the development of Teachers' Ethical Simulator System (D'TESS); a Simulation System of Student Slow Learners within Classroom developed with Agent-based Model. The simulation can be a tool to assist trainee teachers understanding changes in social aspect of slow learner students, communication technique and thinking technique in dealing with this category of students. The developed system can provide simulation of cases related to slow learner students and the proper way of applying ethics as preparation and continue development of ethical values for professional teachers. The system will also covers problems related to slow learner cases for secondary school only. A central concern of this research is on the development of an interactive D'TESS that is usable in term of easy to learn, effective to use, and provide an enjoyable user experience. This paper reviews the development of D'TESS and how the simulation can be used in understanding slow learner behaviour in the classroom. Moreover, this paper will also cover emotional aspect of slow learner behaviour in order to provide understanding on how the simulation can be an effective tool for understanding the real behaviour of slow learner student in real classroom environment.

Keywords: simulation, slow learner

1.0 BACKGROUND OF THE STUDY

Vann (1989), Herman and Stephens (1987), Caliendo (1986), Cardozier (1985), and others have suggested that the quality of schools is primarily dependent upon the quality of teachers employed by the district. Teacher selection is one of the most important decisions that a school administrator can make (Vann, 1989; Wise, Darling-Hammond, & Berry, 1987; Moore, 1987; Smith, 1980). Current selection practices involved only examination and personal interviews. In general, not every individu is qualified to become a good teacher. According to Jensen (1986), characteristic of a good teacher are careful, considerate, ccoperative, dependable enthusiastic, forceful, healthy, honours, industrias, neat and open-mindedness, original and progresssive as well as informed.

This study is concern on the way that can assist trainee teachers on applying ethics as for preparation and continue development of ethical values of professional teachers. The existing practise of formal course as well as clinical experiences provide only limited opportunities for trainee teachers to reflect on the ethical questions they will soon face. The core of system is to provide simulated reaction based on realistics slow learner case study as preparation for them in facing the challenge on handling classroom scenarios. This research was therefore designed to improve the preparation of trainee teachers by studying ethical situations (case studies) and the actions trainee teacher can take to resolve them. The initial study

examined ethical decision making and the professional ethical philosophy of secondary teachers from urban, small town and rural areas of Malaysia in dealing with slow learner students. The identified slow learner case studies will be used as the main source in developing storyline in the simulation system. The real case study is adapted to the simulation in order to give the real situations or problems that the trainee teacher will dealing with in the classroom environment.
Case studies gathered from the experiences faced by real slow learner teachers were analyzed and were used to create the storyline. Then, each of the cases that concentrate on what the teachers action are analyzed and the resulting cases were used in the simulation in order to prepare future teacher for ethical decision making in relation to handle slow learner students. The usefulness and accuracy of the case studies used will evaluated on the first place by a group of researchers. In order to simplify the preparation of future teacher with good quality as well as ethic in dealing with slow learner student, then, the researcher have developed Teachers' Ethics Simulation System or also known as D'TES that can provide simulation of cases related to slow learner students. The simulation can be a tool to assist trainee teachers understanding changes in social aspect of slow learner students and communication technique and thinking technique in dealing with slow learner students.

2.0 CHARACTERISTICS OF SLOW LEARNERS

Slow learners are usually normal in appearance and are able to function satisfactorily in many situations, but people always face difficulty in identifying and understanding them. Balado (2003) has clearly justified the characteristics of slow learners comprises of:

- ability below grade level.
- is prone to immature interpersonal relationships.
- has difficulty in following multi-step directions.
- lives in the present and does not have long range goals.
- has few internal strategies (i.e. organizational skills, difficulty transferring, and generalizing information).
- scores consistently low on achievement tests.
- works well with "hands-on" material (i.e. labs, manipulative, activities).
- has a poor self-image.
- works on all tasks slowly.
- masters skills slowly; some skills may not be mastered at all.

It is not unusual to hear slow learners parents state that they are puzzled over their child's school difficulties since they seems to understand so well at home. This is supported by a study conducted by Kaznowski (2004) that aims to determine which group of slow learners was more successful in school in order to know if special education or regular education is the most beneficial educational "placement" for the slow learners. This study compared the school performance of a sample of slow learners who qualified for special education as learning disabled with a sample of slow learners who did not qualify for special education. Findings suggest that neither group of slow learners is successful in school; both are doing remarkably poorly. Given this outcome, it is very important that educators find the courage to acknowledge the difficulty of slow learners.

3.0 WHAT IS EMOTIONAL ASPECT OF SLOW LEARNERS THAT TEACHER ALWAYS DEALING WITH?

Emotion plays important role in influencing student intellectual developmental stage. Slow learner students or students with learning disabilities have similar characteristics and emotional ability to normal student but merely different in intellectual ability . They need secure environment, give and receiving love, acceptance and recognition from peer group, and also need of experiencing, be responsible and involving in new classroom activities (Reddy & Ramar, 1997). However, slow learner students need to be educated on how to control and use their emotional wisely in order to ensure learning process run smoothly. (Azizi, Yusof & Emir, 2005) also stated that because their emotion and their feeling

more dominating desire and their thinking, emotional change will be bringing large implication on their behaviour compared to other normal students.

Because of their normal physical appearance, there are always misperceptions of this category of students. They always expected to show similar performance as normal students. This higher expectation more that they are able to reach will create disappointment not only to parents or teachers, but also have the higher negative implication to slow learners' emotions themselves. When basic need which all human needs such as love , appreciation and acceptance from others could not be filled, emotional problem and behaviour will be developed and their self esteem and performance will be affected as well.

.

Some emotional problems that apparently faced by most of slow learner students were low self concept, less self assured and always disappointed with something they performed. The negative emotions and the low self concept produced by limited experience in success and good achevement as well as by negative perception labeled by their parents, teacher and other communities (Sitagita, 2009). The negative perception that always comes into their mind is that they are group of students that will never be clever like any other people and unable to improve their level of intellectual no matter what they do. Abdullah & Ainon (2006) said that teacher is the main source of developing students' self concept and confidence. It is because the roles of teachers always overcome the role of parents and peer group. Due to this, teachers need to be more sensitive, tolerant and always show their love and attention in every of their action.

In order to ensure the effectiveness of development of slow learners' intellectual, confidence on themselves need to be builded parallel with their self concept because being positive is part of internal element for self concept. Unrealistic of hope and dream of parents that impossible to be achieved by this category of students can ruin their self confidence. Student will feel huge gap exist between their traits, qualities and value from others. Due to this, teacher should be extra careful in their action, expression and their words during teaching process so that the slow learner students never fee any gap exist with their other peer group. Hence, teacher should understand of slow learners' emotion and feeling and educate them to by encourage them by showing love and encouragement, not by force and negative physical enforcement. Teacher have rather important role in changing perception of parents on level of ability and capability of their children so that this students' emotional need can be filled and it can prevent emotional problems which can lead to the failure of teaching and learning in the classroom.

4.0 THE NEED OF SIMULATION FOR SPECIAL EDUCATION TRAINEE TEACHERS

Educational alternatives are required to prevent slow learners from continuing to fall through the cracks since student's inability to keep pace with the demands of the classroom can produce feelings of inadequacy, performance anxiety, depleted motivation, and even behavioral maladjustment (Levine and Barrienger, 2008). Generally, schools respond to such students with well-intentioned procedures or guidelines that fail to meet the needs of the thwarted learner. Thus, dealing with slow learners requires educators to be more proactive, creative and well-motivate especially in preparing the conducive environment and conducting the teaching and learning (T&L) activity. As the main target, the teaching and learning process should focuses on these three (3) major components consists of making the abstract concrete, not assuming generalization, and working towards automatization of basic concepts (Balado, 2003). In general, teaching these slow learners requires the information to be as explicit and concrete as possible just to ensure that they can see it, touch it, or do it, so the learning will be easier.

Education in Malaysia is on-going efforts towards further developing the potential of individuals in a holistic and integrated manner, so as to produce individuals who are intellectually, spiritually, emotionally and physically balanced and harmonic, based on a firm belief in and devotion to God. Such an effort is designed to produce Malaysian citizens who are knowledgeable and competent, who possess high moral standards and who are responsible and capable of achieving high level of personal well-being as well as being able to contribute to the harmony and betterment of the family, the society and the nation at large. The Ministry of Education Malaysia stated that the objectives of education are as below:

- To produce loyal and united Malaysian.

- To produce happy, well mannered individuals who have faith, knowledge and vision.
- To prepare the nation's human resource for development needs.
- To provide educational opportunities for all Malaysians.

Teacher is the one who's responsible to fulfill these objectives.

Ethics is a collection of moral standards by which each person should be guided in their private and professional life. It tells us right from wrong, and how to live moral lives. The teaching profession, as many others, has its own code of ethics, which describes the process of grading students and teacher's behavior in the classroom as well as outside the premises of the institution. It is one of few professions which evaluate the totality of behavior of an individual and its potential influence on others, in this case – students.

Despite the recent focus on teacher quality, the necessary step should be taken in order to provide guideline for trainee teachers to face the real world of education. Nowadays, teachers not only focus on delivery of knowledge but also need to cater every aspects of problems relate to students. Teacher must achieve the standards of professionalism and ethics of a teacher as highlighted by the Ministry of Education (MOE), Malaysia. The guidelines for teacher prepared by MOE are deceivingly simple. Most teachers who read the guidelines believe that they would never employ in an unethical behavior. Nevertheless, every year a few will find themselves caught in bad situations which begin with a seemingly inoffensive conversation except the experienced teacher who can avoid mistakes that cause the bad situation. These experienced teachers learn best from their mistakes all the years. Excluding inexperienced teachers will burden with wrong decisions. If the mistake done by the new teachers could ruin a reputation or career as a teacher, it would be best to make it in a simulation Therefore a new method in learning the professionalism and ethics of a teacher should be done in order to enhance the professionalism and ethics of teachers. In university for example, trainee teachers not exposed to a real situation in classroom. They only learn about theoritical aspects to deliver knowledge in classroom. The trainee teachers seem to be lack of knowledge on how to decide or reflect on situation related to students' problems. This situation may lead to unethical decision making because they do not have any practical guidance to handle this situation. There are many cases related to students' problems such as slow learner, misunderstanding, lack of attention, demotivation, individu differences and behavioral problems.

The most common ethical problem that any teacher will face at some point in time is the bias-free assessment of students. Teachers are supposed to create a learning environment that fosters autonomy and guides students in their learning experience. An important part of their work is evaluation of students' knowledge and progress. Without such an assessment, one cannot determine if the learning is taking place. And this is one of the most problematic areas of the job. But what does a "to assess a student" mean? Teachers will apply a set of rules and predefined formulas to measure the amount of knowledge that has been successfully retained by students or perhaps they will check the understanding of a problem being considered. This research will focus on slow learner cases that will provides simulation on how trainee teachers should solving student slow learners cases within classroom. With the purpose of providing trainee teachers the best practise of applying the teachers' ethics and to understanding the slow learner behaviour, a selected case study which represent the real scenario of this category of students is used in the DTESS' development phase.The heart of this research is divided into two scopes which are to develop the Teachers' Ethical Simulator System (D'TESS) and to provide analysis on teachers' actions in dealing with the student slow learners situation.

5.0 HOW COMPUTER SIMULATION (DTESS) CAN FACILITATE LEARNING AND UNDERSTANDING BETTER?

The world of education is changing. Teachers nowadays have to deal with the delivery of knowledge as well as to take care on issues related to students. They not only have to teach but their role changing from the teacher that have to teach to the educator that not only have to teach, but also have to educate student to differentiate what is bad and what is wrong as well as to show students the right path to choose to be a better mankind. In the previous era, when we are still young, teachers' job seem to be so easy, they work

half time in a day and only focus on how to deliver knowledge in a proper way to make their students' understand better without have to concern about students' problems. Nowadays, with the growing of technology where information and knowledge can be learned anywhere, the world of education also have to cope with that.

Computer simulation is the discipline of designing a model of an actual or theoretical physical system, executing the model on a digital computer, and analyzing the execution output. Simulation embodies the principle of ``learning by doing'' to learn about the system we must first build a model of some sort and then operate the model. The use of simulation is an activity that is as natural as a child who *role plays*. Children understand the world around them by simulating (with toys and figurines) most of their interactions with other people, animals and objects. As adults, we lose some of this childlike behavior but recapture it later on through computer simulation. Simulation is the imitation of the operation of a real-world process or system over time.
Simulation involves the generation of an artificial history of the system and the observation of that artificial history to draw inferences concerning the operating characteristics of the real system that is represented. Simulation is an indispensable problem-solving methodology for the solution of many real-world problems. Simulation is used to describe and analyze the behavior of a system, ask – what if questions about the real system and aid in the design of real systems. Both existing and conceptual systems can be modeled with simulation. A simulation is designed to provide users with possibilities to intentionally interact with the program, making various decisions and inputs, and to observe the consequences of their actions. Simulations can be divided into two broad categories: operational (learning to act on a specific evolving situation) and conceptual (learning the content by inferring and making experiments), and the learning can take place either by using or building simulations. Generally simulation-based learning has been argued to be highly motivating and engaging, and leading to deeper understanding of content and development of higher order thinking skills.

This research will concentrate on the case study related to slow learner students in school. The slow learner is a common problem in any school in Malaysia. The slow learner is usually normal in appearance and is able to function satisfactorily in many situations. But the slow learners have some difficulty in understanding and have a low performance in ability to complete for schoolwork exercises. This group of student will contribute to poor academic results which can give bad impacts to the schools. The schools are no longer can maintain its mission to produce excellent students. But this group of student is not to be blame 100%. The administrators and also the teachers should help the students to overcome their problems using psychologist method. The proper way to handle the problematic students needs to be identified in order to prepare trainee teachers to deal with students with this specialty. In order to face the challenging world of education, the trainee teachers have to prepare themselves and learn various psychology techniques in order to understand students' with slow learner characteristics and create teachers' own personality to promote respects and proper way in handling with students' problems. Slow learners students come from different age, personality, background and ability to learn. Teachers have to learn to deal with the variety in slow learner students' background because their problems have to be treated individually.

Initial or pilot study has been conducted by a group of researchers in order to gather information on what the actual cases faced by real teachers in the real school environment in dealing with this category of students. 10 schools in various states in Malaysia have been chosen as the sample of the study. Then, the finding of all the cases gathered from each sample of study population have be analyzed to be used as the based in developing the simulation. The study was conducted by using the interview and observation session in the selected classroom. Findings showed that students with low self confident and low self esteem not active in class and also not interested to join any activities in the classroom. The observation also shows that teachers always use various approaches in order to get all students attention and give more attention to slow learner students in order to develop their self confident. The literature review and the action taken by experience teachers are used as the source in determining the content of the ethical value used in the simulation system developed.

Features of Simulation System (DTESS):

1. Attractive and interactive interface.

2. 3D simulation in classroom setting.
3. Storyline for simulation was developed based on the real problem faced in the classroom environment.
4. Pedagogical agent in simulation acts, guides, reflects and assist trainee teacher while using the simulation.
5. Result and analysis in respond of the use of simulation will determine the readiness and ethical value that the user has applied in dealing with the slow learners' problems.

The Teachers' Ethical Simulator System (D'TESS) can be a tool as pre-exposure for trainee teacher in dealing with student slow learner cases within classroom. The importancy lies on the pre-exposure of trainee teachers to theoritical aspects and a teaching training only whilst the real exposure of handling students' problems within classroom is no highlighted during their studies. Therefore the development of the system focuses on trainee teachers to gain real experience through simulations on solving student slow learners cases. The system creates an interactive scenario in which the trainee teachers had to go through in the life of a teacher. The system will provides a case study of student slow learners cases these trainee teachers must communicate with the three main elements comprises of principal/assistant principal/coordinator, parents and students themselves. An analysis on response given by trainee teachers during interaction with D'TESS will be generated at the end of its usage. The trainee teachers also will be given appropriate response to deal with the situation. The trainee teachers who played the simulation would find themselves in an unethical situation in solving student slow learners cases from which they could not escape. They would learn from that failure and not fall into the same mistakes on the subsequent attempt. The trainee teachers gain the knowledge to identify the mistakes and make more effective choices of actions. Therefore the benefit of simulated experiences in the D'TESS is that failure does not mean the end of the life of a teacher.

6.0 CONCLUSION

Good simulations are *like* reality, but not perfect replications of it. Instead, a *good* simulation replicates the job environment in most of its important details — enough to create a situation in which the participant can "live" the situation without undue harm. Ideally, responses become affective or intuitive, but this varies by simulation type, since not all work situations require affective or intuitive responses. DTESS is a recipe that identifies the case studies of slow learner and make possible interaction between teacher and slow learners student in the simulation which can be monitored and tested regularly in order to make trainee teachers understanding on the implication of applying an ethical solution in classroom environment. Apart from that, simulations compress real experiences into a situation that can be manipulated to produce maximum learning impact, without having to wade through many random events looking for one nugget of truth. The development of DTESS can be a better tool to assist trainee teacher understanding the world of slow learner perspective and how to handle them in the real classroom better.

Acknowlegement

The authors wish to acknowledge the support of the Research and Management Centra, Universiti Pendidikan Sultan Idris, who awarded a research grant for this study.

DEVELOPMENT PROCESS OF A WEBQUEST FOR FRICTION

Muhammed Sait GÖKALP [a], Ali ERYILMAZ [b]
a: Dept. of Sec. Sci. & Math. Edu., Selcuk University, Konya, Turkey – sgokalp@gmail.com
b: Dept. of Sec. Sci. & Math. Edu., Middle East Technical University, Ankara, Turkey – eryilmaz@metu.edu.tr

ABSTRACT

WebQuests become a widely used tool in order to integrate technology in teaching and learning process since 1995. They help to enhance students' information technology and literacy skills. Moreover, WebQuests allow students to analyze and synthesize information, not just summarize it. They give opportunities to enhance and use higher level thinking skills.

In Turkey, a new physics curriculum for high school students was developed. This curriculum supports the use of technology in the classes for the better understanding of concepts. Moreover, it requires the use of several technologies to design and plan effective learning environments and experiences for students. It also suggests student-centered learning activities.

In this study the researchers developed a WebQuest for the topic of "friction". In this paper, details of the development process and the developed WebQuest will be presented. This WebQuest can be used as in-class activities compatible with the new physics curriculum. This paper was derived from the PhD thesis of the first author.

INTRODUCTION

Over the time, educational technologists have developed several web based activities in order to have effective use of the web in teaching and learning process. As one of these activities, WebQuest model was developed by Bernie Dodge and Tom March in 1995 (Dodge, 2001a). Dodge (1995) defines WebQuest as "an inquiry-oriented activity in which some or all of the information that learners interact with comes from resources on Internet, optionally supplemented with videoconferencing" (para. 2).

There are two types of WebQuest with respect to duration and learning outcomes (Dodge, 1995). Dodge identified these two types as short-term and longer term. Short-term WebQuests are designed to be completed in one or two class sessions with the aim of knowledge acquisition and integration. On the other hand, longer term WebQuests are took up to a month to be completed. These WebQuests aim to extend and refine knowledge.

Thousands of WebQuests can be found over the web with a simple search. Most of these WebQuests are just simple worksheets containing several web addresses and are far away from real WebQuest model (Dodge, 2001a). According to March (2003), if one just goes and collects information from web pages and prepare a product by using them directly, this activity become something else but not a WebQuest. He further explains that newly acquired information should be transformed into something new by the learners. In the current study, the friction WebQuest was developed to ensure students to use higher order thinking skills to design an experiment and present it with a poster. In the development process, criticisms to WebQuest model and advices of the founders of WebQuest model were taken into account.

CRITICAL ELEMENTS OF WEBQUESTS

WebQuests are usually designed for group works. In a typical WebQuest, there is a scenario to be followed by the learners. At the end of WebQuest activity, learners are required to prepare a product either online or offline. A WebQuest consists of six essential sections:

- Introduction: This is the first section of WebQuests. In this section, it is aimed to get students attention. Moreover, background information about the current topic can be presented in the introduction section (Brooks & Byles, 2000). It is basically a short paragraph explaining why students will complete the WebQuest (Chatel & Nodell, 2002).
- Task: This section is where the students' task is presented. Details of the expected product are given in this section (Brooks & Byles, 2000). If relevant, roles of the members are described.

- Process: In the process section, detailed information about how students complete their task is given. Aim of this section is to provide a guideline to the students. The author of the WebQuest can give tips on managing times and collecting data at this section (Yoder, 1999). Explicit directions should be listed too (Chatel & Nodell, 2002).
- Resources: It is where the chosen web resources are presented. This section allows students to use their class hours effectively without wasting time on searching inappropriate websites (Chatel & Nodell, 2002). Vidoni and Maddux (2002) state that the resources section does not have to contain merely online resources.
- Evaluation: An evaluation rubric is presented in this section. In this rubric, students should see how their work would be evaluated. Evaluation part should be connected with the information given in task section (Chatel & Nodell, 2002).
- Conclusion: A brief one-paragraph conclusion statement is given in this section. One can add higher level questions to be researched in this section (Brooks & Byles, 2000). There should be few sentences about what students learned through WebQuest (Chatel & Nodell, 2002). It is aimed to extend students' knowledge in the conclusion section.

CREATING WEBQUESTS

Dodge (2001b) classified the design patterns by examining existing WebQuests. He stated that if a WebQuest task contains "design, decide, create, analyze and predict" verbs, they usually require higher level thinking skills. According to Dodge, these types of the designs can be categorized as follows: design, decision, analysis, prediction, and creative tasks. Dodge (2002) proposed taxonomy for WebQuest tasks. He stated that a WebQuest could include more than one of them; and, expressed following tasks: compilation, journalistic, retelling, consensus building, mystery, design, judgment, creative product, persuasion, analytical, self-knowledge, and scientific.

Dodge gives five guiding principles to create good WebQuests. He identifies these principles as FOCUS:

- Find great websites: The websites should be suitable to the target group in terms of readability and cognitive level. They should be interesting and contain up-to-date accurate information.
- Orchestrate your learners and resources: One should create WebQuests by considering resources. A WebQuest should be designed to use every available computer. Moreover, every student should be part of the process by using a group work strategy.
- Challenge your learners to think: A good WebQuest should ask something more than memorizing or paraphrasing. At this aspect task of the WebQuest play an important role. It should give opportunity to engage students in problem solving, creativity, and judgment process.
- Use the medium: In a WebQuest it is possible to use different source of the information. One can design a WebQuest that includes peer discussions or "ask to expert" type of activities over the web.
- Scaffold high expectations: Scaffolding should be used in a WebQuest to help students perform high tasks. Scaffolding takes place in the process part of WebQuest. Dodge (2000b) states three types of scaffolding that can be used in a WebQuest: reception, production, transformation. Reception scaffolding occurs when helping learners to see what is important from the given resources and how to organize findings. Production scaffolding is giving guidance to help learners to create their product. That can be with supplying a template or giving structure of what is expected. Transformation scaffolding is to help learners to transform the information to some other form like diagram and chart (Dodge, 2000a).

CRITICS TO WEBQUEST MODEL

Vidoni and Maddux (2002) state that the popularity of WebQuest may due to its name. They express that it sounds like "high tech" concepts and applications, therefore teachers tend to use it. Moreover, they state that although WebQuest has ability to improve critical thinking skills, WebQuest model is not perfect. Vidoni and Maddux explain their claims by referring developmental nature of cognition. They say that WebQuest model does not offer any difference for different graders. A WebQuest for first graders is developed with the same way for graduate students. Furthermore, they expand their claim by saying that existing WebQuests do not seem to be related to the curricular content of the target level.

Maddux and Cummings (2007) extend criticism to the definition of WebQuest. They claimed that short-term WebQuests do not seem to be consistent with Dodge's definition that is based on looking for information and summarizing. Short-term WebQuests do not to require the use of high order thinking skills; therefore, they are not true WebQuests at all. Maddux and Cummings expressed that longer-term WebQuest is true WebQuest. They also repeated claims of Vidoni and Maddux (2002) about cognitive development. They stated that Dodge and March did not care about learners' cognitive development level and use of WebQuests was not appropriate for lower graders.

HIGH SCHOOL PHYSICS CURRICULUM AND WEBQUESTS

A new national physics curriculum for high school students was published in Turkey in 2007. This curriculum supports the use of technology in the classes for the better understanding of concepts (TTKB, 2007). Moreover, the new physics curriculum is based on real life context-based approach in which the connection between abstract physics concepts and real life is emphasized. At a typical WebQuest, the task can be structured to allow students to investigate real life based events.

The new physics curriculum also comes with new highlighting that imply skills gaining and improving processes. One of these skill categories is "information and communication technology skills" (ICTS). The ICTS deal with the information technologies and basic computer skills. The ICTS aim students to "search, find, and select appropriate information", "develop information that suits their purpose", "present information in the most efficient way", "develop communication skill", and "develop basic computer skills" (TTKB, 2007). Each of these categories has associated actions detailed in the curriculum. Table 1 compares these actions with WebQuest components.

Table 1 Comparison of the ICTS with WebQuests

Actions	WebQuest Component
Search, find, and select appropriate information	
Use different resources of information	Resources
Check the reliability and validity of the information sources	Resources, group work, teacher guidance
Use multiple search criteria	Task, process
Search, find, and select information appropriate to the purpose	Task, process
Develop a strategy to use information technology skills	Creating/designing a product
Present the information in the most effective way	
Prepare appropriate presentations that have correct outcomes	Creating/designing a product
Use different formats such as text, numbers, pictures, graphics, or tables at the presentations	Creating/designing a product, Presentation of the product
Use technologic environments (Internet, computer, projection, video, etc.) to perform effective presentations	Presentation of the product
Develop communication skills	
At the physics related communications (verbal, written, visual, etc.) use appropriate terminologies	Creating/designing a product, Presentation of the product
Express complex information clearly and briefly	Analyzing resources, Presentation of the product

THE FRICTION WEBQUEST

In the current study, a short-term WebQuest for the topic of "friction" was developed. This WebQuest was for ninth grade physics students. There are two content related objectives for friction in the physics curriculum. These are "explore the factors that friction depends on experimentally" and "explore the differences between static and kinetic friction experimentally". In this WebQuest, the students are required to design an experiment with respect to these objectives and create a poster to present their experiments.

The first stage in the development process was to decide on a scenario for the WebQuest. Basic factor to decide on the scenario was skill objectives, especially problem solving skills to have students to use each skill through the WebQuest activity. To allow students to think about factors affecting friction and differences between static and kinetic friction, the scenario was written with the idea of having someone working at a shipping company and drifting different sized packages. After having scenario for the WebQuest, the introduction, task, process, resources, evaluation, and conclusion parts of the WebQuest were written. With respect to Dodge's (2002) taxonomy of tasks, the friction WebQuest included design, creative, and product tasks.

The next stage was to develop web pages for the WebQuest. The WebQuest were developed with PHP web programming language and MySQL database to allow dynamic template layout that can easily be changed from the database. Visual design principles for instructional content were taken into account at this stage. The design was completed and the WebQuest was published. Each of the WebQuest page has link to the printable version of the WebQuest.

The expert evaluation form was prepared to evaluate the WebQuest. The rubric for evaluating WebQuests by Bellofatto, Bohl, Casey, Krill, and Dodge (2001) was used to prepare this evaluation form. Finally, the WebQuest outline, which contains the distribution of the objectives and brief information about procedure, was prepared. The expert evaluation form, WebQuest outline, and WebQuest printable version were used to get the experts' opinions. The WebQuest was reviewed by four physics education experts. However, the researcher gave the WebQuest to one of the experts at first. After getting feedbacks for the WebQuests, it was modified and the modified version was given to three other physics education experts to review. Through this process, the WebQuest was revised and the WebQuest website was updated.

The feedbacks and the actions taken against them can be summarized as follows:

- Overall relevance with objectives: It was seen that the friction WebQuest was compatible with course objectives.
- Grammar: There were several grammatical errors pointed by the experts. These errors were fixed and double-checked before updating the WebQuest.
- Layout/Design: Layout of the WebQuest was slightly modified to increase visual attractiveness. The navigation graphics were modified with respect to color scheme. Moreover, name of the next or previous sections were added to each graphics to enhance navigation.
- Task relevance with objectives: When the feedbacks from the first expert were taken, it was decided to give the instructional objectives directly in the task section. Therefore, the task of the WebQuest was modified to include the objectives directly in it. The other experts' feedbacks showed that the task section was relevant with the objectives.
- Task clarity: The task of the WebQuest was slightly modified to make it clearer. These changes were just based on enhancing flow.
- Process clarity: Each step at the process section was detailed to make sure that the students could follow the steps easily.
- Resources: Some of the resources that contain duplicate content or that do not contain valuable information were removed while some others were added. It was pointed out that some of the objectives were not represented with appropriate number of resources. This issue was fixed by adding more resources for respective objectives.

In the current study, the introduction section supported with a video to enhance the effect of the introduction on students. Moreover, in resources section, several websites that does not include accurate information were also listed. The reason of this was to comply with the course objectives that require students to choose correct information and differentiate necessary and unnecessary information. Moreover, the book of the course was also listed as an offline source to provide different type of the information sources to the students. The introduction section and general layout of the friction WebQuest can be seen in Figure 1. The navigation and color theme are the same at the other sections. It is not possible to include other sections of the

friction WebQuest in this paper due to page limit. However, this WebQuest can be seen at http://www.webquestdatabase.com/webquest.php?webquestid=6.

Figure 1. Screenshot of the introduction section of the friction WebQuest

CONCLUSION

In this paper, WebQuests and their development process were discussed. Moreover, their critical elements and compatibility of them with the new physics curriculum were discussed. WebQuests can be used as powerful tools in in physics classes. The friction WebQuest that developed in this study can easily be integrated with the curriculum and teachers can use them in their classes. It should be noted that development process of the WebQuests can take much time and become overwhelming. However, once it is developed, it can be used and accessed at anytime from anywhere. Deciding on a task was one of the most challenging parts of the WebQuest development in the current study. Teachers or researchers should critically examine course objectives and think about corresponding daily life events to decide on a task. Moreover, it can be good to examine pre-developed WebQuests to have an idea about the tasks.

DEVELOPMENT OF ONLINE READING TEST

Associate Professor Dr. Alisa Vanijdee
Sukhothai Thammathirat Open University, Thailand
Alisa.Van@stou.ac.th; avanijdee@hotmail.com

Abstract

This research aims to (1) develop and (2) validate an online English reading test; (3) study the reading performance-level; (4) analyse common weaknesses; and (5) propose the reading guidelines. 31 informants. Instruments included (1) 3 sets of English reading tests; (2) test evaluation forms, and (3) a test-specifications crosscheck form.

Results revealed (1) 3 sets of tests. (2) The tests are qualified as specified; the tests were modified according to the IOC scores of lower than .50; the reliability of the 3 sets was analysed by *Kuder Richardson* 20 formula, which yielded .86, .88, and .61 respectively; the difficulty and discrimination was accepted at .20 < = p <= .80; (3) the reading performance level of the 3 versions 1 , 2, 3 yielded 16, 14, 18 B1 level test-takers, 12, 14, 11 B2 level and 3, 3, 2 C1 level respectively; (4) insufficient understanding of complex structure and vocabulary were found; (5) reading strategies practice was proposed.

Keywords: reading tests, reading test specifications, reading performance level, online reading test

Introduction

Today's advance in social and economic development leads to the need for proficient English personnel in all areas, especially in international business. Moreover, the ASEAN agreement on the cooperation among the regions (http://www.mfa.go.th/web/200.php?id=21888) emphasizes the needs for the language of ASEAN countries—English. Sukhothai Thammathirat Open University (STOU) has been a leading open and distance-learning university offering English language courses since 1980 to a large number of students, adopting various technologies. A research and development on Development of English Test Via Electronic Media in a Distance Learning System, online testing for English for Computer Users, English for Office Staff, and English for Communication have been offered. (http://www.stou.ac.th).

This research aims to (1) develop an online English reading test; (2) validate the quality of the test; (3) study the reading performance-level of the test-takers; (4) analyse common weaknesses found in the test results, and (5) propose guidelines to improve the reading performance of test-takers. Informants were 31 academics and graduate students.

Literature review

(1) The general characteristics of online reading tests at the time of research

From the search engine using English test, there are 7,540,000 websites, offering the test—both free and with payment. Some offer samples of the test to lead to tutorials or book selling. The target groups are students who wish to learn English and to evaluate their proficiency. The activities come in various formats such as part of the standardized tests such as TOEFL, GRE, and IELTS, which offer reading tests. Many educational institutions offer online proficiency tests for their own students.

The online reading tests offer either separate reading passages or paragraphs with multiple choice questions. The language points are tested at the level of word, sentence, paragraph and discourse. Main idea and supporting details, and pronoun references are measured at the paragraph and discourse level. The answer keys, overall marks, explanation for each item and recommendation were provided. Another parallel set of tests for the same language point is also offered for second trial. In Thailand, a few online reading comprehension tests are offered by the Centre for English language development, High Education Commission. Some common technology such as multiple choice and drag and drop at various levels have been adopted (http://www.eldc.go.th/eldc3/page/e_exam/index.jsp Retrieved August 31, 2010). Moreover, from the survey on Thai universities, online courses on content subjects exist but no English tests.

(2) Online English tests offered at STOU

At the time of research, STOU has offered an online English test developed by Vanijdee et al. to the public (http://stou.ac.th). The test takers can test their listening and speaking skills in a form of multiple choices and subjective tests. Test takers are able to speak and record their own answers on the computer. The files are down loaded for teachers to mark. The results are presented for each item, not the overall results. In addition, English for Communication, English for Office Staff, and English for Computer Users courses offer online tests in multiple choice form and evaluation of the language content in each subject.

(3) The significance of reading skills

Reading is the skill that enables students to access overwhelming academic content online, mostly in English. The reading ability for graduate level includes reading research, articles, and textbooks; they must be able to deduce the concepts and issues to apply in their own research; they have to be good at grammar, register and critical reading. The preparation for reading performance is thus very important—like tools to access knowledge.

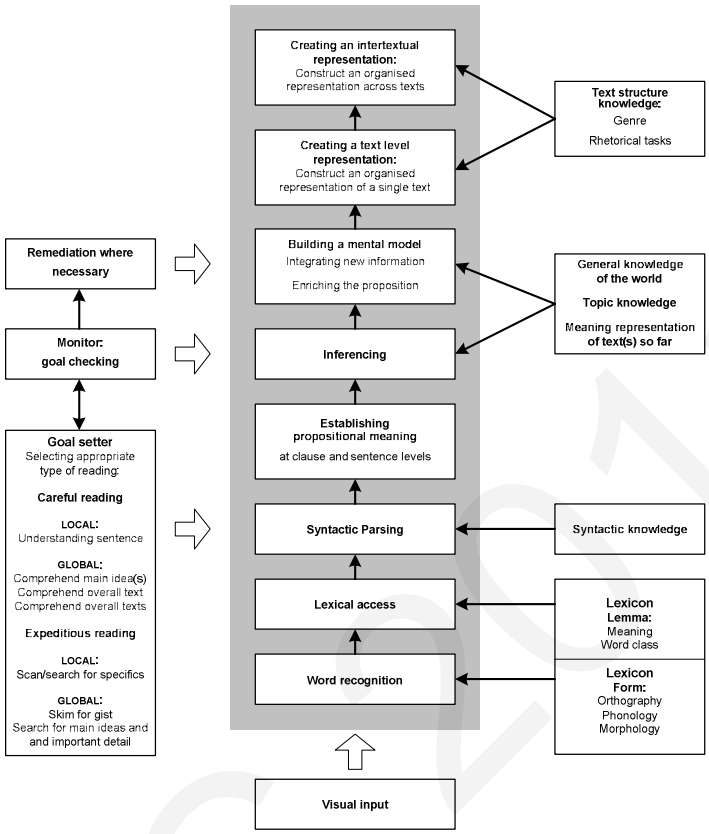
Munby (1978, in Alderson, 2000: 10) distinguishes the microskills which have been adopted by later researchers and cover a wide range of reading skills. These comprehensive lists are worth full quote here: (1) recognizing the script of a language, (2) deducing the meaning and use of unfamiliar lexical terms, (3) understanding explicated stated information, (4) understanding information when not explicitly stated, (5) understanding conceptual meaning, (6) understanding the communicative value of sentences, (7) understanding relation between parts of text through lexical cohesion devices and through, (8)grammatical cohesion devices, (9) interpreting by going outside it, (10) recognizing indicators in discourse, (11) identifying the main point or important information in discourse, (12) extracting salient details to summarise (the text an idea), (13)extracting relevant points from a text selectively, (13) using basic reference skills, (14) skimming, (15) scanning to locate specifically required information, and (16) transcoding information to diagrammatic display.

Reading skills not only involve the ability in language but also the ability in thinking, analyzing, summarizing, and interpreting. Davis (1968, in Alderson, 2000: 9) identified 8 skills: (1) recalling word meanings (2) drawing inferences about the meaning of a word in context, (3) finding answers to questions answered explicitly or in paraphrase, (4) weaving together ideas in the content, (5) drawing inferences from the content (6) recognizing a writer's purpose, attitude, tone and mood, (7) identifying a writer's technique (8) following the structure of a passage.

(4) Framework for reading process

Khalifa & Weir (2009: 62) present a comprehensive reading model, which covers thorough reading process. In designing a reading test, every factor in the reading process must be taken into consideration to maximize the evaluation efficiency. In the model, if considering cognitive validity in the middle column and the right column simultaneously, the core of comprehension starts from visual input up to word recognition whose lexical includes form and meaning; lexical access; syntactic parsing; establishing propositional meaning; inferencing; building a mental model which the readers have to apply general world knowledge, topic knowledge and meaning representation of texts; creating a text level representation; and creating an inter-textual representation which concern text structure knowledge, genre and rhetorical task.

The left column represents reading process from goal setter, which is divided into careful reading and expeditious reading at local and global levels. The local level involves understanding sentence in careful reading and scan/search for specifics in expeditious reading. The global level covers main idea(s), overall text(s) in careful reading and skim for gist, main idea and important detail in expeditious reading. Then the process moves to monitoring and remediation where necessary (Khalifa & Weir, 2009: 62).



(Khalifa & Weir, 2009: 62)

The reading evaluation process thus is based on the reading principles and processes; however, other crucial elements such as test taker characteristics and administration are also involved (Shaw & Weir 2007) but is not the focus of this online reading test. This online reading test is for the general public and not a compulsory test focussing on the level of performance of the test-takers, so it does not cover the administration.

(5) The online reading test design and construction

This online reading test was based on the reading process (Khalifa & Weir, 2009: 62) and the framework of references for languages CEFR (Common European Framework of References — Council of Europe) (www.uk.cambridge.org/elt) and the detail specification of each level by Unaldi (2009).

This online reading test was designed to evaluate and analyse the test takers' performance as presented in the test specifications, focusing on the strong and weak points of the test-takers at the global and local level. Test specifications were designed to help discriminate the different reading comprehension levels. The tests were divided into three sections: grammar, vocabulary and reading passages with contents based on academic domain. In addition, the reading performance was measured at the level of word, sentence, and discourse. Content validity and reliability were at the basis of the design (Weir, 1990: 22; Hughes, 1996: 22).Also, the contents of the test are authentic or "real life language use" as Bachman puts it (Bachman, 1995: 41).

Test specifications were designed based on the mikroskills from Alderson (2000) and test usefulness by Bachman & Palmer (1996). Alderson (2000: 169) covers comprehensive details of test specification that may be grouped into (1) the test itself – objectives, structure, skills, level of difficulty, task types, quantity of passages and items, etc (2) the test takers and (3) the administration. Bachman &Palmer (1996: 133-156) proposes that test usefulness can summarise and predict the test taker's performance and since the results of the performance can be used to judge people in work or academic,

cautious and thorough design must be adopted. These issues are (1) reliability (2) construct validity 3) authenticity (4) interactiveness (5) impact (washback effect), and (6) practicality.

(6) Relevant research

At the time of research, no direct relevant research in Thailand is available. Since tests are either public or business where confidentiality is taken into account, no result analysis is advertised.. However, some research in reading can be useful such as the topic and the reading ability (Vongpadungkiat, 2006); the relationship between test takers and reading texts (Vongpumivitch, 2004); the relationship among attitudes toward computer, stress and familiarity with computers and the reading comprehension ability test on computers (Kiratibodee, 2005); and strategies and test taking (Phakiti, 2008).

Methodology

1. Informants are 31 graduate students and academics.
2. Research instruments cover

(1) **The qualification test evaluation form**. The form was used by three English professors and two evaluation professors to evaluate the overall picture of the test adopting the checklist of Bachman and Palmer (1996).

(2) **Test specifications crosscheck form**. This was used to cross-check actual items in grammar, reading and reading text against the test specifications.

(3) **The online reading test.** The process of development of the online reading test was as follows.

3.1 Study the electronic tests online and offline both offered in Thailand and international, especially reading tests.

3.2 Study computer use in electronic test design and the evaluation of the computer based tests.

3.3 Develop three sets of online reading test with the following details.

Each test consisted of three sections: grammar, vocabulary and reading passages, covering 100 marks. Task types cover discrete items and discourse level questions items. Discrete items were used for grammar that concerned reading ability such as applying knowledge of structure to interpret meaning at word level and sentence level. Discourse level was represented in reading passages measuring the comprehension, main idea, and relevant details. Response methods covered multiple choice questions, matching, and gap filling.

(1) The test specifications for reading were based on CEFR (Common European Framework of References). Unaldi's (2009) comprehensive framework was adopted for outlining detailed test specifications for B1 B2 and C1 level.

Reading texts were processed through vocabulary profile of 'lexitutor' for their detail analysis of vocabulary (http://www.lextutor.ca/vp/). Flesch-Kincaid Grade Level was also employed for reading level. The processed texts were then modified to fit the test specifications in all details. After the reading passages were processed, the questions and question formats were designed.

(2) The grammar items were selected from Grammar City & Guilds ESOL for all three levels: B1 (Achiever) B2 (Communicator) C1 (Expert). Multiple Choice Questions with four alternatives.

(3) Vocabulary was selected from AWL (Academic Word List) at the individual word level, sentence level, and paragraph level (http://www.academicvocabularyexercises.com/#what). The response format covered the identification of the word (this was cancelled because of the software limited ability); multiple matching of the words and meaning; gap filling; replacing the word in sentences; the use of parts of speech; the use of vocabulary in context; identifying the details of reading ability based on CEFR.

(4) Explanation was prepared in the three sections: (1) for each individual item in the grammar section (2) meaning, how to study vocabulary, and useful websites in the vocabulary section (3) how to apply grammar knowledge to interpret meaning from the text, and useful websites for practicing in the reading section.

(5) Three English experts and two evaluation experts evaluated the online reading test for content validity, utilizing IOC (Item Objective Congruence Index) values. Items with IOC value lower than 0.50 were modified. Using test specification crosscheck form, the experts cross checked the items contents against the objectives and the detail of the test. Moreover, the contents that reflect reliability, construct validity, authenticity, interactiveness, impact, and practicality were also evaluated in qualitative form.

(6) The online reading test was first piloted with five interested bachelor degree persons. The language and items were then modified according to Bachman's list (Bachman & Palmer (1996) and by the scores and test-takers' comments.

(7) The online reading test was trialed at the second time with 31 test takers online (LAN) to yield the difficulty level and discrimination quality. Both content and explanation were then modified again. This step included the technique in doing the test online. The reliability was calculated using KR 20 formula.

(8) The final modified online reading test was offered through STOU websites (http://www.stou.ac.th).

Data analysis

(1) The content analysis of the content validity of online reading test was done through the test evaluation form.
(2) The tests were modified according to the IOC scores of lower than .50 and the experts and pilot-test takers' suggestions together with the trial test scores of the pilot-test takers.
(3) The difficulty and discrimination of each item at .20 < = p <= .80 was accepted; the rest were modified.
(4) The reliability of the 3 sets was analysed by *Kuder Richardson* 20 formula.
(5) The test scores and the level of reading ability from informants were analysed by percentage, average, and standard deviations.

Results and discussions

The results of the research are explained in the following order:

1. **Three sets of online reading test**

The design of the online reading test

The objectives of the test were to measure reading comprehension ability at the word level, sentence level, paragraph level and discourse level. Three sets of test with 100 marks each, divided into grammar (30), vocabulary (30) and reading (40). Task types included (1) discrete items on grammar involved in reading such as applying the knowledge of structure to interpret the meaning in the text. (2) at the discourse level; measure reading comprehension, main idea, and detail. Inferences and analysis were also included. Response methods covered multiple choice, multiple matching, and gap filling.

The levels of reading ability were based on the overall reading comprehension details from CEFR at 3 levels B1 (Threshold) B2 (Vantage) C1(Effective operational proficiency). The target group covered graduate students and academics. (CEFR (Common European Framework of References) for languages Retrieved from www.uk.cambridge.org/elt on April, 19, 2010, p. 69)

The level difficulty the reading passages adopted Unaldi (2009)'s details. She focused her study on the difficulty level of the text and has proposed a comprehensive framework when designing tests:

- Contextual covers response method and text length
- Discourse mode covers genre, pattern of exposition, and explicitness of text structure.
- Structural resources covers words per sentence, Flesch-Kincaid Grade Level, the complexity of sentence structure, and cohesion
- Lexical resources covers K1 K2 K3 words; AWL words
- Nature of information in terms of abstract/concrete
- Content knowledge in terms of required/not required
- COGNITIVE: Type of reading main idea; detail, implication
- Text level covers word, sentence and across sentences

The level of difficulty of the vocabulary was processed through lexitutor software (http://www.lextutor.ca/vp/). The analysis revealed frequencies of vocabulary, types and levels (K1, K2, K3, AWL); types, tokens, families, tokens per family, types per family). Flesch-Kincaid Grade Level was also taken into consideration when adapting reading texts to correspond the specifications in B1 B2 C1.

Details of the grammar items were based on Grammar City & Guilds ESOL which are comparable to CEFR at three levels: B1 (Achiever) B2 (Communicator) C1 (Expert). The response method was multiple choice. The academic words in the test were selected from AWL (Academic Word List).

The response methods for vocabulary were mostly multiple choice questions at the word level, multiple matching, gap filling for synonyms or for the use of parts of speech and (6) vocabulary in context.

This online reading test adopted the multiple choice questions where test takers can scroll the screen to check their reading passages; no time limit, answer keys and explanation were provided. However, the best format would be the reading text on the left and the questions on the right where test takers can scroll the text.

With the use of software from STOU (*A*Tutor), the following elements in designing computer tests are considered: navigation, terminology, page layout, text, text color, tool bars and control, icons and graphics, help facilities, item types, forms for writing and short answer tasks, and feedback. (Chapelle C.A. & Douglas, D. (2006) from Fulcher (2003: 384-408).

Explanation for improving reading ability

The recommendation focuses on 3 strategies: cognitive, metacognitive, and socio-affective. (O'Malley and Chamot, 1990; Chamot (2004). Direct and indirect strategies from Oxford (1990) were also applied.

Format of online reading test

For this online reading test, the software used can collect individual test takers' total marks and the result of each individual item. The navigation system is simple and easy. The reading passages are easy to read: no color added because of the distraction; test-takers are required to be focused on the test; not too much interaction with the screen. The limitation lies in the fact that test-takers have to scroll the reading text while there should be two windows side by side. The subjective format is available but cannot keep the scores, so they are not used.

2. The validation of the online reading test

The results of reading passages analysis within test specifications

The reading passages have gone through considerable and complex process. The detailed specifications lend themselves to qualified reading passages according to the required level: B1 B2 and C1and within the framework. Thus, we can conclude that the test specifications are the best guidelines for finding the right texts based on reading theory. However, some details cannot be adjusted to the specifications but are still within the framework. The selection of topic is based on the detail of each level whether it requires content knowledge or not, and also the texts that graduate students and academic may be interested in. The following discusses the B1 level in detail as example:

B 1 level, the response methods are similar such as multiple choice, multiple matching. The number of words is somewhat different within 500 words, except for the reading texts in the third set, which are personal and connected. The types of text are exposition and personal. The language covers narrative, description, instruction, narration, classification. The structure of the text is explicit. Structural resources revealed 18, 15.7, and 20.5 words per sentence—somewhat over the specified level (15). The average of Flesch-Kincaid Grade level is 10, 8.6 and 8.2 with 8 as the specified level. The complexity of sentence structure: most simple sentences with subordinate clauses are at the Preliminary English Test level. The cohesion of the three sets of test is explicit. The vocabulary resources for AWL is set at 2.5 %. The AWL of the three sets are 6.32%, 8.51, and 1.81%. The first and the second are academic texts so there are more academic words (most of them are used in Thai), while the third one is a personal story. The nature of content are concrete and the knowledge of content not required. The cognitive of the whole three sets are similar: main point/multiple matching/relevant point/vocabulary in context/pronoun referents. The levels of the reading passages were discussed at the word level, sentence level and intertextual level.

Development process of the test design

This research focuses on the process in developing the standard tests, so the quality of the test is of extreme importance.

The quality of the test is processed thoroughly based on the reading process framework from (1) the design of the online reading test that has evident concept and framework, apparent specifications and details; (2) the evaluation of tests from experts in English, testing, and native speakers; (3) the pilot test of 5 non-informants to preliminary adjust the language and timing of the test; (4) the online test design by experts in electronic learning and software programs; (5) the trial of 31 informants online for statistical analysis and software testing; (6) the quality of the test by *Kuder Richardson* 20 (KR-20)

formula (Test 1 yielded KR 20 = .86; Test 2 yielded KR 20 = .88; Test 3 yielded KR 20 = .61 this revealed the high validity); (7) each individual item was formatted with a variety of formats: 4 alternatives and 3 alternative multiple choice; matching (8) The difficulty and discrimination was accepted at .20 < = p <= .80 — the rest were modified. The matching items adopted the analysis of average mark. ; (9) In adjusting the individual test item: reading process framework, the CEFR level, modification of test items was based on p, r value. In other words whether they are too easy, too difficult or cannot discriminate between good and poor test takers. Percentage of the corrected answer was also analysed. Each alternative was also analysed meticulously such as the good in the group made more mistakes than the poorer in the group. Of all the issues of the validity of the test, Messick (1989) in Khalifa & Weir (2009) insisted that the validity should be taken in terms of degree more than have or have not. In other words, it is relative.

From the above process of quality assurance, the online reading test is qualified as specified.

3. The level of reading ability of test-takers.

Table 1: TEST RESULTS

Set of test	C1 (effective operational proficiency)	B2 (independent user	B1 (independent user
First set	3	12	16
Second set	3	14	14
Third set	2	11	18

The results corresponded to prediction from the English background of test takers who got a bachelor degree and graduate students and from self-evaluation of the test takers (fair more than good) The number of B1 B2 (independent user) test takers was more than C1 (effective operational proficiency). However, this result must be considered in accordance with other factors such as the administration, the marks (Shaw & Weir 2007), and the physical nature of the test room (too cold for some test takers).

4. Strong and weak points in reading ability of test takers

In general, test takers have fair ability in grammar; however, they need to work on the complex and sophisticated sentences. For vocabulary, test-takers are better at each individual word and sentence but not at a discourse level (paragraph).

5. The guidelines for test takers' reading ability improvement

Reading strategies (O'Malley and Chamot 1990; Chamot 2004 Oxford 1990) can be adopted as guidelines. In addition, the test taking techniques (Bachman & Cohen 1998) are useful, especially for tests that will be used to judge the test takers' ability in their jobs.

Recommendation

The findings of the research call for further study on the following: (1) the test-taker characteristics and context validity (2) setting up framework of references for reading ability of Thai students (3) the correlation between reading strategies and test taking (4) a more sophisticated online reading test such as having verbal explanation and sophisticated software.

ABSTRACT

This paper presents what we have learned about the use and effectiveness of distance technologies to support transformative learning activities in 3 Sino-American classes. We address the following questions:

1. How effectively do cross-border classes use distance education technologies to complete assignments in transformative learning communities?
2. Do cross-border distance education classes generate transformative learning communities?

The results of three Sino-American case studies which use similar distance technologies, but with different intensity, to create cross-cultural transformative learning communities composed of American and Chinese graduate students will be compared. We analyzed our efforts to understand how to create and support transformative learning communities across borders using distance technologies. Our results will be useful to scholars in education and other disciplines who are committed to using appropriate technologies to support transformative learning across borders.

INTRODUCTION

This paper addresses educational technology and cross-border transformative learning. According to Garrison and Anderson (2003), a transformative learning community is:

> composed of teachers and students transacting with the specific purposes of facilitating, constructing and validating understanding, and of developing capabilities that will lead to further learning. Such a community encourages cognitive independence and social interdependence simultaneously. (p. 23)

Because online transformative learning entails a very different type of communication than traditional face-to-face learning, a virtual sense of community among students and teachers must be created. Social presence is developed first. Then teaching and cognitive presences are built and used to achieve learning goals. In qualitative research with 30 undergraduate students, Winograd (2000) finds that even a low amount of instructor social presence facilitates community formation. Knupfer et al. (1997) and Bielman et al. (2000) find that structural and behavioral supports are both essential components of an online community of learners. Finally, Young (2004) finds that learning communities in a Chinese online environment provide an opportunity for both students and faculty to learn and for teaching presence to emerge from social interactions among the learners.

Anderson et al. (2001) analyze teaching presence in online learning using three components – design and organization; facilitating discourse; and direct instruction. They find that instructor-prescribed scaffolding, which provides a framework for learning as well as structured exploration, is an essential part of the design of an online community. McManus (2000) suggests that an effective teaching presence will accommodate different teaching behaviors and learner responses. He observes that highly self-regulating students respond best to a non-linear learning environment with few advanced organizers or scaffolds.

Contrariwise, students lacking self-regulating skills learn more when instructors create linear environments with more scaffolding. Graff (2003) finds significant correlations between online teaching behaviors and learning styles. Young (2004) finds that online instructors must be committed to providing learning in a collaborative community environment.

Bentley et al. (2004) summarize cognitive presence in cross-border online learning. For these authors learning in different cultures is a function of cultural norms, accepted learning philosophies, and personal learning preferences. The authors identify eight cultural value differentials that affect online cognitive learning. First, when English-as-a-second-language users are involved in online learning, course materials must explain both linguistic and cultural assumptions in the text. Second, cultural differences influence online learning styles. In some cases technology is more or less acceptable based on culture. Online learning must address differing local needs. What is important to learn in one culture may not be important in another. Learning styles differ and designers must be aware of cognitive values among the target audience. Reasoning patterns also differ with some cultures being more linear and others more non-directional. In addition, status, non-verbal cues and other cultural norms must be understood. Any culture can be placed on a continuum from high to low context cultures. In the case of China and the U.S., China is a high context culture emphasizing group values, while the U.S. is a low context culture where individual values are emphasized. Online learning designed for high context culture may be less effective in a low context culture and vice versa. Finally, rapport and context needs of learners will suggest the most appropriate ways to transfer knowledge. For a North American low context learner, for example, cognitive learning can occur without much cultural context. The same solution would not be as effective in Asia where cultural context is much more important.

There are several studies of the use of technology in cross-border transformative learning efforts. Townley et al. (2002) and Townley et al. (2003) report the learning results of a bilateral team learning class that occurred in 2001. Lim (2003) describes a model of motivational factors that affect cross-cultural learning. Cooper (2003) presents a case study of teaching techniques developed during a nine course sequence involving German and American students in a virtual foreign exchange program. She finds that cultural and linguistic differences are significant and must be addressed. Lajoie et al. (2006) use Garrison and Anderson's model to study a comparative Canadian-Mexican class, finding a similar proportion of cognitive and teaching presences between the two groups.

METHODS AND PROCEDURES

Three Sino-American cases, each representing a different level of curricular intensity, are analyzed in this study: an assignment; a complex assignment; and an entire course. There are commonalities among the cases: the same universities and departments; common educational technologies; similar specific assignments; and one common instructor in all three courses. There are also differences: Chinese and American graduate students; individual work in the assignment case and group work in the other two cases; and different uses of technologies.

The assignment case involved one American and one Chinese education graduate course during a five week period. One assignment for both classes was to draft a paper on multicultural leadership and then to exchange drafts with other class members, domestic and foreign, for suggestions. Second, each student participated weekly in two cross-national bulletin boards, one on leadership and one on socio-cultural issues. The intent was to give each student an opportunity to build teaching and cognitive presence through the paper exchange and to develop cognitive and social presences in the bulletin boards. The cross-national community was intended to be an enriching supplement to existing courses and not require major redesign.

The complex assignment involved one American and one Chinese graduate course for five weeks. It involved Sino-American teams developing a metadatabase describing learning objects to test the SCORM (Sharable Content Object Reference Model) metadata format (Vossen & Westerkamp, 2006). The intent was to provide students the opportunity to generate transformative learning in cross-national communities where teaching, cognitive, and social presences would be used to carry out a real-world assignment. The problem had the following objectives: (1)to review five online learning objects, to understand the definitions of the tables in the standards database, and to make decisions about what information (or metadata) to enter into the database tables; (2) to communicate with cross-national teammates via text-

based chat, email, and two video conferences; (3) for Chinese students to work in a second language (English); and (4) for cross-national teams to devise their own way of working to finish the task in the allotted time. Students met in teams, using both synchronous chat rooms and asynchronous bulletin boards. A videoconference was held at the beginning of the assignment to create Sino-American learning communities and at the end to report outcomes.

The course met jointly for 13 weeks. The course used multiple educational technologies. Readings, lecture notes, taped video lectures, and synchronous online team discussions addressed teaching and cognitive presences. Student teams used the second part of each class to work on a team project intended to address one knowledge management issue in depth and apply it in an education organization. Students met in teams, using both synchronous chat rooms and asynchronous bulletin boards. All of the students participated weekly in three class-wide, asynchronous bulletin boards, each addressing a separate topic: culture, content, and student initiated topics. A videoconference was held at the beginning of the course to initiate the learning communities. Two videoconferences were held at the end of the course to present the results of the team projects. All of these activities addressed cognitive and social presences.

Each case was analyzed in a common manner. Demographic data were collected, coded and placed into a descriptive table. Quantitative data were collected, coded and reported in the text and tables. Qualitative data were collected for all groups from the videotapes as well as archival transcripts of discussion boards, chat rooms, and student webpages. Qualitative data from selected sources were coded using *a priori* categories (Evered & Lewis, 1981) of teaching, cognitive, or social presences (Garrison, et al., 2000; Lajoie, et al., 2006). The purpose of using pre-determined categories was to reduce complexity (Bruner, Goodnow, & Austin, 1972) and determine if the participants successfully experienced the specific context of these presences. As researchers we posed the a priori categories from existing theory and tested the integrity of the categories by continually determining their reliability through further scrutiny of the data. In so doing, it became possible to answer questions that had arisen from the analysis of and reflection on previous data.

RESULTS

Students in the three cases involved in this study are described in this section (Table 1). The location of the students (P.R.C. or U.S.A.), number of students, major, gender, and ethnicity are indicated.

Table 1: Assignment: Student Profile by Major, Gender and Ethnicity

Location	Number of Students	Major	Gender		Ethnicity	
			Male	Female	Majority	Minority
ASSIGNMENT						
PRC-BNU	37	Education	10	27	33	4
US-NMSU	9	Education Administration	3	6	5	4
COMPLEX ASSIGNMENT						
PRC-BNU	24	Information Technology	7	17	20	4
US-NMSU	14	Instructional Technology	6	8	8	6

COURSE						
PRC-BNU	24	Information Science	5	19	21	3
US-NMSU	8	Education	6	2	1	7

The number of students was always higher in the Chinese classes. Students in each class were education or information science majors. Gender distribution and number of minority students was representative.

To determine how effectively cross-border classes use distance education technologies to complete assignments in transformative learning communities, we analyzed the use of three educational technologies used in the courses: (1) asynchronous text; (2) synchronous text; and (3) synchronous video. Each learning community used asynchronous text on a continuing basis. Synchronous text was used in the complex assignment and the course. Synchronous videoconference was used at the beginning and end of the in the complex assignment and course. Each technology is assessed in terms of its effectiveness in teaching, cognitive and social processes.

Table 2: Effectiveness of Cross-Border Educational Technologies by Presence

Technology	Asynchronous Text			Synchronous Text		Synchronous video	
	Assignment	Complex Assignment	Course	Complex Assignment	Course	Complex Assignment	Course
Teaching	Good	Fair	Good	Fair	Fair	Good	Good
Cognitive	Excellent	Excellent	Excellent	Excellent	Good	Excellent	Excellent
Social	Excellent	Excellent	Excellent	Fair	Fair	Excellent	Excellent

For the assignment, students shared two topical asynchronous bulletin boards, their "most interesting journal entry" and "cultural exchange." The journal entry bulletin board had 211 "hits" and the exchange bulletin board had a total of 214 "hits." Asynchronous technology that allowed for student exploration and reflection seemed exceptionally useful as evidenced by the high response rates to the postings.

The complex assignment used asynchronous text as a way for teams to communicate between class meetings. Students were able to transfer cognitive ideas and experiences with the learning objects. Social presence was maintained through personal statements. There were no topical asynchronous bulletin boards. This may account for the comparatively large amount of social presence in the complex assignment (Table 2). The absence of topical asynchronous bulletin boards did not retard the development of the learning community.

The course used asynchronous text technology to support three topical bulletin boards; one on technical definitions, one on cultural topics, and one on student selected topics. Students were enthusiastic about using these bulletin boards for sharing cognitive information and insights. On this technology second language users had more time to compose their thoughts, thereby facilitating discourse. All bulletin boards encouraged exploration and integration in the cognitive presence. Students would post as they explored topics, comparing and contrasting practices in their cultures or disciplines. The other significant contribution of the bulletin boards was to the social presence, where students engaged in affective and interactive behavior.

The complex assignment used synchronous text technology one hour a week in a workshop context. During this time participants engaged in teaching, clarifying and interpreting the assignment for the entire class. Developing cognitive presence in this format had strengths and weaknesses. Language and equipment limitations sometimes led to confusion or misdirection. On the other hand cognitive

breakthroughs occurred and led to rapid acquisition of knowledge. Social presences were effective as students encouraged each others' contributions. Synchronous comments were short and based on specifics. This was effective for team learning related to the applied knowledge in the project assignment, but was questionable in terms of theory. One Chinese student commented: "Synchronized discussion is limited and not flexible. Some information is likely to be ignored."

The complex assignment used four hours of videoconference; two hours at the beginning of the assignment to form teams, and two hours at the end of the assignment to present team reports. The group formation exercise involved teaching, facilitating discourse and direct instruction. Cognitive presence was effective in both videoconference situations, involving all categories in the team formation exercise and integration and resolution in the project presentations. The team forming exercise and the project presentations were successful in initiating and confirming the socio-emotional ties that developed during the course.

The full course used six hours of synchronous videoconference; two hours at the beginning of the course to form and norm teams, and four hours at the end of the course to present group projects. The group formation exercise involved significant social presence. Cognitive presence was effective in both videoconferences, involving all categories in the team formation exercise and integration and resolution in the project presentations. Both team-forming exercises and project presentations were very successful in initiating and confirming socio-emotional ties that developed during the course. A Chinese student observed: "In the course, there are a lot of tools to help us learn together. But I think we need more videoconference to help us communicate more directly.

To determine the extent to which cross-border distance education activities generate transformative learning communities, we analyzed the cross-national learning achieved in each dimension for each case.

Table 3: Transformative Learning Achievement by Presence

	Assignment	Complex Assignment	Course
Teaching	Not achieved	Achieved	Achieved
Cognitive	Achieved	Achieved	Achieved
Social	Achieved	Achieved	Achieved

The assignment case generated a teaching presence in that students provided direct instruction and sparked limited reflective thinking as they evaluated each others' papers. However, the amount of critical thinking was spotty at best. Given this evidence, the instructors believe that teaching presence was not achieved.

The complex assignment did achieve a useful teaching presence. In part, this was due to the intensively transformative nature of the project. Because of physical access to the instructor in the U.S., there was a tendency for American students to provide the teaching presence, passing on information and for the Chinese to respond. As a result, the complex assignment did result in effective teaching within the learning community.

The course also generated an effective teaching presence. Participants provided structure and taught directly in both modalities. Students developed a real enthusiasm to facilitate discourse and teaching and to interact in the videoconference medium. One American student indicated: "Yes! I'm better prepared not only to learn through distance education, but also to teach through distance education. It has been a very valuable experience for me."

Cognitive presence was significant in the assignment. Students learned from each other and were able to develop new knowledge in multicultural educational leadership. This cognitive presence comprised the majority of postings and represents an effective cognitive presence. Comments on each others' papers,

however, were not very successful. This may have been due to inadequate time for the task or a lack of underlying social presence.

The complex assignment was very successful in terms of developing a cognitive presence by using transformative problem based learning. Students used all three technologies with different levels of effectiveness to learn content. Content was transferred, issues debated, and learning demonstrated through useful assessments of metadata potential in education. Even though it is not emphasized in this case, social learning also took place as students discussed the impact of learning objects and metadata across cultures.

Cognitive learning achievement was significant in the course, constituting the major presence dimension for the teams. One Chinese student reported: "I now know how knowledge is used in (educational) organizations." The assignment achieved affective social learning using only asynchronous communication. Students were very interested in getting to know their classmates in the other country.

In the complex assignment, students developed social presence in all three technologies to develop bonds as a learning community. Perhaps the most memorable moment was at the end of the second videoconference when the video camera was used to pan the skyline of Beijing creating audible gasps among the American students. It was a visual representation of the close social bonds that the complex assignment community had achieved.

Social learning was effective in the course. Synchronous conversations that focused on teaching and cognitive content also contained social content. Asynchronous conversations had significant social content. Videoconferences were enormously popular means of social learning. One self-disclosing Chinese student stated: "We are both interested into the other culture and we are both zealous. For example, all of us are active to express our own viewpoint on calligraphy. We learned that the difference is just individual difference, but not social difference."

These three cases represent different experiences in developing transformative learning communities across cultures. The activities generally resulted in the emergence of transformative learning communities. What is sure is that both American and Chinese graduate students are very interested in comparative and collaborative approaches to learning. The concept is new and engaging. This interest makes it possible to increase learning effectiveness using distance technologies.

CONCLUSIONS

The authors conclude that different educational technologies contributed to the achievement of teaching, cognitive and social presence at different levels of effectiveness. They are summarized here in order from more to less contribution.

- Asynchronous technology, in the form of team bulletin boards, was effective for generating teaching, cognitive and social presences across borders.

- Synchronous technology, in the form of weekly online discussions in the complex assignment and course cases, was effective for creating teaching, cognitive and social presences across borders.

- Video conferencing reinforced cognitive and social presence across borders.

The authors make the following conclusions about cross-border learning achievement using distance education technologies in assignments, complex assignments and an entire course.

- There is evidence that an effective transformative learning community was achieved across borders in each of the cases.

- The complex assignment generated a significant amount of transformative learning across borders involving teaching, cognitive and social presences.

- The course also generated a significant amount of cross-border learning involving teaching, cognitive and social presences.

Based on these findings, we conclude that the complex assignment may be the most effective of these three techniques in developing a transformative learning community across national borders. By using multiple assignments and multiple technologies, teaching cognitive and social development is reinforced. By limiting the cross-cultural work to a complex assignment, course-related administrative issues, like calendar differences, tuition and credit hours are avoided. While the other cases are useful and do generate significant learning, the complex assignment seems to work best in the existing technological and pedagogical environment.

DISTANCE ENGLISH LANGUAGE TEACHER TRAINING PROGRAM FROM DISTANT EFL STUDENTS' PERSPECTIVES: A CASE OF TURKEY

Murat Hismanoglu
Akdeniz University
hismanoglu@gmail.com

Abstract

During the past 10 years, distance education has become widespread all over the world. As a branch of distance education in Turkey, Distance English Language Teacher Training (DELTT) program has been offering initial training for prospective EFL teachers since 2000. The purpose of this study was, therefore, to investigate distant EFL students' perspectives of DELTT and identify the factors impeding their positive perceptions of DELTT program and make suggestions for the betterment of distance learning environments. The study begins with an overview of distance education and DELTT program in Turkey. In the methodology section, quantitative and qualitative data collection procedures are presented. A selection of results is elaborated in this paper along with a discussion part focusing on shifting delivery mode of distance education from existent tools to more enhanced tools, students' demand for effective professional support, the prominence of practicality, and factors to be considered for creating successful DELTT programs.

Keywords: Distance education, teacher training, distant EFL teachers

1. INTRODUCTION

Information and Communication Technology (ICT) has remarkably influenced education and training (Ezer, 2005), which has given rise to the emergence of some new disciplines, or study fields, and distance education has appeared as one of the latest forms of education that mainly relies on ICT infusion. Distance education has become as a new and modern approach to present instruction all over the globe, and accordingly, Turkey has strikingly been involved in distance education during the past fifty years. However, distance education in Turkey traces back 1927 when it was first made known in a meeting aiming at maximizing the number of educated people (Alkan, 1987, p. 91).

Unfortunately, it was not practiced in Turkey because of the view that education is not possible without a teacher and a real classroom atmosphere and it emerged in 1970s with a closer meaning of distance education today. In 1982, the Council of Higher Education (CHE) was established to plan, organize, administer, supervise, and regulate all higher education institutions in the country. Following the establishment of the CHE, the Open Education Faculty (OEF) was founded in Anadolu University within the same year because it had sufficient technical and pedagogical infrastructure. In our time, OEF presents a number of undergraduate degree programs to more than 750.000 Turkish students across Turkey, Cyprus and Europe (Demiray, 1999).

The Distance English Language Teaching (DELT) B.A program was established in 2000 with Basic Education Law numbered 2547 to meet the great need for EFL teachers, especially in primary and secondary schools since English courses were incorporated into their curricula in this year (Ataç, 2002). DELT undergraduate program lasts for four years and during the first two years, students are exposed to partially face-to-face instruction for some basic courses such as contextual grammar, oral communication skills, advanced reading and writing, listening and pronunciation and then they have distance education for the last two years. Bates (2000) emphasizes that DE programs worldwide deploy a wide range of technologies that contain two-way interactive and one-way non-interactive delivery of courses. Instruction in distance higher education system in Turkey is dependent on textbooks, television, CD-ROMs and radio broadcasts, which are, in general, one-way non-interactive delivery methods.

The aforementioned teacher training degree program offers three courses related to ICT implementation. Two of them, *Computer I and Computer II*, aim to improve teacher candidates' computer competency and one of them, *Instructional Technology and Material Design*, aims to teach them how to use ICT pedagogically in the language teaching and learning processes. However, the problem is that these

courses are offered at a distance with the help of mostly print materials. Thus, the prospective teachers cannot have the opportunity to experience ICT, which is of paramount importance. With this study, the researcher aims to stress that prospective EFL teachers at OEF need in-class experience with ICT to be convinced of its usefulness and educational value.

2. RESEARCH QUESTIONS

The basis of this curent study is to find answers to the following reserch questions:

1. What are the distant EFL students' perceptions of DELTT program in Turkey?
2. Which factors impede their positive perceptions of DELTT program?
3. What are their suggestions for the betterment of DELTT program?

3. METHODOLOGY

3.1. Sample

The study was conducted with the participation of 85 EFL students at distance English Language education context in Turkey. The participants were in various levels of a 4 year program leading to a bachelor's degree in Teaching English as a Foreign Language. Each participant was assigned a number during the data analysis procedure because of ethical considerations and they were reminded that this research would not be used for any assessment purposes and that personal details would be confidential. Demographic properties of the participants are presented in Table 1.

Table 1. Demographic properties of the participants (n= 85)

		Frequency	Percentage (%)
Gender	Male	39	46
	Female	46	54
Age	20-22	22	26
	23-24	25	29
	25-above	38	45
Year of Education	Fresman Year	9	11
	Sophomore Year	14	16
	Junior Year	25	29
	Senior Year	37	44
TOTAL		**85**	**100**

As the participants have distance instruction during the third and fourth years of their education, they live in different regions of the country.

3.2. Instrumentation

A questionnaire was developed by the researcher to gather data needed for the study rather than using an existing one. The development of the instrument was guided by a number of experts working at higher education settings. This panel of experts including two professors of educational sciences and distance education, one native speaker and two non-native senior EFL teachers evaluated the instrument for content and face validity and contended that the questionnaire was appropriate and comprehensive for the context of the study. To check the realibility, the instrument was analyzed through the Cronbach's Alpha Coefficient $\alpha = 0.90$, which shows high level reliability.

The questionnaire contains nine items based on the 5-point Likert scale (from 1=strongly disagree to 5= strongly agree). Prospective EFL teachers' personal characteristics (gender, age, year of education) were also included into the design of the study to ensure maximum control of variables (Gay & Airasian, 2000). The instrument was designed in English as all participants were known to have a high level of language proficiency, which is a requisite for attending to the ELT departments in the Turkish higher education system.

The questionnaires were administered to the distant EFL teachers at OEF (N=120) through the Internet as they were in separate parts of Turkey during March, 2010. The return rate from the students was 70.8% (N=85). After rigorous analysis of the collected data, 25 of these prospective teachers were contacted again to obtain their phone numbers or chat addresses for the interview session. The purpose of the

interviews was to cross-check students' responses to the questionnaire, to elaborate on their problems and to gather information about their suggestions for the betterment of DELTT program. 80 % of the contacted students (N=20) agreed to have an interview on the phone or on the Internet. These twenty respondents were interviewed throughout three weeks and their responses were transcribed as the researcher had no chance to record their answers. Hence, interview questions contained two items:

1. What are the factors impeding your positive perceptions of DELTT program ?
2. What do you suggest for the betterment of DELTT program?

3.3. Data Collection and Analysis

Data were analyzed using the Statistical Package for Social Sciences (SPSS. 16). The demographic variables for this study were discrete data (nominal and ordinal); therefore, descriptive statistics were utilized to run for frequencies, percentages, mean and standard deviation (Beins, 2004; Heiman, 2001; Sekaran, 2003).

4. RESULTS

4.1. Results of the Questionnaire

Table 2. Distribution of mean scores on the perceptions of distant EFL students

Items		X	SD
Item 1	I am happy to be a student at DELT program.	3,40	0,49
Item 2	I know that I develop my teaching skills.	2,14	0,35
Item 3	It does not intimidate me to be a distant EFL student.	4,07	0,65
Item 4	DELT program saves my time.	1,89	0,61
Item 5	I feel very confident when I think of my future career.	2,84	0,74
Item 6	I believe that I develop my teaching skills.	3,57	0,77
Item 7	The curriculum of DELT program is efficiently designed.	3,57	0,77
Item 8	I suggest DELT program to prospective students.	2,52	0,50
Item 9	DELT program provides better education than conventional programs.	2,52	0,50
Overall attitude		2,77	0,19

As shown in Table 2, a great number of EFL students at the distance English Language Teacher Training program represented generally disparaging perceptions toward distance teacher training program with a mean score of 2.77 (SD= 0.19). Sixty-eight percent (68%) of the participants exhibited negative beliefs toward DELTT program, while thirty-two percent (32%) of the respondents expressed positive or highly positive intentions in terms of being a student at this program. The most striking result in this section was that the respondents showed no positive attitude toward items 4, 5, 8 and 9. This implied that distant EFL students do not find DELT program saving their time, they do not feel confident when they consider their future teaching lives, and that they do not suggest this program to prospective students. Also, almost all of them were of the opinion that DELT program does not offer better education when compared to conventional programs. On the other hand, eighty-one point four percent (81.4%) of the participants agreed that they do not feel intimidated to be a distant EFL student in the DELT program. Upon investigating items 1, 6 and 7, the results enabled us to come closer to having a respectively positive sense of the participants' satisfaction with the curriculum. Forty-two point eight percent (42.8%) of the respondents consider to improve their skills in their subject teaching as they believe that the curriculum of the DELTT program is efficiently designed.

4.2. Results of Interviews

4.2.1. Factors impeding positive perceptions of DELT program

In response to the first question regarding the factors impeding their positive perceptions of DELT program, they expressed mainly three obstacles as the lack of professional support, exam-driven system, and problems in course delivery methods. The following quotations (presented verbatim) are representative of the views expressed:

"I am learning, in reality, mastering every concept or term included in the books." (Participant 3)

"When I have a question in my mind, I have difficulty in finding a professional to ask it. I must learn everything by myself." (Participant 5)

" I need to do more practice. I may be at a distance but there must be a way of enhancing my practical skills in teaching English as a second or foreign language." (Participant 7)

"While studying at home, I do not feel enthusiastic about learning. Isn't it possible for us to have access to the language classroom with Internet connection for some time?" (Participant 12)

4.2.2. Suggestions for the betterment of DELT program

Regarding the second question related to the suggestions to improve DELT program, they recommended a great variety of changes. From the interviews with the participating distant EFL students, some of the recommendations were as follows:

"Language teachers should be easily reachable so that students can easily ask for information." (Participant 8)

"Advanced communication technologies should be amalgamated into the program. I need professional help when I do not comprehend what is written in the book. In such cases, my friends and I contact another teacher by paying extra money, which is costly for most of us." (Participant 11)

"Books or print materials cannot provide us with the practical knowledge which we really need in our teaching profession. If the book pushes us to deploy technology in language teaching process, we need to experience how it works in the language classroom.' (Participant 7)

"In my viewpoint, factors to be reconsidered can be summarized as the advancement of interaction between the faculty staff and the students, and also among students." (Participant 2)

"The number of students is too many for a faculty. I think, this faculty should change into a university where we may have more academic and technical staff and we may be provided with better opportunities". (Participant 3)

"We can be at a distance. However, we may be presented courses via the Internet so that we can learn better by posing the questions that come to our minds immediately." (Participant 7)

5. DISCUSSION AND CONCLUSIONS

The research focus underpinning the paper was to investigate the perspectives of distant EFL students toward distance English Language Teacher Training Program and to identify factors impeding positive perceptions of DELTT program. On the one hand, the results indicated that students feel ready to employ technology for synchronous or online learning. However, in distance education environment, the view that all the distant students and the facilitators may not be online synchronously and that not all the students may possess necessary foundation have impeded administrators' or policy makers' incorporating synchronous learning into distance education (Altunay & Mutlu, 2008).

The comments unearthed that the delivery mode of distance education must be shifted from such existent tools as television, cassette, and computer software to more enhanced tools, for instance, the Internet (Harper et al., 2004). With the development of large networks in distance education, students may have the chance to deploy communication devices for better teacher to student ratios.

Mossavar-Rahmani & Larson- Daughtery (2007) stress that "smooth and effective communication between students and university governing bodies is one of the key elements in building a successful learning community. Students become frustrated when they need help and none is available, or when they are put on hold for long periods of time" (p. 71). Nevertheless, most of the students are of the opinion that they frequently need professional assistance, especially when they do not comprehend anything included in the books and this lack of communication is a crucial problem in the facilitation of distance education. Thus, this demand for swift and effective support is to be taken into consideration and efforts should gain momentum to preserve the quality of distance English language teacher training program.

In this study, it was also emphasized by distant EFL students that practicality should be attributed prominence so that students can experience how technology works in the classroom and that courses via the Internet should be offered so that students can better learn by asking the teacher the questions coming to their minds immediately. In this respect, it can be stated that students can learn as much as in traditional on-campus courses if distance learning courses are suitably structured and presented (Gagne & Shepherd, 2001).

Finally, as Preston, Cox, & Cox (2000) state, adequate resources, sufficient time, technical and social support are prominent factors for successful training programs as is a focus on the benefits for students' motivation and learning. If DELTT program developers give prominence to these factors, there is no doubt that distance education will allow universities and institutions to achieve four main objectives: to maximize Access, to reduce capacity limitations, to capitalize on emerging marketing opportunities, and to activate institutional change (Oblinger & Kidwell, 2000).

UNISINOS University, Brazil

Abstract
Current literature on Distance Learning is predominately dealing with the technological as well as pedagogical models or its economic, social and cultural dimensions. On the other hand, there is sparse systematic work on the institutional dimension of the construction of policies created by international organizations on the issue.
The objective of this paper is to investigate the role of international cooperation for the promotion of Distance Learning. Distance learning is being mentioned as an important element in the international agenda by a number of multilateral, bilateral and regional organizations as well as by national agencies, private companies and non-governmental organizations. The paper will explore the context within which these actors interact, the challenges that are being posed for transforming the discourse into practice and the potential that international cooperation represents for promoting distance learning.

INTRODUCTION

While there is abundant literature on the theme of distance learning (DL) with regard to the technological and pedagogical dimension as well as its social, economic and cultural impacts, there is sparse literature dedicated to the international dimension on this issue, especially at the institutional level. Thus, there are few systematic studies that trace, examine and analyze the policies and practices concerning DL in international organizations and limited academic production that evaluates the obstacles and opportunities that this activity involves. This occurs due to various reasons. Firstly, the nature of the subject, which is fluid and transversal with multiple impacts in several levels, making it difficult to be categorized. In this way, DL can be found both in an educational policy as well as in a strategy to promote the society of information and knowledge. It can also be traced in the construction of competitiveness, employment, heath and development strategies. Moreover, when it comes to policy making, the emphasis is in the national context with all its characteristics, peculiarities and limitations and the look in the international environment for extracting successful experiences (or not), tends to be left behind. Finally, when it comes to the involvement of international organizations, there is the so-called expectations-capabilities gap, a gap between the expectations created and the real capacity for implementing a policy by an international organization.
The questions "why", "for whom" and "how" permeate the discussion of the construction of international policies and the understandings on how to submit proposals at the national level as well as the process of its local applicability. DL also represents a subject of discussion permeated by both ideological/political and practical nuances. DL has entered the agenda, on the one hand, because of the need to offer and develop “e-skills” so that citizens can meet the challenges of the information society, on the other hand, it represents both a need and an pportunity to use information and communication technologies (ICTs) in a context of great social pressures to access learning. Therefore, at times the terms "learning about ICT and learning through ICT" are mixed (1).
In this context, the present paper aims at offering an introduction regarding the way how international organizations deal with the thematic of DL. The study takes into consideration the position of bilateral and multilateral organizations, as well as private international organizations (multinational companies) and nongovernmental organizations; however, a special emphasis will be given to the United Nations (UN) systems and the EU.

THE EDUCATIONAL CONTEXT

UNESCO emphasizes in its Right for Education, that the access to education is a human right also fundamental for achieving other fundamental rights and that it functions as a catalyst for human development (2).
However, going beyond the declarations regarding the principles that should govern education, in the specific case of the insertion and integration of ICTs into educational systems, a rigorous analysis of the

educational objectives and a realistic understanding about the potential of the technologies used would be necessary, considering the complexity of the matter. An evaluation of the requirements of assessments, and impacts of technologies within the context of educational reform is unavoidable (3).
Since the beginning of the 2000s, the discussion about DL has had its ups and downs in the international agenda. While in some moments it is discussed independently in the agenda of international organizations, progressively it is diluted in broader agendas, which vary in scope and final purpose. Thus, DL has become a part of broader international strategies. This is not necessarily something negative because it proves its thematic transversality and complexity. However, it can occupy a secondary position if the actions are fragmented without considering the set of initiatives developed in many sectors of international organizations.
Haddad and Draxler (2002) identify four major challenges to be confronted in today´s technological environment. First, the rapid generation and dissemination of knowledge, not only at the high sophistication level, but also in the activities developed daily, which will create a technological dependence and a need for creating new skills to cope with constant and not equitable change between countries. Second, the growing awareness regarding social issues such as democracy, peace, people's empowerment, freedom of communication, culture, civic participation, gender equity and quality of life. Moreover, development goals are not tied simply to the economic dimension, they embody goals such as reducing poverty, improving health and education, and sustainable development, according to those mentioned in the Millennium Development Goals. Finally, that education is a central subject to achieve economic and social development, and environmental sustainability (4).
The same emphasis on sustainability was given during the World Economic Forum in 2010, which launched the Global Information Technology Report 2009-2010: ICT for Sustainability. The report argues that the initial positive signs of the global economic recovery also counted with the contribution of ICTs, since they play an important role in modernizing societies, in improving the living conditions, and in decreasing the digital gap within and between countries. The report creates an index of connectivity, in which Brazil appears in the 61th position, considered "stable" to the authors (5).
It also revealed the limitation of the current understanding about education and the demand for a new structural framework around the term education, which goes beyond rigid and traditional models. Models that cannot offer the necessary flexibility and sustainability to deal with the complexity, the ambiguity and the constant change of contemporary life. In this light, it is drawn a timeless and desirable concept for DL, i.e., DL must be coherent as a process that emphasizes the construction and socialization of knowledge, promoting to anyone, despite time and space, the possibility of becoming agent of learning due to the use of different resources and media, and according to economic/social ability, cognitive models and forms of interaction, always permeated by collaborative/cooperative work. The concept is not the premise to analyze the international scenario that this article addresses, but should be seen as where one can reach if consider the diversity of scenarios of human and social order, to which education (DL as well) need to look, to obtain efficiency.
There are many contexts involving different people employing distinct technologies, so the legal models, as well as the partnership models, cannot be restrictive, favoring one or another culture, at the risk of becoming myopic in relation to the enlargement of the inclusion specter for which they are intended.

LEARNING TENDENCIES ASSOCIATED WITH DIGITAL TECHNOLOGIES AT THE INTERNATIONAL LEVEL

The 2011 Horizon Report identifies a number of macro trends that characterize the learning environment at the international level. First, there is the proliferation of resources available through the Internet. The access to Internet contents available through equipments of personal use, such as the mobile phone; the growing number of open contents; and, the variety of e-books demonstrate that knowledge goes beyond the capabilities offered in a school or a campus, which encourages the educators to think in new ways to interact with those looking for learning. Second, there is the expectation to work, study and learn anywhere, anytime. Again, the availability of Internet access offered in mobile phones contributed to the increase of this expectation. Third, the work world is changing, becoming more collaboratively to solve complex problems with global impacts. Solving these problems requires the assistance of several teams in different geographic locations and technology contributes as an ally to facilitate this interaction. Finally, the process of technology decentralization and the new spaces to deposit "cloud based" content impact on decisions related to the adoption of certain technologies for learning, and also shows the importance of discussing issues regarding privacy and control of use thereof (6).
All the more rapidly, social networks show the non-measurable strength of a global or network society and the need for a systemic approach. Phenomena such as the Facebook, Orkut, LinkedIn or Twitter

freely demonstrate the people's need to be constituted as a group for a social, emotional or even economic and social existence. When communication is extended in a timeless way, in any language, with any form of expression, without restrictions categorized by gender, sex or social group, the membership becomes omnipresent, without modulation or boundaries, providing atmospheres for any type of transactions, including learning.

International Cooperation

In addition to the nongovernmental organizations perception on macro trends for the advance of learning through the use of information technology, many countries included in their international agenda the DL issue as an instrument of international cooperation. At the bilateral cooperation level, there are considerable contributions for the discussion, construction, and implementation of e-learning policies and projects from countries also known as the donors of international assistance (Overseas Development Assistance - ODA) for developing countries. The channels for this contribution vary. Cooperation can be allocated directly through national offices of international cooperation (Ministry of Foreign Affairs, International Development Agencies etc.), or in organizations of multilateral cooperation (UN system including UNESCO, the World Bank, and IDB), as well as through regional structures of cooperation in which they are members (EU, MERCOSUR, OECD), and other international initiatives such as the World Summit on the Information Society, the Global Alliance for ICT and Development Policy, and the World Education Forum. The instruments to implement these policies also vary and include both the allocation of non-refundable resources and financing through credit lines, as well as institutional support to authorities which request support in this area and participate in discussion spaces for expanding partnerships and building transnational networks.

Bilateral Cooperation

Thus, there are organizations like the Canadian International Development Agency (CIDA) and its strategy entitled Knowledge for Development through Information and Communication Technologies, and the suggestions from the Canadian government for reducing poverty through the use of ICTs. The Department of Foreign Affairs and International Trade of Canada has a specific unit to encourage practices that use ICTs. The Danish International Development Agency (DANIDA) established the country's principles for cooperation in the field of international assistance for development, and created a space to present the best practices in the area of ICT. Likewise, the German government has elaborated a set of guidelines for international cooperation in the area of ICTs. Other countries, like Ireland, also created a task force to deal specifically with cooperation issues in ICT, in addition to their general policies of international cooperation already established. The Swedish International Development Cooperation Agency (SIDA) incorporates its ICT strategy with the process of reducing poverty through the diminishing of the digital divide. The Swiss Agency for Development and Cooperation (SDC) also operates in a similar way, prioritizing programs and projects for poverty reduction in Asia, Africa, Latin America and the Caribbean through technological instruments. The Agency also created a portal of best practices, and a space to discuss the challenges offered by ICTs in developing countries. In the United Kingdom, the Department for International Development (DFID) also prioritizes the use of ICTs for reducing poverty.

Multilateral Cooperation

In the context of multilateral organizations, there are major initiatives such as the Millennium Development Goals (MDGs), which involve the whole UN system and the international community. They offer an indicative regarding the mainstream of the learning thematic which is reflected in the eight goals that include from the implementation of universal primary education, and the promotion of gender equality to health and environmental sustainability themes. For the implementation of these goals, it becomes necessary a learning process in which ICTs have a major contribution (7).

UNESCO plays a central role within the UN system in constructing policies, capabilities, and training in the area of formal or informal education. It also has developed a set of tools to evaluate the effectiveness of the methods used. Along with other UN agencies such as UNICEF, the World Bank, the Population Fund, the World Health Organization, the Food and Agriculture Organization and the United Nations Development Programme, UNESCO also participated in the creation of the global movement Education for All. The movement, taking as background the 2000 World Education Forum during which the Dakar Framework for Action was elaborated and its Action Plan, suggested six regional plans to be implemented until 2015 in order to stimulate our collective responsibility to ensure a quality, inclusive and lifelong education. In its final report, the action plan makes a special reference to the importance of

ICTs as a key factor for teaching and learning and identifies as a crucial actor to achieve these goals, the involvement of national governments (8).
In 2001, the United Nations Information and Communication Technologies Task Force was created aiming at contributing to build educational ICT policies within the UN system, putting technology at the service of development. Among the activities of the Task Force is the creation and the promotion of the Global e-School and Communities Initiative (GeSCI), which aims at implementing strategies at the local, national, and international level for the use of technology for educational purposes and seminars organization, which resulted in the production of documents emphasizing the importance of using technology for learning (9).
Another initiative represents InfoDev which is a program managed by the World Bank responsible for building ICT policies for development. The Global Distance Education Network (Global DistEdNet) offers a set of resources for educators and policy makers (10). InfoDev also produces a series of "maps" regarding the use of ICTs in education. The maps are divided into four categories, comprising impacts, costs, implementation and planning areas. However, a number of questions have arisen concerning the use of these instruments. There is a lack of consensus regarding its methodology and its performance appraisal as the maps' evaluation does not demonstrate the impact of usage of these technologies. (11).

European Union
In the European Union extent, a set of ambitious actions was designed to expand and strengthen the e-learning. One result of the board of the European Council of Lisbon in 2000 was the creation of an initiative for accelerating the use of the Internet and multimedia technologies in the European education. The action plan mobilized not only educators, but also the civil society and the private sector to become involved in building the information society. Subsequently, the portal for e-learning was created and the program with the same name was initiated, aiming at using technology to foster learning, to embrace life and to promote the modernization of technologies needed to achieve this goal. The program disposes four priorities: digital literacy, development of virtual campi, promotion of virtual union in schools and the promotion of e-learning in Europe.
The Bologna process for creating a European space of education recognized the e-learning as an indispensable tool for the construction of this space. Thus, a series of programs such as Leonardo da Vinci, Comenius, Grundtvig and the Minerva action in the Socrates Program were dedicated to the use of ICTs in education. These actions were further complemented by an e-learning transversal action to take DL ahead of schools and universities, entering the life of European citizens with the proposal of training and qualifying for life.
In the specific case, the reduction of direct references about the DL can be explained by a focus deviation in the European strategies from educational policies to a security agenda. It can also be attributed to the resistance of educators that relied themselves on the ambiguity of policies regarding the DL manners of delivery.
On the other hand, the European Commission, within its strategy for building a global role in the international context, has created a series of external cooperation instruments that include e-learning. The Directorate of Cooperation and Development (EuropeAid) is associated with activities of international cooperation and serves through instruments of cooperation for development (DCI) (12). In the specific case of cooperation with Latin America, many of the regional programs offer a direct or indirect opportunity for the inclusion of a DL dimension. Programs such as the Alliance for the Information Society (@LIS2) aim at reducing the digital gap, contributing to the integration of South America in the global information society. Currently, in its second phase, the program seeks to stimulate the interconnectivity through a dialogue extension between the two sides and the instruments of cooperation. The program allocates non-refundable resources up to 70.4% of the envisaged activities of the approved proposals.
The ALFA Program, currently in its third phase – ALFA III –, co-finances activities for the strengthening and the promotion of economic and social cohesion through networks of higher education institutions. The two calls for proposals in this program exceed a total of €50 million in resources, considering that 80% of the activities are sustained by the European Commission.
Despite being a program designed to foster internationalization of small and micro enterprises, AL-INVEST offers the opportunity to develop initiatives which may include distance training courses, virtual events and exchanges of best practices among other activities. Currently, in its fourth phase and with a budget of €50 million, AL-INVEST operates through three consortia, one of them led by the Brazilian National Confederation of Industry.

Among its priorities, the EUROsociAL program also co-finances innovative practices to improve social cohesion, while the URB-AL promotes cooperation of local government through the construction of agendas with themes regarding common challenges of the EU and LA. New programs launched recently, like EUrocLIMA and RALCEA, which will prioritize themes related to climate change and water management, also provide space for educational action, and distance training.

In addition to the initiatives of regional international cooperation, the emphasis on digital dimension becomes even more evident in the sub-regional cooperation with MERCOSUR, in which projects like MERCOSUR Digital, MERCOSUR Information Society, MERCOSUR Mobility, MERCOSUR Audiovisual, and the program of institutional support for MERCOSUR show clearly the EU understanding that the efforts to consolidate the process of regional integration can be optimized through ICTs and DL (13).

Other initiatives derived from distinct boards can also be identified, as the 7th Framework Programme in the area of Research and Innovation. The program represents the largest funding instrument for research, innovation and technological development in the EU (14). The transverse nature of DL are also visible in the EU attempts to create an integration policy so that the European programs can encourage the use of ICTs for e-learning in all the segments of educational systems.

All these organizations highlight the potential use of ICTs in education or, more specifically, in DL. However, in parallel, they also highlight the challenges to be overcome. From a theoretical point of view, but also from a strategic perspective we have seen that the transformation of the learning process is questioning the traditional understanding of time, space, forms and purpose for constructing, accessing and delivering knowledge. The rapid generation, high sophistication and wide dissemination of knowledge requires a new set of skills for dealing not only with the technological or pedagogical aspects of learning but with the creation of a systemic consciousness involving the need for structural changes in education that go beyond the current rigid models of learning which are not able to offer the necessary flexibility and sustainability for leading with the complexity, ambiguity and constant change of contemporary life. The International Organisations, acting within this environment apart from taking into consideration these factors also face the need of internal restructuring for responding to these developments if not anticipate them. From the point of view of policy construction, a set of challenges can be identified at the structural level starting with the absence of reliable data and information to create policies both in the international as well as national level that take into consideration the needs of different target audiences. The creation of macro policies and the achievement of macro goals for inclusive, relevant, efficient, and quality education for a global society has to take into consideration economic and social contradictions, variable technological access, different legal and political scenarios, budgetary limitations and distinct human capital capacities. Going beyond that, this new era of information/knowledge and relationships perhaps the greatest challenge these organisations are facing is expanding their understanding to include the technologies/relationships dimension because it is in the relationships network that the survival and the sustainability of species and of the planet are consecrated.

ABSTRACT

Universities across the globe now appreciate the fact that higher education is facing challenges of limited funding, increased students populations and the need to maintain quality. They also appreciate that the use of Educational Technology can be one of the ways to overcome these challenges. As a result, efforts to integrate ETs in the teaching, research and learning functions of the university are now supported with improvement in infrastructure.

Unfortunately, students are not fully taking advantage of the gradually improving Technological environment to improve their learning experiences. Differences have been noted in students' use of Educational technologies (ETs) but little is known about the way they perceive ETs and how this could affect and explain existing forms of access to and use of ETs in leaning.

A sample to 200 undergraduate students from Makerere University was selected using a stratified sampling method to participate in the study. This cross sectional study employed both qualitative and quantitative methods of data collection. In the survey, Likert scale questions were used to measure students' perceptions while content analysis was done to interpret and analyse qualitative data. This paper found out that students formed perceptions both positive and negative about ETs. Majority of Negative perceptions – like ETs are time wasting, resources from the net are sketchy (not detailed enough) do not support use while the positive perceptions promote like Internet provides easier access to current and useful academic information, computers can be used for typing academic work support use. However, positive perceptions are many times shattered by a number of challenges that students said stand in their quest to access and use Educational technologies for learning.

Keywords: Education Technologies (ETs), university students, perceptions of ET & use, Makerere University and use of ETs

INTRODUCTION

In this century, Institutions of higher learning are convinced that the use of Educational Technologies (ETs) will help universities not only to over come the persistent challenges of reduced funding, increased students populations and the need to maintain quality amidst insufficient facilitation but will also create a student with life long learning skills appropriate for the changing and global labour market (Agbonlahor, 2005; Tyler, 2005).
Due to liberalization of the education sector, there has been an increase in enrolment and the number of higher educational institutions in Uganda. By the year 2010, there were 21 universities, five of which are public institutions while the rest are private. The expansion of University education has been in response to the burgeoning demand for higher education evidenced by an increasing number of students in Higher Educational Institutions (HEIs) in the country.

Makerere University, established in 1922, is the oldest and largest public institution of higher learning in the country. It increased student intake in the early 1990s and over the years, the student numbers have grown phenomenally. By mid 2010, the university had a student body of about 18,000 female and 22,000 males with an infrastructure whose growth pace has lagged behind that of student enrolment.

Technology enhanced learning environments are arguably key enablers of delivering efficient mass higher education (Agbonlahor, 2005; BBC, 2007; Tyler, 2005). Makerere University argues that technology can increase quality and productivity as well as accessibility to higher education. With the need to address increased demand for higher education amidst over-stretched infrastructure, Makerere University has placed substantial hopes in the integration of technology in the teaching, learning and research activities. The university crafted the ICT policy (2005) and a draft strategic plan for Educational Technology (2007) is in place with a mission to ensure "University-wide access to and utilization of Educational Technology to enhance the position of Makerere University as a centre of academic excellence and its contribution to the sustainable development of society".
The problem however is that students are not fully exploiting the opportunities of utilizing ETs to enhance their learning experiences and outcomes.

PURPOSE OF STUDY

Both men and women form perceptions on ETs, which may be influenced differently by gender. As such, this study explores how male and female students perceive ETs. Resultantly the study examines the effect of the differentiated gender perceptions on the acceptance of ET in Makerere University. This study therefore sets out to investigate students' gender perceptions on Educational Technologies and establish what students'

perceptions are and how they influence use of ETs in Makerere University. This aspects form the core of research questions for this study.

METHODS AND INSTRUMENTS

In this section we present the study design, sampling design, methods used in data collection and analysis as well as the Instrument used.

Design

A cross - sectional research design was employed and the variables of perception, access and use of ET among university students were measured.

Study Population

The study respondents were undergraduate students drawn from 61 departments of the university. Care was taken to have at least one female and one male student in the sample. Respondents were selected following a multi stage cluster sampling method were different academic units were clustered into mainly three groups: Sciences, Humanities (Humanities composed of Arts, Economics and Management, Law, Psychology, Social Sciences and Languages; Sciences include Agriculture, Computing and IT, Forestry, Statistics and Applied Economics, Science, Technology, Veterinary Medicine, Library and Information Science, Environment and Natural) and Education (- consisted of Education and The Institute of Adult and Continuing Education).From these three clusters two respondents – one male and female student were randomly selected. A total of one hundred and twenty two students participated in the study.

Data Collection Methods

A survey with the use of a semi structured questionnaire (see appendix 1) was used to collect quantitative data from the 122. in addition, three FGDs (one mixed and 2 single sex groups) with the help of a focus group guide (appendix 2) were conducted to collect data for the study.

Data Analysis

Processing of data for analysis involved data editing and cleaning where errors detected in the returned questionnaires were eliminated; data categorizing; data entry and presentation.

Results

Both men and women form perceptions on a multitude of issues. In the area of ETs, perceptions can be formed about its definition, access as well as usefulness among others which may be influenced differently by gender. As such, the study explores how male and female students perceive ETs. Resultantly the study examines the effect of the differentiated gender perceptions on the acceptance of ET in Makerere University.

Educational Technologies (ETs) have been defined differently by the different scholars that cared to make a contribution on what ETs mean. In this study, students were asked to choose from the two definition statements, one that they, as respondents perceived to be the

most acceptable definition. If none of the two was close to what they thought was a good definition for ETs, then they were to state their own version of an alternative definition. The two provided statements were tested on a likert scale with five measures from strongly agree as 1 up to 5 strongly disagree as shown in Table1:

Table 1: Students levels of agreement and Perception of ET definition for in (%)

Definition Statement	That ET is the field concerned with the design, development, utilization, management, and evaluation of processes and resources for learning (Luppicini, 2005).									
Measure	Strongly Agree		Agree		Not sure		Disagree		Strongly Disagree	
Scores	FQ	%	FQ	%	FQ	%	FQ	%	FQ	%
Male	12	50	11	45.8	1	4.2	1	.8	1	.8
Female	9	52.9	7	41.2	1	4.2	3	2.7	2	1.8
Totals	21		55		23		4		3	
Definition Statement	Educational Technology (also called Learning Technology) is the study and ethical practice of facilitating learning and improving performance by creating, using and managing appropriate technological processes and resources (Wikipedia)									
Measure	Strongly Agree		Agree		Not sure		Disagree		Strongly Disagree	
Scores	FQ	%	FQ	%	FQ	%	FQ	%	FQ	%
Male	31	67.4	15	32.6					**NG**	
Female	26	54.2	22	45.8	0					
Totals	57									

Source: PHEA Gender Research Data, 2010 NG _ not given FQ – frequency

As seen from table one both male and female students' agreed more with the second statement about ETs than with the first. The study also revealed that only one of the female and male students were not sure among those that considered the first statement about the definition of ETs yet in the second case, all those that answered were sure of what ETs meant to them.

Some of the students who did not perceive ETs as suggested in either of the two definition statements provided alternative definitions during the survey:

Two male students and one female said ETs are for research and typing; One female student said ETs refers to the equipments or gadgets e.g. laptops, desktops which help in teaching, learning and research; ETs are the Aid used in Teaching and learning for example Computers and Radios. While, during the Focus group Discussions (FGDs) perceived

definitions of ETs are summarized in table 2 indicating definitions drawn from the three groups i.e. from the male, female and mixed FGD.

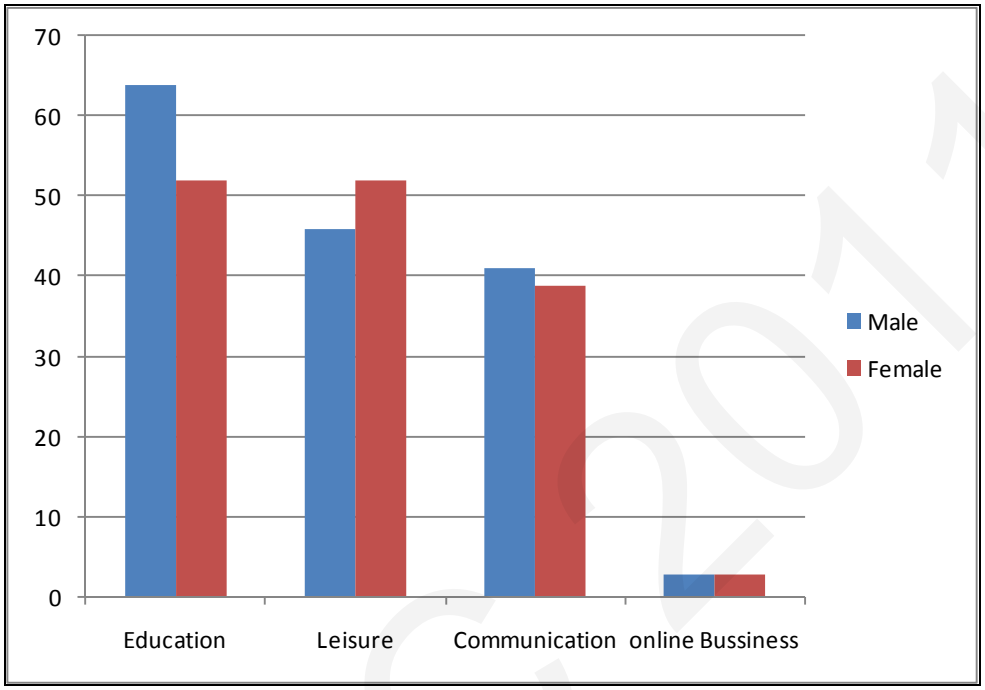
Table 2: Summary of Definitions generated during the FGDs

Male FGD	Female FGD	Mixed FGD
• Approaches, technologies or ways that have been used or developed to make the teaching and learning process easy and a success • The use of information technology as a source of educational resources • It involves imparting knowledge into individuals by the use of technology or equipments in the entire period of learning and teaching • The use of new innovations such as the Internet, phones • Ways in which education is facilitated through use of both Communication and Information Technology	• Learning done with a particular technology	• Human innovations that ease transfer and acquisition of knowledge • Involves use of modern implements in the process of formal learning. • Tools for learning e.g. projectors, computers

It is exciting and interesting to note that students perceive ETs as new innovation tools or equipments used in the learning process basically to aid the transfer and acquisition of knowledge.
Under this they listed computers, Internet, projectors, radios and Mobile phones. Although students use mobile phones mainly for communication, they also recognized them as an ET.

Because of what students perceived ETs to be, they thus used them for Academic purposes like in researching for information as well as typing out assignments. In addition, ETs were also used for communication and entertainment as shown in figure 1.

Figure 1: Use of ETs by Male and Female Students in Makerere in %



Source: summarised from PHEA, Makerere Gender Research data, 2010

Discussion and Conclusion

The aim of this research was to establish students' perceptions about ETs. Some of the research questions asked were: How do University students in Makerere perceive / define ETs? Which technologies available to them are perceived as ETs and lastly how their perceptions influence use of ETs. Universities have recognized the value of integrating use of ETs especially to curb effects of reduced funding, increased demand for higher education, over stretched infrastructure and the need to boost and maintain quality (Agbonlahor, 2005; BBC, 2007). As such policies and strategic plans have been drawn (Makerere, 2001; MakerereUniversity., 2009); ICT infrastructure improved all to support the use of ETs in teaching, learning and research activities -the three core functions of a university. The ideal is that ETs can and should be used to enrich the learning experiences (Yucel, Acun, Tarman, & Mete, 2010). Students in their perception of ETs recognize mainly computers, Internet and mobile phones as ETs that add value to their learning. Other technologies mentioned were specific to disciplines for example sciences with mounted skeletons, batteries and the general ETs like the projectors. Because students perceive ETs as new innovations, they thus do not recognize ETs that have been around for some town among these are musical instruments, televisions and radios.

In conclusion we think students perceptions on what ETs are and their value to their learning experiences greatly influence usage.

ABSTRACT

This study aims to investigate the effects of metaphors and pairing activity on programming performance of students with different self-regulated-learning (SRL) level. A total of 84 computing students was involved in this seven-week study, and they were randomly assigned either to a group that received a combination of metaphor and pair programming (MPP) or to another group that received pair programming (PP) only. Students in both groups worked in pairs according to their SRL level (one high and one low) when solving programming problems in C++ language. The findings revealed that high SRL students in the MPP method performed significantly better in recall than their peers in the PP method, and similar result was observed among the low SRL students. However, no interaction effect was observed between the method and SRL level on programming performance, i.e., high SRL students always perform better either in the MPP or PP groups. Metaphors have assisted the learners to develop better conceptual understanding by linking the known to newly acquired abstracts; and pair programming does cultivate peer discussions. Also, instructor should assist students to improve their SRL to reinforce self learning.

Keywords
Metaphors, Self-Regulated Learning, Recall Performance, Pair Programming, Computer Programming

INTRODUCTION

Computer programming as part of the computing education is an essential skill that ought to be grasped by students in studying computer science. As programming demands complex cognitive skills, students find it difficult to understand, interpret and perform these complex cognitive tasks (Hawi, 2010; Mayer, 2003). Likewise, educators involved in teaching programming concepts to first year computing students are continually facing different challenges in cultivating the students' understanding in the fundamental area of semantics which is the programme comprehension. Miliszewska and Tan (2007) stated that complex cognitive skills such as planning, reasoning, problem solving and analytical thinking play their role in learning to programme. Problem solving skills which include reasoning and analytical thinking are required in analysing the given problem scenario. During the learning process, students are required to understand the given problem, design, coding and perform maintenance that involve complex cognitive and social activity. To the first year computing students, majority of them believe that programming skill is complex and difficult to learn. However, those who are passionately interested in exploring the abstract problems find themselves motivated in acquiring the programming skill. Usually, these students are actively engaged in class activities and during lectures while the programming topics are covered. Somehow, they are able to seek help and discuss problems relating to programming. As such, effective learning takes place when students are learning through positive peer pressure in a fun and joyful environment as well as to reflect on self-learning outcomes by comparing them to the initial goals. Furthermore, higher thinking skill is needed in order for students to be the creators of new ideas, analyzers of information and generators of knowledge which seem lacking in these students (Butler & Morgan, 2007).

An earlier research on cultivating thinking and problem solving skills within students has been carried out when Pseudocode and program flowchart are mainly focused on the basic programming constructs (Tie, 2011). Besides teaching programming concepts, educators have tried in vain to cultivate the skills such as critical thinking, analytical and problem solving which are crucial to students who intent to take up

programming career. Over emphasizing on the program syntax and semantics of individual statements will lead to the students' misunderstanding and inability to construct a complete working system which is the pragmatics. Despite the fact that students could recognise the syntax and semantics errors in the program flowchart or Pseudocode, they might not notice the logical errors. Foremost, these students find it a challenge when they were asked to convert the programming logic (in the program flowchart or Pseudocode) into executable programming codes in C++ language.

LITERATURE REVIEW

Metaphor is a high level abstract concept that involves the presentation of new idea in terms of relating it to the existing knowledge. It is significant to assist the formation of interpretation and application of knowledge from the basic programming concepts acquired. Mastering the basic programming skills is fundamental for preparing learners to the next higher programming courses. Metaphors play a significant role in helping learners to develop mental images to reason abstract situations. They are being described as a real world system which the students are able to apply as a reference for linking existing ideas to the newly introduced concepts in programming system (Parker, 2009). The metaphor is expressed into either visual or textual representation in relating the abstract nature of the programming tasks to the fundamental of programming concepts. In this case, students are to transform these abstract concepts into logical flow by using designing tools such as program flowchart and Pseudocode before converting it into C++ programming codes. By connecting any concrete images with text information it will improve understanding in learning programming and increase the learners' recall (Flanik, 2008). Subsequently, it assists in enhancing programming comprehension and better academic performance. Three conceptual metaphors (Figure 1, Figure 2 and Figure 3) are three examples used to illustrate the C++ syntax in learning programming.

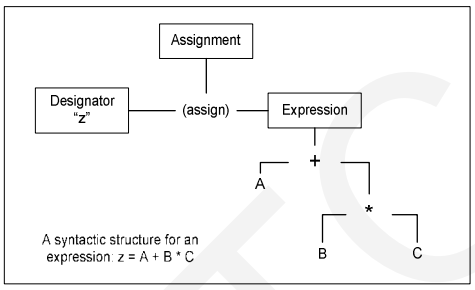

Figure 1. An symbol expression tree formed for assignment (adopted from Merwe, 2008)

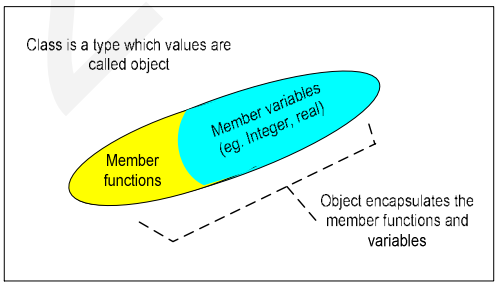

Figure 2. Medical capsule representing classes

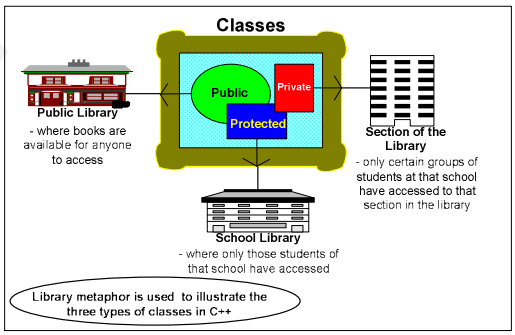

Figure 3. The library metaphor – explaining the "class" concept

Pair programming is a structural and systematic form of programming cooperation. It has been adopted in software industry to increase programmers' productivity and programming skills, where programmers work together in groups to complete the assigned tasks (Chung & Lo, 2006; Beck, 2000); and in education to increase learning. Research findings revealed that students perform better in terms of producing higher quality of codes, increasing retention rates, as well as improving problem solving skills and attitude towards programming when working in pairs (Bruce & McMahon, 2002).

Self-Regulated Learning (SRL) has been defined as a process in which the students set goals for their learning. This includes planning and carrying out certain strategies for the achievement of the goals, and to independently manage time and effort, and evaluate the quality of their own learning environment (Zimmerman, 2000). The students' level of SRL ability, high or low, is based on the group mean measured using the Motivated Strategies for Learning Questionnaire (MSLQ) instrument developed by Pintrich and DeGoot (1990). Studies have shown a significant correlation between an individual student with a high level programming performance and his high-quality involvement in SRL (Zimmerman, 2008; Lee, Shen & Tsai, 2008). In fact, the high SRL students are those who are highly involved in independent learning (Reyero & Touron, 2003). These students have the ability to regulate learning towards a desirable learning outcome and the skill to manage and organize their own learning needs, strategies and learning opportunities. The students with higher level of SRL ability are capable of building their own conceptual metaphors when new ideas are presented. By relating the existing knowledge and experiences to the newly introduced concepts, these highly self-regulated students are competent to set their learning goals based on own expected learning outcomes. When feedbacks and constructive criticisms are obtained from lectures, these learning strategies will be refined to ensure effective learning with positive outcomes.

RESEARCH QUESTIONS

In this study, three primary questions have been formulated to address the research outcomes:

1. Is there any significant difference in terms of recall performance for high SRL students who received a combination of metaphor and pair programming (MPP) treatment and those who received only the pair programming (PP) method?
2. Is there any significant difference in terms of recall performance for low SRL students who received MPP treatment and those who received only the PP method?
3. Is there any interaction effect between instructional methods and self-regulated learning level?

RESEARCH METHODOLOGY

The purpose of this study is to investigate the effects of blending the metaphor with pair programming strategy on the programming recall performance among high and low SRL computing students in learning programming constructs through C++. It aims to examine whether the different levels of SRL could be the moderating factors when an instructional strategy such as (i) metaphors as visualisation techniques, and (ii) pair programming as cooperative learning, are used in both classroom and practical sessions during course delivery.

Research Design

A 2 x 2 factorial design was applied to examine the effects of MPP and PP instructional methods on the students' recall performance. In this case, the self-regulated learning level (high and low) was used as the moderating variable. The students' recall performances were measured based on the immediate post-test scores obtained from the Computer Programming Performance Test (CPPT). A total of 84 students (n = 84) from the first year semester one undergraduate computing course were involved in this study. These two classes, all intact groups, were randomly assigned to the two treatment groups. The experimental group (n= 42) received the MPP treatment while the control group (n= 42) was treated with the PP method. For this study, the course comprises lectures and practical / tutorial sessions. During the lecture session, the students were given the explanation on some programming concepts using tools such as flowcharts and Pseudocode, while during the tutorial or practical session, the students used the C++ language for coding.

Research Instruments

Prior to the study, the Motivated Strategies for Learning Questionnaire (MSLQ) was used to identify the students' self-regulated learning level. It consists of 23 items that requires 20 minutes to complete. In this study, the MSLQ mean score of the sample was 3.50. Students who scored 3.50 and above the group mean were categorized as high SRL and those who scored below 3.50 were classified as low SRL. A CPPT pre-test was administered to the participants prior to the treatment. An immediate post-test of

CPPT, covering both theory and practical knowledge was conducted immediately after the treatment to gauge the students' programming recall performance. Prior to it, a set of reliability tests were conducted on the instruments used in order to determine the Cronbach's Alpha reliability coefficients. The reliability values of instruments are: (i) 0.915 for the pre-test, and (ii) 0.954 for the immediate post-test.

Data Collection Procedures

The first year semester one computing students in the two intact classes were involved in the seven-week experimental study. They were randomly assigned to the two treatment groups. The students in the first treatment group (MPP) received the combination of metaphors and pair programming instructional strategy in learning the basic programming concepts. In the control group (PP), the students were exposed to PP as the cooperative learning instructional strategy in solving the programming problems. To understand the abstract concepts, the students in both groups were taught using programme flowchart and Pseudocode. During practical session, they were to apply C++ programming language in converting these logical concepts into working programme codes.

The students in both the experimental and control groups were paired and each member of the pair was randomly assigned with a role, either as a driver or a navigator. The explanation regarding the roles (driver or navigator) of each member in the pair was given to both the MPP and PP groups. On every programming problem, they were persistently required to cooperate on the same design, algorithm, coding and testing. The role between the driver and the navigator was switched periodically. The experiment was carried out for seven weeks. The immediate post-test was administered to both groups immediately after the treatment. The CPPT instrument was used to measure the students' recall performance of the computer programming knowledge.

RESEARCH FINDINGS

In this study, SPSS 17.0 for Windows was used to analyse the scores collected from the two CPPT namely the pre-test and immediate post-test. The ANCOVA statistical technique was applied in order to determine any significant difference between the students with different self-regulated learning level on their programming recall performance. In this case, the pre-test score was used as the covariate.

The analysis results are shown in Table 1 and Table 2. Table 1 reveals the ANCOVA findings, while Table 2 shows the descriptive analysis and Table 3 indicates the post-hoc results. The interaction effect between the treatment groups and SRL is shown in Figure 4.

Table 1. ANCOVA Results for the Recall Scores of the Two Treatment Groups

Dependent variable	df	Mean square	F	Sig.
Recall (immediate posttest)	3	1102.28	37.96	0.00*
Group * SRL	1	68.20	2.24	0.14

*significant at 0.05 level

Table 2. Descriptive Statistics for the Recall Performances of the Two Groups with Different SRL Levels

	Groups	SRL	N	Mean	SD
Recall (immediate post-test)	MPP	High	24	74.17	4.08
		Low	18	62.80	4.72
	PP	High	27	69.52	6.94
		Low	15	55.11	6.22

ANCOVA results in Table 1 clearly indicate a statistical significant difference in recall performance between the high SRL and the low SRL students who received different treatment methods (F: 37.96; p: 0.00). Thus, these findings have rejected both the first and second hypothesis. The post-hoc test was conducted to further investigate the differences (Table 3). However, the graph in Figure 5 reveals no significant interaction effect between high and low SRL students taught in the MPP and PP groups.

Table 3. Summary of Post-Hoc Test for Recall Performance between the High and Low SRL Students

in the Two Treatment Groups

Level of SRL	Groups	Mean Difference	p-value	Results
High	MPP vs PP	4.65	0.03	Sig.
Low	MPP vs PP	7.68	0.00	Sig.

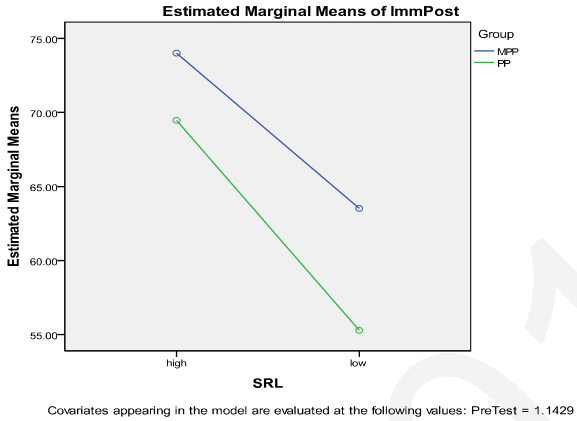

Figure 4. Interaction Effect between the Instructional Methods and SRL

Hypothesis 1: There was no significant difference in recall performance between the high students taught in the MPP and PP groups

The post-hoc test result (Table 3) indicated a significant difference in recall between the MPP and PP groups for the high SRL students, with the former performed significantly better than the latter $\left(\bar{X}_{highMPP}:74.17;\bar{X}_{highPP}:69.52;\ Mean\ diff:4.65;p:0.03\right)$. Thus, the first hypothesis was rejected.

Hypothesis 2: There was no significant difference in recall performance between the low SRL students taught in the MPP and PP groups

The post-hoc result in Table 3 revealed a significant difference in recall performance between the low SRL students in MPP group and those of the PP group $\left(Mean\ diff:7.68;p:0.00\right)$, with the MPP group performing significantly better than those of the PP group $\left(\bar{X}_{LowMPP}:62.80;\bar{X}_{LowPP}:55.11\right)$. Thus, the second hypothesis was also rejected.

Hypothesis 3: There was no interaction effect between instructional methods and self-regulated learning level

Figure 5 shows that there is no interaction effect between instructional methods and the students' SRL level on programming performance between the MPP and PP groups $\left(F:2.24;p:0.14\right)$. This would mean that regardless of SRL level, MPP method is much better than PP. Also, high SRL students outperformed the low SRL students in each method Therefore, the third hypothesis was accepted.

DISCUSSIONS

This study aims to investigate the impact of different SRL levels on the students' recall performance on the instructional methods used in learning C++ programming language. These students from the two intact groups were randomly assigned to two different instructional methods (MPP and PP). One group received the MPP treatment and the other was treated with the PP method. The research findings indicated that the difference in the recall performance for high and low SRL students between the two instructional methods were significant. However, no significant interaction effect between instructional

methods and SRL was shown. Further analysis revealed that the high SRL students in the MPP group performed significantly better than their peers in the PP group for the programming recall performance. Similarly, the low SRL students taught in the MPP group significantly outperformed those in the PP group. As such, the MPP instructional method significantly influenced on immediate recall for both high SRL and low SRL students.

The metaphors with pair programming instructional method significantly aid both high and low SRL students in visualizing the abstract concepts – either in pictorial or textual forms, thus creating higher mental models for reasoning and engaging in interactive discussion. Therefore, this finding demonstrated that metaphors facilitated and improved learning towards information recall (Flanik, 2008). The use of metaphor supported the formation of memory images of the new programming concepts being introduced and positively influenced on memory recall for both the high and low SRL students taught in the MPP group as compared to the PP group. Through classroom and practical learning, it allows the students to connect their current knowledge and experiences with novel problems and thus assists the development of a self understandable neural network in their memory. This network of information stored is easily retrieved as ideas amassed from building clearer mental schemas.

For low SRL students, effective learning takes place when they learn through positive peer pressure in a fun and joyful environment. Since these students in the MPP and PP groups had to work in pairs, they were able to discuss, find solutions for specific problems, form ideas and opinions with their partners (high SRL), and thus helped to cultivate problem solving skills, higher order thinking skills and improved their attitude towards programming (Hawi, 2010). In other words, the low SRL students participated in the discussions by explaining each other's approaches to problem solving thereby creating a higher level of conceptual understanding and promoting critical thinking skills that subsequently improved their recall performance (Flanik, 2008; Felder, 1996). Likewise, these students benefited the most from participating in heterogeneous pairs, specifically by offering further explanations to their peers. Similar results were also reported by Meseka, Nafziger and Meseka (2010) as well as Ballantine and Larres (2007).

This finding revealed no interaction effect between instructional method and the students' SRL level on programming recall performance between the MPP and PP groups. In other words, regardless of SRL level, MPP method is much better than PP. Also, high SRL students significantly outperformed the low SRL students in each method. To enforce effective learning, lecturers should consider the combination of metaphor and pair programming to be adopted in class lectures and during practical session (where the conversation of programming logic into C++ application) as well as to take note of the students' SRL levels in order to have significant influence on their programming performance.

CONCLUSION

The findings revealed that metaphor when combined with pair programming has significantly helped students' learning, both for the low and high SRL students. Thus, metaphors develop better conceptual understanding by linking the known to newly acquired abstracts; and pair programming does cultivate peer discussions. As such, lecturers should assist students to form conceptual visualisation in their working memory during their teaching in order to reinforce self learning. This study has also emphasised the importance of considering SRL components in learning the basic programming concepts through C++ language for classroom academic performance. When used effectively, these self-regulatory strategies could stimulate students' recall performance. It is suggested the lecturers should encourage their students to apply SRL in programming contexts in order to reinforce self learning. In turn, it promotes the development of knowledge and competency within self through life-long learning process.

DOES COLLABORATION OCCUR WHEN CHILDREN ARE LEARNING WITH THE SUPPORT OF A WIKI?

Abstract: This paper reports on the outcomes of a mini-research project about visible forms of collaboration when children are learning with the support of Wikis-online editable websites. The findings were based on observing the children using the Wiki, analysis of the video recording of the task and the survey that was completed by the children using the Wiki as a tool for a task. Qualitative research methodology became a primary technique for the data collection and content analysis approach used to explore the children's behaviour when investigating the use of the wiki and video recording of the sessions. Various types of behaviour associated with collaboration, were observed when the children were working on Wiki pages with their peers.

Keywords: Wiki, collaboration, behaviour, cooperation.

Introduction

The latest innovations in technology over the last decade have had a dramatic impact on the use of technology as a learning tool in classrooms. Educational professionals have adopted the world of collaborative opportunities that the Internet has offered. Tools such as email, blogs and chat are acquainted by many teachers. Recent developments such as Wikis and RSS feeds may not be as well known, but offer wide opportunities for online collaboration for learners. They afford many unique and powerful information sharing and collaboration features. A wiki is a website where users can modify any page, by adding content or editing that which already exists.

The focus of this essay is to investigate the visible forms of collaboration when children are learning with the support of Wikis-online editable websites. A mini-research project was undertaken by a team which consisted of three researchers to find out the answers to two valuable questions;

Does collaboration occur when children are learning with the support of a wiki?

How can collaboration be interpreted in a group activity with children?

The aim of this paper is to give a critical account of the process of completing the mini-research project. After giving a brief description of what a Wiki is, the reasons for choosing the use of Wikis and its links with collaboration as a topic is discussed. Additionally, methods of data gathering, obstacles to using specific methods and any ethical issues are addressed. Finally, a sample data is presented and a relationship between the data and literature is explored to support the research findings.

Research Interest

It is very hard to give a simple definition of a Wiki, but it can be described as a combination of a web site and a word document that allows users to add, modify and update its pages. Wiki's have many different features but commonly they allow their users the ability to compare previous versions of a page, track who edited what and when. Each time someone makes a change on a Wiki page, it gets updated automatically and an older version is stored. The ease of working on a content collaboratively as a group using just a web browser can be seen as the most important element of a Wiki. The name "Wiki" was inspired by the Hawaiian word wiki or wiki-wiki, which means "quick".

Désilets and Paquet (2005) describe wikis as "simple to use Web-based collaborative hypertext authoring systems". Wiki's seen as "valuable tools for successful collaborative knowledge building" (Harrer et al 2008) and widely used by educators because of its suitibality to be used as part of computer-supported collaborative learning (CSCL) (Désilets and Paquet 2005).

Wiki's have been used for many different purposes by different groups. In education Wiki's are mainly used for group writing projects, where groups of students are responsible for creating their own content and learning from each other in the process of collaborative working. The collaborative features of wikis make them particularly well suited for cooperative learning environments (Schaffert, Bischof, et al., 2006). Wikis can also be seen as easy-to-use collaborative technologies. They can support knowledge creation and sharing (Lamb, 2004; Leuf & Cunningham, 2001; Wagner, 2004) between students.

In many ways Wikis are similar to traditional approaches of standard group work such as access restrictions, defined workflows, and structures. What makes wikis different is that user deciding for themselves how they process and groups will develop, usually by making things up as they go along. Jimmy Wales, founder of most well known example of a public Wiki 'Wikipedia' states that Wikis helps young people develop writing skills and social skills by learning about group consensus and compromise all the virtues you need to be a reasonable and productive member of society.

The research questions have arisen when we discussed the use of Wiki's in education for a group activity about how collaboration occurs and which behaviour can be identified as a sign of collaboration.

Research Approach

The aim of this research is to find out more about Wikis and their use in Primary schools. As a starting point collaboration and cooperation terms are defined in a context of teaching and learning.

The research involved different steps; finding literature, practical research in a primary classroom, analysing the data as an outcome of the practical research to find answers to focus questions. The team looked at the meaning of collaboration and cooperation in educational contexts, then, discussed how Wikis can be used to allow children to work in these forms. As a result collaboration is defined as process of participating in knowledge communities (Lipponen, 2002) and cooperation as the act of doing something together or of working together towards a shared aim. Scanlon (2000) suggests that co-operation usually means either splitting up the work or solving subtasks individually and combining the results into a final product. In adversity, collaboration can be seen as a coordinated attempt to solve a problem together.

Both these terms are explored further by Foot, H. C., Morgan, M.J. and Shute, R.H (eds) (1990) in their book Children helping Children. In this book collaboration was seen as an unstructured activity where participants don't have a specific role and don't work under the authority of an adult towards a reward. Interestingly, they control the learning and sharing process themselves and it may take place when a child turns to another to seek help. On the other hand, cooperative learning was referred to as 'highly structured where the aim of the learning and specific roles of the participants had been identified at the beginning and was controlled by the authority of an adult.

There have been various studies about the use of wikis to support collaborative learning. According to Chong et al. wikis, when supported with suitable communication tools, promote the active participation of, and higher level discussions amongst students. One of the case studies the research team looked into which had some vital links to this research question was about using 'A Wiki as a Tool for Web-based Collaborative Story Telling in Primary Schools (Désilets, A., and Paquet, S., 2005). The children were asked to design a story on paper and then write it up using Wiki. As an outcome of their study they came up with different collaboration modes for the different types of media that were being used for the task given. When the children designed their story they all worked at the same time, so the mode of collaboration was called Co-located synchronous. When they were writing their stories using a Wiki, team members worked in parallel on different parts, side by side. There were feedback, coordination and information sharing; this mode of collaboration was called Co-located semi-asynchronous. Random walk, splitting page between the team members, sharing tasks such as writing, uploading images were the visible forms of collaboration they could see. According to Désilets, A., and

Paquet, S; pair editing on story writing phase did not work well in this case. So this outcome created a question in our mind, is pair editing appropriate in primary level?

Data Collection- Ethical Issues

For the case study the team decided to have a class wiki which would be active during the current academic year. As an ICT coordinator in a primary school I took the role of creating a wiki called 'Planet 5J' for a year 5 class of children aged 9-10 years old. As I had regular access to this class, I had a discussion with the class teacher about the Wiki project. It was suggested by the class teacher that creating a 'wow' words dictionary which contained interesting and complex vocabulary would be very useful for their writing skill. This usage of 'Wow words' was also to be part of the whole schools target.

A team meeting was held to talk about how to introduce the Wiki to the children, monitoring the usage of the wiki, sampling data and gaining permission for using the data as part of our case study. It was agreed to introduce the Wiki as part of an ICT lesson, so that the children could have time to practice using it. After introducing the Wiki to the children, it was explained to them that their use will be monitored and analyzed by a team from the university as part of a study project and that the results of this project will be put onto the Fronter MLE ICT room to share with other teachers, parents and children. The team know that in qualitative research informed consent needs to be sought and may be withdrawn at any time, and additionally to include direct talk regarding the continued willingness to participate (Cassell, 1982). A generic permission letter was prepared by the school office regarding using children's photos, videos and work on school websites or publications. This letter also included a line in which it states that educators can study their work to improve standards in school. All of the children's parents signed these letters at the beginning of the year. The children were reminded that they could withdraw from the activity at anytime they liked. In case this happened extra adults were included who would work with these children undertaking different activities on the same topic as developing 'wow' word vocabulary. At the end of the study the students were given information about the findings of the research and the video and questionnaire results were placed in the schools managed learning area.

Due to the limited time scale involved, interviews with some of the children were not sought in this research as a data collecting method. The findings were based on observing children using the Wiki, analysis of the video recording of the task and a survey that was completed by the children on using wiki as a tool for collaboration.

Working with such a young group of children as part of this study, understanding the ethical principals for conducting a research was extremely important to the team. The team spent a considerable amount of time completing the 'Ethics Review Form' thoroughly as suggested by Bera (2004). According to Bibby (1997) it is important that researchers consider different moral arguments as part of their training and reflect on what is acceptable behaviour before beginning their research. It is extremely difficult to determine main moral principals which should guide researchers to deal with the ethical issues that can arise when attempting to interpret individual realities. Ethical codes can only operate as a guide. The best solution is for researchers to regularly reflect on their work to develop their understanding of the ethical concerns associated with their research (Burgess, 1989). During this research project the research team members had continuous dialogue among the researches regarding the ethical implications of our research project.

After introducing the 'Planet 5J' wiki to the children, they were allowed regular access to the wikispace; once a week for six weeks initially. They were also allowed to access the wikispace from home. After six weeks they were still allowed to access the wikispace, but sampling the data from the wiki itself was limited to these six weeks. The children were given tuition about how to edit pages, create links and make changes to previous work. They were not guided about how to collaborate as we wanted to observe the forms of collaboration that may occur naturally whilst they were editing the wiki.

Once the 'Planet 5J' class wiki was up and running, all the research team members were allowed to access the wiki so that they could all observe and monitor the activities that took place. The data collection was administered at two levels. Firstly the team conducted unstructured observations where each researcher read through the entries of 'Planet 5J's wiki and took notes that were vital to share with the rest of the team. Because of the version control tools of wikis, we were able to track the history of the

specific pages and entries. Having in mind the research question 'Does collaboration occur when children are learning with the support of a wiki?' the team was not very clear about the relationship between the wiki entries and our question. Articulating children's entries and actions on wiki in the context of collaborative working appeared to be chaotic. In order to tackle with this ambiguity it has been decided to derive coding from the text entries on the wiki to interpret the boundaries between children's entries and the research question.

The same approach was followed to investigate the video recording. The video recording of the wiki task completed by the children was watched many times and notes were taken by the research team to form an initial explanation of data. Then codes were collected from the video recording data to study deeper to find out more about the visual forms of collaboration the children were using when editing the wiki. In order to investigate the children's attitude to this experiment, a questionnaire was designed and made available online. After the wiki based learning, children were asked to complete the questionnaire.

Reflecting on the project so far, the team decided that although this is a small scale research project, it is important to use more than one method to gather data to support our findings. However when it comes to interpreting the data and constructing meaning, each member analyzed their own data followed by group discussion and analysis of the same data.

Methodology

Sample

A considerably larger than the average primary school in London agreed to host the study. The school serves an ethnically diverse community. 29 pupils from a Year 5 (age 9-10, 13 male and 16 female) class took part in the project.

Software

Wikispaces was chosen to use for this case study. The reasons for choosing Wikispaces are; it is easy to use, secure and free.

Implementation

The project ran for six weeks at the end of the autumn term in 2010. The students were asked to use a Wiki to create a whole class 'WOW' words dictionary. This is to help them to broaden their vocabulary so that they can write imaginative stories using complex sentences. By using 'Wiki's' for this task, they have an opportunity to engage in self-coordinated, collaborative work. The team wanted to see if and how young children would be able to use the 'Wiki' in collaboration.

This case study is based upon a survey that was completed by the children, including analysis of the use of Planet 5J's 'Wikispace' and a video recording of the children during their use of the 'Wikispace'. Through the study of the data collected, the team gained an understanding of; how the children used the Wiki tool to collaborate and the effects of gender in their Wiki activities. In this case the focus was the issue of collaboration. The video recordings of the sessions where children used the 'Wiki' to create a dictionary of "WOW" words.

In order to gain a better understanding about the forms of collaboration visible when children are using a wiki, qualitative research methodology became a primary technique for data collection. A content analysis approach was used to explore the children's behaviour when investigating the use of the wiki and video recording of the sessions. Furthermore, survey questions derived students' perceptions of using the wiki in the classroom. In addition, a comparison of the results from the three sources yielded reliable evidence of the particulars of the wiki use. By using triangulation research methodology the team aimed to produce reliable results which would then improve the validity of this research. According to Cohen, Manion et al (2007, p. 141), A triangulation in social sciences attempt to explore "the richness and complexity of human behaviour by studying it from more than one standpoint", and in the opinion of this author, "the more methods contrast with each other, the greater the researchers confidence".

According to Ole Holsti (1969) content analysis is a technique for making inferences by objectively and systematically identifying specified characteristics of messages. Weber (1990, p.9)

suggests that content analysis is a research method which uses a set of procedures to make valid inferences. Content analysis can involve any kind of analysis where communication content such as speech, written text, interviews, images etc. is categorized. By using content analysis as a method; it endorsed our team to observe and analyze the whole content of the 'Planet 5J'. It also allowed us to sequence the communication took place and therefore made the unobserved content of wiki data clearer. Because of the changing status of the wiki, data analysis was carried out as an iterative process where data was continuously collected and new conclusions drawn (Miles & Huberman, 1994).

The team found it very difficult to obtain coding from the theories and case studies that looked at prior to this research. Coding was mainly acquired from the conventional content analysis of the wiki entries and study of the video recordings of children working on the task. Basically the team adopted a traditional approach to analyze the findings from the video recordings drawing on Strauss's (1987) "coding from the data" method where data were analyzed as they were collected. As the team continued to analyse the data, any word, text or behaviour that represents collaboration was identified and written down. When we looked at the video we identified some behaviour that can be seen as collaboration such as; pointing at the screen, talking, critiquing, advising and suggesting. As mentioned above the team found it hard to create a code table, so we decided to have a list of mode of collaboration that was evident from the data derived through the analysis of video recording, wiki pages and survey. The research team also compared the modes of collaboration that we found with Désilets, A., and Paquet,' findings from their study. The modes of collaboration found will be discussed on the finding section of this essay.

Findings-connection with Literature and Research background

Due to the limits of space in this essay data analysis of the video recording and the children's wiki entries will be used to explain the collaboration modes that occur when children are learning with the support of wikis.

The team studied two main scenarios to identify the visual forms of collaboration in this video.

Scenario 1

Boy A made a suggestion to Boy B who was sitting next to him. Boy A did not touch the mouse or lean over Boy B. Boy A kept his distance from Boy B. Boy A pointed at the word on the screen and told Boy B what he thinks the meaning of the word is. Boy B looked at boy A's face and asked him to explain what he meant. They had eye contact during their conversation. Boy B controlled the mouse until the end of the session.

Boy A and boy B each had a PC to work on Planet 5J's 'Wikispace'. Boy A did not use his PC; he moved his chair next to Boy B and worked with him on Boy B's PC.

Scenario 2

During 'Wikispace' work in the ICT suite Girl D saw that Girl E had spelt the word incorrectly. Girl D left her chair and came over to speak to Girl E. Girl D stood behind girl E. She moved her hand over Girl E and pointed on the computer screen to the word that she had written. She then took control of the mouse and corrected Girl E's mistake. After this she explained to her what she needed to do. Girl D returned to her seat. Girl E subsequently turned to another girl F who was sitting next to her and took the control of her mouse and showed her what to do.

Content analysis of the video has shown that the children worked collaboratively in many ways while they were working on the Wiki task. Jonassen et al states that 'mind tools' helped users express what they know and construct knowledge through critical thinking and higher order learning. In our video recording we could see that using Wikis as a mind tool motivated students to learn, and having a shared learning space improved collaboration between learners. The children were actively involved in designing their own knowledge and helping their peers to learn. While they were typing their wow words onto the wiki, when they saw some entries that were not describing the word correctly or when they found the description not detailed enough, they stood up and lead discussion on how to improve it. This helped them to construct a new knowledge through collaborative working. These student centred collaborative

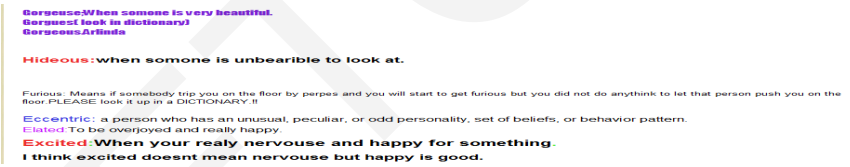
learning activities enabled the learners to take control and responsibility of gaining new knowledge (Myers, 1991).

Another important finding from this video was the improved communication that led to collaboration within the group. Whilst the children were editing their pages, they realized that many others were editing the same page. They could not see their entries directly. They saw this as a problem as they wanted to see their entries directly. Some of the children suggested that either they should ask if someone else was editing the same page and waited until they had finished or go and sit next to that person and work together. Instead of sitting and waiting for a solution or asking the teacher for help they decided to communicate directly with their peers in order to resolve the issue. In other words using wikis improved communication between learners; they can be characterized as enablers of socio-constructivist learning (Schneider et al., 2002). There was also many scenes where they were modifying entries, asking for help from others with explaining their words, suggesting, discussing, questioning and analysing not only their peers but also their own entries. The evident of this can be seen on the wiki pages. Figure 1 shows that a child spelt the word 'Amazing' wrong. Another child made a suggestion for correcting spelling underneath it. We can also see similar action when a child tried to describe the word 'disgusting', where description of the word was re-written by another child.

Figure 1:

Again figure 2 shows children suggesting the correct spelling of the word or asking their friends to use a dictionary if necessary. We can also see that a child describing the word 'excited' and another child giving their own opinion of the meaning of the word.

Figure 2:



According to Lipponen (2002), computer supported collaborative learning such as Wikis promotes peer interaction and allows the sharing of knowledge within a group of learners. In scenario 1 above boy A asked boy B for his opinion about the meaning of a word; in scenario 2 girl D correcting girl E's mistake, girl E passing on her new knowledge to girl F. After analysing these scenarios closer the team found that children are not just learning to write collaboratively; they are also developing many collaborative skills, negotiating with others to agree on correctness, meaning relevance and more(Fuchs-Kittowsk & Köhler, 2005; Godwin-Jones, 2003; Wang& Turner, 2004).

As explained in the previous section of this essay we came up with a list of modes of collaboration linked to the special areas it occurred.

Content-related: Where children helped each other to write and explain the meaning of the 'wow' words; one child suggesting another one which word can be classified as a 'wow' word.

Technology-related: Children explaining each other how to use the functions of wiki software.

Random help skills: Where children showing interest and willingness to help their peers sitting next to them or leaving their chair to go and help others when they needed help.

Comparing the research findings with Désilets and Paquet's research

According to Désilets and Paquet's study (2005) collaboration had two modes; co-located synchronous and co-located semi synchronous. In the Co-located synchronous mode of collaboration; children were observed working side by side on the same task which was designing a story. The activity was paper based. In the co-located semi synchronous mode of collaboration, children were noticed working on parallel tasks, sitting side by side. They were working in a coordinated way and were sharing information. They were also giving feedback. The team hasn't used a paper based activity, nevertheless observed children using similar co-located synchronous and co-located semi-synchronous strategies. In some instances children were working independently on different parts of the "WOW" words dictionary, either in parallel or at different times and in some instances they were working on the same page. Désilets and Paquet (2005) stated that pair-editing mode of collaboration did not happen during their study. In this case study the use of a pair-editing strategy was detected where one child was the driver who typed the words and other was the navigator who helped driver.

The mini-research project produced some important results regarding the modes of collaboration drawn from the wiki based learning experiment. From the analysis of the data we saw children working collaboratively in many ways. They observed their friends' mistakes on Wikispaces, and then they left their chair and went to speak to the person who had made the mistake. The children worked in pairs, randomly walked around and helped their peers. They made suggestions and criticized others work by pointing at the computer screen or taking control of the mouse and keyboard to model what they thought was the correct answer. The use of a video as a data gathering method was extremely useful as all the members of the research team had an opportunity to see the children working on the task. Although the video recording gave some important data for this research, the team also had difficulties analyzing it fully as it was sometimes very difficult to see exactly what the children were doing when they were editing the wiki pages. Were they modifying, deleting, or suggesting?

Because of the noise level in the classroom, it wasn't always easy to hear their dialogue with their peers. When it comes to using the data analysis of the wiki entries itself, although we can see some changes and suggestions made by the children, the volume of this data is not very high. Giving the children more time to work on the wiki pages or using the wiki with more classes may have given us more information about the relationship between wikis and collaboration. Also having a clear idea about the coding of collaborative behaviour would also help with conceptualize the data from the video and the wiki pages.

Conclusion

The purpose of this study was to investigate the visible modes of collaboration when children are using a wiki as a learning tool. Based upon research findings it can be suggested that children are collaborative when learning with the support of wikis. Therefore, wikis could be seen as an effective tool to support collaborative learning and knowledge sharing in education and facilitates group learning where students can learn and share knowledge. Various type of behaviour associated with collaboration, were observed when the children were helping each other with their tasks.

This case study has shown that using a wiki brought the group members together to edit the Planet 5J wiki pages which allowed children with similar ideas to collaboratively build on each other's work. It also gave the children equal access to the most recent version of the wiki.

This research project gave the team an understanding of how collaboration emerged when the children were using wiki as a learning tool. It also gave an insight of how knowledge was built socially. For the future research, it will be worth to try providing children with more structured tasks, where children have an opportunity to work as a team and are given a longer time to complete the task. The children could also be given information about types of roles they could foster in group work. This may help them with understanding of how a group functions when they are working together.

The data collection methods used for this mini-project were appropriate for showing the modes of collaboration that occurred however, the scale of the research was not large enough to draw general

conclusions. Further research is recommended to confirm the findings of this research, and decide the magnitude to which modes of collaboration can be associated with wikis.

DOES LANGUAGE PROFICIENCY MATTER IN REDUNDANCY PRINCIPLE?

ABSTRACT
Although much about redundancy principle per se has already been investigated to date, notably by the studies conducted with native speakers of English, so much more, specifically the impact of language proficiency on redundancy effect, lies undiscovered. The present study revisited the redundancy principle in an EFL setting and explored the impact of language proficiency on redundancy effect. The main results showed that advanced students outperformed intermediate students in animation with narration (AN) retention tests. As for the transfer tests, although advanced students did better than intermediate students on simultaneous animated narration with on-screen text (ANT), *t*-tests revealed that they did not significantly differ from each other. Persona evaluation checklist and interviews showed all the participants enjoyed and concurred with the animation with sequential narration and on-screen text (A-NT) presentations. Some implications for teachers and material developers are also suggested.
Keywords: Educational technology, multimedia learning, redundancy principle, language proficiency

INTRODUCTION

Research studies have investigated the impact of multimedia on students' retention and learning over the past two decades, thereby having allowed us to gain considerably deeper insights and to construct tenable theories underpinning multimedia as a propitious tool. More specifically speaking, cognitive load theory (Paas, Renkl, & Sweller, 2003; Sweller, 1999; Sweller, van Merrienboer, & Paas, 1998) and cognitive theory of multimedia learning (Mayer, 2001, 2005) are the two most conspicuous theories underlying multimedia learning. These theories elucidate separate cognitive processing intended for learning and mental representations in working memory.

The fundamental precept of cognitive theory of multimedia learning is based on three assumptions, each of which has distinct processing mechanisms necessary for verbal and visual representation: (a) dual-channel assumption argues that both visual and verbal channels process information separately (Clark & Paivio, 1991; Paivio, 1986); (b) limited capacity assumption claims that both information processing channels have limited amount of capacity at one time (Baddeley, 1992; Chandler & Sweller, 1991); (c) generative learning assumption suggests that human beings generate knowledge by making sense of the information obtained through both channels. To wit, what is essential for meaningful learning is not only the selection of words and images, and organization them in tandem but also the integration of relevant elements with prior knowledge. Otherwise, mental amalgamation should cause mental overload in learners' cognitive system, thus challenging meaningful learning to spawn.

As for the cognitive load theory, it suggests that there are three separate but additive sources of cognitive load in learning. Germane load is central processing, leading learners to construct knowledge by selecting words, selecting images, organizing words, organizing images, and integrating in tandem (Mayer & Moreno, 2003). Incidental processing or extraneous load is unnecessary or redundant cognitive process such as background music; therefore it does not require learners to make sense of the elements in the presented material. Intrinsic load or 'representational holding' (Mayer & Moreno, 2003) is to do with retention of cognitive representations in working memory over a certain period of time.

Diao & Sweller (2007) claim that to circumvent cognitive load within working memory, while extraneous load should be minimized, on the one hand, germane load should be increased, on the other. If extraneous processing engenders cognitive overload during selection, organization, and integration process, this type of redundant or unnecessary source of information should be weeded both to 'make narrated animation more concise and coherent' (Mayer & Moreno, 2003, p.48), 'to free working memory capacity' (Diao & Sweller, 2007, p.80) and to germinate meaningful learning. Kalyuga, Chandler and Sweller (1998, 1999) researched and found out that not integration but elimination of redundant materials results in better

performance and that weeding redundancy leads to more meaningful learning than the inclusion of redundant material. So, redundancy effect was found.

Although much about redundancy principle per se has already been investigated to date, notably by the studies conducted with native speakers of English, so much more, specifically the impact of language proficiency on redundancy effect, lies undiscovered. Few studies, to the knowledge of the researcher, have investigated redundancy principle in EFL contexts and the effect of language proficiency of EFL learners. The research review in the following section delves into the studies which looked for the extent to which redundancy effect impedes or facilitates mostly ESL students' reading comprehension and recall.

PRIOR STUDIES

Illustrated materials with graphics, sound, video and animation are of central importance for rendering information in multimedia learning. When incidental processing increases and when humans have difficulty sharing their attention between the same sources of visual information in the visual memory channel, it leads information to be unintelligible (Jamet & Bohec, 2007), overloads heavily one channel at a time and finally causes split attention. Whereas some early studies found out that redundancy effect has such deleterious effect on learning (Kalyuga et al., 1998, 1999; Mayer, Heiser & Lonn, 2001; Diao & Sweller, 2007), others found out under some conditions that redundancy effect either fosters meaningful learning or if not, at least it does not cause hurdle on working memory (Moreno & Mayer, 2002; Experiment 1 and 3; Mayer & Johnson, 2008).

Several studies revealed that split attention effect was detrimental to learning. Kalyuga et al. (1998) exposed students to diagrams with speech, with printed text, and with both printed text and speech (redundant group). The analysis displayed that learners receiving diagrams accompanying with narration or speech outperformed learners exposed to diagrams with both speech and text. This result can only be ascribed to the fact that visual channel is overloaded when learners both read printed text and follow diagrams. So, redundancy effect was confirmed.

Aiming to further the investigation of redundancy effect in multimedia environment along with animations rather than diagrams, Mayer, Heiser and Lonn (2001) compared students receiving animated narration with students receiving animated narration accompanying with on-screen text summaries (Experiment 1). The results demonstrated that on-screen text summary group remembered less in retention and produced fewer creative solutions in transfer tests. In the second experiment, Mayer et al. evaluated the extent to which full text and summary text differ and found out that the full text and summary text group did not differ from one another and that animated narration group outperformed students in the groups receiving full text and summary text along with narrated animation.

Diao and Sweller (2007) compared two groups: reading-plus-listening group and reading only group. To cognitive theory of multimedia learning, giving identically analogous information as in the reading verbatim listening group (verbal redundancy) hinders meaningful learning. The results showed that both reading and listening simultaneously engendered higher mental load and thus led to inferior general understanding and remembering. However, if Diao and Sweller had provided the participants to read first, and to listen later just as Gorsuch and Taguchi (2010) did, students would not have had higher mental load that would preclude them to recall and to learn better. In their study, Gorsuch and Taguchi controlled redundancy effect and the results revealed that both reading and listening at the same time helped students improve their reading comprehension.

So tides turned when some research studies looked into conditions in which redundancy could aid to comprehension. These studies manipulated redundancy in spoken and written modes; compared simultaneous and successive presented materials besides redundant and non-redundant formats. They found out that when the elements in the presented material are simultaneous, redundancy induces negative effect; when the presentation is successive, positive effect. In Moreno and Mayer's study (2002, Experiment 1 and 3), the presentation of concurrent narration (spoken) and on-screen text (i.e., verbal redundancy) helped students more than that of narration only. In Experiment 2, students receiving redundant materials sequentially were superior to those who learned with nonredundant verbal materials simultaneously. This positive redundancy can be attributed only to the fact that sequential presented

material does not cause split attention, and so it does not cause hurdle on working memory. Only by preceding the elements in the presented materials can split attention effect be surmounted.

Manipulating on-screen text in a way that does not require learners to read all sentences, and so aiming to revise redundancy principle, Mayer and Johnson (2008) gauged learners' retention and learning on redundant and nonredundant versions. In redundant format, students received animated narration with action-oriented key words from the narration; whereas, in the nonredundant format, students were confronted only with animated narration. The redundant group recalling short key words easily performed better but only in retention test, not in transfer test.

To sum up, all these studies have sought to address the insights underlying redundancy principle and investigated new ways of presenting materials to students in a way that does not cause overload on working memory. Yet, most of these studies have revealed insufficient results about redundancy principle, notably about the impact of language proficiency on redundancy effect. Thus, the present study aims to investigate redundancy effect from this angle. More specifically, the research questions are:

a. In which presentation do intermediate and advanced level students differ when they are engaged in animation with sequential narration and on-screen text (A-NT); animated narration (AN); simultaneous animated narration with on-screen text (ANT)?
b. Does language proficiency of EFL learners have an impact on redundant (ANT)/nonredundant (AN) presentations?
c. What are the preferences of EFL learners with regard to the effectiveness of presented materials within the framework of multimedia learning?

Hypotheses

It was hypothesized that learners would remember many more idea units and produce more creative solutions in successive A-NT material than in AN and ANT material, respectively (Moreno & Mayer, 2002, Experiment 2). Sequential presentation should facilitate mental processes and representations in working memory, thereby leading to more meaningful learning than the other versions (Hypothesis 1).

As for the impact of language proficiency on redundancy effect, it was predicted that advanced EFL students would outperform intermediate students in the redundant (ANT) and nonredundant presentation (AN). To Clarke's short-circuit hypothesis (1988), lower proficiency learners should have limited language proficiency 'exerting a powerful effect on the behaviors utilized by the readers' (p.119) and intermediate learners' limited control over the language should preclude them to integrate and to process information interactively in their cognitive system (Hypothesis 2).

With respect to the preferences, learners at both levels should have more positive tendency in animation with successive narration and on-screen text (A-NT) (Hypothesis 3). Since students have more processing time to deem about the content of the presented material and since they view the animation longer, they should prefer this version more than the other two.

METHODOLOGY

Participants

The participants were 60 first year undergraduate students recruited from a university in Turkey. The mean age was 20.92 years (SD=1.062). Thirty participants in the intermediate group (59% females, 41% males) and thirty in the advanced (34% females, 66% males) served for the study. All had almost six years of English study at high school prior to tertiary level. Students were placed in their proficiency levels on the basis of their TOEFL exam, which was performed by the university. The participants getting over 80 were accepted as advanced; between 40 and 60, intermediate.

Materials and Design

The computer-presented materials consisted of animation with narration (AN), simultaneous animated narration with on-screen text (ANT), and successive animated narration with on-screen text (A-NT). AN was about how water cycles; ANT was about how earthquakes happen; A-NT was to do with the process of photosynthesis. Both intermediate and advanced students received the same presentations. These

materials consisted of three Powerpoint slides. They included static but successive/simultaneous illustrations. The slides advanced automatically. AN included a 44-s presentation and 7 slides depicting how water cycles; ANT included a 117-s presentation and 10 slides showing how earthquakes happen; A-NT included a 160-s presentation and 9 slides about the photosynthesis process. On screen text was written fully under each slide in ANT and A-NT presentations. The students could not replay the slides and they were required to complete all the tests respectively.

The paper-based materials for each student consisted of a participant questionnaire, a prior knowledge test, a retention test question and seven transfer test questions for each of the A-NT, AN and ANT presentations; a persona evaluation checklist. The participant questionnaire solicited information about their age, gender, and TOEFL exam score. It was given along with the prior knowledge test which consisted of a five-point Likert scale (1= very little; 5= very much) in which students' levels of knowledge about water cycle, earthquakes and photosynthesis were assessed. The retention test question asked the participants to write whatever they recall about the topics; for example, "how does water cycle happen?" The transfer test required learners to utilize and transfer the knowledge that they obtained through the presentations into other situations; for example, "why is chemical energy necessary during photosynthesis?" The persona evaluation checklist in the study of Craig, Gholson, & Driscoll (2002) was used to elicit participants' opinions about the presentations; it consisted of a Likert-type scale, ranging from 1 to 6 (1=extremely enjoyable; 6=extremely nonenjoyable) (see table 1 and table 2).

Procedure

This study was conducted with first year undergraduates at a university in Turkey in the first semester of 2010-11 academic years. All the students were invited to a conference hall to be informed about the research and its aim. When the participants came, they were handed out a packet of materials, consisting of a participant questionnaire; an informed consent letter, and a prior knowledge test. After students' knowledge levels were ascertained, ten students were excluded because of their high scores on the prior knowledge test. 60 students left for the study. Prior to study, they watched an example slide about a different topic and then they completed retention and transfer test questions about it. So, all students were familiar with what they would perform later.

Afterwards, students came to the computer laboratory in groups of 10 per session. The apparatus consisted of 6 Pentium III PC computer systems, with a 14-inch monitor. Two tests were conducted after each of the presentation was over. The first test was a free recall task in which the participants were asked to write down in English whatever they remember about the presentation they watched. They were given 5-min time limit to answer the retention question. The second was transfer test in which students were expected to answer a set of questions by using the knowledge that they gained from the presentations. Each transfer test lasted for 10 minutes. Upon completion of all the presentations and tests, students were given a persona evaluation checklist to learn their opinions about which model they enjoyed and thus preferred much. After they were thanked and debriefed, randomly selected 6 students from intermediate and 6 from advanced group were invited to focus group interviews in their L1.

Scoring and Analysis

The prior knowledge level of the participants about the topics was evaluated by excluding students who scored over 3 out of 5 in the Likert scale. The persona evaluation checklist was assessed by looking into the percentages of the participants' opinions. With respect to the retention test, first, 6 key idea units for each topic (water cycle, earthquakes, photosynthesis) were determined together with an expert on these topics. Second, 1 point was given for each idea unit and computed without regarding wording or grammar. In transfer test, there were 7 items for each presentation and 1 point was given for each item; they were computed by counting the total number of the correct responses without regarding wording and grammar. For interrater reliability, the same expert scored each of the idea units in retention tests and each of the items in transfer tests. The reliability was .96. Both types of tests were analyzed through independent sample *t*-tests. Patterns in the focus group interviews about the three different presentation models were also coded.

RESULTS

In which presentation do intermediate and advanced level students differ when they are engaged in animation with sequential narration and on-screen text (A-NT); animated narration (AN); simultaneous animated narration with on-screen text (ANT)?
When the mean scores of intermediate and advanced groups were compared between A-NT, AN, and ANT retention tests, advanced students remembered more idea units in three of the three tests (M=5.1, 4.9, and 4.1, SD=1.92, 1.86, 1.56) than did intermediate students (M=4.8, 4.0, and 3.8, SD= 1.86, 1.65, 1.70) for A-NT, AN, and ANT retention tests, respectively. As for the transfer tests, intermediate students produced fewer creative solutions (M=5.2, 4.8, and 4.0, SD= 2.10, 1.82, 1.78) than did advanced students (M=5.3, 4.6, and 4.5, SD= 2.38, 1.94, 1.68) for A-NT, AN, and ANT transfer tests, respectively.

Does language proficiency of EFL learners have an impact on redundant (ANT)/nonredundant (AN) presentations?
Independent sample *t*-tests revealed that there was only significant difference between advanced (M=4.9, SD= 1.86) and intermediate students (M=4.0, SD=1.65) in AN retention tests, $t(60)=1.\ 64$, p=0.015, d=0.60. With respect to the transfer tests, independent sample *t*-tests showed that there was no significant difference between intermediate (M=4.0, SD=1.78) and advanced students (M=4.5, SD=1.68) in ANT transfer tests, t(60)=1.22, p=0.06, d=0.48.

What are the preferences of EFL learners with regard to the effectiveness of presented materials within the framework of multimedia learning?
To cross-analyze the quantitative findings, qualitative data were collected through a persona evaluation checklist and focus group interviews. In the persona evaluation, the participants were asked to rate the extent to which A-NT, AN, and ANT presentations were enjoyable for them to recall more and to learn better .

Table 1. Intermediate students' opinions about how much enjoyable the presentations were.

Intermediate	Extremely enjoyable (%)	Enjoyable (%)	Somewhat enjoyable (%)	Somewhat nonenjoyable (%)	Nonenjoyable (%)	Extremely nonenjoyable (%)
A-NT	51	38	11	0	0	0
AN	0	15	13	24	30	18
ANT	0	8	11	15	37	29

Table 2. Advanced students' opinions about how much enjoyable the presentations were.

Advanced	Extremely enjoyable (%)	Enjoyable (%)	Somewhat enjoyable (%)	Somewhat nonenjoyable (%)	Nonenjoyable (%)	Extremely nonenjoyable (%)
A-NT	38	43	19	0	0	0
AN	25	17	21	17	16	4
ANT	0	12	16	27	23	22

In the persona evaluation, the most salient consensus among the intermediate and advanced students was for the sequential A-NT presentation. All the participants revealed that sequential presentation was more enjoyable, useful and thus easy to recall more and to learn better. In addition to this, for A-NT presentation, one of the intermediate students interviewed stated that
'Although it was difficult for me to answer transfer questions and write whatever I recall for A-NT presentation, it was easy for me to draw what I saw. I could draw what I saw in the A-NT presentation.'

In the interview, another participant in advanced group provided a similar response:
'Because A-NT presentation was successive, I had time to think and predict what the ensuing narration and text were about. When the narration, animation and text were shown sequentially, I was confirming my prediction, thus understanding and recalling more. I could also draw what I remembered on the sequential A-NT retention test'
What is more interesting for A-NT presentation is that one intermediate student stated that

'When I first saw animation with sequential narration and text, it helped me to recognize the word aurally, visually and in written form. This situation helps me to integrate the picture and the word interactively'.
Another advanced student confirmed the intermediate student:
By analyzing pictures first and texts later, I was able to recall more because I united key words and pictures in the A-NT presentation. This also provided me to learn vocabulary both visually and in written form, because I could understand whether it was a verb or noun in the text.

As for the AN presentation, while 42 % of the advanced students rated it was 'extremely enjoyable' and 'enjoyable', 15% of the intermediate students rated it was only 'enjoyable'. In the interviews, the participants in the advanced group stated that they could understand what the topic was about without the on-screen text; however, those in the intermediate group stated that they needed on-screen text. With regard to the ANT presentation, most of the participants at both levels rated it was not enjoyable much. During the interviews, they expressed that ANT presentation was difficult for them to follow and understand narration, text and animation at one time. One intermediate student stated that 'although narration did not interfere my understanding, the presence of text and animation simultaneously did.'

DISCUSSION

The first hypothesis that the participants would differ and recall many more idea units on retention tests and produce more creative solutions on transfer tests for A-NT presentation than for AN, and ANT presentations was confirmed. Generally speaking, mean scores revealed that both advanced and intermediate students were more successful in A-NT than in AN and ANT retention and transfer tests. This is attested to the fact that the deleterious effect of split attention is minimized when redundant on-screen text is preceded by the corresponding animation. Furthermore, through sequential presentation, redundancy effect which is detrimental to learning turns into positive effect, from which students benefit. This result is also consistent with that of Moreno and Mayer's study (2002, Experiment 2) in which they found out that the redundant group outperformed the nonredundant group when the presentations were sequential.

The second hypothesis that advanced EFL students would outperform intermediate students in the nonredundant presentation (AN) was confirmed only on retention tests. Independent sample *t*-tests showed that advanced students (M=4.9, SD= 1.86) differed from intermediate students (M=4.0, SD=1.65) only in AN retention tests, $t(60)=1.64$, p=0.015, d=0.60. This can be attested to Clarke's short-circuit hypothesis (1988) contending that limited proficiency exerts significant effect on the lower proficient learners' behaviors which revert them to poor reading strategies. In this study, lower proficiency was found to hinder students to select words and images, organize and integrate them in tandem in multimedia learning. On the other hand, the second hypothesis that advanced EFL students would outperform intermediate students in the redundant presentation (ANT) was not confirmed. Although intermediate students (M=4.0, SD=1.78) seemed to have created fewer solutions in the redundant ANT transfer tests than advanced students (M=4.5, SD=1.68), *t*-tests showed that the superiority of advanced students was not significant $t(60)=1.22$, p=0.06, d=0.48. In fact, this study revealed that the participants at both levels did not differ.

Qualitative results obtained through persona evaluation checklist and focus group interviews pinpointed to the effectiveness of the sequential A-NT presentation. So, third hypothesis was confirmed. The checklist showed that 89% of the intermediate students and 81% of the advanced students found A-NT presentation 'extremely enjoyable' and 'enjoyable' (see table 1 and table 2). In the interviews, almost all the participants expressed that sequential presentation provided them time to think and produce hypotheses about the ensuing text. A-NT presentation helped them visualize pictures and texts so much so that they could draw whatever they watched. This sequential presentation provided ample time, through which the participants saw pictures and words together. So they learned vocabulary visually. To sum up, the participants' quantitative responses on both retention and transfer tests were consistent with those on evaluation checklist and interviews.

IMPLICATIONS & CONCLUSION

The results have some important pedagogical implications for specifically EFL teachers. Advanced students outperformed intermediate students both on retention and transfer tests and advanced group did significantly better than intermediate group in AN retention test. Yet almost all the participants at both levels enjoyed and preferred sequential presentation much more than the other formats. Both intermediate and advanced students stated sequentially presented material would help them to learn more.

In addition to learning from the A-NT format – however redundant it is – it can also foster 'the learning of English when instruction is directed to learning the language itself' (Diao & Sweller, 2007, p.78). In multimedia learning, students can see animation or text first successively rather than simultaneously and then they can hear narration. If students improve both reading and listening and pronunciation as in the Gorsuch and Taguchi's study (2010) through repeated reading and listening sequentially, then, a fortiori, they can benefit from redundant materials if the presentation is directed repeatedly for the sake of learning English. Teachers and material developers can prepare advanced students nonredundant materials (AN) as well as redundant but sequentially presented materials (A-NT). Advanced students in this study were more successful in AN retention test and 42% of them stated 'extremely enjoyable' and 'enjoyable' for AN presentation in the evaluation checklist. As for the simultaneous redundant presentations (ANT), not only 72% of advanced but also 81% of intermediate students found ANT presentations no enjoyable. So teachers may not give priority to ANT materials in classes.

This research study revisited redundancy principle and looked into whether language proficiency matters in redundancy principle of multimedia learning. Further, because the study looked for the effect of language proficiency on redundancy, it sheds light on the redundancy effect from another angle and presents some central pedagogical implications for both teachers and material developers to take into consideration.

ABSTRACT

The aim of this study was to investigate the effects of screencast with narration and without narration in enhancing learning performance. A series of screencast teaching Flash animation software was developed using screen capture software for the purpuse of this research. The study was conducted under the online self-paced learning condition. A pre-test post-test experimental design was used involving two different groups that studied the two different strategies. The results indicate that screencast with narration was significantly more effective than screencast without narration in enhancing students' learning performance.

Keywords

Digital video, learning, narration, screencast, screen capture, video sharing

Introduction

The educational value of videos lies in its dynamic visual representation that can be used effectively to show screencast, places, implied processes, storytelling and many more benefits. They can be played silently or applied in combination with audio tracks. When used in a correct manner and combination, video's role as dynamic visual representation might be a powerful tool in enhancing teaching and learning (Montazemi, 2006).

In developing digital video content for learning, teachers need to take into consideration the role and limitations of students' cognitive ability. They need to understand how videos can be used to foster learning, and they should design and develop the materials not from the teacher's perspective, which may risk losing learners' attention and engagement. Therefore, an understanding on how video presentation affects students' learning requires a depth analysis of how it is processed in the human memory structure.

Learning is a process of receiving, processing, coding, storing and retrieving information from memory structure (Lin & Dwyer, 2004). Human memory structure is divided into three processing categories namely sensory memory, short-term memory and long-term memory (Atkinson & Shiffrin, 1971; Mayer, 2001). These memories are limited in terms of capacity and duration. Therefore, not all the information entered the memory structure will be registered in long-term memory structure in schema form (Chandler, 1995). Information entered into the memory structure is processed through two different channels; visual channel that processes visual information such as picture, and verbal channel that processes verbal information such as narration and text (Paivio, 1986; Mayer, 2001). Since human memory is limited in terms of duration and capacity, placing a high cognitive load on one channel may reduce the effectiveness of presentation. By presenting material in a form that involves both channel will reduce the cognitive overload in each channel and the presentation will be more effective (Mayer, 2001).

Based on this multimedia dual coding theory, video with adequate verbal support is more effective in assisting students' cognition. Notwithstanding the strong arguments and theoretical support, research findings on the effectiveness of digital video for learning remain inconsistent (DeVaney, 2009; Dupagne, Stacks & Giroux, 2006; Veronikas & Maushak, 2005). Some findings seem to suggest that video is only suitable as an additional tool to support students' understanding only on certain topics, and not across the entire curricula (DeVaney, 2009; Montazemi, 2006). Inconsistencies of the findings may be partly

attributed to improper design of the video materials and the failures of the developers to take into consideration the limitations of human cognition in their design. For the latter, arguably many developers have failed to pay greater focus on the potential cognitive overload caused by information being presented too much and too quickly, or by the simultaneous appearance of moving elements, narration and on-screen texts in their design that may impede learning (Bell & Bull, 2010; Mayer, 2002).

Furthermore, a pertinent question arises on the need of verbal support such as narration to be employed in the video development and implementation. Even though the dual coding theory proposes that the inclusion of verbal element to support visual element is helpful in terms of reducing cognitive overload, the additional narration does not always support learning (Jeung, Chandler & Sweller, 1997; Fenrich, 1997). With short and simple video and utilization of user-control and rehearsal functions, the video might promote successful learning even without verbal support. Therefore, the primary objective of this study was to investigate the effectiveness of instructional video with narration and without narration in promoting and enhancing learning.

Method

Research question

Based on the discussion above, the primary research question of this study is as follows:

Is there a significant difference between screencast with narration and screencast without narration teaching impacts on students' online learning achievements?

Learning Materials

Two groups of videos consisting of six screencast series were created with Camtasia Studio screen capture software for the research. The screencast series were used for teaching Flash animation software functions namely setting the screen properties, introduction to timeline, drawing tools, creating keyframe and frame, creating motion and saving the output. The first group comprised a screencast series without narration and the second group was based on the same screencast series, but included with narration. The screencast series duration ranged from one to two seconds.

The screencast series developed was uploaded to two separate channels namely MOVIEDU1 and MOVIEDU2 created in YouTube. Two new channels were created to avoid any distraction from any unrelated videos throughout the study that may influence the learning outcome. The first channel contains screencast series without narration and the second channel contains screencast series with narration.

Test Instruments

Pre-test and post-test were used on the two groups that studied the two different screencast presentation strategies respectively. Pre-test and post-test were hands on test that required students to create an animation of bouncing ball by following the specific properties requested. Grades were given based on how accurate students employ the required properties in their design. The pre-test was conducted before the learning process and the post-test was conducted immediately after the learning process.

Procedures

The research sample comprised 45 undergraduates drawn from two intact classes, whose ages ranged from 21 to 25 years and whom were enrolled in a Diploma in Education course. The study was conducted separately for both groups. Pre-test to identify students' prior knowledge consistency of the content was conducted before the study. Fifteen minutes were given to them to complete the task. Immediately after the pre-test, the two groups explored the two different screencast presentation methods that were with and without narration. They were first briefed on how to access and use the materials in the respective channels. Students were also encouraged to utilize the user-control elements in the video player throughout the study. Approximately, 30 minutes were allocated for them to complete the study. Four research assistants helped the researchers monitor the students to ensure that the latter comply with the procedures of the study. Upon the completion of the tasks, a post-test was conducted that lasted for

fifteen minutes. One-way ANOVA test was used to analyze the data collected from the pre-test and post-test.

Results

Consistency of prior knowledge was determined through the pre-test results. From the one-way ANOVA test, Levene's test for homogeneity of variances is not significant ($p>0.05$) and therefore the population variances for each group are approximately equal. The output shows that there is no significant difference in the pre-test achievement of students in screencast without narration and with narration strategies $F(1,43)=0.15$, $p>0.05$. This result further assured that there is no pre-existing difference in prior knowledge by group. Total mean scores of prior knowledge are also obviously low ($M=7.22$, $SD=8.57$), which is necessary for the study.

Students' achievement was determined through the post-test results. From the one-way ANOVA test, Levene's test for homogeneity of variances is not significant ($p>0.05$) and therefore the population variances for each group are approximately equal. The output shows that there is significant difference in the post-test achievement of students in screencast without narration and with narration strategies $F(1,43)=16.62$, $p<0.05$.

Mean scores indicated that students in the screencast with narration strategy ($n=22$, $M=76.14$, $SD=16.25$) obtained a better mean score than those students in the screencast without narrataion strategy ($n=23$, $M=52.09$, $SD=22.65$). The results indicated that screencast with narration was better than screencast without narration in enhancing learning.

Discussion

With the emergence of online video sharing technology, learners can have the opportunity to learn in conducive learning environments that are both visually appealing and cognitively compelling. When used appropriately and judiciously, video being a dynamic visual representation plays a potential role in assisting learning. However, it appears that research findings with regard to the effectiveness of digital video on learning have been inconsistent (DeVaney, 2009; Dupagne, Stacks & Giroux, 2006; Veronikas & Maushak, 2005). The main reason of these inconsistencies may be attributed to the design limitations particularly due to some of the developers' poor grasp on the theoretical underpinnings that may impact learners' cognition (Bell & Bull, 2010; Mayer, 2002). Keeping the video short and simple, and encouraging learners to fully utilize the control functions in the digital video player can have a positive impact; learners' cognitive overload is minimized throughout the learning process, which improves learning. However, question arises on the need of verbal element to support the visual display if the video employs these development and implementation principles. Thus, this study has investigated the effectiveness of digital video, specifically instructional screencast teaching software with and without narration on students' achievement. The findings show that students in the instructional screencast with narration strategy obtained better mean scores than students in the instructional screencast without narration strategy. This suggests that narration supported in the instructional screencast had been very helpful for successful learning, especially for learners with low prior knowledge in this study, which concurs with Mayer's (2001) dual-coding assumption. Screencast with narration that utilize both visual and verbal channel in the memory structure can attenuate cognitive overload resulting in effective learning as pointed out by Mayer (2001). Since this study only focused on narration as a verbal element, further study is warranted to investigate the effectiveness of text as verbal element on learning as informed by the dual-coding assumption, specifically in the instructional screencast design.

ABSTRACT

In this paper in a dynamic way we present the processing of angles on a transversal, angles with perpendicular rays and angles with parallel rays. These angles seem rather trivial, but are used in complex geometry situations to help solve problems. Because students very rarely perceive the application of these angles, we hope to resolve problems that may arise by using the angles in geometric problems.
The main purpose of this paper is to compose several dynamic applets with the help of freeware dynamic mathematics software GeoGebra, and to place them on the PBworks service.
This way we get dynamic worksheets, where students can move the pair of angles and test if the angles are equal or supplementary. This gives a clear image which pair of angles are corresponding, alternate, consecutive, which angles have parallel rays, which angles have perpendicular rays and which ones are equal or supplementary.
Keywords: angles, geometry, GeoGebra, construction, transversal, PBworks

INTRODUCTION

Geometry as a mathematical discipline is difficult to understand for many students, especially for the ones in the lower grades. Therefore we must consider a new approach to its presentation. The new approach should be adapted to the possibilities and needs of the students as well as their age. The new approach should also instigate inventiveness.
Gradually people started to change their old habits, to adopt new technology and to improve their life. This way the technology is penetrating into every sphere of our lives and even in our education. Information and communication technology (ICT) represent a set of different tools and resources used for creating, distributing, storing and managing information. These technologies include computers and Internet, broadcasting technologies (radio and television) and telephony. Information and communication technologies are no longer used in the administration of education, but are entered in the teaching process. The application of ICT in education enables creation and development of new way of learning. Information and communication technologies offer powerful learning tools that require greater engagement of students in the learning process and develop new skills.
The application of information communication technologies to solve geometric problems provides a new approach to their presentation. In this way, students can obtain a complete audio-visual representation of geometric problems with angles. One approach is by using interactive geometry software (dynamic geometric environments). Interactive geometric software is a computer program that primarily serves for creating geometric applets, and later manipulates with the same. There are a number of interactive geometry softwares like: CaR, Cabri Geometry, DrGeo, GeoGebra, Geometry Expression, KmPlot, MathKit, and others. In this paper the interactive geometry software GeoGebra is featured. GeoGebra is free and open interactive geometry software which can be applied to geometry, algebra, tables, graphs, statistics and calculations in a very simple way. GeoGebra software is written in Java and thus is available for multiple platforms. The development of geometric applets of angles using the mathematical software programs is interesting for the children because it gives them a clear image which pair of angles are corresponding, alternate, consecutive, which angles have parallel rays, which angles have perpendicular rays and which ones are equal or supplementary. The software use different colors to represent objects of design, and most importantly can move the angles in order to test if they are equal or supplementary.
The integration of newer information and communication technologies, computers, Internet and Web has enabled rapid and easy way to distribute and share information and data. We previously mentioned that communication is very important for the educational process. Therefore the developed interactive geometric applets for angles will be placed on the web using the service PBworks. PBworks unites more than 300,000 educational workplaces and thereby helped in transforming teaching and learning for millions of students, teachers and parents. PBworks is very good with group and with individual projects as well, wherein students can log in via e-mail or through their school accounts. PBworks provides complete control on the work of the students, because it remembers every change made on the space. PBworks does not permit abuse because it offers the possibility of controlled access to the workspace. We

can determine which students will regulate the working space, and which ones would just review, because PBworks provides different levels of access like reading level, writing level, regulation level and administrative level. Starter edition of educational PBworks is free and offers a working space which can contain 100 users and offers up to 2GB of storage space.
The purpose of this paper is to offer a new way of solving geometric problems with angles, using information communication technologies. So by using interactive geometry software GeoGebra we will elaborate geometric applets for angles, which will be later placed on the working space of PBworks.

WHY ANGLES

Geometry is a part of mathematics, concentrated on issues related to the size, shapes, relative position of figures in space and properties of space. Geometry is one of the oldest sciences because the basics of practical knowledge of length, area and volume were known since the third century BC when the geometry received axiomatic form by Euclid. According to Euclid an angle (or plane angle) is the figure formed by two rays sharing a common endpoint called the vertex of the angle. There are different types of angles like acute angles, obtuse angles, straight angles, reflex angles, complementary angles, supplementary angles, vertical angles, angles on a transversal, angles with parallel rays, angles with perpendicular rays etc. But in this paper we only process the angles on a transversal, angles with parallel rays and the angles with perpendicular rays.
According to Euclid parallel lines are two lines on a plane that never intersect, actually the lines are parallel if they are always the same distance apart (called "equidistant"). When parallel lines get crossed by another line (which is called a transversal), we can see that there are many angles, as in Figure 1. These angles can be made into pairs of angles which have special names. There are angles which have common vertex, angles that lie on the same or on the opposite side of the transversal, internal angles and external angles.

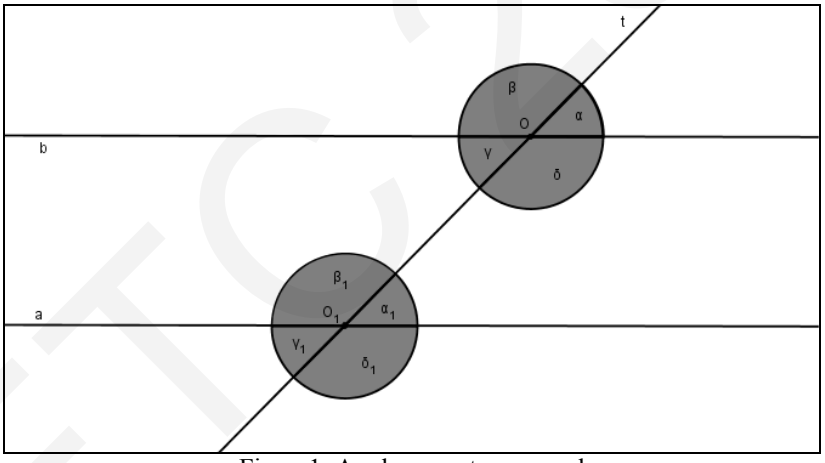

Figure1. Angles on a transversal

Two angles opposite each other, formed by two intersecting straight lines that form an "X"-like shape, are called **vertical angles** or **opposite angles** or **vertically opposite angles**. These angles are equal in measure. In compliance with Figure 1, the pairs of angles called vertical angles are: α and γ, β and δ, α_1 and γ_1, and β_1 and δ_1. The pair of angles that don't have common vertex, lie on the same side of the transversal and one of them is internal and the other is external, are called **corresponding angles**. In compliance with Figure 1, the pairs of angles called corresponding angles are: α and α_1, β and β_1, γ and γ_1, and δ and δ_1. Corresponding angles are equal in measure. The pair of angles that don't have common vertex, lie on the opposite side of the transversal and both of them are either internal or external, are called **alternate angles**. In compliance with Figure 1, the pairs of angles called alternate angles are: α and γ_1, β and δ_1, γ and α_1, and δ and β_1. Alternate angles are equal in measure. The pair of angles that don't have common vertex, lie on the same side of the transversal and both of them are either internal or external, are called **consecutive angles**. In compliance with Figure 1, the pairs of angles called consecutive angles are: α and δ_1, β and γ_1, γ and β_1, and δ and α_1. Consecutive angles are supplementary.

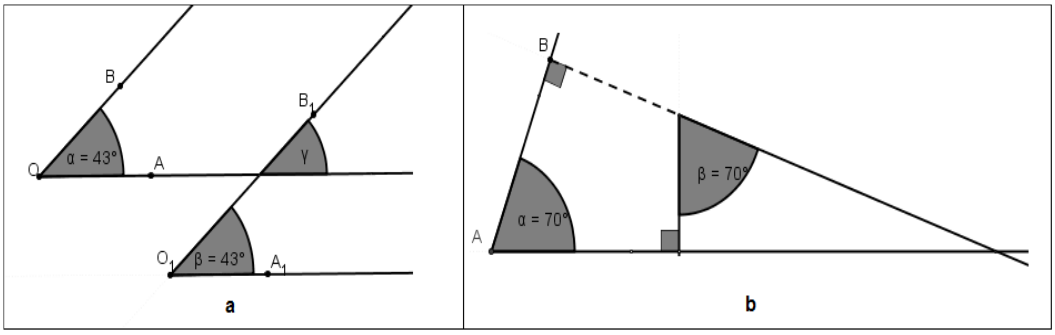

Figure 2: (a) Angles with parallel rays, (b) Angles with perpendicular rays

The pair of angles that have two pairs of parallel rays is called **angles with parallel rays**. Figure 2 (a) illustrate that pair of angles. The pair of angles that have two pairs of perpendicular rays, are called **angles with perpendicular rays**. Figure 2 (b) illustrate that pair of angles.
The angles that we presented before are used in complex geometry situations to solve geometric problems. For example very often we meet geometric problems like "Find the angle" problems, in which some lines and angles are given as problem parameters, and the student will be required to find a particular angle or angles. Also the angles that are present in this paper are used in geometric proofs. The goal of every geometric problem is to be solved by writing geometric proofs. By writing geometric proofs we realize how much we have learned and understood geometry. The materials in this paper review the basic terms and concepts in geometry, and provide lessons to help develop understanding of angles as well as their application in solving problems related with angles.

WORKING METHODS

GeoGebra applets are made and intended for Math teaching in the middle schools in Macedonia (6th grade). These applets are placed on the service PBworks:

- Angles

On this front page there are six different pages representing the lessons for all different types of angles we have mentioned before. These six lessons are listed in Table 1.

Angles
Angles on a transversal
Corresponding angles
Alternate angles
Consecutive angles
Angles with parallel rays
Angles with perpendicular rays

Table 1. Six lessons for angles

Almost all of the six lessons are consisted of:

- Reminding - of what was learned in previous geometry lessons: which precognitions students have about the old geometric concepts that will be used in the new lesson.
- Exploring interactivity – applet made with the software GeoGebra in which the angles are visually presented and gives the opportunity to change the size of the angles.
- Check the accuracy of theorem – the applet made with the software GeoGebra in which a theorem is presented about a certain type of angles, has a feature to check its accuracy by moving the angles.
- Metadata – Basic data for the construction: in which classroom activity this lesson is processed, in which strand of the curriculum, in which grade, how should it be used, which programs are required, etc.

Now we will describe more thoroughly what contains almost every lesson that is set on the working space PBworks.

Reminding

This is a introduction in the lesson, where the students under the guidance of the teacher performs recapitulation of the old geometry lessons in order to refresh their knowledge. In this section there is a picture and several questions that are in reference to the picture. These questions should encourage students to think in order to extricate and surface their knowledge. With the help of this easy method of questions and answers, students realize which precognitions do they have about the geometric concepts, that will be used in that particular lesson.

Exploring Interactivity

At the beginning of this section the new terms that are important for that particular lesson are defined. For example in the working space for the corresponding angles, there would be a definition of the new term "corresponding angle" and an appropriate example, which one from the pairs of angles are corresponding angles. Next in this section there is a geometry applet made with the software GeoGebra, in which a pair of corresponding angles is presented. In every geometry applet the pairs of angles are painted in different colors. This is a great feature of GeoGebra, because the colors are quite interesting for students and in this way they can clearly distinguish the different types of angles. Another great advantage of GeoGebra is the possibility to change the size of the angles. This is great advantage, because in this whey the students don't have to make another applet if they have to change the size of the angle. They can do this by simply moving the slider. Also the students are able to choose the geometric elements that will be displayed on the applet. For example in the working space for the corresponding angles, the students can choose whether to display all four pairs of corresponding angles, or to display each pair separately. In this way we get an applet that isn't crowded with auxiliary geometric elements, but instead the applet displays only those geometric elements that are required in that moment by the students.

Check the accuracy of theorem

In this section firstly we present a theorem about a certain types of angles. For example in the working space for the corresponding angles the theorem states "Every pair of corresponding angles is equal". Then there is a geometry applet made with the software GeoGebra in which the theorem is presented. With this applet we can check the accuracy of the theorem. In this applet there are four sliders, one for each pair of angles. With the slider we can move the first angle from the pair of angles to the second angle from the same pair, in order to check whether they overlap, see Figure 3 (a). In this way we can prove that two angles of the pair of angles are equal. Or we can move the two angles of the pair of angles to a specific position, to check whether their sum is equal to 180^0, see Figure 3 (b). In this way we can prove that the two angles from the pair of angles are supplementary. In this way with a simple movement of the slider we can check the accuracy of the theorem. This excellent opportunity is made available by the program GeoGebra. With this program we can do many interesting dynamic applets, where we can move elements. This movement is enabled using the slider and several additional points that have variable coordinates whose value depends from the value of the slider.

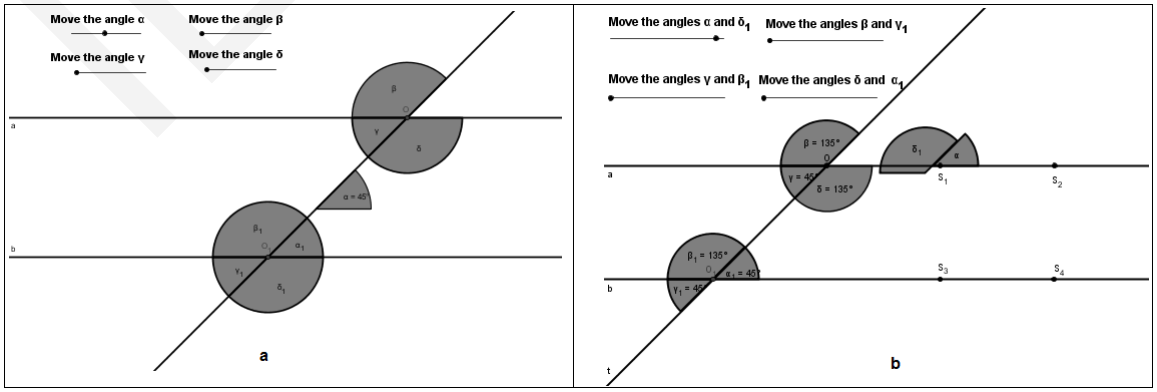

Figure 3: (a) Movement which proves that the angles are equal, (b) Movement which proves that the angles are supplementary

CONCLUSION

Creative and innovative applications of information and communication technologies (ICTs) are important tools to ameliorate the education. The explosion of the Internet in the 1990s, the emergence of a variety of low-cost computing devices and the increased diffusion of computers throughout society, ushered "ICT in education" projects to prepare students to effectively engage in the information age. ICT can be used to improve the quality of education by enhancing educational content development, supporting administrative processes in schools as well as other educational establishments, and by increasing access to education for both teachers and students via remote learning. It offers opportunities for students and young people, particularly those living in rural communities, to broaden their horizons and improve their employment prospects.

In this paper, we present how to use the ICT tools to develop new approach in the learning process of angles. For that purpose we use mathematic software GeoGebra and service PBworks. As previously mentioned, the students especially the novices have difficulties to understand the geometry. But in this paper we present a new and interesting way to learn geometry. According to the first impressions, students react positively to this new way of presenting the geometry – teaching geometry with ICT. During the classes students are more interested and motivated, and they like to experiment with colors. They especially show a great interest in the opportunity to move the elements of the applets.

ECOLOGICAL EDUCATION THROUGH BIRDS FOR THE PUBLIC IN IASI BOTANICAL GARDEN (ROMANIA)

Carmen GACHE
„Al. I. Cuza" Iasi University, Faculty of Biology, Bd. Carol I, 20 A, Iasi, 700505
cgache@uaic.ro

Abstract
Iasi Botanical Garden, the oldest botanical garden in Romania, represents an oasis for biodiversity and people on a surface about 100 hectares in the north-western side of Iasi city. Valuing the experience of the local ornithology school and Romanian Ornithological Society Iasi Branch, we propose a new educative program in this botanical garden using the birds' presence in the area. The program include theoretical ornithological lessons, but also practical activities (birdwatching, research activities, vegetation's management to improve the suitable habitats conditions for birds, artificial nest and feeding sites, etc.), open conferences related to the large topic of environmental ethics. The program will permit us to find the best practices to improve the quality of the green areas from the city in order to preserve the biodiversity and the life quality of the local community.
Keywords: ecological education, long-life learning, birds, botanical garden

INTRODUCTION

The green areas inside and surrounding the big cities represent a special functional site depending on the vegetation and fauna, but also on the buildings and facilities for cultural and education activities, sports and recreation. These green areas have numerous functions: they beautify the urban environment giving a pleasant garment plant in the city's architecture, improve the quality of microenvironment, and purify the atmosphere of dust and harmful substances, providing the oxygen necessary for life. In the same time, the green urban areas are bracing and aesthetic environments for physical and mental recreation of the big cities' inhabitants. At last but nor without importance, these areas present a theoretical and practical interest for the scientific investigation and biodiversity protection.

In the actual context of increased environmental degradation and natural population decline recorded by many groups of plants and animals, the green urban areas become true refuges for ones of the wild species. During the last decades, the specialists have focused their efforts on the diversity and ecological aspects of the green areas' perimeter trying to understand the subtle mechanisms that ensure the functioning of these artificial ecosystems extremely ecologically fragile.

Iasi Botanical Garden is the oldest botanical garden in Romania and covers a surface about 100 hectares in the north-western side of Iasi city, representing the greatest green area inside Iasi city, a true oasis for biodiversity and people equally. The botanical garden serves as a fixative and anti-erosion plantations on a territory prone to landslides, protection for the water resources, and climate protection barrier against the adverse strong winds and excessive temperatures. Since its establishment, the Iasi Botanical Garden is a particularly important milestone in the life of the city of Iasi, but the valences of educational institution are not valued enough thinking about the present and tradition of higher university education opportunities from this city. We must mention that the administration of the Iasi Botanical Garden is taken in charge by "Al. I. Cuza" Iasi University.

During the last two decades, a strong ornithological school developed in the "Al. I. Cuza" Iasi University in good partnership with the Romanian Ornithological Society (SOR/Birdlife Romania). The students' interest for ornithology increased and become constant over the years, being attracted through the practical activities related with the Ornithology optional course and ecological summer camps organised with the logistic support of SOR/Birdlife Romania - Iasi Group. Numerous groups of children have participated in these summer camps organised in Vladeni wetland area (Jijia and Miletin Ponds SPA in Nature 2000 Network), demonstrating a willingness and interest to spend few days of their holiday involved in environmental and ornithological education activities. Many of them became students in our university, taking bachelor in biology, geography and geology areas.

We must notice that the Iasi Botanical Garden, with it twelve sections, represent a huge mosaic of habitats, providing food support varied and numerous favourable places for refuge and nesting birds – during the last 20 years, we recorded 107 bird species in the area, 72 being breeding birds in this perimeter (Gache, 2007), these diversity presenting variations from one year to other (Croitoru, 2009).

All this argues permitted us to propose a new educative program for the public of this botanical garden using the birds' presence in the area and the experience of the local ornithology school and SOR/Birdlife Romania - Iasi Group: *Iasi Botanical Garden, refuge site for birds in our city*. This program will provide

ecological and ornithological lessons outdoors in nature, in a safe location near the house and any potential lover: Iasi Botanical Garden, supplying, locally, the absence of a true national environmental education program.

AIMS, ACTIVITIES AND METHODS

The principal aims of our educative program are:

1. Launching new educational and recreational offerings in the Iasi Botanical Garden by initiating an ornithological and environmental education program to the visitors representing various age groups, and different socio-professional categories.
2. Creating a database on the diversity and evolution of bird fauna in the Iasi Botanical Garden.
3. Improving suitable living conditions for populations of birds present on the Iasi Botanical Garden's territory.
4. Public involvement in the actions of knowledge and protection of birds and their suitable habitats.
5. Change the people attitude toward nature from indifference and carelessness to interest and active involvement in the environmental conservation programs.
6. Develop a responsible environmental behaviour of people and change the present unresponsive attitude to a friendly attitude of human being to the nature.

This permanent educational program address to the local community in Iasi city, but we expect that can attract participants from all over north-eastern part of the country on medium and long term. The running program will develop the knowledge about nature of the participants, which will adopt an active ecological attitude due the understanding the complexity of the ecosystems' functioning and awareness of the need to maintain a balance between biodiversity conservation and expansion of human civilization for the welfare of the human species itself nor only for the other living beings. Through its activities, the program will provide coverage of the priority directions in the Action Plan for Botanic Gardens in the European Union (biodiversity conservation, education, education and information, culture and tourism).

The program *Iasi Botanical Garden, refuge site for birds in our city* include the following activities:

- Carrying out a program to initiate and enhance the ornithological study, including theoretical lessons, themed games and birdwatching practical applications for various age groups.
- Identify a suitable place or build an arbour for ecological education inside the botanical garden's perimeter to conduct the theoretical activities of education program.
- Develop a monitoring program following the evolution of bird fauna's diversity and populations' trends on the botanical garden's territory.
- Develop a program to capture and ringing birds in this area.
- Initiate experimental ornithological studies in the Iasi Botanical Garden.
- Implementation of some measures of vegetation's management to improve the suitable habitats conditions for birds.
- Purchase and installation of bird feeders and nest boxes.
- Providing supplementary food available for birds during the wintering time.
- Monitoring of the nest boxes in order to identify the bird species using it, following the reproductive success of them and to assess the influence on the population's trends.
- Conducting recreational birdwatching activities.
- Building and proper planning of one ornithological observatory in the dam lake from Podgoria Copou rivulet area.
- Organising conferences series related to the large topic of environmental ethics presented by the specialists from Iasi universities, but also, visiting professors in the area.
- Manufacture and installation of presentation panels of bird species in different parts of the Iasi Botanical Garden, valuing photos from the collections of our bachelor, master degree and PhD students.
- Event activities on the schedule of Ecological Calendar (1st April – National Day of Birds, 22nd April - Earth Day, second weekend of May – International Days of Migratory Birds, 5th June - International Day of Environment, first weekend of October – European Birdwatch Days, etc.), organising birdwatching activities, drawing, essay or other literary writings competitions, photo exhibitions, cultural evenings, lectures and debates on topical environmental issues.
- Publish a *Small guide of the birds from the Iasi Botanical Garden* and a *Guide for the study and protection of birds in parks*.

Once the program started, some activities will be permanently, others will take place periodically, and some will have events character.

The installation of feeders and nest-boxes for birds will be phased both in time (over two – three years), and space (on each side of Podgoria Copou rivulet valley, from south to north) in order to use the monitoring results in analysing the seasonal and yearly impact on the birds' diversity and population trends. The feeders will be installed in September – October in different places from the whole territory of the botanical garden, including some big feeders in the area of the *Ecological Education Arbour*, *Ornithological Observatory* and greenhouses complex. The feeders' supplying will be provided weekly during the wintering time (there are recorded very cold winters, with strong winds in the north-eastern Romania). The necessary seeds will be providing by the botanical garden resources (Teaching-Experimental Section) or collected through the volunteers' participation. The installation of nest-boxes will be done during the period 15th February – 15th April, each year (but in order to avoid an effect of overcrowding, after the installation of a sufficient number of nest-boxes, it will repair and replace damaged ones).

During the first stage of the program, the active members of SOR/Birdlife Romania - Iasi Group will be the first volunteers and trainings carrying out the educative activities, installation of first feeders and nest boxes for birds in the area, seeds supplying for birds feeders and initiating the birds' monitoring schemes. By other hand, this NGO will assure the logistic support to initiate the ornithological applicative studies (binoculars, field birds' guides, nets and other means for birds' catch and ringing).

In the first month of the program, while we develop a popularization campaign of this new educational offer, after finding a temporary location in the Botanical Garden's area (probably, the outdoor arbour for Japanese Festivals), will initiate the theoretical lessons of ornithology and ecology. These will be scheduled weekly and will be associated with thematic games, applied ecological and ornithological activities inside the Botanical Garden's perimeter. The working groups will not exceed a total of 10 students following to obtain educational program effectiveness.

We will mark some ornithological routes for birdwatching activities and we will install some presentation panels with the bird species from different areas of the botanical garden territory. Recreational birdwatching activities will be organised monthly (as public required, can be scheduled every two weeks), but also during the specific events. These last will be established for each semester of year, involving the participation of students and pupils of all levels of school education (from kindergarten to high-school).

There it will be a monthly program of conferences included in the series related to the large topic of environmental ethics; the speakers, theme, location and timetable will be publicized in local media, on university and botanical garden websites.

The ornithological research activities will involve high-school, bachelor and master degree students and will have regularly schedule, organised like a component of the monitoring and experimental ornithological studies. All the data will be included in standard forms, adapted to each kind of activity (studies on birds' diversity evolution, birds' population trends' monitoring, nest-boxes and feeders' monitoring). The students can use these activities in order to prepare their bachelor or master degree thesis, but also in different competitions of projects on environmental topic. The scientific results of the program can be valued also through scientific meetings.

This project will permit to strength the existent partnership between our university and SOR/Birdlife Romania. We can use nor only the experience of the NGO' specialists and members, but the central office can provide logistic support for feeders and nest-boxes' manufacturing. We will develop partnerships with other educative institutes in order to involve a large number of children, but also their parents and grandparents, in this ecological education program, including through the development of small environmental projects done by children of different age levels. We are thinking to attract retired professors but also other retired people categories that enjoy keeping their active spirit and human contact in the activities of this program.

The experience gained through this program will permit us to find the best practices to improve the quality of the green areas from the city in order to preserve the biodiversity and the life quality of the local community. We can share this experience with the local authorities implementing part of the component developed in our program in other green areas from the city, for example, installation of feeders and nest-boxes for birds, vegetation's management, etc. that could improve the environmental quality nor only for birds, but for biodiversity generally.

RESULTS AND FUTURE STRATEGIES

The Iasi Botanical Garden will develop and strength it position like ecological education centre following the biodiversity's conservation *in situ* in Iasi city and north-eastern Romania. On medium and long-term, this project's development could motivate a large number of young students to choose the "Al. I. Cuza" Iasi University for their bachelor and master degree studies, developing the research skills and aptitudes

of children, including the communication abilities through team-working activities and experience changes with people of different ages and social-professional areas. In a second stage, there will be organised summer ecological camps for gymnasia and high-school students from the whole historical Moldova region (eastern Romania), for children with poor possibilities, including from orphanages. The children will receive accommodation in the university campus. Publicised around the program' activities will provide additional image growth for both institutions, Iasi Botanical Garden and "Al. I. Cuza" Iasi University.

The program's results will permit to improve the management plans of Iasi Botanical Garden in order to design and implement vegetation's arrangement to preserve the bird fauna's diversity, but also to develop the educational strategy of this institution.

The program development will attract a larger public in the botanical garden and will permit to provide additional funds through special subscriptions (*Ornithological lessons*, *The dawn song*, *The owls' nights*, *Conferences series*, etc.) or through events organised to collect funds in order to initiate mini-projects of students about different ages.

The participant public, but also the passive visitors that will see the educational program's results can value the new knowledge and experience in their own garden or inside the green areas surrounding the blocks of flats, determining an improvement of the environmental quality in Iasi city.

In the future, we are thinking to improve the recreational offer of the botanical garden installing small video-recorders inside the nest-boxes or close to the bird feeders that can provide scientific data but also images that can be projected on large screens installed in the area of *Auditorium* building or *Summer terrace*, projected to be developed in the Iasi Botanical Garden during the next years.

CONCLUSIONS

The Iasi Botanical Garden represents one of the most important green areas inside Iasi city, a true oasis for people and nature in the north-western side of the city.

We propose one new ecological education program for the public of the botanical garden using the birds' presence and diversity from the area. The birds are ones of the more attractive animals through their appearance, songs and behaviour.

Once the program started, some activities will be permanently, others will take place periodically, and some will have events character.

One of the principal aims is to involve a large number of children, but also their parents and grandparents, in this ecological education program.

EDUCATION AND THE FUTURE MODERNIZE

Assistant Professor Dr. Çetin BAYTEKIN
Sakarya University, Faculty of Education
Turkey

ABSTRACT:

Changing technological and social structure based on it, makes changes on educational programs. New forms of education and training programs are in the process of change. The learning environment, the introduction of new technologies in the class are forward-looking shape.Educational technology which has been started via pictures in caves, pictures, movies, radio, TV, the combination of the computer medium output, a combination of Internet and TV, today is shaped by 3G and 4G, develops. Iphones offers two way communication on education, and learning environment . Teaching and learning environment uses , computer, smart table, wood tablets and smart classrooms. Technology changes teaching and learning features. The school offers individual, effective and productive teaching . School organization changes. Faculties of education develop teacher training programs for schools in the future .
Key words: Training programs, new technologies, education, environment, education technologies.

YENİLEŞEN VE GELECEKTEKİ EĞİTİM ÖĞRETİM

ÖZET.
Değişen teknolojik ve buna bağlamlı sosyal yapı, eğiti programların da değiştirmektedir. Eğitim ve öğretim programları değişim sürecine göre yeni biçimler almaktadır. Eğitim ortamı, yeni teknolojilerin sınıfa girmesiyle ileriye yönelik biçimlenmektedir. Mağara resmiyle başlayan eğitim teknolojisi, resimler, film, radyo, TV birleşimi, bilgisayarın orta çıkışı, internet ve TV birleşimi, bugün 3G ve 4G ile biçimlenip gelişir. İPhonlar eğitim, öğrenme ortamına çift yönlü iletişim sunar. Öğretim ve öğrenme ortamında, bilgisayar, akıllı, masa, ahta, tabletler ve akıllı sınıflar kullanılmaktadır. Teknoloji, öğretme ve öğrenme özelliklerini değiştirir. Okul, bireysel, etkili ve üretici öğretimi sunmaktadır. Okul organizasyon değişir. Eğitim fakülteleri geleceğin okulları için öğretmen yetiştirme programları geliştirir.
Anahtar Kelimeler:.Eğitim programları, yeni teknolojiler, eğitim ortamı,eğitim teknolojileri.

Introduction

Education, training and technology experts group emphasize the exchange of education, training and learning environment; like changing the speed of light and in designing future processes. (Cass, 1957).This article is trying to explain a combination of education, training and learning technology. More than terms and concepts, changing life of education, training and learning environment are asked to mirroring.

Education, teaching and learning emerges in; perception of sense in talking, made the transition easy transfer of information, attracting the attention of saying the words used in life and life (Yüksel, 2008.S.135-138). Educator is different from other people while understanding, explaining and interpreting the terms of education.

When the student go into the class, he or she face to face someone who is trying to teach and tell unknown objects. The student learns with repeating the symbols which written by the teacher on the board. (Tuna. 2008.S.244-257) World War II political and economic blocs in technology have increased competition (Varış 1987). In schools Education, training programs, lessons, subject, book, etc. becomes individual approaches.

Out in the launch of Sputnik in 1957, accelerates the use of educational technology education in schools. This removes the U.S. in the 1920s the subject the prohibitions. Ministry of Education after 1980 ban on school programs put topic (Ece, 1994.S.43-47) (Varış.1987). This function, being at school; speaking, understanding, perception, comprehension, synthesis, analysis and interpretation of his contribution to education, learning and teaching equipment and materials affect the environment

Countries, education, training and learning social, economic, cultural, and reveals the future, depending on perspective. Branches of science and technology in the face of change, academic programs, changing and evolving. Training and education programs, updates, future-oriented change is made. No. 28 indicates that the document put forward by UNESCO. Here, student expectations, learning environments and teachers' roles change (Dogan, 1987, Ece, 1994).

J. Tannery (New York City education director) in his speech about education programs, social development would be with Education, emphasizes happen with the improvement of skills and education investments will be made pipe type (Souche, 1957, s.147).

Illich, schools will not engage in the learning environment, his work indicates that universal education. He refers to the establishment of networks for solving educational. Illich, education programs, development and regulation of the investment in education will be noted, in a region the equality of education, family economic power, the environment and form bonds to benefit from technology. Within the same school, same program, the differences of those who continue, the world view, self-reliance, loyalty and despair of poverty indicates that the future of socio-cultural developments forward. Illich, schools, students in Mexico in 1956 as an example enough taught and G. Morris' s as a result of a one-week orientation, different groups outside the school shows up to teach Spanish to people every six months. Cost differences between countries, human culture, his work reflected the individual's knowledge, manners, socialization and the development of skills will be put out (Tan. 1983-p.45-59).

Social changes are inevitable process of social mobility. Cases indicates that this important historical turning points. For example, the Treaty of Kadesh, the Crusades, the Renaissance, the Reformation, the Geographical Discoveries in the Age of Enlightenment, the French Revolution, the Industrial Revolution, I and II. World wars, space wars. These are autistic and changes in foreign viewpoint social improvement of the technological development, changes and developments affecting the societies. This is the clearest example of the interaction, the need for paper because of the increase in literacy is the opening paper mill. Changes and

developments in the social and individual, emotional directions or economic features, cultural and social conservatism indicated to have an effect. Here, the teacher plays an important role in the social, economic, technological change and development (Ata. 2008-s.1-11).

In education quality, between countries and societies of social economic, technological creates privileges. This social change, as well as development, economic power is also effective. By developing technology, developing communication tools, weapons creates a strong impact on the environment (tells the history, 1994).

Human, the relationship between information exchange, socio-cultural and technical change in society, it also affects the change in the quality of people. Scientific results of the implementation of the 20th century technology has shown rapidgrowth and change. Technology and economy of countries is important in the race each other to establishdominance.

Knowledge and the rapid increase in technology, science, scientists education, training and learning methods in terms of models routes to create new teaching environments (Alkan, 1998, p.1-2)

Modernization or the day and the days ahead, in terms of education, considering many factors necessary to examine the education and training environments. These aredemocratic, scientific, economic, social, political, universal features (Alkan, 1998)

If you take the democratic feature of them, the country's population growth, internal, external migration movement, education and training institutions and the power of media to respond to it, should have the power of monetary support. These norms and the norms of six rapid fluctuation with higher-quality supervised support, active individual and society, ensures that producers and consumers (Alkan, 1998, p. 3 Bahri Ata, s.249-275). Countries within the framework of democratic development, underground and above ground resources to develop their own resources towards the right, to seize the resources of technical, economic, social initiatives. To this end, countries have to know, give importance to the development of technology and education.

Scientific, Technology, Educational Developments

Knowledge of science is the fundamental backbone. Theoretical research, new information to be derived from antiquity to this day, the combination of information technology in the 1700s with the emergence of technical, engineering, education, institutionalization reveals. Acting schools teach and learners forces to reach the newly formed agency information.

The industrial revolution, technical, technological invention and innovation is the addition of the results and production industry.

Communities in the development of the printing press provide differentiation in terms of social, technical, economic, education and training. The camera's presence, silent and sound films' effect of the society, the social environment changes, the school will cause a change in the teaching environment. The presence of the radio transmit a wide audience with her knowledge, education and training to be used. The presence of the radio transmit a wide audience with her knowledge, education and training to be used. This black-and-white TV, then the with color change in society and the individuals he observed behavior.Then the computers appear in the field of education. Computers were being started seen in all areas of society. Because it can solve many uneasy problems. Accordingly, the use of Internet networks, the possibility of using the Internet and two-way one-way flow of information, education, equality and social aspects of individual support, training, education approaches in their environment, as it occurs later in life-long learning environment (Kaynakçalan, 1994. s.57-60).

Science, research on the issues, observations, and an examination of judges. The judiciary, technological, economic developments and inter-cultural diffusion varies with. Dogmas, the research not be the result of observations and investigations. Discussed and interpreted universally accepted that there are both semantic and patterns of development closed. Between birth and to look for the facts and the science of human nature which will be dominated by the superior decides. The decision to train manpower and cross-country race that will power is knowledge. The school developed the information is transferred and the production environment and culture. School knowledge, behavior, and I could benefit from training programs to improve gradually prepared. Allows the development of educational programs in developing curricula.

Sent to the launch of Sputnik, the United States until the end of primary school, high school science courses in biology, physics and chemistry courses and content that matters will change in the future. Change, training program, an individual's life and establishes a link between socio-economic and technical. Education programs, the national socio-economic development of the country's manpower requirements are structured to cultivate. Changes, for further change within the school, the school is reflected in non-advanced for the development. Visual, auditory, audio-visual communication tools and materials printed documents with this image promotes. During the life of the individual and society when they are living in contemporary newspapers, magazines, books, radio, films, television, computer and electronic

communication tools, a school (education environment) falls into (Alkan, 1998, p.4-6; Ece 1994-s. 43-47).

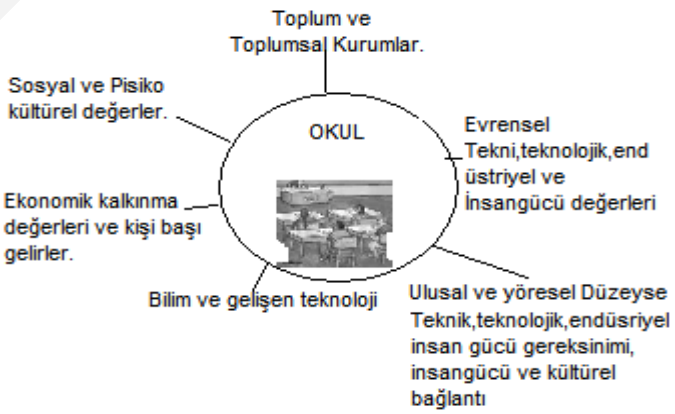
Education, the national socio-economic development of the country to train manpowering need of state. Current life of the individual and society, newspapers, magazines, books, radio, films, television, computer and electronic communication tools, a school(educational environment) into a reduced (Alkan, 1995; Ece 1998-p.4-6).

A matter of the relationship between scientific and technological education and education and society, as previously documented in recent years with rapid change and development of education among the community affects the message between education and social. Today, if western countries can say about 2020, 2030 years of teaching and learning, and technology, this is indicative of the importance given to human and human power. Science, technology, economic development and progress sets out the changes and development in education. Society, values and quality of trained manpower which carries a value (Brunner, 2009:Alkan, 2005).

What are the groups waiting to happen?

Education and training point of view, sets out the functions of social institutions which way you look at the school. To make the desired level, is an ideal teaching and learning, school environment, the quality of teaching, learning and teaching facilities should be plural. Clutches consist of a concrete education and training technologies. Month to show people, the missile up output, the theoretical demonstration of the work on Mars is more effective than Speech. The student is not an abstract scientific values, the concrete values should be taught Today, the visual power of audio-visual and electronic communication, computer, offers individual learning in every corner.

Figure :1 Interaction of the school area, the main sources.



Community groups use the computer to know the various directions, training programs, educational institutions and expectations, forward look in terms of social development. Education institutions to the needs of the country contributes to a balanced distribution of socio-technical and economic sophistication (Alkan 2005; Fares 1986; Baytekin, 2004). The individual's education, training and education in the visual, auditory, audio-visual instruments should be noted that his contribution. Printed tools, slide images, painting, film and film strips, radio, telegraph passing the phone from there and from there to television (TV) of social and industrial life, the visual and auditory activity, education and social formation is rapidly orbit.

How is the development of TV?

Let's talk about development of tv shortly.Paul Nipkow's electric telescope in 1885 and the Russian Boris Rosing's first broadcast in 1907 takes an important place in the countries. The first electronic TV in 1906 in Germany Max.Dieck M., March 22, 1935 in high definition TV is offered regularly. PAL system, "Pay additional Luxury" great American NTSC (Never Twice Same Color) or (Never The Same Color) color televisions in the background of the political development of the common interests of political ideas to face the day revelation (Fernsehen, mobi, 2010). Satellite TV broadcasts are seen as the beginning of the year August 12, 1960. Satellite communication begins. TV and digital broadcasting can not be bypassed again. Helmut Thome ct through application of television broadcasting via the Internet eliminates the limited environment. Today, it is possible to watch internet TV channel of many. In 2007, a new mediathek ZDF TV (technology, environment) throws publication of the draft. Germany in 2010 to digital TV broadcasts (bidb.itu 2006, Fernsehen, mobi 2010). Life-long learning, TV broadcasts, taking advantage of open education and distance education tries to reach a wide audience.

According to statistics, 95% of the people still watch TV in Germany. The 1950s until this day, some homes are more than one TV. Statistical Institute of Turkey according to 2009 data, 90% of people watch TV. Some people have more than one TV at home (Fernsehen, mobi, 2010) To have the TV audience at this rate, socio-cultural society, sets out the contribution of technical and economic mobility.

Letter of instruction to take the radio support, then the TV and More provides support. Radio and TV educational programs and the development impact of development in the walk through the positive and negative direction. Managers of the managers of this country's form of organization of radio and TV is limited (Demiray-Binatlı, 2007). TV hinders an individual's reading habits (Ministry of Education Reports) is indicated. Reading habits of school is given in advance. Reading a book is a socio-cultural feature. Per capita book reading: Japanese year 25, Switzerland 10, Turkey stated that only 6 people read only one book (Yapıcı.2006). Individuals

due to less reading, training and education to benefit from the format of her work with the family and the school to read.

Education in Turkey: The first application as the first TV broadcasts in Turkey by the Istanbul Technical University students begin publication in 1952. (Çilenti 1979 s.151-167) . Between the years 1970-1973 is school TV programs.In 1968 TRT publication of the trial begins, and publicates entertainment and news broadcasting, in adult education.YAYKUR ends in 1976, starting in 1978. 1982-1983 academic year, AOF (Open University) education through broadcasting (Constructive, 2009 p.12-13).

Many national and local TV station is live in Turkey now. These are outside the general education philosophy of education publications give weight to their own philosophies. Aided schools, TV and TV-video combination of courses and course content are presented with the support of technology. TV-integrated technologies, more common still brought down from the school's classes and portable computers. Today, all over the world to track the TV program on your computer.

From TV to the Internet.

In 1936, wide screen images, video projector (Beamer) is used with the Olympics. Bill Gates expects a lot of people to watch television from the internet. In the study of young people to follow television sets out the help of the computer Internet. Man is aware of what is happening all over the world in a broad spectrum. The lives of Education and training also benefited the power of the Internet (Fernsehen, mobi, 2010). With creating equal opportunities for learning and teaching, television combining the power of the internet opens the more common social space. Television, although one-way transfer of information, lack of teachers or teacher's taking place in underdeveloped in terms of information accelerates social development. Integrating with Internet and web-based learning , creates a collaborative learning environment (Sahan 2008. s233-234).

Technology Is In The Classroom

The schools no longer remain trapped in traditional thinking patterns. While nanotechnology shrink laptops became widespread, the student, can access the information at its own discretion. Changes in the classroom, students' computer use in class, the class Web site to share thoughts and feelings, Bolk and accurate access to information and knowledge sharing by creating a Wiki groups make joint efforts. By inserting new information into the visual creates a class discussion with the Wireless. Individuals everywhere to make information sharing (wikipedia.Educational Technology. 2010) has a chance.

Sent to Advertise 98 technical magazines in the journal Medien, with seeing the electronic board, I thought that schools will start a new revolution in education. Instantly I shared the innovation with students in the faculty.I received my books the picture Students made the boxes for future computers and they presented texts describing their work and they told them on the board in Kocaeli. Some people laughed a lot in this event, from time to time had made cynical jokes. All of them are looking to the future and form of the country.

Figure 1: From the tablets to the smartboard transfer. (Tayfunyildiz. com. 'from thereceipt.)

Schools, bringing the format to minimize blackboard and chalk to electronic covered wooden (Smart Board) constitute a better teaching and learning environment. Touch-planks and developing educational programs to enrich learning in the classroom (wikipadia. Edcational Tech-nology. 2010)

Schools ten years ago, gets rid of a wired network. The school education has continued to work with technological tools now working in the wireless network. Since 2005, schools in the 21st century provides support for integrated education technologies to students acquire knowledge and skills. Schools require students technological literacy. Television channels, handheld computers, closed circuit, on line (e-information

management) is now provides two-way learning on mobile phones for students. This changing and improving technology to increase the quality of the teacher's knowledge reveals the possibility of the technology available.Play an active role in learning computer technologies based on the integrated course. This increases the need for primary school students to write their education programs for the more advanced (google.com 2010).

Teachers, information about technology refresh, to use new technological tools, new teaching and learning in the classroom with new technology methods, techniques and strategies will prevail. Teacher will provide students meeting the technology, will implement a flexible curriculum, will look for new methods for classroom assessments. The teacher is very active and function of integrated technologies, the students will implement and make available in the classroom.In the meantime, the profile of student, will change in terms of the student's features. Schools now have computer classes, Information technology classes, computer-aided instructional environment.Users can use e learning Teachers at the school, parents, children to

the school to follow up, may have information about what he learned (edt, Baytekin 2009). The school is considered to be equipped with Web and Internet-based networks (meb.gov.tr. 2010)

Web-based learning and the use of smart technologies, Mobile Internet Technologies (MIT = Mobile Network Technologies (HAT)) the use of web-based e-learning are settling in school and classes. The new digital learning and teaching materials are also guided for their development.

Reflection of Content to New Technology Courses and Programs

Developing digital and embedded computer technologies earned wealth to learning and teaching in the school environment. Wealth of learning and teaching environment, primary education up to secondary education and higher education curricula of training programs to increase variety in the courses, course content, makes changes and additions of new information. Courses to diversity, led to the emergence of new professions, new course content. Course hours increase, according to this school's physical structure and organization of the diversification of elective courses is on the agenda. Physical structures are formatted according to the new technologies in the classroom. Student desks, teachers desk management, board and so on. according to integrated technologies, configure changes. Is that different digital technologies. Johanna Richter. Abstract: This idea of integrating moral education to digital gaming platform had been discussed since digital and online approaches were used in teaching. Online interactive instruction was one of moral teaching forms to assist moral instruction. However, most moral-related interactive online games lacked functions for players to explore themselves while game playing, that resulted in less participation in deeper learning and decrease understanding of moral values. Therefore, we, digital game-based learning lab of National Taiwan Normal University, developed the interactive moral online game, named 'To do or not to do', to help students explore and establish appropriate moral values. Results of Partial Least Squares (PLS) analyses indicated that behavioral intention was significantly influences by behavioral control, self-worth, attitude toward the game, subjective norm and parenting style.
Keywords: self-worth, parenting style, theory of planned behavior, learning and teaching with technology, e-learning

Introduction

Based upon previous studies (e.g. Apple, 1989, 1993; Giroux, 1983a; Gordon, 1991), Yuksel (2005) reported that there are two sorts of curricula in schools; first type refers to 'official curriculum' which consisted of well-written objective, goals and activities; the second type is 'hidden curriculum' which conveys rules, values and implied messages teachers pass to students. According to Yuksel (2005), Kohlberg, the educators and the first researcher, focused on hidden curriculum in moral education. Kohlberg believed that both formal and hidden curriculum provide a ground for the moral development of students. Students experience resolution of ethical conflicts or dilemmas which lead them to the next moral stage. The course of moral development is from a simpler idea to a more complex idea, it is a progressive development.

The internalized value has been placed an important role in children's moral decisions in different

domains (Costanzo & Fraenkel, 1987). However, students are taught with values that they are demanded to learn through class lectures. Earlier study done by Pounds (1969) stated that problem solving as "choosing a model, comparing it to reality, identifying differences, selecting a difference, considering operators, evaluating consequences of operators, selecting an operator, and executing an operator"; and transforming a given situation into a desired situation or goal (Hayes, 1989). For the purpose of the study, research participants were put in a moral dilemma which can be seen as a way of presenting problem, exploring the appropriateness of moral for an individual or a group to deal with values relating to human conduct, with respect to the rightness and wrongness of certain actions.

With concerns about the rapid increase in the incidence of misbehavior in elementary schools, researchers have turned their attention to ways parenting dimensions affect children's moral education. Past researchers had demonstrated that parents influenced children's development of cognitive belief structure (Glasgow, Dornbusch, Troyer, Steinberg, & Ritter, 1997). With the structure children possessed, they conduct their behavior and then form characteristics of themselves and others (Grusec, Goodnow, & Kuczynski, 2000). Therefore, the examination of parenting style on children's ways of thinking in a situated game which consequences-based normative moral problem-solving technique (Hooker, 1996; Lucas, 2000a) was embedded might be helpful to better understand children's insights.

Currently educators face challenge to strike a balance to the moral development of students and the academic achievement of students. How could teachers prepare students not only actively participate in the environment but also make their own choice with justness, and accuracy? How could we develop a program or a curriculum of moral education that encompass the universal morality for use in both school and family?

For the purpose of the study, an online moral game was developed to provide moral-related situations relate to students' life, and question them with different situations and events enabling them to think creatively and critically, test their tolerance, honesty, and problem-solving tendencies. We examine the relationships among self-worth, parenting style and the planned behavior by using this online moral game.

Theoretical Framework

Moral development

For researching whether moral reasoning develops in a predictable sequence, Kohlberg (1981, 1984) provided research participants with 'hypothetical dilemmas' that often put the value of life against the value of someone's life, or put the value of one individual's life against the value of several people's lives. Kohlberg concluded that moral reasoning occurs in a sequence of three levels. Each level includes two stages, for a total of six. According to Kohlberg, every child starts out at the pre-conventional level, reasoning strictly in terms of ego-centered considerations. The child initially focuses on avoidance of punishment and obtainment of rewards (Stage 1) and then on satisfaction of self-interests (Stage 2). Next follows the conventional level and a shift to group-centered considerations. Here the focus is on adhering to the norms of family and other groups to which one belongs (Stage 3) and maintaining social order (Stage 4). The third post-conventional level goes beyond both the self and one's society—reminiscent of the Piaget adolescent's perspective. Here the emphasis is on democratic procedure and social utility (Stage 5) or universal principles pertaining to justice and individual rights (Stage 6).

Self-worth

Once a person recognizes the self as an individual and separate being, he or she begins to construct a 'self-concept' which refers to how that individual perceives his or her 'self' to be in terms of ability, value, and limitations.. Hater (1990) defined self-concept as an individual's perception of the combination of different aspects of the self and thus it was viewed as a multidimensional construct.

Coopersmith (1967) proposed a construct to assess self-concept by combining an individual's self-evaluation across items of various domains. Crocker, Luhtanen, Cooper and Bouvrette (2003) identified seven Contingencies of Self-Worth Scales (CSWs) including: others' approval, appearance, family support, academic competence, virtue, competition, and God's love. Parental values might lead children to experience domains and use the structure to build and judge the content of their contingencies of self-worth.

Parenting style.

Baumrind (1967) was the first researcher developed the concept of parenting styles which she referred to authoritative, authoritarian, indulgent, and neglectful. Authoritative parents required children to follow their demands, and they recognized the flexibility as well. Authoritarian parents required children to follow

their demands, but these parents were not responsive to the children's perspective. Indulgent parents did not require children be responsive to their demands, but they were responsive to the children's perspective. Finally, neglectful parents neither require children be responsive to their demands nor responsive to the children's perspective.

Past study done by Maccoby and Martin (1983) reported that parental warmth, emotional support, appropriate autonomy, and clear communication lead to positive developmental outcomes in children and adolescents. Moreover, children who are raised in authoritative homes have high scores on social development, mental health, and self-esteem (Baumrind, 1989; 1991; 2005).

Theory of planned behavior.

Theory of Planned Behavior (TPB) was developed to state that one's behavior can be predicted by his or her intention (Ajzen, 1991). TPB focused on that intention affects human behavior, whereas attitude, subjective norm and perceived behavior control affect intention. Attitudes are the feelings of acts for likes or dislikes. Russell and William (2007) defined 'subjective norm' as "the summation of the similar relationship between the strength of one's normative belief about the likelihood that important referent individuals or groups approve or disapprove of performing a given behavior and one's motivation to comply with referents" (p. 1575). And finally, perceived behavioral control can be predicted by the summation of one's control beliefs and one's perceived power the act behavior (Russell & William, 2007). The framework of theory of planned behavior was used in this study to reveal the relationship between game playing intention and other factors, such as, attitudes, subjective norm, behavioral control, and parenting style.

Research Hypotheses

In order to explore the relationships between behavioral intentions, contingencies of self-worth, and parenting style; five major hypotheses were proposed to guide this research.

H1: Self-worth will correlate with behavioral intention.
H2: Behavioral control will correlate with behavioral intention.
H3: Perceived attitude toward the behavior will correlate with behavioral intention.
H4: Subjective norm will correlate with behavioral intention.
H5: Parenting style will correlate with behavioral intention.

'To do or not to do' Moral Game Design

Lucas (2000b) indicated that applying complexity thinking to the world around us not only providing a difficulty to us but also giving us many new ways to think about questions and answers to the question, therefore, the hypothetic- deductive- evaluative model (Lucas, 2000a), the consequences-based normative moral problem solving technique (Hooker, 1996; Lucas, 2000a) is utilized for the game design (i.e. What happen-What you choose to do-What will happen next-What you will do next). This educational, interactive game 'To do or not to do' encourage players to consider what else would happen, what you should do, after you do what will happen, and what you will do next and so on. According to Allen (2003), hypothetico-deductivism postulates a theory of the phenomena in question in terms of a set of rules or postulates for obtaining theories, facts are not always observable, but rather by vision, accident or theories. Giving the same picture to two people, may get two different results. Furthermore, the evaluation system created in this game implies the behavior must be correct if the scores are to accord with the moral stages of Kohlberg (1984), otherwise, choice will be changed in next play.

The Model of Decision-Making Incorporating Ethical Values (Fritzsche, 1991) is the first to consider personal values as underlying "precedent of ethical behavior". There are three important parts involving game design. First of all, we consider the model of decision-making behind ethic concept and why we should include values in Part 1 of game designing. By looking at what we actually mean by objectivity, and relate this to the subjective mind that creates such a concept, we develop reductive thinking using appropriate concepts to then show that ultimately 'ought' becomes appropriate, allowing players to solve the problem based on normative concepts. In Part 2, we examine what we mean by game scoring and look at what we must do to incorporate the values of Part 1 into the moral game. We outline the hypothetic-deductive-evaluative model (i.e. what happen – what you will do – after you do what will happen- what you will do next after that happen, and so on.) which brings the integrating ideas of complexity thinking into play

in order to clarify moral value based upon meta-cognition. Lastly, in Part 3, we consider how we can use a game to make social choices in different situations, and allow us to regard conflicting values and contextual variation within a level of cognitive development.

When considering game scenario design, the problem solving model focused exclusively upon morality by Rest (1986) was adapted. Therefore, four psychological processes must occur prior to moral behavior: (1) interpret situation and create alternative actions; (2) choose alternative based upon considerations; (3) prioritize the moral vale choice above amoral values and associate choice; and (4) intend to act. The game develop the moral reasoning ability by choosing the right 'ought' to the fulfillment of these needs and desires within a self-directing self. This game is free to make the choice from many alternatives while the self is restricted by concerns with inflicting harm on himself or herself, or other individuals, interfering on their rights. Through a developmental lens, we could gain insight into some common patterns for how children and adolescents develop morally, and into issues of relevance for how children and adolescents define morality as well

To explore whether moral reasoning develops in a predictable sequence, Kohlberg (1981, 1984) provided 'hypothetical dilemma' that often put the value of life against the value of one' life to participants who were involving in his research. Kohlberg concluded that moral reasoning occurs in a sequence of three levels in which each level contained two stages. Kohlberg believed that every child started out at the pre-conventional level in terms of ego-centered considerations. The child focused on avoidance of punishment and obtainment of rewards (Stage 1) and then on satisfaction of self-interests (Stage 2). Then, the child go to group-centered considerations which the norms of family and other groups to which one belongs was focused (Stage 3), and social order was maintained (Stage 4). The third level, post-conventional level, goes beyond both the self and one's society, the emphasis is on democratic procedure and social utility (Stage 5) or universal principles and individual rights (Stage 6).

Method

This study was conducted using a survey research design. The first step of the study design procedure was to develop a set of survey questions regarding self-worth, parenting style, and theory of planned behavior based on the review of document and literature. Second, the initial questionnaire was given to an expert panel to evaluate. Third, the revised pre-test questionnaire was given to the study sample before starting the game. Fourth, the post-test questionnaire was given to participants immediately after the game. Finally, Partial Least Squares (PLS) was used to measure the path relations of hypotheses.

Participants and settings

This study was conducted in four elementary schools in Taipei, Taiwan. The target population was made up of elementary students. The selection process in this study was a challenge, thus, a convenient sampling was used in this study. A total of one hundred and twelve 5th and 6th grade students (60 males and 52 females) from four elementary schools were invited to involve in this study. Their ages were around 10 to 12 years old; they have never played "To do or not to do" before; and most of them knew how to use computer. Each child was assigned a computer for playing the game.

Instrumentations

To develop an appropriate self-report instrument, the questionnaire of this study was derived from literature review, existing document, and other existing questionnaires by other researchers, such as Baumrind (1967), Crocker and Knight (2005), Crocker, Luhtanen, Cooper, and Bouvrett (2003), Lamborn, Mounts, Steinberg, and Dornbusch (1991), Sessa (1992), and Ajzen (1991).

1. Self-worth inventory

The first instrumentation of the questionnaire was a 13-item self-report inventory adapted from the studies of Crocker and Knight (2005), and Crocker et al. (2003). Participants were asked to rate the extent to which they strongly agree or strongly disagree with each item pertaining to beliefs regarding positive self-worth, and negative self-worth, by selecting one of five points on a Likert scale. This five-point scale read 1=strongly disagree, 2=disagree, 3=neutral, 4=agree, and 5=strongly agree.

Positive self-worth questions listed in the questionnaire, such as, Item 1 (When I feel I am attractive, I feel good about myself), Item 2 (Whenever I follow my moral values, self-satisfaction will be increased), and Item 3 (Knowing my academic performance is better than others, I feel good about myself). Negative self-worth questions, such as, Item 4 (Doing something wrong, I feel ashamed), Item 5 (If I can't follow

moral values, I could not respect myself), and Item 6 (If my academic performance is not good as expected, I feel bad about myself).

2. Parenting style inventory

The second instrument, adapted from the study done by Lamborn et al. (1991), and Sessa (1992), was a 3-item self-report measure. Students volunteers were asked to rate their beliefs associated with parenting style. Items are self-rated on a five-point Likert scale where 1 representive strongly restrict, and 5=strongly open.

Parenting style questions were related to parents' attitude toward buying snacks (Item 14), and attitudes toward helping others voluntarily but causing me in a misunderstanding (Item 15), and attitudes toward caring about others but causing me in a misunderstanding (Item 16).

3. Theory of planned behavior inventory

The third inventory, in the post-post survey, was adapted from the study done by Ajzen (1991). It contained 5 items regarding perceived attitudes toward the behavior, 3 items regarding subjective norm, 3 items regarding behavioral control, and 4 items regarding behavioral intention. Participants were asked to rate these items on a 5-point scale where 1=strongly disagree, 2=disagree, 3=neutral, 4=agree, and 5=strongly agree.

Item examples regarding the theory of planned behavior are provided as follows. Attitudes toward the behavior questions, such as, playing 'To do or not to do' make me feel happy. Subjective norm questions, such as, I play 'To do or not to do' because teacher's request. Behavioral intention questions, such as, I will skip my dinner for playing 'To do or not to do' at home. And behavioral intention questions, such as, I will play the game all the time or whenever I can when the 'To do or not to do' competition is coming.

Procedure

After providing the explanations of the purpose of the study and the instructions of the 'To do or not to do' game to the participants, the volunteer student participants completed the self-report pre-test questionnaire regarding self-worth and parenting style before playing the game. All participants were invited to complete the post-test questionnaire associated with the theory of planned behavior such as attitude toward the game, subjective norm, and behavioral intention after playing the game.

Data Analyses

Measurement model

We expected that each component of the pre- and post-test questionnaires except for background information section would make contributions to behavioral intentions. To test this idea, a confirmatory factor analysis was performed to examine the measurement model. The Partial Least Squares (PLS) method, one of Structural Equation Modeling (SEM), was chosen because it presumes no distributional form for measured variables, nor does it posits strong requirement on large sample sizes (Chin, 1998; Chin et al., 1996; Chin et al., 2003). The sample size of 112 was pass the recommended minimum of 40 for model testing (Wixom & Watson, 2001).

Reliability and validity of the survey

To ensure the content validity of the questionnaire, an expert panel including 10 people who are experts in this field was asked to evaluate the initial questionnaire developed based upon previous studies and literature review. The final questionnaire after the evaluation of the expert panel was administrated to study sample.

Beside the evaluation of an expert panel, the reliability and validity of the survey were assessed in several ways. According to Fornell and Larcker (1981), internal consistency can be assured by examining the composite reliability of the constructs; therefore, composite reliability was examined. Furthermore, Cronbach Alpha value was measured as well. Table 1 shows the results of composite reliability and Cronbach alpha values. All composite reliability values in this study ranged from 0.810 to 0.930, surpassing the suggested threshold value of 0.7 (Nunnally, 1978; Hair et al., 1998), though the alpha value was slightly below 0.7 in parenting style section, it is very close to 0.7, and as we will see later in this article, this parenting style section had adequate factor loading (greater than 0.5), therefore, no changes were made in parenting style section. Convergent validity in this study was evaluated by checking whether the factors loadings of each item are significant and greater than 0.5 (Nunally, 1978). In this study, the factors loadings ranged from 0.51 to 0.91 indicating acceptable convergent validity.

Table 1
Results of composite reliability and Cronbach alpha values

Construct	Composite Reliability	Cronbach Alpha
Negative Self-Worth	0.84	0.78
Positive Self-Worth	0.83	0.74
Parenting style	0.81	0.65
Perceived attitude toward the behavior	0.93	0.91
Subjective Norm	0.89	0.82
Behavioral Control	0.89	0.80
Behavioral Intention	0.84	0.75

Last, to assess the discriminant validity, the square root of AVE of each construct was computed and compared with the correlation between constructs. In Table 2, all square roots of AVE were larger than the correlation coefficients between constructs, indicating that each construct was more closely related to its corresponding measurement items than to those of other constructs. This again supports the discriminant validity of the measures. In summary, the evidence showed good reliability and validity of the survey.

Table 2
Correlation Among Variables and Square Root of AVE

	Negative Self-Worth	Positive Self-Worth	Parenting	Perceived	Norm	Control	Intention
Negative Self-Worth	**0.66**						
Positive Self-Worth	0.29	**0.67**					
Parenting	-0.01	-0.01	**0.77**				
Perceived	0.05	0.10	-0.25	**0.85**			
Norm	0.05	0.11	0.27	-0.06	**0.86**		
Control	0.07	0.03	0.31	0.02	0.50	**0.85**	
Intention	0.17	0.21	0.20	0.40	0.47	0.6	**0.75**

Structural model.

The test of the hypotheses involved estimation of the structural model's path coefficients indicating the strength of the relationship between the dependent variable, independent variables, and the R-square values, which indicate the amount of variance explained by the independent variables. The study used the single-tailed t-test, and the criteria were as follows: $*p < .05$, $t > 1.66$; $**p < .01$, $t > 2.36$; $***p < .001$, $t > 3.37$. The bootstrap re-sampling procedure was used to examine the stability of the Partial Least Squares (PLS) estimates (Chin, 1998). There were 111 re-samples. The structural model analysis was presented in Figure 1. The results showed all hypotheses were supported.

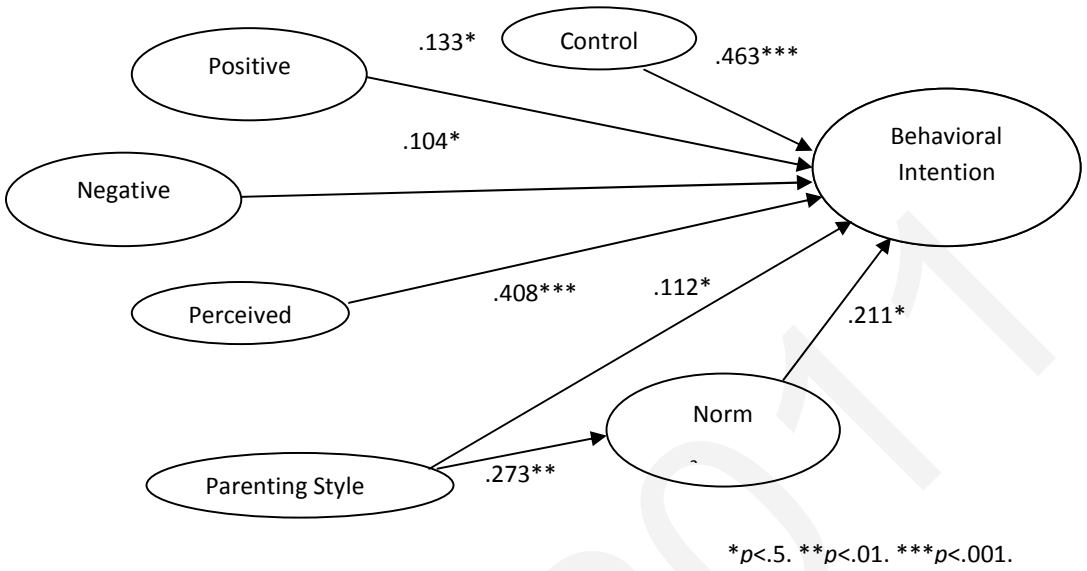

Figure 1: Structural Model Analysis

Conclusions

The present study was designed to use PLS to further investigate the relationship of behavioral intention, parenting style and the planned behavior. We had hypothesized that: (1) self-worth directly influences participants' willingness to play our game; (2) behavioral control also influences participants' willingness to play the game; (3) participants' attitudes toward playing the game positively associated with their willingness to play the game; (4) participants' subjective norm also positively associated with their willingness to play the game; and (5) participants' willingness of playing the game develop as a direct result of parenting style.

The structural model testing indicated that all hypotheses were confirmed. (1) The path direction indicated that positive self-worth positively related to children's willingness to play 'To do or not to do' (p=.13, t=2.24), and negative self-worth also related to their willingness to play the game (p=.10, t=1.71). (2) The result suggested that children's behavioral control significantly influenced playing 'To do or not to do' intention (p=.46, t=5.83). (3) Children's perceived attitudes toward playing 'To do or not to do' significantly influenced their playing intention (p=.40, t=7.18). (4) The subjective norms children possessed influenced their intention to play 'To do or not to do' (p=.21, t=2.31). (5) Parenting styles was investigated as one of factors influencing children' intention to play 'To do or not to do' (p=.11, t=1.89). Moreover, the result indicated that parenting style significantly influenced children's subjective norms (p=.27, t=3.12).

Briefly, the results indicated the self-worth, parenting style and theory of planned behavior measurements, factor loading were fit >0.5 and p values were <0.05 which fit in with research hypotheses referring to the behavioral intention was significantly influenced by behavioral control, self-worth, perceived attitude toward the game, subjective norm and parenting style. These results mirror the results of prior studies (Ajzen, 1991; Russell & William, 2007) regarding the theory of planned behavior, which reported that individual's attitude, subjective norm, and behavior control affected individual's intention. In addition, the results highlighted the importance of parenting style, which was consistent with earlier studies (Maccoby & Martin, 1983; Baumrind, 1989; 1991; 2005). Furthermore, subjective norm in this study was influenced by parenting style which in line with previous studies (Grusec, Goodnow, & Kuczynski, 2000; Lucas, 2000a) which proclaimed that children's cognitive belief structure/ways of thinking can be influence by their parents.

According to the descriptive analyses, it is exciting to find out that majority of all students rated this

game was interesting and would like to play it again. Interest has been seen as an emotion or an affective variable (Dai & Sternberg, 2004; Meyer & Turner, 2002), a powerful motivation to trigger participants to play. In this regard, the evidence of the descriptive analysis is especially revealing because it implies that interest to play the game has a positive influence on their choices to involve in the game again (Hidi & Renninger, 2006), this form of self-interest is one way to ensure that their interest will survive. Students could either play the game at home or school to learn moral education.

During the growth of moral development, people go through various different stages of moral development. Previous studies found that younger children often use the concepts from Stage 1 (avoidance of punishment and obtainment of rewards) and Stage 2 (satisfaction of self-interests) of moral development theory, while the concept of Stage 3 (belongings) became common among adolescence (Kohlberg, 1984; Snarey, 1985; Walker, 1989). This study was in line with the moral development theory, several evidences we saw were students were extremely excited when the demonstrations were offered to them, and eager to involve in the moral online game 'To do or not to do' which the punishments or rewards system was well-established to keep students remaining in the game.

Caution must used when interpreting the findings of the study and generalizing the results of the study due to the limitations related to internal validity. The first limitation was selection bias and sample size. Participants selected for this study from four different elementary schools in Taipei, Taiwan. Because of the limited access, the results of this study may have been influenced. In addition, participants in this study might not truly represent the populations in elementary schools. Caution must be used when generalizing the results of this research to children who did not involve in this study; however, the findings are applicable to those children involving in this study. The second limitation was the use of PLS can only test the relative path of the given causal model to the existing data set, thought the PLS results consistent with our hypotheses, longitudinal studies were encouraged. The third limitation might was instrumentation; participants may be affected by the wording or misunderstood the questions since these questions were adapted from English articles which could have influenced the results. The final limitation was the measures used in the present study largely emphasized the self-worth scales. Therefore, future studies should attempt to balance the content of each construct.

In summary, despite the shortcomings, the present study is consistent with previous work suggesting links among self-worth, parenting styles, and the planned behaviors. The next important step would be to conduct longitudinal studies to the structural model described in Figure 1.

Implications and Future study

The major implication of the study is directed toward identifying ways to improve outcomes of e-learning or digital learning for students in Taiwan. The results of this study showed that participants like to play this online moral game which implied that attitudes or changes that needs to be occurred in either school or at home, (1) policy makers should consider setting up an e-learning classrooms where students and teachers enjoy e-service in each classroom, (2) school administrators, or teachers may put more emphasis on e-learning by providing a variety of e-learning, and interactive courses to vitalize the instruction, (3) other professionals who cares about education, such as, e-learning web site designer, could construct a variety of e-learning platforms to attract students.

This study is unique in that it is the first to explore whether factors, such as, self-worth, parenting style and planned behavior, influence children's intention to play online moral game called 'To do or not to do' which created by digital game-based learning lab of National Taiwan Normal University, Taiwan. Thus, the online moral game itself is unique and may be useful to future researchers interested in a deeper understanding regarding e-learning issues. For example, the result did not tell us whether children's game-based online learning experiences positively affect their outcome of academic regarding moral values or not. Thus much more research is needed in comparing the moral value learning outcome between face-to-face classroom and the online educational game, especially using 'To do or not to do'.

The research approach used a quantitative research design. Interviewing a large pool of students or parents in a reasonable time frame would have proved difficult. Gathering a large data from parents regarding their parenting style would allow more in-depth analysis. Furthermore, gathering data from teachers who had used the 'To do or not to do' game in teaching moral education might be helpful to improve the study or the game we developed. Due to time restriction, and limited access, further research is needed to involve in

different phases of students, and compare the similarities and differences on the planned behavior in either 'To do or not to do' game or other e-learning games, not only in Taipei, but in other counties of Taiwan. Improvements can be made to improve this research and hopes are that educators who work in e-learning area will consider this research for future study.

The researcher offers the following examples for future study: (1) Refine the survey instruments to identify new variables which might strengthen the analysis; (2) Broaden the scope of the research to different cities or counties to enhance understanding the influences that shape students' decisions; (3) This study was limited to the scope of 5th and 6th students. It should be broaden to include multiple grade students in the study to gather a large pool of data for analysis; (4) Include teachers and parents in the study might be helpful to gather valuable data for analyses; (5) Research other influential factors such as student achievement. This would broaden the understanding the role of the game.

ABSTRACT

Automated scoring by means of Latent Semantic Analysis (LSA) has been introduced lately to improve the traditional human scoring system. The purposes of the present study were to develop a LSA-based assessment system to evaluate children's Chinese sentence construction skills and to examine the effectiveness of LSA-based automated scoring function by comparing it with traditional human scoring. Twenty-seven fourth graders and thirty-one six graders were administered with a single-character sentence making test (subtest 1) and a two-character words sentence making test (subtest 2). The performances of LSA-based automated scoring methods in three Chinese semantic spaces generated from three type weighting functions were compared to the traditional human scoring. The results showed that LSA-based automated scoring in three different Chinese semantic spaces and traditional human scoring were highly correlated in single-character sentence making test and moderately correlated in two-character words sentence making test. The Chinese semantic space generated from Log-IDF outperformed the other two types of weighting function in the present study.

Keywords**:** Latent Semantic Analysis, LSA-based assessment system, Chinese, sentence construction

INTRODUCTION

Writing skills are important for children's overall attainment. It is probably one of the few skills we learned in school that will be used often later in life. Writing is an essential element of children's education which has an impact on the progress of children achievement across the whole curriculum. At school, children learn all the subjects by completing assigned tasks (ex., worksheets, exams, homework, essays, etc.). Writing is a means of communication; it allows children to participate actively in learning by sharing ideas, experience, thoughts, and feelings (Huang, Liu, & Hsiao, 2008). Effective writing, which requires writing with clarity, coherence, organization, and accurate grammar, is difficult to achieve, since it involves complex physical and mental processes. One important aspect that is fundamental in learning to write is constructing complete and grammatically correct sentences (Saddler, 2005). However, many children encounter challenges creating well constructed sentences.

Sentence construction can be as difficult a skill to assess as it is to learn. Reliable assessment requires a

set of well-developed criteria and a significant amount of time devoted to the scoring procedure. The present study was aiming at developing an automated scoring system with Latent Semantic Analysis (LSA) to assess children's Chinese sentence construction skills. The system was designed as a pedagogical tool to provide instant computer-generated scores for sentence construction and to reduce the heavy load in the scoring process.

Latent Semantic Analysis (LSA) is a theory and method for extracting and representing the contextual-usage meaning of words by statistical computations applied to a large corpus of text (Landauer & Dumais, 1997). It is closely related to neural net models, but is based on singular value decomposition (SVD) (Landauer, Foltz, and Laham, 1998). LSA as currently practiced has some limitations, such as it made no use of word order, thus of syntactic relations or logic, or of morphology (Landauer et al., 1998). So far, few studies applied LSA in educational purposes, but not yet in the replacement of traditional human scoring of sentences. To develop an automated scoring system with Latent Semantic Analysis (LSA), the present study used three type weighting functions (Log-Entropy, Log-IDF, TF-IDF) to establish three semantic spaces. The effectiveness of LSA-based automated scoring system was reported by comparing the correlations between the human scoring and LSA-based automated scoring.

LATENT SEMANTIC ANALYSIS

The first step using LSA to establish a semantic space is to represent the type-by-document matrix in a given corpus in which each row stands for unique type and each column stands for a document. Each cell contains the frequency with which the type of its row appeared in the passage denoted by its column. The type-by-document matrix is often transformed to weight them by their estimated importance in order to better mimic the human comprehension process (Landauer et al., 1998).

Next, LSA applied SVD and dimension reduction to the type-by-document matrix. SVD is the method used by LSA to decompose the type-by-document input matrix **A**. The SVD for $m \times n$ type-by document input matrix **A** with the rank of **A**=r is defined as follows:

$$A = U \sum V^T \qquad \text{Equation 1}$$

Where U is an orthogonal matrix, V is an orthogonal matrix, and Σ is a diagonal matrix with the remaining matrix cells all zeros (Golub & van Loan, 1989). Next, it used dimension reduction to remove the extraneous information and variability in type and document vectors which referred to as "noise". A pictorial representation of the SVD of input matrix **A** and the best rank-k approximation to **A** can be seen in Figure 1 (Berry, Dumais, & O'Brien, 1995).

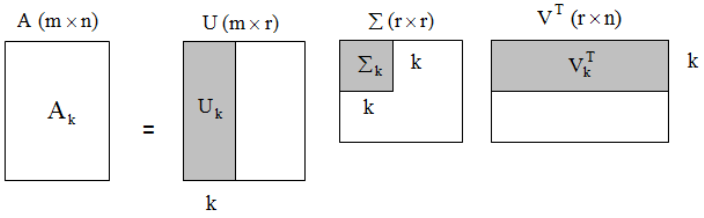

Figure 1. Diagram of the truncated SVD

After the SVD and dimension reduction, A_k is the k-dimensional vector space and called "semantic space".

METHOD

Participants

Participants were 27 fourth graders (G4) and 31 six graders (G6) at Sin-Yi elementary school in Taichung, Taiwan. The mean age of the participants was 10.8 years (range 9.3 to 12.2, SD =1.03).

Sentence Making Subtest 1

Subtest1 was a single-character sentence making test. There were two practice trials and 10 test trials. In each trial, Chinese single characters were distributed in a raw in random order. Participants were required to rearrange the characters to construct a complete and grammatical correct sentence.

Figure2 Interface of the single-character sentence making test Instruction

Sentence Making Subtest 2

Subtest 2 was a two-character words sentence making test. There were two practice trials and 10 test trials. In each trial, Chinese two- character words were distributed in a raw in random orders. Participants were required to rearrange the words to construct a complete and grammatical correct sentence.

Figure3 Interface of the two-character words sentence making test Instruction

Chinese corpus

The study used Academia Sinica Balanced Corpus of Modern Chinese (3.1) from Academia Sinica. The corpus contained 5 million words and 9227 documents. Academia Sinica Balanced Corpus of Modern Chinese was used to establish Chinese semantic space by LSA.

Type weighting function

A weighting function is generally applied to each nonzero (type frequency for type i in document j) element, a_{ij}, of the matrix **A** to improve retrieval performance (Berry & Browne, 2005; Dumais, 1991). LSA applies both a local and global weighting function to each nonzero element, a_{ij}, in order to increase or decrease the importance of types within documents (local) and across the entire document collection (global). So a_{ij} = local(i, j)*global(i), where local(i, j) is the local weighting for type i in document j, and global (i) is the type's global weighting (Dumais, 1991; Letsche & Berry, 1997). The study used three different type weighting functions: Log-Entropy, Log-IDF, TF-IDF, and the equations as follows:

$$\begin{cases} L(i,j) = \log(tf_{ij} + 1) \\ G(i) = 1 + \sum_{j} \frac{p_{ij} \log_2(p_{ij})}{\log_2 n}, p_{ij} = \frac{tf_{ij}}{gf_i} \end{cases} \quad \text{Equation 2}$$

Where Equation 2 was type weighting function of Log-Entropy, $L(i, j)$ represented local weighting. tf_{ij} was type frequency of type i in document j. $G(i)$ represented global weighting, and gf_i was the total number of times that type i appears in the entire collection of n documents.

$$\begin{cases} L(i,j) = \log(tf_{ij} + 1) \\ G(i) = \log(m / df(i)) \end{cases} \quad \text{Equation 3}$$

The Equation 3 was type weighting function of Log-IDF, where m was the total number of documents and $df(i)$ was used for the document frequency. And the Equation 4 represented the type weighting function of TF-IDF as follows:

$$\begin{cases} L(i,j) = \frac{n_{i,j}}{\sum_{k}^{N} n_{k,j}} \\ G(i) = \log(m / df(i)) \end{cases} \quad \text{Equation 4}$$

where $n_{i,j}$ is the number of times the type i occurs in the given document j and $n_{k,j}$ is the total number of types in the document, thereby normalizing the type count by document length.

LSA-based automated scoring

The ability to add new types and documents to reduced rank type-document vector space is important because the original information in the document collection oftentimes needs to be augmented for different contextual or conceptual usages (Martin & Berry, 2007). In this study, the simple way of handling the addition of sentences was used. To measure the similarity between the best answer and each participant's answer, the "fold-in" procedure was based on the existing type-document vector space. A

new sentence folded into the existing k-dimensional vector space. The Equation 5 as follows (Berry et al., 1995):

$$d_{new} = d^T U_k \Sigma_k^{-1} \quad \text{Equation 5}$$

The vector d, representing the best answer or participants' answer, contains zero and nonzero elements where the nonzero elements correspond to the type frequencies contained in the sentence adjusted by term weighting function. The similarity is computed as the cosine of the vector representation of the sentences as follows:

$$sim(S_1, S_2) = \frac{d_1 d_2^T}{\|d_1\|\|d_2\|} \quad \text{Equation 6}$$

Where d_1 is the vector representation of the best answer, S_1, which in the semantic space, and d_2 is the vector representation of the participant's answer, S_2, which in the semantic space. LSA-based automated scoring as follows:

$$score_{item} = sim(S_1, S_2) * s_{item} \quad \text{Equation 7}$$

s is maximum score in each item, and *score* represented the participant's sentence construction score in each item.

RESULTS

Pearson correlations between the human scoring and LSA-based automated scoring were calculated to examine the effectiveness of LSA-based automated scoring. The study used three different weighting functions and presented the results separately in Table 1, Table 2, and Table 3.

Table 1 Correlation between the human scoring and LSA-based automated scoring (Log-Entropy)

Variable	1	2	3	4
1 human scoring(subtest 1)	1	—	—	—
2 LSA-based automated scoring (subtest 1)	0.912**	1	—	—
3 human scoring(subest2)	0.710**	0.611**	1	—
4 LSA-based automated scoring (subtest 2)	0.511**	0.522**	0.531**	1

*p<0.05;**p<0.01

Table 2 Correlation between the human scoring and LSA-based automated scoring (Log-IDF)

Variable	1	2	3	4
1 human scoring(subtest 1)	1	—	—	—
2 LSA-based automated scoring (subtest 1)	0.916**	1	—	—
3 human scoring(subest2)	0.710**	0.617**	1	—
4 LSA-based automated scoring (subtest 2)	0.508**	0.524**	0.543**	1

*p<0.05;**p<0.01

Table 3 Correlation between the human scoring and LSA-based automated scoring (TF-IDF)

Variable	1	2	3	4
1 human scoring(subtest 1)	1	—	—	—
2 LSA-based automated scoring (subtest 1)	0.901**	1	—	—
3 human scoring(subest2)	0.710**	0.594**	1	—
4 LSA-based automated scoring (subtest 2)	0.489**	0.487**	0.467**	1

*p<0.05;**p<0.01

The results showed that the correlation between the human scoring and LSA-based automated scoring in subtest 1 was strongly correlated (r = 0.912, 0.916, 0.901). It was moderately correlated between the human scoring and LSA-based automated scoring in subtest 2 (r = 0.531, 0.543, 0.467). In the subtest 1, the relations between LSA-based automated scoring and human scoring were more consistent. To compare the performance of the three types of weighting function, the results showed that Log-IDF outperformed the other two types of weighting function (Log-Entropy and TF-IDF).

CONCLUSION

The present study developed the LSA-based assessment system and examined the effectiveness of LSA-based automated scoring function by comparing it with traditional human scoring. The results showed that LSA-based automated scoring and human scoring were highly correlated in subtest 1 (single-character sentence making test), which implies that LSA-based automated scoring was consistent with human scoring. In subtest 2 (two-character words sentence making test), LSA-based automated scoring and human scoring were moderately correlated. It was interesting to discover that LSA-based automated scoring system acted similar to human raters in single-character sentence making test (subtest 1) but not as well to two-character words sentence making test (subtest 2). One possible explanation is that LSA automated scoring system rated children's answers by comparing it with the pre-set best answers. In subtest 2 (two-character words sentence making test), the rearrangement of the two-character words would result in high similarities between the participants' answer and the best answers provided by the automated scoring system. In Chinese, each character is a morpheme, and morphemes are combined into words. The ability to manipulate and to be aware of morphemes (characters) is important for Chinese literacy acquisition. In LSA Chinese scoring system, when a sentence (or a row of characters) is given, the system will automatically segment the row of characters into words that match the corpus (e.g. 藍藍的/天空/很/美麗, *The blue sky is beautiful*). However, in subtest 2, the "two-character words" were already given in the items and therefore corresponded to the "answers" in the system. Hence, even the sentence was partially misconstructed grammatically and syntactically, a high score would be given due to the great resemblance between the responses and the pre-set best answers. Therefore, the results may be somewhat different from human raters. On contrary, in subtest 1, only single characters were given, thus, the participants were required to recognize every character; to combine characters into words; and to construct these words into meaningful and correct sentences. These behaviors require in subtest 1 actually

bear a resemblance to the actually writing activity. Above and beyond the limitations of LSA, the present automated scoring system captured both children's morphological and sentence construction skills in single-character sentence making test. In summary, LSA-based automated scoring system is effective in assessing children's sentence construction skills and that Chinese semantic space generated from Log-IDF is superior compare to the other two types of weighting function in the present study.

ABSTRACT

In this study, the effects of interactive multimedia package were investigated in classroom on students' conceptual understanding of heat and thermodynamics. Two groups – one control group and one experimental group of students at first year undergraduate level were studied to determine the role of computer animations in the development of functional understanding of the concepts of thermodynamics. For this purpose, interactive multimedia package on thermodynamics is developed. Thermodynamics Concept Test was administered to test students' conceptual understanding. The difficulty index and discrimination index of the test are 0.40 and 0.44 respectively. The results of the study showed that the interactive method used for experimental group is helpful in students' achievement in thermodynamics. The results of this study strongly support the fact that multimedia assisted instructions in cooperative group learning help students confront their cognitive constraints and foster a functional understanding of physics.

INTRODUCTION

Physics Education Researchers showed that acquiring a conceptual understanding of physics has proven to be one of the most difficult challenges faced by the students. When students enter in the physics class, they have some notions, beliefs and intuitions about how the world functions. Worldwide Physics education research (PER) have shown that students possess misleading conceptions of the nature of force and motion, which are extremely hard to overcome. These results are also observed in the areas of physics like mechanics, waves, optics, heat and thermodynamics, electricity and magnetism, and quantum mechanics [11, 12, 15]. The PER that has been done on conceptual understanding of physics and epistemologies indicates that many students lack solid conceptual understanding when taught by traditional method of instruction. They have epistemologies very different from scientists [18]. Research findings of PER showed that traditional lecture instruction is ineffective in dealing with students' misconceptions. Researchers and Physics Educators have been reported that interactive- engagement teaching methods are effective in conceptual learning of students as compared to traditional instructional method. These methods have ability to encourage students to make their understanding explicit through greater mental engagement and more extensive student–student and student–instructor interaction than does a typical traditional lecture class [6, 13].

The use of modern computer technology in physics classroom teaching environment provides wide-range of alternatives to students such as visualization of abstract concepts that will foster student understanding. These alternatives would be complementary to traditional teaching are able to develop favorable attitude, and in capturing students' interest towards learning physics [5]. Computer simulations seem to be one of the most effective in physics education because a variety of visual representations in them make concepts visible that are otherwise invisible to students [4]. Computer simulations have ability to encourage students to carry out the processes used in physics research: to question, predict, hypothesize, observe, interpret results etc. They can also motivate and cultivate students' interest in learning physics. Simulations may be used for individualized instruction by allowing students to proceed on their own pace and are able to go back to master the skills [7, 19]. Using simulations students could isolate and manipulate parameters and therefore help them to develop an understanding of the

relationships among physical concepts, variables and phenomena [17]. Computer animations offer students potential of learning when there is a need for external visualization and when the content depends on an understanding of motion [3].

The present study aims to investigate whether computer assisted instruction is more effective than traditional instruction in increasing student success in physics at undergraduate level. The topic of "Thermodynamics" was selected for instructions since it is hard to understand due to the abstract nature of the quantities such as concept of heat, equation of state and thermodynamics processes. Researchers showed that students have difficulties to understand the basic concept of heat and work, the basic concept of entropy, and thermodynamic processes. Therefore students have difficulties for understanding of first law of thermodynamics and how to apply for problem solving. The students also have difficulties how to apply P-V diagram for problem solving. Researcher found that students have misinterpretation of understanding of ideal gas laws [1, 14, 16]. The students frequently failed to differentiate the concepts of heat, temperature, work and internal energy. The students have difficulties of understanding the role of entropy in the second law of thermodynamics [10, 20].

P. Jungles' studied effect of thermodynamics simulations on conceptual understanding of engineering students. He studied the four thermodynamics programs like program for state change introduces P-V diagram, program for first law of thermodynamics, program for sterling cycle and program for Isex cycle. Only program for state change introduces P-V diagram and program for first law of thermodynamics are useful for our study. He found that students' reactions to the applets are very positive and they take more active part in the lecture. All simulations are deals with the ideal gas. He found that average score of the final examinations has been increased [8]. Anne J.Cox-et- all found that understanding of basic concept of students using physlets are easy and more interesting. The Physlets so developed help to students visualize abstract concepts and make connections between mechanics and thermodynamics. The students also developed such type of physlets. In the process, students develop a more solid conceptual understanding of thermodynamic processes in introductory physics [2].

The present study aimed to provide animations and simulations through computer assisted instructions (CAI) to students to help better understand the thermodynamics processes without entirely depending on the mathematical formulation [9]. For this purpose Interactive Thermodynamics Simulation Package (ITSP) is developed.

RESEARCH OBJECTIVES

Objectives of this study were to develop and evaluate an interactive multimedia animation package on Thermodynamics and to provide first year undergraduate students of University of Pune with an interactive means of self-learning and evaluation.

RESEARCH QUESTIONS

To obtain data on various points of conceptual understanding in Thermodynamics, following research questions were set for the study.

(1) Student's ability to interpret verbal representations in thermodynamics.
(2) Student's ability to interpret equations in thermodynamics.
(3) Student's ability to interpret diagrammatic representations.
(4) Student's response to the questions posed in different representations.

MATERIALS AND METHODS

Subjects: The subjects of this study were first year undergraduate students (aged 17 to 19) from Prof. Ramkrishna More College, Pune and Hutatma Rajguru College, Rajgurunagar, Pune affiliated to Pune University in the academic year 2009-10. The students were randomly selected for two groups, Gropu-1(N = 36) as experimental group, Group-2 (N = 36) as control group.

Instruments: For data collection, a Thermodynamic Concept Test (TCT) which is composed of 20 items of multiple choices was administered to subjects. The items in the TCT were selected from 30 items following expert's advice on the basis of level of difficulty and the indexes of defined differences. The topics covered in the TCT are laws of thermodynamics, concept of heat, equation of state, isothermal, adiabatic, isochoric processes and Heat engines. Students had to choose correct alternative for each item as well as give justification for the same. The reliability constant of the test has been determined according to Kuder-Richardson method and has been identified as 0.86.

Treatment: The traditional instruction was conducted over 15 lecture hours. The pretest was administered to 150 students at the end of traditional instruction. Students' difficulties were identified in the pretests on the basis of responses and justifications. The average difficulty index and average discrimination index of the test are 0.40 and 0.44 respectively. The instrument is moderately difficult and excellent discriminator.

After the pretest, the students were divided into two groups viz. Group-1, Group-2 on the basis of random selection. During the experiments any data related to students who did not attend all activities, has been excluded from further analysis. As a result only data of 72 students' have been included in the analysis with each group of 36 students.

In Group 1, instructors used traditional method for revision of topics. The topics were revised in five lecture hours. During the revision, instructors also solved some additional problems which included some conceptual and qualitative problems.

In Group-2, Multimedia was used as a support to traditional instructions. The topics of Thermodynamics were revised for four lecture hours using the package and blackboard. The package was projected on a screen using LCD projector in the classroom. Students were observing the animations and simultaneously prepared their notes. The control and management are performed by the teacher. After revision, subgroups, each of three students, were formed. One computer for each subgroup was provided and allowed to operate the package for three hours. Simultaneously, the Multimedia package was projected on a screen using LCD projector by the instructor. Worksheets were provided to students and asked to prepare answers for the questions provided in the worksheet. Necessary details have been explained with question-answer method and animations by the instructor. The students were given step by step instruction on how to use the package and asked to explore different parts of simulations embedded in it. In addition, they were assisted by instructor when they had any difficulties. When the instructions have been completed, a posttest has been carried out.

Multimedia Package: The Interactive multimedia package applied in experimental group has been prepared with the help of Macromedia Flash, Microsoft PowerPoint®, pictures and C programming. The content of the Thermodynamics have been organized in the presentation which is in the form of six modules viz. Concept of heat, Equation of state, Thermodynamics processes, Carnot engine, Otto engine and Diesel engine. The text content in the PowerPoint slides is static as well as dynamic. Cognitive enhancement was maintained by using animations to figures to teach concepts that were inaccessible through the textbook due to the lack of the textbook's ability to show motion. Forward and backward button facilities have been used in each slide. Flash animations and simulations have been hyperlinked at appropriate positions in each module. Multiple choice questions and quizzes have been added at the end of each module. The multiple choice questions are different than that used in TCT. In simulation, students have the opportunity to observe the change in the volume or pressure with change in temperature. It has been aimed to make sure that students develop their conceptual understanding by observing these changes. Figure 1 shows screenshot of animation on Otto engine.

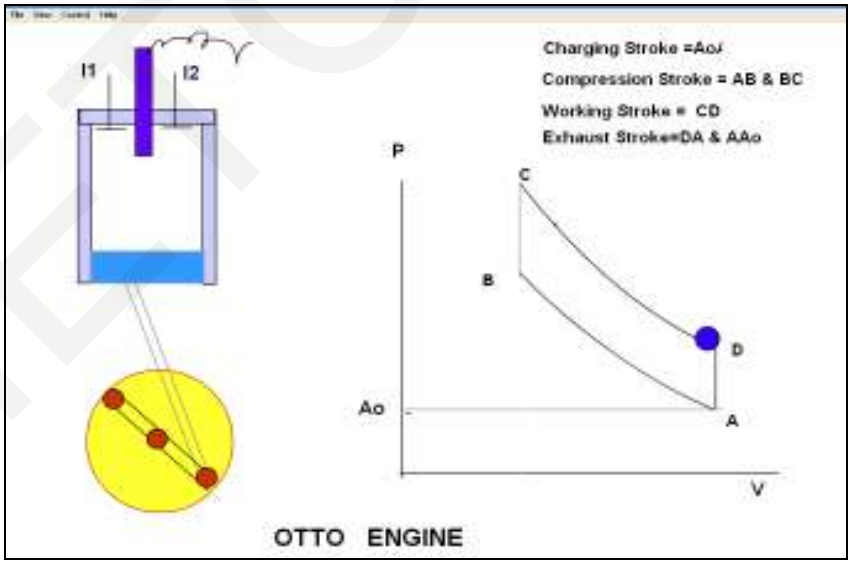

Figure 1. Screenshot of animation on Otto engine.

RESULTS

Evidence for the effectiveness of teaching aimed at producing conceptual change may be provided by initial and final assessments of students' conceptual understanding. Based on the data

obtained by TCT, the students' mean and standard deviation for pre and posttest scores for two groups were obtained. The pretest scores are presented in Table 1.

Table 1: Pretest scores of two groups

Group	N	Mean Score	Standard Deviation	t (0.01)	p	d
Group-1	36	40.26	8.15			
				0.371	0.356	0.088
Group-2	36	39.61	6.64			

The independent sample t-test was used to determine whether there was a statistically significant mean difference between two groups for the pretest at 0.01 levels. The results are presented in Table 1.

Table 1 shows t-test results of two mean scores of Group-1 and Group-2 at 0.01significance level. Effect Size (d=0.088) and critical significance level $p > 0.01$ values indicates that there is no significance difference between mean scores in the pre-test.

These results indicate that the subjects in the two groups that have participated in the research are equal in terms of knowledge according to their t-test results.

In order to investigate the effect of multimedia package approach on students' achievement on conceptual understanding about thermodynamics, a normalized gain g for each student was obtained by using the equation

$$g = \textbf{Hata!}$$

Class average normalized gain <g> with standard deviation was obtained for each group [5]. According to Hake R. (1998), the treatment given to be interactive, if <g> is greater than 0.3. To determine whether there are any differences between two groups based on the average normalized gains, the calculated gains have been subjected to t-test analysis.

The post-test scores and average normalized gains are presented in Table 2.

Table 2: Post-test findings of groups

Group	N	Mean Score	Standard Deviation	<g>	S
Group-1	36	64.29	8.96	0.404	0.113
Group-2	36	51.08	8.81	0.190	0.125

(S = standard deviation for normalized gain for g)

The results of the analysis for comparison between two groups have been provided in the Table 3.

Table 3: t-test analysis of post-test findings of Group-1 and Group-2

Group	N	<g>	S	t – value (0.01)	p	d
Group-1	36	0.404	0.113			
				7.626	4.46×10^{-11}	1.823
Group-2	36	0.190	0.125			

(S = standard deviation for normalized gain for g)

Table 3 shows t-test results of class average normalized gains of Group-1 and Group-2 at 0.01 significance level. Effect Size (1.823) and critical significance level $p < 0.01$ values indicates that there is significance difference between normalized gains in the pre-test and post-test comparison. The computer package used in support of traditional instruction helps to increase achievement in physics.

This research showed the result that Computer Assisted Instruction was pretty and much more effective than traditional teaching in students' achievement in physics.

DISCUSSION

During analysis of students' responses in pretest certain difficulties were observed in the students' conceptual understanding. Students have profound difficulties in understanding thermodynamic

processes, gas laws and heat engines. Most of the difficulties are due to students' difficulties in understanding PV diagrams and heat engines [1, 14, 16]. It is also observed that the students have poor reasoning ability.

It has been found that the Effect Size and critical significance level $p > 0.01$ values which were obtained from pretest showed the result that students in the two treatment groups have similar in terms of their knowledge.

The Effect Size and t-test obtained from class average normalized gains for group-1 and group-2 in this research showed the result that Computer Assisted Instruction was much more effective than traditional teaching in students' achievement in physics.

It is observed that computer visualization of concepts from the thermodynamics enhanced students' ability to transfer the concepts from the abstract level to the concrete level, thereby, improving their conceptual understanding of thermodynamics phenomena [2, 8]. Computer aided visualization of heat engines using computer animations helps students to understand the working of engine with variation of temperature of sink and source. It is observe that animations and simulations helped the students to understand the PV diagram, isobaric, adiabatic, and isothermal processes which may not be as observable as done inside an ordinary classroom set-up [9].

The analysis of students' responses on TCT showed that the students in Group-2 were better placed in interpretation of verbal and diagrammatic representations in thermodynamics as compared to Group-1. They are also more coherent in conceptual understanding as compared to their counter parts. Our results indicate that students significantly improved their conceptual understanding of the subject matter.

The worksheets provided to Group-2 students helped to build a coherent conceptual understanding. These worksheets acted as an instructional support to the CAI. It has been observed that CAI improves student's success as well as develops high level of thinking abilities. Students learn the concepts by comprehension rather than memorizing. The results of this study shows that teaching of "Thermodynamics" performed with animations and simulations in the scope of Computer Assisted Instruction with cooperative learning is a more productive approach than the teaching performed with traditional methods in terms of improving the student success and concept understanding.

CONCLUSIONS

In conclusion, authors have shown that computer-assisted instructions are an excellent way to focus students' understanding of principles in Thermodynamics. The use of the CAI improved the students' ability to make acceptable predictions and explanations of the phenomena in physics. Findings of this study strongly support the fact that Computer animations and simulations may be used as an alternative instructional tool, in order to help students confront their cognitive constraints and develop a functional understanding of physics. To increase effects of CAI authors strongly believe that instructional support must be provided with simulations and animations. The findings confirm that computer-assisted instructional material in physics motivates and cultivates students' interest in learning physics and they have the ability to engage students in a way that other pedagogical tools cannot. Through animations and simulations, teachers can easily demonstrate the laws, concepts, and modeling processes in physics to their students without losing his/her role as the learning guide in the classroom.

ABSTRACT

The aim of this paper was to explore the outcomes of a video game-based intervention, WiiFit sport video games, on balance learning for elderly. Using a mixed-methods design, 58 participants were recruited to complete pre-/post-testing courses in the Biodex body balance (BBS) system and were divided into two experimental groups and a control group. Twenty-three participants voluntarily completed 60-minute WiiFit sport video games 3 times per week for a total of 8 weeks. Nonparametric statistical methods and constant comparison was utilized to analyze with the SPSS 15.0 and QSR Nvivo 7. Significant improvements were found in postural stability and limits of stability after the intervention ($p<.05$). The results also identified key factors to attract their participation. The results conclude that using video game-based interventions is a valuable and viable approach to encourage regular exercise participation and to improve balance learning for institution-dwelling veterans.

Keywords: postural balance, older adults, technology, WiiFit, physical education

INTRODUCTION

Falls has been the most significant serious problems and the leading cause of accidental death among older adults over the age of 65 years (Hornbrook, Stevens, Wingfield, Hollis, Greenlick, & Ory, 1994: Nelson & Amin, 1990). In addition to increasing medical costs, nonfatal falls also decrease the quality of life dramatically by causing physical injury, reducing ability of mobility, loss of confidence and sense of control, and blocking of social interaction (Tinetti, Baker, McAvay, Claus, Garrett, Gottschalk, Koch , Trainor, & Horwitz, 1994). Therefore, postural control/stability interventions have been called for to counter the progression of impaired balance in fall prevention programs for older adults and are recommended to provide movement activities that mimic movements in daily life such as twisting, turning, sudden starts and stops, standing over unstable surfaces, walking while changing speed and direction, using narrow paths, overcoming obstacles (Swanenburg, de Bruin, Uebelhart, & Mulder, 2009). Biodex Balance System (BBS; Biodex Inc.) is a laboratory-based training equipment with a multi-axial device and a circular platform that objectively measures and records an individual's balance. It provides standardized

test protocols (e.g., fall risk screening, weight-bearing assessment) and multiple training programs (e.g, fall prevention, conditioning) to improve balance for elderly (Karimi, Ebrahimi, Kahrizi, & Torkaman, 2008). However, those high-technology equipments are usually costly and limited to research institutions and are thus inaccessible and unavailable for senior institutions or communities. With the advance of technology, we proposed a low cost, accessible, and easily operated video game, Nintendo WiiFit ("WiiFit"), to proxy the high-cost, laboratory-based trainings and examine its efficacy/efficiency in senior institutions. This study aims to understand effects of training under the WiiFit programs, validating by the laboratory-based measurement, BBS. Additionally, quantitative information was also collected to understand the feasibility of the intervention in senior institutions.

METHODS AND PROCEDURES

Participants

A total of 58 participants (82.4±4.1 years) voluntarily completed BBS testing courses within one week. Twenty-three of the participants (82.4±3.9 years) were willingly to be randomly assigned into two groups (yoga group and balance group) and join the 30-minute WiiFit sport video games for 3 time/wk for 8 weeks. Within each one-hour training session, 5-minute warm-up, 50- minute game training, and 5- minute cool-down were provided in the leisure-activity room in veteran home. Thirty-five age-matched veterans (82.4±4.2 years) participated as a control group in this study. Participants were requested to complete BBS post-test within 1 week after experimental groups completing the intervention.

Outcome measures

Overall stability index (OSI) and limit of stability (LOS) are two major index to evaluate the progress of the training effects by using the BBS measures in the study. OSI are overall stability is composed of medial–lateral stability index (MLSI) and anterior–posterior stability index (APSI). Previous studies have shown that BBS is reliable for evaluating dynamic postural balance in healthy subjects (Aydog, Bal, Aydog, & Cakei,2005; Arnold & Schmitz, 1998). It is a multi-axial device which equipped with a circular platform to measure anterior–posterior and medial–lateral axes simultaneously and objectively measures/records an individual's ability to stabilize the involved joint under dynamic stress (Aydog et al., 2005).

Figure 1. Snapshots of older veterans testing on Biodex body balance system

MLSI, APSI and OSI are three major indexes that represent fluctuations around a zero point established prior to testing when the platform is stable (Arnold et al., 1998). According to a previous study, the reliability of BBS measures were R =.94 (OSI), R =.95 (APSI), and R = .93 (MLSI) in an 8 trails reliability estimates and the replication of the protocol with a separate group resulted in reliability estimates of R = .92 (OSI), R = .89 (APSI), R= .93 (MLSI). Martha also identified that intraclass correlation coefficients for the LOS tests in BBS ranged from .64 to .89 (Martha, 2000).

Interventions

Eleven participants (82.9±3.9 years) were randomly assigned to the yoga group. These participants were allowed to choose training programs from 5 Wii-yoga games which included "Deep Breathing", "Warrior", "Half Moon", "Palm Tree" and "Chair" in the very beginning sessions. More yoga postural options (e.g., Spine Extension, Gate, Grounded V and etc.) were provided while the participants were familiar with the game and requested for more challenges. Twelve participants (81.9±4.0 years) who were randomly assigned in the balance group were allowed to choose training programs from 4 Wii-balance games which included "Soccer Heading", "Table Tilt", "Balance Bubble", and "Penguin Slide" in beginning sessions. More game options were also provided when participants requested for more challenges (e.g., Ski Slalom, Ski jump and Skateboard and etc.).

During the training, staff caretakers were requested to monitor their safety and physical performance. Residential physicians and nurses were also on duty in case of emergency. Participants in control group did not receive any training or intervention during the period.

Figure 2. Snapshots of older veterans playing yoga and balance games

Statistical Analysis

The Statistical Package for the Social Sciences The SPSS version 15.0, was used to analyze the data using non-parametric tests: paired (Wilcoxon signed rank test) for within-subject variation, unpaired (Mann-Whitney U test) for between-subject variation, and Kruskal-Wallis one way analysis of variance or Chi Squared test as appropriate. Results were considered statistically significant when $p < .05$.

Qualitative Information

Participation observation and informal conversation were two major qualitative research methods to collect responses and feedback as field notes during the intervention. Older adults who participated in sport video games, co-workers, and facilitators were also interviewed by primary investigators. All data were gathered and analyzed by researchers who have previous qualitative research experience and prior experience working with elderly in senior institutions. Member checking, peer debriefing and auditing are

three main procedures to enhance the trustworthiness, credibility and transferability of the study. The QSR Nvivo 7 Software Package was used to assist in coding, sorting and generating themes of the data.

RESULTS

Adherence with the Intervention

With flexible adjustment for make-up training sessions, all participants completed 24 sessions of the interventions. The overall adherence with the intervention was 100 % and a total of 552 out of a possible 552 sessions (23 participants × 8 weeks × 3 sessions per week) were completed and no one dropped out.

Balance Improvement

BBS measures OSI (MLSI & APSI) and LOS scores in pre- and post-tests to quantify balance improvement in the elderly. Statistical significant differences were found when comparing the several scores of those groups (p<.05). Control group had significant better performance in overall and multiple domains of OSI and LOS in pre-test (see table 1). After the intervention, both experimental groups performed significantly better in overall and multiple domains of OSI and LOS in post-test. Examining the effects of the intervention, both yoga and balance groups demonstrated improvements in OSI and LOS significantly.

Table 1. Comparison of BBS measures in pre- and post-test

BBS measures	Control Group (N=35)		Experimental Group (N=23)					
					Yoga Group (N=11)		Balance Group (N=12)	
	Pre-test	Post-test	Pre-test	Post-test	Pre-test	Post-test	Pre-test	Post-test
OSI	4.02(1.16)	5.71(1.29)***	5.22(1.74)	3.20(0.87)***	5.39(1.77)	3.17(0.78)**	5.06(1.79)	3.23(0.98)**

Backward/Right	21.06(13.35)	17.00(13.73)	14.13(10.73)	22.70(13.52)*	16.73(11.77)	23.45(15.33)	11.75(9.56)	22.00(12.28)
Backward/Left	18.49(9.53)	16.54(11.93)	17.83(15.49)	24.22(16.40)	15.55(10.90)	19.36(10.20)	19.92(19.02)	28.67(19.95)

*p < 0.05 ;**p < 0.01 ;***p <0 .001 in the Wilcoxon signed rank test.

OSI= Overall stability index; MLSI= Medial–lateral stability index; APSI= Anterior–posterior stability index; LOS= limit of stability; Forward, Backward, Right, Left, Forward/Right Forward/Left, Backward/Right, Backward/Left means the degrees of the specific directions of displacement from center.

Qualitative Themes

Constant comparison was utilized to analyze the qualitative information with QSR Nvivo 7. Qualitative results identified that immediate feedback, sense of competition, companionship, challenges, social interaction with their grandchild and fun are six main reasons older veterans stay involved with the Intervention. Enjoyment, social interaction and flow experience are three key areas that ensure the quality of the intervention. In addition, adding extra-workload for staff, no interest in developing technology-based intervention, difficulties in game control/operation and amotivations for learning are four challenges to overcome in order to promote video game-based programs.

DISSCUSSION

The intervention impacted significantly on OSI, MLSI, APSI, LOS with forward, right, left, forward/right, forward/left, backward/right and backward/left ($p < .05$). In addition, experimental groups, both in yoga and balance groups, have significant balance improvements in OSI (MLSI and APSI) and LOS (right, backward/right) within the groups. The findings also extended the result of past previous studies, such as the Pigford's case study, the Nitz's pilot study, the Sugerman's feasibility study and the Williams' acceptability study (Nitz et al.,2010; Williams et al.,2010; Sugarman et al.,2009; Andrews, 2010). We found that lower frequency (3 vs. 5 times per week) and longer duration (2 vs. 8 weeks) of trainings were still able to enhance balance in elderly. Echoed the Nitz and the colleagues' study, we confirmed their results with a control group design and statistically significant outcome measurements (Nitz et al.,2010). The study also advanced the Sugerman's study and excluded veterans undergoing any physical therapy or exercise programs to ascertain the contribution of the intervention (Sugarman et al.,2009). Improving Williams' acceptability study undertaken in a supervised hospital environment, the intervention was completed in their own veteran home setting and had overcame the difficulties in recruitment and a high drop-out rate in their study (Williams et al.,2010).

The study extends the empirical support that video game-based interventions, which focused on balance improvement, activity engagement and leisure enjoyment, are viable approaches in senior institutions. Evidence that comprehensive and holistic fall-prevention studies of the response to WiiFit programs with other modes of fitness and balance trainings is recommended to expand the evidence base for this new approach. In addition, fall by getting carried away with the game, possibility of undesirable movements or postures, and overuse injuries are three major safety concerns of the study. Further safety guidance and information are also suggested in further studies.

CONCLUSIONS

This study gives insight on how leisure interventions were combined with technology and physical activity to enhance middle-old older veterans' leisure participation, improve their balance performance, and finally, promote their health. The research findings showed that WiiFit programs are viable way to attract institutional older veterans to participate initially. Further individualized programs and assistance in

control and selections are needed to continue their involvement. The study implicates that enjoyment, social interaction and flow experience are keys to develop successful video game-based intervention for institutional older veterans.

Key words: Mobile phone games, m learning, edutainment, Tuberculosis

ABSTRACT

Mobile learning solutions are effective and mobile learning content delivery is being used as an ICT based learning method for development communication and edutainment and reaching out to grassroots communities. Tuberculosis (TB) is becoming a growing concern in India and youth comprise a large share of the Tuberculosis patients. Several mobile phone games on development issues are available today. A game on tuberculosis 'Stop TB Cricket' was selected for field testing to study its efficacy as a media for edutainment for youth (male and female) living in a resettlement colony of Delhi (India). An increase in the awareness of youth about tuberculosis was found after playing the game. The game was liked by a majority of the youth. It was found to be easy to play and an innovative way of disseminating information on a serious health concern TB. The youth wanted to acquire this game in their own mobile phones and share it with their friends and family. Several suggestions were offered to improve the game and its overall gaming experience. Several topics were suggested for developing new games. The game was found to be an effective, quick, convenient and innovative media for edutainment.

Introduction

Mobile phones have changed the entire communication scenario of the World. They have become multipurpose tools which are being used for communication, education and gaming or accessing information. Development practitioners and communication experts see mobile phones as important tools in the hands of all communities for social development.

Tuberculosis (TB) is the leading cause of death from curable infectious diseases. Globally more than 1.3 million people die of the disease every year (RNTCP Status Report, 2010). In India, TB kills more adults in the most productive age group (15-54 years) than any other infectious disease. The disruption caused – to both society and economy – is incalculable. A patient of TB takes an average of three or four months to recuperate, losing that much income. The loss is disastrous for those struggling against poverty and under-development (TB India, 2006). Government of India under its TB control programme, Revised National Tuberculosis Control Programme (RNTCP), offers free treatment and medicines at various health centres and government hospitals. DOTS (Directly Observed Treatment Short Course) a strategy recommended by WHO, is the only effective means of TB treatment and is practiced in more than 180 countries (Freedomtb, 2011).

Use of ICTs in Health Management

ICTs cover a broad range of services, applications and technologies using various types of contemporary equipments and software. Modern ICT services include cellular and mobile telephone, email transfer of files from one computer to another computer and the use of the internet. The health sector stands to benefit greatly from the use of ICTs and ICT applications, for example through the more efficient delivery of healthcare services and the provision of health information to the general public. The use of ICTs in the health sector also improves the collection, storage, retrieval and transmission of individual patient information. Furthermore, given the soaring use of mobile technologies worldwide, m health (which refers to medical and public-health practices supported by mobile devices) holds huge promise for improving the delivery of health services to an increasing share of the world's population. Thus, ICTs

have the potential to contribute to more effective delivery of health services and to increase the efficiency of health systems (OECD 2001).

Edutainment
Edutainment is a blend of two words - "Education" and "Entertainment" or educational entertainment. Edutainment content assists in active form of learning, helps in increasing retention and builds skills and competence. It helps to create interesting, situational learning environments that closely reflect a learner's true working environment. Edutainment deepens understanding by introducing the elements of fun for enhancing and retaining knowledge (ZMQ, 2010).

Mobile Phones
With the geometric increase of number of devices in the world, mobile phones have a potential of delivery of sustainable learning on a massive scale. Mobile phones are much more accessible and practical tool for most people in the world. Mobile is a self-learning device and has successfully been able to reach out to the last mile - to the grass-root communities. It is the device of the future, whether it is communication, information, enterprise development, education or edutainment. As the devices are gaining strength, there is a simultaneous gain in scope (ZMQ, 2011).

Mobile Phone Gaming
Games are an exciting way to communicate and connect with a large number of people. Rich mobile games, combined with connected near distance multiplayer gaming over Bluetooth and internet using cellular networks, opens the door for totally new gaming concepts. Mobility will add a whole new dimension to innovative and creative games concepts and will provide opportunities for the games and telecom industry alike (Goggin, 2010).

E-learning
The term e-learning comprises a lot more than online learning, virtual learning, distributed learning, networked or web-based learning. As the letter “e” in e-learning stands for the word “electronic”, e-learning would incorporate all educational activities that are carried out by individuals or groups working online or offline, and synchronously or asynchronously via networked or standalone computers and other electronic devices (Dede, 2000; 1996).

M-learning
Any activity that allows individuals to be more productive when consuming, interacting with, or creating information, mediated through a compact digital portable device that the individual carries on a regular basis, has reliable connectivity, and fits in a pocket or purse. Mobile Learning is an ideal solution today as it facilitates learning anytime-anywhere. Mobile Learning is highly effective for social learning solutions in healthcare programs, awareness programs and literacy programs like basic numeracy and basic alphabetization for the communities with lesser literacy level (ZMQ, 2010).

Stop TB Cricket- a mobile phone game
MDR-TB Partnership has come up with an innovative approach to create awareness on Tuberculosis among children through edutainment and games. **Stop TB Cricket** is a mobile phone based cricket game developed to make young people play and learn about TB anytime – anywhere. The primary aim is to create TB awareness among youth and bring a change using interactive mobile phone games (Freedomtb, 2011).
Stop TB Cricket is a game which uses cricket as a sport to deliver messages on Tuberculosis. In ‘Stop TB Cricket’ there is two teams – Safety XI and TB Germs XI. One has to bat and chase a set of score after choosing his or her team. After every shot, a dialogue box containing facts about the disease of information countering popular myths and misconceptions associated with it is displayed. When a player scores runs, information on how to prevent TB get displayed on screen. When a player loses a wicket, information on how TB is transmitted and its cure is flashed (Jha, 2011).
It has been evidenced that interactive games blended with socially relevant messages help in effective, quicker and easier understanding of the message (Khanna A, Soni J and Singh A, 2011). Digital gaming is an interactive way of engaging people and disseminating development messages.
In the light of the emerging scenario it became imperative to seek answers to the following questions:

What are the mobile phone gaming practices of youth? What types of mobile phone games are liked by them? How frequently do they play games on mobile phones? How do they acquire mobile phone games? What is their gaming experience with Stop TB Cricket? Is the game able to increase their awareness about Tuberculosis? Is there any difference is the opinion of male and female youth regarding the game? What is the opinion of the youth about edutainment games especially in mobile phones?
Assessing the efficacy of Stop TB Cricket - a mobile phone game on Tuberculosis would give feedback to development communication practitioners, programme planners and game developers. Hence the study was designed with the following objectives:

General

To study the efficacy of a mobile phone game 'Stop TB Cricket' for creating awareness on Tuberculosis amongst youth.

Specific

1) To analyze the contents of 'Stop TB Cricket' mobile phone game.
2) To find out the mobile phone gaming practices of the youth.
3) To assess awareness of the youth about Tuberculosis before and after playing the selected mobile phone game.
4) To seek the opinion of youth regarding the following aspects of 'Stop TB Cricket':
   - Instructions for playing the games
   - Ease of playing
   - Ease of understanding the messages
   - Scoring pattern and levels of the game
   - Gaming experiences
   - Entertainment value
   - Quality of graphics
5) To seek the suggestions of the youth for improving the selected game.
6) To elicit the youth's view about mobile phone games as a media for disseminating development messages.

Hypothesis:

H_O: The game Stop TB Cricket does not increase the awareness of youth about TB.
H_A: The game Stop TB Cricket increases the awareness of youth about TB.

Variables:

Dependent: Increase in the awareness of youth about Tuberculosis
Independent: Age, sex, education and occupation of the youth
Control: Mobile phone hand set used for field testing the game
Minimum score (30 runs) that a player had to make on the game before taking the Post Test for awareness

Methodology

The study was conducted in Delhi. For field testing a sample of 80 youth were selected. For content analysis a sample of 20 experts was selected. Methodology used for data collection is described below:

Feedback from the youth: For the study, the resettlement colonies of Badarpur (especially around Molarband Village) in South Delhi (near Delhi-Haryana boarder) were selected. Badarpur is a mixture of urban and rural settlements comprising of a population of 2 lakhs and has four major clusters dominated by migrants from North Indian States. The sample comprised of 80 youth (equal number of boys and girls). Data pertaining to the objective of the study was collected by using a semi structured interview schedule and an Awareness Test administered before and after playing the game. All the youth played the game on the same mobile phone. Data was subjected to quantitative and qualitative analysis. Total score for each respondent was calculated for the pre and post Awareness Test. All the data was reported in terms of frequencies, percentages and other important statistical parameters. Suitable statistical tests were applied to arrive at conclusions.

Feedback from Experts: Twenty experts from the fields of communication and extension, education, medicine and computer were selected for the content analysis of the game. An objective type of schedule containing the messages in the game was given to them. Their opinion about the relevance, accuracy, ease

of understanding the messages and suggestions for improving them were sought. Based on the feedback received messages were graded as Excellent, Good, Average, Poor and Very poor.

Major Findings

Socio Economic Profile of the youth: All the respondents were between 15-25 years and comprised of equal number of males and females. The youngest respondent was 15 years and the oldest was 25 years. The average age of the respondents was 18.65 years. It was found that 68.75% were in the age group of 15-19 years. There were about 40 (50%) males and 40 (50%) females that were included in the study.
Most of the respondents were school going. Of these 50% of the youth were 10^{th} class pass where as 37.5% were 12^{th} class pass. More boys as compared to girls were found to be class 12^{th} passed. Only 8.75% youth were graduates. No one in the sample was post graduate. A majority of the youth (85%) was students and hence a very few were employed.

Mobile phone gaming practices of youth:
Frequency of playing mobile phone games: All the respondents had played mobile phone games earlier. A large majority (81.25%) of the youth played mobile phone games occasionally. Only 7.5% of the youth reported that they played mobile phone games every day. A few youth (5%) stated that they played once a week and 6.25% played mobile phone games occasionally.
Purpose of playing mobile phone games: Most of the youth (81.25%) reported that they played mobile phone games for entertainment and pass time and the remaining played to make their mind sharp.
Age at which started playing mobile phone game: About half of the youth (50%) reported that they started playing the mobile phone game at the age of 16-20 years whereas 38.75% started playing the game at the age of 10-15 years. A few youth reported that they started playing games on mobile phones when they were less than 10 years of age.
Duration of playing mobile phone games: An average mobile phone gaming session was reported to be under 15 minutes for more than half the youth (56.25%), 33.75% played the game for about 16-30 minutes, 10% played for 31-60 minutes and the remaining youth played for 1 hour or more at a stretch. The duration of playing mobile phone games was found to be similar for both male and female youth. On statistical analysis it was found that there was no association between sex, age group and occupation of the youth with the duration of playing mobile phone games. However, a significant association was found between the level of education of the youth and duration of playing mobile phone games.
Place for playing mobile phone games: It was found that 70% of the youth preferred playing mobile phone games at their home. They also played while travelling, sitting in a park or at friend's house.
Favourite mobile phone games: The youth liked a variety of mobile phone games. The most popular type of games were sports based games (51.40%) like Cricket, Rapid roll and Football, followed by adventure games (liked by 31.7% of the youth) and Puzzles and racing games were liked by 8.5% youth significantly related to their sex.
On statistical analysis it was found that the type of game liked by the youth was found to be significantly associated with their sex. No statistically significant association was found between the type of mobile phone game liked and the youth's age, education and occupation
Choice of brand for mobile phone gaming: The most preferred brand of handset for playing mobile phone games was reported to be Nokia by 75% respondents. Other brands were Motorola, Sony Ericson, Spice, and phones by Reliance and Tata Indicom.
Price of mobile phone used: A large number of youth (63.75%) were found to be using mobile phones in the price band of Rs.1000-2000. It was found that low cost mobile phones under Rs 5000/- were used by a majority of the youth. The others were found to be using more expensive phones.
Method of acquiring mobile phone games: Only one-third of the sample was aware that mobile phone games could be loaded through internet (33.75%) or by using Bluetooth technology (16.25%). A few respondents were aware that mobile phone games can also be loaded by using a data cable and a computer. A large number (40%) were of the view that mobile phone games came preloaded from the manufacturer only. It was observed that more boys than girls were aware that new games could be loaded in mobile phones by them.
Frequency of acquiring mobile phone game: Nearly one-third (31.25%) of the youth revealed that they sometimes acquired mobile phone games. Whereas 63.75% revealed that they had never acquired a new game in their mobile phone. It was found that more boys (50%) than girls (17.5%) had tried acquiring new games in their mobile phones.

Ability to download mobile phone game: The youth were asked whether they were able to download mobile phone games and found the process of downloading easy or difficult. About half of the youth (52.5%) reported that they found the process of downloading a game difficult.
On statistical analysis it was found that the ability to load games in a mobile phone was related to the sex of the youth. No statistically significant association was found between the type of mobile phone game liked and the youth's age, education and occupation.
Advantage(s) of playing mobile phone games: About half of the youth (46.25%) stated that playing mobile phone games helped them to gain information, become mentally alert (23.75%) and sharpen their memory.
Disadvantage(s) of playing mobile phone games: The youth listed a few disadvantages of playing mobile phone games. About 42.5% of the youth felt that the major disadvantage of playing mobile phone games was wastage of time, 30% felt they could not concentrate on their studies and some believed that playing mobile phone games would weaken their eye sight.
Problems encountered while playing mobile phone games: The youth were asked to share some of the problems that encountered while playing mobile phone games. The most frequently encountered problems while gaming were reported to be low battery life (45%) and small buttons (28.75%). Other problems reported were small size of the screen, poor sound and graphics.

Feedback about Stop TB Cricket:

Figure: Stop TB Cricket- mobile phone game

Subject of the game Stop TB Cricket: Although a majority of the youth (80%) stated that the game they played was about TB. However, the remaining mentioned that the game was on cricket- of these 30% were girls and 10% were boys.
Time taken to gain proficiency in playing Stop TB Cricket: A majority of the youth (90%) took only 1-2 times to play the game and develop proficiency in it. A similar trend was observed in both boys and girls. Thus, it can be concluded that the game Stop TB Cricket was easy to understand and play.
Ease of playing the game: The game was found easy to play by a majority of the youth. About 20% of the youth found the game 'very easy' to play and 53.75% reported that it was 'easy' to play. About one-fourth of the youth (26.75%) found the game 'difficult' to play.
Ease of understanding the instructions for playing the game: Half of the youth (50%) reported that they found the instructions for playing the game 'clear' where as 23.75% reported that they were 'very clear'. Nearly one-fourth of the youth (26.25%) reported that the instructions were 'unclear'- of these girls were found to be more in number as compared to boys.
Problems encountered while playing Stop TB Cricket: A large number of the youth (65%) did not report any problem in playing the game. However, the others reported problems related to size of buttons on handset, difficulty in understanding some instructions and some messages. It was observed that more girls than boys reported problems while playing the game.
Appeal of the game: Almost all the youth (95%) found the game quite appealing in general. A large number of the youth (70%) found the game very appealing. The TB game was based on cricket which is a very popular sport in India. This was cited as the main reason for liking the game.
Language of the Messages: It was found that only about one-third (36.25%) of the respondents found the messages in the game 'very clear', 57.5% stated that they found the messages 'clear' and the few remaining found them 'unclear'. Although the game was in Hindi, the words used in some messages were found to be difficult to understand. For example, words like '*sankraman*, DOTS *pranalee*, etc. were found difficult to understand.
Efficacy of Stop TB Cricket in enhancing awareness about Tuberculosis: To assess the effectiveness of Stop TB Cricket in enhancing the youth's awareness about Tuberculosis an Awareness Test comprising of 16 objective type questions was administered to the respondents before and after playing the game.

Each question was given 1 mark. The average score on the Awareness Test before playing the game was found to be 10.75 and increased to 12.50 after playing the game. Hence, the average gain in score was 1.75. The gain in average awareness score was found to be more in female respondents (2.08) as compared to male respondents (1.80).
The lowest score before playing the game was 6 and the highest score before playing the game was 15 amongst all the youth. The lowest score after playing the game was 9 and the highest score was 16. The minimum gain in score after playing the game was 1 and maximum was 7. A few respondents (5%) did not show any change in awareness score after playing the game.
Increase in the awareness scores clearly indicated that the game Stop TB Cricket was quite effective in increasing awareness of the youth about Tuberculosis. This was also confirmed by statistical analysis.
It was concluded that awareness about TB after playing the game Stop TB Cricket was significantly higher amongst the youth. It was concluded that the game Stop TB Cricket is successful in increasing the awareness of youth about TB.
It was also concluded that increase in awareness of youth about TB was significantly correlated to the education of the youth. Variables like age group, sex and occupation were not found to have any correlation with the performance of the youth on the awareness test.
Willingness to acquire edutainment based mobile phone games: Nearly all the youth (93.75%) expressed willingness to acquire edutainment based mobile phone games in their phones as they found these games to be very informative and entertaining.
Issues suggested for making edutainment based mobile phone games: Most of the youth had a lot of suggestions to give about the kind of new mobile phone games they wanted to be developed. The youth suggested that new mobile phone games should be prepared on health (83.75%), social issues (12.5%) and environment (7.5%). They were found willing to participate in the game development process. Such initiatives could be supported by the local government, NGOs, corporate, especially mobile phone manufacturers and network service providers, and other institutions concerned with community development (as a part of their Corporate Social Responsibility strategy).
Method of sharing information about edutainment based games: All the youth expressed willingness to share information about edutainment based mobile phone games with their family and friends. They suggested a wide variety of ways by which mobile phone games with development messages could be introduced to more people in the community. These included street theatre (28.75%), internet (22.5%), sms on mobile phones (18.75%), and advertisements in newspapers (18.75%), visits in schools and homes (16.25%) and TV advertisements (12.5%). Posters/pamphlets, meetings and information stalls were suggested by very few respondents.
Suggestions for improving 'Stop TB Cricket': A lot of suggestions were offered to improve the game: 17.5% suggested that the game should have different types and levels, 16.25% wanted the content and language to be simpler, 13.75% wanted both male and female players in the game, 12.5% wanted better graphics and 10% wanted better readability in terms of larger font size and slower speed of scrolling of text.

Feedback from Experts- Analysis of messages appearing in the game:
There were the total 16 messages in the game. It was found that the game contained no message on signs and symptoms of TB. A lay person identifies a disease by seeing certain signs and symptoms. Hence it was very important to have messages creating awareness about signs and symptoms of a disease. There were 3 messages on Causes, 4 messages on Diagnosis and Treatment, 5 messages on Prevention and Myths and Misconceptions and 1 General message on Tuberculosis.
Based on feedback from experts it was concluded that out of 16 messages in the game 1 message were rated as Excellent, 9 messages were rated Good, 6 messages were rated Average, none of the messages were graded as Poor and Very Poor. The suggestions given by the experts were used to revise the messages in the game. The revised messages can be incorporated in the next edition of the game by the game developer. Content analysis of the game gave valuable insights about the choice of language and nature of messages to be included in a game on Tuberculosis for mass distribution in Hindi language.

Conclusions and Recommendations

- Youth played mobile phone games frequently primarily for entertaining themselves. The most popular type of games liked by the youth were based on sports and adventure.
- Stop TB Cricket' was liked by most of the youth. It was found to be effective in creating awareness about Tuberculosis amongst both male and female players. This was confirmed by statistical analysis.

Thus, the game can be used to disseminate messages on TB to people in a cost and time efficient manner.

- Almost all the youth wanted to have Stop TB Cricket in their mobile phones. A majority did not have internet connection activated in their phones. Therefore the game could not be loaded in their phones. Technology should be developed to make it possible to load mobile phone games through Bluetooth to reduce dependence on a live internet connection. This will make it easy to share mobile games amongst people who do not have internet activated on their phones.
- Stop TB Cricket should include male and female players to increase its appeal, especially to female gamers.
- There must be levels in the game like 20-20 or test match so that it excite more of the youth. There could be options to choose male and female players in a team, directions for bowling, sound of audience cheering whenever a player hits a 4 or 6 or gets out.
- Instructions for playing should be provided in Hindi and English.
- Mobile phone games should be developed with superior graphics, sound effects and ease of controlling to enhance the gaming experience.
- Youth suggested that new mobile phone edutainment games should be developed on issues like gender, environment, health, nutrition and on topics from their school syllabus. Developing a mobile phone costs about 5-6 lakh Rupees. Such an initiative can be supported by the local government, NGOs, corporates, especially mobile phone manufacturers and network service providers as a part of their corporate social responsibility, and other institutions associated with community development.
- Messages for Stop TB Cricket should be framed in simple spoken language so that they are easy to understand. More messages on TB can be included in Stop TB Cricket, especially on signs and symptoms and myths and misconceptions. Out of the 16 messages in the game, experts rated only 1 message as Excellent and 9 messages as Good, 6 messages were rated as Average. None of the messages were rated as Poor or Very Poor.
- Mobile phone edutainment games should be widely publicized through the mass media to inform the public about their purpose, source and method of acquiring. Gaming tournaments can be organized to create interest and awareness amongst the public about these games.
- Mobile phone edutainment games should be available for free download on all mobile network service providers to facilitate widespread dissemination of development messages to the masses.

Elameer-Idrus Orbital e-Education Framework for the University of Mustansiriyah (UoMust)

Amer Saleem Elameer & Rozhan M. Idrus
School of Distance Education, Universiti Sains Malaysia, Penang, Malaysia

ABSTRACT

The study of the university of Mustansiriyah case show us very clear that university suffers from a lot of problems start from the security , technology , management , pedagogical and ethical. Based on a pre-questionnaire survey about e-learning results, interviews and studies show us the need to the complete e-education system. Continuous scrutiny and study of the Iraqi higher education showed us very clearly there was something missing and need to be more reinforced in our modified Khan framework especially with the revolution of the wireless technologies. A framework was designed with many added dimensions like stability, time, learner, content control, standardization, scalability and modularization. As a result, a new framework, is an *ELAMEER-IDRUS* orbit e-education framework with a good acceptance at the post evaluation process that was achieved from a group of 231 senior academics.

Keywords : University of Mustansiriyah (UoMust) , e-Education , Khan e-Learning framework , Modified Khan e-learning framework ,

1. INTRODUCTION

There are no doubts about the benefits of educational technologies to higher education and the impact on the learning process; in Iraq it demands for a change in the mindset of the students, lecturers, administrators of the universities, learning leaders, and the decision makers(Harb, 2008; Husain, 2004). Nowadays, the linear learning methods are obsolete and replaced by a cyclical new modern methods. Students now can start with study, go to work and come back to study again. This cyclic pattern will be the future feature of higher education, and technology will be the catalyst in realizing the flexibility, simplicity, durability, standard ability, scalability and mobility. E-learning could also easily customize the academic programs based on the demands and the geographical, culture, technological constraints of the students.

Iraqi universities are in urgent need for e-education systems and also the ministry need for the e-ministry, since the e-education are the focus on the learning and pedagogical factors. E-education can be defined as the learning process that involves e-learning with the different administrative and strategic measures needed to support the learning in an Internet environment, and it will incorporate a local, regional, national and international view of education. Most of the lecturers found them self without any instructional aides or educational technologies to use it because of lowest governmental budgets, especially in education systems with monitored increasing in the students' numbers.

Previously like all the education systems in the world the learning concept in Iraq was teacher-centered, and when the world start to change this concept and start making the learner as the core. The Iraqi education system starts to concrete the lecturer role as the core and center of the learning process. The reason for that was :

1-Difficult economic living condition in all of Iraq, missing the required concentration for the students and learner.

2-Government focusing on the quantity not quality of the graduates.

3-Learner core concept starts at the end of the eighteen decades when the Iraqi economy starts to fall down pursuant to the first gulf war.

As a result of complications and the circumstances that have passed on Iraq and the characteristics of the universities educational environment, it has been found that the adoption of any educational e-learning model or framework will not be useful for UoMust or the Iraqi universities because of the many factors that will play a big role in affecting e-education in Iraq's universities, and it was necessary to build a special e-education framework which considers all the education dimensions into consideration in Iraq to reach the best of the quality teaching.

After scrutinizing the e-learning framework from past researchers, it was found that each designer put their own ideas in the framework but most of them stated some factors that could influence an electronic learning system. Some variables in this research were selected from literature that was

reviewed and others were from interviews with experts in the field of e- learning in different science sectors. Many studies have identified important variables dealing with an electronic learning system.

2. METHODOLOGY

The ADDIE model (Analysis, Design, Development, Implementation, and Evaluation) was utilized in the study. Our framework is a result coming from :

1-Searching for the best e-education and e-learning frameworks in the previous studies and literatures.

2- An exploratory research of the state-of-the-e-learning and e-education and their future perspectives in our research context about Iraqi higher education.

A specially formulated questionnaire was designed and distributed between a group of Iraqi Mustansiriyah University staff to investigate the direction towards the e-learning elements, management & institutional problems, which are the basic elements of the proposed strategy and that could face the implementing e-education projects, the benefits that will be gained to the higher education sector, and the technology problems.

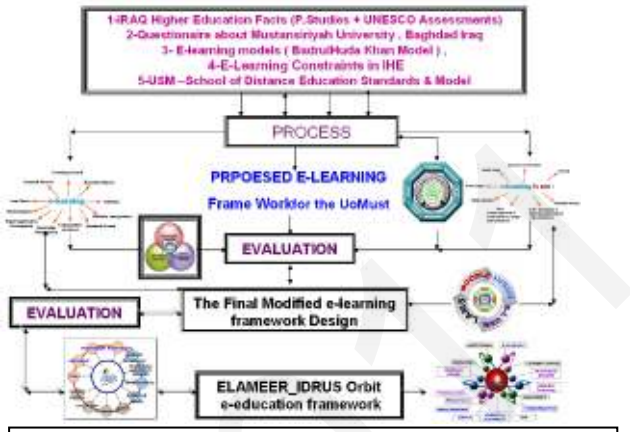

Figure.1 : The research methodology framework

3. THE INSTRUMENT

The Statistical procedure and the data analysis is one of the most important parts of the research work, and according to (Marczyk et al. 2005) "in most types of research studies. The process of data analysis involves the following three steps: (1) preparing the data for analysis, (2) analyzing the data, and (3) interpreting the data". At the preliminary stage, a survey technique was used to collect the data and prepare it for the analyzing through a questionnaire of 44 statements for the e-learning and ICT skills in the UoMust. Preparation of the data for analysis was collected from the questionnaire which was divided into two parts. The first was the general and personal information the second included the targeted questions that as divided into five categories of management, institutional, technology, human resources and general.

The questionnaire was distributed between the academicians and after completing the framework design and at the final stage a post evaluation was achieved by a questionnaire of 50 statements about the design and all its elements and components.

All the statements and feedback were analyzed and computerized using the statically package for social science (SPSS) to obtain the mean (M), standard deviation (St.D), percentages (%). A Likert scale of six points was used (Gelin 2003), and they are: strongly agree (SA)-6, agree (A)-5, neutral (N)-4, disagree (DA)-3, strongly disagree (SDA)-2, don't know-(DK)-1 ((Kaghed & Dezaye, 2009);(Mohammad, 2008)).

4. THE ORBIT FRAMEWORK:

The power and effectiveness of these new tools and methods are always being associated with the electronic learning methods, pedagogy, technology, institutionally, managerially, equity, ethically, interface designs and the way to access and any other variables could play a role in the learning process. To change this situation, we need to build a complete education system its core or center is the student or the learner since the researches and all the up to date educational theories prove that and encourage to design the learning environments centralizing the student or learner for an e-Education framework for the University of Mustansiriyah.

The Khan framework portrays a comprehensive theoretical e-learning model. E-Learning can be defined now as Badrul H. Khan stated: An innovative approach for delivering well designed, learner-centered, interactive, and facilitated learning environment to anyone, anyplace, anytime, by utilizing the attributes and resources of various digital technologies along with other forms of learning materials suited for open and distributed learning environment. The emergence of this frame work made the greatest impact in the revolution of e-learning that take place in the all of the learning sectors since this framework,

for the last 16 years, described all the education and learning process. Further, the framework also offered the logical base for all the e-learning instructional designers on how to design and implement effective learning environment in the e-learning process using the interactions afforded via computers and the internet, considering and stating all the factors that could affect the proposed designs. The Khan framework is still widely utilized until today.((Khan, 2004, 2009; Khan & Granato, 2007)).

And according to the results that we obtain it from a UoMust surveys and studying the Iraqi higher education status we find that the elements that to be considered in any framework design are:

1-Pedagaogical, 2-Ethical, 3-Evaluation, 4-Technological, 5-Interface Design, 6-Institutional, 7-Management, 8-Wireless Technologies, 9-Time, 10-Content Control, 11-Human Resources Capacity Building, 12-Evaluation , 13-Learner. as shown in figure .2.

The Khan framework was modified and a new e-learning framework was built for the UoMust with 12 dimensions as shown in figure .3.

The e-learning elements was divided into three main trajectories, and they are, 1- Technological, 2-Organizational, 3-Educational, and each trajectory has its own elements that related to its functionality and Characterize by its main mark.

We believe that learning is completely systematically operation because it's dealing with the humans whatever its type was, and any systematic operation needed to be stable from the beginning and starting to its final goal or end, and learning must be stable operation in all its steps or phases.

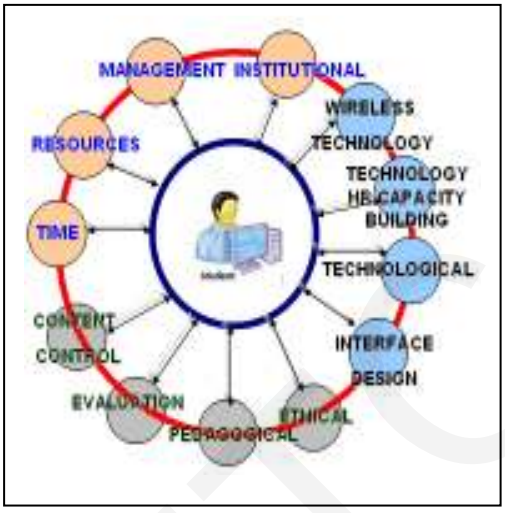

Figure.2 : All e-learning dimensions and elements

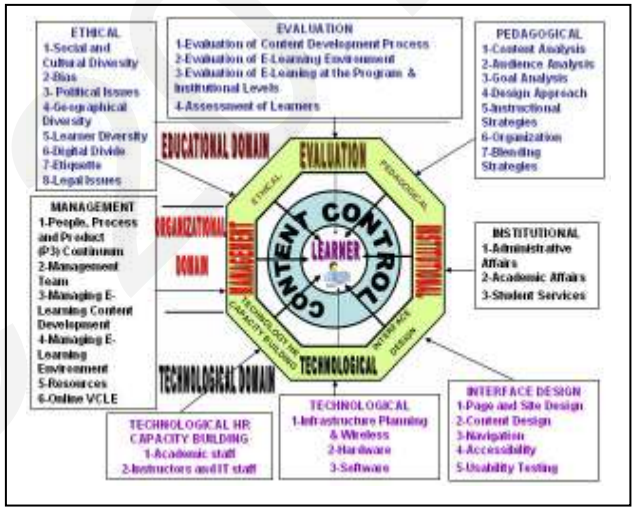

Figure.3 : Modified Khan e-learning framework

In all the investigated models, we never found any model deal with this element that could effect and destroyed all the learning process because most of the designers are backgrounds are stable and consistent. In Iraq, it is a completely different case, and nothing is stable at all and small examples for that in Iraqi higher education undergraduate studies, they invent the third trial exams for whom that fail to reach the exam's rooms in the fixed time and date.

This is in the face to face traditional learning process, and more stability is needed in an electronic learning process. From that point of stand stability become a very important element if we are designing or trying to design e-learning or e-education activities in un stable countries where everything is not stable or going to be stable in the near future, and we also believe adopting such a stable framework could push strongly towards the stability of the learning process. We believe that the technological is the base and the foundation for our framework and for that we give this trajectory the main position inside the design and build all other elements according to its up to date new technological shapes after the ICT revolution which changes all old standards and concepts. These trajectory's elements are :

4-1- Technological Trajectory: the e-learning elements here must be scalable and stable and the elements are: Technology, Wireless technology, interface design, and technological human resources capacity building.

One computer to one learner is a very difficult formula to reach in any learning institution, especially with the same specifications.((Bielefeldt, 2006). Internet speed, or bandwidth, was a crucial issue for performance in large e-education networks. Studies have shown that the introduction of high-

access computing can change the nature of instruction , and the strategies learned with technology may not be the same ones required for standard assessments of learning (Means & Olson, 1995).

"E-learning should ensure sufficient bandwidth is available to support the type of online learning applications being used and to ensure e learners have opportunities for face to face experiences in conjunction with their e-learning."(Ismail, Idrus, Ziden, & Fook, 2009).

ICT technology is the base for our framework, and it is the main trajectory that we build our system on it and without it, there is no e-education. In the Technological trajectory, we have four dimensions, and they are**:**

4-1-1-Technology: The technological dimension of e-learning examines issues of technology infrastructure in e-learning environments. This includes infrastructure planning, hardware, and software and according to that the changes in the education system in Iraq will be completely 180 degree turn, and everything will up to date and new. With considering that most emergent technologies are not widely having an adopted standard (hardware or software).

4-1-2-Human Resources Capacity Building: (MacDonald, Stodel, Hall, & Weaver, 2009) stated that if people did not have positive attitude, knowledge and skills of ICT, the e- learning program fails. Knowledge and skills have a direct impact on using e-learning. Since most of Iraqi universities suffers from the luck of required skills, (Elameer & Idrus, 2010), and we think Iraq needs to increase the believing in ICT which we think it will re shaped the education system completely.

4-1-3-Interface Design: The interface design refers to the overall look and feel of e-learning programs. The interface design dimension encompasses page and site design, content design, navigation, accessibility, and usability testing (((Khan, 2005; Rosenberg et al., 2007) and it is a very important element because it could be the way to the success, or they fail of any frame wok.

4-1-4-Wireless Technology : The growing development and application of wireless Information and Communication Technologies (WICT) opens new windows and opportunities for education improvement and redesigns the organizational and educational settings and shapes

To increase process polychromic, i.e., the possibility to deal with several tasks simultaneously. There is also a social context that includes different cultural formations, situations and moods, degrees of proximity and mutual recognition among people, etiquette and other elements that define what is or is not allowed in certain situations.

4-2- Organizational Trajectory: The e-learning elements here must be standardized according to the progressed university standardization and the elements are: Institutional, Management, Resources, and the Time. Furthermore, the organizational standard must be stable, and do not influence by the country or society changing winds only if it is to the better. The Stability of the universities is one of its basic academic characteristics, and we can find very clearly how the rules and regulations of the big names' universities like Cambridge, Oxford, UCL ,..etc. still same from long years ago and this a big indication for these universities organizational stability.

In Iraq the case is completely different and nothing is stable at all, and this comes from the changing of the regime in Iraq and missing universities stability come as a result for the country transform to the democracy.

In the Organizational trajectory, we have four dimensions, and they are:

4-2-1-Institutional: The institutional dimension is concerned with issues of administrative affairs, academic affairs, and student services related to e-learning.

4-2-2-Resources: The resource support dimension of e-learning examines the online support and resources required to foster meaningful learning

4-2-3-Management**:** The management of e-learning refers to the maintenance of the learning environment and distribution of information and lack of ongoing support from management, failure to perform meaningful reviews to ensure an environment of continuous process improvement, etc.(Idrus, 2008).

4-2-4-Time: Time is considered a very important dimension in any innovative implementation of e-learning framework with considering the differences between the student achievement capabilities and the individualized differences, but we can keep time open without any upper limits or an end.

Availability of time must be adequate time and compensated time for users to become educated and skilled in how to use an innovation. This condition refers not only to the organization's willingness to provide time (such as paid time or release time) but the users' willingness to devote learning time to use the innovation.(Idrus 2008)

4-3-Educational Trajectory: The e-learning elements here must be modularized according to the Iraqi student's characteristics, and the elements are: Pedagogical, Evaluation, Ethical and the Content control.

In IT and in general Modularity definition is the property of the software (computer programs) that measures the extent to which programs or software have been composed out of separate parts called modules.

Modularity in learning is the same concept, and it is defined as the property of allowing to encapsulate, expose and separately reuse parts of a learning resource.

The framework has been designed to modularized the digital learning content, and it has been addressed as a part of the concept of learning objects.

The framework presented in this research can be used as the basis for a good foundation for modularization of the VLE. By modularizing the VLE, new functional components can be easily added in a way that makes them work as an integrated part of the overall learning environment.(Paulsson & Berglund, 2006).

In the Educational trajectory, we have four dimensions and as a word of the truth Khan 2009 framework had covered three dimensions completely, and we cannot find any missing element in his work in the field of pedagogical, ethical and evaluation as educational dimensions, but we also believe that content control should be added here as a new dimension to the educational trajectory.

With any technology, the effects on teaching and learning to depend on integration with curriculum and instruction (Bielefeldt, 2006)

4-3-1-Pedagogical: The pedagogical dimension of e-learning refers to teach and learning. This dimension addresses issues concerning content analysis, audience analysis, goal analysis, media analysis; design Approach, organization, and learning strategies.

4-3-2-Ethical: The ethical considerations of e-learning relate to social and political influence, cultural diversity, bias, geographical diversity, learner diversity, the digital divide, etiquette, and legal issues.

4-3-3-Evaluation: The evaluation of e-learning includes both the assessment of learners and the evaluation of the instruction and learning environment.

4-3-4-Content Control: The central ideology of learning theories is that learning occurs inside a person. Learning theories are concerned with the actual process of learning, not with the value of what is being learned.

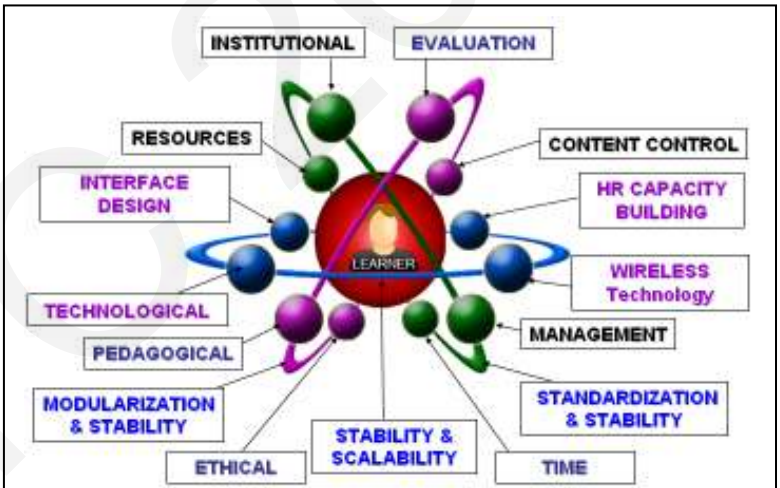

Figure.4 : ELAMEER-IDRUS e-Education Framework

In general content must be cooperative, collaborative and each learner has a learning path that caters for learners learning needs and interests in a productive. Students learn in differing ways and the manner in which information is presented to them affects their ability to learn (Kahiigi, Ekenberg, Hansson, Tusubira, & Danielson, 2008). Students need to utilize the different learning styles interchangeably during the learning process in order for them to have an effective learning experience.

"Technology-enhanced student-centered learning environments organize interrelated learning themes into meaningful contexts"(Muniandy, Mohamad, Fook, & Idrus, 2009).

In order to achieve that (Moodle 1999) can help us and it are developed to facilitate the collaborative creation of content, organization, control and to manage the publication of documents in a centralized learner learning environment.As a final result the e-Learning context, advancement in network technologies, e-Learning technologies, and content development has facilitated multiple content presentations, personalization and ubiquitous learning. After studying each element and its direct effect to the student in the e-learning process, the framework was akin to the mechanics of orbital motion of the electrons that is moving in circular orbits at the constant speed around a nucleus, and when we finally understand the electron movement, we discover that each electron actually moves in a "wave pattern" where bodies (learning elements) with a slight difference en masse orbiting around a common barycentric (student as the core of the learning process). As such, the framework was reshaped into an orbit shape with the three trajectories and the design as orbital e- education framework.

5.ADVANTAGES OF ELAMEER-IDRUS ORBITAL E- EDUCATION FRAMEWORK

The instructionally designed orbital e-Education framework that will be used to digitize education activities and comprehensively covers all the education dimensions in UoMust is presented in Figure .4 with all the dimensions and sub-dimensions details. It has the following advantages:

1- The first framework that pays great attention to capacity building and ensuring well training for productive application

2- The first framework to study time. In the new world, time is money and in education we cannot keep it open freely without any control.

3- The first framework to study the up-to-date wireless technologies and their great benefits to the learning process. It is also the first to identify technology as a factor that can influence learning process or even end it.

4- The first framework to take modularization into consideration.

5- The framework could be useful and applied in any e-learning process, because we have taken into consideration the factors of M-learning, B-Learning and U-learning.

6- The first framework to take scalability into consideration.

7- The first framework to take standardization into consideration.

8- The first framework to take stability into consideration.

6.THE POST-EVALUATION RESULTS

The results of the post evaluation for the new orbit model come in the highly positive side and (87%) of the academic staff welcomed the e-education orbit framework and encourage widely to adopt it and use it and (72 %) believe that it covers a lot of the e-learning area and then using of this framework in the higher education come in the accepted zone with (69%). The good technological area in the orbit framework was completely in the positive side (excellent) and (92%) welcomed the strong technological domain in the framework. The solution of missing communications infrastructures by the wireless up to date technologies in the technological domain was very good grade (87%) and was welcomed . The managerial domain and its developed come in the accepted grade range (65%) and also the same for educational domain (67%). Human resources capacity building was also welcomed and come with (83%) in the zone of the very good grade and (75%) want the focusing of the HRCB to be on the senior academic staff. Furthermore, the VCLE was one of the e-learning component and (87%) welcomed adopting e-learning in UoMust need for a good video conference learning environment.

Distance education still away from the Iraqi higher education because of the luck information about it and its great benefits and the thinking about to certified distance education is come only with (65%) in the grade of accepted only and also the new mobile learning technologies are still also a way (60%) and in accepted grade and this result was completely known to us since the mobile technology is still at its first steps and mobile using was just allowed in 2004. The result obtained from the post evaluation are shown in table.1.

Table . 1 : Some of the result obtain from the post evaluation

Excellent 90-100	Very Good 80-89	Good 70-79	Accepted 60-69			Poor 50-59			Very Poor Less than 50	
Statement			SA	A	N	DA	SDA	N	MEAN	%
UoMust need for a complete e- higher education system as the proposed			117	72	21	10	6	5	5.146	86
E-learning in UoMust need for a good MIS (Management information system)			89	95	5	13	4	25	4.766	79.43
Adopting e-learning in UoMust need for a good framework like the Orbit proposed.			147	49	12	6	1	16	5.242	87.37
Orbit framework covers all the learning dimensions in UoMust.			89	35	45	24	7	31	4.354	72.58
Developed the technological domain in the framework is important			167	47	10	0	0	7	5.558	92.64
Developed the managerial domain in the framework is important			67	40	29	44	9	42	3.939	65.65
Developed the educational domain in the framework is important			65	62	17	27	22	38	4.03	67.17
The wireless technologies and its progressed push it to play a big role in the learning process.			123	66	27	10	3	2	5.255	87.5
Adopting e-learning in UoMust need for a good human resources capacity building plan			143	37	16	5	11	19	5.034	83..91
Adopting e-learning in UoMust need for a clear			144	23	27	3	7	27	4.922	82.03

and good step by step strategy.								
Adopting e-learning in UoMust need for a good video conference learning environment (VCLE).	122	39	43	12	7	8	**5.00**	**83.47**
Orbit framework could be used in Iraq higher education universities	71	48	26	29	33	24	**4.099**	**68.32**
Wireless technologies are the solution for the Iraqi infrastructure problems.	34	15	72	76	26	8	**3.701**	**61.68**
Wireless technologies are the solution for the Iraqi funding problems and the lowest in costs.	18	17	167	6	9	14	**3.943**	**65.72**
Focusing on the capacity building for the senior academic staff is very importing factor in adopting it.	123	39	11	5	2	51	**4.352**	**75.54**
It is very important to build a clever e-gate for UoMust instead of the UoMust president news website	89	37	62	26	5	12	**4.619**	**76.98**
It is very important to design the learning materials to be used in mobile learning also as future step	54	17	27	77	35	21	**3.632**	**60.53**
Start thinking about to certified distance education is very important step towards develop UoMust	42	83	21	21	26	38	**3.913**	**65.22**
The proposed e-education for the UoMust is complete what it needed to install e-learning	62	47	51	34	17	20	**4.186**	**69.76**

7. CONCLUSION

In Taiwan, they start to build the intelligent class rooms "create an intelligent classroom embedded with individualized and interactive learning materials and assessment tools" , and in Iraq, we still after the wood blackboard .(Chang & Lee, 2010).

Dealing and designing for human beings is a very dangerous operation and to achieve it, all the elements of the design was studied very carefully and in e-learning we need to study a lot of different elements in its nature and try to find the correct formula for the best design and frameworks.

From 2003 and even before in Iraq, all these types of designs are done suddenly without any studying or planning and most of the decision makers are completely away from any kind of understanding the new learning theories and the impact of the ICT technologies in education and learning and still focusing on the chalk and talk as the best way of learning in face to face learning methods.

Khan framework was truly a revolution in the field of e-learning and for more than 16 years this framework is standing strongly in this field, and we hear from him two years ago how he designed his framework and added the eight dimension to his framework and our trial is completing what he had started, and we still believe in his framework and think it is one of the best frameworks but it cannot properly work in all learning different environments and as a word of truth as we stated we start from his framework.

At the end our framework becomes a completely different framework from Khan Framework with the similarity in some of the framework elements, and we believe that they simulate between the learner and any e-learning element is a very important and continuous operation.

After studying the learning environment and factors influencing the design we have a special framework for UoMust and the Iraqi higher education.

It was found that any e-learning project tries to complement the traditional way of face to face teaching method is best to be in a blended learning mode. To enhance the development of teaching and learning methodology through sharing of information on the latest pedagogical technique and delivery system for the students.

• Preferably to upgrade the ICT knowledge and skills in students and lecturers.
• Preferably to increased usage of ICT in educational management.

While the States of America fund the education sectors with huge numbers of the money to use up to date educational technologies(Executive Office of the President of the USA, 2010) , and the same in a lot of the other countries the Iraqi budget for education is still less than 5% of the complete Iraq budget and Iraq is a rich country and its budget for 2011 is more than 80 billion dollar. In States now days a lot of universities in its classic studies start to adopt at least one subject to be online and in Iraq, Jordan ,.. etc. we have still not accredited distance education.

ELAMEER-IDRUS ORBITAL E-EDUCATION FRAMEWORK FOR THE UNIVERSITY OF MUSTANSIRIYAH (UOMUST)

Amer Saleem Elameer & Rozhan M. Idrus
School of Distance Education, Universiti Sains Malaysia, Penang, Malaysia

ABSTRACT

The study of the university of Mustansiriyah case show us very clear that university suffers from a lot of problems start from the security , technology , management , pedagogical and ethical. Based on a pre-questionnaire survey about e-learning results, interviews and studies show us the need to the complete e-education system. Continuous scrutiny and study of the Iraqi higher education showed us very clearly there was something missing and need to be more reinforced in our modified Khan framework especially with the revolution of the wireless technologies. A framework was designed with many added dimensions like stability, time, learner, content control, standardization, scalability and modularization. As a result, a new framework, is an *ELAMEER-IDRUS* orbit e-education framework with a good acceptance at the post evaluation process that was achieved from a group of 231 senior academics.

Keywords : University of Mustansiriyah (UoMust) , e-Education , Khan e-Learning framework , Modified Khan e-learning framework

1. INTRODUCTION

There are no doubts about the benefits of educational technologies to higher education and the impact on the learning process; in Iraq it demands for a change in the mindset of the students, lecturers, administrators of the universities, learning leaders, and the decision makers(Harb, 2008; Husain, 2004). Nowadays, the linear learning methods are obsolete and replaced by a cyclical new modern methods. Students now can start with study, go to work and come back to study again. This cyclic pattern will be the future feature of higher education, and technology will be the catalyst in realizing the flexibility, simplicity, durability, standard ability, scalability and mobility. E-learning could also easily customize the academic programs based on the demands and the geographical, culture, technological constraints of the students.

Iraqi universities are in urgent need for e-education systems and also the ministry need for the e-ministry, since the e-education are the focus on the learning and pedagogical factors. E-education can be defined as the learning process that involves e-learning with the different administrative and strategic measures needed to support the learning in an Internet environment, and it will incorporate a local, regional, national and international view of education. Most of the lecturers found them self without any instructional aides or educational technologies to use it because of lowest governmental budgets, especially in education systems with monitored increasing in the students' numbers.

Previously like all the education systems in the world the learning concept in Iraq was teacher-centered, and when the world start to change this concept and start making the learner as the core. The Iraqi education system starts to concrete the lecturer role as the core and center of the learning process. The reason for that was :

1-Difficult economic living condition in all of Iraq, missing the required concentration for the students and learner.

2-Government focusing on the quantity not quality of the graduates.

3-Learner core concept starts at the end of the eighteen decades when the Iraqi economy starts to fall down pursuant to the first gulf war.

As a result of complications and the circumstances that have passed on Iraq and the characteristics of the universities educational environment, it has been found that the adoption of any educational e-learning model or framework will not be useful for UoMust or the Iraqi universities because of the many factors that will play a big role in affecting e-education in Iraq's universities, and it was necessary to build a special e-education framework which considers all the education dimensions into consideration in Iraq to reach the best of the quality teaching.

After scrutinizing the e-learning framework from past researchers, it was found that each designer put their own ideas in the framework but most of them stated some factors that could influence an electronic learning system. Some variables in this research were selected from literature that was

reviewed and others were from interviews with experts in the field of e- learning in different science sectors. Many studies have identified important variables dealing with an electronic learning system.

2. METHODOLOGY

The ADDIE model (Analysis, Design, Development, Implementation, and Evaluation) was utilized in the study. Our framework is a result coming from :

1-Searching for the best e-education and e-learning frameworks in the previous studies and literatures.

2- An exploratory research of the state-of-the-e-learning and e-education and their future perspectives in our research context about Iraqi higher education.

A specially formulated questionnaire was designed and distributed between a group of Iraqi Mustansiriyah University staff to investigate the direction towards the e-learning elements, management & institutional problems, which are the basic elements of the proposed strategy and that could face the implementing e-education projects, the benefits that will be gained to the higher education sector, and the technology problems.

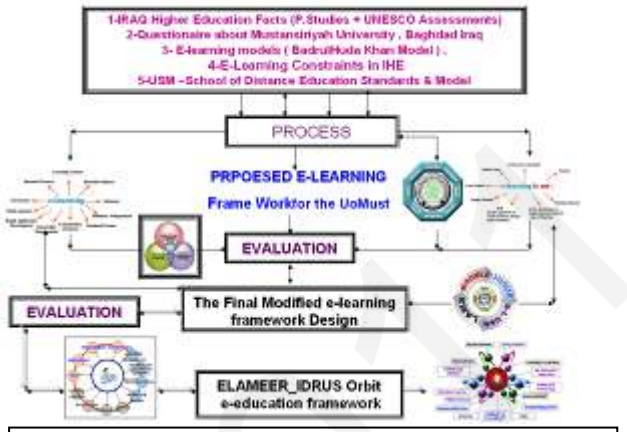

Figure.1 : The research methodology framework

3. THE INSTRUMENT

The Statistical procedure and the data analysis is one of the most important parts of the research work, and according to (Marczyk et al. 2005) "in most types of research studies. The process of data analysis involves the following three steps: (1) preparing the data for analysis, (2) analyzing the data, and (3) interpreting the data". At the preliminary stage, a survey technique was used to collect the data and prepare it for the analyzing through a questionnaire of 44 statements for the e-learning and ICT skills in the UoMust. Preparation of the data for analysis was collected from the questionnaire which was divided into two parts. The first was the general and personal information the second included the targeted questions that as divided into five categories of management, institutional, technology, human resources and general.

The questionnaire was distributed between the academicians and after completing the framework design and at the final stage a post evaluation was achieved by a questionnaire of 50 statements about the design and all its elements and components.

All the statements and feedback were analyzed and computerized using the statically package for social science (SPSS) to obtain the mean (M), standard deviation (St.D), percentages (%). A Likert scale of six points was used (Gelin 2003), and they are: strongly agree (SA)-6, agree (A)-5, neutral (N)-4, disagree (DA)-3, strongly disagree (SDA)-2, don't know-(DK)-1 ((Kaghed & Dezaye, 2009);(Mohammad, 2008)).

4. THE ORBIT FRAMEWORK:

The power and effectiveness of these new tools and methods are always being associated with the electronic learning methods, pedagogy, technology, institutionally, managerially, equity, ethically, interface designs and the way to access and any other variables could play a role in the learning process. To change this situation, we need to build a complete education system its core or center is the student or the learner since the researches and all the up to date educational theories prove that and encourage to design the learning environments centralizing the student or learner for an e-Education framework for the University of Mustansiriyah.

The Khan framework portrays a comprehensive theoretical e-learning model. E-Learning can be defined now as Badrul H. Khan stated: An innovative approach for delivering well designed, learner-centered, interactive, and facilitated learning environment to anyone, anyplace, anytime, by utilizing the attributes and resources of various digital technologies along with other forms of learning materials suited for open and distributed learning environment. The emergence of this frame work made the greatest impact in the revolution of e-learning that take place in the all of the learning sectors since this framework,

for the last 16 years, described all the education and learning process. Further, the framework also offered the logical base for all the e-learning instructional designers on how to design and implement effective learning environment in the e-learning process using the interactions afforded via computers and the internet, considering and stating all the factors that could affect the proposed designs. The Khan framework is still widely utilized until today.((Khan, 2004, 2009; Khan & Granato, 2007)).

And according to the results that we obtain it from a UoMust surveys and studying the Iraqi higher education status we find that the elements that to be considered in any framework design are:

1-Pedagaogical, 2-Ethical, 3-Evaluation, 4-Technological, 5-Interface Design, 6-Institutional, 7-Management, 8-Wireless Technologies, 9-Time, 10-Content Control, 11-Human Resources Capacity Building, 12-Evaluation , 13-Learner. as shown in figure .2.

The Khan framework was modified and a new e-learning framework was built for the UoMust with 12 dimensions as shown in figure .3.

The e-learning elements was divided into three main trajectories, and they are, 1- Technological, 2-Organizational, 3-Educational, and each trajectory has its own elements that related to its functionality and Characterize by its main mark.

We believe that learning is completely systematically operation because it's dealing with the humans whatever its type was, and any systematic operation needed to be stable from the beginning and starting to its final goal or end, and learning must be stable operation in all its steps or phases.

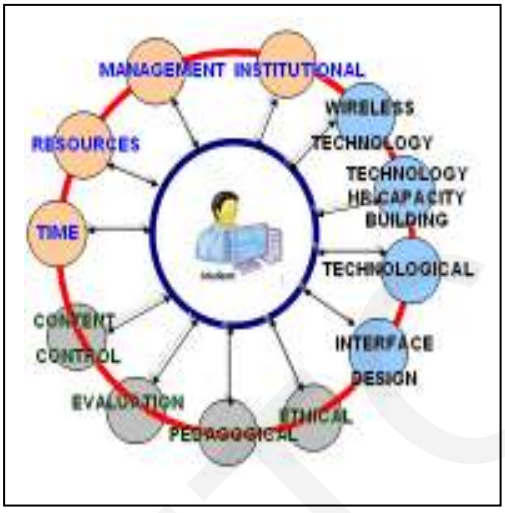

Figure.2 : All e-learning dimensions and elements

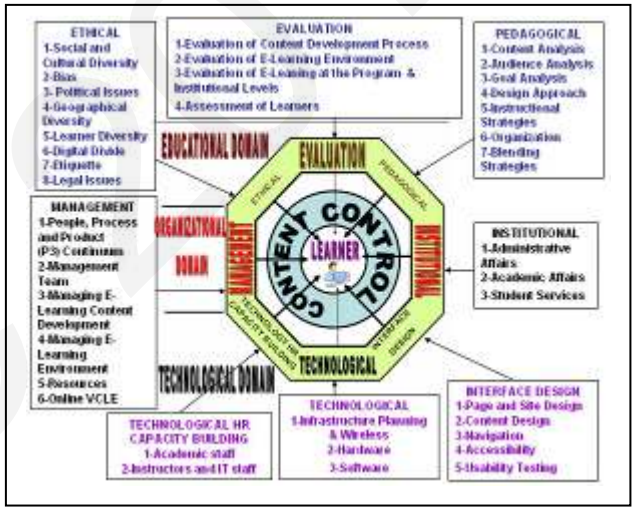

Figure.3 : Modified Khan e-learning framework

In all the investigated models, we never found any model deal with this element that could effect and destroyed all the learning process because most of the designers are backgrounds are stable and consistent. In Iraq, it is a completely different case, and nothing is stable at all and small examples for that in Iraqi higher education undergraduate studies, they invent the third trial exams for whom that fail to reach the exam's rooms in the fixed time and date.

This is in the face to face traditional learning process, and more stability is needed in an electronic learning process. From that point of stand stability become a very important element if we are designing or trying to design e-learning or e-education activities in un stable countries where everything is not stable or going to be stable in the near future, and we also believe adopting such a stable framework could push strongly towards the stability of the learning process. We believe that the technological is the base and the foundation for our framework and for that we give this trajectory the main position inside the design and build all other elements according to its up to date new technological shapes after the ICT revolution which changes all old standards and concepts. These trajectory's elements are :

4-1- Technological Trajectory: the e-learning elements here must be scalable and stable and the elements are: Technology, Wireless technology, interface design, and technological human resources capacity building.

One computer to one learner is a very difficult formula to reach in any learning institution, especially with the same specifications.((Bielefeldt, 2006). Internet speed, or bandwidth, was a crucial issue for performance in large e-education networks. Studies have shown that the introduction of high-

access computing can change the nature of instruction , and the strategies learned with technology may not be the same ones required for standard assessments of learning (Means & Olson, 1995).

"E-learning should ensure sufficient bandwidth is available to support the type of online learning applications being used and to ensure e learners have opportunities for face to face experiences in conjunction with their e-learning."(Ismail, Idrus, Ziden, & Fook, 2009).

ICT technology is the base for our framework, and it is the main trajectory that we build our system on it and without it, there is no e-education. In the Technological trajectory, we have four dimensions, and they are**:**

4-1-1-Technology: The technological dimension of e-learning examines issues of technology infrastructure in e-learning environments. This includes infrastructure planning, hardware, and software and according to that the changes in the education system in Iraq will be completely 180 degree turn, and everything will up to date and new. With considering that most emergent technologies are not widely having an adopted standard (hardware or software).

4-1-2-Human Resources Capacity Building: (MacDonald, Stodel, Hall, & Weaver, 2009) stated that if people did not have positive attitude, knowledge and skills of ICT, the e- learning program fails. Knowledge and skills have a direct impact on using e-learning. Since most of Iraqi universities suffers from the luck of required skills, (Elameer & Idrus, 2010), and we think Iraq needs to increase the believing in ICT which we think it will re shaped the education system completely.

4-1-3-Interface Design: The interface design refers to the overall look and feel of e-learning programs. The interface design dimension encompasses page and site design, content design, navigation, accessibility, and usability testing (((Khan, 2005; Rosenberg et al., 2007) and it is a very important element because it could be the way to the success, or they fail of any frame wok.

4-1-4-Wireless Technology : The growing development and application of wireless Information and Communication Technologies (WICT) opens new windows and opportunities for education improvement and redesigns the organizational and educational settings and shapes

To increase process polychromic, i.e., the possibility to deal with several tasks simultaneously. There is also a social context that includes different cultural formations, situations and moods, degrees of proximity and mutual recognition among people, etiquette and other elements that define what is or is not allowed in certain situations.

4-2- Organizational Trajectory: The e-learning elements here must be standardized according to the progressed university standardization and the elements are: Institutional, Management, Resources, and the Time. Furthermore, the organizational standard must be stable, and do not influence by the country or society changing winds only if it is to the better. The Stability of the universities is one of its basic academic characteristics, and we can find very clearly how the rules and regulations of the big names' universities like Cambridge, Oxford, UCL ,..etc. still same from long years ago and this a big indication for these universities organizational stability.

In Iraq the case is completely different and nothing is stable at all, and this comes from the changing of the regime in Iraq and missing universities stability come as a result for the country transform to the democracy.

In the Organizational trajectory, we have four dimensions, and they are:

4-2-1-Institutional: The institutional dimension is concerned with issues of administrative affairs, academic affairs, and student services related to e-learning.

4-2-2-Resources: The resource support dimension of e-learning examines the online support and resources required to foster meaningful learning

4-2-3-Management**:** The management of e-learning refers to the maintenance of the learning environment and distribution of information and lack of ongoing support from management, failure to perform meaningful reviews to ensure an environment of continuous process improvement, etc.(Idrus, 2008).

4-2-4-Time: Time is considered a very important dimension in any innovative implementation of e-learning framework with considering the differences between the student achievement capabilities and the individualized differences, but we can keep time open without any upper limits or an end.

Availability of time must be adequate time and compensated time for users to become educated and skilled in how to use an innovation. This condition refers not only to the organization's willingness to provide time (such as paid time or release time) but the users' willingness to devote learning time to use the innovation.(Idrus 2008)

4-3-Educational Trajectory: The e-learning elements here must be modularized according to the Iraqi student's characteristics, and the elements are: Pedagogical, Evaluation, Ethical and the Content control.

In IT and in general Modularity definition is the property of the software (computer programs) that measures the extent to which programs or software have been composed out of separate parts called modules.

Modularity in learning is the same concept, and it is defined as the property of allowing to encapsulate, expose and separately reuse parts of a learning resource.

The framework has been designed to modularized the digital learning content, and it has been addressed as a part of the concept of learning objects.

The framework presented in this research can be used as the basis for a good foundation for modularization of the VLE. By modularizing the VLE, new functional components can be easily added in a way that makes them work as an integrated part of the overall learning environment.(Paulsson & Berglund, 2006).

In the Educational trajectory, we have four dimensions and as a word of the truth Khan 2009 framework had covered three dimensions completely, and we cannot find any missing element in his work in the field of pedagogical, ethical and evaluation as educational dimensions, but we also believe that content control should be added here as a new dimension to the educational trajectory.

With any technology, the effects on teaching and learning to depend on integration with curriculum and instruction (Bielefeldt, 2006)

4-3-1-Pedagogical: The pedagogical dimension of e-learning refers to teach and learning. This dimension addresses issues concerning content analysis, audience analysis, goal analysis, media analysis; design Approach, organization, and learning strategies.

4-3-2-Ethical: The ethical considerations of e-learning relate to social and political influence, cultural diversity, bias, geographical diversity, learner diversity, the digital divide, etiquette, and legal issues.

4-3-3-Evaluation: The evaluation of e-learning includes both the assessment of learners and the evaluation of the instruction and learning environment.

4-3-4-Content Control: The central ideology of learning theories is that learning occurs inside a person. Learning theories are concerned with the actual process of learning, not with the value of what is being learned.

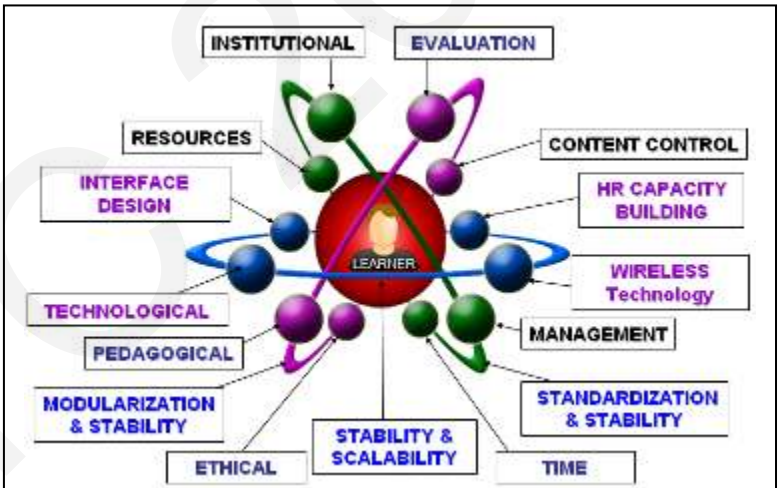

Figure.4 : ELAMEER-IDRUS e-Education Framework

In general content must be cooperative, collaborative and each learner has a learning path that caters for learners learning needs and interests in a productive. Students learn in differing ways and the manner in which information is presented to them affects their ability to learn (Kahiigi, Ekenberg, Hansson, Tusubira, & Danielson, 2008). Students need to utilize the different learning styles interchangeably during the learning process in order for them to have an effective learning experience.

"Technology-enhanced student-centered learning environments organize interrelated learning themes into meaningful contexts"(Muniandy, Mohamad, Fook, & Idrus, 2009).

In order to achieve that (Moodle 1999) can help us and it are developed to facilitate the collaborative creation of content, organization, control and to manage the publication of documents in a centralized learner learning environment.As a final result the e-Learning context, advancement in network technologies, e-Learning technologies, and content development has facilitated multiple content presentations, personalization and ubiquitous learning. After studying each element and its direct effect to the student in the e-learning process, the framework was akin to the mechanics of orbital motion of the electrons that is moving in circular orbits at the constant speed around a nucleus, and when we finally understand the electron movement, we discover that each electron actually moves in a "wave pattern" where bodies (learning elements) with a slight difference en masse orbiting around a common barycentric (student as the core of the learning process). As such, the framework was reshaped into an orbit shape with the three trajectories and the design as orbital e- education framework.

5.ADVANTAGES OF ELAMEER-IDRUS ORBITAL E- EDUCATION FRAMEWORK

The instructionally designed orbital e-Education framework that will be used to digitize education activities and comprehensively covers all the education dimensions in UoMust is presented in Figure .4 with all the dimensions and sub-dimensions details. It has the following advantages:

1- The first framework that pays great attention to capacity building and ensuring well training for productive application

2- The first framework to study time. In the new world, time is money and in education we cannot keep it open freely without any control.

3- The first framework to study the up-to-date wireless technologies and their great benefits to the learning process. It is also the first to identify technology as a factor that can influence learning process or even end it.

4- The first framework to take modularization into consideration.

5- The framework could be useful and applied in any e-learning process, because we have taken into consideration the factors of M-learning, B-Learning and U-learning.

6- The first framework to take scalability into consideration.

7- The first framework to take standardization into consideration.

8- The first framework to take stability into consideration.

6.THE POST-EVALUATION RESULTS

The results of the post evaluation for the new orbit model come in the highly positive side and (87%) of the academic staff welcomed the e-education orbit framework and encourage widely to adopt it and use it and (72 %) believe that it covers a lot of the e-learning area and then using of this framework in the higher education come in the accepted zone with (69%). The good technological area in the orbit framework was completely in the positive side (excellent) and (92%) welcomed the strong technological domain in the framework. The solution of missing communications infrastructures by the wireless up to date technologies in the technological domain was very good grade (87%) and was welcomed . The managerial domain and its developed come in the accepted grade range (65%) and also the same for educational domain (67%). Human resources capacity building was also welcomed and come with (83%) in the zone of the very good grade and (75%) want the focusing of the HRCB to be on the senior academic staff. Furthermore, the VCLE was one of the e-learning component and (87%) welcomed adopting e-learning in UoMust need for a good video conference learning environment.

Distance education still away from the Iraqi higher education because of the luck information about it and its great benefits and the thinking about to certified distance education is come only with (65%) in the grade of accepted only and also the new mobile learning technologies are still also a way (60%) and in accepted grade and this result was completely known to us since the mobile technology is still at its first steps and mobile using was just allowed in 2004. The result obtained from the post evaluation are shown in table.1.

Table . 1 : Some of the result obtain from the post evaluation

Excellent 90-100	Very Good 80-89	Good 70-79	Accepted 60-69			Poor 50-59			Very Poor Less than 50	
Statement			SA	A	N	DA	SDA	N	MEAN	%
UoMust need for a complete e- higher education system as the proposed			117	72	21	10	6	5	5.146	86
E-learning in UoMust need for a good MIS (Management information system)			89	95	5	13	4	25	4.766	79.43
Adopting e-learning in UoMust need for a good framework like the Orbit proposed.			147	49	12	6	1	16	5.242	87.37
Orbit framework covers all the learning dimensions in UoMust.			89	35	45	24	7	31	4.354	72.58
Developed the technological domain in the framework is important			167	47	10	0	0	7	5.558	92.64
Developed the managerial domain in the framework is important			67	40	29	44	9	42	3.939	65.65
Developed the educational domain in the framework is important			65	62	17	27	22	38	4.03	67.17
The wireless technologies and its progressed push it to play a big role in the learning process.			123	66	27	10	3	2	5.255	87.5
Adopting e-learning in UoMust need for a good human resources capacity building plan			143	37	16	5	11	19	5.034	83..91
Adopting e-learning in UoMust need for a clear			144	23	27	3	7	27	4.922	82.03

and good step by step strategy.								
Adopting e-learning in UoMust need for a good video conference learning environment (VCLE).	122	39	43	12	7	8	**5.00**	**83.47**
Orbit framework could be used in Iraq higher education universities	71	48	26	29	33	24	**4.099**	**68.32**
Wireless technologies are the solution for the Iraqi infrastructure problems.	34	15	72	76	26	8	**3.701**	**61.68**
Wireless technologies are the solution for the Iraqi funding problems and the lowest in costs.	18	17	167	6	9	14	**3.943**	**65.72**
Focusing on the capacity building for the senior academic staff is very importing factor in adopting it.	123	39	11	5	2	51	**4.352**	**75.54**
It is very important to build a clever e-gate for UoMust instead of the UoMust president news website	89	37	62	26	5	12	**4.619**	**76.98**
It is very important to design the learning materials to be used in mobile learning also as future step	54	17	27	77	35	21	**3.632**	**60.53**
Start thinking about to certified distance education is very important step towards develop UoMust	42	83	21	21	26	38	**3.913**	**65.22**
The proposed e-education for the UoMust is complete what it needed to install e-learning	62	47	51	34	17	20	**4.186**	**69.76**

7. CONCLUSION

In Taiwan, they start to build the intelligent class rooms "create an intelligent classroom embedded with individualized and interactive learning materials and assessment tools" , and in Iraq, we still after the wood blackboard .(Chang & Lee, 2010).

Dealing and designing for human beings is a very dangerous operation and to achieve it, all the elements of the design was studied very carefully and in e-learning we need to study a lot of different elements in its nature and try to find the correct formula for the best design and frameworks.

From 2003 and even before in Iraq, all these types of designs are done suddenly without any studying or planning and most of the decision makers are completely away from any kind of understanding the new learning theories and the impact of the ICT technologies in education and learning and still focusing on the chalk and talk as the best way of learning in face to face learning methods.

Khan framework was truly a revolution in the field of e-learning and for more than 16 years this framework is standing strongly in this field, and we hear from him two years ago how he designed his framework and added the eight dimension to his framework and our trial is completing what he had started, and we still believe in his framework and think it is one of the best frameworks but it cannot properly work in all learning different environments and as a word of truth as we stated we start from his framework.

At the end our framework becomes a completely different framework from Khan Framework with the similarity in some of the framework elements, and we believe that they simulate between the learner and any e-learning element is a very important and continuous operation.

After studying the learning environment and factors influencing the design we have a special framework for UoMust and the Iraqi higher education.

It was found that any e-learning project tries to complement the traditional way of face to face teaching method is best to be in a blended learning mode. To enhance the development of teaching and learning methodology through sharing of information on the latest pedagogical technique and delivery system for the students.

• Preferably to upgrade the ICT knowledge and skills in students and lecturers.
• Preferably to increased usage of ICT in educational management.

While the States of America fund the education sectors with huge numbers of the money to use up to date educational technologies(Executive Office of the President of the USA, 2010) , and the same in a lot of the other countries the Iraqi budget for education is still less than 5% of the complete Iraq budget and Iraq is a rich country and its budget for 2011 is more than 80 billion dollar. In States now days a lot of universities in its classic studies start to adopt at least one subject to be online and in Iraq, Jordan ,.. etc. we have still not accredited distance education.

Florin.Salajan@ndsu.edu

ABSTRACT
The corresponding emergence, timing, rhetoric, and strategies employed in e-Learning policy in both the EU and the US are notable. Comparative e-Learning studies taking the EU and the US as equal units of analysis are currently in short supply. This inquiry employed a comparative content analysis of e-Learning policy documents drafted at federal level in the EU and in the US to detect convergences and divergences in e-Learning policy development. The purpose was to develop a framework that navigates the functions and purposes of "federal" level e-Learning policy and its evolution over the past two decades, and to provide a comparative overview and analysis of EU's and US e-Learning policies. The aim was to identify consistent trends, discernable patterns, and points of convergence in policy development in the EU and the US, as well as themes, tensions, and contextual divergences, substantiated through empirical review of policy documents and official reports.

Introduction

As a starting point, we view the emergence and development of higher level policy regarding e-Learning by governing bodies as a common phenomenon in response to the historicity of the development and proliferations of ICTs in societies. Brown, Anderson and Murray (2007) have detected common phases in the evolution of e-Learning policy across international contexts. The corresponding emergence, timing, rhetoric, and strategies employed in e-Learning policy in both the European Union and the United States are notable. In response to globalizing trends, the EU and the US are prompted to respond to economic, environmental, security and other social concerns through policy formulation, and there is a growing body of literature comparing EU and US policy responses (Hoornbeek, 2004; Kelemen, 2002; McKay, 1999; Mckay, 2005; Mendez, 2005; Mendez & Mendez, 2009; Obinger, Leibfried, & Castles, 2005). This study offers a comparative analysis of e-Learning policies developed in the EU and the US and aims to establish a coherent framework for a policy comparison between the two governing bodies.

Given the rather fragmented research literature comparing European countries with the US in this regard, this study aims to look at the two political entities from a level playing field perspective. The EU's increasing competence in educational matters as a governing body has created a space for policy making that is more characteristic of a political assembly resembling a federal approach to education. In this sense, this research argues that the EU and the US can be viewed as comparative entities and that a look at e-Learning policies necessarily has to take into account the increased powers of decision-making of the EU as a whole, not as a collection of disparate states when it comes to an instructive analysis of policies on the two sides of the Atlantic. Correspondingly, the federal approach to education policy in the US also presents challenges in implementing more centralized, coherent policy pertaining to e-Learning in specific as well as education reform in general, offering an informative analysis of concomitant policy processes.

Echoing Salajan's (2007; 2011) explication of e-Learning policy in the EU and building on McMillan Culp, Honey and Mandinach's (2003) analysis of twenty years of education technology policy in the US, this project endeavors to provide a comparative overview and analysis of the EU level and US federal level policies on e-Learning. In doing so, we also propose a framework that navigates the functions and purposes of e-Learning policy and its evolution over the past two decades. The aim is to identify consistent trends, discernable patterns, and points of convergence in policy development in the EU and the US, as well as themes, tensions, and contextual divergences, substantiated through an empirical review of policy documents and official reports. This analysis is intended to contribute to and inform scholarly work in the field of educational technology as well as inform discussions regarding e-Learning policy development.

In succession, we will address the elusive term e-Learning and provide an instrumental definition for the purpose of our analyses. Next, our rationale for employing the EU and the US as comparable units of analysis will be revealed. Following the clarification of methods and research procedures, a sketch of the historical development of e-Learning policy is provided for both the EU and the US. Finally, we offer our analyses of EU and US e-learning policy comparatively, and offer some interpretations of the coextensive evolution of e-Learning in the EU and US.

e-Learning Defined

In an attempt to develop a more holistic understanding of e-Learning that takes the wider continuum of definitions into consideration, and drawing from some of Oblinger's and Hawkins's (2005) thinking on demystifying e-Learning, we propose an instrumental definition that confirms the notion that e-Learning is primarily a mechanism for the informed integration of ICT into teaching and learning, but it is operationalized through processes, products and systems that make such integration possible.

1. *Processes*. The processes to which we refer are comprised of the educational transformations facilitated by ICT, both in terms of encouraging the refinement of instructional methodologies and in regards to the procedural or technical requirements for the mainstreaming of ICT in education. Moving in either direction along the continuum of traditional-->technology--enhanced-->entirely technology-mediated education, contemporary ICT have now taken a vital role in supporting learning outcomes in face-to-face, online and hybrid environments. At the same time, the creation of infrastructures and human or material resources necessary to support educational endeavors is premised on strategies that are the result of policy processes without which ICT would not have become part of the educational landscape.
2. *Products*. Digital learning materials as well as the qualitative results of their utilization in education constitute products of ICT integration. As Oblinger and Hawkins (2005) also suggest, the rising trend in the development of interactive applications, simulations and visualizations across the educational environments mentioned above, indicate that such products improve student understanding of complex concepts. By extension, this is to further say that the accumulation of knowledge, ideas, values, beliefs and skills mediated by these applications are products that bear the indelible mark of digitization.
3. *Systems*. Whether we speak of physical computing infrastructures and networks or the curricular structures enabling learner access to ICT-mediated education, we think of systems put in place for the purposeful delivery of media-rich educational content.

Therefore, we conceive of e-Learning as an amalgamation of tangible and intangible elements of infrastructural development, policy formulation, and educational planning working in concert for the systematic incorporation of ICT in education. With this understanding of e-Learning in mind, we may proceed with a description of the rationale for our comparative framework analysis of EU and US e-Learning policy.

EU and USA as Comparable Governance Regimes

We feel compelled to provide a rationale for this comparative analysis, and some clarification as to why the EU and US as "federal" governing bodies can be taken as comparable units of analysis in regards to e-Learning policy. Employing the EU as a unit of analysis in comparative research may be viewed as problematic, mainly due to the difficulty of classifying the EU as a political system. Research in this particular sub-field of comparative education continues to take a cross-national approach, placing the US side-by-side with the national sub-units of the European continent (Hansson, Mihailidis and Holmberg, 2005; Anderson et al, 2006). Not only is this approach unbalanced, but it also appears to ignore the process of European integration that has taken place over the last decade in European education. Nevertheless, simply stating that the US and the EU are comparable in eLearning policy dynamics does not represent a sine qua non justification.

An understanding of these two polities as comparable systems of governance is better served if they are situated within a larger discourse related to policymaking in network governments (Koch, 2007) or in multi-level governance systems (Hooghe and Marks, 2003). In a departure from comparisons at sub-systemic level, it could be argued that differences between the EU and the US as regimes of governance represent variances along a continuum that is common to them at a fundamental level. The notion that the EU represents an n of 1, that is, an entity in its own right, has already been advanced in this field, in a rational effort to legitimize a macro-level approach to EU politics (Caporaso, Marks, Moravcsik and Pollack, 1997).

Lowery et al. (2008) state that "to increase the comparability of a concept across political systems, one should reduce its characteristics and thus at the same time enlarge the class of things it applies to" (p. 1235). Despite the differences in historical evolution, both systems are somewhat fluid in functioning. The US federal arrangement, although in place for more than two and a quarter centuries, is still evolving (Glencross, 2009; Vause, 1995) and has been referred to as a sui generis system (Menon, 2006). Mirroring this, Vause also recognized the potential for the EU, through its subsidiarity principle, to become a more federal political system resembling the US. An exhaustive treatise of the federal political-institutional characteristics is not possible in this limited space, but suffice it to say that it is not unprecedented nor unreasonable to prepare a level playing field in our analysis of e-Learning policy formulation between the two political regimes. Without minimizing the marked differences in the political systems of the EU and US, our argument is that both entities present similar functions and processes in their instruments of governance with mixed outcomes. Consequently, the following section presents our proposed analytical framework for our comparative approach.

Comparative Analytical Framework

Comparative federalism constitutes the first layer of our conceptual framework for analysis. Mendez & Mendez (2009) make an excellent justification for case selection in comparing the EU and the US from the perspective of federal theory. This layer approaches e-Learning policy comparatively in terms of *policy framing*, *policy dynamics* and *policy instruments*. Policy framing refers to the perceived internal and external threats to a polity that motivate decision-makers in that polity to devise policies that will address those threats. Policy dynamics refers to how the various actors in a polity interact and assign themselves responsibilities in the course of policy development. Policy instruments are the vehicles that transpose into practice the goals of the polity through reasoned action and expressly stipulated objectives. These facets of policy provide the overarching structure for our comparison and discussion. The next level of our conceptual framework consists of uniting our e-Learning definition with functions of policy that sustain e-Learning integration. These facets were used in the creation of a data analysis matrix that guided our comparative content analysis of both EU and US policy documents. Finally, the temporal contingencies of e-Learning policy were a major consideration in our analyses and discussion of the conterminous evolution of EU and US e-Learning policy. The purpose of filtering the language of the documents was to capture distinct themes of convergence and divergence in policy evolution. It is important to note that the analysis of the identified documents was not intended to reflect all of the intricacies of e-Learning policy nor the specificity of the historical processes within both contexts, but rather to identify emerging patterns in policy development within both federalized systems as a means to systematically promoting e-Learning in response to the global education context.

Findings and Discussion

Policy Framing

Competition. The coetaneous evolution of e-Learning policy in both the EU and the US suggests a global stigmergy (Harvey, 2010) in policy development. In eliciting the notion of stigmergy, it is important to understand how local activities are organized in space and time in order to explain how seemingly uncoordinated actors respond to stimuli provided through the medium of a common environment. In the case of EU and US federalized e-Learning policy development in response to global trends, stigmergy plays a key role where one acting body provides a stimulus stigma that entices other actors to respond and continue developing more strategic and coherent policies. The similarities and timing of developments of e-Learning policies in both the EU and the US suggest that each actor is answering the other's response to the shifting global environment. The rhetoric, policy language, timing, and evolution of EU and US e-Learning policies suggest that they are not being developed in isolation, but rather coterminously within the broader global policyscape. However, while comparative policy analyses reveal similarities in overall policy objectives and adopted means to address issues as these stem from common institutional models espoused in world polity, it is also important to explore how these approaches take on different meanings within the different contexts.

It becomes clear that e-learning policy, in particular, becomes a middle ground where economic and social policy meet and are negotiated within the context of broader global competition. The differentiation between the narratives of world class as leading the world, and world class as understanding, engaging with and sustaining the world is noticeable. There are also distinguishable contrasting themes between competition

and cooperation, as well as between education for national supremacy and education for global interdependence (Alexander, 2010). This is understandable when one considers the function of the US's national federalist system, versus the EU's federation of European states. The US aims to re-establish its leadership role internationally, whereas the EU's objective is to foster the cooperation and collaboration of many states regionally. While both focus on global competitiveness, the underlying purposes and assumptions differ as a result of the constellations of power that these polities represent.

It is interesting to note that US e-learning policy had an early jump start, as early as 1988 in fact, but has since been prone to pendulous, American bipartisan politics. The US leaped ahead with e-learning policy in the 1990s, with a seemingly cohesive and programmatic plan in 2000, only to lose momentum at the turn of the millennium with the 2002 national shift in focus to NCLB and the accountability movement. It was during this time, from 2001 on, that the EU began to quickly move forward with its e-learning policies, which are increasingly strategic, embedded, and of increasing scope, with the most important documents emerging in 2001, 2003, and 2006. As the EU has continued to steadily develop its e-Learning policies through the Lifelong Learning Programme, the US responded with its 2010 document that has once again catalyzed e-learning policy on the other side of the Atlantic and put forth the call for a more programmatic approach. While the EU has continued to progress its e-learning policies, the US finds itself in the position of having to re-evaluate, re-invest in infrastructures, and reformulate its e-learning policy approaches after a recess of nearly a decade. This leads to the evolving question of whose policy is responding to whom, and which acting body is providing the stimulus stigma that entices other actors to respond and continue developing policy?

Inclusion. The e-learning policy documents on both sides of the Atlantic sustain strong themes of inclusiveness in education systems and society, though these take distinctive forms in the EU and the US and are framed quite differently. Policy on both sides address problems of social exclusion and the need to improve access to education, educational technology, information and resources more equitably in society.

In the US, the earliest e-learning policy documents referred to access primarily in terms of infrastructure and making sure that schools and education institutions were being provided with computers, hardware, software, products and Internet access. In the late 1990s, the term access was reframed and began to be used more in terms of social accessibility of educational technologies, and less of a term referring to mere infrastructure issues. This is where the concept of the digital divide emerged, and the social contexts of educational technologies were taken into further consideration, highlighting the need for improving social access to computer, information and digital literacies making the education system more inclusive. This theme has remained strong in all of the American e-learning policy documents, and has moved on to concepts of Universal Design and the personalization of learning spaces for all individuals through the use of educational technologies. It is of interest that the themes of social accessibility, equity and inclusiveness continue to be framed as individual issues for US citizens, where technology offers personalized, individualized, and flexible solutions for individual learners. While the social context of accessibility and the social issues that contribute to the lack of access to education have been addressed in the literature for decades, these themes are not framed as social issues to be addressed in US policy, but rather technology is presented as a means for solving individuals' problems with lack of access. Instead of addressing the social dynamics that create barriers to accessibility and contribute to exclusion, technology is being presented as a solution for education reform hedging the social and cultural structures that reinforce the inequities long detected in the education system. While the language is strong in terms of aiming to provide better service to underserved populations through education technologies, the social issues leading to their exclusion are not addressed.

The EU's e-learning policy offers a strong narrative of inclusion primarily emphasizing social cohesion and cooperation across member states, and tersely touching on the ability of all individuals to take equal advantage of ICTs in education in European society. E-learning policy is primarily being leveraged to foster mobility, cooperation, exchange of ideas, and most importantly the cultivation of a European identity, so inclusion takes on a different flavor in the EU policy documents. The facilitation of mobility across all sectors in the EU is emphasized as a means of promoting economic flexibility as well as fostering a European culture and social cohesion. The discourse of the EU e-Learning documents is reaffirming education as a public good and a public responsibility. These are to be achieved through improved mobility, increased collaboration and cooperation, increased accessibility and lifelong learning, facilitating an EU identity, recognition of qualifications across states as well as employability and labor rationale. These are the means to the end of improving system coordination and enabling flexible learning paths throughout the EU. The

language in the European documents is much more focused on social systems, and seems less concerned with the specific technological means of supporting these.

Policy Dynamics

Both governing bodies seem, on the surface, to formulate policy mechanisms intended to encourage and facilitate voluntary compliance with the outlined goals and e-Learning action plans, but these are exercised differently in the EU and the US. In using an institutional approach that relates federalist notions to the governing bodies of the EU and US and comparing the outcomes of their e-Learning policy processes, we suggest that e-Learning policies in the EU and the US are the products of the system dynamics in which they were crafted. While there are analogous calls for increased integration of ICTs in education and more programmatic approaches to e-Learning policy on both sides of the Atlantic, and both polities rely on similar rationale, rhetoric, and justifications for e-Learning policy, the EU and the US conceive of, operationalize, and implement policy in very unique ways as a result of differing political pressures and distinctive institutional settings.

Both systems attempt to develop broad range e-Learning policy that can be integrated across agencies as overarching frameworks and guidelines for independent states who are attributed the responsibilities of integration and implementation. Both governing bodies aim to provide common definitions and goals in the face of competition, and leverage similar funding mechanisms to catalyze the development of e-Learning expertise, the convening of multiple stakeholders, and the generation of cooperation between states and institutions. Both federalist systems also urge voluntary compliance of the states, although the US has various mechanisms to intently exercise power by relying on other government agencies to provide incentives and tie-ins to funding for compliance, meaning the EU must rely more on indirect means and soft power. While the US may appear to have more means of ensuring compliance, it is not to be forgotten that education policy is not centralized in the US, and federal mandates are clearer for primary and secondary education, but much less so for postsecondary and higher education.

In terms of implementation, this may indicate that the EU will have more success with the horizontal integration across agencies and states (consistently embedding e-learning objectives across the Lifelong Learning Programme and its sub-programs), but that the US will be more successful with vertical integration and getting the e-Learning policies to "stick" as they are tied into other federally mandated standards and funding. The relatively coordinated planning in the EU may provide advantages in the formulation stage, especially regarding even implementation. The EU also appears to be less prone to shifts due to electoral politics as in the US, enabling the EU to continually improve and develop more comprehensive e-Learning policy. That said, the EU's success pends on whether the member states adopt and effectively implement the EU policies, which occurs more consistently in some places than others (however, this can also be said between states in the US). The EU effectively has no oversight tools to ensure consistent implementation within member states, and policies may not always be transposed and implemented as desired, whereby the US federal government has power and authority over all coordinating policy areas, and can better leverage this authority. A stronger, top-down approach like this may lend to consistency in US policy in general, however this is weak within the realm of education policy, and the political pendulum in the US undoes some of this authority as well. This may lead to more consistent implementation in the future, and may eventually lead to stronger oversight, but with that the focus appears to be relatively narrow which also leads to a more limited and legalistic approach. However, e-Learning policy within both polities appears to be increasing in scope across education sectors, and becoming more programmatic.

Policy Instruments

US e-Learning Policy Instruments. In the US, while a good deal of e-Learning policy has been developed at the federal level, the primary responsibility for education lies with individual states, and each state approaches its obligation to educate its residents individually. It follows, then, that the policy and practice of e-Learning in the US differs from state to state, in spite of federal level e-Learning policy and initiatives. As US education policy is not as centralized as in other countries and regions, in many ways it relies on the diffusion and adoption of policy and practice through state and individual institutions. With this in mind, the function of national policy, initiatives and federally funded research are to support and facilitate the process of dissemination of best practices and their integration both horizontally and vertically throughout state education systems. That said, it seems that there is movement toward more coordinated efforts on the part of

the Department of Education (DOE) to develop more common and interoperable approaches that would eventually apply to all states, and the guidance of the federal government has become much clearer and more influential over the progression of the past four NETP reports.

US federal policy language identifying the need to more systematically address technologies (ICT and computer mediated technologies) within the context of education appeared in 1983 in the federal report *A Nation at Risk,* and e-Learning succeeded rapidly in the 1990s. In early reports, emphasis was placed on the development of infrastructure and the installation of hardware in schools, and data collection and evaluation were centered on the physical access to computers and access to the Internet. At the beginning of the millennium, online learning became a primary focus for policy and a target for funding streams. Regional consortia were supported, and a number of large scale projects were formed with the aim of discovering best practices in e-Learning and online education. The 2010 report is a much clearer document that not only outlines specific, national, e-Learning goals, but also provides clearer recommendations to states, school districts, and educational institutions. The report also clearly outlines the responsibilities of the federal government, states, institutions, districts and local schools. Not only are goals clearly stated for multiple stakeholders, but this document also outlines point by point tasks to be performed in accomplishing the set objectives. The impetus is to provide a common definition and understanding of the formulae and procedures necessary in order to catalyze e-Learning and regenerate the American education system as a whole.

EU e-Learning Policy Instruments. The *e*Learning Action Plan was the first foray of the European Commission into proposing a concrete e-learning policy that was distinctively European in scope and complementary to the Member States' national plans for the implementation of technologies in education. The goals of the plan were ambitious and the text was somewhat drafted as a manifesto for building a European conscientious momentum in the widespread deployment of digital technologies in education for the benefit of the general social well-being and economic competitiveness. While the document is formal in terms of its proposed actions to be taken, the format is derived from what could be considered a white paper containing recommendations for further actions. The language is not as legalistic and tied in law references as the more formal policies published in the Official Journal of the European Union, partly because the document was drafted with the power of recommendation and partly because it could not have been imposed as a constraining instrument on the Member States' power of decision in carrying out their own national agendas for e-Learning. Not having its dedicated budget line from the European Union undermines, to a certain extent, its power of persuasion, but it compensates in advocating for e-Learning actions at European level by striking a cooperative tone in acquiescing to the primacy of Member States priorities in this field. Nonetheless, this seeming subdued attitude should not distract or mislead the reader in drawing the conclusion that the European Commission is in a weak position of persuasion, as the Member States themselves, through the powers they vested into the European Council ceded some of their own powers for the overall good of the fledgling European e-Learning project.

The *e*Learning Programme, though more succinct than the *e*Learning Action Plan, was a much more prescriptive and concrete document endowed with substantial power to influence efforts to incorporate e-Learning in the EU's educational apparatuses. The direct budgetary provision from EU funds, which was a consequence of the "negotiations" occurring among the European Commission, Parliament and the Council of the European Union, lent the *e*Learning Programme a level of authority on par with instruments that benefitted from similar allocations of money from the Community coffers. Furthermore, the legal character of the *e*Learning Programme was reinforced through explicit references to related programmes and to the "fundamental" law of the European Union, that is, the Treaty on the European Union. In a similar vein, the Lifelong Learning Programme, the current policy instrument encompassing a broad range of educational objectives for the European Union, is steeped in legalistic language particular to EU official documents. While no longer represented by a specific programme, e-Learning actions are embedded within the Lifelong Learning Programme. The scope of the Lifelong Learning Programme is not fundamentally changed, in that it continues the rhetorical line on a social, yet competitive Europe. In this sense, e-lLearning is streamlined with other policy instruments, both complementing and supporting them in the overall goal of social responsibility and economic competitiveness.

Convergences and Divergences. While both the EU and the US e-Learning policy have been evolving quickly in response to the emergence of ICTs in education, it is interesting to observe the similarities and differences in policy formulation. It is quite clear that the EU and US reports are generated for very different audiences. In the US, the National Education Technology Plan documents continue to outline a

broad vision, provide common definitions and understandings, and inform and educate technology directors and educators who work at the state and institutional levels. While the 2010 report displays a broader scope and a more programmatic approach, it basically serves the same function as the 1996 NETP. To gain a more comprehensive view of e-Learning in the US, one would have to examine policy within other agencies as well, like the Department of Commerce, and relations with organizations like the National Science Foundation, that also play pivotal roles in promoting e-Learning policy in the US.

In the EU, there are marked differences in the progression of policy documents indicating the continuing evolution and development of e-Learning policy. While the eLearning Action Plan was a policy instrument in itself, it did not exist in a vacuum or in isolation from other instruments in the EU's policy-making armamentarium, nor did it have the weight to effect on its own the transformative vision it proposed. Consequently, in order to operationalize the aims of the *e*Learning Action Plan, the European Commission had woven key measures of the plan within the scope of more established instruments. Four types of mechanisms were targeted by the *e*Learning Action Plan in its drive to promote a comprehensive adoption of technologies in education: several flagship educational programmes (Socrates, Leonardo Da Vinci, and Youth), EU financial instruments (Structural Funds, the European Regional Development Funds, the European Social Fund and the European Investment Bank; the Information Society Technologies programme under the auspices of the Framework Programme) and; programmes with socially-oriented themes (*e*Accessibility, *e*Content and *e*Inclusion). It should be noted that the *e*Learning Action Plan's dependence on this distributive approach to policy implementation did not degrade the importance of the plan's position within the panoply of actions devised by the European Commission to encourage the wide adoption of digital technologies. On the contrary, the *e*Learning Action Plan craftily found niches of policy deployment without sacrificing cogency and coherence in upholding a holistic European development of e-learning in the service of society. As was the case with the eLearning Action Plan, the eLearning Programme was bound in a set of other instruments that ensured its alignment with related European legislation. However, unlike the *e*Learning Action Plan, the *e*Learning Programme was nested in multiple layers of legal documentation that reached up to the Treaty on the European Union. This link to the TEU conferred the *e*Learning Programme a substantial basis for its implementation and an aura of legal weight, even though it was not binding on the Member States. Nonetheless, the single most important factor that created the conditions for the *e*Learning Programme to exert influence on the Member States was the express budgetary allocation attached to the programme. Any prospective grant of funds from the *e*Learning Programme required would-be recipients to establish transnational consortia to develop project proposals that included entities from at least three Member States. Thus, the *e*Learning Programme represented a significant step up in the consolidation of the legal framework created at European level for the promotion of e-learning objectives.

Conclusion

In this paper we provided an instrumental definition for e-Learning for the purpose of our analyses, suggesting that e-Learning is an amalgamation of tangible and intangible elements of infrastructural development, policy formulation, and educational planning working in concert for the systematic incorporation of ICT in education. Next, our rationale for employing the EU and the US as comparable units of analysis was highlighted, positing that both entities present similar functions and processes in their instruments of governance with mixed outcomes, and that the EU and US as "federal" governing bodies can be taken as comparable units of analysis in regards to e-Learning policy. Following the clarification of theoretical conceptualization and research procedures, we illuminated the framing of and historical development of e-Learning policy within the EU and the US. Finally, we offered our analyses of EU and US e-learning policy comparatively, and offer some interpretations of the coextensive evolution of e-Learning policy. Both governing bodies seem, on the surface, to formulate policy mechanisms intended to encourage and facilitate voluntary compliance with the outlined goals and e-Learning action plans, and e-Learning policy within both polities appears to be increasing in scope across education sectors, and becoming more programmatic. Finally, we finished with a cursive analysis of the policy instruments themselves in their respective contexts.

ABSTRACT

This paper examines a guided methodology to apply and manage a blended e-learning management department inside any educational organization, specially k12 education. It first defines some concepts and terms used in both education field and project management field. Then the paper lists some benefits of blended e-learning implementation and corrects some wrong concepts about e-learning in general. After that, it looks through the 6 components that the e-learning system should consist of. It also lists 7 criteria that should be followed regarding e-learning components and solutions. Next, it deals with a short list of standard rates to guide e-learning application. Finally, it studies an important suggestion which was a conclusion of a case study conducted in Al-Andalus schools in Saudi Arabia. This best-practice study suggests in details how to infuse "project management" when managing e-learning including the benefits gained and the organizational structure recommended with sufficient examples and illustrations.

INTRODUCTION

In this paper, the author endeavors to introduce a model of a best-practice methodology to implement and run a blended e-learning unit or body inside educational organizations. He doesn't claim that this methodology is perfect or complete but it is a step towards the right direction where learners can really benefit and gain through infusing technology in education. This big step is a result of a practical real case study took place in Al-Andalus K12 schools in Saudi Arabia. Al-Andalus schools sponsored a multi-project program called "Masar" managed by the author. The program targeted the four thousands learners and teachers of the Al-Andalus and lasted for two years. The program included enhancing the use of web 2.0 tools in education and its objective was to maximize the use of technology in active learning. (Masar-Tech Bolg, n.d).

CONCEPTS AND DEFINITIONS

Education:

In the suggested model, learning is emphasized over teaching. The term "learning" focuses on interactive education where learner is in the heart of the learning process. On the other hand, the term "teaching" implies one-way negative teaching by the teacher who knows everything (Starke, 2007). E-learning in our model is defined as "the use of modern technologies including the internet to introduce wide-range of solutions to enhance knowledge and performance anywhere, anytime" (Rozenberg, n.d.). In our case, Al-Andalus schools applied a "blended" model of e-learning. That means the use of "distance," off-site learning which depends on the internet and other technologies is implemented in parallel with "face-to-face," on-site learning (Wikipedia, n.d.). For example, a teacher shares a clip about earthquakes on his page on "Facebook" asking students to comment and discuss it a week before their science lesson which deals with the same topic. This enhances learners' knowledge and consolidates their practice inside and outside classes.

Project management:

The author throughout this paper suggests integrating the "project management" techniques when managing e-learning. PMI® "Project Management Institute" was selected to be the scientific reference of project management in this paper for many reasons. PMI® is a non-profit organization dedicated to advancing the project management standards since 1969. It is the world's leading association for the project

management profession. Its main publication “PMBOK®” is a project management guide, and an internationally recognized standard, that provides the fundamentals of project management as they apply to a wide range of projects. PMI accredits some certificates which recognize and evaluate the profession of project management. Most important certificate is “PMP®” which states that the PMP person is qualified to manage projects according to global standards. This certificate is granted for graduate candidates after a series of procedures including documentation of 4500 hours of experience and passing an exam (PMI, 2008).

E-LEARNING MYTHS

To be honest, we can say that worldwide vision regarding e-learning is not mature yet. Technology is changing almost everyday and this affects e-learning practices and theories. The swift emergence of new technologies like "iPhone" or "IP-TV" confuses researchers who are accustomed to take months and years to study how to apply them. Let us for example go back six years, before "web 2.0" social networks appearance, and try to browse our options to connect to others. Now, "Facebook" as one of these networks can make it possible to share a video clip with 500 million people in one second! (DidYouKnow, n.d.) On the other hand, in our community, there is some misunderstanding for the basics of e-learning. We have to be aware not be confused by the following rules when we think about applying e-learning system:

1. E-learning is not necessarily interactive learning. That means if we apply e-learning in our organization we may apply it as an interactive modern style, or we may use it just as another traditional, negative, yet "digital," education. In other words, a teacher can use the email to let learners answer a question or deliver a research for example, and this is not interactive learning. He should let them use the internet to discuss the topic with peers or connect to experts to do their research, and that is interaction.
2. E-learning is not replacement to face-to-face learning. When we expand using technologies in education which consolidate distance learning, traditional classes should not decline. Technology in that case provides support to extra-curriculum activities outside classes but does not substitute an extremely important aspect of human interaction. This real-time human communication is very important, especially for k12 learners, as it covers areas of learning outside the scope of distance learning like values, culture, norms, and physical growth….etc.
3. E-learning model is not isolated fragment inside the organization. E-learning system should be implemented as a part of an integrated structure under a unified vision throughout the whole organization. E-learning is not only some PC's and hardware components, software modules, or some system solutions, but it also covers how we operate them, the objectives of using these components, evaluation and support, the theme beyond choosing them, and many other elements.

MODEL COMPONENTS

In our suggested model, e-learning system consists of the following components (Khan, 2001). This classification is just a virtual one to simplify the topic but we have to consider that they are integrated and correlated with each other. Moreover, they should be implemented as a whole system with a main theme and a unified vision.

Instructional design:

It means the pedagogical theory, teaching methodology, learning strategies, activities assigned, extra-curricula techniques, and other related topics adopted within the organization. These issues are always decided in another department like "Educational Development," "Teaching and Learning," or "Academic Affairs" to mention some. We have to remember that worldwide vision recommends "Active Learning" as a philosophy for teaching. "Active Learning" strategies include, but not limited to, "co-operative learning," "thinking-based learning," "learning by exploring," "problem-solving learning," and "project-based learning” (Starke, 2007). Furthermore, it is important to mention that instructional design should address all aspects of instructional domains; cognitive, psychomotor and affective, and not cognitive only.

Web 2.0 tools:

They refer to the revolution of the internet happened after 2004 when many websites and applications emerged where the user participates in creating the content of the site and interacting with other users. Blogs, Wikis, and social networks are example of these Web 2.0 tools most of which are "open

source." Many of them are either useful for educational needs or specialized for that purpose like: "ClassMarker," "DimDim," "Edumax," and "Schoolr." In figure (4) there is a list of these helpful tools.

Figure (4):examples of Web 2.0 tools that are useful for education.

Content and material:

This means the digital version of the curriculum like presentations, documents, web pages, multimedia streams, and electronic tests. Content can be classified into more than one division. It can be divided into "basic" or "enrichment" content. Also it can be divided into "static" or "dynamic" content. On the other hand, there is interest in "learning objects" which mean separate modules which serve various facts or pieces of knowledge and can be utilized in more than educational situation. (Wikipedia, n.d.)

LMS (learning management system) and authoring tools:

"LMS" is a web-application used to manage learning content among learners and teachers including exams and grades. Most famous applications are "BlackBoard" and "Moodle." (Brandon, Bill & Chuck Holcombe, 2006) "Authoring tools" are programs or application which help teacher to create content and upload it to LMS in a user-friendly interface without any need to learn programming or complicated skills. An examples for Authoring tools is "Wimba Create" (Brandon Hall research, 2009)

PC's, Hardware and related applications:

This includes "Data Show" and projecting tools, computers and operating systems, "PDA's," "Smartboards," printers, lab instruments and applications, "School Management System," and other managerial systems.

Infrastructure and network:

This includes wired or wireless network, internet accessibility and email system. It also contains the main operating system like "Windows server" or "Mac OS."

MODEL CRITERIA

Now we will look through some characteristics we should adhere to when we adopt a new education technology solution or any e-learning component whether a complete system or a division. They can act as an assessment checklist when we are evaluating current state or planning for future enhancement as well.

- Ease of use: The whole system or any part of it should be easy and comfortable for all parties of users including teacher, learner, and management. We have to bear in mind that the basic notion of e-learning is to facilitate and smooth learning and save time and effort. (Wikipedia, n.d.) It is not acceptable then to have a software program for example which is considered as a burden by users. Furthermore, it is not adequate to have less

"return on investment" when using a piece of hardware than we do to operate and maintain it. This criterion includes the neat format of the component, the eye-comfortable graphic design, proper user interface, attraction to the user age and mood, and adequacy to learning situation…etc

- Interaction: Currently teaching methodology emphasizes active learning over traditional, one-way teaching as we mentioned before. Therefore, e-learning system should support and afford interaction among all learning parties. Interaction may come true by discussion, feedback, workgroup, role play, peer review…etc. interaction should address both social and cognitive aspects of the learner.
- Active learning: When we design an electronic solution or implementing a new system, we should consider and employ active learning strategies like thinking-based learning or learning by exploring. For example, when a teacher is going to assign a group of students a research on the internet, he should initiate a project or any form of co-operative learning.
- Diversity: Activities and tasks related to e-learning should be diverse and assorted in every side. Solutions presentation should contain audio-video availability. Knowledge resources should include encyclopedia, websites, experts' opinion, peer discussion, and others. Communication among learning parties should include mobile and SMS features, social networks, emails, and web-based systems. In general, diversity suits individualization and guarantees different interests satisfaction. It also motivates learning and reduces boredom of the learner.
- Learner-based inspiration: Planning to any e-learning component should follow learner needs and expectations. Learners have to be represented in the process of planning and design and every step managing e-learning component. Also the frame of the e-learning activity or task should be relevant to learner's culture or environment and authentic material is used for that purpose. Therefore, learner satisfaction should be a success indicator when evaluating an e-learning component or solution.
- Efficiency and integration: The benefits anticipated from utilizing a certain solution should be worthy of effort and cost spent over implementing it. There should be an appropriate way to measure the outcome of the solution implemented and this measure should relate to learner's needs and expectations and be observed from the very beginning and across the whole management process. Each e-learning component is to be compatible with the entire system and reflect the organization's strategic vision. It is recommended to strictly follow a well-known management methodology or frame every time a solution is adopted like "Project Management," "Balance Score Card," or "Deming cycle" as in figure (1). (Shewhart, Walter Andrew 1980). It is worth mention that this paper recommends "Project management" and suggests a more detailed methodology in a following section.

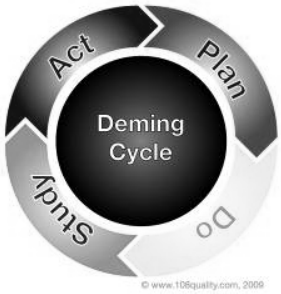

Figure (1): Deming Cycle steps, an example of a well-know management frame can be followed in managing e-learning solutions.

- Support: The component selected should be supportive both financially and technically. There is no point to adopt a modern solution even if it is marvelous and fascinated while the organization can not afford or support it or difficult to be trained on. Support may hold many facets like: users' quantity and geographical coverage, level of security needed, work path among involved parties, compatibility with existing components, local language support, and training packages availability.

MODEL STANDARD RATES

In this section, we glance through per-learner standard rates regarding different elements. It is worth mention that these rates are approximate and needs to be re-calculated according to organization strategic plan and financial level, learners' quantities, level and age of learners, and many other factors.

- Technology expenses: 300$ per learner. (Ted's Blog, n.d.)
- PC technician: 1 per 150 learners. (Becta, n.d.)
- Instructional design technician: 1 per 200 learners. (School Finance Redesign Project, 2007)
- PC server: 2 per 500 learners. (Google savings calculator, n.d.)
- PC's: 5 per learner. (Ted's Blog, n.d.)

PROJECT MANAGEMENT E-LEARNING

Project management versus operational work:

The paper recommends following project management tools and techniques when dealing with e-learning management. "Project Management" can be combined and infused in ordinary "Operational Management" to optimize the outcomes and improve quality. PMBOK® guide (2008) states that projects are different from repeated operational work in that projects are unique temporarily effort to produce a certain deliverable within time, cost, resources and quality constraints. The project is complete when its objective is fulfilled and requirements are met. Unlike projects, operational work repeats itself over time and does not terminate when its current objectives are met.

On the other hand, both operational work and projects can interact between each other in many aspects. For example, when a new solution in the Organization is developed to satisfy the learners' needs, a project is initiated with resources from different departments to research learners' preferences, select best alternative, test it, and deliver the solution to an operational department. This operational department keeps producing and supporting the solution for the learners.

Benefits of infusing project management:

Infusing project management in E-learning implementations results in many benefits which are lost when managing them only as operational work. These benefits include:

Objective-based activities: most of the tasks will be measured against project objective and effort will be optimized. Tasks will be prioritized according to their impact on project overall objective and hence unnecessary time and cost will be saved.

Skilfulness and development of team members: some of the project management HR processes concentrate on the development and management of resources. Moreover, transference of knowledge is assured if we bear in mind the idea of assembling a temporary team consisting of different experiences from different departments of the organization and even representatives from the customers and vendors working through a communication plan.

Requirements-driven implementation: according to PMI® standards, a process of collecting requirements is conducted at the very beginning of the project. Metrics are developed based on these requirements and the whole scope of work is monitored and controlled through these metrics to ensure that the output is done as required by the end user and only the required work is done. As a result, the proper technological tool will be chosen and used for what it is needed for, not for what it offers.

Quality-focus performance: when planning for the project, risks are early identified and various indicators and measurements are developed to help monitor work achieved towards the success of the project. Different risks responses and corrective actions are to be implemented to keep the performance on the track.

Organization chart:

Accordingly, the suggested "organizational chart" of the e-learning department would be different from ordinary one. In the ordinary wide-spread model, as represented in figure (2), you can find an e-learning management department or unit whose technicians present and support different solutions to the final users, learners and teachers. These technicians are professional IT people but do not have enough experience with pedagogy and teaching profession.

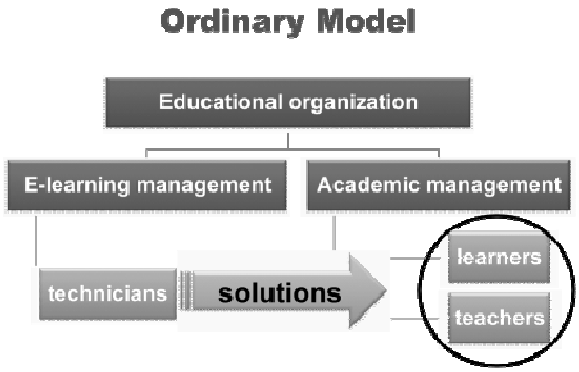

Figure (2): representation of the ordinary organizational chart regarding e-learning management.

On the other hand, the suggested organizational chart is a mixture between operational ordinary model and project management structure as represented in figure (3). The IT employees work as consultant in the field of technology with good background in teaching. The learning parties, teachers or learners or any others, along with e-learning consultant work as one team in the project. Each project deals with a solution or component with its own objective. The project manager could be different each time according to the project objective. For instance, in our case study in Al-Andalus school, a teacher was the project manager in one project and a student was the project manager in another case.

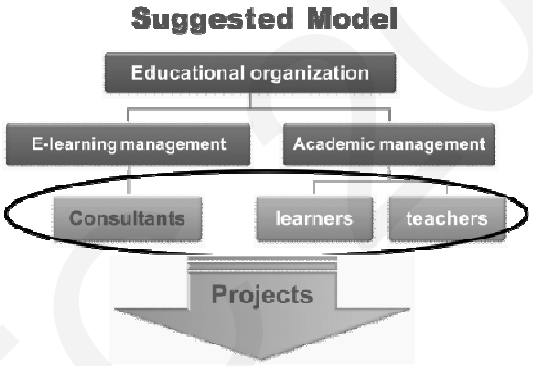

Figure (3): representation of the suggested organizational chart regarding e-learning management.

ABSTRACT:

The object of our interest is the electronic textbook, as a scenario of the process of learning and acquiring knowledge, based on certain didactic and methodical values which enable desirable approach to education, upbringing, learning and student development. Textbook is being considered from theoretical and empirical aspect. In theoretical relations the answers to the questions of the essence of the electronic textbook and those didactic and methodical values that make it an appealing and useful school book are being searched for. In empirical context 7 groups of established didactic and methodical values in the Nature and Society electronic textbook are being considered.

***Key words**: electronic textbook, didactic and methodical values of the textbook, Serbian teachers` attitudes*

1. THEORETICAL CONTEXT OF RESEARCH

In order to define an unknown or a less known concept, it is necessary to uncover its basic, essential characteristics, which necessarily and specifically (in regards to the others) characterize it. It is important to determine the specific difference in regards to a closer and the first superior concept in the conceptual hierarchy to which the defined concept belongs. What is an electronic book, what it stands for, what is its basic function and purpose, are some of the questions to which clear and complete answers are needed in attempt to totally determine it.

The existing definitions of electronic book wander among two basic standpoints. One is connected to the complete hardware and software technology upon which the e-book functions, and the other solely to the content it brings. The protagonists of the first standpoint Lynch (2001), Hillesund (2001), Sawer (2002) emphasize a greater significance of the reviewing technology than the content of e-book. However, Pace (2004: 74) establishes the fact that "technology without a good content is only form without essence". The same standpoint was taken by Cox and Mohammed (2001), adding that e-book is a digital text visible on the computer screen (here the device for reviewing e-books, so called e-reader, is not taken into consideration). McKnight and Dearnley (2003:235) were more precise, defining e-book as "the content of a published book available to readers in e-form".

The fact is that technical and technological development is drastically ascending, that it is difficult to connect any definitions, determinations to the particular, changing process, thereby essential terminological determinations of the e-book are connected to their transmitters, the media which are in the constant process

of changing and improvement. Therefore the need to accentuate the content of the electronic book, and not the technology which supports its functioning.
However, another important issue is imposed here – the issue of quality, the content of e-book. Previously "published books" in the printed format mainly consisted and are still consisted of textual forms and pictorial images. That would denote that e-book, by definition of McKnight and Dearnley (2003) excludes other media content – audio, audio-visual, multimedia presentations, that cannot be acceptable. Moreover, the book is not required to be previously published to gain the characteristics of an electronic book.
In distinction from printed classic issue, mostly linear, e-book also has other options. Electronic publishing allows hipertextual network structure of the content which supports and imitates mental structures and mechanisms of those who teach, as well as those who study.
In attempt to define e-book as precisely as possible Anderson-Inman and Horney (1999) established basic criteria of its defining: 1) an electronic book must have electronic text, which must be presented to the reader visually; 2) the software must adopt the metaphor of a book in some significant way; 3) the software has to have a focus or an organizing theme; 4) when media other than text are available, they are primarily used to support or enhance the text.
In this connection, more acceptable are those definitions of e-book that rely on "book-like" content available in electronic format.
So far we have stated some of the specific differences between the classic and e-book. That list should be completed by certain advantages of electronic publishing: easier delivery of content and better availability to the aim user group (there are no time or space limitations), interactivity between author-content-reader-editing (faster return information on content quality, understanding, critical evaluation...), less cost of production and delivery... The thing that binds together the printed and the electronic issue of the book is their primary purpose, function, goal. And the goal is the end user, reader, the one who mentally interprets the offered content with the intention of understanding the message of the author, thus incorporating it in his own value system. The fact is that the classic book has its advantages in regards to its identical electronic form, but we are focused solely to the definition of e-book, so we are not going to deal with those advantages and restrictions in detail.
Here we ought to remind that the concept is the thought on the essence of what we think about, that means that the concept of electronic book is the thought of its most important, essential characteristics that in so many ways differ from the printed book. The facts are that electronic book is CURRENTLY:

- available in two formats – 1) on a personal computer, laptop or handheld computers with certain software support for reading e-books and 2) electronic readers – special devices with the primary purpose, according to its name, is reading e-books;
- it operates with the adequate hardware and software support;
- materialized in electronic, digital portable form;
- formed of more media content (from textual to multimedia), that can be linear and hyper textual.

Is it possible to give essential, logical definition of a certain concept if its definition is limited by the time category? Certainly the answer is negative. Therefore, it is perhaps the most acceptable general definition: e-book is an electronic book-like multimedia and dynamic content subject to constant changes. Knowing that, supporting the protagonists of the other standpoint who give advantage to the content of the defined form, another (didactic and methodical) approach to definition of the notion of electronic textbook is going to be used here.
All the characteristics of the e-book can be attributed to the e-book, for it is its subgroup with certain and very important qualities.
The place of the electronic textbook in the Act on the basis of education and upbringing in Serbia is not especially determined. Electronic textbooks are not included in detail in the Regulations on the standards of quality, nor does one standard refer solely to them. The same standard and indicators stand for them as for the printed textbooks. Special indicator is given only for supplementary didactic material in electronic form (CD, DVD, etc.).
At the beginning of the twentieth century N.K. Krupskaya (1974) makes a standpoint that a textbook must be well thought of and pedagogically developed material that will be used by the teacher and students. Krupskaya points out several fundamental values of the textbook, without which complete definition of the

contemporary textbook could not be imagined, the emphasis is on: the scientific foundation of the textbook, adjusting the knowledge to practice, adequate cognitive, self-educational and systematic basis of the textbook.
At the International Publishers` Conference in Moscow in 1986, the Polish Jerzy Lozinski and Helena Pawkovska (1986) concluded that the discussion on a textbook and its function must be based on contemporary educational orientation, new school objectives, especially those connected to gradual and planned activity of getting the habit of permanent education for students, most efficiently accomplished in the process of self-education and students` quality of knowledge, as the results of these processes.
In his study Problemy sovremennoj didaktiki, M.N. Skatkin (1980) states that the textbook is not a simple collection of knowledge, it is not a manual for a certain special science, but a wholesome scenario for the future learning process, a scenario based on pedagogical demands, goals of general education, capabilities of students and the rules of the teaching process. The textbook must guide mutually connected activity of teachers and students in the process of learning and provide realization of its three primary functions: education, upbringing and development.
The textbook is, on one hand, a source of knowledge – the bearer of the content of education and aspects of activities of knowledge adoption and, on the other hand, the textbook appears to be an important learning device. Thus understood textbook should accomplish more pedagogical functions in the learning process: informational, transformational, systematization, consolidation and self-control, self-educational, integration, coordination and upbringing (Zujev, 1988, Khabib, 1978, Burov, 1983). Vicenty Okon comprehends textbook closely related with the four learning processes: adoption, repetition, discovery and activity and he attaches them four corresponding functions: informative (logical side – subject and psychological systematization), researching (independence in finding solutions), transformational (the choice of necessary procedures and methods for practical actions) and self-educational (creating cognitive needs and interests).
Considering the tempo of changes in the world, four times faster than the changes in contemporary school, the textbook cease to be a bound content used by teacher to teach and by student to acquire knowledge, but becomes a collection of content aimed at a wide range of students` abilities (understanding and thinking, the speed of learning, managing to find information and new knowledge, learning to learn...) and personal qualities (self-esteem, self-respect, patience, belief in the power of knowledge...) that will be used by contemporary students in changing the world of tomorrow (Žužul and Vican, 2005: 54).
It must not be forgotten, that textbook in the process of education and upbringing, appears to be a device in education of future generations and the material used to study understanding of inner self as people. The message society would like to send to the upcoming generations is always important for itself, for it is the best description of the society it would like to become (Šisler 2004: 19). Besides denoting the process of education and upbringing in the qualitative way, a textbook is multifunctional in character, in the sense of transferring certain cultural achievements onto younger generations, supporting students in intellectual work, development of critical and research spirit, in general sense – development of book using culture (Milić, 2010: 151).
All the definitions and functions of a textbook stand for electronic textbook as well. It must be a well thought of scientific and pedagogic material aimed at moving students` creative powers and his planned getting used to independent work, a scenario for the future learning process based on pedagogical requirements and goals of general education. An electronic textbook must be the bearer of aspects of activities in knowledge acquisition, it is the materialized activity of a student and proposed activity of a teacher, an electronic textbook is a book with accessibly presented different multimedial contents, electronic textbook is cultural, sociological, pedagogic and psychological problem. For the electronic textbook to be an optimal scenario of the future learning process, it must be well didactically and methodically formed, that means based on the rules of the teaching process, learning process and general rules of student development.
These requirements significantly point attention to essential values of electronic textbook.
The values of electronic textbook are various, for they are dependent on: a) good basic science knowledge of the subject for which the electronic textbook is created; b) good knowledge of the rules teaching process on which foundations is the whole student activity based; c) good knowledge rules learning process; d) knowledge rules certain age child development (Laketa, 1999: 71). Through analysis of various opinions on the notion of textbook and, from those derived values known to pedagogic theory and practice, a unique list of didactic and methodical values was created and their verification designed on the Nature and Society electronic textbook.
Our list of didactic and methodical values of e-textbooks, in regards to structure, is consisted of seven mutually separated wholes. They are: informational, cognitive, systematization, self-educational, coordinating

and interactive values. *Informational values* enable content dimension and presentation; including: information coordination with the subject teaching programme according to volume, sequence and depth; the way of content presentation including information, description, explanation and problem tasks; language and stylistic values, sentence complexity and clearness, terminology conformation to age, text saturation with information degree. *Cognitive values*, as a foundation for discovering the most desirable comprehension ways, include: concept formation based on students` foreknowledge and experience; concept formation course, from special to general and general to special; logic errors in deduction, deduction based upon insufficient number of examples, incompatibility of the cognitive process with students` intellectual capabilities; the course of developing connections between the given notions; use of acquired knowledge in practice; the nature of problem situations and the way of finding hidden truths. *Systematization values* enable connection in content presentation, and are consisted of: textbook chapters as special content units; chapter structure, introductory, main and final part; conclusions, in chapters, units and at the end of the textbook; addressing students; questions, tasks and subject summary. *Individualization values* are in purpose of adjustment of the presumed learning process to the actual students` capabilities, especially with their capabilities, levels of knowledge and interests. *Self-educational values* stimulate and enable students for independent work and independent knowledge acquisition, comply: development of students` skills to notice the important, make plans and control their own work and apply the learned in practice; encouraging and enabling students to partial research work and correct use of textbook. *Coordinating values* enable leading (integration), role of electronic textbook in the sources of knowledge system, textual, visual, auditive and audio-visual, multimedial. *Interactive values* of the textbook enable interaction between textbook content and students, student is informed on what is compulsory to learn, what he can choose to learn, there is an opportunity to check the accuracy of solutions, make problem questions and tasks and give new examples.

METHODOLOGY CONTEXT OF RESEARCH

Theoretical research context focused our attention to electronic textbook, particularly (the subject of our research) to didactic and methodical values of electronic Nature and Society textbook used in primary schools in Serbia. The aim is to examine the attitudes and opinions of teachers, the most competent experts in this field, on seven didactic and methodical values of e-textbook and evaluate on those becoming and to what extent an integral part of this contemporary source of knowledge and student development factors. From the established aim the following tasks derived: 1) to examine general attitudes of teachers on didactic and methodical values of e-book; 2) establish teachers` assessment on all the didactic and methodical values of e-textbook, especially: a) informational, b) cognitive, c) systematisational, d) individualization values, e) self-educational, f) coordinating (integrative) and g) interactive, in order to receive a return information on the extent of their creation of this type of textbook.

Based upon the research subject, aim and tasks, the principal scientific and research hypothesis and 4 subordinate hypotheses were formed. The main hypothesis is: 1. *Didactic and methodical values of the textbook are an integral part of the Nature and Science e-textbook, and the subordinate: H1: teachers have different opinions, positive, negative and neutral on didactic and methodical values of e-textbook; H2: Didactic and methodical values (7) are not equally represented in the existing Nature and Society e-textbook; H3: There is a significant statistic difference between the attitudes and opinions of teachers with different levels of education; H4: There is a significant statistic difference in the evaluation of didactic and methodical values of e-textbook between teachers of different sexes and work experience.*

The research was based on the application of descriptive scientific-research method with all its modalities, including analysis, comparison and generalization. In regards to techniques and measuring instruments Likert five-grade scale on opinions of textbook didactic and methodical values was used. All the values in the scale were marked as positive statements, and teachers gave opinions freely: strongly agree, agree, (positive response), neither agree nor disagree (neutral response), disagree, strongly disagree (negative response).

The research was performed in September 2010 randomly on 470 teachers in the five counties of Western Serbia. The research variables are: level of education (high school, junior college, university), sex (male and female) and teachers` work experience (up to 10 years, 11 to 30 years, 31 to 40 years of work experience).

The results were processed using SPSS software. Hypotheses' testing was performed using chi-square test.

RESEARCH RESULTS

Due to the limitations of the scope of paper, only the more important research results are presented, without discussion, including the list of didactic and methodical values:

1. On the whole, didactic and methodical values have significantly become an integral part of the Nature and Society electronic textbook, thus confirming the main scientific and research hypothesis of our research.

2. There is a significant statistic difference, at the importance level 0.01, between teachers` attitudes on didactic and methodical values of e-textbook. It was determined that more than a half of the teachers have positive attitude or 50.7%, neutral-less than one fifth or 18.11% and negative between one and two fifths or 31.17% of teachers (see *Table)*. This confirmed H1 subordinate hypothesis.

Table: Teachers` attitudes on 7 groups of didactic and methodical values of e-textbook of nature and society

Teachers` attitudes on didactic-methodical values of e-textbooks	POSITIVE ATTITUDE			NEUTRAL ATTITUDE	NEGATIVE ATTITUDE		
	Strongly agree	Agree	TOTAL	Neither agree nor disagree	Disagree	Strongly disagree	TOTAL
Informational values	11,9%	38,2%	50,1%	23,6%	13,3%	13%	26,3%
Cognitive values	16,9%	31,4%	48,3%	22,7%	13,8%	15,2%	29%
Systematization values	28,9%	30,1%	59%	16,5%	9,9%	14,6%	24,5%
Individualization values	9,5%	24,9%	34,4%	13,7%	23,3%	28,6%	51,9%
Self-educational values	7,4%	20,3%	27,7%	12,4%	17,3%	42,6%	59,9%
Coordinating values	27,2%	44%	71,2%	18,5%	6,5%	3,8%	10,3%
Interactive values	20,3%	44%	64,3%	19,4%	7,8%	8,5%	16,3%
Σ	50,71%			18,11%	31,17%		

The research showed, as it was supposed (H2), that all the groups of didactic and methodical values are not equally incorporated in the Nature and Society electronic textbook. According to teachers, the most represented are coordinating values (71.2%) and interactive values (64.3%), followed by the values of systematization (59%), informational values (50.1%) and cognitive values (48.3%). However, more than a half of teachers evaluated negatively the self-educational values (59.9%) and values of individualisation (51.9%). That means, that the greatest shortcomings of electronic textbook is the lack of didactic and methodical values necessary for enabling students for self-education and self-development, and adjusting the content to actual characteristics of the students. Further analysis of research results reveals interesting structural elements in regards to specific value groups ($X^2=24.403$ $df=12$ $p<0,01$).

4. The educational level of teachers (X3) did not have a significant influence to the research results, except the case of individualization and self-educational values. It was determined that having higher educational level teachers tend to be more critical in evaluation of these values of e-textbooks. The results are significant at level 0.05 ($X^2=20.080$ $df=8$).

5. Sex and work experience of teachers (X4) did not influence the final research results on either level of statistic significance ($X^2=8.645$ $df=8$).

CONCLUSION

Electronic textbook, as a designed and created scenario of a proposed learning process and student development, is based upon didactic and methodical values making it reliable and attractive source of knowledge. Those are: informational, cognitive, systematization, individualization, self-educational, coordinating and interactive values.

The research implies the need for creating an electronic textbook of higher quality, especially in respect to development of self-educational and individualization values.

Although some didactic and methodical values of Nature and Society e-textbook (coordinating and interactive) were highly evaluated by the teachers that does not mean they should not be further improved.

It should be pointed out that there is no ideal textbook, but it should be constantly engaged, theoretically and practically, in creating a textbook of more quality. That is achieved only by team work of creative experts of different professions responsible for desirable hardware and software functioning of e-textbook. A

contemporary digital textbook is an open and dynamic system, constantly subjected to evaluation, critique and improvement.

EMA-4-MOODLE – AN INTERNATIONAL PROJECT PROMOTING FOREIGN LANGUAGE LEARNING AND INTERCULTURAL COMMUNICATION

Undine Pielot

Hochschule für Telekommunikation Leipzig (Germany), University of Applied Science

pielot@hft-leipzig.de

Abstract
Six universities created multimedia online language courses in German, French, Russia and Slovak on the platform of the free open source Learning Management System Moodle. The aim of this project is to facilitate international mobility for European and non-European students by offering them language skills and intercultural know-how. The course scenarios shown in videos and exercises should help realising beforehand social, cultural, situational and individual aspects in the foreign country. A template is offering a standardized lesson structure which allows teachers and/or course developers to create their own language course. The template with a user and installation guide and the German course are available in the www. The project was financed by the European Commission via the Executive Agency for Culture, Education and Audiovisual.

Introduction
Businesses want employees to have international experience, administrations want their civil servants to communicate in an European context and institutions of higher learning encourage their students to study abroad. We live on a multicultural continent and Europeans have recognized the importance of other cultures. They are no longer a source of conflict but a cornucopia of knowledge and wisdom. Recognizing and accepting our multicultural continent is a first and important step on the way to greater European cohesion, but it is not sufficient. Our multicultural world requires more intercultural communication. We need more than a side by side of different cultures. What we want is a fruitful exchange among cultures and nations. It is the aim of EMA-4-MOODLE, an Erasmus Mundus Project to promote such positive communication.

The Project
There are six institutions taking part in this project:

- Telecom Bretagne, Brest (France),
- Hochschule für Telekommunikation, Leipzig (Germany),
- The Bonch-Bruevich St. Petersburg State University of Telecommunications (Russia),
- University of Žilina (Slovakia),
- Telekom Lille1 (France),
- Siberian State University of Telecommunications and Informatics, Novosibirsk (Russia).

The consortium members have had an ongoing partnership in organizing exchanges for students and staff for language courses, symposia and practical training periods. The six consortium members consider that in today's mobile world lack of foreign language skills and intercultural know-how represent the greatest difficulty that students encounter when confronting a new study environment.
The aim of our project is to facilitate international mobility for European and non-European students by offering them tools that will help them overcome these difficulties. These tools are specifically adapted online language courses and intercultural documents. We are developing four language courses: in French, German, Russian and Slovak. We are essentially targeting at students going to a partner institution, but we also expect that other personnel such as teachers or administrative staff could benefit from the language courses which would be helpful for example in preparing for short term visits to partner countries.
The intercultural communication part of the courses is an online attempt to get students to think about cultural differences. The students are offered some information about the country and culture they are

entering and are suggested ways of overcoming differences which might at first sight appear insurmountable. The course activities contain intercultural dilemmas and there are no right or wrong answers, only different points of view. The subjects treated are pertinent to students coming to study and facilitate their quick adaptation to a new environment.
The project is financed by the European Commission via the Executive Agency for Culture, Education and Audiovisual. The project has lasted two and a half years, but we foresee a continuation of the work on the subject after the official end in May 2011. There are indeed many interesting aspects of our work that could well be the subject of further projects.

The Template
Courses will be made available to students and other university users via the Moodle platform. Moodle is a free open source Learning Management System (LMS) which is easy to manage and use. In order to help both, teachers and course developers, as well as student users a Moodle language lesson template has been created. The language and intercultural communication exercises are based on the large variety of didactic activities available within the Moodle system such as description, essay, matching, embedded answers (cloze), multiple choices, short answers, true/ false, crossword, cryptext.
The language course structure contains a course introduction and 10 learning units or lessons. Each learning unit contains an introduction to the unit, linguistic and intercultural input as well as numerous exercises where the student can practice and develop his/her skills and knowledge. Each unit finishes with a review section and a final test where the student can see whether s/he masters the contents of the unit.
The template and a user and installation guide are available under http://recherche.telecom-bretagne.eu/ema4moodle/ and can be downloaded from there. This template facilitates course creation and course use by offering a standardized lesson structure which allows teachers and/or course developers to create their own language course.

The Courses
Students can benefit from the courses and intercultural materials either at their home institution before they leave or after their arrival at the new residence.
The language courses are based on videos. The videos are provided with the subtitles in German and English languages. They give the opportunity to choose the subject/the role, which the students will adopt abroad. In addition the user will be provided with the necessary vocabulary, expressions, grammar etc. and will learn about the foreign culture.
Each lesson includes also audio, grammar and phonetic materials, reading comprehension, listening comprehension, writing, speaking and intercultural communication activities. It also contains some games, a final test and a glossary.

The German Course
The content for the language course was chosen regarding the survey and the problems of foreign students after their arrival in Germany and at German universities. The online language course should help diminishing the differences between expectations and reality in Germany. It is specifically adapted to the needs of the international students and other persons coming to Germany and especially to the HfT Leipzig.
Due to the fact that the target group had already attained a language certificate, the online language course was designed for German language students on various levels (A1 to B2). The course offers the students 10 lessons of about 2.5 hours work each. The development of the language course was based on the template.
The scenarios shown in the videos and exercises should help realising beforehand social, cultural, situational and individual aspects in the foreign country.
It is the aim of the language course to train intercultural competencies for a daily life in Germany. In addition to this, the course also teaches technical terms, which are necessary for the studies of communication technologies and engineering. The technical terms are explained in different publications within the course. You can test the German language course on the website http://moodle.hft-leipzig.de/.

Long-term Exploitation
Nowadays, more and more young people use smartphones for their entertainment. Therefore in future we plan to offer the Moodle language course as a „course to go“. We will make the video- and audio-files downloadable for mobile devices and create offline-exercises for downloading for areas, in which there is not enough data transfer rate available for the videos and audio files.

The German Course is free for every interested student of the German language all over the world. The online course is available for distance learning and without any access restriction.

EMBRACING COMPLEXITY AND TECHNOLOGY: DEVELOPING A LIFE-LONG LEARNING MODEL FOR ADULTS WITH AUTISM SPECTRUM DISORDERS IN NON-WORKING TIME AT INTERDEPENDENT HOME

I-Tsun Chiang, National Changhua University of Education, john@cc.ncue.edu.tw
Mei-Li Chen, National Taiwan University, meili@ntu.edu.tw

ABSTRACT

The purpose of the study was to employ complexity theory as a theoretical framework and technology as a facilitation technique to develop a life- long learning model in non-working time at interdependent home for adults with Autism Spectrum Disorders (ASD). Medical and support teams, adults with autism and their families were interviewed, observed and analyzed to develop the model during four short-stays from July 2009 to December 2010. Data were analyzed using constant comparison through application of QSR Nvivo 7. This study identified four key elements for developing a viable life-long learning model through technology in non-working time at interdependent home for adults with ASD to adapt the impact of aging society, to improve quality of medical services and to enhance the quality of life for medical teams, patients and their families. The study also found that the model is able to assist medical teams to avoid burnout, to learn leisure and relaxation, to release stress and to enhance life-long learning for medical teams and caregivers/families.

Keywords: Keyword: interdependent home, autism, complexity, quality of life

INTRODUCTION

Past research identified that raising adults with ASD can be stressful and confers exceptional challenges on caregivers (Baker, Hartley, Seltzer, Floyd, Greenberg & Orsmond, 2011; Smith, Jinkuk, Seltzer, Greenberg, Almeida & Bishop, 2010). The challenges are difficult to overcome because the nature of core symptoms of ASD, which include impairments in communication and reciprocal social interaction, and the presences of restricted and repetitive behaviors and interests (American Psychiatric Association, 2000). Therefore, developing long-term care services for adults with ASD is one of the most crucial issues for the autism community. Chiang, Lee, Frey, & McCormick (2004) used a videogame-based intervention to improve the quality of friendship on individuals with ASD and found positive impacts on several components of friendship quality, peer recognition through physical competence, and social expectations among participants. Related studies also echo the study and point out that technology is a potential addition to enhance the quality of learning motivation for individuals with ASD (Narkon, Wells & Segal, 2011).

Non-working Time at Interdependent Home

Lu, Chiang and Wang (2008) pointed out that interdependent home can create a happier and friendlier environment for people with disabilities. The concept of interdependent home is the "mixed" care system between professional/organizational facility and home-based care. In order to have good quality of care, professionals from health care/education/social worker assist to support the interdependent home that is set up primarily based on parents. Parents who have children with ASD will take turns to play the parents of the interdependent home and take care of 3~10 adults with ASD. However, the study also points out that there is still a lack of human resources in interdependent home, especially during non-working time and days (e.g. weekends, holiday, summer and winter vacations, …etc.) With the diverse interests and disabilities, adults with ASD have complex situations to construct a life-long learning environment in interdependent home. Since complexity theory has been pervasively applied in numerous research and practice to adapt multiple environmental changes and multidisciplinary collaboration in both natural and social sciences. McConnell, Lekan-Rutledge, Nevidjon & Anderson (2004) point out that this theory is valuable for long-term care settings to adapt complex situations. As a result, the purpose of the study attempts to employ complexity theory as a theoretical framework and technology as a facilitation technique to develop a life-long learning model in non-working time at interdependent home for adults with ASD.

METHODS AND PROCEDURES

FACT Short Stays

The study cooperated with the first five-year "Shining Star Sustainable Action Project" of the ROC Foundation for Autistic Children and Adults in Taiwan (FACT) and recruited members and staff in FACT and the medical team in Hualian Yuli Veteran Hospital (HYVH) as the service team. The goals of the "Shining Star Sustainable Action Project" are: (1) initiative collaboration between FACT and HYVH; (2) Designing an autism-centered long-term care program with the concept of home rebuild; and (3) Developing a multidisciplinary holistic care program by combining medicine, nursing, psychology and counseling, social work, and occupational therapy. The FACT and HYVH has been initiated and signed the collaborative memorandum of understanding (MOU) on July 20, 2006 and signed the second MOU on November 25, 2008. The project began to run the first short stay at July 20~31, 2009. According to the condition of participants, the other 3 short stays were held at October 19~30 in 2009, May 3~15 and November 8~December 31 in 2010.

Participants

Medical and support teams, adults with autism and their families were interviewed, observed and analyzed to develop the model during four short-stays from July 2009 to December 2010. The medical team members included the superintendent and a psychiatric doctor, one head nurse, two clinic counselors, one social worker, and two occupational therapists from HYVH. Support team members are two teachers and three social workers from FACT. The first stays recruited 8 adults with autism and some of their parents to participate. With screening process, the number of participants decreased to three individuals at

the forth stay. All participants in this project were interviewed and observed when they were available during those stays.

Method

Two qualitative research methods, participant field observation and informal conversations, were used to collect responses and feedback as field notes from adults with autism and their family members, medical team members, and support team members in this study. All data were gathered and analyzed by researchers who have previous qualitative research experience and prior experience working with autism populations. Member checking, peer debriefing and auditing are three main procedures to enhance the trustworthiness, credibility and transferability of the study. The QSR Nvivo 7 Software Package was used to assist in coding, sorting and generating themes of the data.

Theoretical Framework: Complexity Theory

Paley (2007) states that complexity theory has been pervasively applied in a variety of professions to adapt multiple environmental changes and multidisciplinary collaboration in recently research. Evolved from Chaos theory and Lorenz attractor (figure 1), complexity theory that emphasizes uncertainty and randomness constructs a non-linear dynamic system that traditional organizational theories are inability to explain and predict. In the healthcare and education literature, there is a growing attention in complexity theory and its implications. For example, there are a variety of research and professions that using complexity theory as the theoretical framework to construct their studies, such as medical education (Fraser & Greenhalgh, 2001; Rees & Richards, 2004), health promotion (Wilson & Holt, 2001), shared care for patients with long-term mental illness (Byng & Jones, 2004), and healthcare management (Plsek and Wilson, 2001).

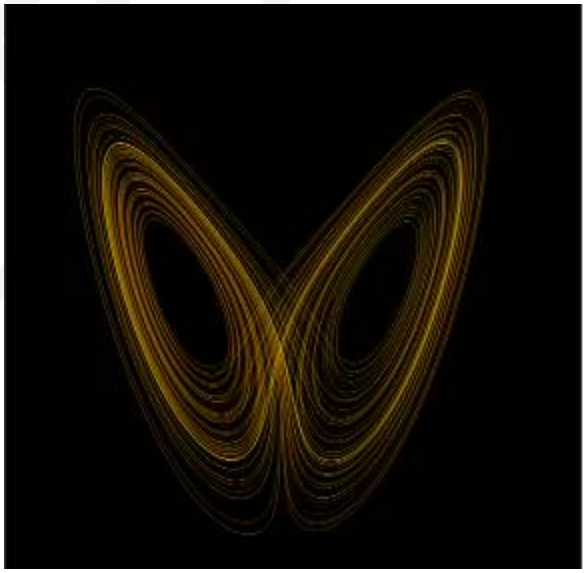

Figure 1. An icon of chaos theory - the Lorenz atractor (Source from Wiki Foundation, http://en.wikipedia.org/wiki/ File:Lorenz_attractor_yb.svg)

Complexity theory has the strength when being used to explain the survivability and adaptability of

systems that need paradoxical explanations (Grobman, 2005). The theory provides a graphical framework that creates a complex zone with appropriate degree of agreement and certainty between simple and chaotic situation (figure 2). In this study, we use it as theoretical framework to construct a life- long learning model in non-working time at interdependent home for adults with ASD.

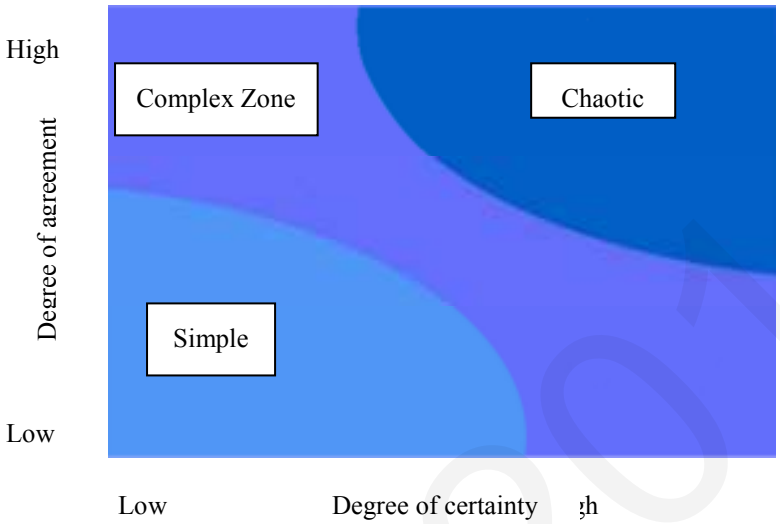

Figure 2. A graphic framework of complexity theory (Adapted from Plsek & Greenhalgh, 2001)

RESULTS

This study identified four key elements which include mutual adaptation, co-evolution, dynamic interaction and self-organization for developing a viable life-long learning model through technology in non-working time at interdependent home for adults with ASD to adapt the impact of aging society, to improve quality of medical services and to enhance the quality of life for medical teams, patients and their families.

Mutual Adaptation

According to complexity theory, mutual-adaptation points out that multidisciplinary cooperation and discussion is extremely important for facilitating adults with ASD a diverse life-long learning environment. Traditionally, professional teams who serve adults with ASD are from medical, nursing, special education, physical and occupational therapy and social worker. All of those professionals do not have trainings on facilitating leisure, recreation, sports and other life-long learning activities during non-working time. Therefore, the model suggests that mutual adaptation shall be promoted to those professionals who serve adults with ASD. For example, higher educators in those professionals are recommended to revise their curriculum and add more technology-based courses (e.g., e-learning) in their professional development and trainings.

Co-Evolution

The study found that both FACT and HYVH have to expand their concepts on their service spectrum

for adults with ASD in interdependent home, such as learning time (e.g., after school hour, midnight, early morning), learning style (e.g., needing a great amount of multimedia to keep concentration), feedback (online electronic interaction), and motivation (e.g., computer attachment, video-/audio-information). This theme identified that organizations have to co-evolve their services and innovations on technology-based learning when there is a lack of human resources during non-working time.

Dynamic Interaction

Dynamic interaction addresses on the importance of increasing interactions between organizations, professionals, and adults with ASD. For example, the FACT and HYVH have to gather possible solutions to develop potential arrangements for adults with ASD and their parents in non-working time at interdependent home since it is a home-based long-term care model. Therefore, interactions like family members are highly recommended and technology, definitely, is a crucial part during the interaction process. The immediate communication via technology is suggested, such as Facebook, Plurk, Twitter, Blog, MSN and Skype.

Self-Organization

Self-organization strongly recommends that service providers (e.g. FACT and HYVH) and parents support groups shall start to advocate and develop non-working time leisure and recreation programs. The concept of self-organization not only provides non-working time leisure and recreation for adults with ASD, but also gives a window for medical team members to avoid burnout, to learn relaxation and to perceive fun and enjoyment during their services. Therefore, continuing leisure education programs are identified as an important component for their self-organizations.

DISSCUSSION

The study also found that the model is able to assist medical teams to avoid burnout, to learn leisure and relaxation, to release stress and to enhance life-long learning for medical teams and caregivers/families. Several matters arising from the research methodology may have impacted on our final results. The lack of directly empirical data to support the model may be criticized due to the nature of exploratory study design. However, with solid theoretical framework support and critical literature review, the study still provides valuable contributions to stipulate possible practical solutions for non-working time and services at interdependent homes. Another potential challenge would question on the legitimacy of borrowing concepts of complexity theory as a metaphors from the physical and biological sciences. In order to overcome this challenge, a great amount of previous studies on complexity theory have been critically reviewed and satisfactory in predicting solutions on multidisciplinary collaborations because complexity theory is a new view of looking at how complex environment, structures form, adapt, and change. The academic nature of the research was emphasized in this study.

CONCLUSIONS

Paley (2007) states that applying complexity theory in health care service and health related

organizations is a right approach, however, it is believed that this approach is still the embryonic state of the complexity science development. Using complexity theory as a theoretical framework, the study found that this technology-based life-long learning model is able to assist medical teams to avoid burnout, to learn leisure and relaxation, to release stress and to enhance life-long learning for medical teams and caregivers/families in non-working time at the interdependent home.

ABSTRACT

The paper presents a study on the potentials of web-based GIS application as a tool in teaching Geography in the lower secondary schools in Malaysia. The objectives of this study are to identify the features and components of the current web-based GIS application and to suggest ways on how it can be utilized to aid the teaching of Geography in lower secondary school. These two are combined to produce an innovative method in teaching Geography subject. Content analysis is the main method used to achieve these objectives. Findings show that it is possible to introduce and apply web-based GIS application such as GoogleMap and Wikimapia with curriculum set for Geography lessons in Malaysian lower secondary schools. The availability of technological advances on the internet has widened the possibility of integrating spatial knowledge into the current curriculum. In addition, web-based GIS maps are easily and freely available on the internet. This will further enhance students' learning capabilities.

Keywords: web-based GIS, online maps, Geography subject curriculum, internet.

INTRODUCTION

Technological advances have changed the ways things are done today and those who are not able to take up the challenges will be left behind and miss the benefits that these opportunities can offer. Information and communication technology or better known as ICT has been widely used in Malaysia since the 1970s (Lateh Habibah & Vasugiammai, 2010). However, it was not used in schools until late 1990s. Since then, projects such as Smart School, Projek Pengkomputeran Sekolah and School Resource Center emerged. Malaysian Government sees the importance of incorporating ICT in the curriculum and allocated RM5 billion budgets for a 7 years period from 2003 until 2010 for the Malaysian Ministry of Education to upgrade computer literacy and ICT among the younger generations (MOE, 2003)(cited in Lateh & Vasugiammai, 2010). In 1995, the only subjects that incorporated the use of computers in their curriculums were Bahasa Melayu, English, Science and Mathematics. In view of the importance of ICT, the computer literacy was included as a subject Malaysian Education Curriculum in 1996 (Gani et al., 2006). In addition, Malaysia government has further initiated one computer one family campaign to encourage the people to own a computer and stimulate government intention to increase the number of computer literacy among its citizens. Furthermore, tax deductions is also provided for those who purchase computers (LHDN, 2011). This has been practiced since the year 2003. In addition, starting this year, in order to encourage the citizens to obtain internet access, Malaysian government also provides tax

deductions for those who subscribe to broadband services. Currently the number of internet subscribers in Malaysia is more than 17 million people (Internet World Stats, 2011).

Online and Web-Based Geographic Information System (Web-based GIS) Maps

Online and web-based geographic information systems or better known as web-based GIS maps are related map applications. On one hand, online maps can be standard digital maps published on a web browser and at the same time they can be represented by web-based GIS maps. On the other hand, online maps can also be published as digital maps that do not have any geographic information systems (GIS) features at all. Kraak (2001) views online maps as digital maps published on web browsers. Represented by two types, online maps are classified as static and dynamic maps (Kraak, 2001). Both types have interactive interface and/or contents and designed to be viewed only. Static map is mainly presented in bitmap or jpeg format. It can be in interactive manner as it provides information using hyperlink provided on the interface of the map. On the other hand, dynamic map according to (Kraak, 2001), has animations on bitmap, jpeg or gif map format. AVI, MPEG or Quicktime provides the animation part of the map. These were the inventions of the early 2000s. Today, technological advances have enabled cartographic elements to be utilized on online maps. GoogleMap, introduced in 2005 is an excellent example of online map that possesses cartographic features which enable users to pan, zoom in and out, project current position, provide direction and conduct search. In this paper, online maps with web-based GIS features are referred to web-based GIS maps.

Web-Based Geographic Information System (Web-based GIS) Application

Web-based GIS is actually an extension of geographic information systems (GIS). GIS is a computer information system that has the capability of capturing, storing, manipulating and displaying geo-referenced data (Al-Sabhan, 2003; Worboys, 1995). Its usage is normally centralized and handled by knowledge personnel. Due to its complexity, platform dependency and expensiveness, the usage of GIS is not widely benefited by many organizations (Al-Sabhan, 2003). However, the internet and the World Wide Web have provided a platform for the public to use GIS application on their web browsers. Widely used in various disciplines such as urban management, tourism application, public participation, precision farming, urban management, e-government, crime control, epidemics management and monitoring and business, the potentials of web-based GIS should not be underestimated (Dragicevic, 2004).

Web-based GIS maps yield various benefits. Freely accessible, no installation required on the client device, easily updated and requires no boundaries are among others. Examples of web-based GIS application that are available include GoogleMap, Wikimapia and Yahoo! Local Maps. However, the effectiveness of the available application is still being evaluated. GoogleMap for example provides information based on users' input (Zainol et al., 2010). The more users' input on certain areas the more information other users will benefit. The use of web-based GIS applications in Malaysia initially started in early 2000 (Beh & Alias, 2003). Recently, these applications have gained popularity among Peninsular Malaysia Town and Country Planning Department and Malaysia Geoportal (JPBD, 2010; MacGDI, 2010). However, the current usage of web-based GIS is limited to data sharing among government agencies and data purchasing by the private sectors. Although these facilities are opened for public usage, most Malaysians prefer to use GoogleMap for their travelling purposes (Seong, 2009; Sia, 2009; Sivanandam, 2009; Zainol, et al., 2010).

Various studies have shown that incorporating GIS as a teaching tool has increased not only students' understanding but teachers' positive attitudes in the subject matter (Demirci, 2008, 2009; Demirci & Karaburun, 2009; Foster, 2008; Lateh Habibah & Raman, 2005). However, the implementation of GIS in schools is faced by various but similar challenges. Common challenges faced can be categorized by technical, institutional, staffing, funding and other factors impacting system development and implementation (Crosswell, 1991). Supplying schools with computers will not encourage the use of computers in teaching and learning. Teachers who teach Geography should be exposed to GIS during their training or preferably during their pursuing of degree programs. This is to enable them to integrate Geography curriculum and features in GIS application. In addition, initiatives by the Universiti Pendidikan Sultan Idris (UPSI) and Universiti Malaysia Sabah (UMS) in incorporating GIS application in their education degree programs should be commended (Che Ngah & Hashim, 2006; Dziauddin, 2004; Lateh & Muniandy, 2011).

Web-based GIS application is freely available on line. Therefore it provides a good initial start to introduce GIS in schools (Johansson & Pellikka, 2005). Furthermore, according to Johansson and

Pellikka (2005), time taken to comprehend the features is shorter as compare to understanding stand alone GIS. A web-based GIS application using Opensource OpenJUMP was once examined in a Malaysian school in Kedah in 2008 by Ratnam. Results show that the application is easily used and there is a positive achievement in post test done by the Form 1 students in the said school (Ratnam, 2008). However, it was found out that teachers face problems in integrating the application with the curriculum, where lacking of technical assistance and obtaining data was the main issue.

However, this is not the case today. GoogleMap for example, is able to display information on Malaysia easily, fast and with no additional software other than a web browser. In addition, information on streets, terrain, and location labeling is also available. Furthermore, users can also conduct search and obtain directions. This is not possible using normal paper-based map. In addition, web-based GIS application supersedes GIS application in terms of skills required in developing GIS model, data required and software purchases. Web-based GIS is able to save tax payers money in terms of training, data acquired and software costs. Challenges described above in implementing GIS in schools can be resolved. However, hardware, time and internet access factors still need to be taken into considerations.

Geographic Curriculum for Lower Secondary Schools in Malaysia

Initial observations reveal that GoogleMaps are not used and referred to at all in any lower secondary Geography lessons. Teachers do not take any initiative in incorporating this application even though it is highlighted in the Geography Lower Secondary Curriculum that the use of information technology and communication such as internet, web sites, emails, CD-ROM and teleconferences in teaching is encouraged (Kementerian Pendidikan Malaysia, 2000). Surprisingly, although GoogleMap is widely used by Malaysians for their travelling purposes, it is not widely known among teachers. This is based on initial observations.

Lower secondary level in Malaysian schools refers to Form 1 to Form 3 with school children aged 13 to 15 years old. At the end of Form 3, these children will be sitting for a major examination called Penilaian Menengah Rendah or also known as PMR. The results of PMR will determine the placement of the children in their next level of education, higher secondary whether to be in science stream or arts stream. At PMR level they are required to sit for 7 subjects for the non Muslim and 8 subjects for the Muslim. The required subjects are Bahasa Malaysia, English, Mathematics, Science, Living Skills, History and Geography with Islamic Studies for the Muslims. Therefore, as one of the major subjects in PMR, Geography subject should be mastered by students. The use of technology will enable students to grasp the subject creatively and innovatively and this has been proven by many studies (Demirci, 2008; Foster, 2008).

METHODS AND PROCEDURES

The objectives of this study are to identify the features and components of the current web-based GIS application and to suggest ways on how it can be utilized to aid the teaching of Geography in lower secondary school. Therefore Malaysian Geography subject curriculums for Form 1 to Form 3 are used as main documents for content analysis. The output of the analysis is matched against the features offered by web-based GIS. By integrating both the curriculums and web-based GIS features, the output will show the matches.

Geography Subject Curriculums for Form 1 to Form 3

The content of Geography subject curriculum can be divided into three categories: Geography Skills, Physical and Human Geography and Local Geography Studies. These categories run across all the school's levels, Form 1 to Form 3. The objectives of first category, Geography Skills, are to allow students to investigate and relate location aspect, direction, scales and distance within spatial organization. Students are also expected to grasp skills in drafting tables, drawing graphs, charts, maps, figures and to produce inferences. In the second category, students are expected to focus on the correlation between the physical entities and the human behavior. This has to be carried out based on eight themes: landform and its potentials; weather, climate and its effects; natural vegetation and wild lives; population dynamics; settlement and its growth; transportation and communication; resources and finally economic activities. The third category focuses on the application of the knowledge obtained from both the first and second categories described earlier.

In addition to the above categories, the curriculums also outlined the thinking and generic skills. The former focuses on critical thinking skills and creative thinking. Likewise the later incorporates communication skills, technological application skills, project planning and implementation, team work, problem solving skills, management and analysis of the chosen information and culture comprehension.

Web-based GIS Features

GoogleMap, a web-based GIS application, is used as the tool since it is widely known among Malaysians (Sia, 2009; Sivanandam, 2009; Zainol et al., 2009). In addition, GoogleMap offers map, earth, satellite, photos and terrain views in its application. All these features are used in this study. Table 1 shows the map features and the snapshots of the application available in GoogleMap.

Table 1 Snapshots of GoogleMap Application

No.	View	Features	Snapshots
1	Map	Pan Zoom	
2	Earth	Pan Zoom 3D viewing control	
3	Satellite	Pan Zoom	
4	Terrain	Pan Zoom	5	Photos	Display selected photo only	

RESULTS AND DISCUSSION

The results show that GoogleMap application can be used in enhancing students' thinking and generic skills. Table 2 shows the matching between Geography subject curriculum and features available in GoogleMap application.

Table 2: Matching between Geography Subject Curriculum and GoogleMap Application

Curriculum Category	Geography Subject Curriculum	GoogleMap Features	Thinking and Generic Skills
Geography Skills	Students are to investigate and relate location aspect, direction, scales and distance within spatial organization	Map viewing and browsing Distance measuring Earth Satellite Map printing	Critical thinking Creative thinking Communication skills Technological application skills
Physical and Human Geography	Students are to relate landform and its potentials; weather, climate and its effects; natural vegetation and wild lives; population dynamics; settlement and its growth; transportation and communication; resources and economic	Map viewing and browsing Earth Satellite Terrain Photos Webcams	Critical thinking Creative thinking Communication skills Technological application skills Management and analysis of the chosen information

	activities	Map printing	Culture comprehension
Local Geography Studies	Students are to apply both the above categories in their project paper to be submitted at the end of the school year	Search Ask for direction Map printing Earth printing Satellite printing Photos	Communication skills Technological application skills Project planning and implementation Team work Problem solving skills Management and analysis of the chosen information Culture comprehension

Teachers can utilize GoogleMap features and application in their classroom provided they have the hardware components which consists of computer processing unit (CPU) or a laptop, internet access, display screen and a projector. With the Malaysian government policy on one house on personal computer, this will assist teacher in getting students to follow up what they have studied in classroom at home using their own personal computers (PCs). Moreover, Malaysia government has given tax deduction for those who purchase computers up to RM3000 per person for a three year period (LHDN, 2011). Furthermore, with tax deduction in subscribing broadband at home will encourage more Malaysians to obtain internet access at home (LHDN, 2011).

With the availability of data and information, user friendly interface, search capability, multiple map viewing functions and freely available online, GoogleMap is able to provide a good foundation for teachers to use web-based GIS application in schools as a teaching tool. The integration between the curriculum and GoogleMap features has been pointed out. In addition, there won't be any problems in getting sufficient information and technical jargons have been avoided. Therefore, teachers need to be creative and innovative to take the challenge in using the current web-based GIS application such as GoogleMap as a teaching tool. Moreover, in order for such application to be implemented in schools, web-based GIS application needs to be incorporated in Geography subject curriculum similar to the steps taken in the Turkey and Singapore (Demirci, 2009; Yap et al., 2008). The use of web-based GIS application and GIS application should not be limited to teaching and learning of Geography but also Science and History subjects. This will empower the teaching and learning of these subjects in secondary schools in Malaysia.

CONCLUSION

Computer literacy issue among Malaysians should not be used as an excuse not to use computer and internet in teaching and learning of Geography subject in Malaysia. Almost 65% of the population is internet subscribers. Therefore, the use of web-based GIS application in schools should be implemented and benefited.

ENGAGING CHILDREN TO STORY TELL IN A TEXT DESIGN CONTEXT

By using engagement features in NEMD Model (Norma™ Engagement Multimedia Design Model)

ABSTRACT

It has been a fact that our teenagers and children are now growing in an era of new technology convergences. Every innovative technique is design to enable children to be engaged and addicted to the environment designed for them. When some form of these addictive features in computer games were used to develop story telling materials in a text design to teach children to tell stories the children were found to be very engaged and able to relate to the stories told by their teachers. "NEMD Model - Norma™ Engagement Multimedia Design Model" (2007) was a rename of an extended research done on a previous "An Engaging Multimedia Design Model" (2004) developed through observations and experimental studies of young teens in engaging situations as they interact with computers. By including the engaging features of the NEMD Model in this text design of an "interactive illustration" of a preschool book series *"Siri 3 Sahabat dan SiRama-Rama"*, correctly used by a group of nurseries in Malaysia, the children were able to remember what we wanted them to remember when they reached a level of being engaged. The children, from three different ethnics, Malay, Chinese and Indians could remember the names of the characters, stories, scripts and recite a new phrase 'pantun' (a traditional rhyme phrases) created to suit the stories in the books) written in a Malay Language in these books at a very fast speed. This paper will discuss on how the transformation of engagement features helped children to acquire story telling skills.

Keywords
Multimedia, engagement, storytelling, digital storytelling, model

INTRODUCTION

Materials design for children, either books or multimedia, need to follow the psychological needs and wish lists of children to make them successful. When the psychological needs and wish list is fulfilled we will be able to instill a long lasting and sustainable interest for them to use and reused the product designed for them.

BACKGROUND

"NEMD Model - Norma™ Engagement Multimedia Design Model" (2007) was a rename of an extended research done on a previous "An Engaging Multimedia Design Model" (2004) developed through observations and experimental studies of young teens in engaging situations as they interact with computers. By including the engaging features of the NEMD's Model in a text design of an "interactive illustration" of a preschool book series *"Siri 3 Sahabat dan SiRama-Rama"*, the children were able to remember what we wanted them to remember when they reached a level of being engaged

In this model, features and factors contributing to why teenagers become addicted to computer games were identified. Features in this model have been tested in various learning platforms so much so that a patented Engaging Learning Model and system has been developed from this. A study relating the application of engagement factors in the NEMD's Model to a

Student-Centred Learning (SCL) teaching methodology has given positive impact to the teaching and learning process experienced by selected university students taking a language in multimedia course. They were not only engaged and highly motivated to the task given to them but were also able to produce optimum learning outcomes.

By including the engaging features in the NEMD Model in a text design of an "interactive illustration" of a preschool book series *"Siri 3 Sahabat dan SiRama-Rama"*, correctly used by a group of nurseries in Malaysia, the children were able to remember what we wanted them to remember when a high level of engagement is reached. The children could remember the names of the characters, stories, scripts and the 'pantun' rhymes in these books as soon as they were being told despite the fact that most of the children have different mother tongue language and dialects.

ENGAGEMENT

The success of acquiring the story telling skills has a lot to do with the fact that the children were engaged during the cause of action. Before a further discussion on engaging children to story-tell it is best a definition of engagement is established in this context.

From a patented engagement system, engagement in the NEMD's Model was defined as an important psychological phenomenon that could determine the success or failure of a technological design system. Any form of representation of systems' design that could make the user or audience 'remain seated', 'be fully engrossed', which is referred to as 'fully engaged' and has "the ability to sustain the engagement level, at a reasonable period of time of one to two hours or more" is a vital factor to "ensure user engagement" and will be defined as "successful" by the end- user or audience.

Even though the engagement system was developed for end- users or audiences amongst teenagers aged 12 to 14, aged 15 to 16 to some extend aged 17 and beyond, application of engagement features in text design has attracted even young children as young as 3 years old.

NEMD MODEL (Norma™ Engagement Multimedia Design Model)

The engagement factors in The NEMD Model are of those mentioned in the "An Engaging Multimedia Design Model" (Said, 2004). Further development of the model has revealed the possibility of measuring this psychological phenomenon. "The Engagement Measuring System"©2004, 2007 in NEMD Model (Norma™ Engagement Multimedia Design Model) could enable us to determine:

- The level of engagement a particular design feature could give its users
- What design feature could give disengagement
- What design feature could give short term engagement
- What design feature could give slightly longer engagement term
- What design feature could give long engagement term
- And what design feature could give sustained engagement term

In this research context, a design system (deduced from the results obtained through experiments conducted to develop the model) is only termed as "a successful design system" if the design could engage and sustained engagement to the user or audience of the system. The system, thereby, could be: a multimedia design system or application; an experiential learning system or environment; an educational learning system or training system; or a multimedia presentation, to some extend a corporate video or advertising presentation. Therefore, in a context when systems are gauge based on successfulness, the system is a failure when it fails to engage the user.

Therefore, at the end of the day the outcomes of these failures are

- Many educational games developed by government bodies like the ministry of education; sponsored projects done by companies on websites and CDs; and educational courseware developed by courseware developers could not sell well or attract audiences as those in some games because none of these designs follow any form of design matrix to indicate at what level of engagement could a user be at when interacting with the multimedia that the designers have designed.

- The educational games does not become engaging after a short while because the flaws are being repeated in other designs too because their designs are mainly a copy or modification of what others have done without following any form of design matrix to ensure the level of engagement is sustained.

- When educational websites have designs that could not engage and sustained engagement the websites will be rarely visited by their target audiences

- Educational courseware that have designs that could not engage and sustained engagement will defeat the educational purpose they intended to perform

- Educational experiential centers like museums, and theme parks, etc. gets fewer visitors to dwell on its simulation or virtual reality design because the center lacks designs that could engage and sustained user engagement

DESIGNING FOR CHILDREN

Research has proven that lots of companies have designed multimedia applications for children. Some worked and some do not (Hughes, 2000). Despite good design features children find some educational CDs designed for them boring or overloading (Said, 2004)

We know that any form of material designed for children need to abide by their needs and desires for them to be successful in the children's eyes. Prolonged and sustainable interest could only be achieved if these wish list and desires are met. Most designers do take children into consideration when designing products for children used especially multimedia CDs designed for them. Designers often include them either at the beginning, during the design process or at the end as testers of informants (Libby, 1998). When the iterative production process is complete the role of children stops as end users.

Observation through the experiments conducted to develop the model has revealed that a product design for children must not end there as a product. Designers must include a portion in their design a place where children could feel that they belong and are part of the creation even if the process is over and the product is developed. It is this part of the creation that makes children be engaged and sustained engagement.

INTERACTIVITY

One design feature that could make users feel that they are still part of the creation of the product is interactivity. Interactivity is a very important feature when designing any form of media, name it texts, hypertext and hypermedia. The opportunity and chances to interact given by the media designed for users has proven to give users the "felt presents" of being part of the creation.

Audiences stay tuned to talk shows when they are given the chance to interact with the host via phone calls, SMS and video conferencing. Interactivity has proven successful to engage users, especially children, to continue using, remained attracted and engrossed to the systems designed for them. The opportunities given in interactive features designed in computer games and play stations has proven to sustain engagement to the level of addictive.

When the chance to interact is transformed in books, the design feature must include making something on paper interactive. "Interactive illustration™" is the term used to describe interactive feature in the book designed to story tell. It is this form of interactivity that has made children enticed to stories told to them and to story-tell after that.

"SIRI 3 SAHABAT DAN SIRAMA-RAMA" (3 FRIENDS AND THE LITTLE BUTTERFLY)

The book series of *"Siri 3 Sahabat dan SiRama-Rama"* (3 Friends and the Little Butterfly) was launched on 1st October 2005 during a graduation ceremony of group of nurseries under the government national unity program in Malaysia. The package is made up of six big books (five stories and one board–game like book feature with pop-ups). The package includes figurines and place stands.

INTERACTIVE ILLUSTRATION

Interactive Illustration is a design feature used in this package that has managed to entice children to story-tell. The stories in the five books accompanying the package were made alive partly because of this interactive feature.

Fig.1: The Interactive Illustration of the board-game like pop –ups from one of the six big books in the story package given to the children

ENGAGEMENT FEATURE VERSUS DRAMA

There are six engagement factors in the engagement model. Users become engaged at various levels when these features are present in multimedia design systems. The six engagement factors (GIFCES) are:

- **G**oals
- **I**mmediacy
- **F**eedback
- **C**onstruct
- **E**xperience
- **S**imulation

When the six engagement factors are place besides factors in drama presentation, the researcher found that children could be as engaged in multimedia as when doing performing arts because many of the factors contributing to engagement in multimedia could be traced when children are taught to dramatized what they have read or being read to. It is from this observation that the stories in the package were presented in dialogue drama script form.

THE STORIES

The stories in the package cover on universal moral values. The characters are from three ethnic groups, Malay, Chinese and Indians of both genders doing everyday mundane things together. The butterfly is the savior of any wrong doings the children made whilst out playing.

THE METHOD

There are two form of exercise involved in this study. Group 1 and Group 2 were relayed the same stories written in a dialogue drama script.

Exercise 1:

In this exercise, the Group 1 children were told of the stories in the book by their teachers. The children were given phrases to memorize in chorus, besides drama scripts and probes based on the stories. The children were given three weeks to act out the story into a play and performed in front of a group of audience.

Fig. 2: Dramatizing the stories being told using related probes and drama dialogue scripts.

Exercise 2:

Exercise 2 involves the use of the story telling package Group 2 was given the story package. They were relayed stories in the big books following the dialogue scripts found in the books. The children were later shown the board–game like book feature with pop-ups and figurines of characters in the books. The children were later allowed to tell the stories as told.

FINDINGS FROM THE STUDY

Observations from both exercise has given insights into how levels of engagement could influence children's acquisition of storytelling skills. The children in the study were able to relay the stories just as it is being told.

In Exercise 1, the Group 1 children were able to express exact dialogues after they have mastered the whole story. Practically the whole group member was able to recite the *pantuns* and dialogues found in the books after three weeks. No problems were encountered when there were absentees because practically everybody knows the dialogue and were able to connect to the stories in the books. They became engaged once they are able to memorize and therefore able to recite the *pantuns* perfectly despite the fact that the rhyme phrases are not of their mother tongue.

In Exercise 2, the Group 2 children were given the story package. The children got engaged through the design feature in the package. The interactive illustration makes the stories come alive. After hearing the stories being told by their teachers, the children rush to the board-game like pop-ups and start making up their own dialogue as the element of role play sets in. During a later course the children starts to mix all the stories and created their own. They became very engaged and were able to remember the names of the characters, stories, scripts and recite the *pantuns* in two days.

CONCLUSION

From the findings above it could be concluded that children are able to remember what we wanted them to remember when they reached a level of being engaged. The findings have justified the point made in The NEMD Model that engagement level is reached when a user acquired skills moved from motor skills to mental model skills. Acquisition of drama dialogues in Exercise 1 and interactive illustration feature in Exercise 2 has successfully moved children's acquisitions from motor skills to mental model skills. Thus both sets of exercise have proven to sustain children's engagement and therefore able to make them remember what we wanted them to remember.

ACKNOWLEDGMENTS

This study owns its gratitude to Universiti Putra Malaysia (UPM) for granting numerous research grants to do an extended research on "A Engaging Multimedia Design Model" (2004) till it gets to its present form The NEMD Model (Norma™ Engagement Multimedia Design Model). This research also likes to convey it's appreciation to the children involved in this research and all those directly and indirectly involved in this research.

ABSTRACT

University websites serve as sharing information with students whether prospective or enrolled. Often, before entering their departments, students visit them to have an idea as to what it would be like to be a part of that university and department. In that sense, websites help students in deciding whether the university matches their expectations. After enrollment, websites start to serve as their representative and an interactive ground for students, academics and administrative personnel of the university. Since schools exist for students, their opinions matter. This study aimed to have students' opinions of their university websites. For the purposes of this study, students of English or related majors (such as English language teaching, English linguistics, English language and literature, translation studies, American culture and literature) were sent a questionnaire to find out their opinions of their departments' websites. It is hoped that the feedback has implications, however indirectly, for universities and departments to promote themselves in a more realistic manner that suits their students' needs.

Keywords: Website, academic resume, higher education, educational marketing, department

Introduction

In Turkey, there are 104 state universities and 62 foundation-owned higher education institutions with 7 private vocational schools (http://www.yok.gov.tr) although many homepages and websites of Turkish universities or their departments have not been very active or worse, there are many problems with them such as dysfunctional links or existence of missing information. Despite there exists improvement, some problems still remain such as design and layout problems; for instance, those related to information overload, inadequacy of negative space (space around and between the subject(s) of an image), inappropriate color scheme, or typography, you can see pages relating to announcements or resumes which have not been updated. Especially important are the resumes of academics, recruited by the school, the very existence of which is the student who demands accountability as to the qualifications of the teaching staff including the question as to which course is offered by which academicians with what qualifications based on what criteria.

Theoretical Framework

As part of new technologies, the Internet and websites are one of the fastest and most effective ways of communication. Compared to traditional ways of communication, Internet-based communication may provide information in either synchronous or asynchronous way. In synchronous communication, the response is received at the same time as the message is sent, that means interaction occurs at the same time like in chat (Ohlund, et.al., 2000: 406). In asynchronous communication, location and time of each interaction change. Hence, a caller system is needed to receive the message back at a later time. Websites as part of Internet-based communication keep several advantages of new technologies: Web transmits messages (or information) either to one receiver or more people. Since it is asynchronous, it does not allow real interaction. Its most significant advantage however is its speed, its use in the global environment and its low cost (Bonchek, 1997: 10, cited in Timisi 2003: 126). The multi-channel

environment may facilitate the negotiations between the organization and the public (Kent and Taylor, 1998: 322).

Websites are suitable for two-way communication. As Kent and Taylor (1998) state the web is ¨an excellent information dissemination tool and useful for getting a message out¨ (325). As an organization, what you would like to announce, what you will let your stakeholders learn about yourself and how much information you will reveal on the website is manipulated by you. On the other hand, your stakeholders expect to acquire as much information as they could through this web source. In our case, students as stakeholders will ask for genuine information about the quality of education, courses, programs as well as on-campus accommodation, social life and other challenging opportunities offered by the university. While they are seeking answers for their questions on the Internet, the university tries to capture the interest of highly remarkable young talents who have taken high marks from the University Entrance Exam and still in quest of the right university to be enrolled / to write down in the preference sheet.

University websites with their rich and updated content besides their layouts, colors and user-friendly interface form a positive image in students' minds while providing detailed information about their educational activities and academic assets. The key point where the university website disseminates information given by the service provider (the university) to the stakeholders (the students) is the quality of that information. Dragulanescu (2002: 250) states that the information is high quality ¨if the provider has taken into consideration both the stated and implied needs of the customers/users (before designing, manufacturing, and supplying the product) as well as their reactions (after having supplied the product)¨. Kent and Taylor (1998) specify five key strategies to build dialogic communication on the web. These can be reinterpreted as factors to create a successful website:

1. The organization needs to have a feedback loop so that it can provide the information that publics need or desire.
2. Websites should make an effort to include general information valuable for all kinds of publics. Publishing historical information is not new but ¨content is what should drive an effective website, and not the fancy graphics that many web sites currently rely upon¨.
3. Websites should contain features that make them attractive for repeating visits. Updated information, changing issues and special forums, are some examples.
4. The contents should be well-organized and hierarchical. Like the second factor, authors insist on that the content should be textual rather than graphical although today many experts agree that graphics and textual design must have a balance.
5. About the links to other sites, Kent and Taylor warn the web designers that offering outer links is usually preferred because of ¨goodwill¨ but it might be a handicap for you as the visitors may never get back to your website. They recommend that web sites should include ¨only essential links with clearly marked paths for visitors to return to your site¨ (Kent and Taylor, 1998: 330).

Eschenfelder, Beachboard, McClure and Wyman (1999) published the criteria used to assess the design and management of U.S. federal government websites. Smith (2001) adapted these criteria of website design from Eschenfelder et.al. (1999) in order to evaluate five government websites in New Zealand. In both studies, the criteria were grouped under two headings as information content and ease-of-use. The former, which has 7 or 8 subtitles, refers to the nature of the information, mentioning of the services provided by that website, the accuracy of the web information, privacy of the user and the use of updated sources and data on the website. The latter, having 5 subtitles in both, is related to links, feedback, accessibility, design, and navigability of the website content. Table 1 compares and contrasts the criteria used in both studies.

Criteria used by Smith (2001)	**Criteria used by Eschenfelder, Beachboard, McClure and Wyman (1999)**
1 Information Content	**1. Information Content**
1.1. Orientation to website (7 criteria): It includes the mission and scope of the website, liability statement, services provided by the website, instructions to use the website and the news alerts.	1.1. Orientation to website (7 criteria):
1.2. Content (10 criteria) It includes matching the mission and the needs of the audience, balanced amount of information, having direct and necessary information. It includes criteria about the language use such as clear and consistent language style, unbiased statements and positive professional tone.	1.2. Content (12 criteria)
1.3. Currency (3 criteria): This is about the updated content with the identified updating periods.	1.3. Currency (3 criteria):
1.4. Metadata: Facilitates retrieval, navigation (4 criteria): It includes clear headings, appropriate metatags and consistent use of terminology and layouts with the	1.4. Bibliographic Control (5 criteria) It includes clear headings, and consistent

headings.	use of terminology and layouts with these headings.
1.5. Services (3 criteria): Availability of services which are operational and relevant to the user's needs	1.5. Services (4 criteria):
1.6. Accuracy (4 criteria): It refers to real information as well as having the sources cited and the accurate use of grammar, spelling and no mistakes of typing.	1.6. Accuracy (criteria):
1.7. Privacy (3 criteria): Users' privacy rights and encrypted exchange of information with the user are comprised under this heading.	1.7. Privacy (3 criteria):
1.8. External recognition (3 criteria): Ways in which the value of the site is recognized by users such as awards and reviews besides the number of links.	
2. Ease-of-Use Criteria	**2. Ease-of-Use Criteria**
2.1. Links (6 criteria): Updated links, shortcuts, warnings about the links or links to other relevant pages are mentioned in this subsection.	2.1. Quality of links (9 criteria): Speed of links and minimal use of bright colors and large graphics are also included in this subsection.
2.2. Feedback Mechanisms (5 criteria): Contact details for entity, data forms and instructions for the user are included.	2.2. Feedback Mechanisms (2 criteria):
2.3. Accessibility (6 criteria): Speed of response, easy and rapid access to the website, publishing on the search tools, backlink to the entity and using not a complex URL which is not open to confusion	2.3. Accessibility (4 criteria):
2.4. Design (7 criteria): Functional format and graphic design, consistent format through website, use of Standard HTML, use of higher level technology such as frames and Java Script, use of downloadable small-size images and documents	2.4. Design (11 criteria): More detailed criteria of graphics use are included here. Another criterion about attention-getting devices like use of bold, italics and blinking is seen in this subsection.
2.5. Navigability (7 criteria): This subsection includes logical organization of the website, use of conventional navigation models with options and facilitated type of browsing as well as providing search engine.	2.5. Navigability (7 criteria):

Table 1. Comparison of the website design and evaluation criteria specified by smith (2001) and eschenfelder, et.al. (1999).

In two other studies, a positive website design has been assessed through different aspects. Kim, et.al. (1999) surveyed on health related websites and peer-reviewed journals to find out common criteria which were being benefited for designing websites on health issues. They included 13 criteria which were rated by the participants. Dragulanescu (2002) however implemented Total Quality Management tools to make questions for the users to answer about the perfect-like web design which meets the basic needs or desires of web users. Thus, this differs from the others with its focus on the viewpoint of users rather than considering designers' or service providers' perceptions. Table 2 compares the criteria revealed by these two above mentioned research studies.

Criteria proposed by Kim et. al. (1999)	**Criteria proposed by Dragulanescu (2002)**
Content: quality, reliability, accuracy, depth) **Design and aesthetics**: layout, interactivity, graphics, use of media **Disclosure of authors, sponsors, developers** **Currency of information**: frequency of updates **Authority of source**: reputation of source, trustworthiness **Ease of use**: usability, navigability) **Accessibility and availability** **Links** **Correct documentation**: presentation of clear references **Intended audience** **Contact addresses/ feedback mechanism** **User support** **Miscellaneous**	**Accuracy**: the extent / degree of information, its exactness and correctness **Authority**: the extent / degree to which the author could be considered an expert in his / her field). **Coverage**: the extent / degree to which topics were observed, analyzed and reported **Currentness**: the extent / degree to which the distributed information belongs to the time in progress **Density**: the extent / degree to which comprehensive and relevant information is displayed on the webpage **Interactivity**: the extent / degree to which two-way communication is operating between the user and author

Table 2. Comparison of the website design criteria of health-related web design and user-focused criteria (adapted from Kim, et.al., 1999: 648 and Dragulanescu, 2002: 253).

Studies about guidelines for making successful university or college websites are a few. Borges, Morales and Rodriguez (1999; cited in Zhang and von Dran, 2000: 1254) adapted Nielsen's guidelines to evaluate 10 university websites and performed user tests on them. Zhang and Von Dran (2000) implemented Herzberg's theory to assess web design to test evaluation on a two-factor model. They formed questions related to features about 12 criteria which were grouped under two factors. The questions were replied by a selected group of university students. The two factors they called were hygiene and motivator factors.

Pinto et.al. (2009) assessed the information provided by Spanish universities on their websites regarding accreditation procedures. They used metric analysis and SWOT analysis as the methodology. The essential structure was based on seven main criteria on 70 indicators not equally distributed among all. The visibility of information, correctness and completeness had the greatest number of indicators while authority, updatedness, accessibility, quality assessment and navigability were the other five criteria to be assessed.

Criteria to evaluate the websites	**Number of survey questions / Sub-criteria**
User perceptions	Q1-Q2-User interest Q3-Manipulative manner Q4-Trustworthiness of the website Q6-User satisfaction
Accuracy	Q5-Accuracy of information
Consistency	Q7-Consistency of quality Q20-Consistency of layout Q25-Consistency of translation
Design	Q8-Plainness Q9-Metadata (hierarchical order of menus) Q10-Q11-Q12-Visual-textual balance Q13-Vividness Q14-Corporate images and colors Q15-Graphics design Q16-Audio-visual format
Content	Q17-Q27-Being informative Q18-Transparency Q22-Categorizing information Q17-Q23-Q26-Use of PR elements
Currency	Q19-Updatedness
Ease-of-use	Q21-Q30-Accessibility of services
Feedback mechanisms / Interactivity	Q24-Student feedback Q28-Contact information Q29-Server-side scripting

Table 3. Criteria of the survey on website design evaluation

As the above mentioned review of the literature show, all aspects of websites are currently studied by researchers so as to enhance their potentials in informing users and visitors. This need is also pressing in Turkey where the Internet is currently used for attaining information about locates and contexts that are difficult to reach physically. Hence, this study aimed to collect the opinions of English or related majors (English language teaching, English linguistics, English language and literature, translation studies (English), American language and literature) about their university's or department's websites.

Methods

For the survey about the evaluation of website design, 30 questions have been formed depending on various aspects of 8 criteria. These 8 main criteria have 24 sub-criteria with varying rates in total. Table 3 displays these criteria with the sub-criteria for each one and the number of every individual question assessing that sub-criterion.

The criteria of accuracy, design, content, currency, ease-of-use and feedback mechanisms / interactivity exist somehow in earlier studies in the literature. However, rather than measuring the users' viewpoints, most of the former studies have been based on the criteria significant for web designers or the executives of organizations as being the publishers of their websites. Furthermore, only a few studies have focused on how to improve university websites. Therefore, assessing what university students think about the website of a higher education institution is one of the primary objectives of this study. User perceptions with the four related sub-criteria endeavor to assess to what extent user interest, the

manipulative manner of the organization, trustworthiness of the website as a source of information and the user satisfaction take a part in the success of a website.

The design criterion has 7 sub-criteria including plainness, metadata, visual-textual balance, vividness, the use of corporate images and colors, graphics design and audio-visual format. The metadata called as 'bibliographic control' in Eschenfelder et.al. (1999), is one of the sub-criteria related to web design in our study. Accuracy like in Smith (2001) denotes the accuracy and reality of released information. Currency, as one of the basic criteria of all studies, mentions how much updated information is used on the web. Ease-of-use, like in Kim et.al. (1999), has been included as a main criterion. In the survey of website design evaluation, it is accepted as the accessibility of organizational services on the Internet while having a broader sense in the resume evaluation survey with the sub-criteria of accessibility and navigability.

Consistency is one of the main criteria in website design evaluation. It refers to consistency of the quality both on the homepage and on the related departmental websites. It also refers to the consistency of layout and the consistency of translation of Turkish website into foreign languages.

The content here has a narrower meaning since it indicates the characteristics of the information released. It has four sub-criteria of being informative (not manipulative), transparent, categorizational and including elements of Public Relations with the focus of publicity in general.

Parallel to the current tendencies, interactivity is accepted as one of the basic criteria for the study. Interactivity is named as "feedback mechanisms" by Smitth (2001) and Eschenfelder, et.al. (1999). That is because three questions have direct emphases on acquiring student feedback, publishing contact information to have general feedback and using server-side scripting to make feedback process easier.

Criteria for academic resumes	Number of survey questions/ Sub-criteria
Content	Academic services and products Q1-Publications Q2-Q10-Q11-Courses offered Q3-Research interests Q4-Oral presentations Q10-Q11-Theses supervised
	Academic competence and skills Q5-Q6-Linguistic(L2) competence Q7-Academic competence
	Personal information Q12-Q13-Q14-Age, marital status, hobbies Q8-Q9-Memberships
Design	Q15-Visual format Q20-Textual format Q21-Downloadable file formats
Ease-of-use	Q16-Accessibility of services Q17-Q18-Q19-Navigability

Table 4. Criteria of the survey on academic resume evaluation

The second survey, which aims to evaluate the quality of academic resumes, has fewer criteria. There are three main criteria as content, design and ease-of-use. Table 5 reveals the sub-criteria and questions evaluating each one.

The content here is again related to the information content in resumes while focusing on three different kinds of data. Academic services and products with 5 sub-criteria, academic competence and skills with 3 sub-criteria and personal information with 3 sub-criteria comprise various aspects of the content.

Similar to the survey of website design evaluation, design criterion is based on textual and visual formats used in the resumes. A third sub-criterion is added to this survey to check the importance of using downloadable file formats. As mentioned before, ease-of-use indicates the accessibility and navigability of the web sources while questioning the relevance of having links to external websites.

Participants

One hundred twenty-five state university students in total from cities of Tekirdağ, Ankara, İstanbul, İzmir, Antalya and Diyarbakır participated in our study. Since most of the web content indexed is English, it is expected of the universities to provide an English version of its web site as well. This fact is one of the reasons for us to send questionnaires to those with a command of English. Secondly, learning a foreign language is an imaginatively and cognitively enriching experience, and helps learners

see matters or events from multiple perspectives. Besides, their youth suggests their familiarity with technology. Since most of them are females, it is thought they have been sensitive to the dimension of design.

The Instrument

A questionnaire included two parts containing 30 items related to university web site in general and 24 to resumes in particular. The survey asked the participants to rate each of the items following on a 1-5 Likert Scale (Strongly agree, Agree, Neutral, Disagree, Strongly disagree). SPSS was used to find out mean scores (along with standard errors and standard deviations) of the items. They ranged from relationship between the effect of a web site and the choice of a university to details regarding the information content, layout, and design of the website in general.

The preparation process of the questionnaire started over a year ago, and it has finalized just before its distribution of the questionnaire. used in our study (actually a pilot questionnaire was administered but due to the problems related to its timing, the results were not evaluated). Professional experts' ideas were important, therefore the Web Marketing Association was emailed. William Rice, the president, informed that they evaluated all of their websites on the items of design, innovation, content, technology, interactivity, copywriting, and ease of use on a scale of ten (W. Rice, May 4, 2009). The association has been evaluating the universities submitted for web awards (the reader can see their report on the 1,092 sites submitted to the WebAwards in 2010 in our 24 page Attributes of an Award Winning Website Study).

In our process, the feedback about the quality and comprehensiveness of the items were obtained from unstructured interviews with the staff of IT departments, press offices, computer teaching departments, an employee of the Ministry of Culture, and academics actively involved in web design and students' ideas. Web sites of various universities in Turkey was analyzed as well. The questionnaire was made accessible online, and the link was sent online to the participants by mail and by using social network sites' interest groups.

The Cronbach's alpha coefficient of the scale was found to be .927 indicating a relatively high internal consistency of the items in the scale. In the narration and explanation of the data as follows, a cut-off point was determined for convenience and ease of reading. The means equal to or above 4.3 (in the tables, those typed in bold) indicated a threshold for good agreement for item whereas those equal to or below 3 (in the tables, those given in italics) was considered to have a lower importance given by the students for the item in question.

Findings

Though lower than the mean score of 4.3, the first item deserves special attention since majority of the students claim to be checking the web sites of their future universities before deciding for application. When they gave their opinion on whether the web site of a department had an effect on their decision, they tended to disagree on the effect of the web site in choosing their department (2.72). However, these results suggest that they give importance to the functions or potential influence of a university web site in forming students' opinions who seek for information about their future schools.

	Items	Mean	St Err.	St Dev.
1	I investigate the home page (opening page) of the university before choosing it for application.	3,9120	,11303	1,26374
2	Prior to application to a university, I investigate the web site of the department.	3,7760	,11122	1,24346
3	The home page (opening page) of the university is/was effective on the question to whether or not to apply for the university.	3,0080	,10746	1,20145
4	The web site of a department is /was effective on whether or not to choose it for application.	*2,7200*	,10632	1,18866
5	The web sites of the educational institutions give ideas about the quality of the education given there.	3,6400	,09732	1,08806
6	I am/was content with the web site of my university.	3,4720	,10929	1,22195
7	There should be no difference as to the quality of the home page (opening page) and the sites of departments.	**4,3920**	,07440	,83179
8	The home page (opening page) of web site should be plain.	3,5200	,09477	1,05952
9	Web site should have clear and hierarchically structured submenus.	**4,5600**	,05611	,62733
10	There should be a balance between visual and textual elements.	**4,3120**	,06855	,76639
11	Web site should have visual elements rather than textual ones.	3,0080	,08980	1,00399
12	Web site should have textual elements rather than visual ones.	*2,8960*	,09216	1,03038

13	Web site should have a variety of colors.	3,5520	,08905	,99560
14	Web site should use the logo and theme colors of the university.	3,9360	,08092	,90468
15	Web site should have animations.	3,3040	,09852	1,10149
16	Web site should have music and sound effects.	3,0800	,11393	1,27381
17	Web site should have an introductory video.	**4,5200**	,06584	,73616
18	Web site should provide the institutional information in a transparent manner.	**4,4880**	,06077	,67937
19	Attention should be paid attention to the update the web site.	**4,7280**	,05492	,61403
20	The sites connected to the home page should be in the same format as the opening page.	4,2880	,08410	,94028
21	Web site should contain announcements and news archive, and this archive should be easily accessible.	**4,7120**	,04927	,55089
22	There should be separate sections for announcements each with relevant content for the student, the academician or the general viewer.	**4,3760**	,07842	,87680
23	A press and media section should be constituted for the news related to the university in the press and media.	4,2400	,06947	,77668
24	The web site should have a student portal.	**4,4720**	,06679	,74678
25	The Turkish content in the home page and the department sites should take place in the English web page as well.	**4,4800**	,06486	,72513
26	Web site should have elements aimed for promoting the university rather than providing information about it.	*2,6160*	,08015	,89608
27	Web site should have elements aimed for providing information about the university rather than promoting it.	3,8160	,07482	,83651
28	The home page and sites connected should have the email addresses of the units concerned.	**4,5440**	,05623	,62867
29	To send a message to the unit(s) concerned, the web site should have a message box on the screen.	**4,4480**	,05843	,65323
30	If the university has its own radio station, it should broadcast from the site.	4,2400	,07903	,88354

Table 5. Students' opinions of university's and departments' websites

As can be seen in Table 5, according to the results, following points deserve special attention since these results constitute what students demand in that

- web sites are updated regularly (4.72)
- an announcements section and an easily accessible section for news archive is available (4.71)
- submenus are clear and hierarchically structured (4.56)
- email addresses are shared (4.54)
- an introductory video of the university/ department is uploaded (4.52)
- information about the university is transparent (4.48)
- content is available in English (4.48)
- a message box is available to visitors to send messages to specific units (4.44)
- a student portal is available (4.47)
- the home page (opening page) of the department and that of the university's are similar in quality (4.39)
- specific announcements sections are available for target viewers: one for the academics, one for the students and one for the general viewer (4.37)
- there is balance between the textual and the visual (4.31), the textual is not dominant over the visual (2.89)

	The resumes of the academics should have	**Mean**	**St Err.**	**St Dev.**
1	Information related to articles published.	**4,4160**	,06444	,72048

21	the feature allowing to download them both in word and PDF format.	3,4560	,10442	1,16746

Table 6. Students' opinions of the web-based information related to their departments' instructors

Students' main priority is the updates regularly made by websites to change their content. The second highest mean score is to do with availability of two sections for both announcements and the news archive with easy access. Being aware of current announcements is necessary to facilitate the availability of up-to-the-minute information. The dimension of current announcements is closely related to updated look. With past announcements archived in a separate section, the site avoids overload of information. The items addressing the usability of email addresses and message box in the first section and the office hours and mails groups in the resume section reflect the demand on their part for teachers communicating and interacting with them.

Preference for the information-based content to the promotional indicates that students do not want their university to associate a commercial image in its pejorative sense, which, if it had, would do harm to their employment outcomes. In other words, a representation of their university is that of theirs. Enthusiasm for representation is implied in student portals as well. They suggest active, autonomous participation through which they are constructive agents of the institution of higher education. Another item to attach importance is the expressed need for an introductory video broadcast on the web site, in which the students as well as professors may be shown highlighting the advantages of their education in their university.

The item to do with English equivalence of the Turkish web site may indicate a bias as the participants are English or related majors. Nevertheless, apart from that possibility, it is a fact that many web sites do not include many important sections addressing international students and foreign academics seeking research partnership, such as announcements that might help international prospective students and other content with potential for relevancy. The translation is also deficient in terms of use of natural English, and lack of cross-linguistic equivalence for specialized terminology sometimes to the point of negative products of machine translation. Another interesting information is the availability of irrelevant content overloaded with legal terms (law number of a regulation). In the resume section, the emphasis is on the need for the following (8 agreed and 2 disagreed items out of 21):

- information related to the articles written (4.41),
- courses offered (4.55),
- their research field/interests (4.48),
- projects conducted or participated (4.34),
- Master's and doctoral theses suprvised (4.37),
- office hours assigned for meetings with the students (4.44),
- links to their publications (4.48)
- their mail groups (4.40).

These results suggest that students attach the least importance to those information pieces related to their instructors' age and marital status although some departments advertise such status the reason of which remains undisclosed. Many mean scores in resume section are expected. One of the more interesting ones is that for the item to do with Master's and doctoral theses supervised. This item is important for those keen on research or in pursuit of a research career. Besides, research makes a university a highly ranked one. In terms of competing for jobs, postgraduate education gains importance to make students stand out amongst the undergraduates, whose numbers increased.

Conclusion

Tasks related to web site development is important. According to Thelwal, Binns, Harries, Page-Kennedy, Price, Wilkinson, (2007), a university web site provides scholarly and pedagogical information. Secondly, it functions "as a marketing tool for prospective students about the courses available and the university itself. Thirdly it contains "information about the research conducted at the university, including details of active scholars, groups and projects" (Thelwal, et al., 2007, p. 95). Once indexed by a search engine, the university web site not only facilitates international collaboration of academics seeking research partners home and abroad but also introduce itself as an alternative choice for students, both home and overseas, with an international appeal. Given the steady economic growth of Turkey, the Turkish government should allocate funds for projects related to the size and quality of the web sites of

Turkish universities so that they use the Internet to have their quality identified and recognized internationally.

In the future, communicative tasks related to university web designs would encourage them to participate more actively in their learning processes. However, it is our observation that students do not participate actively in learning processes in learning English in or out of class. It is not innate, but just the way they have been socialized to study or learn. However, the more involved a learner is, the better they will learn (involvement load hypothesis, Hulstijn & Laufer, 2001). An interesting idea would be involving them as active contributors in the co-construction of the website of their school. A web task might involve learners' sensitivities to issues of discourse such as genre and register along with non linguistic features (audio and/or visual) or cognitive load embedded in the teaching materials. They could gain socilinguistic dimensions of vocabulary from this relevant kind of task-induced involvement could benefit from (involvement load hypothesis, Hulstijn & Laufer, 2001). Another point worth to make is that most of the English or related majors are women, who can contribute especially to visual aspects of designAccording to T. Franklin, professor of educational studies, instructional technology, (personal communication, may 25, 2011), women are very good at visualisation of images, which she witnessed in hiring females as designers, and they are large users of internet in any culture (except the closed ones, where their access is denied).

As for the process related to design, it can also be an imaginatively enriching experience with gift of looking at matters from different perspectives. It would be enriching in terms of the existing literature on websites as well which reminds us of Derrida's famous quote "everything is text". The web related tasks may provide job opportunities. Whether English or related majors pursue a teaching career or not media literacy is a good asset for them. One of the most important features students are the essential most active producers is student portals, which, in Franklin's words (personal communication, may 25, 2011) is the next hot thing in USA. After all, learners are expected to participate in their learning processes in US or UK school settings; it is a part of learning culture in these contexts, which is also expected of learners of English to be aware of as a part of intercultural competence. The way the questionnaire was responded suggested an idea on involvement or participation. In the case participation in works requiring multiple disciplines, our study has implications for promising collaboration of English majors with other majors professionally (professional web designers, bloggers, advertisers, journalists, etc.) as well as academically through the implementation of interdisciplinary studies or double majors (e.g. CEIT and ELT).

We hope that our study might influence English language teachers to entertain the thought of benefiting from web tasks for themselves and students. Wondering if TBLT might work for "teachers and learners in the classroom as it does for SLA research", Van den Branden (2006) underlines the lack of empirical research conducted on the use of tasks as "basic units for the organization of educational activities in intact language classrooms in intact language classrooms" (p. 1). Whether web development tasks may be evaluated in classrooms effectively in task-based language teaching approach (TBLT) may be investigated in future research, though we should be aware of the distance between rhetoric and the realities, as Nunan is reported in Feeney's book review (2006) to cautions us against in comment on the increase on the number of the textbooks based on TBLT.

ENTERPRISE KNOWLEDGE PORTALS AS A KNOWLEDGE NETWORKING SYSTEM

Samer Barakat, Management Information Systems Department, Applied Science University, Amman, Jordan, sbarakat@asu.edu.jo

Hanadi Al-Zegaier, Management Information Systems Department, Applied Science University, Amman, Jordan, zegaier@asu.edu.jo

ABSTRACT

Knowledge portals are a key ingredient in today's organizations strategy for success. It is the right tool for knowledge sharing, storing and retrieval by all organizations stakeholders. Enterprise Knowledge Portals as a knowledge networking system allows organizations to become more competitive, innovative and prosperous. Knowledge management as a term by itself cannot achieve the results designed by top management without the actual implementation of Enterprise Management Systems/Portals. This paper discusses the use of EKP as a new knowledge networking system.

Keywords: Knowledge Management, Enterprise Knowledge Portals

INTRODUCTION

Many researchers, economists, politicians and businessmen are referring to today's economy as "knowledge economy" reflecting a shift in trend for organizations from relying on information to make decisions to relying on knowledge as vital component for organizational survival and success. Knowledge economy as a term also implies that today's organizations has a continuing quest for knowledge that is needed in their daily operations. Although it is information that is at the center stage of everyday activities at organizations, knowledge remains the ultimate goal for employees, top management and decision makers. This accumulation of information over time becomes explicit and implicit knowledge stored in the learning organization. Knowledge accumulation and use needs a knowledge management system to support the "creation, capture, storage and dissemination of information" (Akscyn, Robert M., Donald L. McCracken and Elise A. Yoder 1988). The Internet has played a major role in building a huge database of accumulated information that is ever growing in size and content. In November 2004 Google has announced on its company's website that it has indexed 8 billion web pages (Google Website 2004).

The Internet technology prompted organization to use a modified version of the Internet; this led to the introduction of the Intranet in the organizational settings. The Intranet allowed the fast and convenient sharing of company information among employees (SearchWinDevelopment.com) from the office or home. For many corporations an intranet is seen to be the way in which employees would have access to company's information and expertise and to work collaboratively (White 2000).

Organizations over time learned how to balance the access of information for both internal and external use (White 2000). Today, organizations deploy Intranets and extranets to allow its employee easy access of company's information through its firewalled Intranet and at the same time allows suppliers, vendors and stakeholders secured access to its production data through its Extranet networks.

The overwhelming amount of information available at a company's web site requires continuous amendments and updates and this led eventually to the development of Content Management Systems (CMS). CMS are web applications designed to make it easy for non-technical users to add, edit and *manage* a website (The Plone Foundation). There are many CMS providers out there, some of them provide the system for free and some charges a modest fee to download and use their software. Wordpress.org is considered one of the notorious free CMS software that is used globally by millions of users (http://wordpress.org/).

According to (Reneker and Buntzen. 2000) Organizations are building and identifying strategies to enhance the "intellectual capital of the organization's workforce". This implies paying attention to the use of knowledge management systems and portals within the organization and disseminating knowledge

about the strategic benefits of knowledge management systems for "decision making" (White 2000) and strategy formulation.

Currently the US government is focusing its efforts to bring the "librarian's professional knowledge and expertise to stand on integrating electronic library and information services with rising knowledge management (KM) practices". (Reneker and Buntzen. 2000) Many organizations are following this norm form large to small all over the world. This requires a complete and comprehensive change management approach to allow and guarantee that all individuals within organizations shall grasp this new technological and managerial change.

Knowledge management systems are becoming a knowledge portal and therefore replacing the old concept of information portals. After all it is knowledge what organizations want. Today's large and multinational organizations are using Enterprise Knowledge Portals to manage all their organizational need for knowledge and information. The Enterprise Knowledge Portal is being designed to provide a single point of entry to key information and knowledge resources for managers, employees and external stakeholders.

KNOWLEDGE PORTALS EVOLUTION

Portals evolved over the years to what we know today as Enterprise Knowledge Portals (EPK). In the early days of the Web, portals were merely a collection of disassociated websites (Altman 2007). They were used to "consolidate corporate intranets and to provide single sign-on to back-end applications and database systems" (Colin White 2007). Such systems are still in place today by some small and medium size organizations and are used by their employees on a daily basis. An example of such early day portals are the web enabled Grad Reporting Systems at universities and the HR Employee Attendance Systems utilized in most organizations. Such systems have a user log to record all users' activities on the system for administrative review and to monitor employee's actions and evaluate their performance on a daily, monthly and yearly basis.

Online portals later evolved into online systems that included access to almost all organizations internal applications such as accounting, marketing, inventory, human resources, and finance. Thereby users can access their company systems and perform all the required transactions both form office and home. They would also find information about other business departments through the centralized database over which the system is running on.

Today's portals provide employees a "single sign-on and access to back-end applications, business information, and also other portals in the organization" (Collins White 2007).

Systems and business developers relying on new business flow methodologies started building portals that are connected to back-end systems and thereby providing employees with the advantage of using portals that are "business process-driven, rather than data-driven as in older portal designs" (Collins White 2007).

WHAT IS ORGANIZATIONAL KNOWLEDGE?

In plain and simple language we can define organizational knowledge as knowledge stored and used by organizations to support their daily activities and decision making process. Traditionally knowledge is categorized into two types Explicit Knowledge and Tacit Knowledge (Edvinsson and Malone 1997). Explicit knowledge can be expressed in words and it is easily shared and transferred from one person to another. It is available in books, manuals, papers, and all type of printed or viewed multimedia such as YouTube.com and other online and offline Encyclopedias (Nonaka 2002).

Tacit knowledge on the other hand is hard to transmit or transfer to others since it is hidden within the person head and it is difficult to retrieve and it is "deeply rooted in an individual's action and experience, as well as in the ideals, values or emotions he or she embraces"(Edvinsson and Malone 1997).

Organizational knowledge resides within the heads of the employees and the management of the organization. It is easy to archive Explicit Knowledge but it is by far the most daunting task to retrieve Tacit Knowledge from employee's heads and store it in a database repository. Knowledge management systems evolved into Expert System to store and retrieve the knowledge of experts for future utilization.

Kevin Marshall states in his 2008 paper that "Knowledge sharing is a driver for innovation, improvement of operations, and ultimately, success. Businesses will soon need to adopt the technologies that make knowledge sharing most effective in order to stay competitive" (Marshall 2008).

ORGANIZATIONS KNOWLEDGE AND THE INTELLIGENT ENTERPRISE

Intelligent enterprise refers to the use of information technology by organizations to achieve competitive advantage. According to (Quinn 1992) intellect is the core source in producing and delivering services. Organizations are aligning their business strategies with the strategies of their IT departments to achieve what is known as Business Intelligence (BI) practices. Business Intelligence is combining the use of "applications and technologies for gathering, storing, analyzing, and providing access to data to help enterprise users make better business decisions" (SearchDataManagement.com).

It is through the use of Business Intelligence practices that organization becomes what is called an Intelligent Enterprise. Organizations use BI to analyze business data and information to achieve higher return on investments and to survive in today's highly competitive economy. BI aims at providing better decision making process through the use of business analysis tools and applications such as online analytical processing and data mining software.

Business intelligence depends heavily on information stored in organizations databases and data warehouses to produce the right knowledge needed by decision makers at the organization to make the right decision at the right time. The source for such information comes primarily form information portals and knowledge portals. Today, information portals come equipped with streaming video and audio and include e-learning and e-training applications and tools.

ENTERPRISE INFORMATION PORTALS

Enterprise information portals is the use of organizations website to become the gateway to a company's information and knowledge base for employees and possibly for customers, business partners, and the general public as well (SearchSAP.com).

Firestone (2002) defines EIPs as "applications that enable organizations to extract tacit and explicit information within the organization, and provide users a single doorway to personalized information needed to make intelligent business decisions". Enterprise Information Portals (EIPs) were introduced by Christopher Shilakes and Julie (Shilakes 1998). Also Weinsteing (2002) defines Enterprise Information Portals as "amalgamation of software applications that consolidate, manage, analyze and distribute information across and outside of an enterprise".

Enterprise Information Portals provides organizations with new tools and applications to achieve a competitive stand in today's agile economy. Firestone (1999) defines this competitive advantage as resulting from "the competitive potential lying dormant in the information stored in enterprise systems". Firestone and Shilakes also imply that this shall lead to organization growth that is "being driven by three basic benefits provided by EIP systems (Shilakes and Tylman 1998).

EIPs are also easy to maintain and to develop since they rely on Internet and Intranet technologies. It is different than old client server applications in the sense that they only need to be resident on the server side of the network and that all updates and modifications to the system are only done on the server. Users on the other hand have nothing to do with how the system works and they don't need to worry about installing the system on their client machines or updating the system every now and then.

EIPs benefits also extend to the organizations employees by increasing their productivity and lowering the amount of time employees spend looking for information on the Internet (Plumtree Software 2001). Employees can access and receive information on their laptops of office machines efficiently and with ease. It is a one stop shop for an employee, customers, vendors, suppliers, and major stakeholders Wayne Eckerson (1999).

Being a one stop shop EIPs allowed customers to get what they want from an organization web site or portal in a simple and easy manner. This in turn is translated into customer satisfaction and later on into customer loyalty. Organizations are becoming more customers centric in the sense that organizations understand that in order to be competitive and survive they need to build customer loyalty and this is difficult to achieve unless they provide their customers with all the information and services they want promptly.

According to (Firestone 2002) there are four benefits for EIPs "ROI, competitive advantage, increased effectiveness, and accelerated innovation". Although there are several advantages for employing EIPs in organizations they fall short of providing a true collaborative and communication platform for organizations to become intelligent. Collaboration is important to support decision making and to bring new ideas to the organization through interactive brain storming. The next step for EIPs is to evolve into Enterprise Knowledge Portals by enhancing the "quality/validity of information supplied by the portal" (Firestone 2002).

ENTERPRISE KNOWLEDGE PORTALS

The Enterprise Information Portals evolved over time into what we know today as Enterprise Knowledge Portals (EKP) that are influenced by the goals of Knowledge Management (Grammer 2000). They inherited EIPs functionalities and they also integrated access to expertise and embedded applications functionalities (Grammer 2000).

In reality one may not be able to distinguish from start if the application he is using is an EKP or EIP. Both portals provide information about the organization and its products, services and operations. It also provides "collective services such as security, metadata repository, personalization, search, publish/subscribe," Wayne Eckerson (1999) they also mimic the general layout and look of a portal user interface (Firestone 2002).

Knowledge portals contribute to the success of the enterprise knowledge management systems. They provide users with a unified platform for the access and retrieval of vital information residing on the company's website and web enabled applications. They are considered a knowledge management networking system for organizations.

In theory EKPs are a perfect solution to knowledge management systems in organization, but the real world implementation shows that these systems lack a major contributor to the continued success of knowledge management systems and that is real time online collaboration. "It is not surprising that there is now a perceived need for better collaboration between knowledge workers across organizations" (Marshall 2008).

WEB 2.0 AND ENTERPRISE KNOWLEDGE PORTALS

The use of social networking software generally referred to as Web 2.0 applications shall contribute to the increased level of collaboration among employees among themselves and with external parties such as customers, vendors and suppliers. According to Marshall Web 2.0 is made possible with the use of key open standards, flexible, and ever changing technologies such as AJAX, PHP, SOAP, CSS, and APIs (Marshall 2008).

Web 2.0 applications such as Facebook.com, MySpace and Twitter has made it possible for a person to interact with several people online using one application. These systems provide chatting functionalities in addition to real time collaboration functionalities that are gravely needed by today's enterprises. It is no wonder that most businesses has started to create their own groups and pages on these social networks. They perceive it as a reliable means to reach customers and employees from one location.

CONCLUSION

Knowledge portals are a key ingredient in today's organizations strategy for success. It is the right tool for knowledge sharing, storing and retrieval by all organizations stakeholders. Enterprise Knowledge Portals as a knowledge networking system allows organizations to become more competitive, innovative and prosperous. Knowledge management as a term by itself cannot achieve the results designed by top management without the actual implementation of Enterprise Management Systems/Portals.

Knowledge Portals provide a viable knowledge setting to a large number of users and organizations. It is clear that EKP are the new knowledge networking system among large, small and medium size organizations.

Evaluation and Design of a Context-Awareness Interactive Digital Artwork

Hao-Chiang Koong Lin*, Yu-Chen Yang, Yi-Jen Tseng, Sheng-Tien Wang
[1]Department of Information and Learning Technology, National University of Tainan
No.33, Sec. 2, Shu-Lin St., Tainan, Taiwan
*Email: koong@mail.nutn.edu.tw

ABSTRACT

Digital art is regarded of more and more importance in various kinds of performance arts nowadays. Not only do the performers have more performing forms, but the audiences also receive the performing messages from the stage in completely different ways as compared to before. Moreover, the performers and the audiences can do the interaction with each others. In this paper, we try to establish an interactive system to control the lights of the stage. We wish the user can use the system to create their own stage by themselves. This study is aimed to explore the following concerns:

(1) Which parameters will be set in the programming when the sensors read different music?
(2) After finishing the programming and sending the instruction to the hardware, how to present the light effects?
(3) Can the light effects in real time make the user truly feel that they create their own stage?
(4) Does the system provide good interaction between the user and the system?
(5) Does the user feel satisfied about the system?

The experimental results show that the user can enjoy the interaction by his own way and create different light effect with the music. At the same time, the users believe the system can became more useful and expandable and feel satisfied. Through this research experience, we can understand the interpretation of "Interactive Artistic". The narrow sense refers to the audience's personal participation shows the whole concept of art, a broad sense, we view the process of the audience who sees, identify the concept of mind, and convey the conception as an interactive act.

Human-Computer Interaction; Digital Art; Context Awareness; Interactive Art; Usability Evaluation; Interaction Design

INTRODUCTION

Most traditional art is unidirectional. That is only the audience gets the message from the author. And because of the personal reason and experience everyone get the work levelly. But digital art create a new world by using technology. Especially is interactive art which turn the audience to the author. How does it link the user and the work successfully makes us want to know more. We can find that the recent performances are not just excellent singing and dancing. The performance is also use some special effects like varied light or projection on the stage with the background which is composed of big screen with changing image. The way of using new media on performance motivated us to explore the following things: Can we control the stage light just by sound detection and user directly manipulating but not default setting to create personal work of stage light? It means even using the same song, but different users can get different effects by themselves.

"Digital Art" is the word "Techne" that from the ancient Greek. It refers to arts, skills, crafts, and so on (Luo et a;., 2009). In the process of creation, if the arts were created in digital forms, and methods, that is called digital art. When the traditional forms of arts were recreated by digital methods or tools, it can be called art-digitization. No matter what type of creations, they all can be known as digital art (Hsieh et al., 2010). The difference between the digital art and the traditional art is not the change of the creative spirit, but the use of

digital technologies. Therefore, digital art is that can be shown in the way of digital or together with other technologies to display in various ways (Chen, 2009). In these diverse creations, the influence and change of the science and technology can be seen. We also look forward to the science and technology that progress continuously can lead the digital art into a more brilliant future (Yeh, 2003).

We also want to know more about happening which increase more fun on interactive art. People cannot expect what will happen next, and the surprise just show up. By interacting with the system, we not only brand new things to the same performance, but also wish that the user can get the message about treat the same thing in different sight. The critical factor that transforms unidirectional traditional arts into two-way digital art is the appearance of new media arts. New media arts bring a new way for artwork creation. But is technology really everything? When we enjoy the convenience from technology, didn't we lose some sensibility? By using the system we wish the user can enjoy the changing environment of the light and jump out of the stereotype, just try to feel the relationship between user and the world. We will discuss following questions in this paper:

(1) Which parameters will be set in the programming when the sensors read different music?
(2) After finishing the programming and sending the instruction to the hardware, how to present the light effects?
(3) Can the light effects in real time make the user truly feel that they create their own stage?
(4) Does the system provide good interaction between the user and the system?
(5) Does the user feel satisfied about the system?

LITERATURE REVIEW

In "The End of Art" (Danto, 1998a, 1998b), Arthur C. Danto stated that the function of art imitation and reappearance had disappeared. The emphasis on verisimilitude imitation was also redefined in art history (Oliver, 2003). This redefinition included concepts such as having the text be writable and created by readers. Moreover, readers, rather than authors, interpret the meaning of the text. This redefinition is the known as the "writable text" concept (Zucker, 1997).

Interaction is an important characteristic of digital artwork. Nevertheless, the evolution of the esthetic viewpoint is seldom mentioned. Participation is essential in the creation of artwork. It gradually forms a kind of esthetics based on interactive design. The concepts discussed here are crucial in new media art (Kirk & Gopnik, 1990; Manovich, 2001). Using the computer programs to drive the object around, so that the works of art can interact with the audience. And making the original passive single law of inertia between the creations and the audiences become a community of interactive (Ye, 2000).

The major difference between the digital interactive arts and the traditional arts is that you can let the audience to join the creative process, allowing viewers to create their own world by full use the freedom of digital. Margret Elisabet Olafsdottir, curator at The National Gallery of Iceland argues that interactive art's main objective is to have the spectator actively participate in the creative process. Participation was supposed to stimulate the audiences' creativity as instead of standing in solemn contemplation. This concept is contrast obviously with the traditional arts (Zhang. 2007). "Interaction" makes works of art is not just a one-way creators' tell, the audience is no longer a passive listening. It becomes a dialogue, a two-way communication between the people and the arts.

The most characteristic about digital art is combine technology and use technology to create art. The more technology progress, the more variety can be show on. Using technology to create art work can help artist present the creativity more vivid. And art work has to express the affection directly. Moreover, should inspire deeply thought. So the work can cause the viewers' feedback in mind. Creative work should be open process but not closed, structured or limited (Lin & Fan, 2004). If you add some interactive elements into the work, then you can create a richer interaction between the viewer and the work. And make the relationship between "creator", "audience" and "work" complicate, for example, creators may become the viewer, but the viewer may become creators, and then generate a new route (Lin & Fan, 2004).

DIGITAL ARTS PROGRAMMING

Miller Puckette and other designers have developed Max / MSP at IRCAM in Paris since 1988. At the beginning, they started from the control of sound, now has been combined with images and interactive capabilities. As for the technology, it is a specialized art programming language, which is a comprehensive set

of development kit to use drag components as part of the program (Cheng, 2004; Lin & Li, 2008). Max/MSP/Jitter uses the software to control the connection between many audio and video hardware of computer, such as sensors, MIDI equipment, sound playback, video output,etc. Max is responsible for controlling the messages between MIDI; MSP, for Audio controlling; Jitter, efforts to dealing with static and dynamic images. Among them, Max is the controlling logic of the core process. Consequently, to learn MSP or Jitter, leaners must first have the foundation of Max. (Cycling74, 2011; Cheng, 2004; Lin & Li, 2008).

Cheng thinks: "This system has made progress from the original MIDI controlling functions (Max part) to the immediate processing of voice message (MSP part) in recent years. This has shorten the distance between composers and computer music technology. And it even devoloped to integrate real-time image processing (Jitter plugin). The role of computer in the musical works' roles and functions has aready changed from sound editing, musical instruments, sound simulation, and further into the role of a jam (Cheng, 2004; Lin & Li, 2008; Toner., 2006).

The Arduino is an open source Simple I / O board, as long as we write codes within a integrated-development environment, and use the program to control the Arduino board, and burn it into the chip (microcontroller) of the Arduino board in the end, the link can be developed through the bread plate to complete the electronic components such as Switch, sensors, controllers, LED or other output devices. It also allows Arduino and the electronic components linked with it work independently as an interfaces with other software program (Arduino.TW, 2008).

Having this in mind, we use Cycling '74 Max / MSP / Jitter 5 with Arduino to develop and design an installation system in this study. When users interact with the installation, the system will capture the audio and sensor values, and input the codes we design, and then users can get the feedback as flashing lights in order to reach the stage of writing personal and exclusive research purposes. Refer to the system architecture diagram in figure 1.

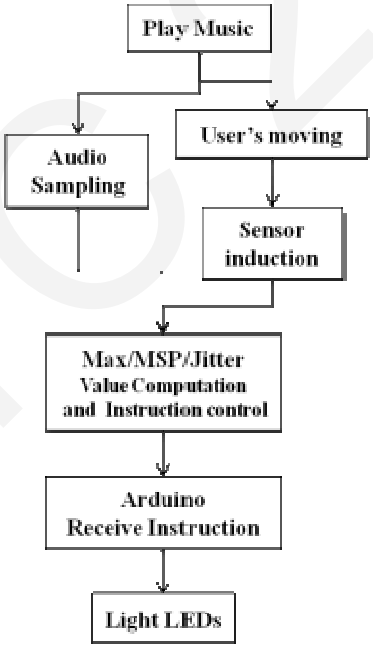

Figure 1: System Architecture Diagram.

RESEARCH METHOD

We mainly study the volume and pitch of the music. When we play the music, the Max/MSP can analyze the audio by using its build-in objects. We use the object of peakamp~ to capture the max value during a

certain period of time. The object of pitch~ is used for detecting the hertz. After calculating the parameter, we can get the audio value which will be used later.

We will use different sensors to do the test, such as pressure sensors or buzzers. As the user dances with the music, the sensor can detect synchronously the pressure during the operating time, and transforms it into a useful value. Next, the system will combine the value with audio value and operate the two values. After that, system will send messages to Arduino according to the variations of the values. In the end, the user can interact with the system, triggering multiple LEDs by using different ways. The system of flow chart presentation is shown in figure 2.

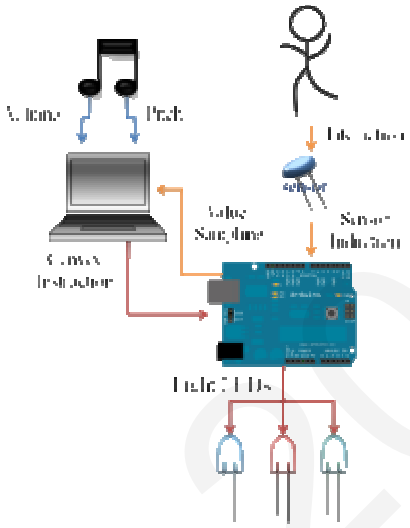

Figure 2: The flow chart to control LEDs.

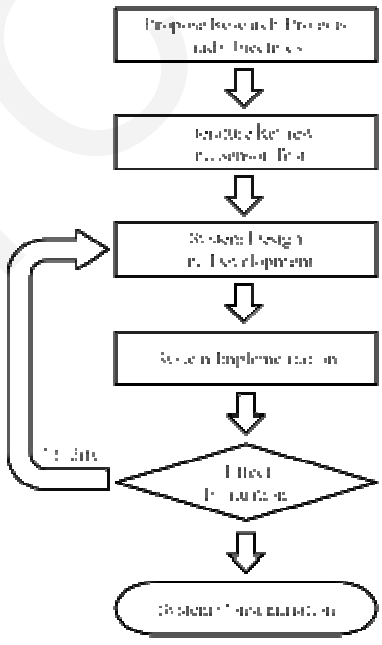

Figure 3: System construction flow chart.

Research Processes

As introduction about software and hardware before, this research will develop the system step by step like figure 3: (1) Use Max/MSP to get the parameter about volume and pitch of the sound which the research need. (2) Choose different sensor to take a test and use Max/MSP to analyze the parameter. (3) Use the parameter we got before to execute the program. After evaluated the parameter, program makes the LED reaction finally. (4) Do the questionnaire about the system. Then improve the system in according to the analysis of the questionnaire.

EXPERIMENTAL RESULTS AND ANALYSIS

After the system finished, we invite 35 users to play it and fill 3 questionnaires which are System Usability Scale, Questionnaire for User Interaction Satisfaction (QUIS, 2006), Interaction and Satisfaction Scale. And we interview 5 users from them. The whole process is depicted in figure 4.

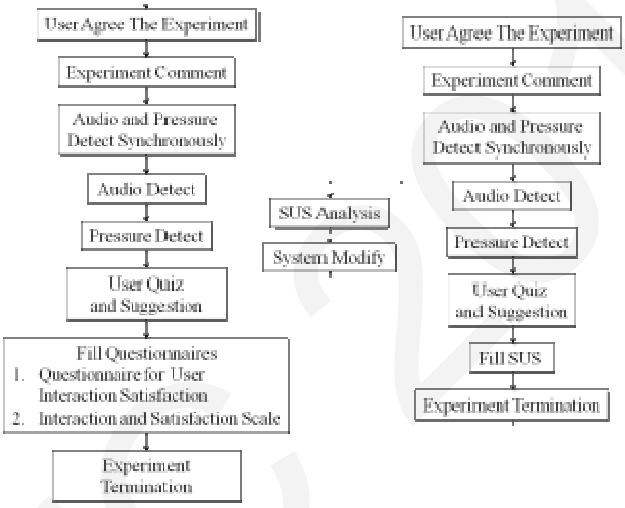

Figure 4: Experiment flow chart.

First, we introduce our system to the user. We only use the sound detection to control the system. Just show them the system is reacting in real time but not setting before. Second, we let the user try to control the system by directly manipulation without sound detection. Finally, we encourage the user to interact with the system by directly manipulation with the sound detection. In the end, the users fill the questionnaires and some of them accept the interview.

User Satisfaction Analysis

Among the 35 participants, there are 4 younger than 19 years old, 29 between 20 to 29 years old and 2 between 30 to 39 years old. 13 were female, and 22 were male. Table1 shows that most people have experience about digital art work before this time.

Table 1: Experience about Digital ArtWork

How many times have you interacting with digital art work before?				
None	***Once***	***Twice***	***Three times***	***More than three times***
4	4	9	5	12

System Usability Scale

The SUS is a questionnaire to estimate users' subjective feelings and their degree of satisfaction with regard to the system. Concerning usability evaluation, the SUS is an efficient, time-conserving, and labor-saving way of gaining a subjective estimate, and it is widely applied to system usability. After users answer ten questions, the scale transforms the subjective feelings of the users into objective data for analysis. That is, a score on the SUS is used to evaluate the usability of the system. The range of estimate scores is from 0 to 100. The higher the score, the more useful the system is and the more easily users can interact with it (Brooke, 1986; Tullis, 2004; Lutes, 2006; Isman, 2010; Hsieh et al., 2010).

Table 2: Descriptive Statistics of SUS Questionnaire

N	Mean	Median	Min	Max	SD
35	71.1	70	35	92.5	13.5

From table 2 we know that the mean SUS score is 71.1, the median is 70, the minimum and the maximum is 35 and 92.5. The scores mean the system is usable and valuable to continue developing.

Table 3: SUS Questionnaire and Statistics of Each Item

	System Usability Scale	Mean	SD
1.	*I think that I would like to interact with this work*	2.14	0.99
2.	*I find the work unnecessarily complex*	3.03	0.91
3.	*I suppose the work is easy to use*	3.23	0.86
4.	*I think that I would need the support of a technician to help me use this work*	2.60	1.18
5.	*I find the various functions in this work are well integrated*	2.43	0.87
6.	*I suppose there is too much inconsistency in this work*	2.57	0.90
7.	*I would imagine that most people may learn to use this work very quickly*	3.17	1.08
8.	*I find the work not very user-friendly*	3.26	0.77
9.	*I feel very confident while using the work*	2.94	0.86
10.	*I need to learn a lot of things before I can get used to this work*	3.09	0.10

Table 3 is scores about SUS questionnaire and statistics of each item. The 8th item gained the highest mean. And the 2nd, 3rd and 7th items also gained higher scores. It indicated that most users felt the system easy to use. The most important is that participants are willing to accept and use this system. The system has potential for installation arts use.

Questionnaire for User Interaction Satisfaction

Questionnaire for User Interaction Satisfaction (QUIS., 2006) is provided from Human-Computer Interaction Lab. Score users' satisfaction with the view of user interface. The content of the questionnaire can adjust for the research. Our research concentrates on the response about manipulating the system and the scene about present the light effects. A 7-point scale ranging from 1 as strongly disagree to 7 as strongly agree was used for the measurement (Preece et al., 2007; Likert., 1932).

Table 4: Descriptive Statistics of the response about manipulating the system

Question Items	Mean	SD
Simple to Use	5.63	1.20
Easy to Use	5.34	1.33
Great	5.23	1.22
Multiple	4.94	1.45
Interesting	5.03	1.52

Question Items	Mean	SD
Efficient	4.77	1.17

According to table 4, each items get the score higher than 4. It means the user felt satisfied about the system. But the efficient about the system get the lowest score. Because some users felt they cannot make sure about either they control the light up or the music did. The interesting about the system gets the highest SD. We found that some user enjoyed the interaction with the music and touch the sensor in their mind. They were success to interact with each other. But the other just focused on the changing light. They do not care about the music. So they feel bored about just saw the light. Table 5 shows that the participants gave mean score higher than 4. It means the participants feel satisfied about the light

Table 5: Descriptive Statistics of the scene about present the light effects

Question	Mean	SD
Multiple LED	5.29	1.32
Colorful scene	5.20	1.19

Interaction and Satisfaction Scale

About the Interaction and Satisfaction Scale, we use Likert scale to score the system. A 7-point scale ranging from 1 as strongly disagree to 7 as strongly agree was used for the measurement. 1 mans terrible, 4 means no judgment and 7 means satisfied. Table 6 tells us about the Interaction and Satisfaction of the system. Besides the inspiring, the other got the score more than 4. Most users can not be inspired in their mind through the interaction (Chin, et al., 1988; Harpe, 1993; Ives et al., 1983).

Table 6: Result from Interaction and Satisfaction Scale

Question	Mean	SD
Challenge and Curiosity	4.63	1.17
Inspiring	4.00	1.04
Satisfaction	4.74	1.10

CONCLUSION AND FUTURE WORKS

Through this research experience, we can understand the interpretation of "Interactive Artistic". The narrow sense refers to the audience's personal participation shows the whole concept of art, a broad sense; we view the process of the audience who sees, identify the concept of mind, and convey the conception as an interactive act. However, the implementation of the whole plan, not just a professional academic research and presentation of digital art, we also hope that this system can be effectively utilized in the commercial sector or entertainment career. In the future, this research work to further the development to the video presentation, by using the capabilities of Max/MSP which can combine the videos and interaction, it can generate a random drawing out of nothing. And then, we can cooperate with the stage design cooperation; through more powerful hardware support, this work of art features and effects will reach more extreme play. We believe in the stunning and unique backdrop of lighting, not only show the professional performer's perfect performance, but also let the audiences feast their eyes on the scene.

ACKNOWLEDGEMENTS

The authors would like to thank the National Science Council of the Republic of China for financially supporting this research under Contract No. NSC 99-2511-S-024-005, NSC 98-2221-E-024-013, NSC 98-2631-S-008-003 and the anonymous reviewers for their valuable comments.

EVALUATION OF ELEMENTARY SCHOOL WEBSITES

Assist.Prof.Dr. Şemseddin GÜNDÜZ
Selçuk University
Faculty of Education
Department of Computer Education and Instructional Technologies
sgunduz@selcuk.edu.tr

ABSTRACT

In the study, it is aimed to evaluate current position of elementary school websites. Study is carried out by investigating elementary school websites in central districts of Konya province in 2009. "Evaluation Form" consists of 4 items in "School Management" category, 13 items in "School Information" category, 7 items in "Staff Information" category, 6 items in "Student Information" category, 5 items in "Lesson Information" category, 8 items in "Activity Information" category and 18 items in "Web Features" category and in total 61 items. As a result of study, it is found that nearly half of the elementary schools bound to central districts of Konya province don't have websites. It is observed that "Student Information" and "Lesson Information" sections of elementary school websites are so poor and other sections are at medium level.

Key Words: elementary school, school, website.

SUMMARY

PURPOSE AND SIGNIFICANCE

It is observed that elementary school websites differ from each other by their content and design. In this study, evaluation of elementary school websites is aimed. In accordance with this general aim, elementary school websites are taken into investigation in terms of "School Management", "School Information", "Staff Information", "Student Information", "Lesson Information", "Activity Information", "Web Features". Moreover, it is investigated whether elementary school websites differ according to district that they exist.

METHODS

Working group of the study consists of National Ministry of Education – Konya Provincial Directorate of National Education, elementary schools within Karatay, Meram and Selçuklu County Directorate of National Education. Study took place in November and December 2008. Websites of 105 Elementary schools which are bound to County Directorate of National Education were accessed. "Evaluation of Elementary School Websites" measuring device was developed for the study. Opinions of consists of students from Department of Computer and Teaching Technologies Training who are going to work as Informatics Technology Teacher in elementary schools, elementary school teachers, students and 12 individuals consists of students and curators are taken. Gathered data is analyzed and submitted to expert opinion and 61 items measuring device is developed. Items of this measuring device; 4 about School Management, 13 about School Information, 7 about Staff Information, 6 about Student Information, 5 about Lesson Information, 8 about activities held and remaining 18 about Web Features.

RESULTS

105 (45%) of 232 elementary school websites in central districts of Konya Province were accessed. No data about lessons that students take were found in 72% of elementary school and no data about students were found in 55% of elementary schools. It is observed that there is not enough data on school management, school information, staff information and activity information in elementary school websites. Elementary school websites didn't differ according to the place where they exist.

DISCUSSION AND CONCLUSIONS

All of the school websites were not accessed, since there is no obligation for schools to have a website. Presented data in websites are comparatively insufficient in terms of "Lesson Information" and "Student Information". These reason that preparation of "Lesson Information" and "Student Information" is extensive and tiring; school managers, teachers and students want to hide their personal information and those data required to be updated frequently can be the reason for sharing those data in websites insufficiently. Even if "School Management", "School Information", "Staff Information" and "Web

Features" of elementary school websites are not in desired level, they are partially shared. In accordance with those results; it is suggested that web broadcasting teams should be organized in order to prepare websites for elementary schools without websites, more extensive standard contents should be organized by MNE for required qualities in elementary school websites and there should be more comprehensive data about "Lesson Information" and "School Information". Researchers were advised to research in terms of identifying that school website data differs according to what variables and asking for students and curators' opinion on what should be included in school websites.

EVALUATION OF STUDENTS BEHAVIOR UNDER MOODLE USING DATA MINING TECHNIQUES

Najwa A. Baraka
nbaraka@iugaza.edu.ps
Faculty of Information Technology, The Islamic University of Gaza, Palestine

I. ABSTRACT

There is a big need for evaluating the effectiveness of the emergent technologies in educational environments and their contribution in achievement of the educational institute's goals. Course Management System (CMS) is one of these technologies which is used in knowledge transfer and management. It is a rich and confidant data source about student's behavior. The aim of this paper is to analyze this behavior for evaluation purpose by extracting useful knowledge from applying data mining techniques on the generated logs from this system.

Index Terms—E-learning, Educational Data mining, Course Management System

II. INTRODUCTION

Data mining is an increasingly important technology nowadays and its application is expanded to many valuable sectors in our life.Its success is proven in decision support and evaluation processes by extracting the useful knowledge from industrial, civil, medical, commercial as well as educational data bases. Educational Data Mining (EDM) has emerged as an independent research area in recent years, culminating in 2008 with the establishment of the annual International Conference on Educational Data Mining, and the Journal of Educational Data Mining **(Baker, 2009)**.Many educational institutes realize the importance of E-learning systems as an advanced way for the knowledge transfer for purposes of education and training.These systems can represent a rich source of educational data and provide complete and meaningful records about the student's behavior. These records are stored in learning management systems as separate logs attached with each course and track each student enrolled in the on-line course. One of these powerful learning systems is MOODLE (Modular Object-Oriented Dynamic Learning Environment) which is a Course Management System (CMS), also known as a Learning Management System (LMS) or a Virtual Learning Environment (VLE). It is an open source application that educators can use to create online learning sites **(http://moodle.org/about/)**.Moodle gives the instructorsand students the ability to overcome the limitation of course time and place, the instructor can design many e-activities such as (e-quizzes, e-assignments) and upload useful supportive e-resources through Moodle. The students can get benefits from them any time in any place. As any CMS Moodle stored the students logs which can be useful for evaluation process. This paper apply data mining tasks such as association rules, classification and clustering techniques on Moodle logs to show the effectiveness of using data mining for students behavior evaluation. The following sections are structured as follows: the next section scan some of the related works in EDM domain, the third section talking about the first step in data mining process, the next three sections show the results from applying association rules, classification and clustering techniques respectively, finally the last section draw the conclusion, recommendations and future works.

III. RELATED WORKS

Many researchers contributed in the emerging discipline EDM. El-Halees extracted knowledge that describes the student's behavior by applying association, classification, clustering and outlier detection techniques on Moodle logs **(El-Halees, 2008)**.The authors in **(S Erdogan, 2005)** clustered university students according to their characteristics; they applied a K-means algorithm to form five clusters. Luo and his research group proposed improved association mining rules to meet the personalized needs of e-learning, they established data cube with three dimensions separately which they are learning behavior patternsdimension, learner's personalitycharacteristics dimension, and time dimension, then they applied Apriori algorithm on that cube to generate irredundant rules, after that they test the performance of the improved method by applying it on E-learning, the results show that the algorithm was effective **(Luo, 2007)**.Ribeiro and Cardoso used semi

supervised and supervised learning techniques, such as, neural networks (NN) and Support Vector Machines (SVM), to build prediction models able to track student's behavior. They depend on weblog-based framework to analyze the navigational behavior from student's logs in a Moodle. An important feature of this framework is that extraction of behavior is achieved by buildingselective models of pattern mining.The results show the model is able to successfully predict student's final outcome while bringing useful feedback during course learning **(Cardoso, 2008)**. A decision tree model is established by using J4.8 algorithm on the Weka platform the authors collected the students' learning behavior data and analyzed them. Then, they studied the relationship between learning behavior and learning effect, their model is assessed and the accuracy rate of it can reach almost 86.7%. They recommended their method proposed to be used in E-Learning evaluation system to evaluate students' learning behavior **(Lingyan, 2010)**. Zhou employed data mining algorithms to discover patterns which characterize learners either across session or groups based on their study choice and goal orientation. He used sequential pattern analysis of log files generated by university students **(Zhou, 2010)**. EDM was introduced in a theoretical and practical way in **(Cristóbal Romero, 2008)**, they described the full process for mining e-learning data step by step as well as how to apply the main data mining techniques used, such as statistics, visualization, classification, clustering, association rule mining, pattern mining and text mining of Moodle data.

IV. Problem Statement and Data Collection

Moodle attracts many instructors to use it as a tool to manage their courses and to get benefit from the facilities which it provides for enhancing and reinforcement of the weak performance of the students who need additional supportive materials. In education faculty in Islamic University of Gaza IUG Moodle was used as assistant tool in teaching a course held at the second semester of 2009/2010. During the course period the instructor monitors the students' performance and when the case indicates that there is a weakness a new supportive e-resources, e-quizzes and e-assignments were uploaded to Moodle. The goal of this paper is to examine the feasibility of choosing Moodle to achieve the educational goals.We applied some of well-known data mining techniques to evaluate the interaction of 275 students who registered in the previous course with Moodle. These techniques used to measurethe effect of this interaction on their grades. The source of data was Moodle logs for these students. In addition we got academic data about them such as the student's level, specialty and the GPA. Moodle logs were the students grades in six e-quizzes, three e-assignments as well as the midterm and final marks, also if the student get benefit from the e-resources or not.

V. Data Preprocessing

Before applying any preprocessing method we need to merge all the data sheets in one sheet, so it will be easier to import these data in data mining tool. Then for each column we perform the required preprocessing methods to make it suitable and ready for mining tasks such methods can be as discretization the numerical values into categories. We transformed the student's grades into understandable categories (excellent, very good, good...etc.). There are several data mining tools which provide the ability to preprocess data and visualization them before performing mining tasks, we used Rapid Miner **(http://rapid-i.com/component/option,com_frontpage/Itemid,1/lang,en/)** which is an open source data mining tool to draw a visualization graph between the final grade and the e-resources. It shows that excellent grades increase when the supportive e-resources increase.

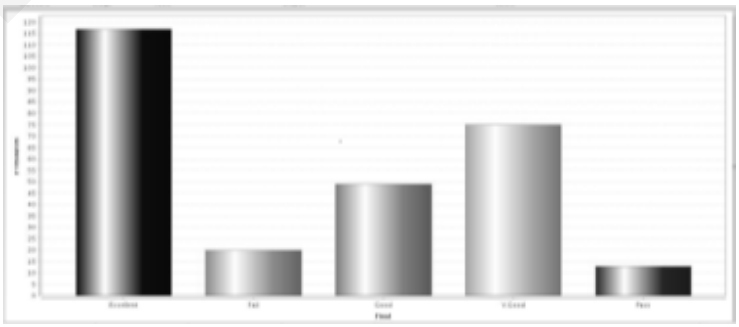

Figure 1:Visualizing the relation between the final grade and supportive e-resources

VI. ASSOCIATION RULES

The goal of mining the association rules in any data is to find the correlations between items. It is one of the most important data mining techniques used today and is a mature field of research in the future (**C**eglar, 2006).The generated rules are in form *if premises then conclusion* where *premises* and *conclusion* are itemsets. There are many interestingness measures of association rules. We use the *Confidence* and *Lift* as evaluation metrics to measure the interestingness rules generated by FP-Growth algorithm. The strength of the rule X⇒Y is measured by confidence metric which is the ratio of the number of transactions that contain X ∪ Y to the number of transactions that contain X **(Huebner, 2009)**.Lift metric is a measure of the probability of finding the conclusion in any random transaction; it measures how well the associative rule performs by comparing its performance to the "null" rule **(Marakas, 2003**). With lift metrics we can know the importance of the association rule, when its value is greater than one it shows the higher positive relation between premises and conclusion. Figure 2 shows some of interesting rules about the students grades in Final, Midterm, TAssG (Total Assignments grade) and TQG (total quizzes Grade). It is easy to notice that better grades achieved when the student get benefit from the e-resources and perform six e-quizzes and three assignments. The worst grades resulted of the bad interaction with Moodle activities; such association rules help theinstructor to evaluate how much the e-supportive materials are useful and helpful to get better achievement in the course.

Premises	Conclusion	Confidence	Lift
GPA = Good, MidTerm = V.Good	Final = V.Good	0.515	1.882
e-resources = no, GPA = V.Good	Final = Excellent	0.686	1.607
GPA = Good, e-resources = yes	MidTerm =V.Good	0.5625	1.363
#Q = six	MidTerm = Excellent	0.672	2.194
e-resources = yes, #Ass = three	TAssG = V.Good	1.0	3.702
e-resources = yes, #Ass = two	TAssG = Good	1.0	3.010
e-resources = no, TQG = Fail, #Ass = one	TAssG = Fail	1.0	3.186
e-resources = no, TAssG = Fail, #Ass = one	TQG = Fail	0.72	1.529

Figure 2: Association rules for students grades

VII. CLASSIFICATION

The goal of a classifier is to learn a body of knowledge from an input dataset.The derived knowledge can then be used to predict (i.e., classify) new instances **(Giovanni Giu, 2005**).The instructor can get prediction knowledge from these rules to predict the high or low grades in the course. So he can avoid the failure of those students who are expected to fail before the final exam time. We use Decision Tree to predict the student's final grades as shown in Figure 3.Some of rules tell the instructor that some students from some specialties need special treatment or additional e-supportive materials. For example in our case study, the specialty "Islamic Education (IslamicEdu)"students who have low GPA and low MidTerm grade may fail in the final grade.

if MidTerm = V.Good and #Ass = two and GPA = V.Good then final=Excellent
if MidTerm = V.Good and #Ass = one and e-resources = yes and TQG = Good then final=Excellent
if MidTerm = Excellent and TQG = V.Good and e-resources = yes then final=Excellent
if MidTerm = Excellent and TQG = V.Good and e-resources = no and #Ass = three then final=V.Good
if MidTerm = Good and #Ass = three then final=V.Good
if MidTerm = Fail then final= Fail
if MidTerm = Pass and GPA = Pass and Department = ArabicEdu then final=V.Good
if MidTerm = Pass and GPA = Pass and Department = IslamicEdu then final =Fail
if MidTerm = Excellent and TQG = Good and #Q = five and e-resources = no and GPA = Good and #Ass = two then final=Pass

Figure 3:Classification rules for student's final grade

VIII. CLUSTERING

The idea of clustering techniques is to segment the data sets into groups of records where the similarity of the records within the cluster is maximized, and the similarity to records outside this cluster is minimized (Zhou, **2010**). We use k-Medoids method to divide the students into five groups according to their GPA and their interaction with Moodle activities. Figure 4 show that these groups have the same interaction style and grades. For example we noticed that excellent students with excellent GPA have high grades in both midterm and final. This clustering helps the instructor to give suitable contents for the poor groups to enhance their performance.

Attribute	C0	C1	C2	C3	C4
GPA	92.55	87.45	79.21	67.84	77.62
TQG	26.0	21.0	20.0	8.0	13.0
#Q	6	5	5	3	3
TAssG	5.0	8.0	5.0	6.0	6.0
#Ass	2	3	2	2	2
e-resources	1.0	1.0	0.0	0.0	1.0
MidTerm	40.0	39.0	36.0	28.0	34.0
Final	56.0	52.0	52.0	42.0	48.0

Figure 4: Clustering students into five groups

IX. CONCLUSION

Moodle is a powerful online CMS which gives instructors the ability to enhance and support the development of their students during the course studying by providing many kinds of online activities such as e-quizzes, e-assignments, e-resources and chat forums. Instructors need to examine the effectiveness of these activities on the overall performance of the students so they can take educational decisions to increase the quality of the given knowledge and information. This paper showed the success of applying Data Mining techniques as an evaluation approach by analyzing the interaction of 275 students with Moodle activities and get hidden information about this interaction. The evaluation started by collecting the required and necessary data from Moodle logs then a preprocessing is done on these data to make them ready and suitable for the data mining tasks namely: association rules, classification and clustering. In each task the results were taken and analyzed according the educational evaluation principles.Association rules help the instructor to define the relationship between the student's grades in Moodle activities and the final grade so he can examine how much the students get benefit from the supportive e-resources to get better grades. Classification is useful to predict who will get high or low final grades based on their interaction with Moodle activities. Clustering is an

effective way to divide the students into separate segments according to their behavior and performance, each segment has its own characteristics. Based on this division the instructor can design suitable guided educational contents to each segment. The knowledge from these tasks can help the decision makers in educational institutes to increase the educational quality. As a result of this work we encourage the utilization of e-learning systems to support and enhance the traditional education process and we recommend the usage of such systems when there are problems in academic achievement, also it is recommended that the best evaluation of such systems can be achieved by depending on data mining techniques so the instructors can discover new knowledge and hidden patterns which may be important in enhancement and development of education. Future research is oriented toward the construction of intelligent CMS which can be used as a powerful source of educational knowledge for instructors and decision makers in the higher levels in educational institutes. This can be achieved by integrating previous data mining tasks and new data mining techniques such as text mining and sequential pattern as well as techniques from Machine learning such as artificial neural networks and fuzzy logic in order to build effective and robust CMS

EXAMINING ATTITUDES OF ACADEMICS TOWARDS EDUCATIONAL TECHNOLOGIES ACCORDING TO SOME DEMOGRAPHIC CHARACTERISTICS

Fikret Soyer

Sakarya University, School of Physical Education and Sports

fikretsoyer@sakarya.edu.tr

ABSTRACT

The aim of this research is determining the status of academics' attitudes towards educational technologies in terms of some demographic characteristics. 130 academics who work for 13 different Universities in Turkey participated to the study. There was not any significant difference of attitudes towards educational technologies' points according to gender, having an administrative position, academic title and education status. Correlation analysis revealed a negative significant correlation between age and attitudes towards educational technology. Findings were discussed according to the relevant literature and some recommendations were made.

Keywords: Educational technology, attitude, academics

INTRODUCTION

Technology rapidly develops and these Technologies are used in many places. Therefore, educational technologies are parts of education and indispensible (Kale, 2006, p.351). Namely, technology adds weight to education process (Gömleksiz & Türel, 2005, p.956). From past to present, teachers and academics in all societies teachers use various equipments in their teaching (Sarıtaş, 2007, p.55). Therefore, using educational technologies is indispensible in our day where science and technology are parts of contemporary life. (Alkan, 1998, p.47–48). Educational technology as a branch of science is an element of education process. (Tüy, 2003, p.45). Academics and teachers always try to use technology and methods related to technology to conduct their teaching mission (İşman, 2005, s.37).

It was proposed that educational materials which are related to educational programs must be used in order to increase the productivity and quality of education (Nalçacı & Ercoşkun, 2005, s.142).

There have been changes in education and teaching since people started using educational technologies for individual and institutional purposes (Odabaş, 2004). Some of these changes are giving opportunity of

accessing to the internet to the state schools, education teachers in order to enable them to use computer technologies, integration of computers with education system (Çağıltay et al., 2001) and online distance learning possibilities (Odabaş, 2004). Teachers and academics have a significant role in the success of this switch (Turan & Çolakoğlu, 2008,s107). Attitudes of teachers and academics towards educational technologies, their experiences and approaches directly affect the use of educational technologies in education.

Educators are making progress in learning about and using technology, but we have a long way to go. Educators are encouraged to practice lifelong learning by constantly enhancing their knowledge and skills (Schrum, 1999, 84).

New Technologies affect students, teachers, academics and educational environments. Technologic changes could affect the functions of teachers and this appears to be an important problem that we might face. Teachers, academics and teacher candidates who study at universities should acquire skills and information related to using educational technologies. Teachers and academics, who will educate students, should be ready to use all new technologies. Educational technology could be called a culture that should be adopted by everybody in education environment (Leh, 1998' as cited in, Tor and Erden, 2004, 123).

Decisions made by teachers about the use of computers in their classrooms are likely to be influenced by multiple factors including the accessibility of hardware and relevant software, the nature of the curriculum, personal capabilities and constraints such as time. However, there is substantial evidence to suggest that, teachers' beliefs in their capacity to work effectively with technology are a significant factor in determining patterns of classroom computer use (O'Dwyer et al., 2004, 1)

Over the past decade, investment in technology for schools has increased at a dramatic rate. Although policy makers are eager to understand the ways in which technology use in schools is affecting student learning, we believe that a critical preliminary step toward assessing the impacts of technology on teaching and learning requires the examination of the varied uses of technology in schools as well as the contexts that are likely to affect the use of technology in the classroom as a teaching and learning tool (O'Dwyer et al., 2004, 1.).

Although the work by Becker et al. found "technology use" to be a multi-faceted phenomenon, the majority of their research focused on teachers' use of technology to deliver instruction (Becker et al as cited in O'Dwyer et al., 2004, 2).

Physical education and sport science is a multidisciplinary field of science and interact with various areas of science. There are four different departments in schools of physical education and sports which are physical education and sport teaching, sports coaching, recreation and sport management. As it is understood from the names of the departments, there are various classes related to social, health and applied sciences. A significant amount of classes in these schools includes theory and the rest of the classes are practical. These practical classes such as football, basketball and handball include teaching methods which were consecutively applied. Therefore, lectures in schools of physical education and sports are conducted in a range of places such as laboratories, classes, athletics tracks, sport halls. That is why educational technologies could be used in

physical education and sport classes in order to analyse fundamental techniques in sport with the aim of using them in forming their teaching methods, to teach theoretical lectures such as sports psychology, physiology, anatomy, sports philosophy, sports coaching, sport management, sport sponsorship, sport economy, sport marketing etc. It could be said that up to date educational technologies could be used in the context of physical education and sport to enhance the quality of learning and teaching.

The aim of this research is determining the status of academics' attitudes towards educational technologies in terms of different demographic characteristics.

METHOD

Participants: Participants were 130 academics who work for 13 different Universities in Turkey. Mean age was 38,79 (sd=7,06) and mean job experience was 13,72 (sd=7,25).

Data collection tool: Attitudes towards Educational technology Scale which was developed by Pala (2006) was used for the current study.Validity and reliability study of the scale was made by Pala (2006) and it is a 5-point likert scale consisting of 43 items. Answers ranged from "complately agree" to "complately dissagree." The was also used by Özgen and Obay (2008).

Data collection: Questionnaires were collected from academics in face to face interactions in their universities. The study was based on voluntary participation and the participants were informed that obtained data would be anonymous.

Data analysis: SPSS 17 package program was used for data analysis and level of significance was determined to be 0,05.

RESULTS

Table 1. Demographic Characteristics of Participants

Title	N	%
Professor	3	2,3
Associate Prof..	6	4,6
Asst.Prof.	66	50,8
Senior Lecturer	27	20,8
Lecturer	20	15,4
Research Assistant	8	6,2
Gender		
Male	106	81,5

Female	24	18,5
Marital Status		
Married	111	85,4
Single	19	14,6
Educational Status		
Undergraduate	3	2,3
Master	47	36,2
PhD	80	61,5
Administrative Position		
Yes	30	23,1
No	100	76,9

Table 2. Educational technology points according to gender

	Gender	N	Mean	Std. Deviation	p
Attitudes Towards Educational Technology	Male	106	4,0621	,56629	0,96
	Female	24	3,9439	,51185	

t-test showed that there was not any significant difference between male and female according to attitudes towards educational technology (p>0,05)

Table 3. Educational technology points according to having an administrative position

	Administrative Position	N	Mean	Std. Deviation	p
Attitudes Towards Educational Technology	Yes	29	4,0343	,41851	0,33
	No	99	4,0369	,59626	

Attitudes towards educational technology points according to having an administrative position showed that there was not any significant difference (p>0,05)

Table 4. Educational technology points according to their title

Title	Mean	N	Std. Deviation	F	p
Professor	4,2596	3	,00770	1,555	0,17
Associate Prof..	4,1635	6	,24342

Senior Lecturer	4,1437	27	,47173		
Lecturer	4,1270	20	,39875		
Research Assistant	4,3272	8	,40131		

Title	Mean	N	Std. Deviation	F	p
Professor	4,2596	3	,00770		
Associate Prof..	4,1635	6	,24342		
Asst.Prof.	3,9157	66	,64905	1,555	0,17
Senior Lecturer	4,1437	27	,47173		
Lecturer	4,1270	20	,39875		
Research Assistant	4,3272	8	,40131		
Total	4,0402	130	,55664		

Attitudes towards educational technology points according to titles showed that there was not any significant difference among participants (p>0,05)

Table 5. Educational technology points according to education status

Education	Mean	N	Std. Deviation	F	p
Undergraduate	4,5736	3	,25617		
Master	4,1131	47	,42481	2,337	0,10
PhD	3,9774	80	,61746		
Total	4,0402	130	,55664		

Attitudes towards educational technology points according to participants' educational status revealed that there was not any significant difference among educational groups.

Table 6. correlation among age, experience, educational technology points

		Age	Job Experience	Attitudes Towards Educational Technology
Age	r	1		
	p			
Job Experience	r	,908**	1	
	p	,000		
Attitudes Towards Educational Technology	r	-,185*	-,146	1
	p	,037	,101	

Pearson's correlation analysis showed that there was a negative significant correlation between age and attitudes towards educational technology.

DISCUSSION

Despite some limitations in the scope of the research-based evidence, there does seem to be a sufficient body of data, both quantitative and qualitative, to determine a positive relationship between increased use of educational technologies and student achievement (Schacter, 2005; Akçay, 2003).

Moreover, Kabadayı's study (2006) data showed that 'teachers are not motivated enough to overcome the difficulties in manipulating technological devices in classroom settings. Both pre-service and their cooperating teachers do not perceive using technology in class as waste of time since they believe that using technology facilitates the students' success and their learning."

In addition Miller (1999) reported in their study that "Most teachers reported improved test scores, better behavior among students actively engaged with technology, and increased self-esteem and self-confidence among many students involved with the educational technology program"

t-test analysis showed that there was not any significant difference of attitudes towards educational technology points in terms of gender, having an administrative position, title, educational groups. This case shows that attitudes towards of academics towards educational technologies are not affected by gender, administrative position, title and education status. In other words, all academics in this research have similar positive attitudes towards educational technologies.

Moreover, correlation analysis showed a strong significant correlation between age and educational technology points; a significant negative correlation between job experience and attitudes towards educational technology.

The positive correlation between age and attitudes towards educational technologies might result from the fact that new technologies are not familiar to academics or they do not know how to use them.

The reasons of the negative significant correlation between job experience and attitudes towards educational technologies might be similar to the reasons of the relationship between age and attitudes towards educational Technologies. Because, people who have more job experience are generally the ones who are older. Therefore, people who have more job experience are incapable of knowing, following and using educational technologies compared to the new generation of academics. It could be said that this case affects their attitudes towards educational technologies.

Implications for further research

Some suggestions for further studies could be made from the results of this study: 1- Academics can be informed by various courses about the new educational technologies and about accessing and using them. Because, for example Hua and Peggy stated that taking an introductory educational technology course was found to be helpful in improving preservice teachers' technology attitudes related to educational benefits. 2- Students should also be encouraged to use educational technologies in their class's activities. 3- Facilities of educational technologies in the universities should be improved. 4- Future research could focus on a) whether educational technologies adequately meet the educational needs of academics, b) facilities of academics to access educational technologies, c) whether academics could effectively use educational technologies.

EXPLORING RECIPROCITY OF INFORMATION EXCHANGE IN ONLINE DISCOURSE OF STUDENT GROUPS

Dr. Hwee Ling Lim
The Petroleum Institute, Abu Dhabi, United Arab Emirates
hlim@pi.ac.ae

ABSTRACT: In e-learning, studies have examined the quality of electronic educational discourse for the presence of information sharing with content analytical methods. The method of social network analysis (SNA) has recently been applied to the discourse of computer-mediated communication (CMC) supported learning groups. While research has mainly focused on network analysis of asynchronous CMC interaction, this study examined information exchange in the synchronous CMC of two e-learning groups in terms of SNA measures of actor-node types and group reciprocity. Also, survey perception analysis was used to examine student perceptions on the relevance of discussions. The survey findings showed that discussions were relevant to the learning tasks. SNA results from comparative group analysis elaborated on the survey findings and revealed differences in reciprocity at group level and mutuality in information sharing at actor level. These findings have implications for e-tutor facilitation of collaborative learning processes and the design of online activities.

Keywords: collaborative learning, synchronous computer-mediated communication, social network analysis

1. INTRODUCTION

Sociocultural constructivism (Vygotsky, 1962) regards interaction as vital to collaborative learning processes as it facilitates the sharing of individual interpretations of experiences and negotiation of meaning that leads to joint knowledge construction. In e-learning, online interaction also helps to reduce transactional distance between distant learners that could result in greater student satisfaction with the learning experience. Studies have examined the quality of electronic educational discourse, from a constructivist framework, for indications of information sharing and negotiation of understandings with discourse and content analytical methods (Garrison, 2003). Recently, the method of social network analysis (SNA) has been applied to examining the discourse of computer-mediated communication (CMC) supported learning groups. In Aviv and Ravid (2005), asynchronous discussion postings were analyzed using a combination of SNA and content analysis methods to investigate participation patterns, learner network structures, and quality of the knowledge construction process.

While research has mainly focused on the network analysis of asynchronous CMC interaction, this study examines patterns of information exchange present in the online synchronous (chat) tutorial discussions of two virtual learning groups in an undergraduate distance course. This paper presents quantitative SNA results from comparative group analysis on reciprocity and mutuality in information sharing among participants in the two learning groups. Survey findings are also presented on student perceptions on the relevance of tutorial discussions to the learning tasks.

1.1 Characteristics of Computer-Mediated Interaction

Computer-mediated communication technologies offer various capabilities and constraints for supporting educational interactions. The asynchronous CMC mode enables delayed-time dialog, through applications such as email and discussion forums, mainly in the form of text-based contributions that can be composed, sent, accessed, without time or proximity constraints. This study focuses on the synchronous CMC mode that requires communicating parties to be 'present' at the same time to engage in dialog. Chat interactions are largely text-based messages, composed and sent by parties who are simultaneously logged in chat rooms. Chat messages appear chronologically and scroll up screens at a speed corresponding to the conversational pace, which brings a sense of temporal immediacy to the interaction.

Even as distance education has embraced CMC for increasing interaction and reducing transactional distance, there are divergent positions held by researchers on the effects of CMC on communicative behavior. From the cues-filtered out theoretical perspective (Culnan & Markus, 1987), solely text-based interactions (including chat) are assumed to have low social presence, provide fewer

interactional cues than face-to-face encounters, and result in negative interpersonal perceptions that disrupt collaborative learning. However, other studies have taken the stand that the appearance screening capability of text-based CMC, which filters out social context cues (Kiesler et al., 1984), could encourage greater self-disclosure that builds ties in e-learning groups and lead to greater equality of participation (Siegel et al., 1986). Moreover, the social information processing model (Fulk et al., 1990) claims that the need for affinity drives people to establish social ties using whatever information and communication means available. Hence, learners develop adaptive strategies and change their linguistic and/or interactional behavior to facilitate information sharing and overcome the limitations of the online communication mode.

1.2 Computer-Mediated Discourse

Computer-mediated discourse (CMD) refers to the electronic communication produced by humans via networked computers (Herring, 2003). The type of CMD of relevance here is synchronous CMD (chat discourse) that is structurally distinctive from text and talk for its interweaving text-based conversational threads containing different topics and speech acts. Lapadat (2002) characterized it as brief, rapid messages with overlapping multiple topics in chronological not topical sequence. Other features unique to chat discourse include the presence of explicit addressing, paralinguistic communication conventions (emoticons, emotags, acronyms), server messages, informality of language structure, and a lack of punctuation and capitalization.

From a pedagogical perspective, such characterization leaves chat discourse vulnerable to claims of interactional incoherence (Herring, 1999), with the implication that the synchronous CMC medium is incapable of supporting collaboration and learning. For instance, Lapadat (2002) asserted that compared to the fragmented threads in chat discourse, student postings in course discussion forums are dense with meaning, coherent, and complete because the asynchronous CMC media support prolonged periods of discussion and facilitate reflection by learners. Furthermore, the lack of conventional turn-taking cues may result in multiple overlapping messages or isolated postings resulting in a loss of discussion focus.

However, it can be argued that these features of chat discourse comprise the appeal of the synchronous CMC mode; to be exploited in instructional activities that require fast decision-making, development of argumentation skills or creative language play. Nevertheless, given the sociocultural constructivist view that knowledge is constituted in the dialogic exchanges, the presence of such features in educational chat discourse could undermine collaborative efforts in information sharing and disrupt the learning process. The research case described next presented an opportunity to further current understanding on the impact of synchronous CMC mode on information exchange during the collaborative learning processes of virtual learning groups.

2. THE RESEARCH CONTEXT

The participants in this case study were undergraduates in a distance IT course belonging to two (out of four) tutorial groups (Group 1 n=15; Group 4 n=9), two tutors and the author. Both tutorial groups were involved in equivalent learning activities. The course adopted a blended delivery design; with face-to-face lectures and formal tutorials held in WebCT chat rooms.

The weekly chat tutorials are seminars for reviewing the course literature, with a tutor-facilitator and student presenters moderating the discussion of set readings. The presenter role is rotated among all students in each group. More specifically, a presenter moderates a ½ hour discussion slot (an episode) in the one-hour tutorial session based on his/her critiques of the week's readings. The tutor acts as a facilitator, evaluates the presenter's performance and quality of participation by other students. The other students participate in discussions and reflectively evaluate the presenter with the aid of archived discussion logs. The course constructivist pedagogical framework is reflected in the chat tutorial activity that involves critical review of readings, dialogic exchange of perspectives, and reflection on learning.

3. THE METHODS

3.1 Social Network Analysis

Social network analysis is a method enabling the patterning of relations among social actors at different levels of analysis such as persons and groups. Essentially, SNA assumes the primacy of relational ties between social units and that interactions between actors sustain and define groups. SNA

techniques include quantitative statistical analysis to analyze and model relational data. In this study, network analysis is applied to textual data comprising conversational turns/ties by actors/nodes engaged in online exchanges (Table 1). A tie represents a connection/link between two actors/nodes and ties are means for the exchange of information, social and emotional support between learners. Ties also reflect the learners' interactions as initiating/responding in exchanges that are characterized by the transfer (one-way) or exchange (two-way) of nonmaterial resources (information).

Given the conversational characteristics of chat discourse and the constructivist view that sharing of individual understandings enables meaning negotiation in knowledge building processes, SNA could be considered a particularly appropriate method for furthering understanding of the dynamic to-and-fro pattern of information exchange in the dialogue of online learning groups. This study applied the SNA measures of actor-node types and group reciprocity (explained below) to examine patterns of information flow present in the chat exchanges of two virtual learning groups.

Table 1: Example of a chat exchange

Participant A	Is there a difference between a group of people and a team?
Participant B	what is your definition of "group"?
Participant C	I think team members have roles, are accountable the team, but a group is just a collective
Participant D	i agree.. a team has roles to and work towards completing a task
Participant A	I concur

3.2 SNA Measures

A node represents a social unit which could be an individual (actor), group or an abstraction. In this study, actor-nodes are a finite set of participants in the two learning groups (G1,G4) who are distributors and/or recipients of information during tutorial discussions held in chat rooms. Based on their overall tendencies to send and/or receive ties or turns in chat exchanges, actors could be categorized as four node types: *Isolate; Transmitter; Receiver; Carrier* (Wasserman & Faust, 1994) (Figure 1). Hence, the proportion of actor-node types present could indicate the extent of directional symmetry or mutuality in information sharing during collaborative learning processes.

Reciprocity is defined as a state whereby both actors in a dyad choose the other on a relation. A relation is the type of tie such as information exchange. In such a relation, ties are directed and valued indicating respectively, the communicative direction of information exchange (ties sent or received), and the frequency of the interaction as degree of connection between a node to other nodes (Figure 2). Reciprocation of choice at the group level could be measured with a reciprocity index that indicates the strength of tendency of the group towards mutual exchange of information.

	(i) = Isolate: actor-node with no ties incident to or from it.
	(i) = Transmitter: actor-node with only ties originating from it.
	(i) = Receiver: actor-node with only ties terminating at it.
	(i) = Carrier: actor-node with ties incident to and from it.

Fig 1: Actor-node types (adapted from Lim, 2006, p.134)

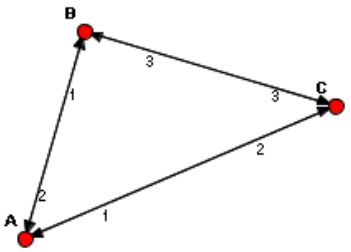

Fig 2: Ties in a relation: directed and valued

3.3 Transcript Dataset and SNA Software

The dataset comprised transcripts of archived chat discussion logs collected over 11 weeks for both groups. In total, the complete dataset comprised 22 sessions (one-hour tutorial) or 44 episodes (½ hour discussion slot) i.e., 11 sessions for each group with two episodes in each session. The chat transcripts were initially analyzed using a discourse analysis coding scheme to form chat exchanges described further in Lim & Sudweeks (2008). Then network analysis was carried out with NetMiner II (Cyram, 2004); a commercial SNA program that supports network analysis and data visualization.

3.4 Survey Instrument and Dataset

A web survey comprising closed and open-ended questions was administered to 23 student respondents with return rates of 93% (G1) and 89% (G4). Responses to closed questions were pre-coded by the survey software prior to descriptive statistical analysis. This paper presents results on student views on the importance of the relevance of tutorial discussions and satisfaction with their experiences with factor during online tutorials: *(Q.8b/9b) From your experience of online tutorials in this unit, how important/how satisfied are you with the given factor: Discussions are relevant to the course readings?*

4. THE RESULTS

4.1 SNA Results: Symmetry of Information Exchange (Actor-Nodes)

In actor-nodes type analysis, participants were only categorized as Receiver and Carrier at episode level for two reasons: (a) The nature of the learning activity during which presenters are required to post summaries of set-readings at the start of each episode that are interpreted as being addressed to all participants in the group. Hence, the default node type would be Receiver since all actor-nodes would have at least one tie incident to it; (b) There would be no Transmitters since any default Receiver node that sends a tie would be categorized as a Carrier which has ties incident to and from it. Table 3 summarizes the predominant node types adopted by G1 and G4 actors for all episodes: G1 actors were Receivers in 15.5% of all episodes compared to 4.1% in G4. G1 actors were Carriers in 84.5% of all episodes compared to 95.1% in G4.

Table 3: Actor-node types (G1 & G4, all episodes)

	G1		G4	
	Receiver	Carrier	Receiver	Carrier
Total	43	234	8	188
%	**15.5**	**84.5**	**4.1**	**95.9**

4.2 SNA Results: Symmetry of Information Exchange (Group Reciprocity)

Group reciprocity was calculated with a reciprocity index that indicates the strength of tendency of the group towards reciprocation of choice at the episode level. In directed relationships, reciprocity is present when both actors in a dyad choose the other on a relation i.e. exchange of information. The reciprocity index used the formula: ratio of the maximum number of reciprocated ties to total number of ties. Application of the reciprocity index assumes the following data conditions: (a) presence of directed ties; (b) conversion of valued ties to dichotomous ties.

The value obtained with the reciprocity index could range from 0 to 1; indicating the likelihood of a sent tie to receive a tie in return, within an episode. If the value = 0, then there is no tendency to reciprocate; if the value = 1, the tendency is maximal i.e., all ties are reciprocated. It was found that G1 reciprocity values ranged from 0.93 (S5-E1) to 0.40 (S9-E2). G4 reciprocity values ranged from 1.00 (S7-E1) to 0.60 (S10-E1).

4.3 Survey Results: Relevance of Discussion

In the survey, student respondents indicated the levels of importance of the factor - relevance of tutorial discussions to the unit (course) readings - and satisfaction with their experiences with factor during online tutorials (Q.8b/9b) on a 4-point scale from *Very Important/Very Satisfied* to Not

Important/Not Satisfied. Table 4 shows that most G1 respondents (92.3%) regarded the factor as important and were equally satisfied with their experiences. In G4, the factor was regarded as important by all respondents and 87.5% were satisfied with their experiences.

Table 4: Satisfaction with relevance of discussion

	Scale	VI&I*	SI&NI*
Group 1	Importance (Q.8b)	92.3% (12)	7.7% (1)
		VS&S**	**SS&NS****
	Satisfaction (Q.9b)	92.3% (12)	7.7% (1)
Group 4		**VI&I***	**SI&NI***
	Importance (Q.8b)	100.0% (8)	0.0% (0)
		VS&S**	**SS&NS****
	Satisfaction (Q.9b)	87.5% (7)	12.5% (1)

5. DISCUSSION AND CONCLUSION

As sociocultural constructivism regards the sharing of individual knowledge as an essential aspect of the collaborative learning process, this study aims to gain insight into patterns of information flow in the chat exchanges of two virtual learning groups with the method of social network analysis. For method triangulation, a web survey was conducted on student experiences of chat tutorials that included a question on their perceptions of the relevance of tutorial discussions to the course topics.

The web survey findings showed very minor differences between groups as most respondents (from both groups) considered the relevance of discussions as an important factor and were satisfied with their experiences of the factor during chat tutorials. The findings may be attributed to the structured design of the tutorial activity whereby the discussions were moderated and definite roles were assigned to the students. While the web survey revealed a broad yet personal dimension of the collaborative learning process, the SNA findings provided a finer-grained impression of the dynamic to-and-fro exchange of information during the online tutorial discussions from the transcript data.

Results from the SNA measure of actor-node type suggest that G1 actors were more likely to only receive ties, hence displaying an asymmetrical directional flow of information compared to G4 actors. In contrast, G4 actors were more likely to both send and receive ties, thus displaying greater mutuality in sharing information than G1 actors. Group reciprocity analysis showed that G4 reciprocity levels were generally higher than G1 for most episodes indicating a greater tendency towards reciprocation of ties. When considered together with findings from actor-node type analysis, group reciprocity analysis confirmed the impression that compared to G1, mutuality in information exchange was more evident in G4. Hence, G4 may be a more inclusive and balanced group in terms of information exchange during the collaborative learning process. This may be partly explained by the profile of G1 participants. The web survey included several demographic questions and a question covered participants' experience with chat use prior to the course. The survey results showed that while all G4 participants had used chat before enrolment in this course, fewer G1 participants had experience in the use of chat technology.

At this point, it is necessary to acknowledge certain limitations in the data and design of this study. Firstly, it is acknowledged that the transcript data used for network analysis did not reflect all the details surrounding the events in the tutorials and that the findings from SNA alone present a limited account of the analyst's interpretation of what occurred during the discussions. However, this study took into account these limitations by integrating social network and survey perception analytical methods and the triangulation of different perspectives on the chat interaction enhances the validity of this qualitative study. In the future, this study could be extended by further triangulating tutors' perspective of the quality of learning interaction with the students' perceptions and the evidence from discourse analysis of the discussion transcripts. Secondly, knowledge from network analysis and participant self-reports from this study are not claimed to be generalizable to wider populations. However, the implications for e-tutor facilitation of collaborative learning processes and the design of online activities supported by synchronous CMC technologies drawn from the findings may be extrapolated to similar contexts.

The findings on group differences in extent of collaborative effort in information exchange and satisfaction with the relevance of tutorial discussions suggest that not all learners may be comfortable with the use of synchronous CMC technology. This was consistent with the group demographic profile which showed that G1 participants had comparatively less experience than G4 participants in the use of

chat. Therefore, it is recommended that blended e-course designs that offer various means of interaction (such as face-to-face, asynchronous and/or synchronous CMC) could enable learners, who are not comfortable with a specific communication channel, to have recourse to other means of communication for sharing individual understandings.

Moreover, findings from network analysis suggest the need for improvement in managing participation in collaborative group learning. In order to reduce passivity and increase involvement in learning discussions, it is recommended that e-tutors should conduct review sessions in the early part of each semester. In such sessions, the e-tutors could specifically focus on successful strategies used by student presenters to stimulate discussion and include others in the exchanges by using excerpts from the archived discussion logs.

ABSTRACT

The findings demonstrated that college students tend to recognize use perception, flow experience, and continuance intentions in leisure Internet usage positively. Browsers and instant messenger are the most commonly used applications. Male and female users' continuance intentions of leisure Internet usage are significantly different. Ease of use has significant difference on online games and FTP (File Transfer Protocol) use; use of online games and BBS (Bulletin Board System) has significant difference on continuance intention; use perception and flow experience have significant correlations with college students' continuance intentions of leisure Internet usage.

Keywords: Internet; leisure; flow experience; use perception; continuance intention

INTRODUCTION

As Internet usage prevails, many recent studies have been conducted on Internet use (Brenner, 1997; Young, 1998; Kandell, 1998). At present, Internet users among college students in Taiwan have achieved 100% (Taiwan Network Information Center, 2010). Therefore, this study aimed to treat college students as subjects, and attempted to determine their flow experiences in leisure Internet usage.

The purpose of study was to probe into the correlations between flow experience and continuance

intentions of Internet leisure activities, and recognize college students' use characteristics and behaviors in Internet leisure through a questionnaire survey. The subjects' software selections in Internet leisure activities, gender difference in Internet usage behavior, cognition of Internet leisure, flow experience, and continuance intentions of internal leisure were discussed. Based on the above, hypotheses of this study are proposed as follows:

H1: There is a significant correlation between use perceptions and flow experiences of Internet leisure.

H2: There is a significant correlation between use perceptions and continuance intentions of Internet leisure.

H3: There is a significant correlation between flow experiences and continuance intentions of Internet leisure.

LITERATURE REVIEW

The Flow Theory was proposed by psychologist Csikszentmihalyi (1975), and was originally defined as "when participating in certain activities, the participants are attracted and concentrated, ignore the unrelated perceptions and affairs, lose self-consciousness, and only respond to specific goals and feedback, and have a sense of control of environment; such state is known as the flow experience". Csikszentmihalyi (1975) indicated that during the interaction between individuals and the content of the activities, the perceived balance between their activity capacity, skills, and the challenge in the activities, are likely to result in flow experience. Csikszentmihalyi (1975) also suggested that once individuals have flow experience, they would be willing to rejoin the same activity (Csikszentmihalyi & LeFevre, 1989).

The flow state of a Model of Network Navigation in a Hypermedia (CME) is based on a balance of skills and challenges (high or low degrees) (Novak & Hoffman, 1997). Flow is a kind of temporary and subjective experience or state, and differs according to individual experiences. Perceived challenges and skills are not definite abilities, and vary according to individual perceptions.

In Internet leisure activities, the participants' flow experience would result in positive feelings and satisfaction. Webster et al. (1993) studied the usage of computer software, such as e-mail, and found a perception correlation between flow experience and users. Users would be willing to use and explore the software, and easily attain flow experience (Webster, Trevino & Ryan, 1993; Trevino & Webster, 1992).

METHODS

The hypotheses were validated according to the research framework (Figure 1) and literature reviews.

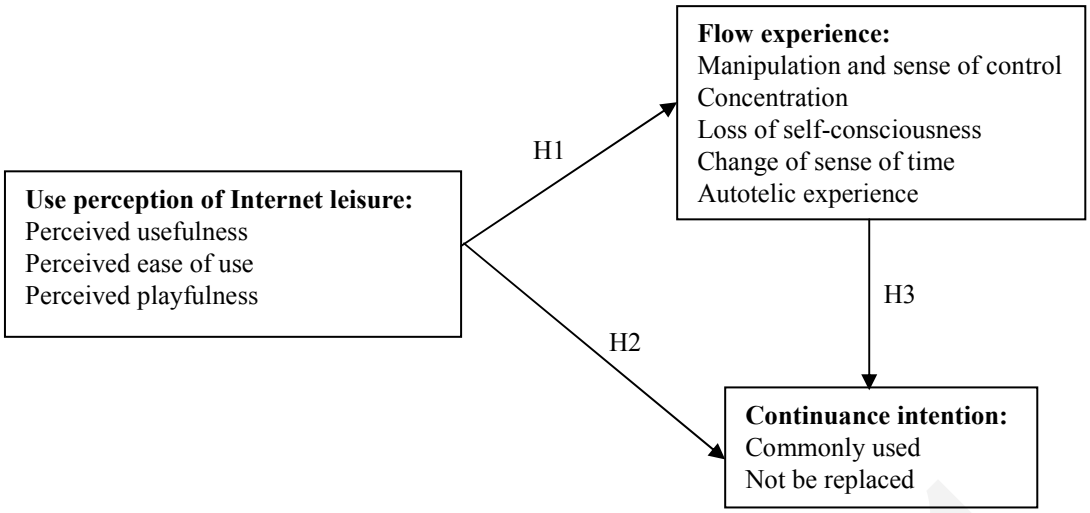

Figure 1. Research Framework

This study investigated college students to determine if they have continuance intentions upon the use perceptions of the Internet through leisure activities with related software or behaviors, and if they have flow experience. Questionnaire survey and analysis were conducted only on college students in Taiwan. A total of 500 questionnaires were distributed, and the valid return rate was 93.2% (198 males and 268 females). Statistical tests, analysis, and explanations were conducted on questionnaire results. In order to probe into the correlations among use perception, flow experience, and continuance intention in hypotheses, Canonical Correlation Analysis was conducted.

RESULTS AND DISCUSSIONS

Leisure Internet Usage

The means of leisure Internet usage are as follows, perceived usefulness (M= 5.51), perceived ease of use (M= 5.39), perceived playfulness (M= 4.91); the overall mean of use perception (M= 5.27) was above the median points of a 7-point scale (4). This indicated that, regarding leisure Internet usage, college students positively identify with "use perception"; means of continuance intention (M= 5.51) were above the median point of a 7-point scale (4), and flow experience (M= 3.41) was also above the median point of a 5-point scale (3). This indicated that college students positively identify with "flow experience" and "continuance intentions". This indicated that browsers and instant messenger are the most commonly used by online users and popular behavior or software selection.

Analysis of Gender Differences

As to "Perceived Usefulness" of leisure Internet usage, both male and female students suggested that it is useful, and did not reveal significant use differences (t= -0.70, p>.05). Regarding "perceived ease of use", both male and female students suggested that Internet behavior or software use is easy, and did not reveal significant use differences (t= -0.15, p>.05). Regarding "perceived playfulness", both male and female students indicated that Internet behavior or software use is playful, and did not reveal significant use differences (t= -0.63, p>.05).

According to the findings of male and female students' flow experience after related Internet behavior or software use, the participants all suggested recognition of flow experience. Hence, gender did not reveal significant use differences (t= -0.37, p>.05**)**. Then, t-test was conducted on the influences of certain Internet behaviors and software use on flow experience, and found that they do not have significant differences on degrees of flow experiences. Both male and female student users showed significant different continuance intentions in leisure Internet usage (t= -3.13*, p <.01), while males had higher continuance intentions.

Correlation Analysis of Use Perceptions and Flow Experiences

Canonical Correlation Analysis on "use perception" and "flow experience" is shown in Table 1. There is a significant correlation between college students' "use perception" and "flow experience" in Internet leisure, indicating that positive "use perception" in Internet leisure would result in positive "flow experience". Canonical Cross Coefficients showed that except for "loss of self-consciousness", which had lower correlation coefficient, all other factors revealed significant correlation coefficients. Therefore, the findings validate H1.

Table 1. Canonical Correlation and Cross Structure Analysis of Use Perception and Flow Experience

Canon	Canonical Correlation Coefficient (ρ)	Square of Canonical Correlation Coefficient (ρ2)	Significance test (Wilk's λ)	Significance (p)
1	.637	.406	.488	.000

Autotelic experience	-.644	-.301	-.626

Correlation Analysis of Use Perception and Continuance Intentions

Canonical Correlation analysis on "use perception" and "continuance intentions" is shown in Table

2. There is a significant correlation between college students' "use perception" and "continuance intentions", indicating that in Internet leisure, positive "use perception" would result in positive "continuance intentions". Therefore, H2 is validated.

Table 2. Canonical Correlation and Cross Structure Analysis of Use Perception and Continuance Intentions

Canon	Canonical Correlation Coefficient (ρ)	Square of Canonical Correlation Coefficient (ρ2)	Significance test (Wilk's λ)	Significance (*p*)
1	0.613	0.376	0.623	0.000

Correlation Analysis of Flow Experience and Continuance Intentions

Canonical Correlation Analysis of "flow experience" and "continuance intention" is shown in Table 3. According to correlation analysis on flow experience and continuance intention, there is a significant correlation between college students' "flow experience" and "continuance intentions" in Internet leisure. This indicated more positive "flow experience" would result in positive "continuance intention". The cross correlation coefficient of low loss of self-consciousness indicated that reactions to external attitudes are not the main attribute of continuance intention. Therefore, H3 is validated.

Table 3. Canonical Correlation and Cross Structure Analysis of Flow Experience and Continuance Intention

CONCLUSIONS

According to the statistical analysis of this study, the conclusions are summarized. Browsers and instant messenger are the most popular software for college students in terms of leisure activities. This study found that college students positively identify with use perceptions, flow experiences, and continuance intentions of leisure Internet usage. In conclusion, when college students engage in leisure activities through Internet tools, their perceptions of use or flow experiences can lead to recreational essence, and enhance continuance intentions.

Abstract

This study was aimed to examine the influence of multimedia presentation modes (e.g. static graphs plus speech and text, static graphs plus speech, and static graphs plus text) and attention types (e.g. excellent and general) on learning performance among elementary school students as well as to explore their the reciprocal effects. This study used quasi-experimental design using three learning materials related to environmental protection issue. A total of 63 3rd grade students from three schools in Pingtung County, Taiwan participated in the study. Pre- and post-tests were implemented in the study. Collected data were analyzed by Two-way ANCOVA, One-way ANCOVA, and One-way ANOVA. The findings of the study are (1) the interaction of different multimedia presentation modes and students' attention has no significant effect on learning performance; (2) different multimedia presentation modes have significantly impacts on learning performance of environmental protection. The posttest score in static graphs plus speech and text group is better than the score in static graphs plus speech group; (3) the different multimedia presentation modes have significantly impacts on learning performance of environmental protection. The posttest score in static graphs plus speech and text group is better than the score in static graphs plus speech group; and (4) different attentions of the students show no significant impact on learning performance of environmental protection.

Keywords: multimedia presentation modes, attention, environmental protection issue

Introduction

In the 21st Century, information can be transmitted to every corner of the world and combined with daily life through the world of the internet. Office of Technology Assessment (OTA) of the United States has pointed out that computer technology has caused important changes to instruction and learning (OTA, 1995); many empirical studies have discovered that incorporating technology into the learning environment can provide students with more opportunities for learning and promote student ability in exploring concepts and organizing knowledge. Teachers are key persons who guide students in learning

the abilities and attitudes relating to the application of information technology. Teachers not only need to possess professional knowledge of their subjects and professional know-how for instruction, but also need to have the ability to apply information technology to elevate student learning accomplishments (Ministry of Education, 2008). Mayer's modality principle states that if learners look at text and image at the same time, it would overload the visual channels, while simultaneous appearance of text and narration would cause redundancy; a simultaneous display of images and narration would decrease the burden on visual channels (Mayer, 2001; Mayer & Rigotti, 2007). Thus, teachers need to integrate multimedia and consider how to incorporate presentation into instruction to concentrate the attention of students, elevate learning interest, and achieve better learning accomplishments.

In 1972, the "Declaration of the United Nations Conference on the Human Environment" announced the conceptual connection between humans and the environment, arriving at the worldwide consensus on the issue of environmental protection that "we only have one Earth" and "people and the environment are an indivisible common entity. On February 16, 2005, the Kyoto Protocol took effect, and controlling the emission of greenhouse gases became an important environmental protection issue for many countries. The report by the Intergovernmental Panel on Climate Change (IPCC) in 2007 stated that due to the greenhouse gases being emitted by human activity, the global temperature has continued to increase, leader to worsening environmental problems such as wind disasters, landslides, and droughts. In the United Nations' Agenda 21 for Sustainable Development, Article 36 states that education is the key to promoting sustainable development and resolution of environmental problems. In 1992, the Executive Yuan clarified that environmental education is a lifelong education including family, school, and social education; it needs to begin from preschool education, so that cherishing good fortune, loving things, and reducing waste can be part of daily life. In 2008 the Environmental Protection Administration of R.O.C. established "save energy and reduce carbon to love Earth," "recycle resources for zero waste," "do not pollute, conserve and protect ecology," and "clean homes and live in Lohas" as the administrative focuses of the Environmental Protection Administration, the objective for sustainable national development. The protection of the Earth's environment and carrying out recycling in daily life would be the important work of saving energy and reducing carbon (Environmental Protection Administration, 2011).

Environmental education is an important point in school education, and it is necessary to incorporate environmental education into academic subjects in elementary school. This study uses environmental protection issues in caring for Planet Earth most commonly known by elementary school students in daily life, such as recycling, reducing Garbage, and saving water resources. The Modality Principle and Redundancy Principle are used to verify how well images with sound and text (Group with Pictures, Sounds, and Texts), images with sound (Group with Pictures and Sounds), and images with text (Group with Pictures and Texts) affect the learning accomplishments of content memory, learning comprehension, and learning transfer in learning environmental protection issues and concentration (good concentration ability, normal concentration ability) of elementary school students in short periods of time.

Methodology

This study uses quasi-experimental design method, to randomly sample three classes in the third grade in two elementary schools that have largely similar computer equipment and environment in Pingtung County in 2009. Each class has 21 students with normal vision and hearing for a total of 63 students, who are then divided into groups A, B, and C.

Experiment design

Table 1: Experiment design model

Class	Pre-test	First week	Second week	Third week
Class A	O_1	X_{12} P_1	X_{21} P_2	X_{33} P_3
Class B	O_1	X_{11} P_1	X_{23} P_2	X_{32} P_3
Class C	O_1	X_{13} P_1	X_{22} P_2	X_{31} P_3

The meaning of various symbols in Table 1:

(1) O_1 means that each class underwent the same pre-test before the experiment.

(2) X_{11}, X_{12}, X_{13} refers to the three experiment processes in Instructional Material 1, which are X_{11}, which means that Instructional Material 1is Group with Pictures, Sounds, and Texts, X_{12} means the Instructional Material 1with Group with Pictures and Sounds, X_{13} means the Instructional Material 1 with Group with Pictures and Texts; the sequences differed based on the classes. For each class, Instructional Material 2 and Instructional Material 3 are used every second week.

(3) P_1, P_2, P_3 means that after the experiments of the three types of Instructional Materials are done, the same post-test is immediately done, and each class does three post-tests.

Multimedia instructional materials

With "Love Planet Earth" as the topic, three sub-topics are formed, which are "Love Planet Earth--Recycling," "Love Planet Earth--Reducing Garbage," and "Love Planet Earth--Saving Water Resources," to introduce how to carry out recycling of garbage resources, the recycling channels for recycled materials, and issues to be noted when recycling, shown from Figures 1 to Figure 3. The two schools where the experiment is conducted have computers, sound cards, headphones, 15-inch LCD screens, and Windows XP operating systems, all with the same functions. The teacher computers are screen broadcasting system servers, which are connected to the student computers. The playing method is to use the broadcasting system to individually and automatically play different media continuously, to prevent the subjects from controlling the time they have for watching.

"How do we recycle? First let us get to know the 'recycling symbol'"

Figure 1: Instructional Material 1: Group with Pictures, Sounds, and Texts

"The recycling cans we see frequently include the four types with plastic, glass, paper, and metal"

Figure 2: Instructional Material 1: Group with Pictures and Sounds

Figure 3: Instructional Material 1: Group with Pictures and Texts

Testing tools

Pre-test (test on preexisting knowledge): this test was compiled by the researcher, the purpose of which is to understand the preexisting knowledge of the subjects for the content of the experiment, and the test results are used as the covariance, to dispel the influence of preexisting knowledge of subjects on learning results. After expert suggestions, the questions of the pre-test were maintained at 10 yes-no questions, 10 multiple choice questions; each question was one point, for a total of 20 points. The content in the pre-test is connected to basic concepts in environmental protection, recycling, and saving water resources.

Post-test (test on learning accomplishments): this test was compiled by the researcher, the purpose of which is to evaluate learning accomplishments of subjects after they see the experiment content. The test content is compiled based on the experiment instructional materials; the test includes evaluation of three kinds of learning abilities: memory ability, comprehension ability, and transference ability. Among these, memory ability is used to understand the extent to which the subjects can remember the experiment content; comprehension ability is used to understand whether the subjects can absorb and integrate the experiment content, or apply the instructional materials in the experiment to solve problems; transference ability is used to understand how well subjects can apply what they have learned in new contexts.

Administration procedures

The three classes are randomly assigned into Group with Pictures, Sounds, and Texts, Group with Pictures and Sounds, and Group with Pictures and Texts. For three weeks in a row, the three sub-topics are conducted in the three groups, and students watch films on the same morning during the same period. The experiment is conducted in the computer classroom, and subjects carry out the experiment based on randomly assigned group categories. When officially conducting the experimental instruction, in the first week 10 minutes are used for the pre-test, in which the researcher explains the topic of the experiment, telling the subjects to watch the instructional materials for about 6 minutes, immediately after which there will be testing of learning accomplishments for 10 minutes, so subjects are reminded to put on their headphones and focus on watching the multimedia instructional materials and avoid interfering with each other. The whole experiment lasts about 30 minutes.

Results and Discussions

The influence of different multimedia display methods on the learning accomplishments of elementary school students in environmental protection issues

The experiment instructional materials in this study include Love Planet Earth--Recycling, Love Planet Earth--Reducing Garbage, and Love Planet Earth--Saving Water Resources; each set has the three experiment processes of Pictures, Sounds, and Texts, Pictures and Sounds, and Pictures and Texts. The research results are as follows:

One-way ANCOVA is used to dispel the influence of pre-test scores on learning accomplishments, to test for the effect of different multimedia display methods on the learning accomplishments of students on the

environmental protection issues. Test of homogeneity of variance (p>.05) showed that the residual variance of each group in learning accomplishments was the same, and there was homogeneity, as shown in Table 2. Different multimedia display methods reached the level of significance (p<.05) for learning accomplishments, as shown in Table 3. Further pair-wise comparison analysis is shown in Table 4: Love Planet Earth--Recycling pair-wise comparison. The means of the groups showed that Group with Pictures, Sounds, and Texts (16.014) had the best learning accomplishments, followed by Group with Pictures and Texts (14.652), and Group with Pictures and Sounds (12.619) was last. Among them, Group with Pictures, Sounds, and Texts had better learning accomplishments than Group with Pictures and Sounds, and reached the level of significance; Group with Pictures and Texts had better learning accomplishments than Group with Pictures and Sounds, and reached the level of significance. Pair-wise comparison of Love Planet Earth—Reducing Garbage resulted in means which showed that Group with Pictures, Sounds, and Texts (15.408) had the best learning accomplishments, followed by Group with Pictures and Texts (15.039), and Group with Pictures and Sounds (13.315) was last. Among them, Group with Pictures, Sounds, and Texts had better learning accomplishments Group with Pictures and Sounds, and reached the level of significance; Group with Pictures and Texts had better learning accomplishments than Group with Pictures and Sounds, and reached the level of significance. Pair-wise comparison of Love Planet Earth--Saving Water Resources resulted in means which showed that Group with Pictures, Sounds, and Texts (14.777) had the best learning accomplishments, followed by Group with Pictures and Texts (13.612), and Group with Pictures and Sounds (12.420) was last. Among them, Group with Pictures, Sounds, and Texts had better learning accomplishments than Group with Pictures and Sounds, and reached the level of significance.

Interactive effects on learning memory of different multimedia display methods on students in environmental protection issues

One-way ANCOVA is used to dispel the influence of pre-test scores on learning accomplishments, to test

for the effect of different multimedia display methods on the learning memory of students on the environmental protection issues. Test of homogeneity of variance (p>.05) showed that the residual variance of each group in learning memory, and there was homogeneity. Different multimedia display methods reached the level of significance for learning memory, and reached the level of significance (p<.05), as shown in Table 5.

Love Planet Earth—Recycling comparisons resulted in means which showed that Group with Pictures, Sounds, and Texts (5.284) had the best learning memory, followed by Group with Pictures and Texts (4.818), and Group with Pictures and Sounds (3.898) was last; Group with Pictures, Sounds, and Texts had better learning memory than Group with Pictures and Sounds, and reached the level of significance; Group with Pictures and Texts had better learning memory than Group with Pictures and Sounds, and reached the level of significance. Comparison of means in Love Planet Earth--Reducing Garbage showed that Group with Pictures, Sounds, and Texts (5.313) had the best learning memory, followed by Group with Pictures and Texts (4.651), and Group with Pictures and Sounds (3.656) was last; Group with Pictures, Sounds, and Texts had better learning memory than Group with Pictures and Sounds, and reached the level of significance; Group with Pictures and Texts had better learning memory than Group with Pictures and Sounds, and reached the level of significance. Comparison of means in Love Planet Earth--Saving Water Resources showed that Group with Pictures, Sounds, and Texts (6.197) had the best learning memory, followed by Group with Pictures and Sounds (5.145), and Group with Pictures and Texts (5.134) was last; Group with Pictures, Sounds, and Texts had better learning memory than Group with Pictures and Sounds, and reached the level of significance; Group with Pictures, Sounds, and Texts had better learning memory than Group with Pictures and Texts, and reached the level of significance, as shown in Table 6.

Correlated sample one-way ANOVA for different classes of students undergoing different multimedia display methods

This study uses an improved counter balance design, in which different multimedia display methods are used for the three classes' correlated sample one-way ANOVA, to test for learning accomplishments in different multimedia display methods on environmental protection issues. Mauchly's test values do not reach the level of significance (p>.05), which shows that it did not violate the assumed sphericity of variance analysis and the sample has homogeneity.

Students of the three classes A, B, and C take turns to undergo to instructional materials experiment of different multimedia display methods. The sequence of experiments undergone by Class A was Group with Pictures and Sounds, Group with Pictures, Sounds, and Texts, Group with Pictures and Texts, correlated sample one-way ANOVA reached the level of significance (p>.05) in "sphericity assumed,"

which shows that different multimedia display methods had significant differences in terms of learning accomplishments. Pair-wise comparison shows that, the means of post-test scores of Class A students were in the order of Group with Pictures, Sounds, and Texts (15.143), Group with Pictures and Texts (13.571), Group with Pictures and Sounds (12.238). This shows that Group with Pictures, Sounds, and Texts had better learning accomplishments than Group with Pictures and Sounds as well as Group with Pictures and Texts, and reached the level of significance. Group with Pictures and Texts had better learning accomplishments than Group with Pictures and Sounds, and reached the level of significance.

The sequence of experiments undergone by Class B was Group with Pictures, Sounds, and Texts, Group with Pictures and Texts, Group with Pictures and Sounds, correlated sample one-way ANOVA reached the level of significance (p>.05) in "sphericity assumed," which shows that different multimedia display methods had significant differences in terms of learning accomplishments. Pair-wise comparison shows that, the means of post-test scores of Class B students were in the order of Group with Pictures, Sounds, and Texts (16.095), Group with Pictures and Texts (15.095), Group with Pictures and Sounds (12.429). This shows that Group with Pictures, Sounds, and Texts had better learning accomplishments than Group with Pictures and Sounds as well as Group with Pictures and Texts, and reached the level of significance.

Group with Pictures and Texts had better learning accomplishments than Group with Pictures and Sounds, and reached the level of significance. The sequence of experiments undergone by Class C was Group with Pictures and Texts, Group with Pictures and Sounds, Group with Pictures and Sounds, correlated sample one-way ANOVA reached the level of significance (p>.05) in "sphericity assumed," which shows that different multimedia display methods had significant differences in terms of learning accomplishments. Pair-wise comparison shows that, the means of post-test scores of Class C students were in the order of Group with Pictures and Texts (14.952), Group with Pictures, Sounds, and Texts (14.810), Group with Pictures and Sounds (13.524). Group with Pictures, Sounds, and Texts had learning accomplishments that were better than Group with Pictures and Sounds, and reached the level of significance. The Group with Pictures and Texts had better learning accomplishments than Group with Pictures and Sounds, and reached the level of significance. The details are shown in Table 7.

Table 7: Means and pair-wise comparison of learning accomplishments of students in different classes who received different multimedia display methods

*p<.05 **p<.01 ***p<.001

Conclusion

1. Regarding the learning accomplishments of elementary school students who undergo multimedia display methods in the environmental protection issue, Group with Pictures, Sounds, and Texts was significantly better than Group with Pictures and Sounds.
2. Regarding the learning memory of elementary school students who undergo multimedia display methods in the environmental protection issue, Group with Pictures, Sounds, and Texts was significantly better than Group with Pictures and Sounds.
3. Regarding the learning accomplishments of different classes of elementary school students undergoing different multimedia display methods in the environmental protection issue, Group with Pictures, Sounds, and Texts was significantly better than Group with Pictures and Sounds.

Suggestions

1. When designing multimedia instructional materials, social customs should be considered
   Results of this study show that among multimedia display methods, the method of using pictures, sounds, and texts was better than only using pictures and sounds or pictures and texts. This result differs from the multimedia theory of Mayer. When designing instructional materials, other than following multimedia theory in design, text explanations should be added based on the social customs and reading comprehension ability of children in our country, to prevent them from being unable to concentrate due to a sense of avoidance.
2. At the site of instruction, the interactivity of instruction should be emphasized
   When teachers select or create instructional materials, they need to note that multimedia instructional materials are just assistive tools. Instructional films should not be too long, and younger students need more interaction with the instructor. Discussion is necessary to truly understand thoughts of the students.
3. Diverse types of instructional materials should be used for the issue of environmental protection

The instructional materials in this study are the application of multimedia. Since it is important for environmental protection to be practiced in daily life, it is possible to make supplemental instructional materials at the instructional site, and instructional methods such as “personal experience” and “actual visits” should be arranged for practice in daily life as a part of evaluating learning accomplishments.

Abstract

Organization for Economic Co-Operation and Development (OECD) has conducted a series of educational assessments in many OECD and non-OECD countries to support their sustainable economic growth since 2000. These assessments are named Program for International Student Achievement (PISA); they focus on the capabilities of 15-year olds in three main subjects: mathematics, science, and reading. PISA also measures students' interests and tendencies toward information and communication Technologies. This study investigates the relationship between Turkish students' reading scores and their use of computers for educational and entertainment purposes by using the data from PISA 2006. In order to examine the relationship between these variables, Structural Equation Modeling (SEM) is used in the study. Results of this study indicate that while the use of computers for entertainment purposes affects students' reading scores positively, the use of computers for educational purposes affects their reading scores negatively.

Keywords: Computer use, PISA-2006, Reading, Structural Equation Modeling (SEM).

INTRODUCTION

It is well known fact that education plays a unique role in individuals' well-being and their contributions to the society. At this point, it can be safely argued that having well-educated young individuals greatly influences the future of a nation (Roberts, 1995). In accordance with this argument, the Organization for Economic Co-Operation and Development (OECD) has conducted a series of educational assessments in many OECD and non-OECD countries to support their sustainable economic growth since 2000. These assessments are named Program for International Student Achievement (PISA); they focus on the capabilities of 15-year olds in three main subjects: mathematics, science, and reading. PISA also measures students' interests and tendencies toward Information and Communication Technologies (ICT), and contains a great deal of data about characteristics of students, families, and schools (OECD, 2006).

Along with many other countries, Turkey has also participated in PISA since 2003 to assess the level of Turkish students' knowledge, figure out the place of their level, and determine the factors of students' achievement in the global world. At the same time, Ministry of National Education (MoNE) initiated an important attempt to change a long held curriculum which could not respond to students' needs anymore. An important part of this process was to integrate Information and Communication Technology (ICT) into education since this age is called the era of Information Technology (IT) (Ministry of National Education, 2005). In this new era, computers and other ICT devices have been introduced into schools, and teachers have been expected to use these devices in their instructions in many countries (Ham & Cha, 2009). In accordance with this trend, almost all schools in Turkey have been equipped with computer technology. Even though it is hard to claim that all teachers effectively use technology as an instructional tool in practice, it is safe to note here that many activities have started to be implemented with computers and other ICT devices in Turkish schools and classrooms. In addition, many students either have their own computers and internet access at home or use internet cafes, which are very common in Turkey. As a result, most students in Turkey can use computers and the internet at various levels, and at least know basic computer components.

In addition to integration of computers into education, it is also obvious that computers have become essential parts of our daily life in the 21st century. People do a variety of their daily activities, including

working, studying, communicating, and entertaining, by using computers. In addition, basic computer skills such as writing documents using in word processors, calculating formulas in excel sheet, and using communication tools, etc., should be known in order to find an occupation in most job markets. Although there is no doubt on that using computer is an essential skill and an important part of education in today's world, it is also necessary for young people to effectively read, write, and communicate with others in order to be successful in their adult life. At this point, reading is known as one of the essential tools for developing an individual's mind and imagination. In addition, having effective reading skills and habits can be a key factor for students to develop their writing and communication skills.

In this context, it could be argued that both being able to use computers for different purposes and having effective reading skills are among the most important characteristics of well-educated people in today's world. Thus, it is very important for Turkey to investigate the relationship between students' computer usage and their reading skills in order to take the necessary steps toward improving students' achievement. At this point, PISA plays a key role as it indicates the students' reading skills and provides sufficient information about their accessibility to and use of computers. However, to our knowledge, most of the existing studies (Aypay, 2010; Ziya, Dogan, and Kelecioglu, 2010; Demir, Kilic, and Unal; 2010; Alacaci and Erbas, 2010; Anil, 2009; Unal and Demir, 2009; Altun, 2007; Ciftci, 2006; Duman, 2006; Yilmaz, 2006; Erbas, 2005) which investigated performance of Turkish students in PISA assessments focused on either students' math or science achievement by ignoring their reading skills. It is very interesting to see that there are not many previous studies (if there is any) investigated the reading performances of Turkish students in these assessments. Hence, it can be claimed that there is an important gap in the literature in terms of analyzing Turkish students' reading performance in PISA and investigating the factors which may affect students' performance in reading. To this end, this study addresses how using computers for different purposes may affect Turkish students' reading scores, by using the data from PISA-2006.

METHODOLOGY

Participants

Turkey has participated in PISA since 2003. However, only data from 2003 and 2006 cycles is currently available for Turkey, since the data of PISA 2009 has not yet been released. Hence, the latest available data, from PISA 2006, was used in this study. PISA 2006 was implemented in a stratified random sample at 160 schools across 78 provinces in seven geographical regions of Turkey. For implementation of PISA 2006, 35 students from a list of all 15-year-old students in each school were randomly selected. The Turkish data for PISA 2006 had a sample of 4942 fifteen-year-old students (2290 girls and 2652 boys) attending 7^{th} (n=23), 8^{th} (n=93), 9^{th} (n=2007), 10^{th} (n=2671) and 11^{th} (n=148) grades.

Measurement and Variables

Using computer of different purposes was selected as independent variables in this study to predict the Turkish students' reading performance. Five plausible reading values showing the students' reading performance in PISA 2006 was used as dependent variables. To identify students' use of computers for education and entertainment purposes, eleven variables were determined by using a rotated component matrix in factor analysis, as detailed below. These 11 variables about the use of computers for entertainment and educational purposes are shown in Table 1. Three latent variables were generated in order to employ Structural Equation Modeling (SEM) in this study using the dependent and independent variable. The first latent variable has three indicators, including 5 reading scores, which is called READ. The second one has three indicators, including 6 variables about the use of computers for entertainment purposes, which is called ENT. The last one has also three indicators, including 5 variables about the use computers for education purposes, which is called EDU.

Table 1: Variables about the Use of Computers for Different Purposes

(IC4a) Browse the Internet for information about people, things, or ideas[2]
(IC4b) Play games[2]
(IC4c) Write documents[1]
(IC4d) Use the Internet to collaborate with a group or team[2]
(IC4e) Use Spreadsheets[1]
(IC4f) Download software from the Internet (including games)[2]
(IC4g) Drawing, painting or using graphics programs[1]
(IC4h) Use educational software such as Mathematics programs[1]
(IC4i) Download music from the Internet[2]
(IC4j) Writing computer programs[1]
(IC4k) For communication (e.g. Email or "chat rooms")[2]

Notes:

Procedures for Data Analysis

Regression analysis is frequently used to examine the relationship between a dependent variable and independent variables. However, in this study, Structural Equation Modeling (SEM) was chosen because SEM enables us to flexibly and powerfully examine the relationships between observed and latent variables (Kline, 2010). While the regression approach to modeling does not allow working with latent variables and measurement error, the techniques in SEM make possible taking measurement error into account and working with latent variables when the data is statistically analyzed (Schumacker & Lomax, 2010).

After determining the number of latent constructs by using a rotated component matrix, parceling techniques, which offer many advantages to researchers, were applied. Parceling, the average (or sum) of two or more items, responses, or behaviors, is a technique commonly employed and suggested by experts (Little, Cunningham, Shahar, & Widaman, 2002). Parceling has two very important advantages: 1) The sum of many items is more representative than only one item; and 2) aggregating items yields greater precision. Moreover, parceling contributes to reductions in sampling error. The score reliability of parcels (total scores) tends to be greater than that for the individual items (Kline, 2010). There are some techniques to create parcels for each construct. In this study, the balancing technique (unidimentional) and the facet representative parcels technique (multidimentional) were performed by using SPSS 18.0. The number of indicators was decreased to three for each latent variable by using these two techniques. Table 2 indicates latent variables and indicators.

Table 2: Parceling for each latent variable

	Parcel 1	Parcel 2	Parcel 3
ENT	IC4a & IC4k	IC4b & IC4f	IC4d & IC4i
EDU	IC4c & IC4e	IC4g & IC4h	IC4j
READ	R1 & R2	R3 & R4	R5

RESULTS

Lisrel 8.8 student version was used in this study. There are two parts in analysis: Model-fit and regression. The first part of analysis is to determine whether the model fits well in structural equation modeling (SEM), is presented in Figure 1.

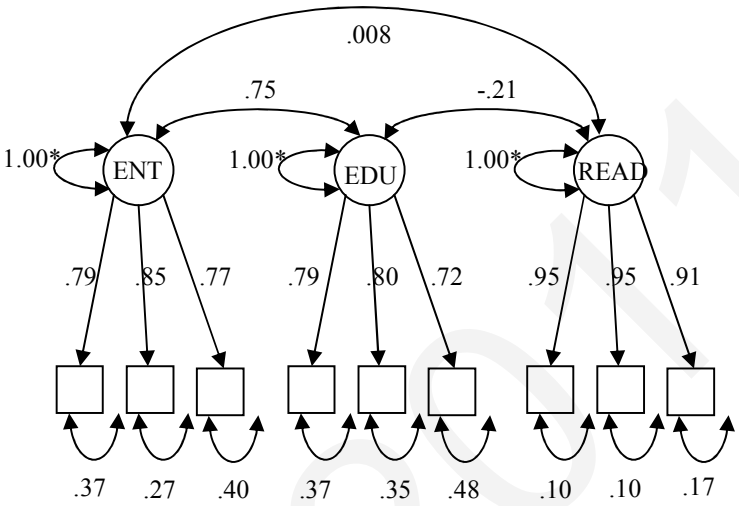

Figure 1: Structural Equation Modeling

Results showed that the model demonstrated acceptable fit (χ^2 (48, 4942) = 270.4, p=<.001, RMSEA=.065$_{(.050-.070)}$, NNFI=.97, CFI=.98), which leads us to apply regression analysis as second part of analysis by using SEM. Regression analysis was to determine if the use of computers for different purposes affected the students' reading scores. The results of this analysis showed that (R^2=.09), ENT affected READ positively (β_1=.375) while EDU affected READ negatively (β_2 = -.499). Figure 2 shows the correlations between latent constructs.

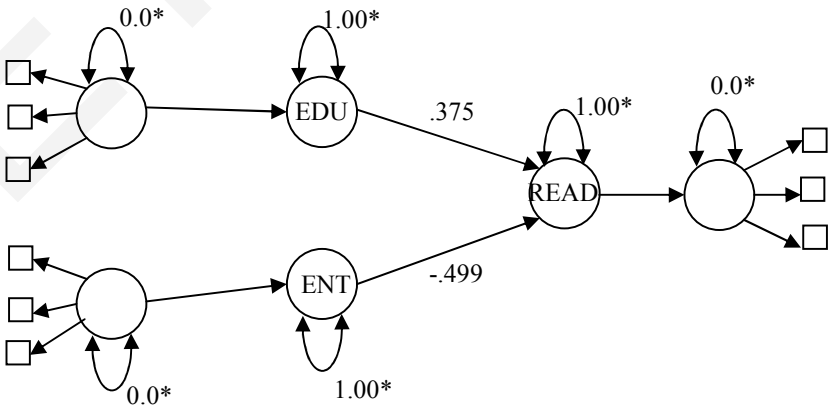

Figure 2: Regression in SEM

CONCLUSION

The purpose of this study was to find out how the use of computers for entertainment and education purposes influences students' reading performance in Turkey. With this aim, the relationship between Turkish students' reading scores in PISA 2006 and their purposes of computer use was examined. Structural Equation Modeling (SEM) was used for the analysis because SEM enabled us to apply the regression model in this study and made possible exploring the relationship among latent constructs. The findings of this study show that while the use of computers for education purposes influenced students' reading scores negatively, the use of computers for entertainment purpose affected reading scores positively. These findings are consistent with the findings of two previous studies (Ziya, Dogan, & Kelecioglu, 2010; Erbas, 2005), which respectively investigated the relationship between Turkish students' mathematics and science performance in PISA and their purpose of using computers.

In general, our findings suggest that students who use computers to perform more advanced tasks show less achievement in reading. At this point, one could argue that these students devote too much time to learn and perform these advanced tasks on computers, and this process may prevent them for reserving enough time for doing their homework and reading different materials. On the other hand, using computers for entertainment purpose may reduce students' stress, increase their motivation, and enable them to study more efficiently. Furthermore, students who use computers for gaming, chatting with friends, or surfing on the internet may unintentionally develop their reading skills. These entertainment activities may also enable students to read in detail and think critically, which are necessary for understanding the context of a reading.

There are also some limitations in this study. First, the findings of this study cannot be generalized to other countries since the sample of the study only included 15-year-old students from Turkish high and middle schools. Second, PISA 2006 included a limited number of questions concerning students' purposes of computer use. Hence, the number of independent variables in this study might not be sufficient to show the relationship between the use of computers for different purposes and reading scores. Third, several previous studies showed that gender as an important predictor of students' achievement in standardized tests (Chiu & McBride-Chang, 2006) and students' attitudes toward use of computers (Lily, 1994). Hence, gender differences should be also taken into account when investigating the relationship between computer use and reading skills. We are currently working on adding gender into our study in order to see if the relationship between computer use and reading skills differ for female and male students. Despite these limitations, the sample size was adequate (n=4952) for employing SEM in this study, and by using the flexible SEM framework, the process of exploring the interrelationships between purposes of computer use and their reading skills has begun.

***Abstract*—Innovation in learning is always the main interest of any educational institute to develop their learning models. E-learning is one of the most innovative models in education. This paper investigates and analysis the factors that influence the adoption of e-learning systems in Jordan as one of the third developing countries. The investigation has been done in the high schools, public and private.**

A new model has been presented in this research. The results of this research has been shown that the legislations issues, human factors, infrastructure, economics and web content had a significant impact on learning goals and objectives. Therefore it is difficult to have a complete e-learning system in Jordan schools. The novel contribution of this research is achieved by using the results of investigations and analysis to assist in building of a theory that will be tested through quantitative methods in the future.

Keywords: E-learning; School; Qualitative Research; Jordan

I. INTRODUCTION

The concept of the learning [1, 2] has grown exponentially with the technological era related that today, corporate learning and the corporate learning organization have ascended to a position of strategic status in the context of managing and growing the project. Identification the knowledge-based economy, the paradigm shift in the way education is viewed and delivered, and huge knowledge gaps as significant trends that have given rise to e-learning [3]. The increase in complexity and velocity of the work environment brought about by technological changes are also major issues that have fueled the demand for e-learning. The shift from the industrial to the knowledge era is presented by [2]. Rapid technological change, the ever shortening product developmental cycles, lack of skilled personnel, enterprise resource planning, and migration towards value chain integration and the extended enterprise as being prominent contributors to the e-learning value chain. The robust economy and the increasingly competitive global business environment as central to the e-learning movement is recognized by [2, 4] .

These composed trends which contribute in driving e-learning systems and show the importance and benefits of e-learning which increases the adoption for this new technology and speedup motivation for creating a new e-learning model in Jordan.

Very few researches study the adoption and use of e-learning technology in the third developing countries. It is very important to reveal that the new technology adoption might be completely different from country to country and from nation to nation. Therefore, this research investigates the factors that influence this variety in the adoption of e-learning systems.

This paper begins with the definition of e-learning. The second part explains the diversity of e-learning practices in terms of persons, computer and technology literacy and social factors. The third part explains a comparison between traditional education and e-learning. In addition, the objectives, advantages and disadvantages of e-learning are outlined after the quality and content section.

II. E-LEARNING DEFINITIONS

The term of e-learning involves using the Internet as a communications medium where the instructor and students are separated by physical distance [5].

While‘‘online’’,’’technologically-integrated’’,’multimedia-based’’,and "e-learning’’ are familiar terms that describe a new approach to instructional delivery. Studies show that schools quickly adopt these delivery modes. Analysts of this growth estimate that online learning is increasing 30-40 percent annually [6]. E-learning 'is a complement to other forms of learning and not a replacement. It should form part of an articulated approach to learning'[7].

III. THE DIVERSITY OF E-LEARNING PRACTICES

No educator will be especially surprised to learn that success in a Web-based learning environment is heavily influenced by what the student brings to the learning situation. There is evidence that students with certain learning styles (e.g., visual) or behavioral types (e.g., independent) do learn better in the Web environment. Conversely, aural, dependent and more passive learners may not do as well. It is this sort of insight that leads some to propose that the potential for maximal learning results when instructional approaches are matched to student learning styles and are supported by appropriate technologies [8]. Furthermore, students with a high motivation to learn can do better by learning online and they will be more independent.

"Our brains may also be the reason why we can become so involved with our computers. As a result of 35 laboratory studies, [9] (1996) concluded that it is the psychology of the relationship between us and the computer that is important, not the fact that one member of this so-called relationship is a piece of technology. They came to this conclusion after experiments where subjects were asked by the computer to evaluation its work. Subjects responded politely and seemed not to want to hurt the computer's feelings. But, when asked by one computer to Evaluation another's work, subjects were more likely to offer criticism"[10].

"Social presence" (i.e., the degree to which a person is perceived as real in an online conversation) is a strong predictor of satisfaction with computer-mediated communications [11]. This skill the production of "immediacy behaviors," since they reduce the "social distance" between teachers and students. In this study, these types of behaviors were positive predictors of student learning and course satisfaction [12].

IV. QUALITY AND CONTENT:

One of the most natural questions that is raised regarding online education (or any educational innovation) is whether it is effective or more effective than what is currently in place? in the case of online education , many comparative studies have been conducted and more are being undertaken to show that online learning produces equivalent or superior educational results to traditional face to face instruction ..., in general the question of whether e-learning is as effective as face-to-face learning has largely been answered by advocates of e-learning with a yes ,''nearly all comparative studies show that e-learning is as effective as classroom instruction'' [13]. In order to make online education work efficiently, large number of students must enroll in courses and degree programs taught by relatively few faculty assisted by teachers aides [14]. Using e-learning technology and innovations in learning methodologies can assist many students to achieve and gain multiple learning goals and objectives.

In any remoteness education situation we need to remember that students are not electronic machines, they are human beings with their proper educational needs and cultural context. E-learning platforms are useful tools to help learners to accomplish their educational and learning activities, to instruct at a distance, to overcome time and space barriers. E-learning platforms do not substitute the human part of the educational process of teaching and learning [15].

Table (1) Description of the Objectives, Advantages and Disadvantages of using E-learning System in school.

Attributes description	Details
E-learning purposes and objectives	Providing a platform to enhance both traditional face-to-face and e-learning system for students. New learning models are needed to bridge the skills gap and demographic changes. Solving Limitations of both time and physical space in the classical learning, Expanding the learning opportunities of students who are facing difficulties that are preventing them from attending traditional one. With the multi platform e-learning environment learning would occur at any time during the day and from any where in the world. Private educational school competitive highly desire Provides flexibility, efficiency and using workflow functionality application [16].
E-learning advantages	E-Learning as a solution to National Specific Problems [17]: Over-crowded classrooms. High price of traditional educational books. Chance for talented students. Active participation in the international educational community. Enhancing the level of national education . E-learning system advantages for student: Building programmed work for students with the excellent support of educated websites made the task of e-learning easier [18]. Provide guidance for students depends on the level in which this

	application is integrated in to teaching [18]. Encourage students to become more autonomous learners Encourage students to make a different kind of use of both contact and non-contact time. In order for students to take full advantage of many of the e-learning innovations and technologies

In this work the main problem is building a new educational learning model. The degree of adoption of the new technology and the trends driving e-learning system including the difficulties forces implementation in our country as a part of the Arab region and Middle East are taken into consideration. The model consists of several variables depending on the real requirements and demands of the schools within the available resources and environment.

It is obvious that e-learning implementation has many factors that can change the attitude of the people to adopt this new model of education. It is so difficult to cover all the factors; the researchers study the factors within public and private school in Jordan in e-learning implementation. The next section explains this case.

V. CASE STUDY: PUBLIC SCHOOL

The growing of technology knowledge underpins schools represented by the ministry of education) to adopt new vision for learning. This vision is implementing the e-learning principles in schools through different phases.

The ministry of education (school) implemented the e-learning project in three phases. The first phase is the establishment of the infrastructure and content.

The second phase is the use of Eduwave (http://elearning.jo) as a supportive tool for the traditional education. It is done through using Internet and other multimedia tools. Finally, the third phase that is:

Migrate from simple supportive e-learning tool using eduwave to a complete content of e-learning system. It provides e-learning content, virtual class system, e-exam, e-video and studio, electronic content management, sharing tools and all the management works for the schools in Jordan.

A. The ministry of education (school) strategies to migrate to a new e-learning system:

Establishment of special building centre for the e-learning project. This centre will manage every thing related to that project such as the staff and infrastructure (king Rania center).

Establish of new schools buildings that have all the infrastructure for the e-learning (labs, wireless node) so the teachers and students can access the system from any where inside the school. Purchasing of e-learning system that can basically be operated under windows. Training of teachers (ICDL, Intel, word links, high diploma in IT) during the last years. And this training extended to all whom engaged in the e-leaning system.

VI. THE RESEARCH METHODOLOGY

A qualitative research was used for induction [19, 20]. That is, the qualitative approach to data collection discovers information from the perspective of the interviewee about the phenomena, such as behaviors and attitudes, that are not directly observable, that is, 'in someone else's mind' [21]. The findings of the qualitative research are not used to test a theory and make generalizations about a population; but rather, to build a theory for further testing, through quantitative methods [22, 23, 24, 25].

This induction characteristic of qualitative methods was a requirement for the first stage of this research for two reasons. Firstly, e-Learning systems in an Internet environment are a relatively new topic in Jordan and Arab region public and private school. In the early stages of theory development, where phenomena are not well understood and the relations between phenomena are not known, in advance used quantitative research methods can lead to inconclusive answer [26]). A qualitative method was required to explore this complex topic in depth with experts who have studied and/or applied (teachers, students and technical's) their knowledge practically to generate ideas rather than to evaluate ideas. That is, qualitative research allowed for flexibility in the gathering of information and a Semi-Structured exploration of issues in a less structured format, with a smaller number of respondents than quantitative methods [20, 27]. This information will be used to assist in the building of a theory that will be tested through quantitative methods in the next method of this research. The second reason for using a qualitative method was the type of information this research is intended to gain in the first stage of data collection. The depth and detail of qualitative data required to understand complex phenomena can be obtained only by getting psychologically close to the phenomena under study. 'The closer the researcher gets to the phenomenon, the clearer it is understood' [28]. Qualitative research allowed us to a gain semi-structured understanding of underlying reasons and motivations and to obtain 'rich', 'real', and 'deep' information with 'non-statistical' data analysis [29]. In summary, the complexity of the research subject warranted a semi-structured exploration that is only possible through qualitative research in the first stage of this research.

This research utilizes an unstructured interview with the Information and Communication technology in Education (ICTE) students in Jordan University. They are teachers in high schools and professional. They are using the e-learning system that is implemented by the ministry of education in their schools.

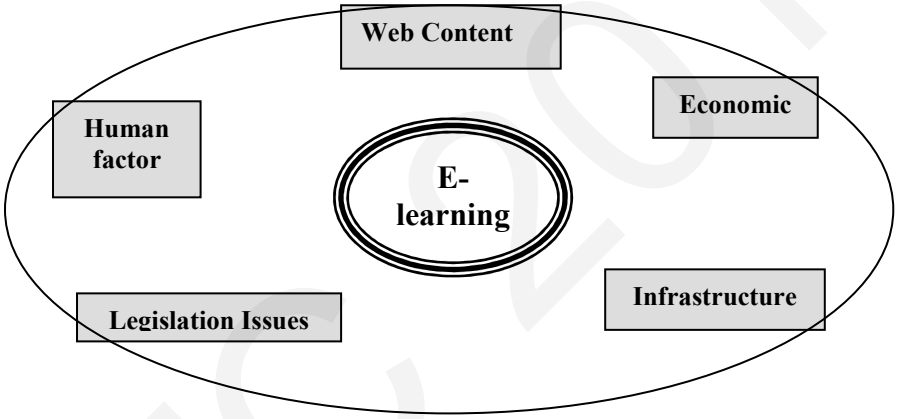
The researchers use each interview for collecting the information required from the respondents and in explaining the data results [28, 30]. The unstructured interview is often seen as an informal interview that is not structured by the standard list of questions. Field-workers are free to deal with the topics of interest in any order, and to phrase their questions as they think is best suited [31]. An unstructured interview is particularly useful for a preliminary study in order to test what the responses might be to a particular issue [32]. In this phase, the researchers asked those teachers who are content developers and users of e-learning system open-ended questions. Although the researchers knew what they wanted, the open-ended questions enabled the researchers to obtain what they were looking for.

The answers of the questions are summarized and analyzed with the cooperation of the interviewed teachers. The analysis focused on the frequencies of concepts in answers and how they are related to each other. Again, the derived concepts are discussed with the interviewed teachers and filtered.

The result is a framework depicts the main factors that influence the e-learning adoption in high schools. This framework is being discussed and approved by the interviewed teachers.

VII. The Result of Analysis

The Factors of E-learning Adoption Model in Jordan schools.



VIII. Discussion:

This research represents a practical investigation into factors and characteristics that influence the new e-learning model.

As seen in our new model in, the legislations issues, human factors (training, resistance), Infrastructure, Economic and web content (Language option, Multimedia, Content quality) had a significant impact on learning goals and objectives in our study.

The rare of legislations that control the use of Internet and guarantee the security and privacy of whom use the Internet were restrict the access of students to the e-learning system. Moreover, the students have not always a reliable access to the Internet. The reliable access is a coherent connection to Internet, continually web site updating, and reasonable server on-line service.

The legislations of the Ministry of Education in Jordan require students' attendance to class's requirement for competitions of there study and the teacher can't develop there own e-learning object and if they do they can't use it inside the school. As a result of that, it is difficult to have a complete e-learning system in Jordan schools.

According to both user and developer, the main barrier is the minds and resistance of change to adopt any new technology. They suggest to have enough training to use a system for both students and teachers and we add the technical's persons of the school who response about the labs in each school, as well as have ICDL as basic requirement for a job and promotion...

The technical infrastructure influences the adoption of e-learning in Jordan high schools. There is a shortage in the infrastructure. The numbers of PCs, laptops, and data shows are inadequate. Furthermore,

the internet connection in the schools is not reliable, as well as the equipped halls/labs for e-learning are inadequate, for example; in many schools, one computer for three students.

For most of teachers and students, the economic factor influences the e-learning adoption. The economic factor is the income of the both teachers and students. Therefore, these people are not capable to have computers and internet connection in their homes. Nevertheless, very few students and teachers have computers, they are not able to connect them to internet through broadband line or even dial-up connection.

The most common complaint from user view was the English language of application. The majority of e-learning systems do not provide a language options to an end users. Therefore, students and teachers will not be capable to understand the instructions and manuals related to the system and that will influence their attitudes to use the system. The interactive interface is not always available and that will not make the learning process interesting, especially the majority users of such systems who are between 12-18 years old. They are used to play games with many interaction options and when they use the e-learning system with few or non interaction options, they feel bored. Course's content and materials which are shown on the web are neither high quality nor new. The high quality courses content is the newest edition books, chapters' slides, online practice exams, paper practice exams, courses' timetables, and interactive tools related to courses such as animations, pictures, and sounds.

Our study yield information that may be useful in guiding for extra and future research. It addresses the realistic key factors that are essential to adoption and effective integration of e-learning strategies, initiatives, and programs for schools in our country.

IX. CONCLUSION

By incorporating e-learning innovations and technologies, students have other learning ways and alternatives. They assist them in meeting the changing demands of the marketplace where complex problems and uncertainty are ever present. Just as ministry of education must find creative ways to continue their competitive edge through the introduction of new technologies and services, schools should take practical steps towards meeting the needs of their students. Introducing e-learning tools and resources may be one way that assists students in achieving the multiple learning goals of exploration, communication, and collaboration beyond the framework and boundaries of the traditional classroom. Our research is preliminary an investigation for the factors that influence the adoption of e-learning systems, as well as seeking information about fact which has not been tested yet in the study domain literature. For that reasons, this information will be used to assist in building of a theory that will be tested through quantitative methods in the future.

X.

XI. 10. LIMITATIONS OF THE RESEARCH

As results for this research, there is a list of limitations for adopting of e-learning in Jordan schools

- Process of integration of the e-learning system is still at the beginning.
- E-learning systems within the Jordanian schools are almost not used as it proposed to be used.
- The teachers teaching load is high and thus slow down the adoption of e-learning system.
- The limited budgets and experts of such projects lead into implementation delay, insufficient training, and late adoption.
- Most of the Learning Objects LO of e-learning is not tested well.

The limitations are opening new opportunities for new researches that can contribute more to our knowledge. This section suggests related areas of research where additional investigation may be rich. It will be a good contribution, if the factors of e-learning adoptions model are validated with all schools, public and private in Jordan. In addition, this model can be checked with any adoption theory. Therefore, we can test to what extent these factors affect the adoption.

ABSTRACT

The purpose of this study is to investigate the students' attitudes toward computer, their attitudes toward making computer supported education, and the correlation between these two attitudes. The study was carried out with 220 students attending to department of classroom teacher. At the end of the study it is determined that, sophomore students compared to freshman students and male students have significantly higher attitudes toward computer. Apart from the exceptions, students' attitudes toward computer are increasing significantly while their computer lesson achievement scores are rising. Junior students have significantly higher attitudes toward making computer supported education. Apart from the exceptions, the students getting high achievement scores in computer lesson have significantly higher attitudes toward making computer supported education. Students' genders don't affect their attitudes toward making computer supported education. Significant and moderate correlation is determined between the students' attitudes toward computer and their attitudes toward making computer supported education.

Keywords: Faculty of education students, computer, computer supported education, attitude.

INTRODUCTION

The influence of the computer is constantly increasing in life. In industrial societies, students don't react in same extent to the expansion of computers and new technologies. But some of them can gain different attitudes and avoid being confronted with the computers and new technologies (Richter, Naumann & Groeben, 2000). Personal attitude is a major factor to affect not only the acceptance and individual usage of computer (Liaw, Huang & Chen, 2007) but also learning environments, such as using a computer as a learning tool introducing computer based applications (CBA) into the classroom (Roussos, 2007). It is likely that the students' attitudes toward CBA and learning about computers may be important in the adaptation of computer technologies into the classroom (Teo, Lee, & Chai, 2008). It is believed that computer attitudes play an essential role in determining the extent to which students use the computer as a learning tool (Teo, 2006) and organizing future behaviors toward the computer technology (Huang & Liaw, 2005; Rosen & Weil, 1995). This attitude–behavior correlation has been investigated by researchers who are studying about affective reactions of students toward technology (Fiore, Yah, & Yoh, 2000; Sanders & Morrison-Shetlar, 2001). Among these reactions, technofobia affecting attitudes and educational practices related to computer should be taken into consideration. So we need to assess and measure individuals' attitudes toward computers in order to determine the extent of the problems and to find solutions (Garland & Noyes, 2008). Increasing use of computers in an educational environment also drove the research agenda (Garland & Noyes, 2008) and different reactions of people requires studying on attitudes toward the computer (Richter, Naumann & Groeben, 2000). Thus, understanding users' attitudes toward computers provides the creation of appropriate CBA for teaching and learning (Liaw, Huang & Chen, 2007). In this context, the problem of present paper is designated about the students' attitudes toward computer and making computer supported education.

PURPOSE

The main purpose of this study is to investigate faculty of education students' attitudes toward computer and making computer supported education. The following questions are answered to realize this purpose:

1.Are there meaningful differences between the students' attitudes toward computer according to their (a) genders, (b) class levels, (c) computer lesson academic achievement scores?

2. Are there meaningful differences between the students' attitudes toward making computer supported education according to their (a) genders, (b) class levels, (c) computer lesson academic achievement scores?

3. Is there meaningful correlation between the students' attitudes toward computer and their attitudes toward making computer supported education?

METHODOLOGY

This study is modelled as a descriptive research. The population of the study consists of faculty of education students attending to department of classroom teacher in University of Çukurova during 2010-2011 education year. The sample of the study is determined by random selection among this population and consists of totaly 220 freshman, sophomore and junior students.

As data collection tools, "The Attitude Scale Toward Computer" (Berberoğlu & Çalıkoğlu, 1991) and "The Attitude Scale Toward Making Computer Supported Education" (Arslan, 2006) are used. The Attitude Scale Toward Computer was developed by Loyd and Gressard (1984) and the scale was adapted into Turkish by Berberoğlu and Çalıkoğlu (1991). The scale includes 40 items and the items are arranged for scoring on a five-point Likert scale ranging as "strongly agree, agree, not certain, disagree, strongly disagree". Berberoğlu and Çalıkoğlu determined the Cronbach's Alpha coefficient for whole scale as .90. In this study, Cronbach'a Alpha of whole scale is calculated as .94. These results shoms that the scale is reliable enough.

The Attitude Scale Toward Making Computer Supported Education was developed by Arslan (2006). The scale includes 20 items and the items are arrenged for scoring on a five-point Likert scale ranging as "strongly agree, agree, not certain, disagree, strongly disagree". Arslan (2006) determined the Cronbach's Alpha coefficient for whole scale as .93. In this study, Cronbach'a Alpha of whole scale is calculated as .89. These results shoms that the scale is reliable enough.

During application process of these scales, data about the individual informations of the students were collected such as genders, class levels, computer lesson academic achievement scores. The collected data was analysed by using independent samples t-Test, ANOVA and pearson correlation methods via SPSS 11.5 (Büyüköztürk, 2010).

FINDINGS

1.The findings for the differences between the students' attitudes toward computer in terms of their genders

Independent samples t-test findings for the differences between the students' attitudes toward computer in terms of their genders are given in Table 1.

Table 1
Independent Samples T-Test Findings For The Differences Between The Students' Attitudes Toward Computer In Terms of Their Genders

Gender	N	$\overline{X}$	S	df	t	p
Male	68	158.11	19.68	218	2.38	.018
Female	152	151.45	18.91			

As seen in Table 1, there is meaningful difference between the male ($\overline{X}$ = 158.11) and female ($\overline{X}$ =151.45) students' attitudes toward computer in favor of male students, $t(218)=2.38$, $p< .05$.

2.The findings for the differences between the students' attitudes toward computer in terms of their class levels

ANOVA findings for the differences between the students' attitudes toward computer in terms of their class levels are given in Table 2.

Table 2
ANOVA Findings For The Differences Between The Students' Attitudes Toward Computer In Terms of Their Class Levels

Class level	N	$\overline{X}$	S	Source	Sum of Squares	df	Mean square	F	p	Meaningful differences
Freshman	102	148.94	21.02	**Between subjects**	5010.29	2	2505.14	7.053	.001	Freshman~ Sophomore
Sophomore	63	160.24	15.76	**Within subjects**	77076.045	217	355.18			
Junior	55	154.27	17.76	**Total**	82086.34	219				
Total	220	153.51	19.36							

As seen in Table 2, there is meaningful difference between the students' attitudes toward computer in terms of their class levels, $F(2, 217)=7.053$, $p< .01$. LSD post hoc test was used to determine the sources of the differences and according to LSD test, meaningful difference is found between the freshman ($\overline{X}$ =148.94) and sophomore ($\overline{X}$ = 160.24) students' attitudes toward computer in favor of sophomore students.

3.The findings for the differences between the students' attitudes toward computer in terms of their computer lesson academic achievement scores

ANOVA findings for the differences between the students' attitudes toward computer in terms of their computer lesson academic achievement scores are given in Table 3.

Table 3
ANOVA Findings For The Differences Between The Students' Attitudes Toward Computer In Terms of Their Computer Lesson Academic Achievement Scores

Academic achievement score	N	$\overline{X}$	S	Source	Sum of Squares	df	Mean square	F	p	Meaningful differences
(1) FD_DD (30-59)	19	141.54	20.64	Between subjects	10992.72	5	2198.54	6.618	.000	1~3 1~5
(2) DC (60-69)	40	147.80	20.97	Within subjects	71093.61	214	332.21			1~6 2~5
(3) CC (70-74)	79	156.71	17.72	Total	82086.34	219				2~6
(4) CB (75-79)	37	147.42	19.67							3~4
(5) BB (80-84)	25	159.46	14.11							3~6
(6) BA_AA (85-100)	20	167.47	12.69							4~5
Total	220	153.51	19.36							4~6

Because of insufficient number of students in the groups [FD (N=4), DD (N=15), BA (N=15), AA (N=5)], FD and DD groups, BA and AA groups are integrated. As seen in Table 3, there are meaningful differences between the students' attitudes toward computer in terms of their computer lesson academic scores $F(5, 214)=6.618$, $p< .001$. LSD post hoc test was used to determine the sources of the differences and according to LSD test, significant differences are found between the students of these groups: Between FD_DD ($\overline{X}$ = 141.54) and CC ($\overline{X}$ = 156.71) in favor of CC; FD_DD ($\overline{X}$ = 141.54) and BB ($\overline{X}$ = 159.46) in favor of BB; FD_DD ($\overline{X}$ = 141.54) and BA_AA ($\overline{X}$ = 167.47) in favor of BA_AA; DC ($\overline{X}$ = 147.80) and BB ($\overline{X}$ = 159.46) in favor of BB; DC ($\overline{X}$ = 147.80) and BA_AA ($\overline{X}$ = 167.47) in favor of BA_AA; CC ($\overline{X}$ = 156.71) and CB ($\overline{X}$ = 147.42) in favor of CC; CC ($\overline{X}$ = 147.42) and BA_AA ($\overline{X}$ = 167.47) in favor of BA_AA; CB ($\overline{X}$ = 147.42) and BB ($\overline{X}$ = 159.46) in favor of BB; CB ($\overline{X}$ =147.42) and BA_AA ($\overline{X}$ = 167.47) in favor of BA_AA. According to these findings it may be thought that apart from the exception such as the differences between CC and CB in favor of CC, generally students' attitudes toward computer are increasing significantly while their computer lesson achievement scores are rising.

4.The findings for the differences between the students' attitudes toward making computer supported education in terms of their genders

Independent samples t-test findings for the differences between the students' attitudes toward making computer supported education in terms of their genders are given in Table 4.

Table 4
Independent Samples T-Test Findings For The Differences Between The Students' Attitudes Toward Making Computer Supported Education In Terms of Their Genders

Gender	N	$\overline{X}$	S	df	t	p
Male	68	84.26	9.77	218	1.65	.099
Female	152	82.06	8.75			

As seen in Table 4, there isn't meaningful difference between the male ($\overline{X}$ = 84.26) and female ($\overline{X}$ =82.06) students' attitudes toward making computer supported education, $t(218)=1.65$, $p>.05$.

5.The findings for the differences between the students' attitudes toward making computer supported education in terms of their class levels

ANOVA findings for the differences between the students' attitudes toward making computer supported education in terms of their class levels are given in Table 5.

Table 5
ANOVA Findings For The Differences Between The Students' Attitudes Toward Making Computer Supported Education In Terms of Their Class Levels

Class level	N	$\overline{X}$	S	Source	Sum of Squares	df	Mean square	F	p	Meaningful differences
Freshman	102	81.17	9.82	Between subjects	874.65	2	437.32	5.473	.005	Fresman~Junior Sophomore~Junior
Sophomore	63	82.36	8.46	Within subjects	17340.82	217	79.91			
Junior	55	86.08	7.62	Total	18215.48	219				
Total	220	82.74	9.12							

As seen in Table 5, there are meaningful differences between the students' attitudes toward making computer supported education in terms of their class levels, $F(2, 217)=5.743$, $p< .01$. LSD post hoc test

was used to determine the sources of the differences and according to LSD test, meaningful differences are found between the attitudes of freshman ($\overline{X}$ = 81.17) and junior ($\overline{X}$ =86.08) students, between the attitudes of sophomore ($\overline{X}$ = 82.36) and junior ($\overline{X}$ =86.08) students toward making computer supported education in favor of junior students in both differences. According to these findings it may be thought that students' attitudes toward making computer supported education are increasing significantly while their class levels are rising.

6.The findings for the differences between the students' attitudes toward making computer supported education in terms of their computer lesson academic achievement scores

ANOVA findings for the differences between the students' attitudes toward computer in terms of their computer lesson academic achievement scores are given in Table 6.

Table 6
ANOVA Findings For The Differences Between The Students' Attitudes Toward Making Computer Supported Education In Terms of Their Computer Lesson Academic Achievement Scores

Academic achievement score	N	$\overline{X}$	S	Source	Sum of Squares	df	Mean square	F	p	Meaningful differences
(1) FD_DD (30-59)	19	78.47	8.75	Between subjects	1299.15	5	259.83	3.28	.007	1~6 4~6
(2) DC (60-69)	40	82.36	11.23	Within subjects	16916.32	214	79.04			
(3) CC (70-74)	79	83.78	7.24	Total	18215.48	219				
(4) CB (75-79)	37	79.86	11.18							
(5) BB (80-84)	25	83.39	7.56							
(6) BA_AA (85-100)	20	87.95	5.81							
Total	220	82.74	9.12							

Because of insufficient number of students in the groups [FD (N=4), DD (N=15), BA (N=15), AA (N=5)], FD and DD groups, BA and AA groups are integrated. Beside, due to the meaningful difference of the Levene statistic (p= .025), Dunnett C was prefered as post hoc test. As seen in Table 6, there are meaningful differences between the students' attitudes toward making computer supported education in terms of their computer lesson academic scores $F(5, 217)=3.28$, $p< .01$. According to Dunnett C test, significant differences are found between the students of these groups: Between FD_DD ($\overline{X}$ = 78.47) and BA_AA ($\overline{X}$ = 87.95) in favor of BA_AA; CB ($\overline{X}$ = 79.86) and BA_AA ($\overline{X}$ = 87.95) in favor of BA_AA. According to these findings it may be thought that generally students' attitudes toward making computer supported education are increasing significantly while their computer lesson achievement scores are rising.

7.The findings for the correlation between the students' attitudes toward computer and their attitudes toward making computer supported education

Pearson correlation findings for the correlation between the students' attitudes toward computer and their attitudes toward making computer supported education are given in Table 7.

Table 7
Findings For The Pearson Correlation Between The Students' Attitudes Toward Computer and Their Attitudes Toward Making Computer Supported Education

	1	2
	Students (N=220)	
1. Attitudes toward computer	—	.69
2. Attitudes toward making computer supported education		—

As seen in Table 7, significant and moderate correlation is determined between the students' attitudes toward computer and their attitudes toward making computer supported education, r= .69, $p< .001$.

RESULTS, DISCUSSION and PROPOSALS

In this study it is determined that, gender variable don't affect students' attitudes toward making computer supported education. Same result was found by Berkant and Efendioğlu (2010) on a paper researching classroom students' computer self-efficacy believes and their attitudes toward making computer supported education. Similarly, Efendioğlu and Yelken (2009) didn't find any correlation between this attitude and the gender. Beside, there are studies indicating higher attitudes of female students (Ekici & Berkant, 2007) and higher attitudes of male students (Cassidy and Eachus, 2002; Işıksal and Aşkar, 2003; Miura, 1987).

Berkant and Efendioğlu (2010) determined that computer lesson academic achievement scores didn't affect the same attitudes. The result of our study indicating significantly increase of attitudes of the students toward computer supported education while their scores are rising is not compatible with the result of their study. Our result is expected, because rise of students' computer lesson achievements may positively affect their view points to the computer and its use in education when they become a teacher. Beside, the results of our study indicate that junior students and the students getting high computer lesson academic achievement scores have higher attitudes toward making computer supported education. Same results from a paper written by Berkant and Efendioğlu (2010) support these findings.

Tuncer and Berkant (2010) researched the students' attitudes toward internet and if we accept the computer and internet together in a same dimension, same and different results with our research can be determined. In their study, students' attitudes toward internet is not affected by their genders and class levels. Similarly Kesici, Sahin ve Aktürk (2009) found no significant differences between male and female students' attitudes toward computer. But in present study, significantly higher attitudes of sophomore and male students toward computer are determined in contrast with their results. This result may become as expected when the nature of using computer is accepted as technical. In society generally men do the technical works and this situation causes development of some sex roles for men and women. Because of these roles, the idea of some requirements especially for psychomotor abilities such as fixing the computer would affect the attitudes of the female students toward computer. Parallel to our results, according to Anderson, Lankshear, Timms and Courtney (2008) female students percieve advanced computing subjects as boring and they express low attitudes to computers. Also, Comber, Colley, Hargreaves and Dorn (1997) determined that boys are havier users of computers than girls and their attitudes toward computers are higher.

In a paper prepared by Efendioğlu and Yelken (2010) the students' attitudes toward making computer supported education were measured and most of the students (91.7%) stated that when they become teachers, they will use computers in their lessons. The students who took place as sample in their study probably had high level attitude toward computer. Because it is an expected situation that the students who have high level attitude toward computer most likely have high level attitude toward making computer supported education. The results in our study regarding meaningful and moderate correlation between these two attitude may confirm this expectation.

This study shows the significant correlation of academic achievement with the attitudes toward computer and with the attitudes toward making computer supported education separately. Students are measured in computer lesson examinations by the use of both theorical and practical methods. In practical methods such as measuring via studying with computer, practice abilities affect students' academic achivements. Thus it is expected from the succesful students to have higher attitudes because of theie abilities.

According to the results, following proposals may be put forward: (1) In this study, male students' significant higher attitudes toward computer are determined. For promoting the attitude level of female students, educational activities may be organized by using educational materials and environments attracting female students' interest. (2) According to results, students' attitudes toward computer and making computer supported education increase when their academic achivements rise. In this context, enterprises and regulations for the learning environments in which academic achievements rise may positively affect the attitudes. (3) In another study, qualitative research methods may be used to determine students' attitudes toward computer and toward making computer supported education.

FOSTERING THE EUROPEAN DIMENSION IN THE *e*LEARNING PROGRAMME CONSORTIA: CATALYSTS FOR THE EMERGENCE OF A EUROPEAN E-LEARNING AREA

Florin D. Salajan, Ed.D.

florin.salajan@ndsu.edu

Abstract

This article discusses the emergence of a European E-Learning Area (EELA) as a consequence of three factors observable in the e-learning developments over the past decade. The first factor consists of the carving of a policy sector in e-learning via formal instruments such as the *e*Learning Programme, the Lifelong Learning Programme and an array of other e-learning policy stipulations embedded in larger policy instruments at European level (e.g., Framework Programme). The second factor is represented by the mainstreaming of e-learning activities, both through formal and informal measures across multiple domains. Finally, the proliferation and consolidation of interlinked networks of practice as incubators of e-learning innovation and sharing of expertise act as the third factor in the shaping of EELA. The conceptualization of EELA, is substantiated through an analysis of the European e-learning policy documentation and the findings of a questionnaire distributed to the coordinators of projects under the *e*Learning Programme. In light of the research findings, theoretical and practical implications for EELA as a nascent policy domain are explored and offered as a basis for further debate on this theme.

Keywords: European E-Learning Area, *e*Learning Programme, European Union e-learning policy, European Union educational policy, European dimension in education

1. INTRODUCTION

In recent years, with the gradual consolidation of ICT implementation and expansion in education, research on aspects of e-learning ranging from policy development, quality assessment, effective utilization and implementation strategies to key pedagogical implications has grown and diversified. The present study is situated in the context of a growing body of research literature on comparative perspectives regarding the problems and successes of e-learning policies and strategies undertaken in various national and cross-national settings, with a particular focus on the European Union (Servaes & Heinderyckx, 2002; Boezerooy & Gorissen, 2004; Debande, 2004; PLS Ramboll, 2004; Dittler, Kahler, Kindt & Schwarz, 2005; OECD, 2005; Salajan, 2007a; MacKeogh, 2008; Stansfield & Connolly 2009). This study is a follow-up evaluation of a previous study I conducted on aspects of policy-making and implementation related to the *e*Learning Programme (Salajan, 2007b). The Programme, which was operational between 2004 and 2006, was the European Commission's dedicated policy program to promote and accelerate the integration of ICT primarily in education, and, by extension in the public and private sectors via educational partnerships. It acted as the continuation of the *e*Learning Action Plan, which was operational between 2001 and 2003. Both the Action Plan and the Programme, which were funded from the EU budget, were the operational components of the *e*Learning Initiative, the political declaration that sought to drive the objectives mentioned above (European Commission, 2001; European Union, 2003).

The previous study had revealed a mixed picture as far as the policies and strategies of ICT implementation in various countries of the European Union were concerned. The in-depth interviews with a number of academics and practitioners from three principal EU countries (Germany, Portugal and Sweden) and several other secondary countries pointed to the differences of approaches in the way the policies were promoted at governmental level. The general dissatisfaction with the cumbersome procedures of obtaining European funding for e-learning projects was an issue often reported by respondents. It was also obvious from the responses received that the e-learning efforts throughout Europe were the result of a grassroots movement of academics sharing common professional and pedagogical interests that accounted for the formation of consortia, partnership and collaboration networks in e-learning. With the present study, I am taking a

structured and methodical approach to measuring the perception and experience of the individuals who held the role of project coordinators under the *e*Learning Programme and, with the help of these accounts, highlight the horizons of a nascent European E-Learning Area. The project coordinators had first-hand experience in developing their project proposals, in obtaining the funding from the European Commission and in managing consortia of at least three institutions from as many countries. Thus, it was sensible, pertinent and necessary to probe this knowledge and experience in order to better understand the dynamics of the *e*Learning Programme and its implications for the European e-learning developments.

The research in this study takes in consideration the 152 project retained for funding out of hundreds of proposals received by the Commission throughout the duration of the Programme.

While the exploratory component of this study on the emergence of a European E-Learning Area is at once observational, theoretical and slightly speculative, for the task of establishing the direction of this study, the research questions guiding it were concentrated around the motivations and expectations of project coordinators under the *e*Learning Programme related to their involvement, in this specific role, in pan-European projects. Normally, only one institution from one country was entrusted with the responsibility to coordinate such a consortium. In most cases, one person from the coordinating institution was designated as the project manager or coordinator.

Against this background, what were the circumstances in which they took the decision to participate? What were the factors that led them to that decision? How did they perceive the administrative procedures of obtaining the necessary funding to get the project off the ground and lead it to completion? What were the specific outcomes of their projects and how satisfied were they with the overall performance of the projects? What were the sustainability prospects of the projects beyond the funded period? What were the most and least rewarding aspects of their participation? These are some of the questions posed to project coordinators and the answers they provided reveal both expected and surprising findings.

The following section constructs an understanding and identifies the structural components of the European E-Learning Area as a developing policy entity. Section 3 explains the methodology and design undertaken to address the research questions articulated for this study. A discussion pertaining to the relevance of the study's findings and conclusions are provided in sections 4 and 5, respectively.

2. CONTOURS OF A EUROPEAN E-LEARNING AREA

As an extension of the discourse on European e-learning, the discussion in this section is related to a body of literature dealing with the convergence of European policies in other sectors, such as the European Higher Education Area, the European Research Area, the European Education Space or the Single European Information Space (DeWit, 2003; Corbett, 2005; Amaral et al, 2009; Dale & Robertson, 2009). All of these latter terms may be construed as natural spin-offs deriving from the integration processes originated by their largely economic predecessors embodied in the Single or Common Market and the European Monetary Union.

This study advances the notion and argues for the acknowledgement of an emerging European E-Learning Area (EELA) governed by normative arrangements similar to those arising in the European Higher Education Area and connoting an implicit "Europeanization" of the e-learning realm. I do not mean European by virtue of a shared belonging to a geopolitical and economic space, but because e-learning actions have become increasingly bound by norms, regulations and "ways of doing things" (Radaelli, cited in Alexiadou, 2007, p. 107) that are intrinsically European, in their institutional origination and formulation.

The departing point in my argumentation supporting the conceptualization of EELA is the communication from the European Commission titled *eLearning – Designing Tomorrow's Education*, also known by its mobilizing title of *eLearning Initiative*. I will deal with the gradual building of a legal framework for European e-learning objectives later on. To set the stage for outlining EELA's substance, I contend that, despite the Commission's explicitly stated intent of keeping the *e*Learning Initiative embedded in the larger discourse of European competitiveness and preservation of its social model evoked by the Lisbon agenda (European Commission, 2000, p. 3), ten years down the line, a parallel process is beginning to take shape. While this may have been an unintended consequence of the peculiarities of European policy-making, it is quite possible that it satisfies an unexpressed sentiment in the Commission that eLearning should have

transcended to a European level and take its place in the armamentarium of other policy streams that have acquired a distinct European scope.

Consequently, as I explain below, I take a three-pronged approach to defining EELA and regard it as the incipient development of a consistent policy at the European level in contrast to investigations of e-learning policies designed at national level. Thus, I consider the impalpable and inexorable shaping of EELA a distinctively different phenomenon from actions taken at purely national level, typically presented as a mosaic of somewhat disparate realities of e-learning programs in individual European countries (see, for example, Dittler et al, 2005). I propose that systematic actions at European level have given rise to a new kind of e-learning appropriation beyond the realm of national policies, not necessarily confined to the exclusive domain of education. The intensification of e-learning transactions and interactions in Europe, with the support of initiatives designed by European sponsoring entities (the European Commission, the European Parliament and the Council of the European Union), has provided the breeding ground for a novel embodiment of e-learning permeating multiple sectors that, at first glance, might seem unrelated to one another.

Although the main sector of applicability for e-learning programs, education is not the only domain in which the European e-learning policies find their justification. Just as we conceive of a European Educational Area or European Educational Space (Hingel, 2001; Dale, 2009; Robertson, 2009), we can acknowledge a European E-Learning Area which emerged somewhat unintentionally and independently from the initial objectives embedded in the e-learning actions and initiatives promoted by the European Union. While EELA may appear as elusive a term as the presumed European Educational Area, it is not inappropriate to suggest here that the former subsumes the latter and not the other way around. The provision of e-learning, spurred by the e-learning initiatives at European level, has expanded beyond the boundaries of the traditional educational space, forming networks comprised of industrial organizations, social alliances, civic associations, non-governmental groups and institutions of governance, each utilizing and adapting e-learning solutions for specific purposes. With the assistance of the EU-supported e-learning programmes in their various guises (the *e*Learning Programme, the Lifelong Learning Programme, the recurring IST Programme under the Seventh Framework Programme, etc.) it was only a matter of time until the amplification of the density and intensity of e-learning exchanges within these networks would logically lead to the materialization of EELA.

European e-learning activities have distinct roles, scopes and objectives, as opposed to e-learning activities unfolding at and below the national levels. While national initiatives in e-learning may embrace and promote cooperation between domestic entities and counterparts from European countries, they can only support European engagement in e-learning on a limited basis, sometimes confined by the domestic entities' pre-existing preferences for collaboration with a small number of European partners. This limited approach through national initiatives, while still conducive to a small-scale Europeanization of e-learning within those collaborative partnerships, may sometimes impede the genuine transfer of e-learning expertise to potentially interested beneficiaries of e-learning products, services and ideas in the wider European arena. Addressing this larger scope certainly requires a broad vision and approach to e-learning from European perspective. Thus, formalized and established European e-learning policies create a distinctively unique appropriation of e-learning activities not solely for the enhancement of ICT-supported actions, but also to consolidate the "European dimension" so often cited in EU institutional discourse. We are not simply talking about the presence of isolated and insulated efforts in e-learning at national levels, but deliberate and specifically directed activities that have as an end result the construction of an area of e-learning that purposefully assumes a European-centered approach with the express intent of conferring a European identity to e-learning-related actions.

To scholars and students of European integration in education, the features of EELA will look somewhat familiar. As an ideational tool and a guiding construct for the amalgamation of the e-learning transformative policy directions in Europe, it is a useful exercise to conceive of EELA as resting on three pillars:

1. ***Formal legislation*** for the deployment and administrative oversight of e-learning objectives at European level;
2. ***Mainstreamed e-learning activities*** through *de jure* measures and *de facto* pressures across multiple sectors deriving benefits from these activities;

3. ***Interlinked networks of practice*** serving European e-learning actors in their pursuit of promoting the acquisition of ICT-related skills, regardless of domain.

3. AN EMPIRICAL EXPLORATION OF EELA

Having sketched out the theoretical foundation of EELA, we need to provide empirical evidence that substantiates its conceptualization. For this purpose, I am using the results of an online questionnaire which was distributed to the designated lead coordinators of projects under the *e*Learning Programme (from this point forward abbreviated as ELP). The choice of ELP for the purpose of this investigation is justified by the fact that, at the time of this research (2008-2009), it had been the only dedicated policy instrument for e-learning designed specifically at European level. Moreover, it provided the largest number of completed projects at the time, with some projects from the last calls for proposals launched in 2006 entering their very final stages of operation. The Lifelong Learning Programme, which acquired jurisdiction for e-learning-related actions, is only now reaching its mid-point of operation. Therefore, a comprehensive assessment of all the e-learning projects unfolding under it will only be possible once it nears completion in 2013.

3.1 Selection of participants

The participants in the study were contacted through the email addresses publicly available on the European Commission's ELP website. While in isolated cases the project coordinators were either unreachable because their email addresses had lapsed or because they ceased involvement in the projects at an early stage, the overwhelming majority of the project coordinators were contacted successfully. In cases in which the original contact information was outdated, alternate email addresses were either requested from coordinators' colleagues listed on the individual projects' websites or obtained from the organizations with which the coordinators had been affiliated. The first call for participation in the study was sent in April 2008 to former and, at the time of survey distribution, current project coordinators. Data collection was completed in May 2009.

3.2 Survey instrument design

The 22 items included in the questionnaire contained a mix of multiple-answer, Likert rating scale and essay questions. Apart from the pre-determined answer choices included, each questionnaire item had an added comments field which allowed the respondents to elaborate or offer further details to their selected answer.

The questionnaire was divided into five sections, depending on the type of information solicited through the questions. Thus, the first section collected general information about the project. The second section focused on the administrative aspects of the project experience. The questions in the fourth section inquired about the outcomes of the project. In the fourth section, the coordinators' satisfaction with the project was probed. Finally, the fifth section contained an open field meant to collect any additional comments related to the project from the participants in the study.

Once the questions were developed, they were pre-tested on a small sample of subjects from European institutions participating in the ELP to ensure relevance, comprehension and accuracy of the measurement items. The rating scales in the final version of the questionnaire were checked for construction reliability and validity with the *Survey Quality Prediction* tool (http://www.sqp.nl/) developed by Saris, Gallhofer and van der Veld (Saris and Gallhofer, 2007). Validity, reliability and quality levels were satisfactory, with coefficients for the rating scales ranging between .968-.975, .779-.829 and .756-.807, respectively.

3.3 Survey response items validation

Before the actual research analysis could be completed, the rating scale items on the questionnaire were tested post-data collection for internal consistency reliability, using Cronbach's alpha reliability coefficient. The alpha reliability value of .766 obtained indicated that the data collected via the rating scales show satisfactory reliability, in excess of the .70 level routinely considered adequate for survey instrument items (DeVellis, 1991).

In addition, item non-response bias was considered to pose a problem for the validity of the results, given the choice of some respondents to leave certain items unanswered. However, the non-response proportion per each rating scale was below the 5% threshold normally accepted in survey research (Silvey 1975, Fowler 2009), rendering item non-response bias negligible in the totality of the data collected. An exception to this rule can be made in the case of one question, which probed the opinion of the project coordinators on the logistical support they received from their national governments. Given the particularities of certain projects, a number of respondents provided textual responses only, specifying that, in their projects' cases, governmental support was either unnecessary or was not solicited. Thus, the resulting number of responses to that question was sensibly lower and item non-response was higher than the 5% threshold.

3.4 Geographic and thematic distribution

A total of 113 individual responses were received, representing 126 separate projects under the ELP in the paper. The cause of this imbalance between the individual responses and the actual number of projects covered by the responses rests in the fact that some respondents coordinated more than just one project. In one instance, because of a shared experience with their individual projects, several coordinators delegated one person to complete the questionnaire on behalf of all the projects. Consequently, the 126 projects covered in this study correspond to a response rate of 82.9% of the total of 152 projects selected by the Commission for funding under the ELP between 2001 and 2006.

Perhaps not surprisingly, the regional distribution of the coordinating institutions in this study's sample revealed that the larger member states of the European Union have been more active than the smaller member states. The data representing the countries that coordinated ten or more projects indicated that Italy (17.5%) was the country with the largest proportion of coordinating institutions, followed by Germany (14.3%), France (11.9%), Spain (11.1%), United Kingdom (9.5%) and Belgium (8.7%). Coordinating institutions from these six countries combined represent 73% of the entire sample of 126 projects included in this study. This situation is a confirmation of an earlier study conducted on behalf of the European Commission by the Time Center of the Grenoble School of Management. The Grenoble study is used here as a measure of intermediary comparison with the results of the present study on the timeline of the ELP. Covering 60 projects from the 2001-2003 period of the *e*Learning Action Plan (the predecessor of the ELP), the Grenoble study showed that the same six large member states accounted for 83.3% of the total number of coordinating institutions in e-learning projects: France and Italy (21.6% each), Germany (13.3%), Belgium (10%), and Spain and United Kingdom (8.3% each) (Grenoble, 2008, p. 27). Even though the ranking order is different in these two instances, it is clear that institutions from these six member states claimed a larger involvement from the early stages of the ELP and maintained this dominant stance throughout its duration. Consequently, they attracted more European funding than institutions in smaller member states.

While only coordinating institutions were considered in this study, if we take into account the total number of participating institutions in the ELP, it is evident that the state of affairs is somewhat similar. From the 729 partner institutions involved in the projects represented in this study's sample, 401 or 55% of the partners hailed from the six member states, out of a total of 37 countries participating in the ELP (Figure 2). Taking the Grenoble study once again as a temporal point of comparison, a similar picture emerges. Thus, the proportional distribution per country of origin of the 477 participating institutions in the Grenoble study was the following: France (13.8%), UK (14%), Italy (12.4%), Germany (9.9%), Spain (9%) and Belgium (8.2%) or a combined 67.3% for these six countries out of the total number of participants counted in that study. The favorable differential for the Grenoble study as compared to the present study is attributable to the simple observation that, by the end of the ELP, existing and additional countries, including member states from the 2004 wave of enlargement, had taken on more coordination responsibilities, thus diluting the proportion of the six countries in the overall sample.

When it comes to the themes under which the projects were categorized, these are well distributed across the themes and funding years of the ELP. Thus, *Digital Literacy*, with 20 projects (15.9%), is the theme with the largest number of projects represented in the sample. Remarkably, all the projects in the *First Phase* theme, that is 10 out of 10, representing the highest proportion of projects under any theme, are included in the sample. The *Media Literacy* and *Virtual Campuses* themes closely follow *Digital Literacy*, each with 19 projects (15.1%) of the study sample. In terms of the absolute number of projects selected in one year, 2003 was the most prolific in this sample, with 35 (79.5%) of the initial 44 projects selected that year. Proportionately speaking, however, 2006 had a larger share of projects represented in the sample, with 18 (94.7%) of that year's 19 projects.

One new development that stands out in this study, in comparison with the Grenoble study, is the presence of three member states from the last two rounds of EU enlargement. Bulgaria, Czech Republic and Poland each figure with one institution in the role of project coordination, although Bulgaria had not been a member state at the time the last call for proposals was issued. We also note that two countries outside the EU are represented in the sample: Norway, with 2 projects and Switzerland, with 1 project. Having provided a synopsis of the basic data about the projects studied, the following section provides an analytical view of the responses supplied by the participants in the study.

4. IMPLICATIONS FOR EELA

The results indicate that the coordinators were considerably disappointed or frustrated with the administrative criteria and procedures that have to be followed in order to obtain the funding necessary for the initiation and completion of their projects. Indeed, they cited bureaucratic requirements, administrative overhead and the limited duration of funding for their projects as the least rewarding aspects of their participation in the project. Despite these apparent shortcomings, it is not surprising that project coordinators placed a higher value on the support received from the European Commission, in comparison with that received from their home institutions or particularly from their national governments. It is plausible to claim here that having a vested interest in the success of the ELP, the Commission would only naturally seek to provide support to the largest extent possible to the coordinators (and, by extension, to the project participants) of the projects that the Commission itself selected for funding.

The close rating that the home institutions received from coordinators on that same aspect can be attributable to the following factors: the favorable financial implications deriving from the acceptance of a project for European funding; a genuine interest in collaboration in e-learning at European level; raising the reputation of the home institution among its European counterparts; and the possibility of continuing e-learning partnerships. The low expectations regarding governmental support should come as no surprise, since, being administered through European agencies, the projects do not normally require the national governments' involvement. Where such involvement exists, this may be usually limited to governmental agencies that provide training and advice on how to effectively apply for European funding, but these services may not always be available or known in all cases.

Even though the financial component of the projects seems to be an important catalyst in the drafting of project proposals, it is somewhat surprising that this aspect is not the lead factor that drives the e-learning practitioners to take on the mantle of project coordinators. They are rather motivated more by professional reasons than financial considerations. As we have seen, the possibility of attracting European funding was only the fourth most important factor that determined the respondents to assume the coordination responsibilities for their individual projects. In turn, they gave more attention to the opportunities to develop and disseminate information on e-learning best practices as well as to the prospect of working on new e-learning initiatives. This speaks volumes to the dedication that e-learning professionals, such as the respondents in this study, show for the advancement of ICT in European education. Further proof of this enthusiasm for e-learning presents itself in the level of collaboration that the coordinators thought characterized their projects. It is clear from the responses collected that the consortia of partner institutions in the ELP were highly productive environments which yielded positive outcomes. It is, perhaps, partly due to this spirit of dedication that most coordinators considered their projects sustainable beyond the completion date under the ELP, even though this also meant that funding from this source would cease. However, the formation of partnerships, the experience accumulated during the Programme, the professional networks

developed and the research dissemination resulting from the projects seem to create favorable prospects for the projects to continue, by attracting funding from other sources.

While the coordinators in this study had relatively modest impressions regarding the impact of their projects within their home institutions and in their national contexts, it is evident from the study's findings that they were highly satisfied with the outcomes of their projects. As a direct consequence of this experience, in what could be considered a "passing mark" for the ELP as the framework within which the projects yielded their results, the vast majority of the coordinators indicated that they would participate in future e-learning projects benefiting from European funding. Essentially, a combination of positive collaboration, satisfactory outcomes and the fulfillment of professional interests outweigh the more tedious and cumbersome aspects of project coordination.

Having synthesized the more observable patterns in the data resulting from the coordinators' responses, it is now necessary to briefly reflect on how these measured perspectives inform the crystallization of EELA. First, the pan-European consortia formed by the coordinators and their institutions provided a conduit for the exchange of practices and innovation resulting in mutually beneficial products or services that may have not been possible in the absence of the express support of a dedicated policy program at Community level. Second, the convergence of participants in a European e-learning venue enriched the participants' own experiences and provided a platform for their further professional development. Third, the collaborative work fostered by the consortia, in many cases, contributed to the promotion of e-learning results in the coordinators' home institutions or countries and, by extension, to the initiation or consolidation of e-learning processes in those jurisdictions. Finally, it is indubitable that the network connections, both institutional and individual, cultivated during the consortia partnerships have had the most lasting effects that are likely to fuel future e-learning developments at European level.

Pulling these four threads together, we notice that they correspond to the features of EELA. However relevant and supportive the data of this study are of the conceptual model of EELA, we cannot venture too far in stating that ELP has fundamentally revolutionized the e-learning landscape in Europe. These are the early stages of a policy-driven common area of e-learning for Europe and the Community is still cautiously treading the delicate balance between the levers of decision-making assigned at Community and member state levels in this realm. Nevertheless, the relevance of EELA as a policy domain cannot be understated. Its recognition would allow for the prioritization of e-learning measures at European level so that e-learning policy initiatives can be made compatible, both horizontally (among Member States) and vertically (between Member States and the Community). As a more important practical aspect, the formal support and long-term commitment of the Community for EELA could ensure that funding for e-learning actions is assigned a precise proportion in each EU budgetary cycle. In terms of application and enforcement, a formally agreed-upon EELA would not entail the drafting of new rules for quality assurance, accountability and progress tracking. Instead, it could adopt and adapt the benchmarking procedures employed in the Bologna process, via the open method of coordination now customary in dealing with policy formulation, implementation and monitoring in the European Higher Education Area.

5. CONCLUSION

The ELP has opened and fostered a space of collaboration in European e-learning that has contributed to development of a sharing of expertise and knowledge throughout networks of e-learning professionals. While the full impact of the Programme is difficult to quantify to the fullest extent, the kaleidoscope of perceptions offered by project coordinators converge to a common point of assessment for European e-learning in this particular case: the final products of collaboration are worth pursuing in the face of laborious and demanding criteria for European funding.

Whether the ELP, by itself, has contributed to a pervasive integration of ICT in education and society is an open question. What can be surmised from this study is that ELP has provided viable models of e-learning practices that can be replicated in various parts of Europe, which have not yet benefited from the collaborative networks formed through the Programme. It can only be hoped that the wealth of expertise and knowledge generated through these projects will continue to spread through other European programmes. With the inclusion of some of the ELP's objectives and outcomes into more comprehensive programmes, such as the Lifelong Learning Programme, there is increased potential for e-learning to broaden its reach

through multiple layers at the intersection of education and society in Europe. In doing so, the seeds sown by the Community in the early stages of e-learning policy formulation at European level are bound to gradually grow into a genuine and established space for e-learning on which Europe can rely in its quest for innovation in the service of socially responsible competitiveness.

Abstract: In this paper we will consider the advantages about using the interactive table in the mathematics class during the educational process. Students are in the center of each process of education, so we look for a different methods to make easier, simplest and fast approve of the knowledge. Using this interactive table in the education, we have a lot of positive affects because with it the work of the teachers gets easier, the students learn new knowledge simply, and most important of all we receive great attention. In this paper we will regard organization on mats classes, for approve new contain – fractions and operation with fractions.

Keywords: Fraction, interactive table

Introduction

When we are talking about an education actually we means a process which is affected from the social life. We can say that with better quality of life and advancement of the technology the education is development too. All news in technology affects on a society and with better social life we have a better educational process. With using on technology invention education became successful, more interesting and is easier for understand from the children. In the center of focus in each educational process is a child, so we are looking different ways to make the education easier process. We can say that with using a interactive white table in the education, the education became easier, the teachers work is more easier than before, and the most important thing is that we can easy keep the children's attention. The traditional process of organization of class usually can be monotony for the children. With using a interactive white table, the class became more interesting, because the children are included in the process of organization. As well as the children successfully absorb the new knowledge and achieve better result.

Interactive white table

The **SMART Board interactive whiteboard** is a product of SMART Technologies. It is a large, touch-controlled screen that works with a projector and a computer. The projector puts the computer's desktop image onto the interactive whiteboard, which acts as both a monitor and an input device.

The first SMART interactive white table is produced in 1991. It was sample but has some of the same function as the modern interactive white table. It was the first interactive table which accomplish control with touch (contact) on computers applications and annotation on standard Microsoft Windows applications.

An interactive whiteboard is a large interactive display that connects to a computer and projector. A projector projects the computer's desktop onto the board's surface, where users control the computer using a pen, finger or other device. The board is typically mounted to a wall or on a floor stand. They are used in a variety of settings such as in classrooms at all levels of education, in corporate board rooms and work groups, in training rooms for professional sports coaching, broadcasting studios and more.

Interactive whiteboards are used in many schools as replacements for traditional whiteboards or flipcharts or video/media systems such as a DVD player and TV combination. In addition, some interactive

whiteboards allow teachers to record their instruction as digital video files and post the material for review by students at a later time. This can be a very effective instructional strategy for students who benefit from repetition, who need to see the material presented again, for students who are absent from school, for struggling learners, and for review for examinations.

In most cases, the touch surface must be initially calibrated with the display image. This process involves displaying a sequence of dots or crosses on the touch surface and having the user select these dots either with a stylus or their finger. This process is called alignment, calibration, or orientation. Fixed installations with projectors and boards bolted to roof and wall greatly reduce or eliminate the need to calibrate. A few interactive whiteboards can automatically detect projected images during a different type of calibration.

A variety of accessories is available for interactive whiteboards:

- Projector — Allows a computer display to be projected onto the whiteboard. 'Short Throw' projectors are available from some manufacturers that mount directly above the board minimizing shadow effects. 'Ultra Short Throw' projectors are even more effective.
- Track — Allows the whiteboard to be placed over a traditional whiteboard or tackboard to provide additional wall space at the front of the room. Some tracks provide power and data to the whiteboard as well.
- Mobile stand — Allows the interactive whiteboard to be moved between rooms. Many are height adjustable as well.
- Printer — Allows copies of the whiteboard notes to be made.
- Slate or tablet — Allows students control of the whiteboard away from the front of the room.
- Personal Response System — Allows students to answer test questions posted on the whiteboard or take part in polls and surveys.
- Wireless unit — Allows the interactive whiteboard to operate without wires to the computer, e.g. Bluetooth.
- Remote control — Allows the presenter to control the board from different parts of the room and eliminates on-screen toolbars.

The SMART Board software bundle comprises Notebook white boarding software and SMART Board Tools. Versions are available for Windows, Mac, Linux, Solaris and SGI (Irix) operating systems.

SMART Board Tools are the start centre, spotlight, screen shade, magnifier, floating tools, on-screen keyboard, LinQ software, video player and recorder. And the notebook is also good for teaching and printing.

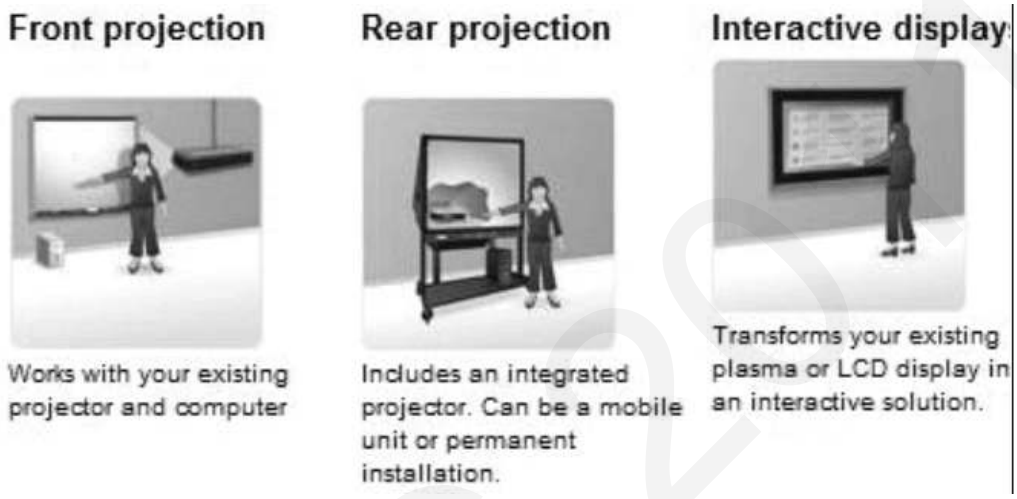
The SMART Board interactive whiteboard works with any program loaded or available on the host computer. Some applications commonly used with the SMART Board interactive whiteboard are Microsoft PowerPoint, Excel and Word, and AutoCAD. Uses for the SMART Board interactive whiteboard include teaching [4], training, conducting meetings, and delivering presentations.

Interactive whiteboards are generally available in two forms: front projection and rear projection.

- Front-projection interactive whiteboards have a video projector in front of the whiteboard. The only disadvantage to these boards is that the presenter must stand in front of the screen and their body will cast a shadow. Presenters quickly learn to compensate for the shadow by slightly extending their arm with or without a stylus. This disadvantage is mitigated when using an Ultra-Short-Throw (UST) projector, which casts its beam from above and just in front of the IWB surface, removing the presenter from the beam's path.

- Rear-projection interactive whiteboards locate the projector or emmisive display behind the whiteboard sensing surface so that no shadows occur. Rear-projection boards are also advantageous because the presenter does not have to look into the projector light while speaking to the audience. The disadvantages of these systems are that they are generally more expensive than front-projection boards, are often very large, and cannot be mounted flush on a wall; however, in-wall installations are possible.

Some manufacturers also provide an option to raise and lower the display to accommodate users of different heights.



1. Interactive whiteboards with front projection and rear projection.

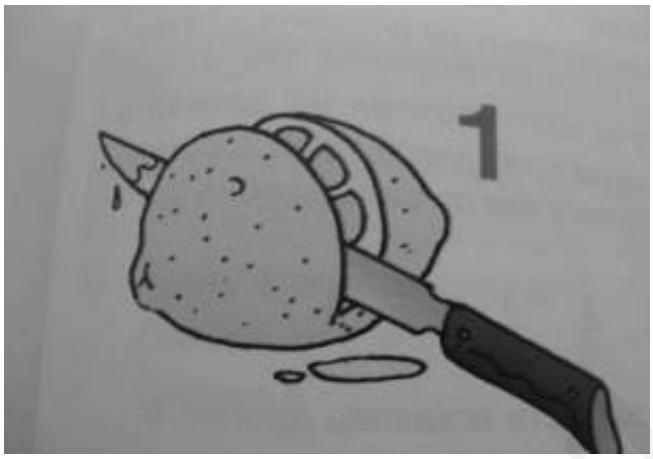
Short-Throw Projection Systems and Interactive Whiteboards

Some manufacturers offer short-throw projection systems in which a projector with a special wide angle lens is mounted much closer to the interactive whiteboard surface and projects down at an angle of around 45 degrees. These vastly reduce the shadow effects of traditional front-projection systems and eliminate any chance for a user to see the projector beam. The risk of projector theft, which is problematic for some school districts, is reduced by integrating the projector with the interactive whiteboard.

Use the interactive white table in the mathematics class

We will explain how the interactive table can be used for easier and more clearly understanding on concept of fraction. To keep the children attention we start the class with one simple example. \

Example 1: One lemon is separated of two peer parts. We gain two half. When again we combine two half we gain one whole.



2. Lemon separate on two parts

Example 2. One square is separated of four peer parts. We can colour these parts in different color. For example we show a quadrat which is separate on fort part and tree of them are in black color. The parts with black color show the salient parts and the number four is showing how many parts have the all object.

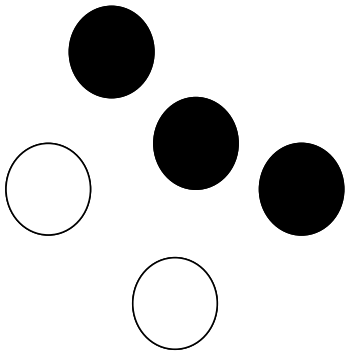
3. square separated on four parts

After, we show them some others examples of object which are separated differently on more parts.

We should include the children in the educations process, with exercise which they should done. We show different fraction to the children and they should separated objects with the correctly part, and color the necessary parts.

We explain to the children, that any fraction is containing from denominator and numerator. On which parts is separate fraction is shown by denominator, and how many parts are taken from them is shown by numerator.

|We show them set with 5 elements, from which 3 are in black color and 2 are white. We explain that with black elements from the set, we shown the fraction 3/5. After that, we give on the children exercise with sets and they should write the true fraction behind them.

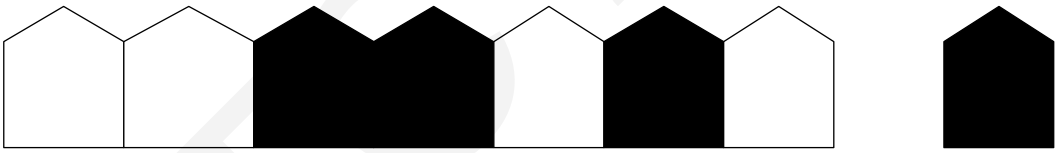


4. set with 5 elements

We explain them that the fraction can be used in practical exercise. We give example with dividing, as the example when the number 8 is separated in 2 parts (at the same time, we show this and on interaction table). We give example, how many is 1/3 from the number 6, and children solution similar example alone. From this we conclude that the children have understood the concept of fraction.

On following example, we show one object which is contain from 6 parts, 3 parts are in white color and 3 in black color. The children should color object on other way, but whit same colors and 3 part with black and 3 with white. From this exercise, they should to understand that is not important where the part is based, but is important to still 3 parts, and that the fraction is 3/6.

With following example, we regard fence which is color in different color. We ask children how many parts from fence are color black and how many white.



5. fence which is color in different colors

We explain to the children, that we can do operation with fraction, ass addition and subtraction. We show some examples with addition, as 1/4+1/4. We explain them, that we should to add 1 and 1, and result is 2. Because denominator is equal for the two fractions, the result of addition is 2/4. After this, the children do addition with fraction themselves. Also, we show some examples with subtraction on fraction. For example, we explain, which fraction will be gain if from the fraction 3/4 is subtraction the fraction 1/4. We explain that we should to calculate 3 – 1 = 2. And because the denominator is equal for the two fractions, the result is 2/4. After, the children do subtraction with fraction themselves. \

Conclusion

When we use the news of the technology we make the education process closer, more interesting and easier for understanding.

If we want to have an interesting and successful class we should use interactive white board and the results are infallible. They have positive impact on the children attention and to increase the children motivation.

We use interactive white board in elementary school for replacing the traditional table, audio and visual aids.

FROM COMPUTER LITERACY TO COMPUTERS FOR COMMUNICATION COURSE

Asst. Prof. Dr. Agah Gümüş

Asst. Prof. Dr. Bahire Efe Özad

ABSTRACT

Undoubtedly, at the outset of the new millennium, technology has an incredible impact on our lives. Particularly, its influence on communication technologies has been changing the communication patterns. Parallel to the other fields, these changes influence education. In education, the discussion of whether to teach through computers or not let its place to a situation where technology is integrated in everyday teaching activities and the issue has been replaced by the extent to which teaching involves Computer Mediated Communication. This fast spread of technology has led to alterations of curricula and the contents of the courses that have been intended to guide tertiary students towards being computer literate.

The present paper sets to compare the efficiency of Computer Literacy course provided at the Eastern Mediterranean University's Faculty of Communication and Media Studies with the Computers for Communication course which replaced Computer Literacy course almost after a decade. The questionnaire prepared and administered in 2002-2003 academic year is applied to 30 students who took the Computers for Communication course in the 2010-2011 Academic year fall term and results are compared.

Key words: computer literacy, Computer Mediated Communications, Communication and media education

The end of the 20th century has observed a smooth but fast transition from traditional literacy to computer literacy (Gümüş & Akter, 2002). Similar to other disciplines, developments in technology has had an immense impact on education. Indeed, Sherblom (2010) points out to Thompson (2008) who suggests that: "There is a 'prevalence of computer-mediated communication (CMC) in education". From this change, particularly Computer Literacy courses have been affected since the students that come year after year are better equipped with technology. Rainie (2006) asserts that "Today's young adults have grown up in an environment rich with digital communication technologies". The expedited spreads of communication technologies necessitate constant changes in the curricula of the courses, particularly the ones that are targeting to improve computer literacy of the students.

The present study sets out to compare the computer literacy skills of students who study at the Faculty of Communication and Media Studies of the Eastern Mediterranean University over almost a decade. After almost a decade, one of the two computer courses (Computer Literacy and Computer Mediated Communication) is removed from the curriculum and replaced by a single course named as Computers for

Communication. The initial study was conducted as pre-test – post-test application. The findings of the first research were presented in IETC 2003.

The word 'literacy' is rather problematic. Despite the fact that literacy, initially, meant ability to read and write, parallel to technological developments, terms like computer literacy, technological literacy, information and digital literacy started to emerge. These terms may emphasize different aspects of technology; however, they can also be used synonymously. In other words, in addition to its original meaning of possessing the basic skills of reading and writing in the mother tongue, the term 'literacy' has taken over a variety of meanings over the time. Currently, a contemporary person needs multiple literacies and among these, 'digital literacy' occupies a significant place in our lives (Goodfellow, 2011).

Computer Literacy

Computer literacy is not a static term. It takes up a variety of meanings as the developments take place and change from one context to another. According to Dictionary of Media Studies (2009:48) it is defined as: "Understanding of basic principles of computers, related expressions and concepts, and the ability to use computers for programming or applications". Indeed, another definition of computer literacy suggests that it covers the:

> knowledge and ability to use computers and related technology efficiently, with a range of skills covering levels from elementary use to programming and advanced problem solving. Computer literacy can also refer to the comfort level someone has with using computer programs and other applications that are associated with computers. Another valuable component of computer literacy is knowing how computers work and operate. … The precise definition of computer literacy can vary from group to group (http://en.wikipedia.org/wiki/Computer_liteacy).

In the continuation of the above quotation, computer skills are divided into 3 categories as basic, intermediate, and advanced. Basic skills include items like switching on the computer, ability to use mouse in order to interact with the monitor and ability to use the computer keyboard. Intermediate skills cover: word processing, using e-mail, spreadsheets, databases, the Internet, installing software and operating systems. Advanced skills comprise programming, using computers for research, ability to fix software conflicts and computer hardware (http://en.wikipedia.org/wiki/Computer_liteacy).

In higher education contexts, the expectations from computer literacy changes with the skills of the newcomer students. The present study focus on the intermediate computer literacy skills of the tertiary students studying at the Faculty of Communication and Media Studies in the Eastern Mediterranean University in 2002-2003 and 2010-2011 Academic years.

Computer Mediated Communication

Computer-mediated communication (CMC) is:

> as any communicative transaction that occurs through the use of two or more networked computers. While the term has traditionally referred to those communications that occur via computer-mediated formats (e.g., instant messages, e-mails, chat rooms), it has also been applied to other forms of text-based interaction such as text messaging.[2] Research on CMC focuses largely on the social effects of different computer-supported communication technologies. Many recent studies involve Internet-based social networking supported by social software (Wikipedia).

The outset of the new millennium has observed expedited spread of Computer Mediated Communication in education (Sherblom, 2010; Thompson, 2008; Truman and Schrodt, 2005). This is not merely so in higher education. Boster et. al (2006:46) draw our attention to the fact that Computer Mediated Communication "is changing the landscape of elementary, secondary, and college classrooms". Despite its widespread use, they further point out that there is "a dearth of strong evidence that it enhances educational performance".

Sherblom (2010: 497) maintains that Computer Mediated Communication classroom instructor can developed positive classroom interaction, relationships and learning experiences. Sherlblom (2010) summarizes the theoretical perspectives of the classroom CMC as:

- The medium and media richness
- Social presence
- Interaction through Social Information Processing
- Identity and deindividuation
- Hyperpersonal relationships
- Critique and Context.

Hrastinki and Keller (2007:62) review recent research (between 2000-2004) on Computer Mediated Communication in education. They suggest that although this is a relatively new research area, literature is growing and it mostly gives what they call 'anecdotal advice'.

Hoag et. al. (2003), review the literature on the use of computers in journalism and media education. They classify the literature into four areas as: computer use in course design, student attributes in a digital learning context, the role of digital information in student learning outcomes and role of faculty attributes. Indeed, they (2003:401) point out that: "Increased computer use has a positive effect on perceived computer self-confidence as well as on computer related articles". In relation to student success in computer-driven classes they conclude that some studies suggest that there is a significant correlation between students' performance and past experiences.

In relation to the use of Computer Mediated Communication in Communication studies, Lane and Shelton (2001:241) asserts that "The Communication discipline's current CMC pedagogy is typical of higher education's outlook toward CMC and all information technologies". They further maintain that:

> The communication discipline can neither turn away from any mode of communication, nor can it practice an educational philosophy that is not grounded in practical use and access issues as well as creative evaluative issues. *Communication* is obviously an inherent part of computer-mediated-communication. In fact, there is a centrality to the role of communication in CMC" (p.242).

Research Methodology

The present study has been designed as a comparative study of students' attitudes towards the computer courses provided by the Faculty of Communication and Media Studies at the Eastern Mediterranean University in North Cyprus. In 2002-2003 academic year, there were two computer courses: one was Computer Literacy and the other was Computer Mediated Communication. In 2010-2011 academic year, on the other hand, merely Computers for Communication course is provided. In the present study, the comparison is made with respect to academic use of computers such as: Email, word processing, searching through the Internet, belief in the Internet content, making web pages, and preparing power point slides.

As it has been mentioned earlier, the study comprises two parts: for the first part of the study data was collected by giving a questionnaire to the 184 freshmen students studying at the Faculty of Communication and Media Studies, at the Eastern Mediterranean University at the end of the Fall semester of the 2002-2003 Academic year. The questionnaire sought to explore their skills in relation to the six points (E-mail, word processing, searching through the Internet, belief in the Internet content, making web pages, and preparing power point slides) mentioned above. Almost a decade later, in the second part of the study the same questionnaire was given to the 32 freshmen students of the same Faculty at the end of Fall semester in 2010-2011 academic year. The comparison is made with respect to the percentages of the responses to the questionnaire.

Analysis and Findings

In the 2002-2003 academic year out of 184 students who replied the questionnaire 101 were male and 83 were female whereas in the 2010-2011academic year, out of 32 students 18 were male and 14 were female.

For the first part of the study, the analysis of the data shows that 53% of the respondents feel very good about using the e-mail. 26% feel satisfactory and 16% feel not very good about using the computers. 5% said that they had no skills in that area. In the second part of the study, after eight years, the percentage of using e-mail good or very good was 80% and the percentage of feeling satisfactory was 16%. Only 3.2% of the respondents said that they are not very good in using e-mail. None of the respondent mentioned that they have no skills in using the e-mail.

In the first part of the study, 26% of the students' mention that they feel good or very good about the use of word processing. 39% mentioned that they felt satisfactory, 29% said that they did not feel very good and 4% mentioned that they had no skills in the area. After eight years, the students who responded to the same questionnaire mentioned that 49% are good or very good in using the word processing, 29% of the students felt satisfactory and 25.8 % said that they did not feel very good in using word processing. No students noted that they have no skills in using the word processing.

In the first part of the study, almost half of the respondents mentioned that they felt good or very good about searching through the Internet. 37% mentioned that they felt satisfactory about their use of the Internet. 15% felt they were not very good, 2% said that they had no skills at all. 3% did not answer this question. At the second part of the study 64.5% of the respondents said that they are good or very good in searching through the Internet and 35.5% felt satisfactory. None of the respondents mentioned that they are either not very good or have no skills in searching through the Internet.

In the first part of the study, 44% of the students were disagreed and 27% of the students were strongly disagreed but only 19% of the respondents were agreed in believing the materials they found from the Internet. at the second part of the study, 38.7% of the respondents mentioned that they were strongly agreed, 45.2 said that they were agreed and only 3.2% were completely disagreed with believing in the materials they were found from the Internet.

Initially, 12% of the freshman students mentioned that they were good or very good at making web pages. 18% felt satisfactory and 30% felt that they were not very good at, and almost 38% mentioned that they had no skills in preparing web pages. 3% did not answer this question. After eight years, 9.7% were good or very good at making web pages, 9.7% felt satisfactory, 25.8% mentioned that were not very good in making web pages and 54.8% said that they have no skills in this area.

In the first part of the study, 23% of the respondents mentioned that they felt good or very good about preparing power point materials. 28% felt satisfactory 26% felt not very good, 22% had no skills and 2% did not answer. In the second part of the study, 51.6% of the students said that they were good or very good, 35.5% felt satisfactory and 12.9% said that they were not very good in preparing power point slides.

Conclusion

The comparison made between the percentages of the responses given to the same issues in 2002-2003 and 2010-2011 academic years indicate that the use of the Internet increased and the Internet established itself as the main source of reliable information. However, tertiary students use the Internet more as consumers rather than producers.

In the conclusion of Gümüş & Özad (2003: 237), it was pointed out that: "Students living in the 21st century must be information literate. This means that, they must have the ability to access, evaluate and use information". The results of the present study indicate that current students are more information literate than the previous ones.

There has not been a significant increase in the ability to make web-pages. Indeed, Dippold (2009:31) warns us against the fact that one's familiarity with the technology does not necessarily mean that students posses the skills to use these tools in educational contexts,

It is also observed that students studying in 2010-2011 use and feel good about using power point more than previous students. This indicates that Computer Mediated Communication has entered primary and secondary education and tertiary students are familiar with power point from their previous education experience.

The results of the study suggest that although the computer literacy skills of the current students better developed, these developments are mostly in the areas where social communication is involved rather than academic skills. Goodfellow (2011: 131) points out that "persistent popular perception of literacy as a singular ability and individual attribute that confers social 'normality' on its owner." Hence stating the social aspect of traditional literacy Goodfellow (2011: 132) asserts the significance of what he calls, digital literacy in higher education as:

> Digital literacy/literacies are transformational for higher education, and relate this enquiry to the view that one of the key benefits that the academy delivers to the society in general is the promotion of practices that are 'critical' whatever the medium of communication.

In a nutshell the result of the study conforms to the literature and emphasizes the social aspect of computer literacy. The significance of the issue is also maintained by Hoag et.al. They assert that:

> "Computers have transformed both the educational environment for communication students and the professions they seek to enter" (2003:407).

GENDERFACTOR IN THE USE OF INTERACTIVE INTERNET-BASED APPLICATION FOR PROCESS WRITING IN EFL CONTEXT

M. Naci Kayaoğlu
Karadeniz Technical University
Faculty of Arts
naci@ktu.edu.tr

Abstract: This quasi experimental research was undertaken to explore the effects of gender on the use of an online internet-based application for process-oriented writing instruction in an EFL (English as a foreign language) setting. The study also aimed to discover male and female students' attitudes towards the integration of forum-based application into the traditional classroom learning environment. To this end, an interactive website, a forum-based blog Mywritingportfolio.net was constructed for English Prep students to use for writing course. The participants were 227 university students (Male =121, Female=106) attending the English prep program. Following a semester of use of the internet-based system for the writing course, a questionnaire was developed to see its use by both male and female students. The results provided encouragement for the integration of internet-based application into the traditional language teaching instruction.

Background

In spite of all our efforts to engage the students in the writing process as part of the syllabus of our University English Prep School, writing does not seem to receive much welcome from the students. Each year about 1900 students are enrolled in our school for a year of intensive compulsory English study prior to their subjects in their respective departments. The students are required to take certain courses in English in their major subject and produce papers in English. When it comes to the picture on the ground, over the last three years the outlook has not been very bright. The challenges have led to a pessimistic mood about the future of the writing course in our program. Our students appear to be very much obsessed with the narrow definition of writing based on the notions of correct grammar and usage. Grammar and rhetorical forms were major concerns of our students since writing was long perceived to be in the service of grammar and secondly the students appeared to have no insights about the qualities of good writing. Therefore; it has become a common practice to use the writing course for error correction and mechanical writing exercises without a true learning experience. In a system where teachers remain the sole reader and students have to write all the time for their teachers, students seriously suffer from a lack of a genuine audience and teachers are led to focus on the finished product rather than the process.

New Hope for Writing with Internet-based Applications

Internet-based applications arrived at a time when we had almost lost our hope for effective implementation of a writing course in the EFL environment. While internet as a technology first appeared institutionally in 1987 through Ege University (Altun 2005) in Turkey, there have been a lack of instructional models and resources for integrating the internet into traditional language classes. Hovewer, there have been several attempts to integrate multimedia and the internet technologies into education in general and few in number in language teaching (Altun 2005, Grace 2000, Altun 1996, İşman 2004, İşman and Çelikli 2009, Dabaj and İşman 2004, Odabasi 2000). Inspite of incresing interest in the integration of internet-based applications into the instruction Writing skill in second or foreign language teaching seems to have received only sporadic attention.

Although educational research in the last several decades has proven that the manifested gender differences influenced students' academic interests, and achievements (Barrett and Lally1999, King et al 2002) and gender is typically a significant factor in several disciplines in particular in educational and psychological research, gender has only received sporadic attention in the studies of language learning. However, different educational domains have different claims to the gender issue. For example, males are claimed to have more positive attitudes than females in using computer technology to assist their academic learning (Li, 2002). Similarly, a number of studies have noted that females are less likely to use the Internet

than males (Ono and Zavodny 2003).It is with the arrival and widespread availability of internet-based applications that we have seen a unique opportunity to integrate the internet into our writing course with an aim to eradicate the above mentioned inherited problems.

Research

The purpose of this quasi experimental research was to explore whether gender makes a difference in using an online forum application in process-oriented writing instruction in an EFL (English as a foreign language) setting. To this end, an interactive website **Mywritingportfolio.net** was constructed for English Prep students to write and send their weekly writing assignments, with an option for other students to read and comment on them. Readers other than peers and teachers were also provided access to the website as guest readers to read and comment on students' writings. Each student was given a password to enter the system and submit their writing assignments online in their own place in their class column. To this end, a questionnaire was administered to the subjects after a semester-long practice. The questionnaire resulted in a very high level of reliability. Reliability Coefficient: alpha= .8271).

Sample and Setting

A total of 227 university English Prep students, 121 of whom were male and 106 female, were involved in this study. The Convenience sampling technique was used in the selection of the participants. At the School of Foreign Languages, there is a six-hour-time block allocated to writing skills per week. For pre-intermediates and intermediates, the focus shifts to essay after studying certain paragraph types. A variety of essay types, namely description, the process essay, the definition essay, the classification essay, narration, cause and effect essays, compare and contrast essays, and argumentative essays are introduced. A "process approach" was adopted in teaching writing in the School of Foreign Languages. The process approach can be defined as an approach that views writing not as product but as a process; helping students explore their own voice; providing teacher and peer feedback; encouraging revision and using student writing as the primary text of the course (Hayland 2003)). The process approach involves six distinct steps: prewriting, drafting, responding, revising, editing and publishing. It is known as a recursive process.

In our system it is crucial for students to give and receive feedback to writings. In an earlier study (Kayaoğlu, 2008) it was mainly the teachers who provided feedback. This was interpreted by students as being authoritarian and formalist. With this in mind, this time peer feedback was compulsory and integrated in the system in the sense that each student was expected to give another three students (peers) feedback for each writing task. Students were encouraged to focus on content rather than the syntax, telling how they felt about writings to create a constant audience to write for in mind. Teachers were told to focus much more on content but not at the expense of neglecting form. While solely language correction could inhibit production, only content feedback might leave students without guidance. To maintain consistency in the feedback system on language and to activate students' higher cognitive thinking, correction codes were used. The codes are colors that the teacher uses when indicating students' errors (such as blue: add something, brown: word order error, red: wrong form, green: subject verb agreement error. The code of colors, which is always available on the site, tells the learner what type of error they have made, and learners can then attempt to correct their errors themselves, using the colors to guide them.

The online tool enabled the teachers to provide feedback in a timely, focused, consequential and organized way since all submitted assignments with given feedback were accessible by topic and date. On the other hand students could modify their subsequent submissions accordingly and become their own editors and could compare their work with the ones commented on by the teacher and other friends.

Procedure

The very first step we did was to get an independent domain name from godaddy.com, which is an online serving company. The domain name www.mywritingportfolio.net was determined to draw the interest of the users. In addition to the domain name, we needed a server in which we would upload our files. The capacity of the server did not need to be more than 100 megabytes since any writing is some 10 or 15 kilobytes, making 100 mb cover more than ten thousand writings. The next step was to develop a forum-based blog. We found that SMF (Simple Machines Forum), which was a free a software that could be downloaded from www.simplemachines.org, was the ideal one in order to meet our needs. After setting up the software in

the server, the forum-based blog was fixed up to the functions for the needs. The forum-based blog included a number of functions allowing the users to shape the portfolio process according to the setting and even putting their own pictures. For this reason the terms "the internet-based application, the forum-based blog, the online system and the website" were used interchangeably in this paper.

So**,** the website **Mywritingportfolio.net"** was constructed for the students to write and send their weekly writing assignments, with an option for other students to read and comment on them. Readers other than peers and teachers were also provided access to the website as guest readers to read and comment on students' writings. Each student was given a password to enter the system and submit their writing assignments online in their own place in their class column. The forum-based blog allowed our students to express themselves publicly in written English, to share their writings with their peers, to have a diverse reader audience, and to see a myriad of writings by their fellow students. Students were supposed to post multiple drafts for the same topic depending on the feedback they received, so they could see their performance over a period of time. Since all postings, edits, comments, corrections, feedback and drafts were automatically stored and could be accessed at any time by date, topic, class and also individual student, all teachers and students could keep track of all postings (writing assignments) online across the school and follow readers and teachers' corrections and previous comments on drafts writings in a very speedy and manageable way. To this end a writing center with a coordinator was established within the school to monitor the whole process. Having been alerted by the results in a study by Odabasi (2000) on 305 fulltime faculty members' familiarity with and use of technological resources at Anadolu University, we organized an in-service training program for the teachers, aiming to stress the practical and pedagogic benefits of using such an online tool for writing course as well as the technical use of the tool. A very similar workshop training was given to the students.

Findings

After a semester experiment with the use of the forum-based blog for the EFL writing class, the questionnaire was administered to the subjects to explore the attitudes of the male and female students towards the implementation of the writing process through the internet based application. Descriptive statistical analysis was decided to be the most appropriate way of displaying data. A non-parametric the Mann-Whitney U test was used in order to see whether there was a statistically significant difference between male and female students in their responses to the items of the questionnaire,

Table 1: The Use of www. mywritingportfolio.net (on line application)

	Percentage					
	Agree		Disagree		No Idea	
	M	F	M	F	M	F
Using mywritingportfolio.net is easy.	76	77	15	13	9	17
I improved my ability to use internet through the internet application -	43	45	41	32	16	24

Male (M)=n 121 Female (F)=n 106

A cross-tabulation of the responses to the two specific items related to the use of online writing course (mywritingportfolio.) reveal a very high strength of relationship between the male and the female learners. It is remarkable to note that majority of the male and the female learners (76% and 77%) agreed that using mywritingportfolio.net is easy. The responses given to the statement concerning whether they improved their ability to use internet with the application show relatively moderate but very similar results. Given the fact that both male and female students were familiar with the internet to a varying degree prior to the use of online writing course, 43% and 45% agreement with the statement by male and female students respectively indicates that the online application served to encourage students to explore greater use of internet while doing their writing assignment.

Table 2: Attitudes towards writing

	Percentage									
	High Positive		Positive		No Idea		Negative		High Negative	
	M	F	M	F	M	F	M	F	M	F
What attitude(s) towards writing have you developed *by using the online application*?	29	31	48	43	15	18	5	7	2	1

Male (M)=n 121 Female (F)=n 106

As Table 2 suggests, both male and female students appeared very similar in their approach to develop a positive attitude towards using online application for writing. This finding was very remarkable in

the sense that male and female students were equally receptive to the experience of becoming an active user of internet-based application. Although it was compulsory for the students to use the form-based blog (mywritingportfolio.net) for writing, sending, giving peer feedback and editing writing, male and female students did not set up defenses against the new application as feared at the beginning.

Table 3: How often do you use online blog?

	Percentage													
	Once a day		A number of times in a day		Once in two days		Once in three days		Once in four days		Once in five days		Once a week	
	M	F	M	F	M	F	M	F	M	F	M	F	M	F
How often do you use online blog?	4	6	6	2	15	9	16	10	10	7	30	25	19	34

Male (M)=n 121 Female (F)=n 106

With respect to the frequency of visiting the website for writing course, there was no significant difference between the two groups, but male students were found to visit the forum-based blog more often than the female students. In the absence of information regarding the availability of computer and internet for the students, the quantitative data in Table 2 needs to be interpreted with some caution. Although the students did not have immediate access to the internet, both male and female students visited mywritingportfolio.net more often they needed to do writing tasks. This can be interpreted that they voluntarily spent much more time surfing the pages of the blog.

Table 4: Practicality of forum-based blog

	Percentage					
	Agree		Disagree		No Idea	
	M	F	M	F	M	F
I don't have so much used paper staff in hand after the teacher's correction.	72	70	18	14	10	13
I do not waste time to writings again and again after each correction.	67	69	18	13	14	15
It is so beneficial to have my writings filed by date and the task.	68	71	18	13	14	15

A comparative analysis carried out to examine the difference between the male and female students in respect of their experience of using the online system as opposed to the traditional paper submission model showed that female students had very similar perception and experience with the male student, appreciating great advantage of using an on-line system in terms of keeping their papers well organized and spending considerably less time on revising and editing their drafts.

Table 5: Having papers on the net.

	Percentage					
	Agree		Disagree		No Idea	
	M	F	M	F	M	F
It is very good not to wait for the next lesson to see the feedback of my teacher.	68	59	22	31	20	10
It is very good that others can view my own writing.	62	55	30	12	8	33
I want to impress others with my writing posts.	59	49	27	29	14	22
I pay more attention to my writing since I know that not only my teacher but also the others read my writing.	64	54	26	27	15	24

As indicated in Table 5 above, a similar percentage of male and female students (68% and 59% respectively) were observed to wait for their teachers' comment on their draft on the web with some interest. Another interesting point to note that majority of the male and female students (62% and 55%, with no significant difference between the two groups) appeared to like the idea that they had their audience to read their papers. A greater percentage of the male students enjoyed viewing what other students wrote and desired to impress others. Only 27% of the female students had negative feeling about the idea of impressing other readers with their writing postings. This also indicates that students regardless of gender did not use the forum-based blog solely to post their writing as required by the school. Rather they interacted with each other through the online application to a varying degree.

Table 6: mywritingportfolio.net has improved

	Percentage									
	Very much		Much		A little		Little		Not at all	
	M	F	M	F	M	F	M	F	M	F
My language skill to form grammatically better sentences	12	9	23	34	39	33	22	15	5	9
My use of variety new words	18	13	33	31	33	30	14	20	2	6
My writing ability to write an appropriate topic sentence.	17	13	37	38	26	30	14	12	6	6
My writing ability to write an appropriate introduction part.	11	6	33	41	40	31	13	10	3	7
My writing ability to develop supportive ideas for the topic sentence.	12	6	29	42	40	34	15	10	4	8

The items in Table 6 are intended to diagnose to what extent the objectives of the writing course outlined in the existing syllabus were met with the introduction of the internet-based application. While the process approach was an overall strategy adopted towards writing instruction, there were certain linguistic

elements and writing traditions which English prep students were supposed to master such as writing appropriate topic sentences, introduction part, supporting and concluding sentences. This is what is called the essential parts of a paragraph. Table 6 reveal that a great majority of both the male and female students were observed to utilize our forum-based blog to master these elements greatly. Almost more than 70% of both male and female students were found to very similarly to improve their ability to write appropriate topic and supportive sentences. A very similar trend was also observed for the use of new words. This indicates that both male and female students paid similar attention not only to what were posted to the *mywriting. portfolio.net* but also how they writings were expressed.

Table 7: Preference for writing course

	Percentage					
	Only online		Only teacher centered classroom		Both online and the traditional way	
	M	F	M	F	M	F
How would you prefer to do writing course in your English prep program?	82	73	12	14	6	13

Perhaps the most interesting finding of this quasi experimental study was related to their choice among the three models of delivering the writing course. In response to the question concerning their preference for the way the writing course was to be done, 82 % of the male students and 73% female, as shown in Table 7, surprisingly appeared to choose the option of "only online model. A great majority of both groups, though males slightly higher, was very much motivated toward using process-oriented writing instruction on the basis of forum-based blog. This may be accounted for by the fact that male and female students felt more involved in writing process in real sense in a very interactive atmosphere. It is more likely that they enjoyed independence and autonomy to some extent in their writing experience as they found an opportunity to discover their strength and weaknesses in writing.

Table 8: The Use of blog

	Percentage									
	Always		Usually		Sometimes		Rarely		Never	
	M	F	M	F	M	F	M	F	M	F
I visit the blog very soon to see my teacher's feedback on my writing.	24	23	35	39	24	25	8	8	10	6
After I post my homework to the blog, I read my classmates' writings.	13	14	25	24	37	33	16	17	9	13
First I read the writings of other students and then post my own writing.	9	14	28	26	41	34	16	17	7	13
First I read the writings of successful students, then I write my own.	6	7	14	16	27	21	20	21	33	36
I compare my own posts with others.	5	5	17	18	26	15	23	22	29	39

A cross-tabulation of the five specific items concerning posting and reviewing writings sent to the application in Table 8 indicates that there was no significant difference between male and female students. Both groups were found quiet diligent in using the forum-based blog. It is remarkable to note that both male and female students did not only use the application for sending their assignments for teacher and peer feedback but also they spent a considerable amount of time to read the writings of other students. 75% of the males and 78 % of the females were found to read other students' writing to a varying degree. Another finding worth mentioning here is that 43 % of the female students and 47% of males (adding the percentages from sometimes to always) first read the writings of successful students and then wrote their paper. Similarly 75% of the female and 79% of the male students reported to first read the postings of other students and then completed their own. This indicates that male and female were very often in an interaction mode with the online application.

Table 9: Practicality of forum-based blog

	Percentage					
	Agree		Disagree		No Idea	
	M	F	M	F	M	F
I don't have so much used paper staff in hand after the teacher's correction.	72	70	18	14	10	13
I do not waste time to type my drafts again after each correction.	66	69	18	13	13	15
It is so beneficial to have my writings filed by date and the task.	72	71	14	13	14	15

Table 9 deals with practical uses of the forum-based blog. Overall analysis of four items clearly indicates that most of the male and female students appeared to appreciate the practical benefit of using such internet-based application for writing course. As process approach requires multiple submission with recursive feedback for the same paper, a huge amount of data were kept and organized in such a way that both students had access to any part of the information at any time at their own convenience. 69% of female and 66% of the male students appeared to be happy not having to write the same writing assignment again after each correction.

Table 10: Online feedback

	Percentage					
	Agree		Disagree		No Idea	
	M	F	M	F	M	F
Receiving online feedback from other students is beneficial.	71	63	7	8	12	16
I prefer the teacher's online feedback to peer feedback.*	30	46	58	28	12	16
Giving feedback to other students is exciting.	62	56	22	25	18	19
I prefer giving online feedback for content rather than language	77	70	13	17	10	13

Another remarkable result was that the new practice of students' giving peer feedback received very positive response from male (71%) and female (63%) students. This means that Both gender enjoyed the process of reading and analyzing their classmates' draft, helping others understand their work better. Considering the fact that students needed to read through the hundreds of papers on the www.mywritingportfolio.net to decide first three papers to give and receive feedback either for content or language, and they did not hold back on writing about good points as well as week points of the paper, this was where real interactive online learning environment was constructed. This turned out to be a sort of dialogue amongst the parties of the community which promoted learning. Although the students were provided with an assessment rubric and types of feedback, it was not of any importance whether their comments or offering suggestions for improvement were appropriate. Peer feedback was used in this study as an instructional strategy to increase the quantity and quality of students' online postings. Judging f the number of students' posts and the data, it appears that giving feedback had the potential to motivate student inquiry and to create a learning context in which collaborative learning occurred. The only statistically significant difference between male and female students was observed in the preference for the source of online feedback. While most of the male students (58%) disagreed with the preference for the teacher's online feedback, this was only 28% for the female students.(Mean rank: male121.76, female:95.11, Z:3.232, , P<.001). Female students' preference for instructor feedback can be linked with the notion of writing which has been long associated with producing grammatically correct sentences. Therefore, the teacher's feedback may serve as a form of prescriptive knowledge and formative assessment whereas peer feedback serves to encourage positive motivational beliefs, self esteem and greater levels of interaction. This perhaps explains why both male and female students (77% and 70%) chose to comment on content rather than language.

Conclusion

The overall analysis of the data in regard to the implementation of the process–oriented writing through the online internet application www.mywritingportfolio.net revealed that there was no statistically significant difference between the male and female students. Contrary to some studies favoring males in the use of information technology (Adam and Bruce 1993), this study showed that females as well as males developed a very positive attitude towards using an internet-based application.

The most remarkable result to note that learning was extended to the outside classroom, resulting in a very dynamic interaction. Secondly, perhaps it was the first experience for most students to explore the communicative merit of using rather than learning a foreign language. This meant that they did have a voice and have the enjoyment of being heard. Our online tool mywritingportfolio.net" was not a replacement for lecturers nor was it a sheer self-study space. It was an attempt to go beyond the walls of the traditional classroom in time, space and mood, extending the learning environment to outer space and creating a dynamic atmosphere. This in turn likely fostered independency and autonomous learning in students' endeavor to discover the excitement of voicing their ideas and emotions for the audience other than the teacher. Pedagogically, automatic achieve of all past posts by date or theme created a lot of fun, made it easy to keep track all of our students' postings and readers' responses in a very speedy and manageable way. This provided the teacher with an effective tool to monitor the students' process.

However, there are some negative points to highlight. Since the school failed to provide enough computers connected to the internet, many students had to find commercially available Internet to connect and post their writing tasks to www.mywritingportfolio.net. Outside readers were very few in number and reluctant to comment on students' postings. Although the students found a real opportunity to publish their work instantly online in a very interactive, attractive atmosphere, we do not know exactly to what extent this process was reflected in their final product. This obvious indicates a need to integrate qualitative data so as to get more deep insight into the process.

ABSTRACT

Researchers developed several activities and tools for the effective use of web in the learning and teaching process. One of these activities is WebQuest. WebQuest model was developed by Bernie Dodge and Tom March in 1995. Although there are many WebQuests on the web, there is no clear description of how to use these web-based activities as a part of a teaching method. There are no guides, teacher handouts, or lesson plans in the published studies. In the current study, teacher handouts for the WebQuest Based Instruction were developed to help teachers or researchers in the implementation process. In these handouts, the teacher's and students' roles in the class were clearly defined. Furthermore, the explanations and objectives from the physics curriculum were directly included in it. In this paper, an example for the topic of "fundamental forces" will be presented. Moreover, the observations in the implementation process will be included. This paper was derived from the PhD thesis of the first author.

INTRODUCTION

There is a rapid development of technology in the world. Computers, televisions, and mobile phones are some of the electronic items that students face with in daily life. There has been a dramatic increase in the availability and capabilities of computers than before. This increase has been observed in education as well as other disciplines (Brown, 2001). Effective technology integration to the teaching and learning process has always been seen as an important and appealing issue for the researchers. As the concerns of educational technology, methods, activities, and tools have been developed by researchers in order to have an effective learning environment. As one of the activities, WebQuest activity was developed by Bernie Dodge and Tom March in 1995 (Dodge, 2001). This is an inquiry oriented web-based activity that allow students to work as groups from anywhere at any time (Dodge, 1995).

March (2003) defines WebQuest as "a scaffolded learning structure that uses links to essential resources on the World Wide Web and an authentic task to motivate students' investigation of a central, open-ended question, development of individual expertise and participation in a final group process that attempts to transform newly acquired information into a more sophisticated understanding" (p. 42). WebQuest brings the advantages of the web with it. However, there is no clear description about the usage of WebQuests as in-class or out-class activities. Unfortunately, most of the studies found from the literature did not supply the helpful documents that were used at the process of WebQuest implementation. In the current study, WebQuests were used as a part of the method called as WebQuest based instruction (WBI).

WEBQUEST BASED INSTRUCTION

WebQuests become a widely used tool in order to integrate technology in teaching and learning process since 1995 (Halat, 2007; 2008; Wang & Hannafin, 2008). They help to enhance students' information technology and literacy skills (Russell et al., 2008). Many of the studies found in the literature are about why WebQuest should have an impact on student learning or how to design WebQuests. However, very few studies including WebQuests implementation have been carried out by the researchers. Moreover, in such studies, guides, teacher handouts, or lesson plans were not presented. Therefore, it is hard to talk about a method called as WBI in light of the literature. In the current study, the WBI is defined as an instructional method in which students were expected to complete a WebQuest in the lesson. In this method, students are expected work as groups of maximum three students. The teacher's roles in the WBI are to provide guidelines and to set tasks that are clearly defined in the teacher handouts whereas the students' roles are to follow the steps of WebQuest activity, prepare products, and present them. In the following sections, details of the WBI can be seen.

HOW TO IMPLEMENT THE WBI

The WBI should be implemented in the computer laboratory with at least 10 internet enabled computers for the class size of 30 students. Mainly, there should be following steps followed by the students and teachers in the WBI:

- The first thing to do is dividing the class into groups, which has maximum three students. Each group should have access to a computer in the laboratory.
- Each group receives note-taking papers to write their findings. They take notes from the websites at the resources section with the help of these papers.
- Each group receives A3 or A4 size papers to prepare the products.
- Next thing is to do a brief introduction to the topic of the day by the teacher.
- After forming groups and ensuring the computer access for each group, students go to the given web address for the WebQuest of the day. The teacher makes sure that all students have found the WebQuest page on their web browsers.
- The teacher should inform students about duration of each step which is defined at teacher handouts.
- The students carefully read the introduction of the WebQuest and if there is a need for any help, the teacher guides them.
- Then, they read the task section. At this section, each student at each group should clearly read it to complete the WebQuest. The teacher should ensure if all of the students read the task section. While they are discussing the task, the teacher should check each group to see if everything is going well.
- The students start to follow steps at the process section. They use resources part of the WebQuest to find necessary information to accomplish the given task. They analyze the information they have gathered and take notes for the findings. When the research is completed, neighbor groups come together to share and discuss their findings.
- The teacher can lecture for few minutes if there are any scientific errors in general.
- The students start to prepare the product specified at the task section. At this step, the teacher checks each groups to ensure that there is no scientific errors. If needed, clarifications and corrections can be made by the teacher.
- After completing the WebQuest, each group hands over their products and performs their presentations.
- At the end of their presentations, students defend their findings by answering students' and teacher's questions.
- The teacher uses the rubrics from the WebQuest to evaluate student's works.

TEACHER HANDOUT FOR FUNDEMANTAL FORCES WEBQUEST

With the help of the fundamental forces WebQuest, it is intended to have students to achieve the objectives given in Table 1. In the high school physics curriculum, two class hours are recommended for the topic of fundamental forces. Therefore the WBI for this topic was designed to be completed in two class hours. It is planned for group works and each group should have maximum three students.

Table 1. Objectives list for fundamental forces

Objectives	Explanations
At the end of the lesson, about fundamental forces, students will • Explain force concept with examples • Explain four fundamental forces with examples • Explain Newton's law of universal gravitation	• Electromagnetic, strong, and weak nuclear forces will be detailed in the future classes; therefore, these topics should not be given in details in this class. • Newton's law of universal gravitation should be detailed by giving the relationship between gravity & mass, distance.

Each group should have access to an internet enabled computer and visit http://www.webquestdatabase.com/webquest.php?webquestid=4 for the fundamental forces WebQuest at their computers.

The details of the implementation process can be seen in Table 2. It is expected to complete each step within the respective time interval.

Table 2. Implementation details of the WBI for the topic of fundamental forces

Step	Duration (minutes)	Details
First class hour		
Introduction to the fundamental forces	10	Students: Each student participates in a group and sits in front of a computer with their group mates. At this step they wait for the introduction by the teacher. Teacher: The teacher helps students to make connection between their prior knowledge and what they will learn with this WebQuest. The students learned force, unit of force, and measurement of force in their previous course – Science and Technology. However, four fundamental forces were not instructed at that course. The teacher should point that and inform about what they will learn in the current lesson. At this step, previously prepared note-taking papers and A4 sized papers which are used to prepare presentation script are supplied to the students. The teacher announces that the students can also prepare their product with computer software such as MS PowerPoint.
Introduction section of the WebQuest	3	Students: They start to read introduction section of the fundamental forces WebQuest. This step usually does not take much time to be completed. Teacher: The teacher control students' progress and direct the students who read the introduction section to the task section.
Task section of the WebQuest	4	Students: They start to go over the task section of the WebQuest. In this section, there are the details of the presentation which the students required to prepare. List of the presentation parts is given at this section. Teacher: The teacher visits each group to see if they have problem and asks them to see if they need clarification on the task. If there is any, the teacher clarifies it.

(table continues)

Step	Duration (minutes)	Details
Process section of the WebQuest	To the end of the lesson	Students: After the task section, the students start to follow the steps given in process section of the fundamental forces WebQuest. They may need to visit resources and task sections while performing their research. At this step, the students are required to investigate each websites at the resources section, determine the needed information, and take notes about their presentation on their note-taking papers. Teacher: At this step, the teacher continues to visit each group and control their computers to check which websites they browse. If there are any questions asked by students, the teacher guides them with answers.
Second class hour		
Process section of the WebQuest (continues)	7	Students: The students continue to visit websites at the resources section and collect information. At this step, they are expected to complete their research and compare their finding with near groups. There will be between group discussions. If there are any inconsistencies about the findings, the group members will explain them to other groups. Teacher: Throughout this process, the teacher visits groups and guides them. The questions of the students should be answered. If it is needed, the teacher can make a short lecturing to the class in order to overcome possible scientific errors.
