Preparation of the presentations	13	Students: The students start to write their presentation scripts about four fundamental forces. Teacher: The teacher checks the progress of the each group. If there are any scientific errors at students' presentation scripts, guides them to lead correct information, makes necessary explanations, and helps to correct mistakes.
Presentations	20	Students: The students hand over their presentation scripts to the teacher. Selected groups perform the presentations. Teacher: The teacher selects one or two groups to present their findings. At the presentation, the teacher carefully listen the presenter and if necessary, makes the corrections.

OBSERVATION NOTES FROM A SAMPLE IMPLEMENTATION

The teacher guidance is one of the most important issues in the WBI implementation. In the current study, it was seen that, especially, time management should be carefully done by the teacher. In the WBI process, the teachers should inform students about the time required for each step. Moreover, they should remind their students about the time left for the next step. In this way, the WebQuest can be completed in the scheduled time. During the implementation, several problems in computers and Internet connection can occur. If there were not any free Internet enabled computers, the group work can be interrupted. In order to ensure the continuity of the WBI, teachers should prepare either offline electronic and printed copies of the WebQuests to supply in the case of any problem. The students can take any scientific errors from the websites and take that information as true. Teachers should control the students' works to see their possible scientific errors. Moreover, if there were critical errors, the teacher should help students to correct them.

CONCLUSION

As a conclusion, it can be said that the teacher handout about WebQuest based instruction for the topic of fundamental forces worked in the class as expected. The WBI allowed students to be active participants of the lesson and they learned by performing a task themselves. Students enjoy having the WBI and find it entertaining. The teachers can implement the WBI in their classrooms in order to attract students' attention to the lesson and allow students to be active participants of the entertaining learning/teaching process. However, in this study the WebQuest and the WBI was developed for ninth grade physics students at the force and motion unit. It can be recommended that researches can develop WebQuests and their respective teacher handouts for other topics.

Valentina SAMOILENCO, "Ion Creanga" State Pedagogical University, Faculty of History, Chisinau, Republic of Moldova, samoilencovalentina@gmail.com

Abstract: This paper is a short analysis on teaching "Human Anatomy" in non medical faculties. For this purpose we have analyzed the syllabus and education curricula, as well as the technology of teaching and evaluation from faculties in Iasi (Romania), Chisinau, Balti and Tiraspol. (Republic of Moldova).

All the materials were analyzed in the context of the common past and European integration, taking into account the regional characteristics.

Keywords: Human Anatomy, Romania, Moldova, programs, curricula.

INTRODUCTION

Romania and Moldova represent a geographic area with a common past and similar traditions. In this context it should be noted that 62% of Moldova's population is currently speaking Romanian.

This article is the result of a study on issues related to teaching "Human Anatomy" in some higher education institutions in Romania and Republic of Moldova.

The material presented aims to highlight some milestones in the evolution of the discipline and to set an example for other colleagues that teach other academic disciplines, and desires to promote the idea of integration between the two countries and the European integration of Moldova.

In the following lines we will present a brief history of the universities and faculties in Iasi, Chisinau, Tiraspol, Balti, that were analyzed in this study.

"Al. I. Cuza" University, Iasi, Romania

1860 - Faculty of Sciences comprising the Physics, Mathematics and Natural Sciences departments,
1948 - Faculty of Natural Sciences,
1959 - Geography Faculty in the Natural Sciences department,
1963 - Faculty of Biology-Geography,
1977 - Faculty of Biology-Geography-Geology,
1990 - Faculty of Biology.

"Al. Russo" University, Balti, Republic of Moldova

1945 - Pedagogical Institute was founded with two faculties, one of them being the Faculty of Natural Sciences and Geography,
1959 - Pedagogical Institute is named "Al. Russo",
1954 - Faculty of Natural Sciences is transferred to the Tiraspol Pedagogical Institute,
1992 - Pedagogical Institute "Al. Russo is reorganized within the "Al. Russo" University, Balti,
2003 – as a part of the "Al. Russo" Balti University, the Faculty of Natural Sciences and Agroecology is founded.

Tiraspol State University (Department of Chisinau), Republic of Moldova

1930 - Public Education Institute from Tiraspol Moldova is founded,
1931- reorganized as the Moldovan Institute of Public Education in Tiraspol,
1933 - Moldovan Pedagogical Institute from Tiraspol,
1952 - State Pedagogical Institute with headquarters in Tiraspol, Moldova
1960-1970 Founding of the Faculty of Biology,
In May 1992, the Pedagogical Institute becomes the State University, and in July of the same year it is moved to Chisinau where it functions until nowadays.

"Ion Creanga" State Pedagogical University, Chisinau, Republic of Moldova

1940 - State Pedagogical Institute with the Faculty of Biology,
1950 - the Faculty of Natural Sciences is transferred to the Pedagogical Institute of Tiraspol,

1955 - State Pedagogical Institute "Ion Creanga",
1960 - is joined to the State University,
1967 re-founding of the „Ion Creanga" Pedagogical Institute.

MATERIALS AND METHODS

The material for this study was gathered from documents in the National Archives of Romania, Iasi Branch, the "Al. I. Cuza" University Archives, Iasi, Romania, the National Archives of the Republic of Moldova, Chisinau Branch, and from sources kindly offered to us by the Rectorship at the "Al. I. Cuza ", Iasi and "Al. Russo", Balti, Tiraspol University (Department of Chisinau), as well as the Physical Education and Sport University of Chisinau.

The study programs and syllabus for the subject "Human Anatomy" have been taken into consideration.

RESULTS AND DISCUSSION

"Human Anatomy" in non-medical faculties was a core discipline in the curricula of higher educational institutions.

In table 1, there is shown the Educational plan for the subject "Human Anatomy" at the "Al. I. Cuza" University in Iasi, Romania, between 1950 and 1954. In table 2 there is presented the same discipline curricula at the Chisinau State Pedagogical University, during 1946-1947.

It may be noted that the discipline taught in Romania has been assigned a great number of teaching hours (28-60) and laboratories (30-81). For Moldova the number is almost the same, 30 course hours and 24 hours of laboratory (National Archives of Romania, Iasi, "Al. I. Cuza" Rectorship, no. 17/1950, pp 26, 30, 32, 36; no.174/1953, pp 4, 18, 34; School Inspectorate, Iasi, no. 210,).

Table 1 Curricula for Human Anantomy "Al. I. Cuza" University Iasi, Romania

Nr.crt.	Faculty	Year	Speciality	Discipline	Course (lectures)	Laboratory	Seminary, practical
1.	Faculty of Pedagogy and Psichology	1950-1951	Pedagogy	Anatomy and Physiology of the SNC	60	-	30
2.	Natural Sciences Faculty	1951-1952	Natural Sciences	Human Anantomy	62	31	-
3.	Natural Sciences Faculty	1952-1953	Biology Zoology	Human Anantomy	32	-	48
4.	Natural Sciences and Biology Faculty	1954-1955	Zoologie	Human Anantomy	48	-	81
5.	Natural Sciences Faculty	1954-1955	Natural Sciences	Human Anantomy	48	-	81
6.	Natural Sciences Faculty	1953-1954	Zoologie	Human Anantomy	49	-	82
7.	Pedagogical Institute	1953-1954	Natural Sciences	Human Anantomy and Physiology	29	-	58

Table 2 Curricula for Human Anantomy, "Ion Creanga" State Pedagogical University, Chisinau, Moldova

Nr.crt.	Faculty	Year	Speciality	Discipline	Course	Laboratory
1	Pedagogical Institute	1946-1947	Pedagogy	Human Anatomy	30	24
2	Pedagogical Institute	1946-1947	Botanics	Human Anatomy	30	24
3	Pedagogical Institute	1946-1947	Zoology	Human Anatomy	30	24
4	Pedagogical Institute	1946-1947	Plants physiology	Human Anatomy	30	24

Regarding the name of discipline, as written in the curricula of these two countries, it varied depending on the speciality for which it was taught: Human Anatomy, Human Anatomy and Physiology, Anatomy and Physiology of the CNS (Erhan V. 2007, Giurescu Constantin C. 1970).

The language used for preparing the plans and curricula for university education in the Republic of Moldova before year 1990 was predominantly Russian; the documents drafted after the aforementioned year, are in the Romanian language (National Archives of the Republic of Moldova, Chisinau, P1961, no.22, pp 2, 52, 58, 59, 63).

Educational plans for the University "AI Cuza", Iasi, Romania, consist of the major systems in the structure of the human body, with specifics of related concepts for each of the departments. Unfortunately, curricula from the same years of education plans for the Republic of Moldova were not kept in the archives and we cannot present them.

Currently, plans and study curricula at educational institutions in both countries present more and more similarities. The most important aspect is that the language for education and designing documents is Romanian, favouring the communication between participants in the educational process without additional effort of speaking a foreign language.

"Human Anatomy" is studied as a subject for one semester, 14 courses of two hours and 14 practical sessions of two hours. The subjects covered in the curricula begin with an introductory chapter (anatomical terms, planes of symmetry, topographic regions), continued by the description of the main organ systems of the body. Scientific terminology is used in accordance with Nomina Anatomica, Paris 1956 and Terminologia Anatomica, New York 1998.

Teaching methods include conversation, modelling, experimentation, exposure, problem-solving, computer-assisted instruction, etc.

The evaluation forms are: continuous assessment (oral, written, practical) and summarise assessment (written). The assessment is carried out during teaching; the final evaluation is usually the one that adjusts final grade.

The teaching materials used varies: laptop, video-projector, casts, educational films, drawing sheets, plates, stored materials, histological slides, microscopes, etc.

The bibliography includes the written course (optional). In the bibliography recommended for students in Republic of Moldova we can find more and more specialized titles from Romania and other EU countries.

More academics keep in touch with the students via the electronic system, providing support training and practical work "online" or specialty consultations (Platform "MEDIAEC", Blackboard software, "A I Cuza" University Iasi, Romania).

"Human Anatomy" was integrated in the context of subjects taught in higher educational institutions from both countries and is subject to general rules of educational evolution by joining the Bologna process.

Bologna Process has set out to achieve a single European higher education space and meant for all the participating countries, major changes in legislation and reconsidering the basic principles of education.

Romania joined the Bologna process in 1999. The latest documents about these changes are included in the Leuven 2009 National Report, which provides the main directions on which the evolved Romanian university education focused on: improving the management quality, operational system development between higher education institutions, employer involvement in the higher education institutions business world, functioning doctoral schools and Ph.D. doctoral research evaluation of university institutions and value increase, balancing the value of research in the three cycles of the training process, improving the conditions in the new campuses.

Republic of Moldova joined the Bologna Process at the European Higher Education Conference of Ministers in Bergen, in May 2005. The issue of quality assurance is a main objective of the Bologna Process implemented in Moldova. The decisive role in enhancing the quality of education in terms of organizing the educational process went, firstly to the teacher, from assistant to professor. Therefore the prioritization strategy for ensuring the best quality in higher education is the management and improvement of university teaching potential/continuous education of the University professors.

The objective of quality assurance includes the following:

Teachers training: over the years there have been held various trainings, seminars, training sessions, round tables and conferences on topics pertaining to both the general teaching of the disciplines and the development of the Bologna Process. Some of the topics of these activities were:

Interactive teaching strategies: work/learning-assessment;

Developing syllabuses based on the training standards;

Effective use of the provided technical means of education;

University studies management has resulted in the creation of an autonomous university structure - the “Quality Assurance Department” at Ministry level. Similar structures have been created in all university faculties and departments.

Involving students as subjects of academic training process is a natural consequence of the democratization of university life, internal and external mobility, the Bologna Process as a whole.

The core problem is the subordination of the whole process of specialist training and certification of the standards. Key factors that determine the standards are: the community’s ideal - what society expects from a graduate of the institution, the requirements of the labour market - the development of standards should take into account the formation of skills necessary to provide service that will be

currently used by the graduate, continuous education in the country and the traditions of European experience accumulation.

Beginning with the 2005-2006 academic year, after the country's accession to the Bologna Process there were implemented essentially modified study plans, as required by the national framework plan. Duration of the cycle (three years / six semesters/180 credits) and uncertainty about the second cycle of higher education have led to compression of the content provided above for 4-5 years within 3 years. Consequently, there are two effects, one positive - keeping highly qualified teachers, and a negative effect - overloading students.

In the first cycle, study plans included 5-6 subjects per semester, concluded by the exam as final evaluation form. Introducing 2-3-4 disciplines modules involved not only keeping a single form of assessment, but a conceptualization of the module itself, an exploration of the connections in both inter- and trans disciplinary teaching and evaluation, which in turn have led to quality improvement of education.

The claimed workload is 1800 hours per student annually, as fixed in the curricula for the first cycle. The average of the working cycle audience/contact hours and individual working in different institutions may be different: 1:1, 1:2, 1: 2.5. The "Ion Creanga" State Pedagogical University, Chisinau average for the first cycle was established by decision of the Senate as 1:1. The new plans foresee 900 hours auditory cycle and 900 hours of individual work. For the second cycle there are set a number of 14-16 contact hours per week, which will be part of the 1800 hours required for the accumulation of 60 credits.

Conclusions

Some conclusions deserve to be underlined: in the last 40 years, the current teaching language in the Republic of Moldova was Russian, nowadays the usual teaching language is Romanian; the syllabus and education curricula are changing in Moldova becoming more and more similar to those in Romania (academic credits, objectives, course chapters, bibliography, methods, evaluation procedures); in Human Anatomy the course content and scientific concepts are in conformity with Nomina Anatomica, Paris 1956 and Terminologia Anatomica, New York 1998; each chapter contains macroscopic and microscopic descriptions of anatomical systems; the syllabus is for a semester, there are two hours for course and two hours for practical work; evaluations procedures consist of two papers, one every seven weeks; the materials are classical (moulds, preserved materials, drawings at the blackboard with coloured chalk) as well as modern (computers, educational softs).

ICT AND CURRICULUM AT SCHOOL'S DECISION. THE ROLE OF CDS IN OBTAINING PERFORMANCE AND DEVELOPING STUDENTS' CREATIVITY

Author: Phd Silvia Moraru
Faculty of Physics , University of Bucharest
"Tudor Vianu" National High School of Computer Science
silviamoraru19@gmail.com ; 0040722547147

ABSTRACT
Keywords: educational software, interactivity, performance, creativity, teamwork, e-learning.
The educational system in Romania keeps the pace with the development of communicational infrastructure, according to International Telecommunication Union 2000 which shows that the number of users in Romania increased from 2.67%in 1999 to 4.46% in 2001 and now about 7% in 2010. This is a necessity to the need to adapt the teaching – learning – assessment to the current requirements of advanced education, SEI platform that has extended nationwide.
Thus, in every school, in order to implement new information technologies, there has appeared motivation in the educational process in order to develop the creativity of students.
Each strategy allows each school to develop a school's curriculum. Our school trains graduates to help get the software developer certificate. There are mixed teams of teachers and students who make educational software integrated in the optional course "The development of didactic IT tools for the teaching of sciences". Period of the course: two years (1h/week) for 10th and 11th grade.
The objectives of this course are:

- Forming and developing the skills of using modern means of communication, using new technologies, in the context of the need to form a "digital culture", as an essential element of the minimal qualifications of students;
- Using software applications specialized for development of educational soft: Flash;
- Identifying the connections between computer science, chemistry and physics;
- Planning scenarios and building stages to explain phenomena, processes, procedures;
- Modeling physical and chemical phenomena, as well as making experiments in virtual laboratories which permit a better understanding in case the experiments cannot be analyzed in the school's real laboratories;
- Processing experimental data obtained from observations or through experiments, which can be processed according to the proposed goal, using adequate computer programs.

The final product is to develop a virtual platform which will include "DIDACTIC-VIP":

- Supporting courses;
- Virtual interactive lessons;
- Teaching projects that include concrete ways of implanting ICT in education:
  - Educational software "Alkanes" – author – Silvia Moraru-made in Tudor Vianu National Collge of Computer Science;
  - Educational software "Elements of termodimamics"author Corina Dobrescu, Stan Florina, Sillvia Moraru – made in"Tudor Vianu" National High School of Computer Science;
  - Projects that implement teaching – stages of lessons from educational software, author Silvia Moraru.

  These software are acknowledged by OSIM and having won awards, assert the professionalism and indisputable success of the course.

CHAPTER I. - CURRICULUM AT SCHOOL'S DECISION

The need to adapt the teaching-learning-evaluation process to the requirements of a qualitative education has led to the development of SEI PROGRAM nationwide. Each school develops its own **EDUCATIONAL OFFER**, implementing, aside the **NATIONAL CURRICULUM,** its own CURRICULUM AT SCHOOL'S DECISION.

Each school's curricular project includes all educational processes and learning experiences that the school is offering the students directly. Therefore, performance can be achieved by constructing individual methods of learning through a flexible offer, adjusted to the school's profile and specifics[1].
Starting from 2003-2004 school year, in the curriculum areas "MATHEMATICS AND SCIENCE" and "COMPUTER SCIENCE" our school has been providing the optional course: "THE DEVELOPMENT OF IT DIDACTIC TOOLS FOR TEACHING SCIENCES (PHYSICS and CHEMISTRY)". The optional course addresses tenth and eleventh graders and it is spread across four semesters.
The course is organized to be held by teachers of computer science but also by teachers of physics and chemistry. The final product is THE VIRTUAL DIDACTIC PLATFORM – VIP which consists of [2]:

- Supporting course materials;
- Lesson plans in which there are integrated ICT-based lesson stages;
- Educational software, whose authors are teachers of "Tudor Vianu" National High School of Computer Science;
- Methodological suggestions on how to utilize the created educational software.

CHAPTER II - THE PRESENTATION OF THE OPTIONAL COURSE "THE DEVELOPMENT OF IT DIDACTIC TOOLS FOR TEACHING SCIENCES (PHYSICS AND CHEMISTRY)".

This course targets students who wish to participate in the development and creation of lessons or lesson stages of computer-assisted lessons in the curriculum area 'Mathematics and Science. It is an elective course in several curricular areas (mathematics, science and computer science).

Why should this course be held? - The motivation behind the course

The course offers teachers and students the opportunity to build knowledge and teaching experience in the IT field by developing educational software. In order to assimilate new computer science technologies and to use them effectively, in order to increase access to digital educational resources and to create new virtual learning environments, the course aims to train students in developing software products that form IT tools for teaching science. It offers students the opportunity to assimilate new tools, absolutely necessary for their initiating in the Computer Science labor market.

Who teaches the course? - The ability to teach this course

The course was held by three teachers specialized in: computer science, chemistry and physics. The teachers' didactic and pedagogical experience in developing educational software, the participation in numerous national and international conferences on this subject, with presentation of some interesting educational software, approved by the Ministry of Education of Romania, existing in the AEL educational platform, which exists in every school in Romania.

Evaluation methods

- Assessment tests;
- Projects;
- Portfolios;

The Development of IT Didactic Tools For Teaching Sciences

I Argument

Why is it necessary to have such a course in our high school of computer sciences? There are sufficient reasons, from which we present the following:

- FLASH 8 expert system is extremely wanted on the software market; the students will learn ways to create interesting, attractive and educational animations;
- numerous and diverse applications of mathematics and sciences have been made, among which we can mention: "ALKANES"- educational software for the study of organic chemistry, "ELEMENTS OF THERMODYNAMICS"- educational software for studying thermodynamics concepts , "20,000 Leagues Under the Sea "-interdisciplinary educational software: computer-physics-chemistry-biology.

II General competences

- Training and developing the necessary skills in the use of modern ways of communicating and in new information technologies as part of the minimal baggage of essential skills that students must possess;
- The use of scenarios and the organization of lesson stages for a better explanation of phenomena, physical and chemical processes;

Identification of connections between computer science, physics and chemistry:

- Modeling of physical and chemical phenomena, as well as making experiments in virtual laboratories that will allow a better understanding of them, in case they cannot be realized in the real laboratories of the school;
- Experimental processing of data, obtained from observations in nature or by conducting appropriate computer programs. The processing of experimental data may include carrying out calculations, calculation errors and graphical representations.

III Specific competences

C1 Training and developing the necessary skills in the use of modern ways of communicating and in new information technologies in the context of needing to form a 'digital culture', as part of the minimal baggage of essential skills that students must possess.

C2 The use of specialized software applications for the development of educational software:
FLASH EXPERT SYSTEM

IV Values and attitudes

1. Development of creativity and imagination in solving a problem.
2. Channeling efforts in terms of developing the analysis and designing skills required by society.
3. Using the expert system to develop useful applications in various fields of computer knowledge combined with those of physics and chemistry.
4. Expanding evaluation capacity / self-analysis through teamwork and analysis of piece of work .
5. Stimulating creativity, students and team's initiative.
6. The diversification of concerns in software services.

CHAPTER III -PRESENTATION OF DEVELOPMENT AND USE OF THE EDUCATIONAL SOFTWARE: "ALKANES" AND "20,000 LEAGUES UNDER THE SEA"

A "ALKANES" – 7 interactive lessons of organic chemistry

- Project information
  - software used in class as supporting course material (10^{th} grade), but also at home by students;
  - the molecules of alkanes and isoalkanes are modeled three- dimensionally, students being able to track the progress of chemical reactions;
  - the development of student's imagination and creativity through 3-D modeling;
  - the lessons are structured in the form of revision lesson and are preceded by a diagnosis test and followed by continuous assessment to get feed-back to help future lesson planning;
- What's new in this software? :
  3D modeling of organic molecules and chemical processes
  The simulation of chemical bonds breaking from REACTANTS and forming new chemical bonds out the products of the reaction;
  Developers: MIXED TEAMS of TEACHERS AND STUDENTS;
- Technical Resources
  Programming languages used:
  - Hyper Text Markup Language (HTML);
  - Java Script;
  - Virtual Reality Modeling Language (VRML);
  - Macromedia Flash Action Script2;

- Applications used in software development: Edit Plus2, Flash MX 2004,Adobe Photoshop 7.0, Hyperchem,Cactvs3

- Using software in teaching-learning-evaluation lessons[3]:

-you can access all 7 lessons from the main menu:
a) Structure of alkanes and isoalkanes;
b) Halogenation reaction of the alkanes ;
c) Oxidation reaction of alkanes;
d) Breaking of simple covalent Carbon bonding in alkanes;
e) Pyrolysis reaction of alkanes;
f) Isomerization reaction of alkanes;
g) Chemical processing of methane;

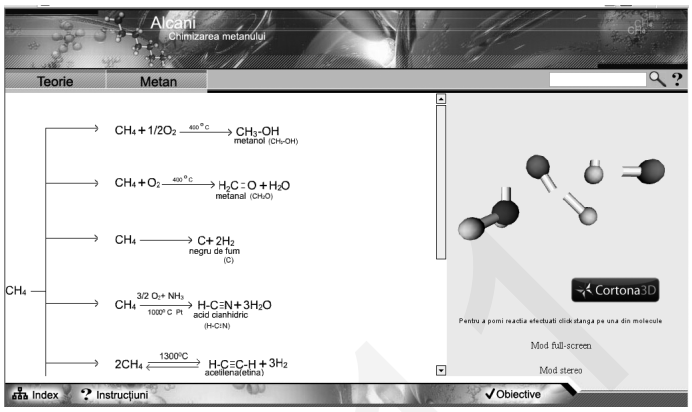

Fig. 1. Chemical processing of methane

Every lesson is accompanied by the diagnosis and the continuous tests, worksheets, real models of alkanes molecules. Each student works both in the laboratory and virtually, on the computer.

- Real aspects regarding the use of virtual lesson stages in teaching-learning-evaluation process.
  - The software, due to its interactivity, reduces the time the student needs to understand physical and chemical phenomena, making the connection between the previously studied physical and chemical phenomena and the physical phenomena that are that accompany the chemical reactions of alkanes: the bond energy, the calculation of bond energy, the calculation of Q given or absorbed during a chemical reaction.
  - The teacher's coursebook is accompanied by a CD containing the educational software t and certain suggestions for conducting the seven interactive lessons from the didactical unit: Alkanes.
  - We present aspects from the interactive lessons: "Methane chemical processing " and "Isomers of Alkanes"

B. "20,000 leagues under the sea" educational, interdisciplinary software physics-chemistry-biology-Computer Science-world literature.

- General presentation of the software[4],[5],[6];
  - the software serves as a supporting course material for universal literature courses(grades V-VIII),chemistry (grades VIII-IX), physics (grades VI-VIII)
  - the development of students' creativity and imagination
  - the understanding of physical and chemical phenomena from Jules Verne's novel "20,000 leagues under the sea"
  - essential rules for correct alimentation
- The planning and development of this educational software highlight the need to achieve the objectives of reference:
  - understanding the specific terms and concepts in physics, chemistry and biochemistry;
  - the development of skills for exploration-investigation of reality and skills for experimenting through use some instruments and procedures in chemistry, physics and biochemistry
  - the development of communicational skills by using physics, chemistry, biochemistry and specific language of universal literature .
  - inculcation of values and attitudes regarding the impact of physics and chemistry on real life;

- re-updating and reinterpretation in a modern vision of the novel "20,000 Leagues Under the Sea"by Jules Verne;

- There are designed five lessons, each with specific skills and each lesson is also given operational objectives;

The lessons are:

a) The presentation of the novel “20.000 Leagues Under the Sea”
b) The expedition under the sea (Archimedes’ force)
c) Producing electricity from chemical energy (cells, nuclear reactions from an atomic submarine);
d) Crew’s menu(biochemistry notions)
e) Instruments in the control room of a submarine;

Educational software can be used sequentially, in lesson stages:

Thus, next we will present 3 sequences from the educational software.

Underwater expedition(submarine), electricity production:cells,nuclear reactor; essential elements of biochemistry

- in lesson L2 “The Submarine”- Archimedes’ Principle is shown using the motion simulation of a submarine based on physical principles;
- Following the virtual experiment in which a submarine is sinking at various depths and calculating for each case, the characteristic physical quantities: hydrostatic pressure, weight (G), Fa (Archimedes’ force).

This lesson can be used as an educational tool demonstration using smart boards and AEL laboratories.

Elements of the lesson are:

a) The theory regarding Archimedes’ Principle, hydrostatic pressure, speed
b) The modeling of the movement of a submarine based on the principles of physics;
c) Making virtual experiments on physical determinations for: Fa (Archimedes force), pressure and speed;
d) Data interpretation
e) Objectives
f) Evaluation to get feed-back

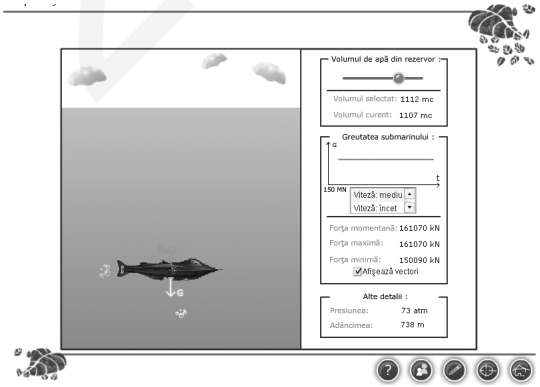

Fig. 2. Submarine expedition

Methodical instructions on how to use the application:

1. Select the water volume so that the submarine descends
2. Select the water volume so that the submarine ascends
3. Compare the values of the buoyant force in both situations
4. Compare the values of the hydrostatic pressure in both situations
5. Explain how the submarine’s buoyant force varies during its movement
6. Explain how the submarine’s hydrostatic pressure varies during its movement

- Methodical suggestions on how to use the educational software:
  - Right after the user opens the novel, he/she is introduced in the science fiction world of Jules Verne. The challenge of this multimedia product is for all students between the sixth and the twelfth grade. The update on the novel which was read by the young user in childhood leads him/her to develop his/her creativity and imagination
  - The teacher-student team can follow the teaching approach increasing the efficiency and the quality of the teaching-learning-evaluation process
  - The underwater expedition stimulates and motivates the student through the interactive teaching approach proposed in the virtual experiment.

In L3 lesson “Fuel cells” there is presented the transformation of the chemical energy into electricity. The lesson contains:

- The theory on the transformation of the chemical energy into electricity
- The theory on redox reactions

- The theory on oxidation and reduction potentials:
  - Daniel-cell modeling and its operation, and the possibility of formatting fuel cell using a different metal electrodes;
  - The objectives of the lesson
  - Evaluation in order to obtain feed-back;

Methodical instructions on how to use this application ("Fuel cells"):

- Select the Movie button and follow the construction of the Daniel-cell in the chemistry laboratory;
- Select the Theory button which presents the scientific knowledge about the construction and the functioning of a cell;
- Select Zn and Cu electrodes for modeling the Daniel-cell in the virtual lab;
- Compare the values obtained for the electrical voltage in both situations (virtual and real lab);
- Select Fe and Cu electrodes for modeling a fuel cell and explain the mode of computing the electrical voltage
- Select one anode and one cathode in order to model the possible fuel cells
- Explain the mode of computing the electrical voltage for the previously modeled fuel cells

In L4 lesson there is presented the "Crew menu" from Jules Verne's novel. These sequences could be used at all chemistry/ biochemistry classes for sixth grade by teachers in all AEL labs. The elements of this lesson are:

- General concepts of nutrition;
- Types of menus pointed out in the diet of the Captain Nemo's submarine's crew;
- Information about ingredients, methods of cooking and nutritional values of the proposed menus;
- The creation of a menu and the computation of its calories;
- The objectives of the lesson;
- Evaluation in order to obtain feed-back.

Methodical instructions on how to use this application:

- Select the Theory button which presents the nutrition rules;
- Select a menu for Captain Nemo so that, at the breakfast, he will eat aliments with the nutritional value equal to 920 calories;
- For the commanded menu, press the I button to inform yourself about the cooking mode
- Select a menu for medium effort;
- Select a menu for intense effort
- Compare the number of required calories for medium effort actions with the one for intense effort actions;

CHAPTER IV: CONCLUSIONS

- This paper presents an interdisciplinary interpretation of scientific concepts related to the science-fiction world envisioned by Jules Verne in his novel "20,000 Leagues Under the Sea";
- The multimedia product "20.000Leagues under the sea "brings back Jules Verne's worldto user's attention and leads him to explain the phenomena studied in chemistry,physics and biology through interdisciplinary;
- The teacher-student team can follow the teaching approach increasing the efficiency and the quality of the teaching-learning-evaluation process;
- The interactivity of this multimedia product initiates the young user in the mysteries of biochemistry, exemplifying him/her what rational nutrition means;

ICT AND EDUCATION
GOOD PRACTICE IN SCHOOLS IN ROMANIA

Author: Phd Silvia Moraru
Faculty of Physics , University of Bucharest
"Tudor Vianu" National High School of Computer Science
silviamoraru19@gmail.com ; 0040722547147

ABSTRACT
Keywords:ICT, e-learning, performance, good practice, innovation.
Paper shows the conclusions of the project "ICT and Education "conducted in 2007-2008, whose coordinator I was. New information technologies are making a contribution to the modernization of teaching-learning – assessment. This presents findings on the impact on educational systems in Netherlands, Finland and Romania. In this project, directors and inspectors have visited in Romania: schools and colleges; laboratories for physics, chemistry, biology and computer science connected to the internet and equipped with necessary infrastructure, students and teachers concerned with implementing new technologies in the teaching-learning-assessment. This paper presents how to make and use multimedia products made joint teams in our schools, "Tudor Vianu" National High School of computer Science, teachers –students, but the use virtual laboboratories for physics and chemistry.
The conclutions of this paper are - ICT has a significant impact on learning-teaching-assessment;

- increase teacher's role;
- obtaing better results in national assessments of our students.

CHAPTER I. COMPARISON BETWEEN THE EUROPEAN STRATEGIES REGARDING IMPLEMENTING ICT IN SCIENTIFIC EDUCATION

The unanimously recognised key words of the European strategy implementing ICT in scientific education are: e-learning, creativity, innovation, e-education, interdisciplinarity.

The European Union launched as an initiative the integration of ICT in educational systems of countries back in 1999 certain questions were the base of the inquiry carried out in 2009 by the European Council[1]:

What are the strategies that lead to implementing ICT in education?
What position and what role are conferred to the new technologies?
What repercussions of ICT do educational systems sense?
What ICT determine the modernization of educational systems?

In Europe, the integration of ICTin education has been done both by schools and by actions of intial and continous development of teachers. Thus, each educational system aims towards:

- The objectives and strategies that derive from policies of implementing ICT in educational systems and schools;
- National initiatives;
- Public/private partnership established for implementing ICT at national levels;
- The 1999 Lisbon strategy that highlighted the necessity of digital literacy and forming the human resource for using the new technologies in the teaching-learning-assessment process.

Finland, Holland are two European countries that started this process right in 1999. These educational systems promote:

a) Learning by "doing"in different practical learning situations;
b) Studying the teacher's role in teaching-learning-assessment process with the help of new technologies;
c) Education focused on the student;
d) The efficiency of learning;
e) The creativity of student;
f) Teamwork (students with different learning levels);

g) e-learning and creativity of each teacher.

An initial strategy was developed in 1995 by the Ministry of Educationn in Finland-The National Strategy for Education, Training and Research in information Society [1], which aimed to achiev two objectives:

- Continuous development of intellectual skills, including ICT ones, with the help of which every student should improve theoretical and practical knowledge;
- Developing information society, based on interactive knowledge.

Based on these findings the Ministry of Education in Finland set four areas for second stage[2]:

- Developing ICT knowledge and skills for the information society;
- Promoting computer networks(as a means of learning);
- Accumulation of information capital;
- Infrastructure development in education and research sectors.

The National Board of Education is the national coordinator of implementation of the programfor basic education (general and secondary), and adult education. It develops networks, makes digital learning equipment, coordinates teacher training and sets up virtual schools.

The implementation strategy of ICT in education schools focuses on:

- ✓ Development of method of learning and organization of learning;
- ✓ Creation of learning materials;
- ✓ Continuous training of teachers and non-teaching staff;
- ✓ Provision of computers, networks and necessary working equipment;
- ✓ Providing both technical support services and educational ones;
- ✓ Development of educational software for all disciplines;
- ✓ Safe utilization of internet;
- ✓ Development of students' digital competencies.

The Ministry of Education of Finland has developed a portal, http://www.tvt.tampere.fi/English [3], which is a component assistant for all school environments, as regards the achievements and implantation of school strategies to use ICT in education. This includes: e-books, tutorial, educational software for all subjects taught in schools, educational package with materials to ensure the promotion of good practice .

During the study visit, which I organized in Romania, acting as coordinator of ARION, with the theme: "ICT and Quality in Education", November 22 to 28 2008 at "Tudor Vianu" National High School of Computer Science, therewas written a Final Report to be sent to European Council in which Finland's efforts were noted for achieving the following: virtual schools, reaserch and development related to learning environments, content production, implementation and impact assessment of the informational strategy.

The project "ICT and Quality in Education", coordinated by myself as school principal and Arion scholarship winner, also scrutinized how the Netherlands has developed and implemented the strategy to achive integration through information technologies in education.Thus, the overall objective is: the upgrading and improving the quality of the provded education. The programmes of the study visit in Romania and in Netherlands have highlighted the performance of Dutch and Romanian teachers in the implantation of ICT in education, mainly in science education. Thus ,I presented the strategy for implementing new information technologies in the "Tudor Vianu" National High School of Computer Science (which is presented in chapter II of this paper)[4].

In educational system, in Netherlands, the structure of a competence is [5]:

- ✓ Seeing: learning
- ✓ Thiking: arranging
- ✓ Choosing: dilemma
- ✓ Doing: acting .

CEDEFOP (European Centre for the Development of Vocational Training)explains the basic learning competencies – Fig.1.

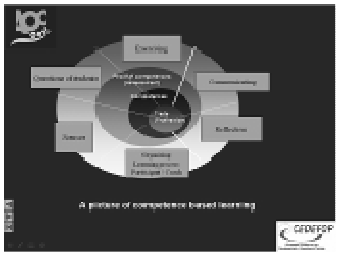

Fig.1 Basic learning competencies

In educational system in Netherlands, in primary education, from 4 to 12 years, which aims to develop the pupils'skills for: physical development and sensorial coordination, studying "DUTCH" landguage, arithmetics and mathematics, artistic development (music and drawing), social activities, health education, history/geography/science (chemistry and physics notions). In secondary schools, the curriculum gives a fixed number of hours for studied but it allows to assign cross-curriculum contents. The schools may decide the teaching methods (Montessori school) and the evalution is made at the end of the semester and the end of the year based on some tests made by CITO (National Instute for Educational Measurement). The secondary education is done between 12-18 years and comprises the following: studying "DUTCH" language, studying English, mathematics, physics, biology, chemistry, IT, history, health education, art, music, drama, dance, physical education.

The implementation ICT into the Dutch educational system was quite a challenge. The process began in 1999 and its main objectives were:

- ✓ The implementation of educational software as a means of teaching and learning;
- ✓ Training of teachers and headmasters;
- ✓ Equal opportunities for all students;
- ✓ The development of international cooperation.

A remarkable program is TANGGRAM program, developed in primary schools, which seeks the following:

- ✓ The establishment of internet connections;
- ✓ The presence of interactive Smart board in every classroom and laboratory;
- ✓ ICT – based school administration;
- ✓ The ability to communicate with parents via the Internet;
- ✓ Training teachers for ICT, at CEDIN.

As an Arion scholarship winner, In February 2007 and November 2008, I closely examined more than 10 educational systems in Europe, and visited over 18 institutions that provide education in the European Union , and I was able to participate in more than 20 classes.Here are some conclusions I have reached:

- ✓ In each and every class, regardless of domain, teachers and students alike use modern teaching-learning –assessment;
- ✓ The key words for a lesson are: interactivity, creativity, attractiviveness;
- ✓ The two members of the teacher–student team continuously communicate;
- ✓ Keeping track of students'responses leads to a fair evaluation of school progress;
- ✓ Maximized efficiency during classes;
- ✓ Training teachers on the use of ICT is done by CEDIN, from the Frisia region;
- ✓ Every school, including those that only have about 60students, is connected to the "RADIUS NETWORK";
- ✓ The semestrial/yearly evaluation is done by Dutch Ministry of Education;
- ✓ The teaching methods are active: "learning by doing works", "learn to learn", "NT2"are just a few examples.

CHAPTER II – THE STRATEGY OF IMPLEMENTATION OF ICT IN IN SCIENTIFIC EDUCATIONIN IN "TUDOR VIANU" NATIONAL HIGH SCHOOL OF COMPUTER SCIENCE

The Objectives of the ICT Implementation Strategy at "Tudor Vianu" National High School of Computer Science

Student Centered Teaching – an Essential Objective in Making a Performing Educational System

The specialized literature, the experience gained during the design and the implementation of interactive lessons places the student in the centre of the teaching – examination process.

What Is Student-Centered Education?

The pupil is encouraged to create, understand and connect all of his/her newly acquired knowledge. (McCombs and Whistler 1997) [6]. Students will be more motivated to learn when they have direct contact with international content. Pupils won't learn information by heart, instead they'll

understand and practise anything they learn as 'co-creators' in the teaching – examination process (McCombs and Whistler 1997).

What Are the Benefits of Student-Centered Education?

The student doesn't directly receive raw information; instead he experiences it through didactic activities created by the teacher. The pupil is implicated in the process with his own efforts. The "student-centered teaching" is the attribute for success in the student-teacher team (North Central regional Laboratory 2000)

How Do We Create Student-Centered Teaching?

The teacher leads the teaching-examination process, designs the layout of the lesson thus helping the student to 'learn how to learn'.

What Are the Steps Needed To Accomplish This Kind of Lessons?

The teaching-examination process needs to be accomplished by the student-teacher team, needs to be active and each didactic activity needs to be authentic, specific and oriented towards applications that will attract the student.

If applied to exact sciences, the student-centered teaching has pointed out the usage of teacher designed "lessons plans", depending on the type of lessons. The didactic strategy consists in teaching the subject in a logical way so that the student is "guided" through heuristic conversation by the teacher. The questions address the whole class and the students, alone or in groups, search for the answer (this is the road towards teaching and applying the "student-centered lesson" model) [7], [8], [9].

Modern teaching puts the student in the center of the educational process that is designed, applied and analyzed by the teacher.

Self-evaluation will determine the teacher to choose the best strategy for the future, depending on each class, group or student's capabilities. The modern didactic designing will stimulate the student-teacher team to efficiently solve the work tasks creatively. Therefore, during the "Oxygen" lesson that takes place in the 8th grade the pupils could rigorously understand the physical and chemical phenomena they encounter during direct or virtual lessons, depending on the location where the lesson takes place.

The precision with which the teacher sets the operational objectives of the lesson, designs the didactic activities (teacher – student) and interprets the feed-back, will influence the "success" of the lack of "success" of the lessons. In comparison, the 'traditional' lesson about "Oxygen" had a success rate of 60%, while the "modern lesson" that determines the student to continuously work for 50 minutes had a spectacular result.

Applying modern didactic strategy , by using the AEL platform, "the didactic project " – THE OXYGEN – makes the pupil capable of communication and permanent collaboration, helps him to consolidate his knowledge by formulating questions or answering the open questions he is asked .

By dealing with the practical activities, explaining the electrolysis phenomenon, the way of obtaining the hydrogen and oxygen from the electrolysis of water, refreshing the knowledge achieved in physics and chemistry, virtually simulating a physical-chemical phenomenon (the electrolysis of bubbly water), outlining all the chemical properties of the oxygen lead to a full participation of the student in the team he works in.

The groups of students, coordinated by teachers, know that during the continuous evaluation (7 minutes), placed at the end of the class, they will obtain spectacular results and so the operational objectives settled by the teacher would be accomplished 99-100%.

These are described in details in the "Oxygen" Didactic Project. The described lesson is based on an extremely well known didactic method, but which has a very poor level of usage and that is "I know – I want to know – what have I learned?"

On the way through the didactic project described above, it is easy to notice:

- The "teacher – students" team is strong and provided with a high level of communication
- The scientific content is carefully selected, is presented in a suggestive way, by making the pupil take part in the rediscovery of every new element of content

The elements of the virtual simulation (the electrolysis of the water, the burning of non-metal substances in oxygen, the oxygen circuit in nature), interactively displayed, transform the student into a "full participant" in the teaching – learning – evaluating process.

By the end of the lesson, both the student and the teacher will have known:

- We know/we used to think we know?
- What we want to know?
- What have we learned?

These gaps are filled in by each and every student and this will lead the "teacher – pupils team" to imagine easier the following step.

Throughout the lesson, the persistent interactivity (educational software to student, student to students, student to teacher) will stimulate the pupil for: his imagination (finding real solutions to the presented problems), his level of applying the studied aspects, the development of his possibility to work efficiently, during a certain time limit with a maximum efficiency in the team.

The interdisciplinary study of the thermodynamics – the laws of the ideal gas – studied in chemistry in the 9th grade and in physics in the 10th grade, has highlighted, by using the ICT methods, the necessity of preparing the teachers in the TIC area.

The ability of using ICT, as shown in the Strategy of Lisbon, is seen as a new form of "digital education", which, together with the classic forms, helps everyone to participate in the society of information. The teacher has the role of selecting the digital resources of learning. Therefore, depending on the pupils, he/she can use:

- AEL Laboratory – virtual platform – a closed system available for every school and high school from Romania;
- Informative materials created by the teacher;
- Digital didactic methods from high-level universities around the world.

This way, the present study provides a comparison regarding the use of these learning methods, dedicated to "The laws of the ideal gas".

The utilization of the AEL virtual platform in the study of the laws of ideal gas has turned to good account [10]:

- A run through scientific notions concerning the isothermal, isobaric and isocore transformations of an ideal gas;
- The student, helped by the teacher, will have a run (according to the didactic project elaborated by the teacher) through the virtual didactic activities involved in the making of the virtual experiments, so as, for each and every transformation, the team, consisting of 2-4 pupils, would be able to deduce the laws of the ideal gas (the law of the isothermal transformation T-constant, the law of the isobaric transformation P-constant, the law of the isocore transformation V-constant);
- The way of learning is chosen by the group of students under the guidance of the teacher. Hence, the didactic activities proposed in the worksheet determine pupils to understand the studied notions, to update the notions studied in physics and chemistry, to put into operation the deduced laws on certain issues;
- The exercises and the applications contained by these methods of study will enable the student to understand the necessity of being aware of these scientific notions (applications in the real life, applications in the industry), leading to the development of his creativity;
- The teacher has the role of coordinating every didactic activity proposed, is active and creative. Thus, he can introduce activities in order to stimulate the children's imagination, making them consider a lesson as a "quest" for knowing the real world and for improving its quality. In the traditionally built lesson, all the student does is to study the laboratory experiments (the transformations of the ideal gas), without having the chance to concretely complete the experimental determinations in a limited time (a class lasts no more than 50 minutes);
- By adapting the informational support to the operational objectives of the lesson, the "teacher – student team" will obtain an outstanding efficiency. The feed-back will emphasize student's ability to apply and operate with the studied notions;
- The study compares and contrasts the results obtained in the continuous evaluations of a "traditional lesson" and those of a lesson in which the ICT methods are used, by focusing on the following issues:
    a. the amount of reservation of the scientific concepts
    b. the amount of applicability of the studied notions
    c. students' ability to explain the natural phenomena based on the studied laws
    d. students' ability to create and solve and proposed exercises
    e. the results obtained in the summative evaluations
    f. students' ability to take part in the improvement of the utilized ICT didactic methods

"TRADITIONAL" LESSON (THE STUDY OF THE IDEAL GAS)	ASPECT	"MODERN" LESSON (THE STUDY OF THE IDEAL GAS)
40%	a	80%
35%	b	80%
40%	c	80%
50%	d	90%
grades > 900 40%	e	Grades>900 90%

-	f	1-2 students propose solutions

ICT Integration in the Curricular Area of Science

The development of the virtual platform "DIDACTICVIP" http://didacticvip.lbi.ro [11] by the teachers of the Science curricular area has underlined the necessity of implementation of new technologies in scientific education. The virtual platform contains: didactic projects at chemistry, physics, mathematics and informatics.

The collaboration of the Science curricular area teachers is materialized in this virtual platform, which can be utilized by any teacher. The methodical-scientific rigor, the high degree of applicability, the proposed modern didactic methods, the accuracy of the operational objectives, the proposed didactic activities, so the Teacher – Pupil team fulfills the purpose of the lesson, which is centered on the student: his capacity of knowing, at the end of the lesson, how to operate with the studied notions. The realization of a modern modality of implementing ICT in the scientific education has led to the modernization of the process of teaching-learning-evaluating.

The digital physics, chemistry, informatics lessons that are presented underline the openness of the school to the outside world (on-line classes) and the efficient use of resources.

From the conclusions of our practical experience, the following are notable:

- the necessity of extending our work in mixed teams : teachers-pupils;
- the development of a creative, innovative character of the lesson, the scientific rigor of the notions presented;
- the continuous realization of a critical evaluation which should lead to self-adjusting our own lessons;
- the necessity of permanent education;
- the realization of an "open learning centre", to facilitate the participation to the teaching-learning-evaluating process.

IMPACT OF ELECTRONIC ACADEMIC STAFF WEBSITES FOR SCIENTIFIC RESEARCH DOCUMENTATION ON WORLD UNIVERSITIES RANKING: UNIVERSITY OF JORDAN CHALLENGE

Ibrahim Alabbadi[1], *Renad Al-Momani* [2], *Hala Khyami-Horani*[3]
[1] MBA, PhD: Scientific Research Documentation Office Director (srdo@ju.edu.jo; i.abbadi@ju.edu.jo)
[2] PhD: Faculty of Foreign Languages. Ex-director of Website office
[3] Professor: Vice President for Scientific Research, Graduate studies and Quality
The University of Jordan-Amman-Jordan

ABSTRACT

The University of Jordan is the first university established in Jordan in 1962 already received more than 125000 undergraduate and graduate students (44th cohorts of UJ graduates). Over the years, UJ have succeeded in crystallizing a central role in offering solid education to successive generations of Jordanians from all parts of the country. If it was not documented it did not happen; the scientific research documentation office was established in 2009 as one of three offices including university website and accreditation offices comprising the Planning and Quality Management Centre aiming to prepare a data base for all UJ faculty members documenting their research, publications, patencies and books on line in order to reflect the real picture of the scientific research in the UJ and improving its ranking internationally. This paper will present achievements particularly the impact of data entry and availability of the academic information electronically on world university ranking.

"World class university" has become a catch phrase amongst all Jordanian as well as regional and international universities; not only for improving the quality of learning, teaching and research, but also for developing their competitiveness in higher education market place through acquiring, adapting and implementing new advanced technologies in the field of education. Most importantly is the electronic communication in the education process.

Although many countries all over the world developed their own systematic ways of identifying and classifying national or local universities, attempts have been made to establish international universities' ranking almost decade ago. The three most comprehensive international rankings; allowing for benchmark comparisons of educational institutions across national borders, are the Times Higher Education Supplement (THES), Shanghai Jiao Tong University (SJTU) and Webometrics. The THES ranking selects the top 200 universities in the world. First presented in 2004, the methodology for this ranking focuses most heavily on international reputation, combining subjective inputs (such as peer reviews and employer recruiting surveys), quantitative data (including the numbers of international students and faculty) and the influence of the faculty (as represented by research citations). Operating since 2003, SJTU uses a methodology that focuses on objective indicators exclusively, such as academic and research performance of faculty, alumni and staff, to identify the top 500 universities in the world. The measures evaluated include publications, citations and exclusive international wards such as Nobel Prizes (Jamil Salmi, 2009). The Webometrics is designed to measure the scientific activity on the web by using different indicators such as the quality of education; the web size, research output and impact.

Few scientists tried to define what world-class universities have that other universities do not, they have identified some basic criteria such as highly qualified faculty, excellence in research, quality teaching, high levels of government and nongovernment sources of funding, international and high talented students, academic freedom, well defined autonomous governance structures and well-equipped facilities for teaching, research, administration and (often) student life (Phillip Altbach, 2004; Khoon et al, 2004; Niland J., 2007). Moreover, recent additions to this definition include range of difficult to measure key attributes objectively such as international reputation of the university and the university contribution to its local society.

The University of Jordan (UJ) is the first university established in Jordan in 1962 -so called the mother university- already received more than 125000 undergraduate and graduate students (44th cohorts of UJ

graduates). Over the years, UJ have succeeded in crystallizing a central role in offering solid education to successive generations of Jordanians from all parts of the country (as well as students from the region and abroad), in contributing fundamentally to the development and progress of the Jordanian society and state and in leading higher education institutions in the country and in many countries in the region. Facing old & new challenges and going through a significant transition – to new horizons and new successes- students, academic staff, administrative team and the top management are determined to forge ahead with a great deal of confidence and courage, with vision, and with well thought-out plans. All are determined to keep UJ at the forefront, not only nationally, but also regionally and internationally.

As we live in a diligent and competitive world, UJ realizes the need to compete and be diligent, to become relevant and effective in today's world. Toward this end, there is a lot to be done in the days to come, and we will be doing it with both joy and faith. As addressed by his Excellency Professor Adel Toweisi; the UJ president; many major challenges need to be tackled without delay. Toward a research university in 2015; on top; UJ should continue to be a center of knowledge and enlightenment, overseeing strategic thinking, planning and quality assurance drive, a radical revision of graduate studies, boosting programs and augmenting methods of instruction and research is also a priority in which a transformation needs to happen in the way scientific research is conducted, making it more international, more human, and more relevant to local, regional, and global needs.

As UJ is one of the early universities in the region which recognized the importance of improving its ranking status on its performance, decision was made early 2009 to establish the Planning and Quality Management Centre directly connected with the Vice President for Scientific Research, Graduate studies and Quality comprising three offices managing scientific research documentation, university website and accreditation.

WEBSITE OFFICE at UJ

Based on Webometrics indicators, the website office at UJ started to analyze the status quo in order to diagnose current practices in which the following important issues were determined as areas that need improvement (Rachil Hill, 2010):

- The presence of one domain instead of minor external domains and no redirects
- The domains must be meaningful i.e. contain full words or well known acronyms
- The URL must be short, without too much numeric codes and must have few directory levels
- The presence of many flashes at UJ website home page
- No enough high term frequency in the content, no metadata in the position of terms, no ALT and anchor from external data
- Concerning the usability, accessibility and search ability; need to have absolute addresses or base declaration, a root for the hyper textual navigation tree and few JavaScript
- The web pages need to be positioned with a meaningful URL rather than such a home page
- The pages must be linked to Google and to other search engines, including pages from the same domain
- Increasing page rank by a dense interlinking to the domain
- Include a web map to the website
- Linking the website with other universities web pages in order to increase visibility especially those who have high page rank
- A useful and practical academic webpage must have portals, directories and search engines

One of the main purposes of the web site office is to increase the digital access activities so more information will be available on line to serve researchers. Besides, to identify the webpage design that impact ranking lists in search engine results from the web publisher's perspective; and to compare the impact of those design factors, and to develop a practical strategy or approach to modifying the ranking (Jin Zhang and Alexandra Dimitroff, 2005).

SCIENTIFIC RESEARCH DOCUMENTATION (SRDO) at UJ

If it was not documented it did not happen; SRDO was established at UJ early in 2009 aiming to prepare a data base for all UJ faculty members documenting their research, publications, patencies and books; on line in order to reflect the real picture of the scientific research in the UJ and improving its ranking. SRDO in the UJ aimed to document scientific research published by UJ academic staff electronically in order to improve UJ

position locally, regionally and internationally. In collaboration with the Computer Centre in the UJ- as pioneers in Jordan- a website for each faculty member or researcher in the UJ (around 1500) was developed containing the following academic information (each in a web page within the faculty website): Research Interests, Published Research, Published Books, Registered Patents, Academic Conferences, Theses / Dissertations Supervision, Awards / Prizes / Orders, Funded Research / Projects, Taught Courses, Ongoing Research and Other Academic Activities (Figure 1). The latter was approved after some modifications made by UJ deans council members, the president and his deputies.

Figure 1: An academician website first page

Life demonstrations started all over the 28 faculties, centers and UJ units in order to show academic staff and researchers how to enter their academic information into their own websites e.g. it took 2 weeks (every day) for Faculty of Medicine staff members to present these demos. All assistant deans for development and quality affairs in the UJ were trained for the same as a follow up data entry for each faculty. In this regard UJ top management made the decision that every new hiring or promotion has to be sent to the SRDO first to be sure that the website data and academic information was entered as required; this enhances and accelerates the entry completion process.

For elderly people, staff members who are outside the country and/or anyone who could not enter his academic information into his website, their resumes were collected and SRDO employees entered their data. This was achieved for more than 90% of the staff in almost 18 months time in which world class universities ranking according to Webometrics was conducted 3 times (once every 6 months) in which a clear progress was noticed.

Table 1 showed the significant advancement in the Webometrics Ranking of World Universities for UJ.

It was concluded that establishing and developing electronic academic staff websites that contain scientific research documentation has a significant impact on world universities ranking. Achievements, obstacles, future plans to improve scientific research based on documented information will be presented in this conference.

Table 1: UJ progress in the Webometrics Ranking of World Universities

Ranking date / position Out of…..universities	International (20,000)	Arabian (250)	Jordanian (28)
July 2009	4874	28	3
January 2010	3246	26	2
July 2010	2462	18	1
January 2011	1823	15	1

Abstract: This study investigates designing and implementing a speaking course in which face-to-face instruction informed by the principles of Task-Based Learning is blended with the use of technology, the video, for the first-year student teachers of English in Turkish higher education. A mixed research method was used to collect data from multiple sources: recordings of a pre-and post-course speaking task, analysis of the video-recordings of students' speaking tasks, informal interviews with the students, and a written end-of-year course evaluation survey. Analysis of quantitative and qualitative data revealed that students made noticeable improvement in their oral communication skills, and they were positive in their perceptions of integrating technology in the lesson. The study also indicated that the use of video camera, as a technological tool, had a positive impact on students' viewing and critically evaluating their speaking tasks. It is suggested that video cameras represent a language-learning resource worthy of further investigation.

Introduction

Second language (L2) courses that combine face-to-face learning and applications of technology, in particular computer assisted language learning (CALL), have been the subject of numerous studies (MacDonald, 2006; Neumeier, 2005; Stracke, 2007). These courses usually require students to attend traditional face-to-face classes and to work independently with a synchronous and/or asynchronous communication tool. As existing studies have shown, this blended approach has become the most popular model of CALL use in L2 learning, particularly in language programmes where CALL components can provide face-to-face instruction with an "efficient use of human and material resources" (Salaberry, 2001, p. 51).

L2 courses that incorporate technology in combination with face-to-face instruction have been found to promote L2 learning effectively as they can give students the flexibility to work independently, at their own pace, promoting language acquisition (Felix, 2003; Singh, 2003). In a study, Ayres (2002) reported that a vast majority of the L2 English and Japanese learners felt that computer enhanced instruction was motivating and appropriate to students' learning needs. In a similar study, Felix (2003) found that the incorporation of technology into face-to-face instruction helped L2 learners of Italian, Japanese and English feel more comfortable with technology and the learning of L2.

As a growing number of L2 learners now experience technology in combination with face-to-face instruction, it is important to examine the value of this technology integrated learning on L2 learners' speaking and their perceptions of technological tools to ensure their success in the learning process. This study seeks to broaden the existing body of research by examining L2 Turkish learners' perceptions towards the use of video cameras as a supplement to face-to-face task-based learning environment, and the effect of using this blended approach on improving students' speaking proficiency.

Related Literature

Task-based language teaching (TBLT) proposes that "the primary unit for designing a language programme and for planning individual lessons should be a 'task' because task promotes L2 learning. An important phase in the TBL framework is the task cycle (Willis, 2009). Willis describes three components of the task cycle - task, planning and report- and highlights that the teacher has a crucial role in each component. She also remarks that the task cycle can be adapted to different teaching situations. Nunan (2004) raises several principles to be considered in a task-based curriculum. Through *scaffolding,* learners should be provided with a supporting framework to facilitate learning. The concept of *recycling* enables learners to maximize opportunities for learning. In TBL, active learning is expected so that learners acquire the language by *actively* using it. Nunan also notes that *integration of form and function* is needed to make the relationships between grammatical form and communicative function clear.

Task-based instruction is considered to be potentially suitable for learners of all ages. It is agreed to be particularly effective when the learners are engaged in relatively similar real-life tasks. As such, task-based language instruction has been employed by many researchers, and it has proved to be highly effective in enhancing the learning of a second or foreign language (Loumpourdi 2005; Stark 2005).

The literature on integrating video-recording of student speaking in language learning offers several advantages: First, students can watch and see themselves and their fellow friends' performances. Similarly, teachers can use video to help students become better speakers in English (Chandra, 2007; Tomalin & Stempleski, 1990). Students also have the opportunity to view the recording on video more than once. Thus, recordings allow students to replay the video as many times as they need; so, they can make self-evaluation of themselves as well as their fellow friends. Students, therefore, become self-critical, as they can see their problems and trace their improvements.

The Study

This study aims to design a speaking course in which face-to-face instruction, based on the principles of TBL is blended with the use of video for the first-year student teachers of English in Turkish higher education.

The study addresses the following research questions:
1. What are the student teachers' perceptions on the effectiveness of video-recorded TBSC as a blended learning environment?
2. What is the contribution of the blended approach to the improvement of student teachers' speaking skills?

Methods and Procedures

The study incorporates mixed research methods, i.e., the use of different instruments and procedures to examine the impact of blended approach on promoting a group of Turkish student teachers' speaking proficiency. Mixed research methods have frequently been implemented by CALL researchers "to strengthen and cross-check the data before conclusions are made" (Levy, 2000, p. 173).

Data were collected from multiple sources: recordings of a pre-post-course speaking task, students' weekly video-recordings of speaking tasks, informal weekly interviews administered with the students, and a written end-of-year course evaluation survey to analyze learners' experiences.

The participants of the study were 28 first-year student teachers of English; seven male and 21 female, aged between 21 -22, attending to a state university in Turkey. On entry to the course, the students' knowledge of grammar and reading comprehension was at the lower-intermediate level, but, they were quite inadequate in speaking skills. None of the students had any prior experience in using video for language learning purposes.

The course was scheduled as three lessons of face-to-face teaching, each lesson lasting 45 minutes, and it lasted one semester (14 weeks). An additional one-hour classroom time was added to the weekly schedule which was devoted to viewing and evaluating students' speaking tasks, which the students video-recorded independently working mainly in groups.

The following steps were followed in developing the framework of the blended TBSC.
Initially, needs assessment was conducted to identify student teachers' speaking difficulties, their perceived needs and expectations from the speaking course and the kind of topics they wished to be

included in the course. To ascertain students' initial language learning needs in speaking, students were invited to speak on one of the argumentative topics below, as a pre-course speaking task:

- Most university degrees are theoretical and do not prepare students for the real world. They are therefore of very little value.
- In the words of the old song "Money is the root of all evil".

Each student was asked to speak into a microphone attached to a PC and their talk was recorded using Goldwave as a record device for further data analysis.

The next stage involved analyzing students' initial speaking using an oral test rating scale, specifically developed for this study. The rating scale featured five categories: fluency, pronunciation, vocabulary, accuracy and task accomplishment, and a clear definition of five descriptors in each category were provided. A score is awarded for each category to a maximum of 20, the whole oral test rating scale totaling 100 points. The global speaking score for each student is calculated by summing up the scores that a student receives for each category.

Each student's recorded speech was listened to several times by the researcher, and was scored using the oral test rating scale discussed above. Another researcher, also familiar with the scale, scored students' speaking independently using the same rating scale. Consistency of raters and agreement among them was high; 92.6%. Any disagreement among the raters (researcher and the second rater) was resolved through discussion (see discussion section for findings). Common problems students experienced ranged from lack of vocabulary and fluency, weak pronunciation, frequent occurrence of language errors.

Furthermore, students were interviewed using a semi-structured interview, lasting between 15-20 minutes. The purpose of the interviews was to evaluate students' present level speaking ability, to elicit their perceived difficulties in speaking, and their expectations from the speaking course. Interviews, which were conducted in English, were audio-recorded and later transcribed for analyses.

Students (*N=28)* stated that they felt anxious and shy about speaking in the presence of others, and their knowledge of vocabulary was restricted. In fact, these problems were already evident in their initial speaking performances. While the initial pre-course speaking task served to identify students' language needs, the same speaking task was given at the end of the study, serving as a post-course speaking task to determine the effect of technology-based TBSC on learning outcomes as will be discussed in the data analysis section.

Designing the Task-based speaking course

Tasks were determined in accordance with the findings of needs assessment. The guiding principles in determining the themes and content for tasks included the students' interests, familiarity, and their relevance to students' needs. Thus, tasks focusing on a variety of actual topics were generated to cater for the present and future speaking needs of student teachers of English. Task-based speaking course (TBSC), as proposed by Willis (1996), was implemented in three stages: Pre-task, task cycle and report.

In the initial pre-task phase, task planning activities were done to provide learners with a repertoire of topic-specific vocabulary, some potential language, and general information students could draw on during the task (Skehan & Foster, 2001). Students read texts or dialogues drawn from a textbook, newspaper articles or other written sources on the theme. During the task cycle, students working in pairs or in groups depending on the nature of the task, made a list of key points covering what they considered to be crucial in performing that particular speaking task. They, then, rehearsed it before reporting on it orally. At the report stage, students presented results of their task orally in groups or in pairs with a focus on meaning and effective communication to convey information appropriately and fluently. Students video-recorded themselves while doing the speaking task. During the next class hour, students' digitally video-recorded speaking tasks were viewed. While viewing the tasks, students' task performance was evaluated using the oral test rating scale, discussed earlier in terms of fluency, pronunciation, vocabulary, accuracy and task accomplishment, and they were given feedback on various aspects of their talk.

In addition to video-recording of their speaking, the students listened to their own speech and transcribed sections themselves. Using task transcripts, students were asked to *notice* and highlight interesting features and the language that they used in their talk. These proved to be very useful in increasing students' awareness of their strengths and weaknesses.

Data Analysis

Student scores from the pre-and post-speaking tasks were analyzed using the Statistical Package for the Social Science (SPSS), version 11.5. Paired Samples T-test was administered to find out if there existed any significant difference between the pre-and post-speaking scores of the students. Data from the interviews and end-of-course evaluation were analyzed qualitatively through content analysis to identify emerging themes and trends. A similar procedure was adopted in analyzing students' written responses to the end-of-course survey evaluation.

Results

The first research question asked what the student teachers' perceptions on the effectiveness of video-recorded TBSC as a blended learning environment was. In general, video-recordings proved to be a very useful learning tool in recording and evaluating the speaking tasks with the learners involved in this study. Asking student teachers to record their speaking tasks independently gave students an important benefit in that they were able to communicate in English, do some additional research on the task, and relate what they had learned in the face-to-face classroom learning environment to the speaking task. The results of the survey on student perceptions indicated that most students acknowledged that recording their speaking was a real challenge for them, and that watching and evaluating their recordings increased their awareness of their own mistakes, as well as enabling them to trace their own progress.

The second research question asked what the contribution of the blended approach to the improvement of students' speaking skills was. First, when the scores from the students' pre-course and post-course speaking task are compared, it can be seen that a considerable progress has been noted for each student. These same students also used a wider range of vocabulary, notably extending their theme-related vocabulary. Additionally, a noticeable improvement in the language used was present.Students' mean speaking score, which was measured as 58.0 before they took the course, which increased to 82.86, as measured at the post-course speaking task, indicating 43.3% of overall average increase in fluency, pronunciation, vocabulary, accuracy and task accomplishment as assessed according to the oral test rating scale. According to the results of the Paired Samples T-test, as indicated in Table 1, a significant difference ($p<.001$) has been recorded between the pre-course and post-course mean speaking scores of students, suggesting that the blended TBSC has had a considerable influence on each student's speaking performance.

Table 2: Results of Paired Samples T-test Regarding Pre-and Post-course Students' Speaking.

Score	N	$\overline{X}$	sd	df	t	P
Pre-course speaking	28	58	5.35			
Post-course speaking	30	82.86	4.75	27	-26.575	.000

Findings obtained from an evaluation of end-of-course survey indicated that students made considerable improvements in all areas in which they felt inadequate in at the beginning of the course. The analysis demonstrated the emergence of several categories: (a) students expanded their knowledge of *vocabulary* and made significant improvements in their *speaking skills*; (b) the interactive nature of pair and group work promoted *collaborative learning* and *incidental learning*, and (c) they appreciated *scaffolding*. The students overwhelmingly indicated that TBSC met their initial expectations. Many students (*N=28*) stated that they had previously been exposed to form-focused instruction, and acknowledged how transition from a conventional grammar-based instruction to TBSC helped students develop their fluency and confidence to speak in English. Furthermore, students stated that while performing the tasks, they acquired both vocabulary and grammar knowledge to enable them to express themselves fluently.

As has been shown from several comments made by the students and based on informal interviews held with them, students are now more aware of the amount of theme-related knowledge they need to acquire. They have started to accept grammar and vocabulary not as discrete elements of language but as powerful means for putting their ideas into communication. TBSC proved to be beneficial in

achieving a balance between accuracy, fluency and gaining a higher level of complexity. This confirms Willis and Willis's (2007) argument that taking the task as a starting point, learners are encouraged to deploy whatever language they already possess, build upon it, improve and expand their capabilities. The findings obtained from this study also confirm remarks made by Foster's (1999) arguments that "…giving learners tasks to transact, rather than items to learn, provides an environment which best promotes the natural learning of languages". (p. 69)

Conclusions

This study reported on the design and implementation of a blended TBSC that combined face-to-face classroom instruction with video-recorded speaking tasks, for the first-year student teachers of English in Turkish higher education. This implementation was found to be helpful in enhancing students' speaking skills by offering an innovative learning experience to students who were able to engage in meaningful interaction, and improve in the areas where they perceived an obvious need for improvement.

Findings of this study are significant in contributing to the related literature as the results indicate that in an EFL/ESL context, a speaking course based on the principles of TBL can be conducive to promoting students' speaking proficiency along with developing their knowledge of language. The findings of this study also advance our understanding of the contribution the use of video-recordings of students' speaking tasks makes to foreign language learning, and offer useful insights to teachers and course designers in designing a speaking course.

Abstract

To stay competitive, universities are accumulating a long history of offering courses delivered via online technologies. As the Internet becomes a major factor in education, higher education in the U.S. is increasingly turning to online education technologies to deliver the curriculum at all levels. This trend makes it essential that universities examine closely how to best do so. Depending on the format, online education can often create challenges that may impact the quality of the whole system. In the case of this paper institutional challenges, taken in no particular order, are discussed. They include infrastructure and space allocations, faculty training, faculty workload, student preparedness, academic honesty, intellectual property, and copyright.

Key words: online education, Workload, Intellectual property, infrastructure, faculty training, copyright

Introduction

To stay competitive universities are accumulating a long history of offering courses delivered via online technologies. As the Internet becomes a major factor in education, higher education in the U.S. is increasingly turning to distance education technologies to deliver the curriculum at all levels. On reason for the popularity of online-based courses is the flexibility to choose the time and place to study. Today, Students, and especially adult learners, are struggling to balance their educational needs with a job, family, health issues, and financial worries. Internet classes allow them to learn at a pace that is comfortable to them, at a place of their choosing, and at a time when there are least interruptions. According to Berker (2003) the main reasons given by adult learners in a research study were: to gain skills that will help them get further in their careers, to enrich their lives with more knowledge, to complete a degree or other credential, and to fulfill the requirements of their employers to take educational courses

Today distance education has become an alternative method for delivering academic course work to students. Ryan et al (1999) wrote "The current paradigm shift in higher education is from traditional classroom settings to distance education program delivery via the World Wide Web (WWW)" p.272. Furthermore, distance education eliminates the barriers of time and distance by offering instructional material instantaneously and continuously (Piskurich, 2003 & Bullen, 2003). Merriman (2006) wrote "Online education is entering the mainstream, according to some higher education analysts, and its growing popularity with employers is part of the reason" p.79.

This trend makes it essential that universities examine closely how to best do so. Depending on the format, online education can often create challenges that may impact the quality of the whole system.

Challenges and solutions

Whenever we consider institutional challenges relative to the delivery of online courses, it is necessary to note that there are multiple stakeholders. In the case of this paper seven major

challenges groups are described. The challenges, taken in no particular order, are discussed in the following,

Infrastructure and Space Allocations

Developing and maintaining the necessary infrastructure to support online teaching-learning process constitutes the first challenge. This involves developing or purchasing the necessary computer bandwidth, instruction development hardware and software, faculty support (IT personnel and instructional designers), as well as providing multiple opportunities for training. This is not simple, nor is it inexpensive. Universities have to be successful in attracting a significant amount of state support and external funding to develop the necessary infrastructure for online delivery. For example, Indiana State University, USA, invested in 2004 over $400,000 over a two year period of time to create a television and Internet ready classroom that is in essence a full-feature studio that seats 19 students.

In short, a good quality online education necessitates the transition of instruction from face-to-face to distance delivery that can be quite expensive, requiring major investments in hardware and software. However, there is often another interesting outcome for this transition; the actual need for space declines as fewer and fewer students choose not to attend on-campus courses. In some cases, this has the net effect of programs losing physical space even with significant growth in enrollments.

Faculty Training

Research suggests that faculty as a whole see online delivery of classes as a good thing; they also admit that many, if not most, lack the skills necessary to incorporate it in an effective way. Many teachers have had no prior experience with this method of teaching and the only solution offered to them in most cases was in-service training (Wonacott, 2001). Among the influences to faculty's resistance to teach distance education courses are: a perceived lack of institutional support and training as well as lack of technical training (Clark, 1993).

Indiana State University, through the Center for Instruction, Research, and Technology (CIRT), offers different training sessions as well as one -on- one training for faculty to learn different technologies of delivering online courses and enhancing their knowledge and skills in areas of teaching on-line. The center provides consultations to help faculty troubleshoot any issue with technology. This is very important as students can get easily frustrated if they experience technological issues that hinder their learning.

Distance education department publishes a free e-newsletter that contains important University announcements to help students start and complete their distance courses. Technical support is also provided to students. A toll free number allows students to call 24 hours for technical support. Quality of instruction is also ensured by peer course review, student evaluation as well as evaluation by instructional designers regarding the design and management of the course.

Faculty Workload

Depending on the format, distance education can often create an overwhelming workload for faculty. Several authors agreed that web-based courses require more time and effort on the part of faculty in comparison with classroom courses of comparable size, content, and credit (Tomei, 2005; Visser, 2000; Rockwell, Schauer, Fritz & Marx, 1999). According to Dibiase et al (2005) an increase from 18 students in a class to 49 students increased course-related workloads from 47.5 hours to 116.7 hours.

As faculty become more involved with online methods the workload tends to increase as many interactions with students become one-on-one interaction. So instead of one teacher teaching a lesson to 30 students simultaneously, that same teacher may have hundreds of interactions with the same 30 students to deliver the same amount of instruction and advisement.

Consequently, today a normal load for a faculty in some programs at Indiana State University is to teach three sections of two courses. Often these courses have both the undergraduate and graduate sections. In that case, the professor would actually have three sections of four courses. However, the University is exploring ways to reduce this workload by reducing the number of sections, and faculty are exploring group means such as a frequently asked questions page on their web pages, chat sessions, and other interactive communication tools.

Student Preparedness

As many universities struggle to maintain a 40% six-year graduation rate, lack of preparedness has been a concern for the faculty who reported that they often found that some students, especially traditional undergraduates were not prepared to better deal with online learning. Very little in their educational experiences to date prepared them to deal with the autonomy and responsibility of online instruction. Faculty need to anticipate where students might have difficulty and ensure that the students are using the material and learning on their own. Otherwise the faculty member can expect frustration and a flood of e-mail messages.

Instructors must assume the responsibility of making sure that students are participating in the class, be very accessible, provide progress updates on regular basis, and encourage students to respond to each other's questions and comments.

Academic Honesty

Academic honesty is another challenge in online education. The internet houses a wealth of information ready to be copied and pasted, and often presented as the learner's own work. This can attempt some students who feel they are not doing well enough, or who simply don't have the skills to do the work themselves. This places a different role on the instructor;

To prevent the problem, faculty develop a section in the syllabus that explains academic dishonesty. Faculty also uses Turnitin.com to detect plagiarism.

Intellectual Property

Of significant concern for both faculty and administration is the issue of ownership and use of the materials developed for online delivery. The issue of intellectual property on university campuses in the United States is still a debated issue. Some institutions insist they own intellectual property on developed university courses. Others take a more "generous" position. Faculty on the other hand, tend to desire to retain ownership rights. In most instances faculty is required to sign a waiver for each course they are paid to develop. The waiver states that both the faculty and the university own the materials and have the right to use them in the future.

Copyright

One small but significant challenge is the use of copyrighted material for Internet based courses. Not all the data and information on the internet can be used without proper approval or proper referencing. The instructor may also have materials that are available for nonprofit educational institutions but can not be posted to the Internet by the instructor. This would require the instructors to look elsewhere for pertinent materials for the class (Wonacott, 2001). Copyright laws were amended in 2003 to include these issues.

IMPROVING CREATIVENESS OF COMPUTER GAMES PRODUCED BY STUDENTS THROUGH APPRECIATIVE LEARNING APPROACH

Assoc. Prof. Dr. Wan Zah Binti Wan Ali[1], Eow Yee Leng[2],
Dr. Rosnaini bt. Mahmud[3] & Dr. Roselan bin Baki[4]
[1, 2, 3, 4]*Universiti Putra Malaysia, Malaysia*

ABSTRACT

Both computer games development and appreciative learning approach are still in their early evolutions at educational setting. By ignoring the educational power of computer games development and appreciative learning approach, educationists could risk losing a valuable tool and pedagogical strategy. Therefore, this study attempted to investigate the effectiveness of appreciative learning approach and computer games development combination in enhancing students' creativity in terms of the products produced. The study applied randomised subjects, with control group experimental design and involved 69 Malaysian form one (grade seven) students, aged 13-14 year-old. Computer Game Assessment Inventory (COMGAIN) was created specifically to assess the product's creativity in terms of the computer games produced by students. It generated a Cronbach's Alpha value .726. It was found students in treatment group exhibited a mean score of 6.62, which was significantly higher at .05 level of significance compared to the mean score of 5.35 exhibited by the control group. Therefore, computer games development and appreciative learning approach combination offers a great opportunity for improving the creativeness of computer games produced by students. Nevertheless, computer games produced by students have more rooms for improvements.

KEYWORDS: Appreciative Inquiry; appreciative learning approach; creativity; computer games

INTRODUCTION

The study of computer games and its players is not possible to be mapped into one research discipline, as it normally covers scopes such as computer science, education, psychology, youth, media and/or cultural studies concurrently (Kirriemuir & McFarlane, 2004). Therefore, this study attempted to look at a bigger combination of technology, pedagogy, and creativity simultaneously. Computer games aligned with the younger generation's habits and interests (Eow, Wan Zah, Rosnaini, & Roselan, 2009; Paraskeva, Mysirlaki, & Papagianni, 2010; Ulicsak & Cranmer, 2010). However, the use of technology alone does not motivate students whom have been living in the midst of technology all their lives to put more effort in their endeavours (Killi, 2005). Therefore, students need tasks and constructive learning environment that capable in encouraging them to work beyond their existing abilities while producing creative work.

Computer Games

Children spent a big amount of time playing computer games, with an average of 13 hours per week for boys, and 5 hours per week for girls (Gentile, Lynch, Linder, & Walsh, 2004). The amount of time spent is increasing with time evolvement, as Yee (2006) found youth spending about 22 hours on computer games per week. A survey carried out by Entertainment Software Association (2010) revealed male gamers as having an average of 12 years game playing experience, while female gamers have an average of 10 years. At Malaysian situation, a survey conducted on 236 students of grade seven in one of the secondary schools shown 75.8 percent were gamers while almost 91.3 percent of the boys engaged with computer gaems (Eow et al., 2009). The big population of gamers is also represented by the year 2009 computer games sales' statistics in United States, which generated an amount of US$10.5 billion dollars (Entertainment Software Association, 2010). Therefore, it is becoming increasingly difficult to ignore the fact of computer games as the contemporary culture of today's youth.

Computer games is one of the ideal ways reaching out to students whom have been growing up in the playstation generation (Kearney & Skelton, 2003). Prensky (2007a) also suggested students to be allowed to

explore with technologies they love using, characterize their age, and be able to prepare them for their 21st century. Keyboarding and word-processing skills in preparing assignments are deemed to be unable in providing up to date technological sophistication level required by students (Niederhauser & Lindstrom, 2006). Therefore, in this study, computer games development was used as a tool to engage students. However, the cost for computer games development which commonly reported in millions of dollars is often used as a reason to argue against its utilization at educational settings (Oblinger, 2006). Nevertheless, as technologies progress aggressively, games development tools become more widely available and affordable for non-professionals. Some games development tools are available for a reasonable licensing fee while some can even be downloaded free. These games development tools are such as Game Maker, Torque Game Builder, Golden T Game Engine, The Game Creators, and 3D Game Studio. Therefore, computer games development is a new learning opportunity for the current generation of students.

Product's Creativity

Creativity is complex term and there is no single or universally accepted definition of creativity (Treffinger, Young, Selby, & Shepardson, 2002; Vidal, 2005). Different researchers defined creativity differently according to their context of study (Rhodes, 1961; Torrance, 1993; Treffinger et al., 2002). Creativity has been defined as a process, person, product, and press or the quality of environment that nurture creativity. This study embarked on creativity as a product produced by students. Product is an effect of creativity (Cropley, 2001). It can be tangible or intangible. As for this study, computer games developed by students are the tangible products. Among the most popular tool in assessing product's creativity is Creative Product Analysis Matrix or CPAM (Besemer & O'Quin, 1999; Horn & Salvendy, 2006). However, no matter how popular the CPAM may be, it might not be suitable as per se for the purpose of this study. A computer game may not be logical or useful in real life as evaluated by CPAM. In addition, the elegancy element of CPAM to be evaluated on computer games does not necessarily encourage gamers to keep playing and trying. Therefore, instead of using CPAM as an instrument for this study, CPAM was adapted and altered to suit the context of the study.

In order to produce a creative product through computers, people need social supports (Selker, 2005). Instead of adapting the approach of learning from technology, students should be trained to learn from thinking by using technology to engage them to think and take actions (Jonassen, Howland, Moore, & Marra, 2003). The use of technology alone does not motivate students to express their creativity optimally since the current generation have been living in the midst of technology all their lives (Kiili, 2005; Reid & Petocz, 2004). Accordingly, computer games development could be fun but it is not an easy stand-alone option to enhance creativity among students of the 21st century. Therefore, appropriate pedagogical strategy is warranted for optimal creativity enhancement. Appreciative learning approach, which based on Appreciative Inquiry (AI) as both theory and practices, was tapped as the pedagogical strategy in this study.

Appreciative Learning Approach

AI theory focuses on the co-evolutionary search for the best in people and the relevant world around them (Cooperrider, Whitney, & Stavros, 2008). Instead of focusing on problems, what is not working and why; AI theory seeks to discover what is working particularly well with the students and what they desire to achieve (Cooperrider & Whitney, 2005; Lebrun, 2007). Positive images of oneself and the world around would inspire the subjects for more volunteer actions and innovations. Subsequently, it counters initial negative images, beliefs, and expectations. Appreciative learning approach provides opportunities for students to be heard; explore; dream; taking actions, and share their products, ideas, and dreams through its 4D*s* model which consists of discovery, dream, design and destiny stages. Therefore, appreciative learning approach as a pedagogical strategy would offer great potential and encouragements for students to produce better creative works.

The public tends to perceive teaching as a simple task, merely requiring the teacher to present information to students, have them learn it, and evaluate these students to see whether they have attained the learning materials (Stringer, 2008, p. 14). However, teaching is much more complex than the general assumption. It requires extended body of professional knowledge in which teachers are not only accountable for creating active classroom environment but also making students feeling safe in taking intellectual risks and expressing

their creativity (Tighe, Picariello, & Amabile, 2003). Tighe et al. (2003) added that teachers themselves should be opened to students' responses, even if those responses are with little relevancy. Since AI theory and practices stress on appreciation and positive reception of others' ideas and creations without negation or criticism (Cooperrider & Whitney, 2005), appreciative learning approach could be an ideal pedagogical strategy in encouraging students to express their creativity without fear.

STATEMENT OF THE PROBLEM

One of the objectives in The National Education Blueprint 2006-2010 was to develop human capital in order to be creative, innovative and marketable (Malaysian Ministry of Education, 2006). However, most teachers still stick to the conventional teaching mode, which mainly taught students to remember factual information and return them in the form of examinations. This seriously hold back students from exploring new ideas and being creative (Northcott, Miliszewska, & Dakich, 2007; Vint, 2005). Even many parents did not want to spend time entertaining their children's curiosity (Lee, Zulkifli, & Loh, 2008). As a result, the mean score for creative thinking index among Malaysian secondary school students was recorded to be much lower than American students of the same age (Chua, 2002). In addition, Malaysian employers described their employees as having insufficient creativity (Ramli & Abu, 2006). Hence, there is a need to facilitate Malaysian students in boosting their creativity.

Although computer games have been noticed to be the younger generation's habits and interests, yet they are still in the early stage of evolution at educational settings (Oblinger, 2006; Prensky, 2007b). This study did not intend to manipulate computer games as another information transmission. On the other hand, it was manipulated as a technological tool for innovating. Most studies of computer games have been carried out at higher learning level (Cagiltay, 2007; Ip, Capey, Baker, & Carroll, 2009; Schaefer & Warren, 2004) but studies among lower secondary students merely stay untapped. Most researches focus on changing people and behaviour by using problem as a base to be fixed (Watt, 2007). However, Cooperrider and Whitney (2005) noted that by starting from the standpoint of problem, it will create more problems. Instead of negation and criticism, AI focuses on the subjects' past and present capacities in creating possible future (Cooperrider et al., 2008). Yet, only a limited numbers have been done at classroom settings (Donnelly, 2004; Yballe & O'Connor, 2000). The application of appreciative learning approach as a pedagogical strategy to enhance students' creativity in terms of the products produced had not been probed previously. In fact, a search for Malaysian AI practitioner through the AI community list at http://appreciativeinquiry.case.edu/ proved futile. Both computer games development and appreciative learning approach are still in their early evolutions at educational setting. By ignoring the educational power of computer games development and appreciative learning approach in enhancing students' creativity, educationists could risk losing a valuable tool and pedagogical strategy. Therefore, this study intended to fill these gaps.

PURPOSE AND OBJECTIVE OF THE STUDY

The purpose of the study was to investigate the effect of appreciative learning approach and computer games development combination on students' creativity in terms of the products produced. Thus, the objective of the study was to compare the level of product's creativity between treatment and control groups.

METHODOLOGY

The effort in assessing the effectiveness or impact of a program is best to be carried out through experimental or quasi-experimental designs (Treffinger et al., 2002). Yet, to date, experimental research studies demonstrating the effects of AI are not readily available due to the qualitative nature of the AI process (Roper, 2006). Therefore, this study attempted to increase the objectivity of measurement by using randomised subjects, with control group experimental design. It is regarded as one of the simplest designs, yet one of the most powerful of all experimental designs (Ary, Jacobs, Razavieh, & Sorensen, 2006). Treatment group applied appreciative learning approach while control group used self-paced learning, followed by do-it-yourself (DIY) session. Students in both treatment and control groups were engaged with computer games development. Creativity as a product was quantitatively measured. The study was carried out concurrently for both treatment and control groups. Each group was facilitated by an independent teacher. Researchers remained objective by working at an emotional distance, and interacting as little as possible with researched subjects and the context.

Students in control group had total freedom during the session since they adopted self-paced learning with game module as a guide and followed by do-it-yourself (DIY) session. As for treatment group, students were guided through the respective sequence of discovery, dream, design, and destiny stages (Cooperrider et al., 2008). Discovery stage was done with the intentions for the gamer students to see new potentials and possibilities. During discovery stage, group conversation was carried out by facilitator. Students listened to each other's stories of success as defined by another person's values. It was the starting point of inquiry in a non-threatening, engaging, and interesting way (Preskill & Catsambas, 2006). It was also an opportunity for students getting to know each other. Group conversation lasted about 20-30 minutes. Then, it was followed by students' discovery of Game Maker through self-exploration, guided by game module adapted from Habgood and Overmars (2006). This was similar to the self-paced learning session carried out by control group. Next, in dream stage, students were asked to dream of how they wanted their own games to be. They sketched or noted down ideas and dreams on the papers provided. As for design stage, students started to develop own computer games based on the dreams and desires they generated in previous stage. As for destiny stage, facilitator guided the students to create their own executable file and engaged again in the group conversation. Students were led to think on how they are going to empower their skills and knowledge in Game Maker.

Only the existing gamer students who were interested in learning computer games development, and have been playing computer games for at least the past two years and are still actively playing were selected for the concern study. Researchers did not intend to create another group of computer games enthusiasts. The study involved 69 (35 and 34 in control group and treatment group respectively) Malaysian form one (grade seven) students, aged 13 to 14 year-old. In order to reduce the interaction between students from control group and treatment group, different school was selected to function as control group. Both schools were identical in terms of the academic performance, social status, and discipline aspects. Appropriate measurements were taken in forming the two almost identical groups. Besides choosing two identical schools in terms of academic performance, students' social status and discipline aspects, additional conditions that strictly considered for equivalency were students' years of experience in playing computer games; computer competency; time spent playing computer games per week; age; gender; and creative perception.

Computer Game Assessment Inventory (COMGAIN) was created specifically to assess the product's creativity in terms of the computer games produced by students. Teacher evaluators filled the first section of COMGAIN. It contained game framework, game content development, and game polishing constructs, which were based on originality. Originality refers to the ability to generate new and unusual ideas or options (Treffinger et al., 2002; Vidal, 2005). The descriptions of each dimension used in the study are show on Table 1. Game framework, game content development, and game polishing constructs in this study were assessed through the seven points Likert Scale ranging from 1 (extremely undeveloped) to 7 (extremely refined). The scales in between were 2 (undeveloped), 3 (slightly undeveloped), 4 (neither undeveloped nor refined, exactly the same as module), 5 (slightly refined), and 6 (refined). Extra guidelines for the assessment were prepared for teachers' reference in order to reduce the inconsistency in the product's assessment. Meanwhile, the second half of COMGAIN, consisted of novelty, arousal, and centrality dimensions. The dimensions being assessed were quite subjective since the judgement could be depended on the persons who rate them. The second half of COMGAIN was based on the five points Likert Scale, which 1 (very disagree), 2 (disagree), 3 (slightly agree), 4 (agree), and 5 (very agree). Student evaluators were chosen from the same age range as the sample. The selection was due to the rationale highlighted by Lubart and Sternberg (1995) that evaluators tend to rate product's creativity more accurate for products produced by their own age cohort. The average score from the three student evaluators was then calculated. Based on the data collected, COMGAIN generated a Cronbach's Alpha value .726. A value of .70 is generally agreed upon as the lower limit for Cronbach's Alpha (Hair, Black, Babin, Anderson, & Tatham, 2005; Runco, 2010).

Table 1: Description of dimensions within COMGAIN

Dimensions	Description
Game framework	Standard framework for the start and end screens. The start screen displays name of the game and buttons; responsible for starting the background music; and initialising other game settings. The end of game screen displays congratulatory or failed to achieve mission message; activates the high-score table for students to insert their name; and lead back to front room.

Game content development	Actual game play. Relevant characters, objects, events, actions, sounds, commands, backgrounds, music, rooms, and messages are developed.
Game polishing	Design of games to be more presentable, playable, and being different from the game modules provided.
Novelty	Relates to attribute aspect. Descriptive terms such as different; delighted; appealed; unconventional; and unique were used.
Arousal	Relates to affective domain. Descriptive terms such as fascinated; excited; stimulated; engaged; and overjoyed were used.
Centrality	Relates to preferences aspect. Descriptive terms such as favourable; desirable; appealing; interesting; and attractive were used.

FINDINGS AND DISCUSSIONS

Product's creativity is part of the outcomes of creativity (Horn, 2006; Torrance, 1993). Appreciative learning approach group produced significantly better product's creativity than the control group. This was proven true from the separate perspectives of teacher and student evaluators, as well as the combination of both. Table 2 presents the analyses results of independent samples t-test on product's creativity scores. Obviously, students in treatment group gained higher scores in all the product's creativity dimensions. The differences between control group and treatment group were significantly different at .05 level of significance for all the dimensions and product's creativity as a whole, except game framework and game polishing dimensions.

Nevertheless, the mean scores for all the dimensions evaluated by teacher evaluators did not display levels deemed satisfactory. Teacher evaluators assessed students' game framework as just slightly above the description of neither undeveloped nor refined level while game content development as slightly below the concern level. Game polishing dimension was even worst with the scale below 1 (extremely undeveloped). These situations could be due to the limited knowledge and skills in Game Maker as students were newly exposed to Game Maker. Csikszentmihalyi (1996) stressed on the need of knowledge and skills mastery in creating product's creativity. The game framework, game content development, and game polishing dimensions were assessed based on originality. Originality refers to the ability to generate new ideas and getting away from the obvious or common piece of works (Treffinger et al., 2002). In addition, Vidal (2005) described original ideas as leading to unique, surprising, and remarkable products. However, although statistically students in treatment group produced significantly better game framework, game content development, and game polishing dimensions than the control group, yet most of the assessed dimensions did not differ much from the game module. Therefore, more efforts are needed in helping students to develop computer games tailored to their dreams and ideas instead of just following the game modules provided.

Statistically, student evaluators judged computer games produced by treatment group as offering significantly more novelty, arousal, and centrality features compared to the control group. However, student evaluators were just slightly agreed on the dimensions being evaluated. There were more rooms for improvements as the maximum scale is 5, with the description of very agree on the dimensions being assessed. Nevertheless, it was highlighted that the assessment of creativity through products produced is complicated since it involves subjective judgement that a person has toward an object (Cropley, 2001; Horn & Salvendy, 2006). Computer technology is fast evolving (Prensky, 2007b). The assessment of novelty, arousal, and centrality of the computer games produced by students in the study could be worn off as computer games technology evolves with time. The student evaluators might have exposed to the latest technology of computer games which involves deep immersions through the three dimensional features. Thus, it justified the slightly agreement by these student evaluators on the elements of novelty, arousal, and centrality.

	Treatment	34	6.616	.3671	.0630					

*significant at .05 level of significance

CONCLUSION

As a conclusion, computer games development and appreciative learning approach combination offers a great opportunity for improving the creativeness of computer games produced by students. This study also provides a basis for future investigations on the application of appreciative learning approach as a new pedagogical innovation to try out at educational settings. Educators have historically used direct instruction to stimulate students' learning, by positions himself or herself in front of the learner and demonstrates or tells the students how to accomplish a task (Sagor, 2005). Sagor commented that direct instruction might not be the best pedagogy. Students are thinkers. Educators should not treat students as parrots. Computer games development may be an ideal task in engaging students of the playstation generation actively while appreciative learning approach may be an appropriate pedagogy in leading the students. Nevertheless, caution is warranted as this study shown that the computer games produced by students have more rooms for improvements.

INFORMAL LEARNING THROUGH EXTRACURRICULAR ACTIVITIES IN KHON KAEN UNIVERSITY

Samang Homchuen
Department of Environmental Science
Khon Kaen University, Khon Kaen, Thailand, 40002.
E-mail: Samang@kku.ac.th

ABSTRACT

Although more formal forms of instruction (i.e. classroom and e-learning types) have always been the effective media of transferring learning to students in universities for years, more informal methodologies of learning through extracurricular activities are important to optimize the learning process of students. Studies showed that success in an organization depends not only on the high intellectual capability of those involved in the organization but more importantly, on the extracurricular skills of its people. This paper is aimed at sharing the experiences of Khon Kaen University in terms of the learning of its students through its extracurricular activities. Learning in the university takes place also through unstructured processes sponsored by the school to complement classroom teaching, such as getting involved in reforestation programs, birds watching club, and youth camp. As a result, the university has now succeeded in transforming its students to become ideologically oriented and dedicated environmentalists.

Keywords: informal learning, extracurricular activities, Khon Kaen University

Introduction

The terms formal and informal learning have nothing to do with the formality of the learning, but rather with the direction of who controls the learning objectives and goals. In a formal learning environment the training or learning department sets the goals and objectives, while informal learning means that the learner sets the goals and objective (Cofer, 2000). Informal learning describes a lifelong process whereby individuals acquire attitudes, values, skills and knowledge from daily experience and the educational influences and resources in his or her environment, from family and neighbors, from work and play, from the market place, the library and the mass media. Extracurricular activities are known as a part of informal learning in the school/university over a number of years. What are extracurricular activities? Extracurricular activities are activities performed by students that fall outside the realm of the normal curriculum of school or university education. Extracurricular activities exist at all levels of education, from 4th-6th junior/high school, college and university education. The extracurricular made its first appearance in American colleges in the nineteenth century (Miracle &RogerRees,1994). It complemented the curriculum as much as subverted it. The students found in it a kind of laboratory for practical and vocational interests. It looks good on college and job applications and shows admissions officers and employers you're well-rounded and responsible. This paper is aimed at sharing the experiences of Khon Kaen University in terms of the informal learning of its students through its various extracurricular activities.

Methodology

This study investigated participation in extracurricular activities in the Department of Environmental Science, Khon Kaen University as a contributor to long-term educational success. Five areas are described: personal-social characteristics, academic achievement, educational aspirations and attainments, participants' roles in activities, and environmental social context. Participants were the graduates of each academic year and company or organization recruiters that they were questionnaire and interviewed. Extracurricular activities, programs offered by a school system that do not form part of the academic curriculum in the department range from sports to reforestation (Figure I- IV):

Inter Cup

Inter Cup is a sports event organized by Environmental Science students. Activities include football, valley ball, cheerleading, during 2 days. The aim is to promote relationships between students from various universities in Thailand and to support extra curricular activities, particularly, sports.

Figure I Events on Inter Cup Day

Reforestation Program

This program was organized by the Environmental Science students to encourage rural community to plant trees on their lands or common lands for adaptation to climate change .Students were granted subsidies of 20,000 Baht per year to plant trees, and were allowed to transport by the university buses.

Figure II Reforestation Activities with Local Community

Bird Watching Club

In fact the bird watching club welcome anyone who has an interest in wild birds whether you are not the environmental Science students. Members learn from one another and most members are eager to share their knowledge. The point of the club is to see more birds and learn about them. Members learn how to identify wild birds and how to use birds as bio-indicators for monitoring environmental change as well as to enjoy birds watching in nature. Students were granted subsidies of 10,000 Baht per year.

Figure III Bird Watching and Nature Tour on a Fieldtrip

Youth Camp

Young people have the key role in resolving global challenges in the future. The target of the Youth Camp is to find young people interested in natural science and help them raised up their knowledge in these fields. Youth Camp is free of charge for participants. The main organizers are Environmental Science students**.** Students were granted subsidies of 20,000 Baht per year.

Figure IV Youth Camp on Forest Ecosystem and Forest Restoration

Results

Significant relationships were found and recruitment implications were discussed. The most basic reason for joining a club or team is that it gives the students something better to do than staring at the wall, wandering the hall, or napping all afternoon. People who are involved and engaged are less likely to become addicted to bad habits, like smoking or drinking. For many students, extracurricular activities present an opportunity to practice social skills and to experiment in activities that may represent a career interest. Education is not solely learned by reading the text-book, students can learn an incredible amount from their peers through extracurricular activities. Students learn how to compromise and work in

a group. Extracurricular activities also allow students to meet and interact with peers that may not be within their close group of friends. In addition, extracurricular activities help to enhance these social skills and teach lessons not being learned in a classroom. Extracurricular activities give students positive activities in which to be involved, and they spend their time in a productive manner. The key points that will be made in this claim of fact are that the students involved in extracurricular activities will receive better grades than those who are not involved in extracurricular activities. In addition, activities will improve the overall students. Therefore, they help students to receive better grades by teaching them the characteristic building lessons, teaching them lifelong skills, saving some at risk students who would possibly drop out of school, and helping the students to develop social skills. From the interviews of companies or organizations, there is widespread agreement that success in organizations requires more than high intellect. Thus, college recruiters commonly examine job candidates' extracurricular activities in search of "well-rounded," emotionally intelligent, and interpersonally skilled students. Colleges not only look at potential students' academics, but also at their extracurricular activities. Activities of the students participated will tell the college the important aspects about the students such as how they've made a meaningful contribution to something, what their non-academic interests are, whether they can maintain a long-term commitment, whether they can manage their time and priorities, and what diversity they'd bring to the student body. Extracurricular activities are very important indeed. However, an overload of activities can be a strain on the budget and also on time. The best thing to do is to set limits. Figure out what you can afford in money and time and go from there.

Conclusion

Therefore, administrations of schools/universities ought to continue their funding of extracurricular activities since it clearly benefits the students' academic achievement. Schools should encourage students to participate in extracurricular activities since they benefit the students in so many ways. Also, the schools should educate the coaches and group sponsors on the influence that the extracurricular activities have on the students' lives. Activities are not solely about what the score is, how many wins or losses are attained during a season, or what place is won at a competition. They provide and instruct students with lessons that will last them a lifetime.

INFORMATICS EDUCATION IN DIFFERENT DISCIPLINES AT UNIVERSITY LEVEL: CASE STUDY: A SURVEY OF STUDENTS' ATTITUDE TOWARD INFORMATICS TECHNOLOGIES

Özhan Tıngöy, Marmara University, otingoy@marmara.edu.tr
Sabri Serkan Güllüoğlu, Istanbul Arel University,serkangulluoglu@arel.edu.tr

ABSTRACT

One area of information technology quickly becoming ultimate is the field of Informatics. To meet this growing need universities are beginning to develop degree programs with the integration of Informatics. In response to the widespread use of and ever-changing nature of Informatics, various investigations were carried out regarding attitudes toward informatics.
This paper attempted to investigate university student attitudes toward the integration of Informatics Technology in their departments and factors contributing to their attitudes so as to provide some constructive information and suggestions for the adoption of technology in informatics education. For survey, we selected a private university in Istanbul. We saw that a new established university is so appropriate for similar studies. In this paper we are going to investigate the informatics theory on students with a questionnaire.
Keywords: Informatics, information technology, informatics theory

INTRODUCTION

The rapid changes that take place in science and technology and developments also affect communication and information technology to a great extent. The rapidly spreading improvements have been felt in all parts of life. These transformations and developments have accelerated the creation, expansion, sharing and utilization of knowledge and they have also become the basic components in public services and economy as well as in information training. It is not quiet logical today to say that only acquiring knowledge is meaningful. Contributing to information production, acquiring changes and improvements as soon as possible and using these are the greatest targets of the modern societies.
When talked about computer assisted learning today in the world, it does not mean computers confined to laboratory settings anymore, instead the holistic outlook of countries to their education systems; a design and problem solving process come to mind. In order to be successful and productive in today's society, even more important than that, to build the inhabitable society of tomorrow, it is necessary for learning to learn, thinking to learn and coming to a understanding on how technology can be used in humanity's service.
Technology greatly affects daily life when looked to school walls. Technology has become an indispensible part of individual life in various areas from ATM's to internet connection. In most of the workplaces, technology usage has become the most preferred knowledge and skills.
In educational environments, the speed of the technological developments suitable to be used in these settings is unfortunately faster than the understanding of the value which these new equipments have contributed to and the pace of applying conscious applications. Therefore, naturally, negative and useless consequences such as the worshipping to technology, seeing the hardware side of technology as a must or having firm dependence emerge. In fact, the way of taking advantage of technological capabilities is more than only acquiring hardware and having internet connection.
As information technology has become the measure of successful performance both in business world, at school as well as in academic areas in recent years the need to integrate technology within educational activities have emerged in many parts of the world. The changing world order, by revealing concept of globalization, have the increased the importance of factors such as competition, and price in the world economy. An intense competition has been observed in the world economy together with the improvement of the information technology, the abrogation of custom walls and the international trade liberalization efforts. In this context, the opportunities brought by technology push the institutions to provide more vigorous and efficient services in global settings.
Today, a number of researches have been made in the integration of computer-aided applications in universities Here, two issues strike one's eyes. The first is that the studies done are not completed truly

towards the interdisciplinary education and the second is that the concept of information technology is seen from technology perspective. Based on this deficiency, studies that help the retention of information more easily should be done. Technology stands out as a numerical concept. However, there are a lot of departments which are not numerical/ quantitative and students of them are present in universities. In order for these students to comprehend issues in their field faster, they need information technology point of view. The main goal of information technology is not only rendering the easy usage of information technology equipments but also helping the retention of information longer in human mind, therefore, fostering the consolidation of new information. So as to provide this, the information technology concept should be transferred with interdisciplinary mentality. For this, the curricula of different disciplines ought to be examined and the most convenient information technology elements to be applied should be determined.

2. INFORMATION TECHNOLOGIES AND THEIR INTEGRATION

The concept of data processing can be briefly defined as the result that is produced when technology and information is jointly utilized. Data processing has some aspects: computer software, computer hardware, and computer user and information society. We can define data processing the results we attain when information and technology are jointly used. The English term information technology (IT) is Turkish equivalent of information and information technology. The second most important element of information technology is computers. The computers are composed of computer programs (or software) and the electronically physical components (or hardware) and these are two basic units. Previously, we were writing letters to our relatives and friends but nowadays we can write an email with the aid of a computer and send it. Also we can make net meeting with a camera and a computer. The computers keep data in a magnetic disc that is unique to them. With the help of special commands, when a need arises, the computers send the needed information in a understandable way through the outer environment unit called monitor after finding the required data.

Information technology is a combination of all technologies that include accumulation, storage and processing of data and the connection of data through cables which makes communication possible for a user. Information technology is a concept used for communication and computer systems connectable to all information services.

It is not possible to sort out information technology with only computers. The major information technologies covering a wider product range are computing and accounting machines used in companies and offices, insulated metal and cable products, electronic gadgets with other electronic parts; the products related with television and radio transmitters, telephone and telegraph line machines, television and radio receiver equipments, sound and video recording devices, photocopy equipments, auxiliary equipment, services related to telecommunication and computer.

The services in particular pertinent to information technologies are the wholesale sale of machinery and equipments and their procurement, the renting of office machines and information technology devices including computers, which can be cited as example of cervices related to telecommunication and computing.

Information and communication technologies are thought to increase their importance in educational settings in the future. The goal of researchers and educators who want to spread scientific literacy nowadays ought to be the development of new equipment and technologies; therefore, the instruction of information technologies and the integration of it to learning activities. Educators can use information technologies with the whole class, small groups or individuals. The educators can use information technologies for the presentation of knowledge, demonstration of process and skills, explanation of concepts, delivering of instruction, the formation of bonds between concepts and ideas, the demonstration of video with audio, and the exhibition of writings for the entire class (Meadows, 2004). One of the hardest tasks of students and educators is the application of information technologies to other subjects and the integration of it in an ordinary class. In this process, this learning activity possesses the attributes for the adaptation and integration of informatics which can lead the way for educators.

The information and communication technologies, which are claimed to be at the center of the technological advancements related with globalization, are now seen as the indicators of the information society we are in. The technological developments have accelerated the research processes of scientists. While the universities are rendering cost-effective education to students by using information technologies, they have reached higher qualification and flexibility (Tural, 2002).

The main objective of technology education is improving the level of technology literacy of societies to a certain extent, namely, to increase it. Technology education contains the education towards technology

which we come across and which finds usage. The science and technology education is forming the basic components the man power that are masters of science and technology and bringing up technology experts for technological advancement and innovation. As such, the education that requires expert knowledge which is higher than the education literacy dimension is in question. In this case, a connection which has scientific dimensions could be mentioned with technological construction and systems which find usage in our daily lives or in different points of life and which can be improved. In education and technology relations, technology has been used to bolster education. This is used for supplying the educated and qualified human resources of the country and it improves general efficiency of education. Furthermore, some new technologies also develop distance education. Thus, meeting old demands and the opportunity of conferring top notch education in case of inadequacy of source of qualified personnel is formed.

3. EDUCATIONAL TECHNOLOGIES

Although educational technology, which is nourished by computer sciences, systems theory, cognitive sciences, psychology, sociology and some other sciences and which has some unique attributes and which is a multidisciplinary field, it is within the "educational sciences". In order to define educational technology, many expressions have been put forward by several institutions and organizations and it has been agreed upon in related committees and meetings. The expression above is the last educational technology definition of Association for Educational Communications and Technology (AECT), which is the international organization of educational technology. While educational technology is the name of a discipline, it has been used both as the expression of this discipline around which an application is developed and the name of developers' profession. In this respect, those individuals who work in the direction of information and principles put forth by the "educational technology" is called educational technologist. All the technologies introduced are called educational technologies.

When we analyze educational technology with its items, we see that it encompasses a large area from theory to application. Many elements stretching from educational psychology to learning and teaching activity are included within the scope of educational technology. The interaction of these elements among each other and their organic connection constitute the technology aggregate. When technology is developed for any educational discipline, the relationship between the estimated targets, for that area, and these elements that form technology with current applications must be taken into account.

While the importance of training and research system that depends on specialization in certain fields still continues in education, it gives its place to interdisciplinary and multidisciplinary research, with a growing trend. We may not yet say that this change is rapid and salient, but we may argue that the change of trends is in this direction. Discipline is the name given to a research area which has a unique educational background, methods and content and which proved that it can produce new information in any field and can develop advanced-level information in aforementioned field (Berger, 1970). Every discipline possesses a distinctive doctrine, a professional language, terminology, and intellectual pioneers and followers (Becher, 1989:22; Parker, 2002:374.).

The main dimensions of knowledge within a discipline is taken on and developed such as historical knowledge, theoretical knowledge, analytical knowledge, practical knowledge, experimental knowledge, empirical knowledge …etc

The dictionary meaning of the term "interdisciplinary" is the integration or containment of two or more academic disciplines or research areas. Therefore, inter-disciplinary presumes the use of arrangement of a priori information which is structured according to traditional academic disciplines. If you need to make a short definition, inter-disciplinary as a concept means to incorporate and to contain two or more disciplines (Kline,1995; Klein,2000; Cluck,1980)

The concept of information technology is seen as the product of inter-disciplinary education and research environment. Information technology concept opens new opportunities for under-graduate, masters and doctoral level students who wish to pursue their research and development careers in academic or industrial settings.

Information technology lessons enrich the multi-disciplinary research environment of students.

The generated large amount of data which is collected with different methods needs the effective transformation of useful information and information accumulation for organizations. An information technology system comes into existence with a series of method and applications that transform data into information and information accumulation in order to support decision making and controlling. These systems besides by safeguarding information can distribute it to related elements inside or outside an

organization. The study area of information technology systems is related with analyses and design of these systems. Consequently, an information technology system is a discipline that integrates the technology and management of information systems in a certain field.
So as to ensure that education and learning process is effective, long lasting and more comprehendible, information technologies should be integrated into all lessons and all the individuals from the administrators to students should be enlightened in learning and teaching processes.
The USA, the leading country, and a lot of countries have taken necessary steps in topics related to hardware and network/internet in order to make educational technologies widespread. However, to make the educational systems really effective on student achievement, issues such as quantitative content and teacher training necessitate serious studies. Moreover, applications in the areas of hardware and network connection are almost inadequate and severe inequalities exist among regions in many countries. When we look at these four areas, for instance, related with the agreed targets in the United States, how national educational policies and goals should be determined becomes evident. The existing formulated target in the USA in hardware area is that all the teachers and students should have the latest model of multimedia computers in their classrooms. The objective in network connection is that all the classes should be connected to information highway. The aim in digital content is the supporting students with effective educational software and online resources in educational environments. The goal in professional development is that all teachers should have necessary in service training and support services so that their students can use computer technologies effectively. Whether the identified four goals in these four areas are being met can be measured according to indicators in every area.
Cradler (1996) is recommending some elements that should be kept in mind so as to integrate technology in school curriculum. These items can be summarized as follows: the needs of learners, the availability of resources, the determination of educational needs related to education and technology design and the supplying of technical support and counseling in technology usage for teachers. From the studies done in literature, two chief targets in technology integration can be suggested for the effective usage of technology in schools: One is how technology (for instance computer) will be used and the instruction of how information can be accessed. The other target is the effective usage of information technology (IT) and capabilities (accessing, processing and analyzing of data). According to Mehmet (1995), in order to attain these goals, educators should take into consideration the results of the studies done in the area of educational technology and the contextual factors affecting learning targets. Teachers play especially an important role in establishing technology integration in training and education processes. The success of technology integration and students' effective usage of technology at school are contingent upon teachers' behaviors and their wishes for internalizing technology.
University which is one of the important components in societal transformation and its pioneering role in usage of technology in education and development are also significant for societies' adaptation to these technologies and the formation of information society. In order to increase technology utilization in universities, primarily lecturers should be eager to use these technologies in lessons and should reach relevant resources when needed. On the other hand, the demands and expectations of students in the usage of technologies in the lessons is also an impetus factor for the existence of educational technologies in classrooms.

4. A STUDY BASED ON STUDENTS' OPINION ON THE INTEGRATION OF INFORMATION TECHNOLOGY TO LESSONS IN DIFFERENT DISCIPLINES IN HIGHER EDUCATION

Within the scope of the lessons of information technology or basic computer technologies, students are given basic information technology concepts, about which the information technology has reached to the point from past to the present, as well as practical education on the standard application software. The most crucial points of this lesson are basic concepts of information technology and computer usage basic training. The commentary of university students related to the scope of this lesson will have a positive effect in the development of this course.
The students are required to answer the survey questions, below, as "I Strongly agree", "I agree", "Neutral", "I do not agree" and " I strongly disagree".
A) The opinions of students on classical education method

1-)The classical plain explanation method in technology lessons is enough for me to understand the subject and system.
2-)Reading a text by looking at the picture in the book to understand the system is not boring and difficult.
3-) I can easily animate the subject in my mind by looking at the picture in the book and reading a text.
4-) I definitely have to repeat myself after the subject is told in so as to understand the system.
5-) It is absolutely necessary for me to comprehend the subject
that the teacher first explain it.
6-) If I understand the structure of the subject thoroughly in lesson, I become successful in workshop applications.
B) The opinion of students about constant visual materials
1-) Besides the picture in the book, I can fathom the book completely by the still pictures shown by a projector.
2-) I can grasp the subject with one picture displayed by a projector.
3-) I can understand complex systems easily with a still picture.
4-) It would be better if more than one picture instead of one was shown in order to grasp the system.
5-) I need extra course materials so as to understand the subjects.
6-) I can keep my focus on the subject without getting bored in course environment.
C) The opinions of Students on Computer Assisted Education
1-) There is absolutely a need for computer assisted education-teaching in education
2-) Computer is an ideal equipment for education.
3-) Classical system is sufficient for technology education.
4-) There is no difference between computer assisted- education and that of classical one.
5-) Computer assisted- education can be used as a method to supplement classical system.
6-) I can learn a subject by myself with the help of computer assisted-education, without a teacher's lecture.
D-) The ideas of students on motion picture
1-) I can more easily understand the structure of systems and subjects with moving picture.
2-) Animation is highly effective in the instruction of complex structures.
3-) There is no difference in facilitating understanding between the motion picture and still picture.
4-) I can more easily focus my attention on a subject with the aid of computers and moving pictures.
5-) The topics that seem abstract to me can be more understandable with moving pictures.
6-) Examining change in the system by punching the variables myself is required for my learning.
This research was applied to students of Science and Letters Faculty's, Economical and Administrative Sciences Faculty's, Communication Faculty's, Applied Sciences Higher School's Turkish Language and Literature, Translation and Interpretation, Psychology, Management, Visual Communication Design, Public Relations and Advertising, Radio, Cinema and TV, Journalism and Accounting Information Systems departments of a foundation university (private) in Istanbul
Ten basic expressions are used in this research. These 10 basic expressions were synthesized from the literature on computer usage on education. The sources used are listed at the end of the article.
1. To reach conventional education and training goals during the education program as a tool
2. To widen and enrich education whilst the education program
3. To motivate the learners
4. To support the learners about thinking on their learning.
5. On other conditions, providing those outside the curriculum a chance for an accession.
6. To increase the efficiency in education
7. To lower the education costs
8. To make education more efficient
9. To prepare for work life
10. To decrease the inequality among the students who reach Information and Communication Technologies in different ways.
These expressions reported above are evaluated by students of different faculty and departments of a foundation university. A foundation university is deemed eligible for this study. The newly established foundation universities have been making arrangements and updates in order to take the course curriculum to a degree for their faculties and departments. Especially within the scope of information technologies which is often appropriate to give a common curriculum, computer, information technology etc, from time to time the suitability of courses for students is an issue that should be considered. Based

on this idea, a newly founded university, that is, assessment of a university with an unsettled information technology course curriculum will give accurate results.
The Analysis Summary
The persons who answered the survey were reported to be 210, as of April 30, 2010.
160 individuals (76 %), whom participated in the survey, claimed that information and communication technologies are indispensible part of education.

5. CONCLUSION

Based on the findings of this study, most of the people answering this survey have agreed to the idea that information and communication technologies are indispensible parts of education. Another derived significant result is that the participants of this survey are of the opinion that the education of information and communication technologies should be bolstered. One other outcome that can be obtained is that the students' computer skills can not be sufficient.
The results drawn form these data put forward the significance of this study. This study will form a serious preliminary study in getting the ideas of people about the usage of Information and Communications in Education in Turkey. The obtained data will be compared with the studies done in other countries and will form the precedent knowledge on the situation of Turkey's ICT and education.
Every university, and even more important than that our whole education system, ought to have a mission and plan about educational technology. Educational technology, which is within systematic approach, for the evaluation of decisions with more objective criteria such as the determination of goals, strategy and solution suggestions, technological applications, integration and the evaluation of results is the necessity of research and continuous scientific reporting.
As a result of this study, the effective and efficient usage of technology as an educational tool can have a noticeable effect on students' achievements, attitudes, communication among teachers and their peers; it can also develop students' interactive, individual learning and high level thinking skills.
Effective technology integration requires radical changes in education and learning system and teachers and the schools that teach them play a key role in this process. Therefore, technology integration devoid of a well-informed, skillful and well-trained teacher will not bring any benefits to education.
In order to meet the related expectations about the utilization of technologies in universities in developed countries and the development of new technologies, the units that just work on this topic have been in operation for a long time. It became obvious that in a variety researches conducted in our country, in strategic plans of universities, in order to meet the determined necessities, these departments should be established within Turkish universities and become widespread.

ABSTRACT: With the largest population in the world, China leads in the number of disabled people. In order to promote educational justice, Special Education in China has been performed at various levels. CSCL has been applied in special education for the disabled. On the basis of analyzing the shared features and learning styles of the students with listening disabilities, effective strategies of performing CSCL are selected in this study. Moreover, resource design principles and design modules for practical learning resource are presented accordingly in order to enhance the learning proficiency for students with listening disabilities. The thoughts and processes of the above teaching design prove to be effective in practical teaching.

KEY WORDS: Dysaudia Students; CSCL; Platform; Instructional Design

INTRODUCTION

Computer Supported Collaborative Learning (CSCL) has been more widely used in higher education. Currently, there is still a lack of awareness with regard to special education groups. The author will design the basic procedures of teaching combined with dysaudia students with the characteristics and the functions of CSCL teaching, and explore in a number of issues about CSCL for dysaudia students' learning.

I.THE FEASIBILITY OF THE APPLICATION FOR CSCL IN HIGHER SPECIAL EDUCATION

In this paper, we choose dysaudia students as research subjects.

1. PROMOTING COMMUNICATION IN BOTH TEACHER-STUDENT AND STUDENT-STUDENT, REDUCING THE LONELINESS

Dysaudia students have certain learning barriers, lack of timely and sufficient interactions when they use sign language to communicate with others in real life. In general teaching activities and communications with the teacher, they usually feel lonely. In CSCL learning, teachers and dysaudia students can communicate through the discussion board which can reduce the communication barriers between learners and teachers. So CSCL plays a particular role in enhancing the communications between teacher and students, as well as students and students.

2. ENHANCING LEARNING INTEREST AND IMPROVING ENTHUSIASM AND INITIATIVE OF DYSAUDIA STUDENTS

As we all know, the disabled, a disadvantaged group in society, suffer from a feeling of inferiority to a greater or lesser extent both physically and psychologically .During teaching activities, teachers should be "disabled student-centered". According to this idea, the teacher selects appropriate teaching methods with physiological characteristics of the dysaudia student to teach. The key point is to mobilize the interest of the student. In the process of CSCL, teachers stimulate the interest of dysaudia learners at a high level and inspire them to take the initiative to solve problems. Upon completion of the CSCL mandate, teachers can help them find the self-confidence to make their life colorful.

3. PROMOTING COLLABORATION AND IMPROVING TEAM SPIRIT

For those students to be able to have a foothold in society it is necessary to engender their cooperation ability. The application of CSCL in university for disabled groups can meet the need in some degree. During this process, dysaudia students complete learning tasks through collaborative activities, and participate in exchanging with group members or teachers. Through solving study problems, these students understand the importance and necessity of collaborative and are enhanced collaboration ability, independent thinking skills and self-confidence. In this process, they can also improve their social skills and team spirit.

II. CSCL LEARNING PLATFORM STRUCTURE AND FUNCTION MODULES

Based on the above analysis of the dysaudia students, we designed a CSCL platform to help the dysaudia students learning.

1. SYSTEM REQUIREMENTS ANALYSIS AND MODULE DESIGN

We must consider the needs of special education learners themselves and the needs of professional disciplines related to the contents of the special education.

(1)Authentification

In order to help teachers arrange students, each learner is required to register, to acquire an account number, and to input his or her general information while logging in the system for the first time.

(2)Arrangement of learning task

Teachers set a task for learners. Learners start learning and discussing under teachers' guidance.

(3)Cooperative Discussion

Learners begin their study collaboratively; they communicate with others and get involved in group discussion on the CSCL instructional platform.

(4)Homework Submission

The CSCL instructional platform provides numerous functions for learners and teachers. For instance, learners are allowed to submit their homework, check the submission status as well as the results online at

any time; teachers are also able to make online evaluations.

(5)Assessment

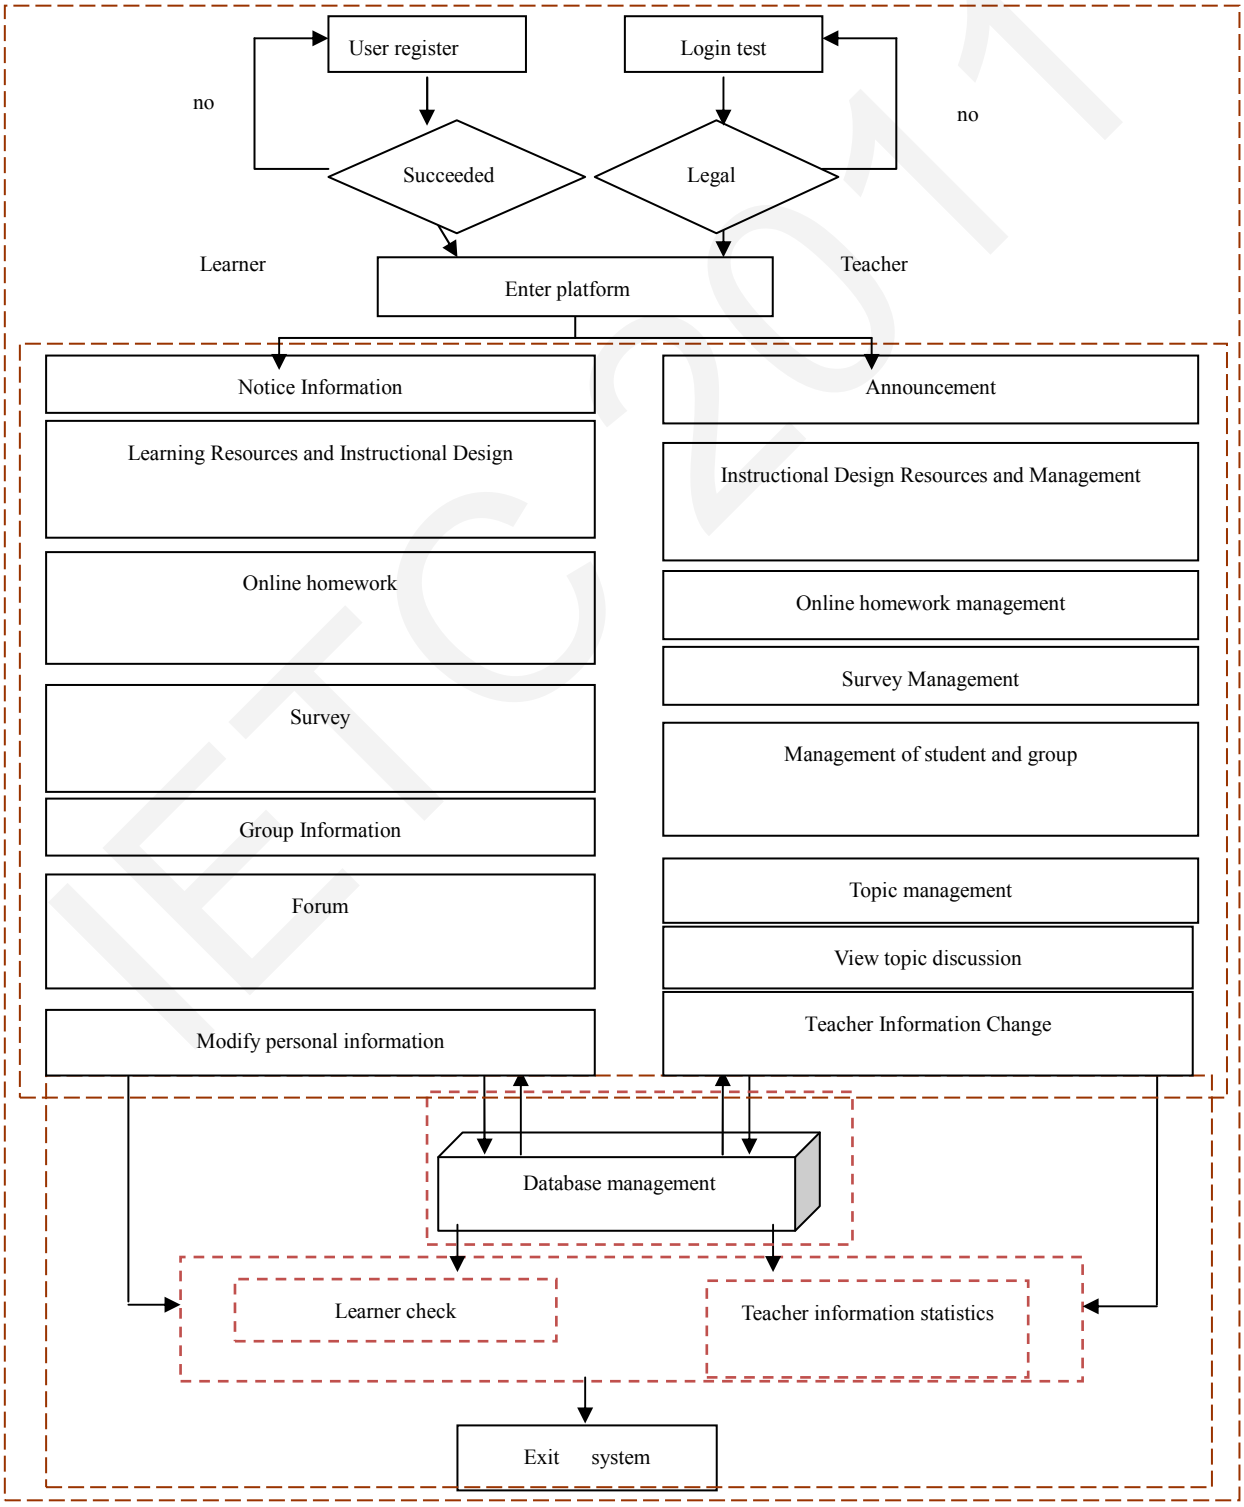
Teachers are able to give correct guidance to improve the learner's development according to each group's learning achievements.

(6)User Management

Based on the practical instructional condition, teachers can add new users or delete invalid accounts so as to maintain teaching safety as well as the fluency of the teaching process.

2. CSCL TEACHING PLATFORM MODULES

According to above functional requirements analysis, the platform modules are divided as follows:



III.THE TEACHING IMPLEMENTATION PROCESS ——BASED ON THE COURSE *GRAPHIC DESIGN*

1. THE TEACHING OBJECT ANALYSIS

Our practice research object is based on the Special Education College of Changchun University, China. The major is art and design for undergraduate students, and the classes are designated by the number 09403 and 09404.The students select one of two classes in the compulsory course *Graphic Design*, which is a practical skills course open to students with an art-design specialty. All these students have hearing impairment, only a few can do simple language exchange with incompetents.

2. CSCL TEACHING PREPARATION

(1)Dysaudia Students' Analysis

In order to put CSCL teaching smoothly into practice, to grasp the learners' cognitive beginning capability accurately, to know their computer skills and attitudes of using CSCL, we conducted an investigation of our teaching. Through questionnaires, we learned dysaudia students' degree of understanding and expectations for the CSCL teaching method, awareness and interest level for *Graphic Design*, etc.

(2)Planning Collaborative Learning Target

The learning target demands dysaudia students acquire the skill of using filter tools in *Graphic Design*. Through team learning, we expect to train dysaudia students in design and operation skills, cultivate students' independent thinking capacity, cooperative spirit and social skills in the process of completing the task.

(3)Learning Tasks Identifying

According to the characteristics of CSCL, we used learning of filters as a learning task, because this task has certain decomposability, and certain complexities. According to the actual situation, students can divide the task into background, font, and filter, which is helpful for collaborative learning.

(4)Grouping Strategy

The teachers established the student's beginning ability through statistical investigation data, and the results showed that there is a small difference between the two classes with regard to their initial starting capability. We chose the original placement, selecting the 09403 class as the control group, and 09404 class as the test group. The teacher divided students (09404) into four groups.

(5)Learning Resources Preparation

According to the teaching content, the teacher uploaded learning resources of *Graphic Design* to the CSCL teaching platform. Learning resources mainly included teaching documents, pictures, etc. The teacher used a username, logged into the collaborative learning platform and updated the latest study announcement. The teacher uploaded the course and the image of *Filters Use* to teach about database; these resources are visible in the learning resource list. The teacher used the information release system to release. Students downloaded the pictures and learning courses used to complete the study task in the repository of the collaborative learning resource list, and then viewed the content of teaching design detailed.

3. IMPLEMENTATION OF COLLABORATIVE LEARNING PROCESS

CSCL teaching practice includes guidance announcement, group collaboration learning, exchange of learning and results display.

(1) Guidance Announcement

Firstly, teachers will give brief introduction about the objective of the course, explain the function of

each tool, and show the possible results. The topic published in the platform allows students access to a cooperative group; teachers answer students questions in a timely manner to monitor student collaborative learning process.

(2)Group Collaboration Learning

①Into the Platform

Teachers and students can obtain their account number and password by registering the system. Each of the students was registered for each user name.

②View Group Situation and Task Allocation

After the distribution, the students entered the group area and checked their team members' information, and then members researched and exchanged ideas according to the learning task until they finish their respective task.

③Collaborative Learning

Each group member is responsible for part of the learning task. Understanding of different members of the task is not exactly same; the various viewpoints can be complementary to the successful completion of learning tasks. In addition, the discussion in the group is classified, and cannot be shared .In the collaborative process, teachers will do their best to answer questions and guide learners to complete learning tasks.

(3)Handing in Assignment

After the learning assignment, learners uploaded their works to the CSCL platform to show the results and waited for teachers to evaluate the completion of tasks.

(4) Evaluation

①Group Evaluation

The effects of cooperative learning evaluation can be produced through collective discussion. The members of the group can further deepen their understanding of the course. Each group needs to prepare the corresponding materials for the presentation and then complete presentations on the platform before group evaluation. During the presentation process, members of the other teams can ask questions and the exhibitors should give answers. According to display and response results, then other groups will give the evaluations. The counseling teacher should control the process and summarize the advantages and disadvantages of each group.

②Teacher Evaluation

The teacher's evaluation means that the teacher makes an appropriate assessment of the students' work and group status. On the platform, in order to check the students' homework, the teacher selects the title of the homework in the homework approval management section. After that, the teacher should then make recommendations and choose the best homework example. Based on the learning results of each study and each group, the performance of team members, the instructors give the evaluation to the students and guide them on how to develop better.

IV. CONCLUSION

After eight weeks of experiment, we conclude that:

1. Collaborative learning can enhance interactions between teachers and students and eliminate the barriers of language communication.

2. Collaborative learning can promote comprehensive physical, mental and skill development of these students. It can also improve problem-solving skills, computer skills, professional skills and social skills

during the process of analyzing and solving problems.

3. The CSCL learning platform provides spaces for collective displaying of dysaudia students' homework.

This study focuses on the practice of high special education based on CSCL, fully mobilizes the learning and mastering of learning enthusiasm of dysaudia students, enhances team spirit during the learning process, along with communication skills, collaboration skills, responsibility, self-confidence of the dysaudia students, changes the situation appearing in the traditional class and provides an effective way to improve the learning efficiency of these students.

INTEGRATING WEB 2.0 TECHNOLOGY INTO AN ESP COURSE: A CASE STUDY OF USING FACEBOOK IN ENGLISH FOR BUSINESS COMMNUCAITON

Vincent Ru-Chu Shih
National Pingtung University of Science and Technology, Taiwan
vincent@npust.edu.tw

Abstract

This case study aimed to explore the effect of integrating Facebook and peer assessment in English for Business Communication course through a blended teaching approach. The subjects were 111 students from a technological university in Taiwan. The students were divided into three groups with three Facebook platforms. The mixed method consisting qualitative and quantitative approaches were administered to analyze the collected data in the study, including the pre-and post-tests, qualitative data of peer assessment on Facebook sites, and a self-developed semi-structured survey questionnaire. The findings of this study indicate that incorporating Facebook in English for Business Communication course can be effective for college students. Student can improve their professional knowledge not only from the in-class instruction but also through peer assessing on Facebook. In addition, the blended learning approach can significantly motivate the students' learning interest. Finally, the findings of this study may provide useful instructional strategies to ESP teachers of English for Business Communication course.

Keywords: blended learning, ESP, Facebook, peer assessment, Web 2.0 technology

INTRODUCTION

Under the constructivism paradigm, a learner acquires new knowledge through a process of initial self-motivated attempts and exploration of using existing knowledge (Lou, et al., 2011). Bruner (1990) also pointed out that students are encouraged to participate in active dialogues with other students and instructors as well as to collaborate with others in activities in order to construct knowledge and discover principles for themselves. Meanwhile, the rapid growth and development of Web 2.0 technology applications, in particular Facebook have made users and learners to interact and collaborate with each other actively in a virtual community. Nowadays, more than 500 million people are using Facebook to communicate, interact, and socialize with others synchronously and asynchronously. Up-to-date, not many studies investigated the effect of learning and teaching through Facebook in the tertiary education. Therefore, it is important to investigate the effect of incorporating web 2.0 technology with various teaching and learning strategies and approach for improving the quality of learning and teaching transaction.

LITERATURE REVIEW

Many studies indicated that team-based and project activities can merit active learning (Lang, 2010; Lou, et al, 2010; Neo, Neo, & Kwok, 2009). Additionally, functions such as emails, bulletin boards, chat rooms, and online discussions can also promote learner-instructor and learner-learner interactions in Internet instruction. Online learning utilizing with web technologies has become increasingly important and crucial for education (Jou, Chuang, & Wu, 2010). Knowledge sharing requires collaboration and cooperation between the interaction of the learners and contributors of knowledge. Thus, students are able to sustain the inter-relationship among the group members through effective group communications and discussions in such a cooperative learning environment (Yang & Chen, 2008). Thus, it is important for educators to understand students' backgrounds, attitudes, and learning needs toward both academic and social life in order to engage a cohort of students (McCarthy, 2010). Furthermore, according to So & Brush, 2008 and Shih, 2010, a blended learning, combining online learning with traditional face-to-face instruction can create a positive experience for both instructor and students as well as facilitate online collaborative learning. Thus, in order to explore how students' learning interests and their learning performance can be motivated and enhanced, this study employed a blended learning approach combining the traditional face-to-face teaching method, Facebook assisted learning, and peer assessment.

RESEARCH METHIOD

The mixed method was used in this study, consisting of pre- and post-test, content analysis of feedback and comments on Facebook sites, and a self-developed semi-structured course satisfaction survey questionnaire.

Research participants

The participants in this study were 111 students (48 males and 63 females) enrolled in an ESP course, English for Business Communication from a technological university in Taiwan. The participants were divided into three groups (college students, postgraduates of Industrial Management, and postgraduates of Business Administration). Each group operated one Facebook platform for conducting peer assessment on their weekly assignments.

Research Instruments

The pre-and post-tests, qualitative data of peer assessment on Facebook platforms, and a self-developed semi-structured survey were the research instruments in this study. The collected quantitative data were analyzed by SPSS descriptive analysis and factor analysis. Content analysis was used to analyze the peer comments on the three Facebook platforms. Figure 1 shows a webpage of the Facebook platform in the study.

Fig. 1: A webpage of Facebook platform for English for Business Communication course

The Learning Satisfaction Survey Questionnaire for English for Business Communication Course

In order to explore the students' learning satisfaction toward the Facebook integrated blended learning course and obtain further information from the students, a 5-point Likert semi-structured satisfaction survey questionnaire, consisting of demographical information and 32 closed-ended questions and 3 open-ended questions was developed by the researcher. The three open-ended questions used are as follows: (1) what do you think of the course arrangement and implementation of the integrated Facebook blended learning for English for Business Communication course? (2) what are the advantages and disadvantages of using Facebook to assist in learning English for Business Communication? and (3) what are the advantages and disadvantages of using peer assessment to learn English for Busienss Communication?

Research Procedures

The study lasted for 18 weeks (one semester) in 2010. The first 7 weeks of the semester were the traditional face-to-face instruction. From Week 9 to 17, a blended learning with Facebook was implemented. The post test and satisfaction survey were administered in the last week. The research procedures are illustrated in Figure 2.

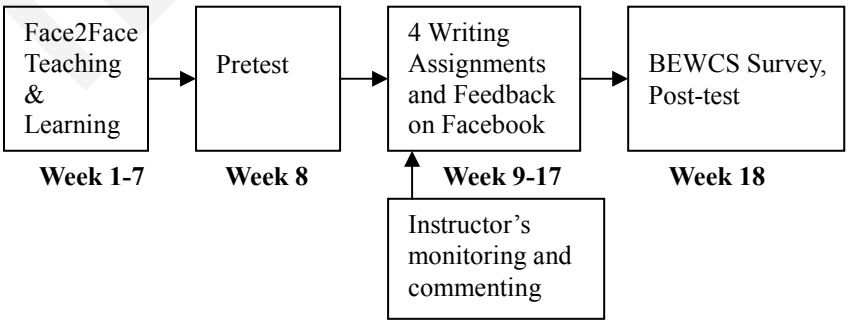

Fig. 2: The research procedures of the Facebook integrated blended learning for English for Business Communication

FINDINGS AND DISCUSSION

Results of the pre- and post-tests

According to the statistical results, the total average scores of the pre- and post-test were 48.04 and 85.73 respectively, indicating the students made significant progress on the English for Business Communication course.

Table 1: The Statistical Results of Pre- and Post-tests for the Three Groups

Department	Sex	test	N	Min.	Max.	Mean	SD
English Majored N=54	Male	Pretest	13	16.00	66.00	41.4615	17.30422
		Posttest	13	56.00	96.00	78.0000	12.11060
	Female	Pretest	41	20.00	82.00	53.7317	15.19543
		Posttest	41	60.00	100.00	88.7317	17.34218
Industrial Management N=35	Male	Pretest	27	20.00	68.00	45.6296	12.36978
		Posttest	27	58.00	100.00	85.4815	11.07447
	Female	Pretest	8	31.00	78.00	58.0000	17.72811
		Posttest	8	82.00	100.00	92.2500	5.89794
Business Admin. N=22	Male	Pretest	8	10.00	52.00	33.8750	13.37842
		Posttest	8	46.00	100.00	80.0000	18.14229
	Female	Pretest	14	18.00	72.00	44.5000	17.06887
		Posttest	14	56.00	100.00	84.1429	16.99709

Results of peer assessments on Facebook platforms

All group members were required to do 4 writing assignments and post them on the Facebook platform. Afterwards, group members had to review and comment on others' works. Content analysis was employed to analyze the three group students' comments and feedback on the Facebook platforms. According to Table 2, the students of Master program of Business Administration made the most comments and feedback on their peers' postings. The English majored students made the least comments and feedback comparing with the other two groups.

Table 2: Statistical Information of content analysis on the three Facebook platforms

Group	Number of Students made comments	Number of comments made	Number of "like" being sent
English-majored	26	44	1
Master of Business Admin.	22	98	12
Master of Industrial Management	32	53	32

The results of content analysis show that the comments on peers' work from the students of the three

groups were mainly about grammatical errors, such as tense, spelling, and structure.

Results of the English for Business Communication Learning Survey Questionnaire

The satisfaction survey questionnaire obtained .963 of Cronbach's Alpha Coefficient, indicating the survey questionnaire has obtained a high level of consistent reliability. In order to further investigate the factors that influenced the students' Facebook integrated blended learning, the exploratory factor analysis was employed. Based on the literature review and the types of questions, the five factors extracted from the survey questionnaire were categorized into 1) course arrangement and implementation, 2) use of digital learning platform (Facebook), 3) interpersonal relationship, 4) English for Business Communication learning, and 5) the fulfillment of learning.

Additionally, the statistical results of descriptive analysis on the responses to the survey questionnaire show that the 32 questions obtained mean scores ranging from 3.8462 to 4.3365 and only five items obtained mean score below 4.00, indicating the students highly agreed on that statements of the questionnaire. In other words, the students agreed that Facebook integrated blended learning for English for Business Communication course was very effective, interesting, and satisfying.

CONCLUSION AND SUGGESTIONS

This study was aimed to explore the effect of incorporating Facebook with blended learning for three different majored and level of students in an English for Business Communication course. The findings of the study showed that the graduate students of MBA program made the most comments comparing with the English majored students and graduate students of Industrial Management program. The reason could be because the course was directly related to their major and future career, although this course was a required course and primarily provided to English majored students. With this regard, the future study may focus on investigating the factors that influence the students' learning motivation and desire. Additionally, using peer assessment on Facebook to assist students in learning English for Business Communication can be an effective way for students to improve their grammar skills such as tense and sentence structure, etc as well as to enhance their learning desire of a such difficult professional subject.

Integration of Health Media to Increase Knowledge and Attitude of Healthcare of People in Southern Border Provinces

Assoc. Prof. Dr.Narong SOMPONG
Department of Educational Technology, Faculty of Education, Kasetsart University, Thailand
fedunrs@ku.ac.th

Assoc. Prof. Dr. Saroch SOPEERAK
Department of Educational Technology, Faculty of Education, Kasetsart University, Thailand
sarochap@yahoo.com

Abstract: From the unrest situation in Southern border provinces (SBP), the people could not understand, access and participate public health services. Moreover, they lacked of knowledge, understanding in appropriate health behaviors and health media. In the present time, mass media; especially person media, health personnel and religion leader played roles in building knowledge and attitude in behavioral change. The **objectives** of this study was to produce and develop offensive integrative health media, health promoting networks in target groups: aging male and menopausal, aged persons, health personnel and village health volunteers; to test and evaluate offensive integrative health media to develop body of knowledge, understanding and good attitude to self health care; to deliver health media to local health organizations and mass media to contribute knowledge for self care, including the campaign, speeding up and public relations to target people; to built knowledge, understanding and awareness of health care, and to disseminate, give public relations of governmental news to local people, to build their images and understanding between governmental organization and people. **The research instruments composed of the** designed and produced integrative media by using ADDIE process and try out for effectiveness. Follow up the effect of media for each target group by analysis of questionnaires of people from 4 SBP of 3,346 and in-depth interview in 7 groups of 36 people. Collective data of needs of people, advices of health experts and mass media for database in production of integrative health media were conducted. **The results** from the assessment of health media needs showed that the most appropriate media was television. The others were radio and medical doctors. Most of people need lectures and additional health checks up after the media exposure. Furthermore, the integrative health media of 10 common diseases of aging people in SBP were produced for television showed as "3 minutes-good health-no buying or selling" in 100 topics, "Good health-no buying or selling" for 25 minutes in 30 sections, poster and brochures in 5 types each, and handbook for people. These made the people understand the content of prevention and treatment for the disease more effectively. In **conclusions,** the appropriate types of health media in SBP should be television, radio, and publication media; including electronic media which were short, easy content, more frequent with attention of identity and equity. The integrative health media made the target groups understand the contents of the diseases, prevention, health care and steps of treatment. There should be continuous production and distribution of health media for health care, understanding of health problems, receiving people's opinion and public relations of governmental media to people in all of local areas; to make images and understanding between health governmental organizations and people. The offensive health units would support there should be additional production of integrative health media and social media. The media should be distributed and increased channels of dissemination, e.g. health roads, peace roads, in cooperation with district or provincial administrative organizations in the areas and related organizations, people, religion leaders. These would create health, peace and quality of life of people and government officials in SBP.

Keywords: Aging male and menopause, Health promotion, Health media, Health communication.

Introduction

1. Importance and origin of the problem

1.1 In the present time, the roles of media are accepted to influence behavioral change of people, especially health media which health personal used to empower people. Health professional persons believe that the empowerments with health media will facilitate the behavioral change to self-care, which will develop personal health status, help each other and their facilities to distribute health knowledge to build strong communities. For each person need to know health and practice under teaching and guidance of health team. In this case, health media have roles in development of knowledge and correct self health care. From Suan Dusit Poll survey of people opinion, radio is the second popular media to TV but can be distributed to all audiences. Therefore, the distribution of health knowledge by radio is efficient and cheap and the people can receive health news from every region easily and quickly.

1.2 The development of efficient media responds to the solution of health problems of aging men and women and aged people promptly. It should be sure that the produced media has potential enough to distribute to target group efficiently and build their knowledge. There should be checking and experimenting for the master media for correction of mistakes and develop to maximum efficiency. The testing of media must integrate each media into the system. The effect of complete integration will affect better quality of life of aging and aged people. Furthermore, the result of experiment will be the prototype in the production of health media and other media.

1.3 From the research of health media for promoting quality of life of people in 3 Southern bordered provinces (SBP) by Sayan Sawatsri and colleagues. It was concluded that health media in this area should use local languages in opening and closing the program, access to Muslim's way of life, the media must integrate in the diversities and the channel that the people can access are TV, radio and person media. The media should be short, easy. The frequency of distribution of health media should be frequent. The interested topics are urinary tract diseases, brain diseases, and the diseases of aging and aged persons. There should be distribution of handbooks, pamphlets, posters, and health education, etc., to local health district offices to distribute to people with emphasis of participation of health networks and mass media of government, private and public sectors.

1.4 The using of information technology in service will bring the feedback data of quality of services, e.g., the health result of the attendee both for physical and mental health, the expenditures and access to health services. This brings to data for determination of health policy for SBP in the future.

2. Objectives

2.1 To produce and develop integrative health media, health promotion networks in target population, e.g., aging men and women and aged people, including health personnel and health volunteers in SBP villages.

2.2 To test and evaluate the efficiency of offensive integrative health media to develop good knowledge, understanding and attitude in healthcare.

2.3 To deliver produced health media to health organizations, and mass media in the specified areas to distribute knowledge in self-healthcare, including campaign, accelerate in public relations to target population to gain knowledge, understanding and awareness of healthcare.

2.4 To distribute public relations of governmental news to people in specified areas to make good image and understanding among health organizations, government organizations and people.

3. Scope of research

This research had conducted under this scope:

3.1 In the media production and development the integrative health media composed of TV media, and publication as posters, pamphlets, and handbooks in health care by using public relations networks.

3.2 The produced media distribution would be used by the medical doctors, nurses, health personnel, mass media, people and community leader in SBP by means of newspapers, electronic media and training, to transfer good knowledge and attitude in health promotion and healthcare of people and government personnel in SBP.

3.3 Health media was evaluated and analyzed the efficiency in development of knowledge, understanding and use them for prototype in the production of other media.

3.4 Health media would be used under the organize meeting for building aging and aged people networks in SBP.

4. Benefits of research

4.1 Gaining the guide for the development of integrated health media for stability and gain media with quality in responsible to health problems and needs people in SBP areas.

4.2 Gaining knowledge with potential and positive attitude in self-healthcare from various appropriate health media for strong communities.

4.3 Target groups could receive health media with quality and appropriate guidelines and practice to bring positive attitude towards health promotion and rehabilitation.

4.4 Public relations network for development of health promotion was built with the disease prevention treatment and rehabilitation of people and officials both inside-outside of 3 SBP areas to ensure fair and equitable and distribute government information to people in the area thoroughly.

4.5 People were empowered to increase their health knowledge from health professional persons and various mixed health media according to popularity or availability in SBP area.

4.6 Health care activities were cooperated from health networks, people, soldiers, academicians, mass media and religious leaders by using integrative health media to join in right and real understanding.

5. Definition

5.1 Aging men and women means men aged 40-59 years and women aged 45-59 years.

5.2 Aged persons means men and women aged 60 years or more.

5.3 Health promotion means the process of healthcare of the persons who are not ill and slightly ill, stressing on basic health services for promoting health, preventing diseases to self healthcare in daily life in all aspects of health, e.g. physical, mental and environmental health for the results of better quality of life, well-being and good health.

5.4 Health media means health technology to increase the potential in knowledge, attitude and elementary self-healthcare as follows:

5.4.1 Network media, e.g., radio, TV

5.4.2 Printed media, e.g., textbook, poster, pamphlet, brochure, articles

5.4.3 Electronic media, e.g., website, e-mail

5.5 Health communication means the communication process which comprises senders, channels and receiver, stressing in communicating health data, including analysis of barriers and distortion of right understanding associated with health.

Research methodology

The research on Integration of Health Media to Increase Knowledge and Attitude of Healthcare of People in Southern Bordered Provinces is an applied research which is operation research.

1. Steps of research

1.1 **Research design**; design and produce various types of media by ADDIE process model and test for effectiveness, monitor the use of each media with target group by analysis of documents, questionnaire and in-depth interview.

1.2 Determination of sample size

1.2.1 **Population and sample**

Population The population composed of two groups as follow;

Group 1: People who stayed in Narathiwat, Pattani, Yala, and 4 districts of lower Songkla(Sabayoi, Thepa, Chana and Nathawi) 6 months and longer in fiscal year 2008.

Group 2: Government official, mass media, community leaders, soldiers aged 40 years and above who stayed in Narathiwat, Pattani, Yala, and 4 districts of lower Songkla 6 months and longer.

Research Sample

Group 1: People aged 40 years and above in SBP, using Yamane's formula at 95% confidence level in the survey with questionnaire. There were 1,600 persons in this group classified by areas and religions..

Group 2: Health personnel government official, mass media, community leaders and soldiers were purposive sampling by volunteer to expose the

media then participated by in-depth interview. There were 369 persons in this group.

1.2.2 **Sample selection**: using multi-stage random sampling

1.3 **Data collection** This research gathered data as follow:

1.3.1 Ask for permission of the specified organization

1.3.2 Sample selection: classified by specified conditions

1.3.3 Develop questionnaire as research tools and evaluate the quality of research tool

1.3.4 Cooperate with the local organizations before sending the questionnaire for data collection

1.3.5 Send evaluation forms to local researchers, e.g., Songklanagarind University, Pattani campus to collect data, evaluate the data and send the data to Aging Male Clinic, Phramongkutklao(PMK) Hospital and Department of Educational Technology, Faculty of Education, Kasetsart University.

Conclusion of the samples

1. People aged 40 years and above: 1,600 persons, classified by areas and religions.
2. Health personnel, government officials, mass media, religion leaders, community leaders, soldiers: around 369 persons for in-depth interview.

Research Methodology

2.1 Meeting for project planning

2.1.1 Meeting with associated local personnel and set educational plan. Plan and manage the project, public relations by using media, e.g., posters, pamphlets and TV.

2.1.2 Meeting with research team and personnel that were responsible for production, testing and evaluation of media, type of media and using of integrative health media.

2.2 **Testing of sample of integrative health media for aging people**, including video for health promotion, posters, pamphlets and handbooks by experts in contacts, techniques and validity evaluation and appropriateness for media presentation for appropriate areas and target group.

2.2.1 **Design and produce** on TV program, electronic media and printed media according to specified types.

1) Steps in media production consists of analyze health problem of people in 4SBP and specify the issues to present in each type of media.

In case of the media planning, the planning process specifically use by ADDIE MODEL

A = Analysis: analyze the problems and context of people in 4 SBP, analyze common diseases, method of health promotion and prevention, analyze content and types of media to distribute knowledge and analyze types of media for presentation.

D = Design: design types of appropriate media to the specified objectives, pamphlets, posters, video 3 minutes and 30 minutes.

D = Development: conduct the production of media according the specified steps.

I = Implementation: evaluate the media by experts and test it with the real target group.

E = evaluate the media and improve them.

2) Production of integrative health media, classified by types

1. **Health promotion TV** Program showed by Aging Male Clinic of PMK Hospital, Royal Thai Army Medical Department, Department of OB-GYN of Faculty of Medicine, Songklanakarin University, Hadyai campus, joining with Royal Thai Army classified to 2 programs

-Three minutes health without Buying/ Selling TV program, broadcast for every Wednesday, Thursday and Friday, 05.15-05.20 from TV 5/1 Pattani, 100 programmed.

- Health without Buying/Selling TV program for people aged 40 years and above:30 minutes per week form TV 5/1 Pattani, 30 programmed.

2. **Posters and pamphlets** series "Prevention and treatment of common 10 diseases of aging people" 5/ type
3. **Handbook** of Health without Buying/Selling No.5 sections 10 common diseases in aging persons in SBP.

2.2.2 **Test of health media** with target group in SBP, test of efficiency of media, survey of satisfaction and result of learning from media by questionnaire and in-depth interview.

2.2.3 **Evaluation of integrative health media**; video of health promotion and healthcare 3 minutes, 30 parts and 30 minutes, 10 parts, pamphlets and poster each 5 stories, only 1 handbook of Health without Buying/Selling No.5, by questionnaire, in-depth interview and conclude the operation.

1) Opinion survey by closed and questionnaire for health personal and soldiers.
2) In-depth interview divided 7 groups totals 369 peoples

2.2.4 **Data Analysis** obtained from the experiments by using percentage, mean, and conclusion the result of analysis.

2.3 **Meeting of operation for doctor**, health personnel and mass media, and training for health personnel in health centers as well as people, officials, soldiers, mass media in the areas, 2 times/year for exchange knowledge and experience in treatment and rehabilitation.

2.4 **Location of operation / Data collection**

Production of health media at Aging Male Clinic, PMK Hospital, develop and design prototype of media at Department of Education Technology, Faculty of Education, Kasetsart University and collecting data from questionnaires in SBP, at Songklanagarind University, Pattani Campus, Yala Hospital , Pattani Hospital, Narathiwatratchanagarind Hospital and Chulabhorn Camp.

2.5 Data analysis

Analyze by using computer programs for percentages, maximum, minimum and Chi-square.

Research Result

The numbers of male samples were more than female ones. Most of them aged 41-50 years, and 31-40 years, respectively. Most of their occupations are teachers and agriculturists, respectively. Most of their religions were Buddhism and Islam, respectively. Most of their marital statuses were married and single, respectively. Other statuses were religious leaders. Most of their personal health problems were headache, joint pain and hyperlipidemia, respectively.

Every media had average scores in high level; 25 minute video media had highest average scores. It was found that pamphlets and 25 minute video media had highest scores in the issue of good transferring of disease concept, quick understanding, content coverage, including appropriate size and type of alphabet. It was found that 25 minute video had highest average scores; poster had high average scores in the issues of appropriate color and pictures.

People in 4 SBP perceived media in the topics of healthcare from 25 minute video media higher than poster significantly ($p< 0.05$). They had continued ways of self healthcare from pamphlets higher than poster significantly ($p< 0.05$). For other issues, they thought indifferently.

Both 3 minute and 25 minute video media had high average scores in every issue. It was found that 25 minute video had highest in the issues of knowledge perception. For the issues of attitude to media and ways of practice, it was found that pamphlets had highest average scores. 3 minute video had highest average scores in the issues of benefit from media and effect to community and localities. After the testing for difference among groups, it was found that there was no difference significantly ($p< 0.05$). It showed that although different religion, but people thought about effect of poster using indifferently.

For the knowledge from media, Songklanagarind University, Pattani Campus and Yala thought that poster gave knowledge higher than Narathiwat significantly ($p< 0.05$). For the attitude to poster, Songklanagarind University, Pattani Campus and Yala had attitude to poster higher than Narathiwat significantly ($p< 0.05$), and Pattani higher than Songkla significantly ($p< 0.05$). For ways of practice significantly ($p< 0.05$), Songklanagarind University, Pattani Campus and Yala thought that thought that poster gave ways of practice higher than Narathiwat significantly ($p< 0.05$). For the benefit from media, Pattani thought that poster gave benefit higher than Narathiwat significantly ($p< 0.05$). For the effect to community and localities, Pattani thought that poster had effect to community and localities higher than Songkla and Narathiwat significantly ($p< 0.05$).

The opinion of islams to effect of pamphlet media was higher than Buddhists significantly ($p< 0.05$). For the knowledge from media, Songklanagarind University and Pattani thought that pamphlets give knowledge higher than Narathiwat significantly ($p< 0.05$). For the opinion to media, Pattani thought had opinion to pamphlet higher than Songklanagarind University Narathiwat and Songkla significantly($p< 0.05$) and Yala more than Narathiwat significantly($p< 0.05$). For the practice, Songklanagarind University concluded that Pamphlet was better in practice than Narathiwat significantly ($p< 0.05$) and Pattani higher than Songkla and Narathiwat significantly ($p< 0.05$). For the benefit of media, Pattani concluded that pamphlet was more useful than Narathiwat and Songkla significantly ($p< 0.05$). For the effect to community, Pattani and Songklanagarind University concluded that pamphlet had more benefit than Narathiwat significantly ($p< 0.05$).

Islamic people thought that the result of 3 minute video media was more than Buddhist people significantly ($p< 0.05$). For the knowledge from media, Songklanagarind University thought that 3 minute video give knowledge more than Narathiwat and Songkla significantly ($p< 0.05$). Islamic people thought that the result of 3 minute video was higher than Buddhist people significantly ($p< 0.05$).

Islamic people thought that the result of 25 min video was higher than Buddhist people significantly ($p< 0.05$). For the knowledge from media, Songklanagarind University thought that 25 min video was higher than Pattani, Narathiwat and Yala significantly ($p< 0.05$). For the effect to community and localities, Songklanagarind University thought that 25 minute video had effect to community and localities higher than Narathiwat, Songkla and Yala significantly ($p< 0.05$).

Conclusions and Discussions

Conclusions: The appropriate types of health media in SBP should be television, radio, document media; including electronic media which were short, easy content, more frequent with attention of identity and equity. The integrative health media made the target groups understand the contents of the diseases, prevention, health care and steps of treatment. There should be continuous production and distribution of health media for health care, understanding of health problems, receiving people's opinion and public relations of governmental media to people in all of local areas; to make images and understanding between health governmental organizations and people. The offensive health units would support the distribution of health media by providing channels for health media.

Discussions: There should be additional production of integrative health media and social media. The media should be distributed and increased channels of dissemination, e.g. health roads, peace roads, in cooperation with district or provincial administrative organizations in the areas and related organizations, people, religion leaders. These would create health, peace and quality of life of people and government officials in SBP.

INTEGRATION OF TECHNOLOGY INTO ADULT ESL CLASSES IN TURKEY: ADULT ESL STUDENTS' AND ESL TEACHERS' PERCEPTIONS ABOUT IMPLEMENTATION OF ICT IN ONE ENGLISH PREPARATORY SCHOOL (FDY) IN ISTANBUL

Seda Khadimally
Glasscock School of Continuing Studies
Rice University
seda.khadimally@rice.edu

Abstract
The purpose of this study is to develop a new perspective on English as a Second Language (ESL) education through bridging andragogy with technology under the umbrella of constructivist pedagogy. The example of instructional methods chosen at a private university in Turkey, together with ESL students' and ESL teachers' perceptions about the implementation and impact of information and communication technologies (ICT) in the Turkish educational system, suggests a theoretical framework for further implementation of learning and teaching in bilingual settings. This is a need particularly evident in a developing country like Turkey that is working to acquire 21st century literacies in educational technologies.

Key Words: andragogy, constructivist pedagogy, ESL students' and ESL teachers' perceptions, ICT, learning and teaching in bilingual settings, 21st century literacies, educational technologies.

INTRODUCTION

This paper elucidates the way the process of adult education (andragogy) used with older adolescents (18-22), in conjunction with emerging technologies, can provide a successful model for ESL education in a wider context. The study draws upon the literature, theory and practice of the field, as well as interviews, direct classroom observations, and data collection through survey. The study suggests that teachers' technological implementations in the classroom can be a powerful means to help students acquire a new language and to become more adult, self-directed, and confident learners. Since the ESL learners were in a transitional age period from adolescence to adulthood, andragogy was an essential constituent in class applications, and ICT played a significant role to help students become adult learners. Evidence drawn from the literature review demonstrates that ICT is a growing phenomenon in various specialties in the Turkish educational system. However, very little research has been done on the impact of ICT on second language acquisition, particularly in ESL classes. This study thus addresses a gap in the bilingual learning/teaching literature and develops a hypothesis about the convergence of theory and practice.

BLEND OF ART AND SCIENCE: FROM THEORY TO PRACTICE

A goal of this study is not to reject the pedagogical view within the theory of education, but to conceptualize an instructional model that blends constructivist pedagogy with andragogy, a theory of adult learning, and to show how ICT can be a major catalyst to enhance the power of both approaches. The model is holistic and student-centered. The teacher acts to blend the constructivist pedagogy with an alternative instructional theory: andragogy. In other words, this study is a blend of art and science through a holistic approach where the teacher still acts as a "facilitator", "guide," "leader," and a "problem solver" (Cohen, 1994). Stated in another way, the conceptual framework relies on an andragogical approach within the constructivist discipline, and the emerging technologies applied underscore the new model in adult ESL classrooms. By definition, adult learning theory, *andragogy* (Knowles, 1950), connects with constructivist pedagogy (Piaget, 1967) with learning/teaching practices that focus on adult ESL learners rather than younger ESL students. According to Knowles (1977), andragogy includes four assumptions related to: 1) self concept; 2) experience; 3) readiness to learn; and 4) orientation to learning. Democratic participation is also another component. The *blended unified design* (BUD) hypothesized for this study demonstrates the usefulness of a blended approach that includes both constructivist pedagogy, andragogy, and the kinds of holistic practices that can be exemplars in both areas.

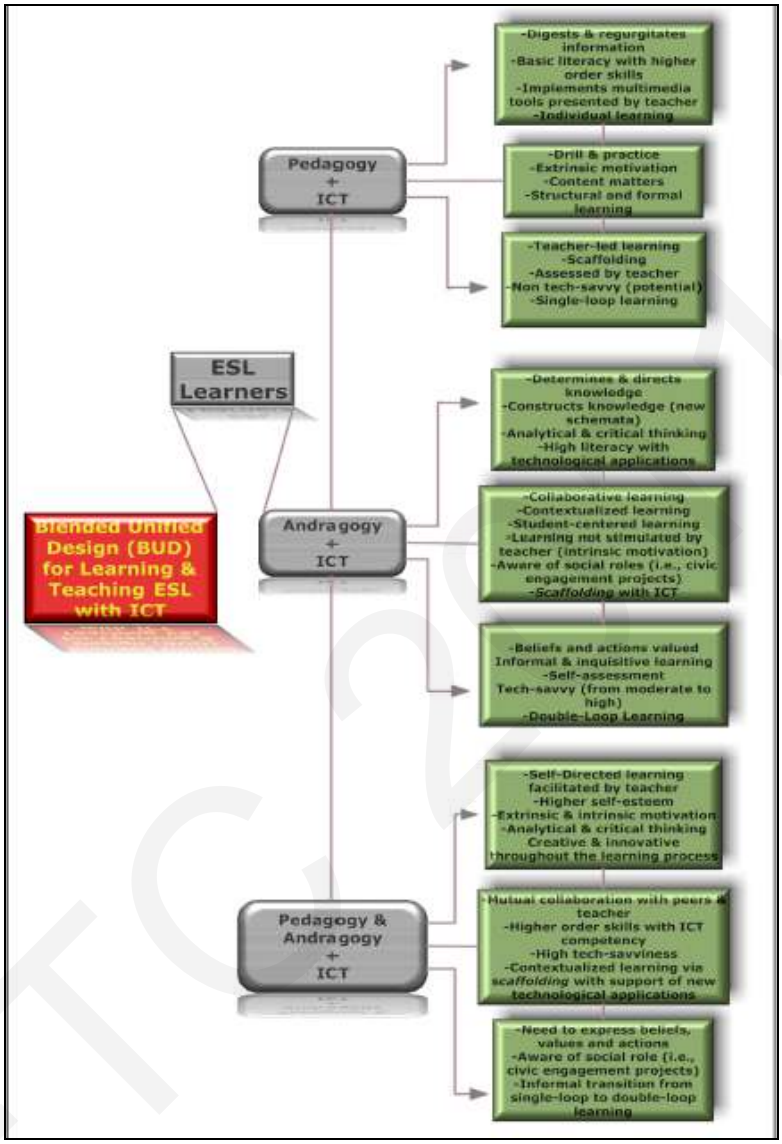

Figure 1. Blended Unified Design (BUD) for Learning/Teaching Adult ESL Classrooms. The figure presents how various courseware such as *Quia*, *Lextutor*, and *Nicenet ICA*, etc. are practiced by ESL learners first pedagogically (constructivist), next andragogically, and finally together.

METHODOLOGY

The methodology of the study at FDY involves the following components:

• A focus on specific software applications such as *Quia, Lextutor, Nicenet ICA,* and more;

• Interviews with school administrators to determine the level of school support, attitudes, and their impact on ICT implementation in ESL classes;

• A triangular method of data collection that included interviews of students, teachers, and administrators; in-class observations; and survey data collected from students to explore general perceptions about the utility and potential

benefits of ICT practices in class. This combined approach to data collection helped generate findings that form the basis for a new hypothesis, the *blended unified design* (BUD) of learning/teaching ESL with ICT.

I used *triangulation method* for data collection. The multiple sources would "give my conclusions far more credibility than if I had been limited to one source or method" (Maxwell, 2005, p. 94). These three sources of data
included: 1) interviews with adult ESL students, ESL teachers and school administrators; 2) in-class observations; and 3) an online survey about ICT implementation in adult ESL classes. These research instruments were designed to address two core questions and one secondary research question listed below:

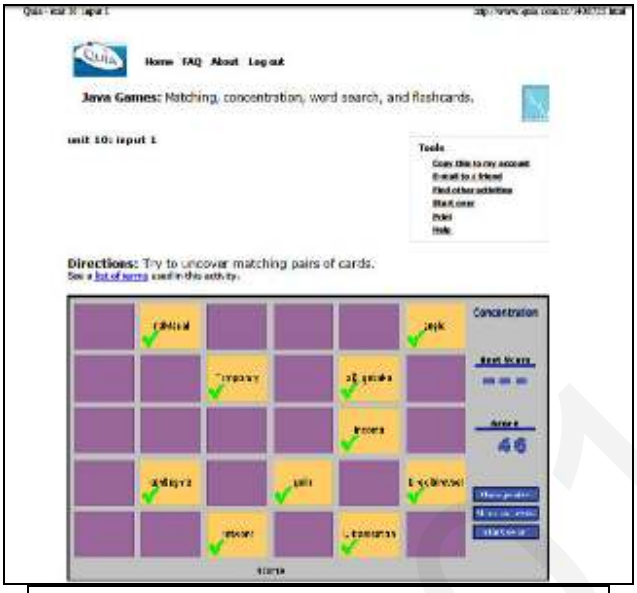
1. How do adult ESL students find the implementation of ICT in their classes as a key component of their learning English?
2. In what ways do ESL teachers see the implementation of technology in their classes beneficial to create *meaningful* and *self-directed learning* for students?
3. In what ways does the school structure conceive ICT resources a key part of adult ESL learning/teaching?

The site for the study was one private university, Sabanci in Istanbul, Turkey. I intended to demonstrate the onsite implementation of ICT in adult ESL classes which might exemplify both constructivist pedagogy and andragogy. Since Sabanci is a leading English preparatory school in Turkey, I thought that the School of Languages (SL) there would let me test both the effectiveness of educational technologies in adult ESL classes and their impact on instructional methods and learning settings. SU is one of Turkey's most prominent educational institutions. It includes a Foundation Development Program (FDP) intended to help students acquire full mastery in English via cutting-edge technologies and engagement in civic projects with the goal of becoming ideal citizens. The program is designed for young adult learners (18-22), a time before they are eligible for various majors across the university's faculties. My criteria for choosing FDY included: 1) sufficient technological resources; 2) the school's awareness of the benefits of technology in meaningful adult ESL learning; 3) professional staff competent with new technologies; 4) a wide array of adult ESL students from traditional to tech-savvy; 5) openness to constructivist studies (i.e., institutional support); and 6) openness to learning (i.e., pre-service and in-service teacher training).

PARTICIPANT SELECTION: INTERVIEWS

This study used a *purposeful selection.* Purposeful selection refers to "a strategy in which particular settings, persons or activities are selected deliberately in order to provide information that can't be gotten as well as from other choices" (Maxwell, 2005, p. 88). My study included nine interviewees and eighty-one respondents to the online survey in total. The student and teacher interviewees were chosen based on *homogeneity*, the administrators were randomly chosen, with groups composed as follows:
• ESL students (Two male, one female)
• ESL teachers (Two female, one male)
• School administrators (Three male)

The student interview sample was *homogeneous* because all ESL students were involved in upper-intermediate classes at SU, FDY, preparing to take the English Language Assessment Exam (ELAE) at the beginning of September. They were using the same types of technologies (*Quia*, *Lextutor*, *Nicenet ICA*, and more).



The second participant group interviewed was ESL teachers at the SL, one male and two females. They, too, were a homogeneous group since they all taught in upper-intermediate classes and were preparing students for the ELAE. I had no prior knowledge of the participants, or their in-class practices with ICT. Gender rationale in the selection of teachers was crucial because I was trying to refute the common belief that female ESL teachers might have a negative approach toward technologies. I therefore decided to analyze the tech-savviness of the FDY female teachers. The three school administrators were chosen at random according to their specialization with these technologies. They all had large areas of responsibility; the university president in the managerial operations of the entire university, the IT administrator in all systems operations and other technological support (i.e., software and hardware allocation and trainings), and the HR administrator in all human resources operations (i.e., recruitment, Intranet correspondence with students and faculty members, program orientations, pre-service and in-service teacher training, etc.).

ESL STUDENT INTERVIEWS

The ultimate aim here was to elicit students' perceptions about technology integration in ESL classrooms. I asked technology-related questions such as:

• Which ESL courseware did you use in the class to improve your English skills: listening, vocabulary, academic writing, reading, and speaking skills?
• In what ways did your ESL teacher use *Quia* in your class?
• To what extent did your ESL teacher use *Nicenet ICA* in the class? How?
• How did your ESL teacher use *Lextutor* in the class?
• Which software programs did you use for research? How?
• Did you use *podcasts* in the class? How?
• What was the impact of technology on your learning ESL?
• How do you assess your teacher's implementation of technological applications when you think about her/his attitude(s) toward ICT?
• Did you learn English better from your female or male teacher?

These interviews were semi-structured and in-depth. Each interview was held individually and in an informal setting. There was also a separate discussion group at the multimedia lab, where we talked informally about the implementation and the effectiveness of ICT in the ESL students' learning process.

ESL TEACHER INTERVIEWS

The purpose of interviewing ESL teachers was to understand their use of courseware such as *Quia*, *Lextutor* and *Nicenet ICA* in class. I was particularly interested in female teachers' approaches to and beliefs about technology and wanted to explore possible gender differences in ICT implementation. In order to understand teachers' perceptions about the use of educational technologies, I asked the following questions:

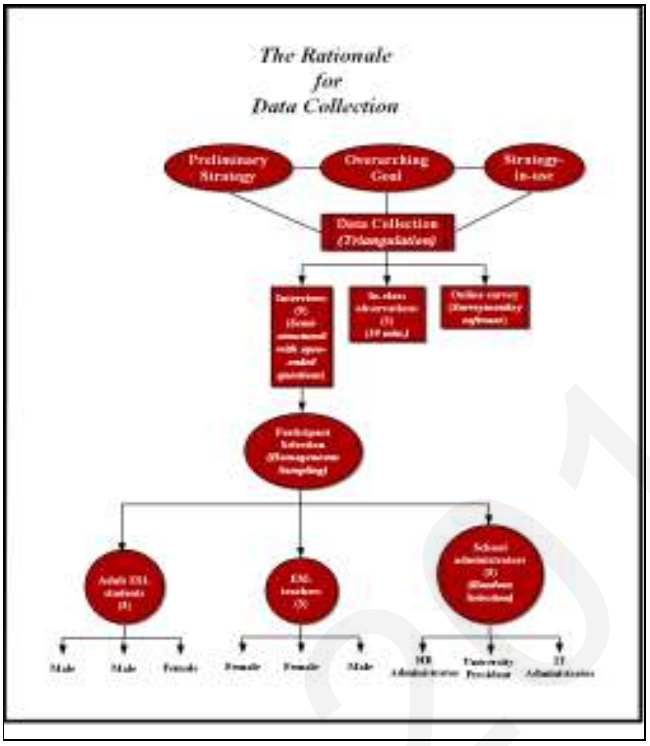
• How do you evaluate your own instructional methods as an ESL teacher?
• What do you think about your colleagues' ICT applications in the classroom?
• How do you evaluate the extent to which your male students and female students learn English? Do girls learn ESL better with technology, or is boys' ESL learning with ICT better than that of girls'?

SCHOOL ADMINISTRATOR INTERVIEWS

The third group of participants was a randomly chosen group that included the Sabanci university president, and the administrators from Human Resources (HR) and Information Technology (IT). My goal in these interviews was to explore school support for ICT implementation at the university and in particular at the SL. I aimed at understanding the extent to which the SU administration allocates technical resources (i.e., software tools and hardware) in instructional practices. My focus was on school support for teaching with technologies during FDY at the SL. These interviews, too, were semi-structured and conducted in an informal setting.

DATA COLLECTION RATIONALE

Each group interviewed for this small-scale study thus provided a different perspective and a different kind of learning, all of which contributed to a salient data analysis. No interviews, in-class observations, or personal communications were held without the permission of the participants. The participant selection allowed for a full exploration of the perceptions about ICT implementation. IT (Information Technology) Department at Sabanci University is also called BT Departmani (Bilgi Teknolojisi) Departmani in Turkish in adult ESL classrooms at SU.



IN-CLASS OBSERVATIONS

The three classes for observations were based on homogeneity because they included the same level of English, upper-intermediate. These classes were selected because they were willing to be observed. Observations were held within the ESL classrooms at the SL. Two regular adult ESL classrooms were visited, and a third class was observed during two sessions that included a morning classroom and an afternoon multimedia lab.

ONLINE SURVEY

This study included an online survey. The survey respondents were chosen as both current SL students and the former students of FDY in Sabanci University. This group was also homogeneous because they had the same experiences with the same courseware and instructional methods in the SL. I sent these respondents the online survey's URL. Online responses were obtained from fifty-one students and then analyzed. The tool I used was *surveymonkey*.The survey allowed me to see the paradoxical data that I might have overlooked, "aiding with conceptual development and instrumentation" (Miles & Huberman, 1994, p. 41). It simply made the data analysis much easier. Since Glaser and Strauss (1967) propose a *grounded theory* in order to weave a pattern through a comparative analysis, I concluded that the use of the survey would enrich the study by providing more evidence. Some of the questions asked in the survey were as follows:

• What types of technology do you use outside the school?
• How often do you use computer(s)/laptop a week?
• There was meaningful learning created during ESL sessions because teachers encouraged us to ….
• Please tell which one of the technological tools below you heard and/or used as part of your ESL courseware.
• As a courseware management system (CMS) on which SUCourse is based, I use(d) the … open-source portal to collaborate and learn online in my ESL classes.

The survey was designed in a *multiple-choice* (only one answer) format in order to elicit the topics in-depth. Fifteen questions were asked to FDY students. The results drawn from the online survey indicated that the

questions were responded by eighty-one students, fifty-one of whom completed all of the questions. The cross-sectional type of survey that included both qualitative and quantitative methods explored answers to both the first research question about ESL students' perceptions about ICT implementation in class, and the third research question in order to find a salient pattern in this study. It is used to gather information on a population at a single point in time. It also tries to determine the relationship between two variables such as—as this study offers—the SL students' perceptions of ICT and its implementation in adult ESL classes, or school (institutional) support at SU/FDY and implementation of ICT, which would answer my first and third research questions. Note that the relationships between these two different factors could merely be provided by the use of a cross-sectional type of survey. The relationships among all qualitative (descriptive) responses such as "There was meaningful learning created during ESL sessions because teachers encouraged us to think and do analytically and creatively with technology (53.3%)" and quantitative responses such as "I use computer(s)/laptop once, twice, three times, everyday (97.4%), never, etc. a week" allowed for the construct of this study's *blended unified design* (BUD). The results and analysis then allowed for the construct of the *blended unified design* (BUD). Students were asked questions related to fifteen topics. These topics that included one question were:

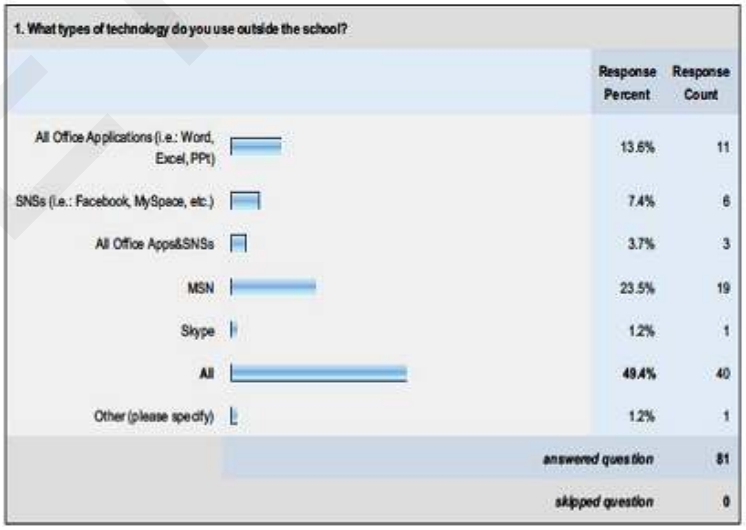
• *Student reflection on technology use*	• *Cognitive learning in ESL*
• *Frequency of technology use*	• *Collaborative learning*
• *Drawback of technology*	• *E-learning environment*;
• *ESL teachers' ICT performance*	• *Research database software*
• *Creating meaningful learning*	• *Software for academic honesty*
• *Learning as an adult*	• *Feedback*
• *ICT implementation in teaching*	• *Comments* (See "Comments from Online Survey")
• *ICT practices in ESL classroom*	

Question #1 is presented below as an example to student response ratings:

Student Reflection on Technology Use

All of the eighty-one students responded to question one. This question indicated a 49.4% response that came from forty students who stated that they use all types of technology (i.e., all *Office* applications, *SNSs*, *MSN* and *Skype*). The second highest response percent was 23.5% responded by nineteen students—about half of the first response. The lowest response percent was 1.2% with *Skype*. One respondent (1.2%) specified in the "Other" section that she/he used all *Office* applications along with *Dreamweaver Photoshop C++*, and more. Their responses are indicated in the following chart:

ICT IMPLEMENTATION IN ADULT ESL CLASSES



Comments

Question fifteen was aimed to assess ESL students' comments on the strengths and/or weaknesses of FDY, and what they thought could be retained or changed to enhance their academic performance in ESL. *Quia*, *Lextutor,* and *Nicenet ICA* were the three courseware to which they most often referred when responding to this question. Thirteen out of sixty-eight ESL students commented on this question. The results are presented in the following table:

Please comment on the strengths and/or weaknesses of FDY you think could be retained or changed to enhance your academic performance in ESL. You may answer this question according to software programs such as *Quia, Lextutor, Nicenet ICA*, etc. that might be used in you classroom. Thanks!
1. Nicenet is a very useful site to see your teachers' feedback on your works and also we can see other people's works as well.
2. Sometimes we spent too much time to learn new computer programs than instead of learning English. Except for these problems, every technological use was very effective.
3. It goes without saying that FDY is essential for every single student who wants to learn and use English perfectly.
4. When I compare the education in FDY with other schools, I can see that FDY gives more speaking, understanding and writing based education. At other schools, they are trying to learn every unnecessary details of grammar which does not make any sense. As a result of this, FDY gives more useful English education than others.
5. There is nothing I earned at FDY. Just a waste of time…. There are teachers who do not deserve the money they earn….
6. In the past, students were not allowed to use Turnitin program. It made hard to make sure about the sentences that you interprete correctly.
7. Technology use in the classes of FDY is not so bad. However, it is sometimes useless. As I denoted on one of the previous questions, it makes students kinda lazy.
8. It is different from high school and use of technology and attention of teacher are very effective for the students who try to learn English in the School of Languages.
9. It really helped me to attain greater success in faculty lessons. Surely, academic style based writing exercises will help us in continuous business life.
10. Weakness: Note-taking, speaking; strength: Reading.
11. In FDY, we use different kinds of programs which I didn't know before and they were beneficial for my improvement.
12. Developing is up to my own struggles.
13. We have used Nicenet to share our papers. We have used Nicenet sometimes, to get more papers to read and to criticize other papers. Nicenet should be used every time in the class; that is, in every topic and activity.

Table 1. Comments from Online Survey (Q15). The table above presents FDY students' comments on the strengths and/or weaknesses of the program in terms of the effective and efficient implementation of ESL technologies that are used in their classrooms, such as *Quia, Lextutor, Nicenet ICA*, etc.

RESULTS

Findings from the interviews and observations additionally imply that there is a symbiotic relationship between the utility of technology in adult ESL classrooms. In this study, it is my finding that ESL teachers also attest to the benefits of ICT as a positive instructional approach to their discipline. Hence, the assertion is that a successful integration of ICT and andragogy, as a complement to constructivism, can engage ESL students and teachers in thinking positively about their own learning/teaching. Another assertion is that administrative support is an important catalyst in and interactive process that leads to pedagogical change in bilingual classes: a transformative process that leads to young adults' meaningful, self-directed learning. The results demonstrate the need to enhance not only *teacher-led,* but a *student-centered* learning/teaching in bilingual classes in Turkey via emerging technologies. This study describes a "best practice" program that prepares students to acquire full mastery in ESL with the successful implementation of ICT unified with constructivist pedagogy and andragogy. The findings and proposed model contribute to a needed expansion of current research in bilingual education, expand the available literature on the topic, and provide new insights to inform possible—and considerable—paradigmatic shifts in the Turkish bilingual education system.

DISCUSSION

The results derived from in-depth interviews, in-class observations, and the online survey indicated that the research questions chosen, methodology used and the hypothesized *blended unified design* (BUD) demonstrated participants' positive perceptions about the implementation of ICT in the adult ESL classes in Turkey. Students' and teachers' positive outlook toward the use of emerging technologies in their learning and teaching, and the amount of school support both university wide and at the SL allowed me to understand the best practices at Sabanci University, a private higher educational institution. These perceptions and administrative support additionally helped me to develop the *blended unified model*, (BUD), where andragogical teaching methods converge with pedagogical principles that are constructivist in nature, supported and enhanced by ICT.

Correct implementation of ICT in ESL classes gives me hope that the Turkish educational system is ready to transcend itself through modern technologies that can be thoroughly applied in bilingual education. Despite the common opinion, learning and teaching ESL/EFL is not an easy task. When technology is dominant, gaining full

mastery in a non-native language becomes more challenging. However, this study asserts that technology can leverage understanding, and that ESL can be better learned and taught with ICT that includes educational technologies such as *Quia*, *Lextutor*, *Nicenet ICA*, and more. Thus, ICT is able to engage students in gaining diverse skills in English. Adult ESL students, ESL teachers, and the administrators at Sabanci University School of Languages prepare their students to acquire 21st century digital literacies via these new technologies. If gaining digital literacies is essential in bilingual education, then the combined approach I offer in this study cannot only cause a developmental change in bilingual learners, but generate higher performance for adult ESL students' learning. These changes owe a great deal to ESL teachers who use their best judgments for change, and utilize the best practices with technology to generate higher academic achievements in their classrooms. They are highly conscious of both the value of adult approaches and ICT implementation in class. Knowles asserts that rather than incorporating traditional methods into their teaching, educators need to integrate innovative instructional methods for adult learners who might have a tendency to resist learning new subjects and under unfamiliar conditions that might not fit their self-concept (Knowles, 1970). With regard to all of these observations, therefore, BUD gives me more motivation to work on educational technologies that will support best learning/teaching practices in bilingual classrooms. Despite the budgetary restrictions, it is undoubtedly that Turkey is a rapidly developing country in several aspects, and thus students can become self-directed learners as much as teachers can apply cutting-edge technologies to create meaningful and self-directed learning in their classrooms. Sabanci was an exceptional model that promoted combined pedagogies, constructivism and andragogy, supported by in-class technology that spurred a considerable change in students' development and learning a second language. It is very likely that this model can also be utilized with support of ICT in other Turkish schools that teach ESL.

CONCLUSION

This study was conducted in one Turkish private university's preparatory school (FDY at the School of Languages) where implementation of ICT (i.e., *Quia*, *Lextutor*, *Nicenet ICA*) in adult ESL classrooms was highly effective and efficient. The findings in this locale demonstrated a best practice program that blended theory and practice with a combined approach of constructivist pedagogy and andragogy supported by ICT. This unified approach to bilingual learning/teaching is essential in terms of a broad understanding of ESL students' learning and teachers' instructional methods along with the school's support. Examining the results through a triangular method led to the construct of a new hypothesis in this literature, the *blended unified design* (BUD) of learning and teaching ESL with ICT. The BUD also showed a way that the divide between ESL learning/teaching with and without cutting-edge technologies can be closed in other private universities' preparatory schools although no generalizations should be made from one small study, no matter how promising. Developing a new hypothesis, BUD, was crucial in this study since this resulting model designed for both ESL learners and teachers addresses a two-dimensional change: 1) developmental at the micro level; 2) educational at the macro level. The fact that technology contributes a great deal to both students' enhanced academic success in English and teachers' better instructional practices makes it an essential component to stimulate this change.

Drawing upon results from the three research methods (interviews, observations and survey) that provided both qualitative and quantitative data confirmed and concluded that a convergence of art (ESL learning/teaching) and science (use of particular appropriate ICT tools) can enhance ESL teachers' instructional quality, and thus provide young adults at English preparatory schools a broader perspective to fully acquire a new language. In-depth interviews with students, teachers and school administrators, in-class observations, and the online survey responses enabled me to see that learning and teaching ESL by support of emerging educational technologies in Turkish higher education exists, can be highly effective and efficient.

My research findings, combined with the theory-in-use allowed me to build a new hypothesis, BUD. It is a model that arose from my concern to address a current educational issue within the bilingual learning and teaching environments in Turkey, particularly when utilizing technologies in adult ESL classes is under close lens. The model was further developed to offer a solution through a unified approach of learning and teaching ESL through ICT. I assert that the BUD hypothesis could be a recipe for enhanced academic success in bilingual education in Turkey. In spite of budgetary restrictions and/or underestimation of this field, initiatives can be taken by MoNE and other private universities. FDY at the School of Languages at Sabanci University has taken this initiative, and has been an exceptional model with best ICT practices in bilingual education. These practices not only helped the ESL students to acquire full mastery in English via technologies, but also encouraged them to become confident adult learners and ideal citizens mindful of 21st century literacies. The expectation from this study is that current best practices with ICT in bilingual education can lead to new perspectives for further research in this literature, spur a remarkable change in the educational system in Turkey, and thus allow for better practices in other private higher educational institutions.

INTERACTIONAL FREQUENCIES AND PATTERNS OF INTRACULTURAL CONTACT AMONG ETHNICALLY DIFFERENT FACULTY MEMBERS AND STUDENTS IN A SYNCHRONOUS DISTANCE INTERACTIVE CLASSROOM CONFERENCING

Halit Hami Oz
İstanbul Aydin University, Faculty of Engineering and Architecture, Department of Software Engineering, Kucukcekmece, İstanbul, Turkey,

hamioz@aydin.edu.tr

ABSTRACT

The southeastern region of Turkey is home to significant populations of Turkish nationals of Kurdish and Arabic heritage. Objective of the study is to analyze the interactional frequencies and patterns of intercultural contact among ethnically different faculty members and students of Istanbul University (IU), Istanbul, and Harran University (HU), Urfa, involved in a project of Synchronous Distance Interactive Classroom Conferencing between the two universities. A total of 260 students at IU, 150 students at HU and 16 faculty members were involved. Method of direct observation instrument was used to analyze the contact patterns that occured among various Turkish students from IU and Turkish students of Kurdish ethnic backround at HU. Faculty members and students from IU for the most part, were urban-educated in Istanbul and found themselves having to interact with the faculty members and students of HU located in Urfa, Southeastern Anatolia. Results: This model permitted interaction between the students at IU and HU and instructor in real-time during and off the class time and problems did occur as a result of intracultural differences. Both sides lacked sensitivity and knowledge about issues related to cross-cultural communication and interaction. In conclusion,The findings revealed that the groups engaged in narrow interaction patterns and there was a virtual wall between the students of IU and HU which was difficult to overcome.

Keywords: cross-cultural contact; intercultural contact; intercultural relations undergraduate education, synchronous distance learning, distance education, classroom conferencing, intercultural communication, virtual walls

INTRODUCTION

Many people have preconceived ideas and stereotypes about cultures and co-cultures. Most of these stereotypes are probably erroneous, and built walls between cultures. “Intracultural communication” is often a trigger for stereotypes. First a definition of “Intracultural communication” is “the type of communication that takes place between members of the same dominant culture, but with slightly different values, as opposed to “intercultural communication” which is the communication between two distinct cultures. An example of intercultural communication triggering a stereotype would be if a person in the dominant culture, let’s say of Turkey, spoke Turkish with easterner, in other words Kurdish, accent. If a non-Kurdish speaking person hears Turkish spoken with Kurdish accent, they may assume the person is of low intelligence and rough in nature. These initial thoughts are unfounded and more than likely incorrect.

Cultural diversity is not a new phenomenon inside the walls of the school, but it has undergone changes in the way it is viewed. It has gone from models that postulated that integration into a society should be through assimilation into the dominant group of the culturally different, to more modern discourses about recognition and valuing, to a greater or lesser extent, of the “other cultures” by society and in schools.

The evolution observed in other societies does not differ greatly from the Turkish case, although the rhythm and the timing do not coincide. Although it is true that there is still a long way to go before Turkey, and, specifically in Southeastern Anatolian region, one of its underserved areas.

The Southeastern region of Turkey has been undergoing development efforts since the 1970s through the Southeastern Anatolia Regional Development Project, known worldwide by its Turkish acronym—GAP (Guneydogu Anadolu Projesi). Turkey is a culturally diverse society. The Southeastern Anatolia region, where the GAP project is located, is heavily populated by Kurdish and Arabic communities. There has been limited intercultural interaction among these people from the west and southeast in terms of cross-cultural marriages or shared cultural celebrations. And, until recently, the region experienced quite tense and complex difficulties as a result of PKK (Kurdistan Worker's Party) terrorist activities causing the loss of 30,000 innocent human lifes. Added to this, the relative limited interaction between this area and the rest of Turkey has contributed to a lack of understanding between these regions and other parts of the country. PKK terrorist activities ended in 1999 when their head was captured and put into jail. Terror was over and it was time to reconnect the southeast to the west and contribute to the human development of the region. I first talked to the president of IU to start Synchronous Distance Interactive Classroom Conferencing between IU and HU. He accepted the idea and asked me to go and talk to the president of HU. I went to Urfa to talk to the president of HU about the project. I said to him that as a faculty memeber from the western part of the country wanted to do something to improve the quality of higher education in the Southeastern region as part of GAP human development project. The presidents of both IU and HU approved and welcomed the project and gave their full support. IU Ziya Gun Foundation provided the financial support for the full cost of the project, 150,000 USD.

Students are admitted to the universities through centrally administered university entrance examination in Turkey. The students with higher scores are usually admitted to the ivory league universities in the big cities located mainly in the west and those students with relatively low scores are admitted to the other universities located especially in the southeastern part of the country. Because of the terrorism threats for many years Turkish students from the western part of the country did not go to these universities located in the southeastern part of the country. Only those Turkish students of Kurdish backround could attend these universities because they are the ones who knew the region and could make it there because of their ethnic backround. Before I started the project I made several trips to HU on my own and talked to the students about what they wanted. They first asked for the faculty members from IU to come and lecture at HU. This was impossible because faculty members from IU still considered the southeastern region not a safe place to travel. The students said if this was not possible then they wanted to take the courses from the same instructors simultaneously with the IU students through synchronous distance interactive classroom conferencing. They did not want to take a seperate course which was designed for them and could also be considered as second quality.

Objective of this study was to observe and examine the type and amount of contact and intercultural interactions as well as the nature of such contact (e.g., topic of discussion, duration, relationship context) took place among the students of IU and HU who were involved in a distance synhronous classferencing project. It was designed to teach basic science courses simultaneously to both IU and HU students using two specifically designed general purpose technology enhanced classrooms in two different universities, Istanbul University (IU) in Istanbul and Harran University (HU) in Urfa, located 1500 miles apart in Turkey. Direct observation instrument was used to analyze the contact patterns and specific intercultural interaction frequencies and dynamics as found among ethnically different students, Turkish students from IU and Turkish students of Kurdish ethnic backround from HU.

Understanding the complex nature of intercultural contact will help us understand the particular dynamics of contact that exist among ethnically different groups (in general and in relation to specific ethnic group relations—for e.g., Turks/Turks of non-Kurdish ethnic backround–Kurds/Turkish citizens of Kurdish backround). Because communication problems among ethnically different groups in general is our biggest problem whether it occurs in the universities, workplaces or in our daily lives.

METHODS

A technologically enhanced classroom of Istanbul University, Istanbul, was connected to another technologically enhanced classroom of Harran University in Urfa which is located in the southeastern region of the country, 1500 km apart from Istanbul. The purpose of the project was to enable the faculty members from the Science Faculty, mainly mathematics, Physics and from Bussiness School of IU to lecture simultaneously also to the students at HU because there was a lack of faculty members who could teach those courses at HU. The students at both universities were listening to and watching the same instructor at the same time and they (HU students) could see IU students and IU students could see HU students all the time through videoconference. HU students could ask question any time they wanted because the lines were always open and they had microphone in their class swicthed on all the time. So it would not make any difference where they are, Istanbul or Urfa, since they were watching, asking questions and listening to the same instructor. I sit in the IU classroom for the first six months of the project to observe and examine the amount of contact and type of intercultural interactions took place among the students. I also went to HU several times and brought in HU students to Istanbul during semester breaks to help resolve the intercultural communication problems. "Intercultural interaction" was defined as a "conversational exchange between at least two racially/ethnically different persons", (Halualani et al., 2004). With this definition in mind, "interactional nature" was conceptualized as those elements that actually constitute the interactional process of contact such as the following: duration (the length of time in which contact occurs), setting (in what environments contact takes place), relationship type (the kind of relationship between interactants—as strangers, acquaintances, friends), and interactional topic (the specific conversational topics are discussed during contact, including at what point is race/ethnicity discussed and what are the difficult points of conversation) (Halualani et al., 2004).

RESULTS

The HU students first asked me to find one student in the IU class who was from Urfa at the begining of the semester. They gave me the name of the student they wanted to get in touch. By chance there was one student who was from Urfa and at the same time IU student and attending one of the physics classes. They first got in touch with him and asked him to provide them lecture notes and previous exam questions etc. They also sent him some money to buy books and lecture notes of the previous classes of the same instructor and sent to them. They also sent him money to buy videocassettes and give them to the technicians in the IU class to record the lectures and put them into the server so that they could view the lectures later if needed or when there was a communication line problem during the videoconference. That student immediately found me and appreciated what I was trying to do for his friends back in Urfa. He and students at IU asked me whether I was a Kurd or Turkish citizen of Kurdish backround. They were shocked to learn that I was neither of them and only a Turk with no Kurdish or any other ethnic backround. They told me that unless someone was either a Kurd or Turkish citizen of Kurdish backround, no one would spent so much time and effort to initate this project. They also learned that the entire project was financed by IU.

The videoconference lines were open from 7 a.m till 11 p.m. everyday between the two universities. I used every opportunity to introduce the students to each other so that they would communicate with each other. They were third and fourth year university students with different ethnic backrounds. At the begining there was some hesitation on both sites and had difficulties saying hello to each other. Especially the female students from HU could only say hello to other female students at IU and could never talk to male students at IU. The same thing was also true for the female students of IU. They could not say hello to another male student from HU. During lunch breaks and other breaks I encouraged the instructors at IU to talk to the students at HU and asked them to chat with them using their first names. That appeared to be very difficult. I even encouraged the male students at both sides to say hello to each other and asked them to give each other their email addresses with little success. Students at both universities were experiencing the existence of some sort of virtual wall between them and it was very difficult to cross or jump over. They just could not get that conversation started. This went on for almost three months. I tried to make fun some times in the class during the breaks that unless they make friends they would not pass the exams. I was the only one who was acting like a facilitator to introduce them to each other. Both sides were appreciating what I was trying to do but they themselves did not try hard to reach out and touch some one from the other site.

One of the faculty members in the Physics Department at IU was Turkish who was born in the southeastern part of the country and she felt empathy to those students of HU. She came and thanked me for what I was trying to do. She was the only one who could dare to go to Urfa and lectured from HU classroom back to IU classroom and then the IU students were listening to her from HU classroom for three days during her stay in Urfa.

From time to time I repeated my statement that unless students at both sides make friends with the other site they could not pass the exam! I said it was the requirement of the course to reach out the other site and say hello to each other. Unfortunately, they just could not do it.

During the first semester break we decided to bring the HU students to Istanbul and introduce them to the IU students and arranged a sightseeing tour in Istanbul. HU provided the financial support for the trip and about eighty students from HU came to IU and met IU students in person. I asked them to shake each others' hands and learn each others' first names. I asked the IU students to join them during their sightseeing tour of Istanbul. It melted the ice a little bit but could not break the virtual wall existed among them. Even though they were next to each other the virtual wall was always there seperating them from each other.

The students took the midterm and final exams at the same time and HU students performed equally well on the exams. But the IU students complained that the exams were not as tough as it used to be in order to make a favor for the HU students. They said the questions were not as difficult as it used to be because of the HU students taking the same exam.

The HU students told me that there was a transfer student from HU to IU in the Physics Department. They kept asking me to find him and ask him to come to the class and talk to them using the videoconference system. Finally I found him and asked him why he had not been attending the classes. He said he had transfered to IU Physics Department because he was the top student at HU. His grades were high enough to be accepted as transfer student to IU. Practically speaking he was supposed to be doing well at IU. However it did not happen that way. He said when he came to Istanbul he had culture shock and felt isolated at IU. He said he could not make friends with the IU students and the atmosphere of IU was very different. He could not feel good enough to attend the classes, sit with other IU students. Therefore, he was doing poorly in the exams and was about the drop out of the university. He simply said he felt he was not welcomed to IU by the IU students.

The IU faculty also gave their email addresses to the HU students so that they could ask questions any time they want. IU faculty was also available during lunch breaks and evenings for any question HU students might ask and could use the videoconference system to discuss any problem.

We had one particular problem with the economics class given by IU Economics Faculty member. This is one good example of what kind of intercultural interaction and communication problem we had in the project. She was a professor and giving her lectures only to HU students between 4-6 p.m. during the Fall semester. That was the only time slot available to deliver that class. However in November our holy month Ramadan started and almost all of the HU students started to fast. The students asked me to talk to the professor to make some changes of the class schedule because breaking fast time was around 5.15-5.30 p.m. So they wanted one hour break between 5-6 p.m. to break their fast and continue the class from 6-7 p.m. IU was known as the most secular university and the rector of IU was famous with his secular views in the country so the economics professor was too. When I talked to the professor about making some changes in the class schedule according to the students' wishes she refused to make any change in the class schedule. She said she was a secular faculty member and she would not give in to the demands of religous students. She accepted fasting was a religous act and those students who were fasting were considered to be religous students. Then the students warned me few more times and they said if their demands were not met everybody should face the consequences. I went back to her again and talked about what the students had said for the last time. She once again refused to make any change in the class schedule. I talked to the students and told them that she had refused to make any change. Then the students told me they knew what they were going to do next and when I asked them what they would do they told me to wait and see. The next day she gave her first hour lecture from 4-4.50 p.m. and we had 10 minutes break. She went to the room which faculty members used it for drinking tea or coffee and to get

some rest. When she and I got back to the classroom we saw all the students had gone to the cafeteria to break their fast and there was no student left at the HU classroom. She and I learned the reality of the southeast a hard way and at the end she had to accept their demands and made the necessary changes. After that walkout she started to deliver her lectures between 4-5 and 6-7 p.m. The following years they paid attention to what had happened in the past and made the class schedules accordingly so that a similar unpleasent event would happen again.

The students were given the exam simultaneously at the same time and we could observe them what they were doing at the HU calssroom while taking the exam. We would send the questions by email and could see the teaching assistant at HU print the questions and distribute them to the students in the class. We could remote control the cameras so we could watch all the students in the class. We were shocked during the economics class final exam. We used to have the classess with around 20 to 25 students and suddenly we saw around 130 students taking the exam at HU and all trying to see each others' paper during the exam, some kind of cheating. This was unacceptable to us and I immediately called the dean of Economics School of HU and told him what was going on in the exam. He said the other students were from the previous years who could not sign up for the course since there was no faculty to teach that course. Now they are sophomore and have to take the exam and pass since it was a required course. We had not been told about it before. As a result of this exam we could learn one more truth about how students at HU pass the exams and quality of teaching in a university located in the southeast of Turkey.

DISCUSSION

The students of IU knew that the other students were from HU which is located in a region where we lost 30,000 inocent peoples' lives due to PKK (Kurdish Workers Party) terrorist and seperatist movements in the region. They (students both at IU and HU) all were raised by their families that the others are the others and they are different and could not be trusted and/or to be friend. The virtual walls for them were already erected by their parents while they were growing up. Virtual lines had already been drawn between these two groups of students long before they got into the universities. Even if they sit next to each other there are virtual lines between them and very difficult to cross over.

In an academic meeting I met the Dean of Science Faculty of Istanbul Culture University (ICU), a private (foundation) university and talked about my project and the problems I had with the HU students and intercultural communication problems between the IU and HU students. Since he was working in a private university and they also had to admit students from the eastern and southeastern part of the country as long as they score high enough to be admitted to ICU and pay the tuition and fees. He said during the first days of each academic year they observe the students in the class and identify those students who come from these regions and show signs of adaptation problems to ICU and Istanbul, a city of 15 million people. He said they opened a special course for them under different names and ask these students to sign up for this course (Figures 1 and 2; Life Culture or Art of Living elective course)). The course was designed to make their adaptation to ICU and Istanbul easy and as fast as possible. For example, they identify the students who do not wear blue jeans because of the cultural problems especially those who are from the southeastern part of the country. So they take them to a big store and do some shoping for them and ask them to try some blue jeans on and wear them. They are mainly male students but very few female ones also come to ICU from this region. After they get used to wearing blue jeans pans and shirts etc they make reservations and take them to the cinemas, teathers, concerts, very good restaurants etc. He said all the expenses are paid by the university. He said they also teach them, for example, how to order and eat fish in an expensive fish restaurant along Bosphorous and also how to order a meal. They also take them to big hotels for dinners or just to drink coffee. He said they want them to be able to enter a very expensive and luxurious hotel and restaurant and not get scared. They later take them to the discent night clups which students usually go and to special dance courses. They teach them how to dance western dances especially valse, polka, cha cha etc. He said they also teach them how to introduce themselves to others or how to start a conversation. He said they call the course "Survivor Course". He said this course was very popular and helps them adapt to Istanbul life and also develop communication skills to interact with other students at ICU. They also offer special course to them to teach how to speak Turkish without southeasterner accent etc. Otherwise they would not be able to make it or survive in Istanbul and ICU. And he said the most important thing is that they will represent ICU when they graduate. The administrators of ICU know that if they cannot communicate well and represent

ICU well it will tarnish the image of ICU in the future. He said it usually takes them one semester to get these students into shape but sometimes two semesters to get these students to feel confident and comfartable and join the student life at ICU. He said they found asking these students to wear blue jeans which is a symbol of being a university student in Istanbul at the begining of the course was the the most important part of the course. The students later were interviewed about the course for their feedback. He said the feedback they got from these students were very positive and they all appreciated what they went through and really liked it very much. He said this is how they solve their intercultural communication problems which exist among the students from different ethnic backrounds studying in the same university. A similar course, under the name of 'Istanbul' elective course, is also open for students in Bahcesehir University, Istanbul, Turkey (Figure 3)

There is no need to pretend that there is no problem among the different people with different ethnic backrounds in the country. Students are raised in the families which are prejudice against the others. People with different ethnic backrounds in the central, western, southern and northern part of the country have some kind of prejudice against the people with Kurdish ethnic backrounds who usually live in the southeastern part of the country. Because we have lost almost 30,000 inocent people lives in fifteen years (1984-1999) due to the terrorist activities carried out by the terrorist organization of PKK. This caused a decline in quality of education in the souteastern part of the country since no faculty member wanted to go and work there. As a result of this there was a severe shortage of qualified faculty members in the universities located in this underserved area of the country. When I first went and talked to the students about my project they welcomed it first. After one year they started to complain about the project because they said they had to study harder more than ever. They used to study less and pass the exams easily. They also complained that they could not make good friends with the IU students because of the prejudice they have against them. They said they could feel the sensetivities of the IU students when they were talking to them. Students at HU spoke Turkish with Kurdish accent very distinctive to that region. Most of the students belong to big tribes in that region. So the degree of influence one student at HU has over the other classmates depends on which tribe he/she belongs to. If one student belonging to a big and powerful tribe decides to boycott the class no other student can resist his decision and no one can go to the class. We have experienced some kind of boycotting of the class initiated by one of these students due to unmet demands he had made to the rector of HU. Although it had nothing to do with the classes delivered by the IU faculty but he used his power to solve other problem they were having at HU through threatining to boycott the classes delivered by the IU faculty.

This was not like this twenty years ago and we all were very friendly to each other regardless of how we speak Turkish or where we were born. This kind of problem has started after PKK terrorist activities which created some kind of animosity among the peoples living in the country. Nowadays if you speak Turkish with southeasterner accent also called "Kurdish accent" in the big cities of the western part of the country you know and feel that you are not welcome into that society. It is even a problem for employment. For example, a teacher who is a Turkish citizen with Kurdish ethnic backround and speaks Turkish with Kurdish accent will have problem working in the west. The families immediately will show reaction to the school administrators and unfortunately ask them to change the teacher because they do not want their children to be taught by Turkish teachers of Kurdish origin. As a result, there is a virtual wall between the southeast and the west of the same country just like Berlin Wall used to divide East and West Germany twenty years ago. Those who are born and raised and educated in the southeastern part of the country are expected to live in that region, stay there, work there and not come to for example Istanbul, Antalya or Izmir to teach the children of the Turks of no Kurdish ethnic backrounds unfortunately. This is also true for faculty members. Those university professors who were born and educated in the southeastern part of the country and became professor in one of those universities located in that region know that they cannot get a teaching job easily in one of the universities located in the big cities in the western part of the country. It is not impossible but it is almost not possible for them to cross this virtual wall and come to the west and get a teaching job for example. We all know it very well and live with these virtual walls. Unfortunately, no Turkish university student with non Kurdish ethnic backround in the west would attend a class to listen to a lecture given by a professor who speaks Turkish with Kurdish accent.

When I talked to some female students at HU and asked them why they were studying at HU. They said their parents would not allow them to study in the West or in any other city. They must come home at

night and it was their only chance to have a university education in Urfa. So not only students but also their parents had their own virtual walls which their children also could not cross.

In another study carried out in the same city, Urfa, capital of GAP region, the factors perceived to impact cross-cultural communication, as well as what they thought were the causes of intercultural communication problems and difficulties, were also assessed. The participants who attended an intercultural communication workshop accepted education and language reportedly had the greatest influence on cross-cultural communication. The majority of the participants also identified prejudice and educational differences as the major causes of the difficulties and problems people have during cross-cultural communication (Cushner et al. (2003).

A columnist, Can Dundar of Milliyet daily newspaper, wrote about one of the most interesting exhibitions he has ever attended in his life in one of the European cities. He described the exhibition called "Virtual Walls". When he went to that exhibition he expected to see many art pieces hanging on the wall of the exhibition hall. Instead, to his suprise, when he got there he saw a big and completely empty exhibition hall and all the walls, ceiling and the floor of the exhibition hall were painted just white. That was the exhibition and he said at the begining he thought he had come to the wrong place. He asked the information desk to confirm whether it was the right place the answer was yes this was the exhibition. Then, he was given a headset and asked to walk through the exhibition hall with this headset. He was given information about how he should walk in the exhibition hall. He was instructed to stop when he hears a ring through the headset. Then he was expected to make a move to one direction or another. If he makes a wrong move he would hear the ring again. He should try making moves to different directions until the ringing stops. Then he should continue to walk. Again when he gets to a point where he is not expected to pass he will hear a ring again and is expected to stop. He should try to make a correct move till ringing in the headset stops again. Then he could continue to walk again. This is how the exhibition was about and it was to remind us that all of us have virtual walls in our lives which we cannot cross.

Halualani et al., (2004) set out to comprehensively investigate intercultural relations at a multicultural university located in the Western region of the USA. They studied what were the frequencies and patterns of intercultural interaction among the major racial/ethnic groups. How much intercultural contact were racially/ethnically different groups actually having with one another at the multicultural university? Which racial/ethnic groups were interacting with one another the most and the least? What was the nature of these interactions in terms of the type of relationship between the interactants, the location and duration of these interactions, and the interactional topics of discussions? They found that in some instances, racial/ethnic group members have isolated themselves away from such diversity, created tight-knit ethnic enclaves, and withdrawn from intercultural contact. Others had de-emphasized their racial/ethnic identities in response to the contradictory US societal messages that promote diversity while also pushing for the necessary assimilation of all cultural groups.

Bochaca (2006) studied the ethnic minorities and the Spanish and Catalan educational systems. Since the 1990s, cultural diversity in Spanish classrooms has increased notably with the arrival of immigrant origin students. This fact, together with the European Union discourses about consideration for cultural differences, have contributed to the appearance in Spain, and particularly in Catalonia, of an intercultural discourse.

Goto & Chan (2005) studied intergroup contact across two cultures This study examined the antecedents and consequences of intergroup contact between African Americans and White Americans. And they found perceived history of conflict influenced intergroup attitude directly.

CONCLUSION

Regardless of the sub-regional variations, the structural attributes of the southeastern Anatolia region are shaped by a variety of ethnic, religious, gender, and socio-economic dissimilarities. These variations not only shape people's thinking, behavior, and perception of others, but affect the communication between various institutions, social groups, and individuals as well (Cushner et al. (2003).

The findings in the studies carried out in the USA also illustrate a powerful contradiction: racially/ethnically different university students have limited interaction with each other in a context—the multicultural university—that hails and promotes "diversity". They have also confirmed this finding in the second research that students had limited contact (and in some instances, none at all) with those outside of their racial/ethnic group. This indicates that these individuals are not engaging in actual contact because of already entrenched racial/ethnic fragmentation and insular enclave formation throughout the US and even in culturally heterogeneous "Majority of None" areas such as in California (Halualani et al., 2004) .

Other authors also talked about the ongoing racial hostilities and divisions among students take shape on university campuses quoted in (Halualani et al., 2004), undergraduate campuses are "balkanized" with racially separated student organizations, intramural sports teams, and residence halls. They argue that although "surveys of undergraduate students indicate that a majority express a wish for more involvement with people of different backgrounds, the picture of campus life that emerges today is one of limited and often tense interaction between ethnically different students" . In conclusion, cultural diversity is not a new phenomenon inside the walls of the school and many people have preconceived ideas and stereotypes about cultures and co-cultures and the situation in our country is not different even from the most developed country and other European countries.

ABSTRACT
The purpose of this study was to investigate pre-service early childhood teachers' attitudes towards using Computer Based Education (CBE) while implementing science activities. More specifically, the present study examined the effect of different variables such as gender, year in program, experience in preschool, owing a computer, and the frequency of computer usage on pre-service early childhood teachers' attitudes towards using CBE while implementing science activities. The study was conducted by survey method and the data were collected by using two instruments which were "Demographical Questionnaire" being developed by researchers and "The Scale of Attitude toward Computer Based Education" being developed by Arslan (2006) and adapted by the researchers for early childhood education domain specifically. The sample of this study was 215 freshmen and senior early childhood teacher candidates attending state universities in Ankara. The data were analyzed by conducting t-tests and ANOVA in order to determine the effect of independent variables on CBE attitudes.
Keywords: computer based education, early childhood education, pre-service teacher, science activities, and attitude.

INTRODUCTION

Nowadays, previous knowledge and skills are seen as obsolete and educational theories are required to be updated since teaching and learning perspective has changed (Molnar, 1997). In this change, technology has become a great power by providing rich environments for learning/teaching in education and it can be profited for instructional environment as much as other areas (Haugland, 2000; Marina, 2001). Although it was thought that computers were expensive and luxury machines in previous years, anymore computers have become part of daily life in recent times and as NAEYC indicated computers are integrated into early childhood practice physically, functionally, and philosophically" (1996, p.2). Additionally, research points to the significant contribution of computer use in the classroom as a learning tool in terms of enhancing cognitive, social, emotional, linguistic, and literacy skills in preschool children with considering their ages (Clements 1995; Haugland 1992; Shade 1994;Vernadakis, Avgerinos, Tsitskari, & Zachopoulou , 2005). Indeed, Kulik (1994) found that students from kindergarten to higher education and using computer based instruction got higher scores on achievement tests, learned in less time, and were more likely to develop positive attitudes in his meta-analysis study. When the effects of computers and computer applications are examined in science education, Gordin and Pea (1995) emphasize that it can be benefited from computer-based applications as powerful tools because they include visualization, modeling, and simulation for teaching scientific concepts and provide students opportunity to master concepts usually considered too complicated for their grade level. As technology becomes easy to use and

early childhood software grows rapidly, early childhood teachers have a responsibility to critically investigate the impact of new technologies on children and arrange to use technology to benefit children in learning environments (Haugland, 2000; Hartle, 2006; NAEYC, 1996, Yelland 2006). Even though teachers have some responsibilities, it is related with their attitudes in order to implement computers and computer based applications in educational system effectively (Yakin & Sumuer, 2007; Zhao, Tan & Mishra, 2001). Similarly, teacher candidates' attitudes play important role to achieve the integration of computers in educational environments (Yakin & Sumuer, 2007). Hence, it is essential to investigate pre-service teachers' attitudes towards using CBE for science activities in early childhood education.

Attitude towards Computer

According to Fishbein and Ajzen (1975, p. 6), attitude is ''a learned predisposition to respond in a consistently favorable or unfavorable manner with respect to a given object". In this theory, individuals' attitudes constitute their behavioral intensions. In addition, computer attitude has been described as a person's general evaluation or feeling of sympathy or antipathy toward computer technologies and specific computer linked activities (Smith, Caputi & Rawstorne, 2000). In the light of Fishbein and Ajzen's theory and computer attitude definition, it can be drawn conclusion that the profile of teacher's attitudes towards computer determines the degree of her/his intentions to use computer in teaching. This conclusion is supported with Levine and Donitsa-Schmidt's (1998) study emphasizing that an individual's behavioral intentions are determined by his/her attitudes towards computer.

The existing literature indicates that there are several factors influencing attitudes toward computer such as gender, age, computer experience, owing a computer and the frequency of computer usage. First, when the impacts of gender on attitudes are analyzed, it is seen that research present conflicting results. For example; some studies affirmed males had more positive attitudes than female (Bebetsos and Antoniou, 2009; Brosnan & Lee, 1998; Comber, Colley, Hargreaves, & Dorn, 1997; Torkzadeh & Van Dyke, 2002; Williams, Ogletree, Woodburn, & Raffeld, 1993). On the contrary, some other studies found that females had more positive attitudes than males (Ray, Sormunen & Haris, 1999; Rugayah, Hashim & Mustapha, 2004). It was stated in some studies that gender had no significant effect on attitudes (Kutluca & Ekici, 2010; Ropp, 1999; Roussos, 2007; Teo, 2008). Second, some studies investigated the effect of age on attitudes and found that younger people had more positive attitude than older people (Deniz, 2005; Erkan, 2004 Selwyn, 1999). The others confirmed that age didn't have a significant effect on attitudes (Gerçek, Köseoğlu, Yılmaz & Soran, 2006; Teo, 2008). Third, when the influence of computer experience on attitudes examined some studies demonstrated that computer experience had a significant effect on attitude (Asan, 2002; Kutluca, 2011). However, Yakin and Sumuer (2007) uttered that computer experience had no significant effect on attitudes. Forth, the studies analyzing the impact of owing computer on attitude were explored that this factor had a significant effect (Çelik & Bindak, 2005; Khine, 2001; Pamuk & Peker, 2009; Taghavi, 2006; Akbulut, 2008). On the other hand, in some studies there was no meaningful difference between computer ownership and attitudes toward computer (Aral, Ayhan, Ünlü, Erdogan & Ünal, 2007; Erkan, 2004). Lastly, the studies about the effect of the frequency of computer usage on attitudes showed that there was a statistically significant effect (Birgin, Kutluca, Çatlıoğlu, 2008; Mitra, 1998; Tsitouridou & Vryzas, 2003). On the other hand, Gercek et al. (2006) found no meaningful difference between frequency of computer usage and attitudes toward computer.

The Purpose of the Study

The purpose of this study is to determine pre-service early childhood (ECE) teachers' attitudes towards using Computer Based Education (CBE) while implementing science activities and to investigate effects of some independent variables such as gender, year in program, experience in preschool, owing a computer, and the frequency of computer usage on their attitudes.

Research Problem

In this research there are three questions as following:

1) What is the status of pre-service ECE teachers' attitudes towards using CBE while implementing science activities?
2) Is there a significant difference between attitudes towards the CBE while implementing science activities and gender, program in year, having practice, having a computer, frequency of computer usage of pre-service early childhood teachers?
3) Is there a significant difference between attitudes towards the CBE while implementing science activities and independent variables of pre-service ECE teachers in terms of university type?

METHOD

Research Design

This study was designed as a survey research. It was conducted to examine attitudes and demographic information of students in early childhood teacher education program attended freshmen and senior grade in spring of 2011 semester.

Context

The context of the study was set in two state universities in Ankara, Turkey. One of these universities' languages of education is English and in this university (University1), students take general computer course as "Introduction to Information Technologies and Applications" in their first year, "Computer Applications in Education" in second year, and "Instructional Technology and Material Development" in the third year. Moreover, students take "Basic Science" course and "Teaching Science in Early Childhood" in the second year. On the other hand, other university's language of education is Turkish and in this university (University2), students take general computer course as "Computer I" and "Computer II" in first year and "Instructional Technology and Material Design" in second year. Moreover, the students take "Science Education" course in third year.

Participants

Participants of this study were comprised of 58 pre-service ECE teachers from one university and 157 pre-service ECE teachers from other university, which were totally 215 with a mean age of 21 years (range 17-32). Most of the participants (40.5%) graduated from Anatolian Teacher Training High School, 22.3% graduated from Anatolian High School, 18.6% graduated from Vocational High School, 9.3% graduated from General High School, 4.2% graduated from Foreign Language Intensive High School, 0.9% graduated from Science High School and 3.7% graduated from other high schools. Moreover, according to results, 3.3% of participants indicated that they started to use computer in early childhood term, 63.8% of them started to use computer in elementary term, 26.5% of them started to use computer in high school, and 7.4% of them started to use computer in university term.

Data Instruments and Data Collection

In this study, data were collected by using two instruments namely "Demographical Questionnaire" and "The Scale of Attitude toward Computer Based Education". Demographical questionnaire was developed by researchers and reviewed by an expert. This questionnaire included thirteen items to obtain information about gender, age, grade, high school type, term of using computer, frequency of computer usage, purposes of computer usage, having computer, self evaluation about computer usage, having experience in an early childhood institutes, attending science course, and attending computer course. On the other hand, the scale of attitude toward CBE was developed by Arslan (2006) including 10 positive items and 10 negative items with 5-point likert scale. Kaiser-Meyer-Olkin (KMO) value of this scale was 0.88 and Barlett test significance value was 0.000. Cronbach- alpha value was 0.93 which means as good. It was adapted by the researchers for early childhood education domain specifically with keeping original form and checked by the experts. Therefore, the validity and reliability of this scale were satisfied.

Data Analysis

In order to determine the status of pre-service ECE teachers' attitudes toward the CBE while implementing science activities, the data were analyzed through frequency, mean, percentage, and standard deviation values as descriptive statistics. Moreover, independent sample t-tests were conducted to examine impacts of independent variables (gender, program in year, having practice, having a computer) on attitudes, and since there are more than two levels of frequency of computer usage, it was used one way ANOVA for group comparison, besides a Post-Hoc Tukey HSD test was employed to find which group causes the difference in the group comparison. Furthermore, in order to indicate whether university type makes a significant effect while explaining influences of independent variables on attitudes, independent sample t-tests were used.

RESULTS

Demographics of the Participants

Of the 58 participants, 53.4% were freshmen and 46.6% were senior, 94.8% were female and 5.2% were male, nearly all of them (98.3%) had their own computer, 60.3% had practice in an early childhood

institution while 39.7% have not, 46.6% attended science course while 53.4% did not, and 82.8% attended computer course whereas 17.2% did not attend in University1. On the other hand, of the 157 participants, 51.6% were freshmen and 48.4% were senior, 94.3% were female and 5.7% were male, most of them (76.4%) had their own computer, 54.8% had practice in an early childhood institution while 45.2% have not, 49.2% attended science course while 51.3% did not, and 97.5% attended computer course whereas 2.5% did not in University2.

Table 1. *Participants' Attitude Scores towards CBE in Science Activities*

	N	Minimum	Maximum	Mean	Std. Deviation
Total_attitude	215	37,00	87,00	69,9767	8.00668

According to Table 1, mean of pre-service ECE teachers' attitudes towards using CBE while implementing science activities is 69.97 (minimum 37, maximum 87).

Effects of Gender on Pre-service ECE Teachers' Attitude towards CBE in Science Activities

According to t-test results, it is found that there is no significant difference in attitude scores towards CBE in science activities between female pre-service ECE teachers (*M*=70.11, *SD*=8.04) and male pre-service ECE teachers (*M*=67.58, *SD*=7.24); *t* (213)= 1.06, *p*=.28 (two tailed).

Table 2. *T-test Result on Gender and Attitude towards CBE in Science Activities*

		F	Sig.	T	df	Sig. (2-tailed)
Total_attitude	Equal variances assumed	,153	,696	1,066	213	,288
	Equal variances not assumed			1,171	12,659	,263

Effects of Year in Program on Pre-service ECE Teachers' Attitude towards CBE in Science Activities

An independent sample t-test was conducted to compare the attitude scores towards CBE in science activities for freshmen and senior pre-service ECE teachers. Results shows that there is no significant difference between the scores for freshmen pre-service ECE teachers (*M*=69.56, *SD*=7.15) and senior pre-service ECE teachers (*M*=70.42, *SD*=8.85); *t* (213) = -0.79, *p*=.43 (two tailed). On the other hand, when it is examined in terms of university type, there is a significant difference between attitude scores towards CBE in science activities for freshmen pre-service ECE teachers (*M*=69.77, *SD*=6.79) and senior pre-service ECE teachers (*M*=74.33, *SD*=5.49); *t*(56)=-2.78, *p*=.007(two tailed), in University1. The magnitude of differences of in the means was approximately large effect (eta squared=.12). On the contrary, there is no significant difference between the scores for freshmen pre-service ECE teachers (*M*=69.48 *SD*=7.32) and senior pre-service ECE teachers (*M*=69.03, *SD*=9.42); *t* (155) = .32, *p*=.74 (two tailed) in University2. Specifically, senior pre-service ECE teachers have higher attitude scores towards CBE in science activities than freshmen pre-service ECE teachers in University1.

*α=.05

Effects of Having Experience in Preschool on Pre-service ECE Teachers' Attitude towards CBE in Science Activities

According to t-test results, there is no significant difference in attitude scores towards CBE in science activities between pre-service ECE teachers who had practice in an early childhood institute (*M*=70.68, *SD*=8.56) and for those who did not (*M*=69.06, *SD*=7.17); *t* (213) = -1.47, *p*=.14 (two tailed). On the

other hand, when it is examined in terms of university type, there is a significant difference in attitude scores towards CBE in science activities for pre-service ECE teachers who had practice in an early childhood institute (*M*=70, *SD*=5.62) and for those who did not (*M*=68.69, *SD*=6.75); *t* (56) = -3.24, *p*=.002 (two tailed) in University1. The magnitude of differences of in the means was large effect (eta squared=.15). On the contrary, there is no significant difference in attitude scores towards CBE in science activities for pre-service ECE teachers who had practice in an early childhood institute (*M*=69.33, *SD*=9.19) and for those who did not (*M*=69.18, *SD*=7.34); *t* (155) = -.11, *p*=.90 (two tailed) in University2. Specifically, pre-service ECE teachers who had practice in an early childhood institute have higher attitude scores towards CBE in science activities than pre-service ECE teachers who did not have practice in an early childhood institute in University1.

Effects of Owing computer on Pre-service ECE Teachers' Attitude towards CBE in Science Activities

According to t-test results, it is found that there is no significant difference in attitude scores towards CBE in science activities between pre-service ECE teachers who have computer (*M*=70.27, *SD*=7.84) and those who have not computer (*M*=68.58, *SD*=8.75); *t*(211)= -1.15, *p*=.24 (two tailed).

Table 7. *T-test Result on Having Computer and Attitude towards CBE in Science Activities*

		F	Sig.	t	df	Sig. (2-tailed)
Total_attitude	Equal variances assumed	1,112	,293	-1,157	211	,248
	Equal variances not assumed			-1,076	47,105	,288

Effects of Frequency of Computer Usage on Pre-service ECE Teachers' Attitude towards CBE in Science Activities

According to descriptive statistics, of the 215 participants, 35.8% spend less than 1 hour, 49.3% spend 1-4 hours, 12.1% spend 4-7 hours, 1.9% spend 7-10 hours, and .9% spend more than 10 hours for using computer in a day. Specifically, it can be concluded that pre-service ECE teachers mostly spend 1-4 hours in a day with using computer. Moreover, when it was examined the relationship between duration of computer use that pre-service ECE teachers spend in a day and their attitudes toward CBE in science activities, it was conducted one way ANOVA and results show that there is no significant difference between the computer usage time and attitude towards CBE in science activities, *F*(4,210)=1.5, *p*=.19.

DISCUSSION AND CONCLUSION

Overall the participants demonstrated positive attitudes towards computer based education while implementing science activities as shown by mean score 69.97 (minimum 37, maximum 87). This could be related with facilities and opportunities that are provided to the pre-service teachers at various stages of their education including before attending in teacher training program and experiences through university education. Additionally, it was resulted that gender, owing computer, frequency of computer usage did not have any effect on pre-service ECE teachers' attitudes towards using CBE while implementing science activities both in general and in terms of university type. This finding does not support to the past research that found meaningful difference between computer attitude and gender (Ray, Sormunen and Haris, 1999; Sadık, 2006; Yıldırım, 2000). However, some other studies stated that attitudes were not related with sexes (DeBlassioa & Bell, 1981; Deniz, 2007; Akbulut, 2008; Bebetsos &

Antoniou, 2008) which supports the outcomes of this study. A possible reason of this finding can arise from common usage of computer in all areas from transactions to shopping that is attractive and useful for both female and male. Besides, the related literature about the effect of having computer on attitudes was examined and contradictory results were seen. For example, while some studies confirmed that there was a meaningful difference between computer ownership and attitudes toward computer (Khine, 2001; Taghavi, 2006; Akbulut, 2008), the others stated that there was no meaningful difference between computer ownership and attitudes toward computer (Deniz, 2005; Aral et al.,2006). Moreover, when the studies investigating the relationship between frequency of computer usage and attitudes were analyzed, some studies stated statistically significant effect (Kutluca, 2010; Tsitouridou & Vryzas, 2003). On the other hand, in the study of Gercek et al. (2006) a meaningful difference was not found between frequency of computer usage and attitudes toward computer. These can be derived from the accessibility and availability of computer resource in participants' environment. According to other result of this study, year in program and experience in preschool made a significant difference on attitudes towards using CBE while implementing science activities just only in terms of university type. Similarly, computer attitudes were affected from the variable of the year of study in most of the studies (Pamuk & Peker, 2009; Taghavi, 2006). These differences can arise from participants' self-evaluation about computer usage and freshmen students' not being taking courses about instructional technology, science and school experience in teacher education. In other words, it is found that there is a difference between participants' self evaluation about computer usage and their attitude score towards using CBE while implementing science activities not only in terms of university type but also grade level. Therefore, it should be given effective instructional technology courses in university education which support functional applications instead of general basic information. In addition, pre-service ECE teachers should be trained as how they can use computer and computer based applications in learning environment especially in science activities. Furthermore, universities could have clear vision which aims to graduate students as competence teachers for integrating technology in their classrooms. To achieve this aim, instructors could be given in-service training. Finally, there are some limitations of this study. For instance, the sample size is too small to generalize the results for Turkey and limited variables are analyzed in this study to determine their effect on attitude. To cover these limitations, a larger sample can be used and other variables can be added to examine their impacts on computer attitudes in future research. In order words, this study reflects the influence of selected variables on the computer attitudes of pre-service ECE teachers. Thus, future studies can investigate all perspectives of teacher education and their relationship between pre-service teachers' attitudes, acceptance, and usage of the computer as a tool for instructional purposes and professional development systematically.

KNOWLEDGE AND RESEARCH BEYOND WEB 2.0: THE CASE OF INVESTIGALOG

Dr. José Manuel Bautista Vallejo
University of Huelva (Spain)
bautista@uhu.es

ABSTRACT

This article discusses some of the ways of generation and management knowledge today and the possibilities of the web 3.0. Part of the analysis is completed with the exploration of the relationship between computer technologies and these new views of knowledge. The characteristics of the global information society, in a general framework for access to it to generate knowledge and manage it effectively, result mainly in access for all, empowerment and cooperation for all, under the scheme of collective intelligence. This paper shows a concrete example of web technology to understand and development this field: the Social Website to Know and Research called Investigalog (http:/www.investigalog.com). The aim of this Web 2.0 technology is create knowledge and share what you know with others.

INTRODUCTION

Programs such as the School Plan 2.0, in Spain and in other countries, and other plans and policies beyond our borders such as *Digital Inclusion, e-Inclusion, e-Learning,* or more innovative and avant-garde proposals such as the semantics web, the application of the Artificial Intelligence (AI) to the new web, the *cloud computing,* the OnToKnowledge, etc., in the frame of the *Global Information Society,* clearly mark the road on which the educative intuitions and society as a whole transition to in order to face the challenges of the future, at least they are proposals that link the next syntactic level of hyperspace to the semantic level of new ontology.

The characteristics of this global society of information, in a general frame of access to generate knowledge and administer it in an effective manner are fundamentally translated to: access for all, empowerment for all and cooperation, a new and more significant collective intelligence in the frame of a solvent *crowdsourcing* at a global level.

If we establish the opportune connection between new information technologies and administration of knowledge, it is necessary to point out that between information technologies and communication (TICs) which provide the basic infrastructure for the knowledge management are found, among others, the networks, the information systems, the intelligence search tools and intelligent agents, the data mining, the data-warehousing and the development tools on the internet.

At the same time, the knowledge management remits the collective activities and practices directed to the most efficient acquisition of the ability associated to this knowledge and the correct utilization, which allows one to associate the knowledge that the capacity to understand and interpret the nature of something, a real phenomenon, the laws that regulate behavior, and also, the application of certain abilities. This is resolved as a fundamental element in the correct response to people, whatever their reality may be since it is a mechanism which allows its generation, execution, acquisition, assimilation, transmission, use, etc. and puts it to the service of personal development.

Since the break out of information technologies and, specifically, of web engineering, knowledge management has done nothing more than transform its range and possibilities, noting, moreover, and here lies a paradox, that more information does not mean more productivity (López Gómez, 2009: 43).

The possibility of knowledge management today depends on at least two factors: on one hand, the idea that we have of knowledge, something related to information but distinct from it. On the other hand, the frame of comprehension of this reality is projected as a paradigm supported by the immense development of information and communication technologies, a new paradigm for the generation and administration of this

knowledge. Thinking further, this possibility has just begun the road of its new evolution and, realistically, we can affirm that we find ourselves now in the prehistory of its immense possibilities.

The latter suggests going over covered ground, but also of the colossal road we have ahead to understand that this new paradigm fulfills the demands for being considered as such paradigm or if, on the other hand, we should consider the new knowledge management through the TICs a simple theory, a passing fad, a weak proposal that will not go anywhere due to its lack of solid argument.

KNOWLEDGE MANAGEMENT AND HUMANIZED TECHNOLOGY

All of the aforementioned tools are used to develop systems which make the administration of knowledge possible, understanding this in a wide sense. Thus conceived, one must highlight the series of possibilities for these tools, which confer their power to human hands. The diversity of functions has been studied, among others, by Davis, Fensel and van Harmelen (2005), Ponjuan Dante (2007), Aguaded and Dominguez (2009).

These technologies have contributed to the rupture of the pyramid model of knowledge, which is considered obsolete in time which the participation and the creation elaborate contents by the actors of the formative process (and elaborative knowledge) is augmented and universalized by equality (Manfredi, 2009). However, this trajectory is not produced linearly, but rather is interrupted and with problems due to the digital breach on one hand, and on the other, because the system is installed on the syntactic level, a place where the user can not substitute the process of thinking, contrasting and verifying with these tools. The matter lies in whether the semantic web, with the help of AI, could resolve these problems.

Nevertheless, the direction produced from the interpretation of the new idea of knowledge undermines the idea that the objective related to the institutions of learning, for example, universities, not only knowledge, understood as a collection of stored data, but rather also the knowledge and the social influence. If people connect, relate with one another, and experience all this as a context and a process, then we find ourselves before a new idea of knowledge and before new demands for technologies that won't stop suggesting it.

In human hands, at our meeting point, the question is that since its origin, both the growth of information and the productivity were linear, a tendency that was consolidated since the web 2.0. Nevertheless, for Lopez Gomez (2009: 43) this line is found at the stage of descent, that is, <more information, less productivity>.

The explanation of this phenomenon is very simple: <our level of uncertainty has grown due to the increase of unorganized information and its weak structure> (Lopez Gomez (2009: 43). An example illustrates this matter even more. In order to accede any data through a search engine the usual problem forms of being a syntactic search and fundamentally guided by reserved words, the majority of the time, bringing undesired results requiring a major human intervention in the labor of interpretation of the results.

The humanized technology has run out possibilities up to a certain point – the web engineering is returning the capacity to pass form the syntactic to the semantic. It is not an easy step, they must follow a series of conditions and, above all, bet on the hypothesis that the computers can not only process the data, but also understand it, realizing automatic reasoning (Ding and others, 2005). We are on the cusp of the semantic web or web 3.0, which will transform the web from a "descriptive logic", from an information space (simple humanization of the web) to knowledge space (complex humanization).

HUMAN TECHNOLOGY AND THE FUTURE OF THE MIND

Just as Berners-Lee and others (2001) conceived it, a web of interlaced data is considered superior to current machines and digital interlaced resources by means of URLs. In an exercise of prospective, and greatly simplifying, the prediction of the kind of changes that the semantic web could contribute to is centered on at least two of these transformations (Codina, 2009: 10). 1) Changes related to Artificial Intelligence; 2) Changes related to information processing.

The first group, which we have identified with AI, it believes that in the future computers connected to the web through complex systems of metadata, ontology and formal logic could produce *reasoning* at the service of the user. The limits of this reasoning are unclear. Possibly, software agents representing users could do the work that today only humans can successfully accomplish.

The second group, which we identified with the information processing, is skeptical about the possibilities of AI if it recognizes and values the great benefits that the semantic web project could contribute to the new web.

The semantic web means to provide documents of information and semantic structure as an explicit way of achieving information systems, from this point on *agents,* can understand the texts (Berners-Lee and others, 2001). Perhaps this is the genius of the new web engineering: the web pages as well as documents could be data destined for the computer. Tim Berners-Lee, the creator of the concept of the semantic web, understands that this is an extension of the current (not one separate and new web), where the information is provided from a well defined meaning, the computers are better equipped and people work in collaboration.

None of these ideas are petty expressions, all project the dimensions of the new idea of technology, knowledge and human development: they provide the human language technologies, the development of AI o quasi-artificial with intelligent software agents and new meanings for the knowledge that the human being generates and administers, which produces the sense of connection and interaction with the machines, computers that *reason and comprehend* (Cunningham, Bontcheva and Li, 2005; Uren, 2006; Java and others, 2007).

In the sphere of contributions of these technologies and the relation to the knowledge and the multiple possibilities for its administration, the appearance of the Intelligent Software Agents (ISAs) supposes a further step into the virtual and virtuosity of the new technologies.

The term agent was used for the first time by Minsky (in his work, *The Society of Mind,* 1985). Here Minsky defined the possibilities of AI and the evolution of the mind, trying to explain the future of the mind associated with these phenomenons which sprouted in the 1980's and today are a reality in evolution, a reality upon which we must project new hypothesis, which in many cases, has exceeded the conjectures launched in the beginning.

Currently the word "agent" has many different meanings since it is used in very different fields. We have independent, biological, robotic, computational, artificial life, software, specific duty, entertainment, and virus agents.

Concretely, the ISAs are pieces of software that act in an independent manner in the networks in the name of the user. They are based on the behavior of the person, or at least, determined by him/her, which entails, according to the changing behavior and diverse necessities of the person, an instrument of great importance surfacing in order to interactively respond correctly and without objections.

The models of AI have been recreated to try to explain the behavior of these software agents, when the conclusion has been reached that the so-called quasi-artificial intelligence is the one that best allows the symbiosis between the machine and the human being.

Marvin Minsky (2006) himself, in his work *The Emotion Machine*, affirms that once we recognize that our brain contains a very complex and complicated machinery, we must then try to find more complex ways to explain our most familiar events, further from the simple explanation that can represent a reduction for the matter at hand. In the end the explanation of the phenomenon is as simple and as it is intelligible.

What he suggests is a new semantic to tackle the question, the one that has been contemplated until now is insufficient. This is reason for which Minksy explores, with very important contributions, in the terrain of development of the graphic, symbolic description, computational geometry, representation of knowledge, computation semantics, mechanic perception, and symbolic and connectionist learning. The development of the human sense in relation to machines or by machines or by going beyond these means, has its place in this new context, although it already began with authors like Jerome Bruner (1984, 2006), who proposed new cognitive foci for the description of human learning.

Thus, to explain the contexts of production of the senses, a genuine source of the production of meanings, Samaja (2008) resorts to the notion of "macro semiotic", which is understood as *large reservoirs of signs*. Upon conceiving the cognition as a process of semiosis, that is, a production, distribution and reproduction of meanings, Samaja also centers his argument on the problem of the subject, and in relation to it, that of the cognition as a faculty of attribution of meanings or interpreting the world through signs.

In both authors one can sense an unavoidable position regarding knowledge, or about the notion of the "mind", since both presume and "active" role of who knows and an attitude of obligation or action oriented to "interpret" a situation. Therefore, the self awareness cannot explain the notion of "reality". In this sense, it must be noted that Samaja as well as Minsky accentuate the conception of *thought and reality* as two

dimensions of one process, which we could call the process of "the birth of the world" beginning with the intersubjectivity which defines the subject in the situation.

The idea of man in Samaja is an analog of the unfinished, unconcluded, incomplete man whose existence is resolved to "grow all the time". Tools like software agents or, in general, human technology tools for knowledge, can be seen as tools for the mind (Wertsch, 1993), because they support a determinate manner of action for the thought process, in the present of certain unpredictability where the future of the mind will set the stage and the conditions of the machine-human being relationship. Moreover, the theory suggests that our contact with the tools has created a certain type of mind, both in its structure and in its function; therefore it makes sense to ask the question with Minksy about the future of the mind in its new relationship with machines.

SOFTWARE AGENTS AND THE EVOLUTION OF THE MIND

The term "agent" describes an abstraction of software, and idea or concept, similar to the methods, functions and objects in the programming oriented to objects. The concept an agent provides a convenient and powerful way of describing a complex entity of software, which is able to act with a certain grade of autonomy, to carry out tasks in representation of people. But differentiating from the objects (which are defined by methods and attributes), an agent is defined by its own behavior. If the model we apply is the human, we talk about the unpredictable character of this behavior, the idea that c*ontinual growth* takes on a singular force.

In a generic sense, the properties of the agents can be summed up in the following ways: reactive, autonomous, oriented by objectives, temporally continuous, communicative, learning, mobile, flexible, character. Its typology usually varies from one author to the next, a typology based fundamentally on three characteristics: cooperative, autonomous and learning: collaborative agents, interface agents, collaborative learning agents, smart agents.

One of the virtues of the software agents is that its applications are numerous. We must highlight among others: the use of agents in internet and interfaces of users, the use of systems information, games and animations, electronic commerce, education, etc.

Specifically, in the sphere of the web, considering the network of networks will continually grow and without great obstacles until it shapes an essential tool in the vital development of the human being, we can point out the following types of agents: autonomous, intelligent agent, user agent…

The Intelligent Agents are the ones that use AI or the frame of comprehension that projects the quasi-artificial intelligence as learning and reason. These two ideas show their importance inasmuch as that of independent way to have the capacity to learn and to adapt (Dini, 2003). But, coming back to the idea of an intelligence that is not totally artificial, these agents always need the impulse of the external mind which in its interaction orders a determinate action or a collection of tasks, interactive bilateral relationship that provides permanent learning to the agents of the binomial human-machine.

For this reason the current model of quasi-artificial intelligence is better materialized for the comprehension of the intelligent software agents. That is, the agents learn by trial and error, by introspection and analysis of the behaviors and events, also through example and generalization. That is to say, the software agent, through the election of certain algorithms or by strategy selection to resolve a problem responds to the capacity of success of the requirements of the external personal agent that initiates it or with the one who interacts.

The necessary process of transmission between distinct versions of the web (1.0, 2.0, 3.0), a transit that is produced from the centralized vision to the level of the user and from the syntactically expressed contents from a natural language, to decentralized states through the use of technology of human language en contents in the form of data with semantic value for the computer, is produced thanks to new algorithms of learning, supervised (classification and categorizing) and unsupervised (grouping), all depending on the best techniques of the AI and the use of these intelligent agents.

More concretely, the advances in automatic learning, multi-agent systems, reasoning based on cases, satisfaction of restrictions and person-machine communication, among others, mark the progress of the new web (Lopez Gomez, 2009) and, consequently, the evolution of the mind, thought processes and consciousness.

INVESTIGALOG ON THE WEB 2.0

As Samaja affirms (2008: 15), <the 20th Century has consecrated the idea the question of *doing* is more profound than the question of *being*. In particular, the Epistemology has set aside the question of "the being of Science", to ask itself "what does Science do?" and in that sense the Methodology has ended up coinciding with the Epistemology>.

Today the problem affects the way which science is done and the way it is taught. Crediting the same Samaja (2008) the possibility of teaching science, but warns that one must add an important requisite so it is viable: that the fundamental object of teaching, not the transmission of methodological precepts but rather the comprehension of the process of research: *that is, the comprehension of the origin of its product*; of the function of its procedures and of the *conditions of execution* which pass.

The importance is a given because it incorporates not only the possibility but also the need that science be more reflexive, that all participants be more reflexive (Gibbons *et al*, 1997). This is due to the fact that the subject on which we base our investigation cannot be answered only in scientific terms and techniques, the solution to the problems will inevitably affect the values and preferences of different individuals and groups who have been considered traditionally on the margin of the scientific and technological system.

Gibbons *et al* (1997) describes, for the critical comprehension of these suppositions, the difference between *mode 1 and mode 2 of knowledge production*. The evidence seems to indicate that the majority of the advances produced in science have been executed by five percent of the population of active scientists (Gibbons *et al*, 1997: 11). This is what we could situate in mode 1 of traditional production of knowledge, generating within a disciplinary context, fundamentally cognitive. In contrast with this mode of production we find mode 2, which comes created in wider social and economic trans-disciplinary contexts. Resuming:

Mode 1 pursues combining in a single phrase the cognitive and social norms that should follow in the production, authentication and diffusion of knowledge of this kind. Its cognitive and social norms determine what will be considered significant problems, who should be permitted to practice science and what constitutes good science. The forms of practice that adhere to these rules are, by definition, scientific, while those others that violate them are not.

Mode 2 of knowledge production is carried out in the context of application. In the same way the configuration of the final solution will be further ahead than any individual discipline that contributes to it, being thus, trans-disciplinary. Another characteristic is that in mode 2 the production of knowledge is heterogeneous in terms of abilities and experience that people bring to it. Organizationally mode 2 is heterarchical and transitory and more socially responsible and reflexive.

Being that, mode 2 critically depends on these emergent computational technologies and on new telecommunications, and favors those that can be permitted to use them. The interactions between those places of knowledge have set the stage for an explosion in the number of interconnections and possible configurations of knowledge and ability. The result could be described as a social system of distribution of production of knowledge.

This communication between what is science and society, through a true idea of what is epistemology and the possibility that society earns prominence in the creation of knowledge and that this is redistributed among the initial actors and others, are ideas that assist as foundations in the origin of Investigalog.

The basic idea is to create awareness of a platform in which knowledge can be freely expressed within reach of everyone. It gives the user the possibility of creating knowledge and sharing with others in an accessible open space (Nafria, 2007).

Given the aforementioned tools that exist in the knowledge management, Investigalog is a platform oriented to the creation and transfer of entitled knowledge for any person that needs to administer their knowledge through the creation and or acquisition, as well as fomenting the relationship between users and the same or of different fields, contemplating the trans-discipline as a fundamental element.

More concretely, Investigalog is characterized by generating determinate potentialities, among which stand out:

- It allows the user to express his/her knowledge without any type of restriction. The judgments about the quality of work are expressed by society as a whole, as it is to society that the generated knowledge is directed. Operatively, the concept of society can be expressed in

smaller groupings that we can call communities, contemplating these as groups of people flexibly related, open and of porous rules, whose fundamental responsibility is the contribution with its contributions to the growth of knowledge through these states of intercommunication.

- It allows that its knowledge is found within reach of everyone. It is an open system - the knowledge is organized in a simple manner so that it serves as a means of social of usefulness and functionality.
- It foments the relationship between users of different fields, thus easing the diversification of knowledge and its possible interconnection. In the vision of science as a complex field which should be studied in a complex manner so that it can be easily understood, it is necessary to use platforms, in a real or figurative sense, since the ones that we can use in relation to knowledge and content agents, in an integrated way, to provide that which has been described in the paradigm of learning and automatic processing which has inspired how biological information systems work.

This last characteristic, which can be derived from the functioning of an information network, leads to the understanding that the system is composed of units called neurons. Each neuron receives a series of entrances through interconnections and emits an exit. This exit has three functions: propagation, activation, and transference. Investigalog and the web 2.0 allows one to connect knowledge and content agents, in a way that in the interconnection throughout the phases of interchange and relationship one can produce networks that collaborate to produce a stimulus of exit, being this the acquisition of knowledge, the resolution of a problem, the learning of a skill, etc.

Thus, Investigalog is a tool at the service of any field of learning and knowledge. All areas are susceptible to be worked in this way to understand science, including narrative, essay, poetry, and journalism. In this way work is included from biology, health science, humanities and social sciences, chemistry, physics and math, engineering and management systems and legal and economic sciences.

In his analysis about the limits of knowledge, Ronald Barnett (2001) affirms that we still do not have a superior education for the society that learns. In the background of his reflection we find the following debate: if what concerns us is a society that produces, then the possibility exists of not being concerned about a society that learns. Thus, a society that learns <is not even on the horizon, including in the narrow meaning that has given "learning" of "the society that learns". Production still reigns> (Barnett, 2001: 245).

Despite proving that society is changing and that individuals will be forced to continually renew their cognitive state, that is to say, continue learning, we can prove with frequency that this appreciation is quite ambiguous. On one hand, with the necessary modesty but with precise determination Investigalog aspires to this new academic ethic, just as Duke (1992) understood, that one should generate learning, better characterized by meta-learning, seen as a critical disposition for analyzing self-learning.

This means that one should keep up a continuous active learning, in which one's own projects and practices are evaluated by one self and discarded when necessary. The verifications are open and also subject to evaluation. The learning, for that reason, is a learning of oneself, carried out in a rigorous manner. It is a never ending process.

The rest of this process of collective intelligence will be, through the semantic web, to achieve that the contents be explicitly equipped of semantics so that, from that point, the agents are able to deduce and infer knowledge.

ABSTRACT Students' performance is an indicator of the kind of approach (deep or surface) that is taken. This study investigated the different approaches used by undergraduate students at the Computing School using the Biggs (2001) Revised Two-Factor Study Process Questionnaire (R-SPQ-2F). Sixty-three students participated in the study. Results showed no significant difference between the types of approach by the demographic variables of gender, nationality, year of study, and degree major. However, the rank ordering of the mean value indicated that almost every one of the students participated in the study were somewhere in between deep and surface and clearly did not possess deep approach to learning. The lack of deep approach to learning among students was attributed to factors such as conditions of learning, professional capacity of teachers, and the lack of instructional rigor in the program or coursework.

KEY WORDS Higher education; computer technology students; learning approaches; Malaysia

INTRODUCTION

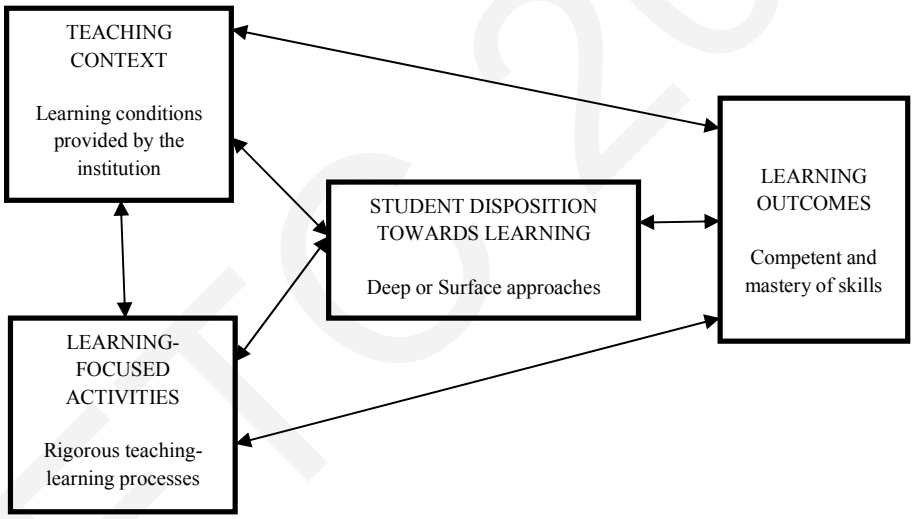
There has been growing concern about the quality of graduates produced by public and private Higher Education Institutions in Malaysia. They are criticized for producing graduates who lack qualities such as critical thinking, an aptitude for self-managed learning, reflective thinking, ability to solve novel problems at the workplace (Khoo, 2001; Koo, Pang, & Mansur, 2006). A tracer study by the Ministry of Human Resources Malaysia conducted in 2006 shows that 30.7% of graduates remained unemployed six months after their graduation while 5.6% were still awaiting job placement (Tan, 2007). Some of the reasons attributed to this situation are graduates' lack of generic skills, inability to communicate effectively via written and oral presentations, inability to participate in problem-solving activities, disinterest in scouting for new ideas, and narrow view of the issue at hand, and resorting to quick fixes. The concern about employability of local graduates and their attributes linked back to the quality of higher education (Woo, 2006). And this leads to the question of the curriculum, teaching methodology, course structure and content, learning environment, quality of teaching and teachers, and student context and disposition towards learning.

Among the numerous competencies expected by the employers, competency in Information and Communications Technology (ICT), business communication, critical thinking, and problem solving skills at the workplace top the list (National Higher Education Research Institute, 2007). While the expectation of the government and the private sector is increasing, the quality of student performance at the colleges is not encouraging. For example, student performance at the Computing School at one of the private university colleges under study has not been improving since 2008. What is the reason for this performance stagnation? Are the students really interested in studying, is there a conducive learning environment that can boost student motivation to learn, or are there any other problems related to the teaching-learning process that are hindering their learning capability? These are some of the questions that needed to be answered in order to help them improve in their intellectual capacity and work performance.

THEORETICAL FRAMEWORK

Student's approach to learning, either deep or surface, is considered a factor that influences the learning process and outcome of a student (Biggs, 1987, 1999; Biggs, Kember, & Leung, 2001). Biggs and colleagues (2001) in their '3P' (presage-process-product) model of teaching and learning explain how the students' approaches to learning can be seen as a total system where student factors, teaching context, learning-focused activities, and the learning outcomes mutually interact. The students' prior knowledge and ability, teachers' pedagogical content knowledge, nature of the curriculum, methods of assessment, the institutional climate and procedures interact to determine the on-going approach to learning which in turn determines the output. Figure 1 that is adapted from the '3P' model of teaching and learning shows that the teaching context, the learning-focused activities influence students' disposition and drive towards quality learning. They are mutually linked and together they produce the desired learning outcomes. The moment the teaching context is changed and the teaching strategies are aligned towards creating a deeper approach to learning the students' preferred approach can also change causing an impact on the outcomes.

Figure 1 Teaching context, learning activities, and student outcomes



Adapted from the '3P' model of teaching and learning by J. Biggs, D. Kember, & D.Y.P. Leung (2001)

METHOD

This study was conducted in the Computing School at one of the private university colleges in the Klang valley using Biggs's (2001) Revised Two-Factor Study Process Questionnaire (R-SPQ-2F) to explore students' approaches to learning from the student's perspective. This instrument measures two latent variables: a deep approach to learning and a surface approach to learning. The deep approach latent variable was indicated by two observed variables (Deep Motive and Deep Strategy sub-scales), while the surface approaches latent variable was indicated by another two observed variables (Surface Motive and Surface Strategy sub-scales). The items were rated on a Likert scale (1— never or only rarely true of me, 2 —

sometimes true of me, 3 — true of me about half the time, 4 — frequently true of me, 5 — always or almost always true of me).

Respondents for this study included undergraduate students enrolled in the Computing School, undertaking courses in Information Systems, Information Technology, and Multimedia Systems. Questionnaires were distributed to all the 200 students in the Computing School. Out of the 200 questionnaires distributed, 63 were returned as completed ones. The sample distribution according to gender, nationality, year of study and degree major is given in Table 1:

Table 1 Demographic information

Gender		Nationality		Year of Study			Degree Major		
Male	Female	Local	International	Year 1	Year 2	Year 3	Info Systems	Info Technology	Multimedia Systems
49	14	39	24	33	19	11	40	14	9

FINDINGS

Independent *t*-tests and one-way ANOVA analysis showed no significant difference between the types of approach used and the demographic variables of gender, nationality, year of study, and degree major However, the rank ordering of the mean value indicated that almost every one of the student participants in the study were somewhere in between deep and surface and clearly did not possess deep approach to learning. As a first step in the analysis, the mean score value was found for all the 20 items. The cumulative mean value for the 'Deep Approach' items was 3.01 (Table 2) and the cumulative mean value for the 'Surface Approach' was 2.91 (Table 3). These two mean values indicated that the students in the study did not fall strongly on either the deep approach side or the surface approach side. They were mainly in the middle indicating that this was true of them half the time and not always. This result indicated that activities focused on learning could be few, and the teaching context not very supportive of developing students' deep learning.

Table 2 Deep approach to learning

No	Deep Approach Items	Mean Score	*SD*
1	I find that at times studying gives me a feeling of deep personal satisfaction.	2.89	1.05
2	I find that I have to do enough work on a topic so that I can form my own conclusions before I am satisfied.	3.27	1.00
5	I feel that virtually any topic can be highly interesting once I get into it.	3.22	1.05
6	I find most new topics interesting and often spend extra time trying to obtain more information about them.	3.29	1.16
9	I find that studying academic topics can at times be as exciting as a good novel or movie.	2.76	1.17
10	I test myself on important topics until I understand them completely.	3.14	1.08
13	I work hard at my studies because I find the material interesting.	2.98	0.99
14	I spend a lot of my free time finding out more about interesting topics which have been discussed in different classes.	2.86	1.18
17	I come to most classes with questions in mind that I want answering.	2.71	1.05
18	I make a point of looking at most of the suggested readings that go with the lectures.	2.97	1.05
	Deep Approach (DA) = 1 + 2 + 5 + 6 + 9 + 10 + 13 + 14 + 17 + 18	**3.01**	

Table 3 Surface approach to learning

No	Surface Approach Items	Mean Score	*SD*
3	My aim is to pass the course while doing as little work as possible.	2.83	1.39
4	I only study seriously what's given out in class or in the course outlines.	2.95	1.22
7	I do not find my course very interesting so I keep my work to the minimum.	2.65	1.12
8	I learn some things by rote, going over and over them until I know them by heart even if I do not understand them.	2.97	1.08
11	I find I can get by in most assessments by memorizing key sections rather than trying to understand them.	2.97	1.03
12	I generally restrict my study to what is specifically set as I think it is unnecessary to do anything extra.	2.98	1.13
15	I find it is not helpful to study topics in depth. It confuses and wastes time, when all you need is a passing acquaintance with topics.	2.79	1.11
16	I believe that lecturers shouldn't expect students to spend significant amounts of time studying material everyone knows won't be examined.	3.05	1.13
19	I see no point in learning material which is not likely to be in the examination.	3.08	1.26
20	I find the best way to pass examinations is to try to remember answers to likely questions.	3.16	1.08
	Surface Approach (SA) = 3 + 4 + 7 + 8 + 11 + 12 + 15 + 16 + 19 + 20	**2.94**	

DISCUSSION

From the results of this study, it is evident that the students from the Computing School were not adopting the deep approach fully in their learning. The reasons for such learning behavior of students can be attributed to three inter-related aspects, namely, the student factor, the teaching context, and the learning activities or the tasks (Biggs, 2001). The student factor may include the prior knowledge or past learning experiences of students that determine the kind of approach they bring with them. The teaching context may include the learning objectives, the assessment methods, school climate or the ethos, the pedagogical practices, and the institutional procedures. And the learning activities refer to the tasks that are assigned and the quality of teaching-learning process that is happening. The activity of uplifting students towards deep approach is a multi-level task. It involves the creation of learning conditions that challenge students' critical thinking and creative ability, teachers who are competent in providing deep and meaningful learning activities that may provide rich learning experiences, and rigorous instructional practices that are engaging and challenging to students.

Learning conditions

Two conditions – 'internal' and 'external' are said to determine student learning (Dewey, 1964). Students' motivation and the teaching-learning environment were found to be the two influencing factors in students' approach to learning (Howe, 1999; Kember, Charlesworth, Davies, McKay, & Stott, 1994). It is critical that an educational institution aiming to cultivate deep approaches among its students look into developing the motivation and aspiration for high quality academic achievement. The press for higher standards is usually accompanied by increased number of assignments, long hours of reading, library research, and more in-depth analysis of subject matter. This can be a daunting experience to many and personal support of teachers can be helpful in keeping student morale and motivation high. Personal encouragement, positive reinforcement, affirmation of student work, and genuine concern shown can help build students' motivation to strive for higher quality learning and better outcomes. In addition to the internal conditions, it also becomes the

responsibility of an educational institution to provide the appropriate physical, psycho-social, and cultural support to the students. An environment where students feel 'safe' to explore and experiment with new ideas and provided with platforms to share and voice their opinions freely can allow the development of deep approaches among students. Academic dialogue sessions, seminars, discussion groups, invited speaker sessions, forums, and symposiums can provide the opportunity for stimulating intellectual robustness and deep approach towards learning.

Professional capacity

Teachers are the driving force behind any successful learning activity. Their quality of education, level of preparedness, and positive disposition become the determining factors in helping students achieve deep approach in learning (Kember, 2000). Teachers' knowledge base grounded well in subject matter knowledge, curricular knowledge, pedagogical knowledge, and knowledge about the learners and their contexts are central to effective teaching and learning (Ball & Forzani, 2007; Darling-Hammond & Bransford, 2006; Grossman, 1990). Competent teachers who possess specialized content knowledge formulate rigorous instructional activities, deliver it in engaging ways, design assignments that will challenge students to question their own thinking processes, encourage metacognitive analysis, motivate students to master higher order thinking skills and apply them to solve complex problems (Ball, Thames, & Phelps, 2008). Clearly, recruiting and developing teachers who are competent are crucial to ensure the supply of expert academic members for developing deep approach in students.

Instructional rigor

Academic depth and rigor is clearly a critical element in the development of deep approach in learning among students. This can be achieved by establishing a coherent instructional practice focused on explicit students' learning outcome, a detailed description of the high quality instructional procedures that will lead to the attainment of learning outcomes, materials and associated tools relevant to instruction, and assessment methods that will contribute towards deep approach in student learning. The organization of the curriculum content aligned with the learning outcomes, and the instructional strategies with the right kind of materials and general pedagogies can result in a rigorous teaching- learning experience. The rigor of learning can be further enhanced through applying the assessment methods that are focused on developing deep approaches. The quality of the learning tasks assigned, assessment method used, types of work asked to be produced and how they are graded and supplied with feedback can improve the overall instructional practice and student learning outcomes (Biggs, 1987; Dornye, 2000; Jacobs & Newstead, 2000). The high-quality instructional practices that are intellectually engaging and challenging will create the opportunity for developing deep approach among students (Gijbels & Dochy, 2006).

CONCLUSION

Students must depart from the surface approach to learning that is focused on a narrow target and rote method and strive for deep approach to learning which pushes for maximization of meaning and conceptual understanding of a subject. It is not sufficient that students merely pass an examination; they must be able to fulfill the intrinsic interest to acquire in-depth knowledge for better performance. But student learning is influenced by a number of factors such as students' values and motives, their perceptions of task demands, teaching and assessments methods, the teaching-learning climate, teacher preparedness and the quality of institutional procedures (Biggs et al., 2001). Students' shift from surface approach to deep approach in learning can be achieved by improving the conditions for learning, raising teacher professional capacity, and scaling up the instructional rigor of programs offered. Improvement of students' motivation and morale, and

the physical, cultural, and psycho-social support provided will improve students' approach to learning. This can be enhanced further with the teachers who are better prepared in their specialized content knowledge as well as pedagogical content knowledge to elevate students' learning. Scaling up of the instructional routines that include the appropriate methodology and assessment is also an important component in developing the students' deep approaches to learning. These three aspects done with care can help bring about positive changes in the teaching-learning process and the students' deep approach to learning and better outcome.

ABSTRACT

Today, students who studies at undergraduate level, need education that independent from time and space because of their life together with education and business. This situation brought about the need for students to use technology. So, supporting formal education or as another alternative to formal education, the importance of web-based education has increased steadily.

In this study it is intended to bring the solution to this requirement with a developed software platform. The software provides education on the internet. This software is a solution of all educational stages as students' system registration, education process and assessment of student achievement with a variety of test modules. So that allows students to receive education as synchronous or asynchronous and aims to develop a solution to the negation which is brought by formal education environment.

INTRODUCTION

Today, with the development of information technologies, necessity of knowledge transfer more fast, more detail, more secure and more quality, as in all areas in the field of education has become a necessity. Specially, increasing number of student-workers at undergraduate level leads to choose these student-workers open education or distance education rather than education that depending on an institution but performed formally. Thus, the dependence on space or time in education has been eliminated.

Online course development tools and assessing service providers is not an easy assignment. As well as instructors and students have different necessities depending on the situation, for the facilities that will be discussed there are countless factor, hundreds of features and benefits. A school that introduces a solution for campus-wide usually requires a complex infrastructure. (Karakuzu, 2004)

At that point teaching management systems is seen as a solution. Learning management system is used for ordering online learning environment. (Macromedia, 2003) E-learning brings innovation to the concept of learning, with the approach ‘’where, when and how you want to learn’’. (Duran, 2008). The usage of internet as an education tool can be a solution proposal to eliminate time and space dependency of education as well as to eliminate negations of school environments for instructor and students.

The most prominent feature of formal education is face to face communication between instructor and student. This type of education is generally organized for common level of group rather than different types of intelligence and learning skills. However, ideal education system is prepared by taking into consideration each student's personal characteristics. This system, which is hard to put into practice by formal education principles, is put into practice by distance education and comprehensive education management systems. Distance education is the cheapest system among other education systems, when there are enough students to cost investment in formal education. (Çetiner, 1999).

Web Based Instruction

With the development of internet, web has become a powerful, global, interactive and dynamic information sharing platform. Web provides new possibilities which cannot be realized before, for students. Hence, all the students in the world can access to resources equally. Information age has a great influence on our education system. Innovations in information age bring new concepts to education. This new educational concept brings rich learning environment supported by well-designed resources. Web can be used for a new learning and teaching tool for creating such a rich learning environment. (Bay, 2005)

Web based teaching is a hyper-media based teaching program that uses sources on WWW for creating a significant learning - teaching environment where learning is encouraged and supported. (Özarslan, 2007)

Learning Management System

Learning management system (LMS) is a management software platform that provides sharing of course content and materials designed for educational purposes, sending and collecting of homework, statistics about attendance of students and the level of success, and online communication. (Hayran, 2010)

Learning management systems offer education content for learning activities, personalities, study environments, learning capabilities and content delivery policies. Learning objects are used for clarity of education content and meet the expectations and needs of individuals. Learning objects are the smallest, independent, structural and modular particles of content. Because learning objects are reusable, they must be independent from the platform which they are distributed.

Learning Content Management System

A learning content management system (LCMS) is a related technology to the learning management system in that it is focused on the development, management and publishing of the content that will typically be delivered via an LMS. An LCMS is a multi-user environment where developers may create, store, reuse, manage, and deliver digital learning content from a central object repository. The LMS cannot create and manipulate courses; it cannot reuse the content of one course to build another. The LCMS, however, can create, manage and deliver not only training modules but also manage and edit all the individual pieces that make up a catalog of training. LCMS applications allow users to create, import, manage, search for and reuse small units or "chunks" of digital learning content and assets, commonly referred to as learning objects. These assets may include media files developed in other authoring tools, assessment items, simulations, text, graphics or any other object that makes up the content within the course being created. An LCMS manages the process of creating, editing, storing and delivering e-learning content, ILT materials and other training support deliverables such as job aids.

LEARNING MANAGEMENT SYSTEM DESIGN PROCESS

Learning management system, which are used for implementation of e-learning, are software platforms that provide the management of learning activities. These systems also provides presentation and editing of learning material, sharing and discussing of learning materials that presented, managing of course catalogs, taking of homework and exams, giving feedback about homework and exams, keeping record of student, instructor and system, and taking reports.

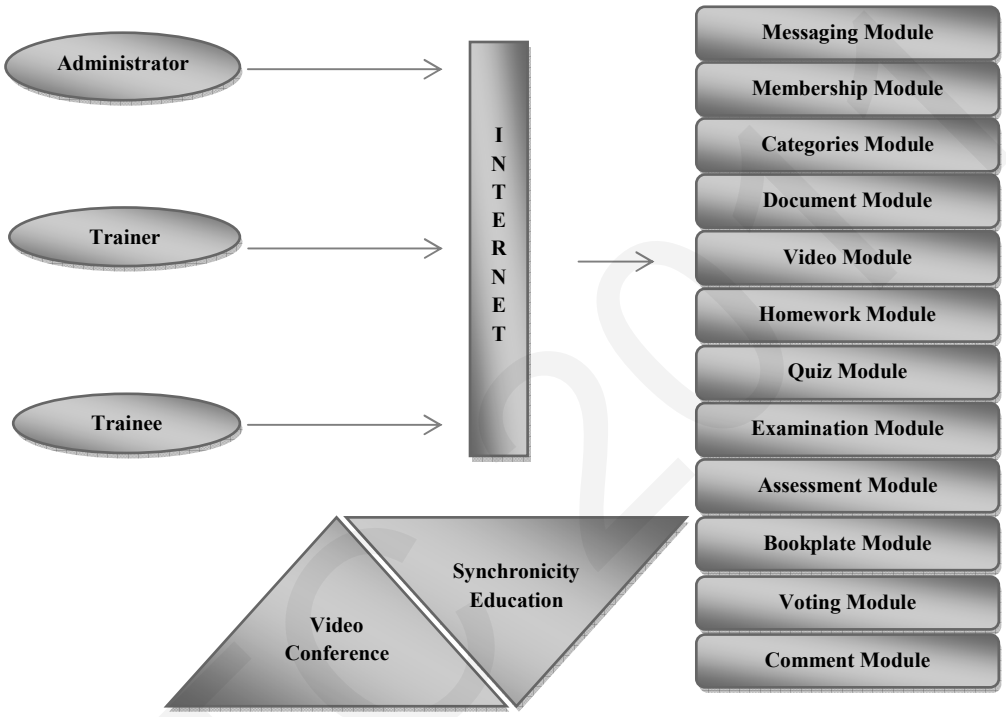

Fig. 1. e-Learning Management System Block Diagram

In the creation stage of project, the needs of students and instructors are examined and a learning environment, which is independent from time and space, is designed. System has a Content Management System feature for being adaptable for presentation of any of the courses. Therewithal, the feature that leads education of students, on the basis of these contents, is a Learning Management System.

Above all, more interactivity is aimed at this application. Thus, highness of student interest and, as a result, highness of the student's success can be provided. Students can reach the content within the system at any time they want and utilize resources freely. Combined with cost advantages, the provided flexibility allows the formation of an ideal model. (Carswell, 2002)

The content of a course to be taught will be determined by the instructor. The specified content will be assigned to student. Not only content, homework and exams will also be determined by the instructor and assigned to students. Thus, instructor will be able to follow student's works via the system and help the student in need.

All Modules in the e-Learning Management System

Module	Explanation
Membership Module	The instructor and students to become a member of the system and to limit the authority provides access to the system.
Messaging Module	The instructors for students in public or private, to send messages and make announcements, send a message to the students to each other.
Categories Module	Lesson plans and the contents of nested grouped into categories, the content of this training the students will be served.
Document Module	Course content categories on the basis of the installation of the system, allows students to download and use and reporting of students use of the document.
Video Module	Installation of the system study the contents in video format, downloaded and used by students and provides students reported the use of the document.
Homework Module	The system allows uploading papers of the students by students and the trainers can download and examine the papers.
Quiz Module	During the e-learning, the system provides quizzes which as a test form.
Examination Module	Students are examined on the web site. The system allows entry of exam questions according to their degree of difficulty by trainer with an administration panel
Assessment Module	Provides entries of Homework, Quiz and Exam module the evaluation by trainers by a management panel.
Bookplate Module	The module provides training contents outside of the categories and one or more categories associated with the subject and filtered.
Voting Module	The contents can be voted by students, this contents how much useful for students can be detect and reporting by the results.
Comment Module	The module provides to making comments and share information to students and educators about the training content.

E-Learning Application

With the help of the modules developed, it is aimed to realise the learning process over the internet in accordance with the aims and objectives of distance education. The modules placed in the Table 2 are application which is aimed to realise the learning process over the internet between student and the teacher simultaneously via the web site of the institution.

Application	Explanation
Video Conference	By performing real-time speech and video over the web site, allowing trainers to make their students practice orally.
Synchronicity Education	Supporting training with video conference at real time over web site.

LEARNING MANAGEMENT SYSTEM ANALYSIS PROCESS

Fig 2 : e-Academia Trainer and Trainee's Application Menus

The menus in e-Academia Learning Management System, which are created for students and instructors separately, indicated in Figure 2. On the page that is created for instructors, in the "User Management" menu, instructors can monitor students' information and make changes in the areas that are allowed by the administrator. In the "Category Management" menu, the instructor can monitor and edit fields and courses that related to the fields. In the "Content Management" menu, instructors can upload content to the courses and assign these documents to students. In the "Content Comment Management" menu, the instructor can monitor, confirm and delete comments that are made on contents. In the "Audio Recording Authorization" menu, audio records, which are recorded to the system by the instructor, are assigned to the courses and it is determined that which students can access these records. In the "Homework Evaluation" menu, instructors can grade students by checking the homework which students enter to system. In the "Exam Operations" menu, as in the sub-menus, instructor can create questions, which can be different types of questions such as classic and test, create exams that are made of these questions and evaluate these exams when they are done. In the "Video Conferencing" menu, the instructor can create invitations for video conferences and can perform courses in an interactive way in "Conference Rooms". In the "Student Statistics" menu, instructors can view the success level of students and the rates of system utilization statistically.

On the page which is created for students, In "Documents" menu, students can download course contents that are assigned for themselves by the instructor. In the "Homework" menu, students can monitor homework that is defined for themselves by the instructor and when they finish their homework,

they can upload their homework to system via the page that is under the menu. In the "Video" and "Audio Files" menu, students can download video and audio files that are assigned for themselves by the instructor. And finally, in the "Exam" menu, students can finish exams, that are defined for themselves by the instructor, on day and time which is designated by the instructor.

RESULTS

The care is taken for designed learning management and content management system to be flexible, practical, easy to use and functional both for instructors and students. With the application, it is aimed to continue and complete education process independently from time and space and efficiently at the same time. As much as meeting the instructor and student at different times and spaces which are created by the instructor for student, carrying out the education process simultaneously via video conference is achieved. This situation increases education quality because of increasing in education interactivity.

ABSTRACT

Speech synthesis is a technology used in many different areas in computer science. This technology can bring a solution to reading activity of visually impaired people due to its text to speech conversion. Based on this problem, in this study, a system is designed needed for a visually impaired person to make use of all the library facilities in Sakarya University. Certain number of books in the library is transferred in digital media via a scanner and they are transferred into their own server. A visually impaired person can use the system with the help of sound orientation of the program and the keyboard commands of the user. System will be developed according to new requests. So, the purpose of this study is to bring a solution to the social problem of visually impaired people.

1 INTRODUCTION

Speech is one of the methods for providing communication between people. The production process of human speech by an external computer or device according to the phonetic expansion of text or message is called synthezing (DUTOIT, 1997). Speech synthesis can be done by adding audio tracks to each other which is stored in the audio recording database. Phonemes r systems that use audio tracks as phoneme binaries have the opportunity to synthezing all kinds of words in a small amount of record using Lego logic (DUTOIT, 1996). However, these kinds of synthesis systems are very poor for intelligibility and naturalness. In this regard, the unit selection systems that use longer pieces of audio are used more widely today (KOMINEK, 2003)(J.ZHANG, 2004).
Turkish studies are still limited even though very large numbers of systems are developed for western languages. MBROLA (DUTOIT, 1996), FESTIVAL (DUBUISSON, 2009), MULTEXT (VERONIS, 1994), GENGLISH (DUTOIT, 2005), HTS (YAMAGISHI, 2007) have been developed for synthesizing more than one language. From these systems MBROLA is adapted for Turkish and a working system is developed (BOZKURT, B., 2001).

In this study, triple sounds which is the most frequently used in Turkish and an additive synthesis system which is developed by using double voices that were not covered by triple sounds is planned to use (YURTAY, 2010). This system is a simple system that works by taking string data in digital media and adding sound pieces in sound database as Lego and it is developed in Turkish-based.
In the study of TUBITAK, frequently mentioned 3000 triple voices are determined and it is seen that these voices represent Turkish 90%. By adding 383 double voices to the list which do not exist in the triple voices, a database is developed that is formed totally from 3383 number of pieces. (BICIL, 2010).
As is known, today visually impaired people cannot go to libraries to read books and they are deprived from this social activity except books read by very little number of volunteers or Braille books. In this study, solutions are developed with the help of technology to overcome these shortcomings.
In the system design, the visually impaired person who wants to take advantages of the library services after arrival in the library is directed to the designed system by a librarian. It is aimed to ensure the new book requests, book search and reading a found book from a requested page number with voice guidance and keyboard commands done by the visually impaired person.
It can be said that, visually impaired people can easily use libraries with the help of this system. The design of the system is fully applicable and after applying the processes mentioned in Section 2 and 3, it is planned to dedicate the system automatically and with the support of very few people to visually impaired people.

The processes in implementation and application of the system can be examined in two main topics: Preliminary Processes and Application Stage.

2 PRELIMINARY PROCESSES

2.1 Hardware

In the design of the proposed system, a server and a computer with a minimum 2.53 Ghz processor, 4GB DDR2 Ram, 200GB hard disk are needed. Using the existing server to store books in digital media in the Sakarya University library is considered. The number of computers is limited to one as the initial number and then can be increased depending on the ratio of users.
Library staff must be convinced of using the system as an active and reliable way. Furthermore the system can also be used by visually impaired users who did not before. For this reason, the need for a monitor and a mouse appeared.
During the system work, visually impaired user will direct the system with an input device. At this stage, a choice must be done between two important input devices. These devices are a keyboard and a microphone. They have advantages and disadvantages among each other. In this sense, if the keyboard is selected by visually impaired person who knows to use the keyboard, it is seen to be more efficient and reliable. In the case of visually impaired person who selects to use the microphone eliminates the requirements of using the keyboard and even without using their hands he/she can manage the system. But today's speech recognition technology efficiency, most of the library environment is not completely isolated from sound and most of visually impaired person can use the keyboard. Because of all these reasons the keyboard will be preferred in this study. In addition, a scanner is required for digitization of printed documents in the library.

2.2 Software

In addition to serve for visually impaired person, the system must have the software infrastructures that must be compatible with libraries own automation systems. Thus, the proposed system and library hardware will be used more efficiently and they can be used like other computers in the library.
Paid or free software can be selected to use in the speech synthesis module. However in this proposed system, speech synthesis module that we have developed before will be used (YUCEL, 2010).
Most important parts of the system are voice guidance and management parts of the program used by the visually impaired person. At this stage, the developed software will guide the visually impaired person vocally and then management will be provided as a result of commands taken from the keyboard.
A scanner will be used during the digitization of the printed documents and books in the library. While scanning the papers of the relevant document, they are converted to image format and an OCR (Optical Character Recognition) system to translate the photos into text format is needed. There is much commercial software developed to translate printed documents into digital media like Fine Reader, ReadIris, etc.

2.3 Preparation Stage

In this stage, converting specific printed documents which do not exist in digital media into digital media process is done. The resources in the library can be simply separated into two groups:

- Digital Resources
- Non-digital Sources

2.3.1 Digital Resources

Master's and doctoral theses in the library are in this group. Copies of these documents in Acrobat Reader or other formats can be found usually in the digital medium. All of them are accessible for users. So, these sources can be transferred into the used system rapidly.

2.3.2 Non-Digital Resources

In this stage, only the resources referred to as ink printing in the library. Stories, novels, magazines, newspapers can be considered as examples of these resources.
Speech synthesis can be done to the resources by translating them into digital medium with the help of a software support. In this sense, the system can be dedicated to the visually impaired users. The problem of resources that do not exist in the digital media (non-digital resources) is necessity of digitization.
Designed system aims to do this job as static firstly and then dynamically. At first stage, most popular books in the library by selecting the first 500 of them are planned for digitization with the help of hardware and

software support. Transferred sources will be stored in PDF format. However, one or more people are needed to select books and then transfer in the designed system.
In this study, Microsoft MS-Project program is used to define project's activity, distribution of resource-task. Project is analyzed under the heading of scope, analysis/hardware/software requirements determination, design, development, test stage, documentation, application, dissemination and last revisions. Project's scope determination takes 3,5 days, analysis/hardware/software requirements determination takes 12,5 days, design of suitable and functional environment for the library and obtaining permits takes 7,5 days, development part includes supplying the using software and integrating this to the system takes 30 days, testing of the system takes 4 days, training process takes 6 days, preparing the help documentation takes 18 days, application takes 7 days, dissemination process takes 3 days and last revisions take 3 days. As a result, the estimated time opening the system to use was calculated and found 94,5 days approximately. Project management designed by using MS-Project program is shown in Figure 1.
Many people work in the designed project. They are management part for determining the scope, project manager for resource assignments, choice of software/hardware and following the project, analyst for the design of suitable and functional environment for the library and obtaining permits, developments for the software, tester for testing the system, trainer, technical service for the documentation process, and distribution team for the user opinions work. Resource assignments are made using MS-Project program is shown in Figure 2.

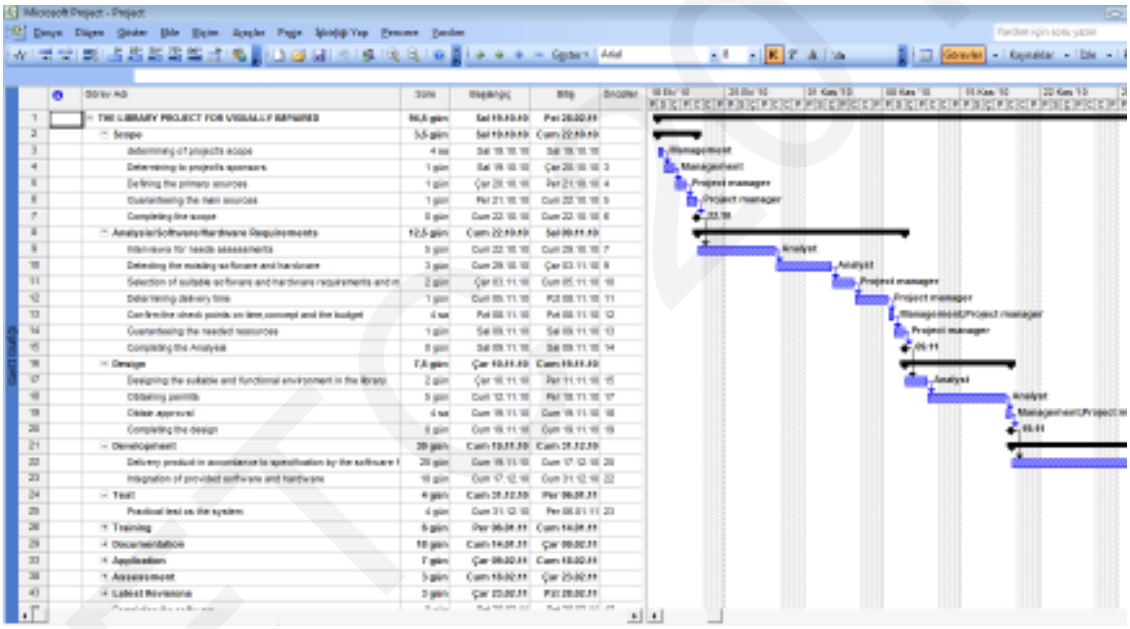

Figure 1: MS-Project Application

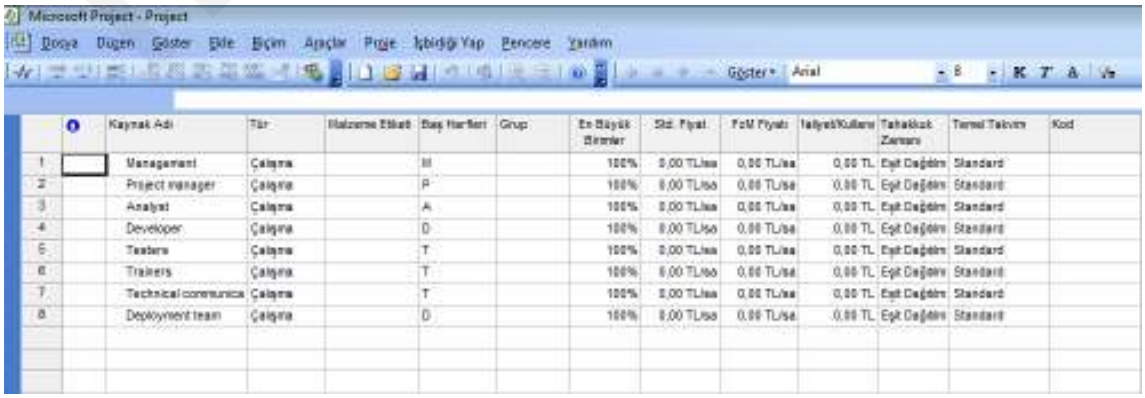

Figure 2: MS-Project resource assignments

3 APPLICATION STAGE

After preparation stage, while the designed system is continuing to serve to visual impaired people; it will continue to evolve according to their wishes. In this stage, system will not need an active care like in preparation stage. Only the new requested ink printing books will continue to transfer to system. In this way, the system will run more efficiently.

4 TEXT NORMALIZATION PROCESS AND THE CHALLENGES OF MATHEMATICAL NOTATIONS

In this study, one of the problem is faced during the synthesizing speech is Turkish non-text format mathematical notation and images. One of the processes to be done is text normalization before synthesizing speech, for example number of 269 as two hundred and sixty nine to read as. Normalization can be used for using of some mathematical notations easily. Such as "% = percent", "°C = Celsius degree", " a^3 = a cube", "$\sqrt{7}$ = square root of seven ".

However, normalization of longer mathematical notation is more difficult. Therefore, creation of clear, understandable and simple standard is necessary. After a standard is created, training and promotion are required for visual impaired. As a result of these, long and complex mathematical notations will be understood in sound format by visual impaired easily.

5 RESULTS

In this study, a simple and working system was designed needed for a visually impaired person to make use of all the library facilities in Sakarya University. A visually impaired person can use the system with the help of sound orientation of the program and the keyboard commands of the user. When the specified requirements are provided, a system can easily be established in the library, so visually impaired people can benefit facilities of the library. Also a standard is created for longer mathematical notations.

6 ACKNOWLEDGEMENT

Thanks to TUBITAK-UEKAE Multimedia Technologies Laboratory.

MATHEMATICS AND MATHEMATICAL TECHNOLOGY IN EDUCATIONAL TECHNOLOGIES

ABSTRACT

authors Dipl.Ing.Ludvík Vlček

To open discussion about some terms of mathematics and mathematical tech-nology in educational. Our main focus should be hightlighted to growing important to more practice methods for solving practical problems. Term „solving“ is in wide meaning of it, eg. manipulating by rules, operators, etc.

Educational process must have two inseparable parts. „Explanation“ part, where we are saying „what“ and „training“ part where we are „doing how“. Be focused not only to classical steps as definition, lemma, verification eg. part expla-nation of mathematical education. We suppose not only University or engineering problems, very important is be able to have some practical abilities for solving problems at secondary school too. We are satisfied there are a lot practical, engi-neering, generaly technical, studies where is probably more important to be able to practically solve some kinds of problem before having all theoretical knowledges about it eg. part training.

It would not be simple at all. Mathematic scienses has more than one century of developing of suitable terms, objects, ways of argumentations, logical structu-res, verifications behind its. Mathematical technology hasn’t such develop progress behind it, hasn’t stable terminology, hasn’t stable argumentation, etc. And mathe-matical technology in educational technologies specially.

Introduction

If we try to define content of term „educational technology“, we have a relativelly hard task. It’s possible to define it various ways. We can use one of the possible, not so exact definitions:

> *. . . is continuous process and set of proper tools how to „pull“ usefull informations to „recepients“, students. Everybody can be a stu-dent, o cer, general director, o ce manager, worker, teacher. . .*

It is not best definition probably, there are exits much more precission defini-tion, much more better definition, but now its enough for us. For e ective educati-onal process, is very usefull to use such tools, such „procedures“, such ilustrative examples which a able to break through, to deep into student’s mind. One of the methods, very good method and very old method is using various tools, various similarities, various examples.

Tools could be various types. Classical tools, for example wired model of cubic box with some highlighted details. New, „modern“ tools, visualised the same mo-del of cubic box on monitor of computer, abstract model using a descriptions of equations and others. It’s clear the computerised, visualised, „virtualised“ models have great potential to bring closer core of studying problem to students. Problem how to demostrate 3D problem via 2D computer’s monitor projection is very inte-resting, popular and important now. But our focus isn’t to solve or study this kind of tasks.

Problem definition

We are focused to partially study similar problem, similar task. How to use a mathematics and mathematical technology, ususally hidden inside of all kinds of computer’s visualisaion in educational processes more efectivelly. We would like to try to show hidden dangerous if mathematics and mathematical technologies aren’t „balanced“ too.

As every scietific branch has two main, dialectical parts, what properties has our subject which we are study and how to use these properties in „normal life“ actually. So mathematic science has the same two parts too. Methodology, how to find various important properties about almost everything and methodology, how to caclulate almost everything. It’s very important to know various propreties of various subject of our study of course. But it’s very important to know how to find usefull practical solution of practical problems, too. And in many parts of (mainly) technical studying we prefer ability to find efective, usefull, usually corect solution of technical problems. On opposite side many „sciencies“ more and more prefer a congitive part of studying. Training, or calculating part of sciences is not so intensive practicing during educational process generally.

Example

We can try to show it on some more ore less trivial examples.

Very good opportunity for such explanation are the numerical series. Due to „classical“ aproach, very often used there are two main di erent type of numerical series. Aritmetical series and geometrical series and its variants. Then a teacher ususally continues some variant of example or some variant of analytical desriptions. For example:

$$\{a1, a2, a3, \ldots, aN\} \Rightarrow aN = \frac{1+n}{1-n}$$

or

$$\{b_1, b_2, b_3, \ldots, b_N\} \Rightarrow b_N = \frac{1}{1-p^0}$$

Then all teachers start to investigate various properties of both series. And formula-tes many generalised theoretical results about it. Some teachers say the students to exists other type analytics descriptions of series. For example recursive description:

$$\{c_1, c_2, c_3, \ldots, c_N\} \Rightarrow c_N = a \cdot c_{N-1} + b \cdot c_{N-2}$$

It is typical that coefients a and b in previous example are usually very compli-cated functions compounded from other very complicated coeficients and these compounded coeficients are compouded. . .

The relatively „friendly“ description of equations in previous example looks suddenly very unfriendly.

Good teachers practise some less or more trivial examples to validating genera-lised theoretical results. A lot of students heard that these analytical descriptions has very deep relationalships with diferential gap. But only heard.

A lot of students heard sometime, somewhere the numerical series be able defi-ned by table. And that series has some properties, there are axists some „special“ method to investigate it and so. But again, only heard.

Discussion

In real world, the numerical series are very often done by table. For everyday life are these series usually much more important than others. Yes, there are economic or financial data. In almost all cases is very di cult to „describe“ them some analytics formulas. Various methods how to „investigate“ such data are subject of special economists studies mainly. During these studies the students „suddnely“ find a „dark, deep mystery“ how to manipulate with. Yes, it’s heavy-handed of course. But we can notice it’s typical to try to „find“ some analytical descriptions in such cases too. Usually various linear, logarithmic or exponential aproximation (interpolation or extrapolation) of table data. Where the economic sicientis take a convince of true of such procedures. Again, it’s heavy-handed, but not much.

We are hope this „state“ is time-temporal only. Best defense against it, in our opinion, is more and better training a part of mathematics which more training a practise method for solving an „life’s examples“. We hope that training more complex examples on non-analytical data is very good way to understand its reati-ons in deep. We hope to reconnect theoretical results and practical facility in one integral entity with really deep harmonic relationships is one of e ective solutions.

ABSTRACT
Computer Education and Instructional Technology (CEIT) Departments train computer teachers to fill gap of computer instructor in all grades of schools in Turkey. Additionally graduates can also work as instructional technologist or software developer. The curriculum of CEIT departments includes mathematics courses. The aim of this study is to identify attitudes of undergraduate students at CEIT departments towards math. In order to investigate the research question quantitative methods was used. Specifically survey research was preferred. Mathematics Attitude Questionnaire (MAQ) that was developed by Duatepe and Çilesiz (1999) was used and the questionnaire includes 38 items. The instrument was conducted with 122 undergraduate students from CEIT departments of four different universities in Turkey in the spring semester of 2010- 2011. Data were analyzed through independent samples t-test and one-way ANOVA by means of PASW Statistics-18. It was found that there are some differences in terms of math attitudes of CEIT's students.
Keywords: CEIT Students, Math Attitudes, Computer Education, Math Courses.

1. INTRODUCTION

As it is known departments of Computer Education and Instructional Technologies (CEIT) were founded in 1998 by reconstructing education faculties in Turkey (Şahinkayası & Şahinkayası, 2004) and there are no departments like CEIT in the world except Turkey. The basic purposes of department of CEIT can be ordered as, for education foundations enhancing the methods and techniques which are essential for functional use of computer and instruction technologies' products, teaching of and expanding these methods and techniques and training individuals who want to be teachers in these foundations.
Today, in Turkey the students who want to get training in the departments of CEIT must have YGS-1 scores. In YGS exam, math composes 40 % of the whole questions. The questions of math in this exam are based on elementary and first grade of high school curricula. Hence, undergraduate students who enrolled in the departments of CEIT may probably have no high levels of math knowledge. However at contents of courses in the departments of CEIT, there are intensive content of mathematics courses.
For instance Math I course includes the topics such as, the concept of functions, the concept of limits, the concept of derivatives, equations of tangent and normal, curve sketching (YÖK, 2011).
In math education, the importance of attitude towards math is emphasized mostly. Attitude towards math has been researched for determining from the point of particular grade of students and different viewpoints (Tocci, 1991; Rounds & Hendel, 1980; Tabuk & Özdemir, 2010). According to Tezer and Karasel, (2010), generally the relationship between attitude towards math and achievement in math is investigated and concluded that attitude towards math influences achievement in math.
A survey study was conducted by Köğce et al. (2009) with the purpose of determining and comparing the second grade elementary students' attitudes towards math. The researchers used the same instrument with this study but they adapted the scale for conducting to elementary students. They reached some statistically significant differences between attitude scores towards math and receiving private tuition at grade 6 and 7, math achievement score and educational background of parents, profession of fathers at grade 6 and 8, profession of mothers at grade 6 and lastly grade level of students in elementary schools. Additionally they did not find significant difference in terms of gender. Another study was applied to secondary school students by Yara, (2009) and it was found that the students have positive attitudes towards math and they think that math is crucial and necessary for their future life.
Ma, (1997) conducted a research which is related with reciprocal relationships between attitude towards math and achievement in math to approximately a thousand high school seniors. The researcher concluded that fathers have more effect in their children's achievement in math while mothers have more effect on their children's attitude towards math. Another result of this study is mothers who have lower education level have more effects on their children's awareness of importance of math so the researcher pointed out this may be a result of that mothers' feelings of deficiencies in terms of education and occupation. And the researcher added culture can affect the attitudes towards math more than the achievement in math in terms of children' parents' education level. Moreover it is found out; gender differences of students do not have an effect on the attitudes. According to Ma (1997); being a successful student at math does not mean that student have less concern about attitude towards math.

Sırmacı (2007) investigated the university students' anxiety and attitudes towards math. The researcher found that female students have more positive attitudes in terms of benefits of the perceived math and parents' attitudes towards math. And she did not find significant difference between attitudes towards math and the students' graduated schools from and the occupation of students' fathers.
According to Duatepe and Çilesiz (1999); it is seen that most of the undergraduate students who are unsuccessful at math for whom it is an obligatory course in the first year of curriculum of universities, have negative ideas about the math course. At the departments of CEIT content of courses requires substantial math content knowledge. However in a research, which was conducted with final-year students and graduates of the departments of CEIT, it was found that science and math courses are viewed as the least useful courses (Acat et al., 2007). At this point, according to a master thesis's result which is about the effect of the mathematical knowledge background of the computer education students to their undergraduate education, it is concluded that students who have more powerful math knowledge have more probability to be successful at CEIT departments (İşlek, 2007).
The main purpose of this study is to determine attitudes of undergraduate students at CEIT departments towards mathematics. The variables that can affect the students' attitudes towards mathematics were investigated in terms of gender, type of graduated high school, grade of high school diploma, YGS-1 score, which they received, their fathers' education level, their mothers' education level, grade of Information Technologies in Education I course and lastly grade of Mathematics I course.

2. METHOD

In the study descriptive model being one of the research methods, is used in order to determine the attitude of CEIT students towards math. Descriptive models are approaches that aim to describe an incident in the way it exists or used to exist. The incident that needs to be known exists and it is out there. The important issue is to observe it in an appropriate way and to detect it (Karasar, 2000). The data of the study were collected by means of "Math Attitude Scale" developed by Duatepe and Çilesiz (1999). The Cronbach's Alpha reliability coefficient of the original scale is 0.96. The reliability coefficient (Cronbach's Alpha) of the scale for this study is found to be 0.96 which is the same value with the original scale. The data were then analyzed and interpreted by means of PASW Statistics 18. In the analysis of data, independent sample t test was used in order to determine whether there is a significant difference among students' attitude towards math as regards their gender and their mothers' education levels. One way ANOVA was used in order to determine whether there is a significant difference among students' attitude towards math as regards their type of graduated high school, grade of high school diploma, YGS-1 score which they received, their fathers' education level, grade of IT in Education I course and lastly grade of Math I course. Reliability level is p=0.05.
The research problem was stated as "What are the attitudes towards math course of the first year undergraduate students at the departments of CEIT? This problem was examined by the sub-problems: Is there a statistically significant difference between total math attitude scores and respectively gender, type of graduated high school, grade of high school diploma, YGS-1 score, mother's education level, father's education level, grade of Information Technologies in Education I course, grade of Math I course?

2.1. Sample

The population of the study is faculty of educations which have CEIT Departments in Turkey. The sample of the study consists of 122 CEIT students, who are taking or have taken Math I course at the CEIT Departments in four universities in Turkey. At this point the purpose was to encounter the students with math in recent time so; it is aimed to provide reflecting consistent and real answers in questionnaire about math attitude. The sample and the universities were randomly selected for the study. The participant students were reached via e-mail and they replied back through e-mails as voluntarily.
Table 1 shows that students' properties which are gender, type of graduated high school, grade of high school diploma, YGS-1 score which they got, their mothers' education level, their fathers' education level, grades of IT in Education I course and grades of Math I course.
As seen by Table 1, 47,5 % of the participants are male students (n= 58) and 52,5 % of the participants are female students (n=64). The majority of participant students who graduated from vocational high school are composed nearly the sample's half. The ratio of them is 48,4 % (n=59).It was also found out that 43,4 % (n=53) of the students' grades of high school diploma is in the interval of 4.51-5,00. Also it can be seen that from Table 1, 43,4 % (n=53) of the students' got from YGS-1 400-419 score. The students' mothers' education levels are mostly elementary education or illiterate. The ratio of them is 72,1 % (n=88). And the students' fathers' education levels are mostly elementary education or illiterate, the ratio of them is 44,3 % (n=54). 40,2 % (n=49) of the students got BB- BA from Information Technology in Education I course. The students' 30,3 % (n=37) got CC- CB from Math I course.

To decide whether conducting parametric or nonparametric tests, Kolmogrov Smirnov test and test of homogeneity of variances in ANOVA were conducted. At the end of these analysis since it is reached the value of p>0,05, it is decided that the data had normal distribution and were homogeneous. Thus parametric tests were conducted to the data.

Table 1. Demographic properties of students that took part in the study

	Property	*f*	*%*		*Property*	*F*	*%*
Gender	Male	58	47,5	Type of Graduated (High school)	General high school	38	31,1
	Female	64	52,5		Vocational high school	59	48,4
					Anatolian high school	25	20,5
Diploma Grade (High School)	4,00 and below	29	23,8	YGS-1 Score	400- 419	53	43,4
	4,01-4,50	40	32,8		420- 439	28	23,0
	4,51-5,00	53	43,4		440-+	41	33,6
Mother' Education Level	Illiterate and Elementary Education	88	72,1	Father' Education Level	Illiterate and Elementary Education	54	44,3
					Secondary Education	37	30,3
	Secondary Education and above	34	27,9		College and above	31	25,4
IT in Education I Grade (Course)	AA	20	16,4	Math I Grade (Course)	BB-BA and above	30	24,6
	BB-BA	49	40,2		CC-CB	37	30,3
	CC-CB	24	19,7		DD-DC	20	16,4
	DD-DC and below	29	23,8		FF-FD	35	28,7

2.2. Data collection

CEIT students' math attitudes were determined by "Math Attitude Scale" developed by Duatepe and Çilesiz (1999); personal information was collected by "Personal Information Survey". In the math attitude scale there are 38 items; of which 22 are negative and 16 are positive; in 4 factors. These factors are "like and interest, anxiety and confidence, occupational and daily importance, enjoyment".

3. RESULTS

Below there is a summary of the findings from the study and some remarks on them. In the study the attitude of students towards math is analyzed statistically according to their gender by an independent sample t test. The results are given in Table 2.

Table 2. Independent sample t test analysis results according to gender*

	Gender	*n*	*∑X*	*SD*	*Levene Test*		*Df*	*t*	*p*
					F	*p*			
Total math attitude score	Female	58	137,88	28,52	3,276	0,073	120	3,465	0,001
	Male	64	118,39	33,13					

It is seen from Table 2 that female students ($\sum X$=137,87) have more positive attitude than male students ($\sum X$ =118,39) towards math. The relation between the total math attitude score of the students and their gender was analyzed and it was seen that there is a significant difference ($t_{(120)}$=3,465; p< 0,05). This result shows that there is a significant difference between the gender and the total math attitude score in favor of female students.

We aimed to analyze the attitude of students towards math as regards the type of graduated high school, and we applied one way ANOVA. The results are given in Table 3.

Table 3. One way ANOVA for the attitude as regards type of graduated high school*

	Graduated High School Type	*n*	*∑X*	*SD*	*Source of variance*	*Sum of Squares*	*Df*	*F*	*p*
Total math attitude score	General High School	38	138,45	26,34	Between groups	19475,08	2	10,77	0,00
	Vocational High School	59	114,66	32,54					
	Anatolian High School	25	141,92	29,22	Within group	107604,46	119		

When Table 3 is analyzed, it is seen that the total attitude scores towards math is the highest ($\sum X$ = 141,92) for the students, who graduated from Anatolian high school. There is a significant difference between type of graduated high school and the total attitude scores towards math ($F_{(2,119)}$= 10,77; p < 0,05). In order to find out among which group this difference results from, we applied Scheffe analysis in ANOVA. It is understood that the total math attitude scores for general high school ($\sum X$= 138,45) is significantly different from vocational high school ($\sum X$ = 114,66) and the total math attitude scores for Anatolian high school ($\sum X$= 141,92) is significantly different from vocational high school ($\sum X$ = 114,66). The students who graduated from Anatolian high school and general high school have more positive attitude towards math separately compared with the students who graduated from vocational high school.

We also aimed to analyze the attitude of students towards math as regards grades of high school diploma. For this analysis we applied one way ANOVA to the data and the results are given in Table 4.

Table 4. One way ANOVA for attitude as regards grades of high school diploma variable*

	High School Diploma Grades	*n*	*∑X*	*SD*	*Source of variance*	*Sum of squares*	*Df*	*F*	*p*
Total Math attitude score	4,00 and below	29	123,58	38,00	Between groups	1810,06	2	0,86	0,426
	4,01-4,50	40	133,03	30,88					
	4,51-5,00	53	125,83	30,27	Within group	125269,48	119		

When Table 4 is analyzed, it can be seen that the total attitude scores towards math is the highest ($\sum X$ = 133,03) for the students whose grades of high school diploma is in the interval of 4,01- 4,50. There is no statistically significant difference between grades of high school diploma and the total attitude scores towards math ($F_{(2,119)}$= 0,86; p > 0,05).

We analyzed the attitude of students towards math as regards YGS-1 score which they got. For this analysis we applied one way ANOVA to the data and the results are given in Table 5.

Table 5. One way ANOVA for the attitude as regards YGS-1 score variable*

	YGS-1 Score	*N*	$\sum X$	*SD*	*Source of variance*	*Sum of Squares*	*Df*	*F*	*p*
Total Math attitude score	400- 419	53	127,00	29,90	Between groups	8068,08	2	4,034	0,020
	420- 439	28	115,11	38,88					
	440 +	41	137,07	28,14	Within group	119011,46	119		

When Table 5 is analyzed, it is seen that the total attitude scores towards math is the highest ($\sum X$ = 137,07) for the students, who got 440 and above from YGS-1. There is a significant difference between grades of YGS-1 score and the total attitude scores towards math ($F_{(2,119)}$= 4,034; p < 0,05). In order to find out among which group this difference results from, we applied Scheffe analysis in ANOVA. It is understood that the total math attitude scores for the students who got 420-439 from YGS-1 ($\sum X$ =115,11) is significantly different from the students who got 440 and above from YGS-1 ($\sum X$ = 137,07). The students who got 440 and above from YGS-1, have more positive attitude towards math than the students who got 420- 439 from YGS-1.

In the study we also aimed to analyze the attitude of students towards math as regards their mothers' education level. For this analysis we applied independent sample t-test to the data and the results are given in Table 6.

Table 6. Independent sample t test analysis results according to mothers' education level variable*

	Mothers' education level	*n*	$\sum X$	*SD*	*Levene Test*		*Df*	*t*	*p*
					F	*p*			
Total math attitude score	Illiterate and Elementary Education	88	129,38	31,64	0,072	0,79	120	0,942	0,348
	Secondary Education and Above	34	123,21	34,40					

When Table 6 is analyzed, it can be seen that the students whose mother' education levels are elementary education or illiterate ($\sum X$ =129,38) have more positive attitude than the students whose mother' education levels are secondary education and above ($\sum X$ =123,21). The relation between the total math attitude score of the students and their mothers' education levels was analyzed and it was seen that there is no significant difference ($t_{(120)}$=0,942; p> 0,05). This result shows that there is no significant relation between the students' mothers' education levels and the total math attitude scores.

In the study we analyzed the attitude of students towards math as regards their fathers' education level. For this analysis we applied one way ANOVA to the data and the results are given in Table 7.

Table 7. One way ANOVA for the attitude as regards their fathers' education level variable*

	Fathers' education level	*n*	$\sum X$	*SD*	*Source of variance*	*Sum of squares*	*Df*	*F*	*p*
Total Math attitude score	Illiterate and Elementary Education	54	121,07	33,43	Between groups	6648,36	2	3,285	0,041
	Secondary Education	37	138,38	32,58					
	College and above	31	126,32	25,42	Within group	120431,18	119		

When Table 7 is analyzed, it can be seen that the total attitude scores towards math is the highest ($\sum X$ = 138,38) for the students whose father' education levels are secondary education. There is a significant difference between the students' fathers' education levels and the total attitude scores towards math ($F_{(2,119)}$= 3,285; p < 0,05). In order to find out among which group this difference results from, we applied Scheffe analysis in ANOVA. It is understood that the total math attitude scores for the students whose fathers' education levels are elementary school or illiterate ($\sum X$ = 121,07) is significantly different from the students whose fathers' education levels are secondary education ($\sum X$ = 138,38). The students whose fathers' education levels are secondary education have more positive attitude towards math than the students whose fathers' education levels are elementary school or illiterate.

In the study we also aimed to analyze the attitude of students towards math as regards students' grades of IT in Education I course. For this analysis we applied one way ANOVA to the data and the results are given in Table 8.

Table 8. One way ANOVA for the attitude as regards grades of IT in Education I course variable*

	IT in Education-I Course Grade	*n*	$\sum X$	*SD*	*Source of variance*	*Sum of Squares*	*Df*	*F*	*p*
Total Math attitude score	AA	20	123,40	36,19	Between groups	1763,09	3	0,553	0,647
	BB-BA	49	126,86	29,42					
	CC-CB	24	125,04	37,68	Within group	125316,45	118		
	DD-DC and below	29	134,10	30,60					

When Table 8 is analyzed, it is seen that the total attitude scores towards math is the highest ($\sum X$ = 134,10) for the students whose grades of IT in Education I course are DD-DC or below. There is no statistically significant difference between the students' grades of IT in Education I course and the total attitude scores towards math ($F_{(3,118)}$= 0,553; p > 0,05).

Lastly in the study we also aimed to analyze the attitude of students towards math as regards students' course grades of Math I. For this analysis we applied one way ANOVA to the data and the results are given in Table 9.

Table 9. One way ANOVA for the attitude as regards grades of Math I variable*

	Math-I Course Grade	*n*	$\sum X$	*SD*	*Source of variance*	*Sum of Squares*	*Df*	*F*	*P*
Total Math attitude score	BB-BA and above	30	142,27	27,73	Between groups	15859,23	3	5,609	0,001
	CC-CB	37	133,22	31,58					
	DD-DC	20	111,00	38,25	Within group	111220,31	118		
	FF-FD	35	118,77	27,24					

When Table 8 is analyzed, it is seen that the total attitude scores towards math is the highest ($\sum X$ = 142,27) for the students whose grades of Math I course are BB-BA or above. There is a statistically significant difference between the students' grades of Math I course and the total attitude scores towards math ($F_{(3,118)}$= 5,609; p < 0,05). In order to find out among which group this difference results from, we applied Scheffe analysis in ANOVA. It is understood that the total math attitude score for the students who got BB-BA ($\sum X$ = 142,27) or above from Math I course is significantly different from the students who got DD-DC ($\sum X$ = 111,00) and FF-FD ($\sum X$ = 118,77) from Math I course. The students who got BB-BA or above from Math I course have more positive attitude towards math than the students the students who got DD-DC and FF-FD from Math I.

4. DISCUSSION and CONCLUSION

This study was conducted by the idea of computer science is a field that requires the ability of analytic thinking and in respect of CEIT departments' extent, it is important to determine students' attitudes towards math. The results that were obtained from can be summarized as below.

It was found that there is a significant difference between the gender and the total math attitude score in favor of female students. Although Ma (1997)'s, Farooq and Shah (2008)'s, Köğce, et al. (2009)'s and Uşun and Gökçen (2010)'s studies reached the result that indicates gender of the students do not affect their attitudes towards math, this study found that female students have more positive attitudes towards math than male students. Yenilmez (2007)'s research result supports this result.

According to type of graduated high school a significant difference is found in terms of total math attitude scores. It is understood that the students who graduated from Anatolian high school and general high school have more positive attitude towards math separately compared with the students who graduated from vocational high school. However Sırmacı (2007)'s study stated that students who have anxiety towards math have negative attitude towards math and the study concluded that there is no significant difference between the type of graduated high school and anxiety towards math.

Another result is that students whose grades of high school diploma are in the interval of 4,01- 4,50 have more positive attitude towards math. There is no statistically significant difference between grades of high school diploma and the total attitude scores towards math.

In the study we concluded that there is a significant difference between grades of YGS-1 score and the total attitude scores towards math. The students who got 440 and above from YGS-1, have more positive attitude towards math than the students who got 420- 439 from YGS-1. When it is considered math questions consist of 40 % of YGS-1 exam, this result is not surprising.

The students whose mothers' education levels are elementary education and illiterate have more positive attitude than the students whose mother' education levels are secondary education and above and there is no significant difference between the students' mothers' education levels and the total math attitude scores. Yenilmez (2007) in his study did not find a significant difference between attitude towards math and mothers' and fathers' education level. However in this study there is a significant difference between the students' fathers' education levels and the total attitude scores towards math. The students whose fathers' education levels are secondary education have more positive attitude towards math than the students whose fathers' education levels are elementary school or illiterate. On the other hand according to Ma (1997)'s study; fathers affect students' math achievement while mothers affect children's attitude towards math.

There is no significant difference between attitude and grades of Information Technologies in Education I course. It is found that the total attitude scores towards math is the highest for the students whose grades of IT in Education I course are DD- DC or below, this seems interesting.

Lastly in the study we analyzed the attitude of students towards math as regards students' course grades of Math I. It can be said that the students whose grades of Math-I course are BB- BA or above have more positive attitude towards math. It is an expected result.

Besides all these results, it is thought that the students who are enrolled the CEIT departments with YGS-I, encounters with Math-2 courses subjects primarily so this situation can cause the students have negative attitudes towards math.

Another important result is that students, who are successful at Information Technology in Education I course, are mostly graduated from vocational high schools and they have less positive attitudes towards math.

Reforming of the CEIT Departments' curricula in terms of math attitudes of the students is essential. Students of the departments should have the ability of analytical thinking and this ability should be existing either prior to the beginning of the studies (at the high school level) or should be given to the departments students by means of academic preparation year at the university. The results of our study are expected to illuminate the discussions in this area.

MENTAL PROCESSES OF READING INSTRUCTIONAL ILLUSTRATIONS IN NON-LINEAR INTERACTIVE SEQUENTIAL ART

Dr. Amany Farouk Ramadan Ismail
Lecturer-Faculty of Fine Arts - Alexandria University
farokamany@yahoo.com

Abstract:

The interplay of written and visual elements may render sequential art an innovative educational medium, especially when channels or mechanisms of traditional media are weak or hardly cause a positive effect in learning scientific subjects where reading sometimes exists as a passive activity. This paper aims to clarify the role of non-linear interactive sequential art and to highlight the significance of instructional illustrations of special characteristics - with Multi, exploded, ghosted views of complex structures and different perspectives - where reading needs certain mental processes and takes other dimensions through several visual techniques as Motion arrows, Frame sequences and animations. This medium could be a valuable learning resource for motivating learners - who may play a role of creators, rather than merely receivers of information - enabling them to construct knowledge and promoting their intellectual and cognitive skills, but with controlling their interactions and guiding their reading path activity.

INTRODUCTION

The unique pictorial language of sequential art with its different formats - according to length and level of narration complexity from short strips to graphic novels – proved to present information directly or indirectly in an interesting way**.** Its use for educational purposes is a trend expanded worldwide through years, either published in a printed or an electronic digital form. The visual appeal of the graphic representation and the tendency towards intriguing narrative make sequential art an excellent vehicle for conveying scientific concepts especially when the learner interact with the subject content.

Learners have fewer chances to use and develop visual learning abilities as we often tend to stress verbal over visual learning because the written text and the lecture are the primary modes of instruction. Tapping these abilities with instructional illustrations in sequential art reinforce learning in ways that verbal learning alone would not. As illustration has always been an important visual communicative medium,it attract attention, aid retention, enhance understanding. The visual graphical elements in illustrations require interpretation and thought to understand them, The learner as an image viewer become an active participant in the perception process and not simply a passive recipient of meaning and this depends on the reading processes especially that those instructional illustrations are constructed within the non-linear narration discovered by the learner .

So this paper aims to show how nonlinear interactive sequential art can be used to enhance learning, engage and motivate learners, and use technology in a practical and effective way, and explain the significance of instructional illustrations of special characteristics with cutaway, exploded, ghosted views of complex structures within the additional panels in the narration. In addition to clarifying the important and basic mental process of reading those illustrations.

NON-LINEAR INTERACTIVE SEQUENTIAL ART

Form structure is the overall system of relations that the learner perceives in non-linear interactive sequential art as a digital educational medium. The reader accesses to the structure of the formal system (panels containing drawings and texts) through his visual sense, where meanings are constructed gradually by understanding and interpreting this formal system. His unifying or framing act of perception and interpretation activates the narration. If the learner does not perceive the arrangement of the graphical representation; he would not continue his interpretation and reading activity.

Usually the scientific subject takes a narrative form, includes a beginning starting with the splash page (screen) or panel which develops till the end. The subject is divided into a number of pages containing panels - the building units of the sequence - which are supposed to be read in specific order; Previous steps or events are seen as causes for later ones; what happens first has consequences for what happens later (this implies a chronological structure). **(**Lefèvre, Pascal, 2000**).** In this case sequential art is highly

linear with limited learner interaction, so reading takes a passive activity, even if the subject is repeated more than once and rarely the learner is provided with a new instructional experience, especially in scientific subjects which depend on observing and concluding. (Bangs, Olav and others, 2004)
In contrast, the subject could be read in non-sequential order, with much fewer pages (panels), a non-linear story can represent many different linear detailed content. Or the sole panel may consists of several virtual panels or frames, a single panel seems to contain a representation of a cause and an effect, of several distinct positions of a moving thing or phenomenon. But the learner has always to divide mentally what is given as one and to add mentally frames inside the panel.
Written and visual elements represented in the non sequential panels define a set of simple and deliberate rules which when combined emerge to more complex patterns, and thus motivate the learner to develop more advanced mental strategies for learning the subject. The learner have a space of discovering, suggesting and expecting through reading but without prejudice to the coherent narrative , so each panel has some prerequisites that must be satisfied by the preceding pages (panels).
In a non-linear interactive story the reader can influence the order of panels. Choosing to read the basic information at first then Deepening in the identification of the subject details .Though reading instructional illustrations in non-linear story depends on non fixed narration. The story subject progresses based on the learner's interaction with several degrees (Bangs,Olav and other,2004).A high use of interactivity gives the learner the responsibility for choosing from multiple paths through subject matter, creating an environment where he can easily locate and manage information. Reading here may be active.
In higher level interactivity, an electronic simulation of an environment is presented and prompt the user to respond to simulated conditions with tools analogous to the controlling factors of real conditions in an actual environment. Here are many of the skills acquired as:

- Learning to track or make compensatory movements based on feedback.
- Perception of sensory stimuli that translate into mental performance.
- Learning to have readiness to take a particular action..
- Learning to perform a complex physical or mental skill with confidence and proficiency.
- Learning to modify and create a complex physical or mental skill to accommodate a new situation.

And though Taking experience in some attitudes as:

- Learning and demonstrating the mental preparedness to make decisions by generating the results expected upon completion of prioritized strategies or tactics in response to normal, abnormal, and emergency cues associated with the performance of an operational procedure, and the ability to generate new actions in response to abnormal or emergency cues.
- Learning and demonstrating the mental preparedness to encode operational cues as indicators of normal, abnormal, and emergency conditions associated with the performance of an operational procedure.
- Learning and demonstrating the ability to judge the worth or quality of normal, abnormal, and emergency cues associated with the performance of an operational procedure.
- Learning and demonstrating the mental preparedness to make decisions by using prioritized strategies and tactics in response to normal, abnormal, and emergency condition cues associated with the performance of an operational procedure.

INSTRUCTIONAL ILLUSTRATIONS

Instructional illustrations in nonlinear interactive sequential art lie on relations between the whole and its parts, and contribute greatly to clarify the facts, concepts, processes and structures, aiming to generate expressive images that effectively convey certain information. (Mandoor Abd-elsalam, 2007) (Viola ,Ivan and E. Gröller ,Meister, 2005).

Instructional illustrations diverse between literal, pictorial representations, conceptual and diagrammatic solutions .(Alan, Male, 2007) Image form plays the principal role in determining the content understood and recognized by the learner who plays a role in constructing meaning from the image. The use of graphical elements , which are frequently non-pictorial such as motion arrows or lines, are intended to extend and support the meaning of the instructional illustration beyond that which can be shown literally. But these graphical elements may add complexity if the purpose and meaning of the element may not be perfectly clear to the the viewer who may not interpret the illustrator's invention as originally intended , so the illustrator have to identify and distinguish those elements to help and lead the learner reading activity. Some Graphical elements serve as a useful shorthand method for representing phenomena such as thought, speech, direction of movement or past or future action, which are not visually evident when viewing a scene. Arrows can serve a lot of purposes in the instructional illustrations, such as revealing the paths, indicating motions of parts, conveying the direction of flow .In addition can also help learner to understand the specific functional relationships between the parts of the whole, Placing the arrows near contact points between illustrated parts that interact along the causal chain can help viewers better understand the causal relationships, depending on the type, the form of the arrow , the direction of movement , its weight, its tone and its color. (Boling ,Elizabeth and others,2007)

In this part we will explain the nature of instructional illustrations that are contained within the additional non-linear panels that appear when the learner needs to know more detailed information about the subject or it is necessary to see a close up scene and observe parts of the elements inside.The illustration appear when clicking on certain, defined parts of an object. In this case part of the shape can be left away to reveal more interesting inner structures. Due to the viewer's prior experience with the object he still can mentally complete the object from the partial information he is shown and then discover and confirm his guessing through revealing the hidden panels .There are variety expressive visualization methods with several levels of abstraction, the purpose of the illustrations distinguish the choice of the representation method, the most important of these representations are:

Cut-away drawings:
It is displaying a section or part section through the complex subjects or objects. This allows to see through the surface and perceive other surfaces or structures behind. Using arrows along the stream surface enables to see beyond the front stream surfaces and perceive the flow direction. It is important to have a clearly defined idea of what to depict and how to depict it . The illustrator must know where to make the cut and what kind of cut is most appropriate, plus choosing the suitable perspective for the specific requirement, as diametric perspective which is often used for cut-aways. There are some rules should be taken into consideration so the learner could read those illustrations clearly:

- inside and outside objects have to be distinguished from each other.
- a section view is represented by the intersection of two half spaces.
- a mechanism to make the walls visible is needed.
- cut-outs consist of a single hole in the outside object
- interior objects should be visible from any given viewing angle .(j.diepstraten and others, 2003) (Giemsa, Bettina,2007) .(Viola ,Ivan and E. Gröller ,Meister, 2005).

Ghosting representation:
This visual representation uses transparency as the dominant method. so they are semi-transparent illustrative views. The inner parts of an object can be seen by displaying the outer case as if it is transparent. Semi-transparent views unveil interesting objects obscured by context information through increasing the transparency of the context. Various levels of depth can be displayed by using multiple levels of transparency , which may appear gradually on the screen by clicking on the defined parts , care must be taken to preserve clarity , taking into consideration that too much detail , that's too much depth , becomes confusing for the learner. There are some rules to be followed so the learner could read those illustrations clearly.

- Faces of transparent objects never shine through.
- Objects occluded by two transparent objects do not shine through
- transparency falls-off close to the edges of transparent objects.
- Use layers of colors and tones to simulate transparency by placing different layers in light colors over each other.
- Adding light effect and shading to enhance the impression of transparency. (Giemsa, Bettina,2007) .(Viola,Ivan and E. Gröller ,Meister, 2005)

Exploded Views :

Exploded views modify the spatial arrangement of features to uncover the most prominent ones. It is also a very effective way to present assembly instructions. Exploded views enable a clear view on individual features and convey the information about the original spatial location by lines or arrows providing information on assembly order. The many parts have to be drawn in extended positions within the hidden panels where the illustration wouldn't consume more space. However, using this representation view in how things work illustrations can make it difficult for viewers to see which parts interact and how they move in relation to each other. The illustrator needs to place parts skillfully, keeping in mind that the order has a direct influence on the clarity and comprehensivity of the illustration . and the reader shouldn't get lost when looking at the illustration. (Mitra, Niloy J. and others,) The rules for assembly instructions are based on cognitive psychology and experiments:

- assembling is decomposed into a hierarchy of operations and parts in sequential panels.
- parts in the same hierarchy have to be added at the same time-step, or in sequence one after another.
- step-by-step instructions in panel by panel are better understandable than a single diagram showing all the operations.
- diagrams presenting the final assembly are necessary to understand the step-by-step action diagrams.
- parts added in the current assembly step must be clearly visible.
- objects have to be presented in their clearest orientation.
- stylistic devices are varied which enables the learner to percept the meaning of the illustration more easily such as line weights , line types which may form patterns to convey regular and irregular textures through choosing appropriate weighs and spacing for those lines . (Mitra, Niloy J. and others,2010) (Giemsa, Bettina,2007) .(Viola ,Ivan and E. Gröller ,Meister, 2005).

READING INSTRUCTIONAL ILLUSTRATIONS

Reading instructional illustrations is a process of translation, analysis, and interpretation of all the illustrated information, and linking such information to gain access to useful scientific conclusions of the subject content **.** Reading process depends on a range of factors and variables associated with reading graphical representations as it is a complex operation that include many of mental processes of decoding the meaning of the illustrated subject as identifying, describing, differentiation and interpretation**.** Training to read such illustrations need some basic skills as:

- Translation of the illustrations; finding out what each line or symbol or number on the illustration means in each panel and this skill includes knowing the components of the illustration, the sequence of these components, and the relationship between them. The learners are guided to describe the illustration through verbal words or through an introductory explaining page (panel) identifying the concepts of the illustration content .
- Analysis of the illustrations; the ability to recognize the relations between the procedures through clarifying the sequence of the procedures, and requirements of each procedure.
- Interpretation of the illustrations; giving the reason or reasons to the sequence of the illustrations, as well as the relations between the illustrated actions .
- Conclusion of the illustrations ; coming up with some results, generalizations or concepts from the illustration and anticipating certain changes as a result of the implementation of the procedures described.(Fathalla, Mandour Abd-Elsalam,2007).

So Reading instructional illustrations depend on several mental and cognitive processes which are supported by the nature of illustrations including:

Perception:
Some learners(visual thinkers) can actually see the percept shift in their mind's eye in the case of visual perception. (Wettlaufer, Alexandra K.,2003), depending on several features of perception the most important are perceptual constancy, grouping and contrast effect. In addition of effect of motivation and expectation.

Observation:
Instructional illustrations are received and recorded by the learner depending on looking where he thinks he will find positive results, or where it is easy to record or sees what expected to be seen or what wanted to be seen. Observation involves drawing conclusions, as well as building personal views about how to handle similar situations in the future, rather than simply registering something has happened. It is considered a continuous process of learning through visual representations .

Retention:
Retention usually refers to keeping information available in the long-term memory, but the ability to retain needed information in working memory is equally important to learning and performance. The combination of verbal proposition and mental image establishes multiple pathways by which the information can be retrieved from memory; where the learner builds a mental model through constructing three linkages when receiving the instructional illustrated subject:

- construct a verbal representation, in which he builds issues in the working memory.
- construct a visual representation where he builds fantasies in working memory.
- construct linkages that have significance between visual and verbal representations, and this contributes to the mental model building, and so enable the learner to solve problems that require a call to this mental model. (Fathalla, Mandour Abd-Elsalam,2007)

Obviously, illustrations can help learners retain information by stimulating the mental images to facilitate dual-coding. They can be of special value when teaching abstract information by providing images that learners might not generate on their own. Charts showing trends, diagrams of processes, and visual metaphors of abstract ideas are all ways of providing images for abstract ideas.

Attention:
Gaining attention is critical because of the limited capacity and duration of the short-term or working memory which has a capacity of five to nine items and a duration of 10 seconds, according to most researchers.

- attentional focalization : focusing attention on a certain element in the panel (page).
- attentional discarding : stopping attention on an object by transforming focus on another.
- attentional movement : passing attention from one part to another of the attentional field inside each panel.

Illustrations can help because they can be complex to the senses, and because they can provide novelty in the probably more plentiful stream of spoken words or written text. Attention is drawn to what is new or unexpected in the learner sensory field.

Understanding:
Understanding concrete information through abstract illustrations - which depend on line drawings or other simplifications, highlighting the critical elements in an unrealistic way- is usually more effective than realistic illustrations, specially for showing those things that can't normally be seen, such as the interiors of objects and the microscopic and macroscopic. Illustrations are important for teaching principles that have spatial determinants. Realism may be necessary for the later stages of developing expertise, where objectives require learners to identify or manipulate objects in the real world.
Illustrations which convey and explain abstract information by providing spatial metaphors for logical structure using space, lines, boxes, arrows, color, and the relative distance between elements can provide a concrete equivalent of abstract ideas. As there are methods of making graphic representations of the common structures of information, such as comparison and contrast, procedural steps, description, causation, and chronology, For example, column charts are efficient for comparing or contrasting the characteristics of items; time lines are good at showing chronological relationships; flow charts can show causation clearly.

And generally the learner require multiple mental processes which affect realization and reading of instructional illustrations in sequential art, through which he can identify the visual elements, and their relationship, and distinguish details through observation , accurate understanding of the relationships, imagination and critical thinking, then tasting artistic structural relations to evaluate the illustration in each panel and its relationship to the subject as a whole.

CONCLUSION

There are several points must be taken into consideration when implementing instructional illustrations in non-linear interactive sequential art as:

- expressing the nature of the information accurately and clearly .
- clarity of illustration and its suitability for learners plus reflecting the visual pleasure by the side of learning.
- Reducing complexity of the illustration to the minimum level necessary for the objectives by eliminating unnecessary elements.
- Critical elements are made conspicuous, non-critical elements are de-emphasized.
- The illustration is organized to reflect the conceptual or real-world organization of the information.
- Interaction with the illustration is encouraged through the use of captions or questions and references in the panels.
- The need for clarity of navigation tools represented in the hyperlinks to use the aspects of non-linear interactive sequential art easily in the learning process.
- Arranging panels to prevent random eye movement through the subject, taking into consideration the characteristics of this movement represented in the direction of eye movement
- The necessity of identifying the moving track between the panels and the illustrations of the subject, through numbering or naming the panels at the beginning of story, or in every page, which raises the curiosity of the learner to discover the separate images. Beside determining the moving to or from the different images, by clicking on special forms or selecting specific elements without tracking the sequence of the story to be re-viewed and followed in an attempt to understand and explore the subject.

KAVRAM YANILGISI, BİLİŞSEL ÇATIŞMA VE KAVRAMSAL DEĞİŞİM: ÖĞRETMEN ADAYLARI ILE BIR DURUM ÇALIŞMASI

Bu araştırma; bir Türk Üniversitesi'nde ilköğretim matematik öğretmenliği programında öğrenim görmekte olan yedi öğrenci ilegerçekleştirilen bir nitel çalışmadır. Bu öğrenci grubundan; bütün kenar uzunlukları eşit ve $\sqrt{5}$ birim olan bir altıgeni bir dinamik matematik yazılımı olan GeoGebra ortamında oluşturmaları ve olusturma sürecini bir ekran kaydetme program olan Wink ile kaydetmeleri istenmiştir. Yedi kişilik öğrenci grubu 15 video kaydı oluşturmuştur. Kayıtlar, öğrenciler tarafından bir Wiki ortamına aktarılmıştır. Ekran kaydı görüntüleri kare izleme yöntemi ile analiz edilmiştir. Çalışmada; kavram yanılgısı, bilişsel çatışma ve bunun sonucu olarak bilişsel değişim, verilen bu problem durumu çerçevesinde öğrenci cevapları ışığında tartışılmıştır.

INTRODUCTION

Conceptual change is different than knowledge acquisition because the former occurs if there exists a prior knowledge and the person who has misconceived this certain type of knowledge is aware of his or her misconception and is willing to evolve his or her understanding towards a correct conceptualization. However, knowledge acquisition needs a lack of prior knowledge – missing knowledge –and/or an existence of incomplete knowledge –gap in knowledge (Chi, 2008). Regardless of the type of conceptual change – whether within or across ontological categories (Chi, 1992), it is quite safe to claim that the first condition to remove misconception is to make the person realize the ill-structure that she or he has. However, realization is necessary but not satisfactory, because the person, then, needs to be convinced to replace the current misconception with the correct one. Put in another way, "[t]he major goal is to create a cognitive conflict to make the learner dissatisfied with his or her existing conception" (Ozdemir& Clark, 2007, p. 352).

In order to achieve this goal in our study, we, first, identified the existence of misconception in preservice teachers' understanding of equilateral hexagons. Equilateral hexagons, in contrast to proper hexagons, may or may not have equal angles. Despite the existence of distinct terms, both in Turkish and English and possibly in other languages too, used to define this distinction; we documented that the distinction is unclear for many people. This paper reports on how we documented preservice teachers' existent misconception on equilateral hexagons and how we used this documentation as an opportunity to engage them in changing –evolving –their conception. Besides reporting conceptual change as a complete process starting from misconception to arriving at the replacement of correct information with the one in conflict, we also documented participants' use of GeoGebra, which provides us with significant information on how they had instrumentalized (Artigue, 2002) this software as a cognitive tool. Regarding the use of technology, this is also an empirically tractable question for us because we also concern about the proper integration of technology itself in mathematics education, theoretically speaking in Technological Pedagogical Content Knowledge – so called TPACK – (Koehler, & Mishra, 2008) of preservice teachers.

Moreover, the research itself is a demonstration of the effective use of Information and Communication Technologies (ICT) in mathematics education research. First, the partners of research team reside in different cities and even in different countries and had to communicate online throughout the research. Second, the exchange of data and information was done through the use of web 2.0 tools, particularly wiki spaces. Third, data collection was done by employing screen capturing, which is a

relativelynew method to collect data (Asselin, &Moayeri, 2010; Cengel&Karadag, 2010; Hosein, Aczel, Clow, & Richardson, 2007; Karadag, 2009). Four, data has been analyzing by using another new method, frame analysis method that is developed by Karadag (2009) during his PhD research and further tested ina study conducted by Cengel and Karadag (2010).

The focus of this paper will be on our initial findings inferred from the screen capturing data illustrating participants' ways of using GeoGebra. We will also present the misconception of a participant by providing explanations and screenshots of her work, as a case,the process of conceptual change that a participant went through. Finally, we will discuss pedagogical implementation of this experiment.

Theoretical Framework

Chi (1992) discriminates the conceptual change within a category and the one across categories and argues that the change in the latter is almost a knowledge acquisition process because the ontological description of concept changes in this case. For example, considering geometric figures such as polygons and circles as functions or relations –that is, analytic form –demandscompletely different type of thinking than what is done in geometry courses and leads to acquisition of a new set of knowledge. Given that conceptual change across categories is beyond the scope of the research being reported here, we will devote our attention to conceptual change within categories.

Figure 1 depicts a tree diagram to represent subcategories of polygon concept within its own category and to delineate the misconception that students may have. As seen in the figure, hexagons can be categorized whether their sides are equal or not. Furthermore, equilateral hexagons can be distinguished with respect to the regularity property. Regular hexagons form a branch of the tree of equilateral hexagons because they have some special constraints. That is, their interior –also exterior –angles at each corner have to be equal whereas this constrain is not a necessary condition for equilateral hexagons. This is the point that many people may have developed a misconception, as a concept in conflict with the correct one but constructed in one's mind as if it is the correct concept (Yenilmez,&Yasa, 2008).

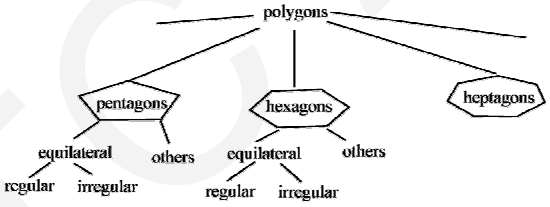

Figure 1: Subcategories of polygon

A similar misconception about regular pentagons has been identified by Ubuz (1999). She stated that students tend to apply the features of regular pentagons to any type of pentagon. It appears that students use the terms of *regular* and *equilateral* interchangeably without paying attention and/or knowing the difference between them. Prior to describing our strategy to remedial this ill structure, it seems to be a good idea to review the framework describing conceptual change for similar cases. Chi (1992) asserts three types of conceptual change within a category, which serves for our purpose as well, to alter misconceptions.

Revision of part-whole relationships

Trapezoids can be defined as quadrilaterals having two opposite sides parallel to each other while parallelograms can be considered as quadrilaterals having also the other opposite sides parallel in addition to the property trapezoids have. Thus, one can interpret the relationships between these two concepts as one of the cases illustrated in Figure 2.

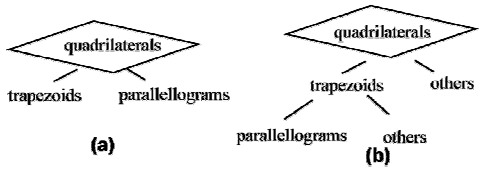

Figure 2.Reorganization of the concept of Quadrilaterals

Moving from (a) to (b) demands a reorganization of the concepts, because no new knowledge is acquired. Also, the change could be achieved through a careful discussion of features.

Formation of new categories

Referring to the example we used in our research, regular hexagons have equal angles whereas equilateral hexagons may have unequal angles too (see Figure 3). The change occurs here is actually the result of a cognitive process because participants are assumed to differentiate one group of figures –regular hexagons – from others –irregular hexagons –to form a new branch under the same tree –equilateral hexagons.

Therefore, the conceptual change in this particular case could be considered as an acquisition process rather than a straightforward migration of subcategories. Aforementioned cognitive processes are the kind of differentiation and integration as well as generalization of subcategories because the person should put a cognitive effort to differentiate the current concepts and integrate in a different way to establish the new cognitive schema.

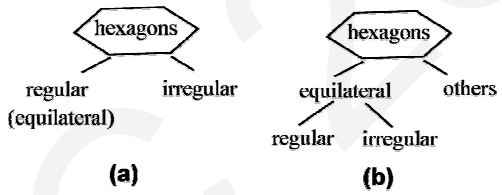

Figure 3.Reorganization of the concept of Hexagons

Reclassification of existing categories

Considering a reclassification of figure 1 as illustrated in the figure 4 requires the formation of new categorical structure. This type of transformation –change –from one existing categorical structure to another one can be achieved without a migration of concepts and even without a really substantial cognitive effort to re-structure his or her understanding but re-classify the current understanding

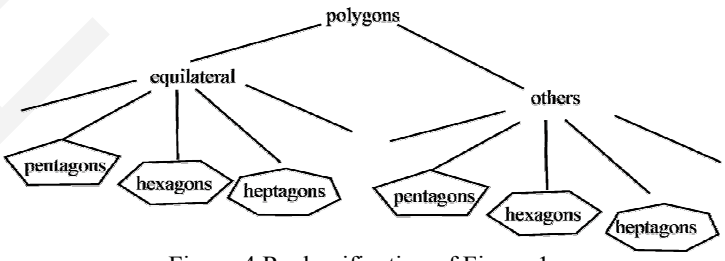

Figure 4.Reclassification of Figure 1

METHODOLOGY

In this qualitative research, 7 pre-service teachers studying mathematics education at a Turkish University were recruited for the study and asked to construct an equilateral hexagon whose sides are $\sqrt{5}$ units in length.

Although it was explicitly emphasized them to create equilateral hexagons, our assumption was that they, at least some of them, would create regular hexagons instead.

They used GeoGebra, which is a dynamic and interactive mathematics learning environment (DIMLE) –a term coined by Martinovic and Karadag (2011)-, to construct their artefacts and Wink to record their work. They were asked to talk aloud while constructing their artefacts such that Wink could record their talking. After completing their work, they submitted their work at a public wiki space because the communications between researchers as well as between participants and researchers have been performed online.

Their work has beenanalyzing by using frame analysis method (FAM), a method developed by Karadag (2009) in his PhD study and re-tested in a study done by Cengel and Karadag (2010). Selected students were interviewed to validate our interpretation of the results and to elaborate on the results of analyses. During the interviews, students were presented their own construction(s) as well as the constructs of equilateral but regular hexagons, developed by researchers.

FINDINGS

The number of constructs submitted to the wiki space by 7 preservice teachers was 15 in total, and some participants submitted more than one construct. The main reason to submit more than one solution is that because those participants intended to illustrate different constructions. The difference in constructions was rooted in various ways. For example, one of the participants used three different techniques such as (1) 1-2-$\sqrt{5}$ right angle triangle, (2) latex command, and (3) analytic formula of circle to make GeoGebra calculate and create a line segment whose length is $\sqrt{5}$. Similarly, they used various techniques to construct the hexagon, such as constructing (1) by using circles, (2) by reflecting triangles, or (3) by marking end points of line segments and connecting them.

In order to investigate how much participants have instrumentalized GeoGebra, screen capturing as a data collection method seems to be an effective strategy because we could have a chance to analyze every and each second of their construction processes. This analysis has revealed that seven participants have developed in varying degrees of competencies of instrumentalization. The detail of the followingdescription of their construction processes is provided in Appendix.

Majority of participants preferred keeping grid view and axes active although some of them used gridlines in their constructions. Their way of using gridlines was usually to construct a line segment, whose length is $\sqrt{5}$, by using two adjacent grid squares, that is a rectangle whose sides are 1 and 2 and therefore whose hypotenuseis $\sqrt{5}$.

Regarding drawing a line segment whose lengthis $\sqrt{5}$, two students used sqrt command while one of them preferred using latex command in their constructions. Also, four of seven students, six out of fifteen constructions,used GeoGebra *regularpolygon tool*to construct hexagon. Therefore, their preferences provide enough evidence for us to assume that their intention was to construct regular hexagons.

Other participants who were not that explicit in using GeoGebra *regularpolygon tool*demonstrated their impressive knowledge of the features of regular hexagons while creating their artefacts. For example, their way of using triangles equilateral triangles, circles, and angles helped us be convinced about their content knowledge and the misconception about the distinction between regular and equilateral hexagons.

More specifically, figure 5 illustrates one construction using 1-2-$\sqrt{5}$ right angle triangle to draw the line segment with a length of $\sqrt{5}$ and using GeoGebra angle command to draw interior angles whose measures are 120 degree each. This construction explicitly illustrates student misconception while drawing an equilateral hexagon because her intention, as seen in her construction, is to create a regular hexagon, whose interior angles are 120 degree. We, researchers, interpret this intention as an evidence of her misconception. Furthermore, one of the researchers, who collected data and is the first author of this paper, explicitly asked her intention in the interview to confirm and validate our interpretation. Given that as any other qualitative research frame analysis method relies on researchers' interpretation to draw conclusion from data, it is researchers' role to validate his or her interpretation.

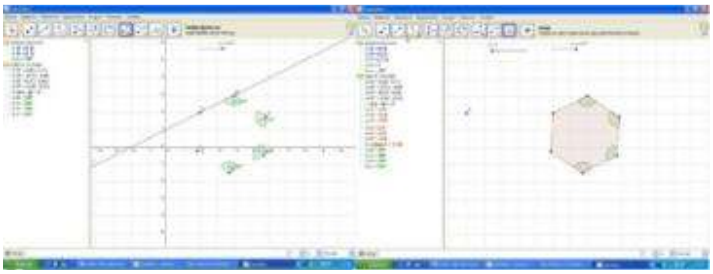

Figure 5. Student construction with GeoGebra

Similarly, figure 6 illustrates another example constructed by the same participant. In this construction, the participant creates an equilateral triangle and reflects the triangle over one of its sides to have the second identical triangle created. Again, our analysis of complete construction process illustrated another construction of regular hexagon. In fact, constructing an equilateral triangle as a starting point seems a strong evidence for the existence of misconception because only regular hexagons have equilateral triangles as part of their internal structures.

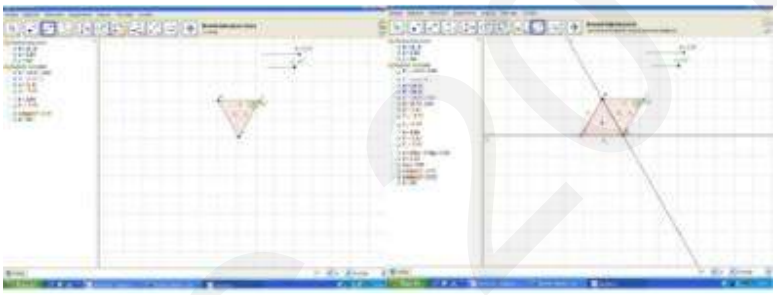

Figure 6.Student construction with GeoGebra-II

In sum, 15 constructions from 7 students explicitly demonstrated that participants had a misconception in distinguishing equilateral and regular hexagons. Then, we interviewed students to confront with their misconception and to experience a cognitive conflict. Transcription of interview data clearly illustrates how they confronted with the conflict and how they replaced their misconception with the correct one.

The first author interviewed participants and videotaped the interviews, and then shared with other authors to analyze their conceptual change process. Since this process is still in progress, we can only share initial findings here. For further data and results, the correspondence author can be contacted. During the interview, their artefacts were presented to participants to confirm our understanding and to triangulate our interpretations, and then some counter examples created by researchers were presented. Their reactions were made explicit by the interruptions of the first author. Their videotaped reactions clearly indicate that their explicit misconception evolve in time and replace with a proper conception. A more important and excitingreality we have learned from this study is discussed in the following section.

DISCUSSION

The data reveals that all participants had the same misconception although we had assumed that most of the participants will have misconception about the aforementioned example. Documenting this reality and bringing this issue front could be considered an academic success. However, the most important and valuable lesson we have learned from this study is not only the existence of misconception nor the method we employed to remedy it. The most inspiring documentation is how participants reflect on their previous

conceptualization periods and how they have started seeking and suggesting strategies to prevent this type of misconception.

To sum, this study shows that this particular type of cognitive conflict –and also cognitive change as an outcome – is quite robust not because of mathematics per se, but rather because of pedagogical consequences of experiment. Further evidence we have gathered through interviewing processes clearly asserts that this type of experience helps preservice teachers to evolve their understanding of mathematical content and, more important than that, to reflect on the reasons had led them to the misconception they had developed in the past. Moreover, this experience encourages them to seek possible strategies to avoid unwanted misconception formation.

ABSTRACT

The increasing widespread of mLearning application in educational institutions, museums business organisations and other contexts justifies the need for a concept in defining the education practice across these contexts, and also because of the clear concept in defining research agenda and producing predictions and generalizations. The present arguments on concepts of mlearning in the literature do not necessarily define mlearning's unique characteristics. These characteristics are important to be appropriately defined and presented for better understanding of mlearning as future concept of sustainable learning for all. Learning theories, design, activities, and practices for mlearning would then be appropriately described once the concept of the learning is appropriately constructed. Hence the study discussed the important elements and characteristics of mlearning concept which essentially differs it from other technology based learning. The study also proposed an adapted model of mlearning for clearer mapping of the concept.

Keywords : mlearning, elearning, future learning, sustainable learning, digital site-specific learning, learner generated context

INTRODUCTION

During the 4th World Conference on mLearning, Keegan (2005) offers three bases for mLearning to justify its incorporation in mainstream education and training : 1) The

future is wireless where he states that M-commerce has began to gain preference over e-commerce since 1999 resulting in the change in how people do business, stock exchanges and banking through wireless application. This change not only is irreversible but advancing rapidly with the establishment of 3G wireless network since 2001 and the current 4G wireless network which commercially been introduce globally since 2009 and in Malaysia by YTL Corporation in 19 November 2010 (Nystedt. M, 2010). These advancement in wireless network enables individuals to communicate both through voice and video interface, acquire, transmit, and exchange information-rich content among other individuals in the forms of text, voice, graphics, videos, or integration of all these forms, effortless anywhere and anytime; thus gaining new knowledge and these strengthen the case for mLearning (Keegan, 2005); 2) Irritation with the published scenarios for mobile devices of Ericsson and Nokia. In this point of view, he raises his concern that ever since the development of wireless application and mobile technologies by such giant telecommunication operators, applications for education, training or for learning were actually never in the operators' agenda. This actually adds to the reason to the study of mLearning especially in resolving pertaining issues of wireless application and mobile technologies in education especially in the interest of incorporating mLearning in the mainstream education; 3) A 'law' of distance education research.

This last base actually fits best in justifying the need to provide mLearning as the 'law' of distance education research states that 'It is not technologies with inherent pedagogical qualities that are successful in distance education, but technologies that are generally available to citizens' (Keegan, 2005, pp.3). The example given is the 12" laser disc which was introduced in 1990 where later it was discovered to be very useful as a instructional media for English Language course. However the idea was abandoned as it was costly to be afforded by most of the people at the time. E-learning, though was introduced since 1999 fails to be embraced widely especially in third world countries such as Africa as it was too costly to provide necessary infrastructures and facilities to support the technologies. For instance, rural areas like Macha, Zambia in Africa would have to fork out a whopping $1100 per month for a bandwidth connection of only 128 kpbs shared among all Internet users within the village to support e-learning (Pais, 2007).

However for mLearning, the situation is the other way round; the technology for this sector is widely available to almost everyone in the world in the form of mobile communication devices (Keegan, 2005). Never before in the history of technology in education there has been as widely available as the mobile phones. At present, there are about 5 billion mobile phone connections worldwide which covers 72.6% of the world's population with China at the top list (Wikipedia, 2010). In Malaysia, mobile phone penetration reaches a staggering 30,379,000 subscribers, more than the country's population of 28,250,000 (Ng, Voges & Goi, 2010). This interprets that some of the subscribers own more than one mobile phone. Due to this wide availability of mobile technology it is projected that in future, mLearning will generate more carriers and professions worldwide. This partly is due to mLearning's special nature, (mobile, light, not costly and easily access compare to desktop, applicable to various fields, robust such as WiFi technology, many collaborative and individual efforts worldwide engage in

researches and applications using mLearning), which certainly requires a great number of software designers and system developers. Apart from world giant hardware and software corporations like Macintosh, Microsoft, Intel and Ericsson, both professions (software designers and system developers) particularly, are also required by all levels of educational and non-educational institutions for designing their own System for Curriculum Content Designs.

However, one of the main issue is how should mLearning be conceptualized and defined? Researchers are still debating on whether the focus should be on the mobility of learners, learning content or the technology. In different contexts, the focus may shift from learning activities to the portability of mobile technologies or in the way the mobile devices being used. This problematic issue owes to the nature of mLearning of being personal, contextual, and situated; in other words, a 'noisy' phenomenon (Traxler,2007). This would lead mLearning defined in relation to informal learning which would be a problem in incorporating this type of learning in formal learning. This paper attempts to address this issue and propose how mLearning may be conceptualized.

MLEARNING CONCEPT FORM

In his study of mLearning in Africa, Brown (2005) suggests a model for mLearning (shown in Fig. 1) which offers discussion in the concept of mLearning. Based on the model, the researcher agrees that mLearning could qualify to be a subset of distance learning in the context of learning beyond the realm of formal traditional classroom learning. In terms of technology accessibility, distance learning could be divided into two main types: a) non-electronic distance learning (mail correspondence through postal service) or paper-based distance learning as termed by Brown (2005); and b) electronic distance learning aided by technology devices (computers, pc tablets, electronic kiosks, palmtop, PDA, mobile phones, smartphones, MP3/MP4 player, and game stations) and supported by electronic facilities/applications such as the internet, Bluetooth, GPRS etc.

Thus mobile learning could naturally be divided into two types in terms of technology accessibility: a) mobile learning type 1: the first type dominantly focuses more on the learners of the olden days who traveled from one place to another, learning and attaining new knowledge with or without a predetermined intention to seek knowledge. This type is a non-formal learner-centred learning which involves the mobility of learners in engaging themselves to learning through people they meet along their journey and also through interacting with the environment as they move. One's knowledge is passed on and exchanged with others when he/she meets with other people and this promotes development of knowledge of oneself and to the knowledge itself.

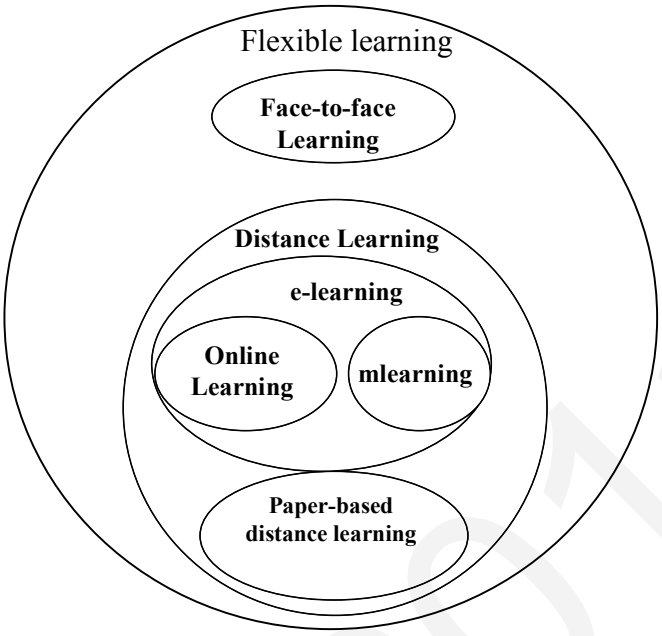

Fig.1. M-learning model

T. H. Brown (2005). Towards a model for m-learning ini Africa. International Journal on E-Learning, 4(3), 299-315.

According to Tokoro (2003), knowledge is only formed when the sender and the receiver of information share a common context of situation which he termed as "common ground". He elaborated that knowledge will be formed in oneself when the information received is "grounded" in the common ground. For example when the sender gives information about a certain place to a receiver, the information will stay as information to the receiver. But when the receiver goes to the place mentioned by the sender, meaning will be given to the information and the receiver will gain 'grounded knowledge' and no longer having mere information (Tokoro, 2003). In other words, in this context, mobile learning is explorative, situative, contextual, and cooperative in nature; 2) Mobile Learning type 2: the second type of mobile learning involves learning aided by mobile electronic technology especially mobile communication devices brought about by broadband technologies in aiding learners who are separated from time and distance to learn. It is important to note that the learners of this type still interact with people and their immediate environment to learn (similar to mLearning type 1) but making use of the advantages of computational power of the mobile devices (Goth, Frohberg & Schwabe, 2006). The main distinctive feature of mLearning type 2 as compared to mLearning type 1 is the learners, both the sender and the receiver, do not have to share a common physical ground in gaining knowledge. With mobile technology advancements developed by broadband technologies, the learners could share a virtual situation/space that closely resembles reality; thus the transformation of information to knowledge will be much easier (Nonaka.I & Tekeuchi,

1996 cited in Tokoro, 2003). Hence, the learners no longer have to commit themselves to time and place to gain knowledge.

Based on the discussion above, mobile learning type 2 could also be referred to as electronic mobile learning or e-mLearning to differentiate itself to mLearning type 1. However, e-mLearning should not be confused with mobile e-learning (also commonly addressed or abbreviated in the literature as mobile learning or mLearning). Mobile e-learning is e-learning through the use of mobile computational devices (Quinn, 2000; Trifonova & Ronchetti, 2003), which is also an e-learning perspective of defining mLearning. This will be elaborated further in this chapter. E-mLearning on the other hand is mLearning aided by mobile computational devices. In this paper, the term mLearning refers to mobile learning type two or electronic mobile learning (e-mLearning).

PERSPECTIVE AND DEFINITION OF MLEARNING

Defining mLearning not only establishes a shared understanding but would also help to conceptualise mLearning which is essential in observation of its evolution and direction (Traxler, 2009). However, similar to mLearning concept issue, the mLearning community of practice has yet to come to a single agreement on the definition of mLearning though mLearning has emerge since the first published studies in the year 2000 (Sharples, 2000). This is especially due to the dynamic nature of mLearning as new concept of learning. In mobile learning literature, there are basically four main perspectives of mLearning (Winters, 2006, Kukulska-Hulme & Traxler, 2007):

1) Technocentric,
2) Relationship to e-learning,
3) Augmented formal learning, and
4) Learner centred.

Technocentric Perspective

The earliest perspective which also dominates the literature is technocentric which is also based dominantly on mobile technology devices. Here mLearning is perceived as learning using the aid of mobile devices such as PDA, mobile phone, iPod, portable Playstation etc. Examples of definitions of technocentric perspective of mLearning would be learning through mobile devices such as Palms, PDA and mobile phones (Quinn, 2002); any educational provision where the sole or dominant technologies are handheld or palmtop devices" (Traxler, 2005); mLearning as learning away from one's normal learning environment or learning involving the use of mobile devices (Sharples, 2004 in Rajasingham, 2010); mLearning as any activity that allows individuals to be more productive when consuming, interacting with, or creating information, mediated through a compact digital portable device that the individual carries on a regular basis, has reliable connectivity, and fits in a pocket or purse (Clark & Quinn, 2009) or even by the £6million MoLeNET(2007) UK project which chooses to define mLearning as exploitation of ubiquitous handheld hardware, wireless networking and mobile telephony to enhance and

extend the reach of teaching and learning". The researcher viewed that technocentric definitions began to overwhelm the literature due to the following three main circumstances: 1) mLearning only began to surface a decade ago at worldwide level to serve the growing mobile community as effect of the development of mobile technology especially mobile communication devices such as hand phones, smart phones, and PDAs etc. Although roots of mLearning could be detected as far as thirty eight years ago when Alan Kay (1972) invented the Dynabook, the coinage of mobile and learning to form mobile learning or mLearning was only introduced recently during the flooding of mobile devices throughout the world which resulted also in conferences, seminars and workshops on mLearning within the past 10 years. 2) technocentric definition of mLearning was also resulted from localized and short-term mLearning pilots, trials and researches where most of them were based on usage of mobile devices in learning either looking into the feasibility of mobile devices in aiding learning or effects of mobile devices on learners in acquiring skills and knowledge (Mann.S., 2009; Utulu, Alonge & Emmanuel, 2010). 3) In addition, some of the mLearning projects at the time were funded by mobile communication companies like Ericsson, Motorola and Nokia. Consequently, the project and outcomes of findings usually were geared towards seeking possible market advantages for mobile communication devices and facilities in education line. Thus the tendency and inclination of mLearning projects and research were based on the use of mobile devices in learning. These also led to the techno centric definition of mLearning.

E-Learning Perspective

Another perspective views mLearning as extension to e-learning or a subset of e-learning where e-learning is the macro concept which involves online learning environment and mLearning (Brown, 2005). Here mLearning implicitly means mobile e-learning. Instances of definition through this perspective are mLearning as e-learning through mobile computational devices (Quinn, 2000; Trifonova & Ronchetti, 2003), mLearning is eLearning Lite (Clark & Quinn, 2009) or mLearning as a subset of e-learning (L. Rajasingham, 2010). E-learning perspective is closely related to the former technocentric perspective, to the extend it seems to be a specific subset of technocentric definition of mLearning. However technocentric/e-learning definitions of mLearning were criticized as imprecise justified by the transcience and diversity of the mobile devices, systems and platforms which resulted in highly unstable definition (Traxler, 2009). MLearning is conveniently placed somewhere on e-learning's spectrum of portability (Traxler, 2005); thus does not lend in characterising the unique nature of mLearning (Winters, 2007). An e-learning definition would assume mLearning as a lesser degree mode of learning comparatively. In e-learning definition of mLearning, the small mobile computational devices are thought to assume similar active role in replace of desktop or laptop computers. This inevitably raises some technical drawbacks of mLearning due to the small screen size of mobile devices and short battery life span compared to desktops or laptops, and conveniently limiting mLearning in its prospect for future learning. MLearning would be perceived as merely a branch of a primary mode of e-learning. In e-learning, computers wired by the internet plays a dominant and active role where learning materials are

delivered, learning process is moderated and context of learning is designed for learners who comparatively assume a passive role. However in mLearning, the learners are activated by the mobile computational devices to interact with the physical, conceptual or abstract place to do and think during the learners' learning process.

Goth, Frohberg & Schwabe (2006) argue that the real physical context of learning or the immediate environmental setting of the learner should be the main foreground of the learners' focus in the learning process whereas the mobile devices (mobile phones, PDA, smartphones etc) should be the background of the learning focus which could be switched to the foreground of the user's attention instantaneously when needed but only temporarily as the learner need to return their focus to the environment. The role of computer device here is to enrich the physical environment on demand and allow additional activities. Hence, in mLearning, it is a passive role for the mobile devices in contrast to the learners' active role in being activated by the devices to do and think in their learning process. This active role is also the main characteristic shared in mobile learning type 1 as discussed above. In other words, the learner assume an active role in learning while the devices play a passive role in facilitating learning. Hence, e-learning and mLearning should be perceived as two different mode of learning, and by placing mLearning in e-learning would do injustice to mLearning. This characteristic of mLearning is in actual fact in contrast with electronic learning (e-learning) concept where in e-learning, computers assume an active dominant role in the learners' learning process where the computer delivers the learning material, moderates the learning process and designs the context of learning (Goth, Frohberg & Schwabe, 2006).

Augmented Formal Learning

The third perspective views mLearning as augmented formal education. This perspective attempts to unfold the misconception of formal education as categorized merely as a stereotype face-to-face classroom bounded learning as oftenly described in technology based or electronic based learning literature. However, the existence of distance education for over 100 years (Peters, 1998) evoked questions on relationship of mobile learning in all forms of traditional learning besides classroom learning. Therefore, it is natural to perceive mLearning as a support to traditional learning or even to enrich classroom learning as proposed in the curriculum design for mLearning in this study.

Learner-centred Perspective

The fourth perspective of mLearning argues that the focus of mLearning should not be in the mobility of mobile devices but rather the mobility of the user and content (Winters, 2003; Kulkulska, 2009) or learner centred (Winters, 2003). This perspective observes a shift of mLearning concept focussing on device to focussing on learners' mobility (Winters, 2003) or mobility of content (Kulkulska, 2009). Examples of definition based on this perspective would be 'any sort of learning that happens when the learner is not at a fixed, predetermined location, or learning that happens when the learner takes

advantage of learning opportunities offered by mobile technologies" (O'Malley et al.' 2003) while Lehner, Nösekabel, & Lehmann, (2003) define mLearning not only covers learning via mobile devices, network and wireless, but it has expanded covering any service or facility that provides a learner with general electronic information and educational content that assists in knowledge acquisition anywhere and anytime. This is supported by Kulkuska (2009) who suggested that devices learners use may be hardly relevant; what should be of importance would be the mobility and the construction of learning conversations in that process. However, Kulkuska (2009) did not deny of the influence of mobile device choice in learning. The availability of technology of learners in fact influences the learners' learning choice. For, example, language learning through mobile phones would be through oral conversation or electronic text (blogs) between learners; whilst learners who own a Nintendo DS, designed for games would engage learners to language learning games instead. Conversations between learners is a vital mode of learning in mLearning as defined by Nyiri (2002) which describes mLearning as learning which occurs when individuals communicate wirelessly.

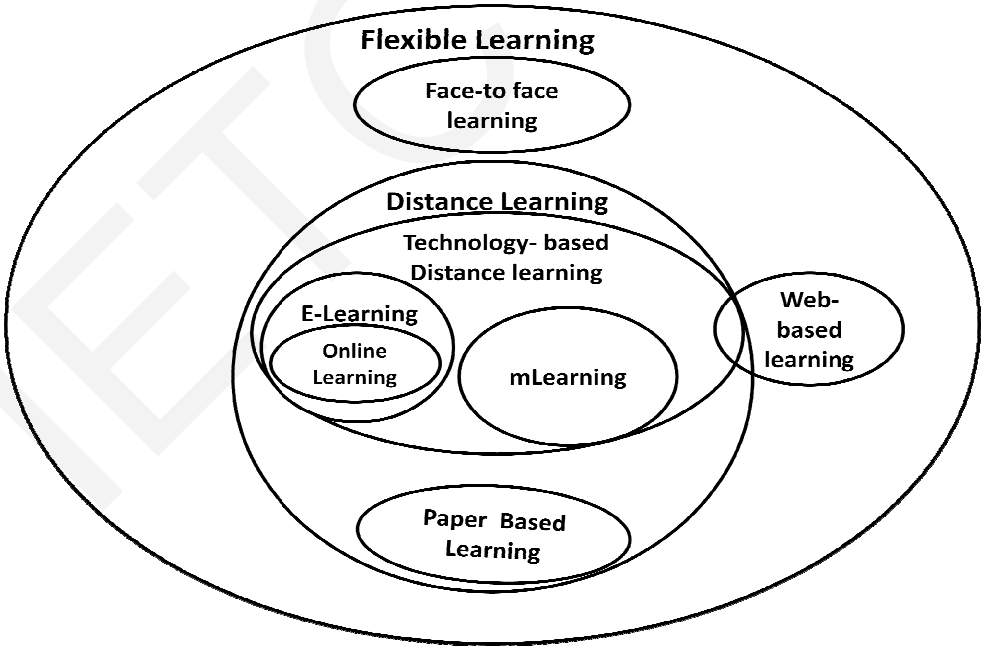
DISCUSSION

Based on the perspectives above, the mLearning elements: the mobile devices and applications, the learner (and the mobility of the learner), and the learning context or learning environment are inseparable and interact with each other to form mlearning. MLearning will cease to exist without the presence of any of the elements. Not only the elements need to interact with each other in order for the learner to be able to engage himself in mLearning; the elements develop each other in the process. To illustrate this, the learner needs to interact with his mobile devices and the context to develop his knowledge. Interaction between the mobile devices and the learner's immediate environment will enrich further the environment to improve learner's learning. Learner's progress in knowledge acquisition will lead to construction of new knowledge as a result of enriched learning environment. This will lead to new needs of learning, which then requires new development in mobile devices and applications; thus, the interaction among learners, the learning context and the mobile devices will further develop the mobile technologies.

However, in conceptualising and defining mLearning, the learners should be the focus
and at the same time assuming great importance of the role of mobile technologies and learning context. In other words as discuss earlier here, in mLearning, the learner plays an active role while the mobile devices and applications assume a passive one which is to enrich the physical environment on demand and allow additional activities. In supporting this view, Goth, Frohberg & Schwabe (2006) stated that the real physical context of learning or the immediate environmental setting of the learner should be the main foreground of the learners'focus in the learning process whereas the mobile devices (mobile phones, PDA, smartphones etc) should be the background of the learning focus which could be switched to the foreground of the user's attention instantaneously when needed but only temporarily as the learner need to return their focus to the environment.

Another important element which needed to be highlighted in conceptualising mLearning
is its unique attribute compared to other technology based learning in aiding learners to learn. In mLearning, students not only embark on knowledge constructions but they would also generate learning context on site that would also lead to more knowledge construction; the students may share common learning environment or context and develop the digital representation of the site or context using mobile technology. The site or context may not necessarily be a physical environment where the students is placed but could also be a network space or even a conceptual or abstract place such as a mutual learning subject or a learning problem (Nonaka, 1966). Laurillard (2007) terms this act of learning through generating context as 'digitally-facilitated site-specific learning' which is an intrinsic nature of mobile technologies which is not shared by other distance learning technologies such as desktop and landlines. This type of learning is very motivating as it offers learners a high degree of ownership and control. In the aspect of learners' motivation, besides degree of ownership and control, other affective forms of motivation afforded by mLearning are fun, communication, learning-in-context, and continuity between contexts (Jones, Issroff et al., 2007). This aspects of motivation offered through mLearning are another unique characteristic of mLearning to other forms of distance learning technologies.

Based on the consideration of the unique characteristics of mLearning to other form of distance learning technologies, a proposed model of mLearning is shown in Figure 2.



Source: Adapted from T. H. Brown (2005). Towards a model for m-learning in Africa. International Journal on E-Learning, 4(3), 299-315.

CONCLUSION

Mlearning is unique on its own; its attributes need to be separately defined from other learning technologies in conceptualising mlearning though it complements other forms of learning. In conceptualizing mLearning, at least three main characteristics of mLearning as discussed need to be considered whether in the design of learning or technologies : the roles of learners and technology devices; digital representation of learning settings and experiences; and the affective forms of motivation as focus of learning. The concepts proposed and discussed here are important in determining the direction of mlearning as future and sustainable learning for all.

APSTRACT

This paper presents an original model 12 x n (covering 12 aspects in the n dimensions): 12 goals, 12 processes of curriculum activities, 12 expected resulting competencies of students etc. According to the presented model is shown the comparative analysis of the modified IT curriculum, including all the key principles and ACM/IEEE recommendations, as well as compliance with international programs with other universities in the region and the EU. Results of the model application are presented in the curriculum changes for IT, as complex process with many participants, and viewed through the prism of ISO/IEC standardization of IT through 12 segments.

Keywords: *IT, modeling, curriculum, standardization*

INTRODUCTION

Information technology (IT in further reading) are an enormously vibrant field that emerged in the middle of the last century as our society experienced a fundamental change from an industrial society to an information society, and in the end of the 20th century IT became a key element of the knowledge society.

IT are not just technology for the processing and use of information, and they have become an integral component of the curriculum as the new programs at the interdisciplinary, multidisciplinary, transdisciplinary (IMT in further reading) studies and similar directions in other areas/fields, providing a basis for effective and creative use of knowledge as key factors in the development of society. Therefore, the education and training of young people must not be left out of IT.

The aim of inovating IT curriculum is to produce a new model curriculum that could serve as a model for the IT basic academic studies and recommend ways of integrating curriculum with research and with professional practice. The curriculum model should incorporate innovations, best practices, continuous monitoring of news in the standardization, but need not be constrained by traditions that no longer make sense.

The IT field has been maturing rapidly and intensivly, and from a set of technology-oriented, autonomous disciplines it has become a profession. The specialties of the profession are many (over three dozen) and can be "placed" in the 12 ISO/IEC standardized fields or be grouped into three sets (Denning J. P., Athale R., Dabbagh N., Menascé D., Offutt J., Pullen M., Ruth S.(2000)) :

1 The IT specialities are concerned with aspects of computing and networking technology itself (Artificial intelligence, Computer science, Computer engineering, Computational science, Database engineering, Graphics, Human computer interaction, Network engineering, Operating systems, Performance engineering, Robotics, Scientific computing, Software architecture, Software engineering, System security);

2. IT-Intensive disciplines (Bioinformatics, Cognitive science, Digital library science, E-commerce, Genetic engineering, Information science, Information systems, InfoSec and Privacy, Instructional design, Knowledge engineering, Management information systems, Multimedia design, Telecommunications); and

3. IT infrastructure areas are staffed by professionals who implement, maintain, operate, and repair IT (Computer technician, Help desk technician, Network technician, Professional IT trainer, System administrator, Web services designer, Web identity designer).

The IT field is thus much more complex in character than computer science and presents completely new challenge to educators. Because the IT field is dominated by professional specialities, not just intellectual disciplines, its students need to be immersed in practice as much as in a study of concepts and principles. They need to learn to be professionals, which means they need to learn and embody their specialty's body of knowledge, its standards of practice, and its ethical codes of conduct.

Given that IT is a very new discipline, its focus is on developing educational programs that give students a foundation in existing concepts and skills. Modeling a curriculum for a set of related IT professional degrees today is not the only challenge. Because the half-life of technical knowledge is so short - and with "Internet time" continues to get shorter - in IT education we must pay special attention to fostering in its graduates the ability to continue learning new technologies with the constant application of standards throughout their future work. In addition, the IT market features a model of innovation that is quite different in character from the research model most familiar in universities.

IT are becoming an output profile in IMT field in higher education in our country, with recommendations of standards (such as bylaws, (Group of authors (2010)) for: 1) **15% of academic education subjects, 2) 20% of theoretical and methodological subjects, 3) 35% of scientific and expert subjects and 4) 30% of professional applied subjects.**

MODELING AND DESIGN CURRICULA FOR ACHIEVING THE OBJECTIVES AND COMPETENCIES THROUGH DOZENS ASPECTS

Modeling/designing of curriculum is guided by the ***outcomes x 12*** that the study program should achieve, i.e. it is essential to consider the goals of the program and specific capabilities that students need to have after graduation. This goals x 12 and associated techniques are used for determining whether the goals are met or they do not provide the foundation for entire curriculum.

The Objectives of the Study Program Through Dozen Aspects

The objectives of the study program are required by standard number 3 for the accreditation of academic programs on the first and second level of higher education (Group of authors (2010)).

Undergraduate studies of IT (2008 - Technical Faculty Cacak), with prescribed content and methods of work should ensure the objectives defined by the 12 aspects, and by analogy with own excellence model:

1) acquisition of professional competence in the field of IT and development of methods for their further development;
2) increase in technical and computer literacy for computer engineering;
3) acquiring academic skills in the IT field and related areas of technology (electrical engineering, mechanical engineering, automation, robotics, etc.) and the adoption of methods for their further improvement and development;
4) development of independence, analytical and critical approach to research and solve problems with IT;
5) international standardization in technical and technological areas and to transfer this knowledge in appropriate educational areas;
6) raising awareness and responsibilities of IT professionals for the development of economic, social system and environment;
7) creative development of innovative capabilities and skills to implement different development procedures;
8) acquisition of theoretical and methodological and theoretical basis for process management in business administration;
9) skills for managing peripheral devices in the IT;
10) training to create a software interface for application integration and configuration of computer system;
11) training students for further self-education and continuous updating of knowledge;
12) education and training professionals to work in specific areas of IT, but in many areas of IT application.

Basis of IT Curriculum Model

Information Technology (IT) in its broadest sense encompasses all aspects of computing technology. IT, as an academic discipline, focuses on meeting the needs of users within an organizational and societal context through the 1) **selection, 2) organization, 3) culture, 4) creation, 5) standardization, 6) networking, 7) visualization, 8) processes, 9) economy, 10) integration 11) knowledge and 12) application**.

According to ISO / IEC standardization and hierarchical classification, IT are classified into the field 35 (ICS 35). They are separated from the information science or science of information (ISC = 01.140) and classified in 12 standard segments.

Based on aspects of computer technology, IMT, processes 1-12 and IT standardization, model of IT curriculum is developed. This model is presented in Figure 1, in order to achieve quality and meet the required accreditation standards for academic programs on the first and second level of higher education (Group of authors (2010)) with a special focus on standard number 5.

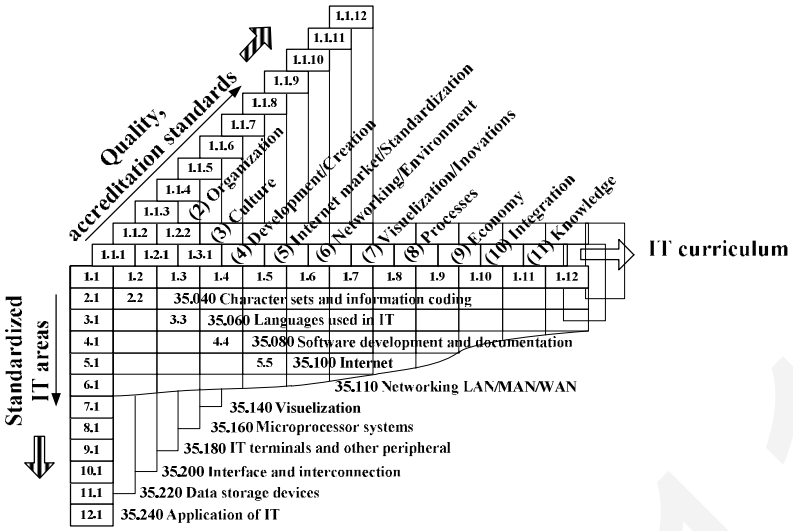

Figure 1: Basis of IT curriculum model

Competencies of Graduates Through Dozen Aspects

Graduates must possess the following skills upon graduation, namely the ability to:

1) collaborate in ***teams*** to accomplish a common goal by integrating personal initiative and group cooperation;
2) analyze, identify and define the requirements that must be satisfied to address problems or opportunities faced by ***organizations*** or individuals;
3) identify and evaluate current and emerging ***technologies*** and assess their ***applicability*** to address the users' needs;
4) ***design*** effective and usable IT-based solutions;
5) demonstrate an understanding of best practices and ***standards*** and apply them;
6) ***communicate*** effectively and efficiently with clients, users and peers both verbally and in writing, using appropriate terminology;
7) recognize the need for knowledge ***innovation***, to continue learning through the career;
8) assist in the creation of an effective project plan or ***business*** process and activities;
9) analyze the impact of technology on individuals, organizations and society, including ethical, ***economic*** and legal issues;
10) integrate solutions in the user ***environment***;
11) demonstrate that they ***know*** how to think critically and have the skills to solve problems;
12) use and ***apply*** current technical concepts and practice in basic IT.

COMPARATIVE ANALYSIS OF CURRICULUM AND INTERNATIONAL COMPLIANCE

In Serbia today, (in IT areas) students are being educated in academic and vocational studies (180 ECTS - IT engineer, 240 ECTS - graduate IT engineer, 300 ECTS - master IT engineer, 360 ECTS - specialist IT engineer, 300 + 180 = 480 ECTS - PhD - IT) in the area of IMT, with the participation of expert and professional applied subjects with about 40%, or 45% respectively, according to the recommendations of the *Commission for Accreditation of Quality Assurance* (Group of authors (2010)).

The Need for Innovation and Curriculum Compilance

IT as the academic discipline can be well characterized as the most integrative of the computing disciplines, which means that a graduate of an IT program should be the first one to take responsibility to resolve a computing need, no matter the source or description of the problem, and no matter the solution that is eventually adopted. The depth of IT lies in its breadth: an IT graduate would be the one to select, create or assist to create, apply, integrate, and administer the solution within the application context.

Dozen aspects of compliance with ACM/IEE - (Information Technology 2008 (2008)), we can find in Figure 2, where the pillars of IT are programming (programming fundamentals - 3 as well as integrative programming & software engineering - 4), Internet technologies - 5, networking - 6, Web design - 4, Web WGI -7, databases - 12, human-computer interaction 1 - 12, upgraded by technology platform - 10 (operating system - 4, computer architecture and organization 8 - 11, as well as computer infrastructure 8 - 9). Overarching the entire foundation and pillars are system integration and architecture, system administration and maintenance - 11, information management, information assurance and

security - 2, and social and professional issues. While this figure does not depict all aspects of the IT discipline, it does help to describe the relation of the key components.

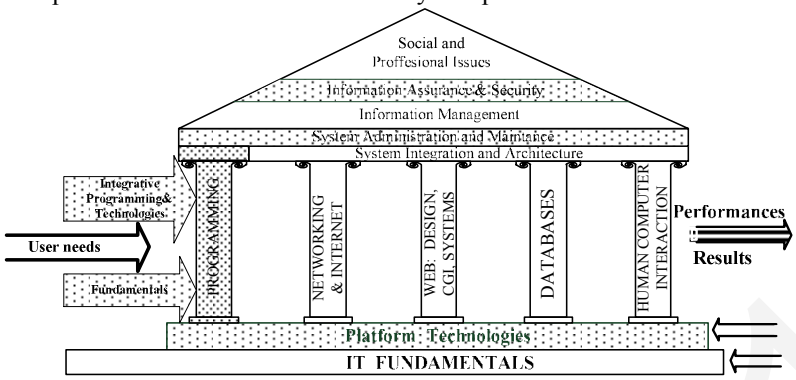

Figure 2: IT as academic discipline (adapted from Information Technology 2008 (2008), p19)]

Technical advances over the past decade have increased the importance of many curricular topics, such as the following: Introduction in ICT (ICT 1, ICT 2, 1-12), Security (2), Object-oriented event-driven programming (3), The World Wide Web and its applications (5), Client-server technologies (6), Networking technologies, particularly those based on TCP/IP (5+6), Systems administration and maintenance (2+4+6+8+9+10), Graphics and multimedia (2+7), Web systems and technologies (5), Service-oriented architecture (5+6+9+10+12), E-commerce technologies (12), Relational databases (12), Interoperability (12), Technology integration (4+12), Sophisticated application programmer interfaces (APIs) (10), Human-computer interaction (1 - 12), Application domains (12).

International and Regional Compilance Curriculum with EU

With the aim to verify the compliance of the innovated IT curriculum model several programs have been discussed. As representative examples from EU countries are taken Faculty of IT (FIT), Brno from Czech Republic, Faculty of Informatics sciences and techologies, in Crema, University of Milano from Italy, while from the region is set aside for the purposese of this analysis Faculty of IT in Mostar, from "Dzemal Bijedic" Univesity, Bosnia and Herzegovina, with the accredited programs of IT studies.

From non-informatics subjects alignment was performed for: Mathematics (Discrete matematihcs, Mathematical analysis, Numerical methods and probability, and probability Statitistic Fundamentals of Engineering Mathematics), Physics (Physics - compulsory or elective), English language, Circuit Theory and Signalisand Systems, Electronics and Automation and industrial measurement (as elective), Technical Drawing and Modeling and Operational researches in industry. From socio and humanistic science are coordinated (as compulsory): Principles of Economics and Business, Sociology, Reporting (FIT, Mostar), Benchmarking (Technical Faculty, Cacak), and as the election subjects Communication Skills, Personality psihology, Business Management, Educational Psyhology, Engineering Pedagogy and Didactics at the FIT in Brno, Business Processes Management (Faculty of Informatics Sciences and Techologies, Crema), Psychology, Marketing, Management of Changes (Technical Faculty, Cacak).

The results of comparative analysis of the above-mentioned study programs - by key segments of the IT field with the appropriate ECTS (where elective subjects are marked with *), with our domestic, innovated model from Technical faculty are shown in Table 1.

[1] Faculty of IT, Brno, [2] Faculty of Informatics sciences and techologies, Crema, [3] Faculty of IT, Mostar, [4] Tecnical faculty, Cacak

In order to complete coverage of all 12 standardized IT segments, at FIT from Brno are studied: Peripheral Devices (4 ECTS), User Interface Programming (4 ECTS), Scripting Languages (5 ECTS), Advanced Assembly Languages (5 ECTS), The C++ Programming Language (4 ECTS), Java Programming Language (4 ECTS), VHDL Seminar (4 ECTS), MS Windows for Desktop Systems (5 ECTS), MS Enterprise Solutions (5 ECTS), Security and Computer Networks (4 ECTS) and Multimedia Transmission over IP Networks (4 ECTS), LAN Switching (4 ECTS), Accessing the WAN (4 ECTS), MS Windows Network Technologies (5 ECTS), which allows further adjustments (for 3+1+1 years).

The new model of IT studies is a formally and structurally aligned with modern world trends and the status of the profession in the IT area. It offers students the latest scientific and technical knowledge and trends in the field of IT. Given the model is a comprehensive and compatible, both with the models from European educational space (Table 1, columns 1 and 2), and with the model from region (Table 1, the 3rd column), with complete coverage of all 12 standard segments of IT.

RESULTS OF THE APPLICATION OF THE PRESENTED MODEL/MODELING

Given the trends of knowledge innovation in the field of IT through the prism of standardization, above mentioned technical considerations and ACM/IEEE recommendations, Table 2 shows the results of application of ***innovation*** model of the accredited undergraduate IT study program (where elective subjects are marked with *), with the representation of the expert and profesional-applied subjects through 12 standardized segments of IT, including ACM/IEEE recommendations (Information Technology 2008 (2008)).

Table 2: The expert and profesional-applied subjects in the accredited undergraduate IT studies, through 12 standardized IT segments (Micic Z. (2005))

</table>

The new curriculum has been successfully integrated into a model study 3+1+1 (year) and should be accessible to a wide range of students (more than 4+1 or 5+0), as too often happens that such a curricula attracts a homogeneous population with relatively few females and students with an ethical, social or economic backgrounds that are not dominant in a given environment. It is necessary to provide a greater diversity, both by eliminating bias in the curriculum and by actively encouraging a broader group of students to participate (Information Technology 2008 (2008)).

The new curriculum must provide students with a capstone experience, but also with a habit to continually innovate their knowledge with the experiences that offer them a chance to apply their skills and knowledge to solve a challenging problem, also the curriculum should include a final one-year project, which requires that students use a range of exercises and techniques in solving basic problems, taking into account that there are aspects of IT disciplines that can not be adequately presented in the classroom, and that those skills can be learned only through the practical work. (Information Technology 2008 (2008)).

During the application of the presented model with 12 aspects of ISO/IEC, the plans were made for each subject through 12 thematic aspects (since the subjects are one semesteral, with 15 working weeks, which is also practical and instructive and produces results, etc.).

CONCLUSION

Centuries-long trends suggest that the role and place of agriculture in in the eighteenth century are more occupied with IT and services, towards knowledge society in the 21st century, which also requires a higher level of consciousness, culture, driven by the expected outcomes and competencies.

The presented model 12 x n provides the basic structure for curriculum development and can be used as a platform for the classification, given the coverage of all IT segments. The model contains all the essential elements which are necessary to build a curriculum which is fully functional, effective and dynamic, promotes innovation, creativity and professionalism, despite the fact that curriculum design requires some adjustment at the local level. Components that are examined in this work are necessary to create mechanisms to respond to constant changes in the environment.

The presented curriculum reflects the integrity and character of IT as an independent discipline, given that IT is characterized by a combination of theory, practice, knowledge and skills in more areas/fields (IMT studies), and IT curriculum ensures good practice .

IT curriculum as a whole maintains a consistent ethos that promotes innovation, creativity, and professionalism. Throughout the entire curriculum, students should be encouraged to use their initiatives, standards and imagination to go beyond minimum requirements and to maintain a professional and responsible attitude from the very beginning.

The innovated curriculum responds to the rapid technical change and inspires students to do the same themselves, because IT is a "living" area that is rapidly changing and therefore the IT curricula must be regularly updated. It is created to teach students to respond to changes in the same way, so that they could respond to the change as well and become lifelong learners, while the faculty staff should constantly look for better ways to deliver the curriculum because a constant improvement should be a hallmark of a healthy IT program.

This research is conducted due to develop a preschool multimedia interactive software (MICFruit) with holistic and spiritual approach that illustrate ten (10) local fruits in Malaysia. It is developed based on our National Preschool Curriculum and National Preschool Standard Curriculum components focuses on spiritual, physical, behavior and socio-emotion, language and communication, mathematic and pre-logic, sensory and environment, creativity and aesthetic. Learning process will enhance student's motivational through dynamic and interesting method combining multimedia elements that stimulates the senses of auditory, sensory and touch integratically. This development consists of many important decision-making stages such as analysis, design, development, implementation and evaluation (ADDIE model). Final expectation from this research is to harvest an appreciation value to our Creator and specifically fruit as the creation among children in the aspect of physical, emotional, spiritual and intellectual form.

Keywords : preschool, multimedia interactive development, holistic, spiritual

INTRODUCTION

In Malaysia, preschool education involving children aged five to six years. These children should be provided with knowledge before commencement of obligatory education at age 7 years old. Education given to children should include all aspects of life to produce balance and holistic child development. The aspects that need to be given attention in the development of childhood are the physical, intellectual, emotional and spiritual aspects.

According to Kamaruddin (1996), *fitrah* (nature) of the children is divided into two; physical and material related to this world and spiritual aspects that relate to God and hereafter. Physical and material are the basic needs in life such as shelter, food, drink and clothing. This nature allows the child to live comfortably. Meanwhile, spiritual refers to the needs of the soul. Exposure to know God is to prevent the child a sense of loss and emptiness in their hearts. Both *fitrah* will cause the child a sense of calm and secure in the love of parents and mercy of the Creator. The potential of the children are grouped into several aspects known as, intellectual, spiritual, emotional, physical and social. All these aspects need to be developed and monitored to produce a balanced child potential.

At the First World Conference on Muslim Education held in Mecca in 1977 emphasized on the balanced growth of total personality of man through the training of man's spirit, intellect, the rational self, feelings and bodily senses. Education should therefore cater for the growth of man in all aspects; spiritual, intellectual, imaginative, physical, scientific, linguistic, both individually and collectively and motivate all these aspects towards goods and the attainment of perfection. The ultimate aim of Muslim education lies on the realization of complete submission to Allah at the level of the individual, the community and humanity at large (Mahayudin, 1999 cited in Wan Noor Hazlina Wan Jusoh & Kamaruzaman Jusoff, 2009).

The awareness of having holistic approach in education has been a major concern to the Malaysian education system (Rohana Hamzah et al., 2010), stated in The Malaysian Education Philosophy (MOE, 2010):

> "Education in Malaysia is on-going efforts towards further developing the potential of individuals in a holistic and integrated manner, so as to produce individuals who are intellectually, spiritually, emotionally and physically balanced and harmonic, based on

> a firm belief in and devotion to God. Such an effort is designed to produce Malaysian citizens who are knowledgeable and competent, who possess high moral standards and who are responsible and capable of achieving high level of personal well-being as well as being able to contribute to the harmony and betterment of the family, the society and the nation at large".

The above definition defined a holistic approach in education as an approach focused more on the whole teaching and learning process in education (Rohana Hamzah et al., 2010).

Thus, with the advance development of information and communication technology (ICT), Muslim educators need to equip themselves with ICT skills especially multimedia in order to cater the growth of students in all aspects; spiritual, intellectual, imaginative, physical, scientific, linguistic, both individually and collectively. If we fulfill this, only then we able to produce balanced students spiritually, physically and mentally, because multimedia tools are part and parcel of their lives nowadays (Wan Noor Hazlina Wan Jusoh & Kamaruzaman Jusoff, 2009).

Computer and multimedia technology offers tools that are very special so called "mind tools". This is due to many applications use this technology in the science subjects that assist teachers in teaching and learning of children involving the use of the mind. Children incorporate information through observation and describing objects, animals and plants as part of a scientific study on their age level. Children also make the collection, ask questions, and talk about science in front of classmates (Feasy & Still, 2006).

MULTIMEDIA INTERACTIVE DEVELOPMENT

The findings of an observation and interview involving preschoolers and preschool teacher in National Children Development Research Center (NCDRC), Sultan Idris Education University towards analysis phase are as follows (Nor Azah & Marzita, 2009):

- the combination of text and audio are preferable due to its easiness and clarity
- children are more likely attracted towards motion and sound
- CD design selection should integrate audio and animation elements such as singing and dancing, stories with cartoon elements
- Concept are based on exploration
- Preferable colours are bright and colourful colours.

To develop a successful interactive multimedia software in the eyes of children, developer have to let the children be in control, work at their own pace, manipulate the system, play a role in the action, create, see the things done on the screen immediately, have feedback that is not too delayed, and have goals either set for them or set by them (Normahdiah Sheik Said, 2007). Design for children is different than design for adults as follows (Kelly, n.d.):

- children are much more critical
- children have no patience. For example, they click before they listen and often (especially boys) need to return to something a number of times before they really get it, not because they are unintelligent but because they are trigger happy
- children don't read (not counting if they are too young to read)
- children want clear responses and intelligent systems
- children need a lot of feedback and like to have a lot of interesting instructions and encouragement when there is a learning challenge
- children need reinforcement of their experience on the computer in the classroom or outside/ beyond the computer
- kids never ask why do I need this programme; adults are much more skeptical
- the computer is a huge motivator for kids

MicFruit development consists of many crucial decision-making stages such as analysis, design, development, implementation and evaluation (ADDIE model). Within analyzing phase, the instructional problem is clarified, the goals and objectives are established, and the learning environment and learner characteristics are identified. Design phase is a phase where instructional strategies are designed and media choices are made. In the developmental phase, materials are produced according to decision making in design phase. The implementation phase included testing of prototypes (with targeted audience) and putting the product in full production. Formative evaluation is presented in each stage

whilst summative evaluation covers criterion-related reference items test and providing opportunities for user's feedback (Nor azah et al., 2010).

The development process starts with identifying targeted users and analyzing their needs, studying and comparing preschool interactive multimedia on the market by identifying its strength and weakness in the context of multimedia elements usage (text, graphic, animation, audio and video), interface, navigation, colour blending and so forth, developing storyboard, acquiring material, manipulating and editing multimedia elements, integrating multimedia elements within authoring software and evaluation followed by producing and managing preschool interactive multimedia software. A high commitment is required in every development phases to produce appropriate and interesting interactive multimedia software, hence fulfilling targeted user's need which is the preschool children.

MULTIMEDIA INTEGRATION WITH HOLISTIC AND SPIRITUAL APPROACH

MicFruit is developed based on holistic and spiritual component, focuses on local fruits topic as stated in National Preschool Curriculum 2006 (*Kurikulum Prasekolah Kebangsaan*) and National Preschool Standard Curriculum 2010 (*Kurikulum Standard Prasekolah Kebangsaan*). It also highlights the principle of learning, reading and experiencing meaningful and fun learning through science process and problems need to be solved by preschoolers. Fruit (durian) with holistic and spiritual approach is as follows:

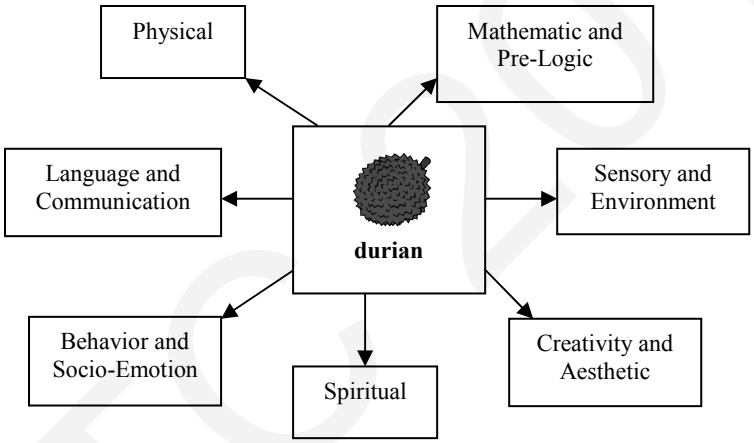

Figure 1.0 Micfruit With Holistic And Spiritual Approach

Referring to Figure 1.0, the elements included in the Micfruit with holistic and spiritual approach are as follows:

Component	Content
Physical	• select color • select size • rearrange durian's life cycle • sing the durian song
Behavior and Socio-Emotion	• thankful for God's creation – say Alhamdulillah, • feel pain when touched durian skin – Ouch! Careful, sharp thorns
Mathematic and Pre-Logic	• durian's life cycle simulation • classifying colors, size and shape
Language and Communication	• Name • Skin texture • Flesh and Seed

	• Size, Shape and colour
Sensory and Environment	• where to grow durian • durian taste • favourite fruit
Creativity and Aesthetic	• coloring durian • durian used to flavour, ice kacang, dodol, ice cream and etc
Spiritual	• Alhamdulillah - Allah produced a durian tree and Allah also make durian flowering and fruiting • scales must be accurate • think what can be produced by durian –Allah loves those who think • sing a song to appreciate Allah's creation

Table 1.0: Holistic And Spiritual Component

An advantage of MicFruit other than holistic and spiritual approach is that it gives opportunity to the preschool children from being passive viewers of multimedia to active participants. Interactivity allows the user (preschool children) to explore a multimedia program according to preferences of children themselves. Children can jump from one topic to another topic in non-linear form. MicFruit used JABA as a guider or character of a friend or assistant who can guide them throughout the application.

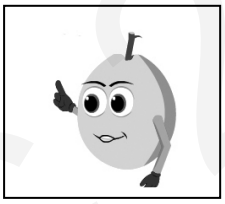

Figure 2.0: JABA

JABA will guide preschoolers throughout the application and help children to answer questions. This software is also able to help improve children's understanding of scientific concepts related to plants or specifically local fruits in Malaysia.

Figure 3.0: MicFruit Interface Design

CONCLUSION

Final expectation from this research is to harvest an appreciation value to our Creator and specifically fruit as the creation among children in the aspect of physical, emotional, spiritual and intellectual form (holistic approach) as stated in The Malaysian Education Philosophy.

USING THE INTERACTIVE LEARNING ENVIRONMENT APLUSIX FOR TEACHING SCHOOL ALGEBRA: A RESEARCH EXPERIMENT IN A MIDDLE SCHOOL

Said Hadjerrouit
Faculty of Technology and Science, Kristiansand, Norway
Said.Hadjerrouit@uia.no

Abstract
Most software tools that have been developed with the aim of helping students to learn school algebra have not yet achieved successful results in classroom. Almost all of them are menu-based systems that provide transformation rules in menus and buttons. Aplusix is a new interactive software tool for learning school algebra. In contrast to existing software tools in mathematics education, Aplusix has been developed to allow students to freely build and transform algebraic expressions as they can do on paper. In addition, Aplusix provides appropriate feedback and interactivity, and as such, it becomes a source of learning. This work reports on a research project on the investigation of students' learning of elementary algebra with Aplusix. The work uses the Theory of Didactical Situations to analyze and evaluate the learning potentialities of Aplusix. The paper also reports on implications for the learning of school algebra and the integration of Aplusix into mathematics classroom.

Key words: Aplusix, learning, mathematics education, school algebra, Theory of Didactical Situations, utility value

Introduction

The difficulties of learning school algebra in a paper-pencil environment relate to different analyses: The evolution from procedural to structural conception (Sfard, 1991), semantic/syntactic difficulties (Drouhard, 1992), the transition from arithmetic to algebra (Vergnaud, et al, 1988), the status of letters and the notion of variable in algebraic expressions (Kieran, 1992). Another difficulty is that algebra is often seen as a formal, isolated system where manipulations of symbols are often dominating (Kieran, 1991). There has been a great deal of research in teaching and learning school algebra the last 15 years (Kieran, 2007). However, despite the fact that researchers know relatively more about the learning of algebra, a great deal remains to be researched, in particular the integration of ICT into classroom. Several software tools aiming at helping students to learn algebra, have been developed, but few of them have achieved successful results in classroom yet (Kieran, 2007; Zbiek, Heid, & Blume, 2007). A promising interactive software tool in school algebra is Aplusix (Chaachoua, Nicaud, Bronner, & Bouhineau, 2004; Nicaud, Bouhineau & Chaachoua, 2004). The aim of this research work is to gain theoretical and practical insights into the learning and teaching of school algebra within the interactive environment of the software tool Aplusix. The remainder of the work is structured as follows. First, the theoretical framework is outlined. Second, the literature review is reported. Third, the research experiment in a middle school is described. This is followed by the data collection methods. The evaluation results are then outlined. Some implications on the use of Aplusix for the learning and teaching of school algebra conclude the article.

Conceptual Framework

The modes of use of Aplusix depend on the chosen conceptual framework in terms of interactions with the students in classroom. The Theory of Didactical Situations (Brousseau, 1997) is one of the most appropriate frameworks for investigating interactions with Aplusix. According to the Theory of Didactical Situations (TDS), learning occurs by means of interaction between learner and a "milieu" (Figure 1).

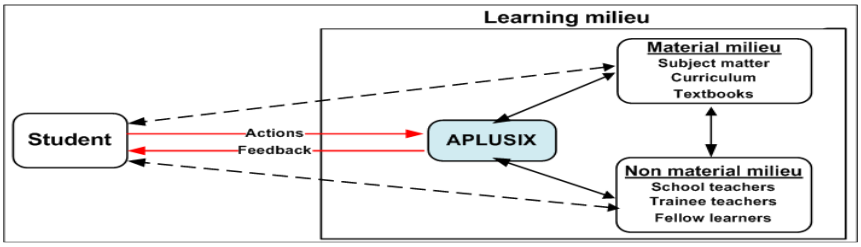

Figure 1: Interactions of the student with the "milieu" according to TDS

Each action of the student in the "milieu", which consists of a material and non material "milieu" (Figure 1), is followed by a feedback of the "milieu" itself, which generates difficulties and contradictions. Learning happens through adaptation of the student to the "milieu". Aplusix can be considered as an element of the "milieu", and as such, its feedback becomes a source of learning. Aplusix provides three categories of feedback (Nicaud, Bouhineau & Huget, 2004): Feedback about the equivalence of expressions, feedback on the state of the current step provided by indicators in the software, and feedback provided by textual messages. The role of the teacher is that of setting a situation or experiment in which students interact with Aplusix to achieve a given educational goal (Cerulli, Pedemonte & Robotti, 2005).

Teaching Experiments with Aplusix: Literature Review

Several experiments with Aplusix have been carried out in mathematics education in different countries (Bouhineau et al, 2005; Nicaud et al, 2006; Nicaud, Bouhineau & Huget, 2004): remediation piloted by researchers in Italy; remediation integrated into the regular functioning of classes in Brazil; collaborative learning in India, and regular use during an entire year in France. On the basis of these experiments, researchers (Bouhineau & al, 2005) concluded that Aplusix has been shown to be a usable computer system, favoring the students' learning of school algebra. In addition, the cost of integrating Aplusix into the teaching of algebra is low. Furthermore, the students gained autonomy and improved their knowledge. Finally, Aplusix facilitated the teachers' work because of the students' autonomy and of already-made lists of exercises. However, despite the promising benefits of Aplusix, research work still remains, among other things develop adapted experiments for many features of the software, collect a large number of protocols and study transformation rules by-hand, use an algorithm to diagnose the transformation made by the students, narrow the domain (in order to get more actions for each student on one domain), determine typical conceptions of students in this domain, and use of Aplusix for a very large number of students, exploiting the feedback of Aplusix to mediate the equivalence between algebraic expressions (Maffei, Sabena, & Mariotti, 2009), and understanding the relation between design and usage of Aplusix (Trgalova & Chaachoua, 2009). Finally, there is a need to perform comparative studies between different countries.

Experiments in Classes of Grade 10

Experiments with Aplusix took place in two classes of grade 10 having 30 students each and 2 teachers in a middle school. The major goal was to evaluate the student progress in learning after the training phase with Aplusix. The experiment consisted of a teaching sequence with four major phases. It is similar to the one described in (Nicaud, Bouhineau, & Chaachoua, 2004). First, a pre-test of 30 minutes, using paper-pencil techniques, was given to the students. Second, before any teaching of algebra, the students were introduced to the functionalities of Aplusix. Then, the learning of equation solving with Aplusix began with the training phase, using the feedback of the system. This phase had a two weeks' duration. Finally, a post-test of 30 minutes using paper-pencil techniques was organized in order to measure the students' progress in comparison to the pre-test.

Data Collection and Analysis Methods

Both qualitative and quantitative methods were used to collect data. Quantitative data collection consisted of three methods. The first one used pre- and post-test with paper-pencil techniques to measure the students' progress in learning school algebra between the pre- and the post test. The second method relied

on statistics that is automatically produced by Aplusix. The data collected statistically can be analyzed and displayed on the screen (Nicaud, 2006). These consisted of students' past activities such as attempted exercises, well-solved exercises, calculation errors, scores and time. The teacher can select the students individually in order to analyze their performances. Finally, a survey questionnaire was used to collect data about the utility value of Aplusix. The questionnaire used a five-point Likert scale from 1 to 5, where 1 is coded as the lowest and 5 as the highest.

Three methods were used to collect qualitative data. The first one used the students' protocols that are produced by Aplusix. Protocols permit the analysis of difficulties encountered by the students, their strategies used in the resolution of problems, the students' acquisition of relational understanding of the equal sign, and the analysis of exercises with bad percentage of success to identify possible didactical variables. The second method used semi-structured interviews with teachers (*N=2*) and students (*N=6*). The third method used observations of students' interactions with Aplusix. There are three types of interactions that can be observed: Student-teacher, student-student, and student-textbooks.

Results

Results are described with regard to the following issues: Students' understanding of the equal sign; students' performances in solving equations; students' algebraic strategies and resolutions, and utility value of Aplusix.

Students' Understanding of the Equal Sign

The exercises in the pre- and posttest contained similar tasks. The goal was to identify students who had a relational understanding of the equal sign both in the pre-and post-test. The results indicate a progression of 23% from the pre-test (11%) to the post-test (34%) with regard to the percentage of students who had a relational understanding of the equal sign (Table 1).

Pre-test (in %)	Post-test (in %)	Progression (in %)
11	34	23

Table 1: Students' progression in their understanding of the equal sign from pre-test to post-test

Students' Performances in Solving Equations

Regarding the students' performances in solving equations the following results were achieved (Table 2):

	Task	Pre-test (in %)	Post-test (in %)	Progression / regression (in %)
1	ax = b	68	90	22 %
2	–a = -bx	18	42	24 %
3	a/b*x = -c/d	2	0	-2 %
4	–ax+b = 0	21	24	13 %
5	ax+b = -cx-d	11	22	11 %

Table 2: Students' performances in solving equations

The results show that tasks using fractions (exercise 3) were very difficult for all students. Exercise 1 and 2, which were more familiar to the students, achieved a progression of 22% and 24% respectively. Most students (90%) solved exercise 1 in the post-test. Exercise 2 was interesting from a pedagogical point of view because it contains a didactical variable (the minus sign). Students had difficulties with this type of exercise in the pre-test (18%). It seems that Aplusix helped some students to solve this exercise (42% achievement in the post-test), a progression of 24%. Exercise 4 and 5 achieved lower results (13% and 11% respectively). This is not surprising since these exercises require the understanding of two didactical variables (the minus sign and the number zero).

Summarizing, the students' performances seem to be dependent on the task type (increase from 0 to 24%). In particular, fraction tasks were a very difficult problem for all students (-2% regression). In addition, problems with the equivalence principle play a role, and it may be well suited to train students with Aplusix.

Students' Algebraic Strategies and Resolutions

The following analysis is about the students who acquired a relational understanding of the equal sign in the post-test, that is to say an understanding of the equivalence principle. The analysis concerned their algebraic strategies they used to acquire such an understanding. The analysis was based on the students' protocols produced by Aplusix. To be able to reason algebraically and develop strategies students need to understand the equivalence principle, manipulate didactical variables, and solve complex equations. The following experiments show the steps the students went through to acquire an appropriate understanding of elementary algebra.

a) Understanding of the Equivalence Principle

The following examples (Figure 3 and 4) show a gradual learning process in three steps. First, the student was not able to use the equivalence principle correctly. In the second step, the student seemed to be able to make progress, before he/she managed in the third step to solve the exercise using the equivalence principle.

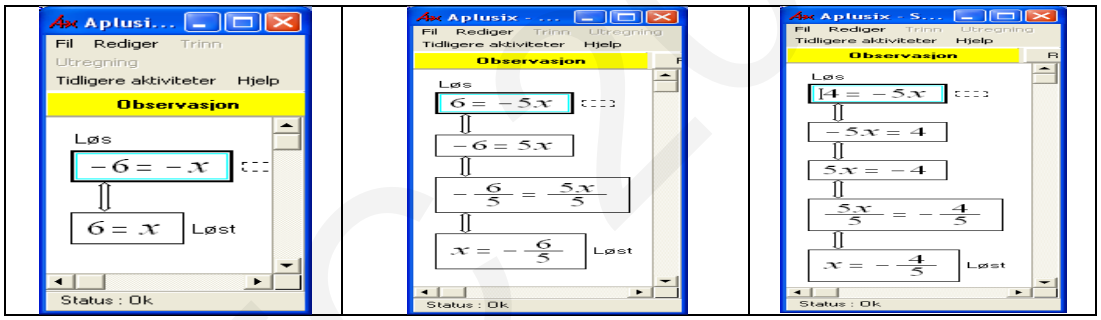

Figure 3: Example showing a gradual understanding of the equivalence principle

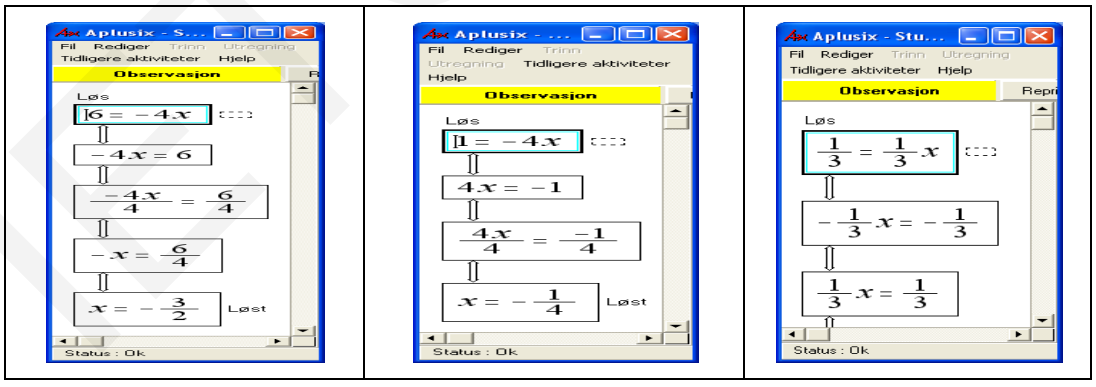

Figure 4: Example showing a gradual understanding of the equivalence principle

b) Use of the Didactical Variable Minus and Arithmetic Knowledge about the Number Zero

This example shows that the student was first not able to understand the role of the number zero and minus sign in algebraic equations. In the second step, the student improved her/his understanding of the didactical variables considered (Figure 5).

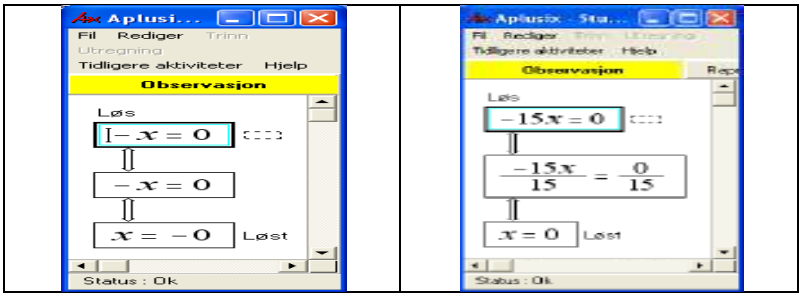

Figure 5: Example showing a gradual understanding of didactical variables

c) Solving Complex Equations

This example shows the students' ability to solve complex equations (Figure 6). It appears that the student made progress in solving complex equations in comparison to his/her performance in the pre-test.

Summarizing, the following conclusions can be drawn:

1. The lack of arithmetic skills may have been an obstacle to learning algebra. In particular, problems with the didactic variables fraction, minus, and zero, but also the lack of awareness of arithmetic conventions, such as omitted count characters and calculation priorities, leading to problems when solving equations.
2. The performance of many tasks seems to have helped the students' learning.
3. One way to help students to acquire an understanding of algebraic equations is to increase the number of equivalent steps in the solution process when using Aplusix.
4. Students, who had a relational understanding before they began to use Aplusix, could quickly increase their understanding and performance.
5. Several students used algebraic strategies in the post-test than in the pre-test.

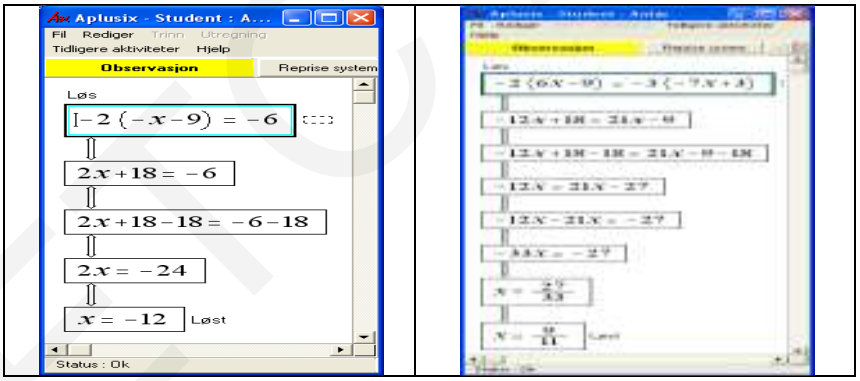

Figure 6: Example showing students' ability to solve complex equations.

The Utility Value of Aplusix

The utility value of Aplusix was evaluated on the basis on 5 criteria: Technical usability, pedagogical usability, feedback, differentiation, motivation, and interaction. The evaluation was carried out by means of survey questionnaires. The results achieved are as follows:

- *Technical usability*: There is a relatively large consensus that the program is easy to learn and to use for most students.
- *Pedagogical usability*: Aplusix seems to be pedagogically suited for both average and strong students, but students at a low level do not appear to have benefited from the software. The reason may be the students' limited prior knowledge, unfamiliar task types, and the mathematical language used in Aplusix. The students' different ways of working (Procedure-oriented, solution-oriented or reflected) seem to affect whether Aplusix may be pedagogically useful. The integration of Aplusix into classroom may have a positive impact on learning, even for students at a lower level.

- *Feedback*: Students from the analysis group (*N=13*), that is to say the group of students who changed their understanding of the equal sign from operational to relational, responded differently to feedback, either unstructured or structured trial and error or with a targeted improvement of the error. All ways of working with Aplusix lead to learning. However, it is difficult to conclude that this applies to all students.
- *Differentiation:* Teachers believed that Aplusix may be suitable for adaptation to some students' needs. Students' responses to the questionnaire indicate uncertainty in relation to differentiation opportunities among students.
- *Motivation:* At the beginning of the experiment with Aplusix all students were motivated and task-focused, and some of them were highly motivated. However, the motivation decreased over time, especially for weak students. Lack of prior knowledge can be a reason for decreased motivation.
- *Interaction:* Most students used Aplusix interactively. They needed little teacher help than in normal hours, and there were few interactions between with the "milieu" and the students. However, the interactions with the "milieu" (fellow students, teacher) were difficult to measure due to a number of contextual factors.

Conclusions and Recommendations

As with all educational research of this nature, it is difficult to conclude direct causality between the characteristics of the experiment and the learning effect of Aplusix since a number of contextual factors may implicitly affect the learning process. However, by considering the various parameters, both technical and pedagogical, that have been taken into account in this work, it has been possible to make some reasonable interpretations of the results. These indicate that Aplusix shows potential for learning school algebra, although not all types of students benefited equally well. Aplusix may have a positive impact on the students' learning if some conditions are met. Firstly, students need to have a basic knowledge of the relational understanding of the equal sign. Secondly, students should have prerequisites, especially a good arithmetic basis. Third, the design of didactical situations is important, such as choice of task types that are adapted to the students. Then, teachers' ICT expertise, both technical and didactical, is important. Furthermore, the time aspect needs to be considered, both for the learning and use of Aplusix. Finally, the integration of Aplusix into classroom could increase the value and benefit of the program for learning elementary algebra. This may be an important condition for improving student achievement and performance.

ABSTRACT

Objecting to develop quality of study process we apply worldwide (International Civil Aviation Organization (ICAO)) European (European Aviation Safety Agency (EASA)) civil aviation education standards to study and practice process at our university. Starting form English language learning in foundation classes we modernize teaching - learning process of speciality subjects and built simulator practice center with Boeing, Airbus and ATR simulators for practice opportunities of both young specialist and students.

We resort general English language learning models of Turkish and aviation English learning models of UK universities, practice technology of USA, Germany, France and Lithuanian civil aviation institutions and distance learning opportunities offered in European universities. The process activated the students to research of study technologies and drive advantages. Hereby, the aim is to get target involving increasing number of students applying international study technologies such as ICT, distant teacher-student trainings and certification, networking and the like.

Keywords: aviation English, simulator center, distance learning, certification, networking

Introduction

There are some international education standards at civil aviation institutions that should be fulfilled by each of them. National Aviation Academy (NAA) works on two of them currently- International Civil Aviation Organization (ICAO) standards and European Aviation Safety Agency (EASA). One of major conditions of the standards is to obtain min. 4th level of ICAO Aviation English level for flight crew, proficiency in English language, the same study standards and systems of European High Education Institutions and aviation schools. NAA leads activities to obtain the standards: New buildings and campuses, special simulator center with apparatus, new curriculum, ECTS of evaluation, new methodology, young staff involvement, refreshment of editions and the like..

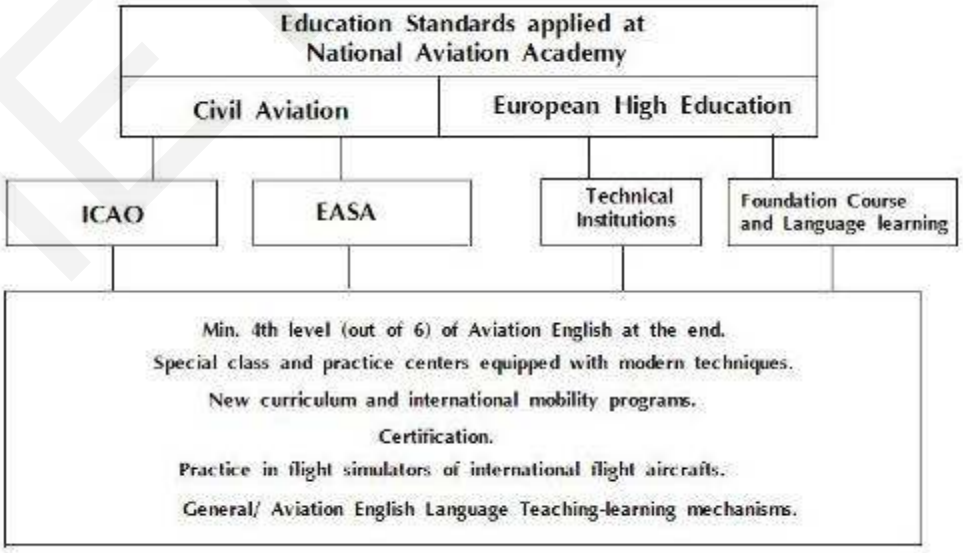

Fig. 1 *(General view of education standards at NAA)*

Since ICAO requirements are one of essentials, we start with fulfillment of ICAO standards from various aspects one of which is to abolish poor language problem. The problem is solved in two directions-organizing general and aviation English language courses in Azerbaijan and abroad and set teacher-student staff of NAA to these programs. These programs are evaluated from various viewpoints, so that participants start to learn or develop not only their language knowledge, but also observe modern language teaching–learning technologies applied in Europe. For instance, the aviation English course organized in July-August 2009 was helpful both for language development and practice that was organized at Lufthansa Training Center TRAINICO, it was a short term model of European language teaching. Short term courses were delivered by different lecturers and lead in non-similar methodology and participants were certificated at the end of the course.

NAA increased its activity in international projects direction and invited language, technical and aircraft specialists to lead courses and teach education technology usage in study process. The last hosted Fulbright specialists with BOEING and English Language Teaching background had prepared two program plans according to teachers and students courses. Teacher attendees of the program were shown what new technology is being used in American high schools nowadays and how a teacher can develop better class environment and get high results at the end. Moreover, participant-students were directed to benefit from internet resources, practice to study the subject both individually and in groups, develop critical approach to topics and the like. Especially language courses were highly evaluated both from certification viewpoint at the end as well as.

To strengthen its language capacity will make international flights for flight crew easier and thus, in general role of human factors-lack of aviation English knowledge that became a cause for air traffic accidents will decrease.

Study Process

Taking into account that NAA was established in 1992, we can say that civil aviation study in Azerbaijan is in its early stages. However, being young HE NAA has applied several important education standards and created real study atmosphere and is involving more and more students who want to study aviation. NAA objects to be the first and strong civil aviation HEI not only in the country but also in the region and develop rate of air transport in transport system of the region.

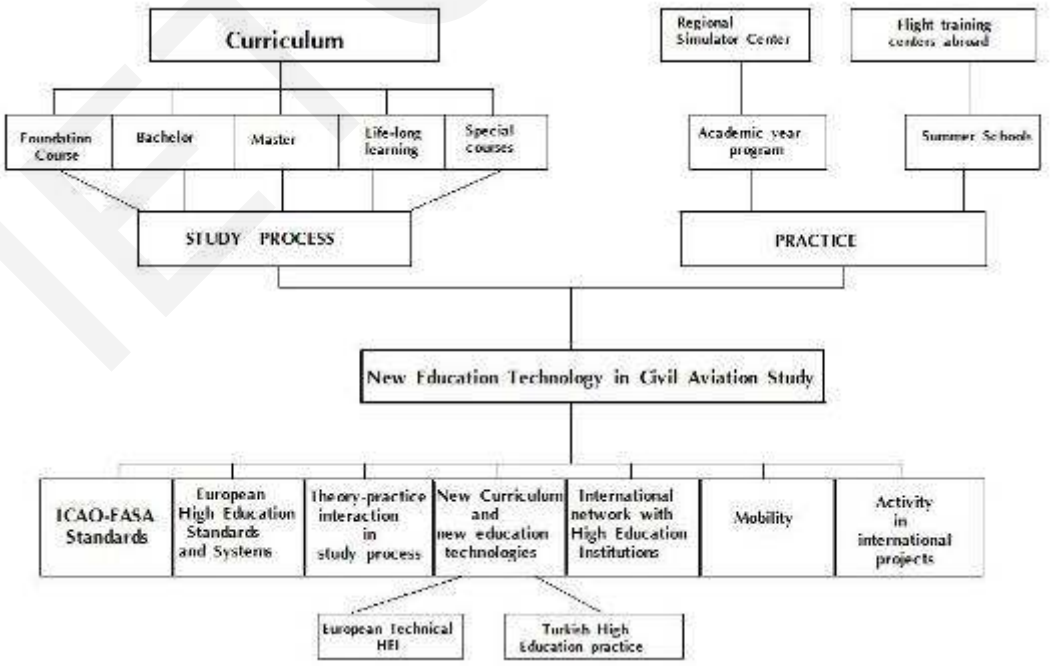

Fig. 2 *(Application of new technology to study-practice process of NAA)*

Now the development program is realized in various directions, special work schemas are prepared and sections were selected to carry out the work. Since civil aviation study system is divided into two main parts as study and practice, we need to teach theory and how to benefit from theoretical knowledge in the practice at the same time. Study sections obtain, foundation course, bachelor, master, long-term preparation, special trainings and the like, whereas, it includes practice in different aircrafts according to students' academic year. Both system refreshment projects include curriculum, renewal and European standards application. Our role in this multi-directed process is to organizing Foundation Course (FC) with modern study approach and special courses and programs using last study innovations and involve academic staff.

FC in English language plays a base role for bachelor degree where students continue to study their speciality in English only. It needs to point that NAA had native (Azerbaijan) and Russian groups beforehand and starting from 2008 we organized English language groups as well. FC will strengthen not only English language knowledge, but also strengthen its secondary school base of technical subjects such as math, physics, chemistry, informatics etc using new methodologies, techniques and curriculum. FC uses experience of famous HEI of Europe, new edited textbooks and involves young specialists to teaching processes. We start with new books in order to sweep away remnants of former Soviet textbooks and methodology. New course books and new curriculum system that is going to be applied in FC will make positive results. These textbooks are highly estimated as because there are both for teacher, student and class use. Sometimes we use several books in order to present unit textbook that will fit to language and topic standards of our program. Taking into account that language learning is the major language literature is core point. Special interest is given to audio-visual learning approach of language learning and therefore, audio books are of special interest. Thus, we applied some variants of language learning:

A. First of all, the student should strengthen language base.
B. Four major aspects of language learning (reading, writing, listening and speaking) are applied.
C. Four major aspects of language learning will be combined and taught in interaction.
D. Certification according to language knowledge.
E. The student has to be fluent in language and participate in various discussions and debates.

FC organizes special language learning classes such as lingophone class, discussion classes, distance learning auditoriums and the like. We plan to teach language together with innovative teaching technologies and mechanisms and therefore, we pay attention to computer-teacher and computer-student friendship strategy in our policy. All the subjects that will be taught in FC will be held with computers, tapes, projectors and others. Computers will help teachers not only to explain the subject with new methods, but it will also help them to organize the class and concentrate students on main topics. If to take into account that aviation English asks fluent speaking and listening abilities, we object to build student capacity in this direction with the help of tapes and computers. These capacities will also build during class and out of class activities. Different topics for discussions, dialogues and group works in every subject will development of students' listening and speaking abilities.

FC founds its archive and web source where we keep both class materials and out of class materials accessible for teacher-student staff. Resources are kept in hard copies and in electronic versions. Annually the library resources will be updated and refreshed with new study materials and student works. Besides, web sources that can be more beneficial for students, we set groups for every subject and it operates as mini class format where we see both student feedback, comments and discussions on given problem and teacher instruction and assisting.

System that we apply at FC is important from the viewpoint of knowledge evaluation, testing and certifying. So that we plan to open center where various testing materials and questionnaires will be prepared for students and it will help for placement, certification and identification of language level of the applicant. The center will use TOEFL, IELTS testing models and test samples, special language trainer and evaluator programs. These testing systems will be applied not only for students but also at teacher refreshment programs and candidate selecting procedures. Testing center will furnished with computers and special testing programs. Testing center staff is not allowed to lead classes and therefore, they will not have any background information about attendant.

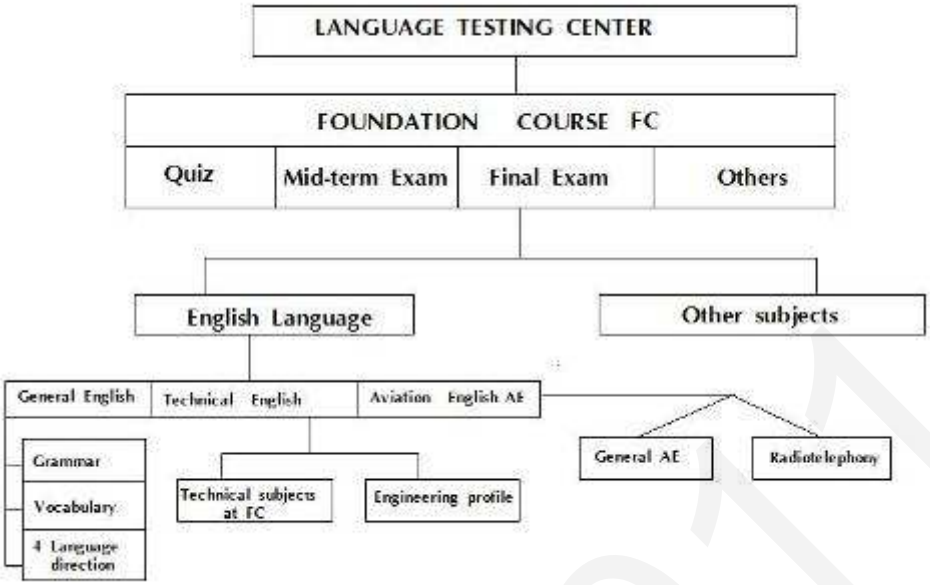

Fig.3 *(Language Testing Center diagram)*

Sections of the center are responsible for question base that will be prepared according to syllabuses used at FC and the resources should be renewed every term and keep in archive.

As it was mentioned above together with language we want students with basic technical knowledge. Study program obtains several technical subjects and specific approach accordingly. Selected subjects will be taught in special auditoriums, centers and labs with appropriate technological assistance. Some of these classes are directed to develop student's logical, critical and analytical approach, use of Information Communication Technologies (ICT), drawing abilities, general worldview and preparing them to bachelor subjects. In general, main policy at FC is to benefit from ICT and thus restore gaps that Soviet education systems left us.

Within the framework of our partnership we build mutual contacts with European institutions and apply their teaching experience. In this direction we work with European Education Center INSE, Berlin (Germany), Lufthansa Training Center TRAINICO, (Germany), Aero-cosmic Center and ATR, Airbus center, Toulouse (France) Izmir Technological Institute, Anadolu University, Civil Aviation Institution, Baltic Aviation Academy and the like.

Similar direction with study process is practice of the theory learned. Practice is the essential part of the study practice in civil aviation. NAA sends its students to "AZAL" Azerbaijan Hava Yollari CSC to practice in aircrafts. However nowadays we started to organize summer schools abroad which include mainly practice in flight apparatus. The above mentioned course in Lufthansa training center was very helpful and important from this viewpoint. Our students applied what they had learned to the ATR, Airbus flight simulators. This summer we will organize summer courses at Baltic Aviation Academy for next practice and theoretical knowledge courses abroad. The practice shows that year after year more and more students are interested in these summer schools.

In order to develop importance of practice and use technology in the classroom NAA has built special Flight Training Center with modern simulators. It is an ideal step towards integration to European education system as the center is ready for competency not only in the region but also in Europe. We often invite foreign specialists and organize training for flight crew, technicians, and other staff together with future aviators-students. With modern Boeing, Airbus, ATR flight simulators of the center we step closer to ICAO and EASA standards in civil aviation study process. Practice in simulators is like digital game. The students sit at the cabin of the aircraft and the situation; circumstances occurred there is the same as in reality. It help student to find way out, to

solve problems, to manage the situation, land or take off the aircraft in various weather conditions and the like.

The center will develop not only civil aviation study in Azerbaijan, but also promote it in regional sphere and interest to this field will increase. Applied methodologies, and study materials and technologies keep aviation industry and hereby, transport system in general to develop. It will make easy our teachers, trainers and technicians to partake in international mobility programs after the experience gained according to new applied standards.

ABSTRACT

In order to improve university teaching in the context of European Space for Higher Education and share our work with the university community we present the most innovative aspects of teaching that we are developing at the University of Valencia: interactive concept maps on each of the topics of a course in microeconomics, the development of multimedia teaching cross-content material (learning objects) of concrete concepts of microeconomic, the design of tools that promote teacher-student interaction and the development of webquests used by educators as a teaching resource aimed primarily at promoting both the students "work in group" and their self-taught.

INTRODUCTION

The process of adaptation to the European Space for Higher Education represents a fundamental change in the way of teaching but also in the role played by teachers and students in the course development. One of the objectives to be achieved is greater involvement and active participation of students in their learning process and it requires some change in the teacher's role who should become a guide in this process. For a succesful change, it is necessary to have tools that allow the orientation of students' self work. So that, these tools must accomplish the following goal: to clearly define the objectives of the course, the basic skills necessary to overcome the course and the work to be completed by the student.

Microinnova is an educational innovation group of teachers in the department of Economic Analysis at the University of Valencia, which has developed a series of digital educational materials related to the early stages of Microeconomics. Microinnova group is present on the Internet through its website (www.uv.es/microinnova) whith information of the group's objectives, links to educational materials developed and information of activities that may be of interest to students.

This work is being developed within the *Learning with Information and Communication Technologies project*, organized during 2009 by the University of Valencia in the framework of its Strategic Plan. On the one hand, *Learning with ICTs project* aims to promote the development of digital content and give continuity to the line of encouragement of ICTs in teaching. On the other hand, the group also has participated in the project *Open Course Ware (OCW)* that deals with the selection of teaching material to be deposited in a open repertoire at the University of Valencia' web (see http://www.uv.es/ocw).

As one of the objectives of Bologna is to promote the daily work by the student and backing it up with continuous assessment by the teacher, it is necessary to have material support: from theoretical content to study aids by means of exercises, case studies and self-assessment systems. In this respect, we have developed several tasks related to the development of digital teaching materials. The material is suitable for both courses in Introduction to Microeconomics and Intermediate Microeconomics. These materials are:

1) Interactive concept maps on each of the topics of a course in microeconomics. These maps can be used as an introduction to the contents of each issue, or provide an overview of the contents when its explanation in class has been completed or, also, as incomplete concept mapping for students to complete the missing information.

2) The development of multimedia teaching cross-content material (learning objects) of concrete concepts of microeconomic:

- Microeconomía I (http://ocw.uv.es/ciencias-sociales-y-juridicas/1-6/Course_listing)
- Microeconomía II (http://ocw.uv.es/ciencias-sociales-y-juridicas/2-1/Course_listing)
- Introducción a la Microeconomía (http://ocw.uv.es/ciencias-sociales-y-juridicas/4/Course_listing).

3) The design of tools that promote teacher-student interaction. We have started a blog (see http://micro-innova.blogspot.com/) in which we incorporate today's news that we think are interesting to students and offer them questions to help them make connections between the news media and the content of the theoretical explanations of the various topics which are taught in the subjects of intermediate microeconomics.

4) The development of webquests used by educators as a teaching resource aimed primarily at promoting both the students "work in group" and their self-taught.

THE CONCEPT MAPS

On the net different definitions of 'concept map' are found, all by itself valid. However, for its simplicity it is interesting the following: "Concept maps are tools for the simple and practical representation of knowledge, which can clearly convey complex conceptual messages and facilitate both learning and teaching. Its purpose is to represent relations between concepts. The concepts are included in boxes or circles, while the relations between them are explicated by lines connecting their respective boxes. The lines, in turn, have associated words that describe the nature of the relationship that links the concepts."

Microinnova group aims to exploit this tool at different levels. At one level, there has been designed a conceptual map as an introduction to the subject. At a second level, there has been designed an introductory concept map of each item. At a third level, the maps are more specific serving as a summary of each item. In a fourth level, we can use incomplete concept maps to be completed by the students.

The concept map relates all the topics covered in Microeconomics, so that the student looks how to relate all issues to be addressed since the first day of school. To achieve the objective, it was felt that without a good presentation, the student might lose track of the course, so there has been a synthesis effort to display the concept map as simple as possible at first glance. An example is shown below.

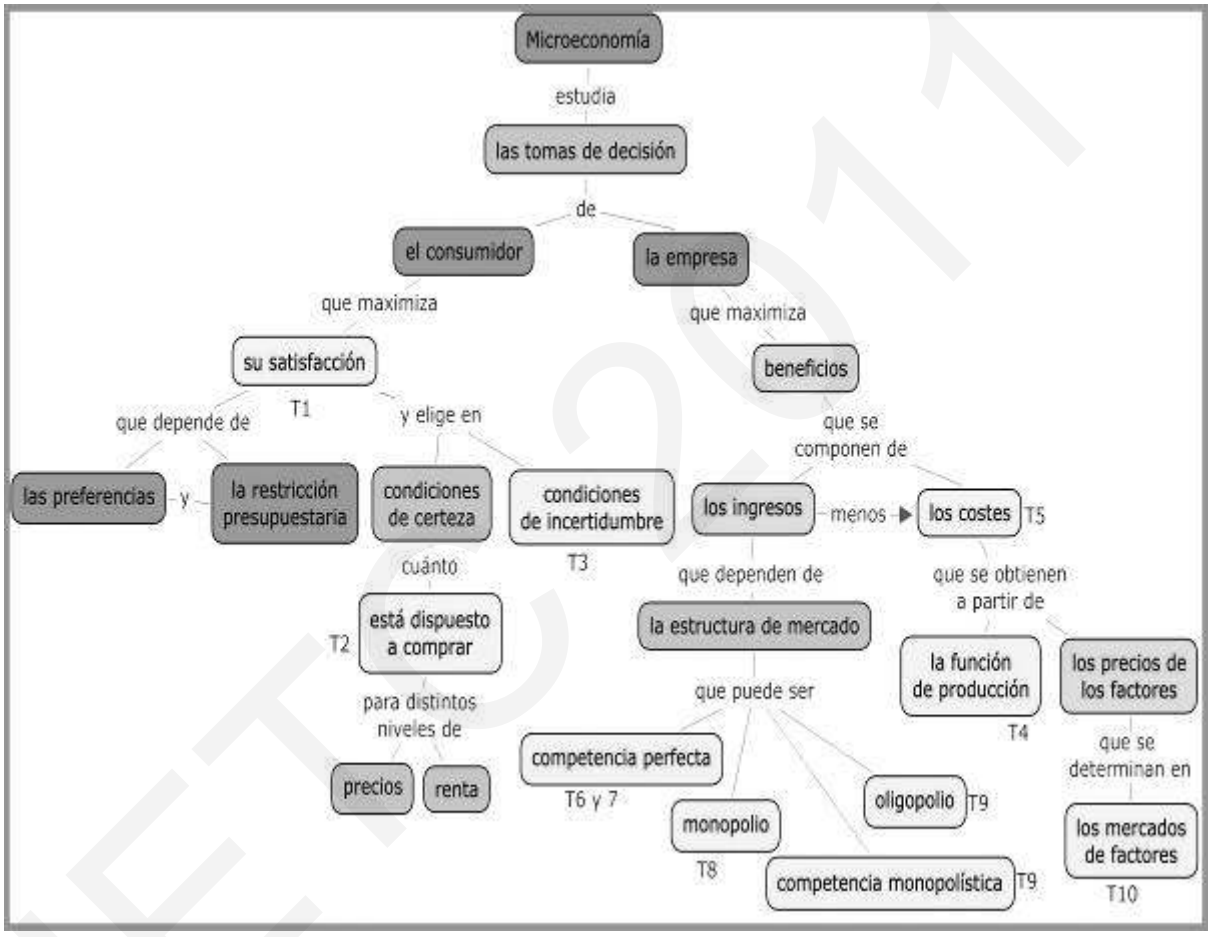
With the same idea as the concept map made for the introduction of the subject, other concept maps have been designed to serve as introduction to each of the topics. Thus, the student has a global vision of what is going to analyze and study in each subject, connecting the most relevant concepts. With a stroll through the concept map, the student will know the key concepts and how they are related. This predisposes them to better understand the objectives of the subject before attending class.

At third level operating, concept maps provide a summary of each topic. Having addressed the content of the topic, the students can clarify their ideas, highlight the most important aspects and display the common thread between the different concepts. These concept maps can have a considerable size, for that reason can be presented as separate linked concept maps.

In a fourth level, the student can evaluate to what extent has understood the subject with incomplete concept maps to be successfully completed. Some of concept maps will be very similar to those already

seen, but others may be totally different. For example, after selecting a number of concepts the student may be asked to draw a new concept map that relates these concepts. Thus, students bring their own understanding of the relationship between concepts.

This tool is an improvement in the teaching method while facilitating student self-learning process. The software used by Microinnova group for the realization of the maps is CMaps Tools program. In addition, concept maps are supplemented by theoretical schemes in PowerPoint format combining graphics with text explanations.



THE WEBQUEST

The webquest can be defined as a self-taught working tool in order to adress the student in the discussion and/or resolution, of a question or case study, preferably by obtaining information through the Internet. Webquest is an educational resource that has been highly successful since it allows the student to work independently although guided, step by step, by the teacher. Furthermore, it is primarily designed to foster teamwork so that students can be evaluated of their ability to work in teams, plus the ability to manage information using basic ICT tools and the ability to analyze information obtained. The analysis results are reflected in a report to be exposed in public

A webquest is prepared as a planned task in which the student presents the performance of a task through a series of steps. In this process, students must understand, analyze, synthesize and transform the information obtained, preferably using the Internet resources. Therefore, the webquest, made by the

teacher to guide the work to be performed by the student must contain a series of paragraphs that characterize and incorporate all the steps the student must follow in resolving the case, all the information they need to reach the objectives. The basic points of a webquest are the following:

The *Introduction* first explicitly states the goal or problem to be addressed and contextualized and explains its significance. In a second section called *Task* the work to be performed by the group is specified, describing the contents to be created and prepared for the report. It should also collect theoretical or empirical tools to be used during the task. A third section, called the *Process* indicates the student's next steps in the development of the task, ie, how to organize and plan the work. Forth, the webquest must include a list of *resources* to be used, places and documents where the information necessary for the production of work can be obtained. Fifth, the *conclusion* states what students should have learned in the course of their work. Finally, it is important that students know how to evaluate their work, and therefore, in a final section presents a table with headings that will be evaluated and the percentage of notes that each represents in the global rating.

The Microinnova group has developed several "webquest", related to the issue of non-competitive markets, government intervention, consumer subsidies and the concept of the production function. The developed issues belong to the content of the course, but real examples are used to adapt the contents to the real economic context. Therefore, related to the webquest of consumer subsidies, the information contained in the webquest adresses the students to web pages related to “aid for purchase”, “aid for rent houses in Spain”, “aid plan for the purchase of cars” or “aid for birth and schooling of children”. The main goal is for students to connect the theoretical concepts with reality and, at the same time, motivate research, review and discussion of the results within the group.

THE WEB PAGE AND THE BLOG FOR MICROECONOMICS

We have designed a website and a blog created to improve communication with the student and facilitate their access to digital materials produced by the group Microinnova. On the website are released the group's goals of educational innovation, innovation-related news and links from which to access the materials developed by the group in the deposit of teaching materials in open access at the University of Valencia (Open Course Ware (OCW)). Also, the website gives access to the Blog (see http://micro-innova.blogspot.com/) created to allow students access to a space in which to comment on current microeconomic issues.

The blog incorporates updated news regarding subjects related to Microeconomics. The news is discussed and students are invited to reflect and participate by offering questions to help them make connections between the news media and the content of the theoretical explanations of the various subjects taught at the intermediate microeconomics courses. Some of the news displayed in the blog is related to agreements between undertakings, interventionist measures or rulings of the “court of competition”. The idea is also to link this news repertory with the development of Webquest.

CONCLUSIONS

Adaptation of Microeconomics subjects to European Space for Higher Education makes necessary to have well-developed teaching materials that allow the teacher to perform his role of guide, mentor and motivator of student work. At the same time, these materials should be used to facilitate active and participatory role of students in their learning process. Microinnova group has developed a series of digital teaching materials for courses in basic and intermediate microeconomics. The tools presented in this paper have been the concept maps as an aid to the master class, the webquest as a way to encourage self-taught, though guided and a blog with updated economic information, with news and reviews tailored to the content of the course in which students can participate.

ABSTRACT

Over the time, the profitability of the course programs should be monitored and the corresponding Organization Development Intervention (ODI) on the marketing strategies should be assessed.

This study involved marketing strategy interventions on the course programs offered.The results of the study showed significant improvements in the obtained t-values. Marketing strategies on Course program operation improved with an average obtained t-value of 5.81. Marketing strategies on Leadership improved with an average obtained t-value of 5.91. Marketing strategies on Work Environment had an average t-value of 5.56. Marketing strategies on Team Work obtained an average of a t-value of 5.68. Marketing strategies on Management obtained an average of a t-value of 5.12. Marketing strategies on staff motivation obtained an average of a t-value of 6.10

The ODI helped the College to improve on its marketing strategies which assisted in the improvement of the profitability levels of the course programs.

INTRODUCTION

Many higher learning institutions in the world are continuously introducing course programs in the market for various potential students. The profitability of such course programs should be evaluated over time. The College is the only recognized training institution in the country for the co-operative movement staff, the committee members, the ministry staff, and individual members as well as potential informal economy groups having intention to form co-operatives in order to reduce poverty nationally and internationally. The profit levels of most of the College courses offered in the past had shown decline in profits as shown in the table below:

COURSE PROGRAM	2004/2005	2005/2006	2006/2007
Certificate in Co-operative Banking and Diploma in Co-operative Banking.	701,771	577,897	405,096
Co-operative Business Administration, Certificate in Co-operative Administration and Diploma in service Movement.	2,643,040	3,382,213	2,874,725
Diploma Pre-service year I, II&III	-110,935	1,531,857	7,218685
Bachelor of Co-operative Business Degree	1,120,012	-200,320	3,488,169
Agri-Business Co-operative Training Center.	1,120,012	853,738	120,673

Source: COCK Income and expenditure Accounts for 3 financial years

The purpose of this study was to introduce organizational intervention marketing strategies to assist in improving the profitability levels of the course programs.

METHODS AND PROCEDURES

The study used two methods. The first was assessment and evaluation of the course programs profitability levels, and marketing strategies on the course programs. The second was descriptive comparative method to determine the prevailing state of marketing strategies and the impact of the same after the ODI on the profitability of the College Course programs. To determine profitability levels, record of income and expenditure from the financial year 2004/2005 to 2006/2007 were used. The second instrument used was the Perception Questionnaire by Ernest Schuttenberg (2003), which was modified to suit the purpose of the research.

Before the intervention activities, the College Academic staff met and discussed issues pertaining to the review of the strategic plan where marketing strategies were to be incorporated. This formed the basis upon which the various intervention marketing strategies were to be implemented. The data collected through the questionnaire formed

the pre-intervention baseline facts. After the approval of the intervention activities through the College Strategic Plan, the intervention activities started.
The data obtained from the pre intervention and the post intervention surveys were statistically treated using the means. The t-test at 0.05 levels was applied on the two correlated means to determine the significant difference of the pre and post organization development intervention activities.

RESULTS

The results of the study showed significant improvements in the obtained t-values. Marketing strategies on Course program operation improved with an average obtained t-value of 5.81 as shown below:

MARKETING STRATEGY ISSUES	t- VALUE	CRITICAL VALUE	SIGNIFICANCE
1. The degree to which the Co-operative College of Kenya produce high quality-programs.	**5.98**	**2.0**	Significant
2. The degree to which Co-operative College of Kenya is concerned with solving marketing strategy problems concerning course programs.	**6.54**	**2.0**	Significant
3.The degree to which the College programs are useful to the Co-operative Movement and the associative economy	**5.78**	**2.0**	Significant
4.The degree to which the College is successful in accomplishing its goals on marketing strategies.	**5.98**	**2.0**	Significant
5. The degree to which the College commits money, time, and knowledge to solution of marketing problems.	**4.89**	**2.0**	Significant
6. The degree to which the College course programs are up to date	**3.65**	**2.0**	Significant
7. The degree to which leadership on marketing strategies for the College course programs is provided by the management.	**7.84**	**2.0**	Significant
TOTAL OVERALL MEAN	**5.81**	**2.0**	Significant

Marketing strategies on Leadership improved with an average obtained t-value of 5.91 as shown below:

MARKETING STRATEGY ISSUES	t- VALUE	Critical Value	SIGNIFICANCE
1. The degree to which Co-operative College of Kenya will give staff the opportunity to do and to learn to do all the things they consider themselves capable of to improve course programs.	**4.78**	**2.0**	**Significant**
2. The degree to which the most knowledgeable people are consulted in making marketing strategy decisions in the College.	**7.03**	**2.0**	**Significant**
3. The degree to which staff feel free to risk making mistakes in doing their job related to marketing strategies for the College course programs.	**6.91**	**2.0**	**Significant**
4. The degree to which those in positions of authority are concerned to hear how staff feel the College is being run-both pro and con.	**4.82**	**2.0**	**Significant**
5. The degree to which management correctly interprets the impact of College Marketing strategies and trends within the College	**4.56**	**2.0**	**Significant**
6. The degree to which staff feel free to discuss College marketing problems and dissatisfaction with those in the organization who can do something about the marketing problems.	**5.92**	**2.0**	**Significant**
7. The degree to which those in positions of authority are responsive to staff suggestions and wishes about the marketing strategies within the college	**7.86**	**2.0**	**Significant**
8. The degree to which the College is strong in long range Marketing planning.	**5.39**	**2.0**	**Significant**
TOTAL OVERALL MEAN	**5.91**	**2.0**	**Significant**

Marketing strategies on Work Environment had an average t-value of 5.56 shown below:

MARKETING STRATEGY ISSUES	t- VALUE	CRITICAL VALUE	SIGNIFICANCE
1. The degree to which the College changes its way of marketing the course programs as new conditions and needs arise.	**7.23**	**2.0**	Significant
2. The degree to which the management keeps abreast of outside developments affecting the College.	**7.54**	**2.0**	Significant
3. The degree to which reactions of clients or others on the outside cause changes to be made at the Co-operative College of Kenya.	**4.87**	**2.0**	Significant
4. The degree to which the College is quick to change the marketing strategies when change is needed.	**5.83**	**2.0**	Significant
5. The degree to which the College is aware of new discoveries and methods of delivering its services	**3.98**	**2.0**	Significant

6. The degree to which the College is effective in foreseeing potential problems in the accomplishment of Marketing objectives	**4.82**	**2.0**	Significant
7. The degree to which the College Course programs have earned a good reputation.	**4.96**	**2.0**	Significant
8. The degree to which the College is directly involved in alleviating problems in the society in addition to offering primary course programs.	**5.23**	**2.0**	Significant
TOTAL OVERALL MEAN	**5.56**	**2.0**	Significant

Marketing strategies on Team Work obtained an average of a t-value of 5.68 as shown below:

MARKETING STRATEGY ISSUES	**t- VALUE**	**CRITICAL VALUE**	**SIGNIFICANCE**
1. The degree to which the various departments and work groups that make up the College work together co-operatively on marketing strategies to get the job done.	**5.96**	**2.0**	Significant
2. The degree to which staff are involved in the making of Marketing strategy plans and decisions within the College	**6.43**	**2.0**	Significant
3. The degree to which people at various levels within the College participate in Marketing planning and decision-making activities	**4.78**	**2.0**	Significant
4. The degree to which group decision-making on Marketing Strategies is practiced within the College.	**5.54**	**2.0**	Significant
TOTAL OVERALL MEAN	**5.68**	**2.0**	Significant

Marketing strategies on Management obtained an average of a t-value of 5.12 as indicated below:

KEY FACTORS ON MARKETING STRATEGIES	**t- VALUE**	**CRITICAL VALUE**	**SIGNIFIC ANCE**
1. The degree to which the College management stresses its responsibility to the Co-operative movement and the associative economy at large.	**5.34**	**2.0**	Significant
2. The degree to which staff are kept informed about the things staff need to know concerning College Marketing strategies.	**6.17**	**2.0**	Significant
3. The degree to which staff understand the goals of the College.	**4.98**	**2.0**	Significant
4. The degree to which the management is concerned to know how those outside the College view its effectiveness in delivering appropriate course programs	**5.72**	**2.0**	Significant
5. The degree to which management is concerned about how staff at the College feel about the marketing strategies and what they think should be done on the marketing strategies.	**3.93**	**2.0**	Significant
6. The degree to which management is tolerant of people trying out new marketing strategies even though they may be unsuccessful.	**5.04**	**2.0**	Significant
7. The degree to which the upward communication about marketing strategies for College course programs flow within the college without obstruction.	**4.65**	**2.0**	Significant
TOTAL OVERALL MEAN	**5.12**	**2.0**	Significant

Marketing strategies on staff motivation obtained an average of a t-value of 6.10 as show below:

MARKETING STRATEGY ISSUES	**t- VALUE**	**CRITICAL VALUE**	**SIGNIFIC ANCE**
1. The degree to which staff get personal satisfaction to the work staff do at the Co-operative College of Kenya.	**6.97**	**2.0**	Significant
2. The degree to which staff feel free to suggest new ways of undertaking marketing strategies for the College programs	**5.76**	**2.0**	Significant
3. The degree to which staff personal goals and aspirations are taken into account in management decisions.	**4.87**	**2.0**	Significant
4. The degree to which it is advantageous to staff in the College to stick their neck out and take risks in doing their job	**4.95**	**2.0**	Significant
5. The degree to which ideas and desires of members of staff within the College influence changes that are made on marketing strategies.	**6.46**	**2.0**	Significant
6. The degree to which staff have the opportunity to use all their abilities in their job to market College course programs.	**7.56**	**2.0**	Significant
TOTAL	**6.10**	**2.0**	Significant

Summary of the Comparison Analysis of Marketing Strategies profiles before and after Intervention at Critical value=2.0 at 0.05

MARKETING STRATEGY ISSUES	**MEAN BEFORE INTERVENTION**	**MEAN AFTER INTERVENTION**	**OBTAINED t-values**	**SIGNIFICANCE**
Course Program operations	1.62	3.86	5.81	Significant
Leadership	2.19	3.58	5.91	Significant
Work Environment	2.04	3.63	5.56	Significant
Team Work	1.82	3.62	5.68	Significant
Management	1.81	3.82	5.12	Significant
Staff Motivation	1.73	3.31	6.10	Significant
TOTAL AVERAGE MEAN	1.87	3.64	6.00	Significant

CONCLUSION

The ODI therefore helped the Co-operative College of Kenya to improve on its marketing strategies which assisted in the improvement of the profitability levels of the College course programs.

ADOPTION PROCESS OF INSTRUCTORS TO ONLINE ROLES

Muhammet BERİGEL, Hasan KARAL
Karadeniz Technical University, Department of Computer Education & Instructional Technologies
mberigel@hotmail.com, hasankaral@ktu.edu.tr

ABSTACT

The emergence of increasingly online learning activities in the 1990s, facilitated by new instructional technology introduced in the 2000s, is contributing to a dramatic evolution in instructors' online roles, and raises fundamental questions about how instructors will adopt these changing roles for their teaching-learning activities. At this study adoption process of instructors' online roles was investigated deeply using ethnographic case study methodology. Sample of study is 3 instructors at Educational Administration, Controlling, Planning and Economics non-thesis master's program. Researcher joined online teaching learning activities as student with new identity and collected data using ethnographic approaches. Data about adoption process were collected focusing 4 main online roles of instructor which are pedagogical technical, social and managerial. Results of study offers deep information about instructors' adoption process to online learning environment

Keywords: instructors' online roles, ethnographic study, adoption process to online roles

INTRODUCTION

The emergence of increasingly online learning activities in the 1990s, facilitated by new instructional technology introduced in the 2000s, is contributing to a dramatic evolution in instructors' roles, and raises fundamental questions about how instructors will adopt these changing roles for their teaching-learning activities.

Online learning has been a highly desired method for learning among adults due to the time and space convenience that it offers compared to that of face-to-face learning. For this same reason, online learning has become widely used in higher education (Debuclet, 2008). Although online learning has become a widely used form of providing and receiving education, its effectiveness continues to be questioned (Jorgensen, 2002). Many online courses are designed based on the traditional knowledge acquisition model and conducted no differently than traditional classes (Lou, 2004; Ying, Fuzong and Xue, 2003).

The role of the online instructor has transitioned from sage-on-the-stage to that of a facilitator. There are many definitions of the changing role of instructors in online learning. Although learning is more student-centered and the instructor is seen as a facilitator, all the definitions focus on the importance of the role in students' learning experience. The instructor is not simply a moderator, but one who purposely designs instruction and guides students through social and cognitive engagement. Though not at the center of the learning process, the instructor plays a vital role in online learning (Anderson, Rourke, Garrison and Archer, 2001; Berge, 1995; Mason, 1991; Paulsen, 1995).

Regardless of the type of distance learning program an institution employs in higher education, if the distance learner is to succeed, instructors must do more than provide access to information (Vonderwell and Sawery, 2004). They need to truly understand the learner's needs and design learning environments that facilitate learning, environments that enhance access to and success in higher education. The success of online learning depends on the instructors' ability to acquire new competencies, rather than mastering the technology.

In spite of the debate among faculty, students and administrators about the effectiveness of distance learning, distance learning is a phenomenon that is here to stay and this debate is likely to continue for quite some time. With regard to the effectiveness of distance learning programs, many researchers have pointed out that the instructor is the key element to the success of a distance learner. However, despite the growth in online instructor competency-related studies, almost none of the competencies identified, took into consideration the distance learning students' perspective. The majority of these competencies were identified by experts in the field (Abdulla, 2006). The success of an online learning program requires effective techniques and strategies about which instructors to be knowledgeable. The findings of this study will help the online instructors make informed decisions in

order to facilitate distance learning activities. This study will also help administrators in higher education institutions make informed training decisions when implementing distance learning programs.

Instructors' Online Roles

To investigate adoption process of instructors to online roles, Berge's instructors' roles - pedagogical, managerial, social, and technical - have been used (Berge 1995, 1996).

Pedagogical: The pedagogical role encompasses everything done to support the learning process of individual students or working groups. Based on the application of Vygotsky's sociocultural theory to an online course for pre-service teachers. Bonk et al. (1999) provide a breakdown of ways instructors can use instruction and facilitation during online discussions. The following role behaviors fall clearly into the dimension of pedagogical functions: direct instruction; direct questioning; providing modeling or examples; giving advice or suggestions; fostering student reflection or self-awareness; pushing students to explore other sources of information; prompting students to explain or elaborate on their ideas; providing feedback or praise; cognitive task structuring; 'weaving' students' contributions into a single summary in order to capture and re-focus students on the essence of ongoing or completed discussions (Harasim et al., 1995).

Managerial: The managerial role refers to activities designed to make the course run smoothly at an administrative level. Managerial roles include the organizational, procedural, and administrative tasks associated with the learning environment (Berge, 1995).

Social: The social function is typically employed to promote a friendly environment and community feelings to support student cognitive learning processes. Such social functions include developing harmony, group cohesiveness, and collective identity (Bonk, 2001).

Technical: The technical role involves choosing appropriate software to meet specific learning goals, and assisting students to become competent and comfortable users of the chosen software.

The purpose of this research was to examine the most important factors affecting adoption process to four dimensions of online instructor roles in a rapidly-expanding online MBA program. This study will focus on the following research questions:

1- What are instructors' perceptions of their roles when teaching online in terms of Berge's (Berge, 1995) classifications?

2- What are factors affecting adoption process of four dimensions of instructor roles?

METHODOLOGY

The purpose of this study was to investigate adoption process of instructor roles and the complex issues involved in a distance learning environment. The ethnographic case study approach for such exploratory research is useful for better understanding a complex system (Stake, 1994).

The central core of ethnography is a concern with the meaning of actions and events to the people the researcher is trying to understand; it always implies an understanding of culture. All of us learn about culture by observing other people, listening to them, and then making inferences. In developing case studies using the ethnographic research approach, inferences are made from three sources: 1) from what people say; 2) from the way people act; and 3) from the artifacts people use (Spradley, 1979).

Research Group

Sample of study is 3 instructors at Educational Administration, Controlling, Planning and Economy Non-Thesis Master's Program in Karadeniz Technical University in Turkey. Data collected using observation forms and semi conducted interviews made with 3 instructor. Study was conducted at 3 steps.

First Step: Observing Instructors during online program.

Researcher joined online program as student with a new identity .Researcher was participant observer, an active member of the online program. Researcher observed instructor's activities based on four main online role of instructor using observation forms. Ethnographic case study was centered on technical, managerial, social and pedagogical roles of instructor at online learning system. Researcher observed instructors during 14 weeks in live classes and asynchronous learning activities. Researcher impacted online learning to reveal and observe instructor's roles. All of live classed were video recorded. Another data resource is instructor's asynchronous activities during education. Researcher was also analyzed video document and asynchronous activities to collect data.

Second Step: Data Collection through Interviews

One interview lasting around 45 minutes was conducted with each instructor at the end of online program. Interviews were focused on perceptions of instructors to their online roles and factors affecting their adoption process to their online roles.

Third Step: Analysis and Writing

Instructor specified their roles and adoption process from their own point of view. Analysis was made to interpret what was said and what was observed. Major categories were emerged from analyzing the data.

Researcher needed to ensure that data collected from observations, video documents and interviews has a valid reflection on instructor's adoption process to online roles and determine whether the conclusions drawn are generalisable or not. Therefore similar to most researchers (Şahin, 2005; Nesrin 2003) in the qualitative paradigm, the researcher used triangulation, which in simple terms suggests that the researcher used multiple methods to collect the relevant data. According to Merriam, the opportunity to use multiple methods of data collection is a major strength of a case study research (Merriam, 1961). Methodological triangulation combines dissimilar methods to study same topic so that the flaws of one method are used as the strength of another. In this study, the researcher used observations, interviews and video documents to collect data.

FINDINGS

Data from the interviews, observations and document analysis were combined to describe how the instructors perceived and adopt their roles in the online learning environment

Researched made observations focusing on 4 main roles of instructors. Researcher observed activities, responsibilities and subroles of instructor at each main role.

Adoption Process and Perception of Instructors to Online Pedagogical Roles

Adoption process to pedagogical roles was analyzed at four main perspectives, course designer, profession–inspirer, feedback giver, interaction facilitator.

Table 1. Analyses of instructors' pedagogical online roles from three dimensions.

Pedagogical Roles		Data Collected From Observations	Data Collected From Video Documents And Asynchronous Activities	Data Collected From Interviews
Course designer	I-1	I-1 has problems designing interactive learning elements,	I-1 could not design course materials, all time use same materials.	I-1 claims that he has enough skills for designing course.
	I-2	I-2 has problems designing interactive learning elements, does not want to share experiences with colleagues	I-2 need help designing online courses; just use same type of material.	I-2 claims that he is insufficient as course designer.
	I-3	I-3 has problems designing interactive learning elements,	I-2 need help designing online courses.	I-1 claims that he has enough skills for designing course.
Profession-inspirer	I-1	I-1 can not promote professional dialogue among online learners	I-1 can not promote professional dialogue among online learners	I-1 claim he is enough promoting dialogues.
	I-2	1-2 can promote professional dialogue among online learners	I-2 can organize dialogues at asynchronous part of online system	I-2 claim he is enough promoting dialogues.
	I-3	I-3 can not promote professional dialogue among online learners	I-3 can not promote professional dialogue among online learners	I-3 claims that he is insufficient as profession-inspirer.
Feedback-giver	I-1	I-1 can provide timely and high quality feedback	I-1 can provide timely and high quality feedback	I-1 claims that he can provide feedback.
	I-2	I-2 can not provide timely and high quality feedback	I-2 can not provide timely and high quality feedback	I-2 claims that he can provide feedback.
	I-3	I-3 provides timely and high quality feedback; provide formative feedback for continuous learning engagement	I-3 can provide timely and high quality feedback	I-1 claims that he can provide feedback.
Interaction facilitator	I-1	I-1 can facilitate peer interaction during live classes.	I-1 can facilitate peer interaction during live classes, can not provide interaction at asynchronous discussions	I-1 claims that he can provide peer interaction among students.
	I-2	I-2 can not facilitate peer interaction enough during live classes.	I-2 can not facilitate peer interaction enough during live classes and did not use asynchronous discussions.	I-2 claims that he has problems facilitating peer interaction
	I-3	I-3 can facilitate peer interaction during live classes.	I-3 can facilitate peer interaction during live classes, can provide interaction at asynchronous discussions	I-3 claims that he can provide peer interaction among students.

Table 1 shows analyses of instructors' pedagogical roles from three dimensions; observations, document analyses and interviews. Results of table 1 show that instructors could not complete their

adoption process to their pedagogical roles. There are some differences at instructor's views and observations. Although instructors claim that they are enough at some pedagogical roles, observation results and document analyses show that they could not accomplish their online pedagogical roles. Factors affecting to instructors' adoption process to pedagogical roles were shown at Table 2.

Table 2. Factors affecting instructors' adoption process to online pedagogical roles

		Lack of Technical Capacity	Affection of using Previous pedagogical experiences	Control of learning environment	Negative attitudes
Interviews	I-1	X	X	X	X
	I-2		X		
	I-3				X
Observations	I-1		X	X	
	I-2	X	X	X	
	I-3	X		X	
Document analyses	I-1		X	X	
	I-2	X			
	I-3	X		X	X

Instructor coded I-1 said that " I have problems controlling classroom, and could not decide to chose teaching methods and materials." Observation and document analyses results also show that instructor coded I-1 has problems to accomplish online pedagogical roles.
Instructor coded I-2 said that "It was fist time that I am an instructor at online learning program. I tried to use my previous experiences and methods for my teaching. I could not design and use new methodologies for online learning." Observations and document analyses results also show that instructor coded I-2 has lack of technical capacity problems for controlling learning environment and try to use previous teaching experiences for online teaching. Instructor coded I-3 has negative attitudes to online learning. Main reasons of his attitudes are his lack of technical capacity, controlling learning environment and not to choose appropriate teaching and methods for online teaching. Instructors have problems completing their pedagogical roles and four main affect; lack of technical capacity, trend of using previous pedagogical experiences, controlling classrooms and negative attitudes.

Adoption process and perception of instructors to online managerial roles

Adoption process to managerial roles was analyzed at two main perspectives; conference manager and organizer and planner

Table 3. Analyses of instructors' Managerial online roles from three dimensions.

Managerial Roles		Data Collected From Observations	Data Collected From Video Documents And Asynchronous Activities	Data Collected From Interviews
Conference manager	I-1	I-1 could not ensure equity in online discussion; provide ,similar students joined to discussions	I-1 could not has ensured equity in online discussion; provide ,similar students joined to discussions, instructor ensured equity in asynchronous activities	I-1 claims that he ensured equity at online learning and he has enough skills for conference manager role.
	I-2	I-1 could ensure equity in online discussion; provide ,similar students joined to discussions and promote knowledge construction	I-1 could ensure equity in online discussion; provide ,similar students joined to discussions and promote knowledge construction	I-2 claims that he is sufficient four conference management.
	I-3	I-3 could not ensure equity in online discussion; provide ,similar students joined to discussions	I-3 could not has ensured equity in online discussion; provide ,similar students joined to discussions, instructor ensured equity in asynchronous activities	I-1 claims that he has enough skills for conference manager role.
Organizer and planner	I-1	I-1 provided clear instructions and organization of course structure at some classes, I-1 could not achieve a balance between structure and flexibility	I-1 provided clear instructions and organization of course structure at some classes, could not provide a clear instruction and organization at asynchronous activities	I-1 claim he is enough organizing instructions and course.
	I-2	I-2 tried to organize instructions and courses using old experiences, have problems composing balance between time, structure and flexibility	I-2 provided clear instructions and organization of course structure at some classes, could not provide a clear instruction and organization at asynchronous activities	I-2 claim he has problems organizing instructions and course especially at asynchronous activities
	I-3	I-3 provided clear instructions and organization of course structure at some classes, I-1 could not achieve a balance between structure and flexibility	I-3 provided clear instructions and organization of course structure at some classes, could not provide a clear instruction and organization at asynchronous activities	I-3 claim he is enough for his organizer and planner role.

Managerial roles include the organizational, procedural, and administrative tasks associated with the Learning environment (Berge, 1995). Instructors have two main managerial role; conference manager and organizer and planner. Results of Table 3- show that instructors have problems managing the online teaching and learning activities. Main problem of instructors was to manage discussions at live classes. They have spent a lot of time for discussions and have problems to complete schedule in time. Another problem was at asynchronous discussions some students take control of the asynchronous discussions and instructors could not control asynchronous discussions.

At interviews instructor noted that online learners need to be provided with a clear structure and timeline to keep them engaged in learning their busy work schedules. Instructor coded I-2 commented that; "At first course I introduces to timeline to students, But following weeks I have problems following up weekly activities. I could not control time of synchronous discussions. I have to transfer some discussions to asynchronous part of online system."

Instructor could not compose flexibility and tried to apply timeline in time. Students get problems completing their assignment in time.

Adoption process and perception of instructors to online social roles

Table 4. Analyses of instructors' social online roles from three dimensions.

Social Roles		Data Collected From Observations	Data Collected From Video Documents And Asynchronous Activities	Data Collected From Interviews
Social rapport builder	I-1	I-1 tried to build social rapport; encourage students joining discussions	I-1 tried to build social rapport, encouraged students being part of online learning community	I-1 claims that he has problems accomplishing his social roles due to insufficient abilities of online learning system.
	I-2	I-2 tried to be part of online learning community, encourage students to discuss and being together at different online systems	I-2 tried to build social rapport, encouraged students being part of online learning community, especially encouraged students to be active at asynchronous activities	I-2 claims that he is sufficient four his social role.
	I-3	I-3 have problems building social rapport, could not communicate students enough, could not compose interaction among students	I-3 have problems building social rapport, could not communicate students enough, could not compose interaction among students	I-3 claims that he is insufficient four his social role.

Instructors have problems being part of online learning community. Instructor coded I-1 said that "This was first time I was a part of online learning, I have a lot negative attitudes before to online courses, but following weeks I have adopted to online environment and encourage students being active at online system.

Instructors noted that ability to build a more personal relationship between educator and student was their biggest challenge for online learning. Instructor coded I-3 said that "Online learning is impersonal environment. I could not develop rapport with students, because I can not see interaction between students. That was my biggest problem in online environment. "

In summary, the instructors had approximately same feelings regarding the importance of the social role in this online MBA program. Also results of observations and documents analyses show that instructors had tried to compose online learning community. In general, these instructors were not yet convinced of the relevance and viability of the social role for student learning. Various technological limitations, negative attitudes about distance education and concerns about time affected their efforts building online learning community.

Adoption process and perception of instructors to online technical roles

Adoption process to technical roles was analyzed at three main perspectives; technical coordinator, media designer and technology integrator.

Table 5. Analyses of instructors' technical online roles from three dimensions.

Technical Roles		Data Collected From Observations	Data Collected From Video Documents And Asynchronous Activities	Data Collected From Interviews
Technical coordinator	I-1	I-I tried to help students for technical problems, but his lack of technical ability he could not refer enough support.	I-I tried to help students for technical problems, but his lack of technical ability he could not refer enough support, discussed students about their technical problems at asynchronous activities	I-1 claims that his lack of technical capacity blocked his efforts to refer technical support to students.
	I-2	I-2 could not refer enough help to students, when students get problems he directed them online system staff.	I-2 could not refer enough help to students for their technical problems.	I-2 claims that he is insufficient for technical coordinator
	I-3	I-3 was willingly to help students for their technical problems but his lack of technical knowledge blocked his efforts, he just directed to students to online system staff.	I-3 could not has ensured equity in online discussion; provide ,similar students joined to discussions, instructor ensured equity in asynchronous activities	I-1 claims that he has he is willingness but insufficient for technical coordinator
Media designer	I-1	I-1 could not develop rich multi media tools, just use presentation and texts for his courses, did not demand extra tools from online system staff.	I-1 just use presentations and texts, used asynchronous parts of online systems only for discussions, did not use any other elements of online system	I-1 claim he is insufficient as media designer.
	I-2	I-2 used presentations and texts documents, used video for two classes, did not demand extra tools from online system staff.	I-2 just use presentations and texts, used asynchronous parts of online systems only for discussions, did not use any other elements of online system	I-2 claim he has some deficiencies but generally he is sufficient for media designer.
	I-3	I-3 used presentations ,texts documents and used survey tool, did not demand extra tools from online system staff.	I-2 just use presentations and texts, used asynchronous parts of online systems only for discussions, did not use any other elements of online system	I-3 claim he is enough for media designer role.
Technology integrator	I-1	I-1 did not use chat rooms, web conferencing and audio conferencing in live classes effectively, was unwillingness to use new technologies	I-1 did not use discussion forums effectively, was unwillingness to use new technologies	I-1 claim that he could not use new technologies effectively lack of his technical ability
	I-2	I-2 tried to organize chat rooms and discussions, was willingness to use new technologies, used web conferencing at some classes.	I-2 tried to organize asynchronous activities at discussion forums	I-2 claim that his technology integrator role is related with his technology usage level.
	I-3	I-3 used just minimum part of online system out of surveys, was willingness to use new technologies,	I-3 did not use functions of asynchronous activities effectively.	I-3 claim he is not enough for his technology integrator role.

Table 5 shows findings about instructor's technical roles. Instructors noted that their biggest problems at online learning were technical. Instructor coded I-3 said that " My insufficiencies for my technical roles affected to accomplish and adopt my other online roles". Instructors tried to use online chat rooms in live classes. But they have problems controlling online chat activities. Instructor coded I-2 said that "It was frustrating not to be able to control chat activities and time consume during chat activities".

Although instructors know functions of online system, they just use limited parts of online system. They were unwillingness to use online system tools. Instructor coded I-1 noted that "I know that system has a lot of tool to prepare an effective lesson, but I was hesitating to use these Technologies because of my lack of technical capacity."

Summary, new technologies increased efforts to include highly interactive pedagogical tools. However, the overall level of technology use was still relatively low. Presentations, asynchronous discussion forums, chat rooms were the most frequently employed tools, whereas more sophisticated interactive tools video, web conferencing, audio& video conferencing, email and survey tool, were in relatively low use.

DISCUSSIONS AND CONCLUSION

The findings clarified instructor's adoption process and perception of instructor to online roles. Instructors performed different roles at different degrees. Instructor's online roles were investigated from three aspects, observations, interviews and document analyses and asynchronous activities. One important point at this study, there were different findings at the view of these three aspects. Main reason for this situation was perception of instructors to their roles. This was first online learning experiences of instructors. Although they could not perform their role adequately, they claim that they are sufficient and performed well their online roles.

Instructors most strongly emphasize the pedagogical roles. Results of observations and document analyses show that although instructors emphasize pedagogical roles mostly, they have big problems for accomplishing and adopting their roles. This finding is consistent with similar with literature. Rohfeld and Hiemstra (1995), in their study commented that online instructors have biggest problems although they give more importance to pedagogical roles.

The degree of facilitating online discussion of online instructors was different from each other. This study revealed that the factors affecting facilitating online discussions. Timing, perception of instructors, moderating skills, technical capacity of instructors was main factors affecting degree of facilitating online discussions. These results are similar with Liu 's (2005) study. Liu stated that timing, course type, perceptions, and moderating skills are important factors for online discussions and show variations among instructor.

Also consistent with the literature is the finding that effect of previous experiences on instructors' adoption process is an important factor. Salmon and Giles (1997) noted that online learning is different from traditional learning, if novice online teachers are insistent to use previous experiences they get problems to build online learning.

The need for flexibility at managerial roles has also been supported in other literature. For example, Rohfeld and Hiemstra (1995) have argued that learners who have a high level of control over their learning activities are encouraged to take greater responsibility for their learning.

The findings related to instructors' perceptions and adoption of the social roles were highly similar to the Bawane and Spector's (2009) study. Bawane and Spector noted that effective online teaching is adapting to student needs, communicating effectively, and showing concern for building social rapport.

Differently form other studies (Lui, 2005; Anderson, 2001; Teles, 2001) instructor's online technical roles present significant challenges to online instructors.

On the whole, the study and results imply that factors affecting instructor's adoption process and perceptions of instructors must be evaluated for designing effective online learning and composing online learning community. Lack of technical ability has influence on pedagogical, managerial and social roles of instructor. Being inexperienced for online learning affected to development of instructor's online role about designing, controlling and managing learning environment.

Finally, the findings in our study confirmed that instructor's effective usage of online learning environment is related how and more instructors adopt online roles. Instructors know that if they accomplish their roles successfully, they will provide satisfactory experience for online learners.

Department of Industrial Education and Technology, National Changhua University of Education, Taiwan, ROC
Chin-Chung Li
Department of Safety, Health and Environmental Engineering, HungKuang University, Taiwan, ROC

ABSTRACT
The objective of this study focuses on the interactions between organizational and individual factors that affect group safety culture. The empirical data come from a simple random sample survey of 373 teachers in electrical and electronic engineering departments at 70 universities in Taiwan. An exploratory factor analysis and a confirmatory factor analysis were employed to examine the safety culture scale. The model is acceptable after slight modification, producing a reliable and valid scale for measuring safety culture. A two-way MANOVA indicates interaction effects on safety culture between (a) the presence of a full-time safety manager and the type of laboratory; and (b) the presence of a safety committee and the age, gender and academic rank of faculty members. Therefore, differences in perceptions of safety culture among university faculty vary according to institutional factors at their university. As a contribution to the development of a positive safety culture, the authors make some recommendations for improvement at universities without safety managers or safety committees.
Keywords: safety culture, organizational factors, individual factors, interaction effects.

INTRODUCTION

Background

University laboratories are a means of developing a student's ability to perform experiments, to work as a team, to communicate effectively, to learn from failure and to take responsibility for one's own actions (Krivickas & Krivickas, 2007). However, the modern university laboratory environment is dangerous, with chemical, biological and radiological hazards (Modica, 2007). In 2005, there were almost 10,000 accidents in laboratories in the USA, or 2 accidents per 100 laboratory researchers (Coghlan, 2008). Between 1997 and 2004, there were 21 research laboratory accidents in Taiwan which resulted in the injury or death of students or instructors (Wu, 2008). In electrical and electronic engineering laboratories and other such departments, there is teaching and research on photoelectricity, semiconductors and nanotechnology processes, as well as instruction and research into traditional electric power systems, control systems and computer systems. Hazards in these laboratories may include mechanical, chemical, biological (or infection), ergonomic, and social-psychological; these hazards are worthy of more research.

These risks and hazards can be controlled by safety engineering and safety management. In safety management, safety culture is the key factor for maintaining laboratory safety. A laboratory's safety culture must support and encourage employees to report events which have caused danger or potential risks, and ensure that the safety of all people working the laboratory is guaranteed (Modica, 2007). A survey of safety culture perception offers the laboratory manager a frame of reference. Not only can it help to ensure the health and safety of the employees, it also enables scientific research and education to be conducted more smoothly.

Factors affecting safety culture

After the Chernobyl disaster, the International Atomic Energy Agency (IAEA) gave the following definition: "*Safety culture is that assembly of characteristics and attitudes in organizations and individuals which establishes that, as an overriding priority, nuclear plant safety issues receive the attention warranted by their significance*"(IAEA, 1991). This definition implies that the value an organization places on safety culture is affected by organizational and individual factors. This feature is reminiscent of social system theory. A social system is composed of two levels, which are theoretically separate but which in practice are highly interrelated. One level is the expectations that an organization has towards its own component sections, given the overall aim of realizing the group goals. The other

level is the needs of the individual and his or her unique character. The organization interacts with individuals to produce what is known as social behavior (Ornstein & Hunkins, 1993).
Scott (1996) believes that a social system is composed of five components – individuals, formal organizations, informal organizations, fusion processes, physical setting – continually interacting. The organization must pay great attention to the motivations and attitudes of the individual, making the aims of the organization and the requirements of the employees the same, and use informal organizations and the fusion process to create a comfortable, safe and healthy physical environment in order to achieve the highest level of synergy.
Hoy and Miskel (1982) propose that in formal organizations, there must be work groups in some form. Through these work groups, the organization's "expectations" and the "requirements" of the employees interact, and both the individuals and organization can adjust the behavior of the other. When employees work in groups, a dynamic relationship exists between organizational expectations and members' needs. Additionally, the work groups themselves will develop their own informal organization, develop rules for the group, and influence the behavior of the organization.

The purposes of this study

This study examines the effects of organizational and individual factors on safety culture in the laboratories of electrical and electronic engineering departments at Taiwanese universities. The organizational factors considered are university size, university ownership, presence of a safety manager, presence of a safety committee, and location of the university. The individual factors are gender, age, years of experience, job title, accident experience, safety training, department, rank, and work site. Both main effects and interaction effects are measured.

METHODS

Population and sample

The population for this study was the teaching staff in departments of electrical or electronic engineering at 70 Taiwanese universities. There were 2,913 faculty (lecturers, assistant professors, associate professors and professors) employed in these departments. We generated a list of all of these faculty members, including information on: their university, their department, name, job title, rank. Among the faculty on this list, 1081 (37.11%) were employed at public universities; 1832 (62.89%) at private universities. 1620 (55.61%) were employed at universities in the northern part of Taiwan; 469 (16.10%) in the central region; and 824 in the south (28.29%). 1629 (55.92%) were employed in electrical engineering departments; 1284 (44.08%) in electronic engineering departments.
Two samples were selected from the population: a pilot sample, and the formal test sample. The pilot sample, a purposive sample of 300 individuals, was surveyed as part of the development of the research instrument. In the middle of October 2006, researchers mailed to each subject a questionnaire, a gift and a return envelope. Two reminders were subsequently sent out, and by late November the same year, 174 completed questionnaires had been received. 10 of these were invalid, leaving 164 valid questionnaires, a response rate of 54.67%. The formal test sample of 687 subjects was selected from the list of faculty by simple random sampling. In early December 2006 researchers began mailing the questionnaires to subjects as for the pilot. Three reminders were sent, and by the end of January 2007, 403 completed questionnaires had been returned. 30 were invalid, leaving a total of 373 valid responses, a rate of 54.29%.

Instrument

The mailed questionnaires contained two parts. The first part asked for general information, which was used to determine five organizational factors (size, ownership, safety manager, safety committee, location) and nine individual factors (gender, age, job tenure, job title, accident experience, safety training, department, rank, laboratory type). The second part comprised 21 items (all Likert five-point items) that formed the safety culture scale (SCS). Also included in the second part were 37 items related to another study. The safety culture scale contained three sub-scales: artifacts, safety climate, basic assumptions. An example of an item in the artifacts scale is: "The lab I most often work in is a safe workplace." An example from the safety climate scale is: "I am very willing to attend regular health & safety training." An example from the basic assumptions scale is: "If there is plenty of safety equipment in the lab, injuries can be avoided." All items were answered on a five-point scale (strongly disagree, disagree, neutral, agree, strongly agree), and the answers were assigned numerical values from 1 (strongly disagree) to 5 (strongly agree).
All of the scales were subject to item analysis, factor analysis and reliability analysis. They were shown to have good construct validity and internal consistency. The researchers also invited five specialists in this field to assess the content validity of the scales (Gay, 1992). These consultant specialists examined the list

of items to confirm the definition of safety culture being used; they also assessed the relevance, appropriateness and clarity of the items (DeVellis, 1991). The questionnaires were adjusted based on the comments of the specialist consultants.

Data analysis

The statistical software used was SPSS 12.0 and LISREL 8.72. The statistical procedures applied were exploratory factor analysis (EFA), confirmatory factor analysis (CFA) and two-way MANOVA.

RESULTS

Respondent profiles

In the pilot study, there were 164 respondents. Ownership: 80 (48.78%) were from public universities, 84 (51.22%) from private. Region: 47 (28.66%) were from northern universities, 66 (40.24%) from central Taiwan, 50 (30.49%) from the south, 1 (0.61%) did not specify region. Department: 92 (56.10%) worked in electrical engineering departments, 72 (43.90%) worked in electronic engineering departments. The data gathered in the pilot study was used for EFA.

In the formal survey, there were 373 respondents. Ownership: 124 (33.24%) public, 249 (66.76%) private. Region: 190 (50.94%) northern, 63 (16.89%) central, 120 (32.17%) southern. Department: 209 (56.03%) electrical, 164 (43.97%) electronic. The figures for ownership and regions in the sample are slightly divergent from the population. However, the sample proportions for department are very close to the population proportions, which means that the survey results can be generalized to the population. CFA and two-way MANOVA were applied to the formal survey data.

EFA results

The objective of factor analysis is to determine the underlying structure of variables (Hair, et al., 2006). In this study, the main dimensions of safety culture were found through principal component analysis, using an orthogonal rotation. All factor loadings were greater than 0.50, so all of the factors should be retained (Hair, et al., 1998). Four of the factors had eigenvalues greater than 1 (5.61, 4.04, 2.81, 2.43). These four factors explain 70.92% of the variance. These four factors were named (1) “basic assumptions”, (2) “artifacts”, (3) “perceived risk and emergency response”, and (4) “commitment to safety”. A Cronbach’s alpha reliability test was used to check consistency and reliability. For each factor the reliability (Cronbach’s alpha) is greater than 0.70; for the scale as a whole, reliability is 0.93. This suggests an acceptable level of internal consistency (Cooper, 1998; DeVellis, 1991; Nunnally, 1978).

CFA results

Following the EFA, a model of safety culture was developed with four factors. CFA was used to confirm the construct validity of the safety culture scale (Pedhazur & Schmelkin, 1991). The initial hypothesized model is shown in Figure 1. Maximum likelihood estimation was used to fit the data.

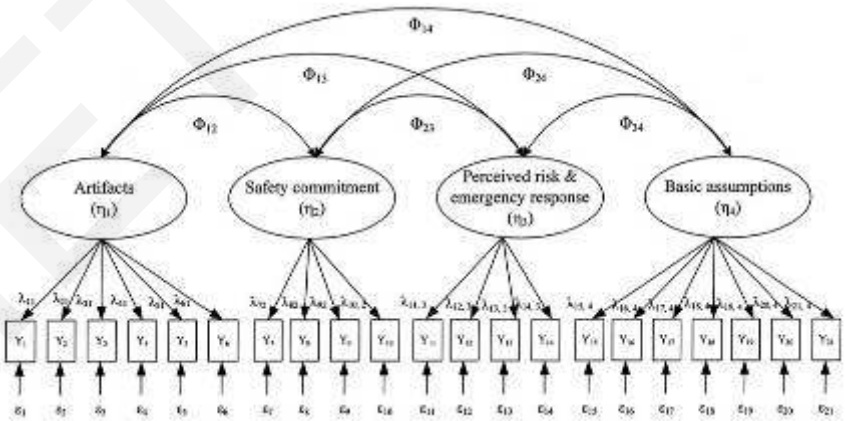

Fig. 1. Initial hypothesized confirmatory factor analysis model

Before assessing the fit of the model, it is necessary to check for offending estimates (estimated coefficients) in the structural model or measurement model that exceed acceptable limits. Examples of offending estimates include: (1) negative error variances or nonsignificant error variances for any construct; (2) standardized coefficients exceeding or very close to 1.0; (3) very large standard errors associated with any estimated coefficient (Hair et al., 1998). In these data there were no negative error variances; standardized coefficients were between 0.11 and 0.94, not too close to 1.0; and standard errors were not large (0.00 – 0.17). There were therefore no offending estimates, so we could proceed with

assessing the overall model fit.

Absolute fit measures. The chi-square (χ^2) value is 975.87 (df = 183, p = .000), which demonstrates that there is a significant difference between the predicted variance-covariance matrix and the observed sample matrix (Brown, 2006). χ^2 is easily affected by the size of the sample (Bagozzi & Yi, 1988), so Bollen (1989) recommends that other fit measures should be taken into consideration when assessing a model with χ^2. The root mean square error of approximation (RMSEA) is 0.11. This is not acceptable, using figures from Browne and Cudeck (1993), i.e. RMSEA $\leqq$ .08. The standardized root mean square residual (SRMR) = 0.08, which is acceptable (Hu & Bentler, 1999).

Incremental fit measures. Non-normed fit index (NNFI) = 0.94; comparative fit index (CFI) = 0.94. According to the rules of thumb given by Hu and Bentler (1999), acceptable levels for both NNFI and CFI $\geqq$0.95. By these measures, the model is not acceptable.

Parsimonious fit measures. Parsimonious normed fit index (PNFI) = 0.81; parsimonious goodness of fit index (PGFI) = 0.63. Both the PNFI and the PGFI range from zero to 1.0, with higher values indicating greater model parsimony (Kelloway, 1998).

Of the seven evaluation criteria, four suggest that the model is not acceptable. With more than half the criteria unacceptable, it is necessary to carry out model modification (Diamantopoulos & Siguaw, 2000). We fixed, in turn, epsilon 12 (model B), epsilon 16 (model C), epsilon 21 (model D), epsilon 10 (model E). After these modifications, most of the evaluation criteria were within acceptable limits.

After overall goodness-of-fit assessment, it is possible to assess the fit of the internal structure of the model. This includes construct reliability or composite reliability, convergent validity and discriminant validity. The construct reliability for the four latent variables were between 0.82-0.94, all above the significance level of 0.60 recommended by Bagozzi and Yi (1988). In terms of convergent validity, factor loadings (λ) were between 0.58 and 0.94. The average variances extracted for the four factors were between 0.51 and 0.75. These values are also higher than the reference value of 0.50 given by Bagozzi and Yi (1988). In terms of discriminant validity, the χ^2 difference value with an associated p value less than .05 ($\Delta\chi^2 > 3.84$, Δdf = 1, $p < .05$) supports the discriminant validity hypothesis (Bagozzi & Phillips, 1982). In another context, the approximate confidence interval for the true correlation using the standard error does not include the value 1 (Jöreskog & Sörbom, 1993). We conclude the four dimensions are discriminable. None of the four can be eliminated or incorporated into another dimension.

Two-way MANOVA

A two-way MANOVA test was used to find interaction effects between the five organizational factors (size, ownership, safety manager, safety committee, location) and the nine individual factors (gender, age, years of experience, job title, accident experience, safety training, department, rank, and work site). Four interaction effects were found to be significant: safety manager with work site; and safety committee with gender, age and rank. The other 41 possible interactions did not show significant effects.

Interaction effects of safety manager and work site on safety culture

The interaction effect of safety manager and work site was significant (Wilks'Λ = .910, p = .027), however it is only significant in one dimension: risk perception and emergency response (F = 4.620, p = .000). The simple main effects of these two factors are also significant. A *post hoc* comparison is showing the disordinal interaction is presented in Figure 2. However, the main effect of work site on safety culture is not significant (Wilks'Λ = .913, p = .037, but a *post hoc* comparison of ANOVA was not significant). This means that whether or not work site affects perceptions of safety culture depends on the presence or lack of a safety manager. The simple effects of work site on perception cannot be viewed in isolation. Figure 2 shows that there is no significant difference in risk perception and emergency response between faculty in different laboratories, no matter whether the university has a safety manager or not. But for faculty in electrical labs, those at universities with safety managers had higher scores for risk perception and emergency response; while those in other types of lab (control, components, computer, communication, other) showed no such variation.

Interaction effects of safety committee and gender on safety culture

The interaction effect of safety committee and gender was significant (Wilks'Λ = .971, p = .031) however it is only significant in one dimension of safety culture: artifacts (F = 4.869, p = .028). The simple main effects of these two factors are also significant. A *post hoc* comparison indicates that there is no significant difference between the safety culture perceptions of male and female faculty, no matter whether they are at universities with or without safety committees. Among male faculty, those at universities with safety committees do show stronger perception of artifact safety culture than those at universities with no safety committee. However, among female faculty, there were no significant differences.

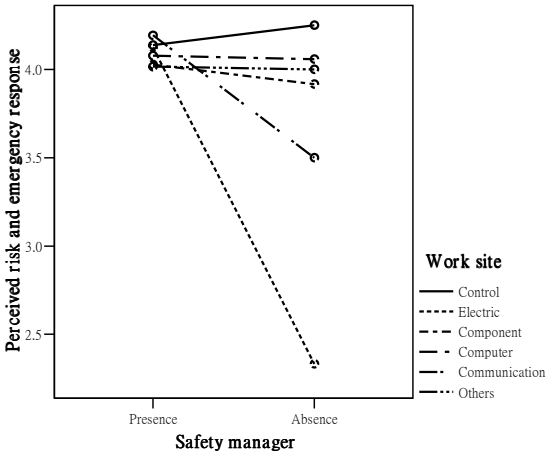

Fig. 2. Interaction effects of safety manager and work site on perceived risk and emergency response.

Interaction effects of safety committee and age on safety culture

The interaction effect of safety committee and age was significant (Wilks'Λ = .959, p = .005) however it was only significant in two dimensions of safety culture: safety commitment (F =13.406, p = .000) and risk perception and emergency response (F = 5.418, p = .020). The simple main effects of these two factors are also significant. A *post hoc* comparison showing the disordinal and ordinal interactions is presented in Figures 3. This figure shows that at universities with safety committees, there is no significant difference in safety commitment with age. However, at universities without safety committees, the scores for 45-65 year old employees were higher than those of 25-44 year olds. Among young (25-44) employees, safety commitment was higher at universities with safety committees; among older (45-65) employees, there was no significant difference between universities with and without safety committees.

In terms of risk perception and emergency response, older employees had higher scores than younger employees, no matter whether their university had a safety committee or not. For younger employees, scores were higher at universities with safety committees; for older employees, there was no significant difference between universities with and without safety committees.

Interaction effects of safety committee and rank on safety culture

The interaction effect of safety committee and rank was significant (Wilks'Λ = .940, p = .033) however it is only significant in one dimension of safety culture: artifacts (F = 2.700, p = .046). The simple main effects of these two factors are also significant. A *post hoc* comparison shows that rank does not have a significant impact on artifacts safety culture at either universities with safety committees or those without. But among lecturers and assistant professors, artifacts perceptions were better at universities with safety committees than at universities without; among professors and associate professors, there was no significant difference between universities with and without safety committees.

Fig. 3. Interaction effects of safety committee and age on commitment to safety.

DISCUSSION

The role of safety managers in promoting a safety culture is to assist in the development and monitoring of communication links between management and employees on safety matters (Cooper, 1998). Safety managers thus promote a positive safety culture. They can take three distinct organizational roles (expert, coordinator, controller) with three corresponding activities (safety counseling, safety coordination, safety controlling) (Hale, 1995). They reduce risk in the workplace and improve employees' emergency response capabilities. Wu, Liu and Lu (2007) have found that the safety climate is better in the labs of universities with safety managers than in those without. In practice, electrical engineering labs have generators, transformers and other electrical equipment, so there is a higher than normal risk of electric shocks and electrical fires. When these accidents happen, they tend to be more serious than in other laboratories. Emergency response is therefore a challenge for teaching staff in electrical engineering labs. One result found in this study is that there is an interaction effect between safety managers and type of laboratory. We therefore recommend that those universities without safety managers should do more to control risks in electrical labs, and should improve the emergency response skills of the teaching staff in these labs.

The presence of a safety committee promotes safety communication between management, labor representatives and safety managers in the drafting of safety regulations (Cooper, 1998). As Weil (1994) suggests, safety committees can improve safety performance through their role as ongoing forum for resolving safety issues. O'Toole (1999) finds that establishing a safety committee can help employers reduce work-related injuries. Wu et al (2007) suggest that the safety climate in laboratories at universities with safety committees is better than at universities without a safety committee. In practice, the vast majority of teaching staff in electrical and electronic engineering departments are men. With limited resources, it may be impossible to bring about comprehensive improvement in the artifact situation for male faculty members. In addition, as men, they have fewer opportunities to attend safety committees, so they have fewer opportunities for safety communication. An interaction effect on safety culture was found in this study between gender and safety committee; we recommend that universities without safety committees should do more to improve the artifacts situation for male faculty.

Super (1957) suggests that humans between the ages of 15 and 24 are in an exploration stage; 25-44 is the establishment stage; 45-64 is the maintenance stage. Individuals in the exploration stage seek to explore their roles, to explore their professions, and to make a commitment. In the establishment stage they work to establish a secure status and professional position, and their commitment gradually grows stronger. In the maintenance stage they maintain the status and achievements that they already have; their commitment to their profession is fixed. University faculty generally must have a master's degree or a doctorate, so they only begin work at a relatively advanced age. Those aged 25-44 can therefore be seen as either in the exploration or establishment stages, and those aged 45-64 could be in either the establishment or maintenance stages of their careers. An interaction effect was found in this study between age and safety committee; we recommend that universities without safety committees should work to improve the safety commitment of faculty aged 25-44. All universities, with or without safety committees, should aim to reduce workplace risks for faculty aged 25-44, and to improve their ability to respond to emergency situations.

University professors and associate professors occupy positions of considerable seniority, so they have many opportunities to take on management and senior administrative roles. They can have a major influence on the safety arrangements in the labs for which they are responsible. Assistant professors and lecturers are relatively less senior, and have a lower status in the university hierarchy. Their influence is fairly minor, and the safety arrangements in their labs are not attended to with the same care. There is an interaction effect between rank and safety committee. We recommend that universities without safety committees should improve the artifacts situation in the workplaces of lecturers and assistant professors.

One of the limitations of this study is that it covers only electrical and electronic engineering departments. The results may not be generalizable to other departments. Departments are microcosms of universities, and each microcosm has its own culture (Clark, 1989). The combination of organizational and individual factors may generate different safety culture outcomes in different departments. Also, as Guldenmund (2000) points out, though the concepts of safety culture and safety climate are similar, they do differ: in origin, features, functions and methods of measurement. Future research could further clarify the definitions and dimensions of safety culture and safety climate, and explore the relation between the two.

ACKNOWLEDGEMENT

The National Science Council of the Republic of China (Taiwan) under grant NSC 95-2516-S-241-001 and NSC98-2511-S-241-002-MY2 supported this research. The support received was greatly appreciated.

PERCEPTIONS OF ARABIC LANGUAGE TEACHERS' OF THEIR COMPETENCIES AND USAGE OF INTEGRATION TECHNOLOGY IN JORDANIAN SCHOOLS

Suad A Al-Waely, Abdallah M Abu Naba, Jehad Alaedein Zawawi, Bassam J. Mohd

ABSTRACT A convenient sample of 40 Arabic language teachers of elementary school students from 14 public schools were selected and nominated by school principals in Al-Zarqa Educational Zone to take part in this study. A three scale questionnaire was used to investigate Arabic language teachers' perception of their competences (TPC) scale and usage of integration technology in their classrooms (TPU) scale and the obstacles and incentives of using CALL in teaching Arabic (OIS). Results showed that there were significant differences between teachers' perceptions of their competencies and technology Integration. The results also revealed gender significant differences in teachers' usage of technology in the classroom in favor of male teachers. Moreover, significant differences in teachers' usage of technology integration in the classroom were found due to years of experience. Also, teachers with more years of experience reported lower levels of lack of incentives than those with less years of experience.

INTRODUCTION

Current Arabic Computer-assisted language learning (CALL) systems have the weakness that learners cannot phrase in an Arabic sentence freely. Similarly, they cannot guide the learner to correct the most likely ill-formed input sentences. The learner just accepts the information which follows the programmed instruction that is pre-installed in the computer. For these systems to be useful, more research to combine Natural Language Processing (NLP) techniques with language learning systems is needed. Parsing, the core component in Intelligent Computer-assisted language learning (ICALL) systems, allows the system both to analyze the learner's input and to generate responses to that input (Holland, Maisano, & Alderks, 1993). Allowing learners to phrase their own sentences freely without following any pre-fixed rules can improve the effectiveness of ICALL systems, especially when the expected learner answers are relatively short and well-focused (Boytcheva, Vitanova, Strupchanska, Yankova, & Angelova, 2004). Both the well- and ill-formed structure of the input sentence can be recognized. The learner should be allowed to correct the typed sentence independently.

In Arabic ICALL, there are two main types of test items for interaction with the learner—selection-type that tends to elicit answers easily classified as right or wrong and supply-type requiring the learners to write a few words. The objective test method is used to assess the learner's knowledge or skills where each question has one (and only one) correct answer—and there is no ambiguity about what that correct answer should be. The present system guides learners to recognize by themselves the erroneous or inappropriate functions of their misused expressions. In other words, it helps learners to make use of their errors. It doesn't give them the correct answer directly but it enables them to try over and over again. In this system, we use NLP tools (including morphological analyzer and syntax analyzer) and error analyzer to issue feedback to the learner. Furthermore, we propose a mechanism of correction by learners which allows the learner to correct the typed sentence independently, and allows learners to realize what the error is. Arabic ICALL follows the curriculum of Arabic grammar at the Egyptian primary schools. The linguistic computation of an Arabic sentence is a difficult task (Othman, Shaalan, & Rafea, 2003). The difficulty comes from several sources: (1) the length of sentences and the complexity of Arabic syntax; (2) the omission of diacritics (vowels) in written Arabic ''altashkiil''; (3) the free word order nature of Arabic sentence; and (4) the presence of an elliptic personal pronoun ''alDamiir almustatir''. For these reasons, there is very little research involving Arabic (I) CALL (Ditters, Oostdijk, & Cameron, 1993). Research into Arabic Computer-assisted language learning (CALL) can be classified by two approaches: the Computer as a tool and the Computer as a tutor. In the Computer as a tool approach, some computer programs can be used as a tool that does not necessarily provide any language material at all, but rather empowers the learner to use or understand language. In the Computer as a tutor

approach, the process of finding the right answer involves a fair amount of student choice, control, and interaction. Hegazi, Ali, Abed and Hamada (1989) presented a way of representing Arabic syntax in Prolog as production rules. The system can detect some errors concerning Arabic syntax, and so can be used for an educational environment. Abou Ela (1994) developed an expert system, the Arabic Syntax Analyzer (ESASA), which can be used as a tool to assist Arabic linguists in building Arabic grammar rules. The grammar is expressed using a declarative language called Grammar Writing Language (GWL). This tool is aimed at building Arabic natural language applications including CALL. The absence of diacritics, which represent most vowels, in the written text creates ambiguity which hinders the development of Arabic natural language processing applications. Thus, ambiguity increases the range of possible interpretations of natural language (Othman, Shaalan, & Rafea, (2003).Using the Internet for publishing web-based CALL materials that contain non-Latin alphabets requires the solution of various technical problems. There are so many unknown factors associated with the operating system of a distant user that affect the browsing characteristics of these materials. Cushion and Hemard (2002) described how recent technological developments have provided the possibility of overcoming these technical problems in conjunction with the Java programming language and the Unicode character numbering system. Shaalan (2005) developed an Arabic grammar checker, called Arabic GramCheck. Arabic GramCheck looks for common Arabic grammatical problems, describes the problem, and offers suggestions for improvement. This program is useful in pointing to problems believed typical of native speaker writing. Thus, the learner can avoid such problems in future. Gheith, Dawa, and Afifty (1996) developed Instructional Software for Teaching the Arabic Language (ISTAL) for grade one prep school. The system presents the curriculum as a simple concept associated with a set of generated sentences. Then, the system generates an exercise for the student and the student's answer is automatically evaluated by comparing it to the system's solution. For example, in Egypt, where there is a growing demand in using computers for teaching and learning, some publishers of off-the-shelf school textbooks provide students with either CD's or web sites that contain vocabulary and grammar practice.

The educational units include Arabic grammar lessons for the primary level. Specifically, they cover the following:

الجملة (pronouns)؛ الضمائر (verbs)؛ الأفعال (dual and plural)؛ المثنى والجمع (adjective)؛ النعت (nouns)الأسماء ؛ أنواع الخبر (types of the enunciative)؛ المبتدأ والخبر pred (inchoative and enunciative) ؛ الإسميّة(nominal sentence) ؛ النداء (circumstantial accusative)؛ الحال (adverb)؛ الظرف (conjunctions)؛ العطف (verbal sentence)الجملة الفعلية ؛ إن وأخواتها (Inna and her sisters)؛ المفعول المطلق (unrestricted object)؛ المفعول لأجله (causative object)؛ (interjection) ، وأنواع (Kana and her sisters)؛ كان وأخواتها (types of predicate of Inna and her sisters)؛ أنواع خبر إن وأخواتها (types of predicate of Kana and her sister)؛ الحروف (articles).خبر كان وأخواتها

The primary stage teacher plays a pivotal role in the development of technology-based literacy skills. Most early childhood educators see the computer center as an important activity center for learning (Haugland, 2000). In the computer center, children can have many opportunities to integrate learning across content areas (Morrow, Gambrell, & Pressley, 2003). To support children's learning in the computer center, teachers should take the time to observe each child and provide them with many opportunities for independent explorations on the computer.

As we increasingly depend on computers for learning, our expectations of language teachers will inevitably change. The aim here has been to highlight generic applications found on virtually any computer in the world so Arabic instructors will feel less inhibited about employing the basic technologies of word processing, e-mail, and the Internet in Arabic language learning (Madhany, 2005). These technologies can assist the teacher in project-based learning where the technology is adapted to the learner rather than vice versa. The best Arabic learning still occurs at the hands of brilliant teachers who use flexible, universal technologies to amplify their pedagogy, not to replace it.

Considering what we already know about teacher technology use, and in spite of the fact that technology-using teachers are seeing the impact on their students, published studies support what we suspect, that teachers are not using technology (Roblyer, 2004). Yet, the integration of technology and quality teaching are said to be inseparable. Content knowledge and pedagogical knowledge, as indicators of quality teaching, become readily evident within the process of technology integration that includes definition, planning, strategies, student management, and assessment (Pierson, 2001). However, technological knowledge must be modeled and emphasized in teacher education programs in order to ensure its understanding and its appropriate, successful application by the teacher in the K-12 classroom (Martin, 2004; Martin & Crawford, 2004; Martin & Crawford, 2005). Special educators are more likely to use technology competently if it has

been embedded in coursework and field experiences (Martin, 2004). Based on indications reflecting a need for better training of teachers, the following issues related to technology use and teacher education programs have been identified: (a) university faculty factors such as a lack of modeling of technology in courses; (b) lack of technology implementation in activities and coursework; (c) a lack of expertise to develop complex technology mediated instruction; and (d) lack of technology integration in education field experiences (Ludlow 2001; Roblyer, 2004). Technology integration at schools and factors affecting such integration has drawn the attention of many researchers and has been of high interest to them. A number of studies have been conducted to explore teachers' use of technology and factors hindering such use (e.g., Anderson & Maninger, 2007; Becker & Ravitz, 2001; Gulbahar, 2007; Zhao, 2007). Parallel with the same purpose, this study aimed to investigate how a primary school teachers perceive their competence of technology integration, and their usage of these technologies in teaching Arabic language in classrooms, in addition the study explore the barriers and incentives relating to successful technology integration in the school. Therefore, the study first illustrated the technology integration approach and the barriers that prevent teachers from using technology integration in their teaching.

STATEMENT OF THE PROBLEM

In the light of the information revolution and the scientific challenges of the 21st, century, there is a sweeping trend to use computers in all aspects of life and education is no exception. On the other hand, the world is heading towards knowledge economy and a lot of money will be invested in computer assisted language learning instructional software programs. Therefore, it is worth investigating the effectiveness of such CALL programs on the performance of learners.

DEFINITION OF TERMS

Technology Use is implemented most often as an instructional tool, but it is the teacher's job to help the student to learn; computers, videos or the like. Technology Integration focuses more on supplementing what the students are already beginning to study, thus allowing for further questioning and investigation into individual subject areas and deeper understanding of topics and information. **Technology Integration** thus actively engages the learner in the activity and into the learning process. Such integration technologies (web making software, wikis, etc.) "require students to think about what they know in different, meaningful ways" (Jonassen, Carr, & Yueh, 1998).

STUDY QUESTIONS

The current study addresses the following research questions:

1. What is the level of fifth primary grade Arabic Language teachers' perceptions of their competencies in Technology Integration in classrooms?
2. What is the level of fifth primary grade Arabic Language teachers' perceptions of their usage of Technology Integration in classrooms?
3. What is the level of fifth primary grade Arabic Language teachers' perceptions of the obstacles and incentives of Technology Integration in classrooms?
4. Is there a significant difference between teachers' perceptions of their competencies in Technology Integration in classrooms and their perceptions of their usage of it?
5. Is there a significant difference between teachers' perceptions of their competencies, of their usage of technology Integration, and obstacles and incentives related to successful Technology Integration due to gender, qualification, and years of teaching experience?

IMPORTANCE OF STUDY

The domain of CALL in Jordan is in need of more research. To the researchers' best knowledge, studies about computer – based instruction in Jordan are not so many. A few studies about the use of CALL by Arabic language teachers have been conducted. It is anticipated that this study will shed light on the competencies and the usage of Call by Arabic language teachers in Jordan. Thereupon, the findings of this study may be functional for different categories of people; it may help EFL curricula designers and EFL

methodologists develop practical ways to train and encourage teachers to use CALL in their classrooms. Finally, this study may encourage other researchers to conduct further studies on the same topic, which will enrich both the local and international literature.

LIMITATIONS OF THE STUDY

This study is confined to Arabic Language teachers of fifth primary stage students in the second semester of academic year 2009/2010 in Zarqa Area schools-Jordan

.

REVIEW OF RELATED LITERATURE

Numerous studies have been carried out to identify the extent of technology usage among school teachers, and factors facilitating or prohibiting technology integration in the classroom, particularly computers. Some studies focus on the availability of computers in the classroom, sharing of resources, a supportive administration, and a strong support staff as the primary influencing factors. As an example, the Becker and Ravitz (2001) study showed that computer use among teachers is related to more constructivist views and practices and to changes in practice in a more constructivist-compatible direction. Bauer and Kenton (2005) found that teachers, who were highly educated and skilled with technology, were innovative and adept at overcoming obstacles, but they did not integrate technology on a consistent basis both as a teaching and learning tool. Results suggest that schools have not yet achieved true technology integration. Gulbahar (2007) concluded that teachers and administrative staff felt themselves competent in using ICT available at the school; they reported a lack of guidelines that would lead them to successful integration. On the other hand, students reported that ICT is not utilized sufficiently in their classes. Zhao (2007) conducted a qualitative research to investigate the perspectives and experiences of 17 social studies teachers following technology integration training. The research indicated that teachers held a variety of views towards technology integration. These views influenced their use of technology in the classroom. Most teachers were willing to use technology, expressed positive experiences with technology integration training, increased their use of technology in the classroom, and used technology more creatively.

In addition, other research studies suggest that there is a relationship between a teacher's student-centered beliefs about instruction and the nature of teacher's technology-integrated experiences (Judson, 2006; Totter, Stutz, & Grote , 2006). Similarly, ChanLin et al. (2006) conducted a study to identify the factors affecting eight teachers' use of technology in creative teaching practicies. The identified factors were classified into four categories: environmental, personal, social and curricular issues. Besides ChanLin's study, Anderson and Maninger (2007) investigated the changes in and factors related to students' technology-related abilities, beliefs, and intentions. Statistically significant changes were found in students' perceived abilities, self-efficacy beliefs, value beliefs, and intentions to use software in their future classrooms. Students' self-efficacy, value beliefs, and intentions were moderately correlated with each other. Abilities were correlated with self-efficacy and computer access. The best predictors of intentions were self-efficacy beliefs, gender, and value beliefs.

METHODOLOGY AND PROCEDURES

SAMPLE OF THE STUDY

The population of this study included teachers of Arabic Language in primary state schools in Zarka. A convenient sample of 40 teachers from 14 schools located in Zarqa city in Jordan were voluntarily recruited to participate in the study and filled in the study questionnaire which were designed for the purposes of the current study. They declared they have technological aids in their classrooms such as internet access, computers, data shows, projectors, video, etc. 40% per cent of the participating teachers were females. 85% of participants hold bachelor degree (BA) in Arabic Language and Literature and the rest are currently enrolled in the Master (MA) different relevant programs in Jordanian universities; 40% had 3-6 years of teaching experience, 37.5% less than 3 years, and 22.5% had more than six years, with average age for the whole sample (M=36.6; SD= 4.6) with age range from 29-45 years. Each school has two computer laboratories (with 25 computers and a projection system), one electronic classroom (with 25 computers, a projection system, overhead projector and TV-video set), and one library. School has 71 computers for administrative staff and

teachers' use and 75 computers for student use (1:13 ratio at student level). In addition, there are 31 overhead projectors, 10 TV-video sets, 2 computer-projection systems and 4 VCD players at school.

INSTRUMENTATION

The instrument used in the current study was developed after a thorough review of the literature worldwide, especially research related to technology integration and language construction development. The survey questionnaire consists of two sections. A demographic section gives a description of the sample used in the study, such as gender, type of educational certification degree (bachelor-Master), and years of working experience. The second section includes three scales; Teachers' Perceptions of their Competencies Scale (TPC Scale), which consists of 22 items using a 3-point scale of responses, with 3 indicating strongly agree and 1 indicating strongly disagree; Teachers' Perceptions of their Usage Scale (TPU Scale), which consists of 22 items used in the TPC Scale a 3-point scale of responses, but this time asking how frequently the teachers practice the behaviors described in the 22 items, with 3 indicating always and 1 indicating never; thirdly, the last part contains obstacles and incentives scale (OIS), and employing a 5-point Likert-type scale of responses, with 5 indicating strongly agree and 1 indicating strongly disagree.

VALIDITY AND RELIABILITY OF THE QUESTIONNAIRE

The face validity of the study questionnaires was established by refereeing it by a panel of university professors with different specializations, including educational technology, Arabic language and Information Technology [IT] teaching methods, in addition , the researcher selected ten Arabic language male and female teachers who identified themselves as providers of technology integration in their teaching practice.The team of panel professors and teachers was asked to validate the content of the questionnaires with regard to instructions, the relevance of questions to target assessed variable, its suitability to the research goals and objectives, and the number questions. The remarks of the validating team, their notes and suggestions were taken into consideration, and the researcher made the necessary modifications before implementing the instruments. The three questionnaire (TPC, TPU and OIS Scales) validity using Cronbach's Alpha was 0.94; 0.88; 0.91 respectively.The questionnaires reliability was obtained through a test-retest method, which was applied on a pilot group of (24) teachers who were chosen from the population of the study and excluded from the sample. The scales were repeated on the same group to check its reliability two weeks later. The reliability correlation coefficient of the test-retest was calculated using Pearson correlation formula. It was found to be (0.84), which is considered to be suitable from a statistical point of view for the purpose of this study.

DATA ANALYSIS

Data gathered from the questionnaire items were analyzed using SPSS 15.0. Descriptive statistics, a t-test, multivariate analysis, and analysis of variance (ANOVA) were used. In addition, the researcher analyzed these items using "Item Analysis" method in order to get a deep understanding of the results from the questionnaire.

FINDINGS

Question 1: "What is the level of fifth primary grade Arabic Language teachers' perceptions of their competencies in Technology Integration in classrooms? Results indicated that teachers moderately regard their competencies in technology integration (M=*1.82*). The mean scores ranged from *1.64* to *2.09* on a 3-point scale, see (Table 1). This moderate perception by teachers might be due to the fact that technology integration in classrooms highly affected by the barriers involved in this process though it is a part of teacher evaluation particularly at public schools. Investigating the items in details, the highest mean scores were for items that are related to teachers' ability to use presentation and analysis, word processing applications, utilize computers to assess students learning hardware and software, using technology to locate, evaluate, and collect information from a variety of sources. While the lowest mean scores were for items that are related to teachers' ability to integrate language labs to enhance students" learning. These results conform to Bauer and Kenton (2005), where they found that teachers were highly skilled with technology and had the competencies required from successful technology integration. In addition, they were also supported by Zhao (2007) who investigated the perspectives and experiences of 17 social studies teachers following technology integration training.

Table 1: Teachers ' Perception of their Competencies in Technology Integration

	Items	*M*	*SD*
1.	Selecting the appropriate computer programs related to language teaching and learning	*1.8*	*.533*
2.	Engaging students in the selection of technology-based materials	*1.8*	*.648*
3.	Using computer programs related to language teaching and learning	*1.9*	*.693*
4.	Producing technology-based materials such as brochures and pamphlets	*1.8*	*.549*
5.	Employing technology to get and assess information retrieved from different resources	*1.9*	*.545*
6.	Using technology for data presentation and analysis	*2.0*	*.525*
7.	Discussion of safety and health issues related to technology use	*1.8*	*.463*
8.	Operating a computer using a variety of software packages	*1.9*	*.619*
9.	Employing terminology related to computers and employing appropriate technology for written and oral communications	*1.8*	*.549*
10	Using devices such as scanners, digital cameras, and/or video cameras with computers and software	*1.8*	*.500*
11	Utilizing word processing applications	*2.0*	*.597*
12	Employing computers for creating databases	*1.9*	*.530*
13	Using spreadsheet applications such as MS Excel	*1.9*	*.552*
14	Creating multimedia presentations such as PowerPoint presentations	*1.9*	*.632*
15	Employing adaptive & assistive devices for students with special needs	*1.9*	*.530*
16	Designing web sites	*1.8*	*.533*
17	Using distance learning hardware and software	*1.9*	*.590*
18	Using computers to assist students with special needs	*1.8*	*.405*
19	Utilizing computers to assess students learning	*2.0*	*.749*
20	Integrating language labs to enhance students" learning	*1.7*	*.619*
21	Integrating technology to enhance students" learning	*1.9*	*.729*
22	Using computer programs that enhance students" reading ability	*1.8*	*.516*
	TOTAL	*1.82*	*.116*
	Range	*1.64*	*2.09*

Question 2 " What is the level of fifth primary grade Arabic Language teachers' perceptions of their usage of Technology Integration in classrooms? Results showed that teachers weakly regard (M=*1.57*) their practice of technology integration. The mean scores ranged from *1.32* to *1.82* on a 3-point scale, see (Table 2). This low moderate perception by teachers might be due to the fact that technology integration in classrooms in reality faced by the many obstacles that prevent teachers from conducting it such as anxiety, lack of administrative cooperation and encouragement, lack of enough time and resources etc. particularly at public schools. Investigating the items in details, the highest mean scores were for items that are related to teachers' use of word processing applications. While the lowest mean scores were for items that are related to teachers' use of terminology related to computers and employing appropriate technology for written and oral communications. These results are supported by Ertmer, Addison, Lane, Ross, and Woods (1999) who found that teachers' perceptions of the role of technology are closely linked to how technology is used. Another study confirming the results of this study was conducted by Kotrlik and Redmann (2005), where results revealed that although teachers feel some anxiety when it comes to technology integration, they perceived that they are effective in using technology.

Table 2: Teachers ' Perception of their usage of Technology Integration

	Items	*M*	*SD*
1.	Selecting the appropriate computer programs related to language teaching and learning	*1.6*	*.545*
2.	Engaging students in the selection of technology-based materials	*1.5*	*.640*
3.	Using computer programs related to language teaching and learning	*1.6*	*.627*
4.	Producing technology-based materials such as brochures and pamphlets	*1.5*	*.598*
5.	Employing technology to get and assess information retrieved from different resources	*1.5*	*.598*
6.	Using technology for data presentation and analysis	*1.7*	*.554*
7.	Discussion of safety and health issues related to technology use	*1.5*	*.506*
8.	Operating a computer using a variety of software packages	*1.7*	*.588*
9.	Employing terminology related to computers and employing appropriate technology for written and oral communications	*1.4*	*.505*
10	Using devices such as scanners, digital cameras, and/or video cameras with computers and software	*1.6*	*.585*
11	Utilizing word processing applications	*2.0*	*.599*
12	Employing computers for creating databases	*1.7*	*.588*
13	Using spreadsheet applications such as MS Excel	*1.5*	*.638*

14	Creating multimedia presentations such as PowerPoint presentations	*1.6*	*.585*
15	Employing adaptive & assistive devices for students with special needs	*1.8*	*.648*
16	Designing web sites	*1.7*	*.576*
17	Using distance learning hardware and software	*1.7*	*.697*
18	Using computers to assist students with special needs	*1.6*	*.496*
19	Utilizing computers to assess students learning	*1.7*	*.757*
20	Integrating language labs to enhance students" learning	*1.6*	*.540*
21	Integrating technology to enhance students" learning	*1.6*	*.585*
22	Using computer programs that enhance students" reading ability	*1.6*	*.590*
	TOTAL	*1.57*	*.114*
	Range	*1.32*	*1.82*

Question 3 "How do teachers perceive obstacles and incentives related to successful technology integration in the classroom? Results indicated that teachers moderately reported existence of obstacles and incentives interfere with their using technology integration (M=3.30; 3.36) respectively. The mean scores for obstacles ranged from *2.62* to *4.04*, and for incentives from *2.42* to *3.83*, on a 5-point scale (see Table 3). Results showed that teachers perceive large number of students per class as major obstacle that hinder their technology integration in their classrooms (see Table 3). They also perceive Lack of participation in special workshops to prepare them well and availability of additional resources for classrooms as reasons that discourage them to integrate technology, see (Table 3).

These results conform to Ismail, Almekhlafi and Al-Mekhlafy (2010), where they found that barriers that hinder technology integration among teachers include lack of training on how to integrate technology effectively, and that most teachers depend on self learning, and they need to be involved in subjects that enable them to learn technology integration techniques and strategies so they can use it successfully in their classes.

Table 3: Teachers' Perceptions of Obstacles and Incentives Related to Successful Technology Integration in Classroom

	Obstacles	M	SD
1	The teacher does not have much time to prepare and implement them	4.00	0.751
2	Curricula are not ready to use such new technologies	4.00	0.816
3	Difficulty in usage of technology in teaching due to the large number of students per class	4.37	0.627
4	Technologies are not available in schools	4.00	0.815
5	Equipped labs are not available in schools	4.10	0.810
	Incentives		
6	Not enough encouragement to use them	4.12	0.790
7	No positive evaluations	4.12	0.647
8	Lack of participation in special workshops	4.25	0.588
9	Availability of additional resources for classrooms	4.15	0.699
10	School or educational zone recognition program	4.12	0.790

Question 4 "Is there a significant difference between teachers' perceptions of their competencies in Technology Integration in classrooms and their perceptions of their usage of it? T-tests for Paired Samples showed that there is a significant difference in all items of the scales between teachers' perceptions of their competencies in Technology Integration in classrooms and their perceptions of their usage of it, as seen from (table 4), Teachers' perceptions of their competencies were more higher than it was their using of it in every items except for three concerning utilizing word processing applications, designing web sites and using distance learning hardware and software. Figure (1) depicts differences between Teachers' Perception of their Competencies and Usage of Technology Integration.

Table 4: Results of Paired Samples T-tests of Teachers ' Perception of their Competencies and Usage of Technology Integration

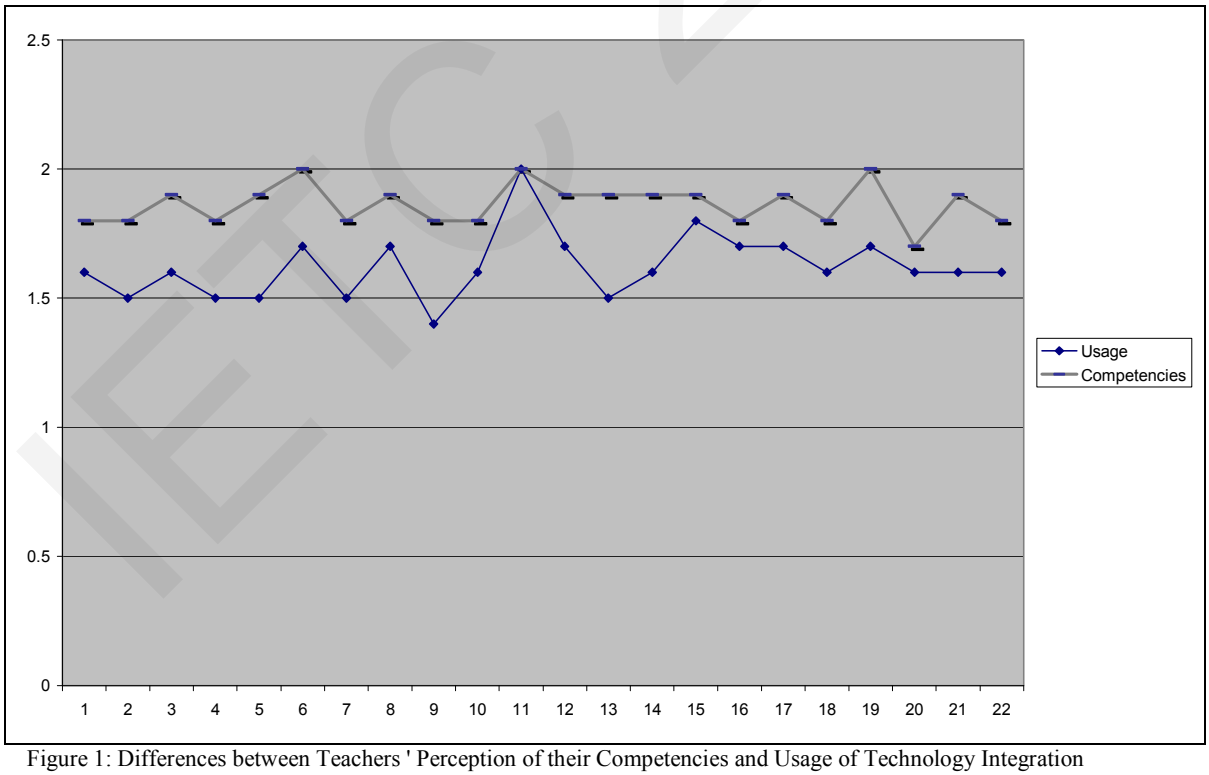

Figure 1: Differences between Teachers ' Perception of their Competencies and Usage of Technology Integration

To answer the first part of question 5 “What is the difference in perception of competence, usage of technology integration and obstacles and incentives among male and female teachers?” a multivariate analysis

was run. Results indicated a significant difference between the two groups only on usage of technology integration with a Hotelling's trace value of 2.94 with a significant f. of 2.27. To locate the significant differences within subscales, a one way analysis of variance (ANOVA) was run for the three scales' items. However, in order to control Type I error when conducting the analysis of Variance, the researchers adjusted α level (0.05) using Benfaroni modification method. The adjusted value of α is ≤ 0.005. Table 4 shows the items that yielded significant differences within the sub-themes. As seen from the table 5/1, technology availability was a concern for female teachers more than it was for males. In spite of this fact, results showed that female teachers use different types of technologies more than male teachers do. The means scores for female teachers on technologies used are all above 4.4, while the mean scores for male teachers ranged from 2.5 to 3.5. This might indicate that female teachers integrate technology in their classrooms more than male teachers do. On the other hand, Hong and Koh (2002) found that female teachers were more anxious than male teachers toward hardware. They also found that the overall computer anxiety levels of male teachers were not significantly different from the anxiety levels of female teachers. Only for the hardware anxiety domain were significant differences detected between male and female teachers.

Table 5/1: Differences between Male and Female Arabic Language Teachers in their Perception of Technology Integration

	Teachers Perception of their Competencies in Technology Integration	M	F	f
1	Using computer programs related to language teaching and learning	2.1	1.5	8.72**
2	Creating multimedia presentations such as PowerPoint presentations	1.7	2.2	8.55**
3	Using distance learning hardware and software	2.0	1.6	6.61**
	Teachers Usage of technology in the classroom			
1	Selecting the appropriate computer programs related to language teaching and learning	1.7	1.3	5.00*
2	Operating a computer using a variety of software packages	1.9	1.5	5.35*

**p< 0.05*

To answer part two of question 5 "What is the difference in perception of competence, usage of technology integration and obstacles and incentives among teachers with different levels of teaching work experience?" Significant differences in teachers usage of technology integration in the classroom, were found according to years of experience where teachers with more years of experience [more than 11 years], showed higher levels (M=36.91), than those with years of experience [6-10 years (M=34.64); and less than 6 years (M=33.42). also teachers with more years of experience [11 and more years] reported lower levels of lack of incentives (M=15.8), than those with years of experience [less than 6 years (M= 16.6); and 6-10 years (17.5). (table 5/2). No significant differences were found in terms of teachers' level of certification.

Table 5/2: Differences Between Arabic Language Teachers in their Perception and Usage of Technology Integration according to years of working experience (group 1[less than 6 years]; group 2 [6-10 years]; group3 [more than 11years])

		Years of work experience			
		1	2	3	
		M	M	M	f
1	TOT-Teachers Perception of their Competencies in Technology Integration	1.80	1.79	1.90	3.00
2	TOT-Teachers Usage of technology in the classroom	1.51	1.57	1.67	7.12**
3	**TOT-Obstacles**	3.43	3.30	3.09	2.16
4	**TOT- Incentives**	3.32	3.50	3.16	3.87**

DISCUSSION AND RECOMMENDATIONS

This study, along with others of its kind, brings to light the reality of real issues affecting technology integration in schools versus technology use and the real dynamics that keep that vision from taking firm hold in public schools. By integrating a quantities approach in this study, the researchers were able to gather real issues and frustrations that if taken into a broader picture, apply to many schools and districts to their inability to upstart technology rich classrooms and curricula. Additionally, there is a need for more professional development programs that help teachers learn how to use technology and to be transferred from the workshop model of "how" to use a tool to the more sophisticated professional learning group model that encourages sustainability and accountability across the curriculum (Guhlin, Omelas, & Diem, 2002; Jenson, Lewis, & Smith, 2002; Willis & Cifuentes, 2002). However, as some scholars have noted, simply becoming more comfortable with the technology and understanding a tool does not equal nor "ensure effective technologically facilitated teaching" (Harris & Hofer, 2009, p. 23). Most researchers and teachers agree that professional development for teachers in the area of technology integration must continue to evolve from the 2 hour "this is the technology and here is how to use it" workshop to a sustainable model from which teachers can "systemically change instruction" (Brock, 2009, p. 10) and learn from other educators' failures and successes over a period of time (Jenson et al., 2002). The integration of technology into content, as reflected by the Technological Pedagogical Content Knowledge (TPACK) model (Mishra & Koehler, 2006) should locus on the interplay of technology, pedagogy, and content knowledge. As noted by Mishra and Koehler (2009) "Knowledge of technology, content, and pedagogy does not exist in a vacuum; it exists and functions within specific contexts" (p. 16). Peer coaching and modeling technology lessons in teaching and learning (Joyce & Showers, 2002) may help teachers contextually overcome personal and classroom barriers, to think outside the box (Wright & Wilson, 2005-2006), and to develop "creative repurposing" (Mishra & Koehler, 2009, p. 16), to use a technology that is specific to the teacher's classroom and curricular needs, and to create better in-service teacher training and learning opportunities for faculty and pre-service teachers in university teacher education program (TEP) to understand and integrate technology in elementary education classrooms.

CONCLUSIONS

Technology should be used as a tool to support instruction. Educational choices have to be made first in terms of objectives, methodologies, and roles of teachers and students before decisions on the appropriate technologies can be made. No technology can fix bad educational philosophy and practice. The challenge is to rethink learning objectives and to align the learning technologies with these objectives. Since technology adoption and utilization are an ongoing issue, there is still need for further investigation. The successful implementation of computers in the classrooms may depend on how well the teachers are prepared to use technologies. There is a need to identify the competencies teachers must posses to use computer technology effectively in classroom. An important question to address is-which teacher competencies are viewed as important for the development and operation of computer technology in K-12 and college school settings. Research studies should focus on various facets of technology implementation and innovation and their specific effects, as well as how students and teachers use technology, rather than simply comparing different delivery methods.

PERSONALIZATION PRINCIPLE IN MULTIMEDIA LEARNING: CONVERSATIONAL VERSUS FORMAL STYLE IN WRITTEN WORD

Assist.Prof.Dr.Adile Aşkım Kurt
Anadolu University, Faculty of Education,
Computer Education & Instructional Technologies Department
aakurt@anadolu.edu.tr

Abstract: The purpose of the study is to examine the multimedia software designed as appropriate to the conversational style and to the formal style with respect to various variables. The model of nonequivalent control group was used in the study and the group studying with the multimedia material in formal style included 22 students, and the group studying with the multimedia material in conversational style included 23 students. An achievement test, the cognitive load scale for both groups and a questionnaire for students' views about the style used in the personalized group were used as data collection tools. A significant difference was found between the cognitive load scores of the students in the personalized group and those of the students in the nonpersonalized group. However no significant difference was found between the background knowledge levels of the personalized and nonpersonalized groups, the posttest achievement scores of the students in the personalized group and those of the students in the nonpersonalized group. In the study the learners stated that the style used in the software motivated them to study and they felt as if they were talking to a human; that they preferred similar multimedia software to be used in their other courses; and that they emphasized the use of such multimedia software in face-to-face education.

Keywords: Multimedia learning, personalization, conversational style, formal style

INTRODUCTION

A student working with multimedia software is alone but with texts, narrations, feedback and cues in multimedia software, the student is provided to be in a conversation. Therefore, Mayer suggested the *personalization principle*. According to the personalization principle, people learn better through multimedia presentations in which the words are in the conversational style rather than in the formal style (Mayer, 2005, 2009). Mayer and his colleagues, in all the 11 experiments they carried out, found out that in multimedia courses, the students taking the instructional content via the conversational style demonstrated better performance in transfer tests than the students taking the instructional content via the formal style (Mayer, 2009).

In the literature, there are several studies investigating the influence of the multimedia instructional messages - given in the conversational style (personalized) and the formal style (nonpersonalized) - on students' achievement. Moreno and Mayer (2000), examined whether the multimedia messages given in conversational and formal style in a multimedia science lesson increases learning through a study involving five experiments. The instructional content was presented via narration in the first, third and fifth experiments and via the text on the computer screen in the second and fourth experiments. In the study, it was concluded that the students receiving the instructional content via the conversational style demonstrated better performance in problem solving tests than those receiving the instructional content via the formal style. Mayer, Fennell, Farmer, and Campbell (2004) examined the performances of the students taking the personalized or non-personalized versions of a narrated animation explaining how the respiratory system of the humans functions. At the end of all the three experiments the researchers conducted, they found out that the students in the personalized group were significantly more successful in transfer tests than those in the non-personalized group. Similarly in another study carried out by Moreno and Mayer (2004), the students studied via an agent-based multimedia educational game. The agents used personalized or non-personalized speech. The students learning via the personalized version were more successful in the reminder and problem solving tests. The related literature demonstrates that in the studies conducted with the conversational style and formal style, the learners studied via software for a quite short period of time (60 seconds, 140 seconds and so on). In the present study, the learners

studied the instructional content for 30 minutes. Therefore, this study could be said to be carried out in a more realistic learning environment.

Purpose of the Study

The purpose of the study was to examine the multimedia software designed as appropriate to the conversational style and to the formal style with respect to various variables. In line with this overall purpose, the research questions were as follows:

- Is there a significant difference between the post-test achievement scores of the students studying with the multimedia software designed based on the conversational style and the post-test achievement scores of those studying with the multimedia software designed based on the formal style?
- Is there a significant difference between the cognitive load scores of the students studying with the multimedia software designed based on the conversational style and the cognitive load scores of those studying with the multimedia software designed based on the formal style?
- What are the views of students studying with the multimedia software designed based on the conversational style about this software?

METHOD

This part of the paper presents the research model, participants, data collection tools, multimedia materials, application process and data analysis.

Research Model

In the study, the model of nonequivalent control group was used. In this model there is no special effort to equate the groups via objective assignment, but it is especially important to have subjects as similar as possible.

Participants

The participants of the study were 3rd grade students taking the course of Scientific Research Methods-ARY204 in the Department of Computer Education and Instructional Technologies (CEIT) at the Education Faculty of Anadolu University. In the study, the group studying with the multimedia material in formal style included 22 (4 female and 18 male) students, and the group studying with the multimedia material in conversational style included 23 (6 female and 17 male) students.

Data Collection Tools

In the study, an achievement test, the cognitive load scale and a questionnaire for students' views about the style used in the personalized group were used as data collection tools.

Achievement test: Including ten multiple choice test items was developed by the researcher.

Cognitive load scale: 9-point likert-type scale was developed by Paas and Van Merriënboer (1993) and adapted to Turkish by Kılıç and Karadeniz (2004). The internal consistency coefficient of the scale translated into Turkish was 0.78, and the Spearman Brown split half test correlation was 0.70.

Questionnaire: Including 10 five-point likert-type items and an open-ended question about the style used in the personalized group was developed by the researcher.

Multimedia Instructional Materials

For the application of the study, the lesson unit of "t test and t test types" of the course of Scientific Research Methods - ARY204 – was developed as a multimedia material by the researcher and one academician. First, in line with the objectives of the lesson unit, the content was prepared, and two

multimedia materials with the same content but in different styles (conversational and formal styles) were designed. The multimedia instructional materials were prepared with the Adobe Flash software, and for the preparation of the visuals, the Adobe Photoshop software was used. Following the development of the instructional software, the materials were presented to three experts in the fields of subject matter, graphics and instructional design. In line with the views and suggestions of the experts, the instructional materials were finalized.

Treatment Process

During the application carried out in the Fall Term of the academic year of 2010-2011, the following process was followed:

- In the first course hour, the academic achievement test (pretest) was applied to the students in both groups.
- The students in the first group studied individually with the multimedia instructional material prepared in conversational style, and the students in the second group studied individually with the multimedia instructional material prepared in formal style. During the application, the cognitive load scale was presented to the students in paper-and-pencil form. The scale included a cognitive load scale question regarding each concept found in the application, and the students marked the appropriate option in the scale after they studied each concept.
- At the end of the application, the students in both groups took the academic achievement test (posttest).
- The students in the personalized group were given the questionnaire developed regarding the formal style of the software they studied with.

Data Analysis

Mann-Whitney U test was applied to answer the first research question; for the second research question, independent samples t test was run; and regarding the third research question, mean scores were used for the analysis of the quantitative data, and for the analysis of the qualitative data, descriptive analysis was used. In order to interpret the mean scores regarding five-point likert-type questionnaire items, the formula of (n-1) was used. The score ranges of 1,00-1,80 represented “strongly disagree”, 1,81-2,60 “disagree”, 2,61-3,40 “partly disagree”, 3,41-4,20 “agree” and 4,21-5,00 “strongly agree”.

FINDINGS

Background Knowledge Levels

There was no significant difference between the background knowledge levels of the personalized and nonpersonalized groups (pretest achievement scores) ($p>.05$). The maximum score to be obtained from the achievement test was 10. As a result of the analysis, it was seen that the pretest achievement scores of both groups (personalized $\overline{X}$ = 1.22, nonpersonalized $\overline{X}$ =2.09) were quite low.

Posttest Achievement Scores

The results of the Mann-Whitney U test revealed no significant difference between the posttest achievement scores of the students in the personalized group and those of the students in the nonpersonalized group ($p>.05$). Although there was no significant difference between the posttest achievement scores of both groups, it was found out that the mean of the personalized group ($\overline{X}$=8.52) was higher than that of the nonpersonalized group ($\overline{X}$=8.40).

Cognitive Load Scores

There was a significant difference between the cognitive load scores of the students in the personalized group and those of the students in the nonpersonalized group ($p<.05$). The cognitive load score of the personalized group ($\overline{X}$=6.03) was found significantly higher than the cognitive load of the

nonpersonalized group ($\overline{X}$=4.67). While the software in the personalized group caused excessive cognitive load on learners, the software in the nonpersonalized group caused low level of cognitive load.

Students' Views about the Software in the Personalized Group

The students in the personalized group believed that the software motivated them, helped them adopt the environment and increased their learning. In addition, the students thought that the conversational style was important and wanted it to be used in face-to-face education. The responses given to the open-ended question of the questionnaire revealed that the learners considered the style friendly and different from the usual style (formal style) and that the style motivated them to study.

DISCUSSION and CONCLUSION

The study aimed at examining multimedia software designed as appropriate to the conversational style and formal style with respect to various variables. In contrast with studies reported in related literature (e.g. Moreno and Mayer, 2000; Mayer, Fennell, Farmer, and Campbell, 2004; Moreno and Mayer, 2004), in the present study carried out, no significant difference was found between the posttest achievement scores of the students in the personalized group and those of the students in the nonpersonalized group. This finding of the present study does not support the personalization principle in multimedia put forward by Mayer (2005, 2009). In the present study, it could be stated that as the learners had a high level of experience in computer use, the personalized group who received feedback designed as polite were not significantly more successful than the nonpersonalized group.

While the software in the personalized group caused excessive cognitive load on learners, the software in the nonpersonalized group caused low level of cognitive load on learners. One of the reasons for this could be the fact that the personalized group was not accustomed to the content presented with the conversational style. In Turkish education system, instructional contents are presented with the formal style. Therefore, students might be unfamiliar with the conversational style.

In the present study carried out on the personalization principle, learners studied for one course-hour (30 minutes) with the software. In contrast with short time (60 seconds, 140 seconds and so on) applications (e.g. Moreno and Mayer, 2000; Mayer, Fennell, Farmer, and Campbell, 2004; Moreno and Mayer, 2004) in related literature, no significant difference was found for the learners' achievement level. Therefore, it is believed that the present study revealed more realistic results. In this respect, the personalization principle should be tested in different courses with different target populations and for a different study time.

ABSTRACT

This article analyzes school physical education (PE) theoretical and methodological frameworks, based upon hermeneutics, a qualitative method of investigation for contextual inferences. The objective is identifying teacher's pedagogical content knowledge, and their "theories of action" to assess the coherency of their "theories-in-use". A sample group composed by sixty-one undergraduate student-teachers was researched during 18 months in São Paulo metropolitan area, southeastern Brazil, searching for assessment criteria about their knowledge on teaching theories, according to international and Brazilian curricular models. The analysis of worldwide curricula pointed out to similarities and discrepancies, thus results have indicated pertinence of both conditions. The integration among curricular propositions seemed desirable to improve teachers' work. Changes in "theories-in-use" are connected with knowledge about theoretical and methodological frameworks. At one hand, the field of PE partially continues with ambiguous teaching practices, but at the other, there are concrete changes related to knowledge about curricular systematizing.
Key-words: Teaching theories, Initial preparation, Pedagogical practice.

INTRODUCTION

Teachers organize pedagogical practice according to a set of theories (Schön, 2000), which include theories of action based on teachers' pedagogical content knowledge, reflective procedures and action-research methods (Barbier, 2002; Thiollent, 2003). Recently in physical education (PE), Tsangaridou and O'Sullivan have analyzed reflective practices (1997), theories of action and theories-in-use (2003), whereas McCaughtry (2004), and McCaughtry and Rovegno (2003) have investigated pedagogical content knowledge. Morford (1972) already pointed out that PE professional field need coherency, therefore teachers' theories-in-use need to be consistent with their theories of action. There is controversy in research findings about this issue, some related to discrepancies (Lawson, 1993) and some to reliability between theories and actions (Tsangaridou & O'Sullivan, 2003). Besides, teachers' pedagogical content knowledge is a significant way of describing the knowledge they use to teach (McCaughtry & Rovegno, 2003).

Tsangaridou and O'Sullivan (2003) investigated experienced teachers' and concluded that more studies are needed with teachers with different levels of experience. McCaughtry and Rovegno used developmental learning theory to assess pedagogical content knowledge, indicating directions to future research, such as the role of reflection and readings in university coursework in order to PE beginning teachers shift to thinking more deeply about teaching. Global issues like these are complex and have incidence in many contexts with different idiosyncrasies. In this way such global problems need local solutions.

Integration among theories is required in complex situations as the teaching process in PE. Do diverse theories of action lead to coherent theories-in-use? Tsangaridou and O'Sullivan (2003) analyzed theories of action with experienced teachers and found that correspondence does exist. This study analyzes different theories of action with inexperienced PE teachers. The expectation is that integrating theories accounts to proper theories-in-use and that teachers' pedagogical content knowledge is a previous condition to work with such integration. Besides, teachers' choices depend on their knowledge about pedagogical issues, such as coherent principles.

Brazilian Physical Education Background

PE in Brazil was related to diverse influences, from health and military interests to gymnastics and sports hegemony in a brief retrospective. The institution of republican democracy, with public policies towards PE, occurred just one year after Black slavery system official ending in 1888 (Sanches Neto & Oyama, 1999). In schools there was concern about youth health and prophylactic procedures, thus the first decades of the XX Century presented contradictory educational policies and unusual social practices as aftermath. There was expansion in educational institutions in inner city areas and urban centers, however those schools were not enough to supply the demand for education. PE classes were associated to gymnastics and calisthenics during World War I, being reinforced by World War II international propaganda until early 1960s, when military generals took over the executive government by 1964.

The following years featured abrupt expansion in education because there was interest in public schools for propaganda. The success of the Brazilian men's football association (soccer) team in 1958 and 1962 FIFA world cup tournaments led to association between school PE and sports, especially soccer. The 1970 FIFA world cup title was the apex of the *panis et circenses* policy, contributing to keep sports contents predominant during 1970s. Only in early 1980s, different PE propositions became relevant in some school programs. Democracy had prevailed in the country and presidential elections happened in 1989, with college faculty engaged in popular political parties and civil rights institutions, because effective liberty was in debate in academic and professional meetings.

Various theoretical and methodological conceptions emerged from that context and approached to school PE with different levels of influence in teachers' practice, including theories of action with diverse pedagogical contents and recurrent theories-in-use. Besides such professional issue for teaching, PE in Brazil has been related to broader scientific conceptions (Crum, 1993; Dufour, 1977), such as five distinguished fields: Kinesiology (Hoffman & Harris, 2002; Tani, 1996), Human Motricity Science (Cunha, 1989; Kolyniak Filho, 1998; Trigo Aza, 2000), Movement Corporeal (Body) Culture (Betti, 1993; Resende, 1992), Sports Sciences (Ferreira Neto, Goellner, & Bracht, 1995; Haag, Grupe, & kirsch, 1992), and Health related Physical Fitness (Böhme, 1993; Corbin, 1981; Malina, Bouchard, & Bar-Or, 2004; Marques & Gaya, 1999). All school propositions described in this work are related to at least one of these fields.

RESEARCH METHODS AND PROCEDURES

Each proposition has been analyzed from a hermeneutic standpoint, apprehended in Betti (1997), Harris (1983) and Park (1986), thus its inner and outer elements have been considered. This method allows comprehending a particular speech as a semantic element and, beyond that, a symbolic issue. It points out an interpretation conflict (Ricoeur, 1978, 1983) between approaches' limitations and possibilities, and then makes possible to identify propositions that are not only likely to be valid and coherent but the likeliest and most coherent ones.

Hermeneutics was used because it is a method that consists in decoding hidden issues in apparently logical, objective, and literal assumptions. According to Ricoeur (1978) there is interpretation wherever multiple conjectures do exist, because symbols, speeches, and interpretations are correlative elements. Such plurality of ideas needs validation since any interpretation should be likelier than others, therefore the revision of all documents was based on the analytical investigation method (Thomas & Nelson, 1996), emphasizing positive, negative, critical, and contradictory aspects in relation to previously collected data about school PE teachers' practice (Borges, 1998; Bracht et al., 2003; Bracht, Pires, Garcia, & Sofiste, 2002; Celante, 2000; Darido, 1997; Moreira, 1992).

Documents consisted in manuscripts, theses, and dissertations to verify scientific relevance; legal projects and public service assessments for professional relevance; and research data about teachers' practice to infer teaching relevance. The importance of such documentation has been attested by organizations that sustain the largest budget for all scientific research projects in São Paulo and in Brazil, respectively FAPESP (São Paulo State Research Support Foundation) and CNPq/MEC (Ministry of Education Council of Research).

Data Analysis

The analysis was centered in the following three criteria to identify common PE concepts present in various propositions. The first criterion refers to scientific pertinence. It was necessary to comprehend what PE means as a scientific field in Brazil and what kind of relations connects Brazilian PE to the international context. Five different categories emerged: Kinesiology, Human Motricity Science, Movement Corporeal (Body) Culture, Sports Sciences, and Health related Physical Fitness. Attempts to

integrate some of them were also noticed in Cavalcanti's (1996), Lawson's (1989), Lovisolo's (1995), and Tani's (1997) works.

The second criterion referred to professional idiosyncrasies, which were inferred from the requirements of public service assessments for PE teachers occurred in Brazil (São Paulo, 2008) and their possible relations to international research in this field (Crum, 1993; Dufour, 1977; Lawson, 1990; Morford, 1972; Park, 1989). Some propositions were emphasized according to social and political demands. Some of them were predominant in a global scale, involving Asian, European, North and South American countries like Brazil.

The third criterion consisted in establishing the teaching relevance of every theory, i.e., its practical elements. The conception of practice was based on reflection and action relationships (Schön, 2000). Several discrepancies appeared among fifteen theories, according to recent sources involved in action-research projects (Bracht, Pires, Garcia, & Sofiste, 2002; Celante et al., 2005; Sanches Neto, Monteiro, & Almeida, 2005): psychomotricity (psychokinectic education), humanistic, progressist, developmental, critical, constructivist, phenomenological, systemic, revolutionary, critical-overcoming, plural (cultural plurality), critical-emancipatory (empowering), health studies, national curricular parameters (NCP), and kinesiology studies (a summary of all conceptions is featured in the *Table* excerpts). Besides the analysis of each conception's authors, there were found meta-analyses inside many propositions, i.e., authors that remarked discrepancies in order to enhance their own propositions' main lines. In the other hand, authors that defended the dynamics in progress among propositions (Betti & Kuriki, 2011; Sanches Neto & Betti, 2008) highlighted the similarities in different approaches.

Participants, Framework, and Trustworthiness

After the revision process of all propositions' pedagogical principles, this study comprehended a design with a sample group composed of sixty-one undergraduate PE student teachers. All students agreed to participate and understood the importance of the investigation to develop some of their teaching skills (Siedentop & Tannehill, 2000). Five predominant scientific concepts of PE and fifteen school PE propositions were taught to this group during three semesters. In the first semester they planned and taught classes with almost absolute degrees-of-freedom, learning pedagogical contents and theories of action related to each conception as well as experiencing the effective use of all theories. During the second semester, they have planned and taught classes based strictly on each singular theory, and during the last semester, they experienced relative degrees-of-freedom in planning and teaching, because theories of action from different propositions could be used.

Four main procedures were used to establish and ensure data trustworthiness. The first consisted in audiovisual registering of all data with videotape, photography, transcription of oral reports, and collective written analyses. The second procedure was discussing research findings with the participants, soliciting that they analyze their own records to verify incoherencies. All participants were submitted to such scrutiny review. The third procedure involved comments by peer professors, graduate students, and teachers from four school PE research groups (Matthiesen, 2005), three of them from São Paulo State and one from Rio de Janeiro. Common issues were reinforced after peer analysis.

The fourth strategy consisted in contents' analysis and categorizing (Franco, 2003; Thiollent, 1984) to search discrepancies and inaccuracies among the three criteria of relevance, and to check which findings were valid for all categories, which data was specific, and which was eventually under or overestimated, or even irrelevant. Conceptual, procedural, and attitudinal dimensions of the contents appeared frequently and were used as parameter to deepen analysis.

PEDAGOGICAL PRINCIPLES AND THEORIES OF ACTION

PE had been through some kind of identity crisis at a given period of time worldwide (Bressan, 1979; Cunha, 1989; Curl, 1973; Felshin, 1972; Henry, 1964, 1978; Lawson & Morford, 1979; Newell, 1990; North, 1968; O'Hanlon & Wandzilak, 1980; Park, 1981; Parlebás, 1971; Pieron, 1975; Rarick, 1967; Renshaw, 1973; Renson, 1989; Ross, 1978; Sage, 1984). Different contexts have featured diverse solutions and propositions to overcome such crisis with repercussions in school PE (Crum, 1993). This diversity resulted in many sources of pedagogical contents and theories of action. In Brazil it happened during the 1980s and due to its later response to the academic versus professional debate in comparison to other regions, Brazilian propositions considered many theories from different countries (Betti, 1996; Tani, 1996).

Few countries in the 1980s held PE preparation courses in only two years, some of them with bivalent options: Denmark, Sweden, Norway, Switzerland, and Saint Domingo. Other countries featured it in three years, like Brazil by that time: Greece, Argentina, India, Israel, Italy, Malta, Paraguay, Tunisia,

and Turkey. Such option was related to the urgency of teachers for elementary and secondary schools. But many countries featured teaching preparation courses in four years, about sixty-two percent in Dufour's investigation (1977). Nowadays, Brazil presents PE preparation courses in three to four years, an option that demands greater quantities of academic personnel, what was impossible in the country before the 1980s qualitative shifting. The following fifteen propositions are the predominant theoretical and methodological approaches to school PE, and were taught to the participants during the research.

Psychomotricity (Psychokinectic Education) Its original nomenclature derived from psychokinetic education and it was first used in educational institutions for students living with mental and physical disabilities (Le Bouch, 1986). Later it was implemented in regular schools' curriculum in France and many other countries like Argentina (Coste, 1978) and Brazil (Negrine, 1987). Theories of action are organized in curricular principles according to this theory, which objective is to enhance cognitive and psychological functions through the movement. Didactic strategies consist in any activities that allow students to elaborate contents that range from synchronism and anticipatory timing, motor coordination, space structuring and organizing to lateral dominance and discrimination. Assessment serves as reference pattern for the teacher.	**Humanistic Approach** This theory dealt with the dichotomy between behaviorist and humanist conceptions, both originated in anthropological approaches (Oliveira, 1983, 1985) with broader sociological repercussions worldwide (Berger & Huntington, 2004). Based on psychology (Rogers, 1978), PE should promote social interactions with cooperative and meaningful learning opportunities for all students (Brotto, 1997). It presupposes physical performance optimization rather than its maximization; moreover every contents selection depends on students' interests with the objective to denote meaning for learning. Indirect methods are usual didactic strategies and assessment involves students' self-evaluation.	**Progressist Approach** It is based on analogous progressist assumptions in pedagogy (Snyders, 1981), which had been analyzed systematically by Libâneo (1985). Ghiraldelli (2001) pointed out this conception of PE as an educational activity that should accomplish political and pedagogical goals. Its objective is to analyze social relationships in constant transformation. Didactic strategies should promote critical analysis of the contents: sportive and general physical activities, play, game, gymnastics, and knowledge about the human body. Assessment consists in overcoming social determiners perceived during the teaching and learning process.
Developmental Approach This theory is centered in the motor development and learning process (Gallahue & Ozmun, 2004; Tani, 2005) with repercussion worldwide (Gallahue, 1987; Tani, Connolly, & Manoel, 1998). The objective is to optimize motor behavior (Manoel, 1989) and the contents are locomotive, manipulative, and stability skills. Didactic strategies consist in motor problems solving in rhythmic activities, play, game, sports, and gymnastics (Tani, Manoel, Kokubun, & Proença, 1988). Assessment serves as reference pattern for the teacher to provide feedback to students and systematize the teaching and learning process (Manoel, 1999).	**Critical Approach** It is based on revision of all legislation (Castellani Filho, 1998) applied to Brazilian educational system during 1980s (Mariz de Oliveira, Betti, & Mariz de Oliveira, 1988) with persistent challenges to its practice (Souza, 2005). The objective is to reflect (Tishman & Perkins, 1995) and participate in motor activities to promote students' global development. Contents involve motor activities, conceptual differences between PE and play, game, sports, dance, gymnastics, and recreation. Didactic strategies vary from ludic and controlled motor activities to readings and reports, according to students' individual and collective interests. Assessment is an analysis of all materials produced in the teaching and learning process.	**Constructivist Approach** To comprehend this theory's fundamentals it is necessary to consider the pedagogical contributions by Vygotsky (Rego, 1995) and Piaget (Carvalho, 2000), whose research findings indicated that knowledge elaboration could be improved with significant environmental interaction (Ben-Hur, 2000). The objective is to construct knowledge and enhance cognitive functions (Freire da Silva, 1989; Freire da Silva & Scaglia, 2003; Mattos & Neira, 1998, 2000). Contents consist in ludic activities from popular culture, especially play and game, and didactic strategies request problem solving by using previous elaborated knowledge (Coll Salvador et al., 1993). Assessment involves students' self-evaluation.
Phenomenological Approach Moreira (1992) had investigated PE teachers' practices and found that their pedagogical content knowledge could not be assessed objectively, without subjective interferences featured in positivist scientific research procedures. Phenomenology would allow teachers to identify the facts in course during the classes and comprehend them as complex phenomena, especially the corporeal manifestations' meanings and the conceptions about the body (Moreira, 1992; Villa, 2003). Its objective is to comprehend corporeal manifestations and the main content is knowledge about the human body. Cross-disciplinary relationships with other curricular subjects are used as didactic strategies and the assessment consists in analysis of all facts happened during the classes from a phenomenological standpoint.	**Systemic Approach** This theory is based on the modern dynamical systems theory (Von Bertalanffy, 1968) and on historical, political, and sociological analyses of PE's major influences (Singer & Dick, 1980). Some principles were proposed to organize teachers' pedagogical actions: inclusion, equifinality, and diversity (Betti, 1991). They mean, respectively, that inclusion of all students in every activity is desirable, as well as different activities could lead to a common problem solving, achieving similar objectives, and as many activities as possible should be used in PE classes. Its objective is to insert students within the movement corporeal culture's expressive manifestations, which are the contents. Didactic strategies are the principles described formerly and assessment is in contextual analysis from the semiotics standpoint (Betti, 1994).	**Revolutionary Approach** Medina (1987, 1996) analyzed the discrepancies between PE's theories and practices, criticizing Brazilian social conditions. The basic fundamentals for this revolutionary theory consist in the need to elaborate utopias in order to overcome diffuse ideologies (Cavalcanti, 1985). Its objective is to overcome the ideology based on a realistic and skeptical standpoint. Contents involve theory and practice of the movement corporeal culture, didactic strategies consist in critique about the social conditions, and assessment is a collective elaboration of utopia by the teacher and the students.
Critical-Overcoming Approach This theory is based on materialistic and historical issues. It has pointed out evidences about intrinsic contradictions in Brazilian social and political organization, besides their influence in PE (Soares et al., 1992). Its primary goal is to promote students' reflective thinking about the movement corporeal culture to realize and overcome as many contradictions as possible. Its objective is to promote social transformation by the comprehension of contents like play, game, sports, gymnastics, dance, wrestling, and capoeira. Didactic strategies are thematic discussions about the movement corporeal culture, thus assessment consists in collective reflection and process systematization by the teacher and the students.	**Plural (Cultural Plurality) Approach** It integrates cultural, social, psychological, and biological aspects in PE classes' planning (Daolio, 1995, 1996). Such integration allowed further associations with diverse sociological, philosophical, and pedagogical theories, e.g., civilizing process, anthropology, and hermeneutics (Betti, 1995). Its objective is to reconstruct knowledge about the movement corporeal culture. Contents are biological, psychological, social, and cultural aspects of play, game, sports, dance, gymnastics, and wrestling. Didactic strategies explore contextual experiences and assessment consists in reflection about body techniques by the teacher and the students.	**Critical-Emancipating (Empowering) Approach** This theory emphasized the worth of critical comprehension in PE. It aims the emancipation of the students' independent thinking, enhancing its degrees-of-freedom (Daniel & Bergman-Drewe, 1998). Didactic strategies used for this purpose are of four kinds: dramatizing, problem solving, broadening, and collective reconstruction of knowledge (Kunz, 1998, 2004). The latter two are named transcendent methods because they apply PE's contents to broader social issues. Its objective is to enhance critical and autonomic thinking, and its contents are play, game, sports, gymnastics, dance, wrestling, and capoeira. Students' self-evaluation of their objective and subjective participation accounts for assessment.
Health Studies It has the health related physical fitness paradigm of prophylaxis for PE classes (Fairclough & Stratton, 2005; Marques & Gaya, 1999). Its goals consist in informing students, changing their health habits, and promoting the systematical practice of exercises in intramurals programs and outside the school context. Both axiology and teleology are similar to the model that had been confronted during the 1980s in Brazil (Nahas, 1997, 2001; Pedraz, 1987), but the main difference is the incorporation of pedagogical principles concerning the inclusion in this renewed view. The objective is to enhance students' autonomy in physical fitness management at an optimal level instead of the maximal level often associated with sports (Guedes & Guedes, 1997), developing physically educated students who should keep active and lasting lifestyles in adulthood (Corbin, 1981).	**National Curricular Parameters (NCP)** This theory is derived from the citizenship concept and its primary goal consists in promoting committed democratic citizenry (Gabelnick, 1998). The Ministry of Education published a series of documents named NCP to integrate all Brazilian basic education (Brasil, 1997, 1998, 1999) with the PE included in every school's pedagogical and political project, according to teachers', students', and community's common interests (Brasil, 1996; CBCE, 1997). Due to its concern with citizenship, ethics, and democratic values some authors labeled it "citizenship approach" (Darido et al., 2001) based on the concept that citizenship means the right to have rights (Betti, 1999; Palma Filho, 1998). Outside Brazil similar propositions are relevant in PE (Coll Salvador, Pozzo, Sarabia, & Valls, 1992; Delignières, 2000; Labarrière,	**Kinesiology Studies** This theory is recent in Brazil (Mariz de Oliveira, 2001), but has similarities with former curricular propositions for PE (Jewett & Bain, 1985). Its objectives involve learning facts, concepts, principles, procedures, rules, values, and attitudes related to the human movement. The contents are organized in four groups: muscular structures and physiological, biomechanical, neural, and psychological potentialities; muscular and neural capabilities; perceptive and motor skills; and relationship with the social and physical environment. Didactic strategies consist in any activities that enhance students' scientific knowledge and assessment is provided by verbal records of the students' comments during the classes, written and graphical documentation, sketches, drawings, phrases, texts, register of answers to direct questions or

Contents involve conceptual, procedural, and attitudinal aspects related to the physical fitness. Didactic strategies consist in non-exclusive physical activities and assessment involves students' self-evaluation as reference for the teacher.	1999; Rodríguez, 2003; Valery, 2001). Its objectives are to build up the citizenship critically and to worth democratic rights with all students' integration within the movement corporeal culture. The contents consist in attitudinal, conceptual, and procedural aspects within the play, game, sports, wrestling, gymnastics, rhythmic and expressive activities, and knowledge about the human body. Didactic strategies involve movement experiences according to the principle of inclusion and transversal themes: ethics, environment, health, gender and sexual orientation, cultural plurality, employment, and consumption. Assessment is provided by reflection about the teaching and learning process to promote the students' autonomy and critical thinking.	questionnaires, and observation.

RESULTS

There is emphasis in theories of action derived from the movement corporeal culture because there were eight propositions related to this area: progressist, constructivist, systemic, phenomenological, critical-overcoming, revolutionary, critical-emancipating, and NCP. The second most representative association happened with kinesiology's five derived propositions: psychomotricity, humanistic, developmental, critical, and kinesiology studies. The next level of association comprehended physical fitness and health studies, as well as movement corporeal culture's and human motricity science's relation with the plural approach. Teachers' theories-in-use were organized in three groups according to different contents' dimensions, because all propositions conceptions are broader than procedural, therefore the conceptual, attitudinal, and procedural dimensions are common goals for assessments.

The undergraduate students emphasized the integration among all areas, corroborating previous findings (Sanches Neto, Penha, & Silva, 2003) and meta-analyses (Dufour, 1977). The Movement Corporeal (Body) Culture is the area with greater pedagogical content diversity in Brazilian teacher education programs. Forty-four percent of the students' sample referred such concentration, followed by 33% of preference for Physical Fitness, 13% for Kinesiology, 6% for Human Motricity Science, and 4% for Sports Sciences.

Such findings are controversial to Darido's (2000) research, which analyzed three public service assessments for PE teachers in the State of São Paulo, considering the requested pedagogical content knowledge in relation to school propositions. Theories and approaches identified in questions compiled from 1986, 1993, and 1998 assessments indicated that in 1986, 22% of PE pedagogical content questions were based on general educational objectives, 22% had been related to the developmental approach, and 4% to the critical theory.

In 1993 there was a change of focus with almost 19% of the questions related to the critical approach, 21% for the developmental approach, and 4% for the constructivist approach. In 1998 the number of requested theories had became six instead of three. Specific pedagogical content questions consisted in 14% for the critical approach, 8% for the developmental approach, 10% for the constructivist approach, 6% for the psychomotricity, 10% for the humanistic theory's cooperative games, and 6% for the NCP.

There was not any noticeable predominance of propositions in the first two semesters, although the student teachers referred to some of them as easier to comprehend and more helpful during practice. It happened to propositions that provided straightforward and detailed theories of action in the pedagogical principles. The NCP approach was predominant in the last semester, denoted by objectives oriented to the citizenship. Three dimensions of the contents were common for class planning and that consisted in a kind of *bias*. The conceptual dimension was noticed in relation to explanations' extent and level of complexity, the procedural dimension was noticed in the use of lines for organization and the activities' complexity, and the attitudinal dimension was noticed in students' participation and indiscipline.

Student teachers pointed out that the language adequacy and the use of audiovisual resources can minimize conceptual discrepancies during the class. The evaluation criteria, the diversity of teaching styles and methods (Mosston & Mueller, 1974) can contribute for procedural questions. The need to explicit the objectives and to establish sincere relationships of mutual confidence with the students, as well as providing their inclusion during the class are related to the attitudinal dimension.

Discussion

PE teachers often combine elements from more than one approach in practice, but their assumptions about pedagogical theories seem to relate to one predominant approach (Bracht, 2003; Bracht et al., 2003; Celante et al., 2005; Darido, 1997). Therefore, their theories-in-use are diffuse from each theory's theories of action. This situation happened in the first two semesters, when the student

teachers used isolated propositions. In the third semester there was more complexity to deal with, because all fifteen propositions could be used. Among them, there was predominance of the NCP proposition perhaps due to its intrinsic attempt to approach different school PE propositions, emphasizing the citizenship.

Dufour noticed integration among some PE approaches in his study involving preparation courses in forty-two countries, including Brazil. Other authors from Argentina (Bracht & Crisório, 2003; Lovisolo, 1995, 2000), Brazil (Cavalcanti, 1996; Taffarel & Escobar, 1994; Tani, 1997), Netherlands (Crum, 1993), and Spain (Cagigal, 1979) followed such integrative perspectives, named essentialist and existentialist by Dufour. The latter consisted in diversity about philosophic and scientific knowledge, didactics, and methodology in opposition to the former, which emphasized objective measurements, techniques, and standardization procedures.

Significant questions must be oriented to present preoccupations, although past conditions and future perspectives (DePauw, 1998) are relevant interferences in this process. The analysis of the Brazilian propositions reinforces the necessity to deepen scope in the professional field (Park, 1989). Do teachers use theories effectively when dealing with pedagogical diversity and complexity? There was consistent use of the propositions that teachers were familiar with the pedagogical contents.

Pedagogical practice is broader than a set of moments with students inside the school environment. It's an everyday process that seems to be never completed due to the possibility of continuous re-signification and elaboration (Bracht et al., 2003). Furthermore, it is linked to social and political context transformations (Betti, 1991) in addition to scientific and philosophical knowledge usage in practical situations. Pedagogical content knowledge is related to the latter issues and extended to how teachers transform their actions in order to teach effectively (McCaughtry, 2004; McCaughtry & Rovegno, 2003), using all immediate conditions and available resources in a competent (Perrenoud, 2004) and skilled manner (Siedentop & Tannehill, 2000).

PE' problems are complex to assess and need complex approaches, e.g., the gap between theories of action and theories-in-use, and the role of the pedagogical content knowledge. Teachers' actions should encompass their theories of action and this dynamical association is essential to formulate a theory of the practice (Betti, 1996) based on research (Lawson, 1993). Even chaotic contexts in which diverse theories of action can emerge have certain order (Tani, 1996), like the fifteen propositions' pedagogical principles. The limitation of this study remains in the possibility to investigate the integration of all theories only in teacher education programs, because meta-analyses about this issue are recent (Celante et al., 2005; Sanches Neto, Monteiro, & Almeida, 2005) and experienced teachers' practice are still linked to isolated conceptions of PE, according to the literature (Bracht, 2003; Celante, 2000; Darido, 1997).

CONCLUSIONS

During the last decades school PE teachers and undergraduate students have been exposed to different pedagogical approaches than before 1980s in Brazil. It was expected that teachers who started practicing upon approaches recollection in college preparation could distinguish themselves in everyday context. Nevertheless, recent sources (Bracht, 2003; Bracht et al., 2003; Darido, 1997) pointed out quite the opposite in relation to those reflective teachers, along with investigations about teachers with non-reflective background (Borges, 1998; Celante, 2000; Moreira, 1992; Resende, 1987). These findings showed that experienced PE teachers tend to avoid new approaches and to maintain traditional practices, although their discourse referred different propositions.

Thereafter is concurrence to recognize the Brazilian propositions' pedagogical sets of objectives, contents, strategies, and assessment criteria as an important issue to improve PE teachers' practice. As this lack of correspondence between theories of action and theories-in-use is a persistent problem outside Brazil (Tsangaridou & O'Sullivan, 2003), this work has been committed in detailing all curricular principles defined by Tyler (1974), according to a combination of three analytical criteria: scientific, professional, and teaching relevance.

Although relevant changes occurred with integrative perspectives in PE (DePauw, 1998; Crum, 1993), changes in teachers' practice are fewer than the emergence of theories of action (Bracht et al., 2003; Darido, 1997). It is possible to search integration among propositions if teachers use different approaches in practice, but first it seems necessary to deal with isolated propositions within school PE programs to verify idiosyncrasies.

Pedagogical contents continuous integration can transform teachers' practice, because the main problem is that teachers do not put in action the theories they think they are following through (Bracht, Pires, Garcia, & Sofiste, 2002). Exceptions like Tsangaridou and O'Sullivan's work (2003) indicate that

more investigations about teachers' theories-in-use are necessary and the present article may contribute to this issue. The main conclusion is that integration among propositions is possible and desirable for qualitative shifting in school PE; moreover, there are perspectives to change already in course.

Abstract: The programming packet Mathematica offers an excellent possibility for visualization in mathematical education, because it has a lot of built-in functions. This programming packet enables us to make highly abstract mathematical content more understandable to pupils and students. By using this packet we can find limit value of a sequence and a function, derivative of a function, to draw a function or functions in one coordinate system and etc., which leads to a more simple understanding of these mathematical notions. At the same time, pupils are introduced to the basics of programming and using program applications. We will also analyze the methodological aspect of solving examples in secondary school by using the programming packet Mathematica.

Key words: Mathematica, education, function, sequence, derivative.

INTRODUCTION

Prosperity of a nation in the global economy depends on scientific and technological strength of a country, which with the other side were built on the basis of mathematical education. Mathematics as science have the important, because development of a young mind of the young population depends from the success of teachers.

Successful teaching in mathematics is a complicated operation, which required knowledge of mathematics as a science and its relation with socioeconomic events in a country.

Mathematics occupies a special place in the system of sciences, because if we take into account the application area of mathematics, and the subject of her research, then the mathematics belongs to the group of social sciences and the science of opinion, as the group of natural sciences. Mathematics is used in all scientific disciplines, where it successfully solves their problems in computer technology as an exceptional component of modern times. Therefore, mathematics is a specific and as a subject. The teaching process consists of communication informations for students and they should understand and remember that they can apply later. From that informations, they should get new. This causes many difficulties in the implementation of mathematical contents. The specificity of mathematics derives from its abstractness. So the content from higher levels of abstraction, we should close to the students and forced them to abstract mathematical concepts and objects.

Teaching is a complex process. It has several stages and each stage has its own components. One component is cognition by the adoption process knowledge. This component has three stages: observation, review and implementation. This components are contained in the application of Mathematica, regardless of which combination of the word, with that stage, the method or form application in the current educational process. Successful implementation and motivation are the basics objectives of any educational process, and they depend on the student attention, motivation, need for students to learn and a responsible attitude towards this subject. Student activities is one of the most important requirements of the teaching process for adoption and permanent knowledge.

Traditionally, students learn mathematics by solving mathematical examples and problems. This can have adverse effect and many cases are not enough for deep ability for Mathematics opinion. With improvement of computer technology, we can "revive" and motivate each student in learning mathematics, any more for far learning. Although well known teaching methods and forms in

mathematics for active learning, we can combine them with work in the software package Mathematica. It offers us a great opportunity for visualization in teaching mathematics.

MATHEMATICA-CONTENT AND OPPORTUNITIES

This software package contains a lot of built-in functions, which gives us great opportunities to get results from a short period of time on a task that requires a longer time to reach a solution. By using this packet we can find limit value of a sequence and a function, derivative of a function, to draw a function or functions in one coordinate system and etc., which leads to a more simple understanding of these mathematical notions. At the same time, students are introduced to the basics of programming and using program applications.

Mathematica is a software package designed for mathematicians and others who use mathematics. It can be used as:

- Numeric and symbolic calculator;
- Graphical presentation of data and functions;
- High level programming language.

Mathematica can do everything.Except as an electronic calculatorsit can be used also as a programming language. It may be useful in all areas of mathematics to help students. Working in Mathematica is very simple and anyone who wants to work in it will handle without any problem. Commands are usually the English translation of mathematical terms. Some complicated problems that can not be solved with the help of built-in functions, can be solved with programming in Mathematica. Programming in Mathematica is not different with programming in other programming languages. Algorithms tasks are identical, the programming in Mathematica is the maximum adjusted to work in mathematics and make Mathematica powerful programming language.

Great possibilities of application of Mathematica allows its attractiveness, and as a teaching tool, as well as research tool. The effectiveness of using the package requires "coaching" the mind in formulating the problems in new ways, not just use the new syntax of the old methods. But this package is the application of mathematics in teaching and learning at a distance.

One of the main outcomes, is: if we want good prepared teachers and students who successfully can used the tool, then we should not allow only technical coaching, but also demonstration of didactic principles and fundamental ideas to solve specific problems.

USING MATHEMATICA TO SOLVE EXAMPLES FOR DETERMINING LIMIT VALUE OF A SEQUENCE

Working with students from first year of the course Mathematics 1, where the curricula chapter processed from real sequences and real functions with one variable, we have follow-up observations:

1. Students do not understand the concept for environment of point;
2. The problem with point of accumulation and limit value of sequences;
3. The problem with disruption of function with one variable and optimization;
4. The problem with limit value of function with one variable;
5. The problem with asymptote of function with one variable.

We analyzed these problems of finding a better way for thinking and understanding in the learning process. Normally, we used Mathematica.

We made a simulation for understanding of term with the following examples:

Example 1: We take sequence with a general member $a_n = \frac{(-1)^n}{n}$. This sequence has members $-1, \frac{1}{2}, -\frac{1}{3}, \frac{1}{4}, \mathrm{K}$, that the numerical axis is

```
ListPlot[Table[{(-1)^n/n, 0}, {n, 1, 10}], PlotStyle → PointSize[0.02], Axes → {True, False}]
```

Picture1.

From the picture 1, we look members of the sequences are distributed from left and right to zero. When the number n increases their distance to zero is less and less. We take this distance as an absolute value of difference between the n-th member of sequence and zero:

$$|a_n - 0| = |a_n| = \left|\frac{(-1)^n}{n}\right| = \frac{1}{n}.$$

If we take some arbitrary number ε, then we will get inequality

$$|a_n - 0| < \varepsilon \Rightarrow \frac{1}{n} < \varepsilon \Rightarrow n > \frac{1}{\varepsilon}.$$

Distance to zero for all members of the sequence, for $n > \frac{1}{\varepsilon}$, which is less than ε. With other words , all members of the sequence of which is true $|a_n - 0| < \varepsilon$, they are located the ε-environment of point 0, the members are in the interval with a length of 2 ε.

If ε = 0.01, then n> 100, it means that distance to zero for all members of the sequence for which n> 100 is less than 0.01. In the interval (-0.01, 0.01) all members of the sequence for n> 100, which are infinitely many, and only a finite members are not in that interval. This is shown in the picture2:

```
ListPlot[Table[{(-1)^n/n, 0}, {n, 101, 155}], PlotStyle → PointSize[0.02], Axes → {True, False}]
```

Picture 2

If ε = 0.001, then n> 1000, it means that distance to zero for all members of the sequence for which n> 1000 is less than 0.001. In the interval (-0.001, 0.001) all members of the sequence n> 1000, which are infinitely many, and only a finite number of members are not in that intervalu. This is shown in the picture 3:

```
ListPlot[Table[{(-1)^n/n, 0}, {n, 1001,1055}], PlotStyle → PointSize[0.02], Axes → {True, False}]
```

Picture 3

It can be concluded, for arbitrary small positive number ε, we can find a natural number $p = \frac{1}{\varepsilon}$, $n > p \in N$, so that all members of the sequences are in ε- environment of point 0th. The point of accumulation is the point 0th.

The conclusion is: the sequence with general member $a_n = \frac{(-1)^n}{n}$ has limit value 0. We tell, this sequence is convergent sequence.

Example 2: We take sequence (a_n) with a general member $a_n = \frac{n}{n+1}$. This sequence has members $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \text{K}$, that the numerical axis is

```
ListPlot[Table[{n/(n+1), 0}, {n,1,15}], PlotStyle → PointSize[0.02], Axes → {True, False}]
```

Picture 4

From the picture 4, we look members of the sequences are in the interval $\left[\frac{1}{2}, 1\right]$. We choose ε-environment of the point 1. That is the interval $(1-\varepsilon, 1+\varepsilon)$, then we can find an integer number p depend of ε, so that all points of the sequence are in that interval. With other words, the distance between any member of the sequence to the point 1 is less than ε when

$$|a_n - 0| < \varepsilon \Rightarrow p = \frac{1}{\varepsilon}, n > p \in N.$$

Then,

$$|a_n - a| = \left|\frac{n}{n+1} - 1\right| = \frac{1}{n+1} < \varepsilon$$

$$n > \frac{1}{\varepsilon} - 1 = p$$

If ε = 0.01, then n> 99, it means that distance to 1 for all the members of the sequence for which n> 99 is less than 0.01. In the interval (0.99, 1.01), all members of the sequence n> 99, which are infinity many, and only a finite number of members are not in that interval.This is shown in the picture 5:

```
ListPlot[Table[{n/(n+1), 0}, {n, 90, 155}], PlotStyle → PointSize[0.02], Axes → {True, False}]
```

Picture 5

It can be concluded, for arbitrary small positive number ε can find a natural number $p = \frac{1}{\varepsilon} - 1,\ n > p \in N$, so that all members of the sequence are in ε- environment of point 1.

The conclusion is: the sequence with general member $a_n = \frac{n}{n+1}$ has limit value 1. This sequence is convergent sequence.

Example 3: We take sequence (a_n) with a general member $a_n = (-1)^n \frac{n+1}{n}$. This sequence has members $-2, \frac{3}{2}, -\frac{4}{3}, \frac{5}{4}, -\frac{6}{5}, \text{K}$, that the numerical axis is

```
ListPlot[Table[{(-1)^n (n+1)/n, 0}, {n, 1, 100}], PlotStyle → PointSize[0.02], Axes → {True, False}]
```

Picture 6

The members of the sequence with even indices are right of the point 1, and the members with odd indices left of the point -1. In this case, we have two points of accumulation 1 and -1.

The conclusion is: no exist arbitrary small interval with distance 2 ε, for that we can find a positive integer number p, witch depends on ε, so that all members of the sequence for $n > p \in N$ are in that interval. This sequence has not limit value. It is not convergent sequence. It is divergent sequence.

Example 4: We take sequence (a_n) with a general member $a_n = n$. This sequence has members $1, 2, 3, 4, 5, \text{K}$, that the numerical axis is

```
ListPlot[Table[{n, 0}, {n, 1, 10}], PlotStyle → PointSize[0.02], Axes → {True, False}]
```

Picture 7

```
ListPlot[Table[{n, 0}, {n, 1, 20}], PlotStyle → PointSize[0.02], Axes → {True, False}]
```

Picture 8

The members of the sequence are distributed to infinity. In this case, we have not a point of accumulation.

The conclusion is: no exist arbitrary small interval with distance 2 ε, for that we can find a positive integer number p, witch depends on ε, so that all members of the sequence for $n > p \in N$ are in that interval. This sequence has not limit value. It is divergent sequence.

Conclusion

These examples provide the visualization of the problem. In this way, students better remember the term and they apply easily.

The advantages of working with Mathematica are:

1. The mathematical operations are done, for that is necessary to programming in other programming languages;

2. Some mathematical problems have not explicit solutions, they can be seen on their graphs with using numerical methods;

3. For some complex mathematical problems are necessary only solutions. They are easily obtained with Mathematica.

The defects are:

1. This package can not use without other teaching methods and forms. The classical methods and forms of teaching mathematics class can not be replaced with any one programming language;

2. Mathematica can use only to help in teaching math and nothing more.

Abstract

The aim of this study is to investigate the effects of daily computer usage, gender difference, ownership of computer and internet connection on computer attitudes, experiences and perceived self-efficacy of pre-service teachers towards computers. The sample comprised 192 graduate students from elementary mathematics education and social studies education at Sakarya University. The survey was used to collect data which consists of 4 sections,designed to measure self efficacy,computer attitudes, computer experiences of pre-service teachers. The results indicated that there is a significant difference between computer attitudes (perceived usefulness), computer experiences, self-efficacy (beginning skills), self-efficacy (files and software skills) and daily computer usage duration. The results also showed that there is no significant difference between gender and attitudes, experiences and perceived self-efficacy towards computer.

Keywords: Perceived Self Efficacy, Computer Attitudes, Computer Experience

INTRODUCTION

Nowadays, the drastic and huge improvement in the technology has affected the communities. This obvious improvement also comes across with the necessity of being able to utilize, manage, understand and evaluate the technology as well. Education has a main role in order to meet this requirement. Therefore, the pre-service teachers who graduated from educational institutions are expected to be capable of finding the knowledge, improving new knowledge and adapting themselves to the new ages by utilizing the technology. For this purpose, curriculum programs of the education institution are restructured and educational technologies are integrated into the all courses that are taught. In order to educate the teachers who are able to use these educational technologies, the pre-service teachers who are studying in the education faculties in the universities are given the computer courses in the 1st and 2nd semester of the undergraduate degree.

According to Wu, "attitudes are individual feelings or perceptions towards objects or actions, which are formed through individual experiences" (Wu, 2009, p.27). The teacher who uses computer technology is a good indicator of his/her attitudes towards computer (Loyd & Gressard, 1984). Teo stated that "the success of student learning with computer technology will depend largely on the attitudes of teachers, and their willingness to embrace the technology" (Teo, 2006, p.413). Positive teacher attitude is very necessary and well-known condition for use of technology effectively in the classroom (Woodrow, 1992).

The integration of technology practices into a pre-service teacher's education can have a positive effect on their confidence level (Pope, Hare, & Howard, 2002). Self-efficacy is the belief "in one's capabilities to organize and execute the courses of action required to produce given attainments" (Bandura, 1997, p. 3). Self-efficacy is not measured with existing skills, it shows what people believe that they can do with the skills they already have (Eastin and LaRose, 2000). At the same time, people can have higher level of computer self-efficacy with efficiency computer training program (Pamuk, 2007).

The previous computer experience which is dimension of computer attitudes and self-efficacy towards computer. The bad experiences in computer usage that people have had in their past has a significant effect on their self-efficacy and attitude towards computers. If the people have positive experiences about the computers in their past, it will cause them to have a high level of self-efficacy and attitude towards the computers.

The current study aims to investigate pre-service social studies and mathematics teachers' level of computer self-efficacy, experience, and attitude towards computer with respect to socio demographic factors which are gender, ownership of personal computer, ownership of personal internet, daily computer usage duration.

Research Problem

"Do the attitudes, experience and self- efficacy of pre-service teachers' towards computer differentiate in terms of their socio demographic characteristics?

Sub-problems:

a. Is there a significant difference between gender and computer attitudes, experiences,self efficacy of pre-service teachers?

b.Is there a significant difference between ownership of personal computer and computer attitudes,experiences,self efficacy of pre-service teachers?

c. Is there a significant difference between ownership of personal internet connection and computer attitudes,experiences, self efficacy of pre-service teachers?

d. Is there a significant difference between daily computer usage duration and computer attitudes,experiences, self efficacy of pre-service teachers?

METHOD

Sample

The sample of the research consists of 192 students- 58.9% of which are male (n=113), 41.1% of which are female (n=79) - undergraduate students from elementary mathematics education and social studies education at Education Faculty of Sakarya in 2010-2011 fall semester.

Table 1:Demographic characteristics of pre-service teachers

		Frequency	Percent
Gender	Male	79	41,1
	Female	113	58,9
Department	Elementary Mathematics Education	100	52,1
	Social Studies Education	92	47,9
Ownership of computer	Yes	90	46,9
	No	102	53,1
Ownership of internet	Yes	93	48,4
	No	99	51,6
Daily of computer usage	0-60 min	97	50,5
	60 min - 2 hr.	59	30,7
	2 - 4 more hr.	36	18,7

Data Instruments

Data instrument of this study is survey which consists of 4 sections which are demographic background, computer attitudes (20 items), computer experience (12 items) and self efficacy (15 items). The "computer attitudes scale (CAS)" developed by Selwyn (1997), "computer experience scale (SCES)"

developed by Yaghmaie (2007) and "computer self-efficacy scale" developed by Murphy et al.(1989). The original survey language was English and it was translated into Turkish. Translations were checked by the experts to in order provide that the translated items conveyed the same meanings.The Likert scale was used in the survey that comprised five points ranging from "strongly disagree'(1) to "strongly agree"(5).

Data Analysis

Data of the study were analyzed with SPSS program. T test and ANOVA were conducted to determine the differences between parametric variables. The significance level was accepted as .05

RESULTS

The first sub-question was defined as "Is there a significant differences between gender and computer attitudes,experiences, self efficacy of pre-service teachers?". T-test was used to determine If there is a meaningful stastisticaly gender differences with regard to computer attitudes, experiences, self efficacy. As a result of t- test analysis,there is no significantly gender difference between the three dependent variables

Table 2: T-test results differences gender and computer attitudes, experience, self efficacy.

	Gender	N	Mean	t	Df	Sig
Computer attitudes - Affective Component	Male Female	79 113	2,2582 2,4142	-1,714	190	,088
Computer attitudes - Perceieved Usefullness	Male Female	79 113	3,9595 3,8159	1,330	190	,185
Computer attitudes - Perceieved Control	Male Female	79 113	3,0612 3,0310	,502	190	,616
Computer attitudes - Behavioral Control	Male Female	79 113	2,5601 2,6040	-,448	190	,655
Computer Experience	Male Female	79 113	3,5293 3,4513	1,005	190	,316
Self Efficacy - Begining Skills	Male Female	79 113	3,6139 3,5619	,436	190	,663
Self Efficacy - Files and Software Skills	Male Female	79 113	4,2342 4,1327	,807	190	,421

*The mean difference is significant at the .05 level.

The second sub-question of the research was defined as "Is there a significant difference between ownership of personal computer and computer attitudes,experiences,self efficacy of pre-service teachers?". T- test was used to determine if there is a meaningful statisticaly differences between ownership of personel computer and attitudes, experiences,perceived self efficacy towards computer. There is no significantly difference between computer attitude, computer experience and ownership of personel computer. However, pre-service teachers who had personel computer, had significantly higher perceived self-efficacy in beginning skills ($t_{(190)}$=2.345,p<.05) and files and software skills ($t_{(190)}$=3.999,p<.05)

Table 3: T- test results of ownership of personal computer and computer attitudes,experiences,self efficacy

	Ownership of P.C	N	Mean	t	Df	sig
Computer attitudes - Affective component	Yes No	90 102	2,3756 2,3275	,533	190	,595
Computer attitudes - Perceived usefulness	Yes No	90 102	3,9022 3,8510	,479	190	,632
Computer attitudes - Perceived control	Yes No	90 102	3,0407 3,0458	-,084	190	,933

Computer attitudes - Behavioral control	Yes No	90 102	2,5444 2,6225	-,810	190	,419
Computer experience	Yes No	90 102	3,4909 3,4768	,184	190	,855
Self-efficacy - Beginning skills	Yes No	90 102	3,7278 3,4559	2,345	190	,020
Self-efficacy - Files and software skills	Yes No	90 102	4,4278 3,9510	3,999	190	,000

*The mean difference is significant at the .05 level.

The third sub-question of the research was defined as "Is there a significant difference between ownership of personal internet and computer attitudes, experiences, self efficacy of pre-service teachers?". T- test was used to determine if there is a meaningful statisticaly difference between ownership of personel internet and attitudes, experiences, perceived self efficacy towards computer. As a result of t-test, there is no significantly difference between ownership of personal internet and computer attitutes, computer experiences and computer self efficacy in beginning skills. However, there is a significantly higher difference in self efficacy-files and software with ownership of personal internet ($t_{(190)}$=2.468,p<.05).

Table 4: T- test results of ownership of personal internet and computer attitudes,experiences,self efficacy

	Ownership of P.I	**N**	**Mean**	**t**	**Df**	**sig**
Computer attitudes - Affective component	Yes No	93 99	2,3613 2,3394	,243	190	,809
Computer attitudes - Perceived usefulness	Yes No	93 99	3,9011 3,8505	,474	190	,636
Computer attitudes - Perceived control	Yes No	93 99	3,0771 3,0118	1,105	190	,271
Computer attitudes - Behavioral control	Yes No	93 99	2,5349 2,6338	-1,028	190	,305
Computer Experience	Yes No	93 99	3,5093 3,4591	,655	190	,513
Self -efficacy - Beginning skills	Yes No	93 99	3,6237 3,5455	,667	190	,506
Self- efficacy - Files and software skills	Yes No	93 99	4,3297 4,0286	2,468	190	,014

*The mean difference is significant at the .05 level.

The fourth sub-question of the research was defined as "Is there a significant difference between daily computer usage duration and computer attitudes, experiences, self efficacy of pre-service teachers?".The one way variance analysis (ANOVA) was used to determine if there is a meaningful statisticaly difference between daily computer usage duration and attitudes, experiences, perceived self efficacy towards computer. The results of ANOVA indicated that there is a significant difference between computer attitude (perceived usefulness) ($F_{(2,189)}$=3.748,p<.05), computer experience ($F_{(2,189)}$=5.693,p<.05), self efficacy (beginning skills) ($F_{(2,189)}$=8,241,p<.05), self efficacy(files and software skills) ($F_{(2,189)}$=15,878,p<.05) and daily computer usage duration.

*The mean difference is significant at the .05 level.

LSD test results show that there is a significant difference between participants daily use computer for 0-60 min, 60-120 and 120 min-more. Participants who use computer in 121 min-more in a day have higher computer attitudes (perceived usefulness) ($\overline{x}$ =4, 14) than those who use 0-60 min. ($\overline{x}$ =3, 75) and 60-120 min. ($\overline{x}$ =3,90) a day.

Participants who use computer in 121 min-more in a day have higher self-efficacy (files and software skills) ($\overline{x}$ =4,60) than those 0-60 min. ($\overline{x}$ =3,85) and 60-120 min. ($\overline{x}$ =4,43) a day.

CONCLUSION

This study investigated self-efficacy, experience, attitude of pre-service social studies and mathematics teachers' relations of socio demographic characteristics towards computer. The results showed that there is no difference between male and female pre-service teachers' attitudes, self-efficacy and experience towards computer. Generally, people who had personal computers and internets, there are no differences in their attitude, self-efficacy and experience towards computer. There is a significant difference between computer attitude (perceived usefulness), computer experience, self efficacy (beginning skills) and self efficacy (files and software skills) in terms of daily computer usage duration. According to LSD test results, when daily computer usage duration of people is increased, their attitudes,experience, and self efficacy towards computers are rised as well.

This research is restricted with 192 pre-service teachers from elementary mathmetics and social studies education in Education Faculty.We can recommend that this research can apply to teachers and instructors. Also, the another dimension of computer anxiety can be added for the next researches.

Abstract : Aim of this study is about mathematics education and dynamic mathematics software. Dynamic mathematics software provides new opportunities for using both computer algebra system and dynamic geometry software. GeoGebra selected as dynamic mathematics software in this research. In this study, it is investigated that what is the usage of preservice mathematics teachers for teaching and learning mathematics concepts. Quantitative and qualitative research methodologies were used in this study. First participants learned basic commands about GeoGebra. During lessons preservice teachers of mathematics used dynamic worksheets. Data were collected by participants' works and opinions on dynamic mathematics software. According to responses of participants, preservice teachers want to use dynamic mathematics software for teaching mathematical concepts. Their works on GeoGebra showed that participants want to offer interactive dynamic mathematics worksheets on internet to the students. for mathematical concepts.

Keywords: dynamic mathematics software, mathematics teaching, mathematics learning

Introduction

Understanding the factors about teachers' use of technology for teaching and instructional purposes is important (Teo,2009). Teachers' usage of computer depends on their knowledge and experience about technology. Teachers integrate technology for teaching in different ways such as presentation purposes or allowing students to use a full range of technology resources (Teo,2009). According to content of teacher education programs, preservice teachers can be able to use technology for educational purposes. Şahin and Toy (2009), reported that student-centered teaching methodology, expertise in computer use, and a high level of technology integration in teaching expressed more preservice teachers' positive attitudes toward using computer applications for instructional purposes.

On the other hand, preservice teachers of mathematics need to improve technological skills in order to use Information and Communication Technologies (ICT) in classrooms. Programs for teacher preparation in Turkey have computer courses. Preservice teachers are able to learn basic commands and usage about operating systems, word processing, presentation preparation, internet. However, preservice teachers must know how to use ICT for teaching and learning.

Also, mathematics curriculum emphasize on using dynamic geometry systems (DGS) for teaching geometry concepts (MoNE,2006). For this reason, teachers should learn use DGS in mathematics classrooms. According to curriculum reform in Turkey, students' role and teachers' role has changed (Bulut,2007). Mathematics teachers must know usage of DGS for preparing lesson activities with it. So, some courses about using DGS offered to preservice teachers of mathematics in Gazi University. During these lessons, they can learn both how to use DGS and how to develop dynamic worksheets with DGS.

Computer Algebra Sytems (CAS) improve students' conceptual understanding and problem solving abilities(Aksoy et al 2007,Bulut et al 2007). Dynamic mathematics software offers opportunities for using both computer algebra system and dynamic geometry software (Hohenwarter et al,2009, Hohenwarter & Lavicza,2009). Preservice teachers of mathematics need applications of dynamic mathematics software during learning and teaching mathematical concepts (Jones,K ,2009).

In this study, it is investigated that what is the usage of preservice mathematics teachers for teaching and learning mathematics concepts. Because of facilities of GeoGebra, it was selected as dynamic mathematics software in this research.

The Study

Quantitative and qualitative research methodologies were used in this study. First 47 second year student participants learned basic commands about GeoGebra. During lessons preservice teachers of mathematics used dynamic worksheets. Data were collected by participants' works and opinions on dynamic mathematics software. Interviews administered to randomly selected participants.

Findings

According to responses of participants, preservice teachers want to use dynamic mathematics software for teaching mathematical concepts. There are some intercepts from interviews:

Preservice teacher of mathematics(PTM-1) stated that: *"...Mathematical proofs can be learned easily by using Geogebra. Students can discover relationships between mathematical concepts through different types of representations such as geometric,algebraic and graphical..."*

PTM-1 preferred to construct geometric figures and prove with dynamic worksheets as shown below:

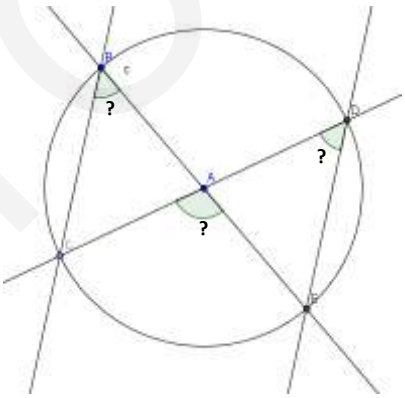

Figure.1. Investigation of relationship between angles in a circle by using GeoGebra

Their works on GeoGebra showed that participants want to offer dynamic mathematics workheets on internet to the students. Participants learned basic commands of GeoGebra during lessons. After that they prepared activities for mathematical concepts. Their dynamic worksheets on internet were interactive learning environment for learners.

There some examples from preservice teachers' works:

According to Figure.2 preservice teachers can produce geometric tessellations and mathematical patterns using dynamic mathematics software instead of paper and pencil. PTM- 2 stated that:

"...I can draw what I need by using GeoGebra. I do not use paper or rubber while using dynamic mathematics. I think my students will learn and build these patterns easily..."

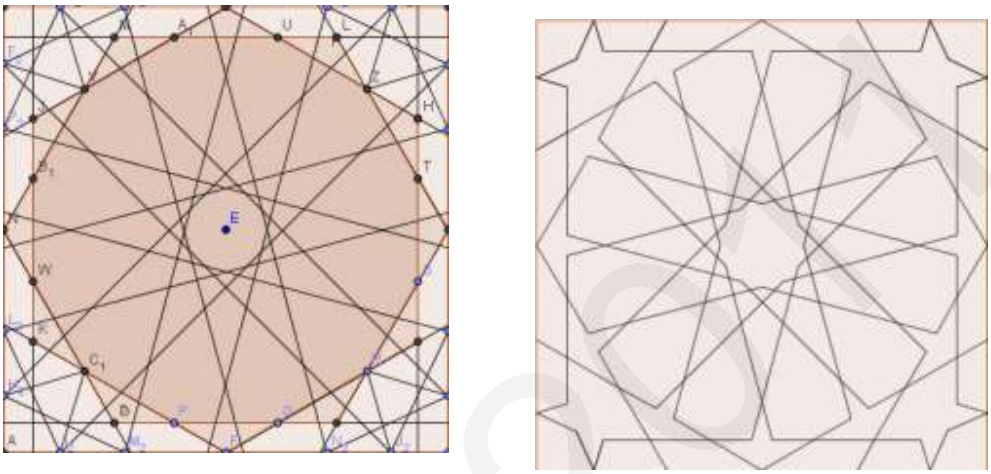

Figure.2 PTM-2's work for geometric tesellation(12-armed star-historical shape in Turkish architect)

PTM-3 was used other materials pictures such as Turkish patchwork for teaching geometric concepts in primary mathematics such as rotation, symmetry, translation and reflection. PTM-3 stated that:*"...I am looking everywhere by mathematical point of view. I can adopt real situations and images to Geogebra. In my opinion, geometry should be thought by using GeoGebra..."*

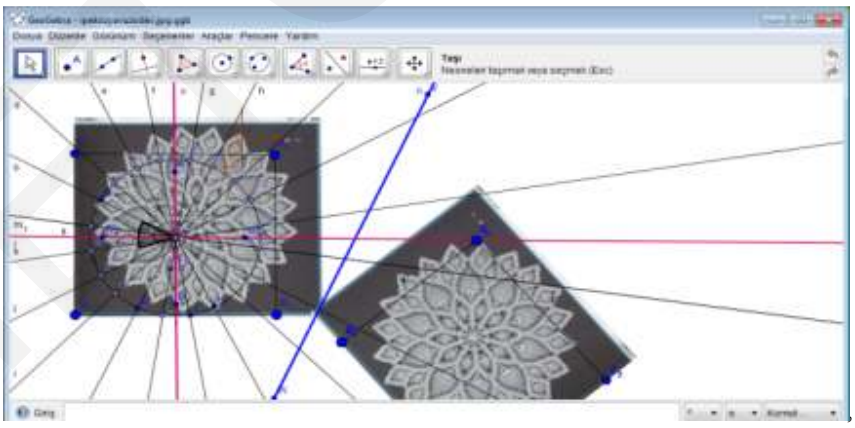

Figure-3: PTM-3's work about symmetry, rotation, translation and reflection

Some preservice teachers used GeoGebra for establishing real life examples with an international perspective from all over the world. For this reason PTM-4 was used a stadium picture from Riyad and PTM-5 was used Pisa tower. PTM-4 stated that:

"…GeoGebra enables using real-life examples for teaching and learning mathematical concepts. During preparation of worksheets I investigate interesting buildings from different cutures and countries. Their common point is usage of mathematics in life…"

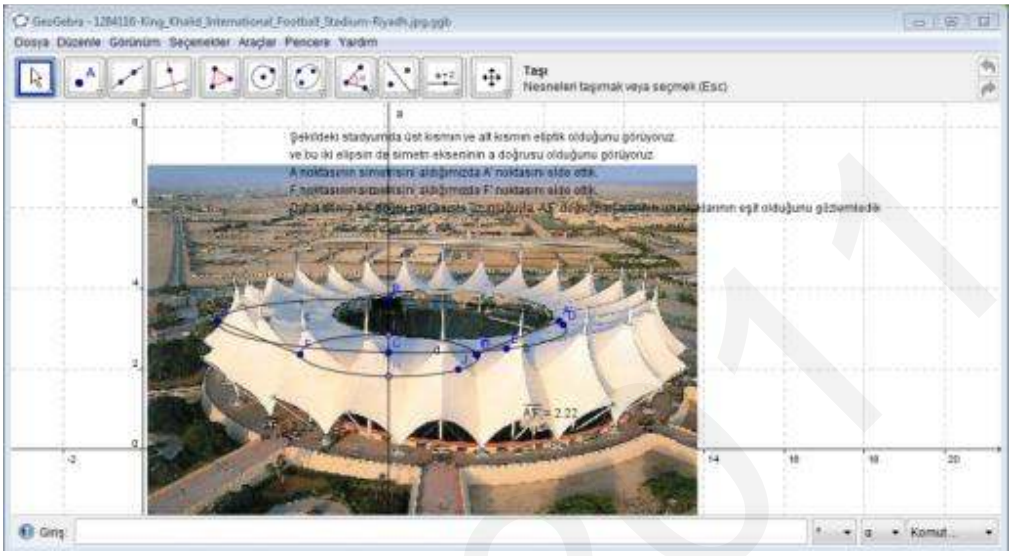

Figure 4.PTM-4's real- life example from Riyad

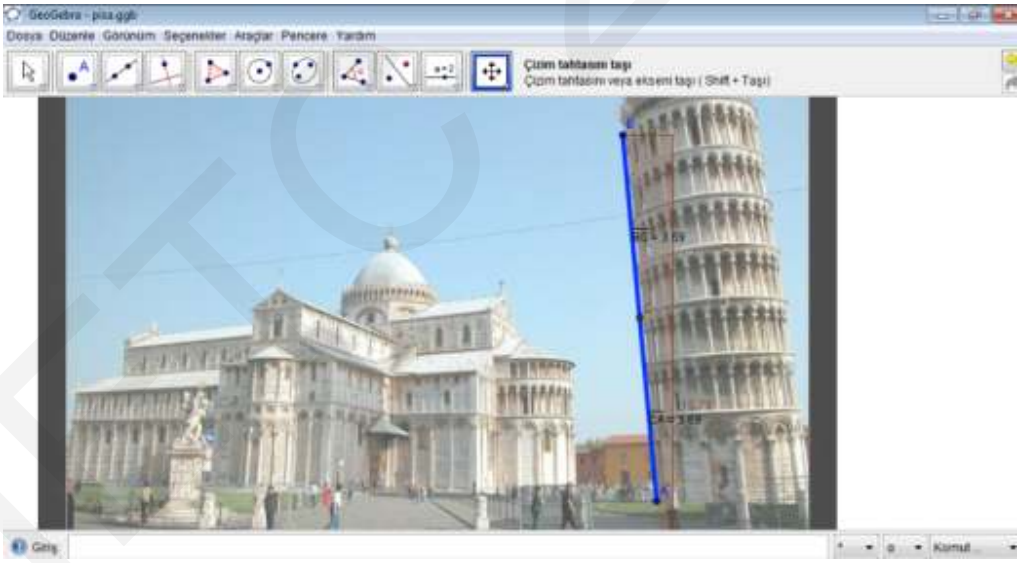

Figure-5. PTM-5's real life example from Pisa tower.

PTM-5 stated that:*"…I can do problem posing by using real examples from touristic places. So I can interrelate my lesson with social studies or other disciplines. According to math curriculum, interdisciplinary approach should be used during teaching of math, so I think it is useful to develop activities by using GeoGebra…"*

GeoGebra offers web-publishing opportunities for mathematics education. Some of PTMs were used these tools for building interactive web pages. PTM-6 and PTM-7 created dynamic worksheet web-pages for teaching mathematics. PTM-6 stated that :

"...In nature, there are some examples of mathematical subjects like fractals and its If I publish these webpages to internet my students can enter whenever they want and they can discover by trying each time. This website was an interactive learning environment for learners of mathematics..."

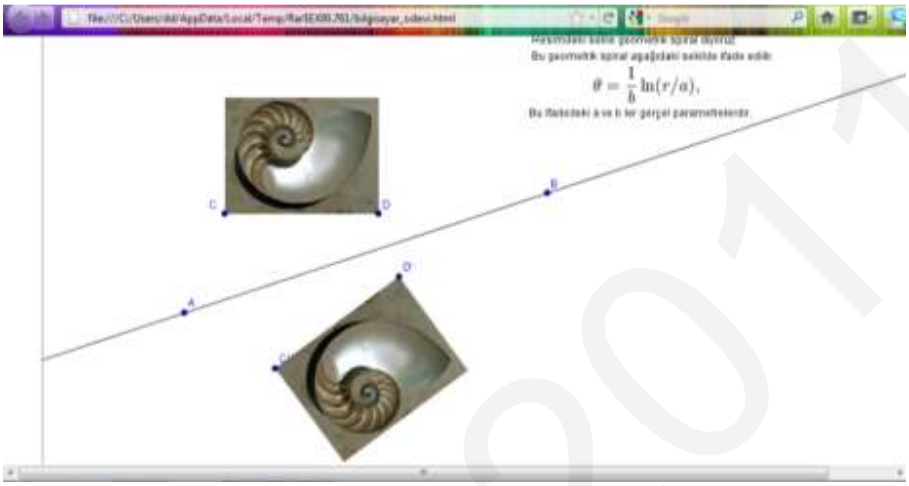

Figure-6.PTM6's interactive dynamic worksheet extracted from GeoGebra as a website.

PTM-7 said that: "…most important part is discovering concepts both in Algebra and Geometry windows in GeoGebra…."

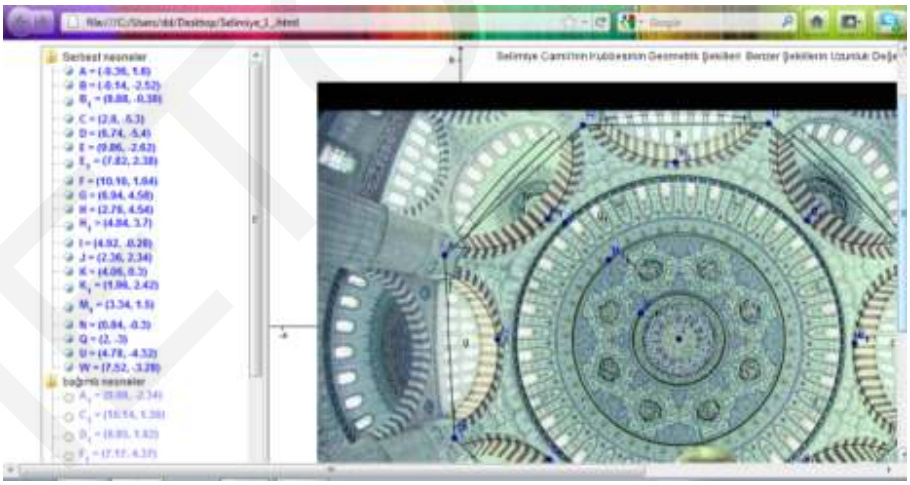

Figure-7.PTM-7's interactive dynamic worksheet extracted from GeoGebra as a website.

Conclusions

In spite of most of the PTMs (%97) were using successfully basic computer facilities and %88 of them know basic commands of GeoGebra %65 of them stated that they were able to design web pages with Geogebra applications for interactive dynamic worksheets. %73 of PTMs preferred to use integrate pictures

to background of worksheets for connect geometry to real life examples. Others preferred just for writing exam questions(%12),building web pages(%8), calculating algebraics(%7). Findings revealed that, PTMs want to use technology with real examples in a discovery-based learning environment. By conclusion, it was a little step for PTMs but a big step for mathematics teaching and learning according to responses.

PRESS THE BIG BLUE BUTTON TO TEACH COMPUTER SCIENCE

Gabor Kiss
Department of Mechatronics and Cartechnics Engineering
Óbuda University
gabor.kiss@bgk.uni-obuda.hu

Abstract: Students of the undergraduate course Introduction to Informatics get acquainted with computer architecture, operating system, computer network and data encryption in history as well as with up to date applications. During the consultation hours the students have the opportunity to ask the problematic questions to understand the learning material that they can download after the presentations. The experiences show the students wait for the last day before the test to download and learn the learning matherial and they do not use the opportunities of the consultation hours. Usually there are just 1 or 2 students coming to ask questions at this time. BigBlueButton is an open source web conferencing system and the students in the first semester could use it to ask the problematic questions from home. The experiences show this way of consultation is near to students' habit and helps them to understand the learning material better and score a higher paper mark.

keywords: Experience, BigBlueButton, using Computer Science Education

INTRODUCTION

I teach the students of the undergraduate course Introduction to Informatics of The Bánki Donát Faculty of Mechanical and Safety Engineering at Óbuda University. This Faculty has three majors: Mechanical Engineering, Safety Engineering and Mechatronic Engineering. In the first semester the students learn about computer architecture, computer virus, logical operations and computer network, this is what I am analysing in this article. I composed this learning material on the basis of the results of an analysis of the entering students' knowledge level (Kiss, 2008) (Kiss, 2009a) (Kiss, 2009b). My goal is to teach the learning material always with a better result so I try to use alternate tools to reach this goal. I have reached some results in the second semester when I teach the most prevalent methods of data concealment (steganography) and data encryption in history as well as with up to data applications (Kiss, 2005) (Kiss, 2010a) in this course. I wrote some computer programs to show up to date steganographic (data concealing) methods using picture and sound files, demonstrating how to use and deciphering the Ceasar code, monoalphabetic encryption and its deciphering. Another program demonstrating the Vigenére encryption continuously shows which rows and columns are used in the process. To illustrate the Cardano grid a program was written, which prepares a rotatable grid adequate to put the characters of the message to the appropriate place in the grid in order to conceal it (Kiss, 2010b) . Unfortunately these ideas were not enough to solve the problem of the learning habits of students (Kiss, 2009c). Students have been downloading the teaching material of Introduction to Informatics from a web based system since 2007. The learning material is accessible in the system just after the presentations, on the same day. By analysing the data of the first semester I tried to find a relationship between the time of download and the result of the papers written by the students. Most of students downloaded the teaching material on the day of the test or the previous day (Kiss, 2010c). The students always have the chance to come up to me after the presentation to ask questions if they have problems with some part of the material or if they could not understand something, but just a few students use this way. I have consultation hours every week when the students can come to my office to make the problematic questions clear, but only 3 or 4 students come at this time. We always hear that young people continuously sit at the computer surfing the Internet or visiting a facebook or other websites (Victory, Cooper, 2002). I want to find a tool to reach the students at home before the computer to make the consultation in this way (Oblinger D., Oblinger J., 2005). I think it might have more visitors. This way will show the students more activity to ask the problematic questions and they will get better paper results. This is my starting hypothesis.

BIGBLUEBUTTON THE OPEN SOURCE WEB CONFERENCING SYSTEM

I have heard about the BigBlueButton open source web conferencing system and I thought I should try it in Computer Science Education as a consultation tool. In this system the teacher can upload any PDF presentation or office document and keep everyone in synch with their current page, zoom, pan, and see the teachers mouse pointer. The users can share their webcam at the same time without limit on the

number of simultaneously active webcams. The teacher can broadcast their desktop for all students to see (figure 1.). The system supports voice over IP (VOIP) conferencing, all students need speakers and a microphone to participate („BigBlueButton", 2011).

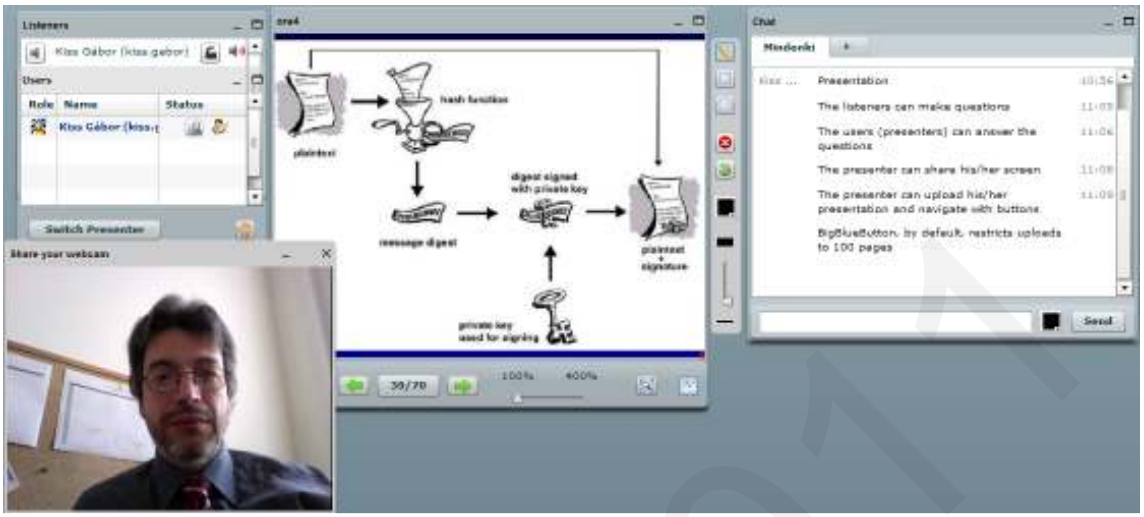

Figure 1. Desktop of BigBlueButton

Our server can serve 40-50 users at the same time so it was the limit of participants in a consultation. I teach more than 500 students so I organised 1-2 all day webconsultation opportunities for the students.

ANALYSING OF THE PAPER RESULTS BY SPECIALIZATION

The Number of Participantst in the First Test in the Two Groups and the Values of Mean and Std. Deviation

The students have to write two papers in a semester to show how they can learn the learning material. I analysed the paper results of the students after the first semester and made two groups. The students who used web based consultation from week to week to ask the problematic questions in connection with the learning material were in the first group (group A) while the students who did not take part in any web consultations were in the second group (group B).
According to the table (Table 1.) the mean of the results of first papers of group A is higher. It means this group wrote the papers with a better result. It does not give enough information to say using of web conferencing results in better written tests because this can happen accidentally, too. So, we needed more analyzing to keep the chance of accident low.
If we spend more time to look at this table, we can see ~25% of the mechanical engineers and safetytechnic engineers took part in web consultations and the bigger part of the students did not. We can see the students who used the opportunity of web based consultations could pass the test in higher percent, but we still do not know if it is an accident or not.

Table 1.
Group statistics of first tests results by specialization

Specialization	Group	Number of participants	Mean	Std. Deviation	Pass the test
Mechanical Engineer	A	85	1,847	0,8998	55,29%
	B	280	1,707	0,7760	22,14%
Safetytechnic Engineer	A	24	1,758	0,8720	59,55%
	B	89	1,729	0,7076	45,83%
Mechatronic Engineer	A	31	2,323	1,0372	77,41%
	B	50	1,550	0,6247	48%

Independent Samples test of First Papers by Specialization

My null hypothesis was that the results of the first paper written by the two groups of students would not differ significantly. Since we have two independent samples, we can use the T-test to tell if the means of the first paper of these groups differ or not (Table 2.).

Table 2.
Independent sample test of first paper results by specialization

Specialization		Levene's test for Equality of variances		T-test for equality of means		
		F	Sig.	t	df	Sig. (2-tailed
Mechanical Engineer	Equal variances assumed	1,683	0,195	-1,401	363	0,162
	Equal variances not assumed (Welch's t-test)			-1,295	124,299	0,198
Safetytechnic Engineer	Equal variances assumed	4,995	0,027	0,171	111	0,865
	Equal variances not assumed (Welch's t-test)			0,151	31,631	0,881
Mechatronic Engineer	Equal variances assumed	7,040	0,01	-4,190	79	0,000
	Equal variances not assumed (Welch's t-test)			-3,747	43,662	0,001

An analysis of the results of mechanical engineers („Levene's test", n.d.) showed the variance of the two groups are not different, because the value of Levene's test is not significant ($p<0,05$) (Levene, 1960).
In this case the means could be compared with T-test („Student's t-test", n.d.) which did not show up a difference between the means, because the value of T-test is not significant ($p<0,05$). It means the using of webconsultation did not have influence on the results of first papers of mechanical engineers.
The analysis of the results of the safetytechnic engineers („Levene's test", n.d.) showed the variance of the two groups is different, because the value of Levene's test is significant ($p<0,05$). In this case the means could be compared with Welch's t test („Welch's test", n.d.) (Welch, 1947). This did not show difference between the means, because the value of Welch's t test is not significant ($p<0,05$). The safetytechnic engineers did not gain advantage of using web based consultation at the first papers results.
The situation is different with the mechatronic engineers. We can see the means of the first paper by this specialization differ mostly. The analysis of the result (Levene test) showed the variance of the two groups are different because the value of Levene's test is significant ($p<0,05$).
In this case the means could be compared with Welch's t test. This showed difference between the means of the results of the students attending the web based consultations were one mark better than the results of the other group where the students had not taken part in these consultations. It means these students could take advantage of using BigBlueButton web conference system.

Measures of Association by the First Paper Results

Earlier, no significant differences could be detected between the means of the first papers by specialization mechanical and safetytechnic engineers just at the mechanical engineers. It means it is profitable to make deeper analysis just of the mechanical engineers to reveal the influence of the web based consultation on the calculated means. I could reveal the influence with the calculation of the Eta-squared (η^2) („Analysis of variance", n.d.). The calculated value in percentage shows how much grouping influences the difference between means. Square root from the Eta-squared gives a value between 0 and 1 (η). This shows the measures of association, i.e. how strong the connection between grouping and the achieved result is. The higher the value is, the stronger the connection is (Cohen, 1973). In the next table we can see the calculated values and the strength of the connection (Table 3.).

Table 3.
How strong the connection between grouping and the achived first paper results

Specialization	η^2	η	Strength of the association
Mechatronical engineer	18,2%	0,426	middling weak connection

Calculating the Eta-squared I tried to make the effect of the web based consultation on the result of the first papers written percentable and got a surprising 18,2%. This means there is a middle weak correlation

existing between the using BigBlueButton web conference system and the results of the first papers written by the students. It seems the students of the other two specializations could not take advantage of using webconsultation before the first paper. The next step is to analyse the results of second paper because more students used BigBlueButton before the second test than earlier.

The Number of Participants in Second Test in the Two Groups and the Values of Mean and Std. Deviation

According to the table (Table 4.) the mean of the results of the second papers of group A is higher again, just like at the first test, but the difference is bigger than earlier. We can see passing the test also shows a higher percentage. This means the students who have taken part in web consultations have more chance to pass the test; higher percent of students of group A could pass the test. We can recognize another change at the values of the second test too, ~ 50% of the mechanical and safetytechnic engineer students used BigBlueButton before the second test to ask the problematic questions. It was just 25% before the first test. It means the students knew this system and gladly used this opportunity in the second half of the semester. The majority of the students needed more time to get to know the new tools to use them. The mechatronical students could take advantage of it right at the first paper, but these studentst have the best skill to learn the learning material of every subject in this Faculty at the Óbuda University. We needed more analyzing to keep the chance of accident low like at the first test.

Table 4.
Group statistics of second tests results by specialization

Specialization	Group	Number of participants	Mean	Std. Deviation	Pass the test
Mechanical Engineer	A	176	1,95	0,719	73,30%
	B	189	1,51	0,600	44,44%
Safetytechnic Engineer	A	61	1,81	0,620	68,85%
	B	52	1,52	0,602	46,15%
Mechatronic Engineer	A	52	2,21	0,743	84,62%
	B	29	1,31	0,471	31,03%

Independent Samples Test of Second Papers by Specialization

My null hypothesis was that the results of the second paper written by the two groups of students would not differ significantly. We can use the T-test to tell if the means of the second paper of these groups differ or not (Table 5.).

Table 5.
Independent samples test of second papers results by specialization

Specialization		Levene's test for Equality of variances		T-test for equality of means		
		F	Sig.	t	df	Sig. (2-tailed
Mechanical Engineer	Equal variances assumed	2,075	0,151	-6,375	363	0,000
	Equal variances not assumed (Welch's t-test)			-6,334	341,779	0,000
Safetytechnic Engineer	Equal variances assumed	0,923	0,339	-2,530	111	0,013
	Equal variances not assumed (Welch's t-test)			-2,536	109,116	0,013
Mechatronic Engineer	Equal variances assumed	2,003	0,161	-5,894	79	0,000
	Equal variances not assumed (Welch's t-test)			-6,668	77,610	0,000

An analysis of the results by specialization (Levene test) showed the variance of the two groups are not different because the value of Levene test is not significant ($p<0,05$).
In this case the means could be compared with T-test by all specialization which showed up a difference between the means, because the value of T-test is significant ($p<0,05$). It means the using of web based

consultation has influence on the results of second papers by all specialization. It means these students could take advantage of using BigBlueButton web conference system, but we need more analysing to reveal the influence on them.

Measures of Association by the Second Paper Results

We could detect significant differences between the means of the second papers by all specialization. It means we can reveal the influence by specializations of the web based consultation on the calculated means with the calculation of the Eta-squared (η^2). The calculated value in percentage shows how much grouping influences the difference between means and the square root from the Eta-squared (η) shows the measures of association, i.e. how strong the connection between grouping and the achieved result is. The higher the value is, the stronger the connection is. In the next table we can see the calculated values and the strength of the connection (Table 6.).

Table 6.
How strong the connection between grouping and the achived second paper results

Specialization	η^2	η	Strength of the association
Mechanical engineer	10,1%	0,317	weak connection
Safetytechnic Engineer	5,5%	0,234	weak connection
Mechatronical engineer	30,5%	0,553	middling strong connection

According to the table (Table VI.) the calculated value of Eta-squared shows the effect of the web based consultation on the result of the second papers is percentable. We can see the strength of association at the mechanical and safetytechnical engineers show weak connection. This means the students from these two specializations have learned to take advantage of the web based consultation test and more of them used this tool too before the second test than before the first one when we found no connection. It seems these students need more time to recognise the advantage of this tool. Earlier, before the first test, we could see a middle weak correlation existing between the using BigBlueButton web conference system and the results of the first papers written by the mechanical engineer students. The situation changed in this case, too. These students could take more advantage of using webconsultation before the second paper. The value of Eta-squared is 30,5%, this means a middle strong correlation exists between the using BigBlueButton web conference system and the results of the second papers written by the mechatronical engineer students.

Conclusion

We can say after the analysing process my starting hypothesis is correct; students get better paper results by using web consultation system. Moreover we have to mention that the effect of using web based consultation system was different by specialization. The mechatronical engineer students could take advantage of this tool before the first test, the mechanical and safetytechnic engineer students needed more time to recognize the advantage. We can see this difference in the number of participants by tests and specialization. Before the first test used just ~25% of students this opportunity to make consultation before the second test the number of participants growed spectacularly. The students could get a half mark better paper results when they used this tool to ask the problematic questions before the test. They took part in consultations from home in this way more gladly than personally coming to the office in this time. The web based consultation is a good way to catch the students who have problems with the learning material but they do not have enough courage to ask questions. BigBlueButtom fills up this gap between the students and the teacher.

Future work

Earlier we could see the using of this tool shows difference between the students by specialization. I would like to find the reasons so I need to make more analysis after the second semester. We might see a growing use of BigBlueButton, maybe it will continue in the second semester, too and I can find the same strong connection between using BigBlueButton web conference system and the results of the papers.

Summary

According to the starting hypothesis exposed in the introduction students who use web based consultation system will get better paper results. The analysis of the test results showed the students who used this tool got better marks, so the original hypothesis was correct. Some students needed more time to learn to use BigBlueButton or understand the advantage of this tool, but the bigger part of the students used it before the second test and got better paper results. We can declare the use of web based consultation system is useful for students and teachers as well, because it is easier to clear the problematic questions in connection with the learning matherial this way.

THE RELATIONS BETWEEN LEARNING STYLES AND DECISION-MAKING STYLES OF STUDENTS

Umut Ayman
Eastern Mediterranean University
Faculty of Communication and Media Studies
umut.ayman@emu.edu.tr

ABSTRACT

The learning styles of an individual may affected the way of living within the social environment. During the socialization process individual learns how to act, react, response or buy the products, services or ideas. Through this study the students' learning styles were explored to understand their styles of learning and examined if those styles related with the decision making styles of them. The questionnaire was applied to collect the data which was administered to the university students in Famagusta, North Cyprus used the Sproles and Kendall's Secondary Learning Style Inventory (SLSI) and Consumer Style Inventory (CSI) as the tools. Based on the research, six decision-making styles and three learning styles were identified and analyzed. It has been found that the majority of students was active practical learners and had a highest positive correlation with the price consciousness style. Thus the positive correlations were found between learning styles and consumer decision-making styles.

Keywords: learning styles, factor analysis, consumer-decision making styles, North Cyprus

INTRODUCTION

Each individual learn the way of being a person or act in his/her socialization process of his/her life. The learning process starts from the time of new baby till the end of his/her life. People learn how they are accepted by the society in their lives during the socialization process. Each person can be seen as individuals, learners, students, consumers and so on in their lives.

The individuals are the consumers who consume many goods and services in their daily lives. Thus the learning styles of people show some typical changes on their consumption decision making process. Furthermore, the learning styles of individuals give some feedback about the way of thinking, acting, believing or learning the topics.

Sproles and Kendall (1990) mentioned that, those years the individual approaches for learning as seen a new way of analyzing the individuals' learning styles. According to them, there was a significant relationship available among people's learning and consumer decision making styles. Sproles (1986), Sproles, Cox, Sproles (1988), Sproles and Kendall (1986) (1990) used Secondary Learning Style Inventory (SSLI) and they indicated that the roots of SSLI based on Kolb's learning theory.

Considering that it is important to focus on the learning styles of Turkish students to explore their styles topic, to understand how the students' minds operate during the learning process, hence this paper aims to find out the relation between students learning styles and decision making styles of Turkish university student in North Cyprus.

Kolb's Experiential Learning Theory (ELT)

Kolb (1984) emphasized that, experiential learning directed for learning through experiences in one's lifetime. According to Kolb, learning is "the process whereby knowledge is created through the transformation of experience" (Kolbö 1984). Kolb, Boyatzis, Mainemelis (2001) emphasized that Kolb's Experiential Learning Theory (ELT) had four stages which two of them focused on experience that were Concrete Experience (CE) and Abstract Conceptualization (AC), and two of them were focused on transformation of the experience as Reflective Observation (RO) and Active Experimentation (AE).
Sproles and Sproles (1990) explained the learning style as "the way each person absorbs and retains information's and/or skills" (p.137). Generally, the scholars who interested in consumer education agreed

that their decision making was based on a process of learning. The learning styles of students give the information about how their minds were managed during the learning process. (Omar, Ali, Hussin and Rahim, 2009)

Leaning Styles as Individual learning styles

According to Cox and Sproles (1988) "Each learner possesses an individual learning style, which is preferential mode of learning. Learning styles may be described many ways, much as individual personality is characterized by psychologists into "personality characteristics". (p.1) Thus the explanation of learning styles seemed as new for education in 1990s.

Sproles and Kendall (1986) found out Secondary Learning Styles Inventory that covers six learning styles as serious- analytical learner, active-practical learner, observation-centered Learner, concrete, detail, fact-oriented learner, Passive-accepting learner and non- passive, struggling learner. They were to use SSLI and applied about 482 students to test their inventory in 1986. Sproles, Kendall and Cox (1987) used SSLI with 2000 students as a sample and tested validity and reliability of the inventory. They examined that these learning styles were the preferred learning styles of students. They found out that 75% of respondents prefer "active, practical learner".

In 1990, Sproles and Sproles found out that there was a relationship exists among the students' preferred learning styles and consumer decision making styles. They declared that "consumer decision making styles as a function for individual learning styles." Thus, they dealt with the "individual learning styles" affected the students' decision making styles during the consumption. The few studies focused on the learning styles of individuals which based on their studies of Sproles and Kendall (1990), the consumer decision making styles were "a function of individual learning styles" **.**

Sproles and Kendall (1986) had developed a SLSI of 23 items for discovering the students' learning styles. It was based on Kolb's theory which was focused on adult people. However, Cox, Sproles and Sproles (1988) focused on younger people as a sample and found out some additional characteristics. There is analytic validity of six factors as basic characteristics of learning styles as follows;

(1) Serious, Analytical Learner, is a style considering the students prefer to think logically, rationallly and cearefully during the learning process. They like to have new ideas and things and complex things to work on topics.

(2) Active, Practical Learner, is a style that the students think that "doing things" is their preference during the learning process. They prefer real practices, cases and experiences during the learning. They like practical applications instead of theorical things. They think that when they excited they learn the things better.

(3) Observation Centered Learner, is a style of students that they like observation and waching others a way of learning during any activity.

(4) Passive, Accepting Learner, is a style that the students keep their silence in the classroom and they accept everything come from instructors.

(5) Concrete, Detailed, Fact-Oriented Learner, is a style that the students focus on subject by dividing them into smaller sections. They like to take notes and prefer detail facts.

(6) Nonadaptive, Struggling Learner, is a style that the students feel themselves doubtful and insecure and they think they have a intutive side of learning.

Consumer Decision Making Styles

Sproles and Kendall (1986) have developed a CSI of 40 items for discovering the consumer decision making styles. There is analytic validity of eight factors as basic characteristics of consumer decision making styles as follows;

(1) Perfectionistic, High-Quality-Conscious Consumer, is a feature considering the degree of consumers' search for best quality for the products in the market available.

(2) Brand-Conscious, Price-Equals-Quality Consumer, is a feature assessing the consumer's inclination towards expensive and reputable products and brands.

(3) Novelty- and Fashion-Conscious Consumer, is a feature of consumers who are open to new offerings and achieve pleasure through possesion of innovative products.

(4) Recreational and Shopping-Conscious Consumer, is a feature that tests the extent of the consumer to view shopping as a fun and leisure activity.

(5) Price-Conscious, Value-for-Money Consumer, is a feature noticable with high price conscious consumers in terms of sales and cheap prices.
(6) Impulsive, Careless Consumer, is a manner of consumer type who are less attantive and spontaneous at their purchases without considering how much they spend.
(7) Confused by Overchoice Consumer, is a consumer category confused by the numerous products and brand offerings in the market and gets exhausted by it.
(8) Habitual, Brand-Loyal Consumer,, is a consumer category with repeated purchases of his/her same favourite brands and shops habitually.

METHODOLOGY

For the current study, factor analysis as a quantitative methodology was used to explore the styles of students. The study was conducted at the Eastern Mediterranean University (EMU). For an exploration to identify the determination of students' learning style and decision making style formats, exploratory factor analysis used to analyze with principle component method with varimax rotation for each factors and reliability analysis construct the validity of each factor. Also, cluster analysis confirm that the number of cases as students available in each cluster. Pearson correlation and Independent Samples T-Test were used to measure the strength of the correlation among the dependent and independent variables. Learning styles was used as independent variables and decision making styles were used as dependent variables.

The Objectives of the Study

The current research study aimed found out the answers of these following research questions:

- Which learning styles do the Turkish university students have?
- Which consumer decision making styles do the Turkish university students have?
- Is there any relationship exist among their learning and decision making styles?

SAMPLE AND DATA COLLECTION

Data was collected through samples formed by random sampling methodology with the usage of SLSI and CSI. A questionnaire survey was conducted to collect the data for the research and was administered to 300 university students at Eastern Mediterranean University. Only 274 university students filled the questionnaires correctly as 122 males and 152 females with as a sample 95% confidence level. Ten demographic questions, twenty three items of SLSI and forty items of CSI were asked to the university students.

In this study, 5-point Likert scale was used and implemented in order to collect data for the data analysis. In the scale, the respondents were asked to state their level of agreement on each statement as (1=Strongly Disagree, 2=Disagree, 3=Uncertain, 4=Agree, 5=Strongly Agree). The questionnaires were translated into Turkish as the native language or mother tongue of the respondents.

ANALYSIS OF FINDINGS

Analysis for Learning Styles

For values of KMO (Kaiser-Meyer-Olkin measure of sampling adequacy) were higher than acceptable point of 0.50. (KMO, 0.923 > 0.50) and Bartlett's Test of Sphericity was significant. (KMO: 92%, Barlett: 2452.71, df: 120, $p < 0.001$). The students' learning styles were 63.524% of variance and a range of eigenvalues of 1.076 to 7.523 that eigenvalues were greater than 1 as shown in Table 1.From the table 2, factor loading for each learning style computed and three learning styles were reliable for this study.

Table 1 Reliability of students' learning style factors and variance

Factors	Number of items	Eigen values	%of variance explained	Coefficient Alpha
Serious Analytical Learner	6	7.523	29.314	$\alpha = 0.91$
Active, Practical Learner	5	1.565	17.451	$\alpha = 0.87$
Observation Concrete Detail Passive learner	5	1.076	16.758	$\alpha = 0.73$
Total Variance explained			**63.524%**	

According to the table 2 analysis, students have three types of learning styles. 89% of the students were Active Practical learner. Serious Analytical learners prefer to think carefully and logically. They prefer new ideas to work on seriously. Active Practical learners prefer real cases and practices. They learn better with real experiences and practical applications. Observation Concrete Detail Passive learners prefer to

observe the other people. They think that writing the notes and listening in the classroom was their preferred way of learning. A degree of passive learning was available and they prefer to look at details during the leaning.

Table 2 Factor Analysis of Learning Styles

Learning Style Characteristics Statements	Factor Loadings	Mean Value
Factor 1 Serious Analytical Learner	**α = 0.91**	**4.17**
Careful and logical thinking is what I value in learning.	0.81	4.23
Thinking things carefully and rationally is what I like.	0.81	4.11
Putting new ideas and thoughts together id enjoyable for me.	0.78	4.26
Hearing new ideas and facts is what I like.	0.77	4.33
Making wise decisions and thinking through difficult things is enjoyable.	0.71	4.10
Serious thinking and looking back what I learn is my way.	0.67	4.02
Factor 2 Active, Practical Learner	**α = 0.87**	**4.11**
Learning through actual practices is preferable to theories for me.	0.69	4.13
Through actual experience and subject practices I learn more.	0.67	4.13
Experimenting and seeing how things work is enjoyable.	0.64	3.86
My preferred way of learning is to do things actually.	0.59	4.27
Practical and useful activities teach me well.	0.58	4.15
Factor 3 Observation Concrete Detail Learner	**α = 0.73**	**3.74**
By observing what others do I learn well.	0.72	3.67
I take notes and writing down facts I learn.	0.72	3.77
Learning through observation is a good way for me.	0.66	3.92
Looking things in detail by dividing them into separate parts is enjoyable for me.	0.64	3.66
Listening quietly rather than speaking up in class is better for me.	0.57	3.69

Factor Loadings were shown next to each factor name row.
The factor loadings were greater than 0.50.

According to cluster analysis, 21 students (8%) were in the first cluster as serious analytical learner, 244 students (89%) fall under the second cluster as active practical learner, 8 students (3%) were third cluster as observation concrete passive learner. As a conclusion for cluster analysis, the majority of the students 89% were seemed as active, practical learners.

Analysis for Consumer Decision-making Styles

For values of KMO (Kaiser-Meyer-Olkin measure of sampling adequacy) were higher than acceptable point of 0.50. (KMO, 0.853 > 0.50) and Bartlett's Test of Sphericity was significant.
(KMO: 85%, Barlett: 3366.30, df: 325, p< 0.001). The students' consumer decision making styles was 65.549% of variance and a range of eigenvalues of 1.452 to 6.816 that eigenvalues were greater than 1 as shown in Table 3. The factor loadings for decision-making styles of students displayed in Table 4 and six styles were found.

Table 3: Reliability of consumer decision making factors and variance.

Factors	Number of items	Eigen values	%of variance explained	Coefficient Alpha
Brand Conscious, Price Equal Quality consumer	7	6.816	17.095	α = 0.89
Perfectionist, High Quality Conscious consumer	5	3.367	12.655	α = 0.84
Confused by Overchoice consumer	4	2.339	11.773	α = 0.88
Recretional –Time Conscious consumer	5	1.808	8.924	α = 0.75
Brand Loyal Consumer	4	1.452	7.896	α = 0.79
Price Conscious, Careful consumer	3	1.261	7.205	α = 0.65
Total Variance explained			**65.549%**	

Table 4: Factor Analysis for Consumer Decision making Styles

Decision Style Characteristics Statements	Factor Loadings	Mean Value
Factor 1 Brand Conscious, Price Equal Quality consumer	**α = 0.89**	**3.39**
My favorite is well-known national brands.	0.62	3.43
My choice is usually more expensive brands.	0.72	3.37
Higher priced product is better in its quality.	0.86	3.41
Best products are offered by nice department and specialty stores.	0.80	3.40
Buying the best-selling brands is my choice.	0.84	3.33
Usually the best choices are the most advertised brands.	0.74	3.45
My wardrobe is up-to-date with the changing fashions styles.	0.54	3.36
Factor 2 Perfectionist, High Quality Conscious consumer	**α = 0.84**	**3.75**
What is vital for me is to get very good quality.	0.76	3.75
My effort is to get the very best or perfect choice while purchasing products.	0.80	3.88
Buying the best overall quality is my concern generally.	0.79	3.90
For choosing the very best quality products I place special effort.	0.63	3.57
For me fashionable, trendy and attractive styles are very important.	0.54	3.63
Factor 3 Confused by Overchoice consumer	**α = 0.88**	**3.43**
So many brands to choose among often confuses me.	0.82	3.51
Choosing which store to shop is sometimes hard..	0.82	3.38
Choosing the best seems to be harder when I learn many information about products..	0.86	3.51
Many information about different products are confusing.	0.85	3.33
Factor 4 Recretional –Time Conscious consumer	**α = 0.75**	**2.93**
For my purchases I really don't think or care so much.	0.64	2.73
For me going shopping is not a pleasant activity.	0.79	2.98
Its a waste of time to shop through stores.	0.82	2.78

My shopping style is fast.	0.69	3.23
Factor 5 Brand Loyal Consumer	**α = 0.79**	**3.64**
I stick to a brand that I like.	0.81	3.64
Everytime I shop I visit the same stores.	0.70	3.43
I buy my favorite brands repeatedly.	0.68	3.86
Factor 6 Price Conscious Careful Consumer	**α = 0.65**	**3.87**
At discount prices I buy as much as possible.	0.78	3.79
Looking for the best value for the money is important to me.	0.80	3.95
Watching my spending is what I carefully monitor.	0.69	3.86

Factor Loadings were shown next to each factor name row.
The factor loadings were greater than 0.50.

Also the students have six types of decision making styles: brand conscious people think that they like to buy expensive and well known brands. The shop's environments also affect their purchases. They like to focus on well known and best selling brands. At the same time, they follow the fashion trends. Perfectionist people thought that the quality is one of the most important vital things. They like to select the best brand and best quality. Also, they have some styles as fashionable and trendy. Confused by overchoice people think that, variety of brands was caused confusion in their minds. They feel that, when they get deep information about the brands, it's not easy for them to choose among alternatives. They are overloaded with information. Recreational time conscious people take care on their purchases. They prefer to go to shops as a pleasant activity. Brand loyal people have some favorite brands and shops. They prefer to buy same brands repeatedly. Price conscious people prefer to make shopping during the discount periods. They are carefully choosing the brands with the consideration of value.

According to cluster analysis, 77 (28%) students were in the first cluster as brand conscious, 36 (13%) students fall under the second cluster as high quality conscious, 40 (15%) students were third cluster as confused by over choice, 48 (18%) students fall under the fourth cluster as recreational time conscious, 33 (12%) students were at the fifth cluster as brand loyal, 37 (14%) students were at the sixth cluster as price conscious individuals.

Analysis of the Correlation between Learning Styles and Consumer Decision-making Styles

Table 5 Pearson correlation coefficient between each decision-making style and learning style

Learning Style Characteristics

Consumer Style Characteristics		Serious Analytical Learner	Active Practical Learner	Observation centered Concrete Detail Learner
Brand Conscious	Pearson Correlation	.103	.070	.259**
	Sig. (2-tailed)	.090	.249	.000
	N	274	274	271
Perfectionist	Pearson Correlation	.342**	.339**	.326**
	Sig. (2-tailed)	.000	.000	.000
	N	274	274	271
Confused by overchoice	Pearson Correlation	-.051	-.016	.047
	Sig. (2-tailed)	.404	.786	.442
	N	274	274	271
Recreational	Pearson Correlation	-.072	-.190**	-.080
	Sig. (2-tailed)	.236	.002	.189
	N	274	274	271
Brand Loyal	Pearson Correlation	.219**	.201**	.200**
	Sig. (2-tailed)	.000	.001	.001
	N	274	274	271
Price Conscious	Pearson Correlation	.495**	.526**	.386**
	Sig. (2-tailed)	.000	.000	.000
	N	274	274	271

**. Correlation is significant at the 0.01 level (2-tailed).

Pearson correlation coefficient was computed to assess the relationship between each decision-making style and learning style in Table 5. Pearson Correlation as shown at the above table, serious analytical learner had positive relations with price conscious (.50), perfectionist (.34) and brand loyal consumer (.22) styles with using the alpha level of p< .01. The active practical learner had positive relationship with price conscious careful consumer (p=.53), Perfectionist consumer (p= .40), Brand Loyal consumer (p=0.20) with using the alpha level of p< 0.01. Also, there was an inverse relationship exist among active practical learner and Recreational Time consciousness consumer (p=-0.19) with using the alpha level of p<0.01. The observation centered concrete detail learner had positive correlation with price conscious (.39), perfectionist (.33), brand conscious (.26) and brand loyal (.20) consumer styles with using the alpha level of p<.01. According to Pearson correlation analysis, serious analytical learner (.50) and active practical learner (.53) had highest meaningful positive relationship with price consciousness style.

CONCLUSION

As a conclusion, three learning styles were found among university students in EMU, North Cyprus which the majority of students were active practical learners. Also, six decision making styles were found among university students. It was the first attempted research focusing on both Turkish students' decision making styles and learning styles in a study. The 21 learning styles and 40 consumer style statements were asked to the respondents. The 44 statements out of 61 founded as meaningful for the recent study. Serious analytical learner and active practical learner had highest positive correlations with price consciousness style. Also, the serious analytical learner had positive relations with price conscious, perfectionist and brand loyal consumer styles. The active practical learner had positive relationship with price conscious, perfectionist consumer and brand Loyal. Also, there was an inverse relationship exist among active practical learner and Recreational Time consciousness. The observation centered concrete detail learner had a positive correlation with price conscious, perfectionist, brand conscious and brand loyal styles.

PROJECT AND RESEARCH BASED MASTER'S PROGRAM IN ENGINEERING

Mohammed Tahir, mta@du.se
Deptment of Material Science, Dalarna University, SWEDEN

Abstract

A new International Master's Program, in the field of metal forming, is developed successfully in the departments of Material Science at Dalarna University, Sweden. The program developed with cooperation of steel and manufacturing industries in the region, among others, Volvo Car Corporation, SSAB, Ortic AB and Jernkontoret - the Swedish Steel Producers' Association. The engineering specialization of the program focused on Steel Materials, Advanced Forming Processes, Surface Technology, Modelling and Simulations, Micro-structure Developments in plastic forming operations and Tribology.

The program is mainly project-based, with focus on practical application of industry. Each project combines theory with opportunities for students to develop their problem-solving capabilities. The program includes projects and the courses are divided into modules.

In addition to the mentioned Master's Program, the department developed too net-based courses within the program to make more accessible for those working in the industry and choose to take some individual courses.

Taking sheet metal forming as main forming process, the purpose of this program has been to complement the present disproportion of Swedish engineering in sheet metal forming and to strengthen the technical competence and competitiveness of the Swedish steel and manufacturing industries.

In addition to that, to fulfil the educational needs of Erasmus and other exchange students (Erasmus Learning Agreement), the department offered advanced level projects and research based courses, corresponding to 30 ECTS credits.

Due to many courses of the program is taken in conjunction with other established Swedish Master's Program, the Non-EU/EEA international students got great opportunity to integrate easily to the Swedish social and educational system, to get access to Industrial projects and to establish a network with steel and manufacturing industries representatives. The Industrial cooperation with the department includes course development, industrial visits, guest lectures, producing industrial projects and helping in conducting industrial laboratories at the industries. That cooperation expected to open good job opportunities within industries, both for EU/EEA and Non-EU/EEA citizens.

Background

Steel industries in Dalarna and neighbouring municipalities traces in its roots far back in time and the region now has some of the world's most modern steel industries, among others, SSAB (a global leader in value added high strength steel), Sandvik (a high-technology, engineering group with advanced products and a world-leading positions within selected areas), Ovako (a leading European producer of long special steel products), Outokumpu (a global leader in stainless steel products including hot and cold rolled, precision strip, tubular and long products). To strength to strengthen engineering competence and to cover the need of the companies, Dalarna University adapted a Master's Program, Master's Programme in Metal Forming and Surface Technology, 120 ECTS-credits.

Dalarna University is the fastest growing university in Sweden. The university specialised in Humanities and Media Studies, Health and Social Studies in campus 1 (Falun city) and Technology and Business Studies in campus 2 (Borlänge). One of the peak competence areas in Technology is Material science division, specialized in Materials, Advanced Forming Processes, Surface Technology, Modeling and Simulations, Sheet Metal Forming, Micro-structure developments and Tribology. These kind of is specialized became obvious for Dalarna University due to many Swedish and multi-national leading steel companies [1] are located at Dalarna and neigboring municipalities, Figure 1.

For that reason, the Swedish steel industry with the cooperation of Jernkontoret - the Swedish Steel Producers' Association and steel companies started graduate school at Dalarna College with specialization in Material Science. The graduate school is started in order to secure recruitment to the field of material science and to build new competence in the field, i.e. to secure Swedish steel research in the future, as well as to educate more researchers.

To fulfill the needs of the regional steel industries, the core study areas of Material Science defined to Metal Forming, Material Characterization, Surface Technology and Modelling and Simulation. Hereby

Introduction

The Material Science depatment plays a decisive role in the development work to meet the needs of the regional steel and manufacturing industries. For that reason, in addition to the existing Swedish Master’s Program [2], a new International Master’s Program in the field of *Metal Forming and Surface Technology* was adapted successfully in 2010 [3]. The new International Master’s Program is based on applied industrial technologies and research related projects. The courses in the program are composed of lectures, industrial- projects, laboratories and visits. Industrial- projects and laboratories are associated with existing industrial problems and planned future developments.

In addition to that, to fulfil the need of exchange students (Erasmus students) and to fulfil Erasmus Student Mobility Learning Agreement, the department offered advanced level project and research based courses, corresponding to 30 ECTS credits [4].

The Program is open to students with different backgrounds in Materials, Processes and Applications. The programme is designed for students who are interested in continuing to doctoral studies and/or working as project leaders in industrial R&D within the steel industry or in various manufacturing industries. Graduated students from corresponding Swedish Master’s Program, Figure 2, achieved to get qualified engineering jobs in the regional steel and manufacturing industries or PhD positions. In the last 5-6 years, about 95% of graduated students got the mentioned job positions. The new Master’s program is expecting to give similar results and that will give International students good opportunities to get and industrial jobs and PhD positions. Typical job positions for graduate students include Process Development, Forming Specialist, R&D, Technical Support, Mechanical Engineers and Production Control.

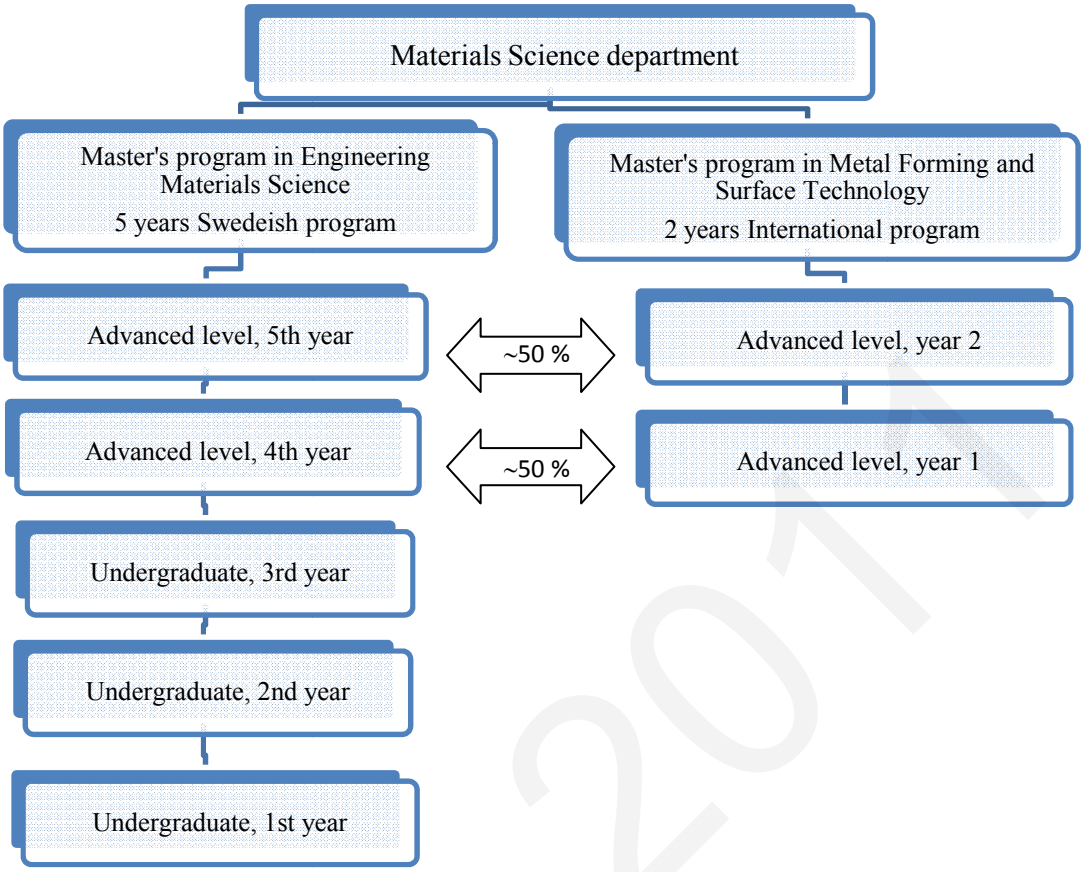

Figure 2: Structures of Master's programs at the department of Material Science at Dalarna University

Procedures

The development of the new International Master's Program initiated by regional steel and manufacturing industries, where reference group from those companies (producers and users) participated actively in shaping and promoting the core subjects of the program. The program is integrated to 50% with the Swedish Master's Program, where the Swedish and international students study together in the same class. This study method gave Swedish students more International experiences. International students benefited too in social and educational integration and got more access in Swedish steel and manufacturing industries. In addition to that, the participation of guest lecturers in the courses helped International students to establish a network with the companies.

Been Sheet Metal Forming as a main forming process of the program, the main reasons of initiating and developing of the program are:

- Fast growing Swedish steel and manufacturing industries and Swedish steel industries' quick recovery from the global financial crisis
- Increased recruitment due to high retirement in the companies and training and recruitment young engineers
- Specialization and niche marketing of special products, formed with Advanced Sheet Metal forming processes, among others Roll forming and Hydroforming processes
- Geographical benefits, where the leading Swedish steel and manufacturing industries are situated in Dalarna and neighbouring municipalities [1], Figure 3
- Flexible study, retraining industry employees' by adjusting some courses in the program as net-based courses, making them more accessible for those working in the industry who choose to take the whole programme or individual courses only.
- Partnership with trade & industry and community

Concerning flexible study or web-based study, the web-based distance learning allows employees in the mentioned companies to study in their free time and improve their knowledge in Materials Science. Dalarna University use advanced web tools to deal with the Web-based study [5], among others; Connect (meeting platform for teachers and students online), Fronter (online learning platform), Videochat (attend lectures that are broadcasted live while chatting with classmates) and iTunes-U.

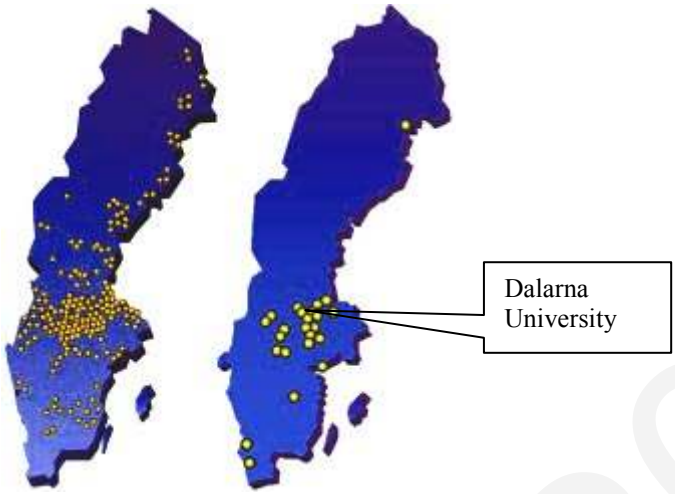

Figure 3: Localisation of the Swedish steel industries, the left shows the extension of the steel industry in 1850 while the map to the right its extension today [1]

Results and Discussion

The adaption of the new Master's Program in the field of Metal Forming and Surface Technology attracted students from different parts of the world; Asians, Africans and Europeans. Due to 50 % of the courses are taken together with the Swedish Master's Program, the international students got good chance to integrate easily to the Swedish society and to exchange experience with Swedish colleagues. Using advantages of guest lecturers from companies and industrial laboratories and visits, international students could establish good contacts with Swedish steel and manufacturing industries. Those networks expected to give qualified jobs in steel companies and or some PhD positions at the department.

As most of Asian education systems are much more theoretical, the courses in the program which is based on practical applications, helped international students to develop their skills of implementation and to realize the potential competence and competitiveness of the steel industries.
From companies' perspective, the companies got great opportunities to observe the potential of International students and to cover their need to solve their engineering problems in the field. This new challenge gave department to broaden opportunities for undergraduate, postgraduate and research education efforts and recruiting PhD candidates.
The planned web-based courses (distance courses), which is the reflection of the campus courses, can also give good opportunities for companies to retraining and develop their employees and to keep pace with the new developments in the field.

ABSTRACT

This study proposed a novel instructional approach, a two-stage LED simulation of Project-based learning (PBL) course with online peer assessment (OPA), and explored how to apply OPA to the different structured levels of a problem in a PBL course to enhance students' professional skills in LED design as well as meta-cognitive thinking. The participants of the study, 73 junior students were divided into two groups, OPA group (with OPA) and Traditional group (without OPA). The evaluation results were listed as follows. (1) Most students agreed that the two-stage LED simulation of PBL course was challenging and interesting and they learned useful things from the course. (2) OPA group performed better than Traditional group in concept clarification. (3) As for the enhancement of LED design skills, OPA group performed better than Traditional group in structured problem solving yet in ill-structured problem solving. (4) OPA group benefited in inquiry learning and reflective thinking abilities cultivation.
Keyword: Project-based learning, Online peer assessment, Problem structure, Meta-cognitive thinking.

INTRODUCTION

The application scope of LED devices has widened recently. Taiwan has gained the second largest market share in the global LED market since 2002 and its market size for LEDs will be NT$540 billion in 2015 (Huang, 2009). Efficiently fostering LED device design professionals has become an issue in higher education to meet the growing demand for the engineers in Taiwan's LED industry. For a student in higher education to successfully completing a LED design requires prior knowledge of semiconductor physics, quantum mechanics, optoelectronics, and material science. Universities need to offer an interdisciplinary curriculum that combines theory and practice to engage students in authentic real-world tasks and to develop their skills in problem solving (Macías-Guarasa, Montero, San-Segundo, Araujo, & Nieto-Taladriz, 2006).

Project-based learning (PBL), a student-centered teaching approach, enables students to integrate their knowledge, skills, values, and attitudes and to construct knowledge through a variety of learning experiences (Maskell & Grabau, 1998). Students deal with interdisciplinary issues as well as pursue solutions to a problem by asking and refining questions, debating ideas, making predictions, collecting and analyzing data, drawing conclusions, and communicating their findings to others (Macías-Guarasa et al., 2006). Moreover, with the assistant of computer simulation technology, the strength of PBL has been highly enhanced for the decades. Simulation-assisted learning (SAL) can help students understand the real world, be able to explore and test hypotheses, and come to a reasoned explanation of the phenomenon in question (Lunette and Hofstein, 1991; Stern, Tao, Yarbrough, Rothmayer, Rajagopalan, Otta, Caughey, Bhaskaran, Smith, Hutchings, & Moeykens, 2006). Furthermore, the time and cost required for the development of the products can be markedly reduced by the elimination of unnecessary trial fabrications (Yaeger, Halamek, Coyle, Murphy, Anderson, Boyle, Braccta, Mcauley, Sandre, & Smith, 2004; Chang, Chen, Kuo, & Shen, 2010). Nevertheless, some studies have revealed that the simulation itself cannot provide an abundant learning environment and that one-on-one simulation-based instruction cannot enrich knowledge acquisition (Rieber, & Parmley, 1995).

Peer assessment recently has often been applied as an alternative assessment method in many different fields, (Strachan & Wilcox, 1996; Falchikov, & Goldfinch, 2000). In the process of peer assessment, students are able to evaluate and learn from peers' work and comments, then work with self-comparison; discover the shortcomings of their own work, and determine the right way to improve their works (Topping, 1998;

McGourty, 2000). Thus, the process enhances students' meta-cognitive understanding about their own learning process (Wen & Tasi, 2006); and develops their social and transferable skills (Topping, 1998), and helps them to clarify their misconceptions.

With the vigorous development of information networks, online peer assessment (OPA) has been a success, providing a more comfortable learning environment that is free from geographic and time constraints, and that allows participants to work and be graded anonymously (Davies, 2000; Tsai, Liu, Lin, & Yuan, 2001; Freeman, & McKenzie, 2002;). Many studies have focused on the factors affect the performance of OPA, including the number times of OPA (Tsai, Liu, Lin, & Yuan, 2001), students' perception about PA (Wen, & Tasi, 2006), teachers' perception about PA (Wen, , Tasi, , & Chang, , 2006) and providing the prerequisite instruction and training of OPA for students before conducting OPA (Orsmond & Merry, 1996). However, few literature deals with how OPA works in different structured levels of problems in a PBL course which could be an important guidance for teachers to successfully implement OPA in PBL.

This study proposed a novel instructional approach, a two-stage LED simulation of PBL course with OPA to enhance students' learning performance in LED design. Moreover, the study explored how to apply OPA according to the level of structured problem in a PBL course to enhance students' meta- cognitive thinking. Knowledge maps, a photonics scoreboard, and the Constructivist Project-based Learning Environment Survey (CPLES) (Chang, 2006), quantitative research approach, were conducted to demonstrate the effects of this learning course. Furthermore, an in-depth-interview, a qualitative research approach, was used to gather an in-depth understanding of students' behavior and the reasons that govern such behavior. The study addressed the following research issues. (1) The effect of OPA upon concept clarification. (2) The effect of OPA upon enhancing LED design skills in structured problem solving. (3) The effect of OPA upon enhancing LED design skills in ill-structured problem solving. (4) The effect of OPA upon attitude toward PBL.

Two-stage LED simulation of PBL course with OPA

According to the theories of constructivism (Honebein, 1996; Wilson, 1996; Tsai, 1998; 2000) and cognitive load (Sweller, Van-Merrienboer, & Paas, 1998), the two-stage LED simulation of PBL course with OPA was developed to enhance students' professional skills in LED design as well as meta-cognitive thinking. The computer simulation software, APSYS, developed by the Crosslight Software Inc., Canada, was adopted in the PBL course. To achieve the above objectives, the LED simulation of PBL course was divided into two stages. The first stage aims to help students learn the operation of APSYS and realize the concept of the active region and how parameters influence an LED. Thus, the project at the first stage was developed as a well-structured problem which was easier for students to solve. The goal of the second stage was to help students realize that several parameter settings could achieve the development goal for the given wavelength, current, and power. Students should find an optimal solution among these parameter settings. The project at the second stage was developed as an ill-structured problem which provided more challenge for students to overcome.

Figure 1 shows the LED simulation of PBL with OPA. First, the instructor assigned a project to all the teams. Second, the students discussed this between themselves and researched information online and in textbooks or technical journals to form their initial ideas. Third, students performed simulations to clarify their concepts. In this step, the teammates were expected to produce a solution to their set project following the simulation. In the fourth step, students checked if their solutions met the aim of the project. Students who had met the objective at this stage finished the simulation. Students who had not achieved the project goal were required to repeat steps 3–5. Repeating steps 3–5 helps students to build their concepts of the operating principle of LEDs. In the sixth step, all teams compared their results when they had achieved the objective. The team online PA step enabled the students to examine each others' results to understand how to gain better results by using different parameters.

Online peer assessment

In the online PA system, there were two kinds of identities: teacher (administrator) and student. Figure 2 showed the OPA system provided teacher with the mechanisms to control and manage OPA process. The functions of OPA system provided for the student's were to upload their homework, assess each other, and provide suggestions about others' projects. The study conducted OPA three times. Only the last two scores were adopted as the evaluation, since the first one was given to students as the OPA training to ensure its validity.

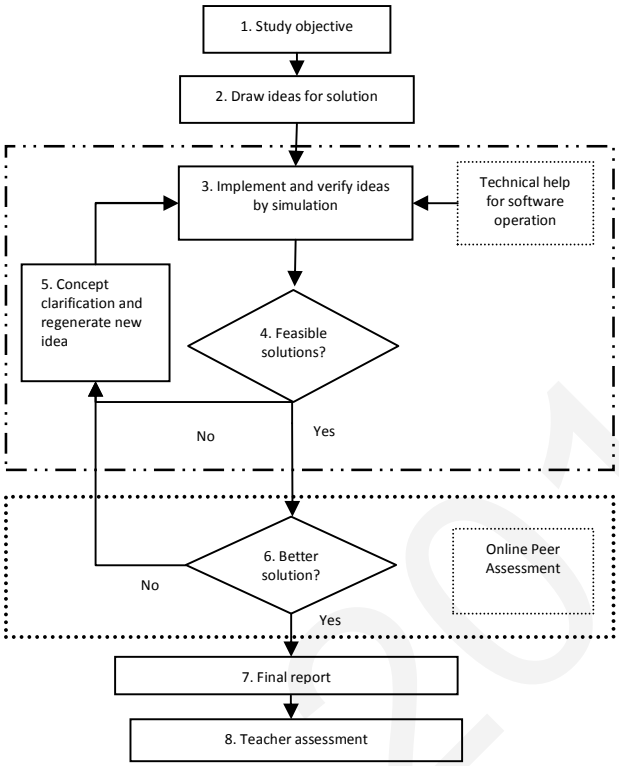

Figure 1. Process of simulation-based learning with online peer assessment

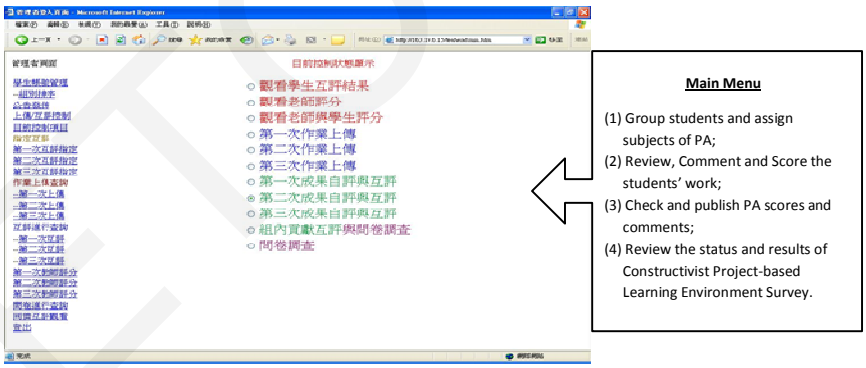

Figure 2. Administrator control interface of OPA

METHOD

Participants

The participants of the study were 73 junior students of two classes, the Department of Physics, National Changhua University of Education, Taiwan. This instruction was implemented in a one-semester Experimental Physics.

Experimental design

The 73 junior students were divided into two groups. One group was labeled as "OPA group" (with OPA); the other was labeled as "Traditional group" (without OPA). In addition to learning the operating principle of LEDs by SAL, the teams of OPA group were requested to review the other three teams' projects and give review comments twice at each stage. Therefore, each team received review comments from three teams to

help clarify their concepts and correct the parameters of their LED design. The teams of Traditional group learned the operating principle of LEDs only by SAL and worked on the project without OPA.

Evaluation tools

As mentioned, the study measured students' knowledge, skill, and attitude in terms of three evaluation tools, a knowledge map, a photonics scoreboard, and the CPLES, respectively.

The knowledge map was adopted to evaluate the students' understanding of the principles of LED operation. In the project-based instruction procedure, students were required to present their concepts of the LED via a knowledge map both before and after the course to examine whether the OPA helped them improve their understanding of the concepts of the LED. An expert in the department of Physics, National Changhua University of Education, graded the students' knowledge maps based on the linkages between concepts. A correct proposition scored one point and an incorrect proposition scored zero points.

The study created the photonics scoreboard, built on an internet platform, for peer and expert assessments. The photonics scoreboard had five rating items: the accuracy of device structure, originality, parameter adequacy, device performance, and device applicability. Each item was scored on a scale of 1–6 points. Moreover, the scoring system provided reviewers with an open-ended column in which they could make review comments to peers' work. Students could learn from peers' work and comments, and then improve their works.

The CPLES was adopted to investigate the students' attitude towards the PBL environment. Students were surveyed with the CPLES, a 5-point Likert-scale questionnaire (1 = strongly disagree, 5 = strongly agree), as shown in Table 1. In analyses of the reliability and of the exploratory factor of the CPLES, the Cronbach α for the whole instrument is over 0.95, and the amount of explained variance is over 62% for each field test (Chang, 2006). Both figures were high enough to demonstrate that CPLES can be applied to assess the students' attitude.

Table1: Items for each sub-scale of the Project-Based Learning Environment Survey

Questions for each sub-scale
Upon completion of the project-based learning course, please answer the following questions.
Inquiry learning sub-scale - I had the opportunity to: 1. Conduct research to find the answers to questions. 2. Conduct research to verify my ideas. 3. Proceed with further research to solve new problems. 4. Design/develop research methods by myself. 5. Collect data, analyze data and present the report.
Reflective learning sub-scale - I had the opportunity to: 1. Reflect on how I learn things. 2. Deliberate upon my thoughts in detail. 3. Learn how to become a better learner. 4. Present my areas of uncertainty. 5. Criticize my own research results.
Teamwork sub-scale - I had the opportunity to: 1. Use the information provided by group members to solve problems. 2. Contribute to the group goals. 3. Help other group members with their work. 4. Be a leader to teach other group members. 5. Exchange and share information or opinions with other students. 6. I loved working with my teammates.
Creative problem solving sub-scale - I had the opportunity to: 1. Detect errors and confirm that they were properly corrected. 2. Propose my own creative ideas. 3. Apply my creative ideas into designs or assigned tasks. 4. Evaluate all the possible solutions to problems.
Open-endedness sub-scale - The teacher let us: 1. Design methods for problem-solving by ourselves. 2. Present our own project proposals. 3. Use various types of data to solve the same problem in different ways. 4. Study the particular problems of our own that interested us. 5. Decide how to proceed with our project. 6. Solve problems from various perspectives.
Authenticity sub-scale 1. The problems met in this project indicate the complexity of practical problems. 2. The information presented in this project is relevant to authentic real-world problems. 3. The knowledge and experience provided by this project are relevant to authentic real-world problems. 4. The problems in this project are derived from practical problems in authentic real-world tasks. 5. Upon the completion of this project, I fully understood its objective and the subject matter.

Experimental procedure

Figure 3 shows the procedure of the PBL with OPA. The analysis of the evaluation data were listed as follows.

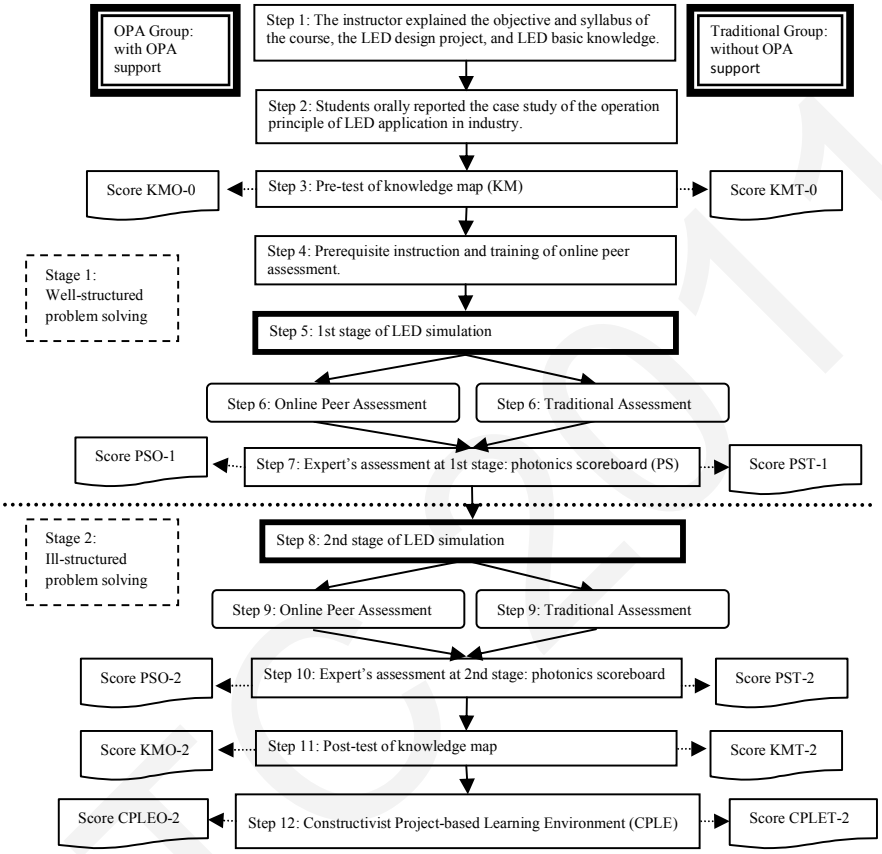

Figure 3. Procedure of the project-based course with online peer assessment and related evaluations

RESULTS

Effect of OPA upon concept clarification

In order to determine if these two groups had the same levels of knowledge on the principles of LED operation before OPA treatment, a t-test of independent samples on the scores of knowledge map pre-test for these two groups (scores KMO-0 and KMT-0) was performed. Since the Levene test on homogeneous variance is not significant ($F = 0.014$, $p = 0.908$), the t-test on the scores of pre-test could be proceeded with and the results were listed in Table 2.

Table 2: t-test of the pre-test knowledge maps for OPA group and Traditional group

	N	M	S.D.	t value	P
Knowledge map pre-test of OPA group	37	2.78	1.456	1.864	0.067
Knowledge map pre-test of Traditional group	36	2.08	1.746		

* p<0.05, ** p<0.01, *** p<0.001

The pretest result revealed that these two groups had similar levels of knowledge on the principles of LED operation before proceeding with the project. To determine if the effect of OPA upon concept clarification worked significantly, the Levene test on homogeneous variance was adopted firstly ($F = 3.965$, $p = 0.050$), and

the t-test on the scores of knowledge map post-test for these two groups (scores KMO-2 and KMT-2) were listed in Table 3.

Table 3: t-test of the post-test knowledge maps for OPA group and Traditional group

	N	M	S.D.	t value	p value
Knowledge map post-test of OPA group	37	5.16	1.21	3.767*	0.000*
Knowledge map post-test of Traditional group	36	3.69	2.03		

* p<0.05, ** p<0.01, *** p<0.001

The t-test result revealed that the scores of OPA group on knowledge map post-test is significantly higher than those of Traditional group, which means the effect of OPA upon concept clarification worked significantly.

Effect of OPA upon enhancing LED design skills in well-structured problem solving

To determine if the effect of OPA upon enhancing LED design skills in well-structured problem solving worked significantly, the Levene test on homogeneous variance was adopted firstly (F＝1.132, p=.291), and a t-test on the expert's assessment scores of photonics scoreboard on well-structured problem solving for these two groups (score PSA-1 and PSB-1) were listed in Table 4.

Table 4: t-test of the expert's assessment scores on well-structured problem solving for OPA group and Traditional group

Well-structured problem solving	N	M	S.D.	t 值	p value
Expert's assessment scores of photonics scoreboard for OPA group	37	21.73	1.503	5.136***	0.000
Expert's assessment scores of photonics scoreboard for Traditional group	36	20.03	1.320		

* p<0.05, ** p<0.01, *** p<0.001

The t-test result revealed that the scores of OPA group on photonics scoreboard is significantly higher than those of Traditional group, which means the effect of OPA upon enhancing LED design skills in well-structured problem solving worked significantly.

Effect of OPA upon enhancing LED design skills in ill-structured problem solving

To determine if the effect of OPA upon enhancing LED design skills in ill-structured problem solving worked significantly, the Levene test on homogeneous variance was performed (F＝2.037, p=.158), and a t-test on the expert's assessment scores of photonics scoreboard on ill-structured problem solving for these two groups (score PSO-2 and PST-2) were listed in Table 5.

Table 5. t-test of the expert's assessment scores on ill-structured problem solving for OPA group and Traditional group

Ill-structured problem solving	N	M	S.D.	t 值	p value
Expert's assessment scores of photonics scoreboard for OPA group	37	21.86	.585	-1.029	.307
Expert's assessment scores of photonics scoreboard for Traditional group	36	22.00	.535		

* p<0.05, ** p<0.01, *** p<0.001

The t-test result revealed that there is no significant difference between the performance these two groups, which means the effect of OPA upon enhancing LED design skills in ill-structured problem solving did not work significantly, though it did in well-structured problem solving.

Effect of OPA upon attitude toward PBL

To determine if the effect of OPA upon attitude toward PBL worked significantly, a t-test on CPLES for these two groups (scores CPLEO-2 and CPLET-2) were listed in Table 6.

Table 6: t-test of the scores in Constructivist Project-based Learning Environment Survey for OPA group and Traditional group

sub-scales	A N=35		B N=30		t-test	
	M	S.D.	M	S.D.	t	p value
Inquiry learning	3.70	0.41	3.42	0.53	2.435	.018*
Reflective learning	3.81	0.41	3.60	0.38	2.142	.036*
Teamwork	3.93	0.40	3.77	0.46	1.461	.149
Creative problem solving	3.71	0.57	3.64	0.49	.494	.623
Open-endedness	3.62	0.69	3.62	0.56	.015	.988
Authenticity	3.54	0.54	3.51	0.60	.257	.798

The t-test result revealed that the scores of OPA group on the subscales of CPLES, inquiry learning and reflective learning, were significantly higher than those of Traditional group, which means the effect of OPA upon enhancing students' inquiry learning and reflective learning worked significantly better. For the rest subscales, there is no significant difference between these two groups.

Interview results- qualitative feedback

In order to gather an in-depth understanding of students' behavior and the reasons that govern such behavior, we collected the feedback from the final project presentations of each group and then conducted an in-depth interview with them after the presentation. The interview were recorded and encoded. S1 represents the interview results with OPA group, S1-1 represents the interview with the number one team of OPA group, and S2 for Traditional group, and so on.

Students' opinions on online peer assessment

S1-1: Comments and advice from others is helpful to refine our work, but assessing other's work is even more important and we learn more.

S1-3: We could learn useful knowledge and practical skills from this interesting course. At the beginning, we do not know how to review other's work…we were not sure if our suggestions is correct or not, but after two or three OPA experience, we had more confident when rating our peer.

S1-4: Although the figure did not match the requirement at the first try, we adjusted the parameters according to comments from classmates, and the results were better.

S1-6: According to the simulation results and online PA, we could summarize the regulation of parameter adjustment, and generalize the operating principle of LEDs.

Students in OPA group considered that OPA helped them improve their works effectively. Students of the first, third, fourth, and sixth teams agreed that OPA could help them to modify their works by taking others' comments. However, some complains which could be a valuable reference to improve the implementation of OPA in PBL were listed as follows.

S1-2: Because we had too much subjects to learn in this (junior) year, we could not do our best in this course especially in OPA. Besides, we needed to start preparing for the entrance examination of graduate schools at this year.

S1-5: Most of the review comment worked well, but sometimes it failed and misled our focus on problem solving. We doubted that some reviewers tried to give wrong comment purposely for the sake of getting competitive advantages.

S2-12: We always waste much time in adjusting parameters by guessing. When you adjust a new parameter, you have to rerun this program and it took a long time.

Students' opinions on two-stage LED simulation of PBL course

Some comments were made by Traditional groups.

S2-1: The two-stage LED simulation of PBL was interesting yet challenging. We learned useful things from the course.

S2-2: At the very beginning, we felt excited while we knew this PBL course would be provided for us at this semester, but we are frustrated to design LED by guessing the parameters. We are not used to this course; we have no idea how to adjust the parameters from the huge scope of numbers.

S2-3: We suggest that the teacher give us more references so that we could use them to optimize our parameters.

According to the interview results, we discovered that students of both Traditional and OPA groups were not used to such instruction and they could not learn independently and actively, which could be the problem for most of students in Taiwan. Some of them also demonstrated a lack of self-confidence when rating their peer, which is similar to the previous studies (Orsmond & Merry, 1996; Sullivan, Hitchcock, & Dunnington, 1999). Students thought that failure caused frustrations and cost too much time. The second and sixth teams of Tradition group indicated that this course differed from those they had taken previously, so they feel excluded and frustrated. Furthermore, students hoped that the teacher could provide more knowledge and hints about the parameters of LED; the students showed an over-reliance on books as well as teacher's assistance, and were not able to search for information actively. Furthermore, their first priority was passing the entrance examination of graduate schools to fulfill with the expectation from their parents or society. Therefore, they push themselves very hard to learn effectively and prevent from making any "try and error" which could be harmful to enhance their meta-cognitive skills and self regulation learning.

CONCLUSIONS

The study addressed and explored how to apply OPA according to the structured level of a problem in a PBL course to enhance students' professional skills in LED design as well as meta-cognitive thinking. The

evaluation results elicit some relevant facts:

(1) Most students agreed that the two-stage LED simulation of PBL was challenging yet interesting and that they learned useful knowledge and practical skills from the course.
(2) OPA group performed better than Traditional group in concept clarification.
(3) As for the enhancement of LED design skills, OPA group performed better than Traditional group in structured problem solving; there is no significant difference between the performances of these two groups in ill-structured problem solving.
(4) OPA group benefited in inquiry learning and reflective thinking abilities cultivation.

Most students of OPA considered the PBL course with OPA to be an effective tool in understanding operating principle of LEDs and clarifying concepts which were similar to the studies of Topping (1998), and Wen & Tsai (2006). However, the OPA did not work significantly to enhance the students' professional skills in LED design as well as meta-cognitive thinking in ill-structured problem solving.

Skill acquisition is a process of procedural knowledge learning and automation in domain-specific knowledge. Practice and feedback as well as analogies were helpful for students to combine the practical skills with procedural knowledge (Gagne, Yekovich, & Yekovich, 1993). However, it should be noted that practice in skills to achieve proceduralization should not be overemphasized. Over-automated basic skills, which might cause the "set effect/Einstellung effect" and make learner become inflexible to deal with novel/ill-structured problems, is harmful to skill learning and skill transfer (Luchins, 1942; Gagne, Yekovich, & Yekovich, 1993). The mechanism which allows the first schema activated by familiar aspects of a problem to control the subsequent direction of attention may contribute to a wide range of biases in expert thought – from confirmation bias in hypothesis testing to ignore results that do not fit their favored theories (Bilalic, McLeod, & Gobet, 2008). Moreover, the quality of problem definition determined the quality of the solution (Getzels, 1975). In the study, some teams of OPA group were misled in the wrong direction on problem definition or solving which were suggested by peer reviewers.

Some students commented that they learn slowly and they need more time to get the project down. Wallas (1926) pointed out that a creative problem solving process involves four-stage-- "preparation," "incubation," "illumination," and "verification" which all took time and required learner to be more patient to implement. Therefore, the above issue required more precaution when the course were developed and implemented.

Limitations

Even though a rigorous research procedure was used, this work has some imitations that could be addressed in future studies. First, a quasi-experiment design was adopted without detailing the individual difference of learners. Individual difference variable, such as learning style, could be a direction for future study. Second, the findings and implications are obtained from just one study that examined a particular computer simulation software (ie, APSYS) and targeted a specific group in Taiwan. Thus, caution must be taken when generalizing our findings and discussion to other educational technologies or groups. Third, the students in Taiwan have unique value and behavior patterns, such as they had different definition on learning achievement and their first priority was to pass the entrance examination. Therefore, a cross-cultural validation using another large sample gathered elsewhere is required for further generalization of our findings.

PROSPECTIVE SPECIAL EDUCATION TEACHERS' UNDERSTANDINGS OF TECHNOLOGY AND ITS USE IN INTERVENTIONS FOR CHILDREN WITH AUTISM

Esra Macaroglu Akgul
Sakarya University

Abstract

Autism and technology use are the two basic concepts examined in this research study. Autism is a pervasive developmental disorder which causes deficits in social interaction. Individuals with autism sometimes may not be able to talk or may choose not to talk. Therefore; there needs to be some other ways to communicate with children with autism. Presently, technology, specifically educational technology comes to the scene to help this communication problem. Individuals' definitions of technology may confuse with their definitions of science. Although technology is neither the same nor the product of science, people sometimes use these terms interchangeably. Children with autism, as well as other special needs children, need highly qualified teachers to help them communicate the world. Based on the explanations above, this research study examines prospective special education teachers' understandings of technology and its use in interventions for children with autism. Thirty prospective special education teachers from a big scale university located in Marmara region participated in this research study. Data were collected through a questionnaire developed by the researcher and a series of semi-structured interviews. Questionnaire includes open-ended questions to examine participants' understandings of autism, technology, and use of technology in interventions for autism. Interviews are also structured around these three issues. Data gathered from questionnaire and interviews were analyzed qualitatively. Open coding is used in the analysis part. Based on the analysis, three assertions about participants' understandings of autism, technology, and the use of technology for autism were generated and presented in the paper.

Key words: autism, technology use in special education, prospective special education teachers

Introduction

The National Autistic Society (NAS) in the United States is among the most prestigious institutions for autism throughout the world. NAS (2000) addressed the following difficulties as the impairments for children with autism: difficulty with social relationship, difficulty with verbal, non-verbal communication, and difficulty in the development of play and imagination. Additionally, there could be repetitive and stereotypical behavior patterns and resistance to change in daily routine. Schlosser and Blischak (2001) reported the estimation of various studies that 25% of 61% of children with autism remain essentially non-speaking. This estimation underlines the importance of finding communication ways other than speaking. Dautenhahn (2000) discussed two ways of connecting individuals with autism to non-autistic world. One way of communication is to teach individual with autism necessary skills to survive in the world outside. The other way is to let them live in their own world which will make

them happier. Before making a choice, it is important to understand what autism is and how these people feel.

One of the ways to understand how they feel about the world and people is to use an interactive technology in education and rehabilitation of individuals with autism. Using more interactive rather than remote-controlled technology for rehabilitation is a recent approach for communication. In this approach, learning about social-emotional cues of children with autism is supported by technology embedded to instruction (Dautenhahn, 2000).

Goldsmith and LeBlanc (2004) mention about several research studies investigated diverse applications of technology-based interventions for children with autism. These diverse applications include two types of designs. Some interventions are designed for indefinite use and they are called assistive technology, like augmentative communication devices, and some are designed for a specific purpose and once the purpose is reached the intervention, temporary instructional aid, is removed. This second category includes tactile and auditory prompting devices, video-based instruction and feedback, computer-aided instruction, virtual reality and robotics.

Mirenda (2001) provided a review of the empirical literature on the number of topics related to Augmentative and Alternative Communication (AAC) and assistive technology used in supporting communication and learning of individuals with autism. In this review, it was argued that AAC interventions included wide range of strategies whose common goal is either to help in communication with others or to understand communication from others. These strategies could be classified support for input and support for output. Input strategies might include schedules, visual symbols for choice making, and aided language stimulation. Stromer, Kimball, Kinney, and Taylor (2006) identified activity schedules, which mentioned in Miranda (2001), as the means of promoting independent execution of previously learned responses by using mostly pictures. Stromer et al (2006) report preliminary studies illustrate how activity schedules delivered on the computer may engender new learning with the use of videos, sounds, dialogues, images and the words as instructional stimuli. Computer activity schedules might be used to teach academic skills like reading, writing and math. Stromer et al (2006) also reported a research study in which a computer program made in power point was used to teach a seven-year old girl with autism. They also proposed that money and number skills might also be taught as tasks embedded in computer activity schedules.

Output strategies might include visual-spatial symbols, picture exchange communication system (PECS), and functional communication training. Mirenda (2001) also emphasized VOCA, which was a portable, computerized device to produce synthetic or digitized speech output when activated, and an empirical study to demonstrate the potential use of VOCA to support the communicative interactions of children with autism. Schlosser and Blischak (2001) also talk about the empirical studies in which teachers' and unfamiliar persons' ratings about children's VOCA communication. Ratings provided social validation support for contextual appropriateness of VOCA.

Although VOCA and PECS are both output strategies, VOCA is a pointing-based system, whereas PECS is exchange-based system.

Other than teaching academic skills, Schreibman, Whalen and Stahmer (2000) investigated the use of video priming to reduce disruptive transition behavior in children

with autism. This is another example for the use of technology in teaching children with autism.

Lastly, collaborative virtual environment (CVE) is another use of computer technology for people with autism. Moore, Cheng, Mc Grath and Powell (2005) designed an empirical study to determine if children with autism could understand basic emotions by interacting with collaborative virtual environment. CVE is a software program designed to evaluate participants' ability to identify and make inferences from facial expressions.

The review of the literature cited above displayed that technology use in interventions for children with autism is not new in Europe and US. Although the number of people with autism is increasing rapidly in our country, there is a limited number of research study focused on different interventions to teach social and academic skills to children with autism. The use of technology, specifically computer technology, is a new concept for professionals and academicians in Turkey. Therefore; this research study is focused on prospective special education teachers' understandings of technology and its use in interventions for children with autism. Following research questions were investigated in this research study:

1. What is participants' understanding about autism?
2. What is participants' understanding about technology?
3. What is participants' understanding about use of technology in interventions for people with autism?

Method

Research Participants:

Research study is designed in a qualitative manner. The researcher is an instructor in the elementary education department of a faculty of education located in Marmara Region, Turkey. Research participants were students of special education department of the university in which the researcher was working. Thirty prospective special education teachers, at their sophomore level, were participated in this research study. The research participants were attending a course named "teaching science for special education children" and instructed by the researcher.

Data Collection:

Data collection process took place within the framework of the course mentioned above. A questionnaire designed by the researcher and semi-structured in-class interviews were data collection techniques used in this research study. The questionnaire includes seven open-ended questions to examine participants' understandings of autism, technology and use of technology in interventions for autism as described in the research questions above. Interviews were also structured around these three items.

Data Analysis:

Data gathered via questionnaire and interviews were analyzed qualitatively. First; participants' responses to each item in the questionnaire were open-coded separately. Open coding of the responses to seven questions resulted in three categories: autism, technology, technology use in autism. Then, in-class group interviews were open-coded and codes from interviews were used to support the three categories cited above. The researcher generated three assertions based on these categories. These assertions are presented in the findings and conclusion section below.

Findings and Conclusion

The research questions were revisited and assertions related to research questions were generated at the end of data analysis. In the section below, each research question identifies an assertion. Each assertion explains how participants responded to research questions.

Assertion 1a): how participants define autism:

Prospective special education teachers define autism as a developmental disorder which shows itself generally with the lack of social communication skills and limited language use before age 3.

Almost all participants defined autism as a developmental disorder. Following excerpts from questionnaire and interviews illustrate examples to their definitions.

"…is a social developmental disorder which limits the social communication skills of the individuals…" (Q1).

"…it [autism] occurs before 3 years-old. Sometimes language does not develop.." (Q2).

Following excerpt from interview support the excerpts from questionnaire above.

"…well…it [autism] is a disorder which prohibits to communicate with others…I think…it must be either before age 3 or around 3 I think so.." (I3).

Although most of the participants define autism as developmental disorder, only one used the term illness for the definition of it.

"[autism] is an illness then there is no recovery for it.." (Q5).

A literature review focused on people's definition of autism support data for both of these ideas. Broderick and Ne'eman (2008) worked on autism as metaphor in their research study. They reported two metaphors consistent with our research participants' definitions: "autism is being different" and "autism is an illness". First metaphor put emphasis on the differences among people and counts this developmental disorder as a difference. This metaphor was created by people with autism. The second metaphor counts autism as an inborn illness and created by people without autism. Broderick et al (2008) defined autism as decreasing the communication with people and the world outside and start to communicate with the self.

Assertion 1b): symptoms of autism:

Prospective special education teachers cited lack of speech, eye contact, and imitation skills among the symptoms of autism as well as citing no reflection to their names when called, stereotypical hand motions and attention deficits.

All research participants were aware of the basic symptoms of autism as cited in the assertion above. The following excerpt displays the point.

"…[their] attention span is too short, there are lack of eye contact, lack of speech and they cannot imitate what you do…even if you call their names, they do not look at you…" (Q27).

The following excerpt from interviews supports the issue above.,

"I know people with autism cannot develop eye contact with the others and they have limited language ability…..they make something typical with their hands…stereotypical I think…" (I5).

Special education departments are not the places which were facilitated to raise teachers for people with autism. Although it is the case, prospective special education teachers participated in this research study, have adequate understandings about autism and its symptoms.

Assertion 2: how participants define technology:

Prospective special education teachers define technology as devices helping people to reach the information resources and making life easier.

The word technology makes participants to think about computers, TV, video and overhead projectors. Therefore; it can be concluded that participants have very limited understandings about what technology is. They also cited some devices like audiometers, machines for magnetic resonance among the technology used in medicine. Followings are the excerpts supporting their understandings about technology.

"…[technology] is designed with the purpose of making life easier for human being…" (Q13).

"…[technology] helps us to reach resources of information…TV, computers, overhead projectors are the technologies in education" (Q22).

"..audiometers, tomography devices, MR devices are examples of technology in medicine I think…nothing for education I know other than computers and videos…" (I3).

Three excerpts presented above display participants' limited understandings about technology. Technology needs not to be an electronical device as participants emphasized. This is consistent with what Aydin and Tasar (2010) argue about the prospective teachers' definitions of technology. Functional definition of technology is "changing natural world to fulfill our needs" (Aydin, Tasar, 2010). This definition includes something more than electronic devices and computers.

Assertion 3: what participants know about the use of technology in autism:

Prospective special education teachers do not have adequate information about the use of technology in interventions for children with autism.

Although there is an increasing number of research studies in countries located in Europe and US, as cited in the introduction part of this paper, prospective special education teachers participated in this research study were not well informed about the technology available for people with autism. Only two of the participants emphasized video modeling, voice recording, and activity schedules among the technology used in the interventions for autism as displayed in the following excerpt.

"I attended a seminar a week ago….talked about the activity schedules but I am not sure…" (I7).

"I only know three things, activity schedules, video modeling and recording the voice of person with autism…you can make him to listen to his own voice then…don't know anything else…" (I4)

The excerpts above illustrate these two participants' limited knowledge about technology use. They have heard the names but they did not really understand how it works.

Three assertions for the three categories informed researcher that research participants were good enough in understanding what autism is and what are the symptoms. They do not show the same level of understanding about what technology is and how it is used in autism. Literature review in the introduction part of the paper informs us in dealing with more technology in the interventions for people with autism.

Based on the findings of this research study and literature reviewed, it is necessary to inform instructors and teachers of special education children to use more technology in their teaching process. In the universities, there need to be more courses focused on how to use technology in teaching social and academic skills to children. At the graduate and in-service level, there also need to be in-service training courses and programs designed with the same purpose.

Abstract
In this article, SWOT analysis of reading of Turkish e-book system has been revealed. Reading of Turkish e-book is examined in terms of system availability especially for the visually impaired. Tests and evaluations are implemented using Turkish speech synthesis module which is developed by us.
Keywords: Turkish speech synthesis, e-book, visually impared

1. INTRODUCTION

Speech is one of the methods for providing communication between people. The production process of human speech by an external computer or devices according to the phonetic expansion of text or message is called synthesizing. (DUTOIT, 1997) Speech synthesis can be done by adding audio tracks to each other which is stored in the audio recording database. Phonemes or systems that use audio tracks as phoneme binaries have the opportunity to synthesizing all kinds of words in a small amount of record using lego logic. (DUTOIT, 1996) However, these kinds of synthesis systems are very poor for intelligibility and naturalness. In this regard, the unit selection systems that use longer pieces of audio are used more widely today. (KOMINEK, 2003) (J. ZHANG, 2004).

Turkish studies are still limited even though very large numbers of systems are developed for western languages. MBROLA (DUTOIT, 1996) FESTIVAL (DUBUISSON, 2009) MULTEXT (VERONIS, 1994) GENGLISH (DUTOIT, 2005) HTS (YAMAGISHI, 2007) have been developed for synthesizing more than one language. From these systems MBROLA is adapted for Turkish and a working system is developed. (BOZKURT, B., 2001). Although there has been some works for Turkish there is not a working system.

In this study, triple sounds which is the most frequently used in Turkish and an additive synthesis system which is developed by using double voices that were not covered by triple sounds is used. (YURTAY, 2010)

It is clear that speech synthesize is a critical tool to access to information especially for the visually impaired people. In this context, especially visually impaired people's need for reading book without another person help comes up. Ink printed resources in Turkey are vocalized by volunteer readers and speech synthesizer applications after transmitted to computers via the scanner and they are shared with visually impaired via internet or in CD format by related agencies. The number of resources is very low accessible by the visually impaired people because of resources take more time to be vocalized in this way and also there is lack of human resources need to process voice. On the other hand, the voice recording format (MP3) used for resources makes search and browse the publication complicate for readers. Moreover, access to those resources which are saved in suitable formats for visually impaired is limited because of cost and use of tools for accessing dubbed resources. Increasing the number of

resources which may be accessible by visually impaired who have very limited possibilities for information in current situation and reaching these resources by all the visually impaired in easy and effortless way regardless of socio-economic status is targeted. Reading and access to information is one of the fundamental rights and freedoms for every person. It says that there is large responsibility in governments for the all sections of society benefit from those rights in many declarations on human rights at the international level and in the contract. World Health Organization defines "handicapped person" as individual who has limitation in one or more major life activities (walking, seeing, hearing, speaking, breathing, learning and working) and has physical or mental disorders.

2.DISABLED POPULATION RELATED STATISTICS IN TURKEY

Table 1 – Disabled population related statistics in Turkey (TÜİK,2002)

The proportion of disability, 2002 (A.Total B. Male C. Female)									
	Total disabled population			Orthopedically, seeing, hearing, speaking and mentally disabled population			Population having chronic illnesses		
	A	B	C	A	B	C	A	B	C
Turkey	12,29	11,10	13,45	2,58	3,05	2,12	9,70	8,05	11,33
Age group									
0-9	4,15	4,69	3,56	1,54	1,70	1,37	2,60	2,98	2,20
10-19	4,63	4,98	4,28	1,96	2,26	1,65	2,67	2,72	2,63
20-29	7,30	7,59	7,04	2,50	3,34	1,74	4,80	4,24	5,30
30-39	11,44	10,43	12,42	2,56	3,18	1,95	8,89	7,26	10,46
40-49	18,07	15,15	21,08	2,65	3,29	1,99	15,43	11,86	19,09
50-59	27,67	22,56	32,67	3,23	3,73	2,74	24,44	18,83	29,94
60-69	36,96	31,60	42,02	5,14	5,65	4,65	31,82	25,95	37,37
70+	43,99	39,77	47,77	7,89	8,45	7,38	36,10	31,32	40,39

As shown in Table 1, disabilities in the total population are 12.29% according to the results "2002 Turkey Disability Survey" which was made by Turkey Statistics Institute (TUIK) and with the cooperation of Prime Ministry Administration for Disabled People.

Table 2 - Proportion of disabled population in Turkey, according to the type of disability (TÜİK, 2002)

The proportion of disabled population by type of disability, 2002 (%)					
	Orthopedical disability	Seeing disability	Hearing disability	Speaking disability	Mental disability
Turkey	1,25	0,60	0,37	0,38	0,48
Age group					
0-9	0,64	0,33	0,20	0,46	0,42
10-19	0,77	0,36	0,29	0,43	0,58
20-29	1,21	0,45	0,32	0,42	0,65
30-39	1,26	0,46	0,35	0,31	0,54
40-49	1,39	0,62	0,35	0,26	0,39
50-59	1,79	0,91	0,41	0,30	0,26
60-69	2,80	1,56	0,77	0,41	0,27
70+	3,94	2,98	1,70	0,39	0,31

According to the results shown in Table 2 in the same study, visually impaired population in Turkey constitutes 0.60% of the total population. Cause of visual disability is loss of function in any center which is responsible for visual sense. Eye diseases such as diabetic retinopathy (as a result of lack of blood that

is needed for retina or stuffed blood) and pigment retinitis (caused by deterioration of the retina), cataract (as a result of the loss of clarity in eye lens) may cause vision loss. "Partial sightedness", "low vision", "legally not see/blind" and "totally not see/blind" are terms used in this context for individuals with visual disabilities.

3.CHALLENGES OF DISABLED POPULATION IN TURKEY

The most preferred conducting library services method for the visually impaired in our country is dubbing the resources. Analog recording system had been used until the 2000s; especially the books sung by volunteer readers were presented to beneficiaries in tape format. Librarianship companies offer services for the visually disabled have begun to make new records in digital systems and to digitize existing analog records because of the development and widespread use of digital recording techniques.

Related organizations share dubbed and saved books in MP3 format in CD format or through the internet for beneficiaries. But it is undeniable fact that the target audience cannot be reached yet in desired efficiency and prevalence.

Table 3 – Challenges of visually impaired population in Turkey (TUIK, 2002)

Challenges of Visually Impaired Population in Turkey	Male (%)	Female (%)	Total (%)
Not sufficient audible warning signals in public areas and environmental regulations	35.97	33.83	35.06
Difficulty taking public transport vehicles	32.09	38.28	34.70
Not able to attend social and cultural activities	77.54	51.31	27.07
Negative effects on marital life	16.46	15.61	16.10
Lack of the community help	27.25	27.46	27.34
Lack of facilities provided by the state	51.88	51.18	51.58
Not able to buy tools for diasability	**38.44**	**40.63**	**39.36**
Not enough and widespread of Braille and audio publications	**27.90**	**24.30**	**26.38**

Again the results of Challenges of Visually Impaired Population in Turkey are given in table 3 in the same study. Today, considering the difficulties of people living with disabilities, it is obvious that large part of it is lack of provided facilities and lack of Braille and audio broadcasts.

Today, information technology, the Internet and advances in the field of electronic publishing provide important opportunities to people who cannot benefit from ink-printed sources. For example, a person who is visually impaired if he has the necessary software or hardware and wants to follow a daily newspaper or a magazine monthly If you have Internet broadcast he can easily follow the broadcast by means of screen readers. However, the reasons such as advantage of the high costs for solutions of information technologies to take by people with disabilities, limited of prevalence or such complexity of an important training process is limiting the number of people can benefit from this opportunity.

4. SWOT ANALYSIS FOR READING OF TURKISH E-BOOK

Strengths	Weaknesses
1) Synthesized speech intelligibility is high and expandable by web technology **2)** Advanced algorithms, low hardware requirements and be compatible with emerging mobile technology. **3)** Emerging technologies, compatible with a limited range of application areas to give a high possibility of synthesizing. **4)** Existing technologies use the accumulated resources and adaptability to the technology used. **5)** As a result of work done for other languages of international multi-media document standard (DAISY) should be prepared for and adapted to the Turkish.	**1)** Synthesized speech quality (naturalness) and the desired level synthesis is not required to improve the quality of infrastructure prosodic (duration model, emphasizing the model, intersection and transition models) is not sufficient for studies relating to Turkish. **2)** There is not sufficient study on Turkish phonetic alphabet and therefore initiative failure to meet the desired level. **3)** Synthesis of the model necessary for the creation of the acoustic sound of the database to be used for determining the corpus is difficult. **4)** Describing feelings and the transmission of the synthesized speech technology is not sufficient to reach maturity yet. **5)** Cleaning of irregular corrupted data in existing systems and the processing of the data needed for creation of acoustic models for synthesis to the database bring an intense workload.
Opportunities	**Threats**
1) To gain popularity multi-language translation technologies especially in the field of language to language voice translation and Turkish involvement in this research field **2)** Ink printed on paper can be transferred to electronic media and Turkish synthesizer for the visually impaired to meet the need for applications to be developed in this field. **3)** The increasing popularity of private investment is an important component of speech and language technologies in calls for national and international projects and similarly, the increasing need for applications to facilitate especially the disabled, the elderly and the lives of children in ambient assisted living (Ambient Assisted Living) technologies. **4)** Supporting the right of access to information by laws and "Talking Library" application has been received by the Republic of Turkey Ministry of Culture. **5)** Increasingly widespread use of mobile technologies used in every area of our life and to be a solution for all kind of people with disabilities needs.	**1)** Discomfort of listener because of synthetic speech in long-term and people begin to the reaction to this type of audience. **2)** Mobile technologies copyright problems and usage of pirated products negatively affect the expansion of the e-book industry **3)** Economic difficulties in finding an e-book synthesizers, difficulties of using existing tools and different interest in new technologies because of the challenges of economic, socio-cultural and educational qualifications. **4)** Narrated narrative synthesis expectations change from person to person. **5)** Ambient assisted living technologies are less awareness.

5. CONCLUSION

Social needs met through data with simple, inexpensive and compatible technologies in each electronic area. When the requirements are considered, including the Turkish area of research and synthesized speech intelligibility is high then this study will find a place in the emerging technologies. It can be said that adopted and used these types of studies will be popular via Internet. Spread of the application will be evidence in the right direction.

With respect to widespread social curiosity and hesitation at the beginning of human life into such technologies is examined and then used this situation has been observed to occur as a requirement of the state of need.

Through this application, all kinds in the study with the prosodic infrastructure development and without the time constraint will allow the development of all aspects of synthesized speech.

6. ACKNOWLEDGEMENT

We would like to thank TUBITAK UEKAE Multi-Media Technology Research and Development Lab for providing the database and knowledge-sharing for Turkish speech synthesis module used in this study. In addition, we would like to thank Mr. Ibrahim BİNGÜL who is visually impaired from birth for helping us in the testing phase.

Reviewing MEBBIS As An Electronic Performance Support System

Muhterem Dindar, Anadolu University

muhteremdindar@gmail.com

ABSTRACT

In today's world, the flow and growth of information is occurring so rapid and besides it is exposed to many metamorphoses continuously during this flow. Due to these swift flows and metamorphoses, organizations are facing challenges to organize the exponentially growing and swiftly flowing information and to transfer the information to other novice and even experienced members of itself. To sort out such challenges instructional designs are used for reliable, continuous and systematic transferring of information. But instructional designs should offer efficient and effective solutions in the process of transferring. The offered solutions may not be all consist of conventional instructional methods. Nowadays using non-instructional methods in learning environments are also an effective way of facilitating learning. These methods are categorized under Human Performance Technology concept. And Electronic Performance Support Systems (EPSS) are one of core components in setting up the infrastructure of Human Performance Technology environments. This paper's aim is to review the MEBBIS (Ministry Of Education Information Systems) of Turkey according to the EPSS criteria and features which were derived from Human Performance Technology references.

Keywords: Human Performance Technology, Electronic Performance Support Systems, MEBBIS.

INTRODUCTION

The history of Electronic Performance Support systems goes back to 1980's. "Pioneers of EPSS movement include Barry Raybould, who proposed ways computers could be used to solve human performance problems and Gloria Gery, who coined the phrase "electronic performance support systems"" (Mckay&Wager,2009). As half life of knowledge is decreasing so fast compared to the old times and moreover the knowledge is growing exponentially, it is not easy for organizations to keep their members up to date with the new information related to their duties in a work environment. EPSS was born from the need to organize the knowledge in an organization and make it available to the members just in time as needed. Therefore, EPSSs can be referred as self learning environments supported with computers. With EPSSs workers learn independent of other colleagues and even they can contribute the knowledge base of the system if faced with any new information or a useful experience in performing tasks in a work environment. Gery (2002) states the function of the EPSS as:"In light of data that were recorded before or recorded just in that time, the software might guide users in performing a task, transforming and storing data, and can present alternative interfaces and interactions due to the hierarchies in the organization".

The definition above gives us a general understanding about the EPSS systems. Raybould, states the essential features of EPSS systems more specifically as presented below. According to the "Raybould(1995)'s definition, EPSS should provide integrated access to:

1. Information.
2. Give advices.
3. Provide learning experiences.
4. Have tools for oneself to manage to perform a task with the minimum help of others"(Mckay&Wager,2009).

In this study, the MEBBIS system was reviewed categorically in light of the essential features given above. The study may help to depict the MEBBIS's current state as an EPSS and maybe useful in forecasting the future of MEBBIS as an EPSS.

WHAT IS MEBBIS?

MEBBIS is the abbreviation of Ministry Of Education Information Systems of Turkey. Ministry of Education of Turkey is one of the biggest organizations in the country with its vast number of members and institutions it possesses. It is very crucial for the organization's administrators and members to have immediate access to necessary information to maintain the continuity of tasks and processes in synchronization and harmony. The requirement of synchronization and harmony in processing information has led to the establishment of the first government Information Management System (IMS) system called ILSIS. ILSIS was built by Educational Technologies Department of Ministry Of Education in 1995. Since then, ILSIS was exposed to many transformations and has had its current structure with the name of MEBBIS.

MEBBIS is designed as an online system which can be accessed via the internet and contains many sub-modules that are grouped according to their functions and objectives. Modules are grouped under eight headings. These headings are: MEBBIS Main Menu, Personnel Operations, E-School, E-Graduate, Public Education, Open Education Institutions, E-Dorm and E-Inventory. All sub-modules that are listed under these categories worth studying separately but below, only the content of main headings are given generally.

MEBBIS HEADINGS

MEBBIS Main Menu: Here, the majority of modules are related to the financial issues of Ministry Of Education of Turkey and mostly used by institute managers and directors.

Personnel Operations: The modules in this category are widely used by all members of Ministry Of Education. They contain personnel information such as total years of service, the proceeding of ongoing investigations about personnel's acts and so. Besides working as an information database, the modules under this heading are used for online application procedures like applications of transfer from an institution to another within or out of Turkey and for applications of in service training programs.

E-School: This heading is designed for k12 schools of Turkey. Teachers and directors have direct access to students' personal information databases and are allowed to input and update required fields of these databases. The updated information is seen by other teachers and directors just in time while they are updated. Moreover, the parents are allowed to access to databases and display scores , attendancy reports of their children without waiting the end of term school reports.

E-graduate: The aim of this heading is to provide vocational guidance to the future graduates of primary schools. Tracking the employment statistics of k12 graduates is another objective of the category.

Public Education: With the modules that are listed under this category, The Apprenticeship And Public Education Department follows the online procedures of educating apprentices for private sector and organizing local courses that are open to public.

Open Education Institutes: Online proceedings of open primary and secondary education programs are handled in the modules of Open Education Institutes heading.

E-Dorm. In e-dorm modules, the online tasks of dormitories belonging to primary and secondary schools are performed.

E-Inventory: Institutions keep and report the records of their inventories in e-inventory module.

REVIEWING MEBBIS ACCORDING TO THE ESSENTIAL EPSS FEATURES

EPSS should provide integrated access to information: Gery stresses on the point that the information available to EPSS users should be grouped hierarchically and access to information should be limited according to the users' status in the organization. This protects users from being overloaded by irrelevant information to perform his task (Warshawsky, 2001). It can be inferred that currently MEBBIS

is mostly serving as a system that is providing integrated access to information. System resembles a gigantic database. It groups users accordingly depending on their position in the Ministry Of Education hierarchy. Users' access to information is limited with group policies. Besides, MEBBIS works integrated with the MERNIS which is the Information Management System of Department of Population. In such cases like divorce, death or birth, MEBBIS updates itself simultaneously with MERNIS records. Thereby the personal information of students in MEBBIS is kept up to date all time.

MEBBIS is useful for planning and organizing many events in education. In example; in 2010, a literacy campaign was announced by The Department of Education of Arnavutköy in İstanbul. Because education levels of the parents were recorded in it, MEBBIS helped organizers to identify illiterates in Arnavutköy. Again, names and pages of all books a primary kid reads throughout a year is recorded in the system, and it is possible for Ministry Of Education to calculate how many books are read totally in primary schools of Turkey.

The weak point of the system regarding the given criteria is that it is designed as an information base mostly for high level officials. Students can only use the system to see their exam scores and attendance reports. Teachers are only allowed to see the records of their own classrooms and to display their personal records. There are no information resources which may help teachers in teaching activities. No resources were also identified for training teachers for personal development. It might be useful to add such resources like plans or lesson materials to MEBBIS system to make it appealing for low level officials in Turkish education system.

EPSS Should Provide Integrated Access to Advice: It is hard to say MEBBIS is a well organized advisor in performing tasks. For now, it only gives automated advices when officials are filling online application forms. If an official inputs wrong data or the official is not allowed to do the specific application, he or she is warned and a short advice is displayed on the screen how or what to do complete the application. It is seen that to help officials in performing newly announced tasks, MEBBIS is not used for the distribution of manuals and guides. All departments in Ministry Of Education publish their own electronic manuals and guides via their websites. But joining and publishing all manuals of different departments under MEBBIS roof might be more efficient and effective.

EPDS Should Provide Integrated Access To Learning Experiences: It is inferred that while designing MEBBIS, the main intention was not to provide an environment to facilitate learning of personnel using the MEBBIS. Currently there are no modules serving to facilitate learning experiences. MEBBIS is mostly designed as an information base. But for the following years, it can be expected to integrate learning environments to the system.

As declared by In-Service Training Department of Ministry Of Education, in 2010; 47389 personnel were planned to be trained in in-service training courses. Again in 2010, the average number of course hours per participant was 18 hours and the cost of all courses per participants was 207 TL. (Hizmetiçi Eğitim Daire Başkanlığı, 2011). Currently there are two types of in-service training programs for teachers in Turkey. The statistics are for central in-service training programs in which the participants are accommodated in several cities. Unfortunately; Department of In service Training Department enrolls only a small portion of teachers applying to the courses. Other issue is that teachers are travelling to other cities for the courses and stay away of their classes even for weeks during course times. It is personally witnessed that headmasters of some schools are not approving the application of teacher to online courses because the education in school is pausing. To have an estimate cost of in service training programs of Ministry Of Education, if 207 TL (the cost/participant) is multiplied with 47389(total of participants) the result becomes 9809523 TL. After these calculations some questions may come into mind. Can we give in-service training courses online? What percentage of courses can be given online? If the courses are given online, will the cost/participant decrease? If the courses are given online, will the number of participants taking the course increase? Finding the answers for these questions may help us to decide whether MEBBIS should be designed for facilitating learning experiences in future.

EPSS Should Provide Integrated Access To Tools Help Someone Perform A Task With Minimal Support From Others: One of the aspects what makes MEBBIS so useful for Ministry Of Education personnel is that it has decreased phone calls, one on one meetings, paper transfers and other

communication processes within and among institutions. It seems obvious that the users of the MEBBIS find it time saving and efficient.

Another objective of EPSS systems is to help newcomers in performing their duties fully from the first day they start working in the institution. To manage this aim, it can be expected from EPSS to provide orientation support to new comers. Thereby, the newcomers will not be dependent on other officials to learn their duties and the way the institution works. In MEBBIS, there is no such a service helping new officials to adapt to their institutions. The orientation activities are carried out locally for new officials. In example, the new teachers of a town are gathered at the weekends in a school to take orientation seminars and courses which continue about three months. In short, it would be useful to add such tools that help officials to solve the problems on their own in MEBBIS.

Conclusion

The MEBBIS is evaluated according to the Raybould's EPSS criteria. MEBBIS seems to be short falling to cover the necessities of the criteria "to provide integrated access to a) advice, b) learning experiences, c) tools to help someone perform a task with minimal support from others". On the other hand MEBBIS is quite useful and strong to meet the requirements of criteria that "EPSS should provide integrated access to information base". In future, it is expected to improve the deficiencies of MEBBIS to meet the requisites of all essential criteria that will turn MEBBIS to be a complete EPSS and supposedly make it more efficient and widespread. But even now with its incompetence in some points, MEBBIS is one of the most indispensable tools for the organizations of Turkish education system.

Amjad Khan, Msc.
PSCEMS, King Saud University

ABSTRACT:

Multidisciplinary education attracts the attention of many educators in the health education sector. They look at it as being more effect in concentrating the focus of the different health care professionals involved in the education toward providing real-time, outcome-oriented and problem-based education. It is a platform for the education reliable to prepare mature students for the real world challenges. However, there are many challenges that form obstacles from implementing this efficient paradigm. Among the major challenges, approachability of the different health care professionals particularly in cities with high traffic e.g. Riyadh, represents a debilitating communication difficulty. These problems can be overcome at least partly by inventing several technology-based strategies such as web 2.0 tools, mobile learning and ubiquitous learning. The paper give an overview about how these different strategies can address the challenges facing multidisciplinary education in the health education and assessment.
Review of the literature revealed the value of web 2.0 tools in creating sharing, communication and collaboration attitudes among students under the supervision and mentorship of their supervisors with subsequent evaluation and correction of the supervisors.
Research in the field of mobile learning revealed the importance of this tool in the monitoring, encouragement and ease of widespread and comprehensive communication and sharing among students and their teachers. Contextualizing the learning by utilizing RFID-sensor interaction-mediated customization of the learning process according to predefined setting proved that it is wonderful tool toward providing one to one tutor paradigm fostering multidisciplinary education.

Keywords: Multidisciplinary education, web 2.0, mobile learning, ubiquitous learning.

*Author of correspondence

INTRODUCTION

Currently students use web 2.0 technologies (facebook, tweeter, blogs, youtube etc) extensively. They use these applications in social collaboration and communication but rarely for educational purposes (Crook & Harrison, 2008). The power of these applications in enhancing collaboration and information sharing make it very good opportunity for educational practices. Many researches explored the use of these applications in pedagogy (Charnigo& Barnett-Ellis, 2007; Hewitt & Forte, 2006; Mathews, 2006; Mazer, Murphy & Simonds, 2007; Selwyn, 2007; Towner &VanHorn, 2007). The good thing about these applications is that it merged with their lives seamlessly where students start accessing these applications using their hand held devices (e.g. mobiles phones) (Boyd & Ellison, 2008).

Multidisciplinary education means collaboration of group of specialists from different specialities in teaching group of students in one discipline hiding common and shared objectives. In contrast, interdisciplinary education is the merge of more than one discipline to produce one new discipline having features build up from these different disciplines.

Multidisciplinary education serve in decreasing the gap between what students learn (learning objectives) and what they should do after graduation (learning outcomes).

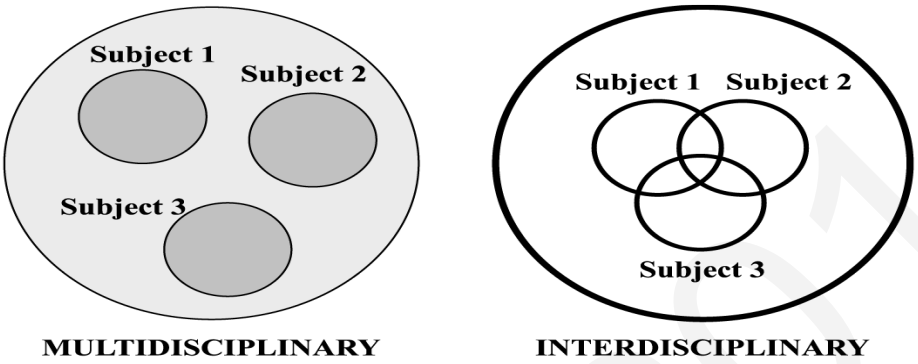

Fig 1.Multidisciplinary education versus interdisciplinary education.

Other benefits of this type of education are:

Communication, mutual understandings between professions, confidence in role and impact on practice.

However, there are number of challenges hindering the application of this type of education. Some of these challenges are :

1- Lack of funding
2- Access to library and IT facilities
3- Bringing different health professionals together
4- Finding a common language to communicate ideas
5- Trusting research you have not skills to access yourself
6- Understanding the concepts underlying a discipline other than your own.

Among those challenges "Bringing different health professionals together" seem to be the most debilitating one and it is the one in which the web 2.0 can offer and advantage (Lampe, Ellison &Steinfield, 2006).

Web 2.0 offers a lot of educational tools which may support multidisciplinary education by providing the following (Hewitt & Forte, 2006):

1- Collaborative learning
2- Information sharing
3- Communication facilitation
4- Group projects
5- Engagement
6- Participation
7- Content development.

Pharmacy profession deals with the wise use of medication in treatment of diseases. It requires knowledge, attitude and skills that are shared between medicine, nursing, laboratory and chemistry specialties.

Pharmacy students struggle usually with the new challenges when working in the real environment. This is because they have been taught by pharmacists who are sometimes not aware about the subtle tasks embedded in the different specialties. However, when only some time elapse they acquire the practical competencies by interacting with different specialists in different disciplines.

Therefore, it will be efficient to overcome the frustration of the new graduants in the real life practice by bringing other specialists together with pharmacists to teach and train pharmacy students the complex skills that may need the expertise of the other disciplines.

HOW SOCIAL NETWORKING AND WEB 2.0 SUPPORT PHARMACY STUDENTS' MULTIDISCIPLINARY EDUCATIO

The utilization of the powerful tools of Web 2.0 early during the curriculum design with critical objective planning shared with all thedifferent professional involved in the multidisciplinary education.

Role Of Social Network And Facebook In Supporting Multidisciplinary Education:

Social networking systems allow users to describe themselves and their interests, and they generally implement notions of friends, ranking, and communities. The ability to record who one's friends are is a common feature that enables traversal and navigation of social networks via sequences of friends. Ranking and communities are more selectively implemented. Ranking of user contributions by community members allows for reputations to be built and for individuals to become members of good standing; this can be an important motivator for the individual contributions that make for a thriving community. The ability to create sub-communities allows for nurturing and growth of sub-community interests in an environment that provides a degree of insulation from the general hub-bub of system activity.

Facebook.com, MySpace.com, and LinkedIn.com are examples of popular social network sites. While all of the Web 2.0 applications discussed here can be considered social in nature, social networks are specifically designed to connect individuals and primarily organized around people, not topics or interests. Facebook is usually the most recognized social network within academic circles, primarily because it was initially developed for and oriented toward college students.

Facebook is equipped withbulletin boards, instant messaging, email, and the ability to post videos and pictures. Mostnotably, anyone can post information and collaborate within the system. Recently, Facebook hasopened up development of downloadable applications, which can further supplement the educational functions of Facebook. While many of these technological tools mirror those foundin currently employed courseware programs (e.g. blackboard, moodle, etc.), the ability and easewith which an individual (instructor or student) can upload photo and videos, the frequent andseamless updates and maintenance, the generous 1024 MB limit on videos, and the compatibilitywith a wide variety of web browsers are superior to some courseware options (Baker, 1999). Facebook provides instructors opportunities and structures by which students can help and support one another by building their courses atop the community already established by the students themselves. Hamann and Wilson (2002) found that students who participated in a web-enhanced class outperformed those students in a traditional lecture format.

Facebook also increases both teacher-student and student-student interaction in the form of web-based communication. Facebook helps instructors connect with their students about assignments, upcoming events, useful links, and samples of work outside of the classroom.

Students can use Facebook to contact classmates about questions regarding class assignments or examinations as well as collaborate on assignments and group projects in an online environment.

Teachers from different specialties can help students to create their own Facebook accounts and become friends. This will create a friendly environment among teacher and students and by this way teacher can share classroom lectures, assignments, events, various academic quizzes, quick tips etc. in a more interactive way.

Any queries or doubts among students can be answered in a no time. Also use of social networking sites such as Facebook in academic education would encourage students to consider.

Blogs Support To Multidisciplinary Education:

Blogs also can be utilized in the multidisciplinary education. It provides a space where teachers and students can work to further develop writing or other skills with the advantage of an instant audience. Teachers can offer instructional tips, and students can practice and benefit from peer review. They also make online mentoring possible. For example, a class of older students can help a class of younger students develop more confidence in their writing skills. Students can also participate in cooperative learning activities that require them to relay research findings, ideas, or suggestions.

Blogs can be use in classroom environment for diary entry; it also can be a useful tool to link communication between study groups within a class or other classes or even schools. If use effectively, blogs can create a learning environment that extend beyond the schoolyard.

There are numerous educational benefits of blogs. Blogs are:
• Highly motivating to students, especially those who otherwise might not become participants in classrooms.
• Excellent opportunities for students to read and write.
• Effective forums for collaboration and discussion.
• Powerful tools to enable scaffolding learning or mentoring to occur.
Blogs can serve at least four basic functions.

1. **Classroom Management**
2. **Collaboration**
3. **Discussions**
4. **Student Portfolios**

Usefulness Of Wikis In Multidisciplinary Education:

Wiki is web server software that allows users to contribute content. One can freely create and edit wiki page contents. Collaboration is the key to Wiki, unlike forums, blogs and social networking sites where only registered member can post, here in wiki all users are allowed to contribute and edit the existing contents. As anyone can contribute and edit wiki so this opens the concept to abuse and misguide, but still most wikis are open. Wikis allow web pages to be written, edited and created collectively in a web browser and it supports hyperlinks and simple text.

Since wiki is free, allows everybody to create and edit pages, being the giant internet digital library and due to providing of unlimited storage space it can be a great tool for education. It can encourage group social interaction and collaboration and group social interaction is the most effective way to learn something. Due to its ease of editing, it can be very helpful for collecting data for a group of students by experts from different disciplines. Different professionals can monitor, edit and correct contents built by students. By such mentoring each professional expert can manage the content related to his specialty very easily with the need to leave his place of work. He can post questions, encourage discussions and answer questions easily.

All professional experts can meet and their meetings and planning can be coordinated right on wiki. Wiki page may include different professionals' norms and activities and a link to all their meeting notes, agendas, documents, and materials.

All the materials which need multidisciplinary educators can be posted right on the wiki and using the discussion tab, teachers can connect and collaborate. Some examples of utilizing blogs and wikis in pharmacy multidisciplinary education are presented in table 1.

Table 1. Suggestions of using Wikis and blogs in pharmacy multidisciplinary education.

Subject	Topic About Activity	Specialist involved
Pharmacology	Real clinical limitation with the use of drugs	Pharmacist, Physicians and nurses
	My on side effects of drugs	Pharmacist, Physicians and nurses
	Warnings for My on drug lab interactions	Pharmacist, Lab specialist
Pharmaceutical administration	Discussion about pharmacy ethics	Pharmacist, Social specialist, health administrator
	Pharmacy laws	Pharmacists, health care administrator, health care certification specialists
Pharmacists	Incompatibility during drug formation	Pharmacists, chemists, Pharmacy factory practioners

The faculty advisors and the other professional can also brainstorm lesson ideas and posted all the lesson topics on the wiki, then faculty advisors signed up for the lesson they were writing by placing their name next to it and posting their lesson. Each advisor wrote one or two lessons leading to instantly creation of bank of lessons accessible to all.

Podcast's Role In Pharmacy Multidisciplinary Education:

The term *podcast* is derived from the combination of 2 words: iPod and broadcast. Podcasts are audio recordings, usually in MP3 format, of talks, interviews and lectures, which can be played either on a desktop computer or on a wide range of handheld MP3 devices. Podcasts are already being used in pharmacy school curriculum. Meng describes many educational applications of podcasting and videocasting, including:

- Podcasts can be used to provide introductory material before lectures, or, more commonly, to record lectures and allow students to listen to the lectures again, either because they were unable to attend, or to reinforce their learning. Podcasts can be used to make lectures redundant while still supplying (possibly didactic) presentations of learning material by lecturers.
- Podcasts can be used to supply audio tutorial material and/or exemplar recordings of native speakers to foreign language learners.
- Distribution and sharing of educational media and resources.

Podcasting can be used for archiving and distributing lectures in video or audio format. It can especially enhance the learning experience in demanding hands-on educational environments such as in medicine (Boulos et al, 2006). Although such podcasting uses are closer to traditional passive learning and web paradigms, they can free class time to be used for problem-solving, project sessions and other active learning activities (Kurtz et al, 2007). An example of using podcasting to support collaborative and active learning can be found in the initiative of the Duke University, where podcasts are created both by teachers and students, covering not only formal educational material, but discussions as well as feedback comments on assignments etc. (Belanger, 2005). A number of medical professional associations and other related bodies are increasingly distributing educational podcasts, while many scientific medical journals are now offering content in the form of podcasts (Agrawal, 2007; Wilson et al, 2009). Podcasting may be of potential volume for Pharmacy students multidisciplinary education (Figure 2.)

Figure2. Suggestions for using Podcasts for multidisciplinary education.

RSS Involvement In Multidisciplinary Education:

RSS is a technology that is being used by millions of web users around the world to keep track of their favorite websites.

Academia has embraced RSS as a means to educate, but scrutinizing how educational institutions are using RSS feeds in their daily routines show RSS is utilized can vary across different industries.

1. Share Resources
Academics are using social bookmarking websites to share quality websites that relate to their area of expertise with colleagues and students.
2. Class Blogs
From elementary schools to university blogs, online journals have flourished. Instructors have used blogging as a teaching tool. Helping students learn writing and reporting skills while understanding how to use technology. Many educational bloggers use RSS as a means to syndicate blog posts.
3. School Schedule
RSS feeds can be used to communicate events scheduled on or off campus to prospective and existing students. Subscribes of a schools calendar feed receive notification as new items are added to the calendar.
4. Podcast Lectures
Podcasts can be used as study guides or even as class preview for students contemplating their course selections or choice of professors.

1. Pronunciation of drugs names by native English language speakers.
2. Lectures on new advancements on drug use from specialized international discovery labs.
3. Subject classes presentation with comments from other specialists.
4. New high authority announcements related to drug holding or obtain.
5. Detailed discussion of precisely briefly discussed complex task from highly specialized experts.
6. Heart murmurs or chest wheezing with physician's comments of pharmacy costs.
7. Description of theoretical parts of lab experiments.
8. Narrations of pharmacy laws and comments from physicians, nurses and health administrators about some pharmacists violations

5. Monitor Research
Students involved in cutting edge research projects can use RSS to monitor news and search engines for specific keywords (like nanotechnology or cold fusion) by creating search feeds. Any time a mention of the keyword phrase occurs in a news piece the item will appear in the search feed.
6. Medical Education
A study recently showed medial students who listened to heart murmurs on an iPod, were more likely to accurately diagnose heart murmurs accurately in patients. Some medical schools have begun adopting podcasts as a means to educate.

Can Twitter Do Any Support To Multidisciplinary Education?

Actually Twitter is an extremely simple platform for friends and co-workers, etc. However, some people even said that it is useless. Just because of that, Twitter has provided us a bigger space for imagination which can make the micro-blogging service be a protocol instead of a platform. Currently, as a standard Internet real-time communication protocol, Twitter has lots of useful features for education too. Students and teachers are able to send replies or DMs to post questions to teachers which means it a real-time two-way communication. As a protocol, an online quiz application can be created based on Twitter. This simply means that the teacher can send quizzes to students through Twitter and students can answer them via the service too. This is also known as a new concept for real-time communication.

Social Bookmarking And Pharmacy Multidisciplinary Education:

Some individuals may like more people to be able to see and remark on the blog post. They could do this by submitting the blog post to a social bookmarking site like Del.icio.us. Social bookmarking sites are Web sites that allow shared lists of user-created Internet bookmarks to be displayed and commented on. Social bookmarking sites allow you to organize your bookmarks by allocating a number of 'tags' to them. This makes it easy for other people who may be interested in a particular group to find related bookmarks. For example, if the tag 'medicine reviews' was added to a bookmark, people searching the bookmark site for 'medicine reviews' information could easily find it.
Social bookmarking applied to the classroom focuses on creating a community of shared sites. There are 5 potential uses of social bookmarking in higher education: (Barsky E, Purdon)

- Acting as a storage location for links.
- Acting to connect individuals with similar interests.
- Examining tagging patterns to identify new research avenues.
- Facilitating group exercises by allowing each person to bring his/her perspective through tagging.
- Tracking student progress by examining site and tag libraries.

Numerous opportunities exist for pharmacy educators to utilize social bookmarking in pharmacy multidisciplinary education. Instructors from different specialties may elect to create a shared bookmark library site that serves as a resource to students during a project or course explaining one idea but from different prospective. To engage students in resource creation, a component of a project may require students to create their own library of tagged sites to support the project. In addition to serving as an output of the project, the sites and tags can serve as part of the summative evaluation in determining the student's grade. For projects, courses, or other longitudinal efforts, periodic review of students' social bookmarks can aid in formative assessment to serve as a teaching tool.(Alexander B. Web 2.0)

The educational uses of social bookmarking lie in the heart of multidisciplinary education of Pharmacists.Teachers and learners can build up collections of resources, and with a little ingenuity can also use social bookmarking systems to bookmark resources for one topic from different disciplines that are not on the web.In this way it is easy to build up reading lists and resource lists. These may, with the use of multiple tags, be structured into sub-categories. Groups of users with a common interest can team together to use the same bookmarking service to bookmark items of common interest. If they have individual bookmarking accounts, they all need to use the same tag to identify their resources. This will minimize the effort of the instructors from different disciplines, since they can build resources for students in their disciplines. These resources can be tagged by students from other resources.

Youtube And Social Videos In Pharmacy Multidisciplinary Education:

As the largest Social Website in the world (According to the Alexa Rank), YouTube, as a video sharing website, plays an important role in enhancing our experience on the Web. Of course, videos can help a lot in

education too. The typical usage of videos is to enable teachers to record education-related videos and students are able to watch them on YouTube itself without the need to travel apart to reach the specialized instructor. As a good interactive way of communication, video communication can also be the future of multi-media communication too. Now the entire world has access to YouTube and other social video sites like Google Video (http://video.google.com). (Educause Learning Initiative.)

These sites are extremely popular, with YouTube streaming 100 million videos per day compared to 20 million unique monthly users 2 years ago. The majority of videos are comical in nature and are less than 2 minutes in length. Finding useful videos for pharmacy instruction may require considerable searching. That is why such tools may help multidisciplinary education. Since you may find many videos related to Pharmaceutical sciences posted by non Pharmacy specialist. These videos are in most time very valuable for Pharmacist to understand complicated Pharmaceutical skills. An analysis of the first 20 videos identified when searching for the term "pharmacy" (on October 20, 2008), revealed the 14th video as the first one of educational value. That American Society of Health-System Pharmacy video discusses the opportunities gained by completing a pharmacy residency. With sufficient time applied to diligent searches, instructors can identify other useful videos. Because of agreements with media outlets, current news stories related to healthcare issues (eg, latest news reports on medication error research) are frequently posted on YouTube. Alternatively specialist from different disciplines can agree to create and post their own videos based on their own disciplines for their students to review, reinforce concepts taught in class, or introduce new concepts. Additional activities may require that students participate in an online (or in class) discussion about the video. A common belief suggests that the best way to learn is to teach. Therefore, a course project might involve pharmacy students developing, recording, and posting a video to demonstrate concepts or skills from a course and being discussed and evaluated by multidisciplinary specialists . Other activities could involve students participating in a role-playing scenario that is posted online for discussion and collaboration with the class and instructor. From a different perspective, an activity could require that students search for, identify, and evaluate online videos for quality and usefulness for predetermined situations.(USA Today)

Virtual World. Can It Be Of Help In Pharmacy Multidisciplinary Education?

A virtual world is a computer-based, simulated multi-media environment, usually running over the Web, and designed so that users can 'inhabit' and interact via their own graphical self representations known as avatars. Linden Lab's (http://lindenlab.com/) Second Life (http://slife.com/) is perhaps the most popular virtual world platform in use today.

The population of Second Life has been doubled since January 2007, and, was at 2nd May 2007, has reached more than six million virtual citizens or 'Lifers', all with their own fully textured high-resolution avatar that can be finely customized to the nth degree. Three-dimensional (3-D) virtual worlds like Second Life can be considered as 3-D social networks, where people can collaboratively create and edit objects in the virtual world (like a collaborative 3-D wiki space), besides meeting each other and interacting with existing objects.(Coffman T, Klinger MB. Utilizing virtual worlds in education)
The potential application and implications of Second Life and other virtual worlds in education environments are abundant. If used correctly, virtual worlds can provide constructivist learning experiences in which students immerse themselves in discovery and investigative activities. Students can be challenged to learn through applied activities, rather than only passively through class lectures. Developers and educators have taken advantage of virtual world applications to provide training and education in areas such as emergency preparedness, risk management, AIDS, and a host of other healthcare-related issues.(Boulos MNK, Ramloll R, Jones R, Toth-Cohen S.). The PULSE!! project (http://www.sp.tamucc.edu/pulse/home.asp, Texas A&M University, Corpus Christi) is one such application that uses high-fidelity virtual worlds to educate medical personnel through online, case-based training.(Hansen MM. Versatile, immersive, creative, and dynamic virtual 3-D health care learning environments). An example of virtual-world use in pharmacy education involves students playing the roles of patient and pharmacist in a Second Life rendition of a real-world family

practice center. Students virtually interact with each other in case history exercises, while simultaneously becoming more familiar with the surroundings of the center.(University of North Carolina Information Technology Services).Such opportunity is of great support for multidisciplinary education. Pharmacy students can virtually practice Pharmaceutical skills under supervision, guidance, support and evaluation of specialist from different disciplines each of whom stemming from his/her own disciplines. This chance is very difficult to be found except in virtual world when specialist nee not to travel away from their work places or even free themselves from their daily duty obligations.

CONCLUSION

Web 2.0 will have profound implications for learners and teachers in formal, informal, work-based and lifelong education. Web 2.0 will affect how universities go about the business of education, from learning, teaching and assessment, through contact with school communities, widening participation, interfacing with industry, and maintaining contact with alumni. Just as the chalkboard, television, personal computer, and Internet were once considered innovative technologies for teaching and learning, Web 2.0 has the potential to alter educational processes. While it would be incorrect to assume that all students of this generation are comfortable and fluid with Web 2.0 technologies, one can safely assume that a large percentage of these students would possess a general comfort level.

One positive aspect of Web 2.0 applications is that they create a participatory architecture for supporting communities of learners.(Brown JS, Adler RP. Minds on fire: Open education). Unlike learning management systems (which are closed systems) and static Web pages (which are singular-owned), blogs, wikis, and social bookmarking sites are open to learners from multiple schools and facilitate collaboration on content creation from multiple disciplines. This participatory culture is, in essence, a key component of Web 2.0 in supporting multidisciplinary education of pharmacists. It is only helpful in facilitating involvement of specialist from different disciplines but also provide authentic education and promote confidence in learning and provide more precise evaluation and assessments.

SCHOOL ADMINISTRATORS, ICT COORDINATORS AND TEACHERS' METAPHORICAL CONCEPTUALIZATIONS OF TECHNOLOGY

Şirin KARADENİZ
Bahçeşehir University, Istanbul
sirin.karadeniz@bahcesehir.edu.tr

Abstract

The purpose of this study is to investigate the perceptions of school administrators, ICT coordinators and teachers about technology concept. 87 participants completed the prompt "Technology is like…because…" by focusing on one metaphor about technology. Qualitative and quantitative techniques were used to figure out the metaphor categories and whether they differentiate according to participants' title, gender and age. Content analysis was used to analyze the perceptions of the participants. Findings of the study showed that the participants indicated 60 valid metaphors which were grouped into five categories: 1) Technology as a changing and developing entity (e.g. children, fashion); 2) Technology as a facilitating means (e.g. key, organ); 3) Technology as a needed entity (e.g. food, air); 4) Technology as a useful and harmful entity (e.g. viruses, sugar); 5) Technology as a diffusional entity (e.g. octopus, ocean). It was found that the majority of metaphorical conceptualization categories aligned with "a useful and harmful entity" by administrators, "a facilitator" by ICT coordinators and "a changing and developing entity" by teachers. The perceptions of the participants were also analysed according to title, gender, age variables. The findings of the quantitative analyses showed that there were no significant differences among the participations' perceptions of technology regarding to gender, age and title.

Key words: Technology, metaphor, administrators, ICT coordinators, teachers

SCIENCE AND TECHNOLOGY EDUCATION STUDENTS AS BLOG PUBLISHERS: EFFECTS OF EDUCATIONAL BLOGGING ON PERCEPTIONS OF THE STUDENTS TOWARD WEB AS A LEARNING TOOL

Erkan Tekinarslan
Abant Izzet Baysal University, Faculty of Education
tekinarslan_e@ibu.edu.tr

ABSTRACT

The purpose of this study is to investigate effects of educational blogging on perceptions (e.g., attitude, self-efficacy) of undergraduate students in the Science and Technology Education program toward Web as a learning tool. In addition, this study examines opinions of the students about contribution of educational blogging to the students' perceptions toward Web as a learning tool, knowledge in the field, and advantages and disadvantages of blogging in science education. The methodological frame of this study is based on both one group pre-test and post-test method, and qualitative approaches including observations, interviews and document analyses. A total of 32 undergraduate students voluntarily participated in the pre-test and post-test sections, and 25 students participated in the interviews. The findings indicate that educational blogging had positive effects over the students' attitudes on the usability, self-efficacy, affective and Web-based learning subscales. In addition, the qualitative findings indicate positive contributions of educational blogging to to the students' knowledge in the field, and to the perceptions and thoughts of the students toward Web as a learning tool.

Keywords: Educational blogging, perceptions, science and technology education students, interviews.

INTRODUCTION

A blog, or Weblog, is an easy-to-use Web-based technology that allows users to deploy text and other media (e.g., visuals, audio-visuals, etc.) immediately to the Web (Kelley, 2008) without sophisticated Web design skills. Students have increasingly used blogs both as personal commentaries and as a required part of certain courses (Educause Learning Initiative, 2005). Understanding why people accept or reject information technology has proven to be one of the most important and challenging issues in information system research (Davis et al., cited in Liaw 2002a). Also, according to Liaw (2002b), understanding learners' perceptions of information technology is useful and necessary before or during their use of it as an assisted learning tool.

Prior studies (e.g., Liaw 2002a; Liaw 2002b; Teo, Oh, Liu, 2003) investigated different aspects of the individual Web use (e.g., perceptions including attitudes, and self-efficacy, effects of design features on web attitude) and blog use (Hsu & Lin, 2008). According to Liaw (2002a), individual computer and Internet experience, self-efficacy, motivation, enjoyment and usefulness and are all key factors for individual use of the Web (Liaw, 2002a). Moreover, the results of Teo, Oh and Liu (2003) study suggest that increased level of interactivity on a Web site have positive effects on user's perceived satisfaction, effectiveness, efficiency, value, and overall attitude toward a Web site. In addition, regarding blog use, the results of Hsu and Lin (2008) study indicated that ease of use, enjoyment, and knowledge sharing were positively related to attitude toward blogging.

Although prior studies have investigated different aspects of perceptions or attitudes of students toward Web and blog uses, effects of educational blog publishing on perceptions of students toward Web as a learning tool have not been sufficiently investigated. Thus, this study focuses on effects of educational blogging on perceptions (e.g., attitudes, opinions) of undergraduate students in Science and Technology Education program toward Web as a learning tool.

Purpose of the Study

The purpose of the study is to investigate effects of educational blog publishing on the science and technology students' perceptions (e.g., attitudes, opinions) toward Web as a learning tool. In particular, this study explores whether there are any significant differences between mean attitude scores of the students on usability, self-efficacy, affective (Liaw 2002a) and Web-based learning subscales (Tekinarslan, 2009) of the Web attitude scale (WAS) before and after the educational blogging activities. Furthermore, this study investigates opinions of the students about contribution of educational blogging to their perceptions toward Web as a learning tool. Also, it investigates opinions of the students about contribution of blog publishing to their knowledge in the field, and advantages and limitations of

educational blogging in the field of science and technology. Specifically, this study explores the following research questions:

1. Are there any significant differences between pretest and posttest mean attitude scores of the students on usability self-efficacy, affective and Web-based learning subscales?
2. What are the opinions of the students about contribution of educational blogging to their perceptions toward Web as a learning tool?
3. What are the opinions of students about contribution of educational blogging to their knowledge in science and technology?
4. What are the opinions of students about advantages and limitations of educational blog publishing in science and technology?

METHODOLOGY

The methodological frame of this study includes one group pre-test and post-test method (Büyüköztürk et al., 2008), and qualitative approaches including observations, interviews and document analyses (Bogdan & Biklen, 1992).

One Group Pre-test and Post-test Section

Instruments

A Likert-type Web attitude scale with 21 items was used to collect data in the one group pre-test and post-test section of the study in addition to the personnel information section (e.g., gender, area of study, Internet experience). The first 16 items of the scale were adapted from a Web attitude scale (WAS) developed by Liaw (2002a). The WAS is a valid and reliable scale to measure individuals perceptions' toward Web self-efficacy, liking, usefulness, and behavioral intention to use and learn the Web (Liaw, 2002a), and it has been used in other prior studies (e.g. Akpınar & Bayramoğlu, 2008; Yang & Lester, 2003). The last five items of the scale were adapted from an attitude scale toward Internet-based learning (Tekinarslan, 2008) to measure more specifically the students' attitudes toward Web-based learning. The scale with 21 items was validated and used in Turkish in a prior study (Tekinarslan, 2009).

Participants

A total of 32 undergraduate students (out of 37) in Science and Technology Education program who registered for the Computer II course voluntarily participated in the one group pre-test and post-test section of the study in the Spring semester of 2009-2010 academic year . The students did not have educational blogging experiences prior to this study.

Data analyses

The data collected in the one group pre-test and post-test section of the study were analyzed by using the software of Statistical Package for the Social Sciences (SPSS). The mean scores and standard deviations were calculated for pre-test and post-test. A paired samples t-test was applied to detect the differences between the pre-test and post-test scores of the participants.

Qualitative Investigation Section

Participants

The participants in the qualitative section of the study were the same students in the one group pre-test and post-test section (N=32) of the study. Furthermore, a total of 25 students participated in the interviews through e-mail to provide additional data regarding their blogging applications.

Data collection

A qualitative fieldwork approach which combined multiple data collection techniques such as participant observations, document analyses, and interviews (Bogdan and Biklen, 1992) was applied in the collection of the qualitative data. The participant observations were conducted by the researcher who was the teacher of the course. Thus, he had opportunities for observations in the computer lab when the students create, edit, and publish their blogs related to science education. The researcher took field notes about noteworthy blogging experiences of the students after a period of observation in the computer lab.

Also, the researcher conducted document analysis based on blog pages and contents of the students. The students e-mailed the teacher about the contents and URL addresses of their blogs related to science education. The e-mails and blog pages of the students were electronically documented for document analysis purposes.

Moreover, the researcher was conducted interviews through e-mail with 25 volunteer students who participated in the course and study. The participant students filled out an interview form containing semi-structured questions to reflect their opinions and experiences about blogging in the field of science and technology education. The students (N=25) submitted their interview forms through e-mail attachments in 10 days after the end of the course.

Data analyses

The obtained data including field notes from observations in the computer lab, blogs, e-mails and interview forms were collected in different electronic files. Then, a content analysis method (Bogdan & Biklen, 1992) was applied to analyze the electronic data. All collected data were read and reviewed by the researcher in order to detect the recurring words, phrases, and thoughts. The detected recurring words, phrases, and thoughts were subsequently identified and marked as the initial coding categories, and the unrelated data were eliminated. After that, these coding categories were read again to generate main and final categories of the study. The findings were reported and reflected by considering these main categories.

RESULTS

The results of the study are provided in two sections. In the first section, the results one group pre-test and post-test are presented, and results of qualitative research are presented in the following section.

Results of One Group Pre-test and Post-test Section

Differences on Usability Subscale

The descriptive results in Table 1 show that the pretest mean attitude score ($\overline{X}$ =31.40) of the students is lower than their posttest mean score ($\overline{X}$ =34.28). A paired samples t-test was applied to determine if there was any significant difference between the pretest and posttest mean attitude scores of the students at .05 significance level. The results in Table 2 indicate that the difference between mean scores of the pretest and posttest of the students is significant at .05 level on the usability subscale (t = -2.165, df = 31, p = .038). According to this finding, blog publishing had positive effect over the students' attitudes on the usability subscale of the WAS.

Table 1. Differences between the pretest and posttest mean scores on usability subscale

Groups	N	$\overline{X}$	SD	df	t	P
Pretest	32	31.40	7.11	31	-2.165	.038
Posttest	32	34.28	3.19			

Differences on Self-efficacy Subscale

The paired samples t-test results in Table 2 indicated that there was a significant difference between the mean scores of the pretest ($\overline{X}$ =13.53) and posttest ($\overline{X}$ =15.53) of the students on the self-efficacy subscale (t = -4.228, df = 31, p = .000). According to this finding, posttest mean score of the students is significantly higher than their pretest score. Thus, it can be stated that blog publishing had positive impact on the students' attitudes on the self-efficacy subscale of the WAS.

Table 2. Differences between the pretest and posttest mean scores on self-efficacy subscale

	N	$\overline{X}$	SD	df	t	P
Pretest	32	13.53	3.43	31	-4.228	.000
Posttest	32	15.53	2.15			

Differences on Affective Subscale

According to the paired samples t-test results in Table 3, the difference between the mean scores of the pretest ($\overline{X}$ =14.12) and posttest ($\overline{X}$ =16.15) of the students is significant at .05 level on the affective subscale (t = -3.156, df = 31, p = .004). This finding reveals that posttest mean score of the students is significantly higher than their pretest score. According to this finding, blog publishing positively affected the attitudes of the students on affective subscale of the WAS.

Table 3. Differences between the pretest and posttest mean scores on affective subscale

Groups	N	$\overline{X}$	SD	df	t	P
Pretest	32	14.12	3.68	31	-3.156	.004
Posttest	32	16.15	1.88			

Differences on Web-based Learning Subscale

The paired samples t-test results in Table 4 indicated that there was a significant difference between the mean scores of the pretest ($\overline{X}$ =18.84) and posttest ($\overline{X}$ =21.93) of the students on the Web-based learning subscale (t = -4.695, df = 31, p = .000). According to this finding, posttest mean score of

the students is significantly higher than their pretest score. Thus, it can be stated that blog publishing had positive impact on the students' attitudes on the self-efficacy subscale of the WAS.

Table 4. Differences between the pretest and posttest mean scores on Web-based learning subscale

Groups	N	$\overline{X}$	SD	df	t	*P*
Pretest	32	18.84	4.02	31	-4.695	.000
Posttest	32	21.93	1.66			

Results of Qualitative Research Section

Observations of the Teacher

The students designed and created Web pages through MS FrontPage and MS Publisher, before blog applications. Many students faced notable technical difficulties and problems (e.g., nonworking links, non-openable visuals) when they designed their Web pages through these software (i.e., MS FrontPage and MS Publisher), and they sought help from the teacher to solve these problems.

The educational blogging activities of the students in the field of science and technology were started after they learned simple Web page design in MS FrontPage and MS Publisher. Initially, the teacher showed the students how to open an account, create, edit and publish blog pages in the computer lab. Then, the teacher asked the students create and publish simple blog pages about the topics related to science and technology. A big majority of the students created and published their blog pages with some visuals easily without facing any notable technical difficulties or problems. In addition, blogging activities were enjoyable and favorable for most students in comparison to the web design activities through other software (e.g., M.S. FrontPage).

The students were required to publish educational blog pages which provide information and teach topics in science and technology at least at knowledge and comprehension levels in Bloom's taxonomy. Many students faced difficulties and sought help and ideas from the teacher when deciding and writing instructional objectives and the content based on these objectives although they did not face any notable technical difficulty when they edit and publish their blog pages. In general, most students were able to write the instructional objectives and the content of their blogs after getting ideas from the teacher and benefiting some text books and online resources in the field of science and technology. The students were free to benefit from both online resources and print resources as long as they are reliable. The students in general used online resources when finding digital graphics and images related to their content. But, most students benefited both reliable online and print resources when writing the content of the blogs based on the instructional objectives. Thus, it can be stated that instructional objectives were effective on the students' decisions about whether to use online resources or print resources. Also, many students improved their information searching skills in electronic databases (e.g., Ulakbim) and search engines (e.g., Google, Yahoo, etc.) when they were searching visuals, graphics and information related to their instructional objectives and content of the blogs. Moreover, the students were required to make comments and give feedback about at least two other classmates' blogs. As a result, the students gained experiences about how to make comments, give feedback and state opinions about other classmates' contents on the blogs.

Contributions of Educational Blogging to the Perceptions of the Students

The students were asked, "Has educational blogging made any positive contributions to your perceptions and thoughts about Web as a learning tool? If yes, why?" Most students (17 out of 25) responded "yes" to the question. After they were asked "why", some students (N=7) stated that because they saw that Web based blogs are convenient tools to share information in multimedia format (e.g., visuals, animations, etc.). Also, according to the some students (N=6), blogs provide time and place flexibilities to share and reach information outside of the class. In addition, some students (N=4) responded that blogs give opportunities to comment on the posts and discuss about the topics and ideas in the blog content. However, 5 students did not answer whether blogging has made any contribution to their perceptions and thoughts about Web as a learning tool. Also, 3 students answered "no" to the question. One of the students among them stated that blogging has not contributed to his perceptions and thoughts about Web as a learning tool since the Web is just a tool, and quality of information and skills of information providers are more important than the tool.

Contributions of Educational Blogging to the Knowledge of the Students

The students were asked, "Do you think that educational blogging has made any contribution to your knowledge in the field of science and technology?" Majority of the students (22 out of 25) answered "yes" to the question. After they were asked "If yes, how?" many (N=12) students responded they learned about new information in the field of science and technology when they search and read information to be

used or published in their blogs. Moreover, some students (N=5) stated that they had a chance to repeat and improve their prior learning in subjects of science and technology when they write and edit their blog contents. Furthermore, some students (N=3) stated that their knowledge in the field increased when they read and view the materials (e.g., visuals, videos) on the blogs of the other classmates.
Also, one student noted that she practically learned that how science and technology are related as she is blogging about her knowledge in science education in a concrete manner with various visuals. Additionally, another student noted that he gained experiences and he got ideas about how to benefit and integrate blogs into science and technology education.

Advantages and Limitations of Educational Blogging

The student interviewees were asked, "What are the advantages and disadvanatges of educational blogging for you?" Nearly all students (N=24 out of 25) stated at least one advantage of educational blogging. The most common advantage of educational blogging is its appropriateness for "information sharing", according to the students (N=18). Moreover, 7 students mentioned that blogs enables the publishers to receive comments and feedbacks from the visitors or readers about contents of their educational blogs. Besides, 5 students noted educational blogging increase the corporation and communication among the classmates while they are making comments on their blogs. In addition, according to the 4 students easy to use features without sophisticated technical skills is another advantage of educational blogging. One of the students stated that, "Dissemination of information and opinions from just one source to many people without complicated technical skills is the most important advantage of blogs for me. When become a teacher I can share many information and post announcements to my students easily".

However, three students noted that wrong information and faulty expressions on the blogs can be considered as disadvantages of blogs, although they think that blogs are handy tools to share information. One of the students stated that, "People may create and publish their blogs easily. However, some blogs have a lot of wrong information that lead us wrong directions. This is the only disadvantage of blogs I think". Also, two students mentioned that copy and paste features in blogs may reduce or inactivate creativity and may instigate the students plagiarism when creating the content.

DISCUSSION AND CONCLUSION

According to these findings, it can be stated that educational blog publishing had positive effect over the students' attitudes on the usability, self-efficacy, affective and Web-based learning subscales. Furthermore, the qualitative results revealed that educational blogging made positive contributions to the most students' perceptions and thoughts about Web as a learning tool since the blogs are convenient tools to share information in multimedia format (e.g., visuals, animations, etc.), since blogs provide time and place flexibilities to share and reach information outside of the class, since blogs give opportunities to make comments and discuss about the topics and ideas in the blog content. Although some students (N=3) reflected that educational blogging did not make any contribution to their perceptions and thought about Web as a learning tool, based on the opinions of the majority of the students (N=17) and results of pre-test and post-test results, blogging in general can be considered as useful activity to improve students perceptions and thoughts about Web as a learning tool. Moreover, the findings of this study in regard to perceptions of the students toward educational blogging support the results of a prior study (Kuzu, 2007; Weller, Pegler and Mason, 2004) which indicated that students had positive views, opinions and attitudes toward instructional use of blogs.

In addition, according to the findings, majority of the students thought educational blogging has made positive contributions to their knowledge in the field of science and technology. The students explained that they learned about new information in the field of science and technology when they search and read information to be used or published in their blogs, they had a chance to repeat and improve their prior learning in subjects of science and technology when they write and edit their blog contents, and their knowledge in the field increased when they read and view the materials (e.g., visuals, videos) on the blogs of the other classmates. Thus, based on these findings, it can be stated that blogging in a teaching and learning environment can be used to improve students' knowledge in the field of science and technology. Furthermore, the results of the current study regarding the contribution of blogging to the knowledge of the students are consistent with the prior studies which suggest that blogs can be used to facilitate students' learning (Stiler & Philleo, 2003) and knowledge acquisition (Glogoff, 2005).

According to the findings of this study and related literature, the advantages of the educational blog can be listed as information sharing among the classmates or online learning community (Kim, 2008), making comments and receiving feedbacks from the visitors or classmates (Huette, 2006),

potentials for corporation and communication among the classmates (Wang, Hsua, 2008), and easy to use features without sophisticated technical skills (Duffy & Bruns, 2006).

To conclude, the results of pre-test and post-test procedure suggest that educational blogging is an effective activity to promote students perceptions or attitudes toward Web as a learning tool. In addition, the qualitative results supports the results of pre-test and post-test procedure by revealing positive contributions of educational blogging to the perceptions and thoughts of the students toward Web as a learning tool. Also, the qualitative results suggest that blogging for educational purposes make contributions to the students' knowledge in the field. Thus, educational blogging can be considered as a convenient activity to improve the students' perceptions toward Web as a learning tool, and to enhance the knowledge of the students in fields such as science and technology.

Abstract

In a study done by George (2000) cooperative learning is defined as the obtaining of knowledge in a setting involving more than one student. On the other hand, Jacobs and Ward (2000) identified it as a combination of styles used by learners and their peers in order to improve the learning process. Dentistry is a branch of medical field that incorporates cooperative learning as part of its clinical course. Since cooperative learning can be used with other instructional strategies and altered to cater to different subject areas, clinical pairing can be viewed as its implementation. Studies are being conducted to show the scholar's concerns about the consequences that assists/hinders the clinical teaching in health care program. Therefore, it is indicated that clinical teaching is equally important as the theory part taught in a class by lecturers. Most dental students are usually subjected to experience clinical pairing since clinics are an inseparable part of the health related/medical major's curriculum. Current study aimed to assess the student's perception on clinical pairing in dental settings. The sampling method for this study is convenience sampling. Participants were year II and III dental students. Findings indicated that majority of the students have the knowledge on why the clinical pairing was introduced but interestingly they still prefer to work alone which indicate that students' acceptance level of Clinical pairing implementation is low.

Key words: clinical pairing, cooperative learning, clinic environment, cooperation

INTRODUCTION

Concept of Cooperative Learning

In a study done by George (2000) cooperative learning is defined as the obtaining of knowledge in a setting involving more than one student. On the other hand, Jacobs and Ward (2000) identified it as a combination of styles used by learners and their peers in order to improve the learning process. Although it is referred as the settings or the styles in obtaining knowledge, Hall (2006) stated cooperative learning as the situation in which learners with a common target work together to achieve their goal or in other words, sharing the experiences with the peers who have similar learning goals.

Cooperative learning is one strategy which has a strong foundation in research. (For reviews, see Cohen, 1994; Johnson & Johnson, 1987, 1999; Slavin, 1995). The cooperative learning potential is also apparent to researchers; its advantages and disadvantage are globally well known (Ding, Xiaobao, & Kulm, 2007). Berkowitz and Bier (2003) stressed that cooperative learning "whether assessed in isolation or as part of character education initiative will result in better conflict resolution skills, greater cooperation ,and higher academic achievement, among other outcomes" (Berkowitz, 2003, p. 13). These findings suggest that cooperative learning promotes learning regardless of the subject area making it easy to adopt or modify to fit in with other modes of instruction. Furthermore, Johnson (1997) claims that CL is one, if not, the best – researched approaches in education. For example, one study on CL reported that content based language instruction was amenable to CL (Chamot & O'Malley, 1994).

Cooperative learning in dentistry

Dentistry is a branch of the medical field that incorporates cooperative learning as part of its clinical course. Since cooperative learning can be used with other instructional strategies and altered to cater to different subject areas, clinical pairing can be viewed as its implementation. Studies are being conducted to show the scholar's concerns about the consequences that assist/hinder the clinical teaching in health care programs. Therefore, it is indicated that clinical teaching is equally important as the theory part taught in a class by lecturers. The prospective of proper cooperation between these 2 categories (curriculum) can produce proper graduates in any dentistry school. Most dental students are usually subjected to experience clinical pairing since clinics are an inseparable part of the health related/medical major's curriculum. This cooperation between the theory and clinical teachings and activities can be considered as cooperative learning in dentistry.

One of the advantages in cooperative learning is the concept of its critical thinking and skills improvement which happens by learning from one another (Jbeili, 2003). This concept of cooperative learning is practiced as a clinical pairing in dentistry. Clinical pairing can be considered as a kind of cooperative learning, because in clinical pairing, interdependency, learning from each other and working in small group for common goals are the basic pillars. George (2000) indicated that these three concepts are among the important concepts of cooperative learning. Cooperative learning also enhanced student performance when used in teaching dentistry, chemistry, sociology, race relations and computer skills (Kogut, 1997; Maier & Keenan, 1994). Literature indicated that cooperative learning will increase students' tolerance of others in terms of different races/cultures in the learning environment.

Qualtrough (2001) indicated that the clinical pairing is not a new concept in dentistry. Clinical pairing refers to a situation in which two students are involved in the clinic; one treats the patient while the other assists him or her. The exchange of knowledge between the operator and assistant will improve the treatment procedures. An earlier study by Hodgson (1975) cited in Qualtrough (2001) stated that the clinical pairing was practiced due to the insufficient number of dental nurses to assist the students but later it turned out to be useful in several ways. This clinical pairing can be the source for early practices of "assistant

procedures", "shorter" appointment will be assigned for the patient visit and finally there will be sufficient use of the space. There are many other benefits which can be gained from this cooperation between the operator and assistant. Students believed that one of the positive products of this cooperation is the dentist-patient relationship from the "objective" point of view.

Objective of the study

1. To assess students' perception on clinical pairing in dental setting.

METHODOLOGY

This research is part of an ongoing educational research conducted by the Department of Conservative Dentistry, University of Malaya. It is aimed at evaluating students' perception on the four handed dentistry concept.

The sampling method for this study is convenience sampling. The study population was 148, year II and III dental students, University of Malaya. These students have experienced both the double and four handed dentistry.

In order to achieve the study objectives, quantitative approaches were employed to achieve optimal results. A questionnaire was designed by lecturers in the Faculty of Dentistry and validated. The instructional review board at the Faculty of Dentistry, University of Malaya reviewed and approved the survey as well as other related documents. All lecturers in the department were briefed on the procedures and the questionnaires were then distributed to the students.

The questionnaire comprised 4 questions designed to extract the relevant information on students' perception on clinical pairing. This survey is the combination of open ended question and questions with 7-point Likert scale (from 1 = not satisfactory to 7 = very satisfactory).

The survey starts with investigating students' knowledge and their reasons for agreeing or disagreeing with clinical pairing. The researchers decided to categorize the data into 6 main themes namely: work related (Q), patient related (PT), partner related (P) Lecturer related (T) Infection control (IC) and leaning environment (L). Table 1 displays the themes in detail. All the data were entered into the SPSS program; all the aforementioned themes were defined by the researchers. The following are the definition by the researchers:

Table 1. Coding System for data analysis

Themes	Definition
Learning environment(L)	The use and organization of the clinical setting in four-handed dentistry during daily practice, its practicality and the social atmosphere. It includes following dimensions: Practicality, Real life situation, Four-handed dentistry, Teamwork, Assimilate real life clinical situation, Practicality of four-handed dentistry
Patient related	Patient related refers to student-patient relationship and all associated issues. It comprises: Patient, Satisfaction, Patient issues, Relationship between student-patient
Infection control	Infection control refers to all issues related to procedures, practices and techniques in preventing spread of infections, including all issues
Lecturer related	Lecturer related refers to student-lecturer relationship and all associated issues including Student perception toward the lecturers in practicing four-handed dentistry. Including Student –lecturer relationship, Student perception toward the lecturers

Partner related	Partner related refers to student-student relationship in clinical pairing and all associated issues. Including Communication, Time management
Quality related	Quality referred to standard of clinical performance, measurement of productivity and clear documentation of clinical management. It covers Productivity, Standard Legislation

RESULTS

Students' knowledge on pairing and reason (s) for its introduction

The following analysis in Table 2 indicated that 93.9% of the students have knowledge on why the clinical pairing was introduced and only 6.1% have no idea about the concept of clinical pairing. When asked to specify the reasons for the introduction of clinical pairing, responses indicated that among the themes defined by the researchers (learning environment, quality related, patient related, infection control related, lecturer related and partner related), the quality related factors (48.1%) ranked the highest followed by infection control (22.4%), learning environment (15.4%), remaining factors were reported less significant (Refer to Table 1).

Table 2 Students' Perceived Reason(s) for Introduction of Pairing

Q2. If the answer to question 1 is yes what are the reason(s)?	
Dimensions	**Percentage**
Quality	48.1%
Infection control	22.4%
Learning Environment	15.4%
Patient related	10.7%
Partner related	2.2%
Lecturer related	1.1%
Total	**99.9%**

Acceptance of clinical pairing

The following Table 3 indicated the students' acceptance level on clinical pairing. Based on Table 3, students' responses to question 3 aimed to rectify students' acceptance level toward the clinical pairing concept. The majority (85.5%) of the students indicated that they are willing to have Friday afternoon session free; that means their preference is to work alone. However only (13.8%) of the class were not willing to work independently and 0.7% did not answer the question.

Table 3Acceptance of clinical pairing concept among the dentistry students.

3. Will you like to have the Friday afternoon session free for you to treat patients without a partner, i.e. all student call patient to treat their own patients?		
Yes	124	85.5%
No	20	13.8%
No Answer	1	0.7%
Missing	3	0
Total	148	100%

Rationale for student preference to work alone

The following Table 4 indicated the students' acceptance level on clinical pairing. Based on Table 4, students' responses to question 4 aimed at identifying their acceptance level toward the clinical pairing concept. Learners believed that the first and most important factor to convince them to accept the clinical pairing is its impact on quality related (55.8%) issues as the highest followed by learning environment (40.1%), partner related (3.3%) and lecture related (1.4%) as the lowest among other factors. Reasons for preferring to work alone were highly dependent on quality issues (55.8%) and learning environment (40.1%) compared to partner or lecturer issues.

Table 4 The Rationale for Clinical Pairing Concept Acceptance Among the Students

4. Please provide some reasons for your response to question 11.	N	%
Quality		55.8%
Learning environment		40.1%
Partner related		3.3%
Lecturer related		1.4%

DISCUSSION

In this study the students' perception toward the clinical pairing was examined among the year II and III dental students. The results revealed that 93.9% percent of the dental students are aware about the reasons why clinical pairing was introduced. Students highlighted the quality related (48.1%) and infection control (22.4%) issues followed by learning environment (15.4%).

Choosing quality related issues as the highest among the other factors indicated that the students are concern about the increasing the efficiency and knowledge sharing, some of the students express their concern about the quality with statement such as "to achieve better quantity of work", "operator can pay full attention to the patient to complete treatment faster" and "better clinical management" and many more and statements such as "we have more opportunities for learning", "to create a better working environment", "to decrease the lecturer student ratio, so the lecturer can attend to the students faster" and "it prepare students to real situations for patient treatment when they go out". Student's rationales for disliking the clinical pairing weigh heavily on partner related issues 45.2%. Students have no interference in their partner selection, the partner can be any one of the student who is assigned by the faculty. Clinical pairing is not a new concept but within the study scope is considered new due to logistics constraints. This study assesses the perception of the students toward the clinical pairing to gauge students' acceptance of clinical pairing if it is being implemented. It also tried to find out what are the shortcomings of the clinical pairing in order to enhance its application.

Majority of the students perceive that they have the knowledge and most of them believed that it improve the quality but interestingly with high knowledge on clinical pairing by students, still nearly 70% of them prefer to work alone which indicate the students acceptance level of clinical pairing implementation is low. It can be hypothesized that students didn't answer the question honestly or the knowledge of the clinical pairing is still lacking. However, this study recommends the further probing into factors that may affect the knowledge and acceptance of clinical pairing among the dental students.

Considering the nature of the clinical pairing, communication is the key factor among the pairs in clinics. If they are unable to understand and cope with each other then the main concept of pairing is not successful which is due to lack of proper communication. The reluctance to take part in clinical pairing can thus be explained by the fact that the students are not allowed to be involved in partner selection.

ABSTRACT

This study examined the phenomenon of students learning information skills from the multiple perspectives of Malaysian higher education teachers, librarians and students as they jointly engaged in student information skills programs. Using qualitative research approach, the study observed student information skills programs, examined the programs' teaching and learning resources, and interviewed teachers, librarians and students who were engaged in the programs. The findings suggest that participants viewed students learning information skills as students participating in information practices. The practices consist of students articulating the needs to participate in information practices, identifying information sources, accessing information sources, interacting with information sources, using information from different information sources to reach new understandings, and negotiating the understandings with collaborators of learning. Furthermore the study found that students' participation in information practices is characterized by independent and collaborative ways of students engaging with information sources, information from different sources, collaborators of learning and their prior understandings. The findings are essential to assist higher education communities to transform higher education students into knowledge creators as required by the national education framework.

BACKGROUND OF THE STUDY

Information skills are defined as a series of abilities of identifying the need for information; locating, accessing and organizing information and its sources; evaluating and selecting information and its sources; analyzing and synthesizing information from different sources to create new understandings; using the understanding to accomplish a specific purpose; and accessing and using information and its sources ethically and legally (Association of College and Research Libraries, 2000; Bundy, 2004; Society of College National & University Libraries, 1999). While UNESCO (2006) identified information skills as an extension of reading and arithmetic abilities necessary for individuals and their communities to function and progress, Bundy (2004) attributed the skills to the 21st century university students and lifelong learning. In Malaysia, student information skills programs were first introduced in higher education institutions during the 1990s when the government called for institutions to develop knowledge workers to run the local knowledge economy. Defined as those who are fluent in using information technology, knowledge workers are also known for their ability to access, use, synthesize and construct information (Economic Planning Unit, 2006). Following this requirement, the institutions, via their academic libraries offered student information skills programs to assist students to acquire skills of searching, accessing, and organizing information and its sources. Later, the introduction of the Malaysian Qualification Framework (Malaysian Qualifications Agency, 2007) into the national education system further reinforces students' demonstration of information skills in higher education. In the framework, information skills are highlighted as parts of series of desirable learning outcomes for higher education students to demonstrate, necessary for the students to graduate. The framework also implies that information skills teaching and learning in higher education is moving beyond academic libraries and toward classroom learning.

STATEMENT OF THE PROBLEM OF THE STUDY

Although Malaysian universities have been conducting student information skills programs via their academic libraries since 1990s, a review of literature (e.g., Chan, 2003; Edzan & Mohd Saad, 2005; Mohd Saad &

Awang Ngah, 2002) suggested these programs were focusing on students searching information and its sources. Similarly, Karelse (1998) and Reid (1998) also viewed that the programs were emphasizing students searching and accessing information and its sources using information and communication technology application, while overlooking students analyzing and synthesizing information. These observations suggested that student information skills programs in Malaysian higher education did not follow standards and frameworks for information skills in higher education (e.g., Association of College and Research Libraries, 2000; Bundy, 2004; Joint Information Systems Committee, 2002), which clearly state that students' ability to analyze and synthesize information as parts of information skills. While more studies have been conducted to understand students learning information skills in Malaysian higher education (e.g., Abdullah, Ahmad Kassim, Mohd Saad, Tarmuchi, & Aripin, 2006; Edzan, 2007), these studies focused on assessing levels of information skills among Malaysian higher education students. While these findings are helpful to estimate levels of information skills perceived to be acquired by the Malaysian university students, they are insufficient to collaborate or refute the view that student information skills programs in Malaysian higher education might be different from the established information skills standards and frameworks for higher education. Previous studies such as by (Maybee, 2007), (Kuhlthau, 2004), (Yoon, 2007), (Floyd, Colvin, & Bodur, 2008), (Boon, Johnston, & Webber, 2007), (Bruce, 1997), and (Lupton, 2003) might help us to understand students learning information skills in higher education. However, these studies only examined the phenomenon using a single or dual perspective of those involved in students learning information skills programs. Following the Malaysian Qualification Framework, which implicitly shifts students learning information skills beyond the universities' library and toward the classroom learning, we will gain a better understanding of the phenomenon in the context of Malaysian higher education if we investigate the phenomenon using the multiple perspectives of teachers, librarians and students who are jointly engaged in student information skills programs.

RESEARCH PURPOSE OF THE STUDY

This study investigated the phenomenon of students learning information skills in the context of Malaysian higher education using the multiple perspectives of teachers, librarians and students as they jointly engaged in the phenomenon.

THEORETICAL FRAMEWORK OF THE STUDY

This study employed a social psychological approach to examine the phenomenon of students learning information skills in the context of Malaysian higher education which is drawn from the perspectives of communities of practice (Wenger, 1998) and symbolic interactionism (Charon, 2007). The concept of communities of practice views learning as a process of social participation and identity construction in communities which learners belong to. Following this perspective, the study further assumed the phenomenon is social, conscious and a joint effort between members of different communities in higher education institutions, that is, teachers, librarians and students. As teachers, librarians, and students participate in the phenomenon, they continuously construct, negotiate, and reify knowledge and ways of knowing about students learning information skills in the context of practices of communities that they belong to.

However the study further assumed teachers, librarians, and students are not merely members of different communities; each of them is also a human being with unique ways of thinking, feeling and doing. Accordingly, to highlight personal aspects of those engage in student information skills programs, this study also employed the perspective of symbolic interactionism to guide the understanding of the phenomenon under study. Situated within social psychology (Charon, 2007), symbolic interactionism can be traced to George Herbert Mead, John Dewey and other educators and is identified as one of the approaches to study behaviors of individuals and their communities (Blumer, 1969; Charon, 2007; Robbins, Chatterjee, & Canda, 2006). While communities of practices emphasizes the social aspects of the phenomenon, that is the jointly engagement of teachers, librarians, and teachers in students learning information skills, symbolic interactionism suggests that the phenomenon could be further understood by examining the personal aspects of those engage in the phenomenon, that is their assumptions or beliefs, perceptions and actions (Charon, 2007). Accordingly, this study examined the perception of teachers, librarians, and students about students learning information skills as they jointly engaged in student information skills programs.

RESEARCH QUESTION OF THE STUDY

How do teachers, librarians, and students perceive students learning information skills as they jointly engaged in student information skills programs?

RESEARCH APPROACH AND DESIGN OF THE STUDY

This study employed a qualitative research approach which is defined as qualitative research strategies (Bogdan & Biklen, 2007). These strategies are characterized by real and information rich cases; flexible and emergent research design; researchers' personal engagement and experience; multiple perspectives of understanding the phenomenon; inductive and creative ways of analyzing and synthesizing data; unique findings from cases and overarching findings across cases; as well as locate the findings in social, historical and temporal context where the phenomenon is being studied (Merriam, 2009; Patton, 2002). Although a qualitative research approach have been widely employed to investigate students learning information skills from the perspective of higher education educators and librarians (e.g., Boon et al., 2007; Bruce, 1997; Doyle, 1992), and students (e.g. Lupton, 2003; Maybee, 2007), the approach is yet commonly employed to triangulate the multiple perspectives of higher education teachers, librarians and students as they jointly engage in student information skills programs. Following the study's research approach, this study selected one university in Malaysia as the setting of the study, which offered students information skills programs and provided an access entry for the study to collect data. Working closely with librarians in the university library, the study selected and observed five student information skills programs that were jointly engaged by teachers, librarians and students, and later examined teaching and learning resources of the programs. Both observation and examination assisted the study to develop interview guidelines, which guided the semi-structured interviews with five teachers, four librarians, and 18 students who were engaged in the programs and willing to participate in the study. The study further employed Merriam's (2009) steps for analyzing the qualitative data. Guided by the research question, the study used bucket, open and analytical coding to construct a meaningful "classification system" (Merriam, 2009, p. 180) of students learning information skills, which suggests patterns and regularities for students learning information skills. The study further employed cross-case matrices to identify possible explanations across cases (participants) and sources (program observations, resource examinations, and interviews) to answer the research question. The study also used Nvivo programs in the data analysis process to electronically organize, revise, and retrieve parent and child nodes/codes/categories and their respective references for data from the interviews.

RESEARCH FINDINGS AND DISCUSSION

The study's observation on student information skills programs suggested that students learning information skills are students identifying the needs to engage with information sources, students identifying information sources that help them to satisfy the needs, and students accessing the identified information sources via various searching tools and strategies. Likewise, examination of teaching and learning resources of the programs, such as teaching aids used by the librarians during the programs, student information skills assignments, and the programs' evaluation forms also indicated similar findings. However, interviews with teachers, librarians and students indicated that students learning information skills are about students participating in certain practices, known in this study as student information practices, which students are expected to perform when they engage with information sources, information from different information sources, collaborators of learning, and their prior understanding.

Participants further viewed that student information practices consist of six interrelated practices which begin with students articulating the needs to participate in information practices. Teachers described the needs as "skeleton" of students' inquiry, "questions" of students' classroom assignments, and topics of students' thesis. Similarly, librarians associated the needs with students' research topics or titles, which students should further refine into searchable keywords. Students also associated the needs with topics of their thesis, lectures, and classroom discussions and assignments. Participants viewed students' articulation of the needs is essential to enable students to access information sources relevant to their working topics, as well provide contexts for students to undertake their information practices, such as classroom learning, thesis examination, seminar presentation, and journal publication. The second practice of student information practices is students identifying information sources that will satisfy their needs. While librarians viewed that the identification

should be strictly driven by students' topics and keywords, teachers' and students identify electronic and online information sources, such as journal articles and internet websites, as information sources that students should engage in their information practices due to the currentness of information available in the sources, as well as the sources provide easy, fast, and full text accessibility to students regardless of time and place. Respectively, librarians viewed that their primary task in student information skills programs is to expose students to all information sources available in and subscribed by the library, while teachers and students expected librarians to expose students to information sources that that are easy and fast to access and provide latest and comprehensive information on students' topics of inquiry.

The third practice of student information practice is students accessing information sources that they had identified earlier. Both teachers and librarians associated the practice with students using various gateways for students accessing information sources. Among the gateways identified by teachers and students are the university library, librarians, website and online cataloging system; online and electronic information databases subscribed and developed by the library; as well as open access databases. Particularly teachers associated the practices with students using specific procedures to interact with search engines of the gateways in order to access relevant information sources available in the databases. However, as the university is moving toward outcome-based and self-accessed learning, teachers perceived that interactive, self-accessed and electronic or platform would better inform students about the library collections and ways to access these collections without the need for students to join information skills programs or see librarians at the library helpdesk. Likewise students highlighted that student inaccessibility to online library collection outside the university premises is the reason that limits their access or use of the collection or sources. The fourth practice of student information practices is students interacting with information sources. Given students have access to unlimited number of information sources, teachers, librarians and students associated the practice with students browsing, evaluating and selecting different information sources that really matter to the needs of students' information practices before printing or saving or collecting the sources. While teachers viewed these actions is a linear process, students reported that after collecting the information sources they re-engage in another cycle of students interacting with information sources in order to select information sources that they would use in their information practices.

The fifth practice of student information practices is students using information sources to develop new understandings. Teachers and students associated this practice with students "digesting" or "processing" information from different information sources which consists of students reading, analyzing and synthesizing information from the sources into a meaningful, coherent and systematic "conclusion", "idea" or "understanding". Students reported that this is the most complex practice that they need to perform in student information practices, and suggested that previous experiences or trainings in this practice would help them overcome the complexity. Finally, the sixth practice of student information practices is students negotiating their understanding via developing and presenting the understanding to collaborators of learning via certain artifacts of the understanding. Among the collaborators of learning identified by teachers and students are students' classroom teachers and peers, thesis supervisors, and experts and practitioners in the topics of students' inquiry. Additionally, while teachers listed librarians as one of the collaborators of learning, students did not share the view. Moreover, the study found that students' artifacts of understanding are ranging from students' research writing and verbal presentation for their classroom assignments and activities, students answering their teachers' questions during classroom learning, students answering their final examination, students writing and presenting their thesis for examination, and students writing a research report for journal and conference publication and presentation. One teachers also viewed that students' sitting arrangement in their classroom learning is also constitutes students' artifacts of understanding.

Lastly, the study found that goals of students participating in information practices characterize ways of students participate in the practices. For example teachers associated the goals with transforming students into independent and lifelong learners, scholars, acceptable members of students' discipline of knowledge community, and talented individuals. Similarly, librarians identified the goals with transforming students into lifelong and informed citizens, while students associated the goals with becoming experts in their field of study and contributors to the well-being of their families, and local and workplace communities. However, most students associated their goals with receiving good grades from classroom assignments and final

examination, and completing their university study. Additionally a few students attached the goals with emotional dimensions, such as, they enjoyed to negotiate their understanding during classroom learning and received "exposure" or recognition from the classroom teachers and peers as the result of the practice. Further analysis on these goals suggested that students participating in information practices are characterized by collaborative ways of students engaging with information sources, information from different sources, collaborators of learning, and prior understandings and independently reach and negotiate their new understanding with the collaborators of learning.

CONCLUSION

Students learning information skills are central topics in transforming students into lifelong learners, knowledge creators and members of knowledge society. The discussion above is intended to clarify how information skills are conceptualized collectively by higher education teachers, librarians, and students while they engaged in student information skills programs. The study found that the teachers, librarians, and students viewed student information skills ascertain practices, known in this study as students information practices, that students are expecting to perform when they are engaging with information sources, information from various sources, collaborators of learning and prior understandings. While the study found that student information skills programs focus to students accessing information and its sources as reviewed by previous literature (e.g. Karelse, 1998; Reid, 1998), the study also found that the programs are only parts of students learning information skills. The rest of the phenomenon is located in the students' classroom learning as well as in students' independent and collaborative ways of engaging with information sources, information from various sources, collaborators of learning and prior understandings. The study also found that by emphasizing student information skills as student information practices, we allow students to take charge of their participation in information practices as well as tailor the practices to suit social or personal practices that they are currently engaged with. On the other hand, viewing information skills as practices also complicated the understanding of students learning information skills because the phenomenon could no longer be seen as students acquiring a set of skills or abilities, but students developing and performing certain practices that are seen by teachers, librarians and students as meaningful to students. Respectively, understanding and integrating social and personal practices of those engaged in student information skills programs are the ways to move forward to help students developing information skills in higher education.

Özet
Bu araştırmanın amacı doğrudan bir programlama dili öğretilen ve yalnızca algoritma öğretilen öğrencilerinin algoritma oluştururken yaşadıkları güçlüklere ilişkin görüşlerini ortaya koymaktır. Bu araştırma, sontest kontrol gruplu yarı deneysel hem nicel hem de nitel karakterli bir çalışmadır. Bilgisayar ve Öğretim Teknolojileri Öğretmenliği Bölümü 1. sınıfında öğrenim gören 45 öğrenci, araştırmanın çalışma grubunu oluşturmaktadır. Araştırmanın verileri araştırmacılar tarafından hazırlanan Görüşme Formu kullanılarak toplanmıştır. Görüşme Formu dokuman inceleme yöntemi yardımıyla değerlendirilmiştir. Erişilen sonuçlardan bazıları şöyle özetlenebilir: Öğrencilerin büyük bir bölümü algoritma tasarlama sürecinde güçlük yaşamaktadır. Yalnızca algoritma öğretilen grup, doğrudan bir programlama dili öğretilen gruba göre bir problemin çözümünü planlama ve matematiksel işlemler gerektiren problemlerin çözümü konusunda daha az güçlük yaşamaktadırlar.
Anahtar Kelimeler: Algoritma, Programlama, problem çözme

INTRODUCTION

Individuals who are to work in fields that require knowledge about information technologies, computer training and programming may need sufficient knowledge about computer programming. Since knowledge of programming languages is of great importance for programming skills, programmers should arguably possess a maximum level of knowledge about the characteristics of programming languages. Therefore, it is very important to teach programming skills (Robins et al., 2003) as these skills are regarded as among the fundamentals of both computer sciences, and computer teacher training programs.

Possessing programming skills is also important for a career in the information industry. Thus, although the popularity of the courses of introduction to programming has been on the rise in higher education, failure and disappointment are quite common as acquiring this skill is hard and requires a lot of effort (Dreyfus and Dreyfus, 1986; Winslow, 1996). In fact, Gomes and Mendes (2007) state that problems are experienced in the process of teaching programming skills in terms of academic achievement and students' satisfaction levels. One of the main reasons behind students' failures in programming courses may be the traditional methods commonly used to teach programming languages, and the instruction tools that disregard students' characteristics. In addition, the general lack of knowledge among students about the problem solving process, and about how to design a program or algorithm (Lawrence et al., 1994; Jenkins, 2002), may also lead to failures. Boulay (1986) underlined the importance of problem solving skills in the programming process. Similarly, Spohrer and Soloway (1986), Winslow (1996) and Soloway et al. (1989) stress the fact that many students experience problems in understanding the algorithmic structure in the programming process.

Students' problems in learning programming skills can certainly be attributed to many factors. Chiefly among them is the inherent complexity of the programming process, the tendency to overlook the fact that this process requires special teaching approaches, the need for strenuous efforts to learn, and the lack of skills to use mathematical knowledge in the programming process (Lawrence et al., 1994). Jenkins (2002) listed the main teaching methods that might cause problems in teaching programming skills as follows: 1. The instruction process based on the overall classroom environment, and the lack of one-to-one teaching with students. 2. Instructors who disregard their students' learning styles, and overlook individual learning preferences. 3. The passive attitude in learning environments of students who simply watch presentations or follow what is written on the board. The disregard for students' learning styles in

the learning process may result in learning difficulties for many students (Kolb, 1985), for these students usually prefer active and interactive environments. Furthermore, most teachers tend to base their teaching on memorising verbal presentation of information and details, instead of establishing, and emphasising, a link between algorithms, and problem solving in the process of teaching programming skills, encouraging students to be active, and presenting them with up-to-date examples.

Programming skills can mainly be examined in two categories, which are (a) the perspective of professional software engineering that requires experience and teamwork, and usually aims at large-scale software projects, and (b) the educational-psychological perspective that is rather based on individual learning, and requires program writing skills for a problem with defined limits (Boehm, 1981; Brooks, 1995; Humphrey, 1999). The present study deals with the problems and solutions in individual programming skills or the educational-psychological perspective which influences one's possession of programming skills to solve any defined problem.

Research in the field of education frequently addresses the problems experienced in learning abstract concepts. Such difficulties usually arise since abstract concepts are not adequately associated with real life or are not made concrete enough (Dede et al., 1999). These problems are also frequently experienced in teaching programming skills, and are always found in the programming process which requires multiple abstract operations (Katai et al., 2008).

Various solutions have been offered to overcome the above mentioned learning difficulties experienced by students in acquiring programming skills. One solution for students is to take an introductory course to programming to learn effective algorithm design skills before directly taking a programming course, which could be an effective solution for the problems experienced in teaching programming skills. In other words, prior learning of algorithm design skills is argued to be important for better learning of programming skills (Özdener, 2008). However, although the literature lacks adequate evidence of whether teaching algorithm skills prior to programming training contributes to programming skills, and if it does, what the extent of such contributions is, it could be argued that algorithm designing skills could be important for developing programming skills and those students' possible difficulties in the process of algorithm designing may adversely affect their programming skills. On the basis of this assumption, the present study aims to reveal what students think about the difficulties they have in the process of designing algorithms.

METHOD

The present study is a posttest control group semi-experimental study with both quantitative and qualitative characters. Most of the students in the study groups graduated from general high schools and had no previous training about programming processes. The sample consists of a total of 45 students in their first year in the Department of Computer, and Instruction Technologies in an Education Faculty, of whom 23 are female and 22 are male.

For five hours a week for four weeks, experiment group I was taught the concepts of program, command, algorithm, flow chart, constant, condition and cycle, and example questions were analysed about how to develop an algorithm. The students were presented with explanations and examples about what strategies they should follow in the problem solving process. At every stage of the instruction, the students were made to develop algorithms to solve different exemplary problems and were provided with instant feedback and corrections for their mistakes. At the end of each session, they were given problem statements as extracurricular activities, which they were asked to solve for the next session.

Similarly, for five hours a week for four weeks, experiment group II was also taught the concepts of variable, Visual Basic editor, program, command, algorithm, flow chart, constant, condition and cycle and basic commands in Visual Basic. Next, example questions were analysed about how to develop a program piece. The students were presented with explanations and examples about what strategies they should follow in the problem solving process. At every stage of the instruction, the students were made to develop code pieces to solve different exemplary problems and were provided with instant feedback and corrections for their mistakes. At the end of each session, they were given problem statements as extracurricular activities, which they were asked to solve for the next session.

The exemplary problems and extracurricular activities used in both groups are the same. However, solutions were formulated as algorithms in experiment group I and as pieces of Visual Basic program in experiment group II. As a result, experiment group I used algorithms to solve a problem, while experiment group II used Visual Basic commands.

In order to identify students' opinions about the kinds of problems they experience in algorithm designing process, an interview form was developed and the students were asked to respond in writing to the questions in this form. During the process of formulating the questions, we considered that the process

of algorithm developments takes place in two stages, which are designing a solution by analysing the problem and applying the designed solution. As a matter of fact, the literature contains evidence that these stages are the basic stages in problem solving process (Schoenfeld, 1992; Harskamp, Suhre, 2007; Kızılkaya, Aşkar, 2009). In this framework, the students were asked the following questions:

1. What are the problems you experience in the process of problem analysis and solution planning when you are to write an algorithm to solve a problem?
2. What are the problems you experience when writing a solution you design in the form of an algorithm?
3. What do you think is the primary problem of first priority that you are faced with during the entire process of developing an algorithm?

The interview form used to identify the students' difficulties was analysed by the researchers using the document examination method; similar ideas were grouped to calculate their frequencies and rates. In cases where a student expressed multiple opinions, all opinions were taken into consideration. Thus, frequencies for some ideas were found to be greater than the sample size.

RESULTS

Table 1 summarises student responses to the following question: "What are the difficulties you have in the process of problem analysis and solution planning when you are asked to write an algorithm to solve a problem?"

Table 1. The Difficulties in Problem Analysis, and Solution Planning for Students

Difficulties Experienced in Problem Analysis	I. Exp. Gr		II. Exp. Gr	
	f	%	f	%
I do not have any difficulty in planning a solution for a problem. I understand a problem, and find out what operations are required.	9	40,9	6	20,7
I understand the problem but cannot design the solution.	8	36,4	10	34,5
When writing an algorithm, I cannot decide on the sequence of operations at the stage of problem analysis.	2	9,1	4	13,8
Since my knowledge of mathematics is inadequate, I have much difficulty in finding out the solution in cases where complex mathematical operations are required.	3	13,6	9	31,0
Total	**22**	100	**29**	100

As is clear from Table 1, concerning the difficulties experienced in problem analysis process, 40.9% of the students who were simply taught algorithms stated that they had no problems in the process; 36.4% experienced problems about mentally designing the solution; 13.60% had difficulties in finding out the solution in cases that require complex mathematical operations since their knowledge of mathematics is inadequate; and 9.1% stated that they had difficulties in determining the sequence of operations needed. As for the students who were directly taught a programming language, 34.5% stated that they had problems in mentally designing the solution; 31.8% had difficulties in finding out the solution in cases that require complex mathematical operations since their knowledge of mathematics is inadequate; 20.7% had no problems in the process; and 13.8% stated that they had difficulties in determining the sequence of operations needed. It could be concluded that the group who were simply taught algorithms had less difficulty in planning a solution for a problem and solving problems that require mathematical operations when compared to the group directly taught a programming language. On the other hand, a significant part of neither the students who were directly taught a programming language nor those who were simply taught algorithms had any difficulty in understanding a problem but both had difficulties about solutions.

Table 2 summarises student responses to the question "What are the problems you experience when writing a solution you mentally design in the form of an algorithm?"

Table 2. Difficulties in Expressing Solutions as Algorithms according to the Students

Difficulties Experienced in Developing Algorithms	I. Exp. Gr		II. Exp. Gr	
	f	%	f	%
I do not have much difficulty in writing a solution I mentally design as an algorithm.	2	7,1	2	7,7
I cannot express the steps I mentally design in the form of an algorithm (I do not know how and where to start).	9	32,1	13	50,0
I experience problems with cycles.	6	21,4	3	11,5
I have problems about condition statements.	6	21,4	1	3,8

I have difficulty in identifying and using variables (particularly index variables).	5	17,9	3	11,5
I can easily write codes using Visual Basic but have difficulty in converting them into algorithms.	-	-	4	15,4
Total	**28**	100	**26**	100

As seen in Table 2 concerning the difficulties experienced in the algorithm development process, 32% of the students simply taught algorithms had difficulties in expressing the steps they mentally design in the form of algorithms; 21.4% had difficulties both in cycles and condition statements; and 17.9% had troubles in the use of variables. As for the students directly taught a programming language, 50% stated that they had difficulty in expressing the steps they mentally design in the form of algorithms; 11.5% had difficulty in both cycles and the use of variables, while 15.4% stated that they did not have any difficulty in writing codes using a programming language but have trouble in expressing these solutions in the form of algorithms. Furthermore, a very small part of both student groups (7.1% of those simply taught algorithms and 7.7% of those directly taught a programming language) stated that they did not have any difficulty in developing algorithms. Thus, a majority of both student groups arguably had problems in the process of designing algorithms. On the other hand, the students simply taught algorithms had the greatest difficulty in expressing the solutions they design in the form of algorithms, in cycles, condition statements and the use of variables, while those directly taught a programming language usually had difficulty in expressing solutions as algorithms.

Table 3 summarises the student responses to the question "What do you think is the primary problem of first priority that you are faced with during the entire process of developing an algorithm?".

Table 3. Primary Problems of First Priority in the Process of Algorithm Development for the Students

Primary Difficulties of First Priority Experienced during the Entire Process of Algorithm Development	**I. Exp. Gr**		**II. Exp. Gr**	
	f	**%**	**f**	**%**
I have difficulty in determining where and how to use variables	4	18,2	1	4
I cannot be sure about how to design cycles.	4	18,2	1	4
My primary problem does exactly not know about the concept of algorithm, and where to use algorithms.	2	9,1	0	0
Failure to comprehend the logic of algorithms	3	13,6	1	4
I cannot put algorithms down on paper.	2	9,1	3	12
I have trouble in establishing links between mathematical logic and algorithmic logic.	1	4,5	3	12
Analysing and envisioning problems.	4	18,2	11	44
Lack of experience.	2	9,1	5	20
Total	**22**	100	**25**	100

As is clear from Table 3, the aspects about which the students had the greatest problems in the algorithm development process include variables, cycles, problem analysis and envisioning solutions, respectively, for the group simply taught algorithms (18.2%), and problem analysis and envisioning solutions for the group directly taught a programming language (44%). On the other hand, 20% of the students in this group attribute their problems to their lack of experience. Therefore, it could be argued that more problems are experienced in variables, cycles and problem analysis by the students simply taught algorithms, and in problem analysis and envisioning solutions by those directly taught a programming language when compared to other skills.

CONCLUSION AND DISCUSSION

According to the student opinions, the group simply taught algorithms have less difficulty in planning a problem solution and solving problems that require mathematical operations when compared to the group directly taught a programming language. Each programming language has its peculiar writing rules. On the basis of such writing rules, mathematical statements differ from standard statements used in daily life. For instance, "a=a+1" is used to increase a variable's value in Visual Basic, whereas statement a++ is used in C# for the same operation. Such statements are used in the form of standard mathematical statements while teaching algorithmic logic. Thus, a lack of understanding about the mathematical statements peculiar to programming language among the students directly taught a programming language might have resulted in greater difficulties for them in finding out solutions involving complex mathematical operations when compared to the students simply taught the algorithmic logic. The troubles experienced by mathematical statements by the students directly taught a programming language might have complicated their problem analysis process. On the other hand, a significant part of both students directly taught a programming language and those simply taught algorithmic logic did not have any difficulty in understanding the problems but had troubles about

solutions. This could be attributed to underdeveloped algorithmic thinking, critical thinking, mathematical thinking or problem-solving skills on the part of students.

The greatest difficulties are experienced in expressing a design solution in the form of algorithms and the use of cycles, condition statements and variables by the students simply taught algorithmic logic, and in expressing the solution in the form of an algorithm by the students directly taught a programming language. The students directly taught a programming language can easily see the results of cycles, and condition commands on the editor, which could have resulted in less difficulty with these subjects for them when compared to the students simply taught algorithms. In fact, some of the students directly taught a programming language stated that they were able to write code pieces using Visual Basic commands but failed to express the same code piece in the form of an algorithm. This might also have led to the greater troubles for these students in expressing the solutions they design in the form of algorithms when compared to those simply taught algorithmic logic. In fact, these students can easily follow the results of the Visual Basic codes they write using the editor, and, when necessary, use the trial-and-error method to solve the problems for which they have difficulty in designing solutions.

STUDENTS' PERCEPTIONS OF ONLINE LEARNING AND INSTRCTIONAL TOOLS: A QUALITATIVE STUDY OF UNDERGRADUATE STUDENTS USE OF ONLINE TOOLS

Dr. David A. Armstrong Ed. D.
DArmstrong@scu.edu

Abstract

The purpose of this study was to describe undergraduate students' experiences and perceptions of online courses based on interviews, observations, and online focus groups. I describe (a) motivational and learner characteristics within online classes, (b) the positive and negative aspects of online courses as experienced by students, (c) what instructors can do to improve the teaching of online courses, and (d) how undergraduate students' perceptions of the online learning environment and the tools used affects the selection of their approach to learning.

Data analysis from this study produced five primary findings across the four research questions. The first finding is the role of communication in shaping students' perceptions and approach to learning. The second finding is that participants did not perceive the negative attributes of technology to be inherent to the technology itself but in its use and implementations. Included in this second finding is that the tools used were not as important as the quality of communication and that the value assigned by students to any tool is influenced by the way the tool is implemented. The third is that course organization is key to student learning and success. The fourth is that student' approaches to learning appeared to be shaped by both the structure of the learning environment and the nature of assessments used in the online environment. Included in this fourth finding is students' perceptions of online learning as being less academically rigorous than their experiences in face–to–face education. The fifth is that students use nonacademic resources to locate information rather than the university library.

Presentation will consist of a summary of students' perceptions and an overview of methodology, including the movement from face-to-face focus groups to an online model and the use of think-aloud observations and interviews in collecting data on online student learning.

Introduction

The number of students taking at least one fully online class from an accredited university in the United States has grown significantly over the past decade. Between 2002 and 2007, the number of online students jumped 145%, from 1,602,970 to 3,938,111. Moreover, of the 17,975,830 students enrolled in degree–granting postsecondary institutions in the US in 2007, 21.9% were taking courses online (Allen & Seaman, 2008). This upward trend in online enrollment, which is expected to continue well into the second decade of the 21st century, clearly poses a number of challenges to the education community (Allen & Seaman, 2008). How will universities handle such a rapid increase in the number of online students? What alternative course delivery methods will best meet online students' needs? To date, much research has been focused on the former question and, in particular, on the technical aspects of online education such as access and information delivery. Research in the area of the latter subject is growing but has overlooked one critical aspect that needs to be understood if electronic learning (e–learning) is to be made more effective in the future: how do student perceptions impact their actions, approaches, and learning within the online educational environment?

Purpose

The purpose of this study was to describe undergraduate students' experiences and perceptions of online courses based on interviews, observations, and online focus groups. I describe (a) motivational and learner characteristics within online classes, (b) the positive and negative aspects of online courses as experienced by students, (c) what instructors can do to improve the teaching of online courses, and (d) how undergraduate students' perceptions of the online learning environment and the tools used affects the selection of their approach to learning.

Significance of the Problem

Research into the effectiveness of online instruction has looked primarily at individual implementations of instructional methods within a single class or set of classes taught by a single instructor (Means et al., 2009). Where this study differs is that it investigates online instruction in the typical faculty-developed course, that is, approaching online instruction from the student perspective in a mix of "typically" delivered and designed classes. These classes were not the exceptional online class designed to investigate a new or innovative online practice, they were simply what Edventures (2009) would term the current state of online instruction.

This study provides a rich, complex, and detailed picture of students within the online learning environment. By organizing the analysis of data and content around approaches to learning, learner–centered tools can be developed that promote deep learning approaches in undergraduate students during online learning experiences. Results from this study yielded recommendations for changes in the design of online and e–learning that encourage student learning that is aligned with faculty, student, and institutional perceptions of online education. Faculty may be expected to improve their online instruction through a clearer insight into the effects of course management tools.

Developing effective online learning environments is becoming a challenge for many universities. Current trends in education, which include shrinking funding, have spurred greater competitiveness among universities as they seek new ways to attract students not only in traditional environments but also in the online environment. In both, it is important to maintain academic integrity and to ensure high levels of student learning and by achieving a better understanding of students' needs in relation to their learning, online education can be improved an its value as an educational tool increased. By investigating ways that students perceive and interact with the learning environment, it may be that the design of the online learning environment can be better developed to support learning.

From a business of education standpoint, it is essential to remember that practitioners of education should not only be concerned with the number of degrees awarded but also the quality of student learning obtained in achieving those degrees. Thus, the focus of this study was on the students, who they are and how best they can be served.

Design, Collection, and Evaluative Framework

The methodology used in this study was derived primarily from research into student learning and the selection of approach, in the tradition of Marton and Sajjo (1976), Entwistle and Ramsden (1983), Biggs (1987), Prosser (1999), and Ramsden (2002). Central to this approach is the perspective of the student regarding both the process and outcomes of learning and instruction. Qualitative data-collection techniques were used to obtain and describe undergraduate student views on online instruction, online learning tools, and instructional processes. Three stages of data collection were used in this study these were (a) one-on-one open-ended interviews, (b) think-aloud observation, and (c) online focus groups. The main data collection was student interviews. Data from think-aloud observations and online focus groups were used to confirm findings from the interviews. Data were collected between the Summer and Fall academic sessions of 2008 at two sites. Additional data were collected in the Summer of 2010. This study will continue and be updated with data collection resuming in the Summer of 2011.

Setting

The sample consisted of 16 undergraduate students who had completed or were enrolled currently in an online course at one of the two universities. Students were recruited to participate in one or more of the data-collection methods; these were 11 in the interview process, 8 in the think-aloud observations, and 8 in the online focus groups: 5 in one group and 3 in the other group. Student participants were mostly in their mid–20s; 10 were female, and 6 were male. Three students participated in all three data-collection methods, five students participated in two of the data-collection methods, and eight students participated in only one data-collection method.

All students were drawn from religiously affiliated universities in Northern California. Both universities (S1 and S2) are primarily undergraduate universities, whereas university 2 (S2) has a more diverse population both in age and ethnicity. The graduate populations at both schools were not included in this study. University 1 (S1) is a medium–size, private university with a student population of approximately 8,500: about 5,000 undergraduate students and 3,500 graduate students. The undergraduate population has a male to female ratio of 45% to 55%, and about 35% of undergraduate students identify themselves as persons of color. Almost 60% of undergraduates are from California, with the others coming from throughout the United States and more than a dozen foreign countries. Between 65% and 70% of undergraduate students receive some form of financial aid: scholarships, grants, or loans. University 2 (S2) has an undergraduate population of approximately 5,500 and a graduate population of approximately 3,300. The ethnic breakdown for S2 is as follows: European American 39%, Asian American 20%, Latino or Hispanic American 15%, International 7%, African American 4%, Native Hawaiian or Pacific Islander 2%, and Native American 1%, with 11% unidentified.

Faculty participation in this study was not a requirement. Two of the faculty from S1 met with me prior to the start of data collection. The purpose of this meeting was to discuss the upcoming course offerings and the data-collection process. Currently, the majority of online course offerings at S1 are within the College of Arts and Sciences academic summer programs; the remaining offerings are in the business school and the law school. Students in S1 for this study were primarily from the College of Arts and Sciences and the School of Business undergraduate programs. Students from S2 were drawn from business and nursing.

Findings

The framework of approach to learning is used to analyze the data collected for this study. Three approaches to learning as described in the literature are called “deep,” “strategic,” and “surface.” Strategic learning is sometimes called “approaching,” depending on the researcher and the nature of the study. Deep learning is defined as examining new facts and ideas critically, tying them into existing cognitive structures, and making numerous links between ideas (Rosie, 2000). The deep learner is able to retain information and to organize materials in a variety of ways that aid in making meaningful connections that promote learning. Characteristics of deep learning include: looking for meaning, focusing on the central argument or concepts needed to solve a problem, interacting actively, distinguishing between argument and evidence, making connections between different modules, relating new and previous knowledge, and linking course content to real life. The strategic learner is a student who intends to achieve the highest grade possible through effective time management and organized study methods. Students exhibiting a strategic approach are focused on the assessment process (Entwistle & Ramsden 1983).

I examined participants’ responses in interviews, think-aloud observations, and online focus groups; categorization of responses was based on the tools mentioned, statements of value, and perceptions of positive or negative effect on learning. The think-aloud observations and online focus groups served to confirm or add insights to data collected during the interview process. Sixteen undergraduate students who had completed or were enrolled in an online course at one of two universities participated in the study. Of the 16 students, 11 participated in the interview process, 8 in the observations, and 8 in online focus groups. Three students

participated in all three data-collection methods, five students participated in two of the data-collection methods, and eight students participated in only one data-collection method.

Analysis of the data from interviews, think-aloud observations, and online focus groups produced five major findings. These five findings are (a) the role of communication in shaping perceptions and actions of students, (b) how technology is used not the technology determines its value, (c) the role of course organization for students success, (d) approaches to learning are shaped by students perceptions as are students determination of academic quality, and (e) students use nonacademic resources because of ease and familiarity.

The role of communication in online learning took many forms and was dominate in every data-collection method. Although students took online courses because they wanted independence and self-regulation, they also stated a desire for concise directions on everything from assignments and assessments to when and how to access course information. The expectations for communication went beyond just a need for direction. All of the participants expresed a view that faculty was "missing" from the educational conversation. How instructors communicate online was perceived to a limitation of online learning. When communication was perceived lacking, participants lower their approach learning electing for more strategic or surface learning.

Participants did not perceive the negative attributes of technology to be inherent in the technology so much as to its use and implementation. What participants expected was that communication technologies would be used in ways familiar to them and in providing a timely response to participants' educational needs. Indeed, poor technology implementation was mentioned in association with the lack of organizational structure found in some online instruction. In interviews, think-aloud observations, and online focus groups, participants expressed the perception that faculty lacking in technology skills were likely to use or implement technology in a way that resulted in confusion.

All 16 participants stated that the main reasons for pursuing online instruction were flexibility and self–control within the learning environment. Participants perceived online learning to be a convenient alternative to traditional classroom learning but indicated that convenience came with a price: in gaining independence, self–directed learning, they were losing direction from and communication with instructors. In some instances, this tradeoff was perceived to decrease the educational and academic value of the learning experience. For these participants, academic value was perceived to come from interaction and engagement from peers and faculty. Participants indicated that without necessary direction from faculty online learning allows for an approach to learning that is more surface– or strategic–oriented than is the case in the traditional face–to–face classroom experience.

The resources provided by universities for students research and information gathering were perceived to of less value then nonacademic tools. The use of nonacademic database sources was especially true when participants were asked to use online databases to perform research. During the think-aloud observations, participants used Google® and Wikipedia® before those resources provided by the university. When asked to explain their use, participants stated that Google® and other free tools are familiar and do not have the access restriction placed on them that university systems have. Additionally, participants stated that the university tools were cumbersome and hard to navigate.

In summary, tools used for communicating or conducting research were not as important as the communication itself. Perceptions of value for any tools used depended not on the tool but on the speed and consistency of communications. Participants did not perceive the negative or positive attributes of tools or technology to be inherent to the technology itself, but to its use and implementations. When faculty were perceived to be unresponsive, it was not the tool that was perceived to be of little educational use but the level of communication. When faculty were perceived missing from the educational conversation the academic quality was perceived diminished compared with face-to-face instruction. When the academic quality was perceived low, participants exhibited a strategic or surface approach to the learning.

Recommendations for Future Research

Although this study confirmed past research results (Cotton, 2006), it is believed that a more thorough study will provide additional data on students' perceptions and use of the online environment in the promotion of learning. Although the study was limited to two religiously affiliated institutions with limited online programs, a larger study would offer results that could be applied more generally. This study was conducted in primarily short 5-week summer online courses with limited enrollments. The exceptions to the summer courses were two short 5-week courses at University 2 (S2) in the Fall of 2009 and the OMIS course taught by me during the regular 10 week sessions at University 1 (S1). It is possible that selection of a small range of online courses produced a limited range of course interactions. Because of this limitation, a larger study conducted in a wider range of disciplines may produce a different set of results. One such study, just completed and published, showed similar findings, yet was able to look more closely at students' approach to learning through a wider set of interviews and other data-collection methods (Ellis & Goodyear, 2010). Ellis and Goodyear were able to draw a relationship between online discussion and student approach to learning. In particular, Ellis and Goodyear found statistically significant relationships between deep approaches, cohesive conceptions, positive perceptions of the learning context, and higher levels of student performance. Although the collection of student performance data can be problematic, more studies investigating students measured use of approach in relation to student outcomes in online learning could prove useful.

Perceptions of communication played an important role in the results of this study. Although this study relied on students' perceptions of communication and observations of their actions within the online environment, actual communications were not assessed. Future studies that look at possible links between faculty use of communications, the content and amount and communications online, and the perceptions of students may be warranted.

This study and others have investigated only a few of the possible relationships between perception of the online environment, the tools used, students' approach to learning, and students' perceptions of learning. A more focused investigation of student perceptions of the design of online learning, including Internet resources, the role of community, and social networking is needed. Although Internet resources and community and social networking were mentioned in this study, they may play a larger role in student communication and learning than was described in this study.

An additional phenomenon not investigated fully by this study is the link between perception and outcome. Assuming a link between perception and outcome based on past research may not be sufficient when considering the online environment. An investigation of the relationships between online perceptions, approach, and outcomes is an area that may merit further research.

Comparing students' expectations and actual use of communication technology with the use and expectation in the online classroom could inform future studies on student perceptions of online learning. Faculty use and knowledge also may effect student perceptions. Additional factors not investigated in this study include (a) institutional beliefs around online learning, (b) the place of online learning in the strategic plan of the university, and (c) the implementations of teaching standards related to online instruction.

Studies investigating faculty perceptions and training are numerous; however, the link between faculty training in the use of standards for the development of online courses and student perception and outcomes is not well understood. What participants say they want in an online course and the standards as written into resources such as the Rubric for Online Instruction (ROI) are similar. These similarities include more communication, faster response time, and more engagement with peers and faculty. The standards used in the ROI, and other such tools, are widely used teaching the development and assessment of online education across the United States and other countries, but studies linking the standards contained in the ROI to student perception are limited, as are studies linking the use of the ROI to either student approach or increased student outcomes. An investigation of the effects of the ROI on perception, approach, and outcome may provide educators a better understanding of how best to design online education in the future. One possible outcome of such research may be that including basic teaching strategies not specific to the online

environment are not necessary in tools like the ROI and that including such information diminishes there value to faculty.

Although not specifically a limitation, one area of concern within this study is that participants' statements of response time was not followed up on during data collection. All participants stated that faculty and students were unresponsive at some time yet a precise time was never ascertained. Investigating what is an appropriate response time for e-mail, discussions, and assignments may be an area of further research.

STUDY ABOUT PREREQUISITE TECHNOLOGY FOR MOBILE COLLABORATIVE E-LEARNING IN CASE OF KOREA

Tae in Han
Korea Open National University
hanten@paran.com

Abstract

Many e-learning service providers are preparing the ubiquitous ages which provide next generation IT environment and have prior occupation of mobile collaborative learning system in a world e-learning market. Based upon excellent experience of the mobile communication technology and collaborative learning LMS developments and instructional design model, mobile collaborative e-learning require many kind of IT and pedagogical technologies. This study suggests prerequisite and minimum m-learning technologies in order to provide mobile educational service of collaborative learning concept to the learners.

1. Introduction

Although related to e-learning and distance education, M-learning is distinct in its focus on learning across contexts and learning with mobile devices. Learning that happens across locations, or that takes advantage of learning opportunities offered by portable technologies. The scope of m-learning includes students using handheld computers, PDAs or mobile devices. M-learning has some tremendous advantage as follows:

- Accessible and easy-to-use
- Wide-range of target markets
- Real-time communication and entertainment (games)
- Rich media source (video clips, pictures, internet)
- Enables learning / practice on-the-go

The e-learning industry is rapidly growing, thanks to the financial support from employment insurance plan. We can see that m-learning industry is in its early stage of introduction to Korean market as well as world market.

Based on the progress of mobile technologies such as mobility, constant availability, individualization, and user-friendly adaptive interface, the future of m-learning is predicted that it looks very potential in terms of prospective market growth.

2. Changes of platform in e-learning

2.1 Changes of e-learning environment

The next generation web is a platform, which enables everyone to use data without owning it in any programming product or any Internet environment. It means that the interaction between a professor and a

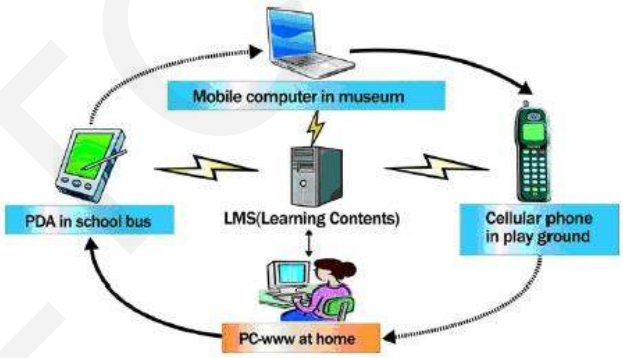
learner becomes active. The following table is a simple abstract demonstrating the changing of the concept of e-learning consortium, which results from the appearance of the next generation web environment.

[Table 1] Change of e-learning environment

existing e-Learning	e-Learning 2.0
Learning organization	Personalization
Centralization (Top down)	Localization (Bottom up)
Push	Pull
Delivery	Oriented learning
SME	Teacher<->Learner, Learner<->Community
Course, Program	Gathering
Intellectual property	Studying element, Connection
The degree of freedom which is limited	Social property, Sharing
Special application	The degree of freedom which is magnified, Open
High investment / Administrative cost	Low investment / Administrative cost

The source: e-learning consortium, Japan, 2007, The sprout base reconstitution

A teacher and a learner will have a collaborative interaction in the next generation. The maintenance of collaborative interaction is one of important environment changes besieged e-learning. Real-time interaction can be enabled with developing telecommunication technology. The following picture shows a real-time collaborative education model according to combination with mobile technology.

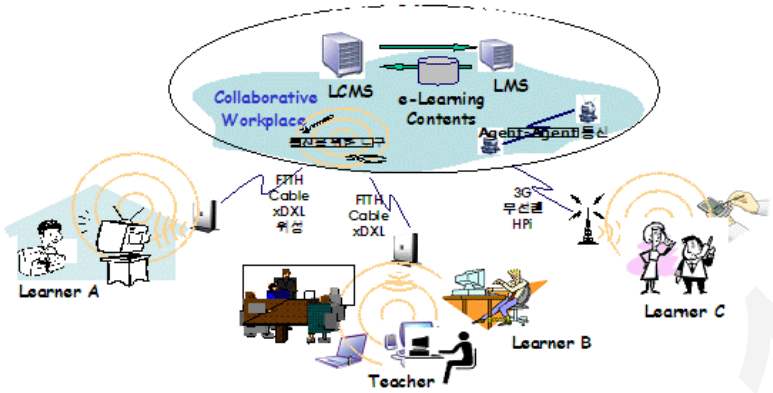


[Figure 1] Environments of mobile e-learning

2.2 Changes into multi-platform

The e-learning is a learning type which supports accessible information seen without limitation of space and time through internet at anytime, anywhere due to advance of information and communications technology. The education content is also advancing from unilateral contents delivery to contents customized by individual needs, and from teacher directed to learner directed personal. The existing e-learning which substitutes online education for traditional education is just passive education/training and its education effectiveness lacks. In order to overcome this, the research about the application various types of contents to multiplatform is under way. Recently various platforms appear and use the same content in various platforms. It demands conversion solution to support various platforms (interactive TV,

PDA, between web contents and the mobile contents).



[Figure 2] Multi-platform Based Collaborative e-Learning Environment

2.3 Environment for mobile and ubiquitous e-learning

In case of mobile media like the cellular phone or PDA which we use frequently, it is possible to search and share information anytime, anywhere without restrictions of time and space. Currently mobile is paid attention as the new education medium due to mobility, accessibility and expandability etc. In other words, mobile can provide opportunity of self directed learning if a learner wants it without restriction of time and space. The hegemony of information and communications technology media has already been moving from the computer into the mobile media. This information gives us serious means when we consider the potential of a cellular phone to be used as an education tool. There are already foundations of mobile education.

Hereafter life-long education will lead through ubiquitous of learning, class and learning space, which can cover digital cyber life space. It is expected that school will be advanced to a local social learning center, one of the learning structural part, network oriented schooling. It is expected that the environment, which is able to support active learning method by using the various IT such as digital TV, magic mirror[1] etc. will be soon developed.

It is possible to develop a creative education course which is learner oriented, through building an education environment which can be used on various terminals anytime, anywhere, and supporting all contents. This educational environment is possible to support education by level since the intelligent program checks open learning performance and responses to the learner. The educational environment delivering knowledge by teacher unilaterally will be changed, and the opportunity and competency of inter communication will be improved.

2.4 Survey of future e-learning technology

The e-learning collaborative learning is distant learning by using the internet. This is instruction-learning environment which provides various learning activities through interaction among learner,

[1] Magic mirror provides various customized information such as learning message, lesson time table, weather forecast, etc. It is possible to explore museum exhibition information and to store still or moving picture with POI(Point of Information) through the carrying electronic digital book.

operator, and contents of learning, based on telecommunication network, where the media is a computer.

The necessity for great human development according to the need of social adult education through aggravating of global competition in every field of social is rising. The adult education change which responses the necessity is leaded mainly by the university education market. On the other hand, it is also coming to be highlighted that there is a social demand for specialty vocational education and life-long education target by common people and not necessarily by the students.

Consequently e-learning is receiving footlights as it supports the means to improve the quality of education and the variety of education, and supports the self-directed learning. A lot of universities accept the course of practical contents from industry fields, because it is too much practical to learn in university. Through such activities, the universities are improving quality of leaning contents.

All over the globe and particularly within advanced countries, leisure culture importance is inclining constantly. Nowadays people value more their free time not only as time to rest and spend with their family, but also as time to broaden their education and knowledge, time to invest and develop their intellectual resources.

KATS(Korea Agency of Technology and Standard) that is one of the Korean Government surveyed about future technology for e-learning in 2009. It was performed using Delphi survey by 48 experts through the e-learning technology domains as [Table 2].

[Table 2] Technology domain for survey

Domain	Number of elements
Instructional design	12
Learning strategy	14
Learning resource	11
Contents development	17
Learning tools	17
Learning environment	11
Assessment and evaluation	11
Participants information	8
Security management	8

Source: Technology roadmap for e-learning for the future, 2009, KATS

The best way to achieve the knowledge in accordance with the situation is through e-learning, an educational system that enables the student to learn in his own terms and within his natural environment, thus he is not forced to leave his home, family, and leisure activities, this way of learning enables him to combine the studies with other activities he might do.

Korea, in common with the US and Europe, is adopting the same leisure culture pattern, if academicals and professional courses were considered as labor time activities in the past, today the number of Korean that choose to enrich their educational and professional knowledge during their leisure time is increasing.

For example, Korean demand for language studies has reached sky-high limits. Many people feel that they miss something, living a lifetime with the idea of only knowing one or two languages.

3. Prerequisite collaborative mobile e-learning technologies

3.1 Mobile and ubiquitous technology

The international e-learning technical standards have an intention of developing the solution which is related with collaborative learning and a contents development and a service. Collaborative mobile e-learning requires the technologies of computer engineering, instructional design, database and contents development etc. not only international technical standard but also technical development of LMS, LCMS or database for collaborative learning where become the technique which leads to future e-learning. Result of survey about mobile e-learning technologies shows in [Table 3] among 9 e-learning technology domains.

This table shows that "collaborative learning based instructional design", "various activities oriented instructional design", "Quality innovation" and "self directed learning based instructional design" are very important prerequisite technologies of instructional design domain for mobile e-learning in the future.

[Table 3] Result of instructional design domain

Technology	Importance		
	Mean	Standard Deviation	Rank
Ubiquitous based instructional design	3.9	1.23	6
Rapid instructional design	3.3	2.64	12
Quality innovation	4.2	1.25	3
User customized instructional design	4.0	1.11	5
Learner participated instructional design	3.6	1.83	9
Intelligent LMS based instructional design	3.6	1.86	9
Self directed learning based instructional design	4.2	1.28	3
Various activities oriented instructional design	4.3	1.29	2
Collaborative learning based instructional design	4.4	1.45	1
Automated instructional design	3.6	1.96	9
Combination of individual and group learning	3.8	1.45	7
Collective intelligence based instructional design	3.8	1.45	7

Source: Technology roadmap for e-learning in the future, 2009, KATS

Korea has the research which is renovation about the solution of ubiquitous e-learning techniques and possesses the technique of collaborative learning which is able to be used by business environment. Also, Korea has advanced the infrastructure which is able to accept new technology and to execute new learning technology. In addition, with about the timely LMS development whose meantime, Korea owns much experience to develop LMS, already learning model and technique and accomplished a research

work about various educational contents.

3.2 Learning environment technologies

In order to fill the gap between customer demand and current technical capabilities (sometimes referred to as the "technology chasm" or the "WAP Gap"), service providers rely on existing mobile messaging and data services capabilities that do not support m-commerce and/or require expensive closed proprietary networks and devices. As a result, today's solutions fall far short of end user expectations. Therefore, for technology delivers today, many of the promises of tomorrow's "Always Connected" environment by supporting existing devices and infrastructure to place customer one click away from completing transactions anytime, anywhere. At the same time the technology provides capabilities that are not supported by any other wireless data technology today. Result of survey about instructional design of e-learning technologies shows in [Table 4] among 9 e-learning technology domains.

This table shows that "mobile environment", "wireless network environment", "ubiquitous and blended environment", "blended and mobile" and "sensor network environment" are important prerequisite technologies for e-learning in the future.

[Table 4] Result of learning environment domain

Technology	Importance		
	Mean	SD	Rank
Mobile environment	4.2	1.37	1
Ubiquitous and blended environment	4.1	1.11	4
Contents reuse like video e-clip environment	3.8	1.79	9
Personalized learning environment	4.0	1.16	5
Smart learning environment	3.8	1.85	9
Self direct learning environment	4.1	1.07	3
Wireless network environment	4.2	1.37	1
Blended and mobile	4.0	1.05	5
Sensor network environment	4.0	1.12	5
Virtual reality environment	3.7	2.25	11
Future web 3.0 environment	3.9	1.69	8

Source: Technology roadmap for e-learning in the future, 2009, KATS

The combination of signaling technology with one-click instant fulfillment makes up signal click, a technology providing a complete end-to-end solution for alert based services. The technology enables mobile device users to stay in touch with time-sensitive events and be taken directly to related information and transactions with one simple click of a button. It alerts cause the user to connect directly to web pages that have all the information necessary to complete transactions with the single click of a button. A feature of the technology does not require any software presence in the mobile handset. It adds

the capabilities of launching, installing, and configuring an application upon reception of an alert.

The following issues technically strengthen to provide m-learning radiantly for learners, tutors and lecturers.

4. Conclusion

4.1 Summary of mobile e-learning technology in the future

From larger e-learning markets, currently, LMS support in the market which becomes the mobile educational platform is insufficient, on the other hand, LMS which will be developed is very efficient in enterprise style e-learning where the educational service structure which is discrimination, is necessary. The successful possibility of mobile service for on-line education is very high because on-line educational field is a target for users who have high loyalty.

On the other hand, interest age class of PDA and cell phone is different from each other, as the form of the terminal changes to the smart phone which is combined PDA and cell phone. The approach in mobile education is coming to be easy gradually.

Collaborative learning is composed of the learning own small-scale group and mutual cooperation process leads to specific subject. The research is plentifully advanced with the learning method to be solved together. But in the solution of actuality it is a situation which is wholly lacking from the application characteristic side. To provide mobile educational service of collaborative learning concept to the user, it requires prerequisite integrated m-learning technologies

4.2 Future work

In order to operate various broadcasting and communication infrastructure, we need a full m-learning services accomplishment, which develops interoperability program, a multiplatform environmental support core technique in learning services and an effective collaborative learning technology based upon the ability to interact among the group, participants and agents.

[Table 5] Future work

Objectives	Items
API technology which supports interoperability in multiplatform	- Design metadata for message communication between multiplatform environments - Development of contents model engine which support to multiplatform - Development of adaptive learning contents API - Development of learner profile management technology
API technology for collaborative m-learning in multiplatform	- Design of workplace reference model - Development of agent-to-agent communication technology - Development of interaction technology for participant-to-participant

ABSTRACT

The main purpose of this research was to study the the perceptions of the professors of Islamic Azad university about Obstacles of using Educational Technology. The statistical population was full_time professors with 2 years record of teaching service at Azad University branches in 2009_2010.By using cluster sampling and according to Krejcie- Morgan table 250professors selected as sample. Data collected using a researcher-made questionnaire in Likret scale. Data analyzed by using chi-square test. results indicated that the disproportion of materials volume to its appropriated time, inaccessibility of teachers to media and auxiliary equipments, students 'impatience, the lack of equipments, unavailability of educational technology publications and the inability of teachers in preparing didactic materials and curriculum were most preventing factors in using educational technology in branches of Islamic azad university.

INTRODUCTION

One of the most important indicators in developing countries ,is the quantity and quality of outputs of the educational system . Qualitative and quantitative indicators has a close relationship with Teaching - learning process. Teaching - learning process, is a set of activities that professors and students do in an educational position, to do the desired changes in learners behavior . Through educational technology which can help improve information and process of teaching and learning ,plays an important in this area. Majdfar(2006) mentioned that it is necessary to identify the capabilities ,facilities and obstacles of educational technology in educational systems in order to achieve the educational objectives of educational systems.

Oulomer(2005) said that the concept of educational technology is "Process and the systematic collection of information and communication capabilities that provide complete teaching performance". Abaszadeh (2006) believes that many teachers have little knowledge about educational goals. Therefore necessary efforts to achieve educational goals is not done. More than half of the teachers are not familiar with the methods and new techniques of teaching and learning for designing curriculum and training students in classroom, so they use traditional methods. Among the most important barriers of using educational technology in the classroom, the numbers of students in each class (student density) and lack of compatibility between volumes of students book and the time for teaching , are most important. Nafisi(2004) in a research concluded that the educators can use various instruments such as computers, local network and internet learn to improve teaching-learning process, and it requires they play as an facilitator of teaching-learning process.Nowruzi et al(2006),mentioned that the appropriate technology in general education process is using multimedia software and simulators, but the best methods of using technology in learning for high schools and vocationary students is using internet-based methods.

Yaghma(2009) believes the fundamentals of educational technology, are based on behavior psychology theory. In educational technology, strengthening and deepening of previous learning, self assessment and feedback found, retrieve the needed information, laboratory and workshop activities in virtual environments, creativity, knowledge production and presentation, using electronic tools and communication Academic centers inside and outside the country is considered. Herou et al (2008) stated that developing a comprehensive e-learning model by using Hypercube model is possible based on studying basic technological features of their components (infrastructure, technology and content) with the current situation of e-learning and institutions teaching skills based on a vision for implement and effective and innovative and management of e-learning.

Marinsko(2008) said that, learning to use computers in educational and teaching-learning context , gradually would be an alternative for classical perspective with the aim of providing individual education rather than group education. Therefore internet solutions and equipment offers many basic features that are replacement of traditional educational system. George(2009) emphasized the use of six efficient words: what, who, why, where, when and who in the initial implementation of education and believes that electronic payments provide electronic teaching to provide opportunities for students in exploring the potential of technology to enhance teaching and learning. Daniel et al(2010) expressed the attitude towards perception, computer knowledge, motivation, learning style, availability of infrastructure, and gender distribution of relatively large extent on the implementation and success of virtual learning is useful and appropriate use of virtual learning environments to learn self-regulation is achieved. There was a significant relationship between student motivation and effort was seen in this environment and ultimately good use of learning resources asa part of competence .

Baras and Avon (2000) mentioned that the increasing growth of science and modern technology, new methods of learning and teaching requires the use of new theories but not the theory of assuming teacher as the only wise man of stage . Learners should be play a more active role in teaching and learning and the teacher must guide the next stages and plays the role of , facilitators, and instructional designers .

RESEARCH OBJECTIVES

The objectives of this research was:

1- identifying and prioritizing barriers and problems in using educational technology.

2 - provide practical strategies to offer Islamic Azad University and other of higher education institutions involved, to eliminate barriers and problems in order to make better context for utilization of educational technology.

RESEARCH QUESTIONS

1 - How curriculum planning in Islamic Azad University ,prevents the use of educational technology in the teaching - learning process ?
2 - To what extent , the shortage of resources, prevent using educational technology in the teaching - learning process ?
3 – To what extent the negative attitudes of professors about using educational technology prevents using educational technology in teaching-learning process?
4 – According to the perceptions of professors, how can a weak performance evaluation system , prevented using educational technology in teaching –learning process?

RESEARCH METHODOLOGY

According to the research objectives and hypotheses the research method is descriptive .

*Statistical population :*The population of this research was all professors in academic year of 2009-2010 in zone 1 of Islamic azad university which were 1633 persons and a 320 person sample of them were selected by cluster sampling method to study their perceptions in this research. As male and female faculty ratio in the statistical community was nearly homogeneous, so the gender factor sampling were ignored.

Research instrument : A researcher-made questionnaire, in five degree Likert scale used to conduct this research. According to the homogeneous variances of internal consistency Spearman Brown prophecy formula for the reliability of the questionnaire which was .79. The validity of questionnaire approved by the opinions of specialists and professors of universities.

Data analysis methods: According to data collected ,Chi square test used to analyze the perception of professors in this research

RESULTS

The first research question: How curriculum planning in Islamic Azad University ,prevents the use of educational technology in the teaching – learning process ?

Table 1.

Question	No.	Frequency						Mean
		Very high	high	average	low	Very low	total	
1	1	110	65	30	20	25	250	3.86
	6	60	70	70	40	10	250	3.52
	8	100	60	40	25	25	250	3.74
	9	80	80	30	50	10	250	3.68
	17	40	75	60	45	30	250	3.20
	20	20	100	80	50	0	250	3.36
	22	80	60	75	35	0	250	3.74
Total		490	510	385	265	100	1750	3.58

df = 4 X^2 e=13.28 X^2o=331.85

As showed in table 1 since the value of observed chi-square (331.85) with confidence level of .01 and degree of freedom 4 was more than chi-square in statistical table (13.28) , so we can say that the difference between the observed frequencies are significant . Obtained mean (3.58) also shows that "weakness in the curricula of academic courses, plays a preventive role in the utilization of educational technology in teaching-learning process to great extent.

The second research question: - To what extent , the shortage of resources, prevent using educational technology in the teaching - learning process ?

Table 2

Question	No.	Frequency						Mean
		Very high	high	average	low	Very low	total	
2	4	65	55	45	50	35	250	3.26
	7	70	85	40	30	25	250	3.56
	10	75	60	60	35	20	250	3.54
	16	70	95	60	10	15	250	3.78
	11	50	70	65	55	10	250	3.36
	24	55	70	60	40	25	250	3.36
Total		385	435	330	220	130	1500	3.48

df=4 X^2 e=13.28 X^2o=205.41

As showed in table 2 since the value of observed chi-square (205.42) with confidence level of .01 and degree of freedom 4 was more than chi-square in statistical table (13.28) , so we can say that the difference between the observed frequencies are significant . Obtained mean (3.48) also shows that the shortage of resources play an important role in preventing using educational technology in the teaching - learning process to a great extent.

Third Research Question: To what extent the negative attitudes of professors about using educational technology prevents using educational technology in the process of teaching-learning?

Table 3.

Question	No.	Frequency						Mean
		Very high	high	average	low	Very low	total	
3	2	90	95	40	15	10	250	3.96
	3	55	90	40	40	25	250	3.44
	5	90	45	65	35	15	250	3.64
	13	40	105	70	25	10	250	3.56
	15	10	40	120	60	20	250	3.84

	21	55	60	55	20	20	250	3.60
	22	80	100	75	35	0	250	3.74
Total		420	535	465	230	100	1750	3.68

df=4 X² e=13.28 X²o=369.27

As showed in table 3 since the value of observed chi-square (369.27)with confidence level of .01 and degree of freedom 4 was more than chi-square in statistical table (13.28) , so we can say that the difference between the observed frequencies are significant . Obtained mean (3.68) also shows that the negative attitudes of professors about using educational technology prevents using educational technology in the process of teaching-learning to a great extent.

Fourth research question: According to the perceptions of professors, how can a weak performance evaluation system , prevented using educational technology in teaching –learning process?

Table 4.

Question	**No.**	**Frequency**						**Mean**
		Very high	high	average	low	Very low	total	
4	12	30	90	70	40	20	250	3.28
	14	60	90	70	15	25	250	3.66
	18	20	90	65	50	25	250	3.12
	19	40	45	120	25	15	250	3.32
Total		155	315	325	130	85	1000	3.34

df=4 X² e=13.28 X²o=256.95

As showed in table 4 since the value of observed chi-square (256.95)with confidence level of .01 and degree of freedom 4 was more than chi-square in statistical table (13.28) , so we can say that the difference between the observed frequencies are significant . Obtained mean (3.34) also shows that according to the perceptions of professors, a weak performance evaluation system , prevente using educational technology in teaching – learning process to a great extent.

CONCLUSION

1 - Results of the first question indicated that weakness in curriculum planning in branches of Islamic Azad university , is an important factor that greatly hinder utilization of educational technology in the teaching process - are learning.

2 - Results of the second question suggests that lack of facilities and resources in the academic units of study population and largely prevented too much advantage of educational technology in the teaching process - learning is.

3 - Results obtained from third question suggests that academics need to know the impact and importance in taking advantage of educational technology are not so much of this factor in the deterrent role of their shows. In other words, the negative attitude of professors in branches of Islamic Azad university can be considered one of the barriers of effective using of educational technology .

4 - Results obtained from the fourth question shows that in teachers performance evaluation the factor of using educational technology were not considered and this may cause as an important barrier in using educational technology in branches of Islamic Azad university

RECOMMENDATIONS

1 - In order to motivate more professors to read educational publications and training human resources ,it recommended that main organization of university make content of educational journals, needed for professors ,available and take an exam from them.

2—Branches of Islamic Azad university hold workshops to improve teaching skills of their professors. These workshops can increase the ability of professors to make simple and relatively complex materials and increase their awareness of the day enjoying the facilities are improving. Obviously enrich workshops in areas that now runs more attention should be placed in this regard, university professors qualified to be used. 3 –it is needed to review current curricula I branches of Islamic azad university and give chances to professors to participate in curriculum designing and setting objectives of each course and this may cause applying more educational technology in their teaching .

4 –if it is possible, we can establish a central educational technology center in every regionThese centers can also provide production of equipment and training required of universities and publishing useful journal and resources for short-term training and education for professors.

Zohreh Azadi , University of Applied science and Technology- Kavar Branch

z.Azadi@yahoo.com

Abstract:

The purpose of this research was studying the relationship between addiction to computer games and communication skills in students of secondary schools in Shiraz .The research method is descriptive and using correlation coefficient. two researcher made questionnaire were used to conduct this study, a questionnaire for assessment of addiction to computer games (chronbach alpha=0.85) and a questionnaire for assessment of communication skills(chronbach alpha=0.83). the population was 76900 students of secondary schools in shiraz city in educational year 2009 -2010 and the sample selected by stratified random sampling and was 296 students. Pearson correlation coefficient , T test for independent groups and one way Anova used to analyze datum and results showed that: there was a significant relationship between communication skills and non-addiction to computer games in students, and addiction to computer games in boys were more than girls. And the level of parents studies had no effects on students addiction to computer games.

INTRODUCTION

Nowadays New medias and entertainment instruments due to their great attraction for many people ,do an important role in peoples life. Also they had important influences on communication , entertainments and many other aspects of our life ,they have raised some public concerns. Computer games are also follows this rule. Kalleja(2007) believes that due to interactive nature of computer games ,people pay many attention to these games. Durkin and Barber (2002) mentioned that the factor of interaction , makes video and computer games different from other media . Shaverdi (2009) mentioned that ,computer games as a social phenomenon, alongside other audio and visual media due to the rapid growth of communication technology, in recent years and also because of their attraction for children ,select most of their audience among children and adolescents .students pay a considerable part of their leisure time to do computer games and also it seems that they spend more time to computer games than doing their homework.

Communication skills in everyday life has the highest relationship with interpersonal behavior. They are a kind of human life skills that are applicable to the collective practices that helps the human emotions and their needs and communicate the personal and social goals should be available. In other words, communication skills, are learned behaviors that are documented on the interpersonal relationships with peers and other adults affect.

Harigie & Dickson (2004) mentioned that communication skills are those skills that people can be involved in interpersonal interactions. in other words those are process that through them people transfer and share their thoughts, information and feelings by verbal and non-verbal messages, to others .The sub-skills including skills related to understanding verbal and non verbal messages , regulating emotions, listening, communication and insight to the process in which assertive communication skills form the basis of skill in establishing appropriate relationships with others on the capabilities and adds to our confidence, talent and achievements that shows respect and appreciation will attract others.

Cole (2007)said that having skill to make good relation with others can give us self confidence , improve our talents and capabilities and cause people to respect us.

Doran et al(2002) in their research as the relationship between computer games and adolescent social skills, showed that the experience of playing computer games has reverse relationship with social skills and the more experienced computer games player, has less social skills.

Ramazankhany et al (2007) in a research with the name of "studying the relation between using computer and students feeling about school and their homeworkss " concluded that the use of computers in the form of addiction to games, Internet and other, on some students can cause serious mental problems and brings to the school and boys were more addicted to computer games and also these boys had bad feeling about their schools and homeworkss.

Young (1996) who found that excessive Internet users are, alone, tired, depressed, introverted, and have no self esteem.

Colwel and Pyner(2000) in their study on students in London to study computer games and its relationship with social isolation, self-esteem and aggression among students. and found that, although there was no direct relationship between playing computer games and social isolation ,but there was a direct relationship between w aggression and computer games in students.

Abdul Khaliqi et al (2005)), studied the relationship between video - Computer games and aggression in students in Tehran , and concluded that continuous exposure to computer games, especially games with violence, increase aggression in students and reduce academic performance of them.

So , reviewing the literature showed that computer games have many side effects on students behaviors. and with these considerations, the purpose of this study was to investigate the relationship between addiction to computer games and communication skills in students of secondary school in Shiraz .

Research questions were as follows:

1 – Is there any relationship between addiction to computer games and communication skills of students?

2 – Is there any difference between boys and girls in addiction or non-addiction to computer games?

3 - Does the educational level of parents (based on their degree) impact on students addiction to computer games ?

METHODS

This study was a descriptive research and datum were gathered by 2 researcher made questionnaire :

1 – A questionnaire for assessing the addiction to computer games with 18 items in likert scale for diagnosing addiction to computer games in students. Its reliability proved by chronbach alpha which was 0.85 The minimum score was 1 and the maximum were 5 in this scale and students with mean score of 2.5 and higher would be considered as addicted to computer games.

2 – A questionnaire for assessing communication skills with 20 items in a Likert scale . chronbach alpha was 0.83 .

Statistical population were 76,900 student from secondary schools in Shiraz in academic year 2009-2010 .and the sample were 296 students which selected by stratified random sampling.

Pearson correlation test, t test for independent groups, and one-way analysis of variance (ANOVA) were used to analyze datum.

RESULTS

In this study along with the main questions, some descriptive information ,that seemed to be useful also were determined.

Table 1: frequency and percentage of computer owners in the computer games device at home

	Frequency	percentage
Have computer game device	253	85.5
Have not computer game device	43	14.5
Total	296	100

As in Table (1) is observed, most students (85.5 percent), have computer game devices at home.

In table 2 , hours that student playing computer games were shown.

Table 2: frequency and percentage of hours playing computer games

	Frequency	percentage
No playing	38	12.83
1-2 hours	158	53.38
3-4 hours	54	18.24
>4 hours	46	15.55
Total	296	100

According to Table (2), only 12.83 percent of students do not play computer games during a day and more than 87 percent of students play computer games at home at least more than 1 hour.

Favorite type of computer games among the sample group can be observed in table 3.

Table3: frequency and percentage of favorite computer games

	Frequency	percentage
Action- combat	136	45.6
Creative-thinking	88	29.9
Non-sport competitive	27	9.2
Sport competitive	45	15.3
Total	296	100

As it is shown in table 3 more than 45 percent of students were interested in action-combat games.

The first research question : Is there any relationship between addiction to computer games and communication skills of students?

Pearson correlation test used to study the relationship between addiction to computer games and communication skills of students. Results showed in table 4

Table 4: pearson correlation between addiction to computer games and communication skills of students

N	r(pearson correlation)	sig
36	0.070	0.686

Because of its significance level which is more than .05 therefore there is no significant relationship between addiction to computer games and communication skills of students.

Pearson correlation test used to study the relationship between non- addiction to computer games and communication skills of students. Results showed in table 5

Table5: pearson correlation between non- addiction to computer games and communication skills of students

N	r(pearson correlation)	sig
260	0.568	0.009

Because of its significance level which is 0.009 and it is less than .05 therefore there is a significant relationship between non- addiction to computer games and communication skills of students.

The second research question: Is there any difference between boys and girls in addiction or non-addiction to computer games?

Frequency and mean score of boys and girls are shown in table 6:

Table6: Frequency and mean score of boys and girls

	Gender	Frequency	Mean
Addicted students	boy	24	4.22
	girl	12	3.70
Non-Addicted students	boy	124	1.89
	girl	136	1.75

Results showed that the frequency and mean scores of boys were more than girls. T test for independent groups was used to analyze datum for this question and the result showed in table 7.

Table7: t- test for studying boys and girls

	df	t	sig
Addicted students	34	3.986	.039

Non-Addicted students	258	1.716	.087

According to the results in table 7 there is no significant impact of gender in non- addicted students ,but there is a significant impact of gender in addicted students. This means that boys had more addiction to computer games than girls.

The third research question : Does the educational level of parents (based on their degrees) impact on students addiction to computer games ?

Frequencies and percentage of addicted students parents educational level ,based on their degrees showed in table 8:

Table8: Frequencies and percentage of addicted students parents educational level

level	frequency	percentage
Under-diploma	4	5.56
diploma	22	30.55
Upper-diploma	16	22.22
Bachelor degree	18	25
Upper than Bachelor	12	16.67
total	72	100

One way ANOVA test use for studying the impact of educational levels of addicted students parents on their addiction to computer games .the result showed in table 9

Table9: One way Anova for impact of educational level of parents on students addiction to computer games

	SS	Df	MS	F	sig
Between groups	2.754	4	.688	.894	.492
Within group	51.59	67	.770		
total	54.342	71			

According to significant level of ANOVA ,the educational levels of addicted students parents ,had no significant impact on students addiction to computer games.

CONCLUSION

Regarding the first question ,research shows that skills there is no significant relationship between addiction to computer games and communication ($p<.686$) This means that students who are addicted to computer games have no good communication skills or in other words computer games cannot improve communication skills in students. But there is a significant relationship between non-addiction to computer games and communication skills ($p<.009$) this means that students who do less computer games, have better communication skills are It could be said that this is because they play other sports or activities are using and these could improve their communication skills .

Regarding to second question ,results showed that the difference between boys and girls mean for addiction to computer games ,is significant ($p<.039$) that means the addiction of boys to computer games are more than girls.That would be due to less interest of girls in playing compute games.

Regarding the third research question, results showed that educational levels of parents does not affect students addiction to computer games. This may be a cause of availability of computers in almost all homes because of the need of doing parents job , as we can see 85 percent of students have access to computer games which is related to having access to computer devices.

RECOMMENDATIONS

Based on the results of research, it is recommended that :

- as the results show that there is a significant relationship between non-addiction to computer games and communication skills , we pursuit students to do physical activities and sports which can develop their communication skills .

- Since most computer games is done by students at home, to reduce the bad effects of these games, we should focus on teaching and doing tea sports and activities in schools.

-As most students play action-combat games which had bad effects on student behavior ,It is recommended that we help students to select creative- thinking games rather than action-combat games to develop their intellectual skills which are a base of improving communication skills.

- Holding some classes for parents to give them information about the result of researches and help them to select good games and activities for their children.

TEACHERS' KNOWLEDGE OF CORRECTING FREE WORDED EXERCISE SOLUTIONS FOR A TEACHER ASSISTING FEEDBACK TOOL

Dr. Sonja Ruda
Chemnitz University of Technology, Communication on Technology, Germany
sonja.ruda@phil.tu-chemnitz.de

ABSTRACT

Exercises are of major importance in teaching. Their correction, however, involves a high effort for the teacher particularly in case of free worded solution texts, which have the advantage that students demonstrate their own knowledge but the disadvantage of a very limited automatic correction on the part of the teachers. A feedback tool that connects the advantages of tasks of free text construction with those processed by the computer can support the teacher in the complex action of correcting since this is effected according to a certain scheme. The feedback tool, based on a pragmalinguistic study of teachers' correction knowledge and actions, assists the teacher by marking different answer possibilities and assigning assessment texts. The prototype of a teacher assisting feedback tool for marking free worded exercise solutions is briefly presented.

INTRODUCTION

Exercises are of major importance in teaching. It can be distinguished between exercises with preset solution possibilities, e.g. multiple choices, and exercises that require a solution text drafted by the students themselves. Free worded exercise solutions offer a considerably high learning effect since students entirely have to resort to their own knowledge, even if the answer consists of only one word, in contrast to exercises with preset solution possibilities, through which the student can only guess the answer. But marking self worded answers solutions requires special knowledge, much time and energy of the teachers. Moreover texts of free worded solutions can merely be evaluated in the simplest way because teaching and learning systems can identify errors simply as formal deviations by comparing the learners' input with the solution preset by the teacher (cf. Klemm & Ruda, 2003, pp. 183–185; Klemm, Ruda & Holly, 2004, pp. 118–125; Narciss, Körndle & Proske, 2004). Therefore, some problems are: If the teacher has not considered ambiguous word combinations, a false solution is though assessed as "correct" since the demanded terms are included, even though the terms were not entered by the student in the designated order and make a wrong sense. If the teacher does not consider correct alternatives, right solutions can nevertheless be marked as "wrong". If a student's answer is assessed as "not completely correct", the corresponding text passages cannot be marked exactly. Furthermore e-learning students' answers are frequently assessed in a very simple way, e.g., "Your answer is unfortunately wrong". All this demonstrates technical shortcomings, the enormous implementation expenditure of a differentiated feedback for every single solution possibilities for all exercises of the (online) course and the involved costs. Therefore a teacher assisting feedback tool for marking free worded exercise solutions could be helpful in solving these problems. This feedback tool shall connect the advantages of free worded exercise solutions with those processed by the computer. For its modeling teachers' correction actions and their knowledge of free worded exercise solutions are analyzed. Some questions are: How is the comparison between the lecturer's and student's solution text made? How are mistakes recognized, analyzed, corrected and assessed? Which actions could be performed by the computer?

METHODS AND PROCEDURES

Teachers' correction actions were determined by consulting a text corpus consisting of offline university examination questions which demand self worded answers with at least one word. I followed the communicative-pragmatic approach that, under certain circumstances, already considers a word or a sentence as a text (Brinker, 2005, p. 18). The research methods included the 'think aloud method' (van Someren, Barnard & Sandberg, 1994) and the 'concurrent record analysis' in combination with the 'focused interview' (Karbach & Linster, 1990, pp. 84 and 87).

14 lecturers produced 15 verbal records which were taped, transcribed and described with regard to actions thus providing analytical transcripts. The lecturers have each revised between three and seven papers. Altogether there are 71 papers from 13 special fields with 488 corrected exercises including subtasks. The tape recordings lasted from about nine minutes up to almost two hours. The average recording amounted to one hour.

This pragmalinguistic analysis is based on Austin's (1962) and particularly Searle's (1969) 'Speech Act Theory' and the subsequent related works by Brinker (2005), Holly (2001), Holly, Kühn & Püschel (1984) and von Polenz (2008). For a detailed description of the analysis and results see Ruda (2008a, pp. 41–208).

A deductive research method was employed since it is regarded to be general knowledge that the teacher revises and subsequently assesses students' solutions. The determination of particular (speech) acts that may be formalized is of special importance. The conversion of certain structures into the feedback tool, on the other hand, was based on the inductive approach since concrete and thus specialized examples were translated into general rules.

TEACHERS' CORRECTION ACTIONS OF FREE WORDED EXERCISE SOLUTIONS

Correcting is often described with only few steps (Kleppin, 2007, p. 55). However, correcting involves many more actions than merely identifying, marking and possibly improving mistakes or grading. The analysis of the present transcripts has shown that correcting consists of five constitutive partial actions in the following sequence:

1. Grasping the complete student's solution attempt or filtering the propositions to be dealt with
2. Comparison with the expected solution
3. Assessment of the student's solution attempt with regard to the definition of the tasks
4. Total assessment of student's solution and
5. Total assessment of all present solutions of a student.

The potential correction actions also include preparations like writing down expected solutions, compiling a criteria grid and determining the approach – paper by paper or exercise by exercise. The envisioning of exercise questions and solutions can take place before the first, second or third partial action. The third step comprises corrections and comments. Remarks concerning the assessment in general can be made at the beginning and/or the end of the revision.

The most challenging action is the individual assessment of a student's exercise solution, which consists of seven areas:

1. Envisioning of the exercise definition
2. Envisioning of the connection between exercise definition and solution
3. Expressing the first impression
4. Grasping the student's solution attempts
5. Comparison with the expected solution
6. Assessing individual parts of the student's solution attempt and
7. Correcting.

It was revealed that there are complex considerations about correct and incorrect facts and forms mainly in the case of problematic and vague solution attempts, which the teachers tried to solve intuitively employing certain problem solving strategies (Ruda, 2008a, pp. 166–185). In order to nevertheless be able to understand problematic propositions, the teachers make certain (speech) acts, e. g.: They name/describe (omitted) (speech) acts of the student. They paraphrase from the student's point of view. They interpret, summarize, explain, specify own solution texts, elucidate the task definition, and search for parts of the solution text which may still be considered as correct.

A feedback tool can support the teacher in the complex action of correcting since this is effected according to a certain scheme. The feedback tool assists the teacher, who has a large number of students and thus many exercise solutions attempts to correct by asking for right, false and vague solutions possibilities. Hence the teacher has more time afterwards to deal with the problematic solution attempts.

TEACHER ASSISTING FEEDBACK TOOL

This feedback tool (Ruda, 2008a, pp. 209–260; Ruda 2008b) is oriented towards free worded exercise solutions whose texts are standardized and brief. It was programmed using „Borland Delphi 5.0".

The feedback tool comprises the three areas of exercise text, solution text attempt and evaluation text (Figure 1). The teacher enters the number and text of the exercise in the first mask "exercise/solution".

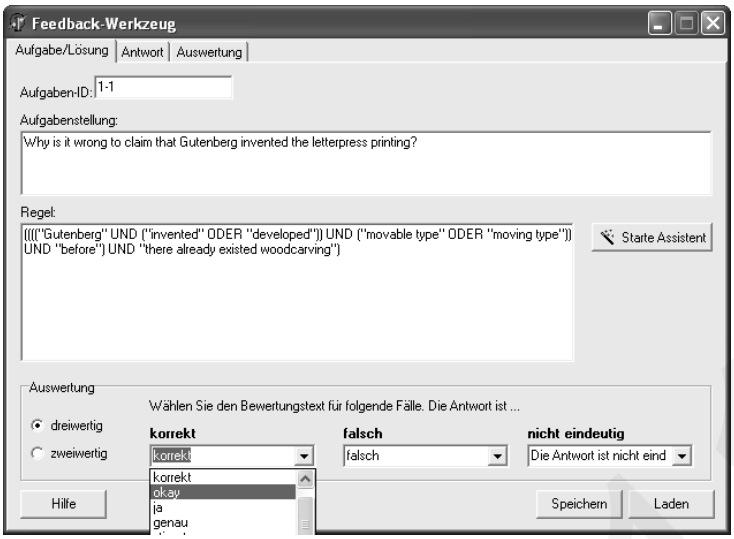

Figure 1: The feedback tool area "exercise/solution".

In the next step, evaluation criteria for the solution texts have to be set. Here the teacher should follow the rules listed under "help" which are based on the pragmalinguistic analysis. The "help" option informs, for example, about the conditions of the feedback tool and the rules for filtering out essential parts of the solution text, e.g., for the distinction between describing and explaining. It also provides hints for editing and further evaluation text suggestions. Moreover the rule assistant can be used. The rule assistant offers Boole's operators resulting in pattern matching:

- AND (UND): *Which words/phrases must be included in the solution?*
- OR (ODER) and PREFERRED (BEVorzugt): *please enter acceptable alternatives to the required words/phrases. If you prefer certain alternatives, please tick them (BEV-Operator)* (Figure 2).
- OR POSSIBLE (ODEREVTL): *Now enter solutions that you would accept even though they are not completely correct.*
- AND POSSIBLE (UNDEVTL): *Now enter solution text parts that may be included additionally.*
- POINT (PLUS): *When would a solution text be particularly good?*
- NOT (NICHT): *Which words/phrases must not be included in the solution?*
  What would not be completely wrong but can nevertheless not be accepted by you?
  What would be a serious mistake?

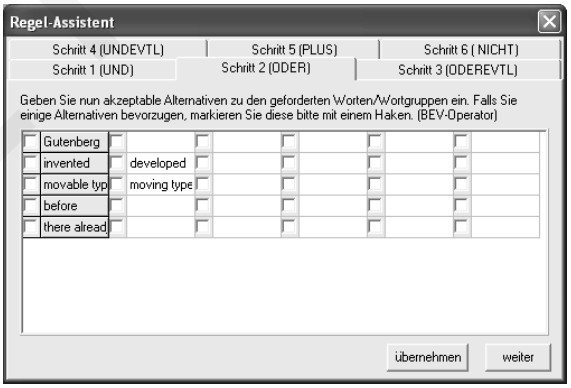

Figure 2: The OR and PREFER mask.

Then the teacher has to decide between the two- and three-valued evaluation (cf. Figure 1). The two valued modus merely concerns the categories "right" and "wrong" and is useful if there are only few correct solutions while all the others can be definitely qualified as false. For all other cases the three-valued modus also includes vague solutions. This selection option is preset since it is mostly applicable

with the present text corpus. In the next step the teacher selects corresponding assessment texts (cf. Figure 1). He can either choose variants from the text corpus or enter his own wording.
The teacher copies the student's solution from a data base and pastes it into the answer mask. If, on the other hand, the feedback tool is integrated into a web based training platform, the student's answer appears directly in the answer mask. The feedback tool evaluates the student's answer in accordance with the agreed rules and shows it in the bottom field (Figure 3).

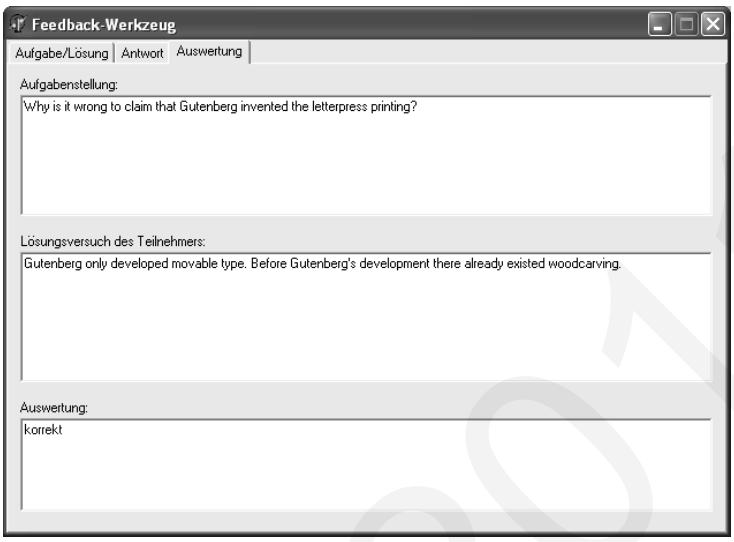

Figure 3: Correct solution.

Students' solution attempts which do not fit into the set framework are returned to the teacher by the feedback tool. The teacher can correct them by hand and then revise and complement the feedback tool with the corresponding rules and data. Therefore the output of non-revised solutions will be reduced with each learner group.

CONCLUSION

It was aimed to design a feedback tool which supports teachers in their correction work by making arrangements with them regarding the solution texts and assessments which requires the acquisition of certain rules and initial training. This means that an automatic correction of all solution texts cannot and should not be expected.
The feedback tool offers the teacher the following advantages: The teacher has to enter relevant solution parts and their corresponding assessment texts only once thus saving time and energy. He does not have to be afraid of a fast fall of his concentration since the feedback tool relieves him of the stultifying comparison of recurring patterns thus allowing him a higher degree of accuracy and objectivity in the correction. The time and energy saved that way can be spent more effectively for nonstereotype solutions.
Benefits for the student: He is urged to make greater efforts answering the exercise than with multiple choice questions, which includes a more thorough preparation. He receives an individual feedback upon which he cannot rest as in the case of sample solutions since he is directly required, e.g., to elaborate on a certain topic or to consult his lecturer. With corrected exercises he can strengthen and deepen his knowledge in a better way thus having a more thorough preparation for future examinations.
This feedback tool is still a prototype and not yet available. The current advancement includes the use of a semantic word net in order to e.g. capture synonyms and statistical data, for example about the frequency of certain students' solution texts.

TEACHERS' PERCEPTIONS OF THE USE OF TECHNOLOGY IN EDUCATION

Mehmet SHAHINER

Qafqaz University/Azerbaijan

msahiner@qu.edu.az

Abstract

The modern era has introduced the implementation of technology in many areas of life especially the education sector. Language learning has been facilitated significantly with the use of technology. This paper seeks to identify what teachers think about their competencies regarding integrating technology in teaching languages; what barriers they perceive while accomplishing this; what kind of expectation they have with their students in learning languages from technological perspective; and, what kind of technological tools do the teachers perceive as easy to implement and use while teaching languages. First an introduction has been given as to what contribution has technology made in education and especially the teaching of language. Then, teachers' competencies and barriers to the integration of technology have been discussed. After that, various technological tools and concept are discussed like CALL, CMI and ICT, which the teachers can make, use of to facilitate their language teaching process.

Introduction

Since the advent of sophisticated technological means, the educators have been trying to modify the instructional process with the help of technology. According to Baker, early 1960's brought with it "new curricula, instructional models, and approaches to individualization" (3) of instruction but the drawback with these instructional schemes was their poor management. An ideal classroom environment is so dynamic in which each student presents his own understanding and is comfortable with his own set of instructional materials. Thus, the teacher needs to organize instructional schemes in such a way that all students with their unique calibers are equally attended to. Before the incorporation of technology in teaching, teachers would process instruction manually but that process was inefficient when it came to collecting and summarizing instructional data for management purposes. This was when the need was felt to construct a reliable, fast and user friendly system which would process and manage modified instruction. Thus, a shift was made toward computer-based data processing or more specifically CMI (*Computer Managed Instructions*), which a lot of educators considered "as a reasonable model for the support of the management functions associated with the individualization of instruction" (Baker). Also, teachers started feeling the necessity of incorporating information and communication technology, commonly known as ICT (*Information and Communication Technology*), in their teaching practice. Kong and Kwok studied teacher perception of the use of information technology in classrooms in a school in Hong Kong and examined this perception under four domains that included "teacher perception of their computer training, computer facilities and assistance available, their confidence and comfortability in using computer in daily lessons, and their perception of their roles in using IT in classrooms." Their survey results supported the idea that teacher perception had a positive effect in the usage if teacher-centered technological approaches in the teaching process. They also found that the teachers and the school administration worked in a collaborative environment for the implementation and usage of IT in classrooms. Another similar research has been conducted by Ismail, Ghaleb and Almekhlafi (37) who studied teacher perception in schools in UAE. They also found that teachers' support and willingness to incorporate technology in their teaching languages is very important to obtain positive outcomes. They discussed the benefits of the usage of IT both for the teachers and the students and found from their qualitative and quantitative research that teacher perception should be considered seriously for better implementation of technological tools in classrooms.

Following is an illustration of various technological concepts that teachers should perceive as important so as to facilitate themselves in their teaching languages.

Computer Managed Instructions (CMI)

Computer Managed Instructions (CMI) is one of the two types of computer based instructions; Computer Assisted Instruction (CAI) is the other. CMI is an instructional scheme that makes use of the computer for obtaining learning resources and objectives, and to assess student performance, thus enabling the instructor to manage instruction in a more efficient way without having to get involved in the teaching process directly. In other words, there is no human interference. To be more precise, it helps the instructor in making effective instructional decisions by providing him with "diagnostic and prescriptive information" by making use of traditional data processing equipment (Prasad114). It includes functions that support the instructional management. These functions include "testing prescribing, record keeping, scheduling, monitoring and time and resource management" (Prasad). For the performance appraisal of the students at regular intervals diagnosis and testing is used. After the analysis of the results the student records are updated. The students are then suggested learning processes that are useful to accomplish their goals.

Teachers who are assisting 50 or more students that are enrolled in two or more courses having 30 teaching-learning units per course, have almost 3000 media assignments to make (Vierling and Shivaram). Thus, teachers feel it important to make use of CMI to manage these assignments. This increases their efficiency and also the quality of instructions given to each student.

Features of CMI

Sieber, O'Neil and Tobias (137) have defined the function of CMI system in the simplest way. They state:

In a computer-managed instruction program the instruction itself is not presented by means of the computer. Rather, instructional materials consist of conventional printed or audiovisual materials. The student sets the pace, and the computer is used to monitor, and to some extent to direct progress through the use of non-computerized instructional materials.

They assert that teachers test and diagnose the student using the CMI system at several places during the whole instructional process so that his strengths and weaknesses may be discovered. Teachers use the CMI system to provide prescriptions to the student to remove any errors they made, and to plan how much and when the student is going to use the instructional resources. They evaluate the students on the basis of their performance and their records are kept and managed. That is why we refer to CMI systems as artificially intelligent systems. The main features of CMI are described below:

- ***Testing***. Executing any new or revised program to check whether all data is processed properly.
- **Prescription generator**. It is based on the comparison between completed training and competency requirements.
- ***Record keeping***. The ability of recording students' details, training history and skill profiles.

How is Instruction Managed?

The steps that teachers go through in the management of instruction by CMI systems include diagnosis of entry behavior of the learners; setting of instructional objectives; generating individualized instructional plans; generating instructional materials and learning experiences; availability of instructional material into curriculum units; monitoring of progress; and, providing remedial instructions (Mangal 541).

What is ICT?

Most simply put, IT provides solutions to process the information while telecom provides solutions to transfer that information. Processing includes management of data (like computing, storage of data in databases, protection and retrieval of data) and its networking. Transfer includes transmission of data from one place/desktop to other using communication techniques. Both technologies are collectively called information and communication technology (ICT) (tutor2u).

CMI and ICT

Teachers perceive that CMI concept is important in the development of Information and Communication Technology (ICT) tools that are being used in educational institutions to provide the

students with the most modern learning environment (Mee Chin). According to Kaka, "education sector can be the most effective sector to anticipate and eliminate the negative impact of ICT. Technology (internet) in another side can be the most effective way to increase the student's knowledge". Teachers feel that students can be made familiar with computer aided simulations and educational games. The objectives of ICT in education are to incorporate latest technology based learning in schools, to endorse literacy about newer technologies in students, to support distance education, and to improve the teaching process by using latest techniques supported by ICT. The main functions of using CMI based ICT in education are the communication and collaboration of students in their activities and the wide availability of resources for teachers (Siraj-Blatchford & Siraj-Blatchford 19).

ICT in the National Curriculum

"ICT has a distinctive contribution to make to the aims of the national curriculum as a whole" (Qualifications and Curriculum Authority). In the national curriculum, ICT has played its role in planning work sequences and learning and teaching procedures. It has helped teachers to make students enjoy their educational activities so that they can relate the technology based learning to their everyday lives. Teachers perceive that students should be able to develop their own independent thinking regarding research, analysis of problems and decision-making. The national curriculum has put forth such programs of study that use ICT to enable the teachers to make students develop self-confidence and think about new ideas. The ICT based study programs in the national curriculum support safe usage of digital communication technologies. The curriculum has made it possible to use ICT in making the teachers and students familiar with the growing utilization of technology.

Example- ICT and Education of Children in Primary School

The national curriculum has proposed efficient study programs for children in primary school (Key Stage 1 and 2). ICT should be introduced to the child right from birth to enable him to understand the needs and demands of the new world. ICT has already become a part and parcel of young kids' lives. Introducing ICT concepts at so young an age helps children discover, examine, explain and solve problems, foresee, argue and judge. For primary school children, that is, key stage 1 and 2, it should be the decision of teachers where to make use of ICT tools to support their teaching process. According to Harriet Price, ICT in early years helps children enhance their independence in their use of ICT tools like digital cameras, digital images and role-play toys; develop creativity in areas like art, dance, writing and music; and, improve their outdoor learning experience using appropriate ICT tools.

For teaching math, teachers can download softwares which deal with making young children familiar with patterns, sequences, addition, subtraction, ordinal numbers and memory games. *Dinosaur Numeracy* is a software that helps teach children the add-1-and-take-1-away lessons. *Right Angle Monsters* helps children learn about right angles in a very interactive way. In this software, students search through the classroom for an item which fits accurately in the monster's mouth and if it does, then it is a right angle. Teachers can use *spreadsheets* and *interactive whiteboards (IWB)* to help children learn numeracy while interacting with one another. *Math board games* such as dice games, bingo and calculator games, geometry games with interactive layout can be used to help children take hold of main arithmetic and geometry skills together with times tables, word problems, ratio, percentage and mental addition. *CD-ROMs* are another important resource which teachers can use to store their math lessons. For teaching science, teachers can use activities like *Animal Magic* that are easily available online. This particular activity asks children to sort out and name animals. It uses animations to attract the interest of kids. Teachers can use *interactive science games* about life processes, living things and physical processes. Students at key stages 1 and 2 can be encouraged to use *digital cameras* and *video cameras* at zoo trips and then write their experiences with the help of videos they make. Presentation tools like *PowerPoint presentations* and *multimedia* can be used to teach using slideshows and simulations. *Computer-controlled microscopes* can be used to observe microorganisms.

Functions and Dysfunctions of Using Technology in Education

The main functions of using technology or ICT in science are the communication and collaboration of students in their science activities and the wide availability of resources for teachers (Siraj-Blatchford & Siraj-Blatchford 19). But, Jenkin states that "judgments need to be made about when and (more importantly) why ICT should be used. It should only be used when appropriate: meaning when and if, it

allows the teacher or the pupils to do something they would not otherwise have been able to do". Armstrong and Casement have argued that the extensive use of computers in schools has brought forward very expensive and useless change in the education history and that the continuous control of children's minds and habits by the screen culture has damaged them psychologically, neurologically, physically and generally. Staying in front of the screen for longer hours has hindered the speech and language development of young children (Healy). In teaching science, a disadvantage of technology would be that it may restrict children's own observation. Similarly, while learning math, if only technological resources are used, then the children may get weak in writing math which is a very important path for the learning process in case of math. Math cannot be learnt without pen and paper. Another dysfunction is lack of sufficient computers, hardware and software and lack of teachers' skill, competency and time in teaching using these resources (Bingimlas).

Technology and Students with Special Needs

Teachers believe that with the growing use of technology in schools, there is no reason why children with special needs should be ignored. There are a lot of technological tools available in the market and online that help children with special needs adapt to their new learning environment which is more efficient and more helpful to them. These tools help children who find difficulties such as language hurdles, cultural hurdles, writing trouble (dysgraphia), reading difficulties (dyslexia), math difficulties (dyscalculia), memorizing difficulties and environmental disadvantages (Namibia Training Authority 11). Special needs may be both physical and mental. Technological resources, like internet, discussion forums, special interest groups (SIGs), educational softwares and e-learning centers, have helped a great deal in meeting the needs of these special children.

Conclusion

To sum up, teachers are getting more and more aware of that technology is an important part of the national curriculum and provides great resources for learning and teaching processes. Children can be made well equipped with up-to-date information while being able to conduct their own research, do analysis, make decisions, share ideas and views, and learn to be creative and initiative using technological tools in their study. Teachers can use technological resources to teach more efficiently with good outcome. Technology is becoming inevitable in the educational and personal lives of students thanks to great advantages it offers. To sum up, ICT is an important part of the national curriculum and provides great resources for learning and teaching processes. Children can be made well equipped with up-to-date information while being able to conduct their own research, do analysis, make decisions, share ideas and views, and learn to be creative and initiative using ICT tools in their study. Teachers can use ICT resources to teach more efficiently with good outcome. ICT is becoming inevitable in the educational and personal lives of students thanks to great advantages it offers. And this is what Sir Jim Rose also suggests in his interim report.

TECHNICAL EDUCATION IN JORDAN: OVERVIEW, SWOT ANALYSIS, AND RECOMMENDATION FOR IMPROVEMENT

By
Saad Abo-Qudais[1], Mohammad Abu-Qudais[2], Abd- Motaleb Al-Khadrawi[3], Salwa Mrayan[4]

Abstract

One of the most crucial problems facing educational systems and workplaces in Jordan is the unbalanced equation between the enrollment rate in technical education at community colleges and the enrollment rate in general education. The enrollment rate in community colleges was about 11% in 2005. while , the enrollment rate was 89% in general education (four and five-year university programs). 75% of them were enrolled in humanities and science programs. One of the main reasons for a low level of enrollment in technical education programs is the public point view of technical education as "hand-work" and dead-end applied education . This paper presents an overview of community colleges education and discusses the of technical education in Jordanian community colleges perspectives. An analysis was performed to determine strengths, weakness, opportunities, and threats (SWOT) of this type of education in Jordan. As a result of this study , an action plan was recommended to improve technical education in Jordan .

One of the most crutial problems facing educational systems and workplaces Jordan is the *unbalanced equation between the enrollment rate in technical education at community colleges and the enrollment rate in general education. The enrollment rate in community colleges was about 11% in 2005. while 89%.,of the enrollment rate in general education (four and five-year university programs) 75% of them are enrolled in humanities science programs. One of the reasons for low enrollement in technical education programs is the traditional pointview of* technical education as "hand-work" and of applied education as a dead-end. This paper presents *an overview on education in community colleges and discusses the perspectives of technical education in Jordanian community colleges. An analysis was performed to determine strengths, weakness, opportunities, and threats (SWOT) of this type of education in Jordan. As a result of this analysis, an action plan to improve technical education in Jordan was recommended.*

Introduction

Human capital can be built by individuals who have the skills and knowledge needed to be compatible in the labor market. Moreover, human development is a major factor in any workforce development effort. Obviously, the education sectors are the main source of high-quality graduates. According to Schultz (1961), with regard to the role of education in human capital development, an investment in education is one strategy that promotes employers' productivity and income. He defined this strategy by stating that an investment in education is truly an investment in human capital, which means that students gain the necessary skills through

theoretical learning, experience, and training, and thereafter become valuable employees in the market place (Schultz, 1961).

On the other hand, there are many examples throughout the world countries that do not have natural resources but depend on their high-skilled workforce to improve their country's economy. For example, Korea, Taiwan, Singapore, and other Asian countries are doing very well after transferring their economies from traditional to light-industry and electronic-based economies. According to Gray and Herr (1998), one of the most important elements in components capital is human capital, the need for technicians who are bled to push the industrial wheel. In Jordan, the old vocationalism began to unravel when student enrollment in vocational education declined suddenly and dramatically. Students and parents concluded that jobs in traditional vocational education were disappearing. The public is always concerned about those who make more money than others. The only thing that seems to be at all certain is the increasingly publicized fact that universities graduates make more money than community colleges graduates.

The community college's concept is not an emerging one; however, it has a deep history that goes back for more than a hundred years. The community college evolved from at least seven sources of educational innovation. Two began in the 1880s and 1890s: (1) community boosterism and (2) the rise of the university research. Three came from the educational reforms of the Progressive Era (1900–1916): (3) the initiation of universal secondary education, (4) the professionalization of teacher education and (5) the vocational education movement; 8, (6) open access to higher education, and (7) the rise of adult and continuing education and community services, were primarily post–World War II phenomena (University State?, 2005).

Jordan is one of the smallest and less affluent economies in the Middle East with close to 15% of the population living below the poverty line. Jordan spends 6.4% of GDP and 13.5% of total government expenditures on education, which is higher than the average for countries with similar population and income levels. Enrollment rates at each level of education are consistent with other countries at similar income levels, but population growth and socio-economic pressures are placing high demand for further expansion and improvement of infrastructure, programs and services. Jordan is well on its way to achieving the Millennium Development Goals in terms of primary completion rates and the elimination of gender disparities in education. In 2004, UNESCO ranked Jordan 18th out of 94 countries in the "Education for All" rating for gender and education, indicating that Jordan provides equal learning opportunities for males and females.

It is clear that additional and continuous improvement of the quality of education will be essential to support overall national economic development aspirations for employment creation, stimulation of economic diversification, income generation and reduction of poverty through increased regional and global competitiveness. To enable and support economic growth, the local labor market requires a supply of well skilled and highly motivated graduates; currently there are far too many youth and young adults who cannot meet the demands of the workforce or the entry requirements for higher education institutions.Jordan has a total of 28 universities as of 2010, : ten public universities and , sixteen private universities , and two regional universities. The University of Jordan was the first established in 1964. A public university is established by a decision of the cabinet and endorsed by a royal decree. Private higher education started in Jordan in 1989, and establishing a private university requires a decision from the Board of Higher Education. As for community colleges, there are 47 *community colleges : 9 governmental, 15 follow Al-Balqa Applied University, 2 follow the United Nations Relief and Works Agency (UNRWA) for Palestinian Refugees, and 21 private colleges.*

, The mission and the main goal of the community college is to prepare the nation's workforce and to ensure that a nation's workforce remains globally competitive (Walker, 2005, p. 16). In light of that meaning, developing highly skilled technicians should occur mostly in community colleges by providing knowledgeable and highly specialized laborers. Gray and Herr (1998) pointed out that the workforce is a form of pedagogy that is provided at a pre-baccalaureate level to increase individual opportunity in the labor market or to solve human performance problems in the workplace (Gray & Herr, 1998, pp. 27–41). In addition, there must be positive growth in the education system in order to enhance the social and economic development of any country's workforce, . According to Alheeti and Brock, ―Education is a tool to aid the

workforce 3 development. CTE is intended to feed the work pyramid, and it is an essential step in building realistic workforce (Alheeti & Brock, 1997, p. 373).

The educational systems in Jordan established community colleges many years before establishing universities. Many community colleges were established as teachers' preparation institutes before the first university was instituted in 1962. As mentioned previously, debate about many issues related to community colleges occurs on a day-to-day basis and at all levels in Jordan and in the UAE as well. For example, in Jordan more than 192,000 students are enrolled in 29 Jordanian??? universities IN 2005, 75% of whom are studying topics in the Social Sciences and Humanities. While approximately 24,000 students are enrolled in about 55 community colleges, the majority of those graduate as technicians (Ministry of Higher Education, Annual Report, 2006). Despite the fact that enrollment in the CTE system in Jordan is considered one of the highest enrollment rates among other Middle Eastern countries (11.1%, when ??) for general education, this rate is still lower than policy makers' expectations, while the rate of enrollment in this type of education, as example, in the UAE a decade ago was less than 1% in general education (UNESCO, 1998). Unfortunately, an extreme shift in direction occurred in the last three decades from technical education to general education, in which technical education is considered to be the last destination for students who do not succeed in general education. Likewise, in 1995 about 38,276 students were enrolled in four-year universities and about 68,385 were enrolled in two-year community colleges. Today, the number of first-year students enrolled in 24??// public and private universities is 51,131 students while the number of first-year students enrolled in community colleges is 24,259 (Ministry of Higher Education, 2009).
Furthermore, previous studies have shown that in 2001 and 2002, 19,359 students were enrolled in community colleges whereas 44,761 students were enrolled in universities. Almost 98% of these students graduated from general education programs with no technical background and have no idea about their career target. In addition, most of the enrolled students in colleges are in general education. It has been estimated that fewer than 2% are graduates from vocational technical education schools (Cameron 2005). In these two countries, people still believe that their children's future will be in white-collar jobs that provide them with high-social-status , prestige and more financial benefits.

The same issue exists in the United States; Gray reported that between 1982 and 1990, the national percentage of students enrolled in college preparatory programs increased by 10%. During the same period, enrollment in vocational education programs declined in 32 states. Gray (1998) argued that students and their parents believe that future jobs with some potential for decent standards of living require this course of action.

Students who wish to pursue their profession in vocational education join a community college after successfully completing high school. Vocational higher education is available in Jordan in a number of specialties, such as administration and finance, agriculture, applied fine arts, applied sciences, engineering disciplines, hotel management, information management and libraries, para-medical subjects, shari'a and Islamic civilization, (other specialities …..) etc. In Jordan, the 52 ??community colleges were established on concepts directly inherent to the community college system in the United States.

In the community colleges, students may enroll in one- or two-year programs at community colleges. Students receive a diploma after successfully completing the program requirements. In the case of two-year programs, which is the most common, students have to pass a national exam in order to receive a certified diploma by the Ministry of Higher Education. A small percentage of students who successfully completed the national comprehensive exam may be admitted to regular programs at a university to study towards a Bachelor degree. The Ministry of Higher Education issues the "bridging" regulations that govern recognition of the courses studied in community colleges to be counted towards the new degree.
One of the vital goals of applied education is to prepare well-educated and highly skilled individuals for the labor market. However, this goal may be influenced negatively by the debate about this system's capability to carry out the mission of supplying the labor market with a highly skilled workforce. Educators complain about the quality of the students enrolled in CTE programs, onone hand; on the other hand, employers complain about the lack of skills, knowledge, and attitudes of the newcomers. Debate on the role and effectiveness of postsecondary education in two- and four-year institutions of higher education fills the air either in the U.S. or other developing countries. Despite the lack of studies on this issue in the two countries,

the rate of unemployment and rate of enrollment in community colleges and in CTE indicate that there is a problem that faces this sector. In the U.S., two camps address this issue; one camp advocates for community colleges, technical education, workforce education, and vocationalism. Education-to-work through community colleges in this perspective is viewed as a remedy for labor market problems such as shortage of the skilled workers, . According to this view, the future holds promise for technicians equipped with the theoretical knowledge and practical skills to compete in the local and international labor market. On the other hand, other groups are not satisfied with community colleges performance and outcomes. The community college, in its current shape, is seen as a work-mind institution that produces semi-skilled individuals who lack the theoretical knowledge to improve themselves or to participate effectively in the labor market (**Al-Alawneh, and Alhawasin**, ???).

Academic staff in Community Colleges

The majority of academic staff (around 70%) have Doctorate degrees(its not PhD??? (PhD) from institutions that are recognized by the Ministry of Higher Education, while a small percentage only hold a,Master degree. Staff members who hold a Master degree are appointed with the rank of*Lecturer*. When a staff member is appointed after obtaining a PhD, he/she is appointed withthe rank of *Assistant Professor*. After four years of service at the university and publishing number of papers in international journals and conferences, he/she may apply for promotion. After an internal and external assessment of the candidate's profile, he/she may be promoted to the rank of *Associate Professor*. After a similar period and comparable number of publications or more, a candidate may be promoted to the rank of *Full Professor*. Staff members may be tenured one year after their promotion to the rank of Associate Professor, provided they have a good record of teaching and community service. Although faculty members are appointed in regular jobs, they remain under probation for at least six years until a decision is made by the Dean's Council to grant them *tenure*, after which they become permanent. The Deans' Council makes decisions regarding the appointment, promotion, and tenure of faculty members. But before that, the relevant departments and faculties make their recommendations concerning all issues related to faculty members. As an example, the quality of teaching and research is firstassessed by faculty members in the faculty concerned. Only faculty members who have a higher rank than the candidate participate in such assessments. Theoretically speaking, the appointment of a faculty member may be terminated before tenure, but practically this is rather difficult to implement.

Significance of the Study

This topic is significant because it focuses on one of the critical issues in many educational systems, and most specifically those that hinder CTE community college graduates from pursuing higher education, which affects the quality and number of students enrolled in community colleges and CTE. Therefore, the focus of discussion will be on the community college system and four-year university system. The study will then demonstrate new trends relating to the community college

Research Objectives

Based on these two perspectives, the current article aims to answer the following questions:

1. What are the current perspectives about community colleges systems in Jordan?

2. To what extent is the current situation in Jordan aligned on this perspective in terms of the enrollment rate and number of the graduates from both systems.
3. How could a new transformation relating to the community colleges assist in resolving the current situation, which hinders applied education program graduates from pursuing their education?

SWOT Analysis

SWOT analysis can be simply understood as the examination of an organization's internal strengths and weaknesses, and its environments, opportunities, and threats. It is a general tool designed to be used in the preliminary stages of decision-making and as a precursor to strategic planning in various kinds of applications (Johnson et al., 1989; Bartol et al., 1991). When correctly applied, it is possible for a community colleges to get an overall picture of its present situation in relation to its community, other colleges, and the industries its students will enter. An understanding of the external factors, (comprised of threats and opportunities), coupled with an internal examination of strengths and weaknesses assists in forming a vision of the future. Such foresight would translate to initiating competent programs or replacing redundant, irrelevant programs with innovative and relevant ones.

The process of utilizing the SWOT approach required an internal survey of strengths and weaknesses of the program and an external survey of threats and opportunities. Structured internal and external examinations are unique in the world of curriculum planning and development.

A SWOT analysis can be an excellent, fast tool for exploring the possibilities for initiating new programs in the community colleges. It can also be used for decision making within departments and committees or even by individuals. A SWOT analysis looks at future possibilities for the institution through a systematic approach of introspection into both positive and negative concerns. It is a relatively simple way of communicating ideas, policies, and concerns to others. It can help administrators to quickly expand their vision. Probably the strongest message from a SWOT analysis is that, whatever course of action is decided, a decision making should contain each of the following elements: building on *S*trengths, minimizing *W*eaknesses, seizing *O*pportunities, and counteracting Threats. In order to be most effectively used, a SWOT analysis needs to be flexible. Situations change with the passage of time and an updated analysis should be made frequently. SWOT is neither cumbersome nor time-consuming and is effective because of its simplicity. Used creatively, SWOT can form a foundation upon which to construct numerous strategic plans for the vocational school. Historically, administrators seek to attract students to their college programs, without paying any heed to their institution's strengths and weaknesses. If, indeed, such internal audits are carried out, areas requiring some changes reveal themselves. Furthermore, the potential and possibilities for new services and programs may also emerge. Making a list of internal weaknesses could reveal areas that can be changed to improve the community colleges performance, also some things that are beyond control.The SWOT analysis covered all of the following areas, each of which may be a source of strengths, weaknesses, opportunities or threats:

Internal environment of the institution

1. faculty and staff
2. classrooms, laboratories and facilities (the learning environment)
3. current students
4. operating budget
5. various committees
6. research programs

External environment of the institution

1. prospective employers of graduates
2. parents and families of students
3. competing colleges
4. preparatory high schools
5. population demographics
6. funding agencies

THE INTERNAL SURVEY OF WEAKNESSES AND STRENGTHS

The external environment has a profound impact on educational institutions. During this final decade of the twentieth century, Jordanians education institutions did not sufficiently respond to changes in economy, social, political structures, and even individual lifestyles. Recent world shifts from an industrial to an information-based society and from a manufacturing to a service-oriented economy has significantly impacted the demands made on vocational program offerings (Martin, 1989). Community colleges, generally, cover a broad spectrum of service areas, but they provide fewer overall programs. Existing programs, and those planned for the future irrespective of the type of school, should be based on a careful consideration of future trends in society.

Strengths

Seldom strengths are present and need to be enlisted as well. Examples of potential strengths could be:

- High-skilled/high-wage graduates
- Reasonable tuition fee charged from students. Community colleges dropout many of education expenses and reduce its period by 50% or more.
- Strong and dedicated faculty with a high morale;
- Articulation with other four-year colleges and universities which would enable students to transfer course credits in some programs;
- Strong reputation for providing the training required to get entry-level employment in some programs; and

 Community college and baccalaureate attainment.

 Advocators believe that the economy needs technicians more than professionals. Community colleges are the main contributors to the workforce preparation activities. Community colleges were viewed as gatekeepers for the skilled jobs of the future and a primary source of advanced technical training. Community colleges improve its graduates socioeconomic status and income, in addition to improve education outcomes.
 Community colleges can play significant role for non-credit continuing education and job training.
 Meeting the needs of low-income workers and those displaced from traditional middle-class jobs because their manufacturing plants have closed. This perspective views the community college as an institution that can lift such people out of poverty by providing both basic education and occupational training.
 Diversity among the student population.

Weaknesses
In many programs offered in the community colleges, the quality of education that students are receiving today is not focused and even poor. In fact, we see that the education system is failing to fill the gap in some major occupations because the programs' aim is to obtain a higher education degree.
 Many four-year colleges and universities have selection criteria for attendance, such as a minimum required GPA, community colleges are either open to everyone or requires less GPA.
 How to develop comprehensive exit examinations that cover any number of courses students may take;
 Needs for remedial courses in some programs.
 How much emphasis to put on community services;
 Unemployment of community college graduates in some areas.
 Community colleges are believed to be static and not following new trends in the labor market, resulting in a weakness in competing with other competitors.
 Many high schools graduates and their parents believed that 4 or 5-year degree graduates will have better and more promising future.
 4 or 5-year degree graduates have more prestigious and highly paid in the long run.
 4 or 5-year degree graduates have higher Socioeconomic status (SES)

EXTERNAL SURVEY OF THREATS AND OPPORTUNITIES

Threats need to be ascertained. They come in various forms. Increasingly, restrictive budgets for vocational education are a rule rather than an exception. An anticipated cut in governmental funding can have a significant impact on implementing a high-budget program. Nearby universities and other local area colleges may be planning some new changes to attract more students to their programs.
An awareness of demographic changes in the local population can reveal potential opportunities to address new issues and pave the way for a more meaningful education. There could exist a pattern of preferences among the various minority or cultural groups. Public concern for the global environment is relatively new and this may represent an area of opportunity. Newer industries or businesses could emerge in the near future, seeking well-trained graduates.
It should be recognized that opportunities and threats are not absolute. What might at first seem to be an opportunity, may not emerge as such when considered against the resources of the organization or the expectations of society. The greatest challenge in the SWOT method could probably be to make a correct judgment that would benefit both the institution and the community.
Stakeholders and policy makers doubted the future of career and technical education in community colleges because they believed it is static and not following new trends in the labor market, resulting in a weakness in competing with other competitors. Moreover, community colleges were viewed as gatekeepers for the skilled jobs of the future and a primary source of advanced technical training (Bragg, 2001). On the other hand, some advocate a renewed focus on meeting the needs of low-income workers: inner-city residents, new immigrants, and those displaced from traditional middle-class jobs because their manufacturing plants have closed. This perspective views the community

college as an institution that can lift such people out of poverty by providing both basic education and occupational training (Badway, Grubb, & Bell, 2003).

Strategies must be developed to ensure that institutions will be responsible to the needs of the people in the year 2011 and beyond. To develop these strategies, a SWOT analysis should be performed. As part of this analysis the challenges facing community colleges education in Jordan should be defined. The main challenges are:

- ***Admission policies do not offer*** equal opportunities to all applicants.
- Weak or absence of quality assurance system in education programs at community colleges.
- ***Weak scientific research and development*** environment.
- ***Shifiting of many programs*** in community colleges from technical education towards classical academic programs offers at other universities in Jordan.
- ***Insuficient funds to community colleges to*** establish high quality programs and cover expenses of low income students who can not offer paying the college fees.
- *unbalanced equation between the rate of enrollment in community colleges and the rate of enrollment in 4 and 5 years universities programs*. This due to low percentage of students who wish to enroll in vocational education programs. This problem most likely is arises both in the home and school. That is, if parents are not satisfied and feel uncertain about the future of technical education in high schools and community colleges, they will not encourage their children to go into that type of education, on the one hand.

- ***Poor colleges environment*** to build the students characters and reinforce loyalty and democratic practices.
- In most cases, the education in community colleges are not opened to a higher level of education in other words this type of education is perceived as a dead-end such that educational systems provide very limited options , the consequences may include the quality-in and quality-out of the graduates and in the low-rate of enrollment in this kind of education.
- Misconception about community colleges' current situation. In Jordan, negative attitudes toward community colleges are rational because community college graduates have a lower status than four or five-year college graduates. Community and businesses are viewing these schools as a last destination for non-successful students. This factor has influenced community colleges as well as belief that the four-year university program is the only one that can help them find the right job. This misconception also exists widely in the United States. Gray and Herr have stated this same misconception of community colleges and reported important facts and numbers regarding education outcomes for four-year university and two-year community college graduates. They have also shown that many jobs do not require a college degree (four-year university); only 22% of jobs required a college degree in 2005. Furthermore, they assured their readers that the future labor market will not pay for education per se with above-average wages but it will do so for occupations that require skills that are in demand (pp. 84–88).
- Uncertainty in remaining the economy strong enough to generate sufficient employment for those graduating from community colleges.

Despite these hurdles, Jordan's community colleges are viewed as an investment that ensures both the social prestige and economic security of the country and its people (Badran, 1989).??????

Recommendations

The National Strategy for community colleges should be revised and campaign to support the reform process The education in community colleges should be pillar of the national ETVET strategy, which emerged from overall system movement towards, the National Agenda. and eventual compliance with, targets for access, equity, social and economic inclusion, relevance, and ultimately quality, as measured by a variety of system approved standards for performance and assessed by competencies, results, and achievements which can be achieved through:

 Connecting education to work and connecting applied education to higher education levels. Many solutions have been suggested for moving the barrier between the two types of education. Recently, a promising trend in territory education is taking place through what has been called the community college baccalaureate‖. Colleges are offering bachelor degrees in many fields that require wide theoretical knowledge and solid practical experiences, such as teacher preparation, at all levels.
 Structuring the educational system to ensure **lifelong learning**
 Ensure **responsiveness** of the community colleges educational system to the economy. This can be achieved by mapping the relationship between vocational education and the labor market. Mechanisms for more systematic longer term tracer studies to provide ongoing information on links to the labor market should be implemented.

 Transform the Community colleges to Produce Labor Market Relevant Skills, by aligning the community colleges with the needs of a changing labor market in an emerging knowledge economy. This can be achieved through:
(i) Developing policy component by drawing on the best international experience, trends in the region and specificities of the Jordanian context;
(ii) Run a series of pilot initiatives to test various institutional options for reform;
(iii) Create institutional linkages to employers, other training providers, and other VET reform initiatives; and
(iv) Form linkages with other TVET work in Jordan (i.e. Vocational high schools, and the Vocational Training Corporation).

 Identify key policy directions with respect to the transformation of the community colleges education system to meet the requirements of what had been identified as the knowledge economy.

 The internationalization of the market and the other is the variety of institutes that provide online degrees in a wide variety of areas

 The education in community colleges should be directed to prepare individuals for competition in the local and global labor markets in order to improve a nation's economy.

 Rremedial English and mathematics courses, in addition to provide the right resources and services to support individual student learning needs through special education, remedial and alternative ways for credentialing student achievement.

 Evolution off a publicity campaign to encourage enrollment in community colleges. This campaign should cover all Jordanian high schools, with particular attention paid to the role played by students' parents.
 Community college workforce development mission should include all of the institutional programs, courses and activities that prepare students for work.

 Governance and administration to ensure the financial and academic autonomy of universities.
 Admission standards to develop admission criteria for achieving fairness and equal opportunity.
 Accreditation and quality assurance to develop a quality assurance system and apply it to all institutions and programmes of higher education.
 Moving to an outcomes-based curriculum from an input-focused model of education
 Adopting a learner-centered approach to curriculum, teaching and learning
 Implementing a "core" curriculum, the learning outcomes of which can be met through different approaches with many different learning resources, and a "supplemental" curriculum to meet the various learning needs of different individuals.
 Support for the central place of the learner in outcome-based education through review and further renewal of program structure and curriculum scope, sequence and content, diversification of core and supplemental learning resources, teaching methodologies and assessment strategies, and new or

renewed programs in career, physical education and health, and others areas that fulfill the needs for holistic education for all students.
 Implementing the role of teacher as the "facilitator" and "guide" for learning from a role of teacher as "provider" of information;
 Recognizing the "professional" nature of instructors through an effective ranking and rewards system as compared to a civil service view of human resource management; In other words, it is important to recognize achievement and reward excellence among teachers and other educators.

 Investing in quality continuous professional development of education staff (teachers and leaders) rather than accepting pre-service training as sufficient to meet the needs of learners. Training program should be designed and implemented for both new and in-service instructors; Teacher training programs should be broad based programs and specialized vocational courses.

Utilizing technology as a an integral part of the education and learning process and as a tool to support/enhance learning;
Scientific research, development, and graduate studies to improve the research environment, encourage research teams from varied specialisations, and support excelling graduate students in various higher education institutions.
Technical and technological education to revise specialisations in community colleges and gear them towards technical education.
 Incorporating a "lifelong learning" approach to the provision of education
Improve Poor colleges environment to build the students characters and reinforce loyalty and democratic practices. This can be achieved through learning environment initiatives that provide additional general and dedicated facilities (schools and extensions), for student enrolment and appropriate program delivery and that will ensure universal connectivity and expanded ICT resources for learning.

 Poor colleges environment to build the students characters and reinforce loyalty and democratic practices.
 Parents and educators should find a way to guide children and students to be employable in the future.
Education-to-work as represented community colleges should be opened to a higher level of education than is currently the case. On the other hand, if this type of education is perceived as a dead-end such that educational systems provide very limited options , the consequences may include the quality-in and quality-out of the graduates and in the low-rate of enrollment in this kind of education.
 Information about the current business climate, demographic changes, and employment and high school graduation rates should be considered in this phase of the study. A multitude of sources include, but are not limited to, parents and community leaders, local newspapers, national news, conferences, the local industrial advisory council, and local business contacts. Each of these is a potential source of highly valuable information.
 Reduction and refocus of the vocational education programs to maximize the emphasis on relevant skill and competencies through curriculum renewal supported by targeted initiatives in teacher training and equipment and resources deployment

Design a strategy to convince students and parents that academically average students who enroll in integrated tech-prep will have high-skill/high-wage careers and thus see the advantage of a technology associate degree over a baccalaureate degree.
 Increase engaging various stakeholders in determining the direction, design and delivery of education.

 Increase the focus on cost-efficiency measures within the educational system to acquire resources for quality enhancement activities rather that depending on annual increments to the education budget as the sole source of funds for educational improvements.

 Development and implementation of an integrated information management system to incorporate current and future specific information systems and provide the basis for modeling policy options and supporting policy decision making, implementation and assessment.

 Review of current structure, processes of Al Balqa' University with respect to central directorate roles and functions, and develop, and implement new ones, and consider development of specialized well-equipped regional community colleges that will replace smaller colleges programs that are outmoded, under-equipped and under-resourced
.

 Implement of mentoring and evaluation system. Make continuous assessment and reflection on actions a habitual practice; Keep performance standards at the forefront of activities;
 Accessing and utilizing information and communications technologies to support
effective learning and system management; **Develop a range and variety of enduring public-private partnerships;**
A Public-Private Partnership is an effective way to build an appropriately skilled, demand-driven workforce that meets the needs of the private sector. A successful example of Public-Private Partnership brings together: Al-Huson University College (AHUC); Consolidated Contractors Company and the Morganti Group Inc. (CCC/MORGANTI); and USAID Jordan Economic Development Program (SABEQ). The Partnership enhances CCC/MORGANTI with its corporate responsibility initiative in Jordan as well as addressing CCC/MORGANTI's labor force needs from Jordan and in the MENA Region.
Consolidated Contractors Company and the Morganti Group Inc. (CCC/MORGANTI), the largest construction company in the region, it needs more pipe fabrication supervisors on large construction sites. In the meanwhile Al-Huson University College (HUC) working on increasing the number of jobs available to the college graduates. In this capacity, CCC/MORGANTI to Al-Huson University College (AHUC), introduced employer-specific training programs.
The first task was for the partners to clarify their roles. The Career Development Center recruits and enrolls program participants, and provides training on computer skills, workplace preparation, and English proficiency to students. The college provides classroom and laboratory space, renovations, rent and utilities, and collects student fees. The construction company supports up-front costs needed to get the program underway (e.g. specialized curricula; equipment; training for University instructors).
The first patch of graduates from this program were 18, most of them appointed in the Consolidated Contractor Company with a starting salary of more than 1,500 US$.

TECHNOLOGY ENHANCED LEARNING: THE CASE STUDY OF ENGLAND AND NORTH CYPRUS

Ebru HEYBERI TENEKECI
University of Birmingham
exh714@bham.ac.uk

ABSTRACT

The purpose of this research was to explore how and why (under what circumstances) Information and Communication Technologies (ICTs) are being used in secondary schools, through a comparative analysis between experience in England and North Cyprus. Furthermore, the study aims to explore any differences between the practitioners in their beliefs about pedagogy and their use of ICT and how these beliefs shape their approach in the classroom. The researcher also has the aim to raise awareness, particularly in North Cyprus, of the opportunities for ICT to be used to enhance learning and, through sharing practical experiences in each country, discover how these technologies can be applied effectively and integrated with subject teaching in the respective learning cultures.

It draws on the interpretive paradigm (Cohen & Manion, 1994), where the focus is on how people interpret and make sense of their world. From this interpretive perspective the beliefs of England and North Cyprus secondary school teachers were investigated.

Two England and two North Cyprus secondary schools' teachers have been involved in this study. The teachers were asked to voluntarily participate in the study and 121 out of 167 (44 male and 77 female, 72 %) completed the questionnaire. The results of the questionnaire were used to justify selected schools and select participants for the interviews. 3 teachers from each schools (12 in total) whose competence (self-rated) level was high, medium and low and who indicated in the questionnaire that they would be happy to participate in the interview process were selected to participate. Analysis of the data, together with the relevant literature builds a picture of the use of ICT in teaching a pedagogy-led way in secondary school education. Providing ICT hardware and software resources to a school is not enough to ensure significant integration in use of ICT for teaching and learning in classrooms. Access to working ICT continues to be an issue for Turkish Cypriot teachers where integration ICT into teaching continues to be an issue for British teachers. Although teachers identified many benefits to teachers and students from using ICT and had made individual efforts to develop their use of ICT for lesson preparation, they also identified barriers. These barriers focused on a lack of appropriate professional development, technical support, availability and accessibility of recourses.

It is expected that the results of the research will guide future research and development in two countries especially in North Cyprus and outline the importance of the use of information and communication technology in education for teachers and students and particularly provide lessons plans of use of ICT in teaching pedagogy-led way for teachers. It will contribute information towards planning in future projects.

INTRODUCTION

Information and communication Technologies (ICTs) are believed to be an important set of tools for improving teaching and learning in education and their integration in school teaching has been championed in developed countries for at least two decades (UNESCO, 2003; Isman et al., 2007). After the announcement of the National Grid for Learning (NgFL) in 1997, there has been a sustained drive to equip all UK classrooms with a range of ICTs including access to high-speed internet connections in the belief that this would lead to benefits for learning. Many other countries have taken similar initiatives to provide ICT to schools as a means of improving the quality of education. The impact of these policies on learning remains

hard to demonstrate for a number of reasons (Pilkington, 2008). In particular, barriers to effective use of instructional technologies are shifting from access to ICT to basic training. Once basic ICT training skills are obtained, it shifts to appropriate use of instructional technology in the classroom to help with subject teaching and enhance student learning (ibid). However, the use of computers and the Internet is still in its infancy in developing countries, if these are used at all, due to limited infrastructure and the attendant high costs of access.

In North Cyprus, similar efforts like the England government have been undertaken by government but the lack of financing and understanding of the benefits of ICT in education are preventing the integration of technology into all schools. Only a few research studies have been conducted to demonstrate that educational technology, as a tool, would improve the quality of education in North Cyprus; those specifically relate to areas such as science and maths (Isman et al., 2007). North Cyprus is a developing country where ICT is less frequently used in the secondary schools. Similar to other developing countries, North Cyprus is experiencing problems related to technology readiness and integration of technology. A question remains as to whether these problems can be seen simply as a development lag with all the same issues that developing countries have experienced or whether differences in specific local cultural contexts and technological advancement mean that a different set of problems and strategies for dealing with them are arising. To address this problem, the Cypriot government aims to extend the use of ICTs into schools to raise standards in teaching and thus provide students with high quality education.

Statement of the Problem

The role of ICT widely considered as a core element in the education of students. Countries all over the world have identified the significant role of Information and Communication Technology (ICT) in improving education and they have invested heavily in increasing the number of computers in schools and in the networking of classrooms (Pelgrum, 2001). Furthermore, many researchers have predicted that the importance of educational technology in the classroom will continue to increase (Becker & Ravitz, 2001).

Become familiar with a range of technological tools and develop the necessary skills in using these within everyday learning environment are required from students within the [England] National Curriculum. The UK Government has invested £5 billion in schools' ICT since 1997. As a result, in the European Union with one computer for every three students, the UK has the highest levels of embedded ICT in classrooms (DCSF, 2008). Furthermore, educational technologies have been in use in the UK for more than two decades. As a developed country, the British government has already extended its use of ICT over many years. Despite substantial investments in ICT, there is little data about how schools are using computers and other ICTs. Ehrmann (1999) states that administrators tend to make large investments of time and money in ICT without sufficient data regarding 'problems, solutions and achievements' associated with ICT interventions.

This problem of lack of information on ICT usage in education is not isolated in developed countries. It is more severe in least developing countries where most education data are unreliable. In these countries, data collected are generally centred on inputs such as teachers, students, classroom and expenditure (Puryear, 1995). Researchers tend to ignore substantive issues regarding ICT implementation and its effect on people and work process (Montealegre, 1999). This finding is supported by Buchmann and Hannum (2001) who noted that there is a lack of qualitative educational research in developing countries. Fuller (cited in Buchmann and Hannum, 2001) presented that while researchers in Europe have explored factors that affect learning such as the use of ICT, developing countries have not yet charted similar research avenues.

In view of the problems identified above, this research study will investigate the problem of lack of documentation regarding the extent of ICT usage in Turkish Cypriot secondary schools. Also, this research will investigate how selected secondary schools' teachers use of ICT and which pedagogical approaches are being employed by these teachers to identify good practice of use of ICT in teaching with appropriate pedagogy. There are many researches about British schools' use of ICT whereas the extent to which Turkish Cypriot schools are using ICT is largely unknown. Without data of this kind, there is little basis for policy

formulation in the education sector. As a result, ICT equipment in North Cyprus tends to be purchased without proper terms of reference and is distributed indiscriminately.

METHOD

Research Question

The main research question for the tudy is:

'How and why are technologies being used in the classroom by teachers to enhance secondary school students' learning in England and North Cyprus?'

Sub-questions:

1. What technologies are being used by secondary school teachers?
2. What are the teacher's pedagogical beliefs?
3. What pedagogical practices are adopted in the school and how is ICT used in them?
4. Why are these technologies being used (integrated)?
5. What are the perceived barriers to and enablers for technology use and what reasons do teachers give for these perceptions?
6. How do secondary school teachers believe ICT impacts on their teaching and their students' learning?
7. Are there any differences between Cypriot teachers and British teachers in terms of the six preceding questions?
8. What can Cypriot teachers learn from the experience of teachers in England and vice versa?

Population and Sample

The population of the study consists of two England and two North Cyprus secondary schools. The sample of teachers was drawn from these secondary schools. 167 teachers from four secondary schools participated in this study's questionnaire. The number of questionnaires returned was 121. A cross sectional sample of 14 people were selected for interview. Of these 12 were teaching staff, whose competence (self-rated) level was high, medium and low and who indicated in the questionnaire that they would be happy to participate in the interview process were selected to participate, and 2 were ICT co-ordinators.

The study sample in the third phase of this research utilising Modified Delphi Method will be comprised all 12 teachers in the first round and 6 (3 pairs) teachers in the second round to discuss and revision provided lesson plans to produce ideal lesson plan which enhance students learning. This phase will be held in the beginning of June.

Procedure

This PhD study is actually based on an interpretive approach as it aims to build consensus by using the 'Modified Delphi Technique' at the end of the research. The research is a mainly a qualitative but also included the use of a questionnaire with quantitative responses.

In the first phase of this study, a survey based approach was adopted to establish the nature of the IT resources available to teachers, its location/accessibility, and state of repair, as well as the availability of technical support, the teachers' use of ICT and the training of staff in the school. The results of the questionnaire demonstrated the 'broad picture' within each of the schools in the two countries, explain and justify the selection of schools and the selection for the interviews of teachers who had the confidence and belief that they should integrate ICT more in their subject teaching, as well as teachers who were less confident.

In the qualitative/second research phase, an interview technique was adopted to determine the value of the technologies that were being used; how and why these technologies were being used/employed; which pedagogical approaches were being applied by teachers related to technology use; the teachers' acceptance of

technology use, the teachers' perceptions concerning barriers and enablers to integration of technologies, and the types of professional development provided by schools for the interviewed teachers and, ICT co-ordinators. The results were compared and contrasted between the two countries. Furthermore, the result of interviews was enabled the researcher to choose good scenarios of ICT integration into teaching for the last phase of this study.

The 'Modified Delphi Technique' will be employed for eliciting teachers' opinions on good scenarios of ICT use in teaching as the aim of Modified Delphi Method is to provide a practical means of obtaining the opinions of a group. This final phase will be completed in three rounds. In the first round of the study, ideal three scenarios will be sent to all participated teachers to examine these and then each teacher will rank scenarios according to their preference. The feedback workshop from round two is designed to highlight the different requirements for making that scenario of use a working reality for each teacher's classroom, subject and level of student – they will make decisions in designing their lesson plans concerning how to use ICT in the classroom in a pedagogy-led way – they will feedback to the group what their individual concerns were and how they arrived at a plan that would work in both countries and what changes they might need to make to be able to use the ICT effectively in the way suggested. Each teacher chooses one other lesson plan which they think they might like to try with their own group commenting on why – the results are fed back to the group – at this point it is hoped consensus around what will work (in North Cyprus and the UK) and which scenarios represent good pedagogy-led practice should be emerging – further rounds may be undertaken if needed to build a clear consensus.

RESULTS

Questionnaire

The results of questionnaire were demonstrated, first, the 'broad picture' of England and North Cyprus selected schools as presented in tables and figure in the below:

The tables below show the types of ICT resources that British and Turkish Cypriot schools have in their schools.

*Table1. Distribution of ICT tools in **England and North Cyprus** schools*

ICT Tools	Availability % (n)	
	England secondary schools (n=50)	North Cyprus Secondary schools (n=71)
Computers	94.00% (47)	90.14%(64)
Overhead projector	88.00% (44)	57.74%(41)
Printers	76.00% (38)	76.05%(54)
Scanner	56.00% (28)	35.21%(25)
Electronic whiteboard	78.00%(39)	52.11%(37)
Laptop	96.00%(48)	8.45%(6)
Camera	90.00%(45)	
Video Camera	24.00%(12)	
PSPs	34.00% (17)	
Notebook	12.00%(6)	
Mobile Phone	4.00%(2)	
Voting system	16.00%(8)	
MP3 Player	12.00%(6)	
Microsoft office programs	92.00%(46)	80.28%(57)
Publisher	18.00%(9)	
Video and sound editing soft	18.00%(9)	
Educational games	46.00%(23)	
Subject specific software	26.00%(13)	

Designing software	14.00%(7)	
Simulations	26.00%(13)	
Internet	100%(50)	91.54%(65)
Real smart	12.00%(6)	
VLE	92.00%(46)	
Intranet	92.00%(46)	
E-portal	14.00%(7)	
P drive	12.00%(6)	

The results shown in Table1 indicated that the Department for Education in England had devoted their efforts to providing schools with a different types of ICT tools 'computers', 'laptops', 'overhead projector', 'printer', 'electronic whiteboard' and other ICT tools that mentioned above, which helps all teachers in the school whatever their subjects. Teachers with these tools were able to modify their teaching methods, giving them opportunities to present their lessons more effectively.

In addition, the results shown in Table1 indicated that the Northern Cyprus Minister of Education had also devoted their efforts to providing schools with a different types of ICT tools 'computers', 'overhead projector', 'printer' and 'electronic whiteboard', which helps all teachers in the school whatever their subjects. However, when these results compare with the results that obtained from English schools, it can be said that English teachers have more ICT resources than Turkish Cypriot teachers to use in their teaching. Although Turkish Cypriot teachers have less ICT resources, they with these tools were able to modify their teaching methods, giving them opportunities to present their lessons more effectively.

Second, the results of questionnaire helped the researcher to select the most appropriate and reasonable representative participants within the selected secondary schools for the interview. The selection was based on how they are confident, how much they are using ICT in their classroom, how they rate their stage of ICT use and have they had the training. Teachers whose competence level was high, medium and low were selected for the interview. The teachers were chosen as a high competence level who use computers more than 90 minutes in their teaching activities in each week, describe his/her level of ICT skills ,particularly his/her 'classroom practice', as an intermediate level, received training and whose stage of technology adoption is between 4 to 6. The teachers were chosen as a medium competence level who use computers 15-45 minutes in their teaching activities in each week, describe his/her level of ICT skills ,particularly his/her 'classroom practice', as an beginner level, received training and whose stage of technology adoption is between 3 to 4. The teachers were chosen as a low competence level who use computers less than 15 minutes in their teaching activities in each week, describe his/her level of ICT skills ,particularly his/her 'classroom practice', as an beginner level, received training and whose stage of technology adoption is between 1 to 3.

After teachers were selected for the interview process, the selected teachers were interviewed and their analyses were given below.

Interview

These findings that were presented below are the initial findings. This means they could be changed a little bit and extended.

Teachers were asked to describe their teaching styles and it was suggested to teachers that their approach to teaching in use of ICT fell into one of the three categories. The first was instruction approach (A), where students need teachers to set clear goals and boundaries, give them access to high quality structured resources and information and lots of practice on problems to achieve success, and the teachers who fell into this category use traditional teaching methods. The second was construction approach (B), where students need collaborative group activities that help them to develop critical thinking skills, be creative, take pride in their team's work and learn to work together, and the teachers who fell into this category use constructivist teaching approach methods. The third way was to apply combination of both approaches (C). These are represented in Table2.

Table2. Teachers' Preference for the three approaches to teaching statements

Approach (Vision A, B, C)	English Teachers' responses Percentage (%), Number (n=6)	Turkish Cypriot Teachers' responses Percentage (%), Number (n=6)
A-Instruction Set clear goals and boundaries Give students access to high quality of resources Give students access to high quality information lots of practice on problems to achieve success	% 0	% 33.33 (2)
B- Construction Collaborative group activities Develop critical thinking skill Be creative Take pride in their team's work and learn to work together	% 0	% 50 (3)
C-Mixed Combination of Instruction and Construction approaches	% 100 (6)	% 16.66 (1)

All English teachers responded that they employ combination of instruction and construction approach in their teaching where half of Turkish Cypriot teachers responded that they employ construction approach, thirty three of Turkish Cypriot teachers prefer to use instruction approach and only one of them prefer to apply combination of both approaches in their teaching.

However, after examining the teachers' example of use of technology in their classroom, it can be said that teachers' responses to above question, which was about their teaching approach, is not really match with the approach that they applied in reality. For example one Turkish Cypriot teacher - Teacher9-OC-CY stated that her preference is vision B that is construction approach, however when her use of ICT in teaching examined which is below

> 'I teach literature, reading a text is very important and I need to teach my students how they need to be read it. So...I brought the CD-Player into classroom to have my students listen a text from a professional speakers.'

Most Turkish Cypriot teachers still use instruction approach. After examined their example of use of ICT in their teaching, most of them use technology as a tool to help them present their teaching. However, most of teachers in England use technology as a tool to help students to understand better, increase their problem and critical thinking skills. Some British and Turkish Cypriot teachers, who apply instruction approach, use technology to present a topic in the beginning of the lessons and then, they apply construction approach to provide group work activities or discussions to increase students' understandings, problem solving and critical thinking skills.

There are factors that influence teachers' choice of teaching approaches. Turkish Cypriot teachers' culture and school have influence their preference. Conversely, British teachers' personal preference is the factor that influences their choice of teaching approach and they give reason why they use it.

Teachers were also asked why they use technology in their teaching. Most of Turkish Cypriot teachers stated that the reasons (enhance students learning) to use technology in teaching are engage students, increase their interest on lessons, improve their understanding for better learning and make learning more enjoyable. However, British teachers use technology in their teaching to improve students critical and problem solving skills as well as help them understand subject better and engage students and take their attention.

Teachers were also asked if they see any problem in using technologies in their classroom to find out the barriers and enablers to teachers' use of ICT in teaching. The issues of lack of accessibility of ICT resources and technical support in English schools were the areas that the most of teachers pointed out where lack of available training, resources and technical support and lack of good quality of ICT resources were the areas that the most of Turkish Cypriot teachers pointed out. In terms of enablers, availability of training, technical support and resources were the most pointed out areas by British teachers while Turkish Cypriot teachers pointed out access to own personal laptop and have a skill to use technology were enable them to use technology.

Almost all British teachers received training from their schools or trainings that were provided by government. However, none of Turkish Cypriot teachers received any training on technology use or integration.

Three teachers' use of ICT, which are good practices, were selected to present how these teachers employ ICT in their teaching in pedagogical-led way and ways of enhancing learning. One of the selected teacher's use of ICT with construction approach is as follows:

'I took an entire year group and gave them an opportunity to film a zombie movie and all I gave them was some paper and planning materials, a video camera and some fake blood and they spent whole day using technology, they created a movie, they filmed it and then they edited on computers and they came up with what they wanted to come up with which I think is vision B[construction] I did it in groups which worked very well.'

Teachers stated that it's valuable learning experiences for life skill and creative thinking skill of students. Then all these good practices are examined and they are combined to produce ideal scenario later for the Delphi component.

Conclusion

These are the part of finding as last phase of study did not carried out yet but these findings reveal that the two countries are very different in available ICT tools to them, their use of ICTs, training and support that they have received and their stage of ICT adoption/integration. As it can be seen from the findings Turkish Cypriot teachers need ICT resources and training and British teachers need more training on integration of ICT into subject teaching. Third phase of study, which will be held in the beginning of June, will provide an opportunity to Turkish Cypriot teachers to learn from British teachers experiences of ICT use or vice versa through email and Skype communication software to discuss provided ideal pedagogical scenarios/(lesson plans).

Abstract

As the availability of technology has tremendously increased over the past few years, so it is the best way to utilize it efficiently in education. But due to this increasing availability of technology some questions arise in mind: if all the material can be provided to the students out of a typical class room then should they attend classes anymore? How can a teacher give his students best motivation with this increasing availability of technology, and has the role of an instructor changed? We have tried to address some of these issues in this paper and let the instructor think of a new way to improve their class room learning using some technology tools.

1. Introduction

For a long time teachers and the text book were the main source of information for the students and the material available to the students was class notes and text books, while lectures were also given by traditional use of black board and chalk.

When the overhead projectors were introduced the faculty started bringing prepared materials into the class rooms in the digital format. This data in the digital format can be made easily available to the students through the internet (Internet is no long a luxury now and is assumed as a freely available technology). But if all the materials are available to the students out –of – the class room then a problem arises that the students may start skipping the classes as why should they attend the classes if all the stuff is available out-of- the class. This leads to have some effective evaluation criteria for the students. So how can we evaluate the students effectively by the use of technology tools, and how can we help the students to enhance their classroom learning are some of the questions that we would like to answer in this paper

1.1 What are the problems of learning in classrooms?

Joseph D. Novak stated that "Education has the Five elements: Learner, Teacher, Knowledge, Context and Evaluation. The central purpose of education is to empower learners to take charge of their own meaning making" (reference). There are two types of learning in classrooms: active learning and passive learning. Passive learning is defined as that type of learning in which it is assumed that the students will enter the course which they want to study with open minds, which are like empty vessels or sponges, and the teachers will merely fill the minds of the students with knowledge, simply for the sake of securing better results in the examination and at the end of each of the sessions, the students usually remember only about ten per cent of the content which was taught during the class session. The lecturer in passive learning is basically a verbal textbook.

Active learning refers to techniques where students do more than simply listen to a lecture. Students are doing something including discovering, processing, and applying information. In active learning a student also generates rather than only receiving knowledge.

2. Mobile Learning

Mobile learning is the provision of education and training on PDAs (Personal Digital Assistants). Smart phones and mobile phones, including palmtops, handhelds, iPods and MP3 players can also be used for this purpose.

2.1 Class Room Response System

A classroom response system is a set of software/hardware mobile learning platform that facilitates teaching activities in which a teacher poses a multiple-choice question to his or her students and each student submits an answer to the question using a mobile phone or a clicker. A Software on the instructors computer collects the answers and produces a bar chart the teacher can makes “on the fly” instructional choices based on the class response

2.1.1 Using Mobile Phones as a Class Room Response System

In this system, every student has a mobile phone to answer the question asked by the instructor using SMS. It is a low cost solution (One can purchase a mobile phone for less than ten dollars. However it is not useful in those countries where the cost of an SMS is too high. (Not one paisa like Pakistan!!!)

Figure1. Students attempting a quiz using mobile phone

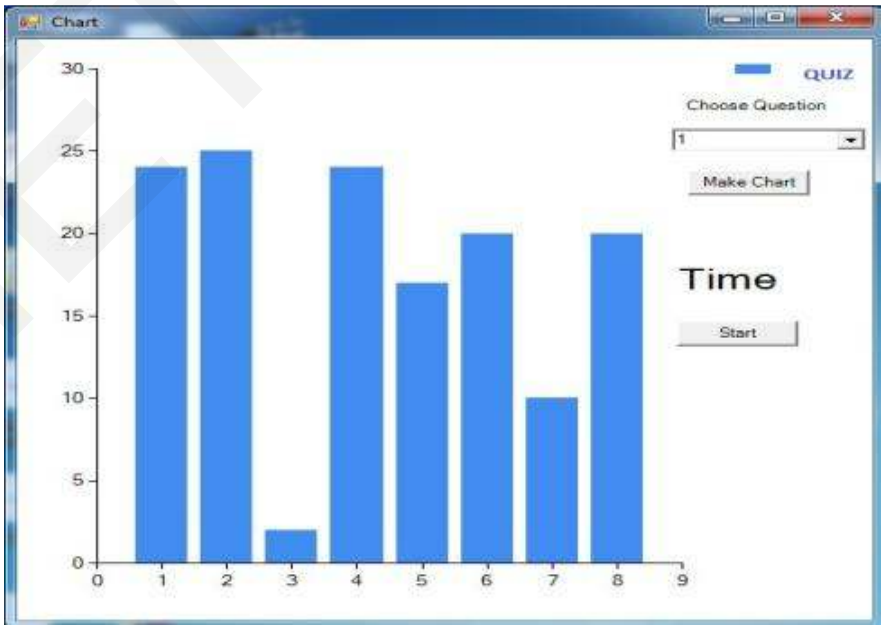

Figure 2. Bar chart showing the results of the quiz

2.1.2 Using Clickers as a Class Room Response System

Clicker is a handheld transmitter that beams a radio-frequency signal to a receiver attached to the teacher's computer. Its onetime cost is higher than the mobile phone, about 30 dollars per clicker + about 150 dollars for receiver (just one required for the class). But it does not have any issue like per sms cost.

Figure 3. Students using clickers in a classroom

3. Web 2.0- the new wave of Innovation in Teaching and Learning

Web 2.0 refers to a supposed second generation of Internet-based services such as social networking sites, wikis, communication tools etc. that emphasize online collaboration and sharing among users. All of these features are needed because of the need for community collaboration, collective intelligence, collaborative, self directed students and technology accelerators in new concept of school 2.0

3.1 Wiki

A wiki is a type of Web site that allows the visitors themselves to easily add, remove, and otherwise edit and change some available content, sometimes without the need for registration. This ease of interaction and operation makes a wiki an effective tool for collaborative learning. The term wiki also can refer to the collaborative software itself (wiki engine) that facilitates the operation of such a Web site, or to certain specific wiki sites, such as Wikipedia.

3.2 Blogs

A blog is a website where entries are made in journal style and displayed in a hierarchical order.

Blogs often provide commentary or news on a particular subject, such as food, politics, or local news; some function as more personal online diaries. A typical blog combines text, images, and links to other blogs, web pages, and other media related to its topic. Most blogs are primarily textual although some focus on photographs videos or audio and are part of a wider network of social media. The most important advantage of the blogs is that they have freely available plug-in and don't have any backward compatibility issue

Using these features of a blog we would provide a platform (http://www.lumstech.info) on which an instructor would have the following facilities:

- He can upload his lecture of different subjects in digital format with the concept maps of each lecture.

- In each lecture the student can identify the parts of the lecture (time wise and topic wise) in which they faces problems in his understanding and later on the instructor can improve his teaching by observing the graph of the student's responses.
- The instructor would have the capability to filter the responses and comments of the students in the area where most of the students are facing problems.
- He can integrate randomly generated quizzes using some freely available software like question writer, with the lectures that a student has to attempt after viewing a lecture and the result of the student would be automatically emailed to the instructor.

Figure 4. Screenshot for www.lumstech.info

4. Conclusions

In this paper we explored how technology can be used as an accelerator to enhance learning of students in classrooms and developed a low cost learning portal on which the student would be able to enjoy all the features of a course management system.

TECHNOLOGY INTEGRATED LANGUAGE LEARNING STRATEGIES: LEARNERS OF ENGLISH

Şaziye YAMAN, University of MERSİN, syaman33@gmail.com

ABSTRACT

Technology Integrated Language Learning (TILL) has become undeniable component of education both for learners and teachers in learning process. Although there are considerable studies in the field of Language Learning strategies and Technology Integrated Language Learning, the use of learning strategies in Technology Integrated environment is a new research space. Learners are involved in a technology integrated learning process through problem solving and evaluation procedures by analyzing the new material as well as activating prior knowledge and experience. Through cognitive and behavioral activities, learners can comprehend based on individuals' cognitive styles, strategy use and preferences. The learning process refers to habits involving processing, receiving, retaining, and analyzing information.

The use of strategies in language learning through technology, as a new phenomena, which is the research interest of this study, will be reflected under a literature review, and will bring discussions in strategy use. Drawing the attention to the use of technology integrated learning, this study therefore will lead to an investigation for a source/data -TILLS research tool- under the light of field experts' views and relevant literature for item development. An in-depth interview, and relevant strategy scales will be discussed critically considering Turkish learners, and a model to construct and develop an instrument TILLS will be illustrated. This study also contributed to identify and analyze domains of strategy use in technology integrated language learning environment.

ÖZET

Teknoloji desteğiyle dil öğrenme, öğrenci için ve öğrenme süreçlerinde eğitimin kaçınılmaz bir bileşeni olarak yer almaktadır. Dil öğrenme stratejileri ile ilgili önemli sayıda alan çalışması olmasına rağmen, teknoloji desteğiyle dil öğrenme, alanda henüz yeni araştırmalar olarak yer bulmaktadır. Öğrenci teknoloji desteğiyle dil öğrenirken, problem çözme, teknoloji yoluyla sunulan malzemeyi değerlendirme, deneyim ve varolan bilgilerinin üzerine yapılandırarak öğrenme sürecinde aktif rol oynamaktadır. Davranış ve Bilişsel etkinliklerde, öğrenci biliş tarzı, kullandığı stratejiler ve tercihleri ile kavramayı gerçekleştirir. Öğrenme süreci, sürecin içerisinde öğrencinin bilgiyi anlaması, akılda saklama, ve bilginin analizi gibi öğrenme alışkanlıklarını ifade eder.

Teknoloji desteğiyle dil öğrenmede kullanılan stratejiler bu araştırmanın konusu olarak, alanyazındaki tartışmaları ortaya getirecektir. Bu çalışma, Teknoloji desteğiyle dil öğrenme sürecinde Türk öğrencilerin kullandıkları stratejileri ortaya çıkararak, bir sonraki adım olan, alana bir ölçme aracı kazandıracak tartışmayı planlamaktadır. Türk öğrencilerle yapılan görüşmeler sonunda toplanan maddeler, ölçme aracının oluşturulmasına olanak sağlayacaktır. Çalışma aynı zamanda, teknoloji yoluyla kullanılan strtejileri ve maddelerin kategorilerini belirlemede katkı sağlamaktadır.

INTRODUCTION

Due to Technological Revolution, beginning in the second half of the 20th century, knowledge and practices have beeen accelarated gradually. The transformations of technology have attracted the attention of organisations and academic institutions. The challenges have brought about exciting opportunities in educational arena; re/shaped people's perceptions, habits, routines and the ways of learning and teaching. As a revolution, along with its popularity and effects in the mainstream of education, pedagogical and instructional matters related to technology have still been debatable issues. While theoretical explanations are strongly needed on the one side, its extensive use and benefits in education seem to bring innovations, networks and social platforms in instruction. Being a heavy investment for a stimulating learning environment in education, potential initiators in teaching and learning, technology has entered our lives, predominantly in education, by allowing individuals to choose their own learning styles, to learn at their own pace, considering their preferences in an enormous amount of memory storage.

As to theoretical point of view, many theories from different disciplines have contributed to conceptualization of the use of technology in education; such as second language acquisiton theory, foreign language teaching theories, language theories, and social constructivism as a learning theory, cognitive science, autonomous learning and blended learning models, etc… The theories are underlying the assumptions and beliefs about language learning, and use of technology as a purposeful and constructive knowledge building tool for a meaningful learning environment through context and pedagogical base. This paper supports meaningful language learning models, and proposes knowledge building based on learners' prior knowledge in a constructive way. Learning is a personal meaning making process, allowing learners to construct their own knowledge. Different from traditional face to face learning environment, instead of using traditional tools and delivery of lesson, individual differences in class, being unique bodies in their own way of meaning making learning process, learners construct their own knowledge based on their previous experience and knowledge.

One of purposes of this study is to discuss the effectiveness of technology in language learning process. A body of literature review about current practices of technology integrated language learning and language learning strategy use were considered. Existing literature on the use of technology integrated language learning strategies is somehow very limited in terms of empirical and systematic studies at different levels of instruction where English has been taught as a foreign language (EFL). Only limited number of studies have shown contributions of technology into language learning process. While some studies indicate the positive contribution of technology, others have claimed the lack of contribution of technology (Butler & Mautz, 1996; Clark, 1983; Kozma, 1991 in Debevec, Yau Shih and Kashyap, 2006). Integration of technology into learning has been studied and reflected as follows; technoloy as a facilitator by Mayer (2003), knowledge transfer over electronic channels by Rosenberg (2001), knowledge as special form of communication by Qvortrup (2006), learning effectiveness and satisfaction by Joy and Garcia (2000), relationship between gender and learning performance in the context of computer based anc and independently. Hui, Hu, Clark, Tam and Milton (2007) proposed the contribution of technology for high acquisition of vocabulary and grammatical skills in language learning through "technology assissted learning" (p. 249), Ahorony (2006) studied the use of deep and learning strategies among EFL learners in Internet environment, Harris, Mishra and Koehler (2009) analysed approaches to technology integration in teaching, and recommended "using the technology, pedagogy and content knowledge (TPACK) framework as a way to think about effective technology integration (p. 393), Gupta and Bostrom (2009) proposed "Technology mediated Learning" as a term, and discussed the combinations of the learning modes (blended learning) as web based/computer based, asynchronous/synchronous, instructor-led/self-paced, individual based/team based (p. 687).

Technology integrated learning terminology, in this study, refers to the ways of learning using the electronic technology such as internet, intranet, audio and video based material use, webcasts as well as learning through computer, which means learning and using the internet and modern technology. The synonymous of technology integrated learning can be named as "e-learning" covering all the levels of educational process from managing the appropriate use of technological process to handle with the resources for "self regulated learning" (based on the definition of competence by Weinert, 2001). The use of computers, internet, on line learning, digital communication tools, social platforms, World Wide Web, online practice quizzes, Power Point, some courseware, such as DynED (in Turkey), e-learning software programs such as MOODLE, have all been used as vehicles assisting learners to learn particular language skills, content knowledge, or update-upgrade information. Multimedia-as a kind of combination of text, graphic, animation, video, music, voice, and sound effects to communicate proposed by Gaytan & Slate (2002)- has been integrated into education.

For various purposes in learning language, learners communicate using wide range of vehicles in technology, they use different language learning strategies as well as the starategies defined and listed by Oxford (1990). With the beginning and integration of computer in the process of language learning (Tschirner, 2001), learning has become beyond the limitations of classroom, board and marker. Moreover, due to modern technology, learning has transformed into student-centered platform where learners are socially negotiating meaning on a virtual environment, with their own choices, own pace and preferences.

Learning Strategy

Learning strategies are special ways of processing information that enhance comprehension, learning or retention of the information (Oxford, 1990). They are defined as specific actions, behaviors, steps, or techniques such as seeking out conversation partners, or giving oneself encouragement to tackle a difficult language task used by students to enhance their own learning (Scarcella & Oxford, 1992).

Learning strategies can enable students to become more independent, autonomous, lifelong learners (Allwright, 1990).

Language learning strategies are among the main factors that help determine how and how well our students learn a second or foreign language (Oxford, 1996). The types of language learning strategies used by different learners change according to many variables including motivation (Bedell & Oxford, 1996), gender (Politzer & McGroarty, 1985), learning style (O'Malley & Chamot, 1990), and cultural background. Some research findings (Oxford, 1994) have completely explored the effects of culture in determining strategy preferences.

Although a great deal of knowledge and findings about students' learning strategies have been studied and discussed in recent years, very little is known about their use in the new environment of today's technology. It has become an urgent research interest to discuss the strategies used when learning a language through technology. Eliciting those strategies will help us understand how students can be successful in learning a foreign language regardless of the teaching method and approach employed. The mis/match of students' own learning style, preference, the training needs will shed a light on effective strategy use as well as autonomous learning discussions. As O'Malley and Chamot, (1990) point out the importance of strategy training in the use of language learning strategies, and the link between students' learning style and strategy use by Ehrman, (1994), a framework is therefore needed to help learners find out about their language learning strategies in technological environment. That will provide students guidance and opportunities for self-monitoring, become initiators for organizing and reflecting on their own learning process where they are encouraged to be self-directed and actors as process leaders. Empowering language learners by having them develop learning strategies may help them to cope with the demands of learning atmosphere and indeed, may help them to continue to learn on their own apart from the class. Oxford (1990), O'Malley and Chamot (1990) have emphasized that effective learners use a variety of different strategies and techniques in order to solve problems that they encounter while acquiring or producing the language. They put the strategies under 3 headings as cognitive, metacognitive, and social-affective strategies.

Cognitive Strategies play an executive role and refer to directly information processing". As Weinstein and Meyer (1991 in Cornford, 2002, p. 359) state that "A cognitive learning strategy is a plan for orchestrating cognitive resources, such as attention and long-term memory to help reach a learning goal. They indicate that there are several characteristics of cognitive learning strategies including that they are goal-directed, intentionally invoked, effortful and are not universally applicable, but situation specific". They are *repetition, elaboration, organizational, problem solving, resourcing translation, contextualisation, grouping, imagery, note taking, key word, inferencing, transfer, deduction, and recombination strategies*

Metacognitive Strategies refer to the regulation of learning process and are "higher order executive skills that may entail planning for, monitoring, or evaluating the success of a learning activity" (O'Malley & Chamot, 1990, p. 44). These are *organising, selective attention, planning, directed attention, self management, advance preparation, self monitoring, self evaluation,*

Social-Affective strategies refer to the maintenance of learning process, coping with success and failure. They assist learners in learning, interactive communicative skills (Mendelsohn & Rubin, 1995) and motivation. These are *self-talk, self reinforcement, self activation, cooperation, peer work-pair work, questioning for clarification.*

In this study, the need to know about why the learners tend to use technological devices will provide us how to make language learning faster, effective and easier. Learners, as learning through the use of technological devices, have different learning preferences and strategies. This study reported here explores the characteristics and the relationship between the use of learning strategies, and the use of technology in instructional context. The specific objectives are:

1. To describe the characteristics that can facilitate students' technology integrated language learning strategies,
2. To discuss the factors of language learning strategies in technology based learning process.

METHODS

In order to collect the strategies used by Turkish language learners, qualitative data was collected through interviews, field notes, expert opinions, open ended questionnaire. 76 items were elicited from the learners. Qualitative data collected in Turkish (see Attachment 1 to see item examples) was recorded and items collected were categorised in English (see Attachment 2) saving strategy names–as proposed by O"Malley and Chamot (1990). Open-ended questionnaire-asking about technology integrated

strategies used by language learners as they learn language- was conducted by the researcher and an ELT researcher in Turkish. 400 TEFL learners were selected randomly among the students studying at various levels of English as a foreign language at MEB schools. Students who are volunteer to answer the questions and ready for interviews were negotiated on the strategies while learning language through technology. The technological sources, platforms, frequencies/preferences of technology use, the skills they are applying, the needs for technoloy support, etc… were collected.

This study will lead a new research as well as develop a research Inventory-Technology Integrated Language Learning Strategy Inventory. The Inventory aims to find out language learners strategies-specifically and culturally specific to-Turkish students. Cultural background, as Deneme (2008) mentions in her research is "one of the factors that might influence strategy choice" (p. 84). 65 most frequently used www sites (see attachment 3) were elicited from the learners randomly selected both from the state and private schools in Mersin. The learners could use DynED as a courseware which was integrated into National Curriculum as well. All of the studens have the technology ability/skills, and have technology access facilities.

Concerning the learning strategies by integration technology into environment, what kind of learning strategies; cognitive, metacognitive were not observed, but asked directly to learners in their own perceptions. Metacognitive strategy use was often problematic and difficult to observe and register. Social-affective strategies were observed and interviewed as part of data collection procedure. Observation was one of the important tools to elicit students' behaviour and reactions for such studies. Besides many difficulties, "one of the difficulties with researching language learning strategies is that they cannot usually be observed directly; they can only be inferred from language learner behaviour" (Griffiths, 2004, p. 11). So, strategy use was supported with interviews and questionnaires, as well as task observation for elicitation. Items collected were categorised under 3 domains defined by O'Malley, & Chamot (1985) as cognitive, metacognitive, and social-affective strategies.

CONCLUSION

Learners tend to use more technological devices than past, and eager to change their learning habits, open to more sophisticated learning atmosphere than merely learning in traditional face to face education. The learners have also expressed that they have used technology into learning process by using 4 language skills integratedly(see Attachment 3). This study proposes that;

1. Cognitive strategies: The learners operated directly on incoming information through repetitions to remember while using technological devices, used visual images, guessing from the context, completed missing parts of information in communicative learning environment etc… Problem solving was frequently used as well as recombination strategies through games and social platforms. Using key words and clues helped them understand whole passage while practicing reading texts. Imagery and , contextualization helped their vocabulary learning process more. Moreover, they applied the rules in quizzes, online activities to understand the language, deduced the meaning it in ways that enhance learning. Without pen and paper, learners behaved technology- friendly, used comfortably.

2. Metacognitive strategies: The learners used planning strategies while organising their learning both before and during-phases of the process. They were interested in monitoring a process to comprehend, and were able to complete the task. While focusing on specific aspect of a task, in four language skills, they became more aware of their strenghts and weaknesses, then either checked with their pers (DynED), or used the source they were familiar with (such as a web page, dictionary, answers supplied, etc…). These strategies were the most frequently used ones, and integrated with cognitive strategies as well as social strategies in comfortable ways.

3. Social-Affective strategies: The learners' reactions to language learning through technology integration revealed that they cooperate with peers to solve a problem such as in online games both at and outside classroom environment to pool information, check their notes, or get/give feedback on a learning activity. Moreover, they used clarification, questioning strategies for eliciting information either from their teachers or peers; needed additional explanations, used rephrasing, or examples for clarification. However, no construct related to for example; self-talk or mental redirection of thinking have been observed or elicited from the learners.

Data collected revealed that technology Integrated Language Learning may improve learners' acquisition of knowledge in which learners are allowed to conceptualise abstract knowledge and reflect on, as proposed by experiential learning model of Kolb (1984). It facilitates learners' acquisition of knowledge. Knowing about the use and frequency of strategies through technology in language learning will provide us to train the learners in enabling them to become autonomous learners.

LİSELERDEKİ ÖĞRENME ORTAMI PROFİLLERİNİN BELİRLENMESİ: BİR KÜME ANALİZİ ÇALIŞMASI

A Cluster Analysis Study of Profiling Learning Environments in High Schools

Köksal Banoğlu, MEB İstanbul Maltepe Halit Armay Lisesi, koksal_banoglu@hotmail.com

Mustafa Çakır, Marmara Üniversitesi, Atatürk Eğitim Fakültesi, Ortaöğretim Fen ve Matematik Alanları Eğitimi, mxc446@gmail.com

ABSTRACT

Profiles of learning environments in Turkish high schools were investigated by means of hierarchical cluster analysis. Employing stratified random sampling procedure, data was collected from 900 students in 6 general, 13 Anatolian and 3 vocational high schools located across 12 different districts of Istanbul. In order to assess high school students' perceptions of their learning environments TROFLEI (Technology-Rich Outcome Focused Learning Environment Inventory) was administered. According to hierarchical cluster analysis, students' perceptions were clustered and categorized into 4 school learning environment profiles, namely "technology-rich & ideal", "positive", "moderately positive" and "negative" learning environments. It was revealed that 42.7% of general high school students and 53.1% of vocational high school students perceived "moderately positive learning environment" in their schools on the first rank, whereas 41.8% of Anatolian high school students mostly perceived "positive learning environment". "Technology-rich & ideal" environment was ranked first among vocational high school students with 11.2 %.

GİRİŞ

Farklı bireyler bulundukları aynı ortamı farklı algılayabilirler. Bu durum bize insan davranışlarının bulunulan ortama göre değerlendirilmesi gerektiğini gösterir. Öğrencilerin öğrenme ortamları hakkında geçerli karar verebileceklerinin öne sürülmesi, günümüz öğrenme ortamları araştırmalarının bir çoğunun temel fikridir (MacLeod ve Fraser, 2009). Öğrenme ortamlarının gerek öğrenci gerekse öğretmenlerin algı ve tutumları doğrultusunda değerlendirilmesi öğrenme ortamlarının istenilen düzeye gelebilmesi için yol gösterici olacaktır.

Sınıf öğrenme ortamları kavramı, eğitim ortamına hâkim olan iklimi, formu, havayı ve atmosferi ifade eder (Aldridge, Dorman ve Fraser, 2004). Telli ve Çakıroğlu (2002) aynı kavramı öğrenci-öğretmen etkileşimlerinin gerçekleştiği ve öğretim programlarının uygulandığı ortamlar olarak ifade etmişlerdir. Öğrenme ortamları öğrenmenin belirleyici öğelerinden biridir. Çalışmalar sınıftaki öğrenme ortamı değişkenleri ile öğrencilerin bilişsel ve duyuşsal öğrenme ürünleri arasında kuvvetli bağlar bulunduğunu ve öğrencilerin sınıf öğrenme ortamı ile ilgili algılarının onların öğrenmelerini etkilediği göstermiştir (Fraser ve Fisher, 1982, Fraser ve diğerleri, 1987; Fraser ve Butts 1982; Fraser ve Fisher, 1983; Talton ve Simpson 1987'den akt. Telli ve Çakıroğlu, 2002; Köse ve Küçükoğlu, 2009).

Öte yandan aynı sınıfta olmalarına rağmen öğrenciler farklı öğrenme ortamı algısına sahip olabilmektedir (Fraser, Rennie & Tobin, 1995). Bu durumun ortaya çıkmasında öğretmenlerin birbirinden farklı yaklaşımları ve bu yaklaşımların öğrenciler tarafından aynı şekilde algılanmaması etkili olabilmektedir. Glower ve Law (2005)'ın araştırması okuldaki örgüt kültürünün de öğrencilerin öğrenme ortamı algısını etkileyebildiğini ortaya koymuştur. Mann (2005), okullarda algılanan öğrenme ortamının doğru öğretmen bileşenlerden daha çok doğru iletişim becerisine bağlı olduğunu vurgulayarak, öğretmenlerin iletişim becerisinin öğrenme ortamı algısı üzerindeki etkisine dikkat çekmiştir.

Davranışın duruma özgü oluşu fikrinden yola çıkarak, günümüzdeki araştırmalar insan davranışlarını ortamdan izole etmekten ziyade bu davranışları içinde bulunduğu ortamda araştırır. Lewin, davranışın (B) kişi (P) ve çevre (E) arasındaki etkileşimin bir sonucu olduğunu öne sürmüş ve bu kavramı matematiksel olarak B = f (P, E) şeklinde ifade etmiştir (MacLeod ve Fraser; 2009). Öğrencilere uygulanacak öğrenme yaklaşımının belirlenebilmesi için öğrenme ortamının tanımlanması ve niteliklerinin ortaya konması önemlidir (Köse ve Küçükoğlu, 2009). Öğretim ancak öğrenme ortamları değerlendirilirse geliştirilebilir. Linden ve Erkens (2000)'e göre öğrenme ortamlarını farklı kılan 6 boyut vardır: (1) bilginin yapılandırılmasına karşın bilginin aktarılması, (2) tüm ödev-görev durumlarına karşın parça ödev-görev durumları, (3) kişisel anlam yerine öğretmenin yönlendirdiği anlam, (4) profesyonel veya bilimsel durumlara karşın resmi durumlar, (5) işbirliği ve iletişim'e karşın bireysel öğrenme, (6) öğrenme atmosferinin geliştirilmesi (akt. Efe ve diğ., 2007).

Bireylerin öğrenme ortamı algılarını ölçmek amacıyla birçok ölçme aracı geliştirilmiştir. Araştırmalarda kullanılan ölçme araçlarının hedef kitleleri, içerikleri, bilgi toplama yolları arasında farlılıklar bulunsa da, temelde hepsi öğrenme ortamındaki zihinsel süreçlerin, davranış biçimlerinin ve sosyal ilişkilerin öğrencilerin öğrenebilme aktiviteleri üzerine etkilerine yoğunlaşmıştır (Köse ve Küçükoğlu, 2009). Farklı amaçlara yönelik geliştirilen öğrenme ortamları ölçekleri arasında WIHIC (What is Happening in This Class) (Fraser, Fisher ve McRobbie, 1996), Öğrenme Ortamı Tanıma Anketi (Fraser, Anderson ve Walberg, 1982), Sınıf Ortamı Ölçeği (Fisher ve Fraser, 1983), Öğrenme Ortamı Envanteri - LEI (Learning Environment Inventory) (Walberg, 1979), Öğretmen Etkileşimi Anketi - QTI (Questionnaire on Teacher Interaction; Wubbels, Levy, 1993) ve TROFLEI (Technology-Rich Outcomes-Focused Learning Environment Inventory) (Aldridge, Dorman ve Fraser; 2004) sayılabilir.

Bu çalışmada TROFLEI ölçeği kullanılmıştır. Teknoloji-Donanımlı ve Kazanım-Odaklı Öğrenme Ortamı Envanteri (TROFLEI) Barry J.Fraser ve Jill M.Aldridge tarafından 2003 yılında Avustralya'da geliştirilmiş ve doğrulayıcı faktör analizi çerçevesi içerisinde Çoklu-Özellik Çoklu-Yöntem metodu ile geçerliliği sağlanmıştır. TROFLEI 10 alt ölçek içerir ve toplam 80 maddeden oluşur. TROFLEI'nin alt ölçekleri şınlardır: (1) Öğrenciler Arası Uyum, (2) Öğretmen Desteği, (3) Katılım, (4) Araştırma, (5) Görev Bilinci, (6) İşbirliği, (7) Sınıf içi Demokrasi ve Eşitlik, (8) Farklılaşma, (9) Bilgisayar Kullanımı, (10) Ergen Kültürü. Bu ölçeğin tercih edilme nedenlerinden biri TROFLEI'nin amaca uygun olan boyutları birleştirmiş olması nedeniyle, diğer öğrenme ortamı araçlarına göre, fen öğrenme ortamlarının birçok alanını geniş kapsamlı olarak göstermesi; diğeri ise TROFLEI'nin öğrenme ortamı araştırmalarında çok yaygın şekilde kullanılması ve birçok ülkede ve dilde geçerlik çalışması yapılmış olmasıdır.

YÖNTEM

Araştırma, tarama modeline dayanan betimsel araştırma desenine uygun olarak belirlenmiştir. Var olan bir durumu olduğu şekliyle ortaya koymayı amaçlayan bu araştırma deseninde (Karasar, 2006), İstanbul'daki ortaöğretim kurumlarında okumakta olan öğrencilerin öğrenme ortamı algıları incelenmiştir. Araştırma evrenini, 2010-2011 eğitim-öğretim yılında İstanbul ilindeki genel liseler, anadolu liseleri ve meslek-teknik okullarda eğitim gören 326,346 ortaöğretim öğrencisi oluşturmaktadır (istanbul.meb.gov.tr). Bu evrene dair sağlıklı sonuçlara ulaşmak için örneklem ilçelere göre tabakalandırılarak, öğrenciler bu tabakalardan basit tesadüfi örnekleme yapılarak seçilmiştir. İstanbul'un 12 ilçesinde yer alan 6'sı genel lise, 13'ü anadolu lisesi ve 3 tanesi mesleki-teknik eğitim veren lisede okumakta olan 985 ortaöğretim öğrencisinin verileri örnekleme alınmıştır.

Örneklem dahilindeki 985 öğrencinin 446'sını (% 45.3) erkek, 539'unu (% 54.7) kız öğrenciler; 190'nı (% 19.3) 9. sınıf, 352'sini (% 35.7) 10. sınıf, 217'sini (% 22.0) 11. sınıf, 226'sını (%23) 12. sınıf öğrencileri; 702'sini (% 71.3) sayısal alanda, 69'unu (% 7.0) sözel alanda, 132'sini (% 13.4) eşit ağırlıklı alanda, 10'unu (% 1.0) yabancı dil alanında eğitim gören veya bu alanlarda eğitim görmeyi düşünen, 72 'sini (% 7.3) ise henüz seçeceği alana karar vermemiş öğrenciler oluşturmaktadır.

Öğrencilerin sahip olduğu öğrenme ortamı algılarının ölçümünde, 10 boyutlu TROFLEI ölçeği kullanılarak, elde edilen ölçüm sonuçlarının normal dağılım istatistiği basıklık ve çarpıklık değerleri açısından incelenmiştir. Boyutlara ait çarpıklık ve basıklık değerleri Tablo 1'de sunulmuştur.

Tablo 1. Veri Setinin Çarpıklık ve Basıklık Değerleri Tablosu

Boyutlar	N	Ortalama	Standart sapma	Çarpıklık		Basıklık	
				Değer	Standar Hata	Değer	Standart Hata
Öğrenciler Arası Uyum	985	4.214	0.640	-1.336	0.078	2.613	0.156
Öğretmen Desteği	985	3.445	0.989	-0.493	0.078	-0.334	0.156
Katılım	985	3.637	0.835	-0.484	0.078	0.015	0.156
Araştırma	985	3.705	0.800	-0.738	0.078	0.794	0.156
Görev Bilinci	985	4.038	0.733	-1.122	0.078	1.826	0.156
İşbirliği	985	3.438	0.943	-0.348	0.078	-0.299	0.156
Sınıf İçi Demokrasi ve Eşitlik	985	4.124	0.867	-1.288	0.078	1.630	0.156
Farklılaşma	985	3.125	0.935	0.094	0.078	-0.407	0.156
Bilgisayar Kullanımı	985	3.169	0.955	-0.018	0.078	-0.449	0.156
Ergen Kültürü	985	4.024	0.819	-1.208	0.078	1.815	0.156

Verilerin çarpıklık değerlerinin tüm boyutlar için +2 ile -2 aralığında, basıklık değerlerinin ise +3 ile -3 aralığında olduğu görülmüştür. Ancak örneklem büyüklüğü 985 olduğu için verilerin çarpıklık değerlerinin standart hatasına oranının yüksek olduğu belirlenmiştir. Nitekim, Tabachnick ve Fidell (2007, 80), özellikle büyük örneklem sayısında standart hata oranına göre hesaplanan z değerlerinin normal dağılım için sağlıklı sonuç vermeyeceğini belirtmiştir. Dağılımı olumsuz etkileyebilecek aşırı değerlerin tespiti için veri setine uç değer analizi yapılmıştır.Bu analizde boyutların mahalanobis uzaklık değerleri incelenerek, box-plot testleri sonucunda aşırı değer veren 85 gözlem veri setinden çıkartılmıştır. Söz konusu ön analiz sonucunda ortaya çıkan yeni çarpıklık ve basıklık değerleri Tablo 2'de sunulmuştur.

Tablo 2. Uç Değer Analizi Sonrası Çarpıklık ve Basıklık Değerleri Tablosu

Boyutlar	N	Ortalama	Standart sapma	Çarpıklık		Basıklık	
				Değer	Standar Hata	Değer	Standart Hata
Öğrenciler Arası Uyum	900	4.233	0.613	-1.141	0.082	1.473	0.163
Öğretmen Desteği	900	3.448	0.973	-0.453	0.082	-0.372	0.163
Katılım	900	3.638	0.834	-0.475	0.082	-0.074	0.163
Araştırma	900	3.717	0.788	-0.638	0.082	0.484	0.163
Görev Bilinci	900	4.060	0.696	-0.900	0.082	1.039	0.163
İşbirliği	900	3.452	0.933	-0.312	0.082	-0.350	0.163
Sınıf İçi Demokrasi ve Eşitlik	900	4.147	0.832	-1.191	0.082	1.290	0.163
Farklılaşma	900	3.244	0.863	0.119	0.082	-0.296	0.163
Bilgisayar Kullanımı	900	3.169	0.956	0.003	0.082	-0.500	0.163
Ergen Kültürü	900	4.054	0.784	-1.082	0.082	1.398	0.163

Tablo 2'deki bulgular, uç değer analizi sonrası veri setinin yeni çarpıklık ve basıklık değerlerinin daha fazla normal dağılım özelliği gösterdiği belirlenmiştir. Bu sonuçlara bağlı olarak temel analizler 900 kişiden oluşan bu veri seti ile gerçekleştirilmiştir.

Verilerin Analizi

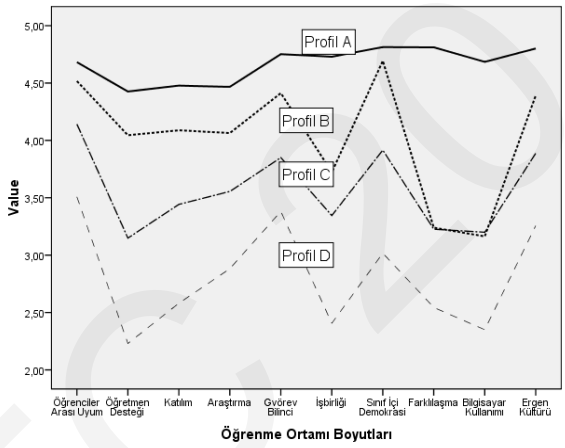
Araştırmacının, incelediği veri setinde kaç grup olduğunu başlangıçta bilmediği durumlarda, kümeleme analizi yöntemlerinden hiyerarşik kümeleme yönteminin kullanılması önerilmektedir (Çokluk,

Şekercioğlu, Büyüköztürk, 2010, 142). Öğrenme ortamı profillerinin verilerin kümeleme sonuçlarına göre oluşturulması amacıyla, kümeleme yöntemlerinden hiyerarşik kümeleme analizi seçilmiştir. Tüm boyutlara ait veriler likert tipi ölçekle toplandığı için verilerin standartizasyonu için dönüşüm uygulanmamıştır. Veriler arasındaki uzaklığın hesaplanmasına kare öklid uzaklığı esas alınarak, muhtelif kümeleme tekniklerinden "en uzak komşuluk" (furthest neighbor) ve kümeler içi kareler toplamını minimize eden Ward yöntemine ait dendogramlar incelenmiştir. Her iki dendogramda dört boyutlu küme yapısında ortaklaştığı görülmüştür (Ek-1). Küme içi varyans farkını en aza indirmesi, eşit aralıklı ölçüm sonuçlarında tercih edilen bir yöntem olması ve benzer araştırmalarda kullanılması göz önüne alınarak küme kategorileri Ward yöntemiyle belirlenmiştir (Brok, Telli, Cakiroglu, 2010; Sharman, Roorda, 2010). Her kümeye ait öğrenme ortamı boyutları arasındaki ilişkinin incelenmesinde basit korelasyon analizi ve pearson korelasyon katsayısından yararlanılmıştır.

SONUÇ

Küme analizi sonucundan ortaya çıkan 4 öğrenme ortamı profili Grafik-1'de sunulmuştur. Her bir profil, o kümede yer alan öğrencilerin okuluna ilişkin algıladığı 10 boyutlu öğrenme algısını göstermektedir.

Grafik 1: Öğrenme Ortamı Profilleri



Her profilin yatay düzlemde ayrıksı bir hat oluşturması, profillerin sahip olduğu ortalama değerlere göre isimlendirilmesini kolaylaştırmıştır. Bu nedenle, tüm boyutlarda en yüksek ortalamaya sahip ve grafikte en üstte yer alan Profil A, "teknoloji destekli ideal öğrenme ortamı" olarak; öğrenme ortamında teknoloji kullanımı dışındaki tüm boyutlarda ikinci en yüksek ortalamaya sahip Profil B, "olumlu öğrenme ortamı" olarak; bilgisayar kullanımında ikinci en yüksek ortalamaya sahip olup, diğer boyutlarda üçüncü en yüksek ortalamaya sahip Profil C, "orta düzeyde olumlu öğrenme ortamı" olarak; tüm boyutlarda en düşük ortalamaya sahip Profil D ise "olumsuz öğrenme ortamı" olarak isimlendirilmiştir. Sonuçlara göre, mevcut öğrenme ortamı açısından 61 öğrencinin okulunu (% 6.8) Profil A'da, 342 öğrencinin (% 38.0) okulunu Profil B'de gördüğü, 372 öğrencinin (% 41.3) okulunu Profil C'de ve 125 öğrencinin (% 13.9) okulunu Profil D'de gördüğü belirlenmiştir. Öğrencilerin öğretim gördüğü okul türü (genel, anadolu, mesleki-teknik) ile okuluna ilişkin algıladığı öğrenme ortamı profili arasındaki ilişkinin inecelenebilmesi için çapraz tablo oluşturulmuştur. Sonuçlar Tablo 2'de sunulmuştur.

Tablo 2: Okul Türü ve Öğrenme Ortamı Profilleri Çapraz Tablosu

Okul Türleri	Profil A		Profil B		Profil C		Profil D		Toplam	%
	N	%	N	%	N	%	N	%		
Genel Liseler	15	7.0	70	32.9	91	42.7	37	17.4	213	100.0
Anadolu Liseleri	35	5.9	246	41.8	229	38.9	79	13.4	589	100.0
Meslek-Teknik Liseler	11	11.2	26	26.5	52	53.1	9	9.2	98	100.0
Tüm Okul Türleri	61	6.8	342	38.0	372	41.3	125	13.9	900	100.0

Tablo 2'deki sonuçlar genel liselerde ve meslek-teknik liselerde öğrencilerin algıladığı öğrenme ortamının daha yüksek oranda (% 42.7 ve % 51.3) Profil C, yani orta düzeyde olumlu öğrenme ortamı olduğu; anadolu liselerinde ise öğrenciler tarafından en yüksek oranda algılanan öğrenme ortamının (% 41.8) Profil B, yani olumlu öğrenme ortamı olduğu görülmüştür. Tüm okul türleri için Profil A ile gösterilen ideal öğrenme ortamının en az algılanan öğrenme ortamı olduğu bulunmuştur. Bununla beraber görece en yüksek Profil A öğrenme ortamı algısının (% 11.2), mesleki teknik okullara ait olduğu tespit edilmiştir. Okul türü gözetmeksizin sonuçlar değerlendirildiğinde, orta düzeyde olumlu öğrenme ortamını ifade eden Profil C'nin okullarda en çok hissedilen (% 41.3) öğrenme ortamı olduğu görülmüştür.

Öğrenme ortamı profilleri, alt boyutları arasındaki ilişki açısından Ek-2'de tablolaştırılmıştır. Öğrenme profilleri öğretimde bilgisayar kullanımı açısından değerlendirildiğinde, tüm profillerde bilgisayar kullanımının araştırmaya açık bir öğrenme ortamıyla ilişkili olduğu, ya da tersi bir değerlendirmeyle araştırmaya dayanan öğrenme ortamıyla okullarda teknoloji kullanımı arasında anlamlı ilişki olduğu görülmüştür. Teknoloji kullanımı ile öğrenme ortamının işbirliğine ve farklılıklara açık olması arasında da benzer şekilde tüm profillerde ilişki tespit edilmiştir.

"Teknoloji destekli ideal öğrenme ortamı" profilindeki (Profil A) öğrencilerin öğrenme ortamının alt boyutlarına ilişkin algıları detaylı olarak incelendiğinde görülmüştür ki, ideal öğrenme ortamında: öğrenciler arasındaki uyum ile derse katılım (r=.548), derste sahip oldukları araştırma olanağı (r=.407), işbirliğine açık öğrenme ortamı (r=.454), bilgisayar kullanımı (r=.331) ve ergen kültürü (r=.303)arasında; öğretmen desteği ile araştırmaya açıklık (r=.388) arasında; katılım ile araştırmaya açık öğrenme ortamı (r=.597), görev bilinci (r=.381), işbirliği (r=.526) arasında; araştırmaya açıklık ile işbirliği (r=.646) ve bilgisayar kullanımı arasında (r=.394); görev bilinci ile işbirliği (r=.424), sınıf içi demokrasi (r=.476) ve farklılaşma (r=.453) arasında; işbirliği ile algıladığı sınıf içi demokrasi (r=.303), farklılaşma (r=.458) ve bilgisayar kullanımı (r=.517) arasında; sınıf içi demokrasi ile farklılaşma (r=.453), bilgisayar kullanımı (r=.408) ve ergen kültürü (r=.331) arasında; farklılaşma ile bilgisayar kullanımı (r=.391) ve ergen kültürü (r=.520) arasında orta kuvette ve diğer profillerden daha yüksek ilişki bulunmaktadır.

Genel olarak boyutlar arasında Profil A lehine daha kuvvetli görülen ilişki örüntüsü, sadece görev odaklı öğrenme ortamı ile ile aştırmaya açık öğrenme ortamı arasında küçük bir farkla Profil B (olumlu öğrenme ortamı) lehine; görev odaklılık ile ergen kültürü arasında ise açık bir şekilde Profil D (olumsuz öğrenme ortamı) lehine tespit edilmiştir.

Görev bilincine sahip öğrencilere daha fazla sorumluluk verilmesi ve onların yetişkin olarak görülmesi beklenen bir durumdur ancak daha olumsuz öğrenme ortamı profillerinde bu iki boyut arasında daha yüksek ilişkinin varlığı ilginç bir sonuçtur. Diğer bir değişle, kendini yetişkin olarak gören insanların öğretim sürecinde daha aktif görev bilincine sahip olması Profil D (r=.522) , Profil C (r=.254) ve B'de (r=.225) anlamlı ilişki gösterirken, Profil A'da söz konusu boyutlar arasında anlamlı ilişki tespit edilmemiştir. Nitekim Grafik 1'deki profiller incelendiğinde, tüm profillerde görev bilinci ile ergen kültürü ortalamasının birbirine çok yakın olduğu görülmektedir. Ancak, tam öğrenmenin hedeflendiği ve çoklu öğrenme kuramına göre herkesin başarılı olabileceği ve öğrenebileceği bir alanın olması gerektiğini öngören çağdaş öğretim anlayışı düşünüldüğünde, ideal öğrenme ortamında ergen kültürü ile birlikte farklılaşmaya da önem verildiği (r=.522) ve farklılaşma ile görev bilinci (r=.429) ve sınıf içi demokrasi arasında ilişki olduğu (r=.453) görülmektedir. Görev bilinci açısından ele alındığında ergen kültürünün yerini "ideal öğrenme ortamında" farklılaşma ve sınıf içi demokrasinin aldığı, bu nedenle söz konusu ilişkinin Profil A'da anlamlı çıkmadığı yorumlanmıştır.

TARTIŞMA

Brok, Telli, Çakıroğlu, Taconis ve Tekkaya(2010) biyoloji sınıf ortamlarını öğrencilerin nasıl algıladıklarını belirlemek, diğer ülkelerdeki öğrenciler ile öğrenci algılarını karşılaştırmak ve Türkiye'deki lise biyoloji sınıflarında, öğrenme ortamı profillerini ortaya çıkarmak için Bursa'daki 4

okuldaki 52 sınıfta, 1474 lise öğrencisi ve 11 biyoloji öğretmeni ile bir çalışma yapmışlardır. Küme analizleri sonucunda, 6 öğrenme ortamı profili tanımlamışlardır. Bu profiller: (a) özyenetimli öğrenme sınıfı; (b) göreve yönelmiş işbirlikli öğrenme sınıfı; (c) ana akım sınıfı; (d) göreve yönelmiş kişiselleştirilmiş sınıf; (e) düşük etkili öğrenme sınıfı; (f) yüksek etkili öğrenme sınıfı olarak adlandırılmıştır. Brok, Telli, Çakıroğlu, Taconis ve Tekkaya (2010)'nın "özyenetimli öğrenme ortamı" profili ile bu çalışmada elde edilen Profil B, "olumlu öğrenme ortamı" arasında ciddi benzerlikler olduğu görülmüştür. Söz konusu araştırmadakine benzer şekilde bu araştırmadaki olumlu öğrenme ortamı profilinde sınıf içi demokrasi algısının yüksek değerler aldığı ancak sınıf içi işbirliği değerlerinin diğer boyutlara oranla daha düşük değerler aldığı görülmüştür. Bu durum okullarda yapılan takım çalışmasının öğrenme ortamı üzerinde beklenebileceği ölçüde etkili olmadığını ve öğrencilerin sınıf içi işbirliği algısının yapılacak işbirlikli öğrenme etkinlikleri ile geliştirilebileceğini düşündürmektedir.

Gupta ve Koul (2007)'un 705 lise öğrencisi ile gerçekleştirdiği araştırmada, öğrencilerin öğrenme ortamı algısı incelenmiş ve algı boyutları arasındaki ilişkiler tablolaştırılmıştır. Araştırmanın bulguları, Hindistan'da teknoloji destekli bir öğrenme ortamının daha öne çıktığını ortaya koymuştur. Boyutlar arasındaki ilişki incelendiğinde, en yüksek ilişkinin öğrencilerin öğrenme ortamındaki işbirliği ile araştırmaya açıklık (r=.58) ve sınıf içi demokrasi (r=.59) algıları arasında oluştuğu görülmüştür. Gupta ve Koul (2007)'un araştırma sonucuyla, yürütülen araştırmanın sonuçları boyutlar arasındaki ilişkiler açısından benzerlik göstermektedir. Bulgularda görüldüğü üzere, bu araştırmanın sonucunda boyutlar arasındaki en yüksek ilişkinin, Profil A'da (teknoloji destekli ideal öğrenme ortamı) öğrencilerin işbirliği algısı ile araştırma algısı arasında oluştuğu ortaya konmuştur (r=.65). Bu sonucun, genel anlamda düşük olan işbirliği algısının nasıl yükseltilebileceği konusunda önemli bir veri sunduğu düşünülmektedir. Araştırma çalışmalarının artırılması ve sınıflarda araştırma çalışmasına uygun öğrenme ortamlarının oluşturulmasının, işbirliği algısının yükselmesinde önemli bir etken olabileceği yorumlanmıştır.

Dorman, Aldridge ve Fraser (2006)'in Avustralya'da okuyan 4,146 lise öğrencisi ile yürüttüğü araştırmada öğrencilerin öğrenme ortamı algıları incelenmiştir. Bu çalışmaya benzer şekilde kümeleme analizinin kullanıldığı araştırmada, 5 öğrenme ortamı profili oluşturulmuştur. Oluşan kümelerin, bu araştırmada ortaya konan profillerle önemli ölçüde benzerlik taşıdığı görülmüştür. Görev bilinci ve sınıf içi demokrasi boyutlarının, bu çalışmayla benzer şekilde yüksek değerler aldığı, ancak sınıflarındaki bilgisayar destekli öğrenme ortamına yönelik öğrencilerin düşük algıya sahip olduğu görülmüştür.

Diğer araştırmalardan farklı olarak, bu araştırmanın kümeleme analizinde teknoloji destekli ve ideal bir öğrenme ortamı profili (Profil A) oluşmuştur. Ancak bu algıya sahip öğrencilerin sadece % 6.8 oranında olması oldukça düşündürücüdür. Lim (1995)'in araştırması, öğrencilerin öğrenme ortamına ilişkin algılarında okul türünün en önemli etken olduğu sonucunda ulaşmıştır. Bu anlamda, mesleki ve teknik okullarda diğer okullara oranla teknoloji destekli öğrenme ortamının daha yüksek yüzdeyle görülmesinin (%11.2), bu liselerde verilen teknik eğitimle ve bazı bölümlerinin teknoloji ağırlıklı eğitim vermesiyle ilişkili olabileceği yorumlanmıştır.

Araştırma sonucunda şu önerilere gidilmiştir:

1. Genel liselerde öğrencilerin büyük oranda (% 42.7), orta düzeyde öğrenme ortamı (Profil C) algısına sahip olduğu görülmektedir. Özellikle hissedilen öğretmen desteği ve bilgisayar destekli öğretime yönelik düşük algıyı işaret eden bu durumun aşılabilmesi için öğretmenlere sınıflardaki öğrenme ortamının zenginleştirilmesi konusunda gerekli hizmet içi eğitimler verilmeli ve buna bağlı olarak okullardaki bilgisayar destekli eğitim faaliyetleri geliştirilmelidir.

2. Ortaöğretim ders programlarında araştırma yöntemleri dersine daha çok yer verilerek, sınıf içerisinde araştırmaya açık bir öğrenme ortamı teşvik edilmeli ve öğrencilerin takım çalışması ile araştırma yapmaları teşvik edilmelidir.

ABSTRACT

The main purpose of this study is to determine the professional competencies and indicators that teachers should have for TPACK-based techno-pedagogical education. the present study was carried out with qualitative research methods. The participants of the study were 24 faculty members from the field of educational technology at 9 different universities in Turkey. An incremental structure was applied for the preparation of the data collection tool. Data included the video records, audio records, researcher diaries and documents that were collected during the workshop. Based on the findings, the main themes were gathered under six dimensions as "Designing the instructional process", "Executing the instructional process", "Being open to innovation", "Obeying ethical issues", "Problem solving" and "Specialization in the field". As a result of the present study, techno-pedagogical competencies, competencies area and indicators were determined in line with the views of the field experts.

Keywords: Technology Integration, Technological Pedagogical Content Knowledge, TPACK, Technological Education, Teacher Competencies.

* The present study is based on a part of a scientific research project supported by The Scientific and Technological Research Council of Turkey (TUBITAK) – number 109K191 – called `Effect of The Techno-Pedagogical Education on Pre-service Teacher and a Framework for Techno-Pedagogical Education`.

1. INTRODUCTION

In order to provide effective technology integration in education and minimize the barriers of technology integration, various approaches have been developed. One of these approaches is Technological Pedagogical Content Knowledge (TPCAK) framework proposed by Koehler and Mishra (2005) as a model that focuses on effective technology integration in the teaching process with respect to teacher competencies in technology use. In other words, TPACK focuses on technology integration not only with respect to the teachers` technology use knowledge, but also with respect to the interaction and combination of teachers' knowledge in the field of technology, pedagogy and content.

Since the model of TPACK is a new and up-to-date approach to effective technology integration, there are an increasing number of studies carried out based on this model. It is seen that many of these studies are generally conducted based on the quantitative approaches such as survey models to measure TPACK. Depending on this, studies related to the development of TPACK-based teacher professional competencies will contribute to TPACK literature and relevant researches. In addition, there are professional studies on the establishment of educational technology standards at international and national area. In these studies, the competencies that teachers should have with respect to their leading digital age-education were determined with NETS-T by ISTE. These studies which were conducted to determine the competencies and indicators for teachers in terms of TPACK could help train teachers to have the necessary skills and knowledge about the effective technology integration in the national and international literature.

2. METHOD

Within the scope of the present study, the teaching-learning process carrying out based on TPACK is defined as techno-pedagogical education. The main purpose of this study is to determine the professional competencies and indicators that teachers should have for TPACK-based techno-pedagogical education. Depending on this purpose, the present study was carried out with qualitative research methods. The participants of the study were 24 faculty members from the field of educational technology at 9 different universities in Turkey. An incremental structure was applied for the preparation of the data collection tool. In this process, the document was created after the creation of the conceptual framework and then the pre-workshop held with educational technology experts was used as the basic data collection tool of the study. With the participation of the 24 faculty members' expert in the field of educational technology, a workshop was held within the scope of the 3rd International Computer and Instructional Technologies Symposium on the 8th of October in 2009, in Trabzon, Turkey. Data included the video records, audio records, researcher diaries and documents that were collected during the workshop. The transcriptions of the data revealed 120 indicators regarding techno-pedagogical education. The inductive content analysis approach was taken as basic for the analysis of the indicators. The themes obtained as the result of the data analysis were called as the competency area and the sub-themes as competency. The resulting indicators were placed under the related competencies in the competency area.

3. FINDINGS

Based on the findings, the main themes were gathered under six dimensions as "Designing the instructional process", "Executing the instructional process", "Being open to innovation", "Obeying ethical issues", "Problem solving" and "Specialization in the field". There were five sub-themes under the theme of 'Designing the instructional process' determined as the competency area; two sub-themes under the theme of 'Executing the instructional process'; four sub-themes under the heading of 'Being open to renovations'; five sub-themes under the heading of 'Obeying ethical issues'; three sub-themes under the heading of 'Problem solving'; one sub-theme under the heading of 'Specialization in the field'. Thus, a total of 20 competencies were determined. A total of 120 indicator statements regarding each competency included in the competency areas were created.

4. CONCLUSIONS

As a result of the present study, techno-pedagogical competencies, competencies area and indicators were determined in line with the views of the field experts. In addition, considering the competency areas, the competencies and the indicators as a whole, a booklet called "Techno-pedagogical Educational Competencies and Indicators" was prepared. Furthermore, these competencies and indicators were used for the development of the "Techno-pedagogical Educational Competency Scale", which was the following phase of the study. In this respect, the present study constituted the basis of the "Techno-pedagogical Educational Competency Scale" developed for the purpose of determining teacher candidates' levels of techno-pedagogical educational competencies. In addition, we plan to use these proficiencies and indicators to structure and develop a course content based on the techno-pedagogical education in the next phase of the study.

TESTS IN THE EXAMINATION

Csilla Muhari
DE IK
csmuhari@yahoo.com

ABSTRACT: Since long years is a serious problem in Hungary the large number of students in higher education institutions, and because of that the teaching overload due to massive test corrections. All this has a bad influence to the teaching and learning processes too. In light of these raises – in order to facilitate the teaching work – the tests need to be involved in the correction process.
Many people have doubts about the application of tests, and the suitability of the result showed by them. But well-constructed tests are used effectively in many areas of life. One of the big areas is the exam for Traffic Rules to the acquisition of a driving licence what is necessary for participation in traffic. The other important area for the application of the tests is the language learning today, and the language exam.
The assessment, with the presentation of practical experience and results, tries to point the substance of test type examination with a particularly among the informatics courses.
KEYWORDS: test, informatics, examination

INTRODUCTION

Numerous options are available in the education for measuring students' knowledge both in the case of normal and electronic materials. It is often thought to be obvious that the exam is paper based if the material was printed out as well. However, it has several disadvantages, especially the unnecessary energy and paper usage which are harmful both financially and environmentally. (Dövényei-Nagy *et. al.,* 2005, p 12) Tests can be written electronically also in the case of normal paper based materials either in self-developed systems or different free softwares. Electronic materials are available in the known free LMCSs (Learning Content Management System). In this case tests are obviously taking place in the frames of the system. The opportunity of usage is preset, however these systems can be expanded with some creativity and savvy. It is typical that a time limit for answering the questions can be set and each solution can have a score.
Beyond the beloved and free *Hot Potatoes* tests which are mainly popular among language teachers, it also contains an interlace module that can form the separate questions into questionnaires. (http://www.halfbakedsoftware.com/hot_pot.php) These questionnaires should practically be exported to one of the material developer systems so that time and score can be ordered to the exercises. Examples for sentence complement, word fill in, true or false and multiple choice questions can be found in the free *eXe* (eLearning XHTML editor) open source-coded editor too. (http://www.exelearning.org) These softwares – Hot Potatoes and eXe – ensure chance for widening the functions of LCMSs and provide variety in the display. Additionally they also make electronic tests available for those who have not used LCMSs before. Fitting these questionnaires into the system can be committed to system administrators.
The above mentioned things prove that tests are not only appropriate for self-check but for examination as well.

TESTS

One unarguable advantage of the tests lies in the definite answers which make simple and quick corrections possible.
There are two different types of knowledge measuring tests: the multiple choices and the answer generating questions. *Multiple choice questions* are mainly used for measuring cognition style knowledge. These types of questions are true/false, yes or no questions, multi-select questions and joint answers as well. (Szabó-Thalmeiner, 2010) In case of informatical course these exercises can be e.g.: searching for source-code errors, checking the running results of code items or recognizing hardwares in pictures, deciding the verity of technical statements. The advantage of using multi-choice tasks, the evaluation system is developed after using the key, and it's easy to scoring assignment evaluation of the papers. However one disadvantage is that students need to go through the false answers as well so in case of faltering knowledge they may memorize the wrong answer. Furthermore in the first they give more work for the examiner, e.g.: he needs to draft believable wrong answers which are not easy at all. With *answer generating questions* not only cognition but the communication and reasoning skills can also be measured. These kinds of questions can be sentence completion, giving shorter or longer answers or essay

writing. The advantage of these exercises are easier since only the questions needed to be composed and giving possible false answers is not required. (Szabó-Thalmeiner, 2010) Students need to draw up the answers on their own. However computerized correction of the tests is more problematic since a more detailed key is required from the teacher.
In knowledge measuring norm orientated and criteria orientated evaluation need to be differentiated. In norm orientated knowledge measuring the evaluation of each student depends on the result of the others as well. In criteria orientated measuring however students need to reach a certain level to pass. (Falus I., 1993)
In higher education it has been a problem that students have different knowledge from the secondary schools. (Kiss G., 2011) However in the semesters afterwards they need to fulfill the same requirements for getting the credits of a certain subject irrespectively of the secondary school they are coming from.
In this present research only criteria orientated tests are detailed.

INFORMATICAL INFRASTRUCTURE

Hardware

Test exams have two different types: printed or electronic. Printed tests have many disadvantages however. The teacher sets the questions on his own computer, prints out at least one copy and manifolds it with a copy machine. In the beginning of the exam he gives the tests to the students and in the end he collects them. He can either correct with templates but he needs to go through each tests and given answers. Students work ends with writing the exams, but the instructor work only just began. One great advantage of printed exams is on the other hand that it does not require high informatical skills and complete system development.
For electronic examination a certain number of computers is required.
In our case – for B.Sc (and M.Sc) computer engineering students of University of Óbuda, John von Neumann Faculty of Informatics – both for seminars and examinations seminar rooms with 24 modern computers are available. The practices and exams detailed in this research were both held in these rooms.

Software

There are certain types of test and unique systems developed specifically for knowledge measurement. The learning material does not need to be electronic and in most cases it is usually printed. However exams are electronic due to the high number of students and compensation of the grown duties of teachers.
A short (2-3 sentences), essay responses is set out in this already exists in practice. The eMax intelligent knowledge assessment system makes the evaluation of short essays possible and was developed by the cooperation of University of Óbuda John von Neumann Faculty of Informatics (before 1st Jan 2010 Budapest Tech John von Neumann Faculty of Informatics) and IBM. Evaluation in this system is semi-automatic since one part of the tests needs to be corrected by the teacher. (SIMA *et al.* 2008) In this case each answers needed to be checked by the teacher one by one. However these test represent only 10-20% of the whole.
The development of this system was started in 2005 and its β version has been used since 2008. The idea of the application came from the difficulties of evaluating essay type questions. In this programme in University of Óbuda the evaluation of answers is 80-90% automatic but setting the tests is – still – not. After setting the test questions and the possible answers they are mixed by the programme. So the correct answers are not marked with the same signs for students sitting next to each other and questions are not in the same order. These individualized exams also help objectivity since this highly reduces the chance of using external help.
The background of this research is provided by eMax intelligent knowledge assessment system which has already shown its great advantages in exam situations since 2010. This system was developed specifically for evaluating short essay answers but setting and evaluating tests are also possible.

PRELIMINARIES

The focus group of this research is the results of the *Assembly Programming* trial and real exam in the 2nd semester of the academic year 2010/2011 among full time B.Sc. computer engineering students in University of Óbuda John von Neumann Faculty of Informatics.

There are 182 students in the class learning in groups of 18-24 persons. Lessons are held in the previously mentioned seminar rooms with 24 available computers. Theoretical education is held in these rooms as well. The 8 groups – due to the number of students – are divided among 4 teachers but not equably. There are max 24 students in 1 course which makes possible for the teachers to follow the students with attention.
The requirement of *Assembly programming* is to fulfill an exam in the end of the semester. The result gives the students a semester mark. This exam consists of two parts.
Part one contains tests which need to be solved electronically in closed system. Evaluation in this case is possible by one click since the parameters are set previously.
Part two is for testing the practical knowledge. Students need to finish the exercise in limited time frame, these programmes need to be able to compile and able to run and also need to have all required functions. The tests included in tasks should be implemented in the code. Not only ability to compile, ability to run and functions but its codes are important as well. In the practical part there is more than one programming exercise which are done and evaluated beyond eMax.
Based on the experiences of the previous years from the 2nd semester of the academic year 2010/2011 on students have a trial practical exam in the course as well. Its advantage is that students are facing the knowledge requirements before the end of the semester. Additional advantage that it also forced the students to learn programming not to leave to the last minute, because learning it requires a lot of time and mainly lot of practicing. However writing this trial exam is not obligatory. On the other hand it is useful to know if the personal knowledge fulfills the requirements or not. Furthermore it does not come with any disadvantages since the result is only informative and can only effect at the end of the semester grade positively.
Students write the real exam before the last lecture of the semester so that they can have another chance in the last occasion to retry it if necessary. At this point, it is possible to repeat only the unsuccessful task part of the test. The result of this exam will give the final grade. For those who do not manage to pass this way have the chance to re-do the exam one more time in the first two weeks of the examination session.

THE TESTS

First a question database needs to be set while some previously set exercises were taken out of the possible exam questions. Others were modified and also some new exercises were composed. Previously the ratio of test and essay questions was 50-50%. It was the first occasion this year that both the trial and the real exam contained tests. Test questions needed to be grouped and installed into the system in topics so that they can stay clear. This also makes possible to increase the number of questions later and helps to see which parts need to be extended.
In the first step the database also needed to be re-edited for the trial exam. It also needed to be taken into account that the semester was still not over and students still did not study about all topics. While composing the questions high attention was required not to contain any topics still not studied. Different types of questions, e.g.: true/false and multi-select questions were written in all topics. Multi-select questions are dominating in the database however.
There were altogether 15 questions in the test part of the trial exam with a time limit of 20 minutes. Answers could be sent to the server faster as well but after the time limit elapses the system automatically does so. The tests included the true/false type of questions however the majority of the test were multi-select questions. Among the multi-select questions some had 2 correct answers but some had only one. Students were informed that the number of the correct answers can be one, more or none. It also meant that questions were written both in singular and in plural, e.g.: *„Which statement(s) is/are correct about the XXX instruction(s)?”*. The other possible test type with one or more correct answers is the comparison of two things, when similarities or differences need to be found. For questions like *„Which result do we get after running the following code item?”* can be more that one correct answers given. They can either give the result in decimal or binary value but the answer can be described in words. This case the correct answer also consisted of more parts. There were 3 programming exercises in the practical part.

After the trial exam the question database needed to be extended to the whole learning material and had to take account the experience gained during the trial exam. New topics were added to database and „None are correct.” was also added to the possible answers. It was required since in some cases no correct answers were marked by the student as it was also a possible answer. This way however it could not decided if the student skipped the question or thought that the correct answer is not among the possibilities. In the real exam students marked this possible answer many times but there were still some

of them who didn't mark anything. So it is possible to judge how carefully solve students the tests and to call their attention to this problem.
There were already altogether 20 questions in the test part of the real exam with a time limit of 35 minutes. Half of the questions were given among the ones in the trial exam but they were not asked in the same courses as previously. This way one exact type of exercise was solved by higher number of students and better statistical conclusions could be drawn. The number of practical exercises was also increased from 3 to 5.

RESULTS

The rating of tests was the following. 1 point was given for each test no matter how many correct answers should have been marked. In this exam (both trial and real) 2 possible answers could give one correct answer. If only one of the correct answers was marked, the student goes 0.5 point. However marking a wrong answer meant 0 point for that question. E.g.: in a question where the number of correct answers is 2, the student marked 1 correct answer and 1 wrong answer he got 0 point. The situation is the same if he marked both correct answers but also a wrong one. So 1 or 0.5 point could have been got only if the student had confident knowledge. This way it was not possible to pass with guessing the answers.
As mentioned previously, writing the trial exam was not obligatory. However, if more than 50% was reached on the trial exam if meant +5% in the final grade if the result of the real exam was at least 60%. Despite this only 78.5%of the students (143 people) have chosen this option.

Groups	Group 1 (18 ppl)	Group 2 (14 ppl)	Group 3 (18 ppl)	Group 4 (22 ppl)	Group 5 (18 ppl)	Group 6 (15 ppl)	Group 7 (18 ppl)	Group 8 (20 ppl)	Class mean (143 ppl)
Test mean (%):	77,6	68,3	67,4	63,8	68,3	59,3	67,2	68,0	67,5
Practical mean (%)	31,4	33,1	40,9	40,3	45,9	33,0	18,3	40,2	35,4
Result (%)	54,5	50,7	54,1	52,0	57,1	46,1	42,7	54,1	**51,4**

Table 1, Results of the trial exam in groups and aggregated.

The results of the trial exam can be seen in Table 1. Students were for less successful in the practical part of the exam than in the tests. It could be stated that the theoretical tasks because of nature of being test were easier than the practical ones. To refuse this opinion a calculation has been completed which shows what correlation there is – in case of each student – between the test results and the results of the programming tests. It appears that a medium positive relationship between them can be discovered (correlation: 0.42), which shows that typically those students performed better on multi-select questions, who were better in the practical tests. Who has not been a good test of performance, they are weakly active in the programming, or, worse, it has not even written. This is why the mean of Group 7 is lower than other groups since after the bad test results student have chose not to try the practical part.
The best result in tests was 96.7%, the worst 13.3%. As about the practical part: results are more extreme since students either did the exercises or did not try them at all. The best result in this case was 100%, the worst 0%. The mean of the trial exam was 51.4%. The average result of the students participating in trial exam was 51.4%.

As it can be seen in Table 2, only 173 students out of 182 have written the real exam. The reason for it can be the dropout during the semester. If the student does not attend 30% of the seminars he is automatically blocked in the course in that semester. The missing 9 students have the chance to write the exam in the last lecture of the semester it is impossible to know for sure – yet – how many people fulfills the requirements of the semester.
Results in Table 2 do not contain the results increased with 5% since it does not affect this research, only student has benefit from it. However it can be clearly seen that the result of the real exam was better than the trial exam. It is especially exciting if we mention that the test results were worse in the real one than in the trial. The reason for the improvement is that students solved the programming exercises much better than in the trial exam.

Groups	Group 1 (22 ppl)	Group 2 (17 ppl)	Group 3 (24 ppl)	Group 4 (23 ppl)	Group 5 (23 ppl)	Group 6 (17 ppl)	Group 7 (24 ppl)	Group 8 (23 ppl)	Class mean (173 ppl)
Test mean (%):	55,0	55,1	47,5	54,2	46,4	54,6	49,7	57,4	52,5
Practical mean (%)	76,8	57,8	59,2	59,0	73,6	68,8	68,4	76,4	67,5
Result (%)	66,0	56,4	53,3	56,6	60,0	61,7	61,0	66,9	**60,0**

Table 2, Results of the real exam in groups and aggregated.

Despite these facts the performance of students is worse than expected. Despite the number of available exams only 97 students out of 182 managed to reach the limit of 60% to get the credits that is only slightly more than half of the students succeeded.

SUMMARY

Among the three basic requirements of evaluation objectivity was absolutely materialized since the correction of the tests was fully automatical according to the previously set parameters. That the scoring, and thus the assessment is carried out by the computer, the possible mistakes made by overloaded teachers can be reduced. The wording and clarity of questions has allowed the fulfillment of the objectivity on the examiners' side, as they were only present on the exams to secure the exams fair and without external help. Automatic evaluation has one more great advantage. The results almost immediately become available for trainers, and this way the students are much sooner informed of their performance.

After summing up the result of the trial exam the *„None are correct."* optional answer was also given in the real exam. Due to this change there were fewer questions without any marked answers. However it brought another problem to the surface: students even leave some questions without answers if this new optional answer was given. It either means that they were lack of time for marking any options or they were careless. It is worth examining how those students did in other questions that left some without answers. If they did bad, spending too much time with other questions might have been the reason for it. If they did well in other questions they might have been short of time which is also worth examining.
There was something strange both about the trial and the real examination however. More than 77% of the students (111 persons) had questions with two correct answers. In these cases the two answers were absolutely the same only the composition was different. Without mentioning the exact questions and answers they had the following style:

a. X is smaller than Y.
b. Y is higher than X.

38 students have marked only 1 correct answer and have lost 0.5 point.
In the real exam the whole class (173 students) had this question among the tests one group has even got 2 from this type of question. The number of students with partly correct answers was 65 totally correct answers were given only by 54 people. It is despite the fact that in 3 groups this question was in the test in the trial exam as well. As a whole it can be stated that students do not read the exercises carefully and do not pay enough attention to the solutions.

Protecting a question database with low number of elements is important at the moment. Subsequently, the increase in the number of tests instead of the treasured secrets can open a test which the students may be practicing and learning purposes. Each time there are some students who try to get the questions previously and they are not even aware that it is harmful for them. The improper use of restraint beyond the means of learning bad habits can be rolled back to the electronic assessment. It is enough to think of students who usually prefer to go through workbooks and previous tests while preparing for an exam. They even try to memorize the letter of the correct answers. If answers are given in different orders these problems can be easily solved.
So far this situation has also had its advantage. The low number of questions allows the teachers more experiments without more extra work. In this case, the students submitted written tests of statistical test results are analyzed, it was expanded in the light of questions. Furthermore, and this experiment was not

against but for the students since they could also have the chance for practice. The positive results of this can be seen in Table 2.
The small size of the test database presently available cannot enable the tests to be issued to students with the purposes of studying and self-monitoring. Later, with the steep increase in the number of tests their issue will become possible for practice.

Summary

One of the aims of the education is to train individuals according to the needs of the society. The individuals should not only transfer the information but also should use the educational technologies and reach the information with the help of them. Therefore, to grow up individuals who have this understanding is the responsibility of the educational system.

Determining the attitudes of foreign language teachers are extremely important as foreign language teaching is one of the main fields that the education technologies are widely used. Besides, defining the attitudes will lead more productive use of the educational technologies.

In this study, the attitudes of the students at English language teaching department towards the educational technologies were tried to define by using the scale developed by Pala (2006) which is titled "Attitude Scale towards Educational Technologies". The results were analyzed according to some variables such as gender, age, etc. Totally 111 students who continue their education at "Yıldız Technical University, Foreign Languages Teaching Department" participated in the study. Some suggestions were given based on the gotten results. Both the results and the suggestions will be presented in the paper.

Key Words:

English Language Teaching Department, Educational Technologies, Attitude

İNGİLİZCE ÖĞRETMENLİĞİ BÖLÜMÜ ÖĞRENCİLERİNİN EĞİTİM TEKNOLOJİLERİNE YÖNELİK TUTUMLARININ ÇEŞİTLİ DEĞİŞKENLER AÇISINDAN İNCELENMESİ

Özet

Eğitimin amaçlarından bir tanesi de toplumun gereksinimlerine uygun bireyler yetiştirmektir. Bundan dolayı eğitim anlayışı doğrudan bilgi aktarılan bireyler değil de eğitim teknolojilerini kullanabilen ve bu eğitim teknolojileri sayesinde bilgiye kısa ve verimli şekilde ulaşabilen bireyler yetiştirilmesi gerekmektedir.

Özellikle eğitim teknolojilerinin en çok kullanılmaya ihtiyaç duyulduğu alanlardan biri olan yabancı dil eğitiminde geleceğin yabancı dil öğretmenlerinin eğitim teknolojilerine karşı tutumlarının ortaya konulması, eğitim teknolojilerinin daha verimli kullanımı açısından önemli ve gerekli görülmektedir.

Bu çalışmada İngilizce Öğretmenliği Bölümü öğrencilerinin eğitim teknolojilerine yönelik tutumları, Pala (2006) tarafından geliştirilen "Eğitim Teknolojilerine Yönelik Tutum Ölçeği" kullanılarak tespit edilmeye çalışılmış ve çeşitli değişkenlere göre incelenmiştir. Araştırmaya Yıldız Teknik Üniversitesi İngilizce Öğretmenliği Bölümünde okuyan 1. ve 4. sınıf olmak üzere toplam 111 öğrenci katılmıştır. Araştırma sonuçları doğrultusunda önerilerde bulunulmuştur.

Anahtar Kelimeler

Introduction

The expectations of the people to be able to live in a contemporary environment have brought the fast developments in technology. It can be said that the most important role is on the education. Therefore, we should use the technology effectively in educational activities.

Technological development which is seen as a product of educational process has also changed the structure of the process and has brought a different perspective to the understanding of the education (Keser, 1991).

Technology includes all machines, procedures, methods, processes, systems, management and evaluation which are utilized in the areas like science production, service, and transportation. In addition, it functions as a bridge between science and practice. Educational technology can be regarded as the process of structuring learning and teaching process, its practice and its development as well (Alkan, 1997).

Educational Technologies

The concept of educational technologies has moved far from the definition of "materials used in the education" and it has become one of the main disciplines including wide issues from human technology to the interaction. However, fast developments in the conceptual field have not been applied at the same speed.

Educational technology is a complex process which analyzes all problems that "human learning" includes. It develops appropriate designs by operating related issues (human power, information, methods, techniques, materials, organisations, etc.) and it applies them, evaluates and manages (Yalın, 2007).

One of the aims of the education is to train people according to the needs of the society. Therefore, it is needed to educate individuals who can reach the information effectively in a short time by the help of educational technologies and use these technologies. What we do not need are the ones who get the information directly (Alkan, 2005). The relation between technology and education were examined in terms of its effects on education. Main points were as below;

1. To transfer necessary abilities to the individuals
2. To train people who have the necessary qualifications of technological enviroment.
3. To take advantage of technological opportunites.

Educational technology has both direct and indirect benefits. Indirect benefits; it leads to creativity, changes the role of the teacher, makes the equality real, creates motivation, makes the education personalized, provides free education, brings the information from the first source, makes a system that can be copied. Direct benefits; it makes learning easier, it provides active learning, it makes concrete learning happen, it builds the base of the progressive learning and succeeds special aims in thinking (Rıza, 2003).

Even though education technologies have an important role and function on education, the one who makes the education meaningful and makes it functional and effective is the teacher. Considering the rapid developments in the technology and rise in the use of technology, teachers are expected to use these technologies at the schools and teach them (Akkoyunlu, 1995). In this context, it is extremely useful to examine the attitudes of candidate language teachers.

Attitude

Attitude is one of the actions that direct human behaviors. Attitudes of the individuals affect their love, hate and behaviors significantly (Morgan 1991). As a result, not only the evaluation of the attitudes but also to know the level of the attitudes is required in many fields (Erkuş 2003).

Attitude means "ready to action" in Latin origin (Arkonaç, 2001). Katz (1967) describes attitude as "pre thinking style of perceiving an object, person or the world with its bad and good sides depending on the values a person has".

Attitude is also a psychological structure seen as critical and important procedure of the cognitive, behavioral, perceptional sides of human behavior (Anderson 1988). Attitude is also something

acquired by learning, directing the behaviors of the person and causes bias in decision making process (Ülgen 1996).

METHOD

Method

A questionnaire was used in order to get data on demographic characteristics of the students and their attitudes towards usage of the educational technologies. The questionnaire used for this study which is named "Attitude Scale towards Educational Technology" was developed by Pala (2006). SPSS 17.0 Pack was used to make statistical analysis of the gotten data.

Model of the Research

The study was conducted according to scan model. In this model, it is tried to describe the group, case and variables separately (Karasar, 2004). The reason to use scan model is to define the attitudes towards technology in a neutral way.

Sample

Sample includes 111 undergraduate students studying "Yıldız Technical University, the Faculty of Education, Foreign Languages Teaching Department" in 2010- 2011 spring term. All the students at all grades were taken into sample but the ones who did not participate in the study were not taken into consideration.

Data Collection Tool

As a first step an information scala designed by the researchers for demographic features in order to analyze students' attitudes toward education technologies in terms of several variables was used and later "Attitude Scale toward Educational Technology" was applied.

The scale named ""Attitude Scale towards Educational Technology" was developed by Pala in 2006. Cronbach Alpha reliability coefficient was found 0.92. The scale which was organized as Liker type includes 43 items.

Data Collection Process and Data Analysis

The data of the research was gotten during 2010- 2011 spring semester. The option of "totally disagree" was calculated as one point and the option of "totally agree" was calculated as point 5. The lowest score which will be gotten is 43 and the highest score is 215. Total point of "totally disagree" corresponds to 43- 77, 78-111 corresponds to "disagree", 112-145 corresponds to "undecided", 146-179 corresponds to "agree" and 180-215 corresponds to "totally agree". High total point means high attitudes towards educational technologies.

t Test was used in order to determine whether there is a meaningful relation between gender and attitudes towards educational technologies. One-Way Anova was wanted to be used whether there is a difference according to the type of the high school or not. However, as there is only one graduate from vocational high school, t-Test was used again.

FINDINGS and COMMENTS

%76 percent of the students who participated in the study was female students () and %24 percent was male students (n=27). 85 percent of the students (n=95) are graduates of Science/Anatolian/Anatolian Teacher's High School and the others are graduates of high school and one is the graduate of vocational high school. %93 percent of the students stated that they have computers at home and %80 percent has internet connection as well.

%68 (n=76) of the students find themselves successful in computer usage. %85 (n=94) of the students indicated that they have not taken computer education outside of the school enviroment. % 67 of the students (n=74) gave "no" as an answer for the question of "Have you taken any education on educational technologies in English language teaching?".

The average attitude score towards educational technology is 147. This average corresponds to the item of "agree". This shows that the attitudes of the students towards educational technology are positive. This finding is similar to the results of the study conducted by Çardak and the others (2001). The study they conducted has determined the attitudes of candidate science teachers and it was found that they developed positive feelings towards technology.

Table 1: Comparison of the Attitude Level towards Educational Technology according to Gender

Gender	N	Average	Standard Deviation	p
Female	84	147	14,88	,601
Male	27	150	12,31	

According to table 1, while the average attitude score of female students' towards educational technology is X=147, the average attitude score of male students' attitudes towards educational technology is X=150. When P value (p>,05) was examined it was seen that difference between the attitudes of female and male students was not significant.

It was also stated in the study analyzing attitudes of candidate maths teacher by Özgen ve Obay (2008) that there is no significant difference related to "gender" variable.

Table 2: Comparison of the Attitude Level towards Educational Technology According to Type of the High School

High School Type	N	Average	Standard Deviation	p
Science/Anatolian/Anatolian Teacher's High School	95	148	14,84	,538
High School	13	142	10,58	

According to Table 2, the average attitude score of Science/Anatolian/Anatolian Teacher's High School graduates is X=148 whereas the average attitude score of High School graduates is X=142. When P value was examined (p>,05) there is no significant difference statistically between the graduates of Science/Anatolian/Anatolian Teacher's High School graduates and High School graduates.

This finding correlates with the results of the study conducted by Can (2010) and Günhan and the others (2008). They found that there is no significant difference between students' attitudes towards educational technology in science teaching and class teacher departments and the high school type.

Table 3: Comparison of the Attitude Level towards Educational Technology According to the Success Perception

In Computer Usage	N	Average	Standard Deviation	p
Finding himself successful	76	147	15,47	,336
Finding himself unsuccessful	33	149	11,91	

According to Tablo 3, while the average attitude score of the students who find themselves successful in computer usage is X=147, the average attitude score of the students who find themselves unsuccessful in computer usage is X=149. According to P value (p>,05) it can be said that there is not significant statistical difference between the attitudes of the students in these two groups.

CONCLUSION and RECOMMENDATIONS

According to the findings of this study it revealed that the students' attitudes towards educational technology in English language teaching department are positive at the level of "agree".

It was also found that there is no significant difference between the attitudes of male and female students.

Even though the attitudes of Science/Anatolian/Anatolian Teacher's High School were found higher in the comparison made according to high school type, it can be said that there is no significant difference between graduates of Science/Anatolian/Anatolian Teacher's High School and High school graduates in terms of statistics.

Significant difference between the students who find themselves successful or unsuccessful was not also determined.

It is a fact that integration of educational technologies increases the success of the education. As a result of this, it is needed to focus on the courses which transfer necessary technological skills especially at undergraduate curriculum.

This study included candidate English language teachers. It may be suggested to conduct the same study with the students studying at different teaching departments.

Abstract: This study aims to investigate the use of e-learning among future school heads in education management and leadership. The study was conducted in two phases. The first phase focused on developing a learning management system using open source software - *Moodle*. This phase emphasized on the processes involved in designing and developing the learning management system prototype called *E-Headship*. The second phase evaluated participants' suitability in becoming future school leaders and managers through the use of *E-Headship* for the National Professional Qualification for Headship (NPQH) programme. *E-Headship* was then evaluated in terms of the applications of the learning management system. Sixty (60) participants from Institut Aminudin Baki (IAB) - an institute for training school administrators took part in the study. The data were analyzed using descriptive statistic focusing on reporting of the results in percentile, means, standard deviation and frequency. As it compared the performance results of two groups, a simple T-test was also performed. The results revealed that *e-Headship* has succeeded in promoting teaching and learning strategies to a higher degree. It is hoped that the use of such prototype will help the education institution in designing and developing better programmes that could benefit the participants at large.

Key-Words: - open source, education, leadership, management, learning management system, school administrators

Introduction

The development in information technology has now moved from the first wave that emphasises on computer technical skills to the second wave which focuses on the application and management aspects (Adams & Morgan, 2007). The second wave in online learning technology emphasises more on the administration and management of information technology. In other words, online learning explains how man manages technology in their daily lives. Ready-made software and system are abundant in today's market but the problem remains: how are developing countries use the available software with a budget that fits their pockets? A study has found out

that Free Libre Open Source System (FLOSS) is very potential in using open source system and also has contributed to the education system (Ghosh, 2004). A research in Bhutan discovered that poor developing countries have to fork out a substantial amount of their GDP to obtain legal licence and original software (Ghosh, 2004).

Based on the research mentioned, profit is not the main factor in developing open source software. Only 13% of open source users use it to gain profit. Most designers and software users agree that between 70% to 78% use open source based on social principle which is knowledge sharing and learning and developing new skills. Therefore, choosing to operate on open source is a wise decision for non-profit government and non-government agencies (Preston et al, 2010). The main challenge in online technology applications in education management and administration is adapting matters which are related to educational administration policy of a country, pedagogical approaches and learning theories. The understanding of using technology in management and administration is mostly geared towards the uses of technology in industrial management and not in education. This inevitably call for an effort in developing the technology for online learning that adapt pedagogical approaches and embrace learning theories. In this scenario, there is a need to involve experts in the education field to select the content materials. Research shows that the use of open source in education can benefit the education field. Educators and webmasters could design and mould it in accordance to the needs of the institution (Gosmire et al. 2009)

This paper describes the use of learning management system among future school heads in education management and leadership. The study was conducted in two phases. The first phase focused on developing a learning management system using open source software - *Moodle*. This phase emphasized on the processes involved in designing and developing the learning management system prototype called *E-Headship* for the National Professional Qualification for Headship (NPQH) programme. The NPQH Programme is a one-year course on management and administration leadership designed for school leaders held at Aminuddin Baki Institute, Ministry of Education, Malaysia. The second phase was on the evaluation of participants' suitability in becoming future school leaders and managers through the use of *E-Headship.* It was evaluated in terms of the applications of *E-Headship.*

Open source software - MOODLE

The technology development and advancement accelerates globally. The existence of Microsoft which revolutionised computer software is a mark of that advancement. There is no doubt that computer system designers made a great fortune from their work and gained massive popularity. However, not all system designers design for profit. For instance, *Moodle*, an open source software, which was developed by Martin Dougiamas is one of the examples of software that emphasises on online learning which does not operate on profit. Martin Dougiamas is an educationist who has smartly combined the pedagogical knowledge of education and computer technology together which enriches the education of the 21st century. From *Moodle*, individuals or organizations are given the permission to download the software free of charge and the downloading comes with license (William, 2006). The system is equipped with all aspects of online learning such as the ability to store learning resources, communication and activities that are based on certain learning topics (Williams, 2005). The interesting features of *Moodle* includes downloading and

sharing of documents, developing content in HTML, forum or discussions, quizzes, grading, formatted questionnaire, journal writing and other features which are seen as important to the development of online learning.

The programme, *Curriculum, Technology and Education Reform (CTER)* which was executed by College of Education, University of Illinois in 1998 uses *Moodle* (Gosmire, 2009). The programme has successfully produced post graduates who mastered three areas of education: curriculum, technology and reformation in education. The findings encompassed that most in-service teachers gave favourable feedback towards the online learning programme. The CTER programme combines various teaching methods that could promote learners' acquisition of knowledge. Another advantage that was brought in by online learning is the fact that it has changed the society's perception on lifelong learning. Online learning has allowed learners to learn in a virtual world. This, in turn has increased the number of diploma holders as well as those who try to get a degree while working. It has also increased the number of professionals who gained a second degree. This proves that online learning is widely accepted (Norazah, 2002). Although initially the online learning is viewed as any other method of learning, the perception is gradually changing. Many countries see this as an alternative mode in developing and training their human resource. Furthermore, ICT is seen as a 'push factor' that could solve many educational problems across the countries in the world (Levin et al. 2009).

Methodology

This section details the design and development of the learning management system, using *Moodle* for management and school leaderships, *E-Headship* the National Professional Qualification for Headship (NPQH) programme. The study was conducted in two phases. The first phase focused on the development process of *E-Headship.* The second phase stressed on evaluation of participants' suitability in becoming future school leaders and managers through the use of *E-Headship* for the NPQH Programme. The participants were the NPQH candidates at the Aminuddin Baki Institute (IAB), Ministry of Education, Malaysia. IAB is a training institute on management and educational leadership. It was evaluated in terms of the applications of *E-Headship*.

The process of designing, developing, implementation and evaluation of *E-Headship* was based on the model of Holistic Cycle (Norazah, 2002) and web development model for education (Perrin & Mayhew 2000). The conceptual framework is shown in Figure 1.

In the first phase, during the design process of *E-Headship*, it was ensured that all technical aspects such as the registration process, the main menu, updating content materials, links and arrangement, graphic and user guide were user friendly and learner centred. In setting up the *e-Headship* format, *Dreamweaver* software was used and the PhP configuration system was modified using *Moodle*. In the development of the teaching and learning content, softwares such as Microsoft PowerPoint, Microsoft Word, Flash and Raptivity were used.

In the second phase, the evaluation of *E-Headship* was done in terms of the applications the leaening Management system. The applications involved were the accessibility, registration process, e-content, interactivity and forum/quizzes. Sixty

(60) participants who were the NPQH candidates took part in the study. The data were analyzed using descriptive statistic focusing on reporting of the results in percentile, means, standard deviation and frequency.

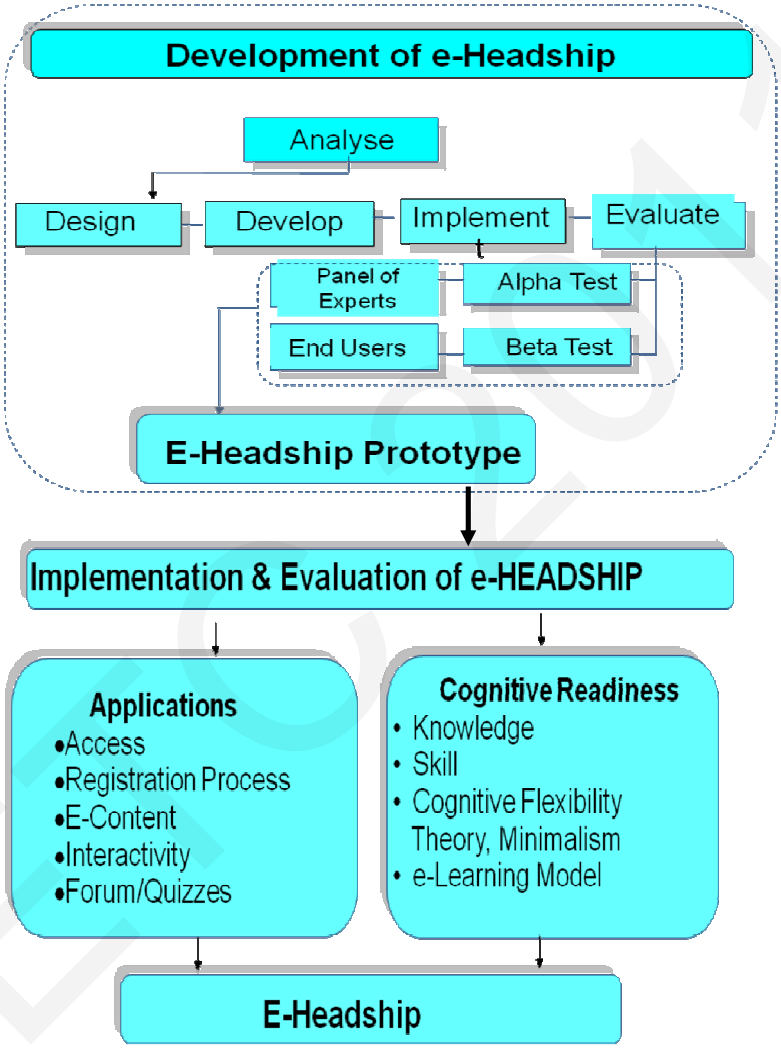

Figure 1 E-Headship Conceptual Framework

Findings

The research findings are as follows:

Accessibility of *E-Headship*

In this research, the interface menu system used was based on *Moodle*. Amendments were made to suit the needs of the NPQH Programme as well as to adhere to the suggestions made by the experts of the system and NPQH content. Figure 2 shows one of the interfaces of *e-Headship*.

Figure 2 The Interface of *E-Headship*

Table 1 Data distribution the accessibility of *E-Headship*

ITEM	Mean	Std-Deviation
E-Headship is user-friendly.	4.03	.414
E-Headship module is easy to use.	4.17	.379
Access for *E-Headship* is smooth and fast.	4.03	.615
E-Headship has clear instructions.	4.07	.521
E-Headship has easy to understand user- guide	4.10	.548

Based on Table 1, the respondents agreed that *E-Headship* was user friendly (mean 4.03), the menu system was easy to use (mean 4.17), *E-Headship* is quick access system (mean 4.03) and it has clear instructions (mean 4.07).

***E-Headship* Registration System**

Moodle is equipped with registration system to ensure that the recorded information system and participants data were well kept. Figure 3 shows the registration system of E-Headship that was developed using Moodle format. It takes into account the safety features as well as users' information accessing this system.

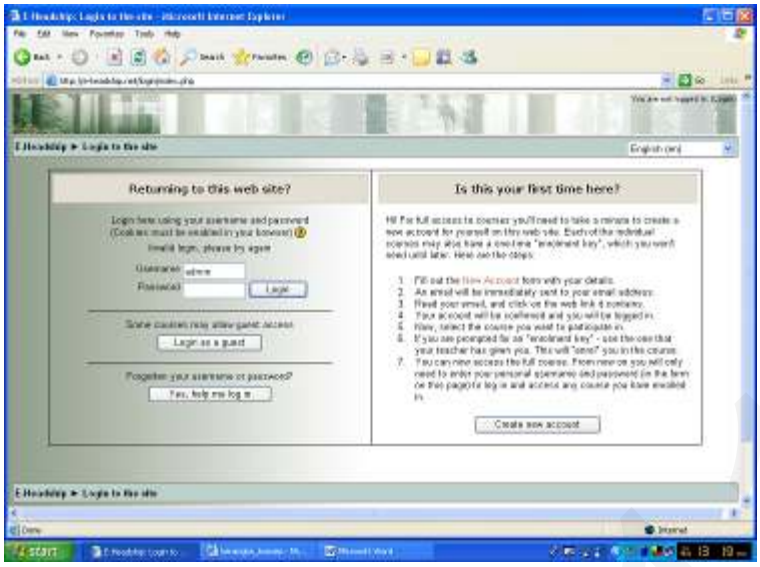

Figure 3 Registration system of *E-Headship*

Table 2 The data on *E-Headship* registration process

ITEM	Mean	Std-Deviation
E-Headship registration system has easy to understand instructions.	4.07	.583
E-Headship registration system does not require high skill technology.	3.97	.615
E-Headship registration system is user friendly.	4.03	.556
E-Headship registration system is simple and easy to acquire.	4.00	.587
E-Headship registration system is smooth running.	4.13	.507
E-Headship registration system is effective and quick to access.	4.03	.490

Table 2 showed that the respondents agreed that the registration system was easy to understand (mean 4.07), does not need high technology skills (mean 3.97), user-friendly (mean 4.03), simple and easy to use (mean 4.00), efficient (mean 4.13) and effective and quick to access (mean 4.03).

E-Headship Content

The teaching and learning content of *E-Headship* is one of the most important aspects in the development process. The content must adhere to the needs of the school leaders and managers and in line with the courses covered in the education management and leadership -NPQH. Figure 4 shows the list of courses in *E-Headship*.

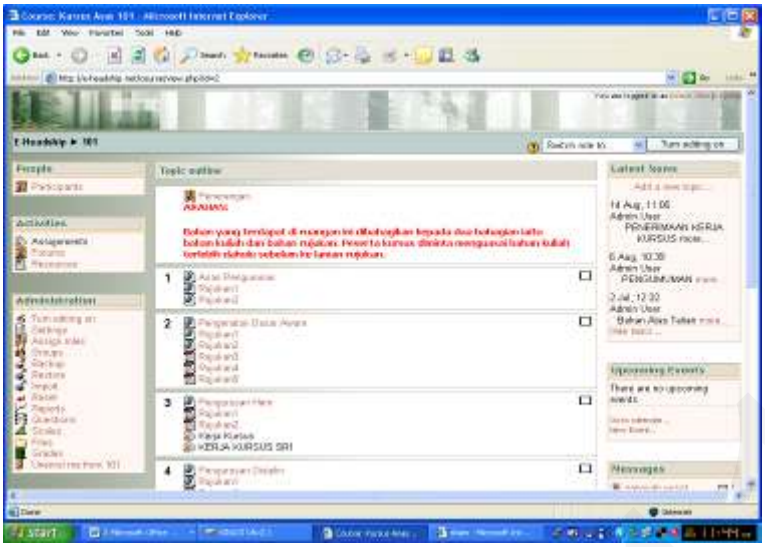

Figure 4 The list of courses in *E-Headship*

Table 3 *E-Headship* learning content.

ITEM	Mean	Std-Deviation
E-Headship content is developed to suit my level of knowledge.	4.00	.371
E-Headship content can increase self-motivation towards learning.	4.17	.531
E-Headship content requires minimum time to access.	4.03	.490
E-Headship content satisfies the objectives of the course.	4.07	.450
E-Headship content increases my understanding of the subject matter.	4.13	.434
E-Headship content uses technology that suits my ICT skill level.	4.17	.461
E-Headship content provides links to broader online information.	4.10	.403
E-Headship content is organized systematically.	4.13	.434
E-Headship content diversifies my learning methodology.	4.13	.507

Table 3 showed that the respondents agreed that the *E-Headship* content is suitable with the level of their ICT skille. (mean 4.00), provides self motivation (mean4.17), requires minimum time to access
(mean 4.03), the content suits the objectives of the course (mean 4.07), increases understanding (mean 4.13), uses appropriate technology (mean 4.17), provides suitable links (mean 4.10), systematically arranged (mean 4.13), and enables diversity of learning methodology.

E-Headship Forum, Quiz and Discussions

Online communication and interactivity between learners and lecturers play very important roles in determining the effectiveness of a learning management system. This is due to the fact that students were not able to meet face-to-face with the lecturer all the time. *E-Headship* is equipped with chatting and messages modes to ensure smooth communication between students, education administrators and lecturers. Figure 5 shows the chatting room in *E-Headship*.

Figure 5 Forum and Messages in *E-Headship*

Table 4 Respondents' feedback on the *E-Headship* Forum and Quizzes

ITEM	Mean	Std-Deviation
The forum in *E-Headship* helps in my learning process	4.00	.455
E-Headship quizzes increase my understanding of the subject matter.	4.00	.455
Discussions in *E-Headship* help my understanding of a topic.	4.13	.507
Discussions in *E-Headship* help to increase communication with course-mates.	4.03	.556
Discussions in *E-Headship* help students exchange information.	4.00	.525
Discussions in the forum help me in understanding a topic quicker.	4.10	.548
Forum in *E-Headship* helps to quicken the information delivery system.	4.17	.461
Forum, quiz and discussion in *E-Headship* learning supports my classroom learning	4.07	.583

Table 4 shows that the respondents agreed that the forum helps in their learning process (mean 4.00), the quizzes incorporated in the forum increase their understanding of the subject matter (mean 4.00), Discussions in *E-Headship* help their understanding of a topic (mean 4.13), help to increase communication with course-mates (4.03), help students exchange information (4.00), help them in understanding a topic quicker (4.10) and helps to quicken the information delivery system (4.17). The results also showed that the Forum, quiz and discussion in *E-Headship* supports their classroom learning.

Conclusion

Many learning institutions have implemented efficient learning management system from the open source software. Research findings on the perception of the future school heads in education management and leadership towards *E-Headship* are encouraging and remain very positive. They perceived the learner-to-content interaction, learner-to-learner interaction, learner-to-instructor interaction in the *E-Headship* positively. The studies by Gosmire et al (2010) also reveals similar positive interaction. The design and development of *E-Headship* has succeeded in promoting teaching and learning strategies to a higher degree. These findings are parallel with many studies on the effectiveness of the integration of technology in the teaching and learning process (Gregory & Beyrer (2010), Effandi et.al (2007) and Uys (2010) & Dell et al (2010). Their studies revealed that web-based learning could increase learning motivation. Therefore, opting for open source is in line with the mission of higher learning institutions (Kovalik & Hosler (2010 & Wilburt (1997). By incorporating the theories of learning and teaching strategies, *E-Headship* dship has succeeded in enticing and encouraging school administrators to further explore the function of ICT in education.

THE ATTITUDES IF EDUCATIONAL PREPARING STUDENTS WHO HAVE INTEL CERTIFICATE TOWARDS TRAINING CASE PROGRAM

Bilal Mohammad Diabat

Tafila Technical University - College of Educational Sciences

belal_deabat@yahoo.Com

Tel +965788229695 Tafila – Jordan

Abstract

This study aimed at recognizing the attitudes of educational preparing students who, have intel certificate following study questions: what are educational preparing students attitudes who have got intel course towards the training course program? Are there statistical differences at the level (= 0.05) in the means of teachers attitudes who Intel course towards the training course program due to scientific degree and teaching experience variables? the scale consisted of (40) items in order to make sure of the scale validity, the study instruments and the instrument as whole were calculated the study findings showed that teachers attitudes toward the training course program were in middle degree, also, the findings showed that, there were statistical differences in favor of (Bachelor) with mean (3.59), and experience years, in favor of (Less than 6 years) with mean of (3.79) the researcher recommended that teachers must follow modern electronic method in teaching.

Introduction

During the past two decades, electronic programs in the universal universities witnessed a wide spread because of the great successes in the combination of education technology and information technology as well as the development of the culture of community in the use of the Internet; such programs include Intel (education for the future) which help both teachers and students to get to know the potentials of science and technology in education; the program provides a comprehensive and flexible training course in which the teachers train other teachers regarding the ways of integrating technology into the daily lessons provided to their students; the program employs skills and integrates technology with curriculum to improve the way of teaching in the classroom to an advanced degree so that teaching starts using computerization and electronic learning-mail, which would give the students more opportunities in learning, develop and enrich their thinking skills and encourage them to analyze, create , discuss and interact with each other. Furthermore, the program helps teachers to acquire the proper planning of the future of students and the development of their learning through the use of more sources of knowledge and means of modern technology, which supports the job effectively through the use of the Internet, (Tokan, 2004).

The Problem of the Study

The problem of the current study comes from the reality of the Jordanian universities regarding the computerized projects such as education for the future project (Intel) which most students of educational qualification and university students trained on using. The researcher, a teacher of education technology, believes that there is a wide gap between the views and trends towards these programs which led to not achieving the objectives as required. the traditional methods of education are still used throughout the universities and schools of Jordan, as well as the fact that many devices and laboratories ,that have been processed for the purposes of e-learning, were consumed before being invested in a real way, or may have been used for other purposes, such as providing Internet services. Because of the fact that the human

factor is important in any job and because the researcher works in the field of e-learning, it was noted that there was a variation in the views of the trainees 'specially those educationally qualified regarding Intel, a modern program. There are some other reasons such as the confusion in our knowledge about the nature of individuals' trends to such programs, the belief of the researcher in the importance of knowing such positions, and the importance of the variables of training programs and trends, the researcher was eager to know and study the trends of the teachers who completed the Intel course and started the training course of the program, as well as the training and administrative obstacles they face during the program; therefore, the problem lies in the training and the trends towards it.

The Importance of the Study

The importance of the study lies in its being rare in the field of education in Jordan, which includes Intel, so it is possible that this study enriches the local educational literature in this field; furthermore the importance of this study comes from the fact that its findings might help the educational planners and officials in the Jordanian universities to know the reality of the training programs and the variables that might affect the teachers' trends toward those programs, which play an important role in letting teachers receive such trends. Also the importance of this research comes from its simultaneousness with the current attempts at the Jordanian universities to study the possibility of applying the programs of e-Learning and the fact that such topic has become the focus of professionals in the field of information technology and education in the Arab world being a feature of the Information Society, which is considered today an indication of the level of advancement and progress of countries. Finally, the importance of this study comes from paving the way for future researchers to conduct other field studies related to Intel in the light of other variables.

Procedural Definitions

Trend: the tendency of the individual towards positive or negative trends.
Intel: education for the future is a global program that helps teachers in employing technology in education in the classroom and enhancing students' learning. This program provides a comprehensive and flexible training course depending on the effectiveness of direct and practical training.
Students of educational qualification: teachers who have obtained Intel training certificates and designed computerized educational packages in the years 2009/2010; they are also qualified for the bachelor degree and diploma degree in Education.

Studies conducted in this area

Al-Majali (2009) conducted a study that aimed to investigate the effect of using Intel's package in teaching mathematics on the students of the ninth grade in the Directorate of Amman the fourth. This study has attempted to answer the following questions: What is the impact of using Intel's packages on the achievement of ninth grade students in the Directorate of Amman the fourth compared to the regular way? Are there statistically significant differences at the level of the statistical significance ($\alpha = 0.05$) in the means of the ninth grade students' grades due to the method of teaching?. Are there statistically significant differences at the level of statistical significance ($\alpha = 0.05$) in the means of the ninth grade students due to the interaction between the teaching method and gender? The results of the study showed statistically significant differences at ($\alpha = 0.05$) in the post-achievement between the students of the experimental and control groups due to the variable of the teaching method for the benefit of students using Intel's packages and the students' gender in favor of females. The study did not find any statistically significant differences at the significance level ($\alpha = 0.05$) due to the effect of the interaction between the teaching method and the gender of students and the study recommends conducting further studies and researches on the impact of e-learning on the students' achievements and trends towards the computerized educational materials.

Ateya (2009) also conducted a study that aimed to analyze the trends of graduate students in the Faculty of Educational Sciences at the Hashemite University towards e-learning applications, and recognize the effect of both the cumulative average and experience on the electronic courses. The study sample consisted of (70) male and female students from the Master's Program in the Faculty of Educational Sciences who have been randomly selected and a questionnaire has been used consisting of (44) items which was developed to assess the trends of students. The study results have revealed the presence of positive trends of graduate students in the Faculty of Educational Sciences towards e-learning

applications, while there were no statistically significant differences in the trends of graduate students towards e-learning applications due to the cumulative average and experience in the electronic courses. in light of the results of the research, some recommendations have been provided such as expanding the use of e-learning applications at the Hashemite University with the graduate students in particular being the future leaders of e-learning in the future and because of the fact that this type of learning is permanently renewed, which makes the students in touch with everything new in the world of e-learning.

Reason, Valadares & Slavkin, 2005 conducted a study comparing between the regular, compact and electronic methods of learning in terms of achievements and trends among the students of the Faculty of Economics. the study sample consisted of (403) students distributed to three groups, the first group conducted their studies by e-learning via the Internet, the second one conducted their studies in the regular way, and the third group conducted their studies by the integration between the method of e-learning and the regular way. The results showed that the achievement of the students of the third group was higher than that of the second and third groups; their trends were more positive, while the trends of the group which conducted their studies by e-learning were more positive than the one conducting their studies in the regular way.

Bark 2005 conducted a study that aimed at exploring the relationship between computer trends , frequency of use and the transmission of the impact of training on the various conditions of e-learning; the results have proven the effectiveness of various e-learning environments in creating positive trends towards technology ; the study has an important role in the transmission of the impact of training for learners.

Mark, Van't 2005 conducted a study that aimed to identify the impact of using hand-held technology on the teaching and learning of social studies for the pre-service teachers and investigate their future trends towards the integration of technology in teaching social studies. The study indicated to the effectiveness of using handheld computer technology in teaching social studies in secondary schools and the development of the trend towards the integration of technology in teaching social studies.

Methods and procedures

Community study

The study consisted of all the students of educational Diploma qualification in the various specialties of the faculty of educational science faculties at Mutah university and Al-Tafila Technical University, and the students registered in the first semester amounting (150) male and female students according to the data available from the departments of the universities for the academic year 2010/2011

The study sample

The study sample consisted of (100) students in the educational qualification who obtained (Intel) certificates towards the training program, who were randomly selected from the study community,

The Study Tool

The researcher designed the scale as a study tool to measure the trends of students of educational qualification who obtained Intel training certificates after returning to the books and the previous studies; the scale consisted of (55) items.

The ratification of the study instrument

The veracity of the tool has been checked by submitting it to a panel of judges consisting of (12) competent and experienced arbitrators from the members of the faculty at the University of Al-Tafileh, Mutah University, and the University of Jordan. According to the observations of the judges, the formation of some items has been modified in terms of construction and language; 15 items have been deleted; therefore, the scales consisted of (40) items.

The Reliability of the scale trends

To ensure the stability of the scale, the researcher applied it on a sample outside the study sample consisting of (45) male and female students with a two-week interval between the first and the second application. Pearson correlation coefficient was calculated between the results of the two applications of

the scale which was (0.88), and Cronbach alpha's reliability coefficient was also calculated , which was (0.86).

The study variables

The study included the following variables:
First: the independent variables
Degree: It has two levels: (diploma, BS).
Number of years of academic experience: It has two levels: (less than 6 years, 6 years and over).
Second: the dependent variable:
It represents the trends of the students of the educational qualification who obtained Intel certificates towards the training package; it is expressed as arithmetic means for the estimates of the study sample of the items of the trends scale, which was designed for this study.

Results and discussions

First: the Results of the study questions:
The first question: What are the trends of students of the educational qualification who obtained Intel certificates towards the training program?
To answer this question, we have calculated the means and the standard deviations of the entire study tool and the tool as a whole and applied One Sample T-test on the tool as a whole; table (2) explains this.

Table (2)
The arithmetic means and the standard deviations for all the items of the study tool and the tool as a whole (n = 100)

Number	item	arithmetic mean	standard deviation	level	Evaluation degree
1	The training package provided me with high technical skills	3.71	1.17	11	high
2	Education via multimedia takes into account the individual differences among students	3.64	1.11	14	Medium
3	I feel that the training package does not give me the strength to think and reason	3.39	1.09	25	Medium
4	the objectives of the training package express the actual needs of students	2.76	1.21	39	Medium
5	I prefer getting information through the internet and not from books and studies.	3.64	1.04	14	Medium
6	the lectures via the training package encourage students to use critical thinking processes	3.98	1.21	5	high
7	I feel tired during teaching via the training package	3.38	1.06	26	Medium
8	I find it difficult to provide the capabilities and the technical equipments for e-learning.	3.33	1.15	29	Medium
9	The goals of the training package are clear and specific to the trainees from the beginning.	3.91	1.05	9	high
10	the training package training is able to arouse my curiosity care	3.87	1.03	10	high
11	The training package helps to acquire various teaching skills for the presented concepts.	4.35	0.93	1	high
12	I think that the training package has opened the way for students to train for using the computer and acquire its skills.	2.77	1.24	38	Medium
13	time runs quick during the study through the training package	3.50	1.23	21	Medium
14	I hate the use of computerized educational software in learning because it weakens the relationship between the teacher and the student.	3.12	1.29	33	Medium
15	the training package needs high teaching skills	3.51	1.14	19	Medium
16	I feel that the training package is a waste of time and effort in the teaching processes.	3.22	1.35	32	Medium
17	I think that learning via multimedia encourages the development of the spirit of collective cooperation and increases familiarity among students.	3.41	1.05	23	Medium

18	I think that the training package enabled me to learn a lot of information in a short time.	3.35	1.25	28	Medium
19	How nice it would be that teachers benefit from the training package method in their teaching.	3.07	1.30	35	Medium
20	I think that the use of multimedia would be one of the best and effective methods of teaching.	3.25	1.25	31	Medium
21	The use of the training package prompts worry and lack of attention.	3.51	1.18	19	Medium
22	The training package increased my interest in the courses that I teach.	3.97	1.13	7	high
23	I think that the training package works on raising mental thinking among students.	4.05	1.11	3	high
24	The use of advanced scientific means in education has a positive impact on the education of students and their academic achievement.	3.65	1.02	13	Medium
25	I guide students through multimedia such as the computer and the Internet.	3.36	1.07	27	Medium
26	I have difficulty in teaching the lectures to the students via multimedia.	4.11	0.94	2	high
27	I vary in the teaching methods between the traditional learning and multimedia.	3.55	1.22	17	Medium
28	I think that the distribution of the days on the units was inappropriate.	3.26	1.24	30	Medium
29	I think that the training package helps to dispense with the printed sources significantly.	3.98	1.09	5	high
30	I think that the Encyclopedia of photos, graphics, shapes, and sounds was inadequate for the purpose.	3.71	1.27	12	high
31	I think that the trainee faced difficulties during using the cds attached with the training material.	3.40	1.13	24	Medium
32	I think that the training package might have contained adequate educational techniques and sources.	2.96	1.15	37	Medium
33	I find difficulty in translating the samples related to the computerized learning package when dealing with the training package.	3.63	1.11	16	Medium
34	I think that the content of the training package cannot be applied to all of our school courses.	3.47	1.26	22	Medium
35	I think that the student sample in the training package has increased the ability of students in the preparation of reports and researches.	3.10	1.13	34	Medium
36	I think that the Websites contained within the training package commensurate with the age of students targeted	2.60	1.11	40	Medium
37	I think that the Office software used in the training package commensurate with the modernity of the content of the training package	3.94	1.20	8	high
38	I believe that the training package is presented in sequence and logic.	3.52	1.15	18	Medium
39	I believe that the training package had given the trainee the adequate capacity for the design of computerized teaching package.	4.00	0.95	4	high
40	I think that Intel is the perfect solution to the various issues of teaching.	3.02	1.22	36	Medium
The tool as a whole / the trends of the students of the educational qualification who obtained Intel towards the program of the training course.		3.50	0.62		Medium

It appears from Table (2) that the arithmetic means of the trends of the educational qualification students holding Intel towards the training course program are between (2.60-4.35); the highest was for the item " the training package helps to acquire the various skills of teaching the presented concepts", while the lowest was for the item "I think that the Websites contained within the training package commensurate with the age of the students targeted", and the arithmetic mean of the tool as a whole was (3.50) with a medium degree.

Table (3)
The results of applying One Sample T-test on the tool as a whole (n = 100)

Field	arithmetic mean	standard deviation	T	freedom degrees	statistical significance
the tool as a whole / the trends of	3.50	0.62	8.036	99	0.00

the educational qualification students holding Intel towards the course training program					

Table 3 shows that there is an intermediate level for the trends of educational qualification students holding Intel towards the course training program; the arithmetic mean of the tool as a whole was (3.50) with a medium degree and the value of (T) of the tool as a whole was (8.036), which is a statistically significant value at the significance level (α = 0.05); this indicates the existence of a statistical significance for the trends of the educational qualification students holding Intel towards the course training program. The researcher attributes that the medium trends of the students towards the training program of the course might be due to the variables of positions: time, preoccupation with work, attending lectures frequently, as well as the fact that both the teacher and the student were not fully ready to use the program in a way that gives the true image of the program in order to form a positive direction.

II: the results of the study questions:

The second question: Are there any statistically significant differences at (α= 0.05) in the means of the trends of the teachers holding Intel towards the course training program due to any of the following variables: Degree and teaching experience?

To answer this question, we have applied Independent Samples T-Test on the tool as a whole according to the scientific degree and the teaching experience. Table (5) explains this.

Table (5)

The results of applying Independent Samples T-Test on the tool as a whole according to the scientific degree and the teaching experience.

Variable	level	arithmetic mean	standard deviation	T	statistical significance
scientific degree	Diploma	2.98	0.54	3.74	0.000
	BA	3.59	0.59		
Number of years of academic experience	less than 6 years	3.79	0.43	5.05	0.00
	6 years and above	3.23	0.65		

Ttable (5) shows the presence of statistically significant differences (α= 0.05) between the arithmetic means of the trends of teachers holding Intel towards the course training program due to the scientific degree; the value of (T) was (3.74), which is a statistically significant value at the significance level (α = 0.05), for the benefit of academic qualification (BA) with an arithmetic mean of (3.59), while the arithmetic mean of the scientific qualification (diploma) was (2.98). The researcher attributed this result to the presence of the averages of the bachelor degree being the most distinguished degree and experience giving more opportunities for the program to be distinguishable from the other qualification, diploma.

Ttable (5) shows the existence of statistically significant differences at (α= 0.05) between the arithmetic means of the trends of the teachers holding Intel towards the course training program due to the number of years of academic experience; the value of (T) was (5.05), a statistically significant value at the significance level (α = 0.05) for the benefit of the period of experience (less than 6 years) with (3.79) as an arithmetic mean, while the arithmetic mean of the period of experience (6 years and above) was (3.23). The researcher attributed this result with the fact that the less experienced teacher is more willing and at work, which led to the development of capacities in order to reach to a technical level appropriate to the academic expertise.

Recommendations

1 – the importance of using modern electronic methods of teaching by teachers and activating the role of technology in the institutions of higher education.

2 - Working on holding educational workshops and training programs for e-learning in the institutions of higher education

THE BUSINESS COMMUNICATION COURSE AND THE MOODLE FRAMEWORK SYSTEM

Experiences at the Budapest Business School, College of International Management and Business (Hungary)
Edina Kriskó
krisko.edina@kkfk.bgf.hu

Abstract: In my presentation I will argue that the use of learning content management systems is also justified in full-time education, especially in business education and communication studies. Nowadays not only multinational companies, but domestic medium enterprises also manage the training of new employees and existing staff with LCMSs. Companies in Hungary's financial sector are cutting edge in the development of electronic learning objects, and base employees' training on these new technologies. That is why it is extremely important for students to get acquainted with learning management systems and other web-based applications as tools that support the learning process and also as sites of communication. I will present the business communication Moodle course, which was introduced to international business and commerce and marketing studies in the 2010/2011 academic year. I want to present the wide range of web2.0 applications that can be used to explore the fields of business communication.

Keywords: LCMS, e-learning, business communication, user tracking

Introduction

Today, when our students (as well as our colleagues) spend a significant proportion of their spare time on Facebook and similar networking sites and virtual communities, communication cultures and expectations in the workplace also seem to be changing. (More than half of the Hungarian Internet users between 18 and 64 enter at least one networking site - iWiW, Facebook, Myspace, Twitter etc. – each day according to domestic surveys. www.technet.hu) Professional blogs, analyses, audio and video commentaries published on the Internet (message boards, profile pages, photo, file and other content sharing sites) have by now become part of business communication, and consultations can also be held online in education. However, when our students are asked if they know what web 2.0 means or what is behind the expression semantic web, we invariably get negative answers. Therefore it seems necessary to set some concepts, phenomena and applied tools straight, even within the sometimes rather narrow frames of subject curricula. The business communication course offers a good opportunity for this. Its perspective as well as its content (curriculum) enables it to follow technological changes felxibly, and the innovations of social and new media can be presented at the attendance courses and alongside them. The question is whether the institutions and the students are open to receive this, and how well the instructors themselves are prepared for it.

Teachers

As regards the skills of teachers, the National Institute of Vocational and Adult Education has provided accredited in-service teacher training programs related to e-learning for years, under titles like „E-learning, „The School of the Future", „From Synopsis to E-learning curricula", „E-textbook – developing electronic curricula in the framework system", etc. (https://www.nive.hu) (The author of the present paper also participated in such training courses.) However, no imperative other than their self-imposed professional standards and motivation is in force as yet in domestic practice to incite teachers to participate in these programs. (The new act on public education and act on higher education, the model for teachers' careers, as well as the principles of quality assurance are currently being outlined as part of the reform measures of the second Orbán government that came into office last year. The plans are as yet subject to heated debates, and they are also rejected by the Teachers' Union.)
The composition of the teaching staff in the institution in question (Budapest Business School, College of International Management and Business – BGF KKK) is also relevant to our theme; it is summed up in the following table:

	2008	2009	2010
Holds academic degree	32%	36%	37%
30 years old or younger	4%	3%	2%
31-45 years old	30%	35%	39%
46-54 years old	21%	20%	17%
55-62 years old	33%	30%	31%
older than 62	12%	14%	14%

Table 1: Age of instructors and proportion of instructors holding an academic degree
(Source: Supplements No. 4.1 of the yearly reports of BGF KKK for 2008, 2009 and 2010)

The table shows that similarly to other universities and colleges, the age group in which the educational activities were definitely not accompanied by the use of computers from the beginning is represented at around 62-66%. They were the ones from whom the appearance of web technologies demanded the greatest shift in attitudes and equipment use. Their age, on the other hand, may also give rise to certain concerns regarding the issue of replacement.

Students

We do not doubt that our students are open to everything new, although we sometimes get a distressing picture of their motivation and diligence. For example, it is not clear why they try to catch up with a whole semester's study during the 1-2 days before the exams instead of continuous learning. (This is what we can conclude from teachers' accounts, our own teaching experiences and, as we shall see later, the course statistics available in the framework system. See also Kriskó, 2011 on this topic) It is not clear why they claim that they are not familiar with the framework system, wen it is built up of tools and modules they already know from other computer applications.

Participants of the study were groups of first year full time students of international management, commerce and marketing. Most of them were first degree students who took the given course for the first time. There was a total of 6 seminar groups with some 30 students each. Due to the limited length of the present paper, I will concentrate on the business communication course of the international management program in this lecture, and will only present data from the commerce and marketing program as a basis of comparison where this seems relevant.

The Business Communication Course

The subject taught is business communication, which consists of a theoretical lecture series and a seminar course. Both the practical and the theoretical courses take place in two hours biweekly. (The teacher of the theoretical subject and the seminars is not necessarily the same person.) The aim of the subject is to acquaint students with the basic know-how and knacks with which they will be able to communicate adequately in the wide-ranging field of business life.

To this end, all we need to do is involve students in communication, in the traditional as well as in the virtual classroom. If we take the interactive view of communication (namely, that it proceeds towards something and has a definite end, and every participant has to make an effort in order to achieve the common goal) as a starting point, we can witness a fortunate encounter of the subject and the method under the aegis of web2.0. The primary aim of the course is to convey to the students the message that „[…] in order to profit more from the knowledge base of a community, first of all you have to be an active participant of the community in question." „[…] the more you read and write, share and communicate, the more the opportunities that are close to you will find you." (Kulcsár, 2008, no page number)

Interactivity in terms of communication

To stay on the field of communication, my courses can probably be most easily described in Newcomb's interactive model (Newcomb, 1966), as communicative acts in which we communicate as A (teacher) and B (students) about X (communication, business communication), and we mutually orient to each other and the topic (X) as well. In the system of group exercises, all this means that students produce and experience the same communicative acts within the groups, and the group exercise will be the reflection of some state of balance within the group. Their solutions will reflect that they acquire knowledge about each other during the work, and also about X (communication) and other Bs (who assume the roles of A' or A'B in the new models), and their attitudes towards the Bs and X also change. All this results in a multiple coorientation network, and leads to what the literature defines as networked learning. The latter is a process in which the informal, networked exchange of information supported by electronic facilities (LCMSs) dominates, and which turns learning into a networked process, where the students also learn from their peers. (Bessenyei, 2007)

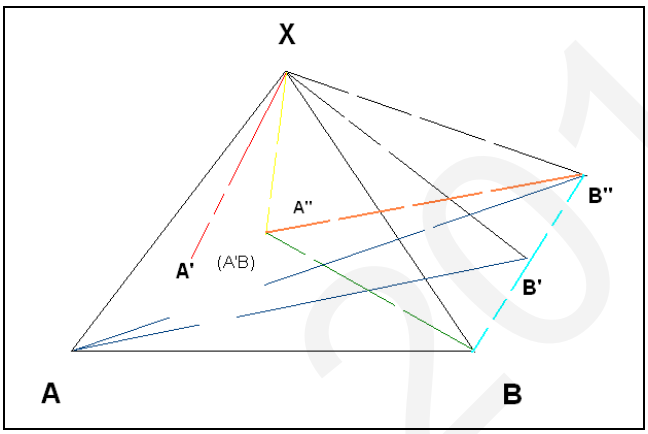

Figure 1: The extension of Newcomb' model for communication during a course
(image created by the author)

As a teacher, I aim to focus on what I can add to this, so that the Bs develop positive attitudes with respect to X (communication), and aim to incite them for further study, even if this will not be manifested right there and then or during the course, only years later in their professional practice. If being open to others and being oriented on a subject together happens at a sie like the LCMS, the returns are twofold. It leads us to a site which is not included in classical business communication textbooks as yet, the systematic analysis of which is ongoing, and the experience has the power to increase the credit of group communication, group thinking and Web 2.0. All of this is implemented with a method that employs the current paraphernalia of business life, and integrates them in the learning process. Thus blogs, the e-portfolio, the time band, the message board and all the other applications help update our whole set of business communication tools (up to the point of video conferences).

To all those who ask about the areas of pedagogy and IT, I would say that I am thinking in terms of the first step of connectivism. My attempts aim to make the Internet and virtual spaces part of our everyday lives, sometimes even against institutional powers that withhold us, and to find a place for group work that is not subject to simultaneous physical presence among our acts of communication and our sites, while our theme is business communication all the time.

Reasons for using Moodle

The framework system developed in New Zealand is fairly widespread worldwide, and has been one of the most popular in Hungary, too for several years. (There are 50519 registered Moodle pages in 211 countries and 266 in Hungary - http://moodle.org/sites/, download: 03.21.2010. 13:46h) „Moodle is an open source program package that enables the complex implementation of learning and teaching by the provision of a learning environment." (http://docs.moodle.org/hu/A_Moodle) It is practically an LMS also equipped with Web2.0 applications.

It was introduced at the BGF KKK in the year 2009 as a pilot project, upon the initiative of technical language instructors. The first users were the staff of the German language department, who primarily used it to publish language placement tests. The use of functions supporting learning, editing curricula

and group work has become prevalent by now, but the faculty is still in the phase of the initial steps. The system has 5163 users and 33 courses are available, which is a significant number if we consider the fact that the faculty does not offer distance education. However, the high number of users is misleading in that every active student of the department has been given a user account, but not everyone has an active course to take as yet, due to the small number of courses. For the time being, there is no full scale course management within the system.

Business Communication subject curriculum

In the following section I present the structure of the business communication course provided in the programs of commerce and marketing and international management. The subject has different contents in these two programs, one reason for which is administrative: the two subjects are managed by different departments (Department of Applied Communication and Department of Social Communication), and, on the other hand, the programs situate the subject in different curricular networks. Therefore in the following section I present the teacher's conception and the first results (not analysed in detail so far) through the course offered to students of international studies.

The major themes are: 1.) Organisational culture and behavior, 2.) Job application, CV, interview 3.) Internal communication, negotiation, meeting, 4.) Written communication, writing tools, 5.) Decision making in a group 5.) Organisational communication, mass communication.

Students engage in group work throughout the semester, and are given written assignments to be submitted at the end of each class. After the first three group exercises – that is, after six weeks' time – they receive a written evaluation of their performance through Moodle, broken down by the individual chapters of the curriculum. On the last occasion, they give group presentations of their work during the semester.

Curriculum elements in the Business Communication course

In the case of the seminar, there was no traditional, paper based material among the compulsory readings. A textbook available in electronic form was included (Béla Buda: *A közvetlen emberi kommunikáció szabályszerűségei*), and a Power Point summary (based on different textbooks) was compiled for each topic. References were included on the slides in each topic to encourage participants for further research and reading. Any aids that offer specific guidance or secure subsequent control for elaborating the group exercises during class are available as a website in Moodle. In addition to the above, test questions and a mini self-check (10-question true or false) test offer support to preparation, and a teachers' blog has also been avilable since spring. Students have been informed about the existence of the former in a message sent through the Neptun system in each course, and its availability has also been demonstrated during class.

The blog has a double function: on one hand, it enables the presentation and sharing of spontaneous assignments during class, which are based on relevant current events of public life (Fukusima and the nuclear emergency, or what are the major principles of crisis communication), on the other hand, assignments are offered for marks, in order to help students apply what they have learned in real life situations. (What is the difference between a statement made in a live radio program by an executive of the Hungarian Television on the program policies of the channel, and the same person publishing preliminary plans ahead of time in his professional blog, and this leads to dismissal? Does the director of the Festival Orchesrta criticise the work of the government in an interview given to a foreign paper as a private person?) It would be important to develop critical thinking in students.

Among the above elements, it was the blog from which I was expecting a breakthrough, because it was the one that secured the widest frames for the study of communication phenomena and the initiation of dialogues. Theoretical considerations can be made more colourful by multimedia elements, and as this ensures a more informal tone, humour and irony also have a place here. Individual themes are meant to illustrate that what we talk about during the sessions is very human, everyday, subjective, manipulable, and any related knowledge can be used to our own ends.

Experiences in the Business Communication course of autumn 2010/11

The following diagram is meant to demonstrate that most students only entered the course on the eve of the final test of the semester, and this was when they reviewed the material and aids uploaded there or read the detailed description of requirements or skimmed through the compulsory and recommended reading list. One might say that there was no activity in the Moodle course before that. 8 students from the 30-member group did not visit the Moodle course at all. The average time spent in the system was 10.4 minutes. The attendance sessions also resembled lectures rather than seminars. It was difficult to

initiate dialogue, there were no questions that catalysed the debate. There was not a single forum comment or response (except for the teacher's comments on the requirements, recommended literature, links and other relevant issues). Not one student began to compile an e-portfolio, and not one participant of the course started a blog.
This was when the idea of group work was raised, and the necessity of active tutoring was admitted. This gave rise to the rethinking of the whole conception, aiming to generate active participation by students through the combination of the interactive view and Web2.0.

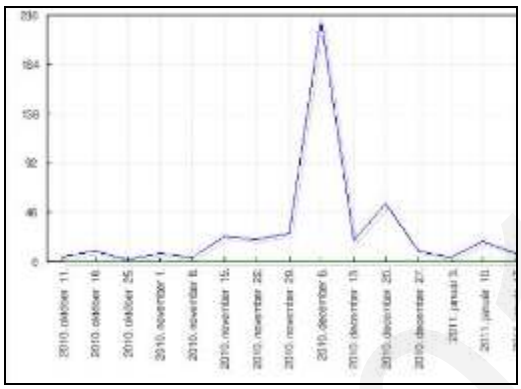

Figure 2: Student activity in the autumn course
(Source: http://moodle.kkfk.bgf.hu/)

Experiences in the Business Communication course of spring 2010/11
The academic year is still on at the time of writing, 3 weeks are left from the term time, but the available data already point to some progress towards dialogue-based work. As opposed to the previous semester, more than half of the students logged in to the system and entered the course after the first contact hour. The rate of viewing each element of the curriculum varies widely between 12 and 90%. The only item visited frequently in every course is the Job search and Job Interview Encyclopedia created in a Wiki format (a visiting rate of 180% with respect to active course members).
The first steps of the realisation of the teacher's intention are seen in the G7 group (top right diagram of Figure3), with a continuous activity around 20. (Unfortunately, this also reflects the extent of student interest experienced at the attendance sessions.) As a comparison: attendance at the course varies around 3 and 5 per cent in the marketing program.

Figure 3: The activity of the 3 spring groups (G5, G6, G7)
(Source: http://moodle.kkfk.bgf.hu/)

However, the number of views for course elements was 1.5-2 times higher than it was in the previous semester, calculated for the corresponding period of time. This is most striking in group G6. The average amount of time spent in the system is expected to be as high as 20 minutes/person – due to the fact that students still only use Moodle for downloading course material most of the time
It remains a question whether stronger and more compulsive methods should be used for promoting the use of electronic facilities (e.g. compulsory exercises to be submitted through the framework system, on a weekly or be-weekly basis), as the amount of course material required in this subject is small. It would be much more important to see interpersonal dynamics, processes and states in practice, and to get to know students' own set of communication tools in vivo and extend them to web-based tools that also enable group work from the distance.

Summary

We have found data (course journals and personal activity lists) supporting the finding that we hold our classes to 4-6 students per group, which is reinforced by the personal feedback by other teachers on their experiences at attendance sessions. Naturally, this is enough to generate tractive force in each group, but does not secure permanent participation by each course member. A positive reading could be that students have first-hand experience of the difficulty of work organisation, and face the burden that slackers constitute, as well as the difficulties of motivation and engagement, but the concerns we are faced with in the phase of evaluation are twofold. It is difficult to separate the reward of work inside and outside the classroom if we evaluate the work itslef and not the process. If the submitted work is evaluated favourably thanks to the most diligent and most apt group members, everyone can equally take part in the success. This is realistic, but it will cause a tension between aptitude in the subject and the mark received in many cases.
There are, however, some positive returns as well. The atmosphere of the attendance sessions and the standards of the submitted works have improved, the jointly prepared assignments are more professionally adequate and comprehensive than individual students' works have been or used to be. Students have learned to think in a group, and as a result of the themes discussed, they are more reflexive on their participation and the biases within the group. Also, more questions are raised at the attendance sessions. Apart from a few exceptions, if a group member misses a meeting, he or she asks for an extra assignment, so they will not make the impression of taking a smaller part in the group work.
In sum, we can say that this chosen track has made the subject that students had been averse to more popular, it initiated a dialogue, and finally created a distance from the teacher's style at the attendance sessions and made them more like an event of joint thinking characterising seminar work. Even if at a less profound level, they acquired some experience on the operation of framework systems, and gained an insight into the view of electronic learning and teaching, which has been gaining ground extensively. They have approached Facebook more consciusly as a site of communication, as a tool for self-management and civil will formation. This is a good preparation for their studies in (online) marketing next year.

The Development Model of Knowledge Management Via Web-Based Learning to Enhance Pre-Service Teacher's Competency

Nattaphon RAMPAI
Educational Technology Department, Faculty of Education, Kasetsart University, Thailand
n_rampai@hotmail.com

Assoc. Prof. Dr. Saroch SOPEERAK
Educational Technology Department, Faculty of Education, Kasetsart University, Thailand
sarochap@yahoo.com

Abstract: This research explores that the model of knowledge management and web technology for teachers' professional development as well as its impact in the classroom on learning and teaching, especially in pre-service teacher's competency and practices that refer to knowledge creating, analyzing, nurturing, disseminating, and optimizing process as part of the learning quality improvements. In this process, web technology particular web-based learning has a necessary role to drive and integrate knowledge and learning activities within the knowledge management process (I-Can do model). In this respect, this research aims to study and develop the appropriate model of knowledge management via web-based learning by the 18 expert's consensus and evaluate competency of the 64 pre-service teachers that divide and random assignment into 2 equal groups (control and experimental group). The competency assessment tools are conducted the volunteer participants' competency particularly in knowledge, attitude, and skills approach. The research results exhibited that the model of knowledge management via web-based learning was appropriated and enhanced the pre-service teacher's competency.

Keywords: Knowledge Management (KM), Web-based learning (WBL), Competency.

Introduction

Teacher quality is the top contributing factor to student achievement. Quality ongoing professional development contributes to teacher growth and success. The need for professional development that can meet today's educators' demanding schedules, that uses quality content and resources that are available to teachers from any place and any time, and that can deliver relevant, accessible, and ongoing support has stimulated the development of online teacher professional development programs. Online teacher professional development programs make it possible for educators to communicate, share knowledge and resources, and reflect via asynchronous interactions. Moreover, Chai (2010) suggest that the many current ICT-supported reform efforts demand teachers to assume the role of epistemic facilitator of knowledge construction supported by technology. In addition, Koc and Bakir (2010) explored the characteristics of such technology training programs were discussed to help pre-service teachers learn how to use technologies as instructional tools to enhance their teaching and students` learning. The condition of education in Thailand today still has several problems. Especially, the quality of teachers seems shortages (Secretariat of the Council of Education, 2010: 53). Along with the lack of pedagogy training that is not match in the actual practical needs for schools (Keawdang, 2009: 131). Likewise, the competency problems effect on operations of teachers and learners (Ratchatavipasnant, 2009). Particularly, the lack of the good knowledge management let the opportunity to

exchange and share knowledge is decreased between them and focuses on the upstream of training from real situations process (Dejakoop and Khangkhan, 2008) furthermore, Lee, et al (2010) have suggests that the common difficulties and limitations regarding the implementation of knowledge management into schools' organizational cultures are reviewed and discussed. In addition, Erkunt (2010) exhibited that students' collective inquiry relied on socially distributed cognitive resources that were generated by their social interactions in class and online using technology. The concept of web-based learning that based on the appropriate tool and the medium to deliver knowledge, and helps learners can communicated with each other (Catherall, 2008) especially in teaching and learning using the potential of internet network to access with various sources of learning (Speranza, 2008). The main purpose of this study is to research and develop activities to be appropriate with the learners that integrated with the concept of knowledge management and web technology. The question then becomes, "How to develop the appropriate model of knowledge management via web-based learning to enhance pre-service teacher's competency". The expected benefits are the appropriate model that is the systematic approach to enhance pre-service teacher's training. More over the results of quality assessment of model that is body of knowledge to develop the pre-service teacher's curriculum. In addition the results of pre-service teacher's competency assessment by using the knowledge management model via web-based learning that are information to support the educational systems policy maker.

The Study

The first phase: Studying the model of knowledge management via web-based learning to enhance pre-service teacher's competency.

1. Analyzing the elements of knowledge management (KM) are included the knowledge management activities: Creating (Explore and Capture), Analyzing (Identify and Organize), Nurturing (Utilize and Demonstrate), Disseminating (Transfer and Diffuse), and Optimizing (Evaluate and Improve)

2. Analyzing the elements of web-based learning (WBL) are included the elements of web-based learning (instruction, interaction, and internet) and web technology (collaboration, communication, and storage technology).

3. Analyzing the elements of competency (Knowledge, Attitude, and Skill approach).

4. Integrating the elements of knowledge management, web-based learning and competency.

The second phase: Developing the model of knowledge management via web-based learning to enhance pre-service teacher's competency and competency assessment tools.

1. Developing the model of knowledge management via web-based learning.

2. Developing the competency assessment tools that include the achievement test, attitude test, and performance test.

3. Developing the efficacy of the model of knowledge management via web-based learning to enhance pre-service teacher's competency.

The third phase: Evaluating the model of knowledge management via web-based learning to enhance pre-service teacher's competency.

1. Research design by following the Two-Group Posttest Only Design.

2. Population and samples:

2.1 Population are the first year pre-service teachers who study in 2ndsemester, 2010 academic year at faculty of Education, Chandrakasem Rajabhat University, Thailand.

2.2 Samples are random sampling the 64 pre-service teachers that divided into 2 groups: The first group is 32 peoples for experimental group and the other group is 32 peoples for control group.

3. Research tools:

3.1 The model of knowledge management via web-based learning.

3.2 The competency assessment tools (knowledge test, attitude test, and performance test).

4. Data analysis:

4.1 Descriptive statistics ($\bar{x}$ and S.D.) are used to describe the basic features of the data.

4.2 Inferential statistics (t-test with independent sample) are used to compare the data between control and experimental group.

Findings

1. The model of knowledge management via web-based learning to enhance pre-service teacher's competency — I-Cando model was appropriated with the 18 expert's consensus.

1.1 Input step: comprise that the elements of web-based learning (Instruction, Interaction, and Internet: I^3) and web technology (1.Collaboration technology: Wikis, Blogs, Forum, Peer review. 2. Communication technology: Skype, Presenter, Twitter, SLOODLE. 3. Storage technology: YouTube, Data mining, Mind Map) — I^3 - WBL (Figure 1)

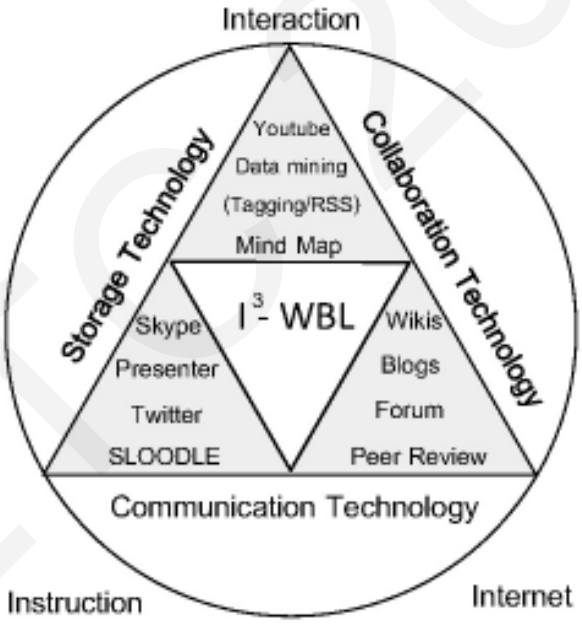

Figure 1: The elements of web-based learning and web technology— I^3 – WBL

1.2 Process step: comprise that the elements of knowledge management (KM) are include the knowledge management activities: Creating (Explore and Capture) is driven by Benchmarking: B_1 activity, Analyzing (Identify and Organize) is driven by Communities of Interest: C_1 activity, Nurturing (Utilize and Demonstrate) is driven by After Action Review: A-A-R activity, Disseminating (Transfer and Diffuse) is driven by Communities of Practice: C_2 activity, and Optimizing (Evaluate and Improve) is driven by Best Practice: B_2 activity — I-Can do model (Figure 2).

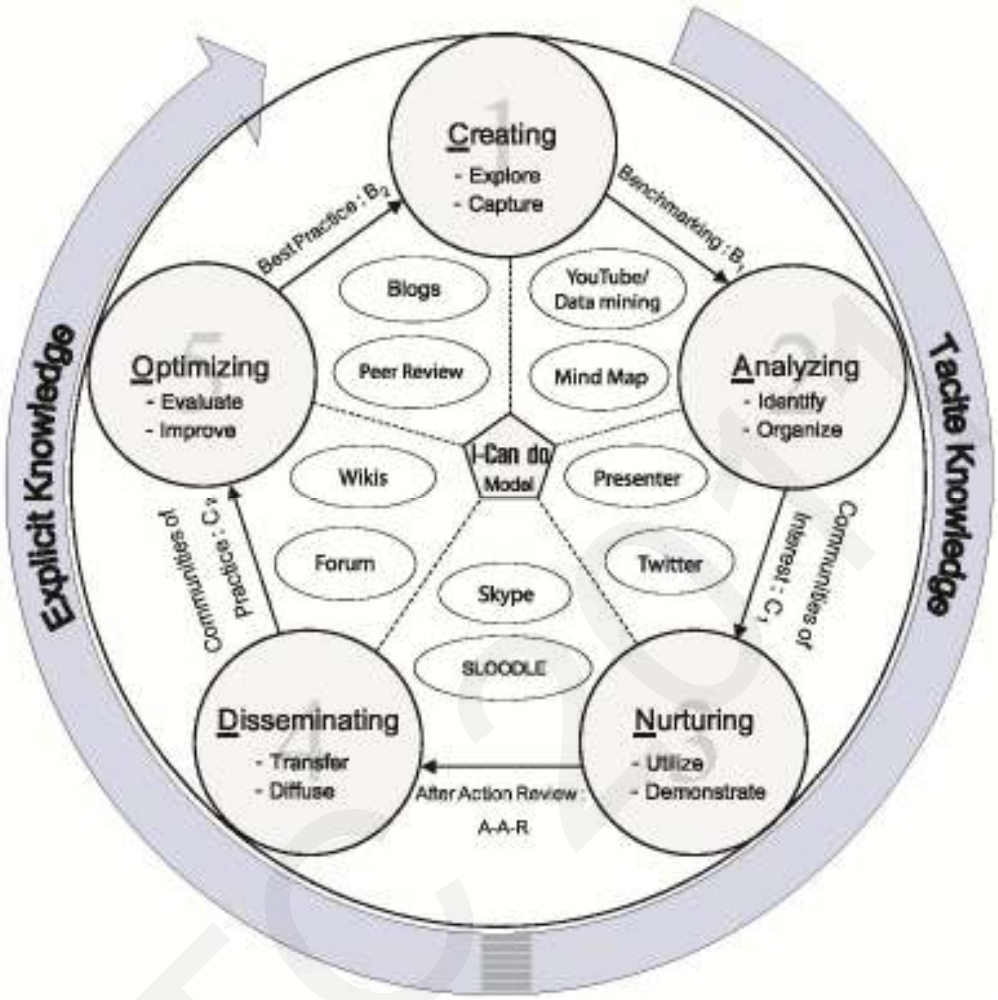

Figure 2: The elements of knowledge management process— I-Can do model

1.3 Output step: comprise that the elements of competency (Knowledge, Attitude, and Skill— KAS approach) and evaluate by Knowledge, Attitude, and Performance assessment (Figure 3).

Figure 3: The elements of competency— KAS approach

2. The efficacy of knowledge management via web-based learning model was appropriated with the volunteer participants' competency (E1 / E2 = 86.23/85.33) that accord with the efficacy criteria of web-based learning (85/ 85 Standard) (Brahmawong, 2002; Whattananarong, 2004) (Table 2).

Table 3: Comparison of competency assessment (control and experimental group)

Conclusions

The research results exhibited that the model of knowledge management via web-based learning was appropriated and enhanced the pre-service teacher's competency. Norbert Pachler, et al (2010) have suggests that teachers' participation in online communities exists in complex interrelationship with other learning practices, only some of which use technology. Collaborative professional development involves the use of technologies for the sharing of experiences and artifacts within and across schools as a basis for critical reflection on pedagogy. Developing and sustaining an effective online learning community can be challenging even in the midst of an era of much technological advancement. More over developing and sustaining an effective large-scale online community is even more challenging. As online teacher professional development is an emerging trend it is still a "new frontier." Educators around the world experience many demands on their knowledge, time, and professional development (Zygouris-Coe and Swan, 2010). In addition, professional development has mainly centered on training processes that involve updating knowledge, yet it has made little headway as a construct that includes both the professional and personal characteristics and working conditions. It has also focused more on developing training program than on analyzing the tools for continuous training (Gairín-Sallán and Rodríguez-Gómez, 2010). Finally, online learning technologies have the potential to transform the professional development of teachers; penetrate cultural, discipline, and other barriers; bring educators together to learn, share successes and challenges; and co-construct and transfer learning.

ABSTRACT

One obstacle to industrial technology education is that the difficulties or problems students encounter during experiments are not easy to detect. Students are often unaware of their flaws, and some will not notify the teacher of these flaws even if they are aware of them. Consequently, many opportunities to rectify these flaws and improve teaching methods are lost, and students who are falling behind are deprived of instant guidance and cannot catch up. Therefore, this paper aims to develop a web-based self-reflective learning system to enhance students' learning of industrial technology.

This study applied sensor network technology to develop a web-based self-reflective learning system based on a self-reflective learning approach. The system was integrated into a MEMS technology course for empirical study. Subsequently, the influence of the web-based self-reflective learning system on students' learning performance and technical skills was investigated. Analysis of the data obtained from learning cognition, skill assessment, and learning satisfaction following education indicated that the web-based self-reflective learning system could effectively improve the learning performance of students falling behind, thereby allowing these students to catch up in their cognitive and skill achievements by the end of the semester.

INTRODUCTION

Dewey (1933) was the first scholar to propose the concept of reflection, which he defined as the behavior of repeated thinking and searching upon encountering problems; combined with observations of the surrounding environment, understanding of the causal relationship stimulates deeper thinking. Kemmis (1985) believed that reflection was a process of internal and external dialectics. Through reflection, individuals can increase comprehension of their own thinking process. Reflection is a psychological activity that extracts and forms meaning from experience, which contributes to reorganizing and restructuring perceptions. This further enables gained knowledge to become refined and differentiated gradually. Consequently, this study considers reflection distinctive from thinking. Reflection is the process of integrating experience or past perception with newly received perspectives before further internalization into personal knowledge. Therefore, reflection is thinking with the additional components of reflection and action. Paris and Ayres (1994) pointed out that reflective thinking motivates students to learn; applying strategies to accomplish specific objectives is very useful. Reflection may occur before or after the action, which indicates that personal knowledge is progressively formulated during actual working action. Regarding the relationship between personal action and reflection, Elliott (1991) stated that reflection originates from action, which suggests that reflection is generated from collected information during personal action. From a teaching perspective, Schon (1983) divided reflection into two major frameworks: reflection-on-action and reflection-in-action. Reflection-on-action indicates that reflection occurs in the interval after teaching and before planning and thinking. Reflection-in-action is an attempt to adjust personal teaching and deal with responses during the process of teaching. Carver and Scheier (1998) identified self-reflection as individual survey, evaluation, and comprehension of personal thoughts, feelings, behavior, and self-awareness. Davis (2000) requested learners perform self-reflection during the process of learning; the action of reflection allowed the learners to re-survey, test, and modify existing thoughts and knowledge, which further achieved improved and more structured comprehension. Costa and Kallick (2000) believed that students who could conduct self-reflection were more able to gain cognitive structure among teachers and classmates as they had a clearer understanding of their own steps in reasoning.

Paris and Ayres (1994) suggested that applying learning portfolios and authentic assessment could effectively induce reflective learning. The creation of learning portfolios is a continuous process from the beginning to the end of the learning activity. Prior portfolios can provide learners with a reference for

reflection, allowing the learners to focus their reflection on the learning objectives. This approach is more effective and directional. E-portfolios are primarily a development of traditional portfolios, and only secondarily result from the process of digitizing; data that are collected, stored, and managed digitally before being placed on webpages are called web-based portfolios. The main functions of the web-based student portfolio system developed by Younes (2004) were storage, display, and reflection of students' learning processes from admission to graduation. In the structured web-based portfolio assessment system established by Chang (2008), one of the functions was composition and assessment of reflection. This system provided students with a reflection outline for them to compose their reflections; the teacher assessed the compositions and responded with feedback. Students could assess their own reflections as well as assess and give feedback on the reflections of their peers. E-portfolios assist students in evaluating their own learning processes and performing reflections (Liu, E. Z. F., 2010, and Chang, C. S., et al., 2011). Through having the students observe and emulate each other, mutual understanding among peers is increased along with the opportunity for learning competition; teachers are thereby aided in observing the learning circumstances of the students and can assess accordingly. However, how to combine modern technology and construct a web-based learning system based on a self-reflective learning approach to enhance learning performance is an issue requiring further research.

With recent advances in micro-electro-mechanical systems (MEMS) and wireless communication technologies, wireless sensor networks have emerged from laboratories to be used everywhere, changing our future lives. Wireless sensor networks are more attractive and useful than traditional wired sensing systems due to their ad-hoc and easy deployment. This new technology expands our sensing capabilities by connecting the physical world to communication networks and enabling a broad range of applications (Akyildiz, Su, Sankarasubramaniam, and Cayirci, 2002). Sensor networks are the integration of sensor techniques, distributed computation, and wireless communication techniques, and can be embedded in our physical environment and used for sensing, collecting data, processing information of monitored objects, and transferring the processed information to users. The sensor node's hardware consists of five components: sensing hardware, processor, memory, power supply, and transceiver (Tubaishat and Madria, 2003). For numerous applications, a sensor network operates in three phases. In the first phase, sensors take measurements that form a snapshot of the signal field at a particular time, and these measurements are stored locally. The second phase is information retrieval, during which data are collected from individual sensors. The last phase is information processing, during which data from sensors are processed centrally with a specific performance metric (Dong, et. al, 2007, and Shyr, 2011). Such a network is composed of numerous tiny low-power nodes, each consisting of actuators, sensing devices, and a wireless transceiver. These sensor nodes are deployed in significant numbers in a region of interest to gather and process environmental information.

WEB-BASED SELF-REFLECTIVE LEARNING SYSTEM

The new technology of a wireless sensor network expands sensing capabilities by connecting the physical world to the communication networks. To support learning in MEMS technology, numerous sensor devices must be deployed in the laboratory to collect real-time information of students' motions and machine operation conditions. This study used the Zigbee modules to build a wireless sensor network. The proposed architecture of the sensor network system is shown in Figure 1. The overall system architecture comprises a Web camera, a Zigbee dongle (base node), a server, and wireless sensor nodes. The wireless sensor nodes consist of two key parts referred to as the static and the mobile nodes. The static sensor nodes are scattered in the laboratory, forming a multi-hop mesh networking topology. One key role of the static node is to transfer all the data packets from the mobile node to the dongle. The static node's other key role is to provide sufficient anchor points for the localization. Each sensor nodes is capable of collecting data and routing data peer-to-peer to the Zigbee dongle. The Zigbee dongle is used to bridge the sensor network to the Internet, and provides a serial interface and wireless connection for node programming and data transfer. The server is connected to the Internet to enable remote users to access the laboratory monitoring system. The mobile node, comprising an accelerometer worn by students, is for monitoring student motion and position in an indoor environment.

During experiments and practice, students need to rotate handle by hands while operating machines and adjusting machining parameters. Some machines also require students to pedal using their feet to adjust machining parameters. Therefore, this study intends to incorporate ultra-thin force sensing units (0.127mm) into the Zigbee node, make flexible force sensors, and install handles and pedals. To ensure students are able to use the tools correctly, training during experiments and practice is necessary. Therefore, this study plans to connect the Zigbee node with the PIR325 infrared sensing unit to make a wireless infrared sensor, which will then be installed in the toolbox. This study connects a Zigbee node

with a three-axis micro electro-mechanical system (MEMS)-based accelerometer to make a wireless accelerometer. An accelerometer is a device that measures acceleration, and detects the acceleration magnitude and direction as a vector quantity. The sensor is worn by a student, and not only detects and records the student's position inside the laboratory, but also senses their movements.

A graphical user interface (GUI) enabled remote users to carry out the desired operations, such as sending commands and parameters to drive the sensor nodes, and visualizing the measurement results. This thesis used ASP.NET and Microsoft Visual C# to write an internet program that enabled quick and convenient information processing. Figure 2 displays the Web GUI of a user monitors the laboratory environment at the remote client side. By clicking on the mouse, a remote user is able to adjust the camera's viewing angle to acquire video data. This interface accepts remote client-side to acquire information on which node to monitor though clicking the buttons and checkboxes on the panels. Upon clicking the sensor installed on the node, the sensors' signal can be observed. The data from selected sensors are collected and sent to the Web GUI at specific time intervals. In Figure 3, the top-left corner displays the information measured by the force sensor at various intervals, while the bottom-left corner displays the force sensor's instant information. Additionally, the top-right corner displays information measured by the IR sensor at various intervals, while the bottom-left corner shows the student's current position in the laboratory.

RESEARCH PURPOSE

The objectives of this study consist of the following:

1. Investigating the influence of a web-based self-reflective learning system on student learning performance and technical MEMS Technology skills.
2. Investigating the influence of a web-based self-reflective learning system on student satisfaction of MEMS Technology learning activities.

Based on the preceding research motives and research purposes, this study formulated the following hypotheses:

Research Hypothesis 1-1: Students' MEMS Technology cognitive aptitude test scores before and after experiencing the web-based self-reflective learning system demonstrate no significant difference.

Research Hypothesis 1-2: The MEMS Technology technical skills test scores from different raters after implementation of the web-based self-reflective learning system show no significant difference.

RESEARCH METHODS AND INSTRUMENTS

The study population comprised students taking courses in MEMS technology; the sample size was 54 students. The curriculum contained a series of formal lectures and laboratory experience. Besides the fundamental scientific and technology subjects presented in the classroom, the students were required to complete practical work based on problem-based learning (PBL) approaches. The practical work aimed to increase the theoretical understanding of subjects and the development of practical micro-fabrication and micro-packaging skills.

The experimental tools used during this study include a Cognitive Aptitude Test, a Learning Satisfaction Survey, and a Technical Skills Indicator. Following revision and correction, the Cognitive Aptitude Test had 50 multiple-choice questions. The passing mean and discrimination percentage were 0.58 and 0.35, respectively, demonstrating it to be a reasonable test with a good passing and discrimination percentage. According to reliability analysis, the Cronbach's alpha value of internal consistency was 0.786. Moreover, the criterion validity was based on a significant positive correlation between the semiconductor assembly and packaging test scores of several comprehensive and technological universities. As a result, the cognitive aptitude test had good reliability and validity.

In addition, the satisfaction survey for this study was based upon a Likert-type five-measurement scale. Using a pre-test satisfaction survey, this study had participants answer questions regarding observations and thoughts, and then analyzed each question's effectiveness and reliability according to the received result. Following evaluation of the survey's effectiveness and reliability, the questions were carefully revised and edited to produce the final and official questionnaire.

To understand the technical skills of students, this research developed a technical skills indicator based on E. J. Simpson's Seven Levels of Taxonomy. To avoid subjective judgment, the researchers together with the teaching assistants monitored and evaluated the testing groups during the exam. Upon

reviewing the results using Spearman's Rho rank order correlation, the correlation coefficient was 0.889, indicating that the researchers' and teaching assistants' evaluations were consistent.

DATA COLLECTION AND DISCUSSION

The data collected in this study include the scores from the two cognitive aptitude tests, the learning satisfaction questionnaires of technical activities, and the technical skills tests. The adopted methods for statistical analysis were mean, standard deviation, and a t-test, conducted using SPSS12.0.

This study examined the relations between pre-course cognition, post-course cognition, satisfaction, and the technical skills test. Pearson's correlation coefficient was applied to investigate the correlation and strength among the variables. As shown in Table 1, significant linear correlation exists between pre-course cognition and post-course cognition (r = 0.812), between post-course cognition and the technical skills test (r = 0.320), between satisfaction and pre-course cognition (r = 0.657), and between satisfaction and post-course cognition (r = 0.604). The correlations are all positive, indicating that: pre-course cognition is proportionate to post-course cognition; higher scores in the technical skills test represent greater post-course cognition; and satisfaction is greater in students with higher pre-course cognition or post-course cognition.

Table 1. Summary of Correlation Analysis

Item	Pre-course Cognition	Post-course Cognition	Technical Skills Test
Pre-course Cognition			
Post-course Cognition	.812**		
Technical Skills Test	.137	.320*	
Satisfaction	-0.061	-0.151	-0.031

*p<.05; **p<.01

This study adopted an independent t-test to determine whether significant differences exist between students with higher and lower learning achievement. Students scoring in the top 27 % in pre-course cognition were in the high achievement group, while the bottom 27 % comprised the low achievement group, and the statistics from these two groups were compared. As exhibited in Table 2, a t-test presented significant difference (p<.05) between the high and low achievement groups in the pre-course cognition test, indicating a difference between the two groups in pre-course cognition. In post-course cognition, a t-test also showed significant difference (p<.05) between the two groups. In terms of progress, the difference between the two groups was also significant (p<.05); the margin of progress was greater in the low achievement group than in the high achievement group. The above results indicate that receiving web-based self-reflective learning causes the learning cognition of students to differ.

Table 2. Comparison of t-test Results for Pre-course Cognition of High and Low Achievement Groups

Group	Low Achievement Group (n = 16)		High Achievement Group (n = 18)		p	t
	Mean	SD	Mean	SD		
Pre-course Cognition	44.50	11.74	68.00	3.43	.000**	-7.72
Post-course Cognition	54.38	12.48	71.78	5.69	.000**	-5.12
Improvement Score	9.88	6.55	3.78	5.04	.004**	3.06

*p<.05; **<.01

Table 3 presents the t-test results for technical skills in the two groups of students. Excluding the perception and set constructs, the t-tests all reached significance (p<.05), indicating that considerable differences appeared in the technical skills test of both groups. The total score of the technical skills test was derived by summing up the mean number of times in the achieved items of each construct, and converting that sum to a percentage. Analysis revealed that the majority of the constructs reached significance (p<.05), indicating considerable differences in the technical skills of students in the high and low achievement groups upon receiving web-based self-reflective learning.

Table 3. U test Results for the Technical Skills Test Scores of High and Low Achievement Groups

Group	Low Achievement Group (n = 16)		High Achievement Group (n = 18)		*p*	*U*
	Mean	SD	Mean	SD		
Perception	2.00	0.00	2.00	0.00	1.000	352.0
Set	5.88	0.34	5.83	0.38	.081	291.0
Guided Response	7.25	2.08	8.06	1.63	.001**	175.0
Mechanism	12.94	3.21	13.67	3.36	.000**	149.5
Complex Overt Response	8.19	2.61	8.72	2.89	.022*	226.0
Adaptation	2.50	0.73	2.72	0.75	.000**	122.0
Origination	2.06	1.06	2.28	1.41	.049*	244.5
Total Score	62.19	11.71	64.86	12.73	.002**	174.5

*p<.05; **<.01

According to the data analysis shown in Table 3, a radar chart was created for the percentages converted from the sums of the mean number of times in the achieved items of each construct. Figure 4 exhibits the overall learning performance of both groups of students for each technical skill. Using weighted calculation, the mean comprehensive ability values were derived; these were 1.53 and 1.43 for the high and low achievement groups, respectively. As indicated by the values, the mean comprehensive abilities of both groups of students differ significantly after employing the web-based self-reflection learning system. This result corresponds with that of Table 3. The web-based self-reflection learning system effectively improves the learning performance of students falling behind, enabling these straggling students to catch up. Regarding satisfaction, a t-test revealed no significant differences (p>.05) in both groups as shown in Table 4.

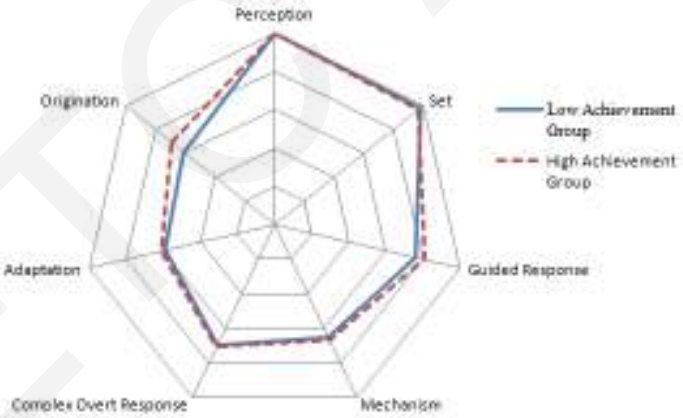

Figure 4. Comparison of Radar Charts for the Technical Skills of Students in the High and Low Achievement Groups

Table 4. T-test Results for Satisfaction of High and Low Achievement Groups

Group	Low Achievement Group (n = 16)		High Achievement Group (n = 18)		*p*	t
	Mean	SD	Mean	SD		
Satisfaction	4.14	0.59	4.24	0.57	0.623	-.497

*p<.05

STUDY LIMITATIONS

The sensors developed in this study were experimental. One study limitation was that the large sensor size reduced the wearabilty for students. However, this issue will be resolved with future progress in flexible electronics; sensors may become soft and small like a piece of cloth, which students will barely

notice when using. Another limitation of this study was that the precision of the sensor network system's indoor positioning was approximately one meter. Though this affected the positioning of students within the test room, it did not affect the sensing and measurement of data while students operated equipment.

CONCLUSIONS

Practical training is an important teaching strategy to improve students' industrial technology competence. To overcome the obstacles of traditional experiments and practical training courses, and to enhance current e-learning system functions, this study used sensor network technology as the foundation for developing a self-reflective learning system. This system presents the students' operational results immediately, thereby enabling appropriate guidance when students encounter problems during experiments and practical training. Moreover, this system can record students' learning processes during experiments and practical training, and this data used to identify students' learning difficulties. Even when practicing in a clean factory room, the teacher can be aware of the problems encountered by students during the practice process, using the system developed by this research. Therefore, teachers can appropriately guide students to avoid repeating mistakes. According to related data, a web-based self-reflective learning system can effectively improve the learning performance of students falling behind, enabling these struggling students to catch up by the end of the semester.

THE EFFECT OF E-LEARNING BASED COMPUTER COURSE ON THE COMPUTER SELF-EFFICACY LEVELS OF PRE-SERVICE TEACHERS

İrfan Şimşek[1], Gamze İnan[2]

ABSTRACT

Self-efficacy is a motivational construct, which is used prevalently in educational psychology research. Computer self-efficacy is individuals' beliefs on their capability to use the computer. E- learning is defined as an extended notion that comprises all kinds of electronically supported learning and teaching processes. In the present study, the effectiveness of an e-learning based computer course on the computer self-efficacy scores of pre-service teachers is investigated in one group pre-test-post-test design. The sample of the study is composed of 48 first year undergraduate students of Elementary Mathematics Education Department at Hasan Ali Yücel Education Faculty in Istanbul University. According to the results of the study, the computer self-efficacy scores of pre-service teachers are significantly increased after they attended to the e-learning based computer course.

Keywords: Computer self-efficacy, pre-service teachers, e-learning

INTRODUCTION

Self-efficacy is a motivational construct that has been proposed by Bandura (1977, 1986) in the frame of Social Cognitive Theory. According to that theory, self-efficacy belief, being a core construct, is defined as "…beliefs in one's capabilities to organize and execute the courses of action required to produce given attainments." (Bandura, 1997, p.3). Bandura (1986, 1997) states that self-efficacy belief has a determining effect on individuals' choices, effort, persistence and anxiety experienced in the face of challenging goals. Since Bandura has proposed it theoretically and empirically, self-efficacy has become a research subject in a wide range of studies from organizational psychology to clinical or educational psychology areas. According to Bandura (1997), Social Cognitive Theory defines individuals as proactive and self-regulating in terms of behavioral adaptation. This adaptation is established by the concept of reciprocal determinism, which defines human functioning in a dynamic interaction between environmental, behavioral, and personal influences (Bandura, 1997; Pajares, 2005; Moos and Azevedo, 2009).

Recently, depending on the advancements in the information technologies, computers have become an inseparable part of education and thus computer education has become a prerequisite for the teacher training. Computer self-efficacy is individuals' beliefs on their capability to use the computer (Compeau and Higgins, 1995). The levels of computer self-efficacy is reported to be related to the decisions of individuals' on engaging in computer related tasks, spending effort, persistence in learning about computers, apart from their judgments on the importance of the computer using (Aşkar and Umay, 2001; Sam, Othman, Nordin, 2005). Computer self-efficacy can be also defined as the self-perception on the one's capability related to specific computer skills and knowledge (Murphy et al. cited in Moos and Azevedo, 2009). In terms the instructional practice of teachers', computer self-efficacy can be counted as an important factor in determining the use of information technologies as educational tools. This utilization can differentiate according to the self-beliefs and individual characteristics of teachers such as gender, age, earlier experience and subject area (Paraskeva, Bouta, and Papagianni, 2008).

In higher education the use of e-learning based applications are becoming prevalent (Alexander, 2001; Selim, 2007). The use of Information and Communication Technologies (ICT) in teaching and learning seems to provide solutions at least some part of the problems that are faced in higher education (Alexander, 2001). The reasons to use technology in higher education are grouped in four by Bates

[1] Research Assistant, Istanbul University Hasan Ali Yücel Education Faculty, Department of Computer Education and Instructional Technologies
[2] Research Assistant, Istanbul University Hasan Ali Yücel Education Faculty, Department of Educational Sciences

(1997). These reasons are, improving the quality of learning, improving access to education and training, reducing the cost of education, and improving the cost-effectiveness of education. In the present study, the effectiveness of an e-learning based computer course on the computer self-efficacy levels of pre-service teachers is investigated in a one-group pre-test post-test experimental design.

METHOD

Sample

The sample is consisted of pre-service teachers that are 20 female (41.6 %) , 28 male (58.4 %) in total 48. The participants of the study attend to Elementary Mathematics Education Department of Istanbul University, Hasan Ali Yücel Education Faculty in 2009-2010 academic year fall semester.

Measures

Computer Self-Efficacy Scale: The computer self-efficacy is developed by Aşkar and Umay (2001). The scale is composed of 18 items and a Likert type scale (1=always to 5=never for the reverse items). The higher the score gained from the scale indicates the higher the academic self-efficacy score. The Cronbach alpha score of the scale is reported to be .71.

Besides *a demographic information form* and *a 3 items questionnaire* in order to gain information on the participants' computer experience levels are also applied.

Procedure

In the pre-test of the study the participants are applied the measures in the beginning of the 2009-2010 academic year fall semester. Following the pre-test they attended to the e-learning based computer course. The course is designed as a learning management system. The students were able to acess all the documents related to course from this system. Besides they completed the homework or other course related duties by use of the learning management system. At the end of the semester the participants are applied the post-test. The descriptive and inferential statistics are applied after the data collection.

RESULTS

In this part, the descriptive analyses related to the data gathered by means of the measures are reported. The mean and standard deviation of computer self-efficacy scores of the sample in pre-test and post-test are M= 47. 83, SD= 5.58, and M= 49. 77, SD= 7.52, respectively. The one-sample t-test conducted revealed that there is a significant increase in the computer self-efficacy scores of the sample in the post-test when compared to the pre-test scores ($p<.001$).

CONCLUSION

As it is reported by Zhang, Zhao, Zhou and Nunamaker (2004) that "Internet and multimedia technologies are reshaping the way knowledge is delivered, and that e-learning is becoming a real alternative to traditional classroom learning" (p. 76). In other words, as the technology advances the use of these advancements reformulate the way teachers and students consume knowledge apart from the knowledge delivered traditionally in the regular classroom. When compared to the traditional classroom learning, the use of e-learning based applications on teaching and learning have many advantages, which can be listed as being learner-centered and self-paced, flexible in time and location, cost-effective, unlimitedly accessible, archival in terms of reuse and share.

In the present study; the effect of an e-learning based computer course on the computer self-efficacy levels of pre-service teachers on the computer education course are investigated. According to the results of the study, it is found that the computer self-efficacy scores increased significantly in the post-test. That is this significant increase can be reported to be effectiveness of e-learning based computer course. The relevant literature demonstrate that although for unprepared students in terms of computer familiarity may cause negative impacts on the instructor or other students (Fink, 2002 cited in Levy, 2003), e-learning based courses lead better performances on the students parts as did the traditional courses (Beyth-Marom, Chajut, Roccas, & Sagiv, 2003).

In the literature, studies aiming the understand the relationship between computer self-efficacy and e-learning based learning, primarily stress on the effect of the self-efficacy on students readiness to learn in an e-learning based environment (Welsh, Wanberg, Brown and Simmering, 2003). In the current study the main focus is on the self-efficacy levels of the pre-service teachers in an e-learning based computer

course. As it is stated before, the computer self-efficacy may change related to encounters and experiences with computers. However, the results of this study should be evaluated in caution because of the deficiency of a control group, which could be compared to the experimental group in the research design. That is, a following study should be conducted with a control group in order to test the effectiveness of the e-learning based computer course when compared to a traditional in-class computer course.

EFFECTS OF LINEAR TEXTS IN PAGE SCROLLING AND PAGE-BY-PAGE READING FORMS ON READING COMPREHENSION INTRODUCTION

Ayfer Şahin*

Abstract

This research aims to analyse the Effect of Scrolling and page by page moving Static Texts on Comprehension of Screen Reading of 4th grade students of secondary education. The working group of the research which has been done with Quasi experimental method is composed of 46 students of 4th grade students of a elementary school in Kırşehir Central Province. The classrooms in which the research has been done has been selected by random sampling method. The students were appointed to experiment group and control group according to the result of drawing. The achievement test for reading comprehension has been applied as a preliminary test in order to understand the readiness level of the two groups. Then, 6 texts,compliant with the level of the students, (two narrative and two informative texts and a poem) were read by the students. The students in the experiment group read the text with scrolling method and the students in the control group read the text with page by page moving method. As a post test, reading comprehension test composed of 30 questions, has been applied to students of both groups.It is believed that the recomendations which will be genrated in the light of the data of the research, will play a guiding role on the regulation of screen reading text for elementary-level students.

Key Words: Linear texts**,** page scrolling, page by page moving, screen reading, comprehension.

Introduction

With the technology making its mark on all areas of the age we are living in, it is now a necessity to utilize technology also in the field of education. The age we live in affects the reading habits of the most of the world negatively. When reading, or reading from paper as we know, is in question, particularly children and the youth tend to computers which are cheaper and easier sources of information. Screen reading has become a necessity due to the rapidly developing information technologies of today. Because texts are more and more transferred into computerized pages and published by means of computers. In order to reach new information, readers have to read from screen. By this way, a new way of reading called as "screen reading" and a new kind of reader referred to as "screen reader" have appeared. This way of reading that becomes widespread in all areas has distinctions from the conventional way of reading from paper (Günes, 2009). It is now possible to learn through screen reading and to design and develop the customizable reading media that distinguish the individuals and differentiates according to their differences (Brusilovsky, 2003).

The fact that the amount of information to be learned increases incrementally and the learning needs being continuously updated due to the information loosing their currency in time necessitate a change in the point of view regarding learning and learning environments (Khan, 1997; Alotaiby, 2005). This requires the implementation of a number of changes pertaining to modernization of learning programs. It is known that the effectively used instructional technologies increase the effectiveness of the learning - teaching process. For this reason, the educational development objectives of many countries in the recent years also cover the integration of computer technologies with instructional programs (Korkut & Akkoyunlu, 2008).

In this context, also the Ministry of National Education (MNE) of Turkey establishes Information Technology Courses in all schools and stipulates students to learn to use computers and more importantly raises generations that reach information through internet access. The skills for "using information technologies" have been included among the basic skills to be taught to students in the primary school programs modified in 2005 (MNE, 2005).

Besides modifying the programs, MNE also restructures learning environments in order to raise individuals capable of utilizing the technology. With the Increasing Opportunities and Improvement of Technology Project of 2010, which has been planned in line with the objective related to the utilization of

* Assist. Prof. Dr., Ahi Evran University, Faculty of Education, ayfersahin1@gmail.com

information technologies in our education system stated in the (2006-2010) Information Community Strategy prepared by State Planning Organization as "Information and communication technologies will be among the fundamental tools of the educational process and the active utilization of these technologies by the students and teachers will be ensured.", the Ministry has initiated the works for equipping 620.000 classrooms of all our pre-school, primary and secondary schools with laptop computers, projection tools and internet infrastructure in order to ensure the effective utilization of IT tools during the courses, for the purpose of providing equal opportunities and improving the technologies of our schools. (URL-1, 2011). For this reason, it is believed that electronic texts will be more frequently utilized in educational environments in the forthcoming years.

Since the functionality of the reading process is directly related with the design of these environments (Altun, 2000), it is needed to know how the reading text to be presented to the students on the educational environments are to be designed and with which kind of text can the most effective results be obtained. In this paper planned with this purpose, the effect of linear texts prepared in page scrolling and page-by-page reading forms used in Turkish courses, on the reading comprehension skills of the students attending to 4th grade of primary schools, has been examined. The pages where information are provided in a computerized environment can be designed in two separate forms as the long pages where the information is viewed by moving the page up and down by using a ***page scroll*** bar or the page***-by-page*** designs where information is divided into small pages that can be viewed one by one by using the next page or previous page buttons.

Linear text or linear hypertext are designs of hypertext that allow transitions from the current screen only to the next or previous screen are possible and where a linear movement is allowed between the screens through the links given (Cakmak & Altun, 2008). When working with linear texts, the reader or the learner has to follow the path provided by the designer in order to access the information necessary for learning. Information beyond the linear path cannot be accessed from the current point. Both in printed materials and conventional computer aided educational materials progress is made in a linear way. Linear order is considered to be more convenient for presenting details and cause and effect relations (Ayersman, 1996: 505 quoting from Gordon, Lewis, 1992). Emphasizing that linear texts are one of the fundamental structures of hypertexts, Karadeniz, Karatas and Kilic (2004) states that "(a structure where) the reader or student reads the information in order and passes to another one after finishing one is a linear structure".

During the composition of this paper, many researches on the texts to be read by students and the environments in which these are to be submitted in has been found in the literature (Eyuboglu, 2007; Dunser & Jirasko 2005; Karadeniz 2004; Kilic & Karadeniz, 2004; Calcarterra, Antonietti, Underwood, 2004; Schwartz, Andersen, Howard, Hong & McGee 2004; Lee & Tedder, 2003, Graff, 2003; Kim 2001; Ford & Chen, 2000; Leader & Klein 1994). Yet, these studies were generally conducted with high-school and university students. On the other hand, very few studies conducted with primary school students have been found (Cakmak & Altun, 2008; Riding & Grimley, 1999; Reinking, 1988). Similarly, according to Eyuboglu and Orhan (2009), although there are many studies on the design properties of hypertexts (such as the page arrangement of the menus, different types of menus and links, and browsing tools) a relatively lightly focused matter in these studies are the page lengths of hypermedia or hypertexts. With the purpose of filling this gap in the literature, this study has been conducted in order to set forth the effects of scrolled and page-by-page displayed texts on the reading comprehension of the students attending to the 4th grade of primary school. Within the frame of this general objective, the answers of the below given questions have been sought:

1. Is there a significant difference between the reading comprehension preliminary test success rates of the students of the experimental and control groups?
2. Is there a significant difference between the reading comprehension preliminary test success rates among the students of the experimental group?
3. Is there a significant difference between the reading comprehension preliminary test success rates among the students of the control group?
4. Is there a significant difference between the reading comprehension final test success rates of the students of the experimental and control groups?

Method

The study is an empirical study based on preliminary - final test model with control group.

Study Group

The research has been conducted with a total of 44 students attending to randomly selected two fourth grade branches of a primary school located in Kirsehir city center, during the 2010-2011 educational spring season. The students which were available in school on the days when preliminary and final tests were conducted have been included in the study. By casting lots, one of the branches has been determined as the control group where the texts are presented in a page scrolling format, while the other has been determined as the experimental group where reading texts have been submitted in a page-by-page format. Experimental group consists of 19 students. 31,6 % of these are females while 68,4 % are male students. The control group consists of a total of 25 students, of which 44 % are females and 56 % are males.

Preparation of the Texts

The texts have been compiled from the school book of Koza Publications, which the Board of Education and Discipline had distributed to primary school 4th grade students as textbook in the previous years and which no longer was being implemented at the date of the realization of the tests, due to the expiry of its recommended term. This book has been selected so that the students could not have read it before. The 2005 Turkish Curriculum for Primary Schools stipulates that three kinds of texts are to be included in the textbooks. These are narrative texts, informative texts and poems. It has been paid attention for the texts to be given to the students in this study to include all of these three kinds of texts and two texts for each type have been selected. The titles of the selected texts are given below:

Narrative texts;"Seeing Bird Chirps and Bakery Smell" and "The Flute that Lost its Sound".
Informative texts; "How to Cope With Your Phobias" and "The Hand".
*Poems; "*Farmers" and "The Requiem of the Olive Tree".

When the selected texts have been arranged to fit both page scrolling and page-by-page reading techniques by the researcher, also visuals that will aid and ease the comprehension of the context of the texts have been added and computerized.

Implementation Phases

The implementations pertaining to reading the texts from screen have been carried out in the information technology classroom of the school of the participants. Before starting the implementation, the computers in the classroom have been checked and ensured to be in working condition. 13 computers have been determined to be properly working and the text files to be read have been saved on the desktops of these computers. The works have lasted for a total of 6 weeks. Each week, on the hours when the students attend to their Information and Technology course, the students of both control and experimental group have been separately asked to perform screen reading by the researcher for 2 hours. Due to the fact that the number of the students in both groups exceeds the number of available computers the students have been divided into two groups and they have been allowed to the classroom separately to read the same texts. When a group has entered into the information technology class to read the selected texts, the other group has continued their courses in their own classes with their class teachers. Before starting the implementation, it has been checked whether the students know about the basic computer commands. Since the students have attended computer course through their fourth grade, it has been observed that they all have the basic computer using skills.

Each week one of the texts prepared with page-by-page reading form have been read from the screen by the students of the experimental group. Each time, the texts have been read aloud by the researcher one time before the students. After the exemplary reading, the students have been asked to silent read the texts a couple of times. Then, the texts have been read aloud by the students. In the meantime, the other students have been instructed to listen to and follow the text being read. After it has been ensured that the text has been comprehended by the students, they have been asked to take a multiple choice text concerning the read text.

The same process has been implemented with the students of the control group in their own Information Technology courses for the same 6 texts arranged in page scrolling format.

Measuring Tools

Preliminary test: After the students had been divided into experimental and control groups, a reading comprehension test consisting 30 questions has been applied as the *preliminary test*. In order to prepare the reading comprehension test, the 39 attainments concerning reading comprehension for the fourth graders as per the Primary School Turkish Curriculum has been determined (MNE, 2005: 92-94). It has

been ensured that the questions included in the reading comprehension test inquire these attainments. At first 50 questions have been prepared. The words, sentences and paragraph lengths have been paid attention to in order to balance the difficulty levels of the texts included in the test. Two Turkish teachers and two class teachers have been consulted in order to ensure that the questions are understandable and suitable for the skill levels of the students. After being rearranged as per the experts' opinions, 40 questions have been submitted to 120 students attending to the fourth grade of a primary school in the city center of Kirsehir. Item discrimination index and item difficulty index have been determined for each item as per the results of the application. By correcting the questions with low item difficulty and discrimination indexes, the measuring tool has been given its final form with the number of questions reduced to 30.

In consequence of the Kuder Richardson-20 statistical analysis conducted with the purpose of examining the internal consistency between test scores, the KR-20 reliability coefficient of the reading comprehension test the students were to be subjected to has been calculated as .83. The 30 question comprehension test prepared in this way has been applied to the students in experimental and control group at the same date for an hour for each group and in the form of reading from paper.

Final test: The measuring tool implemented as the final test has been formed out of 5 questions at information level for each text read. The scale had been initially prepared with 48 questions (as 8 questions for each text) and then had been evaluated by 4 experts (2 Turkish teachers and 2 class teachers) in order to tests its validity. In accordance with the feedbacks received, some of the items have been removed from the test and some others have been rearranged. 130 students attending to the 4th grade of a primary school in Kirsehir city center has been subjected to the new form of the test that covers 40 questions. In conclusion of the analysis conducted in order to determine reliability, the questions determined to have low reliability have been removed from the test. However, with the purpose of the test covering all six texts equally, the distracters of some questions have been rearranged and kept in the test. The KR-20 reliability coefficient of the test prepared in this way with 30 questions, as 5 questions for each text, has been calculated to be .81. Sencan (2005) emphasizes that, in case the KR-20 formula is implemented for a test consisting low number of items, even a score as low as .50 can be sufficient for deeming the test reliable. According to this, it has been accepted that a .81 reliability coefficient found for a 30 question test indicates a good level of reliability in terms of the norm based test approach.

The students have been given one point for each question they have answered correctly during the tests. Wrong answers have been ignored. Therefore, the highest score the students can get from the preliminary test and final test has been determined to be 30 points.

Data Analysis

Average, percentage, frequency and standard deviation have been utilized in analyzing the data. For comparing the scores the students of the experimental and control groups have obtained T-Test for independent samples and for comparing the final test and preliminary test results of the students T-Test for dependent samples have been utilized. Significance level for comparisons has been determined to be .05.

Findings

The findings related to the reading comprehension scores of the experimental and control group have been summarized in the following tables:

Table 1. *Independent T-Test Results of the Preliminary Test Scores of Experimental and Control Group Students*

Groups	N	$\bar{X}$	S	Sd	t	p
Experimental	19	21,63	4,43	42	3,61	0,01
Control	25	25,76	3,14			

P< 0.05

According to the findings given in the table, there is a significant difference in favor of the control group between the points scored by the experimental and control groups from the preliminary test, conducted in order to determine the students' reading comprehension levels (t (42) = 3,61 and p<.05). While the

reading comprehension preliminary test score average of the control group students is (X= 25,76), the reading comprehension point averages of the control group student has been calculated as (X= 21,63).

Table 2. *Dependent T-Test Results of the Preliminary Test - Final Test Scores of Experimental Group Students*

Measurement	N	$\bar{X}$	S	Sd	t	p
Preliminary Test	19	21,63	4,44	18	1,77	0,93
Final Test	19	20,32	4,30			

P>0.05

No significant difference has been found between the preliminary test points of the experimental group students regarding paper-reading comprehension and the final test points they have obtained in relation with the text they have read by means of page-by-page screen reading (P>0.05). While the preliminary test point average of the students has been calculated as X= 21,63, their final test point average has been determined to be X= 20,32.

Table 3. *Dependent T-Test Results of the Preliminary Test - Final Test Scores of Control Group Students*

Measurement	N	$\bar{X}$	S	Sd	t	p
Preliminary Test	25	25,76	3,14	24	4,23	0,00
Final Test	25	22,84	2,85			

P<0.05

There is a significant difference between the paper reading comprehension preliminary test points and the page scroll reading comprehension final test points of the students of the control group ((t (24) = 4,23 and P>0.05). While their preliminary test point averages of the students had been X= 25,76, their final test point averages has declined to X= 22,88.

Table 4. *Independent T-Test Results of the Final Test Scores of Experimental and Control Group Students*

Groups	N	$\bar{X}$	S	Sd	t	p
Experimental	19	20,32	4,30	42	2,34	0,24
Control	25	22,84	2,85			

P>0.05

Independent T-Test results for the final test point averages of the students of experimental and control groups are given in Table 4. According to the findings presented in the table, there is no significant difference between the final test point averages obtained by the students of the two different groups (t (42) = 2,34 and p>.05). This indicates that the primary school 4th grade students comprehend the texts they read by page scrolling and page-by-page forms with similar levels. While the control group students have answered 22,84 of the 30 questions related with the text they have read by page scrolling correctly, the experimental group students have answered 20,32 of the questions related with the same texts they have read page-by-page.

Conclusions and Discussion

Although a significant difference has been found in the study for the students of the control group between the paper reading comprehension preliminary test results and the page scrolling reading comprehension final test results, no such significant difference could be found for the students of the experimental group between the points they have scored from the tests examining their comprehensions from paper reading and the page-by-page screen reading. However, it can be stated that this results from the fact that a significant difference in favor of the control group has been found between the preliminary test results of the experimental group students and the preliminary test points of the control group students. Since the students have been randomly divided into experimental and control groups, it can be

interpreted that the equalities have not been established at the first place. Also, there are studies in the literature pointing out that reading from paper or from a screen does not have any advantages over each other. In this context, in the study conducted on 33 students from fifth and sixth grades Reiking (1988) has reached the conclusion that reading linearly presented texts from a computer screen does not bring any advantage over reading them from printed materials, in terms of aiding recollection.

In this study, the point whether the linear texts, which had been prepared for Turkish course, read through page scrolling and page-by-page screen reading have any effect on the reading comprehension skills of the 4th grade primary school students, and it has been determined that there is no difference between the final test success rates of the students of the control and experimental groups. This is to indicate that 4th grade primary school students comprehend the texts they read by page scrolling or page-by-page display at similar levels. In the literature, it is possible to find many studies with conclusions either supporting or contradicting with the conclusions of this study. Eyuboglu (2007), Bernard, Baker & Fernandez (2002) and Nielsen, 1997 have found that readers and students mostly prefer texts presented in long pages. In his research examining the effects of page scrolling and page-by-page reading on comprehension, Baker (2003) has once again found that page scrolling has a more positive contribution in the comprehension levels, compared to advancing through the pages with a forward button. On the other hand, Roussey & Thunin (1998) have determined that dividing information into separate pages and presenting it in a form that can be viewed page-by-page increase performance (quoted by Bernard, Baker & Fernandez, 2002). The findings of the mentioned study do not coincide with the finding of this study.

In another study, it has been concluded that page-by-page reading is mostly preferred by inexperienced users, yet it does not create a significant difference in completing a given task or conducting a search within the text (Schwartz, Andersen, Howard, Hong, and McGee (2004)). In some other studies it has been concluded that neither of the techniques have any effect on user performance (Bernard, Baker, and Fernandez, 2002 quoting from Mills & Weldon, 1986). These findings support the findings of the present study.

Suggestions

By conducting researches similar to the present study, in which the comprehension levels of the 4th grade primary school students from page scrolling and page-by-page reading have been examined, with different regions, different schools and for different grades and age groups, the matter how the page lengths and designs of the screen reading or learning materials are to be prepared for primary school students can be determined.

In this study, the students have been provided with linear hypertext samples of a single type and structure, where the students have to follow the path the designer provided and cannot jump to the information beyond the designed linear path. Accordingly, the determinations are limited for the texts of this type and structure. Therefore, the study can be repeated for hypertexts of different structures as hierarchical, nonlinear and mixed hypertexts.

ABSTRACT

In this study it is investigated that teaching of different pattern types by using computer animations and activities. The sample of this study was 28 eighth grade students in second semester of 2010-2011 educational years. They are at public school in Ankara. The one group pre-test post-test design was used for research methodology. Data were collected by pre-test and post-tests which were developed by researchers and it was revised in terms of reliability and administered to the students. The subject showed by using computer to the students after pre-test. At the end of the teaching, that achievement test is applied on the group as the post-test. For data analysis, quantitative methods were used. According to the findings; academic performance of the students increased by using computer animations and activities about patterns. Also, it is found that there was a significant difference between academic performance of students about different pattern types.

Keywords: mathematics education, patterns, computer animations, teaching strategy

INTRODUCTION

Mathematics, which is known to improve thinking, is one of the most important devices.As it is known, the basic property which distinguishes humans from other living beings is the ability to think, making inferences and rearranging condition suitable to him (Umay, 2003).

Mathematics is a science which has application in science, technology and in all other sciences, and mostly it is called a science of order and pattern. It doesn't mean numbers and operations carried out with them (Yaman, 2010). A sub-branch of maths which we confront in nature, art, environment and in many other areas is geometry. Geometrical shapes and objects which have an important place in human life are encountered frequently in daily life. When we look around there are quite a lot of geometrical shapes, patterns and structures in the good we use (Gürbüz, 2008).

The pattern concept encountered prevalently in daily life has started to be given at primary education level. Pattern concept which takes place in primary education maths curriculum, especially at the levels of 6^{th}, a 7th and 8th grade is given with different presentation forms.

Especially given the level of primary education algebra means that abstract and fight for students (Willoughby, 1997). The education of algebra that began in the 7th grade with the Mathematical Curriculum, changed in 2004, begins to be given from the first years of primary school with the new programme. Among the subgroups of algebra, patterns and decorations subject, which is appropriate for the level of students and more concrete, take place in the first step of the primary school in the Mathematics Programme. With the help of this subject, students can make generalizations by seeing concrete models. How the pattern will be presented is as important as the pattern concept itself, taking place in the Mathematics Programme and also significant for Mathematical Thinking. When the studies are examined, it is seen that the achievements of the students with different presentations about patterns has been examined but the 8th grade students' hasn't been yet. For this reason in this study, the achievements of the 8th grade students with different presentations about patterns are compared. In the comparison it is determined that in which presentation students are more successful.

In Mathematics teaching, students have difficulty in especially abstract subjects such as algebra. As well as the subjects, teaching methods and techniques applied on the students for these subjects cause that they are seen as difficult and impossible to understand. In order to make the students like Mathematics and increase their academic achievement, it is necessary to notice them the enjoyable and usable sides of Mathematics in daily life. This helps students break their prejudice. Among the subgroups of algebra, patterns and decorations subject, taking place in Mathematics Programme especially from the first years of the primary school, and the way of their presentations can also help the students break this prejudice. The students can see different ways of the subjects with different presentations of the same question and learn the subject suitably for their own level. With this study it is aimed that in which presentation of patterns students get the relation between the numbers better and make generalizations easily. Nonetheless, it is thought that this study will be a leading for the new Mathematics Programmes.

A BRIEF REVIEW OF LITERATURE

Early grades, algebraic notation can play a supportive role in learning mathematics (Carraher, Schliemann, Brizuela & Earnest, 2006). It is clear that algebraic thinking is a particular form of reflecting mathematically (Radford, 2006). The National Council of Teachers of Mathematics (NCTM, 2000) recommends that the development of algebraic reasoning begin with experiences with patterns and relationships in Grades K-2, incorporate variables and expressions in Grades 3-5, and focus on analysis, representations, and generalisations of functional relationships in Grades 6-8. On the basis of algebraic thinking patterns, patterns of relationships between and patterns of generalization (Yaman, 2009). Number patterns, the relationship between variables and generalisation are considered important components of algebra curricula reform in many countries (Samsan, Linchevski & Olivier, 1999).

Children, from a very early age, love colouring patterns and Islamic patterns may be utilized introduce symmetry at the tender age of 3 or 4. At the university level, the patterns may be used to teach transformation geometry (Abas, 2004). A major learning goal for students in the primary grades is to develop an understanding of properties of, and relationships among, numbers (NCTM, 2011). Children's thinking processes in generalisation reports on children's strategies in abstracting number patterns and formulating general relationships between the variables in the situation (Orton and Orton, 1994). The relationship which is called functional relationship begins with the notion of patterns in early grades, develops gradually in algebraic thinking process, and gains the abstract manner with the function notion (Kabael, Tanışlı, 2010).

From the national survey, reasoning on geometric number patterns is a proper initial activity for learning algebraic thinking in Grade 7 (Lin, Yang, 2006). The study of patterns' generalization in school mathematics has been the focus of research conducted over the last years. Many researchers have made some attempts to investigate stages or levels in the development of patterning ability mainly focused on students' ability to generalize (Cruz, Martinon, 1998). Some definitions are in order here by Bishop (2000),

> A number pattern is a sequence of numbers in which there is a well-defined rule for calculating each number from the previous numbers or from its position in the sequence. In a geometric number pattern, the numbers relate to a sequence of geometrical figures in which each figure is derived from the previous figure by some well-defined procedure. A number or geometric number pattern is linear if each number is obtained by adding a constant increment to the previous number or, equivalently, if each number is a linear function of its position in the sequence.

Past research has indicated that children tend to have a propensity to look for the additive strategy (look down the table) when searching for patterns in tables of values (Warren, 1996). Children try to construct simple multiplication (proportional) structures, but when it does not fit the database, they quickly give up and then invent all kinds of error-prone recursion strategies. In all activities where students identified a function rule, most of them described their rule in words rather than using symbols (Samsan, Linchevski and Olivier, 1999).

Experiences with a variety of patterns help students recognize order and make predictions. Creating patterns gives students opportunities to describe what is being repeated or how the pattern grows and to explain what should come next (NCTM, 2011).

From 2000 to 2005, close to 70,000 students in the US Bay area participated in open-ended assessment that involved generalizing linear patterns. Five years of data collection and analysis of 8th grade students' work have shown that while 72% of those tested could successfully deal with particular

cases of linear patterns in visual and tabular form, less than 18% of them could use algebra to express correct relationships or to generalize to an explicit, closed formula (Rivera & Becker, 2006).

As students work with multiple representations of number and with counting, their knowledge of number concepts grows more sophisticated. As students have repeated experiences with patterns, they will be able to make and investigate conjectures about counting sequences (NCTM, 2011).

METHODOLOGY

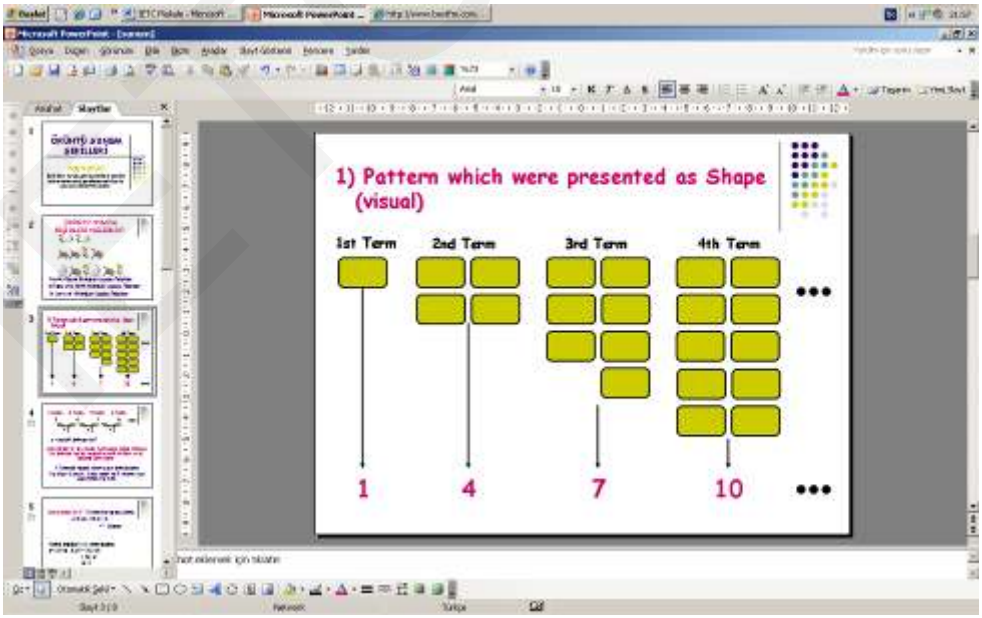
In this research;

. ● Is reminding has an effect, according to presentation styles of 8th grade students, in their performances with mathematical patterns by using computers?

● Is there a meaningful relationship between performances regarding mathematical patterns according to presentation styles of patterns at the reminding in 8th grade students by using computer? questions will be answered.

The application was carried out at a primary school in 8th grade class belonging to National Education Ministry in Ankara. We worked with 28 eighth-grade students (11 boys, 17 girls, mean age of 13) in an urban school in Ankara. Prior to application a pretest comprising 6 questions prepared by scientists was applied to the students (appendix-1). The questions were prepared by using three different presentation styles from linear increasing patterns (shape, number sequence, and table). While the validity of the questions were provided by taking expert opinions, the reliability coefficient was found as α =.8905. Reliability coefficient of achievement tests being more than 0.70 is a sign sufficiency of reliability level (DeVelles, 1991). The result of the analysis show the level of validity and reliability was high for pattern subject of maths lesson. The application was carried out for four hours with 28 students in the 8th grade in a primary school chosen for the application. In the first lesson pre-test was applied. Students knew pattern presentation styles which could be shown in three different ways comprising shape, number sequence and table. During the application students were educated for two hours by using computer in a way to remind presentation shapes (figure–1). The presentations which were used during the application were prepared by the scientists in accordance with the curriculum by scanning necessary literature. Different examples belonging to three different presentation styles were solved with the students and the application was completed and following this a post test was applied.

Figure – 1: The example belonging to the presentation used in the application



RESULTS

In this section, in order to answer the questions, took place in the search, the findings, reached by reason of data's statistically analysis and the comments, based on these findings, and are mentioned.

Findings and Comments about the Pre-Test Marks of Experiment and Control Groups

In order to find an answer for the first question in the search, it is analyzed if there is a significant difference between pre-test and post-test marks of the groups on whom they made application. The students' pre-test and post-test average marks they take from the achievement test about patterns in Math lesson, standard deviation values, and results of paired sample t-test are such as in table-1.

Table-1: The Paired Sample T-Test Results about Pre-Test and Post-Test Average Marks

Measurement	N	$\bar{x}$	S	df	t	p
Pre-test	28	2.21	2.347	27	-4.500	.000
Post-test	*28*	*4.79*	*1.371*			

After the reminders with using computer, students' academic achievement has a significant increase in pattern lesson [t_{27}=-4.500, p<.01]. As the average of the true answers, that the students give before the applications, is $\bar{x}$ = 2.347, this average increases to $\bar{x}$ = 4.79 after two-hour application with computer. This finding shows that the reminder, made by computer, has a significant effect on increasing the academic achievement of the 8th grade students in linear increased pattern.

Findings and Comments Related With Academic Achievements According To Pattern Presentations Based On Final-Test Results

In order to find an answer for the second question in the search, by looking the post-test marks of the group, it is analyzed if there is a significant difference between their academic achievements according to the pattern presentations. The questions in the achievement test are grouped as set of number presentation style, figure presentation style and form presentation style, and the difference between these groups are compared. The average post-test marks of 28 students, in the application, according to different presentation styles of patterns' achievement test in Math lesson, their standard deviation values and *simple factored ANOVA* results of the paired sample are such as in table-2.

Table-2: Post -Test Marks' ANOVA Results According To Pattern Presentation Styles

Variance Source	Total Squares	df	Average Squares	F	p	Significant Difference
Intersubjects	16.905	27	0.626			
Measurement	3.167	2	1.583	10.469	.000	1-2,1-3
Mistake	8.167	54	0.151			
Total	28.239	83				

1-Form presentation style, 2-Figure presentation style, 3-Number sequence presentation style

It is found a significant difference between set of form, number and figure from the students' pattern presentation styles [$F_{2\text{-}54}$=10.469, p<.01]. Figure presentation style mark ($\bar{x}$ = 1.7143) and set of number presentation style mark ($\bar{x}$ = 1.7500) are higher than form presentation style mark ($\bar{x}$ = 1.3214). On the other hand the difference between figure presentation style and number sequence presentation style is not seen as significant.

The finding shows that the students are more successful with the figure presentation and number sequence presentation style than that of form presentation style.

DISCUSSION

In this section, it is mentioned about the results, reached by the findings and comments of the search said before, the arguments about these results and suggestions developed by the results.

In this study, the achievements of the 8th grade students with different presentations about patterns are compared after the reminders made by using the computer aided teaching. In the comparison it is determined that in which style of presentation students are more successful. When the data, obtained by this aim, is examined, those results are reached: According to the pre-test results, made before the application, a significant difference isn't seen between the academic achievements of the students with different presentations about patterns.

At the end of this search, it is appeared that the reminders, made by using the computer aided teaching, are effective in increasing the achievements of the students about the patterns and decorations in Mathematics. This result shows that computer aided teaching has positive effects on the achievements of the students and also supports different studies determining that computer aided teaching increases the students' achievement in different teaching levels and subjects. In this search, Akçay supports the studies those of Tüysüz and Feyzioğlu's Science lesson in the 8th grade (2003), of Ebenezer's Chemistry lesson (2001), of Yenice's Primary School Science lesson (2003), and of Sulak's Primary School Maths lesson in the 6th grade. The search above, displays that computer aided learning method has a positive effect on the students' achievements and the findings of the search are parallel with them.

In conclusion, people encounter with computer almost everywhere in Turkey. It is unavoidable for computer to be used while it is commonly preferred by everyone. Enabling active participation and addressing more than one feeling at the same time, computer makes the learning states more dynamic and colourful.

Because of all these reasons, it is thought that computer aided teaching can be used effectively with many lessons including even Maths.

This research is one of the few search made about computer aided teaching in Primary School Mathematics in Turkey. According to the search results, the suggestions for the Mathematics teachers, classroom teachers, and the corporations growing up teachers, program developers and searchers studying on this section are:

1. In primary school level, computer aided learning method can be used more in Maths lessons according to learning areas.

2. In-service training programmes about introducing and applying computer aided learning method for Maths teachers.

3. In universities' Mathematics teaching department, much more lessons about computer aided learning can be studied.

4. Computer aided learning method, used in the search, can be tried on different class levels and different subjects in Maths lesson and then the results can be evaluated.

5. The problems that the Maths teachers, using computer aided learning method, encountered at the time of the applications, can be searched.

THE EFFECT OF UTILIZING BLENDED LEARNING STRATEGY ON THE ACHIEVMENT OF JORDANIAN FEMALE FOURTH GRADE STUDENTS IN ARABIC PATTERNS AND LANGUAGE STRUCTURES

Dr Sameer Al- Sous

sous@quttouf.com

ABSTRACT

This study aimed at identifying the effect of utilizing blended learning strategy on the achievement of Jordanian female Forth Grade Students in Patterns and language structure in Arabic Language. The subjects of the study consisted of (51) female students from a public school in the Directorate of Education of the Second District of Amman. The results of the study showed that there were statistically significant differences ($\alpha \geq 0.05$) attributed to the method of teaching in favor of the Blended Learning Strategy. In the light of this result, some recommendations were suggested.

Key words: *Blended Learning, Modes and Language Structure in Arabic Language, Achievement Level.*

INTRODUCTION

The remarkable infusion of Information and Communication Technology (ICT) into our lives has greatly affected the world today as well as the school as an integral part. The past twentieth century left a huge legacy of technology, communication in particular, changing the whole globe into a small village whose parts are closely connected via satellites and internet. In the light of the rapid developments of (ICT), it is imperative to raise the question: Where is the educational curriculum located nowadays? It goes without saying that the concept of the traditional curriculum, or the text book, has dramatically changed since it has no longer been a sufficient source of information for learners, where the mediated technologies and internet provide an easy and flexible access to information that every learner should take advantage of to obtain knowledge and develop the teaching – learning process.

However, could these technological advances have positive reflections on the re-innovation and development of educational curricula in a way that guarantees greater satisfaction that meets the aspirations of learners, instructors, and the whole society of all its institutions as well? Could an alignment be created between the curriculum and technology to produce what might be called the technological curriculum? With standing the fact that technological developments are always faster than the educational.

In effect of the Jordanian educational initiative with regard to computerizing the Arabic language curricula, the Ministry of Education signed an agreement with the French Telecommunications Company (Orange) on 4/11/2004. For this purpose, the roles have been determined to all participating parties in the project as follow: - The Ministry of Education: to supply labor force including supervisors and teachers, French Telecom: to finance the project, - Jordan Telecom Group: to manage the project in Jordan, E- Dimension: to implement the project and Enic Telecom Lille: (institute) to provide the technical expertise, guidance and general supervision.

The computerized Arabic language material is characterized by providing (480) hours of the curricula learning content accredited by the Ministry of education for all school grades (from the first grade to the twelfth grade), re – presenting the curricula in a richer and simpler way. Furthermore, it is based on the Blended Learning (BL) rather than the self – directed learning. (Jaradat 2006)

In general, Blended Learning (BL) is not considered a new concept. As a pedagogical approach, BL stems from most tendencies that called for combining learning strategies with a wide variety of modes and means; therefore this process has acquired different terminologies: Blended Learning, Hybrid Learning, and Mixed Learning (Orey, 2002). Being broadly varied, BL approach is based on several elements, such as: experience, context, students, learning objectives, and sources. Thus, there is no one specific strategy adopted for blending. To render a successful and effective Blended Learning relies on the ability to combine the proper and complementary different elements supporting each other in an adequate and practical manner. The definition of Blended Learning (BL) has been of interest to several studies. For instance, in Driscoll's study (2002), BL was defined as having four different meanings:

a- Combining various modes of internet – based technology to achieve an educational objective: Direct hypothetical classes, self – pacing learning, cooperative learning, video instructing, sound instructing, and texts. This definition was later supported by Singh, 2003.

b- Combining various pedagogical methodologies based on several theories: (the Constructive, Behavioral, Cognitive) to render optimal learning with or without the use of technology.

c- Combining any form of technology, like: Video tapes, CDs, Web – based training, Films to be utilized by the teacher in the face – to – face instruction.

d- Blending technology with real tasks in the process of teaching to produce effective creations that might enhance harmony between learning and actual work. This meaning was pointed out in the study of Bersin (2004) as the definition of BL.

Designing the Lessons of Blended Learning

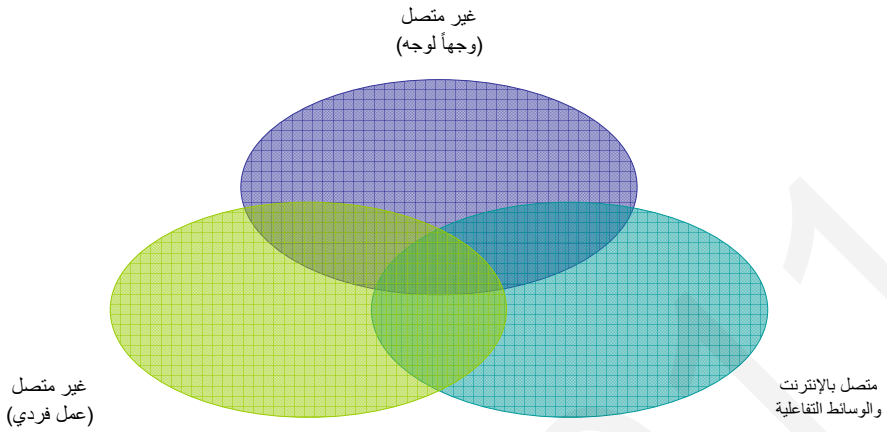
Designing lessons based on BL go through three basic procedures (Dziuban, Hartman, and Moskal, 2004): **First Stage:** Content Analysis: it could include :(General targets and learning objectives which constitute the compass that assists instructors to direct the whole parts of the lesson. Time Span: a time schedule must be determined to ensure a balance between internet activities on one hand and the activities of face - to -face learning on the other hand so as not to overuse one of them at the expense of the other. Those activities should be limited within specific and reasonable but sufficient time to fulfill tasks and activities. It is important to cover the class time adequately with activities avoiding time waste. Therefore, the designer of the program has to create extra activities for the teacher with latitude to decide on their timing. Prerequisites: they are required from both teachers and students. But, the specific academic skills related to the lesson in concern are to be highlighted over other technical skills. Determining the diversity of skills related to the content intended, such as: cognitive, procedural, intellectual, personal, psychomotor.

Second Stage: the methodology of implementing each component of the content. This can be applied in three ways: Offline (face – to - face and work – based) such as: lectures, shows, direct teaching, workshops, role – play, simulation, conferences, training, supervision, feedback, task learning, projects, field visits. Offline (individual work), for example: books, magazines, newspapers, exercise books, portfolio, revision, cassettes, video tapes, TV, radio, DVD, CD). Online and Interactive Media, for example: simplified learning resources, interactive contents, competencies support, simulation , e- instruction, e- training, e- supervision, feedback, e - mail, announcements boards, conversations, sound conferencing, video conferencing, hypothetical classes, research – based knowledge, consulting expertise, research engines, internet websites, news groups).

Third Stage: Analysis of Students Needs**, Fourth Stage:** Regulating requirements and limitations to organize work in general.

Sands (2002) pointed out a group of principles and strategies to be taken into consideration when designing for Blended Learning, they are:

1. Drawing a Venn diagram as illustrated hereunder.



2. Setting strategies workable for each group assigned to apply the content.

3. Reviewing the diagram after every stage of the four mentioned above with a view to reconstructing the diagram.

4. Starting simple with focusing on the final objectives of learning.

5. Focusing on the interactive aspect more than implementation: access to information via the internet might be more effective but it does not at the same time guarantee the actuality of students learning. Thus, the teacher is required to set a number of activities for students to perform basic academic tasks such as: summarization, analysis, and conversation.

6. Managing time in accordance with a clear strategy to be set by the teacher who should be able at the same time to teach new skills.

The Study Problem

The Arabic language is considered a basic and essential material for all students; therefore much of attention has been directed to this subject by teachers. The experiment of the Jordanian Ministry of Education is still considered new in relation to the tendency towards the adoption of BL strategy; thus such studies are of significant necessity. My study seeks to identify the effect of utilizing Blended Learning Strategy on the achievement of Jordanian Female Fourth Grade students in Arabic language patterns and structures. More precisely, this study attempts to find the answer for the following question: Is there a statistically significant difference (0.05>_a) between the two means of marks in the exam on the Arabic language patterns and structures for the fourth grade female students attributed to the groups (experimental and controlled)?

The Study Terms

Academic achievement: the total learning outcome of knowledge and rules related to the patterns and structures of the Arabic language as stated in the fourth grade text book for the year 2005/2006. This outcome is assessed according to the mark of students in the achievement test prepared for this purpose given directly after completing the material in concern.

Blended Learning: it is the learning strategy in which participate the teacher and the students with the utilization of the computer, the text book, the board plus other aids - all of which are to be used according to specific percentages determined by the teacher.

Class traditional teaching: through this traditional class teaching methodology, the teacher writes on the board the title of the lesson with examples adequate for students to discuss in order to elicit the rule and to be able to do the exercises provided in their text books.

The Study Limitations

- The study was restricted to include a sample of the fourth grade female students in Um Habiba Primary School in the Directorate of Education of the Second District of Amman.

- The study focus was limited to examine the language patterns and structures of the Arabic language as provided in the Arabic language text book of the second semester for the year (2009/2010).

- The study only used two measuring tools:

a. The computerized program authorized and applied by the Ministry of Education.

b. The achievement Test.

Therefore, the findings of this study can be generalized on other samples with similar conditions and limitations.

Participants

The participants were girl students from Um Habiba Primary School was randomly selected among the four exploratory schools that apply the e – learning of the Arabic Language – up to the date of preparing this study (Queen Rania Al – Abdullah School for Girls, Dirar Ibn Al- Azwar Secondary School, Um Habiba Primary School for Girls) . Two classes of the fourth grade from three in the school were randomly selected. The study sample from the two classes contained 51 female students. The sample was divided into two groups: the first which included 25 students was assigned as the experimental group to taught according to BL strategy, the second which consisted of 26 students was assigned as the controlled group to receive the traditional class teaching methodology only.

The Study Instruments

First: Learning Material: it was divided into: a. The computerized program; b. The material prepared specifically for the class traditional teaching; and C. The Achievement Test.

The Study Procedures

The study researchers followed the procedures as follows:

1. Reviewing the previous literature pertaining to Blended Learning and its relation with the academic achievement.

2. Designing the study instruments as stated above.

3. Obtaining an official permission from the Ministry of Education, The Directorate of Education of the Second District of Amman, and Um Habiba Primary School.

4. Determining the study sample divided into two groups: controlled and experimental.

5. Getting the results of the final exam in Arabic language (out of 100) for the first semester 2009/2010 from the school principle.

6. Training the teacher of the experimental group on the mechanism of applying Blended learning by enrolling her in a three – day course on BL in which all electronic material of the fourth grade in concern was displayed, allowing the teacher to review most of the lessons and examine their organization and structure. Then the teacher gave a lecture within the micro – teaching program after which she received the required feedback.

7. Conducting an Exploratory experiment.

8. Launching the actual practice of BL at the beginning of the second semester for the year 2009/2010. The teacher of the experimental group started to deliver the lessons of language patterns and related structures from both the book and the computerized material – which is often referred to by an icon of a CD displayed beside the exercises in the book.

To apply the strategy of Blended Learning, the teacher started the lesson on the board to be followed with the computerized material then the board again and the book. For this purpose, the teacher was provided with a laptop and data show by the Ministry of Education for the class to be equipped with necessary aids.

9. Ensuring that the students of the controlled group received the same material, but by delivering the traditional teaching methodology by another teacher who is equivalent in qualifications and experiences with the other group teacher.

10. Applying the achievement test (Post test) directly after completing the experiment.

11. Correcting the test according to the criteria defined by the referees.

12. Entering data and performing statistical analyses required for the purpose of this study.

The Study Findings and Discussion

In order to scrutinize the study hypothesis which has proposed the absence of statistically significant differences (0.05>_a) between the two means of the students achievement in the test on Arabic language patterns and structures for the fourth grade attributed to the two groups (controlled and experimental), Independent – Sample T – Test was used. The results are illustrated in Table (1)

Table (1) The Results of Independent – Sample T – Test to examine statistically significant differences between the two means of the two groups in the achievement test

Groups	No. of Individuals	Mean	Standard Deviation	T value	Degrees of Freedom	Level of Significance
Experimental	25	36.800	4.138	2.694	49	0.010
Controlled	26	33.115	5.505			

The findings of the statistical analysis illustrated in table (1) prove the existence of statistically significant differences between the two means of the two groups: controlled and experimental in the achievement test at the level of significance (0.05>_a) in favor of the experimental group.

The distinction of the experimental group that received Blended learning over the second controlled group who were taught according to the traditional teaching methodology can be attributed to a number of reasons, among them are:

first, the increased student – student interaction and students - teacher interaction through raising questions by the teacher about the material displayed on the computer screen; second, the teacher's use of a diversity of teaching methods – electronic and traditional in addition to her guiding and directive role. Furthermore, Blended learning provided a more cooperative and interactive social environment when compared to the environment in which students received only the traditional learning.

The study findings came in agreement with the conclusion found out in the following studies:

(Anderson, 2002; Dean, 2001; Job, 2003; N J Institute of Technology, 2005; Singh, 2003; University of Central Florida, 2001; Valerie, 2005)

Recommendations:

A number of recommendations based on the study conclusion are highlighted by the two researchers:

- To conduct studies related to utilizing Blended Learning in developing the various Arabic language skills.

- To re - apply this study on other populations with different places, ages, gender, or the academic grade.

- To encourage teachers to design computerized learning programs based on Blended Learning. Add the need for more attention and interest by the Ministry of Education in relation to this perspective.

ABSTRACT

This study investigates the effectiveness of Computer Assisted Instruction (CAI) on undergraduate students in kitchen and food hygiene. The instrument of this research is the Computer Assisted Instructional Package (CAIP) titled "cook safe"*. The research is a quasi experimental study, the sample of this study consists of control group (39 students) and experimental group (41 students) of the first year undergraduate students in its three different departments at the faculty of Specific Education, Alexandria University, Egypt. The student's pre-test and post test scores for two groups were analyzed using independent sample test, paired sample test and Eta-Squared η 2 .The results of this study showed that there is significant difference in the achievement of students in kitchen and food hygiene in favour of students who exposed to CAIP. Based on the research results, recommendations were made on the need to develop relevant CAI package for teaching kitchen and food hygiene in all departments of the faculty.

INTRODUCTION

Education technology has logically focuses on computing and information technology literacy (Clark,2001), it is a fact that there is now a wealth of digital resources and information and communication technology tools to support learning and teaching. (Conole, 2004). Computer Assisted Instruction (CAI) is teaching process in which a computer is utilized to enhance the learning environment by assisting students in gaining mastery over a specific skill (UNESCO, 2002). There are now several CAI packages on different subject because of the use of computer facilities and resources to enhance students' learning. (Yusuf, 2010).Computer assisted instruction (CAI) continues to increase, eventually offering several advantages. Some of the benefits of using CAI include emphasis on active learning, enrichment of collaborative learning, encouragement of greater students' independence and task-based teaching (Spinelli, 2001; Prvan et al., 2002). Computers have been promoted as a tool to facilitate learning, subsequently, an enormous growth and development of computer assist instruction CAI in health and hygiene (Werner,2009).

Domestic labor has been traditionally considered a family members' responsibility (Demo and Acock, 1993; Abdelgalil Mona S. 2005). A home is packed with places where germs can breed and spread easily. Kitchen is one of the most main areas have recently been classified as being at risk from contamination. Kitchen hygiene and food safety are an important part of all family members' health, so it is necessary to emphasis the importance of good food and kitchen hygiene practice and of the need to handle and prepare food in a safe

and clean environment (Food safety refresher,2010). The world is rapidly becoming more technologically complex. As a result, learners need to be taught and communicated differently than they have been in the past. Universities must prepare learners to become active members of this changing society to adapt to these transformations as they occur. Also, they must build rich online programs that facilitate and promote multi-way knowledge transfers by having various interactive communication methods, techniques and activities. To save time, energy and money in programs (Edmonds & Barron,2002).The objective of this study is to provides the understanding knowledge on kitchen and food hygiene for the development of students' awareness on kitchen and food hygiene management system, and encourage students to use new technologies e.g. CAI to support education in different domains.

Purpose of study

The study investigated the effect of CAI on the student's achievement in kitchen and food hygiene.

Research question

Will there be any difference in the achievement of students who exposed to the CAI package in kitchen and food hygiene and those taught the same contents using traditional method of teaching?

Research hypotheses

The following research hypotheses were tested in the study:

1- There is no significant difference in the achievement of experimental and control groups before exposing to the educational content of kitchen and food hygiene package.
2- There is no significant difference in the achievement of students who exposed to the CAI package in kitchen and food hygiene(experimental group) and those who taught the same contents using traditional method of teaching (control group).
3- There is no significance difference in the achievement of students (control group) before and after exposing to the educational content of kitchen and food hygiene package using traditional method of teaching.
4- There is no significance difference in the achievement of students (experimental group) before and after exposing to the educational content of kitchen and food hygiene package using CAI.

RESEARCH METHODOLOGY

Research design

This study was a quasi experimental type of the pre test, post test, control group design.
This study represents two groups of treatment; students exposed to computer assisted instruction package (experimental group), and students exposed to the traditional method of teaching (control group). The two groups included male and female students.

Population and sample

The target of this population of this research was all of the first year undergraduate students of the three departments (art education, music education and home economics departments) at the faculty of Specific Education, Alexandria University, Egypt. They divided into two groups depending on acquisition of a computer where computers are available for students' use and where the students are computer literate and selected as the experimental group, a traditional method of teaching was used with the control group. The sample of the experimental group is made up of 41 students, while the control group was made up of 39 students.

Research instruments

The instruments of this research were the treatment instrument Computer Assisted Instructional Package (CAIP) named '' cook safe '' Food safety Assurance System / e cook safe Issue 1 cited on http:/cooksafe.dumgal.gov.uk/food safety refresher/safety_40.htm,and the test instrument "cook safe –test your knowledge".

The treatment instrument, Computer Assisted Instructional Package on kitchen and food hygiene was a self instructional, interactive package that lasted for 80 min; the study of this Package aims to: Understand the importance of food safety, Know what makes food unsafe, Understand the consequences of unsafe food, Identify actions to ensure safe food hygiene practices.

Computer Assisted Instructional Package on kitchen and food hygiene contained thirteen (13) lessons structured into module. The topics covered in the package are: 1- Introduction to the kitchen and

hygiene.2- Hazards; microbiological, chemical and physical.3- Bacteria; Sources and growth, Food spoilage, Food poisoning, Food born disease.4- Training; types of training. 5- Personal hygiene; Personal cleanliness, Protective clothing, Reporting illness / exclusion. 6- Cleaning; Hazards, Methods, Precautions. 7- Temperature control; important temp, using a thermometer 8- Cross contamination prevention; Types, Personal, Equipment, Utensils and cleaning, Food allergies, dealing with food allergies. 9- Pest control; Methods of pest control, House keeping, Checking and inspection. 10- Waste control; Types of waste.11- Maintenance, Premises structure, Equipment and utensils.
12- Stock control, What is stock control, Stock control measures. 13- Kitchen roles and ways to improve kitchen storage space are added to the package and a few sub-headings deleted from the package to facilitate the study. All related to the home management curriculum of the faculty of specific education Alexandria University. It was developed by the researchers to reinforce concepts that appear difficult in this research. The package is provided by the sites related to the topic for more information e.g. http://www.dolceta.eu ,www.eufic.org ,http://www.doityourself.com

This package was chosen for its easy language, simple design, its clarity, cover a subject that most related to family daily activities. The test instrument "kitchen and food hygiene package" was a (26) item multiple choice objective test, fill in achievement test.

Procedure of data collection

All the experimental and control group were exposed to the kitchen and food hygiene test as pretest. Then the students in experimental group were exposed to CAI package.

The students in the experimental group were introduced to the CAI package under lecturers' supervision, long enough for them to be familiar with the navigation buttons and use the package independently.

The control group students were exposed to the traditional method of teaching (face to face method) on the same content used for experimental group, using a conversation and a whiteboard.

The treatment for the two groups lasted for 6 weeks. After the treatment the two groups were exposed to the achievement test which had been rearranged as post test. The raw data were coded and analyzed statistically in SPSS software program (statistical package for social science) version 10.0

RESULTS

The scores of the students in the two groups were analyzed by comparing means of the scores using Paired Sample Test, independent sample test and Eta-Squared η 2. The analysis was done using the four research hypotheses state for the study. The results of the analyses and discussions are as stated below.

Hypotheses one

There is no significant difference in the achievement of experimental and control group before exposing to the educational content of the kitchen and food hygiene package.

Table (1a) differences means between experimental and control group before exposing to the treatment

	VAR.	N	Mean	Std. Deviation	Std. Error Mean
Experimental and control group before treatment	Experimental gr.(A)	41	8.93	4.22	.66
	Control gr.(B)	39	8.62	3.87	.62

Table (1b) Independent samples test between experimental and control group before exposing to the treatment

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Experimental and control before treatment	.031	.862	.344	78	.732	.31	.91	-1.49	2.12
			.344	77.906	.731	.31	.90	-1.49	2.11

An examination of the table (1a,1b) reveals that t score = .344 and the significance of t α =.862 is more than the 0.05 alpha level. This means that no significant difference between the two groups before treatment, so hypotheses one is accepted.

Hypotheses two

There is no significant difference in the achievement of students who exposed to the CAI package in kitchen and food hygiene(experimental group) and those who taught the same contents using traditional method of teaching (control group).

Table (2a) differences means between experimental and control group after exposing to the treatment

	VAR.	N	Mean	Std. Deviation	Std. Error Mean
Experimental and control after treatment	Experimental gr. (C)	41	21.07	3.47	.54
	Control gr. (D)	39	16.41	3.64	.58

Table (2b) Independent samples test between experimental and control group after exposing to the treatment

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Experimental and control after treatment	.909	.343	5.863	78	.000	4.66	.80	3.08	6.25
			5.856	77.271	.000	4.66	.80	3.08	6.25

An examination of the table (2a, 2b) reveals that t score =5. 863 and the significance of t α =.000 is less than the 0.05 alpha level. This mean that there is a significant difference between the two groups after exposing to the kitchen and food hygiene package , so hypotheses two was therefore rejected.

To confirm the effectiveness of the CAIP in kitchen and food hygiene on the student using Eta-Squared η 2 (Abo Hatab &Sadek 1996) (η 2) equation $(\eta\ 2) = \frac{t^2}{t^2+df} = 30.589401\%$

This mean that there is a strong effect of the CAIP on the students' achievement.

Hypothesis three

There is no significance difference in the achievement of students (control group) before and after exposing to the educational content of kitchen and food hygiene using traditional method of teaching.

Table (3a) Paired Samples Statistics mean of experimental group before and after treatment

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	Control group before treatment	8.62	39	3.87	.62
	Control group after treatment	16.41	39	3.64	.58

Table (3b) Paired sample test of control group before and after treatment

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			

Pair 1	Control group before and after treatment	-7.79	2.17	.35	-8.50	-7.09	-22.469	38	.000

An examination of the results in the table (3a,3b) showed that the t score = 22.469 and the sig of t = 0.000 is less than the 0.05 alpha level. This mean that there is significant difference between the students' scores for the control group before and after exposing to the educational content of kitchen and food hygiene using traditional method of teaching, in favour of students who are exposed to the educational content of kitchen and food hygiene package, so hypotheses three is rejected.

Hypotheses four

There is no significance difference in the achievement of students (experimental group) before and after exposing to the educational content of kitchen and food hygiene package using CAI.

Table (4a) Paired Samples Statistics mean of experimental group before and after treatment

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	Experimental group before treatment	8.93	41	4.22	.66
	Experimental group after treatment	21.07	41	3.47	.54

Table (4b) Paired sample test of experimental group before and after treatment

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	Experimental group before and after treatment	-12.15	4.66	.73	-13.62	-10.68	-16.685	40	.000

An examination of the results in the table (4 a,4b) showed that the t score = 16.685 and the sig of t = 0.000 is less than the 0.05 alpha level. This mean that there is significant difference between the students' scores of the experimental group before and after exposing to the educational content of kitchen and food hygiene using CAI package, in favour of students who are exposed to the CAI package in kitchen and food hygiene, so hypotheses four is rejected.

DISCUSSION OF FINDINGS

The results of the analysis showed that both sample's mean in control group (8.62± .62) and experimental group (8.93± .66) were similar in their scores before their exposure to the educational content of kitchen and food hygiene, that there were no significant difference between experimental group and control group.

So the two samples were equivalent. The results showed also that there were significant differences between experimental group (mean= 21.07); who exposed to the kitchen and food hygiene package using CAI and the control group (mean= 16.41) who exposed to the same educational content of kitchen and food hygiene using conventional method of teaching in favor of the experimental group . These findings reveal that CAI increases the learning levels of students and improves their achievement to the kitchen and food hygiene compared with traditional method of teaching and confirm the importance of using CAI in teaching.

This findings similarly agree with previous findings of Willam (1989) in hospitality management , the findings of Wilson & Sneed (2001) in a veterinary anesthesia , Basturk (2005) in statistics, Aliasgari , Riahinia &Mojdehavar (2010) in mathematics and Yusuf & Afolabi (2010) in biology.

Results reveals that the mean scores of students in experimental group before and after exposing the educational content equal 12.15 which is more than the mean scores of students in control group before and after exposing the educational content which is equal 7.79, that means that the educational content affects on both groups but the most effective way is using CAI package.

Recommendation

Based on the results of this study the following recommendations are made:

1- Necessary attention should be accorded to computer literacy, and using the CAI package method of teaching in diverse domains.
2- The importance of applied kitchen and food hygiene package to the students in different domains in the faculty and consider it as a cultural course to the other faculties because of its importance in our daily life.
3- New technologies and software featuring CAI should be implemented and used in teaching process especially for those courses which contain illustrations and stimulated software, could help students to utilize stimulated objects, concepts and problem solving.
4- To emphasis the importance of good food and kitchen hygiene practice and the need to handle and prepare food in a safe, clean environment and provides the understanding knowledge of kitchen and food management for the development of students' awareness.

ABSTRACT

Cooperative learning is a process through which students with various abilities, gender, nationalities and different level of social skills carry out their learning process by working in small groups and helping each other. Cooperative learning is a pedagogical use of small groups which enable students to maximize both their own and others' learning.

This study was carried out in order to identify the efficiency and the effects of cooperative learning techniques on the reading skills of the students who learn Turkish as a second language. A total of 40 students (20 subjects in experimental group, 20 subjects in control group), who learn Turkish as a second language at Istanbul University Language Center, participated in this study which was done in accordance with the 'pre-test post-test control group' model as one of the experimental research designs. In the experimental group, cooperative learning techniques were used for reading comprehension activities, while traditional teaching model was followed in the control group. The data were gathered through the 'Reading Comprehension Skills Achievement Test' developed by the researchers, and a number of suggestions were made to develop reading skills in teaching Turkish as a foreign language.

Keywords: cooperative learning, reading comprehension skills, teaching Turkish as a foreign language.

1. INTRODUCTION

Thanks to communication and information technologies, the disappearance of the borders with the spread of globalization, and the world's getting smaller make it necessary to learn a foreign language. In accordance with these advancements, the interest in Turkish language also increases.

Upon a boom in the interest in Turkish language, those working in the field mostly focus on how to teach Turkish more effectively or how students can learn this language on their own. In other words, the innovations in the field of education have started to be applied in teaching Turkish as a second language.

As it has already been known, teaching a language is a multidimensional task which requires different techniques and methods compared with teaching other subjects. In order to study a language either as a first or second language, one makes an effort to develop and integrate four basic skills which are listening, speaking, reading and writing. However, it is difficult to improve all these skills all at once in terms of teaching a foreign language since proficiency in learning a foreign language differs from an individual to another, whereas a native language can be learnt by all the members of a society to some extent. Therefore, it is necessary to make use of various methods and techniques which will minimize the differences within a classroom and help learners to participate in lessons equally. Cooperative learning which is the focus of this study is one of these methods which help learners to participate in lessons equally and effectively.

1.1. Cooperative Learning

As a learner-centered method, cooperative learning is a teaching method by which learners study by helping one another in small groups in their learning process in order to achieve a common objective

(Açıkgöz, 2003). Cooperative learning as a concept consists of several instructional methods in which learners study a language in small groups of 4-6, and group performance is rewarded in several different ways (Slavin, 1988).

Cooperative learning is an in-class learning approach which is used to help learners develop a positive image both for themselves and their peers, and to improve problem solving and critical thinking skills in order to encourage learners in terms of social skills based on cooperation (Gömleksiz, 1993). Cooperative learning is a learning method in which learners help each other in terms of their learning process by making up small homogenous groups to achieve a common goal; and in which group performance is rewarded in several different ways.

There are differences between learners' studying in groups and cooperative learning method. In group-work, learners can sit around a table while studying, but they cannot communicate with each other independently while studying together. Therefore, small study groups cannot affect each other positively. That's why, their communication can be considered to be individual learning. Then, in cooperative learning, learners' efforts are rewarded as a group. To illustrate, if learner groups are to do an assignment, if only one student does that whole task, and studies without the help of the others, this cannot be considered as a group work based on cooperative learning method. In cooperative learning groups, sense of responsibility means that group members should know that materials prepared by all group members are for the sake of the success of the group. The learners in these groups do not need to learn how to cooperate since teachers manages the organization and the structure of the groups (Johnson and Johnson, 2002).

In order for a group work to be a cooperative one, learners should be aware of the fact that they need to study so as to maximize the learning of both their own and their friends. In these groups, learners make an effort to maximize their own and other group members' learning since the performance of cooperative learning groups is possible only when each individual struggles for the benefit of all group members.

For a group work to be considered a cooperative learning process, following components and conditions should be taken into consideration:

1. Group reward: In order for members of a group to succeed, it is necessary for the group itself to become successful.

2. Positive interdependence: It creates a situation in which individuals make a common effort for the reward and their common goal which can in fact be possible via positive dependence, positive product dependence, and positive process dependence.

3. Individual accountability: It means that group success depends on the learning of each and every individual. Every learner has the responsibility to learn the subject and do whatever must be done.

4. Face-to-face promotive interaction: It means that group members motivate one another.

5. Social skills: It is about teaching learners how to build relations among individuals and encouraging them to use this.

6. Group processing: It is about identifying which behavior of the members benefit to the success of the group, and also which behaviors should continue and which ones should be modified.

7. The opportunity for equal success: It is about benefitting to the success of the group by developing their own behaviors and this can be achieved through a specific grading method (Açıkgöz, 1992).

In cooperative learning method, the realization of individual objectives is dependent on the overall success of the group. Therefore, the ones who want to be successful are forced to help other group members. Wilkinson (1994) states that cooperative learning enables fast learners to help respectively slow learners in terms of improving their skills. In other words, every learner struggles to develop both themselves and other group members because they are aware of the fact that the success of the group depends on the performance of each individual.

According to cooperative learning, group is a whole entity and all the members are responsible for the success or the failure of the group. As Senemoğlu (1998) quotes from Webb, Deering, and Melath, a group goal encourages learners to make an explanation in order to help their learning; to teach them learning strategies; and to communicate actively based on a theme, whereas it motivates low-level learners to ask for help. In cooperative learning groups, even though the success of the group is the focus, it should be noted that it is also based on individual performance of the learners.

1.2. Cooperative Learning Techniques

Within the framework of its basic principles, several cooperative learning techniques have been developed. Of all these, the most widely exploited techniques are presented below (Açıkgöz, 2007):

1. Learning Together
2. Academic Conflicts
3. Learners Teams
   a. Learners Teams- Achievement Divisions
   b. Team-Game-Tournament
   c. Team Pair Solo
   d. Cooperative Reading and Writing
4. Group Research
5. Co-op
6. Jigsaw I
7. Discovery
8. Jigsaw II
9. Ask Together - Learn Together

The learning techniques to be used in classroom environment need to be chosen considering lesson objectives, subject, learners' achievement levels, their skills and available amenities. If teachers and learners are not experienced in using cooperative learning techniques, they had better choose more well-structured techniques (Slavin, 1980; Yıldız, 1999).

In this study, of all those cooperative learning techniques, "Ask Together - Learn Together" is used because this technique consists of instructional tasks which help the development and evaluation of comprehension skills.

1.2.1. Technique of Ask Together - Learn Together

This technique has been developed by Açıkgöz (1990). According to Açıkgöz (1992), it is based on the principle of sheer cooperation among learners and it does not give the opportunity to do nothing. This technique gives utmost importance to positive interdependence within group, individual accountability, group processing, reward, and face-to-face promotive interaction.

In Ask Together - Learn Together Technique, the following materials could be exploited:

Reading Texts: Some excerpts or sections taken from books, stories or notes prepared by the teacher can be used as reading materials.

Question-Response Cards: These are the cards on which the questions and responses of the group and individuals might be written and its size might vary depending on the activity.

Theme Sheets: This is a paper on which important points to be considered during reading are listed.

Group Presentation Evaluation Forms: It is developed by the teacher to evaluate group presentations in terms of content and organization.

Examination: It consists of multiple choice or short-response questions which are about the subject. It must not exceed 10-15 minutes.

The following are the suggested steps to be followed while carried out the Technique of Ask Together - Learn Together:

1. Organizing groups: Groups ideally should consist of 3-4 learners. It is important to organize groups heterogeneously based on their skills, level of achievement, gender, and their socio-economic status. Finding a name for each group has a positive effect on motivating learners and attracting their attention into the lesson.

2. Reading: Each learner reads the related text or section individually and silently. The teacher might inform the learners about the important points to be considered during reading or the themes.

3. Preparation of Learner Questions: It is the step at which learners are expected to prepare questions about the reading or the themes. They write the questions on a card. The teacher grades each questions based on their level and accuracy, which is necessary to monitor the performance of each learner.

4. Preparation of Group Questions: Having prepared individual questions, members come together to prepare the group question. Learners are expected to explain the positive and negative aspects of each question to one another rather than tagging them as bad or good. In order to make sure learners' participation, learners are given roles in turns such as recorder, postman, reporter, debate leader, and invigilators or monitors.

5. Sending Group Questions: The question prepared by the group is written on a card and sent to another group chosen randomly by a student with the role of a postman.

6. Responding to Group Questions: This is another step requiring the cooperation of group members. The fact that each group has only one question card is necessary due to positive interdependence.

7. Presenting Responses to the Class: By means of spokespeople that they have chosen, the groups present their response to the question they have to the whole class. In order to guarantee the learning of everyone in the group, the spokespeople can also be chosen by the teacher rather than the group members.

8. Evaluating Group Presentations: The performance of the spokesperson is evaluated by the teacher or other students. The teacher might give a form for this; and after the evaluation process, a point is given to the spokesperson and the group.

9. Whole-class *Discussion*: After the groups have completed their presentation, the teacher can start a discussion by summarizing the subject. During this discussion, it is aimed to clarify the points that could not be focused on and not understood completely.

10. Testing: After the session is completed, all students take an exam individually. The points gathered from the exam and their presentations are summed up and a group point is measured. By comparing group points to previously defined criteria and a scale, groups are given rewards which are also decided in advance such as "very good", "good", "not bad".

2. METHOD

2.1. Design of the Study

In the present study, experimental research model consisting of pre-test, post-test with a control group was applied. Experimental group was taught through Ask Together - Learn Together, whereas control group was taught through traditional teaching methods which involve lecturing and question-response.

The experimental research model is shown on Table-1:

Table 1: Experimental Research Model

Groups	Pre-test	Experiments	Post-test
Experimental Group	Reading Comprehension Achievement Test	Cooperative Learning	Reading Comprehension Achievement Test
Control Group		Traditional Teaching	

2.2. Participants

The study was carried out at Istanbul University Language Center and subjects were chosen from the learners who study Turkish as a foreign language in Turkey. For this study, a total of 40 students who learn Turkish at B1 level according to Common European Framework, and 20 of the subjects were in experimental group, while 20 students were in the control group.

2.3. Data Collection Instruments and Analysis of the Results

The data of the study were gathered through "Reading Comprehension Achievement Test" which had been developed by the researchers. Firstly, during an 8-week period until the experimental tasks were finished the objectives and skills which had been aimed to be taught were identified and a comprehension test was developed in order to test the level of achievement. The KR coefficient of the test was calculated as .7984. In this test composed of 24 multiple choice questions, there are 6 texts 2 of which are informative; and there are also 3 stories and a poem among these texts.

The data of the study were analyzed through software package SPSS 11.00 (Statistical Package for the Social Sciences). In order to understand the efficiency of cooperative learning method, pre- and post-test results were compared and t-test scores were analyzed to see whether the differences were significant or not.

3. FINDINGS AND DISCUSSION

In order to analyze the effects of cooperative learning method and traditional teaching methods on reading comprehension skills and achievements of the students learning Turkish as a foreign language, first Reading Comprehension Achievement Test were carried out both in experimental and control groups and then the differences were compared.

Tablo 2: A Comparison of Reading Comprehension Achievement Pre-test Scores of Experimental and Control Groups

Group	N	$\bar{x}$	Ss	Sd	t	P
Experiment	20	14,15	4,46	34	0.59	0.55
Control	20	13,97	4,44			

p>.05 (insignificant)

When the mean scores of experimental and control groups (the mean score for the experimental group is 14.15; the mean score for the control group is 13.97), are compared, it can be seen that these scores are very close to each other, and the facts that there is no significant difference between the mean scores of these groups shows that groups were at a similar level of achievement at the beginning.

In order to analyze the effects of cooperative learning method on reading comprehension skills and achievements of the students learning Turkish as a foreign language, according to the Reading Comprehension Achievement Post-Test results of cooperative learning and traditional teaching method groups, their means scores, standard deviation scores were calculated and t-test was conducted.

Tablo 3: A Comparison of Reading Comprehension Achievement Post-test Scores of Experimental and Control Groups

Group	N	$\bar{x}$	Ss	Sd	t	p
Experiment	20	20,46	4,28	34	2.41	0.02
Control	20	15,27	3,88			

p>.05 (insignificant)

Table 3 shows the difference between reading comprehension achievement post-test scores of experimental and control groups. The mean score of the experimental group is 20, 46, whereas the mean score of the control group is higher than 15, 27. As a results of the statistical 2-tailed t-test results, p value is lower than .05 and the t score is 2, 41. The results show that there is a significant difference between the mean scores of the experimental and control groups and it was observed that cooperative learning method applied in experimental group has a higher effect on reading comprehension skills when compared with the effects of traditional teaching methods.

Tablo 4: A Comparison of Pre and Post-test results of Reading Comprehension Achievement Test Scores of Cooperative Learning Group

Experiment Group	N	$\bar{x}$	Ss	Sd	t	p
Pre-test	20	14,15	4,46	18	4.42	0.01
Post-test	20	20,46	3,28			

p>.05 (insignificant)

Table 4 shows that the mean scores of post-test results (20, 46) of cooperative learning group is higher than their pre-test scores (14, 15). In order to analyze the significance of the difference statistically, t-test was carried out and it shows that there is a significant difference between the mean scores of pre-test results of the cooperative learning group when it is compared with their reading comprehension achievement post-test scores. (sd=18, t-test=4,42, p<.05).

Tablo 5: A Comparison of Pre and Post-test Results of Reading Comprehension Achievement Test Scores of Traditional Teaching Group

Control Group	N	$\bar{x}$	Ss	Sd	t	p
Pre-test	20	13,97	4,44	17	1.18	0.16
Post-test	20	15,27	3,88			

Table 5 shows that the mean scores of post-test results (15, 27) of traditional teaching group is higher than their pre-test scores (13, 97). In order to analyze the significance of the difference statistically, t-test was carried out and it shows that there is no significant difference.

6. CONCLUSION AND DISCUSSION

Considering the results of the present study, it is obvious that cooperative learning is more effective in improving reading comprehension skills of learners who study Turkish as a foreign language when compared with traditional teaching methods. Moreover, the students expressed that they had fun

during experimental studies; they did not get bored since they were active during almost the whole lesson, and finally they got to know their classmates more thanks to these activities.

Since reading is a multidimensional process covering various aspects such as communication, perception and cognitive, affective and kinesthetic process (Sever, 1995), carrying out reading comprehension activities through cooperative learning strategies has helped the process to be experienced more actively.

As a consequence, following suggestions can be made:

1. In this study, as one of the cooperative learning techniques, Ask Together - Learn Together technique was used. In parallel to lesson objectives, further research could be done to analyze the effect of other cooperative learning techniques on teaching Turkish as a foreign language.

2. Cooperative learning techniques could be benefited not only in terms of reading comprehension skills but also in respect to developing other language skills such as grammar, writing, and speaking.

3. Since studies covering a short period of time is restrictive and misleading, further studies covering a longer period of time could be carried out in respect to the effectiveness of cooperative learning model.

ABSTRACT

This study is aimed to help students in writing Jawi and to introduce them with the better ways of identifiyng Jawi letters that cannot joint together with the next alphabet in Jawi writing system. It is also hoped that the new learning method will enhance students' interest to learn Jawi. Samples from four difference schools were chosen in this study. The primary schools' pupils are from Bukit Kalam Primary School and Pantai Primary School, Federal Territory of Labuan, Malaysia. The secondary schools' students are from Labuan Technical Secondary School, Secondary Science School of Labuan, Lajau Secondary School and Taman Perumahan Bedaun, Secondary School. The samples' level of proficiency in writing and reading Jawi script range from low to intermediate level only.

INTRODUCTION

The *Jawi* alphabetical system is a writing method that has exist for centuries in Nusantara Region amng the South East Asian country. The *Jawi* alphabets composed of Arabic Alphabets were adapted for Malay writing. It is written from right to left and has 6 more letters (sounds) not found in Arabic alphabetical system: ca, pa, ga, nga, va, and nya.

Jawi lesson is part of the Islamic Studies subject in Malaysia Education system for primary and secondary schools. The lesson can be taught to any students who are interested to learn. Because of early and sometime only exposure to the Romanic alphabetical system, the primary schools' pupils and the secondary schools' students have been found to face difficulties in learning Jawi.

PROBLEM OF STATEMENTS

Based on the pupils' performances it is found that most of the low level proficiency pupils are unable to read, to write, and to identify correctly the single letter that should be joined together when writing Jawi. The time allocated to teach this subject is only half an hour per week. The class's short duration contributes toward the pupils' inability to understand the concept in Jawi lesson. Jawi is very unique because there are many ways in spelling and joining the letters. When the pupils cannot understand these basic concepts, they will become uninterested in learning Jawi. The pupils also perceived that Jawi is not as important as English or Mathematic because it is excluded from the national examination and a very

tough subject too!. This papers come out of ways to make the subject easy and interesting. Its also want the students to place great importance in their achievement in this lesson. Each time the teacher teach the subject; they have to explain the concepts in detailed and elaborate descriptions repetitively. The non-stop lecturing made teachers exhausted and frustrated after each lesson.

Meanwhile, the text book's instructions are also not very clear and can confuse the students understanding. Exercise on joining the letters asks the pupils to join the Jawi letters. Every single letter is followed by add (+) symbol. Most of the student will join all the letters because of the add symbol, when in fact, only certain Jawi letters can be joined to another letters in the exercise.

This is an example of the text book's instruction for joining single letter Jawi.

Pupil's answer	Join the single letter below
	ل + و + ف + ا

This is the modification that made easier to follow the instruction when joining Jawi letters.

Pupil's answer	Join the single letter below
لوفا	ل + و – ف + ا

All these teaching problems and students' difficulties in learning Jawi lead to a conclusion that there is there firm but yet simple technique to explain the concept of writing and joining Jawi letters? Several techniques and approaches to get these pupils to embrace this legacy subject. After trials and errors and many modifications, finally this papers managed to establish with two techniques to solve these major issues.

First technique is named as DALIL and it is a technique that helps pupils quickly to be able to write Jawi. Second technique is AVU ZAR ZAD; a method for identifying which Jawi letter can join or remain alone. The students' performance and passing rates increase tremendously after successful implementation of these techniques. Even though, Jawi is not been considered for evaluations in the primary national examinations, it is evaluated in the Lower Secondary Examination (PMR) and Malaysian Certificate Examination (SPM). This studies hope to boost the advancement of Islamic Studies Subject in the secondary examination. At the same time it will also preserve our heritage and legacy.

FOCUS OF THE STUDY

The main focuses of the studies is on the most basic and important elements of writing and joining of the letters. The studies is to determine the effectiveness of these two techniques:

- DALIL Card:

  A technique in writing simple words in Jawi.

- AVU ZAR zAD:

  A technique in identifying which letter can be join with another

letters (using add (+) and subtract (-) symbols).

OBJECTIVE OF STUDY

General Objective

To enhance the students' proficiency in Jawi subject; this will result in improving the quality of students' performance in the Lower Secondary Examination (PMR) and Malaysian Certificate Examination (SPM) Islamic Studies subject.

Specific Objectives

The specific objectives of the studies, are as follows:

- To increase the students' interest and ability in learning Jawi.
- To enable the students to write in Jawi script.
- To enable students to identify letters in Jawi that can be join together.

SAMPLING AND TARGET GROUPS

The target groups are students with different ability level from different age sets. The first groups consisted of 10 pupils from Year 2 (8 years old with low ability), whereas the second consist of 16 pupils from Year 6 (12 years old with low ability). These two groups are under the same level of proficiency from Bukit Kalam Primary School, Federal Territory Labuan. The third group consisted of 10 pupils from of Year 4 classes Pantai Primary School, Federal Territory Labuan (low and intermediate ability 10 years old). The last group are students from secondary schools. The sampling are 55 students (low and intermediate ability teenagers) from Technical Secondary School, Science Secondary School, Lajau Secondary School and Taman Perumahan Bedaun Secondary School, Federal Territory Labuan.

RESEARCH IMPLEMENTATION

Identification of the problems

Most pupils are found to not be able to maintain concentration for the whole period of Jawi lesson. The pupils' answers in the test papers, exercises and pre-test confirmed the finding that they do not command a solid grasp on the lesson concept. Thus, unable to answer the question correctly. Pupils were also depending too much on the teachers' *spoon feeding*.

Research Implementations

The pupils in the classroom can be divided into 3 groups for teaching and learning. There are group A for high proficiency, group B for intermediate and group C for low ability. The group C pupils always left behind when it comes to grasp the concept of the lesson. This same problem faces other Jawi teachers in the class.

The study begins with pre-test to identify the weak pupils in two competencies areas. The first competency area tests the student skill in writing Jawi. They were given test that requires them to convert ten words from Roman script to Jawi script. The second test expects pupils to identify any Jawi letter that

can be joined or not. The test contains ten questions that asked the pupils to join the Jawi letters appropriately. The same test is given all the primary schools' pupils and another set of questions is prepared for the secondary schools. The pre-test conducted for the four secondary schools been carried out centralized in the Labuan Federal Territory, Education Department. The suitable students were identified during this centralized test for the study. After the test , 55 students were selected from different proficiency level to be the sample of the research. The results of the tests are as below:

Table 1: Analysis of Pre-Test Result (10 Pupils, Year 2)

Test score range	Grade	Before the aid of DALIL Technique		Before the aid of AVU ZAR ZAD	
		Number of pupils	Percentage %	Number of pupils	Percentage %
10	A	0	0 %	0	0 %
8 - 9		0	0 %	0	0 %

Table 4: Analysis of Pre-test Result Secondary Schools Students (35 students) (Before with the aid of DALIL technique)

Test Score range	Grade	Before the aid of DALIL technique	
		No. of student	Percentage %
31 – 40	A	0	0 %
21 – 30	B	1	3 %
11 – 20	C	14	40 %
0 - 10	D	20	57 %
% of passes		43 %	
% of fail		57 %	

A pretest was used to test and measure the pupils' and students' proficiency in writing and joining letters.

Analysis of the Problem Identified

According to the outcome of the test, baesd on the table below, the studies found that students have great interest in the subject. The analysis is based on the two competencies of writing and joining letters.

Table 5: Pre and Post Test Analysis of Writing Skill After Using the DALIL Technique

School / Year	% pre DALIL		% post DALIL	
	Fail	Passes	Fail	Passes
Year 2 Bukit Kalam Primary School	**100 %**	**0 %**	**0 %**	**100 %**
Year 6 Bukit Kalam Primary School	**100 %**	**0 %**	**0 %**	**100 %**
Year 4 Pantai Primary School	**80 %**	**20 %**	**0 %**	**100 %**

Combination of the 4 Secondary Schools	**57 %**	**43 %**	**17 %**	**83 %**

Table 6: Pre and Post Test Analysis of Writing Skill After Using the AVU ZAR zAD (AVZZ) Technique

School / Year	% pre AVZZ		% post AVZZ	
	Fail	Passes	Fail	Passes
Year 2 Bukit Kalam Primary School	100 %	0 %	20 %	80 %
Year 6 Bukit Kalam Primary School	100 %	0 %	0 %	100 %
Year 4 Pantai Primary School	80 %	20 %	0 %	100 %
Combination of 4 Secondary Schools	54 %	46 %	6 %	94 %

Based on the analysis shown above, these two techniques were very helpful in enhancing the student's Jawi proficiency.

IMPLEMENTATION

The low proficiency students were identified through observations, teaching and learning sessions, exercises, examination results, and pre-tests. These low proficiency students were tested at difference time. First, the study conducted a test to identify the student's writing Jawi competencies. Secondly, the students were tested on their ability to identify the Jawi letters that can be joined. After they have completed the pre-test, the answers were analysed. The answers were not discussed because the test will be conducted again as a post-test. The studies introduced the DALIL and AVU ZAR SAD techniques to the weak pupils in the remedial sessions as soon as they were identified.

DALIL Card

The students been interviewed to gauge their ability in writing Jawi. The questions are on the subject of the similarity between Jawi and Roman alphabets. For examples, the students been asked on which letter in Jawi is the same as letter 'b' in the Roman script. None of the students could answer the questions. Later, an alphabet table called DALIL CARD been distribute to the pupils. The alphabet table showed the

similarity between Jawi and Roman script. The alphabet card uses the system of alphabet arrangement based on the combination of the latest Jawi grammatical spelling.

The test process been repeated. The same questions been asked and now the students can answer them accurately!. As for the drilling, a subjective exercise been given, where the students were asked to write down the similarity for each single Jawi alphabet and Roman alphabet. Then, the students were asked to write ten simple Jawi words. After satisfied with their performance, the students been given a simple post-test exercise which consist of ten questions. The questions requires the student to convert ten simple words from Roman script to Jawi script. The stuides discovered that the students can comfortably complete their test in brief. None of the students left any questions unanswered. They answered all the questions completely. The effort is rewarded and really satisfied with the results. The studies shows that the student can just be facilitate rather than spending time giving them lecture. The student utilized the DALIL Card as a reference for the entire questions. Before DALIL Card was used as teaching aid, the pupils from primary school did not score any mark, but after they were taught to use it, their achievement increased to one hundred percent passes. Since some of the test questions for the secondary schools student are highly difficult, as it involved Jawi grammatical spelling, the secondary school students' result were only increased to forty percent.

AVU ZAR zAD

Although most of them could convert the words correctly to Jawi script but it does not mean that they can join the alphabet. What will happen if we asked them to join the letters? The students were found to join the letters without any thought about which letter can join or not. In order to evaluate the students' actual ability, we test them again with ten questions on joining letters.

From their answers, we concluded that the students did not know which Jawi letter can join or not. Immediately we began our corrective session. We introduced to the student Jawi letters that cannot join which are the letters that sound 'AVU ZAR zAD'. AVU ZAR zAD is a combination sound of Jawi letters for Alif, Va, Wow, Zai, Ro, Zal, and Dal. If there is any letter from AVU ZAR zAD is found in a word a subtract symbol (-) is placed after them. The add symbol (+) is placed after the other alphabets in Jawi which do not falls under AVU ZAR zAD.

After we introduced this technique, the students did very well in the post-test. For the primary school, their achievement increased from zero percent to hundred percent for the two classes in level two. For level one pupil, the percentage of passing score increased to eighty percent and the secondary school students passing rate swell to ninety-four percent from forty-six percent. From the analysis, we can concluded that the overall results indicate positive impact from using of two techniques to teaching aid in writing and joining the Jawi alphabets.

CONCLUSION AND SUGGESTIONS

As far as the test results are concerned, the studeise indeed very grateful because there are vast improvement in term of abilities from the pre-test and the post-test results. It shows from all the samples that have been made are remarkable improvement in their scoring. In fact, fourteen students from the

secondary schools' managed to achieve full marks (10/10) in the post-test questions, when they could only managed scores of 0 to 9 in the pre-test.

As for writing skills, the three primary schools pupils samples achieved one hundred percent scores in the post-test, where they failed to score any marks in the pre-test. These show that DALIL Card and AVU ZAR Zad techniques really help the pupils and the students. Till now our students still use the DALIL Card during the lesson. However, for some students and pupils that have already mastered the use of DALIL Card and AVU ZAR zAD techniques, they do not refer to the DALIL card or place add or subtract symbols when attempting class exercises any longer. These are suggestions to develop for future research.

- Introduce these learning techniques as early as possible to pupils who have difficulties in learning Jawi.
- Distribute the Dalil Card, so that it can be used to teach other pupils who have similar difficulties learning Jawi.

THE EFFECTIVENESS OF LANGUAGE LEARNING STRATEGIES ON VOCABULARY LEARNING IN TEACHING TURKISH AS A FOREIGN LANGUAGE

Dr. Fatma BÖLÜKBAŞ
Istanbul University Foreign Languages Department
fbolukbas@istanbul.edu.tr

ABSTRACT

Learning strategies are all approaches and behavior that both an individual uses while learning and that make it easier to learn. The learning strategies that make it possible for the students to realize their own learning period increase the effectiveness of learning period. Through learning strategies it is aimed that the students follow the most effective ways in choosing, acquiring, monitoring and integrating the information that they will learn.

The aim of this study is to specify the learning strategies that the students use while learning Turkish as a foreign language and how effective these strategies are on learning vocabulary. Conducted in compliance with "pretest – posttest control group model" among experimental patterns, this study involved 40 students of Turkish as a foreign language in Istanbul University Foreign Languages Department and Istanbul University Language Center, who were divided into two groups as the experimental group and the control group, each of which consisted of 20 students. While the experimental group was subjected to the usage of strategies and strategy-oriented activities, traditional method of teaching was applied in the control group. The data of the research was gathered with "Language Learning Strategies Inventory" and "Vocabulary Success Test", was evaluated in SPSS software and certain findings and recommendations were proposed accordingly.

Key Words: Language learning strategies, teaching Turkish as a foreign language, teaching vocabulary.

1. INTRODUCTION

In recent years, a tendency in education from behavioral approach towards cognitive approach is in question. While behavioral approach deals with how a learning material influences learning, the aim in cognitive approach is to understand how information is processed and structured in memory. With the increasing interest in cognitive approach, student-centered approaches and studying the individual learning differences among students have gained importance.

In parallel with this change in educational mentality, the methods adopted by students for comprehending, learning and remembering new information have been discussed, which have resulted in an increasing interest in learning strategies.

Learning strategies are all kinds of approaches and behaviors adopted by the individual to facilitate the process of learning. According to Weinstein and Mayer (1986, 316), learning strategies are "behaviors or thoughts which affect students' processes of acquiring information, encoding it in memory and recalling it when necessary." According to Woolfolk (1998), learning strategy is 'a plan implemented to achieve the learning objectives.' In short, a learning strategy is "each of the techniques facilitating the process of self-learning for the student" (Özer, 2002: 17).

Grasping the significance of learning strategies has made these strategies available for foreign language teaching. The strategies used in foreign language teaching are named as "language learning strategies."

1.1. Language Learning Strategies

Researches on language learning strategies have started in 1960s. Determining what people with "excellent knowledge" of a foreign language have done while learning that language is the basis of the researches on this matter. For instance, Rubin (1975) recommends ensuring that language learning strategies applied by successful students are also adopted by unsuccessful students.

Language learning strategies are certain activities, behaviors or techniques adopted by students for improving their foreign language skills, internalizing, discovering and utilizing what they have recently learned, mostly in a planned way (Oxford, 1990). Wenden and Rubin (1987: 17) have defined language learning strategies as procedures, steps or plans used by students with the aim of acquiring, storing, recalling and making use of information. In other words, language learning strategies are all kinds of techniques, methods, thoughts and behaviors helpful for internalizing, recalling and utilizing a newly-learned foreign language. Looking from this point of view, it can be said that there are strategies used by every student while learning a foreign language, either with or without actually being aware of them. At

this point, the duty of the teacher is to make sure that students learn more easily and permanently by teaching students language learning strategies or by helping them choose the suitable strategies for themselves.

Students will always have to depend on teachers if they do not know what they will learn, which parts of the learning material are important and which strategies to use while learning. This situation is a substantial obstacle for the acquisition of an overall skill like knowing a foreign language. Therefore, it is necessary to teach students "how to learn." Through learning strategies, the student will become a better learner. Here, it is a job of teachers to determine the strategies which are used by students and the strategies they need, and to adapt these strategies to his/her own teaching method. In order to determine which strategies are to meet student needs or which strategies are to solve student problems, it is necessary for teachers to acknowledge the principles of teaching learning strategies.

What is aimed with learning strategies is to ensure that students follow the most effective ways of choosing, acquiring, organizing and integrating information. For this reason, teaching learning strategies and involving these strategies in course books are of utmost importance for perfect learning.

Oxford (1990) considers the purpose of language learning strategies as the development of communicational skills. Oxford (1990: 299-300) categorizes learning strategies in two basic groups as direct and indirect strategies and classifies them in 6 sub-groups:

Direct Strategies:

a. Memory Strategies: These strategies enable the transfer of information to long-term memory and recalling it for communication. E.g.: Establishing mental connections, applying to images and sounds, repetition, matching given information with movements, etc.

b. Cognitive Strategies: Used for creating mental models, revising and receiving and generating messages in target language, these are mental strategies utilized by students for making inferences out of what they have learned. Practicing (repetition, learning sound and writing systems practically, recognizing), strategies of sending and receiving messages, making appropriate predictions, building structures for inputs and outputs (such as summarizing, underlining important points) and reaching conclusions through analysis can be examples of cognitive strategies.

c. Compensation Strategies: These strategies enable students cope with difficult situations obstructing communication. Overcoming difficulties by making logical guesses, applying to native language while speaking or writing and using body language can be counted among the examples of compensation strategies.

Indirect Strategies:

a. Metacognitive Strategies: These are the strategies that allow the students to plan, organize and evaluate their own learning process. Focusing on learning by establishing connections with previously learned materials, organizing and planning the process of learning, evaluating personal process of learning can be examples of metacognitive strategies.

b. Affective Strategies: These strategies help learners control their feelings, motivation and attitudes related with learning. Reducing anxiety, encouraging or rewarding oneself, controlling his/her own emotional changes by listening to himself/herself, keeping a diary of language learning or sharing feelings with others, etc.

c. Social Strategies: These strategies are helpful for interaction with others (especially in oral communication). Asking questions, requesting someone to correct his/her mistakes, collaborating with people speaking the target language, developing empathy with people from other cultures, etc.

When sub-groups are analyzed, it is seen that all strategies, no matter whether they are direct or indirect, interact with each other. For example, a student uses social strategy while asking a question to a friend, but he needs not only to utilize his previous knowledge in order to understand the answer, but also to form a new and meaningful sentence in order to maintain the dialogue, therefore he makes use of "cognitive" and "memory" strategies. This example is significant, in the sense that it shows the close relationship between strategies.

1.2. Language Learning Strategies and Vocabulary Teaching

Teaching and improving vocabulary is a multi-dimensional task necessitating a long process, because words can be conceptualized when they are heard for the first time but they can be forgotten if they are not placed in memory steadily. Moreover, knowing and remembering the meaning of a word mostly does not mean that it is completely "learned." Scrivener (1994: 73) emphasizes that solely learning the meaning of a word is not enough for using that word by saying "In some cases, we may find it difficult to use a word in our own sentences, even though we remember that word. Therefore, the role of vocabulary in class environment is of great importance."

Researches on vocabulary improvement show that the most common strategies of learning new vocabulary are repetition and practicing. Nation (2005: 6) emphasizes that continuous repetition is necessary for ensuring that the meanings of words are learned. Rather than learning words at once, it is more effective to repeat them regularly and frequently. In the experiment conducted by Peterson on the amount of forgetting between 0-18 seconds, it is stated that information starts to be gradually forgotten right after it is acquired. While 62% of what is learned is remembered after three seconds, only 15% is remembered after eighteen seconds (Senemoğlu 1997: 276). For this reason, regular repetition is necessary for maximizing the amount of information learned. This way, information in short-term memory is transferred to long-term memory. On the other hand, repeating information "with certain intervals and through different activities" increases permanency even more (Bilen, 1999: 42). Exercises are good tools of application for this purpose. Exercises have the functions of reinforcing skills and converting them into habits (Başaran, 1996: 323).

Baddeley (1990) states that by using word cards, the connection between the form of a word and its meaning can be strengthened. Apart from the lexical meaning of a word, writing additional information on cards such as with which affixes it can be used or with which words it can form a phrase and to involve exemplary sentences related with that word makes it possible to learn the usage of that word.

Using wordlists is another strategy of vocabulary learning. Although not common today due to the fact that it is thought to cause learning only by heart, this technique is supported by researches to be helpful when effectively applied (Nation, 1995; Shillaw, 1995; Thornbury, 2002).

One of the most effective strategies in vocabulary improvement is to teach words by grouping them in mind and associating them with each other. Words are easily forgotten when they are separate and not related to a context. For instance, words related with travelling can be grouped and presented as "luggage (bavul), hotel (otel), swimming pool (havuz), journey (yolculuk), to book (yer ayırtmak), to travel (gezmek)" for teaching Turkish as a foreign language. Especially on beginner level, it is accepted that learning words with connotation technique is quick and effective and that words can be stored for a long time this way (Cook, 2001: 70). For example, while teaching the word "dip" in Turkish (meaning "bottom" like "bottom of the sea" or "bottom of the glass"), it is possible to utilize the word "deep" in English, as these words are close in terms of not only meaning, but also sound. According to Hulstijn (1997: 205), choosing connotative words which are not from the native language, but those which are from the foreign language and well-known by the student is more effective. At this point, choosing words with a similarity in terms of sound is a technique to facilitate learning and recalling. For instance, for the words "dinlemek (meaning "to listen")" and "dinlenmek (meaning "to rest")", which are mostly confused with each other by students, can be presented in a sentence such as "Ali bugün işe gitmiyor, evde müzik dinliyor ve dinleniyor." (can be translated as "Ali did not go to work today, he is listening to music and resting at home"), and a comic strip or a photo with a man resting at home with his earphones can be provided to support the example.

Another strategy utilized while teaching vocabulary is to create lexical maps. In this technique, a text harboring the words to be taught is chosen and the students are asked to determine the words which are related with each other. However, the attempt of learning words with very close meanings at once can result in confusion.

The other effective way used while improving vocabulary is trying to guess the meaning of a word. For this, clues such as the general meaning of the sentence or the text, the relationship between the sentence harboring the unknown word and other sentences, the type of the unknown word, its affixes, punctuation and conjunctions can be helpful. Once teachers teach their students how to use these clues and create awareness, students can comprehend the text without having to depend on a dictionary.

Dividing the words in the target language into roots and affixes, knowing the functions these affixes have, what kind of a meaning they add to the word and how they are used are also among vocabulary learning strategies. Teaching affixes with their meanings and functions in Turkish as a foreign language lessons will not only facilitate vocabulary learning, but also grasping the mentality of the language, as Turkish is an agglutinative language. For instance, a student knowing the meanings and functions of the affixes in Turkish will not have to check his dictionary for words such as "gözlük (glasses), gözlükçü (optician), gözlükçülük (opticianry), gözcü (spotter)" once he learns the word "göz (eye)"; he will at least know that these words are related with "göz (eye)."

Using a dictionary is also among vocabulary learning strategies. Bilingual dictionaries having the equivalents of words in the target and the native languages are commonly used on beginner level. In addition, dictionaries defining a word in the target language and offering synonyms to it, and those supported by exemplary sentences and pictures are of great benefit in vocabulary teaching.

2. METHOD

2.1. Research Model

In this research, the pretest – posttest control group model was used with the aim of specifying the learning strategies adopted by students and measuring the differentiation between the situations before and after learning strategies are taught. In accordance with this model, two groups were created as the control group and the experimental group. Certain processes of measurement were conducted in each group before and after the experiment.

Table 1: Experimental Pattern:

Group	Tests and Scales	Experimental Pattern	Tests and Scales
Experimental group	Language Learning Strategies Scale Vocabulary Success Test	Teaching language learning strategies	Language Learning Strategies Scale Vocabulary Success Test
Control group	Language Learning Strategies Scale Vocabulary Success Test	Traditional teaching	Language Learning Strategies Scale Vocabulary Success Test

In this study, the experimental group received language learning strategies education, while the control group was taught without language learning strategies education. The strategies applied on the experimental group are: Predicting the meaning of a word, asking the synonym/antonym of a word, associating the word with its pieces, creating concept maps, repeating the word orally and by writing, utilizing songs and advertisements in the target language, dividing the word into its root and affixes, underlining the unknown word, connotation, composing word lists and keeping a vocabulary notebook.

2.2. Universe and Sampling

The universe of this research is constituted by students learning Turkish in Turkey as a foreign language, whereas the sampling consists of 40 students studying in Istanbul University Language Center and having B2 level in accordance with European Language Portfolio, 20 of which were involved in the experimental group, while the other 20 were in the control group.

2.3. Data Gathering Tools and Data Analysis

The data in this study was gathered with "Language Learning Strategies Scale", which was developed by Rebecca Oxford (1990) and translated and adapted to Turkish by Demirel (2007), and with "Vocabulary Success Test", which was developed by the same researcher. Vocabulary Success Test involves the meaning and the usage of 20 previously untaught words which existed in the topics to be covered in the following 3 weeks, the time period necessary for the experimental procedures to be accomplished.

The data of this research was analyzed via SPSS 11.00 software. For all the statements in Language Learning Strategies Scale, the options "Completely Agree (5)", "Agree (4)", "Undecided (3)", "Disagree (2)", and "Completely Disagree (1)" were used. In Vocabulary Success Test, knowing the meaning of a word and using the word in a sentence were separately awarded with 1 point each.

3. FINDINGS AND COMMENTS

The number of questions and the strategy groups assessed by each chapter of Language Learning Strategies Scale (Oxford, 1990) used in this research were given in Table 2.

Table 2: The Strategy Groups in Language Learning Strategies Scale

Chapter A	10 questions	Memory Strategies
Chapter B	10 questions	Cognitive Strategies
Chapter C	10 questions	Compensation Strategies
Chapter D	10 questions	Metacognitive Strategies
Chapter E	5 questions	Affective Strategies
Chapter F	5 questions	Social Strategies

The average values of pretest strategy usage for the students in the experimental and the control groups are given in Table 3.

Table 3: The average value of pretest strategy usage for the experimental and control groups

Group	Strategies	X	Group	Strategies	X
Experimental	Memory Strategies	3.20	Control	Memory Strategies	3.22

Group	Cognitive Strategies	3.12	Group	Cognitive Strategies	3.11
	Compensation Strategies	2.92		Compensation Strategies	2.74
	Metacognitive Strategies	3.30		Metacognitive Strategies	3.32
	Affective Strategies	2.27		Affective Strategies	2.81
	Social Strategies	3.26		Social Strategies	3.21
	Total	3,01		Total	3,06

By examining Table 3, it can be seen that the students in both the experimental and the control groups used metacognitive, social and memory strategies most, that they utilized compensation and affective strategies less frequently, and that the average values of strategy utilization of the experimental and the control groups are close. Additionally, it is understood that before the experimental procedures, students in both groups make use of these strategies on a medium level.

The average values of posttest strategy usage for the students in the experimental and the control groups are given in Table 4.

Table 4: The average value of posttest strategy usage for the experimental and control groups

Group	Strategies	X	Group	Strategies	X
Experimental Group	Memory Strategies	3.71	Control Group	Memory Strategies	3.20
	Cognitive Strategies	3.74		Cognitive Strategies	3.18
	Compensation Strategies	2.98		Compensation Strategies	2.80
	Metacognitive Strategies	3.87		Metacognitive Strategies	3.38
	Affective Strategies	2.96		Affective Strategies	2.87
	Social Strategies	3.61		Social Strategies	3.08
	Total	3.47		Total	3.08

When Table 4 is examined, it is visible that at the end of the experimental process during which strategy education was given, differences in the average values of strategy utilization of the students in the experimental group appeared. Strategy utilization average of the students before the application, which was 3,01, increased up to 3,47 at the end of the experiment. On the other hand, no significant difference was witnessed between the average values of strategy utilization of pretest and posttest conducted on the control group (pretest: 3,06, posttest: 3,08).

In Vocabulary Success Test, knowing the meaning of a word and using the word in a sentence were separately awarded with 1 point each. Accordingly, the highest point that a student can get from a success test involving 20 words is 40.

Pretest and posttest results of the students in the experimental group in Vocabulary Success Test are given in Table 5.

Table 5: Pretest and posttest results of the experimental group in Vocabulary Success Test

	N	X	Sd	t	p
Pretest	20	19,21	4,96	5,98	.000
Posttest	20	30,16	6,28		

(P<0.05)

The average success value of the students in the experimental group, which was 19,21 before the application, increased up to 30,16 at the end of the experiment. According to this, it can be said that a statistically significant difference between pretest and posttest results of the experimental group in Vocabulary Success Test came out.

Pretest and posttest results of the students in the control group in Vocabulary Success Test are given in Table 6.

Table 6: Pretest and posttest results of the control group in Vocabulary Success Test

	N	X	Sd	t	p
Pretest	20	21,78	4,96	1,44	.17
Posttest	20	25,09	6,28		

(P>0.05)

The average success value of the students in the control group, which was 21,78 before the application, was observed to be 25,09 at the end of the experiment. Accordingly, there is no statistically significant difference between pretest and posttest results of the control group in Vocabulary Success Test.

4. CONCLUSION AND RECOMMENDATIONS

In this study, which was conducted with the aim of determining the learning strategies adopted by students learning Turkish as a foreign language and the efficiency of these strategies on Vocabulary, following conclusions were achieved:

1. It was seen that the students utilized language learning strategies on a medium level.
2. The students in the experimental and the control groups used metacognitive, social and memory strategies most, whereas they utilized compensation and affective strategies less frequently.
3. It was observed at the end of the application that the average value of strategy utilization of the experimental group, which received strategy education, increased.
4. A significant difference between the pretest and the posttest results of the experimental group, to which strategy education was given, was witnessed.

In the light of these conclusions, following recommendations can be made:

1. It is necessary to decrease the level of student dependency on teachers by teaching them learning strategies.
2. Language learning strategies should be used not only for vocabulary teaching, but for teaching all dimensions of a language.
3. Students should be guided to choose which strategies to use on their own and to organize their own processes of learning individually.
4. Language learning strategies should be taught as a separate lesson in academic divisions where foreign language teachers are trained.
5. Studies covering a longer period of time should be conducted on the efficiency of strategy education, as short-term studies may be deceptive.
6. Further research on the utilization of foreign language learning strategies, which has been extensively investigated for teaching English, should also be conducted for teaching Turkish as a foreign language.

THE EFFECTS OF TEACHER CHARACTERISTICS, BELIEFS AND CONTEXTUAL FACTORS ON TECHNOLOGY INTEGRATION AMONG MALAYSIAN SCHOOL TEACHERS: A PROPOSED RESEARCH FRAMEWORK

Nurullizam Jamiat, Irfan Naufal Umar & Merza Abbas

Centre for Instructional Technology and Multimedia, Universiti Sains Malaysia, 11800 Penang, Malaysia
nurullizamj@yahoo.com, irfan@usm.my & merza@usm.my

ABSTRACT

This paper describes a proposed study to investigate factors affecting technology integration among Malaysian school teachers, namely, teacher characteristics, teacher beliefs, and contextual factors. This paper will mainly focus on the relevant literature review pertaining to teachers' technology integration. From the review of literature, there is no path analysis study on technology integration in Malaysia. Therefore, in order to explain the complex relationship of factors affecting teachers' technology integration, Structural Equation Modeling (SEM) methodology will be applied in this proposed study. A path analysis was derived from the review of the previous studies that indicate the factors affecting teachers' technology integration. A stratified random sampling will be applied and the data will be analysed using Analysis of Moment Structure (AMOS). The findings are expected to reveal numerical importance of all direct, indirect and mediated factors on teachers' technology integration simultaneously.

Introduction

The use of media in Malaysia's education system started early in the 1940's with the launched of Educational Radio in 1946 and the Audio-Visual Section in education was developed in 1949. Nevertheless, tremendous effort by the government to immerse technology in the education system begun with the launched of the nation's proudly Multimedia Super Corridor (MSC) which was conceptualized in 1996 to leapfrog Malaysia into the information age. Through this project, Smart Schools Initiative was launched in 1997 and then followed with other ICT initiatives (for instance: Piloting of Smart School in 1999; Computer Lab Initiative in 2000; Computer Literacy Program in 2002; English for Teaching Mathematics and Science in 2003; SchoolNet Initiative in 2004; In-service Courses for Smart School Teachers in 2006; Information and Communication (ICT) in Education Program in 2007; Eduweb Television portal in 2008) to ensure teachers and students will benefit from the advancement of technology in education.

Within years of implementing various technology initiatives in Malaysian education system, most of the findings in teachers' level of ICT knowledge and skills were still low (Mahmud, Ismail, Mohd Yasin, Mustapha & Din, 2006; Mahmud, Ismail, Sahid & Yazid, 2007). Although several researchers reported that teachers' attitude towards ICT were positive (e.g.: Sa'ari, Wong & Roslan, 2005; Sharif & Buntar, 2005), teachers' level of technology integration was still low (Ismail, Zakaria & Aziz, 2007). Furthermore, despite numerous studies in Malaysian context on in-service teachers' technology integration in teaching and learning (e.g.: Mohd Salleh, Mohd Nordin & Mohd Jelas, 2008; Mahmud, et al. 2007; Othman & Baki, 2007; Wahab & Kaur, 2006), there are no studies on the direct and indirect effects of certain factors on technology integration that have been carried out and reported. The only path analysis study in Malaysian context that has been conducted was among female pre-service teachers (Wong & Teo, 2009) on their behavioural intention to use computers. The path analysis approach provided by applying Structural Equation Modeling (SEM) technique would enable a systematic analysis towards the factors affecting technology integration. According to Byrne, "...there are no widely and easily applied alternative methods for modeling multivariate relations, or for estimating point and/or interval indirect effects; these important features are available using SEM methodology" (2001, p. 4). Therefore, instead of merely providing a list of significant factors, the resulting model of this proposed study will reveal the importance of each factor in terms of its direct, indirect and also mediated effects toward technology

integration. Additionally, this proposed study which covers a nationwide sample will provide an insight on technology integration among Malaysian school teachers as a whole.

Literature Review

In order to fulfil the need of competent teachers in utilising technology in teaching and learning activities, the foundation of educational technology is introduced to the pre-service teacher programs in the teacher training institutes and universities. Masood (2010) has carried out an initial comparative study to compare the educational technology courses for training teachers at Malaysian universities. The study focused on four higher institutions, namely, Universiti Sains Malaysia (USM), Universiti Kebangsaan Malaysia (UKM), Universiti Putra Malaysia (UPM), and Universiti Malaysia Sabah (UMS) that aimed to compare and analyse the curriculum and strategies in these four universities to the revised International Society for Technology in Education's (ISTE's) 2008 National Educational Technology Standards for teachers (NETS•T). The findings indicated that the practical aspect in integrating technology in the actual classroom should be more emphasized to provide pre-service teachers with the skills and confidence in using technology besides the theories and knowledge. Furthermore, Jamiat, Umar and Masood (2010) carried out a content analysis to investigate the research trends in Malaysian teacher education. The analysis was limited to the latest five proceedings from the conventions organised by the Malaysian Educational Technology Association (META). From the analysis, the researchers revealed that the trend in Malaysian teacher education was focused on investigating pre-service teachers' involvement in technology enhanced learning environment (e.g.: Modular Object Oriented Dynamic Learning Environment (MOODLE), wikis and mobile learning). The findings showed that the country is on the right track by focusing technology enhanced learning tool as there is a need to discover and explore new technologies to be integrated in teaching and learning. The above descriptions indicated that Malaysian pre-service teachers were exposed to the current technology in education and they are also given sufficient training and support to implement technology in their future teaching and learning practices.

In addition, numerous studies pertaining to Malaysian teachers' technology integration have been reported. For instance, a study conducted by Mohd Salleh, Mohd Nordin, and Mohd Jelas (2008) among 125 Smart School teachers reported that their technology integration were still at the moderate level. Meanwhile, in order to describe the commonalities and differences in Science teachers' technology integration between Malaysian Smart Schools and mainstream schools, Ong and Ruthven (2007) carried out a survey and interviewed Form Three Science teachers from these two types of schools. The findings showed that the level of ICT use among Smart School teachers were higher than the Science teachers in the mainstream schools. Another finding on the Smart School Initiative research indicated that ICT facilities provided in Smart Schools have really helped the teachers to enrich their teaching practices and transform the traditional method to a more technology-supported learning environment (Fong, Muniandy, Atan & Idrus, 2006).

Furthermore, Ismail, Mahmud, Sahid and Yazid (2007) have conducted a research among 31 secondary school teachers teaching Malay Language to investigate their skills through three different aspects, namely, knowledge, attitude and performance in using World Wide Web as their teaching tool. The results revealed three significant relationships between factors which are knowledge with skills, experience with skills and knowledge with attitude. Othman and Baki (2007) have also investigated Malay Language teachers' technology integration by focusing on the use of computers in their practices. The results indicated that most of the teachers have the skills and concept of teaching language in a technology supported environment as they have received ICT training before. However, most of the findings also reported that although teachers have the knowledge and skills to integrate technology in classrooms, they were reluctant to embrace ICT in their teaching and learning activities because of several barriers such as heavy administrative and teaching workload (Alias & Chung, 2007; Wahab & Kaur, 2006), uncomfortable in using technology (Othman & Baki, 2007) and lack of support and guidelines for teachers to manage and implement technology initiative (Alias & Chung, 2007). However, this review of technology integration studies in Malaysia has revealed that no path analysis studies have been carried out.

As most of the previous studies have investigated the direct effect of certain factors on technology integration or practice in the classrooms, there are also studies that attempted to describe the direct and

indirect effects of variables on technology integration. For instance, Mathews and Guarino (2000) developed a path model to assess the affect of four teacher-level factors, namely, gender, academic degree, years of experience and school level on computer usage. The findings revealed that gender, years of experiences, number of computers and computer ability had a significant direct effect on computer usage. Meanwhile, Van Braak, Tondeur, and Valcke (2004) created a path model to investigate the complex relationships between demographic factors, computer experiences variables and attitudinal variables towards two types of computer use. They reported that teachers with more years of computer experiences, training and frequent computer users used computer intensively for professional support. Nevertheless, the model proposed by Mathews and Gurino (2000) and Van Braak et al. (2004) were only involved on teacher-level factors and lacked of school-level factors (e.g.: access and support).

Robinson (2003) has created a model to illustrate the relationships between variables that affected the actual usage of computer. This model which was adapted from the Technology Acceptance Model proposed by Davis in 1989 consists of teacher-level factors (demographic variables) and school-level factors (external-support variables). One of the studies conducted geographically close to Malaysia was conducted by Mohd Salleh (2005) in Brunei. Mohd Salleh (2005) proposed an adopted model of Theory of Planned Behavior (TPB) by Ajzen in 1985 which was Information and Communication Technology Use Model (ICTUM) to investigate the direct and indirect effects of internal and external factors affecting technology use among teachers. This adopted model aims to investigate the direct factors (teachers' attitudes, subjective norms, and perceived behavioural control), indirect effects (behavioural beliefs, normative beliefs, and control beliefs) and external factors (age, sex, subject taught, teaching experience, teaching periods, qualifications, teaching level, class access, and computer laboratory access) that might affect teachers' intention and behaviour on using ICT in their teaching. Another path analysis model that included school-level factors was conducted by Inan and Lowther (2010). The findings indicated that only teachers' readiness, teachers' beliefs, and computer availability had a significant positive direct effect on technology integration. Meanwhile, Chen (2010) as well as Wong and Teo (2009) have also applied path analysis technique to investigate technology use. The samples of their studies were pre-service teachers who have yet to integrate technology in the real teaching and learning environment.

Although it was obvious that the review of path analysis approach concerning factors affecting technology integration is nothing new, the explanation on ICT use in these analyses is too general. No detail or specific sub dimensions of ICT use such as Internet use, general computer use of the purpose of using certain type of technology in teaching and learning have been reported. Thus, this proposed study intend to look into detail how these sub dimensions of technology use, namely, in teachers' technology use in their teaching and learning processes, management tasks and communication. Additionally, the proposed study attempts to address the direct and indirect effects of factors influencing technology integration specifically in Malaysia as there is no path analysis study on technology integration has been carried out. Furthermore, this study will form a basis for more local study on path analysis in education. It is hoped that the findings from this study will enable the school administrators and Malaysia's Ministry of Education to provide certain support and development needed to increase the driving forces and reduce the factors that inhibit technology integration.

According to Bandura (1977), "...psychological functioning is a continuous reciprocal interaction between personal, behavioural, and environmental determinants" (p. 194). In this particular study, personal factors (teacher characteristics and teacher beliefs) and environmental factors (contextual factors) will be indentified as the indicators impacting the teachers' behaviour (technology integration). The path model in this proposed study was derived from the previous studies that indicate the factors affecting teachers' technology integration. The literature that supports the developed path analysis model is depicted in Figure 1. Based on the model, it is indicated that there are direct and indirect effects from the factors that affect the technology integration. *Teacher characteristics* (Goos & Bennison, 2006; Still, 2006; Hughes, 2005), *teacher beliefs* (Tasouris, 2009; Goss & Bennison, 2006; Angers & Machtmes, 2005; Baylor & Ritchie, 2002; Windschilt & Sahl, 2002; Cuban, Kirkpatrick & Peck, 2001; Figg, 2000) and *contextual factors* (Hall & Hord, 2006; Goos & Bennison, 2006; Angers & Machtmes, 2005; Mumtaz, 2000; Kent & McNergney, 1999; Dwyer, Ringstaff & Sandholts, 1989) are hypothesized to have direct effects towards *technology integration*. In addition, *teacher characteristics* (Nagamine, 2007; Still, 2006; Hughes, 2005) is hypothesized to have direct effects towards *teacher beliefs*. Therefore, the indirect effect of *teacher characteristics* towards *technology integration* is hypothesized to be causal to *teacher beliefs*. Also, *teacher beliefs* are hypothesized as the mediating variable in this study.

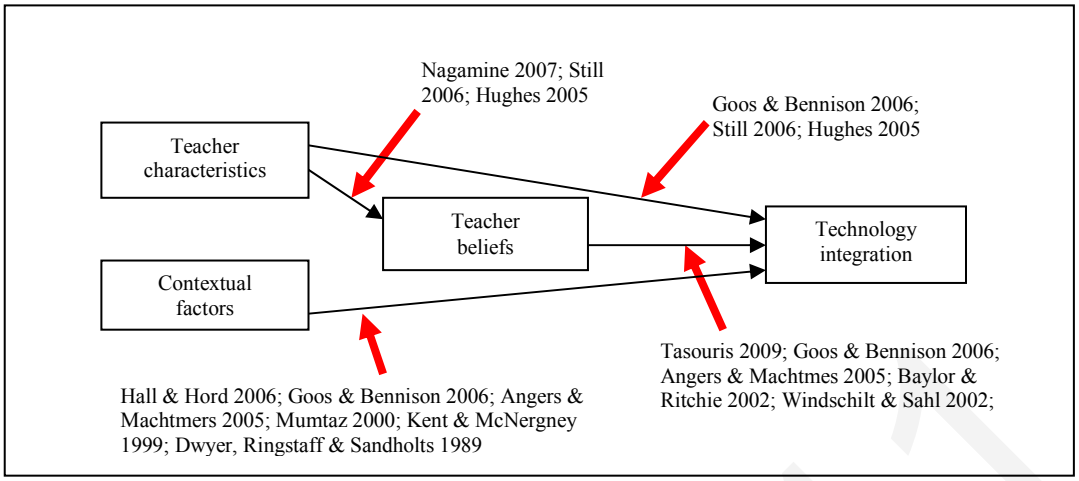

Figure 1: Literature supporting the hypothesized path analysis model

Methodology

This study will adopt the Structural Equation Modeling (SEM) methodology to evaluate the direct and indirect effects of three identified factors: (a) teacher characteristics, (b) teacher beliefs and (c) contextual factors towards technology integration. This technique will enable the researchers to provide empirical evidence that exhibit the relationships among the factors and also to determine if the causal relationships implied by the model structure fit the actual relationships given by the data collected. The population for this research will be school teachers throughout Malaysia. A stratified random sampling will be applied to select the sample for this study. Firstly, the administrative zones of all the states in Malaysia will be identified to attempt fairness in selecting the schools according to the number of schools located in the zones. The identified zones are Northern Zone; Eastern Zone; Southern Zone; Central Zone and East Malaysia. The schools will be randomly selected from each zone according to their locations (either rural or urban). Also, there are three types of school identified in this study, namely smart schools, non smart secondary schools and primary schools. From the random stratified sampling, a total of 192 secondary schools and 154 primary school teachers will be selected. Besides these schools, 20 smart schools will also be involved. A total of 20 teachers from each school will be selected as the respondents to participate in this study. Hence, it is expected that there will be more than 7,000 teachers involve in this study. A pilot study has been carried out to estimate the reliability of the questionnaire among 59 teachers and it was found that the instrument has a reliability of 0.882. The questionnaire will be administered to teachers after securing the approval to conduct this research from the Education Planning and Research Department (EPRD) at the country's Ministry of Education and every State Education Department. The data collected will be keyed-in using SPSS 18 and analysed using AMOS 18.

Expected Outcomes

According to Byrne (2001), the primary interest in SEM is the extent to which a hypothesized model adequately describes the sample data. Therefore, based on AMOS 18 model summary, the chi-square (X^2) value is provided as a quick overview of the model fit. This model fit determines the degree to which the hypothesized path analysis model proposed in this study fits the sample data. Therefore, in order for the proposed model not to be rejected, there is certain goodness of criteria: (1) Discrepancy/degree of freedom (CMIN/DF), (2) Comparative fit index (CFI), (3) Normed fit index (NFI), (4) Tucker-Lewis index (TLI) and (5) Root-mean-square error of approximation (RMSEA) need to be fulfilled and this will eventually show how well the model will perform in the future (Raykov & Marcoulides, 2000).

Based on the literature review, it is expected that: (1) teacher characteristics will significantly influence their beliefs in technology integration, (2) teacher characteristics will also significantly affect their technology integration, (3) contextual factors will significantly influence teachers' technology integration, (4) teacher beliefs will significantly have direct effects on their technology integration and (5) teacher characteristics will significantly affected their technology integration indirectly as teacher beliefs will be the mediated factor.

Conclusions

This paper has reviewed and established the need to study technology integration in teaching practices. In specific, the direct and indirect effects of *teacher characteristics* (age and teaching experiences), *contextual factors* (access and training), and *teacher beliefs* (perceived usefulness) on *technology integration* (teachers use of technology in teaching and learning, management task, and communication) need further investigation, specifically in the Malaysian context. The findings of this study will provide valuable information for the school administrators and the Ministry of Education to determine current technology resources and practices. For instance, the data would indicate the best predictors in technology integration that will be useful for developing and planning of future in-service training to improve their technology integration in teaching and learning.

THE EFFICACY OF E-LEARNING MANAGEMENT SYSTEM ON PERFORMANCE OF RURAL SCHOOL - A CASE STUDY

Dr. S. Arulchelvan, Assistant Professor, Department of Media Sciences, Anna University, Chennai-600025, India. E-mail: arulchelvansriram@gmail.com/ achelvan@annauniv.edu

ABSTRACT

Technologies are available for education in various forms now. One primary task involves determining how best to utilize available technology resources to enhance student learning. Technology is getting popular in schools because educators believe it can improve students' learning. Besides evaluating the academic performance of students there is a need for evaluating the overall performance of students. Here comes the electronic learning management system (e-LMS) and related technologies. e-LMS, the basic description is a software application that automates the administration, tracking and reporting of learning events. The e-learning which is integrated into the LMS software, has the ability to document the knowledge levels of the individual student. This documentation of the student is analyzed and reported periodically to their parents. This is highly useful in determining the overall academic performance of the student. This study aimed to know the facts and effectiveness of e-LMS among the school students. From the study, the effectiveness of e-LMS is high. The absenteeism ratio has declined. This in turn reflected in the academic performance of the students since they have no other option than sustaining with the learning. Overall performance of a student is significantly increased. The effectiveness of e-LMS may be improved from the following suggestions: Reporting in regional languages; Web based reporting; Interactive communication; Touch screen information kiosk integrated with e-LMS for reporting. The system has positive impact among the students. This will prove very effective when implemented in large scale.

INTRODUCTION

Today, educators are facing with many new challenges and responsibilities. One primary task involves determining how best to utilize available technology resources to enhance student learning. Technology is popular in schools because educators believe it can improve student learning by providing: a more active learning, more varied sensory, conceptual modes, less mental drudgery, learning better tailored to individuals and better aid to abstraction. Besides evaluating the academic performance of students there is a need for evaluating the overall performance of students. Here comes the electronic learning management system (e-LMS).

While there are several definitions of a e-LMS, the basic description is a software application that automates the administration, tracking and reporting of learning events. Generally, the e-learning content provided in schools will be having generic topics, out of which the topic which syncs with text book curriculum has been taught. Now the trend has changed, e-learning contents which exactly based on curriculum are designed by several e-learning vendors. Since it completely synchronizes with the textbook curriculum, it is now being followed in many institutions. The e-learning content, which is integrated into the LMS software, has the ability to document the knowledge levels of the individual student on the subjects. This documentation of the student is analyzed and reported periodically to their parents. This documentation is highly useful in determining the overall academic performance of the student. The e-LMS software will be connected to a Biometric cum Access card scanner device. When the students punch their fingers in the biometric device, automatically the student's in-time at school will be sent as Short Message Service (SMS) to their parents. In the evening their out time will be sent as SMS to their parents. This helps to inform the parents about their children's whereabouts. Since the academic performance of a student is documented periodically, the e-LMS would have a database of marks scored by the students of all classes in their monthly tests and term examinations. These marks will be reported to parents through SMS, instead of report cards or progress reports.

e-LMS range from systems for managing training and educational records, to software for distributing courses over the Internet with features for online collaboration. Some e-LMS are web-based to facilitate access to learning content and administration. E-LMSs are used by regulated industries for compliance training. It is also used by educational institutions to enhance and support classroom teaching and offering courses to a larger population of learners across the globe. Some E-LMS providers include "performance management systems", which encompass employee appraisals, competency management, skills-gap analysis, succession planning, and multi-rater assessments.

A learning content management system (LCMS) is a related technology to the learning management system, in that it is focused on the development, management and publishing of the content that will typically be delivered via an e-LMS. An LCMS is a multi-user environment where developers may create, store, reuse, manage, and deliver digital learning content from a central object repository. The e-LMS cannot create and manipulate courses; it cannot reuse the content of one course to build another. The LCMS, however, can create, manage and deliver not only training modules but also manage and edit all the individual pieces that make up a catalog of training. These assets may include media files developed in other authoring tools, assessment items, simulations, text, graphics or any other object that makes up the content within the course being created. An LCMS manages the process of creating, editing, storing and delivering e-learning content. Besides reporting the academic performance of the students, Extra-curricular and other disciplinary issues of the students are also evaluated, documented and reported to their parents. With this, the e-LMS software documents and reports the overall performance of a student.

e-LMS is an upcoming method in educational institutions to provide overall analysis of students. In Tamil Nadu some of the schools started to use e-LMS to give holistic education. At present, evaluating a student on the basis of his academic performance is no more valid. An overall assessment is needed to guide the student in developing individual competencies. The e-LMS plays an important role in overall assessment of a student. The aim of this study is to study the effectiveness of e-LMSs on the performance of rural high school students. Objectives of the study are: To study the implementation of e-LMS; to analyze the effectiveness and overall performance of e-LMS among high school students.

REVIEW OF THE LITERATURE

Many literatures supported that the electronic learning (e-learning), e-LMS are highly suitable for the educational development. Some of the literatures are cited for reference. Students who used computers and incorporated constructive strategies reported significantly higher scores. Review on studies related to technology and student achievement, positive and significant gains for students who were engaged in technology-rich environments. Those students showed significant gains and achievement in all subjects, increased achievement and improved attitude toward their own learning, and increased self- esteem.

According to Stephenson (2001), online interactive learning environments appear to provide a perfect forum for an academic discourse that promotes increased student engagement, critical analysis and reflection, and the social construction of knowledge. Rudestam et al, (2002) explains that online learning solutions can provide more collaboration and interaction with peers and experts as compared to traditional instruction. Kear & Heap (2007) explains that the e-learning environment, computer conferencing including discussion forums provides a framework for peers or student to student interaction and learning. The learning process is aligned with a more constructivist view of learning where knowledge is not seen as transferred from one person to another but rather the learner is actively taking part in the learning process. Keengwe, et al (2008) established the relationship between computer technology use and student learning with conflicting outcomes. Christine Spratt and Paul Lajbcygier (2009) opine that the LMS is improving the performance of the studnets. A 12-year meta-analysis of research by the U.S. Department of Education found that higher education students in online learning generally performed better than those in face-to-face courses.

Both globalization and computer communication technology have caused and resulted in the growth of each other; they have emerged as two sides of the same coin and have impacted one another in complex and

multiple ways. New trends in education have also come about, and new challenges have been thrown up to reckon. At the same time there is an indisputable need to maintain continuity, change and growth, all at once. With the information obtained from the literatures there are many advantages in the Learning Management systems.

METHODOLOGY

Survey, Comparative analysis and expert interview methods were used to study and find out the effectiveness of e-LMSs on performance of rural high school students. In this study, the survey is conducted to find the influence of the e-LMS and to check the student's status in using this learning management system. Comparative analysis is carried out to compare the older manual recoridng method with the e-LMS. Expert interview is done to use their valuable suggestions to make this learning management system more effective.

The e-LMS which is studied in this research is implemented in a rural school viz., Selvam Matricuation Higher Secondary school which is located in Arakkonam, 65 km North West of Chennai, India. The total strength of school is 1100. The e-LMS system was implemented in the campus on October 2009. A of now, the e-LMS system is used in the classes from sixth standard to twelfth standard. The total strength from sixth to twelfth standard comprises of 600 students. Out of which three classes i.e., from sixth to eighth standards are taken into the study.

Regarding to the survey method, purposive sampling method will be used in this research. The class will be divided in to three categories based on their academic performance. The three categories are below average, average and above average students who score below 35 marks, 35 marks to 75 marks and above 75 marks out of 100 respectively. Five to six students were selected from each category in the three classes, which are sixth, seventh, and eight standards. Parents of the selected students and teachers who handled these three classes are selected for the survey. The total sample size is 120. This comprises of 50 students, 50 parents and 20 teachers. For the comparative analysis e-LMS documentations of each student were compared and analyzed with previous manual documentations. The main sources for manual documentations are progress report cards, in which the overall performance of a student's is documented thrice a year at the school. Expert interview is done to find out the e-LMS more effective.

RESULTS AND DISCUSSION

The collected data through survey from the respondents, manual records and e-LMS documents from the secondary sources and in-depth interview are processed and analyzed in accordance with outline laid for the purpose at the time of developing research plan.

Evaluation & Documentation of Academic Performance

The e-learning content which is integrated into the e-LMS software has the ability to document the performance levels of the individual student on the subjects. This documentation of the student is analyzed and reported periodically to their parents. This documentation is highly useful in determining the overall academic performance of the student. If students' performance dipped, it would be taken note of by the school authorities and remedial measures will be initiated.

Reporting Academic Performance, Daily Attendance and Disciplinary Issues

Since the academic performance of a student is documented periodically, the e-LMS software would have a database of marks scored by the students of all classes in their monthly tests and term examinations. These marks reported to the parents through SMS. Instead of reporting the marks by report cards or progress reports, this SMS reaches instantly and this will kept as record by the parents. The E-LMS software connected to a Biometric cum Access card scanner device. When the students punch their fingers in the biometric device,

automatically the student's in-time at school sent as SMS to their parents. In the evening their out time sent as SMS to their parents. This helps to inform the parents about their children's whereabouts. Besides reporting the academic performance of the students, Extra-curricular and other disciplinary issues of the students are also evaluated, documented and reported to their parents. With this, the E-LMS software documents and reports the overall performance of a student.

Survey

The data collected from the students, parents and teachers are presented here.

Subjects difficult to understand by the students and Interested subjects for the Students

Data shows that Chemistry is the most difficult subject to study (30%) followed by Biology (24%) and Mathematics (18%) by the students of the school (see the table 1). Data also revealed that Physics is the most interested subject to study by the students followed by Social Sciences. Biology and Chemistry are considered as less interested subjects.

S.No.	Subjects	Difficult Subjects		Interested Subjects	
		No. of Students	Percentage	No. of Students	Percentage
1	Physics	8	16%	15	30%
2	Chemistry	15	30%	6	12%
3	Biology	12	24%	7	14%
4	Mathematics	9	18%	10	20%
5	Social science	6	12%	12	24%

Table 1 Subjects difficult to understand by the students and Interested subjects for the Students

Usefulness of Courseware and Students

It was found that except languages all the other subjects are taught through courseware. Equal importance has been given to all subjects like Physics, Chemistry, Mathematics, Social Sciences, Biology, etc. Regarding to the usefulness of courseware, 70% of students told that courseware makes them to easily memorize the subjects. 27% of the students told it increases their understanding level and 3% of students said that it helps to increases the knowledge level of the particular subjects.

Absenteeism after implementing the E-LMS system

The biometric device was integrated into the E-LMS on October 2009. Attendance of the students will be sent to their parents daily. From the secondary data, it was found that after implementing the biometric system the absenteeism has gone down (see figure 1).

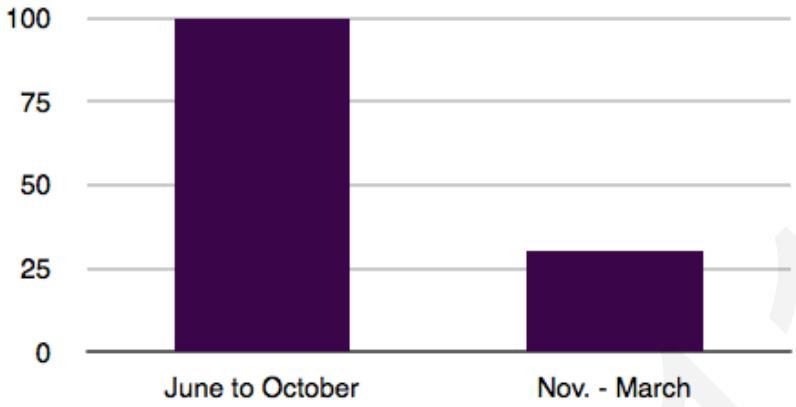

Figure 1 Absenteeism after implementing biometric attendance system

Absenteeism and academic performance

From the data, absenteeism is indirectly proportional to the academic performance of the students. When the absenteeism is decreases, the academic performance of the students is increases (see the figure 2).

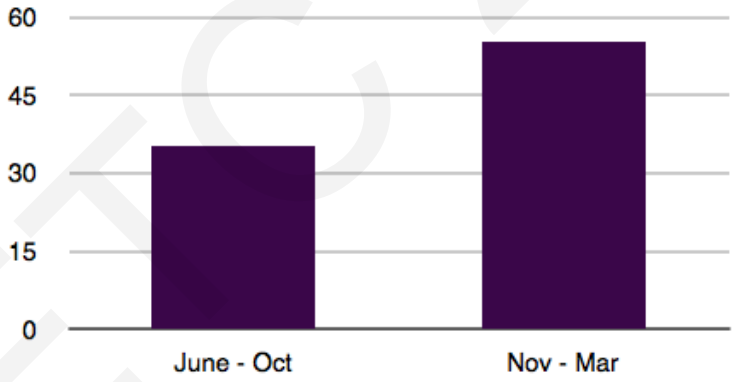

Figure 2 Representing the absenteeism and academic performance

Parents and Teachers with e-LMS System

Most of the parents (98%) have access to cell phone and only 2% of parents do not have access to cell phones. Among them it was found that 100% of the parents responded positively towards the attendance SMS of their ward. 90% of parents responded positively towards the academic performance of their ward sent by SMS. This helps them to know their child's performance instantly while 10% of the parents responded that it is useless unless remedial measures are taken. Among the teachers 97% of them responded positively towards the documentation of academic performance of the students E-LMS. This helps them to know the student's academic performance throughout the year and to take necessary remedial measures by individually concentrating on the particular students. But 3% of them said that unless remedial measures are taken there is no use in documenting the academic performance of the students.

Examination performance of students before and after using e-LMS

Students score in the examination is important criteria for the academic performance. Students who are scoring below average marks is 30% (35% out of 100), average score is 45% (35% – 75% out of 100) and above average is 25% (more than 75% out of 100) before using the e-LMS. The marks of students who are scoring below 35% have come down and the percentage of average scorers also iincreased after using the courseware.

Comparative analysis of absenteeism, average marks, sustainability, overall performance of students before and after implementation of e-LMS

Comparative analysis is carried out to check the impact of the e-LMS among the students, teachers and parents. e-LMS reports / documents and manual records of before implementation of e-LMS (progress report card of students in which the overall performance of a student documented term wise) were analyzed. From the records it was found that the absent rate before implementing the biometric attendance system was 6%. After implementing the biometric system the absent rate has gone down from 6% to 2%. The average marks before implementing the E-LMS was found to be students who were scoring below 35 marks constitute 35% in a class, students who score 35 - 75 marks were 40% and above 75 marks are 25%. After implementing the E-LMS there is a internal shift between this mark based division the percentage of below average students came down from 35% to 25%. And the average scorers range increased since some of the below average students shifted to average levels. The students' sustainability with the learning system was found to be 75% and 25% of the students did not cope-up with the learning systems. After implementing the E-LMS, the non sustainability ratio of the student has come down, since they are forced to follow the learning systems practiced in the school. The overall performance of a student i.e., their academic performance, disciplinary issues, extra-curricular were documented manually in report cards. The average overall performance of a student was found to be 70%. The overall performance of the student after implementing the E-LMS found to be increased because, the performance of the student was documented and reported promptly, than manual system which were reported only thrice a year.

Expert Interview

From the in-depth interview experts given following points, opinions and suggestions: School management needs to have a regular interaction with the parents to have a better understanding. The performance of students should be analyzed on all dimensions. The e-LMS will help the management in making very quick decisions. Reporting systems will be useful when parents never turn up to the schools. The SMS mode of sending test marks to parents makes them aware about the achievement level of their kids. SMS mode easily reaches the parents. Motivating the students will achieve maximum attendance and performance. This prevents absenteeism and droupouts. It leads to more sustainability in the system. Secured feeling among the parents will increase. e-LMS redefined the way the students' performance. Easy for teachers to track down & access the performance of students. SMS is one of the fastest methods of communication and best reporting method. e-LMS brought the schools and parents community closely. Governments and other authorities should encourage the schools in implementing these e-LMS technologies will give a better development for education.

FINDINGS AND CONCLUSION

The effectiveness of e-LMS is excellent among the rural high school students. The absenteeism ratio has declined after integrating the biometric attendance system into learning management system. This in turn reflected in the academic performance of the students since they have no other option than sustaining with the learning process. The success of e-LMS depends upon the remedial measures should be carried out when

needed. The greatest advantage and prime reason for the success of e-LMS is 'instant reporting.' In manual reporting system, the academic performance and overall performance of a student is reported only thrice a year using progress report cards, whereas in e-LMS the overall performance of a student is reported instantly. Since the performance of the students was reported instantly and remedial measures were carried out when needed, the overall performance of students' progress gradually besides improving their academic performance. The success of e-LMS is that it has instant reporting systems integrated into it. To make the e-LMS more effective, the reporting system should be enhanced. Reporting systems in regional languages; Web based reporting system; Two way SMS communication; Touch screen information kiosk integrated with e-LMS for reporting. E-LMS has positive impact among the rural high school students. This will prove very effective when implemented in large scale.

THE EVALUATION OF ECONOMIC AND SOCIAL FACTORS' INFLUENCE ON THE SCENARIOS OF HIGHER EDUCATION DEVELOPMENT IN RUSSIA

OKHOTINA A.Y.,
NATIONAL RESEARCH UNIVERSITY HIGHER SCHOOL OF ECONOMICS,
ANNA_OKHOTINA@YAHOO.COM

ABSTRACT

The research is devoted to the analysis of economic and social factors' influence on the long-term development of higher education development in Russia. The method which is used is Analytical hierarchy process. The pilot project enabled 8 experts in higher education in Russia to take part in the research. In the main research project 30 experts from different groups of actors are supposed to take part by giving their preferences to economic and social factors' influence on Higher education development in Russia. The survey is based on research scheme made in advance and consists of two tournaments. After the first tournament by means of a specific computation procedure the scenarios are formulated, which on the second tournament of the survey are going to be estimated by experts. In the end of the research the final scenario is generated and the conclusions, explaining the proposed scenario of the long-term Higher education development in Russia are given.

INTRODUCTION

Today's modern economy is characterized as knowledge-based economy, so the importance of education and its development is now regarded by scientists and researchers from all over the world as themes of big importance.

The problems in Higher education in Russia and their solution were examined by Y.I. Kuzminov «The Higher education for the mass», A.Y. Volkov, Y.I. Kuzminov, I.M. Remorenko, B.L. Rudnik, I.D. Frumin, L.I. Jacobson «Education in Russia in 2020: the education model for the innovation economy», S. Belyakov «The education modernization in Russia: the improvement of management», T.L. Klyachko, V.A. Mau «The tendencies of Higher education development in Russian Federation», A.A. Fursenko «On the notion of Higher Education: 2008-2016», S.M. Guriyev «Our highest education», L.I. Polishchuk, E. Livni «The quality of Higher education in Russia: competition and labor market's roles» and other numerous scientists.

Foreign experts regarded the significance of various inner end external factors' influence on educational system development and the reaction on them from the side of managerial boards. These aspects could be found in such works as, for example: «Board of Regents – University of Wisconsin System», J. Atkinson-Grosjean «The Use of Performance Models in Higher Education: A Comparative International Review», D. Braun «Changing Governance Models in Higher Education: The Case of The New Manageralizm», F.A. van Vaught «Policy Models and Policy Instruments in Higher Education. The Effects of governmental policy-making on innovative behavior of higher education institutions», «Education Governance and Social Integration and Exclusion», R. Birnbaum «Management Fads in Higher Education: Where They Come From, What They Do and Why They Fail», «Governance for Quality of Education».

In other works the system of Higher education is described and possible ways of transformation and withdrawal from the current situation and desirable managerial and educational models are analyzed («Campus-2020-II. Governance», «New Models for Higher Education: Creating an Adult-Centered Institution», C.C. Burton «The Higher Education System. Academic Organization in Cross-National Perspective», «The Changing Landscape of Education Governance», B. Friehs «Models of Education Governance and Administration», «From Goals to Results: Improving Education System Accountability, Challenge to Lead Series», «Reorganization of Education Governance», R. Hahn «The Global State of Higher Education and the Rise of Private Finance», D.E. Hanna «Higher Education in an Era of Digital Competition: Emerging Organizational Models» и т.д.).

The aim of the research is to explore and evaluate the economic and social factors' influence on Higher education development in Russia.

Such researchers as A.V. Sokolov «The long-term Foresight projection of Higher education development», E.P Tavokin «The research of socio-economic and political process» and T. Saati «Decision making. Analytical Hierarchy Process» had suggested and applied different projection methodologies and methods to the long-term projection of Higher education in different countries.

The problem: But while methods based on both mathematical calculations and expert's choice are used worldwide, in Russia there are used either tentative or methods based on statistical data.

The research novelty consists in the application of T. Saati method called «Analytical Hierarchy Process» (AHP), which is based on experts' choice method and mathematical calculation both.

METHODS AND PROCEDURES

One of the approaches, which is based on the T. Saati method and is called AHP helps us to resolve problems of lacking complexity while resolving the problem of educational projection. The strong features of the method consist in the possibility to take into account diverse elements (factors', actors', actors' aims and other), influencing on the system, while making the long-term projection.
As for the sources of information while using AHP - paper analysis, statistical data and expert's knowledge (on the stage of scheme creation and pairwise comparison) - are used.
So AHP allows using not only the information from the paper sources or just experts judgment, but group opinion on the complex questions obtained by means of pairwise comparisons as well.
Talking about AHP we should mention its disadvantages as well. This method can't be used when the problem can't be decomposed and presented in a hierarchy format of smaller parts or in the case of experts' absence.

The stages of research implementation are:

1. On the preliminary stage we had analyzed different paper works and studies of other researchers on the theme and determined a problem on the sphere mentioned above and marked out the T.Saati method.
2. Then, on the first stage with the help of experts and paper analysis I had determined groups of factors and actors influencing Higher education development.
3. The second step was to draw up a scheme, which is presented below.
   The scheme consists of:
   1) Research focus «higher education development during in 2010 - 2020»
   2) The factor's level: factors which will influence on the higher education system in Russia in 2010-2020
   3) The actor's level – level of the main characters, who will influence the factors of higher education development in Russia in 2010-2020.
   4) The level of actors' aims
   5) The level of contrast scenarios.
   What is going to be done next is:
4. The next step is to conduct a survey in two tournaments
   To form the groups of selected experts;
   To make an inquiry form for experts
   To run the first tournament
   To make mathematical calculations and develop second tournament inquiry for based on it.
   To run the second tournament of the survey.
5. On the third stage of the research
   To formulate the scenarios of long-term higher education development in Russia on the basis of the inquiry made;
   To organize the second tour of the inquiry to state the optimal scenario of long-term higher education development in Russia;
   To run a conformity test of expert groups in the field of higher education.
6. To formulate the valid conclusions on the basis of conducted survey.

The pilot project survey's scheme and its results are presented below (Scheme 1).

While working with experts randomization of the questions on the inquiry form with the aim of possible avoidance of the information received should be used.
On the step of data collection experts are asked to give their judjements (by means of pairwise comparison) to the alternatives, placed on each scheme level.
In the inquiry form we use the scale of relative significance.

Table 1

The scale of relative significance

The intensity of relative significance	The definition	The description
1	The equal significance	*An equal* contribution of both categories to the aim
3	Slight dominance	Slight domination of contribution to the aim of one category in the pair above another
5	Essential or strong dominance	*Strong* domination of contribution to the aim of one category in the pair above another
7	Significant dominance	*Very strong* domination of contribution to the aim of one category in the pair above another
9	Superiority of one above another	*Full domination* of contribution to the aim of one category in the pair above another
2,4,6,8	Intermediate significances between categories stated above категориями	Are used in the compromise case [Саати, Кернс, 1991, с. 32]

Scheme 1

The research scheme «Projection of Higher education system development in Russia»

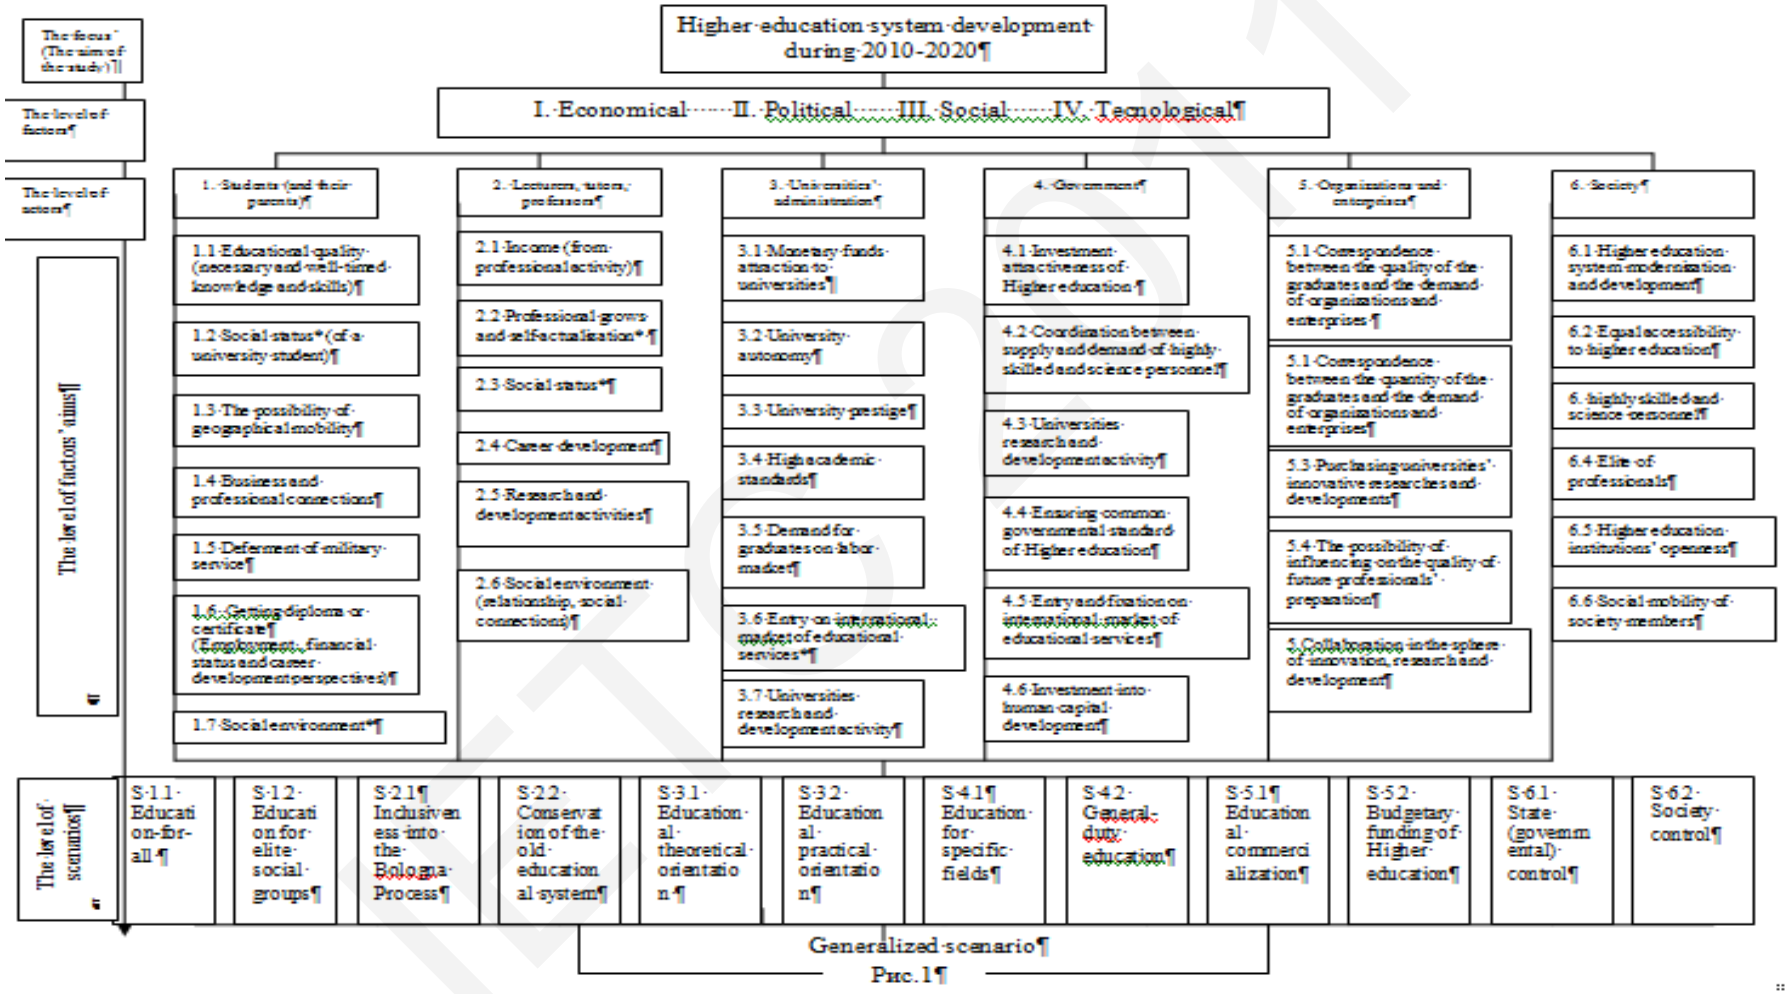

Рис. 1

The next research objective is to aggregate all pairwise comparison matrices received for each expert into matrices for each question, and to check its conformity.
Later weighting coefficient values for each level are calculated. While calculating the coefficients of the level the values of the coefficient of each downstream level of the of the hierarchy are taken into account [Саати, Кернс, 1991; Саати, 1993, Саати, 2008].
On the stage of pilot survey data collection six experts in the field of Higher education took part. They are:

Abankina Irina Vsevolodovna – Candidate of Economics, Director of Institute for Educational Studies;

Abramov Roman Nikolaevich - Candidate of Sociology, associate professor of Social Institutions' Analysis, Sociology of Education lecturer, Higher School of Economics;

Musarsky Mark Mikhailovich – Doctor of Economics, professor of the faculty of Economics of Education, Moscow Institute of the open education;

Solyannikova Svetlana Petrovna - Candidate of Economics, assistant of the director of department for the research; associate professor of Finance Academy under the Government of the Russian Federation;

Stukal Denis Konstantinovich – Applied Politology lecturer, Higher School of Economics;

Chepurenko Alexander Ulyevich – Dean of Faculty of Sociology, Professor Department of Economic Sociology , Senior Research Fellow of Laboratory of Sociological Studies, Higher School of Economics.

It should be pointed out that the conformity relation values for all aggregated matrices of pairwise comparisons belonged to the interval from 0,01% до 5,61%. It indicates quite high conformity of experts' judgments on all sets of questions, as the accepted interval of the coefficient of conformity relation is the interval from 0 % to 10 % [Саати, Кернс, 1991, с.39].

RESULTS

After the analysis of the experts' judgment data, it can be pointed out that the most important on the factors' level are the factor of lecturers' qualification (23,5%), the factor of financing of Higher education system (21,5%), the factor of international integration and cooperation in the sphere (12,4%) and the factor of resource base (12,1%).
On the fifth position, according to experts judgment, is the factor of students' relation to the knowledge and skills obtainment process (11,4%). Then the factor of coordination of supply and demand of highly skilled and science personnel (10, 3%) and the factor of accessibility of Higher education (8,8%) follow.
On the actors' level the most significant influence on factors of Higher education development in Russia during the period of 2010-2020 will have universities administration (23,15%), students (21,03%), Russian Federation Government (20,85%) and university lecturers (14,98%). The least important for the system development actors in the list are organizagions and enterprises (11,26%) and society (8,73%).
While evaluating the importance of actors' aims, we have received that the most important among them are: monetary funds' attraction to the Higher education institutions (15,26%); graduate students' employment perspectives (12,47%) and universities' research and development activity (11,49%). Less weights received such aims as correspondence between supply and demand of graduates of Higher education system (9,97%), Lecturers' income from their professional activity (9,87%), universities' prestige (5,47%), the quality of Higher education (4,8%), professional growth and professional self-actualization of lecturers (4,72% и 3,95%).
The list of aims stated above are the most important, as experts think, from the whole set of aims of all actors of Higher education system. They all weigh 82%.
Afterwards the estimation of the most perspective scenarios of Higher education development in Russia for the most significant actors' aims was made. The results of weighting coefficients, received on these step of expert data analysis are given in Table 2.

Table 2

Generalized scenario of Higher education development in Russia during 2010-2020

	Scenarios of Higher education development in Russia during 2010-2020	Weighting coefficients of scenario preference
Generalized scenario with	Innovative (orientation on modern methods and technologies of teaching)	32,4%

scenarios' preference weights	Practical orientation of education (orientation on practical skills and knowledge)	20,3%
	International integration and cooperation in the sphere	14,8%
	Education for elite social groups (either for talented or for those who is able to pay for their education)	14,5%
	Theoretical and scientific orientation of education	12,2%
	Education for all	5,9%
	The sum:	100%

So, the result of research implementation is presented in generalized scenario of Higher education development in Russia, which can be formulated as ***Innovative Higher education, oriented on practical skills and knowledge, and international integration and cooperation in the sphere for the elite groups of population***.
By elite groups of population we understand either talented or those who are able to pay for their education.

CONCLUSIONS

As a result of the research implementation the conclusion could be made, that among all factors influencing the Higher educational development economical and social factors (the factor of financing of the system of Higher education (21,5%) and the factor of lecturers' qualification (23,5%), play most significant roles).
So, as we had implemented only the pilot project with a small group of experts we are going to continue studying the problem by scheme perfection and attraction of more groups of different experts into our survey. It should be stressed that the creation of hierarchy scheme itself is the most important part of the research. Afterwards experts give their judgments to the pairs of alternatives included into the scheme and as a result the long-term projection based on experts' knowledge could be received.
One of the most important things while working on the scheme is the necessity of including all significant alternatives on each level. On this stage experts, who can complement or criticize the research model, could be attracted.
We also should keep in mind the possibility of different ways of interpreting of the alternatives included into the research scheme by the experts. That is why the thesaurus with the alternatives' description should be made for experts, which than should be used distributed among experts on data collection stage.
The conformity of experts' opinions is one more significant issue. Coefficient of conformity relation is the instrument, which sould be used to check it.
In the end, we should point out that application of such complex method as AHP, is not only possible while determining different factors influence on such a complex system as Higher education system, but is also applicable for the next stage – planning of the development of the system.

THE EXAMINATION OF ONLINE SELF-REGULATED LEARNING SKILLS IN WEB-BASED LEARNING ENVIRONMENTS IN TERMS OF DIFFERENT VARIABLES

WEB TABANLI ÖĞRENME ORTAMLARINDA ÇEVRIMIÇI ÖZ-DÜZENLEYICI ÖĞRENME BECERILERININ FARKLI DEĞIŞKENLER AÇISINDAN İNCELENMESI

Ertuğrul USTA
Ahi Evran University Education Faculty Department of Computer and Instructional Technology.
Kirsehir/Turkey, ertugrulusta@gmail.com

Özet
Bu araştırmanın amacı web tabanlı öğrenme ortamlarında çevrimiçi öz-düzenleyici öğrenme becerilerinin öğrencilerin bilgisayar, internet ve web tabanlı öğretime yönelik tutumlarını farklılaştırıp farklılaştırmadığını belirlemektir. Araştırma betimsel bir niteliktedir. Tarama modelinde yürütülmüştür. Araştırmanın çalışma grubunu 169 üniversite öğrenci oluşturmaktadır. Bu araştırmanın verileri Çevrimiçi Öz-Düzenleyici Öğrenme Ölçeği (α=0,94), İnternete Yönelik Tutum Ölçeği (α=0,77), Web Tabanlı Öğrenme Tutum Ölçeği (α=0,86) ve Bilgisayar Tutum Ölçeği (α=0,97) kullanılarak toplanmıştır. Toplanan veriler üzerinde frekans, yüzde, aritmetik ortalama, t ve Pearson's r korelasyon istatistikleri kullanılıştır. Elde edilen sonuçlardan bazıları şunlardır: Çevrimiçi öz-düzenleme becerileri düzeyleri öğrencilerin internete dönük tutumlarını etkilemektedir. Çevrimiçi öz-düzenleyici öğrenme beceri düzeyleri, "Web Tabanlı Öğretimin Etkililiği" faktörü açısından öğrencilerin web tabanlı eğitime dönük tutumlarını farklılaştırmaktadır. Çevrimiçi öz-düzenleyici öğrenme beceri düzeyleri, öğrencilerin bilgisayara dönük tutumlarını farklılaştırmaktadır.

Anahtar Kelimeler: Web tabanlı öğrenme, öz-düzenleyici öğrenme, bilgisayar, internet, tutum

INTRODUCTION

It can be argued that rapidly starting to use information and communication technologies in education, as it brings along different concepts, brings about people to need more skills day in day out to be able to keep up with developing technology and in this case, computer use leads to an inevitable necessity in terms of both individual and social rationales. Besides, computer motivating students more, supporting life-long learning and increasing flexibility in education programs can be said as principle reasons of computer usage (Keser, 1988; Alkan, 1997). On the other hand, today, learning is regarded as a concept that can emerge not only in schools and specific centers but also in all kind of environments and every phase of life (Reigeluth, 1999).

There may be plenty of conditions for web-based education to be able to become successful. One of them is self-regulated learning skills. Self-regulated learning, which refers to an active and constructive process when individuals attempt to adjust their behaviors, supra-cognitive competency and motivation towards learning goals they introduce, limit their goals by guiding with respect to environmental influences, can be said to possess an important function in developing life-long learning skills (Pintrich, 2000; Zimmerman, 2002; Wirth & Leutner, 2008). Many researchers conducted on self-regulated learning put forward that there is a positive significant relationship between students' motivation levels and learning strategies that they use and academic accomplishments (Pintrich & De Groot, 1990; Zimmerman & Martinez-Ponz, 1990). These findings led to the concept of self-regulation to be on the rise and politicians, who guides education in distinct countries, and educational psychologists to regard self-regulation as a key to success (Boekaerts, 1999).

In terms of web-based education to be able to provide sufficient contribution to academic accomplishment, in addition to self-regulated skills, it can be said that students' attitudes directed to web-based education, computer and internet are important. Attitude is defined as "considerably organized long-term sensation, faith and behavior tendency" (Cuceloglu, 1998). Khine (2001) describes attitude as a mental preparation condition that affects people's stances against a situation and formed as a result of their lives. Ozgur and Tosun (2010) denote that attitudes directly affect success in web-based education and it is quite important to appropriately meet student expectations and requirements in time in terms of their accomplishments.

The objective of this research is to determine whether online self-regulated learning skills differentiate students' attitudes towards computer, internet and web-based education. In this context, questions below were sought an answer:

1. How are the self-regulated learning skill levels of students in online environments?
2. Is there a correlation between students' online self-regulated learning skills and attitudes toward internet?
3. Is there a correlation between students' online self-regulated learning skills and attitudes toward web-based education?

METHOD

Research is of a descriptive character. It was conducted in the scanning model. 169 students(female 111, male 58) in total in five departments receiving the course of Computer II in the form of web-based instruction practice in the Departments of Elementary Education Science and Social Studies Teaching in the Faculty of Education of Ahi Evran University during 2010-2011 spring semester constitute the study group of this research.

The data of this research were gathered using Online Self-Regulated Learning Scale, Attitudes toward Internet Scale, Web-Based Learning Attitude Scale and Computer Attitude Scale. The details concerning scales are as follows:

Self-regulated learning skills of students in online environments were collected by using Online Self-Regulated Learning Scale designed by Bernard et al. (2009) and whose original name is "Online Self-Regulated Learning Questionnaire (OSLQ)". The scale developed by Bernard et al. (2009) consists of six factors and 24 items in total. The validity and reliability study of the scale was performed separately in two distinct study groups as consisting of students, who received education in both blended learning and online learning environments. Confirmatory factor analysis was carried out to determine structure validity in both applications. Parameters in both applications point to its acceptable fit for this structure with 6 factors. Turkish adaptation of the scale was made by Korkmaz and Kaya (on press). Researchers employed confirmatory factor analysis to test structure validity of the scale in Turkish culture. On the other hand, Cranach's alpha values regarding factors are seen to vary between 0.632 and 0.941.

"Attitudes toward Internet Scale", whose reliability and validity studies were performed developed by Tavsancil and Keser (2001), was employed to measure student attitudes toward internet. The scale, which is 5-point Likert scale, consists of 25 items and 5 factors. Five factors explain 55.381% of total variance. According to analyses conducted by Tavsancil and Keser (2001), the internal consistency coefficient for the whole scale was estimated as 0.79.

"Web-Based Learning Attitude Scale", whose reliability and validity studies were performed developed by Erdogan, Bayram and Deniz (2007), was employed to measure student attitudes toward web-based education in this research. The scale, which is 5-point Likert scale, consists of 26 items and 2 factors. These two factors explain 47.308% of total variance. According to factor analysis conducted by Erdogan, Bayram and Deniz (2007), the internal consistency coefficient for the whole scale was calculated as 0.861.

"Computer Attitude Scale", which was developed by Janes and Clarke (1994) and adapted into Turkish by Uzunboylu (1995), was used to measure student attitudes toward computer. The scale, which is 5-point Likert-type, consists of 40 items and it is single dimensional. The internal consistency coefficient of the scale was calculated as 0.97. Positive items in the scale were graded from 5 to 1 and negative items were inversely graded from 1 to 5 in options of "I Totally Agree – I Certainly Do Not Agree".

To be able to mention online self-regulated learning skills of students and their attitudes towards web-based education, of course, they should experience web-based learning. In this context, 6-week portion of the course of Computer II was applied in the form of web-based instruction. Instruction practice incorporates the subjects of basic concepts regarding internet-based education, internet-based education in Turkey and the world, content design in internet-based education and learning and motivation. 3-week part of web-supported instruction practices lasting 6 weeks was performed in the normal hour of the course in the program; in the rest 3-week part, students were provided flexibility to resume their practices in anywhere. Computer laboratories were kept open in hours with no course under the supervision of department assistants for students to be able to easily access computer and internet. Student-student, student-instructor and student-content interaction were provided for students as both senkron and asenkron. Student questions related to content were provided senkron or asenkron feedback and correction within the context of chat and forum. Face-to-face interaction with students was abstained

in the part of practice within the course, it was elaborated that all interaction was realized in chat platform. Asenkron feedback was provided by using forum platform in the part of practice outside the course.

A web site was prepared incorporating the subject of the basic concepts regarding internet-based education, internet-based education in Turkey and the world, content design in internet-based education and learning and motivation in accordance with web-based learning approach within the scope of research. In prepared web site, explanations of topics were supported by various videos. Dreamweaver software was used for visual design of the site, Articulate software was used for content design and Ms-Sql and PHP softwares were employed for student management system. A student management system, where informations such as study durations of students, what topics are studied, answers given to exercises etc. are kept, is situated on the designed web site. Students can access topics via their own passwords. Necessary interventions were carried out aimed at ensuring students to use the system in accordance with records in student management system.

Each item on scales was scaled as never (1), rarely (2), sometimes (3), usually (4), always (5). Converting the scores that students obtained for answers they gave to 5-point Likert type scale into standard scores in a way that the lowest one will be 20 and the highest will be 100 is appropriate. When students are grouped with respect to online self-regulated learning skill levels, students with the average score being 66 and below were designated as sub-group and students with the average score being 67 and above were designated as upper-group. Frequency, percentage, arithmetic average, t and Pearson's r correlation statistics were used on the collected data. Significance level of 0.05 was predicated on for testing of difference and correlations.

RESULTS

1. Self-Regulated Learning Skill Levels in Online Environments:

Online self-regulated learning levels of students, who participated in web-based learning practices, are summarized on Table 2.

Table 2. Online Self-Regulated Learning Levels of Students

Variables	N	$\bar{X}$	sd	Min	Max
Goal Setting	169	70,65	14,22	32,00	100,00
Structuring the Environment		77,57	17,21	20,00	100,00
Task Strategies		65,98	13,19	30,00	95,00
Time Management		65,16	13,12	20,00	100,00
Help Seeking		71,63	14,30	25,00	100,00
Self-Regulation		71,41	14,23	30,00	100,00
Total		**70,56**	**11,19**	**35,00**	**95,00**

As seen on table 2, online self-regulated learning skill scores of students vary between 35.00 and 95.00; their average is $\bar{X}$=70.56. Accordingly, it can be argued that self-regulated learning skills of students in online environments are high. When looking at in terms of scores regarding factors one by one, it is seen that the factor with the highest average is "Organizing Environment" ($\bar{X}$=77.57) and the factor with the lowest average is "Time Management" ($\bar{X}$=65.16). So, it can be uttered that the highest level student skills in terms of their online self-regulated learning levels is "Organizing Environment" and the lowest level is "Time Management".

2. The Relationship between Their Online Self-Regulated Learning Skills and Attitudes towards Internet

Online self-regulated learning skills of students were allotted into two groups as sub-level and upper-level. Students with the total score of online self regulated learning skills being 66 and below comprised sub-group and students with the total score of online self regulated learning skills being 67 and above constituted upper-group. Findings related to the relationship between online self-regulated learning skills and attitudes towards internet are summarized on Table 3.

Table 3. The Relationship between Online Self-Regulated Learning Skills and Attitudes towards Internet

	Goal Setting	Structuring the Environment	Task Strategies	Time Management	Help Seeking	Self-Regulation	**Total**
Internet Denial	,240(**)	,237(**)	,071	,153(*)	,179(*)	,214(**)	,246(**)
Internet Trust	,079	,124	-,021	-,011	,017	,136	,081
Belief in Internet's Benefits	,100	,133	-,064	-,013	,050	,102	,080
Enjoying Internet	,117	,111	,004	,027	,112	,120	,113
Enjoying Internet's benefits	,095	,136	,002	,157(*)	,134	,271(**)	,173(*)
Total	,195(*)	,216(**)	,017	,097	,149	,226(**)	,207(**)

N:169; ** p< 0.01; * p<0.05.

It is observed in Table 3 that there is a positive and significant relationship (r=207) between the total score of online self-regulated learning skill and the total score of attitude towards internet. Besides, there is a positive and significant relationship between the total score of attitude towards internet and "Goal Setting", "Organizing Environment" and "Self-Evaluation"; between the total score of online self-regulated learning and the factor of "Denying Internet". Accordingly, it can be said that as positive attitudes of students towards internet increase, their online self-regulated learning skill levels also increase. Besides, as their attitudes toward internet increase, their skill levels of "Goal Setting", "Organizing Environment" and "Self-Evaluation" accordingly go up; as "Denying Internet" increases, their total scores of online self-regulated learning accordingly go up.

Considering in terms of factors, there is a significant positive relationship between total scores for online self-regulated skills and "Enjoying Possibilities that Internet Offers" and "Time Management", "Self-Evaluation" among other skills except the factor of "Denying Internet" and "Duty Strategies" among self-regulated learning skills. Accordingly, it can be argued that as student levels for getting accustomed to internet go up, their skill levels of "Goal Setting", "Organizing Environment", "Time Management", "Seeking Help" and "Self-Evaluation" also increase. On the other hand, it can be said that as their attitudes of "Enjoying Possibilities that Internet Offers" increase, their "Time Management" and "Self-Evaluation" skill levels also go up. Findings related to differentiation in student attitudes towards internet with respect to their online self-regulated learning skills are summarized on Table 4.

Table 4. Differentiation among Student Attitudes towards Internet with respect to Their Online Self-Regulated Learning Skill Levels

Variables		N	$\bar{X}$	sd	t	df	p
Internet Denial (reverse coded)	Subgroup	53	77,89	13,27	-2,557	167	,011
	Topgroup	116	83,29	12,51			
Internet Trust	Subgroup	53	75,28	18,15	-1,026	167	,306
	Topgroup	116	78,10	15,82			
Belief in Internet's Benefits	Subgroup	53	77,83	15,86	-,679	167	,498
	Topgroup	116	79,57	15,25			
Enjoying Internet	Subgroup	53	78,49	14,79	-1,414	167	,159
	Topgroup	116	83,49	23,71			
Enjoying Internet's benefits	Subgroup	53	73,36	16,74	-1,952	167	,046
	Topgroup	116	78,26	15,60			
Total	Subgroup	53	76,96	11,57	-2,228	167	,027
	Topgroup	116	81,28	11,73			

As seen in table 4, there is a significant differentiation among student total scores for attitude towards internet according to their online self-regulated learning skill levels ($t_{(2-167)}$ =-2,228; p<,05). When looking at attitude toward internet in terms of factors, it is seen that there is a significant differentiation between factors of "Denying Internet" ($t_{(2-167)}$=-2,557; p<,05) and "Enjoying Possibilities that Internet Offers" ($t_{(2-167)}$=-1,952; p<,05), as for other factors, there is not a significant differentiation with respect to online self-regulated learning skills. When averages examined, it is seen that differentiation is in favor of upper group. Accordingly, it can be asserted that the total score of online self-regulated learning skill levels differentiate student attitudes towards internet in terms of factors of "Denying Internet" and "Enjoying Possibilities that Internet Offers". In other words, online self-regulated skills affect student attitudes towards internet.

3. The Relationship between Online Self-Regulated Learning Skills and Attitudes towards Web-Based Education

Findings pertaining to the relationship between online self-regulated learning skills and attitudes toward web-based learning are summarized on Table 5.

Table 5. The Relationship between Online Self-Regulated Learning Skills and Attitudes towards Web-Based Education

	Goal Setting	Structuring the Environment	Task Strategies	Time Management	Help Seeking	Self-Regulation	**Total**
Effectivity of WEB Based Teaching	,082	,140	,064	,105	,229(**)	,148	,169(*)
Resistance against Web Based Teaching	,223(**)	,207(**)	,303(**)	,181(*)	,204(**)	,163(*)	,274(**)
Total	,046	,015	,098	,003	,092	,045	,005

N:169; ** p< 0.01; * p<0.05.

It is seen in table 5 that there is no relationship between the total score for online self-regulated learning skill and total scores for attitude towards web-based learning. So, it can be argued that an increase or a decrease in total scores of student attitudes towards web-based learning do not affect total scores for online self-regulated learning skill. Considering in terms of factors, it is observed that there is a significant positive relationship between the factor of "The Efficacy of Web-Based Instruction" and

"Seeking Help" and total scores for online self-regulated learning skill. Additionally, it is seen that there is a significant positive relationship between all factors and total scores concerning online self-regulation skills and the factor of "Resistance Against Web-Based Education". Accordingly, it can be uttered that as attitudes towards the factor of "The Efficacy of Web-Based Instruction" rise, all factors and total scores of students regarding "Seeking Help" and total scores of online self-regulated learning skills also go up accordingly. Besides, it can be said that as their attitudes for "Resistance Against Web-Based Education" rise, all factors and total scores of students regarding online self-regulation skills also increase accordingly. Findings related to differentiation in student attitudes towards web-based learning with respect to their online self-regulated learning skills are summarized on Table 6.

Table 6. Differentiation among Student Attitudes towards Web-Based Instruction with respect to Their Online Self-Regulated Learning Skill Levels

Variables		N	$\bar{X}$	Sd	t	df	p
Effectivity of WEB Based Teaching	Subgroup	53	67,94	13,65	-2,762	167	,006
	Topgroup	116	74,04	13,17			
Resistance against Web Based Teaching	Subgroup	53	66,70	14,35	1,879	167	,062
	Topgroup	116	61,89	15,91			
Total	Subgroup	53	67,53	10,74	-1,378	167	,170
	Topgroup	116	69,84	9,86			

As seen in table 6, there is a differentiation only in terms of the factor of "The Efficacy of Web-Based Instruction" in student attitudes towards web-based learning with regard to online self-regulated learning skill levels of students ($t_{(2-167)}$=-2,762; p<,05). When averages examined, it is seen that this differentiation is in favor of upper group. It is observed that there is no significant differentiation between groups in terms of total score and the factor of "Resistance Against Web-Based Education". Accordingly, online self-regulated learning skill levels can be said to differentiate student attitudes towards web-based education in terms of the factor of "The Efficacy of Web-Based Instruction".

DISCUSSION AND CONCLUSION

Self-regulated learning skill levels of students in online environments are high. While the highest level skills of students are "Organizing Environment" in terms of their online self-regulated learning levels, their lowest skills are "Time Management". Even though online learning environments are popular today, students receiving education in the faculty where this research was conducted generally have gotten to know online learning environments recently. High scores of students in the sub-factor of "organizing environment" should not be perceived as contradictory with this situation. Because, student is unfamiliar to online learning environment, not online environment. Put it differently, online experiences that students attained before assisted them while organizing online learning environment during the learning process realized throughout research. On the other hand, their low scores in the sub-factor of "time management" is a situation frequently emphasized in the field literature. Howland and Moore (2002) stated the difficulty for students to follow a specific work schedule in learning environment and organizing time is a critical requirement.

Online self-regulated learning skill levels differentiate student attitudes toward web-based education in terms of the factor of "the Efficacy of Web-Based Instruction". An increase or a decrease in total scores of student attitudes towards web-based learning does not affect total scores of online self-regulated learning skills. Nevertheless, as their attitudes regarding the factor of "the Efficacy of Web-Based Instruction" rise, total scores of online self-regulated learning skills of students and "Seeking Help" rise accordingly. Furthermore, as their attitudes of "Resistance against Web-Based Education" go up, all factors and total scores concerning online self-regulation skills of students rise accordingly.

As a conclusion, further research is needed aimed at how their online self-regulated learning skills affect attitudes of students directed to computer, internet and web-based education and additionally, how these variables affect academic success. Educational institutions, instructors and educational designers obtaining more pre-information about perception, motivation and attitudes of students before performing a course will serve them to increase interaction diversity in online environments, to better understand problems that students might face and as a result, to effectively fulfill educational goals of students.

THE FACTORS THAT MOTIVATE AND HINDER THE STUDENTS WITH HEARING IMPAIRMENT TO USE MOBILE TECHNOLOGY[1]

Assoc.Prof.Dr. Abdullah KUZU
Anadolu University
akuzu@anadolu.edu.tr

ABSTRACT: This research which aims to find out the factors that motivate students with hearing impairment to use PDA (Personal Digital Assistant), a product of mobile technology, in instructional activities, interactions with their peers and instructors, and in their daily lives, and the factors that hinder these individuals from using PDA was designed as an action research. The research was conducted with 12 students with hearing impairment taking "BIL151Fundamentals of Information Technology-I" course in School for the Handicapped, Department of Applied Fine Arts at Anadolu University. The participants used the HP IPAO hw6915 modeled PDAs for education and social interaction purposes in the activities carried out in the scope of the research for 16 weeks. For data collection, reflections gathered with questionnaire and critic event method were employed. The quantitative data were analyzed with descriptive statistics while the qualitative data obtained from one sample t-test were analyzed with content analysis done in an inductive approach. The research was supported by TUBITAK, The Scientific and Technological Research Council of Turkey (Project Number: 107K022). This article presents the findings of the project that show the situations that motivate and hinder students with hearing impairment to use PDA.
Keywords: Mobile technologies, hearing impaired, motivators, barriers

INTRODUCTION

Children with prenatal or pre-language hearing loss face great difficulties in acquiring the speaking dimension of their mother tongue. The problems in their hearing and the differences in their speech cause the children with hearing impairment not to understand talks thoroughly, reduce intelligibility of their speech, or make them totally unintelligible (Brannon, 1986; Northern and Downs 199; Osberger and Macgarr, 1982; Tüfekçioğlu, 1989). The inadequacy of the speech intelligibility in children with hearing impairment may make their communication through speech harder, and it may even cause them not to communicate at all (Kretschmer and Kretschmer, 1978; Sanders, 1971). These communication breaks of the child with hearing impairment may result in facing problems in social and emotional problems as well as problems in their future lives, education, and work (Sanders, 1971; Tüfekçioğlu, 1992).

Besides face to face communication we experience through talking in our daily lives, we can feel the need to reach previous or distance information, and communicate with the people far away from us. We can use tools such as telephone, fax and e-mail to meet our distance communication need. The widespread use of cell phones and their texting facility began to be an alternative way of communication for individuals with hearing impairment. However, the importance of reading and writing, another dimension of oral communication is undeniable for the individuals with hearing impairment to use distance communication tools. In this sense, mobile technology environments that offer opportunities of teaching and learning free from time and place serve as a very effective option for the education of children with hearing impairment.

The mobile technology concept is generally used to refer to mobile information-communication tools and standards such as cell phones and PDAs (Personal Digital Assistant) (Çuhadar and Odabaşı, 2004). The small size properties of the mobile technologies enable the individuals to carry those tools while they are maintaining their daily life activities. Similarly, a new concept called "m-learning", namely, mobile e-learning appeared in literature with instructional use of these tools which are easy to carry in daily life activities, and suitable for wireless communication.

[1] This study is a part of TUBITAK Project (Project No: 107K022) entitled "Mobile Technologies in the Education of Hearing Impaired Individuals [İşitme Engelli Bireylerin Eğitiminde Mobil Teknolojiler (İBEM)].

There are various definitions of the m-learning in the literature. For instance, while Quinn (2000) defined it as an e-learning activity that can be facilitated through portable computers, Fagerberg, Rekkaedal and Russell (2002) defined it as the use of mobile technologies in the world of education. Similarly, Georgiev, Georgieva and Smrikarov (2004) defined m-learning as the new form of existing e-learning and distant learning applications. The common point of these definitions is originated from the fact that the content of learning is transmitted to the learners through wireless networks by means of mobile instruments (Odabaşı et.al. 2009).

Learners can interact with their peers either on the course related or on extracurricular subjects without any time and place limitations in student center m-learning applications where PDAs are used. One of the important contributions of PDAs, which are used for the purpose of education, is that, they could prolong the teacher-student or student-student discussions that occur during the class hours to the post lesson sessions through using various Internet tools such as blogs, discussion forums or chat rooms. The PDAs could be used at any time by the teachers for feedback purposes, since they provide communication without any time and place limitations and include various communication means such as e-mail, voice call, and SMS (short message), etc. Similarly, PDAs also enable students to ask questions to their teachers or friends and get answers to their questions whenever and wherever they want. Furthermore, since PDAs have Internet access in and out off the school contexts, they could also enable the use of Web-based applications in the courses. The interactive Web pages, which are also called blogs, can be used to provide social interaction among the students and to provide learners a richer interaction environment with other stakeholders. Recent educational studies and theories that focus on blogs highlight the importance of social interaction in the field of teaching and learning (Ferdig and Trammell, 2004).

Although PDAs are assumed as tools that can fill an important gap in education and social interaction areas of both hearing and hearing impaired students, this function of technology can only be fulfilled when individuals with hearing impairment accept and use mobile technologies. It is supposed that recognition of the possible factors that can motivate or hinder individuals with hearing impairment to use mobile technologies for instructional and social interaction purposes, or organizing the learning environments so as to solve the possible problems, might lead acceptance of the technology and motivation for their use by the hearing impaired individuals.

Purpose of the Study

The purpose of the present study is to define the possible factors that can motivate or hinder individuals with hearing impairment to use mobile technologies for instructional and social interaction purposes. The present study employed PDAs as the mobile technology. It is hoped that the findings of the present study might contribute to the further studies in the field and guide the researchers who might design mobile technology based learning environments for the individuals with hearing impairment. Along with this purpose, the present study posed following research questions;

1. What are the motivational factors that might lead to use mobile technologies by the hearing impairment students in their instructional activities, interactions with their peers and instructors, and in their daily lives?
2. What are the hindering factors that might prevent the use of mobile technologies by the hearing impairment students in their instructional activities, interactions with their peers and instructors, and in their daily lives?

Limitations of the Study

- In terms of the content, the present study is limited to the course materials and face to face and online activities that were structured along with these course materials throughout 16 weeks.
- In terms of the mobile technology, the present study is limited to the hardware and software characteristics of a PDA which is commercially known as HP iPAQ hw6915.
- In terms of the online activities that were offered to the students, the present study is limited to a blog environment which was supported by WordPress software.

METHODOLOGY

Research Design

The study was designed as an action research which is one of the qualitative research methods. Action research is a pre-planned and well-organized research process, which intends to improve or understand

the current actions or teaching procedures that exist in real classroom environment and inform other parties about the current phenomenon (Johnson, 2002). The nature of such kind of research designs necessitates figuring out a problem that exist during the practice process and providing solution to that problem through gathering and analyzing the data systematically (Yıldırım and Şimşek, 2005).

Participants

The students with hearing impairment at tertiary level form the universe of the study. When determining the participants in the research, criterion sampling which is the way of examining the cases meeting a series of predetermined criteria (Patton, 2002) was used among the purposeful sampling methods. The criterion used in determining the participants was choosing the students with hearing impairment at tertiary level who hold preliminary information and skills for computer use. Thus, the participants of the study were 12 students with hearing impairment taking "BIL151 Fundamentals of Information Technology-I" course in the Research Institute for the Handicapped Students at the Department of Applied Fine Arts at Anadolu University. The students' participation to the study was on volunteer basis. Additionally, all of the participants signed a written confirmation (consent form) about their volunteer participation to the project prior to the beginning of the research.

Data Collection Instruments

The action research process requires collecting research data systematically in order to identify and solve potential problems that might occur in the teaching environments. It is expected that the collected data should describe the setting (context) sufficiently and in detail. Thus, the data of the study was collected through a questionnaire (survey) and reflections which were performed as critical event analysis technique. The data gathering instruments of the study were explained in detail in the following sections of the paper.

PDA Use Questionnaire

The "PDA Use Questionnaire" is developed and used in the present study in order to identify the possible factors that can motivate or hinder participants to use PDAs. Basically, the questionnaire consists of two separate sections. The questions in the first section inquire the demographic information about the participants, whereas, the second section includes items related to the possible factors that can motivate or hinder participants' use of PDAs for their instructional and social interaction purposes. The second section of the questionnaire includes total 48 items and participants responded each of the items through selecting one of the stated options which are "agree", "neutral" and "disagree".

Regarding the fact that different PDAs have different hardware and software features, 37 of the items in the second section were formed on the basis of the technical features of HP IPAQ 6915 which was the model of PDA used by the participants throughout the research process. Thus, participants stated their opinions through selecting one of the options ranged from "agree", "neutral" to "disagree" in order to identify the factors that can motivate or hinder participants' use of PDAs for their instructional purposes.

The (Practice of) Critical Event Approach

In the last week of the study, participants were asked to write reflection reports and describe the favorable and unfavorable moments that they have experienced while they work with PDAs. The questions were delivered to the participants as two separate forms where they could write their opinions. At the beginning of the practice (study), each of the participants was delivered the first form in which they were asked to write their opinions related to their favorable moments while using the PDAs. The participants were given a plenty of time to write their opinions on the forms. During this process, when the participants gave their forms to the instructor, he examined the forms and guided the participants to write their feelings in detail. However, the instructor paid attention while guiding them so as to not have any effect on the opinions of the participants. Subsequent to students' returning the first forms, they were given the second form in which they were asked to write their opinions related to their unfavorable moments while using the PDAs, and the similar procedures were followed in this phase as well.

The Data Analysis

The descriptive statistical analysis methods were used in the analysis of the quantitative data that obtained by means of questionnaire and percentages, frequencies, means and standard deviation values were identified. Since every parametric tests require the normal distribution of the data (Pallant, 2001), prior to

making any parametric test, all of the data were examined by using SPSS 15.0 software regarding the normality of the distribution of the data, thus, Q-Q, P-P diagrams and histograms were analyzed, skewness and kurtosis values were examined, and Shapiro-Wilk and Kolmogorov-Smirnov (k-s) tests were used in this process. Additionally, one sample t-test was used in order to examine the difference between the mean score that obtained from qestionnaire and the hypothetical mean score.

The expert opinion was also taken in order to establish the reliability of the quantitative data that obtained by means of questionnaires. In terms of the reliability issues, Cronbach alpha internal consistency coefficient was used and 0.70 internal consistency coefficient value was regarded as the baseline (Huck, 2000; Pallant, 2001). As the result of the reliability estimations, the reliability of the first section was calculated as (cronbach alpha) $\alpha = .86$, whereas, it was calculated as $\alpha = .84$ or the second section of the questionnaire.

Inductive content analysis was performed with the qualitative data, which obtained by means of the written responses of the participants on the first form that inquires their opinions related to their favorable feelings while using the PDA, and on the second form that inquires their opinions related to their unfavorable feelings while using the PDA. The main aim of the content analysis is to figure out the findings of the study out of the frequent, dominant and/or meaningful themes that emerged from the raw data (Thomas, 2003). Inductive content analysis requires in-depth analysis of the data, which helps to figure out the themes and dimensions that were not predicted beforehand (Patton, 2002; Strauss and Corbin, 1990).

The reliability and validity calculations of the obtained themes were performed by the field experts and the reliability of the data that obtained by critical event analysis of the first form was computed as .94, whereas, it was computed as .95 for the data that obtained from the themes in the second form. In order to establish the trustworthiness, transferability, credibility and confirmability (Guba, 1981: cited in Shenton, 2004) of the qualitative data, following actions were performed; selecting purposeful sampling, recording and reporting every details througout the research process, objectivity in the identification and interpretation of the data, colecting suficient data, using real data sources, prolonged interaction, perspective based data colection, data triangulation, getting expert opinion and descriptive narration.

RESULTS

The findings related to motivating and hindering factors that affect the use of PDAs by hearing impaired individuals were presented in the following section along with the research questions. The findings of the quantitative data, which were obtained by means of participants' responses to 48 items in the first part of the questionnaire, concerning the opinions of the participants related to the motivating and hindering factors that affect the use of PDAs by hearing impaired individuals, can be summarized as follows;

As the first step, the participants' total scores that they have attained from the first part of the "The Use of PDA questionnaire" were computed. In order to test whether the data match the requirement of normal distribution, which is the prerequisite of the parametric tests (Pallant, 2001), the total scores of the participants were examined by means of Shapiro-Wilk and Kolmogorov-Smirnov (k-s) tests through using SPSS 15.0 software. The test statistics for K-S test was computed as $D=.129$, and in the .05 significance level, the findings were regarded as significant $p>0.05$. The Shapiro-Wilk statistics of the data was computed as $W=.94$ and in the .05 significance level, the findings were regarded as significant $p>0.05$. Additionally, the Q-Q and P-P diagrams were examined. It was observed that the computed skewness value of the distribution (.021) and kurtosis value (-1, 20) were within the normal distribution criteria. Thus, the distribution of the data was regarded as normal distribution.

The mean score of the first part of the "Use of PDA" questionnaire was computed as 18, 25. There are 48 items in this part of the questionnaire. Thus, the minimum mean score that can be obtained from the questionnaire is 48 whereas the maximum score is 114. The hypothetical mean score that can be obtained from the questionnaire is 96. According to the results of one-sample t-test, which was performed to examine the difference between the mean score and hypothetical mean score, the mean score of the items in the questionnaire was found statistically significant at .05 significance level ($t=5.66$; $p<.05$), thus, having higher mean score (118, 25) than the hypothetical mean score (96), revealed that the motivation levels of the participants in using PDAs in their instructional activities is also high. When the mean

scores of each participant were examined further, it was found that none of the participants get lower mean score than the hypothetical mean score. Thus, it can be claimed that all of the participants have higher motivation in using PDAs in their instructional activities.

According to the average points of each item of the questionnaire, "using PDAs in instructional activities" is the most important factor that motivates students to use PDA. Using PDA for interacting with each other follows this. While using PDAs to interact with their instructors is in the third rank, using PDAs in their daily lives is the least motivating factor. When we look at the total average point of each dimension, we see that the most important factor that motives participants to use PDA is "interaction". The third important factor is using PDAs in instructional activities whereas the last factor is using PDAs in daily lives.

When the findings of the quantitative data were reviewed in general, it was found that following courses that the participants missed, reaching the information they look for any time and any place they want, learning information they do not know or missed from their peers, getting immediate response to the messages they send, benefiting from their friends in solving problems related to the course and carrying the course notes with them all the time are the most motivating factors to use PDA. Learning more effectively in the discussions they hold on the net, expressing themselves better in these discussions, and reinforcing what they have learned during the lesson via reaching the main resource and materials of the course through web are among the factors that motivate participants to use PDA.

On the other hand, when the hindering factors that did not lead the participants to use PDAs in their instructional activities were examined, it was found that only five of the items have mean scores below 2.00; thus, it was supposed that those five items might be the factors which prevent participants' use of PDAs in their instructional activities. Not making new friends through PDA, having extra load because of this PDA aided course, feeling obliged to using PDA for lessons all the time, feeling uncomfortable since other people get interested in them while using PDA, and the difficulties they experience in sending messages are the factors that hinder the participants from using PDA.

In terms of equipment properties of PDA, all the participants have high level of motivation to use PDA. The most important equipment factors that motivate participants to use PDA are camera feature of PDAs, having some features not included in cell phones, and using Window operating system which the participants are accustomed to from their computers. Carrying files and data with PDA, keyboard feature, its use as cell phone, running MSN Messenger program, sending e-mails, having calculator and taking notes easily on it are the other motivating factors. The factors that hinder participants from using PDA are using some programs in PDAs only with writing pen (Stylus), lack of some programs that participants are accustomed to using in computer environment, interference while talking on the phone, difficulty in running a program on PDA and difficulty in entering numbers in PDA.

DISCUSSION

The success of current technologies is based on the practicality of that technology when it is used in any field. The new-world concept, which gives importance to the new developments in social life, to the individual differences and to the educational issues rather than economic wealth of the nation, especially paying attention to the special education might lead the handicapped individuals to get their share from the application of technology into their education sufficiently. The new technologies, which also called mobile technologies, will be the indispensable source of the twenty-first century's technology through conveying their time and place independent features into mobile environments. The handicapped individuals who need special education may even follow the current issues by means of such technologies. The learners especially the ones who need special education, such as handicapped individuals, the students who have to stay at the hospital for their treatments might continue their education by the help of mobile technologies, thus, they can follow the courses without any time and place limitations, they can access the needed information whenever and wherever they want, they can get information about the courses hey missed from their classmates and they can ask and get answers to their questions immediately. Thanks to the Web nets, the mobile technologies have the potential to simultaneously transmit the information that the individuals need.

Like all of the new technological application, the mobile technologies might also have some limitations such as the cost, accessibility and acceptability. However, through practicing new governmental policies for the education of handicapped people, it could be increased the use and availability of mobile technologies in the field of special education. Likewise, through conducting studies similar to the present study, the acceptability, compatibility, effectiveness and practicality of the technology could be examined. The motivating or hindering factors for the students might be identified along with the different special education fields. Thus, the present study revealed that the greatest problem that the hearing impaired students encountered during their use of PDAs, was using the PDAs with hearing aid caused interference (noise). However, orthopedically handicapped students might complaint about the small size key pad of the PDAs. Being the first initiative in cooperation with special education and mobile technology was inspired the researcher of the present study. The researcher believes that a lot more studies can be conducted on this issue in Turkish context. The forthcoming studies on this issue might contribute to enhance the quality of life of the handicapped people as well as contribute to the sustainable development of the country.

Özet
Bu araştırmanın amacı, doğrudan bir programlama dili öğretilen ile yalnızca algoritma öğretilen öğrencilerin eleştirel düşünme ve mantıksal-matematiksel zekâ düzeylerinin algoritma oluşturma becerilerine etkisini ortaya koyarak, algoritma becerilerini geliştirmeye yönelik önerilerde bulunmaktır. Bu araştırma, sontest kontrol gruplu yarı deneysel hem nicel hem de nitel karakterli bir çalışmadır. Çalışma grubunu 45 öğrenci oluşturmaktadır. Araştırmanın verileri algoritma beceri testi, eleştirel düşünme eğilim ve düzeyleri (α=0,88) ve mantıksal-matematiksel zeka öz algı ölçeği (α=0.925) kullanarak toplanmıştır. Algoritma beceri testi ile elde edilen veriler, bir dereceli puan anahtarı yardımıyla doküman incelemesi yöntemiyle değerlendirilmiştir. Toplanan nicel veriler üzerinde aritmetik ortalama, t ve pearson analizleri yapılmıştır (p<,05). Ulaşılan sonuçlar ise şöyle özetlenebilir: Açık fikirlilik ile meraklılık alt boyutları dışında diğer alt boyutlarda ve toplamda eleştirel düşünme öğrencilerin algoritma geliştirme becerileri üzerinde etkili olmaktadır. Öğrencilerin mantıksal-matematiksel zekâ düzeyleri algoritma geliştirme becerileri üzerinde oldukça etkilidir.
Anahtar Kelimeler: Programlama becerileri , eleştirel düşünme, mantıksal-matematiksel zeka

INTRODUCTION

Students' problems in learning programming skills can certainly be attributed to many factors. Chiefly among them are the inherent complexities of the programming process, the tendency to overlook the fact that this process requires special teaching approaches, the need for strenuous efforts to learn and the lack of skills to use mathematical knowledge in programming process (Lawrence et al., 1994). In addition to such causes as the general lack of knowledge in students about the problem solving process and about how to design a program or algorithm (Lawrence et al., 1994), critical thinking skills frequently used along with the problem solving skill and students' intelligence levels can also be a cause for such failures. In fact, Boulay (1986) particularly makes emphasis on the importance of the problem solving skill in the programming process.

Thinking refers to mental processes such as problem solving, investigating a phenomenon, reflection and criticising based on establishing meaningful links between concepts or events and arriving at conclusions (Yüceliş, 2003; Aybek, 2006). Critical thinking is defined as logical and reflective thinking which focuses on deciding what to do and what to believe (Ennis, 1991: cited in Dam and Volman, 2004). Accordingly, critical thinking is argued to be a significant skill in the problem solving process. The literature contains a great deal of evidence about the contributions of critical thinking to students' academic achievement (Doney, Lephard, 1993: cited in Akbey, 2006; Kaasboll, 1998;Akbıyık, 2002; Kökdemir, 2003;). The contribution of critical thinking to academic achievement is not only limited to courses in certain fields but also covers all courses (Kökdemir, 2003).

There are many other variables that influence learning apart from critical thinking skills. Chiefly among them concerns students' intelligence levels. The Theory of Multiple Intelligences developed by Gardner takes intelligence as a fundamental variable that affects learning. Gardner (1999) defines intelligence as an individual's capacity to create products that are valued within one or more cultural settings; the skill to produce efficient solutions to real-life problems; or the ability to discover new or complex problems that require solutions. In order to add broader insights to the issue of intelligence in his theory, Gardner (1997) termed the abilities and potentials acquired in different ways by people as "intelligence domains". The theory argues that there exist important relations between intelligence types and learning styles (Gardner, 1989).

With regard to the characteristics concerning programming skills, particularly logical-mathematical intelligence arguably gains prominence over other domains. In fact, Saban (2002) argues that individuals with strong logical-mathematical intelligence are successful in categorising objects, establishing logical links between events, and establishing some abstract relationships between events by quantifying and calculating certain properties of objects. Such skills are usually those that are needed in the programming process. Therefore, the present study only addresses this particular aspect of the theory of multiple intelligences. In the light of the above discussions, one could suggest that critical thinking skills and logical-mathematical intelligence levels may influence students' programming skills. Furthermore, the effects of these variables may differ in two different instructional applications i.e. direct teaching of a programming language and simply teaching algorithms. On the basis of this basic assumption, the study aims to reveal the impact of critical thinking and logical-mathematical intelligence levels of students who were directly taught a programming language and those who were only taught algorithm upon their algorithm design skills and to offer suggestions to enhance algorithm skills.

Sub-Problems:

1. How are students' algorithm design skills influenced by their critical thinking dispositions and levels?
2. What is the relationship between students' algorithm design skills and critical thinking skills?
3. How are students' algorithm design skills influenced by their Logical-Mathematical intelligence levels?
4. What is the relationship between students' algorithm design skills and their Logical-Mathematical intelligence levels?

METHOD

The present study is a posttest control group semi-experimental study with both quantitative and qualitative character. The sample consists of a total of 45 students in their first year in the Department of Computer, and Instruction Technologies in an Education Faculty.

For five hours a week for four weeks, experiment group I was taught the concepts of program, command, algorithm, flow chart, constant, condition, and cycle, and example questions were analysed about how to develop an algorithm. The students were presented with explanations and examples about what strategies they should follow in the problem solving process. At every stage of the instruction, the students were made to develop algorithms to solve different exemplary problems and were provided with instant feedback and corrections for their mistakes. At the end of each session, they were given problem statements as extracurricular activities, which they were asked to solve for the next session. The assignments were checked at the beginning of each session and appropriate feedback and corrections were provided.

Similarly, for five hours a week for four weeks, experiment group II was also taught the concepts of variable, Visual Basic editor, program, command, algorithm, flow chart, constant, condition, cycle and basic commands in Visual Basic. Next, example questions were analysed about how to develop program piece. The students were presented with explanations and examples about what strategies they should follow in the problem solving process. At every stage of the instruction, the students were made to develop code pieces to solve different exemplary problems, and were provided with instant feedback and corrections for their mistakes. At the end of each session, they were given problem statements as extracurricular activities, which they were asked to solve for the next session. The assignments were checked at the beginning of each session and appropriate feedback and corrections were provided.

The following data collection instruments were used to collect the necessary data.

a. Algorithm Skill Test: In order to measure algorithm development skills, the students were administered a test form containing four open-ended algorithm questions. The students were asked to write down the solution they project to solve the problem in each question, to write the algorithm and to draw the flowchart for their solutions, and to prepare check tables for the algorithm.

b. Critical Thinking Dispositions and Levels: The study data were collected from the target groups using the California Critical Thinking Disposition Inventory (CCTDI). Originally written in English, the inventory was translated into Turkish and was subjected to the required validity and reliability analyses by Kökdemir (2003). Composed of a total of six subscales and 51 items, the new version of the inventory had an internal consistency coefficient (alpha) of 0.88. The total variance explained by the inventory was found to be 36.13%.

c. Logical-Mathematical Intelligence Self-Perception Scale: In order to determine the students' logical-mathematical intelligence levels, we used the Logical-Mathematical Intelligence Self-Perception Sub-Scale – suggested for independent use – from the Multiple Intelligences Self-Perception Scale

developed by Yeşil and Korkmaz (2010). The Logical-Mathematical Intelligence Self-Perception Scale has an internal consistency coefficient of Cronbach Alpha=0.925.

The data obtained through the algorithm skill test were evaluated using a rubric. The rubric includes three categories: 'problem analysis', 'solution design', and 'mathematical transfer'. Analysis and solution design are among the stages of the problem-solving process (Schoenfeld, 1992; Harskamp, Suhre, 2007; Kızılkaya, Aşkar, 2009). Mathematical transfer refers to the mathematical expression of a solution. One cannot algorithmatise a solution that cannot be mathematically expressed. Therefore, it may be useful to consider in this process mathematical transfer skill along with the stages of problem-solving skill. Skills that could be included under each category were identified by a literature review, and with the help of four field experts including a computer engineer, a software engineer and two education technologists.

The skills under each category were separately examined by the researchers. Each skill was rated with "0" in cases where students failed to respond or gave fully wrong responses, with "1" when there were incomplete responses or small errors, and with "2" when the response was correct. Thus, each question was evaluated for ten different skill levels and with a rating range between 0 and 20. Each category and total scores were then converted into standard scores ranging between 20 at the minimum and 100 at the maximum. These categories can be summarised as: a. Problem Analysis: 1. The ability to express a problem as a whole, 2. The ability to verbally express a solution, 3. The ability to correctly design a solution. b. Solution Design: 1. Ability to algorithmically express a solution, 2. Ability to correctly use the variables, 3. Accuracy of cycles, 4. Accuracy of Condition Statements, 5. Brevity of the algorithm. c. Mathematical Transfer: 1. Accuracy of the Mathematical Operators Used, 2. Mathematical expression of the solution.

To analyse the data about critical thinking, responses were collected using the Likert-type scale with six intervals added and raw scores were computed for each of the sub-dimensions; next, these raw scores were divided by the number of questions, the result being multiplied by 10 and converted to a standard score of six at the minimum and 60 at the maximum. The lowest and highest possible scores for all sub-scales are fixed. The scores obtained on the basis of the students' responses to the five-point Likert-type Logical-Mathematical intelligence scale do not exhibit a standard quality due to the differences in the number of items under the factors. Thus, the raw scores obtained were converted to standard scores, which were 20 at the minimum and 100 at the maximum. In the framework of the study's sub-problems, the collected data were subjected to arithmetic means, t test and Pearson's r correlation test analyses. The level of $p<.05$ was deemed to be sufficient for significant differences.

RESULTS

1. Differences among the Groups' Critical Thinking Dispositions and Levels According to the Posttest

Table 1. Intergroup Differences of Critical Thinking Dispositions and Levels

Critical Thinking Dispositions and Levels / Groups		N	$\overline{X}$	Ss.	T	sd	p
Analyticity	I. Experimental Group	22	40,05	6,028	-,676	43	,503
	II. Experimental Group	23	41,13	4,684			
Open-mindedness	I. Experimental Group	22	36,41	5,369	-1,552		,128
	II. Experimental Group	23	38,70	4,497			
Inquisitiveness	I. Experimental Group	22	37,64	6,012	-,247		,806
	II. Experimental Group	23	38,04	5,032			
Self-confidence	I. Experimental Group	22	39,14	6,628	-2,460		,018
	II. Experimental Group	23	43,91	6,395			
Truth-seeking	I. Experimental Group	22	38,32	4,735	,101		,920
	II. Experimental Group	23	38,17	4,877			
Systematicity	I. Experimental Group	22	37,86	6,402	-,997		,325
	II. Experimental Group	23	39,52	4,660			
Total	I. Experimental Group	22	229,45	22,125	-1,636		,109
	II. Experimental Group	23	239,26	17,958			

As shown in Table 1 the students' mean scores in the sub-dimensions of overall critical thinking dispositions and levels range between 36.41 and 43.91, while overall means are $\overline{X}$ =229.45 for the group simply taught the algorithm process and $\overline{X}$ =239.26 for the students who were directly taught a programming language. Thus, it is clear that most of the students have a low level of critical thinking dispositions and levels. On the other hand, there was only a significant intergroup difference in favor of the group directly taught a programming language only in the self-confidence sub-dimension of critical

thinking dispositions and levels ($t_{(2-43)}$=-2.460, p<0.05), while no significant difference was found with regard to the other sub-dimensions and total scores. Accordingly, it could be argued that students who were directly taught a programming language have significantly greater self-confidence when compared to those simply taught algorithms.

2. Relationship between Algorithm Design Skills and Critical Thinking Skills

Table 2. Relationship between Students' Algorithm Skill Levels and Critical Thinking Dispositions and Levels

Critical Thinking Dispositions and Levels / Groups		Algorithm Design Skills			
		Analysis	Design	Mathematical Transfer	Total
Analyticity	Pearson r	,466**	,650***	,694***	,713***
	p	,001	,000	,000	,000
Open-mindedness	Pearson r	-,108	,085	-,040	-,011
	p	,479	,578	,795	,944
Inquisitiveness	Pearson r	,140	,395**	,244	,334*
	p	,360	,007	,106	,025
Self-confidence	Pearson r	-,072	-,085	-,129	-,109
	p	,640	,578	,397	,475
Truth-seeking	Pearson r	,426**	,515***	,464**	,565***
	p	,003	,000	,001	,000
Systematicity	Pearson r	,320*	,639***	,612***	,630***
	p	,032	,000	,000	,000
Total	Pearson r	,303*	,560***	,468**	,541***
	p	,043	,000	,001	,000

N=45; *:p<0,05; **: p<0,001; ***:p<0,000

As is clear from Table 2, there is a significantly positive relationship both between the students' total scores in the algorithm design skills sub-dimension and analyticity, truth-seeking and systematicity; total scores in inquisitiveness and critical thinking and all sub-dimensions and total scores about algorithm design skills (p<0.05). On the other hand, no relationship was detected between the sub-dimensions of open-mindedness and self-confidence and all sub-dimensions of algorithm design skills; the inquisitiveness sub-dimension and the analysis sub-dimension of algorithm design skill. Thus, it could be argued that with an increase in the total scores of critical thinking dispositions and levels and analyticity, truth-seeking, and systematicity levels, a parallel increase occurs in all sub-dimensions and total scores of algorithm design skills. Moreover, it is interesting that with an increase in inquisitiveness level, only the total scores in algorithm skills and the scores in the designing sub-dimension increase.

3. Intergroup Differences between Logical-Mathematical Intelligence Self-Perception Levels According to Posttest Results

Table 3. Logical-Mathematical Intelligence Levels of Student Groups

Logical-Mathematical Intelligence / Experimental Groups		N	$\overline{X}$	Ss.	t	sd	P
Mathematical Transfer	I. Experimental Group	22	65,55	12,157	-1,126	43	,266
	II. Experimental Group	23	69,52	11,536			
Mathematical Relationship	I. Experimental Group	22	63,18	9,898	,219		,828
	II. Experimental Group	23	62,48	11,587			
Logical Relationship	I. Experimental Group	22	73,09	17,035	-,174		,863
	II. Experimental Group	23	73,87	12,850			
Total	I. Experimental Group	22	67,18	12,003	-,400		,691
	II. Experimental Group	23	68,57	11,184			

Table 3 reveals that in terms of the students' logical-mathematical intelligence levels, their mean scores in the sub-dimensions range between 62.48 and 73.87. Overall means are $\overline{X}$ =67.18 for the students in experiment group I (the group simply taught algorithms) and $\overline{X}$ =68.57 for experiment group II (the group directly taught a programming language). Thus, arguably, most students have a moderate

level of logical-mathematical intelligence levels. On the other hand, there are no intergroup differences with regard to the logical-mathematical intelligence sub-dimensions and total scores (p>0.05).

4. Relationship between Algorithm Design Skills and Logical-Mathematical Intelligence Levels

Table 4. Relationship between Students' Algorithm Skill Levels and Logical-Mathematical Intelligence Levels

Logical-Mathematical Intelligence		Algorithm Design Skills			
		Analysis	Design	Mathematical Transfer	Total
Mathematical Transfer	Pearson r	,521(**)	,651(**)	,662(**)	,729(**)
	p	,000	,000	,000	,000
Mathematical Relationship	Pearson r	,406(**)	,559(**)	,489(**)	,591(**)
	p	,006	,000	,001	,000
Logical Relationship	Pearson r	,425(**)	,681(**)	,657(**)	,709(**)
	P	,004	,000	,000	,000
Total	Pearson r	,483(**)	,694(**)	,662(**)	,740(**)
	P	,001	,000	,000	,000

N=45

Table 4 demonstrates that there exists a significantly positive relationship both between the students' total scores and all the sub-dimensions of algorithm design skills and their total scores and all the sub-dimensions of logical-mathematical intelligence (p<0.05). As a result, it could be argued that as logical-mathematical intelligence levels increase, all sub-dimensions and total scores of algorithm design skills show a parallel increase.

CONCLUSION AND DISCUSSION

Students directly taught a programming language are significantly more self-confident when compared to those simply taught algorithms. Students directly taught a programming language have the opportunity to spontaneously test the solutions they themselves developed to solve the problems they encounter using Visual Basic editor and they can see and immediately correct the mistakes in their solutions. This opportunity may have influenced the students' self-confidence. It is an interesting finding that in the open-mindedness and self-confidence sub-dimensions, the students' algorithm designing skills are negatively influenced and particularly in the self-confidence sub-dimension, this negative influence reaches a significant level. Nevertheless, the students' total critical thinking scores and their scores in other dimensions significantly differ in favor of the moderate-scoring group. In other words, except for the sub-dimensions of open-mindedness and inquisitiveness, in all other sub-dimensions and overall scores, critical thinking is influential on students' algorithm design skills. The process of producing algorithms can in fact be considered as a direct process of problem solving, one of the distinctive characteristics of which is the thinking skill (Özden, 2006; cited in Canan-Günhan, Başer, 2009). Özden also argues that critical thinking skill is among the most widely known thinking skills. As suggested by Elias, Kress (1994), it is natural for students with critical thinking skills to be more successful in academic terms. For this reason, apart from open-mindedness and inquisitiveness, analyticity, self-confidence, truth-seeking and systematicity sub-dimensions and total critical thinking scores contributed to the students' programming skills, which could also be regarded as a natural result.

Students' logical-mathematical intelligence levels are highly influential on their algorithm designing skills. As their logical-mathematical intelligence levels increase, there is a parallel increase in all sub-dimensions and total scores regarding algorithm design skills. This result is in agreement with those presented in the literature. Logical-mathematical intelligence refers to the ability to think numerically, calculate, deduce, establish logical links, produce hypotheses, solve problems, think critically, be familiar with abstract symbols such as numbers and geometrical shapes, and establish connections between pieces of information (Köksal, 2006). Individuals with this type of intelligence tend to choose computer programming as a profession among others (Ekici et al., 2008).

SUGGESTIONS

When teaching programming skills, it could be suggested to take care to concretise the offered solutions using an algorithm simulation or a programming language editor, instead of simply teaching algorithms or teaching a programming language on paper. At each and every step of the instruction process, measures should be taken to improve students' critical thinking skills. One of the main

requirements to benefit from computers' many advantages is to possess programming skills. It is particularly indispensable for the instructors of computer technologies to posses these skills at good levels. Nevertheless, the literature contains a limited number of studies on teaching programming skills. In particular, there is a need for further research on the methods to be used for better teaching of these skills and the variables that could affect these skills.

ABSTRACT
This study examines 326 technical and vocational school students' entrepreneurial learning behavior and its influencing factors to serve as a school reference for the development of entrepreneurship education measures. The results show that students' 'computer self-efficacy (CSE)' has a significant direct effect on 'entrepreneurial learning behavior (ELB)', and 'entrepreneurship cognition (EC) 'has a significant effect on 'entrepreneurial learning behavior' through 'computer self-efficacy.' The influence pattern and empirical data of 'entrepreneurship cognition 'and 'computer self-efficacy' on 'entrepreneurial learning behavior' has a good fit.
Key Words: Entrepreneurship cognition; entrepreneurial learning behavior; computer self-efficacy.

INTRODUCTION

The service industry occupies a large of percentage in the industrial structure in Taiwan, especially insurance, fixed property, retail, wholesale and so on. Some factors influencing business management style and employment include scientific innovation investment, alliance chains, and on-line entrepreneurship (Chou, 2010; Dyer, Gregersen & ChristnCSEn, 2009).

The small and medium-sized enterprise platform supported e-commerce business counseling service to members includes e-commerce business, independent business, network marketing, and benchmarking e-commerce business. This small and medium-sized enterprise platform counseled 88 industrial associations from 2009 to 2010, and assisted more than 9,000 small and medium-sized enterprise application e-commerce opportunities. It also set up approximately 1,000 enterprise e-commerce web sites for women entrepreneurs (DGBAS, 2011; SMEA, 2011).

As the domestic unemployment rate climbs, employment-oriented technical and vocational education programs urgently need to find the teaching resources for entrepreneurship education in Taiwan. The difficulty currently faced by students of technological and vocational schools in their learning careers cannot be solved with a confinement to school employment (Chou, 2010; Sobel, & King, 2008).

Entrepreneurship education plays the role of helping to reduce the unemployment rate in a country. Entrepreneurship learning behavior explores the students' entrepreneurship learning result and entrepreneurship learning attitude on the entrepreneurship and business field and at the same time providing entrepreneurial experiences in the process of learning entrepreneurship ability and belief in the entrepreneurship curriculum (Chou, Shen, Hsiao & Chen, 2010a; Gurel, Altinay & Daniele, 2010; Van Dam, Schipper, & Runhaar, 2010; Todorovic, McNaughton & Guild, 2011; Yemini, & Haddad, 2010).

Some research found students' experiences of learning entrepreneurship cognition and computer self-efficacy have provided them with chances to learn new entrepreneurship skills, which may be helpful for their future entrepreneurs(Brigham, De Castro & Shepherd, 2007; Dyer, Gregersen & Christnesen, 2009; Haynie, & Sepherd, 2009; Kicjul, Gundry, Barbosa & Whitcanack, 2009). Entrepreneurship cognition define cognitive adaptability as the ability to effectively and appropriately change entrepreneurship learning behavior and given feedback from the entrepreneurship education learning context in which cognitive processing is embedded. Research suggests that computer self-efficacy is important to affect entrepreneurship learning result. It is positively related to student belief, ability, and attitude in contexts that can be characterized as complex, dynamic, and inherently uncertain.

PURPOSES OF THIS STUDY

The paper, Analysis of factors in technological and vocational school students perceived entrepreneurship cognition and entrepreneurial learning behavior, using computer self-efficacy as a mediator variable, discussed the variables which may influence vocational student's entrepreneurial

learning behavior and found the relationships among the variables. The purposes of this study are to address the 4 following issues.

1. There is no significant correlation between technological and vocational school students' entrepreneurship cognition and entrepreneurial learning behavior.
2. There is no significant correlation between technological and vocational school students' perceived entrepreneurship cognition and computer self-efficacy.
3. There is no significant correlation between technological and vocational school students' computer self-efficacy and entrepreneurial learning behavior.
4. Influence models of technological and vocational school students' entrepreneurship cognition, computer self-efficacy, and entrepreneurial learning behavior fit the data collected by this study.

REVIEW OF LITERATURE

Entrepreneurship Cognition

Some metacognition research, and integrated with related entrepreneurship education in social cognition, and entrepreneurship cognition has five theoretical dimensions: goal orientation, metacognitive knowledge, metacognitive experience, metacognitive control, and monitoring (Brigham, De Castro & Shepherd, 2007; Haynie, & Sepherd, 2009; Kicjul, Gundry, Barbosa & Whitcanack, 2009).

There are three issues could be to conducted further investigation and serve as thee entrepreneurship cognition for this study. First, there remains some debate on whether an EC construct is even necessary. Several scholars advocate the use of a general measure of metacognition instead of a domain-specific EC construct. Second, the dimensionality of the construct has yet to be fully established. While most scholars acknowledge the multi-dimensional nature of the EC construct (Brigham, De Castro & Shepherd, 2007; Haynie, & Sepherd, 2009; Kicjul, Gundry, Barbosa & Whitcanack, 2009), very few researchers have explicitly examined the underlying dimensions that make up the actual construct by using some type of theoretical model of entrepreneurial activity and tasks.

Moreover, several scholars have simply relied on single survey questions to capture an individual's level of EC. Finally, very few studies have included a sampling of nascent entrepreneurs. Rather, most of the initial studies of CSE relied on samples of university students or samples of small business owners (Haynie & Sepherd, 2009; Kicjul, Gundry, Barbosa & Whitcanack, 2009).

Computer Self-Efficacy

Computer self-efficacy is an individual's judgment of their computer competence (Chou, Shen, Hsiao, & Chen, 2010b; Vajargah, & Jahani, 2010). The current study examines students' self-efficacy beliefs with regard to their computer literacy skills. It is emphasized that computer self-efficacy reflects individual perceptions and abilities to fulfill job requirements of computer competence, which is not related to practical computer skills (Wilfong, 2006).

Some research suggests that computer self-efficacy may be an important factor related to the acquisition of entrepreneurial skills in the e-commerce industry (Vajargah, & Jahani, 2010). A review of the literature indicates CSE has been investigated in similar settings; however, it has not been thoroughly investigated as an additional assessment tool in this important entrepreneurial educational context.

Mars & Garrison (2009) claimed that students' attitudes toward computers were critical issues in entrepreneurial education courses and entrepreneurial-based curricula. Todorovic, McNaughton & Guild (2011) concluded that monitoring the user's attitudes toward computers should be a continuous process if the computer is to be used as an entrepreneurial tool.

Based on the above, for students, there is a close correlation between computer self-efficacy and entrepreneurial learning results (Vajargah, & Jahani, 2010; Verzat & Bachelet, 2006; Mars & Garrison, 2009). Researchers have proposed that positive attitudes toward entrepreneurial cognition, high computer self-efficacy and entrepreneurship attitude could be important factors in helping student learn entrepreneurial learning behavior.

Entrepreneurial Learning Behavior

Entrepreneurial learning behavior includes students' entrepreneurial learning result and entrepreneurial learning attitude to accomplish entrepreneurship education learning. Technical and Vocational School Students will participate in entrepreneurial education that they prefer learning benefits over entrepreneurial cognition and a high rate of entrepreneurial self-efficacy(Sobel, & King, 2008; Gurel, Altinay & Daniele, 2010; Yemini, & Haddad, 2010).

Entrepreneurial learning behavior through undergraduates' immediate involvement in carrying out entrepreneurship education are also hoped to spark interest besides giving a clearer perception for the students concerning the entrepreneurial world, and reduces the rate of unemployment among graduates(Chou, 2010; Chou, Shen, Hsiao & Chen, 2010a).

The research's findings also indicate 'computer self-efficacy' in individual's entrepreneurship response towards the field of entrepreneurship which is affected by important factor (Dyer, Gregersen & Christnesen, 2009; Haynie & Sepherd, 2009; Kicjul, Gundry, Barbosa & Whitcanack, 2009; Van Dam, Schipper, & Runhaar, 2010). According to Kirzner (2009) conducted that in terms of attitude towards the involvement in the entrepreneurship education programme. Haynie & Sepherd (2009) stated that computer self-efficacy through perception of entrepreneurial belief and ability. Previous empirical research provides conclusive evidence on the differences of response undergraduates. Thus, present study aims to identify the effect of 'entrepreneurship cognition ', 'computer self-efficacy', and 'entrepreneurial learning behavior'.

METHODOLOGY

Subjects

This study treats students from technological and vocational schools as the population, and adopts random sampling and cluster sampling for survey. A total of 326 valid samples were collected, and the analysis of their gender, work experience, current post, teaching background, and school attributes is shown in Table 1

Table 1 Distribution of participants' background in formal scales

Basic information	Group	No of people	%
Gender	Male	172	52.9%
	Female	154	47.1%
Work experience	1 years (and below)	84	26.0%
	More than 1 years and less than 3 years	104	31.8%
	More than 3 years and less than 5 years	94	28.8%
	Over 5 years	44	13.4%
Current post	Full-time students	124	38.0%
	Part-time students	202	62.0%
Learning background	Science, engineering, agriculture and design	98	30.1%
	Business, management, tourism and recreation	185	56.6%
	Livelihood, health and medical care	18	5.6%
	Liberal arts, law, education and general knowledge	25	7.7%
School attributes	Public	170	52.1%
	Private	156	47.9%

Measures

A 41-item survey questionnaire was developed to measure participants' entrepreneurial cognition, computer self-efficacy, entrepreneurial learning behavior, and demographic information. The research tool is a 'Questionnaire of Factors Which Influence Technical and Vocational School Students' Entrepreneurial Learning Behavior.' The questionnaire includes Entrepreneurship cognition Scale, Computer self-efficacy Scale and Entrepreneurial Learning Behavior Scale (Chou, Shen, Hsiao, & Chen, 2010; Dyer, Gregersen, & ChristnCSEn, 2009; Haynie, & Sepherd, 2009; Kirzner, 2009; McGee, Peterson, Mueller & Sequeira, 2009; Mars, & Garrison, 2009; Todorovic, McNaughton & Guild, 2011). The scales' factors, number of questions reliability and validity are shown in Table2.

Table 2. An overview of factors, number of questions, reliability and validity for technical and vocational school students' entrepreneurship cognition, computer self-efficacy and entrepreneurial learning behavior scale.

Entrepreneurship cognition Scale				Computer self-efficacy Scale				Entrepreneurial learning behavior Scale			
Factor name	No. of questions	Cronbach α	Factor loading	Factor name	No. of questions	Cronbach α	Factor loading	Factor name	No. of questions	Cronbach α	Factor loading
Goal orientation	5	.83	25.52%	Playfulness	3	.90	28.24%	Entrepreneurial learning result	5	.88	34.52%
Cognitive knowledge	6	.87	23.41%	Ease of use	3	.87	19.44%	Entrepreneurship toward venturing	4	.84	18.21%
Cognitive experience	4	.83	19.58%	Effectiveness	3	.83	17.23%	Employment attitude	5	.86	14.92%
				Usefulness	3	.84	4.52%				
Total reliability Cronbach α		.88		Total reliability Cronbach α		.91		Total reliability Cronbach α		.89	
Accumulated explained variance			68.51%	Accumulated explained variance			69.43%	Accumulated explained variance			67.65%

The 'Questionnaire of Factors Which Influence Technical and Vocational School Students' Entrepreneurial Learning Behavior' was reviewed by three experts for subject contents' suitability to ensure the scale's expert validation. Five technical and vocational school students were invited to answer the questionnaire to enhance the validity of the scale's contents. In addition, five technical and vocational schools were selected for a pre-test, and 74 students were selected as the pre-test objects in total. The

scales used in this study are in self-assessment form, and a Likert 5-point scale is used as the scoring method. There are five levels of choices from 'agree' to 'do not agree;' five equal portions of 5, 4, 3, 2 and 1 are distinguished according to the extent of agreement, and 5 points, 4 points, 3 points, 2 points and 1 point are given in this order. The higher the score an individual receives, the larger extent of agreement the individual has.

Data analysis

In processing the survey data used in this study, the collected questionnaires were coded, and Statistical Package for Social Science (SPSS version 12.0) and linear structural analysis (LISREL version 8.5) were used to verify the correlation among the factors of 'entrepreneurship cognition,' 'computer self-efficacy' and 'entrepreneurial learning behavior' variables and their effects in order to achieve the purpose of this study. In this study, the statistical test level $\alpha = 0.05$.

RESULTS

The empirical results of technical and vocational school students' entrepreneurial learning behavior are shown in Figure 1, and are analyzed as follows: The estimated value of the direct affecting parameter between 'entrepreneurship cognition 'and 'computer self-efficacy' is 0.83 ($t = 6.13$, $p<.05$). This means that 'entrepreneurship cognition' has a significant effect on 'computer self-efficacy.'

The estimated value of the direct affecting parameter between 'entrepreneurship cognition 'and 'entrepreneurial learning behavior' is 0.42 ($t = 2.52$, $p>.05$). This means that 'entrepreneurship cognition' does not necessarily have a significant effect on 'entrepreneurial learning behavior'. The estimated value of the direct affecting parameter between 'computer self-efficacy' and 'entrepreneurial learning behavior' is 0.89 ($t = 4.28$, $p<.05$). This means that 'computer self-efficacy' has a significant effect on 'entrepreneurial learning behavior.'

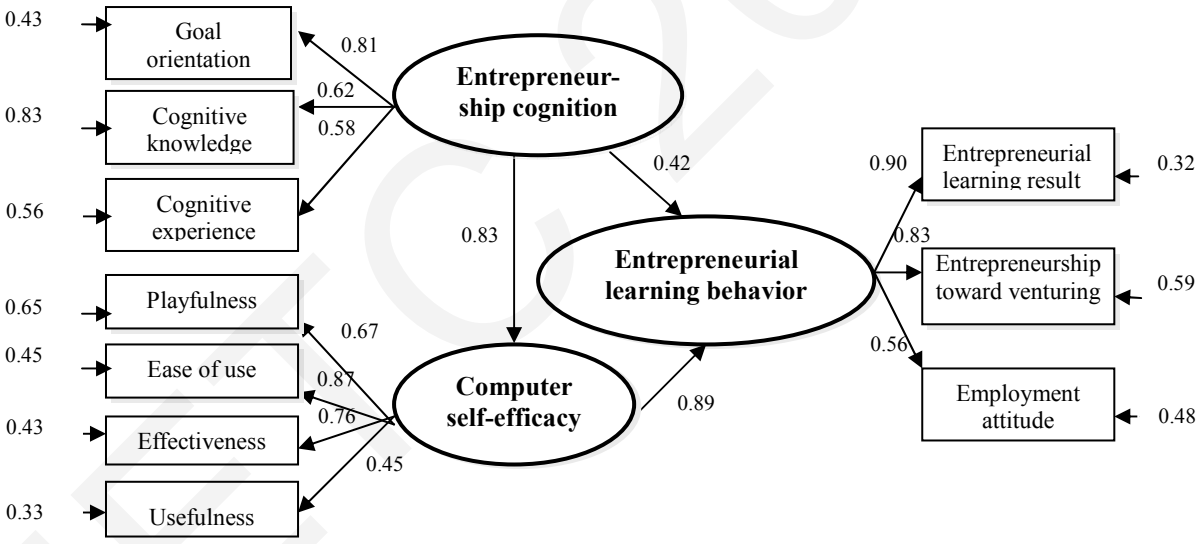

Figure 1. Path of technical and vocation school students' entrepreneurial learning behavior.

In summary, in this study of technical and vocational school students' entrepreneurial learning behavior and its influence pattern, 'entrepreneurship cognition' has a significant effect on 'computer self-efficacy,' but does not have a significant effect on 'entrepreneurial learning behavior.' 'Computer self-efficacy' has a significant effect on 'entrepreneurial learning behavior.

DISCUSSION

Students' 'computer self-efficacy' has a significant direct effect on 'entrepreneurial learning behavior,' and 'entrepreneurship cognition' has a significant effect on 'entrepreneurial learning behavior' through 'computer self-efficacy.' The influence pattern and empirical data of 'entrepreneurship cognition' and 'computer self-efficacy' on 'entrepreneurial learning behavior' has a good fit. The influence effects of 'entrepreneurship cognition' 'computer self-efficacy' and 'entrepreneurial learning behavior' shows that for technological and vocational school students, the influence of 'entrepreneurship cognition ' on 'entrepreneurial learning behavior' comes mainly through their awareness of 'computer self-efficacy.' In addition, 'computer self-efficacy' has a direct and significant effect on 'entrepreneurial learning

behavior.' From the influence of entrepreneurship cognition, computer self-efficacy and entrepreneurial learning behavior, we can clearly see that compared with entrepreneurship cognition, computer self-efficacy has a greater influence on entrepreneurial learning behavior (Bustos-Orosa, 2008; Dyer, Gregersen, & ChristnCSEn, 2009; Mars, & Garrison, 2009).

Regarding the test results, according to the goodness of fit test standard by Hair et al, the model in this study has a good overall fit (Hair, Anderson, Tatham, & Black, 1998). In the absolute fitness and incremental fitness tests, all indices meet the standard, and have the best fit. Most of the parsimonious fitness indices meet the test standard, and have a good fit. Overall, in the entrepreneurial learning behavior and its influence model established in the study based on theories, both the model and the data have a good fit, and in the parameter estimation most of the estimated values are significant. This shows that all the indices of latent variables have their importance, and only the parameter value of 'entrepreneurship cognition 'on 'entrepreneurial learning behavior' is low. Overall, the empirical data have a good explanatory power.

Students' 'entrepreneurship cognition' influences 'computer self-efficacy' and 'benefits of entrepreneurship' is an important factor which influences 'computer self-efficacy'. Students' 'computer self-efficacy' influences 'entrepreneurial learning behavior', 'belief" and 'ability' are important factors which influence 'entrepreneurial learning behavior'(Haynie & Sepherd, 2009; Prosser, Martin, Trigwell, Ramsden & Middleton, 2008; McGee, Peterson, Mueller & Sequeira, 2009).

The results show that among all latent variables in the model, the direct influence of 'entrepreneurship cognition ' on 'entrepreneurial learning behavior' is not significant, indicating that the assumed influence of 'entrepreneurship cognition ' on students' 'entrepreneurial learning behavior' needs further testing; this is something worthy of a more in-depth study and validation in the future. Based on test results, although the overall result is acceptable, the model consistency level is not entirely satisfactory, and its entrepreneurship cognition has a relatively low explanatory power for entrepreneurial learning behavior. The possible reasons are:

The measurement error variance of the three main variables in the model is too large. Although in the course of the investigation in this study each step was made following reasonable procedures, in a sample survey there are a survey bias and restrictions on the study objects in answering the questionnaire. These can result in a bias between the survey data and the actual situation (Bentler & Bonett, 1980; Hair, Black, Babin & Anderson, 2010; Verzat & Bachelet, 2006).

The influence is test of indices and method. Currently in the verifying calculation of structural equations, the index value is subject to the sample size, and sometimes the index value may influence each other. When the index is far greater than or much lower than the standard value, the judgment is more accurate; when the index is close to the standard value, we then need to consider the possible influence from the error of the missing scope of variables. Although a complete research model was tried to be established in this study based on past researches and theories, there has been little domestic research on the topic of students' entrepreneurial learning behavior.

IMPLICATION

There may be undetected factors which resulted in a low explanatory power, and there are other variables which have not been identified (Jones & Iredale, 2006; Shinnar, Pruett & Toney, 2009). Regarding this model's test results, perhaps in the future a further study can be conducted to find the variables either missing in the theories or can be further added or deleted, or more comprehensive empirical data can be collected for testing to improve the consistency between this model and empirical data.

Abstact
The purpose of this study was to investigate the extent to which students from Turkey have access to a computer and the internet at school and at home, and differences in ICT accessibility by geographic region based on the data obtained from the PISA 2009. Data collected through the ICT questionnaire were analyzed by descriptive statistical indexes such as percentage technique. Important findings from the study indicated (i) access to a computer and the internet at school and at home in Turkey is still very low; (ii) Western Anatolia is the best region. The region is above the average of country in the accessibility of ICT; (iii) South Eastern Anatolia is the worst region. The region is below the average of country in the accessibility of ICT. These findings confirm that developing countries in general tend to have limited computer and the internet access at school and at home.

Key Word: Information and communication technology, inter-regional differences, NUTS, PISA 2009, Turkey

INTRODUCTION

Information and Communication Technology (ICT) has provided enormous opportunities for developments all around the world (Kari, 2007). Rapid growth and development in ICT has conduced to the diffusion of technology in education (Corbett & Willms, 2002); therefore, ICT is nowadays indispensable for educational studies, such as surveys, presentations, project work or research, online and distant learning. ICT is not only the basis of learning environment, but also it enables individuals to have lifelong learning, improve educational outcomes, learn new occupational skills and decrease inequities between groups (Çavaş, Kışla, & Twining, 2004). Having access to and using ICT at home and at school is played a crucial role in developing technical skills, processing information, getting source material and new information (Sinko & Lehtinen, 1999; Symons, 1997) Similarly, equitable and high-level access to ICT at home and at school play an important role of child development (Corbett & Willms, 2002).

People from Turkey continue to have a slow uptake of new technology. For example, the percentage of computer access in home was 17.65 and the percentage of internet access in home was 13.93 based on Turkish Statical Institute 2005 data. According to PISA 2003 data, computer access in Turkish schools were much lower compared to OECD average (Aşkar & Olkun, 2005) and students in developing countries such as Mexico, Turkey and Tunisia had the highest proportion of students who had never used a computer with 13 per cent, 14 per cent and 39 per cent of students respectively in this category and the largest gender differences was found in Turkey where 21 per cent of females and 9 per cent of males reported never having used a computer. Results showed that approximately 50 per cent of students from Turkey had access to a computer at school and fewer than 40 per cent of students from Turkey had access to a computer at home (Thomson & De Bortoli, 2007). From these data it was found that only 14 per cent of students from Turkey had link to the internet at home (Ainley & Searle, 2005). In Turkey, there is about 15 million students enrolling in grades K-12, we would anticipate that a considerable number of K-12 students do not have access to a computer and the internet from their school and home. The under use of ICT in education may be arisen from illiteracy, inequality, low levels of living, low productivity, poverty (Kessy, Kaemba, & Gachoka, 2006) and inter-regional differences. Students of inequality of access to ICT are called the “digital divide” (Becker, 2000; Wolff & MacKinnon, 2002). Several researches (Ainley & Searle, 2005; Aşkar & Olkun, 2005; Corbett & Willms, 2002; Gündüz, 2010 Mallon, Monseur, Quittre, & Wastiau, 2010; Thomson & De Bortoli, 2007) related to digital divide were examined to access and use of ICT in participant countries by gender, by socioeconomic background, by geographic location and by state using data from international benchmarking studies. Therefore,

international benchmarking studies provide potential insights for the participant countries to assess their educational opportunities with a critical eye.

The Programme for International Student Assessment (PISA), which was conducted with the support of Organization for Economic Cooperation and Development (OECD), is the largest international benchmarking study focusing on curriculum based learning outcomes. The survey has been conducted every three years since 2000 and the PISA was carried out with the participation of 43 countries in 2000, 41 countries in 2003, 56 countries in 2006 and lastly, 65 countries in 2009. Each cycle evaluates the three domains concurrently, with the importance to the one particular domain each time: reading literacy in 2000, mathematical literacy in 2003, and scientific literacy in 2006 and again reading literacy in 2009. With its student and ICT questionnaire, the PISA also collects data concerning students' socio-demographic status, school environments, learning styles, parents, views about themselves, motivation to perform well in related domains and computer familiarity.

The purpose of this study was to investigate the extent to which students from Turkey have access to a computer and the internet at school and at home, and differences in ICT accessibility by geographic location based on the data obtained from the PISA 2009.

METHOD

The study adopted the descriptived survey research method with the student ICT questionnaire in PISA 2009 as the instrument. The data used in this study were provided by the international PISA web site. Data of the study were analysed with SPSS 13.0 program. The percentage technique is used to present and analyse data with appropriate tables.

Participants

The tests and surveys of PISA 2009 project were conducted in April 2009 among 4996 students from Turkey. The students were randomly selected from 170 schools, from 12 NUTS (Nomenclature of Territorial Units for Statistics) regions in Turkey. According to the NUTS regions in Turkey which take part in PISA 2009 study the percentages and numbers of the students were as follows; Istanbul Region 800 (16.0%), Western Marmara Region 244 (4.9%), Aegean Region 620 (12.4%), Eastern Marmara Region 525 (10.5%), Western Anatolia Region 481 (9.6%), Mediterranean Region 637 (14.8%), Central Anatolia Region 296 (5.9), Western Black Sea Region 375 (7.5%), Eastern Black Sea Region 216 (4.3%), North Eastern Anatolia Region 142 (3.8%), Central Eastern Anatolia Region 218 (4.4%), South Eastern Anatolia Region 442 (8.8%), [total 4996, 100%].

RESULTS

Access to ICT Resources at School and at Home

Access to a Computer at School

In many countries school plays a crucial role in providing equitable access to ICTs (Thomson & De Bortoli, 2007). Table 1 presents the regional disparities in access to a computer at school for the twelve NUTS regions in Turkey. As can be seen in Table 1, access to a computer at school in Turkey (49.1%) is still very low. Overall, 49.1 per cent of students from Turkey have access to a computer at school; this range from 38.0 per cent in Mediterranean Region to 72.5 per cent in North Eastern Anatolia Region. Students from North Eastern Anatolia Region, Western Marmara Region, Central Eastern Anatolia Region reported the highest proportion of students accessing to a computer at school, quite above Turkey's average and students from Eastern Marmara Region, Western Black Sea Region, Central Anatolia Region and Aegean Region reported reasonable accessing to a computer at school, slightly above Turkey's average. In Istanbul Region, Eastern Black Sea Region and Western Anatolia Region less than 50 per cent of the students indicated accessing to a computer at school, slightly below Turkey's average. However, results showed that the lowest access with approximately 40 per cent of the students from Mediterranean Region and South Eastern Anatolia Region had access to a computer at school, quite below Turkey's average.

Table 1. Students' from Turkey access to a computer at school

The NUTS regions in Turkey	School (%)	Home (%)
Istanbul Region	46.6	73.4
Western Marmara Region	65.6	63.1
Aegean Region	50.5	63.4
Eastern Marmara Region	54.7	63.8

Western Anatolia Region	44.9	65.9
Mediterranean Region	38.0	40.2
Central Anatolia Region	51.0	47.6
Western Black Sea Region	54.7	49.6
Eastern Black Sea Region	45.4	44.9
North Eastern Anatolia Region	72.5	35.9
Central Eastern Anatolia Region	61.5	31.7
South Eastern Anatolia Region	38.5	28.7
Turkey's average	49.1	54.3

Access to a Computer at Home

Almost all of the Turkish PISA 2009 students showed they had less access to a computer at home. Overall, 54.3 per cent of students from Turkey had access to a computer at home; this ranged from 28.7 per cent in South Eastern Anatolia Region to 73.4 per cent in Istanbul Region (Table 1). Students from Istanbul Region, Western Anatolia Region, Eastern Marmara Region, Aegean Region and Western Marmara Region reported the highest proportion of students accessing to a computer at home, quite above Turkey's average. However, in Western Black Sea Region, Central Anatolia Region and Mediterranean Region less than 50 per cent of the students indicated accessing to a computer at home, slightly below Turkey's average and results indicated that the lowest access with approximately 30 per cent of the students from South Eastern Anatolia Region, Central Eastern Anatolia Region and North Eastern Anatolia Region had access to a computer at home, quite below Turkey's average.

These percentages implied that students from Istanbul Region, Aegean Region, Eastern Marmara Region, Western Anatolia Region and Mediterranean Region had less access to a computer at school than at home, and students from Western Marmara Region, Central Anatolia Region, Western Black Sea Region, Eastern Black Sea Region, North Eastern Anatolia Region, Central Eastern Anatolia Region and South Eastern Anatolia Region had more access to a computer at school than at home. All in all, students from Turkey had less access to a computer at school than at home.

Access to the Internet at School

Table 2 indicated that similar regional disparities were evident for access to the internet at school for the twelve NUTS regions in Turkey. Link to the internet at school in Turkey (44.4%) is still low-level. Overall, 44.4 per cent of students from Turkey also had access to the internet at school; North Eastern Anatolia Region had the highest percentage of students with access: over 70% of students in North Eastern Anatolia Region reported accessing to the internet in their school. In contrast, only about 30% of students in South Eastern Anatolia and Mediterranean Regions had access to the internet at school. Students from Central Eastern Anatolia Region, Western Marmara Region, Western Black Sea Region had an internet connection at home, quite above Turkey's average, and in Aegean Region, Eastern Marmara Region and Central Anatolia Region, less than 50 per cent of the students indicated accessing to internet at school, slightly above Turkey's average. But, in Istanbul Region and Western Anatolia Region less than 40 per cent of the students indicated a link to the internet at school. This was lower than the Turkey's average.

Table 2. Students' from Turkey access to the internet at school

The NUTS regions in Turkey	School (%)	Home (%)
Istanbul Region	39.4	74.0
Western Marmara Region	57.0	61.5
Aegean Region	49.8	60.3
Eastern Marmara Region	49.1	60.6
Western Anatolia Region	39.7	60.3
Mediterranean Region	33.3	40.0
Central Anatolia Region	47.0	43.2
Western Black Sea Region	53.9	48.5
Eastern Black Sea Region	44.0	44.9
North Eastern Anatolia Region	72.5	31.0
Central Eastern Anatolia Region	58.3	27.1
South Eastern Anatolia Region	29.4	26.9
Turkey's average	44.4	52.2

Access to the Internet at Home

Table 2 showed that that there were regional disparities in link to the internet at home. Overall, 52.2 per cent of students from Turkey also had link to the internet at home; in Istanbul region nearly 75% of students had link to internet at home, whereas the average was lower amongst the South Eastern Anatolia Region, and lower still – about 30% – in Central Eastern Anatolia Region and North Eastern Anatolia Region. About this percentage is still half that of Western Anatolia Region, Aegean Region, Eastern Marmara Region and Western Marmara Region. Students from Istanbul Region, Western Anatolia Region, Eastern Marmara Region, Aegean Region and Western Marmara Region reported the highest proportion of students accessing to the internet at home, quite above Turkey's average. But, in Western Black Sea Region, Eastern Black Sea Region, Central Anatolia Region and Mediterranean Region less than 50 per cent of the students indicated a link to the internet at school. This was lower than the Turkey's average.

These findings showed that students from Istanbul Region, Western Marmara Region, Aegean Region, Eastern Marmara Region, Western Anatolia Region, Mediterranean Region and Eastern Black Sea Region had less access to the internet at school than at home, and students from Central Anatolia Region, Western Black Sea Region, Eastern Black Sea Region, North Eastern Anatolia Region, Central Eastern Anatolia Region and South Eastern Anatolia Region had more link to the internet at school than at home. All in all, students from Turkey had less link to the internet at school than at home.

DISCUSSION

The purpose of this study was to examine the extent to which students from Turkey have access to ICT resources at school and at home, and differences in ICT accessibility by geographic region based on the data obtained from the PISA 2009.

Results indicated that:

i) 49.1 per cent of students from Turkey overall reported having access to a computer at school, and 38.0 per cent in Mediterranean Region to 72.5 per cent in North Eastern Anatolia Region;
ii) 44.4 per cent of students from Turkey overall reported having link to the internet at school, and 29.4 per cent in South Eastern Anatolia Region to 72.5 per cent in North Eastern Anatolia Region;
iii) 54.3 per cent of students from Turkey overall reported having access to a computer at home, and this ranged from 28.7 per cent in South Eastern Anatolia Region to 73.4 per cent in Istanbul Region;
iv) 52.2 per cent of students from Turkey overall reported having link to the internet at home, and this ranged from 26.9 per cent in South Eastern Anatolia Region to 74 per cent in Istanbul Region;
v) The access to a computer and the internet at school was highest in the North Eastern Anatolia Region and lowest in Mediterranean Region;
vi) The access to a computer and the internet at home was highest in the Istanbul region and lowest in South Eastern Anatolia Region;
vii) All in all, students from Turkey had less access to a computer at school than at home. Similarly, students from Turkey had less access to the internet at school than at home.
viii) Western Anatolia is the best region. The region is above the average of country in the ICT resources;
ix) South Eastern Anatolia is the worst region. The region is below the average of country in the ICT resources.

This finding supported the findings of previous studies (e.g., Gök, 2004; Koçberber & Kazancık, 2010; Sarıer, 2010) which revealed that the South Eastern Anatolia region was below the average of country in the educational opportunities, in particular, in terms of educational investments. This result is consistent with Koçberber and Kazancık's (2010) study which indicated that Western Anatolia is the best region in all the educational indicators. Access to a computer at school and at home in Turkey is still very low. Similarly, link to the internet at school and at home in Turkey is still very low too. At this point students from Turkey are still among the world's digital poor. Students in developing countries such as Tunisia, Turkey, Philippines and Mexico had the highest proportion of students who had not access to a computer and the internet at school and at home (Rodrigo, 2005; Thomson & De Bortoli, 2007). Result showed that students from Turkey can not access and link to ICT resources to the same extent as their international counterparts and Turkey has inter-regional differences in terms of ICT resources. These findings confirm that medium human development countries in general tend to have limited computer and the internet access at school and at home, and students from developing countries can not participate fully in the digital world (Rodrigo, 2005; Thomson & De Bortoli, 2007).

CONCLUSION

Nowadays, although information and communication technology is used a lot in every field, the results of PISA 2009 show that in Turkey, access to a computer and link to the internet at school and at home is still too low. These findings imply that information and communication technology (ICT) in Turkey is not completely integrated into learning environment and students' life. The under use of ICT in education and in home may be arisen from illiteracy, inequality, low levels of living, low productivity, poverty (Kessy, Kaemba, & Gachoka, 2006) and inter-regional differences. In conclusion, these results also provide potential insights for the conduct of the future research.

THE INVESTIGATION OF CYBER BULLYING LEVEL OF TEACHER CANDIDATES IN RELATION TO SEVERAL VARIABLES

Didem ALSANCAK[1]
Özgen KORKMAZ[2]

The purpose of this study is to determine the level of cyber-bullying experiences of teacher candidates. Differences in cyber bullying according to gender, frequency and skill of internet use, social relation problem are investigated. The sample of study is 253 first grade teacher candidates from different department in Education Faculty in Ahi Evran University. As a data collection instrument, Cyber Bullying Scale was developed by Erdur-Baker and Kavşut (2007) and revised by Topçu (2008) and personal information form was used in this study. In the analysis of the data, mean, t-test and one-way analysis of variance (ANOVA) was used. According to the results of the study, there were significant differences between students'cyber bullying in terms of gender, frequency of internet usage and skill of internet use. However, there was no significant difference between students' cyber bullying in terms of social relation problems.

Keywords: Cyber bullying, teacher candidates

INTRODUCTION

The use of the Internet and the mobile phones has recently increased. The number of people using computers and the Internet is constantly increasing. The "Information and Communication Technology (ICT) Usage Survey in Households and Individuals" (TÜİK, 2010) which was carried out by Turkish Statistical Institute (TÜİK) indicated that the use of computers and the Internet has recently increased. According to the results of ICT Usage Survey in Households and Individuals carried out in April 2010 by TÜİK, the proportion of households with Internet access is 41, 6%. Moreover, the proportions of the male that use computer and Internet were 53, 4% and 51, 8 and these proportions were 33, 2% and 31, 7% for female, respectively in 16-74 age groups. These proportions were 50, 5% and 48, 6% for males and 30,0% and 28,0% for females in the same period of the previous year. People might be engaged in many Internet-based activities like gaming, searching for interest, communicating with their friends. The increase in access to the technologies in education might also increase the student's social interaction and collaborative learning experiences.

In addition to this, the emergence of e-communication into the classrooms brought some problems with it that we should take into account. One of these problems is cyber bullying which is defined as giving harm to others using e-communication tools. With the emergence of information and communication technologies (ICT) which have an important role on interaction and the life of the individuals, there has been a shift from physical bullying to the cyber one and this shift required the scientist to broaden their definition of bullying to the unlimited digital world (Akbulut, Şahin and Eristi, 2010).

Li (2008) defined cyber bullying as the bullying with e-communication tools like e-mail, mobile phones, PDS, instant messaging and World Wide Web. Willard (2005) defined cyber bullying as sending harmful materials using the Internet and other digital technologies or being rude to others using the other types of social aggressiveness. Cyber bullying was also defined by Smith, Mandav, Carvalho and Tippett (2005) as the use of electronic-based communication tools by an individual or a group of people towards the undefended victim on purpose and repeatedly. A more specific definition made by Patchin and Hinduja (2006b) was disturbing someone sending offending and harmful messages through internet-based communication tools. The common point of these definitions is the use of the Internet-based communication tools for bullying. Cyber bullying include sending e-mail messages or instant messages

[1] Arş. Gör. Ahi Evran Üniversitesi, Eğitim Fakültesi, BÖTE, alsancakdidem@gmail.com
[2] Yrd. Doç. Dr. Ahi Evran Üniversitesi, Eğitim Fakültesi, BÖTE, okorkmaz@ahievran.edu.tr

including damage and threat, publishing insulting content for someone on web sites and frightening or threatening someone in online environment (Hinduja and Patchin, 2007).

Before preventing this problem, we should clearly understand what it is. In studies carried out for this purpose, it was aimed at determining the concepts related to the cyber bullying. In these studies, it was investigated whether the level of cyber bullying changes according to some variables like gender (Li, 2007 Smith and et al., 2005), socio-economic status (Erdur-Baker, 2007), the frequency of using information technologies (Li, 2006; Erdur-Baker, 2007). As the frequency of using information technologies did not cause any change in cyber bullying, it was considered that some variables like the period of using Internet, the skill for Internet usage might cause cyber bullying.

In the light of these, the purpose of this study is to determine the level of teacher candidates to become a cyber bully. Taking that the age group which use the information technologies most is 16-24 age period (TÜİK, 2010) into account, the level of teacher candidates who spend time on the Internet for different purposes to become a cyber bully was investigated in terms of different variables.

Problem Statements: What is the level of cyber bullying of teacher candidates?

Research Questions:

1. Is there any significant difference between cyber bullying and their gender in teacher candidates?
2. Is there any significant difference between cyber bullying and their daily internet usage in teacher candidates?
3. Is there any significant difference between cyber bullying and their skills of internet use in teacher candidates?
4. Is there any significant difference between cyber bullying and problems of social relations in teacher candidates?

METHOD

Research Method: Survey method was used in this study. The purpose of this study is to determine level of cyber bullying of teacher candidates.

Sample: The sample of study is 253 first grade teacher candidates from different department in Education Faculty in Ahi Evran University. Distribution of sample according to the department is shown in Table 1.

Table 1. Distribution of sample according to the department

Department	Total
CEIT	43
PCG	44
Elementary Mathematics Education	33
Early Childhood Education	29
Primary School Education	78
Social Studies Education	26
Total	253

Data Collection Instruments: As a data collection instrument, Cyber Bullying Scale which was developed by Erdur-Baker and Kavşut (2007) and revised by Topçu (2008) and personal information form was used in this study. The participants were asked to report their experiences on four-point Likert type items (never, once, twice or three times, three times and more) providing scores for being a cyberbully in cyber bullying scale. Questions were asked to students about gender, daily internet usage, skill of internet use and problems of social relations in personal information form.

Data Analyses: The data was analyzed through SPSS. Mean, t-test and one way analysis of variance (ANOVA) were conducted in order to statistically analyze the obtained data.

FINDINGS

The distribution of normality of scores is examined and it was found that scores of cyber bullying have a positive skewness. If you have a positive skewness between scores, "logarithmic transformation" is done (Büyüköztürk, 2007). Therefore, “logarithmic transformation" was performed on scores of cyber-bullying in order to normalization.

In this section, descriptive statistics analyses of cyber bullying score of teacher candidates are given. Result of analysis is shown in Table 2.

Table 2. Descriptive statistics of students’ cyberbullying score

	N	$\overline{X}$	Min	Max	SD
Cyberbullying	**248**	**1,20**	0,70	1,70	0,11

According to results of descriptive statistics, teacher candidates’ cyberbullying level is low.

Findings about cyber bullying and gender

The first sub-problem of this research is defined as “Is there any significant difference between cyberbullying and their gender in teacher candidates? “ T-test was applied to determine whether there are statistically meaningful changes on the cyber bullying level according to gender. Result of analysis is shown in Table 3.

Table 3. T-test results of teacher candidates’ cyber bullying according to gender

Gender	N	$\overline{X}$	Sd	Sf	T	P
Male	171	1,19	0,1	246	-3,81	,000
Female	77	1,24	0,14			

*The mean difference is significant at the .01 level

Table 3 shows the findings concerning female and male students’ cyberbullying. The findings showed that female and male students received differing score averages from cyberbullying scale. It is evident from Table 3 that female students received higher averages than male students. A significant difference was found in term of gender ($p<0.01$). According to this result female students have higher cyberbullying than male students.

Findings about cyber bullying and daily internet usage

The second sub-problem of this research is defined as “Is there any significant difference between cyberbullying and their daily internet usage in teacher candidates?” Primarily mean values of cyber bullying score according to skill of internet use is presented in Table 4.

Table 4. Mean values of cyber bullying score according to daily internet usage

Daily internet usage	N	$\overline{X}$	Df
Less 1 hour	125	1,17	0,09
1-4 hours	93	1,22	0,12
4 hours and more	25	1,23	0,16
Total	243	1,20	0,11

When Table 4 is examined, teacher candidates who use internet more 4 hours in a day have highest mean score ($\overline{X}$=1,23) and teacher candidates who use internet fewer than 1 hour in a day have lowest mean score ($\overline{X}$=1,17) One way variance analyses (ANOVA) was applied to determine whether there are statistically meaningful changes on the cyber bullying level according to daily internet usage. Result of analysis is shown in Table 5.

Table 5: ANOVA results of teacher candidates’ cyber bullying according to the daily internet usage

	Sum of Squares	Df	Mean Square	F	P	Meaningful difference
Between groups	0,169	2	0,71	6,906	,001	1-2 1-3
Within groups	2,938	240	0,12			
Total	**3,107**	**242**				

*The mean difference is significant at the .01 level

1: less 1 hour, 2: 1-4 hours, 3: more 4 hours

It is evident from Table 5, According to the results obtained from one-way variance analysis, there is a significant difference between cyber bullying and daily internet usage (F=6,906, p<0.01).

The Bonferroni test was applied to the data to be able to determine the groups that causes statistically meaningful difference in the cyber bullying of teacher candidates. As a result of the Bonferroni test, it is determined that this meaningful difference arise from students that express a daily internet usage duration of "less 1 hour" with "1-3 hours" and "4 hours and more"

Cyber bullying of daily internet usage of "less than 1 hour" is significantly lower than daily internet usage of "1-4 hours" and "more 4 hours". In similar way, there is a significant difference between "1-4 hours" and "less than 1 hour". Lastly there is a significant difference between "more 4 hours" and less 1" hour". In this situation, it was determined while the daily internet usage is increasing, the cyber bullying increases in positively.

Findings about cyber bullying and skills of internet use

The third sub-problem of this research is defined as "Is there any significant difference between cyberbullying and their skill of internet use in teacher candidates?" Primarily mean values of cyber bullying score according to skill of internet use is presented in Table 6.

Table 6. Mean values of cyber bullying score according to skill of internet use

skill of internet use	N	$\overline{X}$	Sd
Amateur	34	1,18	0,06
Medium	153	1,19	0,10
Advanced	60	1,25	0,14
Total	247	1,20	0,11

When Table 6 is examined teacher candidates whose skill of internet use defined as "advanced" have highest mean score ($\overline{X}$=1,25) and teacher candidates whose skill of internet use defined as "amateur", have lowest mean score ($\overline{X}$=1,18). One way variance analyses (ANOVA) was applied to determine whether there are statistically meaningful changes on the cyber bullying level according to skills of internet use. Result of analysis is shown in Table 7.

Table 7. ANOVA results of teacher candidates' cyber bullying according to the skills of internet use

	Sum of Squares	**Df**	**Mean Square**	**F**	**P**	**Meaningful difference**
Between groups	0,20	2	0,100	8,314	,000	1-3 2-3
Within groups	2,947	244	0,012			
Total	**3,148**	**246**				

*The mean difference is significant at the .01 level

1: amotor, 2: medium, 3: advanced

It is evident from Table 7, According to the results obtained from one-way variance analysis, there is a significant difference between cyber bullying and skill of internet use (F=8,314, p<0.01).

The Bonferroni test was applied to the data to be able to determine the groups that causes statistically meaningful difference in the cyber bullying of teacher candidates. As a result of the Bonferroni test, skill of internet use defined as "advanced" whose scores of cyber bullying significantly higher than "beginner" and "medium". In this situation, it was determined while the skill of internet use is increasing, the cyber bullying increases in positively.

Findings about cyber bullying and problems of social relation

The fourth sub-problem of this research is defined as "Is there any significant difference between cyber bullying and problems of social relations in teacher candidates? One way variance analyses (ANOVA) was applied to determine whether there are statistically meaningful changes on the cyber bullying level according to problems of social relations. Result of analysis is shown in Table 8.

Table 8. ANOVA results of teacher candidates' cyber bullying according to problems of social relations

	Sum of Squares	**Df**	**Mean Square**	**F**	**P**
Between groups	0,019	3	0,06	,507	,678

Within groups	2,984	240	0,12
Total	**3,148**	**243**	

It is evident from Table 8, According to the results obtained from one-way variance analysis, there is no significant difference between cyber bullying and problems of social relations (F=, 507, p>0.01).

RESULTS

As a result, it was found that teacher candidates have a low level of cyber bullying. It is possible to say that teacher candidates avoid behaviors that harm others in the virtual environment

A significant difference was found in term of gender. According to this result female students have higher cyber bullying than male students. It is possible to say that female students have more cyber-bully behavior among teacher candidates. Results are supported by other studies. These studies reached similar conclusions: the level of female students' cyber bullying scores are higher than male students (Li, 2007; Smith and etc., 2005).

There is a significant difference between cyber bullying and daily internet usage. The teacher candidates who use internet less than 1 hour in a day have lower cyber bullying level than those who use 1-4 hours and more 4 hours in a day. In this situation, it is possible to say that while the daily internet usage is increasing, the cyber bullying increases in positively. This finding is similar to Erdur-Baker's (2009) study which investigated adolescent's cyber bullying experience and Ybarra's (2004) study. Ybarra (2004) found that the amount of internet use is important predictor for the experience of cyber bullying. Patchin and Hinduja (2006) came to a similar conclusion: youth who participated in more activities online were more likely to experience online bullying. The result of this study was supported by the results of Erdur-Baker and Çapa-Aydin's (2008) study. Topçu, Erdur-Baker and Çapa-Aydin (2008) found that usage frequency of online communication tools was a significant predictor of cyber bullying

There is a significant difference between cyber bullying and skill of internet use. Skill of internet use defined as "advanced" whose scores of cyber bullying significantly higher than "beginner" and "medium". The findings of Vandebosch and Katrien's (2009) study differ from finding of this study. Vandebosch and Katrien (2009) found that advanced internet skills were not significant predictors of bullying.

There is no significant difference between students' cyber bullying score and problems of social relations Vandebosch and Katrien (2009) came to a similar conclusion: social competence was not significant predictors of bullying. The results of this study are similar to Vandebosch and Katrien's (2009) study.

SUGGESTIONS

Variables such as cyber bullying and skill of internet use measured as self reported. Future research should use other methods, such as those involving focus groups, in-depth interviews, and observations. Various types and sources of data would be helpful in gaining a more comprehensive view on the phenomenon.

Whether or not there is a significant difference between cyber bullying scores in term of internet use areas should investigate in further.

Future research, teacher candidates' levels of exposure to cyber-bully behavior and what variables affect levels of exposure to cyber-bully behavior can be investigate.

And predictor variables of level of cyber bullying of students can be investigate. Psychological conditions of cyber bullying should receive serious attention in future studies.

ABSTRACT

Educators are facing the challenge of adjusting their teaching practices and styles to accommodate a new generation of learners. The Net Generation, Millennial, Generation Y or New Generation of Learners, who are now entering universities, have learning styles, expectations and needs different from previous generations. This paper addresses some particular characteristics of this new generation and the challenges that faculty has to cope with to accommodate a generation digitally literate, demanding for practical and appealing learning, feeling confortable interacting through social networks, and expecting immediate responses and connectivity, as well as the educational challenges to accommodate their learning needs. Finally, some thoughts are in place about the responsibilities that faculty and universities need to face because of this generation's learning preferences.

Keywords: ICT in education, Net Generation, Millennial, Generation Y, New Generation of Learners

I. INTRODUCTION

Today's help calls for any type of support through an 800 number can be diverted to any part of the world. Indeed, many world firms are outsourcing their technical support departments to other locations of the planet. The borders of the world are more than ever blurring, as the internet brings us all a few keystrokes away from the service we need.

Higher education on the other hand, is facing many new demands and is challenged with decreasing funding from all supporting sources. There are increasing requests for accountability from a variety of communities, both inside and outside of the academy. There are demands for curriculum revisions to graduate learners with the necessary skills to meet changing workforce needs. There are mandates to meet requirements for appropriate information technologies infrastructure, for new faculty coming in at universities as well as for an aging faculty. Issues and challenges aggregated with a new and unique population of learners are converging upon higher education institutions.

To understand this unique population of learners and their challenges, it is important to know the age groups on the time period in which they were born. Oblinger & Oblinger [18, 19] discussed a classification system that describes various generations as Matures (1900-1946), Boomers (1946-1964), Generation X (1965-1982); and Net Generation (1982-1991), New Learners, Millennials or Generation Y as called by others. This classification intersects in time periods with other classifications. Howe and Strauss [10] classified the generations as: Boomers (1943-1960), Generation X (1961-1981) and Millennials (1982-present). In most instances in Ecuador, faculty are primarily Matures or Boomers. However, the student population crosses all generations with the newest, the Net, Millennial, Y or New Generation of Learners, being distinctly different in their characteristics and learning expectations.

The digital revolution significantly influenced the children born after 1981; Generation X practically started using information technologies when adults. Children from this generation were shaped mostly by TV, and Video Games, while Generation Y came during the digital revolution embracing information technologies and shaped by the Personal Computer, Computer Games and the WWW.

The effect of information technologies in the New Generation of Learners is particularly strong as we consider their profound effect in higher education. Information technologies have become so pervasive on university campuses that it is hard for faculty not to include them in the instructional process. Even more, in our developing countries, our universities must deal with an ever growing demand for infrastructure to support student's personal technologies, such as wireless laptops, smart phones or PDAs.

Much has been written about this new generation, but who are they and how do they differ from the past generations? Referred to Sue Bennett, Karl Maton and Lisa Kervin [1], who have written an extended review describing the characteristics of the Net Generation.

Marc Prensky [21] used the qualities of the digital natives and the digital immigrants to differentiate students in the past from the students of today. Digital natives grew up with technology; they live in a digital world. Digital immigrants view technology as an innovation and grew up in an analogue world. A good example to distinguish between the two is to see how people find information about a particular service or where to buy a particular item. The digital immigrant looks at the "yellow pages", while the digital native "googles" the information on the Internet. As digital immigrants, most faculty and staff are still working to adapt to this new way of doing, thinking, communicating, socializing, teaching and learning.

The purpose of this article is to highlight some important characteristics of the New Generation of Learners and their impact on higher education as they challenge the teaching-learning paradigm; looking from the perspective of their preferences as digitally literate, demanding for practical and appealing learning, feeling confortable interacting through social networks, and expecting immediate responses and connectivity, as well as the educational challenges to accommodate their learning needs.

II. THE NEW GENERATION OF LEARNERS

The New Generation of Learners, Net, Millennials or Generation Y, has unique characteristics that differentiate them from other generations. Several authors (Brown [2]; Frand [7]; Howe & Strauss [10]; Merritt [14]; Oblinger [18]; Skiba [27]) have written about the characteristics of this generation. These unique characteristics are challenging the traditional classroom teaching structure, and faculty are realizing that traditional classroom teaching is no longer effective with these students.

These characteristics include [27]: The sense of *authentication and trust*, because people from this generation, as knowledgeable individuals about information technologies, need to verify, check resources and authenticate people. They are *emotional and intellectually open*, because the openness of the online environment and anonymity are considered the most important assets of this generation, as well as the freedom for *exploration, discovery, and curiosity*. Their sense of autonomy stems from the experiences of being an *active information seeker and creator of information*. Having access to information at their fingertips, this generation is active and confident with *strong views and freedom for expressing themselves*. One of the most visible characteristics is the *immediacy*; this generation views the world as 24x7x365 and demands real time and fast processing. *Diversity and inclusion* are also characteristics of this generation, which views the world in a global context.

Important to mention is *innovation*; this group likes customization and wants to have options and try before buying, and have fascination for new technologies. They are constantly trying to push the technology to its next level and figure out how to create a better world.

Considering these characteristics, this new generation of learners, demands for new learning settings. The traditional teaching has emphasized the acquisition of facts and it was a content-focused learning. Faculty from previous generations is mainly text-based, with emphasis in memorization, repetition, and recall. The New Generation is digitally literate, demanding practical and appealing learning, feeling confortable interacting through social networks, and expecting immediate responses and ubiquitous connectivity.

The New Generation of Learners grew up and is comfortable in a digital world; where more important is what the technology enables them to do, than the particular technology. As part of this digital literacy, this generation is both information and multimedia literate. "They are more comfortable with an image-rich environment than with text" [19]. It is important to note that this generation seeks immediate information not by finding it in a textbook, but by connecting to the Internet.

The New Generation of Learners wants to construct their knowledge. Learning is not done in isolation and they learn cooperating with others. According to Frand [16], this is the Nintendo Generation and "…the key to winning Nintendo is the persistent trial and error to discover the hidden doors". Visualizations, simulations, case analyses, and other methods of participatory learning such as fieldwork are all part of this scenario.

"The TTT (talk, text, test) approach", is not valued by the New Generation of Learners [19]. TTT represents the traditional teaching paradigm of lecturing, asking students to read text, and giving a test to

insure they have recall and acquisition of facts. This generation promotes social interactions, reinforcing their use of instant messaging, blogging, gaming, and their large global network of contacts.

The New Generation of Learners has little tolerance for delays. They expect instant access and responses as they live in a 24x7x365 world. Emailing is from the past, when they can instant message someone immediately. This generation is also multitask, and mobile nomads who are always connected through cell phones, wireless devices, or laptops; use short hand symbols to communicate, usually not familiar to the digital immigrant population.

The social aspects of the new technologies and the services they facilitate should not be underestimated as powerful tools for exchange of knowledge, ideas and experience between students, professionals and researchers. There are many examples of blogs that became research and professional forums, even virtual places for workshops and conferences.

III. EDUCATIONAL CHALLENGES

The above mentioned characteristics are imposing some interesting challenges to faculty, concerning not only their teaching practices, but also their relationships with students, which need to be revised to accommodate the New Generation learning needs.

The recent developed "social technologies" empowered by wireless connectivity, generally omnipresent, have enriched the informal learning process that commonly occurs outside the classroom. At present, the learning process for the New Generation of Learners occurs in two settings: Formally, at the University, where they go to get credentials and the formality of teaching occurs, and; informally, outside the University, where they are fully involved in their social networks and personal virtual spaces, sharing and communicating through instant messaging.

As digitally literate, to facilitate learning to this New Generation of Learners, wired classrooms are a must. The lecture format is not the kind of setting they preferred, it is important to take advantage of their multitasking ability by posting relevant internet links, course materials and notes, hence students can explore relevant and interesting resources and become engaged with the course. Learning facilitators should not rely solely on Internet search engines, but direct students to specific databases and relevant specialized sites.

Today's university courses usually are complemented with class materials, notes, slides, webliography and other rich multimedia materials, available through learning management systems (LMS); although, this is relevant to the new generation of learners, web-based components need to engage students to motivate interaction, and not just a static web page dispensing content.

Since the New Generation of Learners lives in a mobile world which facilitates their multitasking nature, pod-multi-ip-casting important lectures will engage students to listen to these lectures on their smart phones, wireless and other MP devices.

Demanding for practical and appealing learning needs to be addressed, the use of simulation technologies will help engage learners in a process that provides the interaction they desire with the feedback they need in real-time situations. Through the design of pertinent scenarios, faculty can direct learning in a way that facilitates student understanding of subtle changes in reality. This might help prepare this New Generation of Learners transition to the work force.

Blogging has become a popular way to express opinions and it is a method that allows students to interact and get engaged in course discussions. Interactive LMSs with appealing web environment will allow learners to interact not only with the instructor, but with other learners and with the content. Learners can research and look for information and provide their reflections on the learning process through the blog.

Feeling comfortable interacting through social networks, this generation facilitates the implementation of creative teaching strategies in the area of collaborative learning. While previous generations have consistently worked backwards to the concept of "group work," [7, 8], this generation relays on collaborative learning in both face-to-face and virtual venues. For example, SIDWeb, the LMS used in ESPOL University, provides collaborative workspaces, where learners interact through chat rooms, audio, or video conferencing. Learners can store documents and schedule synchronous meetings over the Internet. The collaborative concept facilitates partnership and sharing while requiring students to be active participants in the learning process.

Through interactive response devices professors can foster interaction within the classroom environment, creating long-lasting learning experiences by asking learners to use these devices to select responses to questions, thus interacting with the content. Responses can then be automatically displayed for all in the class to see or used as a resource for discussion and reflection.

Current LMS struggle to catch and hold the attention of New Generation of Learners; these environments place the learner in a passive role of static content recipient. This generation expects to be connected, actively interacting and collaborating with their contact community, in a personalized learning environment, that they helped to build and unrestricted managed by them.

For the New Generation of Learners, the notion of collaboratively construct knowledge within a social community is very appealing [26]. Professors need to increase the use of websites that allow users to add content, such as Internet forums, allowing anyone to contribute to enrich course materials and notes.

The immediate response and connectivity expectations of this generation of learners are challenges that digital immigrant faculty needs to overcome. While email is used regularly for communication, deferred responses do not fit within "instant messaging". It is important for faculty members to communicate with students up front so they know when they can expect to receive feedback.

IV. FINAL CONSIDERATIONS

The challenge for universities increases as the gap between institutional information technologies and the technology environments, the New Generation of Learners has created for themselves, grows. Today's students are avid users of the Web, e-mail and a variety of other information resources; however, their rapid adoption of cell phones for instant messaging and social networking through collaborative resources, which generally are not part of campus infrastructures, leads to a whole new set of concerns.

It is fact; the New Generation of Learners has arrived in our higher education institutions. Faculty must know and understand these learners and their expectations. Universities must rethink the classroom setting, and faculty needs to adapt their teaching practices and consider various strategies to accommodate the learning needs of this generation, as well as be open to adapting their teaching methods.

There is no uncertainty; this new generation of students is challenging the traditional teaching practices in higher education. It is important to conceive learning activities that line up with the learning styles and expectations of the New Generation of Learners. For the faculty, the challenge includes knowing the students and their preferences and how to adapt to those preferences, as well as how to engage learners to the learning process, while adapting teaching practices by incorporating information technologies. The university needs to define an appropriate balance between the activities performed face-to-face within the classroom and those within the virtual worlds of learning, and to balance between faculty and student perspectives.

Students not only need to developed basic skills for handling information technologies to facilitate their learning, but the educators must keep pace with the learners. Professors must be aware of the learning preferences of this generation and develop course curriculum based on current materials to meet their learning needs, stimulating their interest for science, creativity and exploratory learning, developing their critical thinking and persistence.

And this is just the beginning, because Generation Z, the age group born after 1993, is now arriving to the universities. If we consider Generation X as the younger part of the current academic staff, they will be the ones engaging Generation Z, how prepared are we and our Institutions to cope with this challenge?.

THE POLITICS OF BLACK HAIR IN EDUCATIONAL TECHNOLOGY

INTRODUCTION

Donna Kakonge

I started doing research on the politics of black hair back in 1998 at Concordia University in Montréal. I developed an online virtual salon called Salon Utopia, as well as wrote a 90-page thesis paper called Afro Forever. Salon Utopia and Afro Forever was peer reviewed and evaluated by Dr. Martin Allor, Dr. Lorna Roth and Dr. Kim Sawchuk.

In 2006, Afro Forever was reformatted and was self-published under Lulu.com under the title of What Happened to the Afro? I applied to York University, Ryerson University and four times to OISE/University of Toronto until I finally proposed the idea of continuing this research and my current advisor is Dr. Stephanie Springgay at OISE to do my PhD in Curriculum, Teaching and Learning Development.

I started my PhD in May 2010 and completed an online course in Foundations of Curriculum with Dr. Heather Sykes. I was highly impressed with the organization of this course and have adapted some of its models as I built the curriculum for The Politics of Black Hair Online Course that started July 19, 2010 and ended August 29, 2010. The summary of the course is as follows after the literature review.

Part of the exploration of my research is to answer the question, since African women of the diaspora spend the most money on their hair (Rock, 2009), why are they not being taught the skills in post-secondary education to own the means of production to their personal choice of hair transformation? Young black women who can articulate themselves in either Patois for those of Caribbean heritage, English for those of former British colonies and French for those of former French colonies explain their experiences of going through body and hair modifications in order to prepare for their educational experiences. A huge influence on these body and hair modifications include the power of songs such as Prince's (1984) "The Beautiful Ones," as well to a lesser extent meditation-inspired music such as Gregorian chants. The methodology used includes a case study building on online qualitative research.

My own currere in getting ready for school and buying into the beauty culture began with the assistance of my wonderful mother. She did her best to make me "presentable" (as my Mom would say) for school. She would sit me down each night before school would start in the morning and braid my hair mostly into two simple braids on each side of my head. I would then cover these braids with a scarf so the style would look fresh for school. She would do the same for my sister.

When I turned nine, I was heavily influenced by the power and importance of musical artists such as Michael Jackson and Prince. To this day, the only poster of a musical artist whom I have had on my bedroom wall is that of Michael Jackson. I begged my mother to let me get a Jheri curl, and eventually she allowed me to do so. This began my personal body/hair modification to fit into the codes of passing that I was educated about through the media. However, just as I was educated to "pass," I was also being educated to be a passive receiver of these media messages, rather than an active agent in the means of distribution that heavily occupy the finances of so many women from the African diaspora.

In 2003, I was in a province-wide public service announcement (PSA) for the Ministry of Health and Long-Term care. In this PSA which promoted the Ministry's Tele-Health service across Ontario, I wore a long black straight wig (bought by me) and tons of L'Oreal makeup (bought by me). I was taking acting classes at George Brown College at the time and how I was identified in the PSA as "Donna – Student." I had achieved what my white producers of the PSA wanted, I had become the "Beautiful One," I had passed through the lens of the white eye.

Passing, authenticity and the power of the white gaze all started with the first encounter of Africans with Europeans before the slave ships came to North America. In Willie Morrow's (1973) book and movie 400 Years Without a Comb, Morrow explains how white people saw black people as a source of labour to build America. In the film, once black people came to the Americas, there is a scene in which the white slave owners stare at the Africans, commenting on how their skin is so "black" and their hair is like "wool." The

white slave owners would tentatively touch the Africans. Later in the movie, Morrow (1973) explains how Africans, once put into bondage and used as labour, would start to develop what he calls "the inferior seed." Black people started to emulate the look of whites by pressing their hair with irons, even covering their hair to keep it out of site from their white masters. Some slaves would also use the washing bleach to whiten their skin and pinch the noses of the newly born African-Americans. It was a mother's duty to purse the lips of her baby to look more like their white slave owners. Although the rape of black women during slavery by their white masters was unwelcome, the result of a lighter-skinned mulatto child who would have an easier time in American society because they could pass was welcomed (Morrow, 1973).

Passing and authenticity is prevalent in courtrooms, classroom, media arts, and visual arts and even in technology now hundreds of years later. It all comes down to the power of the white gaze and the power whites have in a global society. In Looking White People in the Eye: Gender, Race and Culture in Courtrooms and Classrooms (Razack, 1998), Sherene Razack discusses the power of the white gaze in the classroom. Razack does not focus on media, but her arguments are powerful. Razack's points of view however are powerful at illustrating the meaning behind the white gaze, as well as the effect it has on non-whites. It is the power of the gaze that Razack discusses most non-white women present themselves as "culturally different." The notion of passing, via the straightening of hair for black women, puts black women in a position to surpass their cultural difference and to be accepted in the classroom. It is also important to discuss how the education affects racialized bodies in the media arts. This sets up the notion of the importance of passing versus authenticity in the educational realm.

hooks (2000) notes that many blacks have not seen the visual arts as important towards the black struggle because they have followed the ways of white folks. hooks (2000) notes that many black people are influenced by television and movie images. It is all part of the power of the white gaze. This is why I have painted a picture of a "Black Woman with Afro embodied by a Rose and Based in Water" (Kakonge, 2010). This painting is featured in my home in a location where my black gaze takes precedence, my bedroom wall. It is a literal illustration of taking back the power of the white gaze and how others may or may not view me. It is an authentic replication of self.

Much has been said and written about the racial stereotyping of blacks in the media, as well to the roles of skin colour and hair. Yet, look closely at the black women who play romantic leads in films: they nearly always have light skin and long hair. Light-skinned black women with classic European features also are predominate in beauty pageants, music videos, and the world of modeling (Russell, Wilson, and Hall, 1992; Craig, 2002).

For a brief period in the early seventies some of the same colour biases that affected the casting of black men were applied to very light-skinned black women. Debra Pratt, a writer, director, and actress, was told after one audition that she was inappropriate for the lead because it required a real black woman, and she did not really look black enough (Russell et. al., 1992).

More recently, light-skinned black actresses are always lighter than their black leading men. It is apparently an inviolate rule in Hollywood that black actresses: Appolonia in Purple Rain, Vanity in Action Jackson, Shari Headley in Coming to America, Cynda Williams in Mo' Better Blues, Halle Berry in Strictly Business and Lonette McKee in Jungle Fever are always lighter than their black leading men (Russell, et al., 1992). This trend continues to be true. Even in more recent movies such as How Stella Got Her Groove Back, Angela Bassett was lighter than her leading man, and in How Do Fools Fall in Love, leading women were lighter than the leading man. In the world of cultural studies/media studies and how that educates, the colour and hair biases persist.

In music videos, the image of the octoroon beauty have been resurrected. Rarely if ever are dark-skinned black women with Negroid features and natural hair depicted in rap videos. Instead, long-haired black women with Caucasian features strike provocative poses behind macho black male rap artists. According to the (Russell et. al, 1992), Harvard psychiatrist Alvin Poussaint commented that for those who are not aiming to pass, perhaps this is where the true power lies: talented black women rappers, like Queen Latifah [who has now gone mainstream], Sister Souljah, Bytches With Problems, and the folk rock singer Tracy Chapman are also challenging the prejudices of the media with their strongly ethnic looks and Afrocentric styles. This new wave of female musicians are letting audiences know that black women do not have to be light-skinned and delicate to be considered beautiful and sexy (Russell, et. al, 1992: 160). However, it grates on some black people's and non-black people's nerves like Gregorian chants due to its non-conformity.

Michele Wallace (1990) brings in a whole other element when looking at media education, race and passing. She also brings up the important element of commodity and the materialistic culture that we live in.

This links back to Peggy McIntosh's (1988) idea of a White knapsack of privilege. Where as Wallace (1990) so poignantly points out that television shows like The Cosby Show indicate how blacks can pass through the commodified culture we have. Moreover, what this tends to mean in terms of television and a show like the Cosby Show, for example, is that blacks are shown as characters who possess positive attributes of white culture, which are really the attributes of a hypothetical and impracticable absence (or commodification) of culture. Similarly, Prince with his purple dress (not black), and aspiring for the "Beautiful One" (1984), Appolonia, as also accepted and defined by a white power and dominant culture.

Culture is then reduced to a style of consumption that offers up, say, expensive, exotic-looking hand-knit sweaters, or a brief scene of the Cosbys at a jazz club where a black woman is singing, rather than any concrete or complex textualization of cultural difference. Indeed the show seems to suggest, in its occasional use of Asians and Latinos, as well as blacks, that no one is ultimately different, since culture is something you can buy at Bloomingdales, a kind of wardrobe or a form of entertainment (Wallace, 1990: 2).

Course Introduction:

As part of the content of the online course that was be powered through KickApps.com and will continue to be, plus via email, photographs will be part of the curriculum. I have taught in the Independent Digital Photography program at Seneca@York's School of Communication Arts. "Photographs make the dynamics of racism visible as well" (Castenell et al. 1993). Mariamne Watley analyzes images of black women that were meant to be positive, although negative connotations could be drawn. "Exotic," "sexually dangerous," and "asexual" were some of the impetrations that Watley came up with (Castenell et al. 1993). As well, as part of the online course, three pieces of literature were analyzed. Ralph Ellison's Invisible Man (1952), Toni Morrison's The Bluest Eye (1970) and the author of this dissertation, Donna Kakonge's My Roxanne (2007). The self-actualization that can be found through narrative is transformative (del Guadelupe et al. 2009). English literature was my minor at Carleton University and I have written 41 books. I have also taught and/or am teaching writing at Seneca College, Ryerson University, George Brown College, Humber College, University of Guelph-Humber and UTSC-Centennial College joint journalism program, as well as Centennial College itself. Among these writing programs I have taught at, I have also taught scriptwriting. I have taken scriptwriting courses with the late author/producer Toni Cade Bambara and also Mary MacKay-Smith who writes for children's television. The scripts that will be examined include Barbershop (2002), Barbershop II (2004), 'da Kink in My Hair (TV or play) (2006), Good Hair (2009), Hairspray (2007) and Hair (1979). A special focus will be placed on 'da Kink in My Hair (2006). A look at Third Wave Feminism and Television: Jane Puts it in a Box (Johnson 2007), nothing is mentioned about the presence of black third wave feminism in this book. On the other hand Astrid Henry (2004) discusses Cheryl Lynn's popular 1978 song "Got to be Real" in terms of not faking it – what can also be analyzed as keeping to one's extraordinary beauty as a black person. Henry (2004) notes that realness and being real is a recurring theme in third-wave black feminism. This theory also works well with black women keeping to their extraordinary beauty, different from the ordinary beauty that is shunned by the character Brad of the character Angela in the movie American Beauty (1999).

Journalism articles were included in the curriculum. I have been working as a professional journalist since 1990. Radio podcasts such as this will also be featured – I have worked in radio since about the same time I started in journalism. Plus, an analysis of online blogs concerning hair politics will be analyzed, such as this one and also this one. All this will make up a more "mainstream" media studies content of "alternative" material where the aim will be to discover deep analysis of its content and subtext.

At the end of the course, there was a section on the business of hair that was so adeptly displayed by Chris Rock in Good Hair (2009). Hair salons would traditionally straighten and style a black woman's hair, only to sell her an afro wig when she felt like exploring more freedom (Scranton 2000). The afro wigs' popularity in sales post-1960 rivaled the business of pressing and straightening hair. The afro was also the beginning of a number of other hairstyles, such as cornrows, braids and locks that you can easily see in abundance in most urban areas in North America (Scranton 2000). The last part of the course will discuss this business aspect of the politics of black hair. The final outcome of the online course was an ebook that the active participants collectively contributed to and it was published by Amazon Kindle under the sole proprietorship business of Donna Kay Kakonge, M.A.

Here is an excerpt from the ebook:
Photographs
As part of the course outline: I wanted to discuss some images I found on www.dreamstime.com, an online photo gallery. I went through about 15 pages of pictures and could only find a few where I saw natural African-American hair. The ones I did find were completely different than the texture of say My hair, for example. I consider my hair to be reallllly "Black" hair because it is very coarse, very thick, and ridiculously hard to comb, especially when dry. The natural hair I saw here was softer, looser curls. Oh, and the last picture, well I put that up because I think it's the worst weave blending job I've ever seen in my life.

The third image is a picture of a woman who seems to have a hair texture similar to mine. She's the only one I saw in her naturality. There were loads of images in this gallery, and the majority of the images had relaxed hair. I love the second woman's chiney bumps too!
This also brings me to the whole terming of "Black" or "African-American"... Obviously this woman with the flower isn't 100 per cent black; for sure she's been recently mixed with another ethnicity of some sort, right? It seems if somebody has even one drop of African blood in them, they are deemed Black. That brings up issues because then there is a huge variety of features for one race, and confusion may arise. This whole issue with Blacks is subjective in my opinion so we can either allow ourselves to be sucked in, or dare to be different
Camille James
Re: Photographs
LOl I remember the chiney bump days; I never got a chance to sport that style :(
I agree with your comment on the last picture...I don't know too much about weave, but that doesn't look right to me either :)
I understand your point about the selective use of the terms "Black" and "African-American". I have friends who are African, and they don't fit the general physical stereotypes associated with "African-Americans".
It's the same thing with Asians...most people automatically assume someone of Asian ethnicity is Chinese. It's ignorance really.
Alicia Blagrove12

- Re: Photographs

I don't know why my comment has been posted twice [second one deleted]...this system needs a prayer and some holy water...geez lol
AliciaBlagrove13

- KickApps System

Yeah you're telling me??? I've written paragraphs only to have it not be posted - glitches probably :S
Camille James

- Photos

The woman in the fourth photo looks very much like Alison Stewart, one of the anchors on "Need to Know," the weekly news program on PBS.
The pictures remind me of the variety of hair textures within my own family. My mom had five of us--and we all have different hair textures. My hair is probably the thickest, the most coarse, and the kinkiest. My older sister's hair is thick and coarse, but more of a wavy texture. My younger sister's hair is finer and prone to breakage. And there's a range of difference among our children. My older son's hair is more wiry like his dad's, while my younger son's is more reddish and curly like mine. I've had the chance to braid up my older sister's hair, along with her three daughters, and one of her sons--and I find the differences to be fascinating.
As for the question of 100 per cent Black...well, I hate to break the news, but--scientifically, there is no such thing as 100 per cent of any race, unless you come from one of those isolated peoples who intermarry among themselves. (Which means you probably won't be on the Internet!). I think this has been more of an issue

with blacks because of the legacy of slavery and segregation, where this "one drop" rule was the law. Sociologically and culturally, well, that's another discussion. Once again begs the question of whether we will be sucked in, or dare to be different...
CynthiaCarr-Johnson

- Chiney bumps

Took me a while to understand what style you were talking about, because we didn't call them chiney bumps (yea, I probably dated myself). Forgot what we called them...I tried styling my hair like that, but it just wouldn't cooperate. :-)
Cynthia Carr-Johnson

- ...and I thought I was the only one

I often get frustrated by images of our "hair." It seems for our hair to be deemed photo-worthy, we have to have relaxers, weaves, etc. And, unfortunately, the general public seems to think that our hair is or should be like what they see on TV, or in movies and magazines. I was really disappointed when I found a natural hair magazine and bought it without flipping through it. ALL of it was dedicated to weaves and extensions made from human hair. Even the one natural hair salon in my city is questionable. I went there once for a blowout and after she washed my hair, she put me under a dryer sans detangling or heat protectant. Then, she proceeded to rip through my hair with a comb!
We need to educate ourselves and the rest of the world about our hair because it's fascinating and beautiful in all of its various natural forms and textures.
Robbin Melton
Hair
Oh yeah 100 per cent Black was the wrong wording Cynthia that was my bad... You opened my eyes to realize that our race, as well as many others is very broad. You mentioned the variety of hair textures within your family... that is very true !
Camille James
I agree!
Yep, I can only identify with the third picture, too. Ironically, I thought I found some gorgeous natural hair styles, but when I clicked the pictures, they were weaves from khimitkinks! I was shocked! One weave was absolutely stunning and is the look and natural length I'd like to achieve, but it was a $300 weave! I think the hair was another $200! They even had short twist-outs!
I also get upset when I grab a black hair magazine because most of the women are not wearing natural hair. One magazine even went so far as to advertise itself as a natural hair magazine, but it was human hair weave hair!!!! I guess that could be construed as natural, but not in my book. Natural is working with the hair God gave you without much manipulation. I mean, I even feel guilty about my twist-outs because that's not my true natural texture. It's close, but not 100 per cent real. My profile pic, however, is my natural texture. Just when I go to bed at night, I can't do anything with it the next day without soaking my head in water so I just do huge twists at night so I can style it in the morning.
At least a few new television shows feature black women with natural hair...maybe. At this point, I guess they could be weaves. I used to admire the heads of Erykah Badu and Solange with her afro, but when I learned they all are wearing natural wigs...I don't even know what to think about my sisters anymore when it comes to hair.
Robbin Melton
Robbin
Hi Robbin,
I completely agree with you how sad it is to go into many hair salons or to look on magazine racks and not see many natural hairstyles on black women. This is something that really must change. Magazine images have always served to be a major influential force on the way many women wear their hair, as well as dress. Until these images change, there will not be enough black women who know they have the option of wearing their hair natural and that it can still look absolutely stunning.
Donna Kakonge
Conclusion

As far as I know, this is the first ever online politics of black hair course in its existence. It took place from July 19, 2010 to August 29, 2010. A second version of the course will be beginning on September 5, 2010 with the aim for this to be an on-going project over many, many years.
All materials for the course were completely free. To participate in the course was also free. What you see here are pioneering women who helped me with my research with OISE/University of Toronto so I can do a discourse analysis of the content towards my dissertation for my PhD in Curriculum, Teaching and Learning. The journey has been awesome!
I thank all of the women who have participated. May as many of you as possible continue on this journey with me. I also feel as though I have reacquainted myself with friends of old and new.

THE READINESS OF SECONDARY SCHOOL TEACHERS IN USING COMPUTERS IN TEACHING AND LEARNING

Ahmad Moghni Salbani
Centre for Instructional Technology and Multimedia
Universiti Sains Malaysia
11800, Penang, Malaysia.
E-mail: amoghni@usm.my

ABSTRACT

This research aimed to observe the readiness of secondary school teachers in using computer applications for teaching and learning. The study areas include; teachers' attitude in computer applications, inside knowledge level and computer application skill in teaching and learning process. Research respondents constituted of 142 teachers. The study was analyzed using a descriptive analysis with Likert Scale questionnaires. Study findings were analyzed using Statistical Package Software for Social Sciences (SPSS V.15.0) to determine the frequency, percentage and mean score.

By using T-test, it was found that there were no significantly differences in the mean score for knowledge, skill and attitude between male and female teachers. ANOVA test was also used to determine the frequency of using computer applications with respect to knowledge, skill and teachers' attitude. The result showed that there was a significant difference between frequency of computer usage and teachers' attitude. Due to this, some suggestions were proposed to increase awareness, skill and knowledge on computer applications in teaching and learning process.

INTRODUCTION

Education in Malaysia is an ongoing effort to develop the potential of individuals in a comprehensive and integrated approach in creating balanced, harmonious and high morals. It has enshrined in the National Philosophy of Education. In the realization of human development as intended by the Curriculum for Secondary Schools and the Curriculum for Primary Schools is a discourse to be able to Malaysians who are balanced in terms of physical, emotional, spiritual and intellectual (Curriculum Development Centre, 1998).

Education in Malaysia once again experienced a paradigm shift with the introduction of the Smart Schools Program which is an effort to prepare the Ministry of Education (MOE) shaping the country's education system to meet the needs of the new millennium. Planning began in early 1996, in line with the development of Multimedia Super Corridor (MSC). The changes made in a curriculum that is required to be disclosed accurately. The role of teachers as facilitators between the media in the process of teaching and learning is demanding and more challenging.

Implementation Computer Program in education and smart schools as a result of changes in the educational system experienced pressure to make modifications. The significant changes proposed is the practice of teaching-learning and school management in the elements of 'smart use of technology' to prepare students for the information age (Smart School Project Team, Ministry of Education, 1997a). The use of computers in the Smart Schools also includes efforts to integrate computers into the activities of teaching and learning.

So the objectives of this study are to determine the readiness of teachers based on knowledge, skills and attitudes. Besides that the research also determines whether there are differences between the sexes in terms of knowledge, skills and attitudes of teachers using computers for teaching and learning. It also determine whether there is a difference between the frequency of using computers in teaching and learning of knowledge, skills and attitudes.

PROBLEM STATEMENT

The readiness of teachers in the use of computer based information technology is one important aspect in dealing with changes to teaching and learning to be effective. The application of information technology subjects in the syllabus given in schools is an initiative to enable teachers to familiarize themselves with computers. However, to what extent do teachers actually use computers in the optimum teaching and learning? Do teachers have the knowledge and skills in handling computers in teaching and learning? How do teachers' attitudes towards computer technology? All these questions demand a study done to determine the current use of computers in teaching and learning among teachers. Attitude towards computers is one of the factors that led to the willingness of teachers to receive the computer in daily work. Positive attitude is important to encourage someone to learn computers (Zulkifli Abdul Manaf & Raja Maznah Raja Hussain, 1994). Attitude or mental readiness factors, knowledge and skills among members are essential to a change in an organization (Steers & Black, 1994).

HYPOTHESIS STATEMENT

H_0 1: There is no significant difference between the knowledge scores of male and female teachers.
H_0 2: There is no significant difference between the skill scores of male and female teachers.
H_0 3: There is no significant difference in attitude scores between male and female teachers.
H_0 4: There is no significant difference between the frequency of computer use by knowledge.
H_0 5: There is no significant difference between the frequency of use of computer skills.
H_0 6: There is no significant difference between the frequency of computer use by teachers' attitudes.

METHODOLOGY

This study used quantitative methods as the primary approach. Descriptive approach was also used to see the current situation in schools to see the willingness of teachers to use computers in their teaching. According to Gay, Mills and Airasian (2006), descriptive design involves the collection of numerical data to test hypotheses or to provide an overview of the current situation.

A questionnaire was prepared to be answered by respondents. This questionnaire will be administered to respondents to survey the readiness of teachers to teach in national schools by using computers in teaching and learning. This study was conducted using a questionnaire that includes demography of teachers, background information of teachers, teachers knowledge of using computers, teachers attitude toward using of computers, ability and readiness of teachers in handling the computers. This study uses a quantitative analysis of statistical inference aims to find relationships and differences between the dependent variable with independent variables. Independent variable of this study is the willingness of teachers to use computers in the teaching and learning.

Population and sample study

Respondents for this study are teachers from four schools, where 60 teachers in School A, 50 teachers from School B, 55 teachers from School C and 51 teachers from School D. School A and B are in the Northeast region, while Schools C and D are in South West District of Penang. A school in this study consists of a smart school for good academic achievement based on the results of public examinations every year. While School B is a cluster school and School C and D are the normal school where the academic performance was average based on the results of public examinations every year. Questionnaires were sent to school principals for distribution to all teachers in the respective schools. The length of time given for teachers to answer the questionnaire was for a week.

RESULTS

Findings related to the willingness of teachers to use computers in the teaching and learning in schools was analyzed.

Table 1 Interpretation on the Level of Teachers Readiness to Use Computers for Teaching and Learning.

	Mean	New Value	Interpretation (Level)
Knowledge	2.6385	.53932	Medium
Attitude	2.3785	.21365	Medium
Skills	2.7592	.48492	Medium

Based on Table 1 the levels of teachers knowledge using computers for teaching and learning ia at medium level with the mean value of 2.6385. Whereas the mean value of teachers attitude is at medium level of 2.3785 and the mean value for teachers skills is also at medium level of 2.7592.

Gender

Table 2 below shows the gender distribution of respondents. Based on the table, there are 42 (29.6%) male and 100 (70.4%) female respondents

Table 2 Gender Distribution of Respondents

Gender	Frequency (*f*)	Percentage (%)
Male	42	29.6
Female	100	70.4
Total	142	100.0

N= 142

Tablel 3 Distribution Of Respondents Based On Age

Age	Frequency (f)	Percentage (%)
Less than 35 years	98	69.0
35 to 42 years	26	18.3
More than 42 years	18	12.7
Total	**142**	**100.0**

In Table 3, the majority of the respondents are more than 35 years of age that is 98 (69.0%) whereas the respondents between the age of 35 to 42 years is 26 (18.3%) and the respondents which are more than 42 years of age is 18 (12.7%).

Table 4 Distribution Of Respondents Based on Teaching Experience

Teaching Experience	Frequency (f)	Percentage (%)
5 years and less	81	57.0
More than 5 years	61	43.0
Total	**142**	**100.0**

Based on Table 4, there are 81 respondents with teaching experience for 5 years and less, that is 57.0%, and 61 (43.0%) respondents with more than 5 years teaching experience in schools.

Table 5 Distribution of Respondents Based on Frequency of Computer Use

Frequency of Use	Frequency (f)	Percentage (%)
Sometimes	3	2.1
Monthly	13	9.2
Weekly	39	27.5
Daily	87	61.3

Total	**142**	**100.0**

Table 5 shows that 87 (61.3%) respondents using computers daily, 39 (27.5%) using computers weekly, whereas 13 (9.2%) respondents using computers once in a month, and 3 (2.1%) respondents using computers once in a while when necessary only. The frequent use of computers determine the high literacy level. Therefore those who frequently use computers have a good literacy skills.

Hypothesis results

$H_0$1: There is no significant difference in knowledge mean scores between male and female teachers.

Table 6 T-test Result for the Mean Score of Knowledge between Male and Female Teachers.

		N	***M***	***SD***
Knowledge				
	Male	42	31.40	6.18
	Female	100	31.77	6.62
t(140) = -.306 , p =.76				

Table 6 shows the mean scores of knowledge between male and female teachers. From this study it is found that the mean score for female teachers (31.77) is higher than the mean of male teachers (31.40). The t-test showed that there is no significant different between male and female teachers' knowledge t (140) =. 306, p =. 76 level of p <.05. This means that the null hypothesis fails to be rejected.

$H_0$2: There is no significant difference in scores of teachers' skills in males compared to females

Table 7 T-Test Results For The Mean Scores Between The Skills Of Male And Female Teachers

		N	***M***	***SD***
Skills				
	Male	42	43.48	6.78
	Female	100	44.43	8.15
t(140) =-.667, p =.51				

Table 7 shows the mean score results for male and female teachers' skills. The results showed that the mean score for male teachers (43.48) is slightly lower than the mean score for female teachers (44.43). This situation reflects the skills of female teachers in computer use for teaching and learning is slightly higher than male teachers. The t-test showed that there is no significant different between male and female teachers' skills (t (140) =-. 667, p =. 51 level of p <.05. This resulted in the null hypothesis failed to be rejected.

H03: There is no significant difference in attitude mean scores between male and female teachers

Table 8 T-Test Results For The Attitude Mean Scores Between Male And Female Teacher

		N	***M***	***SD***
Attitude				
	Male	42	44.79	4.68
	Female	100	46.04	5.31
t(140) = -.1.329, p =.19				

Table 8 shows the results mean scores in attitude between male and female teachers. The results showed that the mean attitude of female teachers (46.04) is slightly higher than the mean score of male teachers (44.79).

The t-test showed that there is no significant difference between male and female teachers' attitudes (t (140) = -. 1329, p = .19 at the level of p <.05. This decision resulted in the third null hypothesis fails to be rejected.

ANOVA test results

One-way ANOVA test was used to see a significant different between the frequency of using computer knowledge, skills, and attitudes. Table 9 shows a one-way ANOVA test results on the frequency of computer use by knowledge.

$H_0$4: There is no significant difference between the frequency of computer use by knowledge.

Table 9 One-way ANOVA Test Findings Between The Frequency Of Computer Use In Teaching And Learning With Teachers' Knowledge.

Source	***SS***	***Df***	***MS***	***F***	***P***
Between Groups	236.360	3	78.787	1.918	.130
Within Groups	5669.415	138	41.083		
Total	5905.775	141			

Table 9 shows the results of analysis of One-way ANOVA used to test whether there were significant different between the frequency of computer use with respect to knowledge. The result shows that the value of F = 1918, p = .130 was not significant at level p <.05. This means that the fourth null hypothesis stating there is no significant different between the frequency of use of computers with less knowledge fails to be rejected.

$H_0$5: There is no significant difference between the frequency of computer use of teachers with the skills.

Table 10 One-Way ANOVA Test Findings Between The Frequency Of Use Of Computer Skill.

Source	***SS***	***Df***	***MS***	***F***	***p***
Between Groups	311.159	3	103.720	1.750	.160
Within Groups	8176.736	138	59.252		
Total	8487.894	141			

Table 10 shows the results of analysis One-way ANOVA used to test whether there were significant differences between the frequency of computer use in teaching and learning with skills of teachers. The result shows that the value of F 1750, p = .160 was not significant at level p <.05. This means that the null hypothesis that state there is no significant difference between frequency of computer use in the teaching and learning with less skill failed to be rejected.

$H_0$6: There is no significant difference between the frequency of computer use in teaching and learning with teachers' attitudes.

One-way ANOVA test was used to test the relationship between frequency of computer use in teaching and learning with teachers' attitudes.

Table 11 One-way ANOVA Test Findings Between The Frequency Of Computer Use In Teaching And Learning With Teachers' Attitudes.

Source	***SS***	***Df***	***MS***	***F***	***p***
Between Groups	465.162	3	155.054	6.547	.001*
Within Groups	3268.281	138	23.683		
Total	3733.444	141			

*significant at level $p < .05$

Table 11 shows the results of ANOVA One-way analysis used to test whether there were significant difference between the frequency of computer use in the teaching and learning with teachers' attitude. The result shows that, value F = 6547, p =. 001 level is significant at p <.05. This means that the sixth null hypothesis stating that there is no significant difference between the frequency of computer use and attitude was rejected.
Therefore, post-hoc analysis was carried out to see in more detail for the existence of these differences.

Table 12 The Findings of Post Hoc Test On The Attitude Of The Frequency Of Computer Use

4	V	5	.022*

* Significant at level p >.05

CONCLUSION

Discussion of research results :

(A) The level of preparedness of teachers based on knowledge, skills and attitudes.
The results shows that the level of knowledge of teachers were average. The findings of a study on the availability of knowledge is in line with the study by Iding, Crosby and Speitel (2002) who found that 65 percent of the respondents were at medium level in terms of computer knowledge. While the findings related to the level of skill is in the medium level, the findings of this study is in line with the findings made by Wahaida Wahi (2008) where the overall skill level of computer technology is moderate except for writing reports, letters and documents (M = 3.02), and print documents (M = 3.02) is considered a high proficiency. The level of computer skills that are in line with the average, Sathiamoorthy Kannan (2002) found that 71 percent of teachers are capable of managing computers in teaching and learning in schools are at medium level. The findings are also parallel with the findings by Noraini Attan (2002) that state of readiness of teachers in computer use is at a moderate level.

There are findings related to respondents' attitudes toward computers for teaching and learning that appears to be moderate. The findings of this study of attitudes contrary to the findings by Zulkifli and Raja Maznah (1994) who conducted research on teachers' training at the University of Malaya and found that 83% of students showed positive attitude towards computers and 13% being moderate.

(B) The relationship between knowledge, skills and attitude of male teachers compared to female teachers.
Results from t-tests found that there was no significant difference between male teachers with knowledge compared to that of female teachers, the male teachers (M = 32.54), while female teachers (M = 27.33). Therefore, no significant different between teachers' knowledge of male and female teachers. The finding is in line with the findings made by Wahaida Wahi (2008) which found no significant different in the willingness of teachers to use computer technology in teaching and learning for the knowledge based on gender.

T-test results also found that there was no significant difference between male and female teachers' skills. Skills in male teachers (F= 45.13), while female teachers (F = 39.33). This shows that there were no significant different between male and skill female. Findings of this study is parallel to the findings by Wahaida Wahi (2008).
The findings also showed no significant difference between male and female teachers' attitudes in using

computers. Attitude male teachers (M = 45.82), while female teachers attitudes (M = 44.92). This showed no significant difference between male and female teachers' attitudes. The findings are consistent with the findings by Wahaida Wahi (2008). This indicates that gender differences do not affect the willingness of teachers to use technology in teaching and learning.

Frequency of computer use in teaching and learning based on knowledge, skills and attitudes.
This study examines the readiness based on the frequency of computer use in teaching and learning. The results showed no significant difference between the frequency of computer use by teachers' knowledge. The study also found that there was no significant difference between the frequency of computer use with skill. But unlike the findings related to the frequency of computer use which is closely related with the attitudes of teachers.

Teaching and learning methods, such as the use of traditional books, chalk and transparency indicates inefficiencies in the current environment of competition (Ciglaric & Vilmar, 1998). As such, changes are to be made in developing and improving education. One area of concern in this study is the development of education and computer technology.

This study can be summarized that the overall availability of teachers use computers in teaching and learning in the schools studied were at a moderate level. Therefore the study showed that the level of preparedness of teachers in secondary schools are at moderate level in order to practice the use of technology, specifically the use of computers for teaching and learning.

ABSTRACT

The aim of this study is to investigate the relationship between social cohesion and computer-internet usage among university students. The research was conducted among university students in North Cyprus. The sample for the research consists of 38.8% (n=80) female, 61.2 % (n=126) male, 206 university students by using the criterion sampling method. "Hacettepe Personality Inventory – Social Cohesion Scale" developed by Özgüven (1992), the Cronbach's alpha reliability coefficient of which was the mean of reliability .82 and Biographic-Demographic Information Form used as a collecting data. Percentage documentation average, ANOVA and Pearson Moment's correlation were figured out in data analysis in this study. The statistical significance level was accepted as .05 in the study. The results of this study showed that there is a significant correlation between social cohesion as social relations and the computer usage of the university students. There is significant correlation between social cohesion as family relations, social relations, social norms and antisocial tendency with each other.
Keywords: Social cohesion, computer usage, internet usage, cohesion, internet.

INTRODUCTION

Nowadays technology and social change is being very affective on people's relationships. Especially computers are the most important technological machines that alter this relationship. For example, in face to face interaction you may find people smiling, frowning and nodding while computers have no social feedback. Computer technology affects the people's awareness of themselves, relationships with others and the world (ref. Zanden, 1990).

Social cohesion is a "we feeling" that members of a group are bound together, such as by attraction for one another (Myers, 1993). According to Durkheim, religion confirms to social values to the people and it is contributing of social cohesion. Religion, education and family life all help to improve social cohesion and strengthen the collective conscience (Tischler, 1996; Giddens, 1997; Marsh, 2000).

The concept of social cohesion refers to "good relations with the individual's environment establish this relationship and knowing the status of adopted". Social Cohesion describes the four concepts. In the first one, family relation reflects the level of family harmony with the individual's family relationships. The second one; social relation indicates the nature of the relationship between the individual with other people. In the third concept, social norms refers to the legal situation, the social rules and values need to be taken into account, being respectful of the rights of others, their own wishes and needs of society by reconciling certain behaviors, such as measures to meet the criteria as an independent attitude as well as mandatory legal situations. The last one is antisocial tendencies. People with antisocial tendency, usually a hard, full of anger, quarrelsome, prone to hard to use, are persons with feelings of revenge (Özgüven, 1992; ref. Yücel, 2007).

Cohesion behavior, defined as the degree to meet the individual's personal independence and social responsibility. Individuals depending on the degree of their lives improve more effectively behavior. All of these behaviors occur in a chain. Behavior in itself is a process chain that contains both cognitive and behavioral elements (ref. Toy, 2006). Especially, the years of adolescence is described as years of social development and cohesion. Social cohesion recovered over time but it develops some experiences in adolescence (Yavuzer 1995).

The need to spend increasing amounts of time on computer activities such as playing games, arranging files or participating in online discussion groups are indicated by psychological tolerance. Computer users are aware of this problematic behavior but they continue to use the computer compulsively. When a person is unable to access a computer they showed that withdrawal symptoms are indicated by an increase in irritability and anxiety (ref. Orzack, 1998).

According to the Young in 1996, there are lots of negative consequences of addictive use of the

computer and internet, such as familial problems, academic problems and occupational problems. The context of relationship problems caused by internet addiction has been undermined by its current popularity and advanced utility. The serious relationship problems were reported by addicts surveyed. Patients will spend less time with people in their lives (ref. Aslanbay, 2006).

Computer and internet usage, which is defined as a new type of addiction, became an important study area that attracts the interest of different disciplines including psychology, sociology and communication (Balcı, Gülnar, 2009).

In this context, this result of research will light the way for researches of academics, educational program developers, managers, educators and etc.

The Aim of the Study

The aim was to investigate the relation between social cohesion and computer-internet usage on university students.

The Problem Statements of the Study

The main problem statement of the study: "Is there any statistical meaningful correlation between social cohesion and internet-computer usage in university students?" The following sub questions were answered in order to reach the result of the main problem.

1. Is there any statistical meaningful correlation between computer usage and social cohesion?
2. Is there any statistical meaningful correlation between internet usage and social cohesion?
3. Is there any statistical difference between social cohesion and duration of computer usage?
4. Is there any statistical difference between social cohesion and duration of internet usage?

RESEARCH METHODOLOGY

Research Design

The research was made by descriptive type of associational research method. The aim of the descriptive perspective is to determine related cases. This type of research aimed to evaluate the level and the variation together between two and more variables (Karasar, 2009)

The Universe and Sample of the Study

The universe of this research is obtained on university students in North Cyprus. The sample for the research consists of 38.8% (n=80) female, 61.2 % (n=126) male, 206 university students used by purposive sampling techniques of criterion sampling method. According to modify sample of study students have their own personal computer set as a criteria.

Instruments

In the collection of data "Hacettepe Personality Inventory – Social Cohesion Scale" and Biographic-Demographic Information Forms were used. Biographic and Demographic Information Form is prepared by the researcher and it is arranged according to the suitability with the aims of the study. It is formed of 17 questions. In this form people are subjected to demographic features related to questions (sex, which department and class he/she attends etc.) as well as computer-internet related questions. "Hacettepe Personality Inventory (HKE) – Social Cohesion Scale" was developed by Özgüven and the Cronbach's alpha reliability coefficient of which was the mean of reliability .82. In HKE Social Cohesion Scale there are four subscales. These subscales are family relations, social relations, social norms and antisocial tendencies. Family relations reflect the individual's relationships with his/her family. Scores were high refers to people were friendly and healthy relationships with parents and siblings in a family that show love and is loved by his/her family. Family relations in the low score shows that the confusion and inconsistency in its dealings with the individual's family. Social relations score indicates the individual nature of its relations with other people. In terms of social relations score is high indicates a high level of the individual's maturity and social skills. These people are happy and comfortable in groups of friends and other adults give an outlook. In the low score of the individual's means that stagnant in terms of socialization and social skills. Social norms score, as well as mandatory conditions to be considered legal and social rules and values of society means being respectful of the rights of others. The high score of social norms means personal desires may be delayed according to the needs of the group's and also meets the individual's understanding of the rights of others. Antisocial tendencies to the low score indicates that an individual with antisocial aptitudes. People with antisocial tendencies are usually hard, full of anger, quarrelsome, who desire to hurt, hard to use the prone, in feelings of revenge,

disrespectful individuals. Score is higher refers that the individual has not antisocial tendencies (Özgüven, 1992).

Hacettepe Personality Inventory has a reliability score. Reliability score refers to respond careful inventory of the individual with insight and a conscious, carefully read each item to respond to reviews, such as paper fill out a reliable of the inventory answering behavior. In practice, the reliability score is lower than 5, and answer sheet in case of invalid counted and are not included in scoring (Özgüven, 1992).

Data Analysis

All analysis are performed by using the SPSS 15.0 for Windows. Considering purposes of the study percentage documentation average, ANOVA, Pearson moment's correlation were figured out in data analysis. The statistical significance level was accepted as .05 in the study.

RESULTS

In this study, 206 students were distinguished by the personal computer criteria. It was applied to the university students. The group was formed from 38.8% (n=80) female, 61.2% (n=126) male students. The following results were found according to the problem statement and sub questions of the study.

The first and second sub-questions of the research were expressed as "Is there any statistical meaningful correlation between computer usage and social cohesion?" and "Is there any statistical meaningful correlation between internet usage and social cohesion?"

The aim was to investigate the correlation between Hacettepe Personality Inventory – Social Cohesion Scale and computer-internet usage scores of the students with the scores of these scales with Pearson Moment's Correlation Test applied and these results were determined.

It was determined statistically meaningful mild positive correlation between Social Relations subscale score and computer usage scores (r=.166). Statistically meaningful mild negative correlation was found between computer usage and internet usage scores (r=-.408). It was no statistically meaningful correlation between computer usage and Family Relations (r=.070), Social Norms (r=-.099), Antisocial Tendency (r=.009) and Social Cohesion (r=.063) subscales of HKE Social Cohesion Scale.

There was no statistically meaningful correlation with internet usage scores and Family Relations (r=.010), Social Relations (r=-.089), Social Norms (r=.068), Antisocial Tendency (r=-.044) and Social Cohesion (r=.024) subscales of HKE Social Cohesion Scale.

There was statistically meaningful strong correlation with Family Relations and Social Cohesion (r=.773) subscales. Statistically meaningful mild correlation was found between Family Relations and Social Relations (r=.278), Social Norms (r=.387) and Antisocial Tendency (r=.472) subscales. It was determined statistically meaningful moderate correlation with Social Relations and Social Cohesion (r=.646) subscales. Statistically meaningful mild correlation was found between Social Relations and Social Norms (r= .229) and Antisocial Tendency (r=.279) subscales. There was statistically meaningful moderate correlation between Social Norms and Social cohesion (r=.665) subscales. Statistically meaningful mild correlation was found between Social Norms and Antisocial Tendency (r=.334). It was determined statistically meaningful moderate correlation between Antisocial Tendency and Social Cohesion (r=.743) subscales of HKE Social Cohesion Scale.

The third sub-question of the research was expressed as "Is there any statistical difference between social cohesion and duration of computer usage?"

Table 2. Comparing Student's Duration of Computer Usage with Social Cohesion Subscales Scores

Subscales	Computer Usage Duration	N	$\bar{X}$	Sd	df	F	P
Family Relations	**Not daily usage**	15	15,66	2,60	4

	8 hours and up	41	49,65	10,11			
	Total	206	49,96	9,56	205		

The investigation was to compare the daily computer usage duration to the Social Cohesion scales with ANOVA.

It was determined that there was no significant difference to the computer usage duration during a day to the not daily usage ($\bar{X}$=15.66 ± 2.60), 1-3 hours ($\bar{X}$=14.38 ± 3.69), 4-5 hours ($\bar{X}$=13.37 ± 3.73), 6-8 hours ($\bar{X}$=13.28 ± 3.85), 8 hours and up ($\bar{X}$=13.70 ± 3.50) and Family Relations subscale scores (p=.181). There was no significant difference to the computer usage duration during a day to the not daily usage ($\bar{X}$=14.60 ± 3.24), 1-3 hours ($\bar{X}$=12.72 ± 3.46), 4-5 hours ($\bar{X}$=12.59 ± 3.67), 6-8 hours ($\bar{X}$=13.78 ± 3.57), 8 hours and up ($\bar{X}$=13.75 ± 3.26) and Social Relations subscale scores (p=.130). There was no significant difference to the computer usage duration during a day to the not daily usage ($\bar{X}$=11.93 ± 2.68), 1-3 hours ($\bar{X}$=12.50 ± 2.79), 4-5 hours ($\bar{X}$=12.31 ± 2.92), 6-8 hours ($\bar{X}$=12.13 ± 2.70), 8 hours and up ($\bar{X}$=11.43 ± 3.20) and Social Norms subscale scores (p=.568). There was no significant difference to the computer usage duration during a day to the not daily usage ($\bar{X}$=11.40 ± 3.18), 1-3 hours ($\bar{X}$=11.55 ± 3.18), 4-5 hours ($\bar{X}$=10.59 ± 3.56), 6-8 hours ($\bar{X}$=10.98 ± 3.37), 8 hours and up ($\bar{X}$=10.75 ± 3.47) and Antisocial Tendency subscale scores (p=.802). There was no significant difference to the computer usage duration during a day

to the not daily usage ($\bar{X}$=53.60 ± 8.90), 1-3 hours ($\bar{X}$=51.16 ± 9.88), 4-5 hours ($\bar{X}$=48.88 ± 9.79), 6-8 hours ($\bar{X}$=50.18 ± 8.98), 8 hours and up ($\bar{X}$=49.65 ± 10.11) and Social Cohesion scores (p=.491).

The fourth sub-question of the research was expressed as "Is there any statistical difference between social cohesion and duration of internet usage?"

Table 3. Comparing Student's Duration of Internet Usage with Social Cohesion Subscales Scores

Subscales	Internet Usage Duration	N	$\bar{X}$	sd	df	F	P
Family Relations	**Not daily usage**	13	14,92	3,66	4		
	1-3 hours	24	13,12	4,05			
	4-5 hours	76	13,80	3,73	201	,989	,415
	6-8 hours	62	13,17	3,68			
	8 hours and up	31	14,22	3,19			
	Total	206	13,66	3,67	205		
Social Relations	**Not daily usage**	13	13,84	3,15	4		
	1-3 hours	24	12,29	3,56			
	4-5 hours	76	13,42	3,69	201	1,047	,384
	6-8 hours	62	13,11	3,33			
	8 hours and up	31	14,12	3,70			
	Total	206	13,33	3,54	205		
Social Norms	**Not daily usage**	13	11,92	2,81	4		
	1-3 hours	24	12,20	2,63			
	4-5 hours	76	12,31	3,18	201	,441	,779
	6-8 hours	62	12,04	2,75			
	8 hours and up	31	11,51	2,66			
	Total	206	12,07	2,88	205		
Antisocial Tendency	**Not daily usage**	13	10,38	3,92	4		
	1-3 hours	24	10,70	3,35			
	4-5 hours	76	11,11	3,61	201	,308	,872
	6-8 hours	62	10,62	3,46			
	8 hours and up	31	11,16	2,70			
	Total	206	10,88	3,41	205		
Social Cohesion	**Not daily usage**	13	51,07	10,42	4		
	1-3 hours	24	48,33	10,31			
	4-5 hours	76	50,65	9,99	201	,579	,678
	6-8 hours	62	48,96	8,86			
	8 hours and up	31	51,03	9,13			
	Total	206	49,96	9,56	205		

The investigation was to compare the daily internet usage duration to the Social Cohesion scales with ANOVA.

It was determined that there was no significant difference to the internet usage duration during a day to the not daily usage ($\bar{X}$=14.92 ± 3.66), 1-3 hours ($\bar{X}$=13.12 ± 4.05), 4-5 hours ($\bar{X}$=13.80 ± 3.73), 6-8 hours ($\bar{X}$=13.17 ± 3.68), 8 hours and up ($\bar{X}$=14.22 ± 3.19) and Family Relations subscale scores (p=.415). There was no significant difference to the internet usage duration during a day to the not daily usage ($\bar{X}$=13.84 ± 3.15), 1-3 hours ($\bar{X}$=12.29 ± 3.56), 4-5 hours ($\bar{X}$=13.42 ± 3.69), 6-8 hours ($\bar{X}$=13.11 ± 3.33), 8 hours and up ($\bar{X}$=14.12 ± 3.70) and Social Relations subscale scores (p=.384). There was no significant difference to the internet usage duration during a day to the not daily usage ($\bar{X}$=11.92 ± 2.81), 1-3 hours ($\bar{X}$=12.20 ± 2.63), 4-5 hours ($\bar{X}$=12.31 ± 3.18), 6-8 hours ($\bar{X}$=12.04 ± 2.75), 8 hours and up ($\bar{X}$=11.51 ± 2.66) and Social Norms subscale scores (p=.779). There was no significant difference to the internet usage duration during a day to the not daily usage ($\bar{X}$=10.38 ± 3.92), 1-3 hours ($\bar{X}$=10.70 ± 3.35), 4-5 hours ($\bar{X}$=11.11 ± 3.61), 6-8 hours ($\bar{X}$=10.62 ± 3.46), 8 hours and up ($\bar{X}$=11.16 ± 2.70) and Antisocial Tendency subscale scores (p=.872). There was no significant difference to the internet usage duration during a day to the not daily usage ($\bar{X}$=51.07 ± 10.42), 1-3 hours ($\bar{X}$=48.33 ± 10.31), 4-5 hours ($\bar{X}$=50.65 ± 9.99), 6-8 hours ($\bar{X}$=48.96 ± 8.86), 8 hours and up ($\bar{X}$=51.03 ± 9.13) and Social Cohesion scores (p=.678).

DISCUSSION

In this study the aim was to investigate the relation between computer-internet usage and social cohesion in a group of university students who have a personal computer. The social cohesion refers to individually good relations with their environment. "We feeling" is important to social adaptation and proper social cohesion in the society. The social cohesion to become improves with religion, education and family. In this study family relations, social relations, social norms and antisocial tendency concepts used as a explaining social cohesion. The main aim of the study is to investigate the relation between computer-internet usage and social cohesion. It was found that as level of computer-internet usage not severely affected the social cohesion in this group. Computer usage duration is affected social relations. On the other hand, the original data show that family relations, social relations, social norms, antisocial tendency and social cohesion related with each other.

According to Milliyetçi's study examined the relationship between social skills and attitudes towards the internet, the findings shows that no statistically meaningful difference between social control,

social sensitivity, social expressivity, social skills and the use of internet (Milliyetçi, 2008). Also in this study was not found statistically meaningful relation between internet usage and social cohesion as a family relations, social relations, social norms and antisocial tendency was not found.

The study average of South Korean students spending 23 hours during a week for gaming and another 1.2 million are probably believed to be at risk for addiction. Therapists worry about the increasing number of student's low school success, dropping out from school to spend time on computers. Internet addiction is resistant to treatment and high relapse risks regrettably (Block, 2008). In this study it was determined that most of the students using 4-5 hours both computer and internet usage during a day. So it is a cause of personal, familial and social problems and shows us probably most of university students to be at risk for computer-internet addiction.

CONCLUSION AND SUGGESTIONS

The present study indicates that computer usage duration was related with the social relations. The internet usage was not related with social cohesion as family relations, social relations, social norms and antisocial tendency. Also denote that the students use computer and internet at least 4-5 hours a day. It shows us a part of the students become computer-internet addiction and most of the student to be at risk for addiction.

In this study, it was focused on the university students that use their own personal computer and their social cohesion. As related with findings we are aware of the effects of computer and internet usage on family relations, social relations, social norms, antisocial tendency and give importance to the relations of students with their parents and evvironments.

Only adolescents who attend university and who have families with higher socio-economical status and education participated. Low socio-economical status of the family, low education may be some other factors related with computer-internet usage and social cohesion, a sample having wide range of these characteristics should be formed. Having a large sample of students with different backgrounds may enable to generalize the results to the community. If the further studies could be applied to other age groups like secondary and high school students, a varity of views may occur.

University students with social cohesion vision accepted by their peers in interpersonal relations, sense of belonging to a group can survive, this is also related to him/her provides positively influence the perceptions, to show positive behavior. Around the individuals who can establish good relations with both personal and social satisfaction by providing a positive personality and self-esteem.

Abstract

Recently computers and information and communication technologies (ICT) have been widely used in classrooms for teaching purposes. It is important to investigate how these recent developments affect students' performance at school. In this study, the effect of ICT on students' math and science performance was examined. The data for this study comes from the 2009 administration of PISA. The sample includes 4996 students in Turkey. Hierarchical linear modeling was used for analyzing the effects of ICT in student and school levels. The results indicated that students' familiarity with ICT and exposure to technology help to explain the achievement difference between individuals and schools.

Key words: ICT, PISA, technology, achievement, hierarchical modeling

Introduction and Theoretical Framework

In recent years, computers have been used extensively for various reasons by wide user groups. School-age children use computers for entertainment, communication, and education, etc. Over the past few years, due to improvements in technology, computers and related technologies have become cheaper and more sophisticated. That is why households are both able and willing to buy computers for their children in order to give them the chance to become advanced computer users. Lauman (2000) stated that "not only is the number of computers in education growing exponentially, but also the number of computers in the home is growing at a rapid rate" (p. 196). Despite the increase in the number of computers and related technologies, everyone does not have the same access to these technologies: "Media availability varies depending on such things as child's age, gender, race/ethnicity, family socioeconomic status, and so forth" (Roberts et al., 1999, p.9).The economic level of the countries might also affect the availability of media for school-age children either at school or at home.

Parents believe that using computers helps their children's academic achievements and job opportunities (Ortiz et.al, 2011), therefore they buy computers with internet connection to help their children succeed in school (Turow, 1999).Today's computer revolution provides cheaper and better home computers that allow students to practice what they have learned at school(Stock and Fishman, 2010). Although there is an agreement among researchers that computers are useful for learning opportunities, Becker (2000) found that students use computers at home more for entertainment than for school related purposes. There are countless things that can be done with computer applications, and some of these applications might have latent impacts on children's development. For instance, computer games might be considered a waste of time by some parents. However, they may have positive effects on children's cognitive development (Hamlen, 2011; Li and Atkins, 2004). By spending time with the computers, children can learn how to "read and utilize the information on computer screens" (Subrahmanyam et al., 2001, p14). Using computers can also improve children's visual attention because some applications require users to keep track of or control many things at the same time. Durkin and Barber (2002) also found that computer games have positive impacts on adolescents.

Children are not only exposed to technology at home but also at school by new information and communications technologies (ICT). Due to having new computers and related technologies, schools are in need of new technology plans and designs. According to Kozma (2003), "teachers in many countries are beginning to use ICT to help change classroom teaching and learning, and are integrating technology into the curriculum" (p. 13). Therefore, it is necessary to develop strategies for students to effectively use

computers and advanced communication technologies that can help them to improve their academic performance (Lee et al., 2009, p. 226). According to analyses of U.S. data (NCES, 2001), students' science achievements are positively affected by teachers' computer use for certain activities at school. Papanastasiou et al. (2003) argued that students who have available computers at home and in the library have higher levels of science literacy. Lee et al. (2009) found in their study that students who were using computer 1 hour per day had better math scores. Kim and Chang (2010) stated that computer use for math was associated with reducing the achievement gap among different diverse backgrounds. It is obvious that there might be many factors affecting students' science and math performance. Technology is one of these factors; that is why it is important to explore how we can explain students' science and math achievements by looking at their use and accessibility of computers and related technologies, as suggested by Subrahmanyam et al. (2001). Notten and Kraaykamp (2009) stated that science performance is positively affected if there is a positive reading climate and computer availability at home. They also mentioned that "the absence of a television set at home seems to narrow a child's worldview and knowledge of science." (p. 379).According to Attewell and Battle (1999),mathematical performance was positively associated with having a home computer. Dumais (2009) also mentioned that using computers for fun was related to increasing math achievement.

In this study, we aim to investigate how using computers and related technologies affect science and math performance among students.

Method

Data Source

The data for this study come from the 2009 assessment of The Programme for International Student Assessment (PISA) that is an internationally standardized assessment jointly developed by participating economies and administered to15-year-olds in schools. PISA assesses the domains of reading, mathematical and scientific literacy that are covered not merely in terms of mastery of the school curriculum, but in terms of important knowledge and skills needed in adult life. Besides assessing these specified areas, the PISA includes student, parent and school surveys that have survey items related to students', parents' background, their attitudes towards different topics such as ICT.

The sample includes 4996 students (male=2551, female=2445) from 170 schools in Turkey. 169 of 170 schools were public schools while only 1 school was privately funded in the sample. Student level variables were obtained from the PISA 2009 Student and ICT survey, and school-related variables were obtained from the PISA 2009 School Survey.

Obtaining Technology Scores

In order to quantify students' exposure to technology, the questions in the PISA Student ICT Survey were used. The survey includes questions about several topics such as students' possession of technological devices, and how frequently they use these devices.

The technology scores from the ICT survey were obtained using the Graded Response Model that is a polytomous item response theory (IRT) model developed by Samejima (1969) for analyzing cognitive processes. The model is similar to the Birnbaum's (1968) two-parameter IRT model in terms of dichotomization process. The response categories (k) are dichotomized into two categories: (1) greater or equal to score category k; (2) less than score category k. With k response categories, there are k - 1 or j boundaries between the categories. For each between-category boundary, an operating-characteristic curve should be estimated. These curves can be found by using the following equation:

$$P_{ij}^{*} = \frac{e^{a_i(\theta - b_{ij})}}{1 + e^{a_i(\theta - b_{ij})}}$$

where P_{ij}^{*} is the probability of selecting category j or higher, a_i is the item discrimination for item i, θ is the latent trait, b_{ij} is the category-boundary parameter (threshold) for category j in item i. For k response categories, k-1 (or j) category-boundary parameters (b_{ij}) are estimated. These parameters basically represent the ability level necessary to have a 50% chance of responding in a category above the j^{th}

between-category boundary. In the present study, the ICT survey items have either four or five response categories that provide three and four between-category boundaries, respectively.

Hierarchical Data Analysis

In this study, hierarchical linear modeling (HLM) was used for analyzing the effects of technology on students' achievement. HLM focuses on the effects of social variables on behavior or performance. It allows examining the variance hierarchical data structures where students are nested within classes and schools. The relative variation in the outcome measures, between students within the same school and between schools can therefore be evaluated.

For hierarchical linear modeling, *lme4* package (Bates, Maechler & Bolker, 2007) in R was used. Before conducting HLM analysis, several assumptions were addressed to determine the adequacy of the hierarchical modeling. In order to see if student-level residuals are normally distributed, a histogram of observed residuals was generated. If the distribution resembles a normal distribution, it can be concluded that the level-1 errors are normally distributed (Raudenbush & Bryk, 2002). Second, multivariate normality of the school-level residuals was checked by examining the Q-Q plot of expected and observed Mahalonobis distance. A 45 degree line is the evidence of the multivariate normality of the level-2 residuals. Also, homogeneity of level 1 variance was checked. There were four hierarchical models fitted by using math and science scores as an independent variable and independent variables such as technology scores (TECH), socioeconomic status (SES), ICT use at home (ICTHOME), confidence in using computers (HIGHCONF), school size (SCHSIZE) and ratio of computers at school and school size (RATCOMP). The same models were fitted for both math and science scores. Table 1 gives a summary of the HLM models used for the data analysis.

Table 1

Hierarchical linear models used for data analysis

One-way random effects ANOVA
$Y_{ij} = \beta_{oj} + r_{ij}$ (Level 1 – Students) $\beta_{oj} = \gamma_{00} + u_{0j}$ (Level 2 – Schools)
Random intercept model: Model 1
$Y_{ij} = \beta_{oj} + \beta_{1j}(TECH) + \beta_{2j}(SES) + r_{ij}$ $\beta_{oj} = \gamma_{00} + u_{0j}$ $\beta_{1j} = \gamma_{10}$ $\beta_{2j} = \gamma_{20}$
Random intercept model: Model 2
$Y_{ij} = \beta_{oj} + \beta_{1j}(TECH) + \beta_{2j}(SES) + \beta_{3j}(\text{ICTHOME}) + \beta_{4j}(\text{HIGHCONF}) + r_{ij}$ $\beta_{oj} = \gamma_{00} + u_{0j}$ $\beta_{1j} = \gamma_{10}$ $\beta_{2j} = \gamma_{20}$ $\beta_{3j} = \gamma_{30}$ $\beta_{4j} = \gamma_{40}$
Random intercept model: Model 3
$Y_{ij} = \beta_{oj} + \beta_{1j}(TECH) + \beta_{2j}(SES) + \beta_{3j}(\text{ICTHOME}) + \beta_{4j}(\text{HIGHCONF}) + r_{ij}$ $\beta_{oj} = \gamma_{00} + \gamma_{01}(SCHSIZE) + \gamma_{02}(RATCOMP) + u_{0j}$ $\beta_{1j} = \gamma_{10}$ $\beta_{2j} = \gamma_{20}$ $\beta_{3j} = \gamma_{30}$ $\beta_{4j} = \gamma_{40}$

Note: Y_{ij} is students' math or science score in the 2009 administration of PISA.

df	3		5		7		9	

Note: In each cell, the first estimated value (top) is based on science scores (S), and the second value (bottom) is based on math scores (M).
(*) The coefficient is not significant at the alpha level of .05

Results and Conclusion

First, HLM model assumptions were checked. The output related to these assumptions was not included in this paper due to space limitations. A histogram of observed residuals was generated. The distribution was fairly normal. Multivariate normality of the school-level residuals was checked by examining the Q-Q plot of expected and observed Mahalonobis distance. The plot had a 45 degree line between two variables. That was the evidence of the multivariate normality of the level-2 residuals. Lastly, homogeneity of level 1 variance was checked by using chi-square test. The test result showed that the hypothesis of homogenous variance was failed to reject ($p > 0$ .05).

Second, the HLM analyses were performed. Table 2 shows the results of the HLM analyses. As mentioned earlier, the first model is the one-way random effects model that accounts for variance between individuals and schools without any covariate. This model was used a baseline for comparison with other three models that include several covariates in level 1 (student) and level 2 (school). In each step, technology-related variables were included in the model. Technology scores obtained from the ICT survey was not a strong predictor of science and math scores by itself. However, when it was used with other ICT-related variables, it was a significant predictor in all three models. The availability of ICT at home (ICTHOME) and confidence in using computers (HIGHCONF) were other important predictors of math and science performance in addition to the technology scores.

In the bottom of Table 2, deviance values and degrees of freedom were reported for each level in each model. Deviance values can be used for comparing fitted-models. The difference between deviance values from two models and the difference between degrees of freedom from the same models can be used as a chi-square test (e.g. $\chi^2 = \text{Deviance}_{\text{model1}} - \text{Deviance}_{\text{model2}}$, $df = df_2 - df_1$). Based on these comparisons (*not included here*), it was concluded that all models explained significantly more variance than the one-way random effects model which means that the additional variables related to ICT were helpful to explain the difference among students and schools.

In conclusion, the results indicated that students' exposure to ICT in their daily lives was a strong predictor of their math and science performance while ICT availability at school did not have a significant effect on students' math and science performance. The practical implications of this study can be beneficial for educators and policy-makers in education in terms of constructing classroom environments and designing curriculums. The results of this study are limited to 15-years old students in Turkey. Therefore, the results may not be generalized to other populations (e.g. different countries).

ABSTRACT

Geographic Information Systems (GIS) technology is widely employed for comprehensive analyses in the analytical studies which are indispensable for any planning activity and have a substantial place in curricula of urban planning education. This paper aims to show the role of GIS in the planning education by analyzing the analytical studies realized in Tuzla, İstanbul, as a part of the courses "Internship of Analytical Survey" and "Planning Design II-III" in the City and Regional Planning Department of the İzmir Institute of Technology. This analytical survey includes five steps: (1) field works and data collection, (2) data storage and manipulation, (3) spatial analyses, (4) visualization of outcomes, and finally (5) data assessments by employing ArcGIS software. The GIS technology enables students to analyze complex systems like cities, spatial processes and geographic inputs. As GIS is a useful technology for urban planning, it should be integrated in the urban planning education.

Keywords: Geographic Information Systems, Urban Planning Education, Analytical Studies, Tuzla-İstanbul

INTRODUCTION

In the urban planning education, analytical studies have a substantial place in the planning curricula in general. In accord with the paradigm of positivism, an analytical study is vital for designing and projecting the future development of urban systems. There is a strong mutual determinism between the different components of the urban form and this is why an urban structure behaves in integrity. It is possible to reflect this integrity in a plan by projecting the future development. An analytical study is generally designed as two independent, however highly interrelated processes: field and studio works. Field works are composed of all the studies done in a place (a neighborhood unit, an area, a city, a region, etc.) which is subject to the planning activity. It includes land use studies, distribution of questionnaires, interviews, etc. Studies carried out in the field work, are organized as internship stage, and very helpful for planning students to gain practical experiences and communicative abilities (Frank, 2006).

The integration of technology to the planning education is advocated by a number of experts (Ben-Joseph, 2004; Dalton, 2001; Willson, 2008). Some experts assert that the use of technology-aided learning in planning education provides practical and pedagogical opportunities. Complex issues with respect to the 3D visualization and web-based mapping in planning can be easily overwhelmed by the use of GIS (Ben-Joseph, 2004). With the use of GIS, experts can manage large amounts of spatial and non-spatial data in the multiple layers (Dai, Lee, & Zhang, 2001; Masser, 2001). In addition, GIS facilitates the construction and analysis of urban indicators (Martínez, 2009). Since the beginnings of 2000s, the use of GIS has extended rapidly covering various fields such as transportation (Arampatzis, Kiranoudis, Scaloubacas, & Assimacopoulos, 2004), landscape design (Kong, Yin, & Nakagoshi, 2007), geo-environmental assessment (Dai, et al., 2001), and population analysis (Jokisch & Boone, 2003). The use of GIS has been becoming widespread (Peters & Hall, 2004; Pettit & Pullar, 2008), and its role in the planning process has been increasing (Drummond & French, 2008; Holden, 2000). For this reason planning schools make more room to GIS courses and train students with the ability to handle GIS software. After the graduation, students-planners can find a position in the sector more easily than their counterpart (Yin, 2010). The number of professors, academic researchers and planners using GIS are growing rapidly (LeGates,

2006b). Moreover, the need of GIS related knowledge and skills are diversified. These are the reasons why urban planners should learn GIS and related technologies (Turki, 2010).

The use of the GIS technology in the planning education has opened up a discussion in 1990s (Frank, 2006). Its application has hardly found in place and planning schools were generally reluctant to make a room in the curricula (Carlson, 2008; Chapin, 2003; Godschalk & Lacey, 2001). Today, GIS has been widely used and become substantial part of the education in general. Therefore, the use of the GIS technology should be considered as a substantial part of the core curriculum of urban planning program (LeGates, 2006a).

Even though lots of studies (Carlson, 2008; Chapin, 2003; Dimitrova, Burov, & Nikolov, 2010; Godschalk & Lacey, 2001; LeGates, 2006a) underline the importance of integrating GIS in planning education, there is a lack of studies emphasizing the use of GIS practically in the planning education. Carlson (2008) focuses on integrating GIS in teaching a field-base laboratory exercise for urban studies; on the other hand some others are in favor of organizing a quick course in using GIS software to collect and analyze data and prepare maps (Santo, Ferguson, & Trippel, 2010). However, instead of certificate program or short courses, we claim that GIS should be an essential part of the planning curriculum in the form of both a must course and practical internship period.

In the curriculum of the City and Regional Planning Department of the İzmir Institute of Technology, the internship of the analytical study was held in Tuzla-İstanbul in 9-21 August 2010. The internship lecture is the prerequisite course of the third year studio lectures, CP 301-302 in fall and spring terms respectively. Complementarities of the upper scale, including politics, strategies and application to the lower scale plans and project packages is the main purpose of the curriculum of the City and Regional Planning Department (Akpınar, Bor, Atay Kaya, & Demirkesen, 2010). İstanbul was located around the globalization discourse and then Tuzla was chosen as the field study area. The role of the GIS technology in planning education will be discussed in relation to the analytical studies realized in Tuzla- İstanbul.

In the internship period, a bundle of techniques were used: large survey analysis of area was realized and its social, economic, historical and physical characteristics were documented. Questionnaires were distributed to the households, industrial zones, business, commerce, and institutions. The public sector opinions, thoughts and aspirations were surveyed. After all these studies, a large data set containing spatial and non-spatial data were composed, stored, analyzed and mapped with the help of GIS. The students learnt that the efforts of storage, analysis, and mapping of geographic data could be visualized and analyzed easily with the selection of appropriate GIS tools. GIS have proven to be essential tool in collecting and processing the various data.

MATERIALS AND METHOD

The internship course was held in August, 2010 by a study team including 20 students, 3 instructors, a specialist and 3 research assistants. The course is consisted of five steps: (1) field works and data collection, (2) data storage and manipulation, (3) spatial analyses, (4) visualization of outcomes, and finally (5) data assessments by employing ArcGIS software (Figure 1). The first step is described in the following study area and materials parts. First, Tuzla is presented; and then collected and analyzed data is described. The method part involves the steps about data storage and manipulation and spatial analyses. The final steps including visualization of outcomes and data assessments are detailed in the results and discussion part.

The scope of the “Internship of Analytical Survey” is based upon the whole activities comprising investigation, analysis and assessments. The purpose is to make a comparison of the settlement’s actual position with respect to its past situation and then to detect development potentials, trends and limitations, and eventually to project the future development akin to the real situation. Internship program in the curricula of the City and Regional Planning Department is designed as this extensive and comprehensive analysis of the settlement which is subject to planning. The program generally takes place in the summer period. After the internship, the planning activity took place in the fall and spring semesters. In the program, it is expected that students can have an ability to manage the whole planning process, beginning of drawing the real data from the field and then processing them into the plan of the settlement. The

program is designed as close as the real situation of the planning in the Turkish context. At the end, the students can have an ability to comprehend the whole process and gain expertise to manage the complex data set which is the basic input of the planning activity.

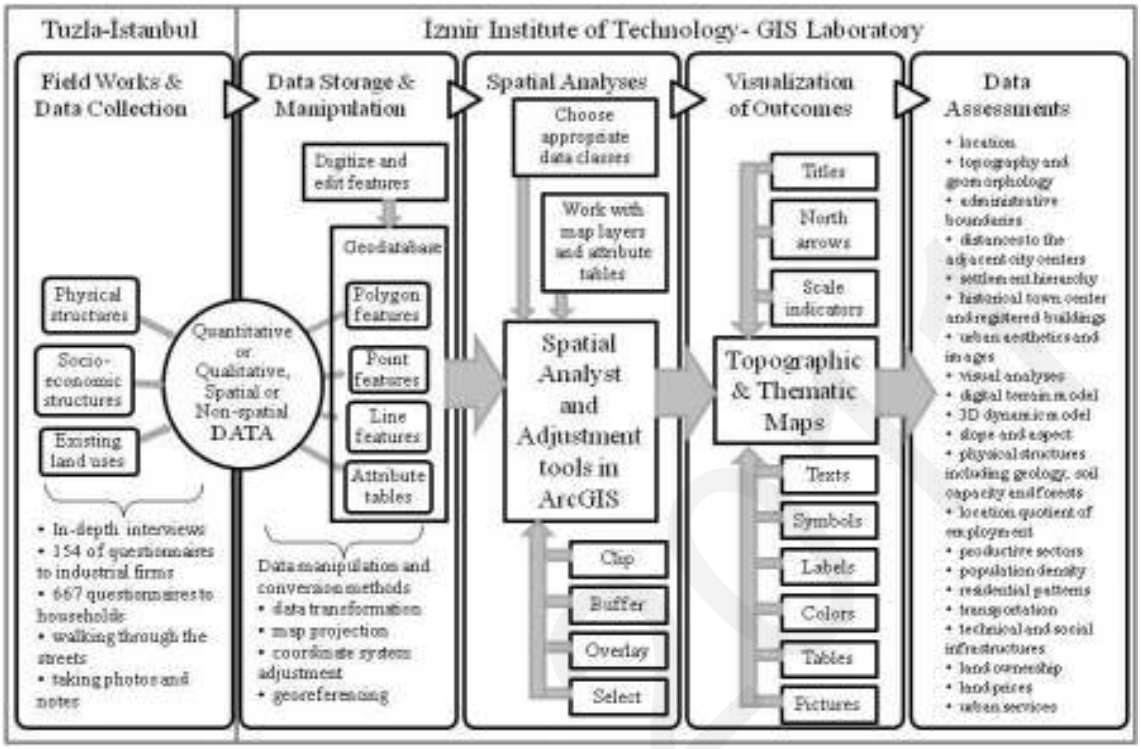

Figure 1 Steps of the Methodology

Study Area

Tuzla is the one of the 39 towns of İstanbul Metropolitan Area. Tuzla is located on the eastern part of the city, can be considered as an edge zone, and opened up the city to Anatolian Peninsula (Figure 2). The population of Tuzla has 185.819 people in the census of 2010, in an area of 123 kilometer squares (TSI, 2010). The district is full of heavy organized industrial zones, a free trade zone, and the biggest shipyard of the nation. Also, an International Airport, large university campus areas, natural areas, a historical town center and various urban areas can be found together in Tuzla which presents a rich study area for planning activity.

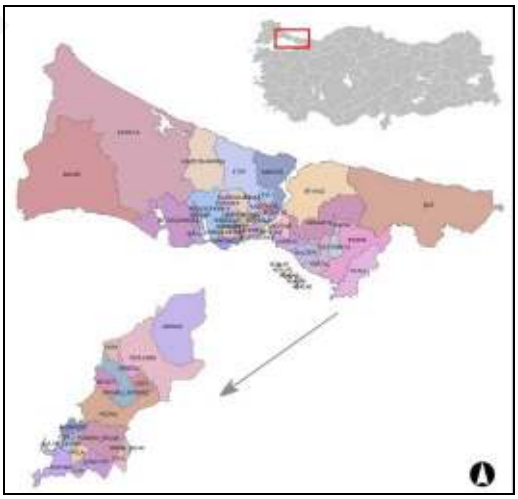

Figure 2 Study area

Materials

The analytical survey consisted of various researches including physical structures, contextual position of Tuzla in global, regional and national level, and socioeconomic variables. Physical structures covered extensive research on geologic, geomorphologic, topographic, climatic and environmental situations. Spatial organization and its evolution in time series were analyzed. Social, demographic and economic conditions, in relation to the employment and production sector analyses were done extensively. Property relations, land values and their fluctuations were investigated heavily. Existing land uses were detected and transferred into the maps. In-depth interviews were realized with the public employees. Beside all these formal studies, informal talks with the lay person in the streets, unprecedented interviews were also taken place. The field study covers the two intensive work weeks in Tuzla. At the end of the internship period, a 154 of questionnaires were distributed to the industrial firms and 667 questionnaires were done with the households living in Tuzla.

Socio-economic structures of families, housing conditions, life quality of the environment, demographic trends, employment structures, and etc., were explored. Economic activities, trends and problems were detected. Urban services and infrastructures were analyzed. Large scale land-cover and land-use analysis were conducted. All these studies were realized by walking through the streets, taking photos and notes, as well as talking with the people.

The next phase after the field study was composed of enumerating of the whole data set, whatever they were, quantitative or qualitative, spatial or non-spatial. The data obtained from the questionnaires were transferred into the SPSS program and a data base was composed. Statistical analyses were performed about the demographic structure. Moreover, socioeconomic position of the households with respect to the income, employment structure and education were analyzed statistically. At the end of all these extensive and intensive works, a research report was written.

Method

The data processing was started after two weeks with a training course about GIS and their application in urban planning. The data collected during the field work were stored, analyzed and visualized in ArcGIS software in the GIS laboratory. In addition to GIS, statistical programs, SPSS and Excel were employed in the study.

The geodatabase were provided to the students. Then, they stored the data they collected in the field works. The database includes polygon features to show different land-use zones and buildings; point features are employed to show schematically downtown and landmarks; and finally line features are used to indicate roads and administrative boundaries. Attribute tables are added to indicate all kinds of properties in the geodatabase. At the end of all these procedures, students have an ability to join non-spatial information to the spatial datasets. In the final phase, all pieces of work were merged into a single geodatabase.

In addition to the primary data collected from the field, there were the secondary data acquired from the municipality such as the maps of topography and property ownership (cadastral map). Not all these secondary data were in GIS format, some of them were in various data types such as ‘dwg’ format of AutoCAD and ‘ncz’ format of NetCAD software. Therefore, there was a need of converting data. The data in different formats were converted into ArcGIS format. Besides, there have been some mismatching parts among the data coming from different sources. This problem was solved by the data manipulation and conversion methods such as data transformation, map projection, coordinate system adjustment and georeferencing.

After storing and manipulating the data, various spatial analyses were performed by the students with the help of the spatial analyst and adjustment tools in ArcGIS. Students learnt to manage the data in this step. Depending on the type of analysis, they chose appropriate data classes and created thematic maps employing colors, labels, tables and pictures in accordance with the emphasis of objects. For example, when they analyzed the ownerships of the land, they arranged the legend by emphasizing the landowners and added a table and a pie chart showing the percentages (Figure 3). On the other hand, when they made a slope analysis, they prepared a 3D dynamic model of the terrain (Figure 4).

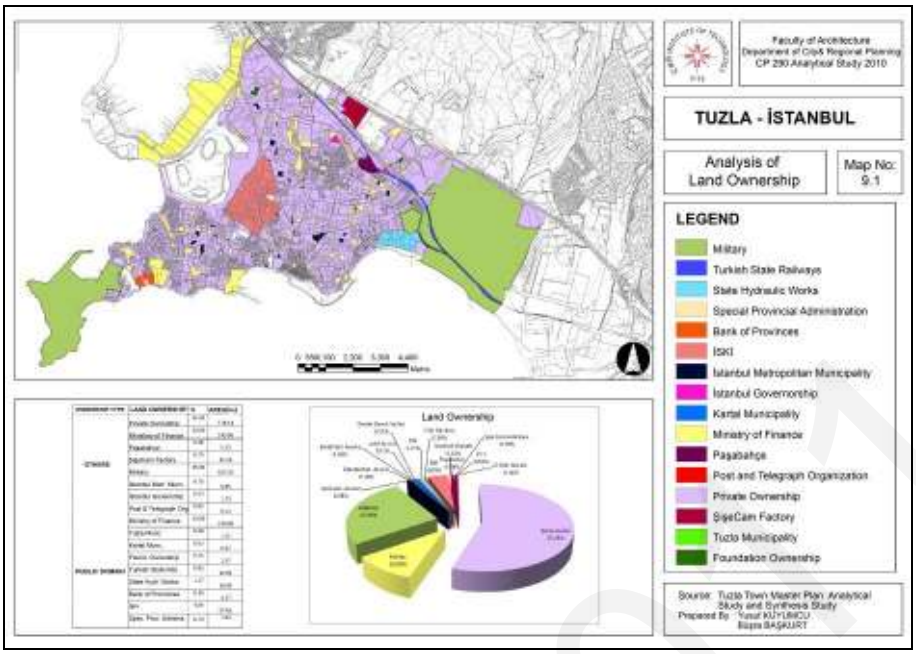

Figure 3 Analysis of Land Ownership

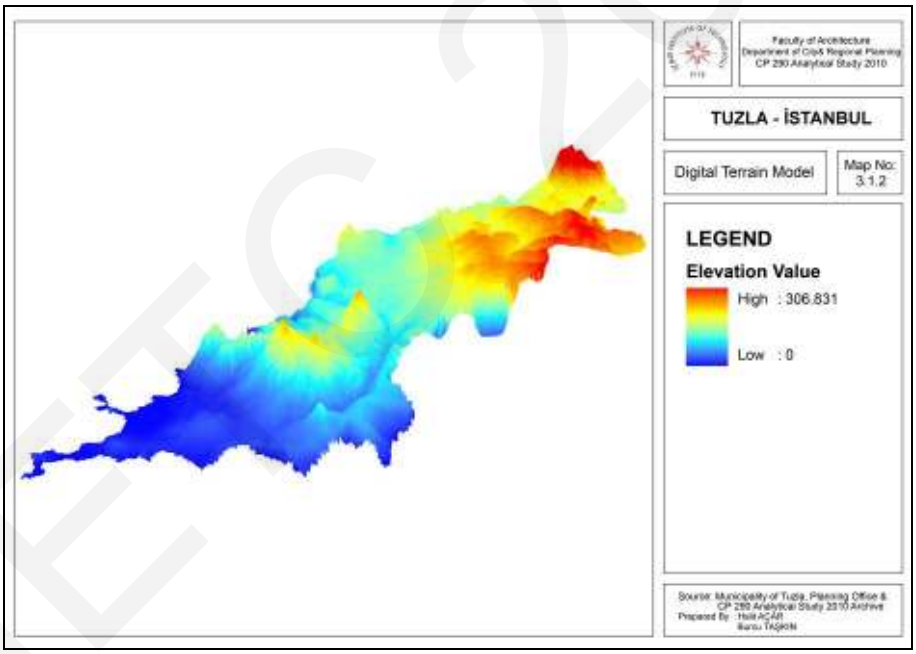

Figure 4 Digital Terrain Model

RESULTS AND DISSCUSSION

Planning students attending the analytical survey of Tuzla prepared several topographic and thematic maps in various scales in terms of analysis types and printed them in both A0 and A3 extended maps. These maps show the location of Tuzla in the metropolitan area, topography and geomorphology of the study area, administrative boundaries, distances to the adjacent city centers, settlement hierarchy, historical town center and registered buildings (Figure 5), urban aesthetics and images (digital photographs of some important buildings), visual analyses, digital terrain model, 3D dynamic model, slope and aspect, physical structures including geology, soil capacity, and forest areas, location quotient of employment, productive sectors, population density, and residential patterns (Figure 6). Transportation analyses, technical and social infrastructures, land ownership, land prices, urban services and their

distribution, and other urban sectors were visualized into maps. To produce these maps in ArcGIS, students learned to create and modify geodatabases, created and managed geographic or spatial features consisting of the objects of the points, lines and polygons. In addition to these, they digitized and edited features, set coordinate projections coming from different map sources, converted the data from different data formats such as CAD files. They exported and imported files to and from other computer applications. They also worked with map layers and attribute tables, adjusted symbols and label features, adjusted transparency values, processed data with spatial analyses using tools such as clip, buffer and overlay, selected data with attribute and location based queries, and designed layouts of the maps by adding titles, graphs, pictures, texts, north arrows and scale indicators.

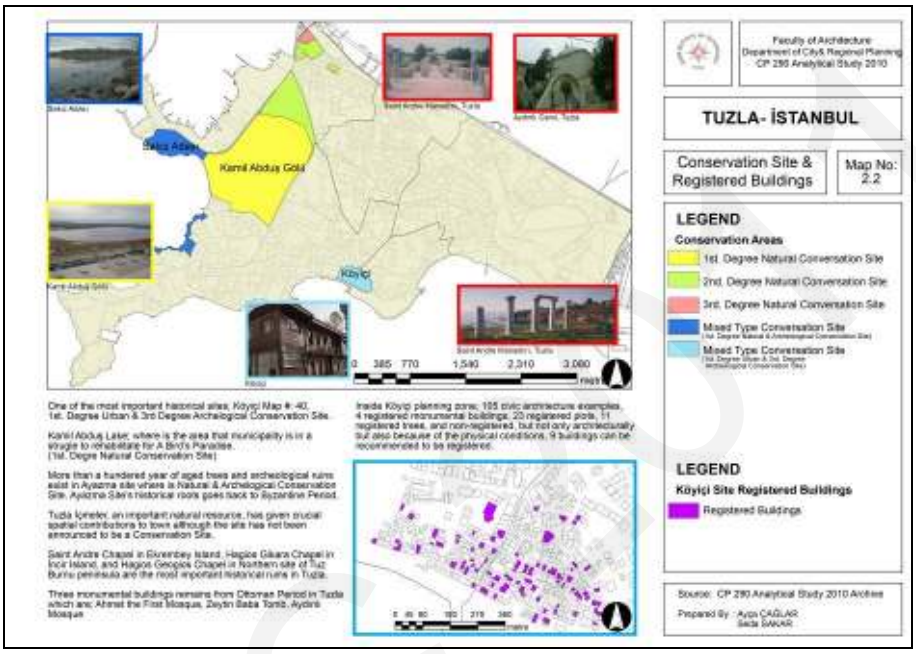

Figure 5 Conservation Site and Registered Buildings

Figure 6 Analyses of Settlement Pattern

GIS provide ease of the management of large data set obtained from different sources with different formats. Students can create a single geo-database and use the data as a necessary input to the various planning activities.

CONCLUSION

Today planning students are more and more increasingly required computer skills than before. With the use GIS software, statistical analyses can be performed as the outcome in the form of digital maps which can ensure visual interpretation as computer-aided applications in planning activities. The GIS technology gives students the ability to relate geographic information coming from different sources, make linkages of non-spatial data to spatial data, analyze spatial, natural, demographic, economic variables by using multiple layers, and arrange scales and map projections. The GIS technology provides analytical survey more easy and fast in terms of data collection, data storage and manipulation, spatial analysis, construction of the 3D digital terrain model, visualization and finally assessment of outcomes. For these reasons, the use of GIS is indispensable for spatial analysis and its application is becoming widespread.

Technological advances provide wide range of facilities for planners. Expert planners dealing with the management of the complex systems like urban areas need extensive and intensive data sets for solving the problems, simulating the complex systems and creating linkages of the sophisticated relationships. GIS software is proven to be essential instruments of the management and assessments of large collection of data. The software application has founded itself more place in planning and planning students in via of constituting their professional identity have to learn it effectively. GIS provide convenience and time-saving in an urban world that is overwhelmingly changing, transforming and sophisticated. The visualization and assessments of large and complex data set in a form of maps provide easy access of visual information which can be shared by a large part of citizens in interactive ways. Planners can express themselves, solve the problems and communicate by large part of the population in a planning process. For these reasons, GIS applications provide ability for the planners to manage complex urban systems and behave in a proactive manner. Therefore, education programs of the planning schools should include GIS applications.

ABSTRACT: This study is a report on a learning experiment involving secondary school pupils with the aim of using information technology techniques to acquire cartographic skills. The Google Maps and Google Earth programmes available on the Internet provide an infinite number of images of the whole of the earth's surface that can be selected and used as a resource to enable learners' active participation in knowledge-building. This strategy allows pupils to use cartographic codes to create their own maps of the areas in which they spend their lives and even of the most distant regions of the planet. The development of these skills is a prerequisite for the citizen to interact with modern society in which technology is performing a fundamental mediating role. The school, which must always be innovative and prepared to change, cannot avoid the task of developing new learning techniques for reading and interpreting the modern world.

Keywords: cartography, google maps, teaching, geography, information technology

INTRODUCTION

We are living in a technological revolution every day of our lives. As has already been pointed out, we have been turned into citizens of the cyberculture. New information technologies affect the organisation of work and ideas so they have to be included in the world of education as working tools (Passini 2007). There is in fact a variety of multimedia resources and computer programmes that encourage dynamic and interactive study while providing a new interface between space and time, which is a vital question today since knowledge of cartography has come to be seen not as an end in itself but also as a means of interacting with reality.

Not only the written word, but also detailed images of the whole of the Earth's surface can be shared across the five continents. As well as eliminating passive learning, use of the Internet along with interactive learning provides the learner with a combination of entertainment and study (Pontuschka 2008). In this new context new reference points have to be built into research in teacher training courses (Goodson 1981). Thus the importance given to research into innovative methodologies based on forms of information technology should be linked to establishing a relationship with practical work.

The learning strategy presented here was developed taking these factors into account. Google Earth allows the Internet user to look at any point on the planet by means of satellite images. It is possible to locate in a few seconds the district and even the building in which one lives in a distant town or even to put oneself into the position of seeing a 3D image moving through 360°. The programme also permits multi-temporal analysis by providing images taken at different times, which is clearly important for understanding the changes occurring in geographical areas over time.

METHODS AND PROCEDURES

In terms of map work it is vital to develop from an elementary level of reading concentrating simply on location to more complex levels involving the decodification and interpretation of maps and providing challenging learning situations so that something more than mere cartographic literacy is achieved (Pontuschka 2008; Kaercher 1999). Given the possibilities that exist, the aim of this study was to develop the notion of space and cartographic representation based on exploring digital atlases (Vogos et alii 2009), in other words the programmes provided by Google - Google Maps and Google Earth - that are available on the Internet. The methodology that was developed includes the aims described below.

- An integrated pedagogical approach conceived in all its historical-cultural and socio-economic dimensions, giving primary school pupils an effective resource for mastering cartographic concepts;

- the use of digital images as a store of information and research on topics related to school geography, such as relief, hydrography, urban expansion, landscape development, and environmental degradation, among others and
- taking the area in which the pupil lives as a basis for acquiring knowledge about geography on a local scale in order to achieve meaningful learning.

Procedures

Working as undergraduate students, future geography teachers on teaching practice at a secondary school in Brasilia were involved in setting up strategies and creating teaching materials, going back to using mapping skills to encourage relational and multidisciplinary thinking (Pontuschka 2007), and introducing satellite images as a learning resource. The process included the following stages.

1. Diagnosis of the teaching institution.
2. Research and planning to develop the project on the theme: "The world at the touch of a mouse".
3. Developing teaching plans - "navigation guides" - containing the following specific objectives:
   - Recognizing the uses of the elements of cartography, in other words, symbols, scale, location (latitude and longitude) and directions, and using them in navigational and photo-interpretation tasks.
   - Interpreting and identifying the various attributes of the region pictured, such as types of vegetation, areas of degradation, natural landscapes, and others.
   - Understanding the configurations and spatial relationships concerning the phenomenon of urban growth in the Federal District, together with related environmental implications.
   - Making maps of the area pupils live in (district, town, journeys and places they habitually visit).
4. Carrying out activities in the school computer laboratory.
5. Final evaluation.

The Activities Developed

As Castrogiovanni warns (1999:35), the purpose for which the pupil learns the language of maps is not based on colouring or copying shapes, but in building representations based on a close or distant reality, following each step of the process. With this in mind, we show some examples of navigation aids that pupils used to guide them.

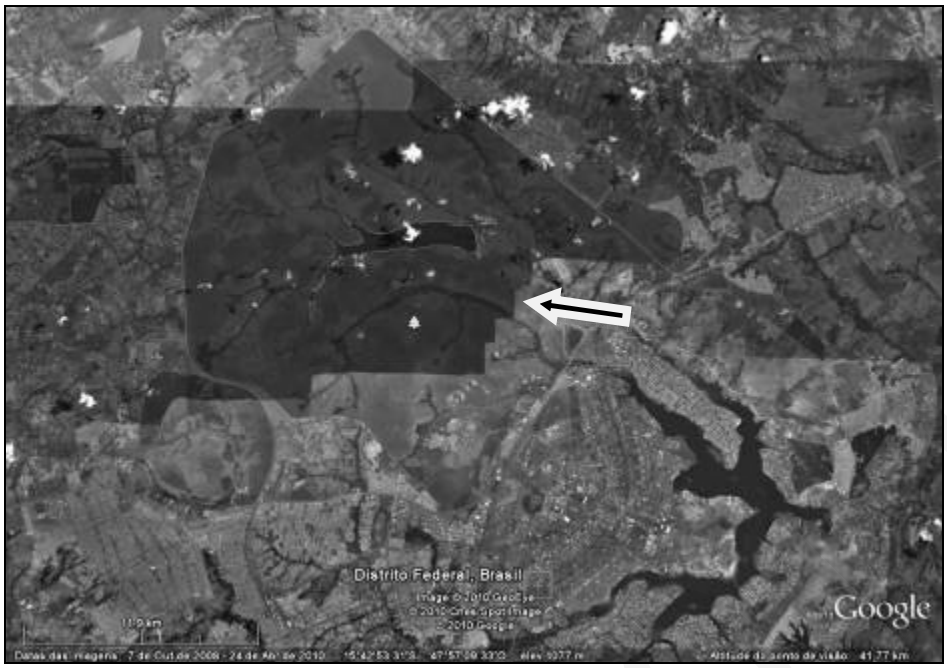
Navigation guide 1

1st Step: Location

- Flying to Brasilia, D. F.
- Going to the 'More' level and then entering 'Areas/Parks'*
- Finding the Brasilia National Park and viewing it on a scale in which its whole area may be seen.
- Placing the cursor in the centre of the lake (Santa Maria Lake, a major source of Brasilia's water supply) and checking the altitude. Then finding the altitude of the outlying areas of the park.

What conclusion can be formed?

*These environmental protection areas are already indicated in the images.



Comments: based on the differences in altitude within the park it is possible to identify the direction of run-off.

2nd Step: Recognizing Places

- Placing the cursor on the northernmost point of the park (the apex) and tracking the external areas of the boundaries of the park in a clockwise direction.
- At the edges of the park we find:
  urban areas ( ) roads ( ) cultivated areas ( ) natural vegetation ( ) areas of environmental degradation ( ) de forested areas ( )

What are the risks to the park's quality associated with the closeness of rural and urban districts?

What type of degradation was found? What has caused it?

Comments: The areas indicated by the arrow show the process of degradation, that is, accelerated erosion. The danger caused to the park by this phenomenon was discussed with pupils. In addition, examining the areas surrounding the park enabled pupils to evaluate and comment on current risks (fires, pollution by pesticides, squatters).

Navigation guide 2
1st Step: Physical Phenomena of the *Cerrado* (Savanna)
Within the park area, three shades of gray may be seen. Each of them corresponds to a phenomenon within the *cerrado* biomass.

Identify these three physical phenomena in the picture: Gallery Forest, *Cerrado*, Open *Cerrado*.

Why do these different types of vegetation exist?

Comments: It was found that pupils were quite efficient in identifying the different types of *cerrado* because the images could show a scale that gave a very detailed view. The pink and yellow pins in the image show, respectively, Gallery Forest and *cerrado*.

RESULTS

Among the actions adopted here we can indicate new contributions to help future teachers define resources and learning strategies and make lesson plans. We should first of all mention the mastery of techniques to help build knowledge through functional activities (observing, collecting, recording data in a form relevant to the proposed aims, producing reports, graphs and tables for data analysis, relating the information obtained to previous knowledge; putting the knowledge into systematic order; applying acquired knowledge in new situations and re-formulating and anticipating new questions to study).

Secondly, the concept of strategies and plans for building knowledge in geography encourages understanding and the study of the processes involved in the occupation of space and in the development of society. The final part of the project will be the production of a CD-ROM to be used along with the activities developed with Google Earth, revised and expanded to enable users to take advantage of the latter programme's potential in terms of geographical knowledge and application, as well as in daily life.

We strongly believe that both future student teachers of geography as well as those already working in education will be able to experience a new way of understanding geography using a powerful tool, within an environment of dynamic learning.

CONCLUSION

Recognizing the usefulness of the elements of map work, that is, symbols, scale, location (latitude and longitude, direction) and using them in the activities of navigation and photo-interpretation has become a vital skill for today's citizens. For the modern knowledge society, the interpretation and identification of the various elements of the Earth's surface such as types of vegetation, degraded areas, natural landscapes and others, constitute a basic tool in understanding the interfaces between people.

THE VIEWS OF 4TH AND 5TH GRADERS ON THE USE OF WEBQUEST IN LEARNING

Erdoğan Halat, PhD

Afyon Kocatepe University
College of Education
Department of Secondary Science & Math Education
ehalat@aku.edu.tr

ABSTRACT

The purpose of this study was to examine the perspectives of primary school students about the use of WebQuests in learning. There were nine graduate students (primary school teachers), twenty-six 4th and thirty 5th grade students involved in this study. The graduate students developed their WebQuests as a project based on their interest areas, which were appropriate to the level of primary school students. This study took place about eight weeks during a graduate course. After the development of the WebQuests, the graduate students implemented their projects to their students. The researcher gave a questionnaire including open-ended questions to both graduate and their students who stated their perceptions on the development and implementation of the WebQuests. In this study, the researcher only examined the views of the primary school students on the use of WebQuests. After the collection of the qualitative data, the researcher examined the data by coding and classifying them. The study showed that both 4th and 5th grade students stated that they liked learning from internet and this new learning environment. Moreover, they claimed that they found something very interesting with WebQuests that enhanced their motivation towards learning. They also added that they learned new information about the topics and they revised their knowledge. However, some of the participants pointed out couple of limitations about the use of WebQuests.

Key words: WebQuest, primary school students, internet, teaching technique

Introduction

There are many factors, such as real-life activities, teachers' knowledge, instruction, gender, prior knowledge, parental-care, curricula, peer-interaction, use of technology, and so forth playing important roles on the students' achievement and motivation in learning (Middleton, 1995; Stipek, 1998). Today, most of the people, in particular, the students use the internet in their daily life. Therefore, many researchers and educators recommend the use of internet in the classes because it is a great source of knowledge for both teachers and students (Schofield, 1995; Dodge, 2001; Halat, 2008b). One fast emerging use of the internet is web-based activities (e.g., Wei & Chen, 2006). "WebQuest" is a computer-based learning and teaching model in which learners are actively involved in an activity or situation, and use the Internet as a resource. Likewise, Lamb & Teclehaimanot (2004) claimed that WebQuests are a student-centered and project-based approach to teaching and learning, which is supported by a variety of theories including the following areas: constructivist philosophy, critical and creative thinking, situated learning environments, cooperative learning, and engaged learning.

WebQuest has become very important in many educational areas and has received considerable attention from teachers and educators since it was proposed and developed by Dodge (1997). Dodge (2001) defined two types of WebQuests: short-term and long-term. Besides, according to him, well-designed WebQuests—either short-term or long-term—consist of the following critical attributes: Introduction, Task, Process, Resources, Evaluation, and Conclusion (Dodge, 2001 Kelly, 2000).

Though educational theories and models, such as van Hiele theory, constructivism, behaviorism, multiple-intelligence, cooperative learning and others, help teachers and students, it seems at times that a theory or model is inadequate when applied to curriculum (e.g., Swafford, Jones & Thornton, 1997; Billstein & Williamson, 2003). So if we support curriculum development that uses technology based on these theories or models we might be more successful in teaching and learning (Timmerman, 2000; Perkins & McKnight, 2005). In particular, the use of computers with well-prepared educational software

would enhance teaching and learning. It is clear that the Internet has a great influence on both students and teachers (e.g., Wei & Chen, 2006). Therefore, an instruction supported with webQuest-based applications including use of technology and the Internet might help students overcome their difficulties and enhance their motivation in teaching and learning mathematics. Research shows that there have been many studies conducted in different areas about the WebQuest and its implementation since 1997 (e.g., Halat & Jakubowski, 2001; Wilson, 2008; Sox & Rubinstein-Ávila, 2009; Altstaedter & Jones, 2009; Öksüz & Uça, 2010; Cameron & Champbell, 2010; Subramanian, 2010). Mostly they did their studies with pre-service teachers. In this study, the researcher examined the perspectives of the primary school students on the implementation the WebQuests.

Method

The researcher used a qualitative research method in this study. It is one of the best methods so as to get more detailed information about any problems, issue, event, or any theory implementations, and get clear and better answers of how and why questions in a research study (McMillan, 2000). The researcher chose this method because he wanted to get more and intensive information about the implementation of the WebQuests at the primary school level.

There were nine graduate students (in-service primary school teachers), twenty-six 4th and thirty 5th grade students involved in this study that took place in an elective graduate course, New Approaches in Mathematics Teaching. The graduate students developed their WebQuests as a project based on their interest areas, which were appropriate to the level of primary school students. The topics of the WebQuests were "geometric figures", "natural disasters", "step by step Turkey", "our culture and its elements", "heart and blood circulation", and so forth. This study took place about eight weeks. The researcher explained the theoretical structure of a good webQuest and showed how to prepare one. The graduate students designed their WebQuests in the guidance of the researcher. Then they were supposed to implement their work to their students. They were free to choose the number of 4th or 5th grade students between four and ten. They practiced their webQuest with 56 students. After the practice, they asked general questions to their students, such as "what do you think about the use of webQuest in learning?, What parts of the webQuest do you like?, what are the things on webQuest you dislike? . The students wrote their answers on the papers. The researcher examined these written papers, coded and classified the students' responses. He made valuable inferences from the qualitative data. The results are presented in the results and discussion part.

Results and Discussion

This current study found that the webQuest had positive effects on the motivation of the primary school students in learning. This supports Schofield (1995) who claimed that using technology in teaching and learning has positive effects on student motivation and achievement. Likewise, according to Wei & Chen (2006), the Internet has a great impact on both students and teachers. Most of the 4th and 5th grade students gave positive responses about the implementation of the WebQuests. They stated that they liked this new teaching and learning technique. Besides, they gave some reasons why they had found WebQuests useful and amusing. For instance, "we learned new information… using internet is very good, but using it such this learning environment is much better". Moreover, many of the students claimed that while they were surfing on the internet, which was exciting, they learned a lot. One said, "Learning by a click is more efficient than other ways because I like using computer and surfing on the internet that is funny and enjoyable". These views are not different form the perspectives of the pre-service middle and secondary school mathematics teachers on using WebQuests in teaching and learning of mathematics (Halat & Jakubowski, 2001).

In this study, primary school students expressed that they found something very interesting with WebQuests that included animations, nice figures and pictures, and good stories, or adapted scenarios, such as Keloğlan, Şirinler, Harry Potter, Hugo, Sünger Bob, and so on, added that this enhanced their motivation towards learning. According to the students, animations and other interesting parts made the webQuest attractive and different from the other teaching techniques or approaches, in particular, from the traditional way of teaching in the classrooms. For example, "I completed the study because of the story used in the WebQuest. I gave my full attention to the study because I wondered what was going to

happen at the end of the story. Therefore, it wasn't boring for me to complete the study that I liked", "There were several videos on the webQuest helping me to understand the topic very well. Including videos in teaching was a great idea", and "we found the information on the webQuest that couldn't be found in the textbooks. The webQuest also included more figures and pictures than the textbooks, which helped students to learn the topic very well and retain the information effectively". The finding of this study was lined up with the claim of Middleton (1995) who stated that real-life examples or activities were major motivating factors in a mathematics classroom. He added that it seems using real-life applications, group practices, hands-on activities, and other strategies played important roles in students' motivation. Similarly, according to Halat & Jakubowski (2001), the pre-service middle and secondary mathematics teachers stated that "they felt that this environment allowed students to apply geometric concepts in real-life applications using technology. Projects included topics such as the Bermuda triangle, sports, and music. The use of webquests provides K–12 students with appropriate educational uses of the Internet" (p.3).

The students stated that the webQuest could be used in other classrooms, such as Mathematics, Social Science, and Science and Technology classrooms. For example, "we would have understood the lessons very easily if our teachers had used the WebQuests in our classrooms", "the topic, matter, in the Science and Technology classroom was explained easily with webQuest. Therefore, the ones who felt weak in mathematics could study the math topics on the WebQuests that presented the topic in a game or story including figures, funny pictures and videos. This could help these students to learn the topics easily and efficiently in mathematics". Furthermore, one student said that this technique could be used efficiently in story-writing in the Turkish classes, which enhanced our thinking. In addition, it could be beneficial in teaching some topics, such as weather forecast, climate, water -circulation, evaporation in the Social Science classes. And, one student added, "I believe that webQuest can be more useful in Social Science classes than in other classes, and a topic taught in a week can be taught in a short time with the use of WebQuest". However, one of the students involved in the study, on the contrary, said that it couldn't be used in other classes. For example, it was necessary to do some complex operations in mathematics. So, we were not able to ask anybody if we did not understand any points in the topic.

Some students claimed that the teachers could use traditional way of teaching style but, at the same time they could use the webQuest in the classrooms because sometimes it (traditional way of teaching) became very boring. So, the webQuest could be a break for the students who got bored. And one said, "While the teacher was teaching, I got bored, but I did not get bored when I was working on the computer by myself. I liked the webQuest. I liked computer classes in which I enjoyed a lot". Furthermore, one stated, "I prefer learning from the webQuest instead of other ways because it is funny and there is a competition and reward in learning on the webQuest. You get nice rewards if you successfully complete it…It is like playing a game". Likewise, one student said, "I understand well when the teachers use different methods in their teaching. Studies like this one are more instructive and more entertaining". However, this student added, "although I follow the directions and reach the results by myself, I suppose I cannot pay attention to all things. I think that if the teacher shows or explains the points I do not understand, then I can learn things better". This is not in contrast with the claim of Dudeney & Hockly (2004) who state that while the students are working on the WebQuests, they should be reminded about what they are doing, why they are doing it and what the benefits are to them because it is very easy for the students to not think of the benefits and view regular visits to the computer labs as a waste of time.

Moreover, some of the students expressed that while they were working on the webQuest, they felt as if they were in the story and played the roles of Hero or the characters. For example, one said, "I felt as if I were Harry Potter in the scenario. It was great for me to save the Harry's life. I saved the life of Harry by giving right answers to the questions. So, I felt as if I were in the story or in the game". Similarly, another student expressed, "I felt as if I were Keloğlan in the competition…I achieved to help Keloğlan who got married with King's daughter. I felt as if I were there during the competition, or I were in a knowledge competition. He never became hopeless throughout the competition, I did, too. So, I trusted myself throughout the competition, and this enhanced my self-confidence. This was good; I would suggest it for everybody."

Furthermore, one of the students expressed, "I learn better by reading. Therefore, the webQuest is good for me. I think I learn much better with this way". Another student said that she learned more

detailed information about the natural disasters, and added that she could use this information if she faced this kind of natural disasters in her real life. Similarly, the other one stated that he got more information on the WebQuests about the topic, such as solid, liquid, gas, and water- circulation and so forth. The research findings show that rewarding plays prominent roles in students' achievement in the classrooms, and enhances students' motivation towards the classes. In this study, many students claimed that they liked rewarding in the WebQuests. For example, "while I was working on the webQuest, I enjoyed and received the award as well as new information."

As a conclusion, the findings about the use of webQuest at the primary school level encourage the teachers or educators to develop WebQuests and implement them in the classes. Moreover, it is clear that this teaching and learning technique can be used in any classes, such as Mathematics, Social Science, Science and Technology, Turkish, and so on.

Limitations and Implications

Even though the students stated a lot of good sides of using WebQuests in teaching and learning, they also claimed that there were several limitations in the use of it. For instance, there was a common view shared by the students was that when they were visiting other websites for the information, or formulas, they wanted to go or visit other links. In other words, they had hard time to go back to the webQuest when they were visiting the other websites. This is lined up with the finding of Halat (2008a), "students may not come back to the webQuest portals and complete their works if they are distracted by other websites that they might find more appealing or attractive" (p.110-111).Moreover, several students claimed that reading the story, making connection to the internet, doing the assessment questions and watching the videos took a lot of time. This bored and tired them. Likewise, another one claimed that one weakness of the webQuest was use of time; it took a lot of time. In addition, the other student added, "Sometimes I had difficulties with making connection to the internet" and there were other students stating that the suggested websites as resource had a lot of unnecessary information about the topic I was looking for". Besides, some students expressed that the one who couldn't use the WebQuests did not have basic use of internet knowledge. This result supports the reports of Halat (2008a) who argued that limitations in using WebQuests include the possibility of lack of access to the Internet, and finding reliable links for resources for the webQuest.

Although there were several limitations in using webQuest in the classes, there were many good sides with the use of it. And, it has also positive effects on students' motivation. This current study implies that using webQuest in learning may be helpful for the students to overcome their difficulties they face in some of their classes, and developing and implementing WebQuests may be beneficial for the teachers to attract their students' attention to their classes and increase their students' achievement in the classes.

TOWARDS AN INTELLIGENT TUTOR FOR SOCIAL SKILLS

Ciprian Cucu, University of Zurich, Department of Informatics
cucu.ciprian@gmail.com

ABSTRACT

Intelligent Tutoring Systems have been successfully used to enhance learning in various domains, such as physics, algebra, geometry, computer programming and others. For ill-defined domains such as social skills, the current models are, however, not sufficient.

The current paper proposes a computer-based tutor can train a person's behavior by a virtual role-playing method: monitoring the person's actions in a virtual environment, observing patterns in his behavior, matching them to predefined "good" or "bad" patterns and providing feedback to reinforce good behavior and suggest corrections for bad behavior. To this end, the current paper provides details about the development of an Intelligent Tutoring System that supports simulations of social scenarios and includes such methods for matching patters of user actions to predefined patters.

INTRODUCTION

Social skills has for a long time been an important research area, connecting good skills in social interaction to "professional success, relationship satisfaction, personal fulfillment, psychological well-being, and even physical health" (Greene & Burleson, 2003).

Two main points of view can be considered: a *psychological point of view*, where social skills development has been linked to enhancement of friendships, prevention of drug abuse or treatment of juvenile delinquency, depression or even schizophrenia (Segrin & Givertz, 2003) and a *professional / human-resources point of view*, where social skills are associated to human capital, next cu technical abilites. (Green, 2000).

In the latter sense, social skills are defined as "the propensity to behave in a manner conducive to the firm's objectives" (Green, 2000) or as the ability to make oneself understood, accepted and even followed (Daly & Vangelisti, 2003). Other research has shown also that "The increased emphasis on customer service and a more diverse workforce make solid social skills a requirement for all employees." (Joinson, 1997)

As there are both similarities and differences between the two viewpoints, it is important to note that the current paper focuses on the later aspect and views the training (tutoring) of social skills from its benefits on the professional life of the individuals, in companies as well as in schools or other organizations. A short review of training methods that range from classroom discussions to role playing is provided, as well as some arguments for using Intelligent Tutoring Systems in Social Skills training. The main proposal is that *a computer-based tutor can train a person's behavior by a virtual role-playing method: monitoring the person's actions in a virtual environment, observing patterns in his behavior, matching them to predefined "good" or "bad" patterns and providing feedback to reinforce good behavior and suggest corrections for bad behavior*. To this end, the current paper provides details about the development of an Intelligent Tutoring System (PM Game, 2011) that supports simulations of social scenarios and includes such methods for matching patters of user actions to predefined patters.

SOCIAL SKILLS TRAINING

There are important concerns in research regarding skills training, including technical, problem-solving and social skills. Skill training has been seen as a constant process that allows individuals to develop a range of responses to situations and tasks that occur in pursuing their lives (O'Donohue et al., 2003).

A definition of social skills training is provided by Goldstein (1982):"*The planned, systematic teaching of the specific behaviors needed and consciously desired by the individual in order to function in an effective and satisfying manner, over an extended period of time, in a broad array of positive, negative and neutral interpersonal contexts.*"

The specific teaching methods for social skills are summarized by Segrin & Givertz (2003) as follows:

- **Assessment**: as in the case of most skills development processes, social skills training should be

based on an initial evaluation of the current skills. It has also been argued (Smith et al., 1996) that this phase will allow an analysis of the current needs, since not all individuals would require training in the same skills.

- **Direct Instruction and Coaching:** the basic method of providing declarative knowledge (Anderson, 1993) that concerns learning basic facts (eg. „Giving positive feedback to employees keeps them motivated").
- **Modeling**: is based on showing (usually by recorded examples) different examples of social interaction, either presenting positive or negative examples.
- **Role Playing:** is the most important method, that allows individuals "to practice the desired behaviors in a controlled setting where they can be observed and from which feedback and reinforcement can be offered" (Segrin & Givertz, 2003).
- **Homework Assignments:** it is a technique used after some of the other methods, which aims to provoke individuals to deliberately try to create specific social contexts in order to *test* the skills that they have been learning.
- **Follow-Up**: it is a method of monitoring individuals' progress in order to better guide them in the future and to keep the attained skills from decaying.

POTENTIALS OF INTELLIGENT TUTORING SYSTEMS

Development of Intelligent Tutoring Systems has been seen as a potential answer to the "2-sigma" challenge proposed by Bloom (1984), that shown one-on-one tutoring with a human expert tutor as the most efficient form of instruction.

Thus it is proposed that a computer-based system that behaves similar to a human expert tutor would also have similar results. This claim has in fact been proved for several domains, including but not limited to College-level physics (Gertner & VanLehn, 2000; Shelby et al., 2001), high school algebra (Heffernan & Koedinger, 2002), computer programming (Corbett & Anderson, 1993), SQL database commands (Mitrovic, 2003), database modelling (Suraweera & Mitrovic, 2002), punctuation (Mayo, Mitrovic & McKenzie, 2000).

An ITS is usually defined as a system that has some type of *knowledge representation* of the domain it is teaching, is able to monitor the user's progress and *predict the user's abilities and skills* in that specific domain and *adapts* itself to the needs of the user (eg. changing the sequencing of information provided, the speed or the level of details according to the users' abilities). (Murray, 1998)

This definition shows why ITS have great potential for social skills training:

- they provide simple means of recording and presenting both declarative knowledge (the facts) and procedural knowledge (how facts have to be put into practice);
- they can adapt themselves to the users' abilities and focus on the problem areas;
- they are re-usable and extensible with minimum effort.

Furthermore, several researchers (Andersson et al., 2006; Kerr et al., 2002) have argued that Virtual Environments (VE) have a very important potential for social skills teachings, in that they allow *virtual role playing,* ie., a simulated environment in which users can "practice skills safely, without experiencing potentially dangerous real world consequences and [in which] the stimuli the user receives can be controlled" (Kerr et al., 2002).

AN INTELLIGENT TUTOR FOR SOCIAL SKILLS

As shown above, in the development of a social skills tutor, some initial principles have to be take into account:

- *A simulation-based setting, focused on human-computer communication*

As role play is the main method of social skills training, it is essential the a social skills ITS provides a Virtual Environment(VE) that allows development of social interaction scenarios. These scenarios have to provide the users with the possibility to communicate with simulated characters and interact with the simulated world through various objects with specific properties.

- *Knowledge representation focused on behavior patterns*

A computer-based tutor that aims to act similar to a human tutor needs some representation of domain related knowledge, called an *expert model* (Murray, 1998). In the case of social skills, the expert model needs to be able to distinguish between positive behavior and negative behavior, in order to capture such patterns in the users' actions observed in the VE.

System overview

One essential aspect in developing an ITS based on a VE paradigm is the design of the scenarios themselves in such a way that it would "allow freedom of exploration and flexibility in interactive behavior, without the risk of users missing important learning goals" (Kerr et al, 2002). Defining the learning goals and the criteria when those goals are met are important consequences of this issue.

The proposed system is thus based on two user-roles: *the user* is the trainee, the individual that uses the system to train his/hers social skills; *the designer* develops the scenarios, sets learning goals and defines criteria to consider those goals met. Figure 1 shows an overview of the system, with the two user-roles.

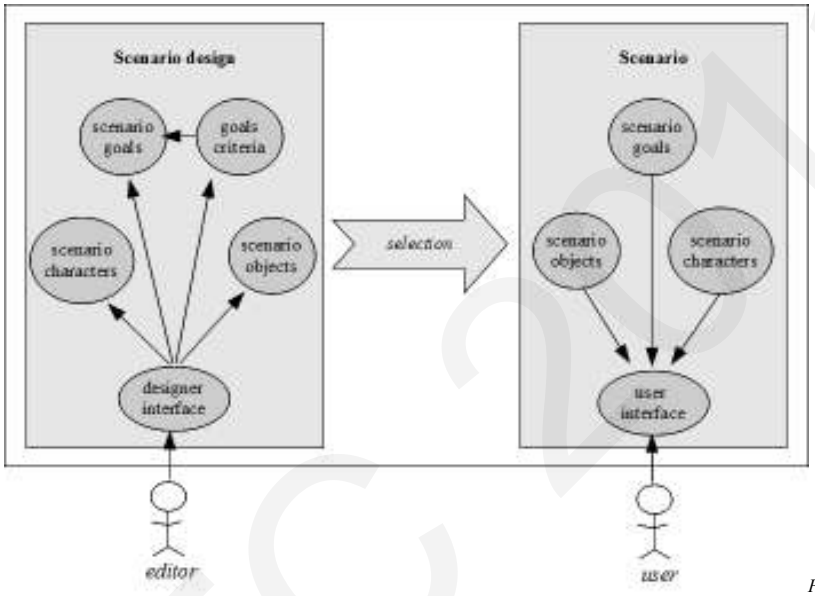

Figure 1: System overview for a VE based social skills tutor

As shown in Figure 1, the proposed system (PM Game, 2011) provides the designer with the tools needed to develop the story of the scenario (eg. "customer meeting", "employee discussion"), including objects and simulated characters that the users can interact with. The main component however is the set of scenario goals, that has to define the desired path of behavior (solution) to the scenario. As social skills are considered an ill-defined domain, in the sense of definitions provided by Lynch et al. (2006), in most cases there could be several solutions to one scenario.

The goal - feedback model

In order to implement a system that monitors the users' behavior in the VE and provides feedback based on predefined criteria regarding said behavior, the model started from the following principles:

Multiple solution paths

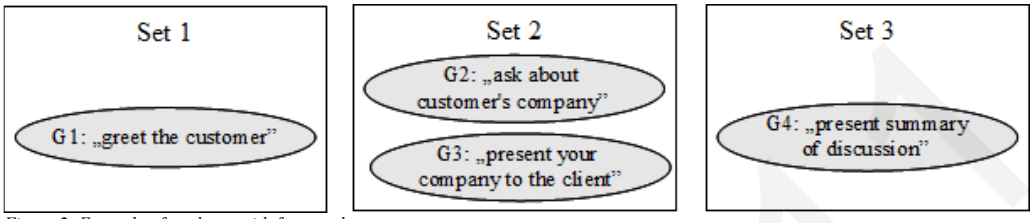
As shown above, a problem in an ill-defined domain can have more acceptable solution paths. A solution path is usually seen as a sequence of user actions that trigger a series of goals in a specific order. For example, in an example proposed by Anderson (1995) - "Write a function that joins two lists in one", the solution path is the sequence of goals: "Code 1st List"; "Code 2nd List"; "use APPEND to join lists". In this example, any action from the user is either positive (exists on the solution path) or negative (does not exist on the solution path) and the system reacts to each user step outside the solution-path, an approach called *model-tracing* (Anderson, 1993).

Social skills exercises may have any number of solutions and have to allow for a wider freedom of exploration: some user action may not be either positive nor negative in the scope of the scenario and the proposed learning goals.

For example, in a *first customer meeting* scenario the goal may be to train users to make a summary of the

discussion at the end of the dialogue. All other interactions of the user with the system that do not contradict this goal are thus not errors. The scenario may have two goals - "make summary" and "present your company to the client", or a third goal "ask about the client's company", but there can still be any number of user actions that do not trigger any goals yet are not errors.

The proposed model gives the decision to the scenario designer (Figure 1) who can select any number of goals for the scenario, group them into sets and order the sets. The sets are relevant to hold goals that may be achieved in any order, yet ordering the sets allows ordering the groups of goals. Figure 2 shows an example of three goal sets organizing four goals: this example implies that G1 must always be achieved first, there is no order between G2 and G3 which have to be achieved before G4.



Goal reiteration

The proposed model is able to use goals re-iteratively, when this is necessary. In the example from Figure2, all the goals should only be achieved once. However, in a simple feedback scenario where the user has the goal to provide feedback to an employee, the same goal would be achieved after every feedback given. The designer can choose to have either a fixed number of iterations, or an unlimited one for each goal.

Reinforcement and corrective feedback

A social skills tutor has to provide the user with both positive feedback, reinforcing good behavior patterns and remedial feedback to correct negative behavior patterns. There are three steps by which the correct feedback is chosen:

- if the current goal is from the wrong set, ie., there is a goal not yet achieved in a lower set, a *order_error* message is prompted indicating there should have been some previous actions;
- if the current goal is on the correct level, but it's iteration number has been passed, a *number_error* message is prompted, indicating the goal was already achieved;
- if the goal's criteria set *decides* that the behavior was positive, a *success_message* is prompted to the users, if not a *content_error* message indicates the reason why the predefined criteria consider the behavior to be negative.

A special type of goal is also implemented called a "buggy goal", which when triggered always prompts an error message. These are meant to capture frequent errors, between the triggering of regular goals. To explain this, consider the goal "say hello" (Figure2). If the first user action is not a greeting but also does not trigger any goals, the user would not get a remedial message. A buggy goal "always say hello first" that is triggered by all actions except the ones in the existing goals captures such behavior.

The expert model

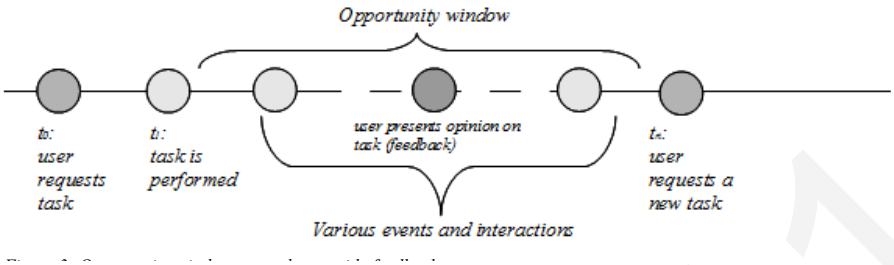
An ITS expert model is in charge of knowledge representation; in model-tracing tutors this is implemented using production rules "IF... THEN..." rules – that match conditions with facts in the system and execute when the conditions are met. (Edwards, 1991). For the social skills tutor, the criteria based on which the goals decide "positive" vs "negative" are also represented through production rules, but in a customized approach.

Firstly, there are two types of criteria – simple and complex. The simple criteria relate to actions that are completed in a single interaction: for example the sentence "Hello", this satisfies the criteria "Say hello" and the sentence "Our company has ten years of experience" satisfies the criteria "present your company to the client". It should be noted that this paper does not deal with the complexities of natural language processing and the underlying assumption is that the user's input is already mapped to a desired meaning.

The complex criteria are based on actions that may take more user-system interactions to complete, such as "provide feedback". A user sentence such as "you did great work" is not sufficient to satisfy this criteria: it must also be in a correct sequence (eg., it needs to follow an action from a simulated character).

To address this issue, two components have been developed: a History that records all system events, to provide a time-line of events (including but not limited to user actions) and a mechanism to activate and deactivate the rules according to predefined conditions called *opportunity window*.

Figure 3 illustrates the opportunity window for the example "provide feedback" considering this simple principle: the feedback on a performed task must come before another task is requested of the employee.

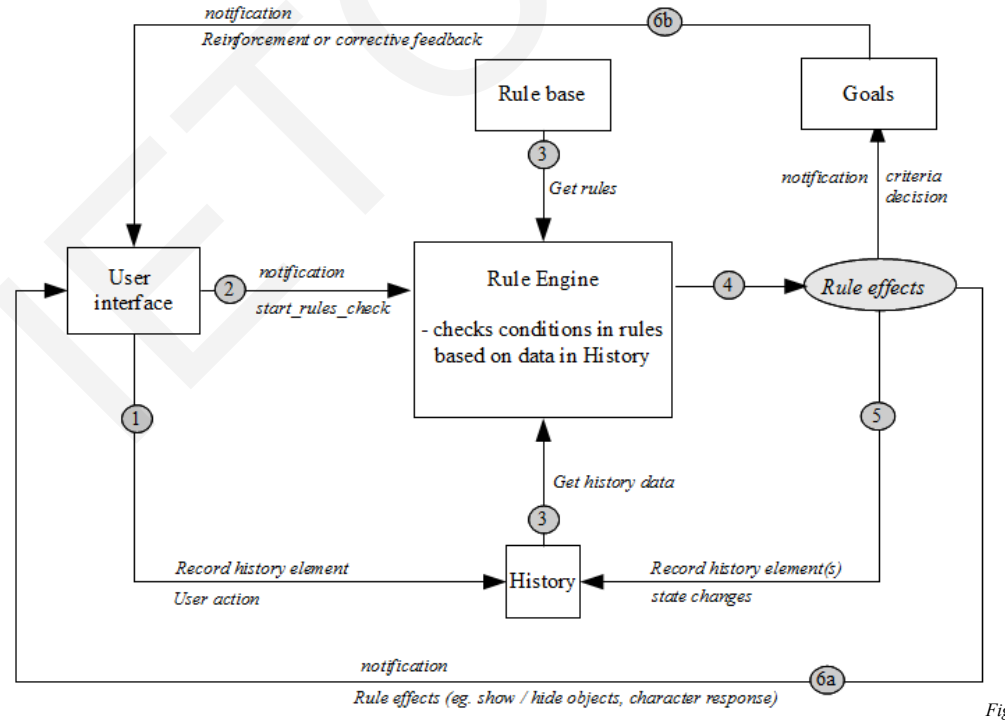


Designing production rules that will match the facts inside opportunity windows, change the "IF... THEN..." paradigm (based on one condition) to a three-condition paradigm: :

(R1) IF *start_of_opportunity_condition* THEN *activate_rule*
IF *fulfillment_condition* THEN *execute_rule_action*
IF *end_of_opportunity_condition* THEN *deactivate_rule*

Although the expression R1 seems similar to the expression "IF *start_of_opportunity_condition* AND *fulfillment_condition* THEN execute-rule-action" (R2), the two are in fact different due to one important point: processing of the three conditions in the proposed model may be done in completely distinct phases, that have different facts in the History. A rule of form R1 may be activated at a moment t_l and then executed at a moment T_k even if at moment T_k, the activation condition is no longer true. In R2, the rule executes only if the activation condition and the fulfillment condition are true at the same moment t.

Figure 4 illustrates the connections between the History, the rule engine (evaluating the criteria for the goals) and the goal module.



Figure

INITIAL STUDY

To better understand the way users would interact with the application in general and the feedback module in particular, an initial formative study has been performed.

The study consisted in two groups of 10 students using a scenario with the goal to attend a first customer meeting. The first group played the scenario without any feedback, while the second group was given feedback according to the above model.

More learning goals have been set in the goal layer: “Say hello”, “Present your own company”, “Ask for information”, “Make discussion summary”. To keep the study as simple as possible, the study has been focused on the second goal. Thus a metric P_{err} = 'Present company errors' has been defined to see how many users *forget* to present their own company. A secondary metric has been set up for the feedback group – P_{rev} = “present company review”, to show if students receiving a feedback to present their own company immediately act upon this feedback.

The study found that P_{err} was very similar for both groups: none of the students form the feedback group presented their company on their own and only one of the students in the control group. This metric performed as expected, showing that there was no significant difference between the two user-groups.

About P_{rev}, the study found that 8 out of 10 people receiving the feedback, immediately acted upon it, presenting their company as soon as the feedback module indicated that. Observation shown that the other two users were too focused on the dialogue and payed no attention to the feedback window.

Other observations have been made to complete the initial study:

- the implemented feedback module reacts to the user's actions but does not provide pre-action hints; some users have shown to be confused as to what they should do next;
- some users have shown confusion with the feedback messages received; for instance, reinforcement feedback such as “you achieved the goal X” was prompted by three of the students by a new attempt to perform the action X.
- the interface itself has been confusing for some of the users that could not express all their intents using the menu-based input; this may affect their behavior as some could browse through the available options and choose any of them randomly, without having a communication intent of their own. This hypothesis needs further testing and is so far the most important limitation of the proposed system.

CONCLUSIONS AND FUTURE WORK

The current paper showed a new approach for Intelligent Tutoring Systems that could be applied to social skills, an ill-defined domain based on communication. The main claim is that such a system can help train user's behavior by letting them “rehearse” different simulations of social interaction and by providing feedback to reinforce predefined good behavior and to correct negative behavior.

It is also argued that the “administrator” or “designer” should have an important role, by creating the simulations – the virtual worlds with specific objects and simulated characters, but also by defining good / bad patterns of behavior and setting up the learning goals and the appropriate feedback.

The initial study shows the potential of the approach, as most users immediately acted upon the feedback received from the system. There are some important limitations as well, the most important one being so far the confusion generated by the menu-based input system. A natural language processing module should thus be the focus of further research.

Further work will also imply a continuation of the initial user study, to better understand the users' reaction to the system and in particular to test if the “temporal generalization” principle is met, ie., verify if the behavior change is maintained over time.

TRAINING OF SURGERY FOR A STUDENTS AND PREPARATION OF SURGEONS-INTERNS USING MEDICAL SIMULATORS

Dzyak G.V., Bereznyts`kyy Y.S., Sulyma V.P., Duka R.V.
Dnipropetrovs'k State Medical Academy, Dnipropetrovsk, Ukraine, Volodyasulyma@mail.ru

ABSTRACT

Taking into account that the level of qualification of the doctor is in the first place in various gradational system of educational societies it's understood the necessity to improve the quality of the doctor in institutes of higher education, in which directed implementation of the credit-module system to the educational process. This requires to reconstruct the process of teaching surgery both students and medical interns towards a positive effect - mastering the full range of theoretical knowledge and practical skills with the help of modern equipment.
Received results underscore the increased objectivity in the control of knowledge on the part of teachers' interest and increasing students and medical interns' interest to master a subject, that allowed to prepare a general practitioner in surgery and surgeons, and integrate in the future in practical public health in Ukraine and worldwide.

INTRODUCTION

Taking into account that the level of qualification of the doctor is in the first place in various gradational system of educational societies it's understood the necessity to improve the quality of the doctor in institutes of higher education, in which directed implementation of the credit-module system to the educational process [2-3, 5, 13-14]. Preparation of doctor's of the general practice is the principal task of the medical institution of higher education, and therefore the proper teaching of surgery in the whole complex of other disciplines will create conditions for quality medical practice doctor in the future, especially for those professionals who plan to work as surgeons.
The doctor's of the general medical practice tasks determinates basic requirements of scope of knowledge and practical skills for graduating student of institute of higher education of IV level of accreditation: goal-directed methodic algorithm of questioning of the patient (getting anamnesis), physical examination, substantiation of provisional diagnosis, determinate algorithm of additional methods of investigations with analysis of received results, differential diagnosis, forming clinical diagnosis, substantiation of treatment program and it's implementation [4, 6-7]. And for the intern surgeon it's important to mastering of surgical manipulation and stages of surgical interventions in treating the most common surgical diseases or providing an emergency assistance in case of emergency conditions. Development of modern surgery is impossible without modern techniques, including laparoscopic technology, so it's necessary to prepare medical interns to work on equipment that meets the time.
This requires to reconstruct the process of teaching surgery both students and medical interns towards a positive effect - mastering the full range of theoretical knowledge and practical skills with the help of modern equipment.

METHODS AND PROCEDURES

The aim of the study.
To implement the system of planning, monitoring and evaluation of the education quality for a real degree of assimilation of students with specific components of the program during the academic year of surgery training and discipline for module "Abdominal surgery" in general based on the cumulative number of ranking points for the European Credit Transfer System (ECTS) [1-4, 8-12]. This will improve the quality of learning discipline among the four-year students of enrolled this year, and develop common indicators for professionally-oriented exam after 6 year of study to get a general level of theoretical and practical knowledge and skills of physicians interns of surgery.
Object and methods of investigation.
The Department of Surgery № 1 of the Dnipropetrovs'k State Medical Academy was conduct structured, multiple planning of the study process and the use of different forms of the staging control. Taking into account the Standard program of the discipline, curriculum, Working program for the department was

create the specific actions by teachers, students and interns of surgery to achieve theoretical and practical knowledge, necessary resources and sequence of technological operations with the use of credit-modular system [1].
Thus, there were additionally created classes for training with medical mannequin and simulators to master the practical skills of students in educational time and time for self preparation on products firm "3B Scientific".
Was founded Ukraine's first training center "Endoscopic technologies in medicine", bases on which interns learn to use mini invasive operating technologies in surgery. This center was open thanks to involving special training and instruments of the company "Karl Storz-Endoscope" and "Ethicon Endosurgery" (subsection "Ethicon a Johnson and Johnson Company").
Nosological principle of training that exists in most clinical departments, unfortunately, does not meet the practical work of a doctor, so we came to forming the curriculum by the syndrome principle: a practical training combines several pathological conditions, with oriental features, such as the module "Abdominal surgery", consists of two modules of content (substantial modules): "Urgent abdominal surgery" and "Surgical Gastroenterology and Proctology".
Thus, the substantial module "Surgical Gastroenterology and Proctology" includes "Syndrome of chronic pain in the upper region of abdominal cavity", "Syndrome of mechanical jaundice", "Syndrome of an acute pain in perianal area", "Syndrome of rectal prolepses" and "Diarrheic-inflammatory syndrome", combining similar diseases or their complications in the form of so-called educational elements, where, for example, a practice training for "Syndrome acute pain in perianal region" contains "Acute hemorrhoids", "Acute anal fissures", "Acute paraproctitis" and "Inflammation of the epithelial coccygeal passage".
This approach is appropriate to expediently use the time of practical training, examine patients according to pathological syndrome, mastering the skills in classes with medical simulators, perform differential diagnosis with the definition of a rational treatment program.
To support the learning process developed by the principles of credit-modular system using multimedia lectures, the textbook "Surgery" in 3 volumes (5 books) [6], methodological guide of development for students and interns, methodological guide of development for teachers, hand book and individual plans for students and interns, journal of the teacher.
For the practical training used division's computer class (10 computers) - for computer testing of students and interns, two classes of medical mannequins and simulators (products firm "3B Scientific") - for acquiring and mastering practical skills, supervision of patients in the surgical department, supervised and theoretical survey in training rooms.
For the interns besides the basic work in the surgical department with patients it's necessary to mastery of the operational equipment in operation and manipulation rooms, as well as mastering of mini invasive surgery technology in the learning center "Endoscopic technologies in medicine".
The algorithm of training and preparation on surgery of students of 4th course on practical studies (2 hours 40 minutes):
1. Muster, the announcement of a theme and the purpose of practical studies - 5 minutes;
2. Carrying out of theoretical computer testing on an studies theme in a computer class of chair (30 tests for 30 seconds on everyone students) - to 15 minutes;
3. Control of the mastered two concrete practical skills on an studies theme on simulators and firm training apparatus "3B Scientific" - to 50 minutes;
4. Investigation the thematic patient in surgical division of clinic after development of practical skills on simulators and firm training apparatus "3B Scientific" - to 30 minutes;
5. Theoretical analysis of results investigation the thematic patient and a theme of study with poll of each student - to 50 minutes;
6. Analysis of the basic errors admitted by students - 5 minutes;
7. The information on the task on preparation for following practical studies - 5 minutes.
After each study to students time for independent development of practical skills by preparation for following study is allocated.
The algorithm of training and preparation on surgery of surgeons-interns on practical studies (8 hours):
1. Muster, the announcement of a theme and the purpose of practical studies - 5 minutes;
2. Work in surgical division on inspection of patients, participation in medical and diagnostic manipulations, on operations - 4 hours;
3. Theoretical analysis of a theme of study – 50 minutes;
4. Development of practical skills of performance of medical and diagnostic manipulations on firm "3B

Scientific" productions - 1 hour;
5. Development of practical skills of performance surgical, including, laparoscopy operations in a special class of firms "Karl Storz-Endoscope" and "Ethicon Endosurgery" (subsection "Ethicon a Johnson and Johnson Company") - 1 hour;
6. The information on the task on preparation for following practical studies - 5 minutes.

RESULTS

Experience of using credit-modular system in teaching and measuring knowledge of surgery since 2005 suggests that this approach is effective.
Received results underscore the increased objectivity in the control of knowledge on the part of teachers' interest and increasing students and medical interns' interest to master a subject, that allowed to prepare a general practitioner in surgery and surgeons, and integrate in the future in practical public health in Ukraine and worldwide.

CONCLUSION

It is necessary the cooperation of the educational institution, clinical department and companies - manufacturers of medical and educational equipment, as in our case, working with "3B Scientific" and "Karl Storz-Endoscope", "Ethicon Endosurgery" (subsection "Ethicon a Johnson and Johnson Company").
Use of medical simulators and training mannequins for acquiring practical skills and new technologies of operative interventions using modern endoscopic equipment, tools, and simulators allows to imitate the real clinical situation during operative interventions and learn steps to resolve it. As illustrated by the medical literature, the main errors in the operative interventions falls on the first 30-40 operations. That's why the working out of these first surgical interventions should be conducted on medical simulators for the purpose of reduce the risk of mistakes in the future.

ACKNOWLEDGEMENTS

We wish to gratefully acknowledge the advice and support of representatives "3B Scientific" and "Karl Storz-Endoscope", "Ethicon Endosurgery" (subsection "Ethicon a Johnson and Johnson Company") in the preparation of our work and this text.

ABSTRACT

In recent years, especially as reflections of the developments in computer technologies, essential changes toward practicing technology based instruction in educational curriculum are realized and teachers' use of technology is getting more important. Providing teachers' requirements about computer based learning objects they can use in classrooms is needed for both using the curriculum and increasing learning levels of the students. In this context, the purpose of this study is to represent examples from designing and constructing process of the some selected experiments which are designed by using simulation based learning objects of physics, chemistry and biology subjects taking place in Science and Technology Laboratory Practices II lesson that is taught in second class level of department of classroom teacher. The learning objects are designed by using Adobe Flash software. During the designing process, the experts about computer and instructional technologies, graphics designing, physics, chemistry and biology are included. Beside, two and three dimensional graphics, audio, text and animations are used while designing experiment simulations as learning objects. During the process of organizing the contents of experiments and designing the learning objects, technological pedagogical content knowledge (TPCK) and cognitive load theory (CLT) are taken into consideration for providing students flexible and practical learning objects directing them to learn by discovery.

Keywords: Simulation, learning object, technology based learning content, instructional technology.

INTRODUCTION

Due to the progress of information and computer technology development, e-learning is emerging as the paradigm of modern education environments (Sun, Tsai, Finger, Chen, & Yeh, 2010). These days, digital media have enriched the teaching and learning experiences and have become commonplace with students and teachers (Engelbrecht & 2005; Liaw, Huang, & Chen, 2007). E-learning requires providing experiences to support the educational process and during this process using information and communication technologies are needed (Davis & Wong, 2007; Selim Ahmed, 2010). Thus e-learning is rapidly increasing as a basic vehicle carrying instructional activities to the higher levels.

All these developments are featuring the constructing and practicing process of e-learning which may be defined as the reflection of technology into the education. From this point of view, educational programmes, teacher and student characteristics, learning environment and the learning objects to be used in this environment are so important. The use of technology in educational environments plays a key role for planning process which is realized toward educational reformation of educational programmes, especially teacher training programmes (Angeli & Valanides, 2009; Dawson, Pringle & Adams, 2003; International Society for Technology in Education-ISTE, 2002; Thompson, Schmidt & Davis, 2003).

Putting the e-learning into practice is possible by training the teachers as technology users. International Society for Technology in Education (ISTE) determines new technology standards for students and teachers. Teachers may use the technology and its materials for education and instruction according to these standards. These technologies are also defined as basic elements connecting the academic objectives and content for learning process (ISTE, 2000a, p.17). Using the technology and content in a proper pedagogy is needed for e-learning environments supporting teaching and learning. Beside, student characteristics should be taken into consideration for designing the e-learning process. Because student centered design is required for learning deeply (Biggs, 1999; Ramsden, 2003; Smyth, 2011). To realize this design, technology should be used as an assistant element for pedagogy instead of applying the pedagogy directly and the learning process should be taken under control by the student.

Thus teacher should think of the answer of the question "Which material should I use for better learning?".

According to constructivism, teacher is supposed to be a guide and designer supporting student to construct information by themselves instead of presenting the learning subjects directly to students (Smyth, 2011). This situation features the learning object concept. The concept of learning subject aims to provide and ease the use of teaching experiences, pedagogical knowledge and educational sources (Carey & Hanley, 2008; Klebl, Krämer, & Zobel, 2010). If the technology is used effectively to create learning objects and serviced for the teacher use, new opportunities may be provided them to apply the constructivism. Activity theory emphasizes the importance of using the learning content and digital technology together for teachers and students (Stevenson, 2008). The theory states that by this way a frame for designing learning environments can be created and the power of digital technology can be used.

Teaching with technology is related to technological pedagogical content knowledge (TPCK) and may be defined as the whole structure of technology-pedagogy-content elements (Karamarski & Michalsky, 2010). Koehler, Mishra and Yahya (2007) stated that the heart of TPCK includes an operational and changeable structure formed by the connection of the technology-pedagogy-content. Archambault and Barnett (2010) show the deficiencies about how technology-pedagogy-content elements would be integrated for TPCK as a whole structure. Similarly Koehler, Mishra and Yahya (2007) state that there is no clear sources to answer the question of how technological knowledge would be constructed, used and presented by emphasizing TPCK.

According to Klebl, Krämer and Zobel (2010) reusable educational sources such as learning objects should have three basic characteristics. These are flexibility, content and pedagogical expertness. In this context, theorical approaches about the designing and developing process of learning objects should be taken into consideration. Curriculum development process and its characteristics can be taken into consideration during this process. Because learning objects developing process is like curriculum developing process. Five basic elements of curriculum development process should be paid attention: Needs, objectives, content, teaching-learning process, measuring-evaluation process (Prideaux, 2007). A successful program designing process requires a long-term and cooperative study (Williams, et al., 2009). Lunenberg (2002) explains some of the steps of this process as formulating objectives, analyzing content, organizing the designing process and determining the roles of the experts who take place in this process.

Angeli and Valanides (2005; 2009), Efendioglu and Yelken (2010), Mishra and Koehler (2006) and Niess (2005) stress the integration of theorical and conceptual structure of technology into the teaching-learning process as one of the weaknesses of instructional technology area. In this context, putting forward the application samples from the steps of technology based content organizing process which are used for creating learning objects is accepted as important.

PURPOSE

The purpose of this study is to introduce the development process of computer based simulations-learning objects and the structure of learning objects.

METHOD

The structure of working group in which the experts are included for the development process of learning objects, development steps and samples are given in this section.

Structure of Working Group

Learning objects development process is same as curriculum development process. So during this process five different experts of computer and instructional technology, physics, chemistry, biology and graphic design were included in working group.

Learning Object: Computer Based Simulation (CBS) Development Process

Following steps were carried out during the development and designing process of learning objects (computer based simulation-CBS) which were separately developed for 20 different experiments in science and technology laboratory practices-II (STLP) lesson.

Step 1: Determining the Objectives and Content Designing Process of CBS

Objectives of each lesson were determined by computer and instructional technology and subject area experts. Contents of experiments were reviewed and required arrangements were done. Following these

process computer and instructional technology and subject area experts developed a rough CBS in which the steps of experiments were included visually.

Step 2: Visual and Instructional Design

In the rough which had been prepared in former step required arrangements were done by computer and instructional technology and subject area experts. It was decided that the visual objects included two and three dimensions. Also scene settings of CBS were organized. The visuals to be included in each scene were prepared by graphic design expert by using 3D-Studio Max software. Computer and instructional technology expert completed the CBS design process by using the prepared visuals in Adobe Flash CS5 software.

Step 3: Evaluation of CBS

CBS design was tested by subject area expert on computer. Deficiencies and problems were reported on a form. According to this report, computer and instructional technology expert made corrections and changes on CBS and completed it as final situation.

Two Samples of CBS

Sample 1: Dynamo Experiment

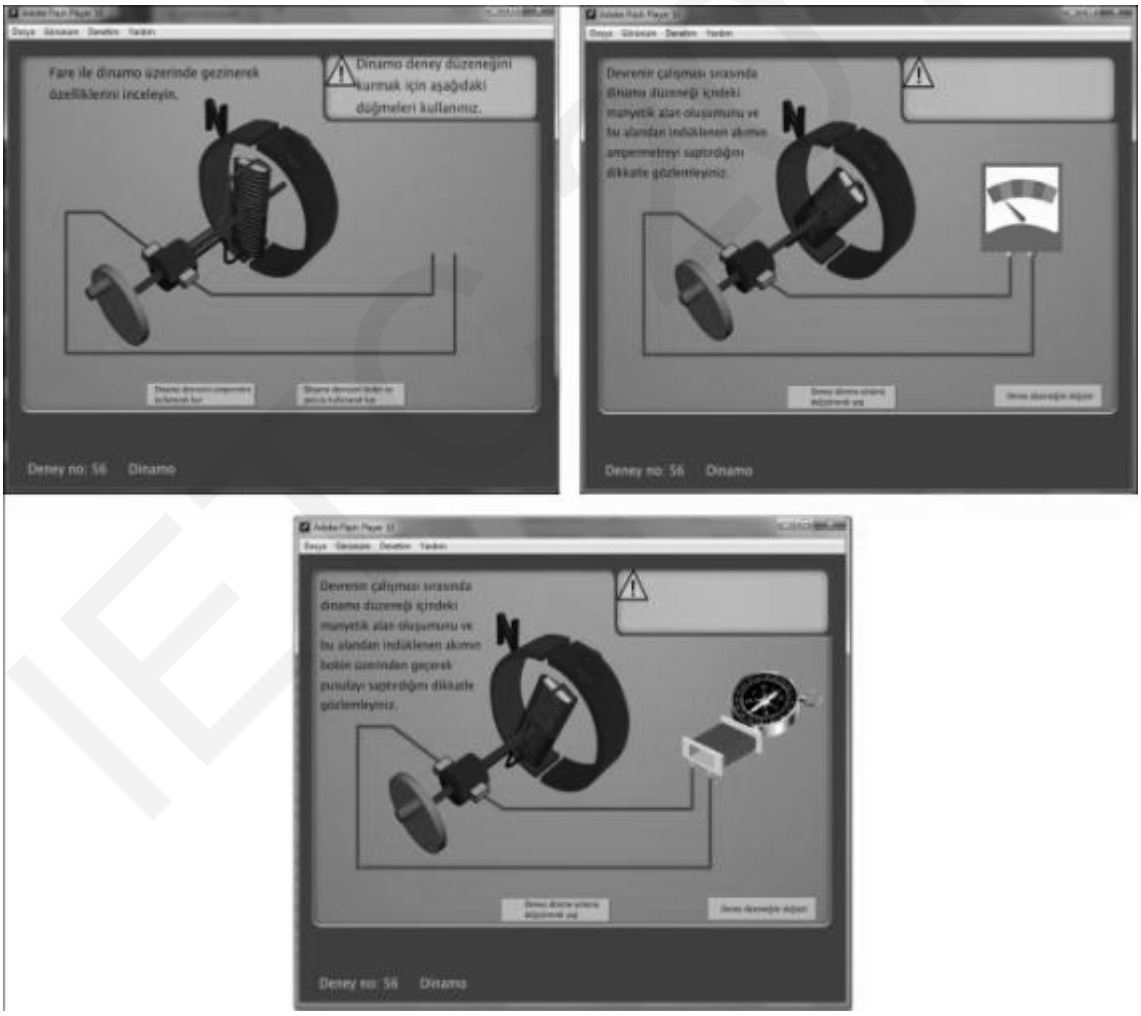

Figure 1. Screenshots of Dynamo Experiment

The purpose of dynamo experiment is to understand the structure of dynamo, its working principles and to test it. Students may learn the function of structures included in dynamo mechanisms by

using this CBS. Different dynamo circuits may be designed and worked and real time tests can be done for the results. Students can stop the working dynamo and can pass to another mechanism whenever they want. All the specifications and circuit works can be repeated, so the retention of the knowledge is provided.

Sample 2: Shadow and Penumbra Experiment

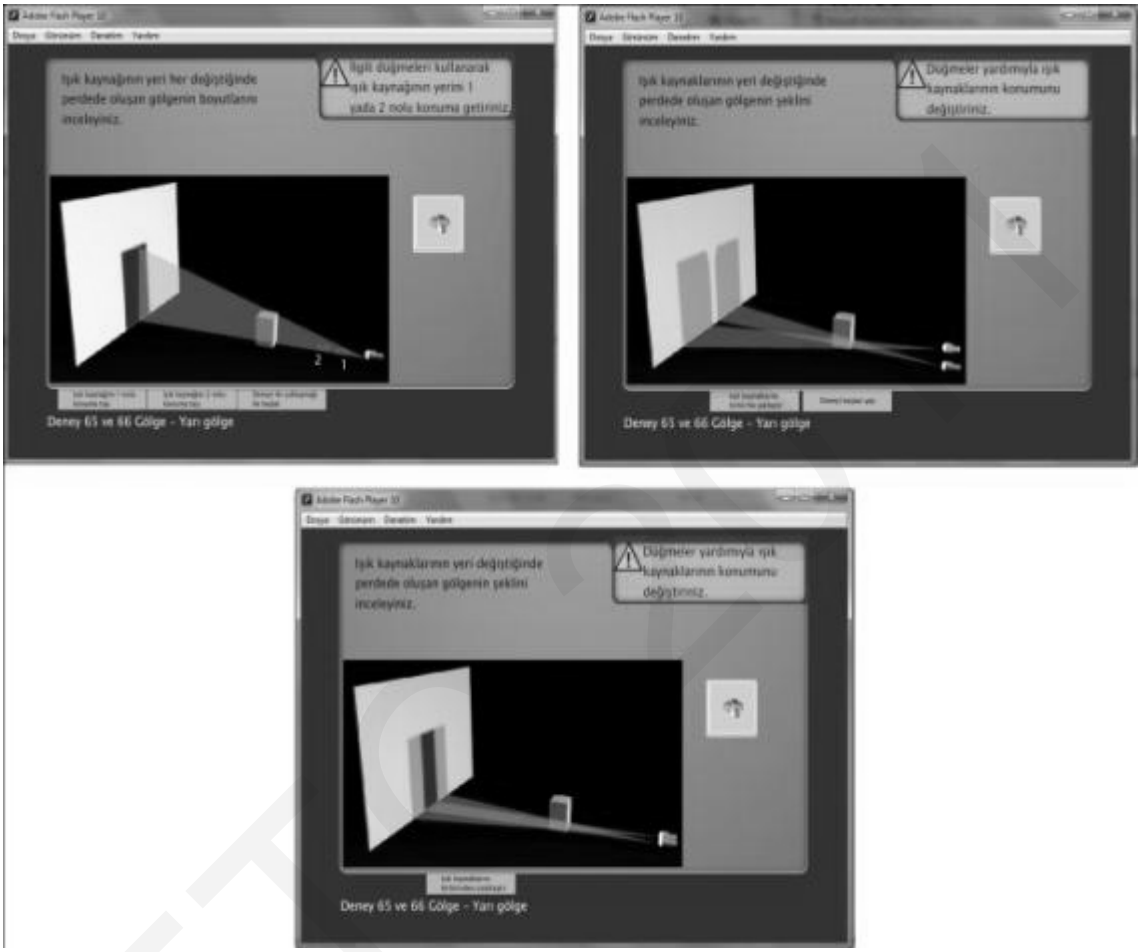

Figure 2. Screenshots of Shadow and Penumbra Experiment

The purpose of the experiment about shadow and penumbra is to help students to understand characteristics of shadow and penumbra. Students may recognize the characteristics of the materials which are used in experiments. Also they can use different characteristics and observe the results real timely. They can repeat these activities, and by this way fill the learning gaps and gain permanent knowledge. They can decide about the mathematical linkages between the light source, object and shadow by benefiting from the facilities of visual objects.

CONCLUSION and DISCUSSION

Learning objects are needed because of the requirements for regulating the learning environments effectively. Boyle (2010) states that learning objects should be accepted as the elements of learning design. This paper describes the characteristics, development steps and importance of learning objects by presenting them via a sample of CBS. The present paper especially proposes the use of learning objects to enhance the cognitive and affective development of students. In literature, evidences supporting this idea are found. The increase of the interaction of students with the learning objects in learning environments contributes the rise of students' academic achievements (Bower & Hedberg, 2010; La Pointe & Gunawarndena, 2004). According to Baki and Cakiroglu (2010), the attitudes and approaches of students are generally positive toward the use of learning objects and they find the learning

objects as effective learning tools. Hoe and Woods (2010) describe the learning objects as an alternative approach enabling learners to control their own learning. Students are positive about the learning benefits, quality, engagement values and motivation of learning objects. By this way their academic achievements are increasing by the use of learning objects (Cameron & Bennett, 2010; Kay & Knaak, 2008). Studies show that the learning objects are effective not only for students but also for teachers. Teachers' attitudes are positive about the use of learning objects and learning objects increase their motivation for lessons (Cameron & Bennett, 2010; Kay & Knaak, 2008). When these results are taken into consideration, we propose the development and use of learning objects as effective learning tools.

TRANSFORMING THE EDUCATION IN INTERNATIONAL MARKEING FROM TRADITIONAL TRAINING TO PARTIAL SELF-TRAINING WITH INSTRUCTOR'S HELP USING OPEN SOURCE SOFTWARE: THE EXPERIENCE OF BURGAS FREE UNIVERSITY

Evgeniya Nikolova, Burgas Free University, enikolova@bfu.bg
Irena Kuneva, Burgas Free University, reni_kuneva@abv.bg

This paper is an attempt to present the work of a team of lecturers and students on a project named "Development of an electronic course in International Marketing". The first part presents the theoretical background - epistemology, methods of IT application, Moodle e-learning environment. The second part discusses the motivation for the decision to direct students' activities through the electronic channel, as well as the practical algorithm of work and the sequence of actions. The last section focuses on the practical results of the project, the achievements, the shortcomings and the possible ways of removal.

"I heard and I forgot, I saw and I remembered, I did and I understood."
Confucius

INTRODUCTION

This report presents the work on the project named "Development of an electronic course in International Marketing", funded by the University Research Fund of Burgas Free University. The project was conducted in the period 01.02.2010 - 10.11.2010 by a team of teachers and students. Writing this report, we fulfill the obligation to present the methodology and promote it participating in conferences and seminars.

Before the start of this project, the course in International Marketing was led in the traditional way with a combination of lectures (20 hours), seminars (10 hours) and development of a project on a given topic. Due to the nature of the written work, which is an export plan of a company, the limited seminar classes were mainly used for consultations on the students' problems with task. The checking of the written texts was carried out in consultation hours out of the training schedule, which benefited a limited number of students and the papers were sent by e-mail or had to be printed in order to be checked. For years, the attempts to intensify the students' individual work were giving poor results and depended on factors related to motivation, education, and working habits built by high school. The decision to change the methodology and to upload the training materials on the Moodle platform complies on the one hand with the policy of the Faculty of Business Studies, on the other hand with the aim to remove formal barriers to motivation and to encourage self-training of students. Since the change was made in the interest of students, together with the satisfaction of the accepted educational standards, the views of the students from the project team had been taken as a corrective all the time regarding the requirements for understanding, comfort, simplicity of education and communication. As the use of computer technology in the learning process can stimulate and maintain student's motivation, promote self-organized learning and encourage group training, the e-course was expected to create working conditions as close as possible to the conditions in the marketing structures of the companies.

THEORETICAL BACKGROUND – EPISTEMOLOGY, METHODS OF IT APPLICATION, MOODLE E-LEARNING ENVIRONMENT

The constructivist theories of learning are the most widespread trends in contemporary theory of learning [4]. Prominent pedagogues and psychologists, Jean Piaget, Jerome Bruner, and Lev Vygotsky among them, are their supporters and advocates. The constructivist theories of learning are divided into several groups:

• *Trivial constructivism*. Knowledge is constructed actively by the learner, not passively received from the environment.

• *Radical constructivism*. Obtaining knowledge is a process of dynamic adaptation in respect of feasible interpretations of experience. The emphasis here is on the individual learner as a constructor of knowledge.

• *Social constructivism*. Knowledge is complete, when the students share and discuss with others learning achievements.

• *Cultural constructivism*. Learning is related to the specificity of the cultural environment in which the knowledge will be applied.

The electronic course in International Marketing BFU seeks a combination of social and cultural constructivism, as far as the marketing activity combines social and cultural aspects.

The model of learning based on the constructivist theories involves the use of didactic methods such as project work, discussions, problem solving, experimentation, research, literature exploration, linking theory and practice [1]. The technological tools applied in e-learning (e-mail, discussion forums, group education systems, integrated systems for e-learning) are a prerequisite for the realization of the constructivist training model. Five main methods of using information technology in teaching and learning are known:

• *Support method*. Technology is used for increasing accuracy and performance of work. Such tools are word processing packages, auxiliary programs for engineering and design.

• *Method of investigation and control*. The main tools are software packages, through which the students can study, explore, experiment and build solutions.

• *Management method*. The information is provided by the teacher at an appropriate level and pace, allowing for feedback on progress in training.

• *Resource method*. Technology is used to access information and other resources online.

• *Connection method*. Technologies are used for communication between the individuals. Examples are the electronic mail and video conferencing.

In modern development integration of functional characteristics of the different methods is observed. Today there are many different technologies that can be used for e-learning with the Internet. The Web-based learning can be described as a study in which the Web is used as a virtual environment for the presentation of learning materials and/or for carrying out the learning process [1]. It may be in two forms - to support regular training or to completely replace a course taught in the audience. In such courses the learners play a central role and are given the opportunity to learn at their own pace. Another feature of these courses, which distinguishes them from other types of training courses, is the possibility of communication between students and teachers and among students. In the courses and e-learning systems based on constructivist theories, the emphasis is placed on activities entailing new knowledge self-constructing – problem-solving, experiments in a simulation environment, project work, group education, participation in discussions. In most cases there is no separation between lectures and seminars, the course structure is hierarchical, often based on a modular approach. A typical course includes:

• G*eneral description of the course* - objectives, organization, curriculum guidelines for use of the various structural components of the course - recommended sequence through the curriculum and activities, announcements and discussion forum relating to the whole course, links to other similar courses, further reading;

• *Preliminary test* to establish the starting level, if necessary;

• *Modules (topics, subtopics)*, each of which may include learning objectives, a preliminary test, course content delivered in various formats, discussions relating to the curriculum, simulation programs, assignments (individual or group) that are carried out or transmitted online, assignments made and transmitted out of the system for e-learning, test to check knowledge and skills after passing through the structural element (module, topic, subtopic), literature and links to other useful sources concerning the current structural component of the course;

• *Final test*.

The main didactic methods that can be implemented in e-learning are interactive methods [5]. The essence of the dialog (interactive) learning methods is limited to the relationship between questions and

answers that in the training process can be drawn from both the teacher and students. The main types of the dialog methods are:

• *Discussion* - exchange of views and ideas within the theme to achieve greater clarity and deeper knowledge;

• *Interactive simulation* - a method that uses technological means to study an object or process;

• *Problem solving and bottleneck resolving* - methods directed to practical training and common elements in e-learning courses, especially when the course is based on the constructivist theories of learning;

• *Project work* - a method that is implemented in e-learning through the use of information resources available on the Internet to carry out an examination;

• *Exercise* - deliberate repetition of a certain action to develop skills and habits according to a standard;

• *Methods for monitoring and assessment of knowledge* - testing, solving practical problems, project work, portfolio that includes a systematic collection of the student's work [2].

The electronic course in International Marketing in BFU is concentrated around the implementation of the last three methods in combination with discussion and problem solving within the offline seminars.

"Learning by doing", one of the main principles of constructivism, is embedded in the pedagogical model of the open source e-learning environment named Moodle (Modular Object-Oriented Dynamic Learning Environment) [3, 6]. The platform as a system for e-learning makes possible the realization of the following basic elements and functions:

• Registration and cancellation of students who are supposed to pass the training course;

• Publication of any text and illustrative materials;

• Seeking feedback through surveys;

• Preparation of examination materials;

• Giving assignments for course projects and providing sources of information online;

• Application of different means of evaluation;

• Discussion forums;

• Messaging;

• E-mailing.

Moodle supports three different course formats: weekly, thematic and social. The content and training activities may be added in the order in which they will be used by the trainees. The resource module contains mainly web pages and other documents. It allows loading of external information such as Power Point presentations, since it has an interface that supports this feature. By the users' registration the trainer can trace the work of each student.

The advantages of Moodle are: coordination of people, resources and activities; monitoring of the training; self-organization of the students; adaptability of the modules and systems.

We chose Moodle as electronic environment because the platform is free for use, distribution and development. It has a simple interface translated in Bulgarian. With regard to the particular course it makes possible the provision of theoretical information and instructions for practical work which can be used without the simultaneous presence of the lecturer and the students in the auditorium. Furthermore, the electronic course allows coordination of efforts in several directions - between the lecturer and the students, among the students who work together in teams and consultation between the different teams.

The possibility to organize online meetings at a specific time in which to conduct group and/or individual consultations, the results of which are visible to everyone at the moment or at convenient time, was also an important factor for choosing the platform. Here we should note that the system is currently used by the students of Burgas Free University and it is available at the address http://students.bfu.bg/moodle. The students can work from their personal computers anywhere in the university. Places for work are also provided in the reading rooms of the university library.

METHODS AND PROCEDURES

With the creation of the electronic course in International Marketing we set the following goals:

• to develop a training methodology for the International Marketing course in an electronic environment in terms of the idea to allow for maximum autonomy and independence of students in both theoretical and practical aspects;

• to develop the multimedia content of the course materials with an emphasis on independent learning, self assessment and course-project work on real data;

• to motivate the students with good projects to present their achievements in conferences and seminars.

The idea of the project was to enable students' self-training while timely updating the educational materials in conformity with the continuously changing market environment. By creating this e-course we respond to the requirement of the Lisbon Strategy to expand the share of modern methods for management of training. The practical task of developing an export plan aimed to build skills and competence to apply theoretical knowledge in particular cases closer to the actual market conditions. The envisaged electronic version of the manual *"Guidelines for Developing an Export Plan"* allows supplementing, updating and testing of lists of electronic data sources (the export plan is developed on the basis of information from active sites of companies, the European Commission, websites of ministries, international databases).

The uploaded materials provide an opportunity for the marketing graduates as guest users of the database to follow the latest developments in export planning in the context of the Single European Market and the realization of the idea of lifelong learning.

The work on the project proceeded in the following order:

1. Overview of the existing methods and learning materials available

2. Study of literary and accessible via the Internet materials on the subject

3. Development of presentations of the topics from the approved course curriculum as reference materials accompanying the textbook

4. Development of materials for self-training

5. Updating the existing manual and template for the development of the course project

6. Preparation and publication of the manual

7. Uploading and testing of the educational materials for the e-course in the system

The course was organized by topics and each topic was presented with a plan of the main theoretical issues included in it. In addition to the PowerPoint presentations on the theoretical textbook chapters other useful materials are added, such as exercises, short self-tests, copies of legal documents, word files with hypertext links to web pages containing additional teaching materials, research results, legal libraries, case studies. All documents can be used online or downloaded. Some of the exercises and case studies are used in the seminars and in these cases the students have an obligation to print them in advance.

Since the primary aim of the project was to encourage the independent work of the students, the greatest attention was devoted to the preparation of the materials for the course project called "Plan of ... (company) for export of ... (product or product line) to the market of ... (member state of the EU). Creating a plan, though training is a complex, labour intensive, time consuming job and requires special efforts as regards the creation of teams, the allocation of roles and responsibilities in them and the right choice of a company, market and specific product for export. For this purpose, in the preparatory stage of the project we developed appropriate support materials to maximally facilitate the training and provide an algorithm of work and evaluation. To avoid repetition of the instructions by the lecturer and the students to be able to receive a constant source of organizational support and consultation at any time we developed the manual *"Guidelines for Developing an Export Plan"* and it was uploaded in a separate topic of the e-course. The manual was issued as a book as well and could be purchased or used in the library. As an application to the manual we developed a template containing the structural parts of the plan and specific instructions on the places that would embarrass the students. At the beginning of the

template we put a list of hypertext links to company sites, legal libraries, addresses of European institutions, Bulgarian ministries and NGOs, research agencies and electronic databases for which Burgas Free University has been subscribed. The template and the manual are supposed to be used in parallel and the relations between their parts are visible through the numbering, but nevertheless we also provided a system of signs that forward the students from one to the other document and information sources. The template was uploaded to same topic. It was recorded on CDs and attached to the manual in book format.

In the same Topic we uploaded two examples of projects given high ratings in previous years, and a sample test for the exam. The exam in International Marketing is conducted in two parts - solving a theoretical test and presentation of the project.

The development of the course ended in early October, after which in the first seminar classes for the semester the enrollment organization was established. In general the students supposed to pass a course register on the website with their faculty number, but in this case it was not necessary because they had passed other courses in electronic format.

The main page of the course is presented in Fig. 2.

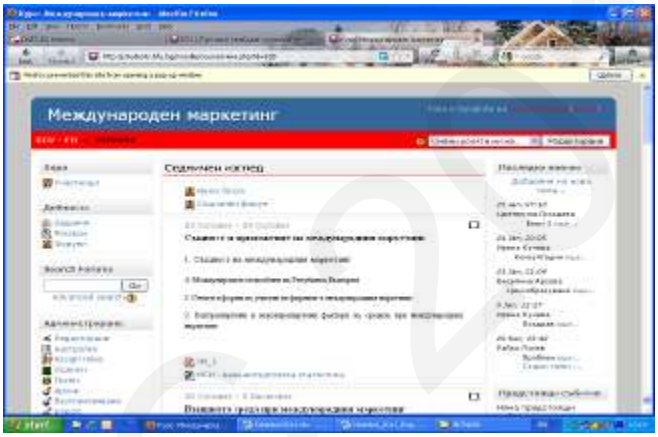

Figure 2. The main page of the course

Upon completion of the lecture course in seminar classes teams were created, each consisting of three students, and each team was given a deadline to decide on the company, the product and the market. After the final decision in the module "Assignment" we published the lists of the teams and their specific tasks. The students were expected to download or use online the manual and to download the template and start filling it. After completing the work up to a pre-scheduled stage the template had to be uploaded into checking system. The lecturer had to check the uploaded papers in the order of receiving and return them back to the teams' pages to continue working on them. The system was configured so that it assumed an unlimited number of corrected returned templates. The final version had to be printed and presented on the date of the exam.

In the module "Forum" during the whole semester each team could ask questions in all areas of concern and obtain detailed answers that could be viewed by all the other teams. Every ten days through messages in the forum the best achievements and the typical errors and deficiencies in the written work were announced and could be discussed without quoting names .

The system was tuned in such a way that for each new message in the forum and for each uploaded file the lecturer received an email to be able to respond as soon as possible.

RESULTS

As a result of placing the International Marketing course in electronic environment during the past semester many problems have been solved. The main benefits of the new technology of work are described in the following section.

1. In the past all the materials, theoretical and applied, were uploaded to an external memory or were sent to the students via e-mail, which took much time and efforts. Now this is not necessary and according to

the students the opportunity to use the presentations, exercises, tests as well as the manual and the template facilitated the organization of their work.

2. Since the system was tuned so that the corrected work could be seen only by the members of a single team, any attempts for imitation or fraud were avoided. At the same time this organization allowed us together with the corrected drafts to upload additional pieces of information that could be used only by the respective team. On the other hand the posted messages for general problems in the forum, according to the students helped them to avoid systematic errors and gave them new ideas.

3. The observations during the semester showed that in this scenario of work the students very well allocated the roles in the teams and for the first time there were no conflicts concerning the obligations. Also for the first time the system allowed us to observe how one team was answering a question asked by another team before the lecturer had been able to respond.

4. Under this organization of work the semester proceeded rhythmically and the project work went much faster.

Of course, some problems arose and before the next course they should be removed. For example, we, as a team of trainers, have no information about the number of downloaded documents and the number of the documents used online, and we can not make conclusions about their usefulness. If this shortcoming is removed, it will be possible to assess why some materials are not appreciated by the students and make changes. We also have no summary information about the duration of stay of each student but only about the number of entries. It would be better to make an adjustment when a student has not logged in for more than 48 hours to receive an automated reminder e-mail that the forum could have new messages.

In the course of work particular problems were caused by the fact that the system was arranged to put the projects uploaded by a team not in the order of their arrival but by their name, forcing the uploader to change the file name if it coincides with the previous version. It would be significantly easier if the system could automatically numerate the files and arrange them by the version number.

We could report as a problem the fact that the module “Chat” was not used at all during the past semester. The team has ideas for conducting group consultations through it, for discussion of various topics, and for addressing general problems.

CONCLUSION

The training in electronic environment creates conditions similar to those in individual training and this is the greatest advantage of the depicted methodology. The individualization in this case benefits the complete development of the capacity of students for independent activity in respect of theoretical material for learning with their own rhythm and organization. This increases the motivation and creates a sense of freedom. At the same time teamwork is encouraged in terms of practical work in conditions maximally close to the actual conditions in the companies. In the team form of training, easily realizable through Moodle, one can apply personalization by allocation and coordination of the collaborative work. In the process of seeking for solutions in problem situations it is possible for the students to generate new knowledge based on the existing knowledge, applied in practical aspects. The good combination of independent work and teamwork in training leads to the development of critical, non-standard, heuristic and scientific thinking and prepares the students to work in real market conditions.

TRANSITION AND FAMILY VIOLENCE (THE SITUATION IN BOSNIA AND HERZEGOVINA)

Saric Hariz, hariz.saric @ untz.ba

Summary

In this paper, the authors used an interdisciplinary approach to provide a representation of origin and definitions of "transition" and "violence" and analysed their complex content, position and cause-and-effect interrelationship. The transition is understood as a process of privatization and the establishment of a system of political democracy with elements of political pluralism, parliamentary government and a modern market economy where the main participant would be primarily private owners of capital. In many works, "transition" is understood and beyond, as well as changes in social order, changes the ruling ideology and the collective consciousness, the establishment of different forms of social regulation. The violence involves the abuse of force as an act of aggression that violates a person or destroys the property. At the social level, especially dangerous is coordinated violence as cases of war and terrorism. Since the seventies of the 20th century the term structural violence has been used, which indicates the systemic forms of violence such as racism, sexism, nationalism, heterosexism, and underestimating the elderly, etc. Family violence is any act that inflicts physical, psychological, sexual or economic harm or suffering, as well as threats of such acts or omission of such acts and attention that seriously hamper family members to enjoy their rights and freedoms on the principle of equality in public and private life. Transition and post-conflict societies, like the Bosnian, besides the so-called 'old risks' (such as age, illness or poverty caused by unemployment) occur new risks that are associated with discontinuous work careers, with the uncertainty associated with occasional and short-term employment with a new, vulnerable forms of family and demographic processes. Long-term illness among old people, long-term unemployment, insecure work, single-parenthood, poverty among the employed, etc. are considered as the significant new social risks. The phenomenon of "future's shock" or the pace of change in the modern industrial world in technology, engineering, education, social relationships, lifestyle, etc, is so great that it overcomes human limited abilities of assimilation and its adaptive capability. Previous findings indicate that in Bosnia and Herzegovina there is no detailed sociological study that systematically identifies and analyses the transition risk factors concerning family violence. But in a country that has only recently emerged from a war that has ravaged hundreds of thousands of homes, where tens of thousands of refugees, thousands of missing persons, the unemployed ... few of the representatives of the authorities considers the issue of family violence and social violence, a priority which requires an organized response. Research conducted supports the thesis of the existence of family violence in Bosnia and Herzegovina. The research sample consists of 564 families. The research results support the hypothesis of the existence of family violence in Bosnia and Herzegovina and it correlates with transitional changes and that has a trend of expansion and growth. The "dark figure" of the problem indicates its size and risk, and needs an immediate interdisciplinary and multidisciplinary work of preventive and

interventional levels. Based on the results we have proposed specific intervention actions for reduction and resolution of domestic violence as a result of the transition.

Keywords: transition, violence, domestic violence, inter-relationships, intervention, social prevention

1. Introduction

Dealing with violence in post-Dayton Bosnia and Herzegovina is not particularly difficult, primarily because of its frequency. Each dimension of social relations in Bosnia and Herzegovina, along with every social manifestation, has a violent dimension, whether inherent or consequential, so the subject on violence research is constantly there Bosnian post-war, transitional experience is the perfect witness to the social and economic inequalities arising from the transition which is imposed by the socio-political framework, and the pervasive violence in their parent's culture, and politics – that more is said about in theory than done in practice. The aim of this paper is to explain the facts that suggest a causal interconnection and interdependence of transition and domestic violence. This is manifested in terms of deep-seated deformations and incontinent erosion of the family milieu that is taking on more forms of deep crisis. Any disruption in the social context has a definite impact and repercussions on the family. The common belief in the Bosnian society is that the root of domestic violence lies in a traditional and patriarchal model. The social transition and the psychological and physical consequences of the war such as post-traumatic syndrome, disability, incomplete and disorganized families, the impoverishment of the majority of the population, bad economic situation, high unemployment, fallen standards of living, increased offers of illegal employment, the increase in crime, alcoholism, fallen social values – these are just an incentive for violence to manifest itself. Domestic violence continues to be considered and tolerated as a "socially acceptable behaviour," despite the intensive activities aimed at improving the legal and actual protection from violence in public and private life. Prejudices and patriarchal attitudes are often expressed even by the professionals who should deal with this issue, as they teach and raise young people, provide helpe for the victims or punish perpetrators. The available data from the government institutions that have had the first contact with victims of domestic violence (police and prosecutors) are incomplete and contradictory, and suggest different interpretations and approaches to addressing the problem.

Many research studies on domestic violence have been conducted in Bosnia and Herzegovina, but not a single study includes a period of three or more years. The results of this study can perfectly integrate in earlier research in order to make it possible to follow the continuity and diffusion effects of domestic violence. It is precisely the "dark figures" of the problem that indicate its seriousness and danger, and the need for a quick inter-disciplinary actions on preventive and interventional levels.

2. The definition of Terms

In general, there are two terms that are being used for the total change that is taking place in post-socialist[1] or post-authoritarian societies, often as synonyms – even though there is a difference in terms of their meaning, scope and content. These are the concepts related to transition and transformation process. By taking into account these concepts, we are referring to the theories of transformation and transformation processes of research (german: Transformationsforschung) and transitology as scientific fields that are engaged in the research of these changes. Lat. (Transative - pass), transitions. (Klaic, B. 1978). This very term is used to signify the transition from one system to another[2]. The term transition first appeared in Western literature of the '70s in the last century as a label for transition from industrial to post-industrial society. After the fall of the Berlin Wall in 1989, the term has been used in the literature of social sciences throughout the former Eastern bloc. According to one of the best studies by transitologist Dankwart A. Rustow (1970.), the successful transition to democracy is possible only with variables such as economic stability, political culture and political participation. Guillermo O'Donnell and Philippe C. Schmitter (1986.) are considered to be the leading political scientists in the theory of transition. According to these authors the transition to democracy can be identified by observing the weaknesses of the old autocratic regime and in the change of the game rules of the "pillars of society"[3]. It is a global, not regional process and we can feel free to claim that virtually numerous societies in the modern world are in the process of transition[4]. Highly developed societies are between the industrial to the post-industrial society, the postrealsocialist ones are from the authoritarian to the pluralistic civil system, while the third-world countries are moving from the traditional to the industrial society. Bosnian society is in the state of "wildness" in which there is a clear antitransit movement. Poverty, job loss, family crisis, crime on the increase, the dominance of "turbo-folk" culture are just

[1] In terms of Bosnia-Herzegovina, the most pernicious and most devastating cause is the recent war with all the untold consequence of the war that the war and post-war condition implies, along with the ongoing process of transition that society in Bosnia-Herzegovina is in at the present. Exposure to political violence: persecution, imprisonment, threats, coercion, harassment, repression, concentration camps, injury, loss of home, loss of close persons, separation from family, exposure to constant shelling, snipers, constant threat of violent death, terror, homocides - creates the most intense feeling of vulnerability, fear, insecurity and helplessness. It has been recorded that the terrible war devastations and heavy losses are of incalculable proportions to the extent to which the population in Bosnia-Herzegovina was exposed, including every family in this society which was affected by this abnormal, highly-stressful events which led to the incredible disruption of social structure and social functions of the society as a whole.

[2]. Historically speaking, the term 'transition' is used to describe two major events. One refers to the transition from feudalism to capitalism, and the other refers to transition of war economies to peacetime economics after the Second World War. A common feature of both events was the establishment of a market economy. Transition - a comprehensive process of structural change and transition "from socialism to capitalism", represents a return to a market economy and civil democracy. Areas of transition are: stabilization, price liberalization, enterprise reform, privatization, financial sector reform, liberalization of external trade, reform of the social security system, reform of the political system. The transition in Bosnia and Herzegovina is completely different from other countries "blocked or stifled" and deeper basis of this transition, blocked, paused, resistant to change can be explained by heredity, or the process of restoring traditional values and patriarchy.

[4] John Keane claims that civil society represents"... a simple, dynamic ensemble of legally protected non-governmental institutions that are primarily based on non-violence and the principles of self-organization and self reflex..."

some of the outcomes of Bosnian version of the transition. The lack of synchronization transition activities in Bosnia-Herzegovina resulted in black markets, a parallel currency, hyperinflation, spontaneous privatization, etc[5]. Numerous studies have confirmed the association between poverty and unemployment to be a protective factor of family violence.[6] The fact is that the concept of civil society, in the normative sense, has a positive connotation. However, specific civil society organizations have the ambivalent character. Although the majority of non-governmental institutions, which form the backbone of civil society, stand for nonviolence, the author warns of the danger of neglecting the presence of violence, that is uncivility in a civil society. In more extreme circumstances the violence leads to the establishment of uncivilised society and that is a sign of a chronic deficit of civility in a particular civil society (Keane, J, 2003).[7] When violence occurs or there are signs that it could occur, many systems such as influential violence prevention groups (Mitchell and Büchele-Ash, 2000) get involved in the process. This is especially important to keep in mind when analyzing the structure of non-governmental sector in Bosnia and Herzegovina, where we meet ethno-nationalist associations and groups that favored militaristic tradition in a way that contains all the characteristics of cultural violence.[8] Violence is a historically known phenomenon that is, one might say, as old as human civilization. It leaves multiple, lengthy and extremely serious consequences on the overall life of the people. Domestic violence has a long and a brief history. Unfortunately, the authoritative history contributes to "antiplural" black and white approach, which recognizes

[5] According to the Agency for Statistics in Bosnia-Herzegovina (2010.), there are 3,922,205 inhabitants living in Bosnia and Herzegovina. According to data of the Employment Service in Bosnia and Herzegovina from 31st March 2011, a total of 530,055 persons have been registered as unemployed, and the average number of employed persons has amounted to 677.214 with the low employment rate of young people in particular - under the age of 24 years and older than 55-64 years. The official unemployment rate in B&H is 44%. Out of 76% of all the unemployed were unemployed for more than two years. The number of pensioners was 550,000. About 60% of pensioners in B&H live in extreme poverty, and about 215,000 receive less than 150 euros per month. Every fifth citizen in B&H lives on 1.5 euros per day. Households where the head of the household is (in terms of employment status) retired (19.5 %), unemployed or seeking work (23.4 %), housewives (25.5 %), or persons with disabilities (44.4 %) (According to the data of UN Development Programme).

[6] Poverty may, of course, produce a provocation to oppose the established laws and regulations. However, it does not necessarily give people the initiative, courage and real ability to use force and violence. The economic misery may not lead to any kind of direct violence, but it would be wrong to conclude that there is no connection between poverty, on one hand, and violence, on the other (Amartya, S. 2006).If an effective country supports consolidation of democracy, it is necessary to have these five inter-related arenas. First, there must be conditions for the development of free and active civil society. Second, there must be relatively autonomous and valued political society. Third, the rule of law is necessary, in order to guarantee civil liberties and freedom of associations. Fourth, there must be a state of administrative apparatus which the new democratic government can properly use. Fifth, there has to be an institutionalized economic society. (JL Juan and Alfred S. 1996).

[7] See about the violence issue in civil society Keane, John: "Civil Society: old pictures, new visions", Filip Višnjić, Beograd, 2003., pg. 143-145.

[8] Over the past two centuries of existence, Bosnian society was marked by at least six changes of political-sistematic context that were caused by the actions of the external political factors, such as: Ottoman-Turkish, Austro-Hungarian, SCS-Yugoslavian, period of Independent State of Croatia, Socialist Yugoslavia, and a period of conditioned independence under the rule of "International Community", commonly known as "transition period".

only the aggressive opposition from one side on one hand and the withdrawal and conflict avoidance on the other hand. Violence has many manifestations such as poverty, hunger, intolerance, discrimination, chauvinism, fascism, racism, genocide, sociocide.[9] Violence, we can say, represents a sort of compromise or shortens the life of human beings. Different manifestations of this phenomenon include not only physical, structural, psychological or cultural violence, but also bad governance, organized crime and illegal activities[10]. Violence is a violation of fundamental human rights and is the responsibility of both the individual and the society. According to the sociological lexicon (1982): "Violence includes escalating behaviours such as: physical abuse, economic manipulation, social and sexual abuse." Domestic violence[11] can be defined as a set of behaviors designed to control others by force, intimidation and manipulation. This is a specific form of violence because it occurs and takes place within the family, and family is supposed to be the place where the closest and warmest human coexistence take place. Domestic violence is not a normal part of community life, and is socially unacceptable, but still we can not say that there is a society that is free of domestic violence.

Domestic violence in the past was considered to be a private issue. Gillespie notes that this evidence is based on the passivity and helplessness of abused woman, and opens the door to reinforce existing stereotypes about abused women (Nikolic-Ristanovic, V. 1984). In a number of "developed" countries around the world, since the '70s of the 20th century, as a result of the manifest consequences, domestic violence has been recognized as an important social and political problem that can be approached seriously, systematically and scientifically. Domestic violence has been addressed earlier in the 1920-ies and 1930-ies by the Slovenian women's movement (Medarić, Z. 2011.). However, it was not until the early '70-ies, before they began to seriously investigate violence against women and violence in relationships. In the 80-ies the focus of interest for experts is the sexual abuse of children. In the early 90-ies they started to study violence against elderly people in the family. The key moments in recognizing the problem of domestic violence and its successful transition from the the private sphere issue to public issue that is ranking high among the local, national and international priorities, includes the impact of the feminist movement, the discourse of the European Union, the adoption of legislation on prevention of domestic violence, etc. According to the estimates of many organizations dealing with this problem,

[9] Charles Ingrao, Thomas A. Emmert, (2010): Confronting The Yugoslav Controversies (Central European Studies), inicijativa naučnika, Memorija, Sarajevo

[10] Structural violence is a term that was first used by Johan Galtung in the '70s of the last century. The mentioned term denotes a form of violence in which a particular social structure or institution is slowly killing people in a systematic way, by making it impossible for them to exercise their basic needs. Structural violence inevitably produces conflict, and often direct violence, including elitism, ethnocentrism, classism, racism, sexism, nationalism, racial violence, hate crimes, terrorism, war and genocide, and domestic violence, which is certainly evident through the example of Bosnia and Herzegovina.

[11] When analysing definition of the family, this one stands out: "The family consists of parents, or at least one adult, and children, or at least one child living in the same household, they successfully operate as a community that meets the needs of its members, and their relationship is based on consanguinity, legal (marriage, adoption) or simple regulation "(Adžajlić, A. et al 2005). According to the structure, functions and valued orientation, there are several types and forms of families: monogamous, polygamous, matriarchal, patriarchal, complete, incomplete, nuclear, extended, authoritarian, democratic, etc.

at least every fifth woman who is living together with her partner has experienced physical violence at least once, and every second woman knows of a case around them where a woman has been abused in her relationship. According to the United Narions Development Funds for Women (UNIFEM) research, domestic violence occurs in one of three families, and there seems to be no place in the world where domestic violence has not occured (Ajduković, M. et al 2008). The data show that there it is more likely for a women to experience violence by a current or former partner than by any other person (Reid, 2003:15). Epidemiological studies show a relatively high prevalence of violence between partners. It turned out that 8% to 37% of women are exposed to violence in marriage (wrightsman and Deaux, 1981., Frieze, and Brown, 1989). What stands out is widely spread tolerant attitude towards physical abuse of women (Pećnik, 1990). Although a number of studies demonstrated the existence of mutual violence between partners (Straus, 1980; Stewart et al., 1987. And others), there are only some data on the number of women exposed to violence and it is relatively low and vary considerably depending on whether the data source is official by the police or it is a self-report. It has been proved that the woman is the most violent in self-defense. (Saunders, 1988.; Bowker, 1983). Intimate partner violence (IPV) often begins even before marriage, so that on the basis of certain conduct on pre-marital relationship one can predict the occurrence of violence in marriage (Frieze & Brown, 1989.; Pećnik, 1990.; Newspaper, 1993. And others). Intimate partner violence (IPV) is known to occur among all social classes. (Stewart et al. 1987). The term of intimate partner violence (IPV) refers to the systemic form of abusive behavior that occurs over a long time, for the purpose of control, domination and intimidation. Such behavior includes verbal violence and threats, physical, psychological and sexual abuse, breaking things, abuse of pets, etc.

In the historical context, the process that helped create a modern state, attributed the power of the family to a man (Sauer 2002, according to Nikolić-Ristanović and Dokmanovic, p. 2006. 176). An individual act of violence is not random and not an isolated event of control loss. On the contrary, such episodes are part of a complex, ongoing pattern of behavior in which violence is an integral part of a relationship dynamic which is primarily characterized by power and control. Most of the correlation studies of domestic violence focus on the individual variables and seeks to determine their significance in the development of violent behavior. It is all to do with the "univariant" or "primarily-effective" models. However, the causal mechanisms of violent behavior are multifaceted, complex and transactional (eg, multiple risk and protective factors interact with each other during the development). Considering this, today we tend to integrate developing factors in the ecologically valid models (Cicchetti, Lynch, 1993). Regardless of the type of violence, the results of numerous studies show that families in which it takes place are largely disorganized, with poor socio-economic status and are socially isolated. Domestic violence in Bosnia and Herzegovina, due to the recognition of problem distribution, is defined by the social and relevant legislation that has been adopted along with the systematic actions. The non-governmental organizations have played a significant role in domestic violence setting in a family, which is a specific problem in the public sphere. The documents of internationally-legal character are binding the state of Bosnia and Herzegovina, including its entities to take all the available measures to prevent domestic violence, protect victims

to the greatest possible extent and punish appropriately the perpetrators. In 2009, the Council of Ministers proposed and adopted a strategy of prevention and fight against domestic violence in B&H from 2009 to 2011. This strategy defines the objectives, actions and bodies responsible for policies aimed at preventing and reducing domestic violence and binds the community to prioritise this issue, express the political will and provide the resources and multisectoral approach.[12] The difficulties in this study are contained in the facts: the social tolerance of domestic violence; domestic violence is considered to be private and not public; understatement of government regulation on the level of privacy; a number of stereotypes found in relation to the family and family relationships and roles; male domination, tolerance in the preservation of domestic violence within the private sphere; The key factors include the traditions of religion, lack of development of social institutions. The aim of this paper is to investigate the quantitative and qualitative forms of occurrence of domestic violence, identify and analyze the causes of domestic violence, the presence and types of violence, as well as determine the social consequences, and others, arising from the transitional changes. A special part of the work is determining the measures and actions to be taken into account in order to reduce or prevent the violence. The paper used the method of theoretical analysis and survey research methods and instruments of the survey questionnaire designed for families intent of this research.A special part of the work is determining the measures and actions to be taken in order to prevent, reduce or prevent the violence. The paper used the method of theoretical analysis and survey research methods and instruments of the survey questionnaire designed for families intended for this research. The study was conducted on a sample of 564 families[13] randomly. Respondents were persons of both sexes (which at the time of the research was 18 years and over). A total of 28 interviewers were engaged and trained for the study (the implementation of the survey). During the processing of data, the statistical package SPSS 16 was used. The analysis of data consisted of basic statistical analysis (distribution frequency of variables) and a comparative analysis between the variables. For data analysis, we used the correlation coefficients and chi-square test. The level of significance for this study was on $p = 0.05$.

3. Data Analysis, Presentation and Interpretation

1. When asked how many members there were in your household, the answers were as follows: two members (104), or 18.44%, three members (150), or 26.59%, four members (210), or 37.23%; five members (80) or 14.18%, and six or more members (20) or 3.55%.

[12] National Strategy provides the analysis and alignment of legislation in Bosnia and Herzegovina, which regulates the field of domestic violence, achieving greater protection for victims of domestic violence, public awareness of violence issues and the promotion of prevention and systematic collection, integration, processing and publishing data on domestic violence.

[13] When it comes to general information about families and their members, we took some demographic parameters (number of family members, the completeness of the family, gender, age, education level, employment status, disorganization of marriage, number of children, religious commitment, ethnic background, place of residence).

2. According to their place of residence – there were 205 or 36.35% from rural families, 198, or 35.11% from urban families and 161 or 28.55% from suburban families.

3. When asked how they saw their family, the answers were as follows:: patriarchal - 420 respondents or 35.00%; Modern - 155 respondents or 12.92%, a combination of these two types - 625 respondents or 52.08%.

4. When asked whether they had ever been a victim of domestic violence, the answers were as follows: Yes - 36.25% or 459 respondents No - 61.75% or 741 respondents.

5. When it comes to the completeness (wholeness) of the family in this study, there were 448 complete and 166 incomplete families: 95 Single-Parent families was and 21 No Parent Families; 180 families where no one had an employment and 90 families who made the living on their pension. Research shows that violence is more prevalent in families that are complete in 65% of cases (usually violent behaviour by husband towards his wife), whereas in incomplete families the violence is present in 36% of cases (usually violent behaviour by children towards their parents).

6. When asked about the most frequent forms of violence, the results show that most victims suffered physical violence: 115 persons or 9.58%, followed by psychological violence, 78 people or 6.50%, followed by sexual violence in 33 cases or 2.75%, social cases 53 or 4.42%, economic violence over 35 people, a combination of these forms - 155 cases or 12.92%. 731 persons or 60.92% eclared that they were not a victim of violence in their family.

7. According to the age structure of respondents, most victims were women aged between 19 and 27 – 168 of them, followed by the number of 126 women 126, aged between 28 and 45 years, while the number was significantly lower when it comes to women who have suffered violence that were aged over 46 years – 68 of them. When it comes to violence against men, the results show that they are less exposed to violence (almost four times less), and only men aged over 46 years have frequently suffered violence – 44 cases, while the lowest number of victims are men between the ages of 19 and 27 years – 9 cases.

8. When asked, what was the most frequent way of violence, the answers were as follows: The most frequent was pushing – 85 persons, slapping in the face (more than once) –26 persons, slapping in the face (once) – 31 persons, pulling hair – 29 persons, hitting – 26 persons. Some of the respondents said they suffered violunce in the following ways: pushing to the wall – 20 persons, scratching and forcing them to leave their home – 19 persons, twisting their arms – 12 persons, use of cold weapon – 8 persons, tying their hands – 7 persons. The least frequent forms of physical violence were as follows: strangling – 2, 27% or 6 persons, causing burns – 1, 81% or 4 persons, use of fire weapon – 1, 81% or 4 persons.

9. The most frequent forms of sexual violence according to the answers of the respondents were as follows: *forced sexual intercourse – 46, 48% or 33 victims, forced oral intercourse – 12, 68% or 9 victims, other forms of sexual violence such as crushing genital and anal*

parts –11, 27% victims, forced oral intercourse – 9 victims, forced masturbation – 6 victims rape – 4 victims, sexual intercourse after physical violence – 10, 6% of women. A total of 51, 5% of women who have suffered physical violence responded that they have never responded with violence back.

A significant data for the statistics is that the respondents didn't classify incest under the form of sexual violence whereas they did classify prostitution and pornography under the form of sexual violence – in 4, 22% or 3 cases.

The result of x^2 is 108,03, which is far higher than the threshold value and the responses that the respondents gave back are not accidental but statistically significant. All the respondents had the same attitude on sexula violence: they all considered it to be one of the hardest forms of violence that leaves victims with not only psycho-physical consequences but also social consequences as well.

10. When asked if they had suffered mental violence, the answers of the respondents were as follows: underestimation in 45 cases or 11,32 %. Insults and calling them bad names in 44 cases or 11,14 %, followed by belittling in 38 caases or 7,92%. Accusations and use of profanity words in 35 cases. Mocking in the public, limited family visits, accusations of infidelity and harrassment are only some forms of mental violence and seem to be less frequent.

11. When asked, what was the most frequent way of social violence, the answers were as follows: constant control over a woman and whom she is speaking to – 32, 18% or 21 cases, prohibition of spending time with friends and cousins – 28, 12% or 18 cases, prohibition of telephone use at home – 21, 87% or 14 cases,

The result of x^2 is 3,01, which is the 3rd degree of freedom, 0.05 level of significance, the value of chi-square test was 7,81. Since the obtained x^2 is far lower than threshold, we conclude that there is a statistically significant difference between the obtained and expected frequencies.

12. When asked about the presence and forms of economic violence, the answers were as follows: forms of violence such as: controlling the money, forcing the victims to beg for money, present in 20.96% cases of the total violence, forcing the victims to do hard work in over 18.54% or 23 cases, forcing the victims to borrow the money in over 17.74% or 22 cases of the most common forms of economic violence. Subtract (loss) of assets in 5 cases and it is less applied form of economic violence.

13. That the level of education can be the cause of domestic violence is considered by 32.5% of respondents, while 25% considered it not to be the cause of domestic violance, and 47.5% of respondents had not given their answer. Responses received by women, as well as men, do not show a statistically significant difference.

14. When asked about the impact of employment on the level of domestic violence, 48.23% of the respondents said that the unemployment rate increases violent behavior, while 33, 45% said the opposite, and 18.32% haven't answered.[14]

[14] Survey results show that economic violence is the strongest form of violence and occurs mainly between the employed spouse over the unemployed spouse in 53% of cases. In families that are users of pensions as

15. When asked how if they consider poverty to be a protective factor of violence, about 40% of respondents (and nearly half are complete families and only a third areincomplete families) said yes, 20% of them said no, while 40% of respondents had not answered.

16. When asked whether alcohol use can cause violent behavior, 55% of respondents answered yes, and 23.25 answered no, and 22.75% of respondents had no opinion about it. The implied conclusion is that the prevailing opinion is that alcohol causes domestic violence. The responses of both sexes are similar.

17. When asked whether violent content in the media can negatively affect the violent behavior of family, 65 % of respondents answered "yes" 65%, and 23.55% said no. A total of 11.45% of respondents have not answered. Overall, the opinion of the respondents, in general, is that the impact of media on the presence of domestic violence is of high importance.

18. When it comes to ethnicity, the survey was conducted over 440 Bosniak families, 90 Croatian, 25 Serbs and 11 others. This roughly reflects the number of the total population in the area where the study was conducted. On the basis of research results we can conclude a regularity in terms of balanced presence of domestic violence.

19. When asked about the psychological consequences of violence that pushed victims to seek doctor's help, or they are recorded in the medical documentation, the respondents said that the most frequent is depression, then the instability in relationships and low self-esteem, while the suicidal attempt was less frequent.

	Psychological Consequences	Total	%
A	Low self-esteem	19	13,19
B	Anxiety	24	16,66
C	Depression	32	22,22
D	Agression	12	8,33
E	Suicidal attempt	7	4,86
F	Addictions	9	6,25
G	Instability in relationship	29	20,13
H	Poor functioning in the workplace	22	15,27

The result of x2 is 24,53, which is the 7th degree of freedom, 0.05 level of significance value of chi-square test was 14,1. Since the obtained x^2 is greater than threshold, we conclude that there is a statistically significant difference between the obtained and expected frequencies.

---

the sole source of domestic income (and economic) is most frequent between the holder of pension towards other family members in 45% of cases. In these families a very strong emotional violence is present between children over the pension beneficiaries, in 35% of cases.

20. When asked about the greatest consequences of violance, related to the functionality of the victims of violence, respondents indicated:

	Types of Consequences	Total	%
A	Physical	76	18,45
B	Psychological	96	23,30
C	Emotional	128	31,07
D	Economic	48	11,65
E	Social	28	6,80
F	Conative	36	8,74

The result of x2 is 26.09, the fifth degree of freedom at the 0.05 level of significance value of chi-square test was 11.1. Since the obtained x2 is greater than threshold, we conclude that there is a statistically significant difference between the obtained and expected frequencies.

21. When asked which are the most common social consequences of violence that the victims are exposed to, the respondents reported difficulties in raising children in 64 cases or 10.06%, smoking, tabletomania in 58 cases or 9.12%, the isolation in 50 cases or 7.86%, while only a few number of respondents indicated social consequences: loss of property - 1.57% or 10 respondents, and sucidal thoughts - 14 respondents or 2.20%.

	Social Consequences	Total	%
A	Stigmatization	24	3,77
B	The problem in establishing social relationships	44	6,92
C	Izolation	50	7,86
D	Loss of job	24	3,77
E	Loss of family or friends	44	6,92
F	Fear of losing custody over children	38	5,97
G	Fear of family accusations	46	7,23
H	Fear of ostricism (ignorance, blockage in communication)	24	3,77
I	Unwanted pregnancies	22	3,46
J	Loss of property	10	1,57
K	Smoking, tabletomania	58	9,12
L	Difficulties in raising children – identifying with parents	64	10,06
M	Alcohol, psychoactive substance	18	2,83
N	Inefficiency at work	44	6,92
O	Suicidal thoughts – suicide	14	2,20
P	Debts	46	7,23
R	Unemployment	36	5,66
S	Financial addiction	30	4,72

The result of obtained x^2 is 56, 58 and in terms of freedom degree and threshold value, we can conclude that there is not a statistically significant difference between the obtained and expected frequencies.

22. We asked respondents what way they are socially isolated:

The most common form of social isolation, according to the statements of respondents, is a problem to do their own maintenance – the problem of residential nature in more than 104 victims, or 15.02%, and isolation from friends and relatives in more than 100 cases or 14.45%, a parent convincing children to be against another parent in 80 cases to 11.66%. These are the reasons for the feelings of alienation in relation to the wider community, the abuser takes advantage of the right to visit and turns it into a threat, difficulties in maintaining and establishing relationships with other people and the problem of concentration.

23. Na pitanje povjerenja u institucije sistema (policija, Centri za socijalni rad, nevladine organizacije) u smislu prijavljivanja nasilnog ponašanja, skoro dvije trećine ispitanika, njih 62,34% su odgovorili da nemaju povjerenja, da imaju povjerenja izjasnilo se njih 22,25%, dok njih 15,41% se nije izjasnilo. Navedeni odgovori ukazuju da se nasilje taji, krije i poriče te da se ne prijavljuje određenim institucijam i organizacijama.
When asked whether they trust the institutions of the system (police, Centres for Social Welfare, NGOs) in terms of reporting violent behavior, almost two thirds of respondents, 62.34% responded that they have no confidence, 22.25% said that they trust them, while 15.41% of the respondents haven't had an answer. These responses indicate that the violence is still kept in secret, hidden and denied, and is not being recorded in certain institutions and organizations.

Conclusion:

Domestic violence is forever a taboo subject, it exists now, it has existed in all times and has always been suppressed as irrelevant. The research results relentlessly show that domestic violence is a widespread problem in Bosnia and Herzegovina, and thus represents a serious violation of fundamental rights and freedoms.
Social transition, the psychological and physical consequences of the war such as post-traumatic syndrome, disability, incomplete and disorganized families, the impoverishment of the majority of the population, poor economic situation, high unemployment, decline in social values – this is just the encouragement to manifest violence.
The most common form of domestic violence is physical violence, followed by psychological, social, economic and sexual violenc. Unfortunately, there are estimates according to which each reported case of violence in the Bosnian family equals to ten more cases of violence that go unreported.

Because domestic violence is a social and not a private problem, there is a need to establish services to provide comprehensive support to people who have experienced violence and rebuild their trust in institutions that provide legal assistance to victims of violence.
It is necessary to organize interdisciplinary teams at the local community so that, in cases of violent behaviour, they can provide services in the implementation of programs for prevention of violence and will work closely with government agencies. Through the development of information system (database) they will collect the data and distribute the information on domestic violence.
It is necessary to define priorities, working methods and provide financial support for research on causes, consequences and prevention of violence. It is necessary to grab public attention on the problem of violence through the media and develop a responsible attitude towards the promotion of gender relations based on mutual respect and equality.
It is necessary to do a comprehensive strategy at the national level (including all levels, from individuals, families, local communities and beyond) inspired by the economic, social, political and demographic change and ethnic tolerance, which may be a condition for successful prevention. To prepare such a strategy, it is necessary to use the experience, programs and models from other countries, especially from the European Union member countries.

ABSTRACT

The target of the paper is the identifying main trends in engineering education for information and communication technology sector or industry under the aspects of changes of value chain, technology, market, policy etc. All kinds of changes in the economy, society and environment have the impact on the needs and expectations that new engineers must fulfil. The expansion of information and communication industry creates the necessity for new qualified professionals and also creates the new time and spatial dependences between education, social development and economic activities. This contribution explains impacts of these dependences or qualitative changes on curriculum development and it describes the experiences in this field at University of Zilina, Slovak Republic.

INTRODUCTION

The fast technology changes in the information and communication technology (further ICT) require the "intelligent" education with "balanced" using of the long-valid principles, the newest information and developing the skills and competences of the students. The changes of the curriculum, contents and forms of education or learning are characterized by conversion from classic to integrated education and learning. The main elements of educational programmes for the society based on information, knowledge and creativity are:

- Flexibility of subjects and curriculum
- Diversification of the education forms
- Life-long learning and distance learning
- Short or long courses
- Workshops and conferences
- PhD studies etc.

The development of higher education system and institutions in the Slovak Republic during the past two decade are quite extensive by the number of students, the number of programs or the faculties and institutes. It was similar as in another transition economy. But the modern university management is connected with the interdisciplinarity, research, academic culture and creativity. They have to be included to the all processes and activities on the university, e.g. to the innovation of profile or key competences of graduates.

The ICT sector represents all subjects, firms and institutions etc. that produce ICT products including content and media products. They must primarily be intended to fulfil or enable the function of information processing and communication by electronic means, including transmission and display (by OECD product classification). The market of ICT products/services/applications is formed by hardware and software producers, network and service operators, providers, content suppliers and final users. Rate of these participants is changing and depends on product/service/application specifications and on market segments, e.g. private or business customers.

NEEDS OF SECTOR

Contextual curriculum, in profiles and specified alumni scope is needed to be permanently submitted to critical analysis in several valuation views. As the most important is the valuation aspect, related to content filling, from the point of labour market view in a sector. Business sector requirements for the student knowledge, skills, and abilities have been the part of a large number of researches in our country and abroad too. The results of these researches are generalized within the scope of the European university area, but it is needed to emphasize, that opinions coming from the national and sectional assignments are similar. They mention that academic environment and business environment opinions about the most important student knowledge and skills are different. This means, that progress of the characteristics examined from the characteristics with the largest stress, up to those with the lowest stress by the knowledge, skill, ability is under consideration for the purpose of alumni's successful exertion at the labour market, when knowledge, abilities, skills are under consideration. All these should alumni obtain for purpose of alumni's enforcement in a labour market, does not show from the professional sphere point of view sufficient harmony.

The labour market prefer for example student's communication skills and team work, but the university teachers judge for example theoretical knowledge in a professional sphere or the ability to use information-communication technologies the most. Labour market awaits changes in development of not technical skills at the university educational programs.

The new economy, information society or knowledge society impose a shift in the structure of education and training and also in the skills obtained by students during their education. The engineers of tomorrow must be educated for tomorrow, for solving new problems that are another kind like contemporary problems. New curricula, subjects, courses for the new economy, the globalization era cannot include only the theoretical knowledge of engineering disciplines but must implement, include also the social sciences from philosophy and ethics to ecology and environment. The complexity of solving the scientific or technology problems requires some other abilities like in the past. Figure 1 demonstrates the changes in the importance of engineering and managerial abilities and skills.

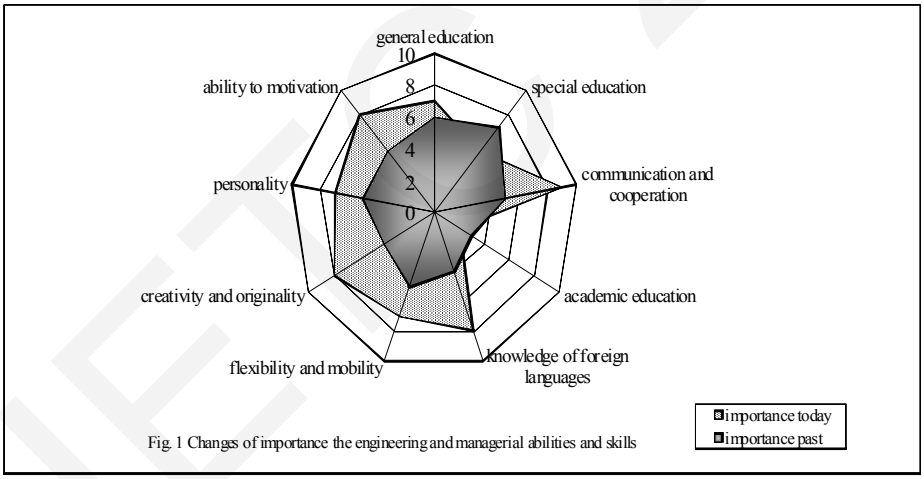

Fig. 1 Changes of importance the engineering and managerial abilities and skills

Just the social competencies are very important in the most professions and their importance is growing with the rank in the enterprise hierarchy. If the professional skills of the employee are sufficient, e.g. hard knowledge and skills, than on the higher rank are put another requirements on him/her related with soft skills and knowledge. The social competencies include: communication skills, crisis management, styles of management, ability to motivate oneself and also another people etc.

Discussions about study profiles of technology university graduates resulted in acceptation of two significant documents of European and worldwide prominence [1],[2]. Present-day professional public has no doubts that technology university students have to be given the knowledge from non-technology domains, e.g. in the courses such as philosophy, economy, sociology, ethics, aesthetics, law etc. This

results from the fact that a representative of engineers has to be flexible, creative and responsible for consequences of his/her doings. In addition the new social-economic conditions, especially those in the transitive countries, ask for a qualitatively new generation of specialists and professionals that will cope with the latest technological trends and will be successful in management of business subjects.

ATRIBUTES OF ENGINEER IN ICT SECTOR

One of the shifts, the university (faculty or department) should achieve by the university education nowadays, is content and methodological supporting the international defined „engineering attributes“, which are transformed to 10 characteristics (by the University of Žilina) These characteristics were applied also for the conditions of engineers in a ICT sector. These characteristics are:

- Usage and convenient application of knowledge from the area of technologies and services to labour market
- Experiments creation and managing from the area of technologies and services, as well as analyzing and data and information interpretation as a result of search.
- Technology, process and service innovation, as the customer demand satisfaction
- Ability to work efficiently in a multidisciplinary team
- Diagnosis (identification and formulation) and problem solving, emergent in a operational and economic business system
- Professional and ethic responsibility
- Effective communication (outside and also inside the company)
- General knowledge widening (general orientation, overview) for understanding the incidence on solution and decision in a postal sector in a global/social context.
- Ability to realize a permanent long life learning
- The best „training“ utilization (do not imagine already made- up and learn on mistakes the others)
- Order, in which are the characteristics shown is not the order of importance, but when whichever characteristic is missing, final effect is debatable and positive image achievement is ambiguous.

Problem	***Traditional access to education***	***Innovative access to education***
Development of skills by doing on the practical projects	low	high
Relations of practise to content of higher education	low	high – more than 50% of study
Requirement of adaptability and re-education of graduates in practice	high	minimal
Flexibility of curriculum in relation with the requirements and needs of practice	low	high
Main topics in study	Facts, information	Logic thinking, creativity, development of skills and knowledge
Form of study	Lectures, seminars, laboratory work, case studies, seminar thesis	Discussion with lectors and specialists from practise, project education, workshops, coaching, working and practice in firms
Content of study	Know-how and experiences of teachers	Needs of ICT sector

Table 1. Comparison of important characteristics in access to engineering education from the point of view of ICT sector in SR

Tendency and attainment of some positive shifts at the university education for the ICT sector has specified objective very clearly. There are many ways how to achieve this objective, for example changing the education form, changing the role and participation main person involved in education etc. The quality of graduates depends also on several factors that we can divide these factors to three groups:

- physiological and psychological development of the people
- family environment
- secondary environment, that student regularly and intensive perceive, especially during the professional preparation, study etc.

The first and second groups are decisive for general quality of the students and also graduates and for their value preferences. They are constant and they create base for expected quality of graduates. So, the main decisions about the quality of students and graduates are related with secondary environment characteristics or processes.

CONCLUSION

Modern approach to university education for the ICT sector represents the progress from the number manager to creative employees, new ideas creators and innovators, because also in the ICT sector, productivity market will have to be replaced by the creative world. The world of perfect working-plan officers and optimizers roll over new profession than creative and innovation engineer, business innovator, thinking innovator, innovation manager. Creativity, innovation ability and change ability will win. The using of ICT in education and its processes can be assessed as one of more innovations that are connected with increasing performance and efficiency of teaching and learning activities. Indeed innovations in engineering education have more aspects that are connected to educational technology, trends in the industry and society, adaptation the curriculum, legal aspects or standards. In the presented paper we discussed some impacts of sector changes on the required competences, knowledge and skills in condition of Slovak education system.

ACKNOWLEDGEMENT

This contribution was undertaken as part of the research project APVV-0230-07 Regional dimensions of knowledge economy and VEGA 1/0149/10 Diffusion processes of new mobile services (m-commerce) and their value chain. It benefited from grants from the Ministry of Education of Slovak Republic and the Slovak Research and Development Agency for which the authors express their gratitude.

USAGE OF TINKERPLOTS TO ADDRESS AND REMEDIATE 6TH GRADE STUDENTS' MISCONCEPTIONS ABOUT MEASURES OF CENTRAL TENDECY: THE CASE OF MEAN AND MEDIAN

Zuhal Yilmaz
North Carolina State University
zyilmaz@ncsu.edu

Abstract: Current need for interpreting data, making inferences from existing data, leads to an increased emphasis on the teaching of statistics in mathematics curricula. In order to teach statistics well, teachers should be equipped with content knowledge as well as technology usage. This study addresses the importance of technological tool usage to introduce introductory statistical concepts; mean and median and diagnose student's misconceptions about these concepts. Three teaching experiment sessions were conducted with three 6th grade American students and this paper reports one of the students' work in the teaching experiments. In each teaching experiment sessions dynamic data exploration software TinkerPlots were used. Study findings support that proper usage of TinkerPlots help teachers to diagnose students' misconceptions and help students to think about statistical ideas and focus on interpretation of the statistical results rather than merely understand the statistical computations. (Chance et.al,2007).
Key words: Mean, Median, TinkerPlots, Misconception

INTRODUCTION

National Council of Teachers of Mathematics (NCTM) in *Principles and Standards for School Mathematics (PSSM)* states that "the existence, versatility, and power of technology make it possible and necessary to reexamine *what* mathematics students should learn as well as *how* they can best learn it" (NCTM, 2000). Being well equipped requires strong preparation. This preparation includes, academic content knowledge as well as pedagogical content knowledge, which imply obstacles that prevent students' learning, and students' misconceptions, and students' prerequisite knowledge and experience that they bring to class. This paper will address the role of technological tool, TinkerPlots (a dynamic data exploration software), in helping teachers to introduce introductory statistical concepts of mean and median to students and to diagnose students' misconceptions around those concepts.

Guidelines for Assessment and Instruction in Statistics Education (GAISE) curriculum framework for PreK-12 states "advances in technology and in modern methods of data analysis of the 1980s, coupled with the data richness of society in the information age, led to the development of curriculum materials geared toward introducing statistical concepts into the school curriculum as early as the elementary grades" (Franklin & Garfield 2006, as cited in Garfield & Ben-Zvi, p.93). Langrall & Mooney (2002) suggests a framework that represents the middle school students" statistical thinking as, describing, organizing, representing and analyzing and interpreting data. This framework is used as a basis for this study to understand how students learn statistical concepts in middle grades. To achieve a better and complete understanding of these measures of centers, NCTM "has recommended that middle school students (ages 12 to 14) have experiences collecting, organizing, representing, and interpreting data" (Langrall & Mooney, 2002, p.1). Teachers have important role in this understanding process. They need to provide meaningful experiences that facilitate students' construction of concept of mean, median and mode. It is important for students to construct their knowledge about the mean, median, mode by directly involving a data collection process. Thus, they have chance to connect the abstract statistical concepts to the real life situations. The other important way to facilitate students learning of central measures concepts is to have an understanding of how students perceive these concepts. At that point, it is important to detect students' conceptions and misconceptions. The major students' misconceptions revealed in the researches (Li & Shen, 1992; Batenero et.al., n.d) are:

1. Students made errors while finding two weighted means

2. Li and Shen (1992) shows that many students forget to deal with frequency of the given data when they are computing the mean
3. Students know how to calculate the mean and assume this calculation satisfies these axioms, identity element and associativity. Students assume that score of 0 do not affect overall scores mean of an examination scores
4. Students define mean as midpoint or most frequent value

All these misconceptions reveal that " knowledge of a computational rule not only does not imply any deep understanding of the underlying concepts, but may actually inhibit the acquisition of a more complete conceptual knowledge" (Batenero et.al. , n.d) This study reports on how a teacher use TinkerPlots to promote a student's (Zan's case) conceptual understanding about mean and median.

METHODOLOGY

In this study three teaching experiments, each lasts 50 minutes, were conducted with three 6th grade students who are studying in United States. Students' work from each teaching experiment is analyzed by using qualitative analysis. In the teaching experiments, real world mathematical tasks and a technology integrated mathematics lesson layout is used. In the teaching experiments, TinkerPlots was used as a technological tool. All three students attended a workshop about how they use this software before the teaching experiments. The task and teaching experiment layouts were designed to elicit students' conception about mean and median.

In the first session of the teaching experiment, students share their initial knowledge about mean and median concepts and collected real world data to analyze them statistically by using TinkerPlots in the second teaching experiment session. These real life application help students to make sense of the topic by firsthand experience. As NCTM learning standards states that, "Students must learn mathematics with understanding, actively building new knowledge from experience and prior knowledge." (NCTM, 2010) Usually many students have some idea about mean as in the sense of average from their daily life experiences. Although these prior ideas are not actually true but they have a strong influence on students' conception about mean, median. As a result, students' initial ideas sometimes become a learning obstacle for them.

In the second session of the teaching experiment, students formulate their conjectures about the mean and median of their collected data (e.g. height of the boys and girls in their classroom). And they test which factors affect the mean and median of their data set.

In the third session of the teaching experiment, students test their conjectures and revise their conjectures. They state their understanding about mean and median concepts and summarize what they learn from these teaching experiments.

ANALYSIS AND FINDINGS

In this part, I will analyze students' mathematical understanding in three process cycles as, student's initial level of understanding, changes in student's understanding during the teaching experiment and student's level of understanding at the end of whole process.

Analysis Around Mean Concept

Watson and Moritz (2000) states that students may have an understanding of calculation procedure of statistical measures mean, median and mode without having deeply understanding their mathematical properties . In Zan's case, firstly she defined mean of the height data set as "It is the middle point of my data." After that, I asked Zeyn "Can you check your assumption by using TinkerPlots to see it is always middle point of your data?" Then she checked her assumption with two numbers first as 145 and 150 and see that the mean is half of the sum of two data measures.

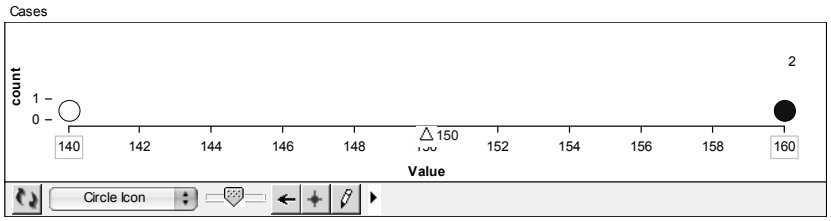

Figure 1: Student's work: Mean of 140cm and 160cm is 150cm

In the previous case, the mean was still the middle value of the given data set. So, I asked "if you have one more height data measure, what happens to your mean?" Then, she added one more data measure and realized that the mean was not the middle measure of her data set. Usage of technology, TinkerPlots, created contradiction with her understanding of mean: the middle point of her data set. TinkerPlots assisted her to attach the meaning of the definition of mean into her experience. She continued to check her assumption by adding or removing data from her existing data in Tinker Plot and write her findings about the mean and median of each data set in her data table. Eventually she defined the mean as, "sum the all data measures and divide the total number of data." As, Ben-Zvi (2000, p. 128) points that, usage of technology leads active construction of knowledge related to mean by "doing" and "seeing" statistics.

The next part of the teaching experiment continued with addressing Zan's interpretation of frequency of the data concept while calculating the weighted means. In order to assess the student's initial perception, I posed a word problem as, "There are 10 students in the classroom 6 of them boys and 4 of them girls. The average heights of girls are 155cm and the average height of boys are 170cm. What is the average height of ten students in this class?" The student said, "since we have two groups, boys and girls we add two means and divide by number of groups: two." After that, I let her to keep continue on the given activity sheet, since in the activity sheet student asked for finding mean of the data measures by adding additional height measures, which were sometimes equal measures, sometimes not. Also, during the process I asked her "If you have two equal height measure data and one different height measure of data, how do you find you mean?" She tried several scenarios in TinkerPlots and observed the mean behavior in each case. Eventually, she reached four conclusions:

1. "If I have some data measures and I add some new measures into my data then my mean will affect."

2. "If I add a data greater than my existing mean, the new mean will increase." Figure 2 shows one of the student's works.

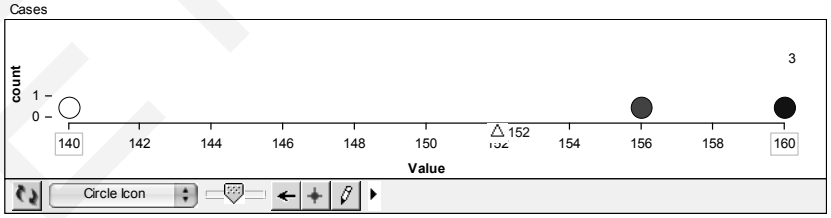

Figure 2: Representation of adding a greater data measure (156cm) than the previous mean (150cm), the new mean is 152cm

3. "If I add a data smaller than my existing mean, the new mean will decrease." Figure 3 shows one of the student's works.

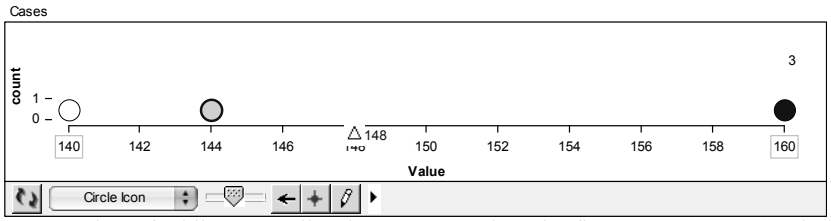

Figure 3: Representation of adding a smaller data measure than the first mean (150cm). The new mean is 148cm

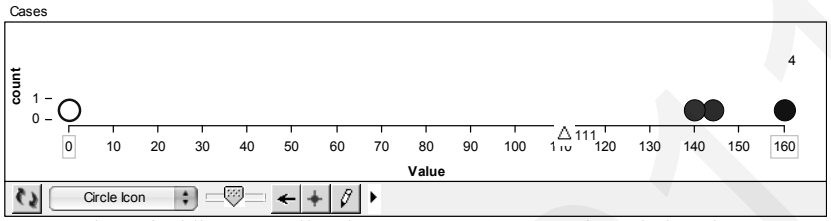

Figure 4: Representation of adding a smaller data measure (zero) to the existing three measures. The new mean is 111cm

In this case, Zan understood that adding zero to her existing data set decrease the mean. Usage of TinkerPlots remediates the previously stated misconception: students know how to calculate the mean and assume this calculation satisfies these axioms, identity element.

4. "If I have equal measures of data, all my data measures contribute to my mean so, I need to divide by number of my data measures not number of groups." (Figure 5A and 5B)

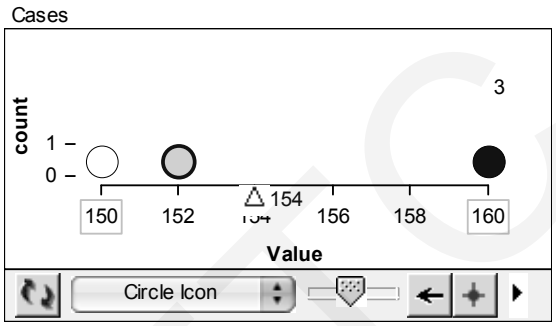

Figure 5A

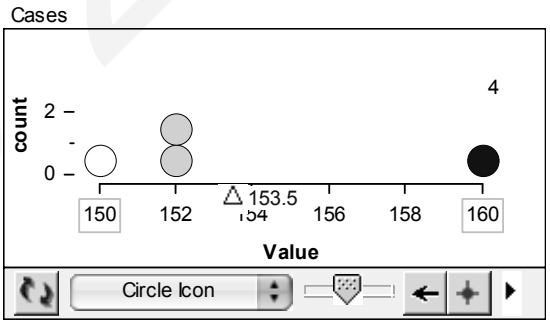

Figure 5B

Figure 5A showed that she added a data measure (152cm) into her existing data set and observed that her mean changed. Figure 5B showed that she added the same data measure and observed that the frequency of the data measure had an effect on her mean. Then she concluded : " in the first problem, I divided group's mean value sum by the number of the groups. Now, I understand that it is not correct. I need to divide my total measure by the number of the total people." First, she multiplied the number of the boys in the class with their avareage height measure of boys to find the total height measures of boys in the class. Second, she multiplied the number of the girls in the class with their avareage height measure of girls to find the total height measures of girls in the class. Last, she added these two total height measures of boys and girls. Then, she divided the total measure by the total number of the students in the class to find the average of height measure of the class. Figure 6 represents Zan's solution process for the first word problem.

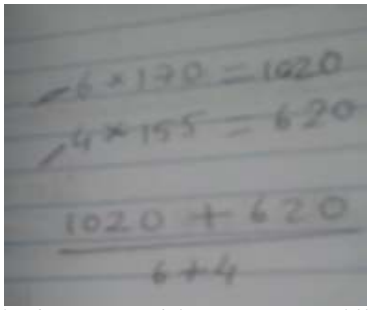

Figure 6: Student deal with the frequency of data measures while calculating weighted mean

The dynamic nature of TinkerPlots allows Zan "to focus on interpretation of results and understanding concepts rather than on computational mechanics" (Chance et.al, 2007). Zan had chance to add, remove and drag cases and reflected observed phenomena and revised her initial thoughts about how to calculate weighted means and how to deal with frequency of data measures while calculating the weighted mean.

Analysis Around Median Concept

Zan's initial conception about median was, it is the middle of the scale. She showed what it means to be the middle of the scale by adding the smallest and biggest value from the data set and divided by two. Then she described the final value: "this is my median." After that, I asked Zan "Can you check your assumption by using TinkerPlots?" With the help of the activity sheet, she tried several scenarios and note down the changes in her median. In her first trial in TinkerPlots, she added two data point to the graph and noted on the worksheet, her conjecture hold. Then she tried three data measures and noted that, her conjecture did not hold. At that point, I asked "why your conjecture did not hold?" She said "in this case it is the mid value of my data set, not the value for adding biggest and lowest number and divided by two." She added one more data measure to the existing three data measures. She said "My median is changed again." I asked "Why do you think it changes again?"

Based on overall observation that she made, she realized that, number of the data measures in the data set affect her median and she revised her conjecture. Her new conjecture was: "My median cannot be half of the sum of biggest and smallest number in my data, it should be something else." Then, I asked "What it means to be something else? What sources may help you to figure out this?" Then she turned back to her notes about each trial that she made. She tried to catch up a pattern. At the end of the teaching experiment, she realized that, when she had an odd number of data measures the median would be the middle data measure of the set. Also, when she had an even number of data measures the median would be half of the sum of two middle data measures.

DISCUSSION

Designing teaching experiments around revealing misconceptions and determining prior knowledge is parallel with NCTM's teaching principle: "Effective mathematics teaching requires understanding what students know and need to learn and then challenging and supporting them to learn it well." Technology usage has important role for teaching mathematics effectively. In this study, proper usage of TinkerPlots software challenges students to organize data, order data and explore the mean, median and mode by using real life cases. Ben-Zvi (2000) states how technological tools can support students' statistics learning. Table 1 represents these benefits (Ben-Zvi, 2000) and some implications of these three teaching experiments. (2000, p. 128)

Technology Usage Benefits	Example Learning and Teaching Implications from Teaching Experiment
Students' active construction of knowledge, by "doing" and "seeing" statistics	Students can use the collected data to form graphical representations in Tinker plot Students can form different data that has same mean, median and mode
Opportunities for students to reflect on observed phenomena	By adding and removing cases in the Tinker plot and observe their effects on mean, median and mode For instance, they add identity element 0 cm to the cases so they will see identity element also effects mean, median so they can see there is no identity element for mean and median
The development of students' meta-cognitive capabilities, that is, knowledge about their own learning and thought processes, self-regulation, and control	Follow up questions after dealing with technology help students to be aware of their own learning and understanding. For instance, what do you notice when you remove a bigger value case from your data collection? What will happen if you remove the smallest value?

Table 1. Benefits of Technology Usage and Exemplars from Teaching Experiments with TinkerPlots

The important aspect of TinkerPlots is: it lets students' visualization of abstract statistical concepts and immediately reflects the changes in data set on the graph. TinkerPlots gives opportunity to students to apply what if case scenarios by adding or dragging data icons so students can observe and analyze what happens to mean, median and mode of the given data set. By doing so, they can realize which factors affect the mean, median and mode.

All these attributes of the TinkerPlots helps teachers to remediate students' misconceptions about statistical concepts and helps students to explore the meanings of these abstract statistical concepts and understand underlying statistical ideas behind mere computation (Chance et.al, 2007). This study supports the notion that, appropriate usage of technology lets students exercise statistics with real data that allow them to make sense the statistical concepts and their interpretations. (Ben-Zvi , 2000) But, the technology itself is not enough to create these opportunities and experiences. There need to be a teacher assistance to promote questioning, discussion in order to create a complete understanding.

USE OF NEW MEDIA TOOLS IN EDUCATION: iPAD MODEL

Cem S. SÜTÇÜ
Marmara University, Turkey
csutcu@marmara.edu.tr

Deniz YENGİN
İstanbul Kültür University, Turkey
d.yengin@iku.edu.tr

Abstract: We live in a time of a continual transformation in technological advancements. McLuhan's "*Technological Determinism*" theory corresponds to the daily individual experiences with technological expansion in all areas. New media has an important place in these transformations. New media tools accelerate digital transformation with its characteristics such as digitalization, interactivity, and virtuality. The institution of education, which shapes individuals' future, renews itself constantly according to demands. As we know, young generations are shaped primarily by visual information, thus technologies; especially media-rich technologies become important tools during their education. In this study technology is taken as a helping tool for education. The new media tool –Apple's tablet computer "iPad" is analyzed whether it changes education, how and why? Increasingly, a lot of people including experts say that it shows the new ways to engage students in lessons and make use of cutting edge technology in classrooms. To us, the iPad represents a new pinnacle of the shift from wired society to "wireless society", along with the cellular phones as users become "digital immigrants". The Ipad's intuitive touching experience, its form factor and its thousands of free or cheap applications for education purposes seem very promising and iconoclastic. Applications are especially play a major role because instead of static publications and they are using dynamic content with animation, movies, video, and other multimedia built into it. Some argue that tablets will change education in the future because they align neatly with the goals and purposes of education in a digital age either in or out of the classroom. The impact of Internet and tablets on journalism profession is a good example for high expectations in education field. Even today's K-12 students have the world at their fingertips when it comes to technology, and are only limited by budget when it comes to getting their hands on items like Apple's new iPad. A lot of the success of the iPad (if there will be) as it enters the realm of education will be on the shoulders of iPad application developers, curriculum developers, and educators. In this study, allegedly said six things the iPad will change in schools and education namely textbooks, note taking, paperless classroom, studying and reviewing, student interest level, and individualized curriculum will be analyzed by conducting surveys among application developers, curriculum developers, and educators and students. The questions will provide insight into the parties' perspectives on and interests in the use of new media tools in education. Thus, a model will be formed that will help to show the use of tablet devices in education as a new tool.

Introduction

Today we race with time amid fast information exchange traffic. Under shower of information, people have access to, interpret and share information with others. In this age of information when the information is the most important capital, technological advances have accelerated. Made up with a combination of the words "techner" and "logos" in Greek, technology means "*systematic application of the information processed in the industry*" (Atabek, 2001). Conveyance of the past through papyrus, parchment and paper as technological means of the era to today has made possible the growth of technology rapidly. Particularly the process of conveyance of information by means of manuscripts has become formalized with visual codes, giving birth to a uniform, repeatable and reproducible cultural reality (Innis, 2006). Especially the writing, which is artificial in all respects, is a technology (Ong, 1995). As a result of transfer of the writing to the press systems, technological developments have become more manifest and reached vast masses. Especially as a result of introduction of the Internet to our life, technology has become an indispensible means. McLuhan has brought forward the theory of technological determinism. According to this theory, the community is transformed into a small village as a result of information bombardments (McLuhan, 1992). This transformation is toward the direction where the people will lose their old private identities and will be assigned with new identities within a social structure as a part of the technology. The notion of technological

determinism emphasizes the fact that the destiny of man is not determined by him, but by the technology which is an extension of the man. McLuhan focuses on the fact that the communication means which shape the world direct the affairs of the masses and that the mass uniformity emerges. Technological determinism, especially spread of the Internet, accelerates the sharing of the information. In this sense, the concept of network society becomes important.

Interaction Society

Society of today is referred as the *Network Society*. Underlying the transformation of the people in the information age from the information society into the network society, Castells, starting from the Informational Capitalism, draws the attention to the importance of the information by saying that "*Interaction of the information with the information is the very source of the manufacturing*" (Castells, 1996). Stating that McLuhan announced in his book, *Gutenberg in Galaxy*, that the television is the end of the printing system, Castell announces in the same way the transformation of the information society through the Internet medium into the interactive society. Stressing a society where the technologies working on the information are in the center, Castells cites the determinism of the new order which he defines as the 'informational mode of development'.

The network society conceptualization, in fact, does not bring about a new thing for human kind. Humans live in networked environments as social beings. Being social means belonging to a network. Therefore, new media systems or so called information and communication technologies (ICT) help individuals to be full-time networked. Even when they are out of reach of cables, they help or make it possible to connect wirelessly. So that it is not a coincidence that first Internet and later wireless technologies have been welcomed by the society and widely adapted.

In everyday life we see several examples of pros and cons of being full-time networked in our business life and in our spare time. This connectivity issue is so intense that some scholars argue that we are stepping into the fluidity of interaction in an emerging interaction society from the network society (Wiberg, 2005, p. 15).

According to Wiberg, there is an ongoing broadening of the use of information technology (IT) that traditionally has been applied for calculations, transactions, storage of data, etc., into new areas more closely related to human communication and interaction needs. We mention those areas as social networking, healthcare information systems, e-commerce, mobile phones, tablets and e-learning (Wiberg, 2005, p.vi)

Pervasiveness of New Media and iPad Example

Today, greater part of the society is closely familiar with the institution of school. Especially from the age six or seven on, individuals enter into an interaction with the school and as a result the school becomes a part of their life. The objective of the school is to impart information on various topics, such as living in a society, today's environment, culture, rules or laws to the individual in a systematic way under the name of education. The notion of education, which comes from its Latin roots '*educare*', meaning 'to feed', and '*educere*', meaning 'to grow' (Tanilli, 1998), is defined as "*educating and cultivating of the children by their parents, relatives and older members of the society until they reach the adolescence in relevant with the jobs, functions and modes of behavior they will take upon in the future"* (TDK, 2011). For this reason, education, which plays a great role in maturing and formation of the individual, is the most natural right that the individuals must have.

Duration of education covers more or less one third of one's life span. As a result, we give direction to our future in line with the education we get. Especially university students are equipped with theoretical and practical information throughout the study for bachelor's degree. However, the most important problem here stems from the fact that the student is unable to make the connection of a subject learned in a theoretical course with the real life. In a system based on learning by heart from the elementary and intermediate school to the university, the students are focused on either passing to the upper class or getting the adequate grade marks for the courses.

The mediums designated as 'new' are discerned by examining such characteristics which differ from one thing to another, rather than by passing of time. The new becomes the old depending on the technology which pertains to it.

The communication medium is regarded as the future of the yesterday and the past of the today. While the writing was once the most important technology, it now has become an ordinary medium belonging to the past. What the adjective '*new*' in the new communication medium denotes is very important. The communication itself has not changed, but rather the communication medium itself is designated as new. The medium is a vehicle by means of which the message is transmitted from the source to the target. The new communication medium has the characteristics of being able to bring all known mediums distinct from each other together. As an extension of the digitality, the new communication mediums represent the mediums where the loss of data is prevented.

The communication medium is one of the basic fields where the thought of the human beings is shaped. This field is updated by means of the mass communication means which are shaped through the technological developments. Getting updated makes the use of the word 'new' compulsory. The communication medium is getting transformed by taking on board and getting reconfigured by the advances in the present day, evolving into a new communication process. In short, the new communication media are the fields of communication where interaction at high speeds occurs between various different components in a structure built upon a digital coding system.

Wiberg says that the computers of yesterday were commonly labeled as "information technologies," "IT" or "IS" (i.e., Information Systems). He suggests that it might be a good idea to reinterpret this "IT" acronym because of the fact that more social focus of modern IT use might be more appropriate and talk about IT in terms of "Interaction Technologies" as a general label for what this technology does for us on a social level (Wiberg, 2005, p.4).

Today, as Wiberg mentions, it becomes clear that also the role of the technology has changed from being in the frontline of our attention to now becoming a more pervasive technology that enable us to do new things without directing our attention to the technology per se (Wiberg, 2005, p.4).

In the related literature there are many studies about how to use "computers in education" and "the impact of computers in education". A quick search in Google Scholar reveals 2.6 million results for the former keywords and 951,000 results for the latter to view respectively as early as 1965. When we search these keywords only in ACM Database (Association for Computing Machinery – acm.org) we found 97,413 within The ACM Guide to Computing Literature (Bibliographic citations from major publishers in computing), and found 27,080 within The ACM Guide to Computing Literature (Bibliographic citations from major publishers in computing) respectively. Since its launch in April 3rd, 2010, the iPad (for an extensive review read Angelova, 2011) has got enormous interest all over the world and sold 300,000 iPads sold in the first day (Waters, 2010) and nearly 19 million worldwide in one year (Costello, 2011). This and other products made Apple a big revenue (Apple Reports, 2011) and the brand became the most valuable brand in the world (Prodhan, Sharp, 2011) When you do a quick search "ipad" in Google you get 760 billion results for viewing as of May, 2011. On the other hand, if you search "ipad tablet or apple ipad" in Google Scholar you only get 4,260 results to view. And the search "ipad in education" in Google Scholar you get 10,800 results to view. When we search "ipad in education" only in ACM Database we found only 88 within The ACM Guide to Computing Literature (Bibliographic citations from major publishers in computing) as early as 2010.

Ipad is defined as post-pc product by its creator/producer Steve Jobs and this view seems accepted among both the users and technology producers. As we look at the market share of iPad among other tablets and the number of similar products introduced to the market in less than one year period (Hiner, 2011) we can tell that this may not be exaggeration despite some counter-arguments (Dignam, 2011, Gewirtz, 2011).

This product (iPad) has opened up interesting issues recently. They are interesting because the problems that these issues address are very important. For example, some people show as a concept that iPad (or we think any other tablet too) can be used to allow the blind to use iPad (Moylan, 2011). Another issue is that The US Justice Department is currently testing encryption software – Good for Enterprise – iOS and LRW's Pinecone – to determine if it is suitable for transmitting sensitive data via government-issued iPads. The Federal Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF) may receive up to 4,000 iPads from Apple for use with teleworking, according to The Washington Post. Currently, 80 percent of ATF employees are eligible for teleworking. The US Office of Management and Budget (OMB) gave all government agencies 90 days to explore new technologies and solutions to reduce costs and increase the number of employees

working from home. An astounding 1,000,000 Federal employees are eligible to telework, which is more than half, while currently only 10% do so (Britton, 2011).

We think that the tablet era that we are living through is different than the previous times because we actually see that tablets draw the attention of lay public. We can say thay popularity of technology devices among all levels of society is rising. Their sales are exceeding the PC sales (Dutt, 2011, Harris 2011). And finally, we can say that their "new" method of interaction i.e. touch screen and gesture interface has drawn attention of educators.

Use of New Media Tools in Education: iPad Model

According to Steve Cheney, ever since MIT's famous OpenCourseWare initiative was launched in 2001, people have been fascinated with the power that technology would have on open sourcing of information and the democratization of education. […]The iPad will take customized learning a step further, by factoring in a student's presence. Collaborative and Social tools will enable students to interact with the online and physical world at the same time—sharing info in real-time and making that sharing valuable in the context of their current physical environment (Cheney, 2010).

According to his article in Mactrust, Roberts argue that with children spending on average 900 hours in the classroom and 1500 hours watching TV, the iPad seems to have found stronger support for its interactivity, less harmful advertising, portability, and learning applications. He adds that strong opposers of both mediums were also vocalizing with valid points of getting away from screens altogether and actually going outside and enjoying this great planet we live on. But he argues that the fact remains that perhaps the iPad is a greater tool for your children than TV because of the wide variety of functions and interactivity it can provide and if you just want to watch TV, well you can do that on your iPad anyway (Roberts, 2011).

When iPod was introduced in 2001, there was almost the same flame of enthusiasm as we witness today. Later, iPod device (although it was not a PC alternative or companion at all) has been widely used and the term "podcasting" became familiar in business and educational environments (for example, Bovee, Thill, 2010, p.225-230, Digiovanni, L., Schwartz, S. & Greer, C., 2009)

On the other hand, iPad and similar tablets are very new. It started in 2010. But there are many people thinking and sprending time on how to use iPad/tablets in education platforms. For example, you may look at articles like Penny, 2011 and blogs like Mark Wagner's Educational Technology and Life (http://edtechlife.com/?p=2477), Ian Wilson's iPads in Education (http://www.ipadineducation.co.uk/) Sam Glinksman's iPads in Education blog (http://ipadeducators.ning.com/) and iPad 4 Edu (http://ipad4edu.com/).

According to Wilson, traditionally there have been 4 spaces in education (Wilson, 2010a):

- The handheld space contains products such as the iPod Touch and smart phones, devices which fit into the pockets of learners and are able to be taken anywhere as they can stay with the learner. Due to the small physical form factor and therefore small screen size, it is primary used for 1 to 1 learning.
- The portable space has been filled by laptops, notebooks and netbooks, offering screen sizes of 10" and above with the 17" display laptops offering close on desktop power and functionality.
- Desktop computers provide the power and screen estate to do serious video and audio editing work, both of which are more difficult to do meaningfully on other smaller machines.
- Finally, servers are the workhorses which provide the infrastructure behind institutional networks.

The 'agile' space now created by the introduction of the iPad, although tablet style devices have been around a while, has yet to be proven as educationally useful; indeed some are not convinced that there is any need for another 'space' in learning technology (Wilson, 2010a).

One of the great aspects of the whole iPhone and iPod Touch eco-system, into which the iPad was launched, is the amount of free and cheap apps written for these devices. The iPad can take advantage of this existing situation and can run the vast majority of the current educational apps on the App Store. Fortunately many of the free and cheaper apps have been re-written for the iPad and its larger screen. Given the current financial situation for most schools, the resource of free and affordable software on the App Store is particularly valuable (Wilson, 2010b).

The iPad's most mentioned properties are that the iPad will change in schools and education namely textbooks, note taking, paperless classroom, studying and reviewing, student interest level, and individualized curriculum (http://blog.targethealth.com/?p=15488). They are seemed a bit presumptuous but considering its new way of interaction, and enthusiasm around the product make us search the possibilities of this change.

Figure 1: *Screenshot from iPad showing some apps for writing and educational purposes.*

Some schools already started to adop their iPad pilot programs in their curriculum (I-Pads Continue to Gain Ground at College, 2011, McCrea, 2010, Ferenstein, 2011). Obviously, the iPad has the potential to replace more than just textbooks. Andy Zucker says that the recent introduction of devices like the Amazon Kindle and the Apple iPad is a reminder that the printed book will evolve in the face of new digital devices, new capabilities for users, and new business models. But he thinks that schools must go further than this and asks the following questions: Suppose the textbook of the future included movies, animations, and interactive models so students could better understand complex ideas? What if end-of-chapter quizzes were interactive, allowing students to immediately see their scores as well as links to tutorials for questions they got wrong? How about allowing students to respond to homework assignments directly from the textbook, or permitting teachers to make modifications in the electronic text to meet needs of their students (by changing vocabulary, say, or adding more problems)? Can the textbook accommodate limited readers of English, by speaking text aloud or including an interactive glossary? (Zucker, 2010). According to Donahoo, the iPad is more than simply a media consumption tool. He says "we don't need one iPad for each child; we need each child to have access to an ipad. We need to recognize that creativity is not fostered by technology, but technology is one tool through which creativity can be expressed." (Donahoo, 2011).

Brian Phipps sees the iPad and iOS platform as proactive learning platform that improves education and pays cultural dividends many times over, across every country in the World. He concludes that the iPad's ability to combine textbooks, lectures, class materials, course notes, class work and reference materials in an interactive, networked device could make the iPad a handheld university, a portable and immensely powerful learning platform. Combined with an expansion of Apple's iTunes University, iTunes distribution network, and working arrangements with textbook publishers and universities, the iPad could enable Apple to become a leading brand of education Phipps, 2010). Despite the pros of this platform the biggest problem seems to some is that if there's a specific application you need for a class, if there isn't a similar app already in the App Store, you're out of luck (Crump, 2010). But, educational iPad applications (as of 15th of May 2011 there are 9,581 apps in the App Store) can cost $2, $15, or more, but some programs are available for free, as reported by Carter (Carter, 2010).

Methodology

In this study the data has been collected through survey method. 450 respondents have been asked 19 survey questions via the survey portal of Marmara University (http://anket.marmara.edu.tr/v2/survey.php?sid=284). The survey questions are closed ended questions. Four of these questions measure demographic qualities, two of them about usage of the apple products and the other thirteen comprise the questions concerning the usage of iPad tablet in education.

Findings

Data from 450 respondents has been collected through the survey held via internet. Survey questions have been addressed to 238 males (53%) and 212 female (47%) (Table 1)

	Frequency	Percentage
Female	212	%47
Male	238	%53
Total	**450**	**100**

***Table 1**: Distribution according to gender*

The participants have been asked distribution questions comprising 5 scales according to their ages. Distribution is measured according to the groups between 13-18, 19-24, 25-30, 31-36 and 37 and above. It is found that 19-24 age group has the highest number of members (307 out of 450 respondents) with a rate of 68%. And 54% of respondents have 500 TL or more monthly expenses.

	Frequency	Percentage
Haliç University	53	12
İstanbul Kültür University	296	66
Marmara University	18	3
Other	83	19
Total	**450**	**100**

***Table 2:** Distribution of students universities*

73% (328 people) of the respondents stated that they use Mac products. And 135 of the respondents (30%) were actual iPad users.

Other questions aim to learn respondents' approach to the use of iPad in education. The five point Likert scale is used in the following definitions. Table 3 shows the distribution of assessment the usage of iPad in education.

	Strongly Disagree		Disagree		Neither Agree nor Disagree		Agree		Strongly Agree	
	f	%	f	%	f	%	f	%	f	%
Visual representations are important to achieve clarity while teaching a course.	3	1	-	-	4	1	103	23	340	75
Use of tools is required to support teaching.	25	6	37	8	51	11	113	25	224	50
iPad is an easy to use tool (user-friendly).	29	6	99	23	127	28	116	26	79	17
No special training is required to understand ipad interfaces.	26	7	74	16	78	17	172	38	100	22
iPad is necessary while teaching a course.	15	3	117	26	106	24	160	35	53	12
iPad may facilitate the understanding of courses with several applications.	25	5	42	9	72	16	125	28	186	42
Information provided during the courses may easily and entirely be stored by ipad.	12	3	54	12	110	25	185	40	89	20
I think the touch screen of iPad and similar tablets is a facilitating feature.	3	1	85	19	71	16	61	13	230	51
The fact that iPad and similar tablets reduce the need for tools such as keyboard and mouse increases interaction with the tablets.	5	2	31	7	75	16	221	49	118	26
I think the interface of iPad is more transparent.	3	1	12	3	107	24	284	62	44	10
I think those who are used to using computers may have difficulties with the use of iPad.	126	28	125	28	156	34	35	8	8	2
I think all future computers will resemble tablet computers in size and feature.	4	1	155	34	13	3	173	38	105	24
I think the use of iPads in education will not affect the use of laptop and desktop computers in education.	64	14	196	43	125	28	35	8	30	7

Table 3: *Distribution of assessment the usage of iPad in education*

In order to test the reliability of the scales, Cronbach alpha (α) coefficient has been calculated. The low value of the Cronbach (α) coefficient (close to 0), which is the most common reliability method, shows that the variants are not reliable. The alpha coefficient is found 0.594 if 10 questions addressed to the users according to the five point Likert scale is studied mainly according to the Cronbach alpha values. The alpha coefficient close to 1 shows that the scale is highly reliable.
After conducting a factor analysis using varimax rotation method, we obtained KMO Measure of Sampling Adequacy 0,584 and Bartlett's Test of Sphericity p-value=0,000 which means our sample is adequate for factor analysis. Analysis revealed us four factors. We named these factors as following:

1. "Ease of Comprehensibility" of iPad in courses.
2. "Form Factor" effect of iPad compared to other PCs.
3. "Superiority of Interactive Interface" of tablets copared to PCs.
4. "Ease of Use" of iPad.

When we conduct Mann-Whitney U nonparametric hypothesis testing on these factors among females and males. We saw that in case of "Ease of Comprehensibility" of iPad in courses female and male respondents have significantly different opinions (p=0.001). Female respondents are more tending towards a positive view than male respondents. On other factors they are indifferent.

It was interesting to see the results of Kruskal-Wallis H nonparametric hypothesis testing among different age groups on these factors. We saw that in case of "Ease of Use" of iPad, respondents in 5 age categories have significantly different opinions (p=0.000). Respondents in 13-18 age group are more tending towards a negative view than all other ages groups respondents. On other factors they are indifferent. The possible cause of this result may be the fact that the relatively problematic PC savviness of respondents in older age groups make them think that using iPad or similar tablets is easier than using PCs.

We foud no significant difference among the different spending categories of respondents in terms of all four factors. This may indicate that the amount of spending does not play a role on these factors.

It was very surprising to see the results of Mann-Whitney U nonparametric hypothesis testing among users and non-users of iPads on these factors. We saw that in case of "Ease of Use" of iPad, respondents in two

groups have significantly different opinions (p=0.005). Respondents in iPad users group are more tending towards a negative view than non-users group. On other factors they are indifferent. The possible cause of this result may stem from a possible slow or difficult adaptation period to iPad's relatively new finger-touch interface.

A parallel result is faced when we conduct Mann-Whitney U nonparametric hypothesis testing on these factors among Mac users and non-Mac users (PC users). We saw that in case of "Ease of Use" of iPad, Mac users and non-Mac users have significantly different opinions (p=0.004). Again, this may be due to the "different" interface of iOS compared to Mac OS. Mac users are more tending towards a negative view than non-Mac users. On the other hand, in case of the "Superiority of Interactive Interface" of tablets copared to PCs, Mac users have a more positive view than non-Mac users (p=0.036). This recalls us that Mac-users see iOs as having a superior interface than Mac OS. On other two factors users are indifferent.

Conclusions

Technology is in the foreground throughout the study. Especially the communication media updated on daily basis brings along with it difficulties and facilities. The difficulties may in general be interpreted as the adaptation or adaptation problem of individuals to the media. However, the tablet media offers many possibilities to the individuals. iPad as a new media is becoming a significant rival both against PC and Laptop. With easy-to-use nature and system, iPad offers many features to the users including portability, muldimedia possibilities, interface facility, applications, touch screen usability, convergence and productivity. iPad transforms many elements in education such as book carriage, note taking, follow-up of courses into easily applicable activities. iPad will change the concept of education significantly with many features like Ebooks, voice record of the classes, paperless classroom, electronic note taking, web research, presentation, publishing, art-work, digital storytelling, creativity, studying reviews and individualized curriculum. iPad could provide the students the change to take better care of their educational resources. Especially in today's communication media where the web concept is replaced with applications, the data transfer speed of communication shall speep up with features like productivity, convergence, mobility and community and therefore the communication will increase. Within this context the education will be fast, interactive and productive with the use of new media and the data exchange of students will be more efficient through a creative communication media.

Abstract The growth of the Internet in the world provides many opportunities to many people around the world in many different ways. When students are considered, the use of the Internet is mainly for social and entertainment purposes. However, it is very obvious that the Internet provides not only social connection and entertainment, but also academic and scientific information as well. Additionally, the Internet can be used as a tool to learn the latest news all around the world as well as getting any kind of information that serves different purposes such as learning more information about a hobby or health. Therefore, it can be said that the Internet is the source of spreading information quickly to a large audience and of going beyond the limitation of time and space. In the light of the above information, it is vitally important to encourage students to use this invaluable source to get any kind of information they need in their academic studies. For the reasons mentioned above, the aim of this study is look at the students' use of Internet in their academic studies. The participants are around 150 English Preparatory School students in Eastern Mediterranean University. These students have come from different countries in order to study at various departments in the university. The study is carried out in the Spring Semester of the Academic Year 2010-2011.

Keywords: *Internet, Education, Prep School, Academic Use of Internet*

INTRODUCTION

In modern life, the communication amongst people varies as there are more than one alternative for effective communication. This has been applied in education as well. In the past, the only way for an instructor to communicate with his students was face-to-face conversation whereas today the messages are able to be conveyed in a voicemail or telephone conversation, a written memo or letter, or an e-mail besides face-to-face interaction.

The variety of the use of electronic feedback on the Internet is one of the rapidly growing areas in every aspect of education, especially in higher education. Using electronic feedback speeds up the delivery and also the quality of it. The most common electronic way of giving students feedback is to use e-mail. There are a number of advantages of using e-mail while giving students feedback. One of them is that an e-mail can be sent at any time and at any place convenient for the sender. Another plus is that the sender has the chance to edit his feedback before sending, which is not possible while giving face-to-face feedback. Also, it is an asynchronous process so when the feedback is sent, the receiver can read it any time he is available and ready. Additionally, time constraints make it impossible to spend too much time with one student in terms of detailed feedback. However, the length of an e-mail could vary according to the needs of the students. The other benefit of using e-mail to give feedback is that students can get as many feedbacks as they would like to or they need to. Thus, this chance is provided for both instructors and students for a better communication while giving feedback.

Consciously or not, especially sending e-mails is an increasingly preferred way for communication between instructors and students in this technologically developing world. In the context of feedback communication, students directly or indirectly ask for feedback via e-mail as this can be considered as a less formal and adequate, maybe practical, way to convey their important -personal- messages (King & Xia, 1997). As Brown (1997) and Gibbs (1992) have discussed, returning feedback to students on their work plays an important role in the learning process. No matter this also requires some technical knowledge or capabilities, online communication for giving feedback is the way that is perceived as appropriate even by scholars (Markus, 1994; Nadler & Shestowshy, 2004).

Some research suggests that negative feedback can cause some problems (Lawler et. al., 1984) so that the recipients tend to shield themselves psychologically from this kind of feedback. Consequently, as research has shown, the recipients who get negative feedback tend to disregard it and believe that it is not useful (Facteau et. al., 1998; Brett & Atwater, 2001). Besides the fact that feedback (either negative or positive) needs to be delivered successfully, it also has to be accepted by the recipient as well (Ilgen et.

al., 1979; Bannister, 1986) as the effectiveness of feedback is determined more by the recipient's understanding than by the rating instrument itself (Feldman, 1981).

BACKGROUND OF THE PROBLEM

In one of the compulsory courses offered by Educational Sciences Department to all Education Faculty students, Research Methods, students are expected to work cooperatively with their instructor. They are supposed to learn the steps of how to research and report the research and follow these steps by submitting a mini thesis at the end of the semester. Because of the nature of the course, it is necessary for instructors to be aware of every step students follow in order to help them better. Students are asked to contact with their instructors and show their necessary documents to their instructor in every step of the study. First of all, they need to show their instructor their hypothesis, the articles they have found to be included in the literature review section, and an instrument to be used in their study and get the approval of him. As the instructor had three different groups last semester and there were around 30 students in each group, it was very difficult for the instructor to arrange a meeting time with each student. In order to overcome the time constraint and to be more helpful to the students, it was necessary to find another way to be more effective in this process. In order to overcome the communication problem and use time more effectively, it was decided by the researcher to use e-mail as a feedback tool.

THE AIM OF THE STUDY

As using e-mail is considered to be one of the effective feedback tools, in this study it was aimed to examine the efficacy of using e-mail as a feedback tool.

METHODOLOGY

Research Design

Action research, which is a process in which participants examine their own educational practice systematically and carefully, using the techniques of research, was conducted during the study in order to find a solution to the problem of immediate communication with the students.

Participants

In the study there were 90 students from three different groups who were studying in different departments of Education Faculty during the fall semester of 2010 – 2011. These students were taking the course "Research Methods" as part of their academic studies.

Procedure of the Study

One of the requirements of the course that students took was to design a research, conduct it and report it. The final report of their own research was one of the components of their assessment. So in order to be successful for this course they had to complete this report successfully. When they were assigned the task, students were told that they could also send an e-mail in order to contact with their instructor, instead of getting an appointment and visiting him in his office or waiting for his office hour every week. They were told that they could contact with their instructor via e-mail in each step of their study in order to get an approval from their instructor. During the study, the instructor mostly communicated with the students via e-mail as this was students' preference and the instructor tried to be online not only during the day but also after school. When students submitted in their reports to their instructors, they were asked to write down their opinions about using e-mail, and they were told that they were free to write any kind of opinions.

RESULTS

Positive Opinions

Table 1 shows the participants' positive opinions about using e-mail as a feedback tool and the students' opinions were put in order according to frequency level.

Table 1 showed that using e-mail saves time was the most common opinion of the students and out of 90, 28 students believed that e-mails helped them save time because they did not have to go and find the instructor in order to get feedback. They reported that sometimes it was very difficult for them to visit the instructor and they preferred to delay it. Even one of the participants said that "I could contact with my instructor without wasting any time, whenever I want."

For the participants another important point was "getting feedback in a short time". 25 students out of 90 believed that this was the most important point of using e-mail as a feedback tool. They were happy that they did not need to wait for another meeting to get feedback.

24 students reported that e-mails made the communication easier. They believed that they faced with problems while contacting with their other instructors due to different reasons such as having meeting, having classes or meeting too many students. However, they commented "e-mails enabled easier communication between me and my instructor."

Students believed that using e-mails gave them a chance to contact with their instructor outside the working hours. They stated "I had the chance to send an e-mail when I was studying at home, and normally I study after school so it is good for me to have a chance to share my opinions with my instructor whenever I want," 12 of the students shared this view and they were happy with it.

Students reported that when e-mail was used as a feedback tool, they had a chance to clarify the topics which were not clear for them. "Sometimes I had some questions in my mind that needs to be clarified and I couldn't have moved on if I hadn't had the chance to ask my instructor whenever I need." 11 of the students reported how important that chance was for them. Similarly, seven of them believed that using e-mails gave them the chance to ask immediate questions to their instructors.

It was interesting to find out that 5 of them believed using e-mails helped them prepare comprehensive reports for their course and five of them reported them using e-mails helped them to study in coordination with their instructor.

Table 1 Positive Opinions about the Use of E-mail

Positive opinions	Number of Students
Getting feedback in a short time	28
Time saver	25
Easier communication	24
Outside working hour	12
Clarifying topics	11
Asking immediate questions	7
Comprehensive essays	5
Work in coordination with instructor.	3

Negative Opinions

Table 2 shows the negative opinions of the students when they used e-mails to get feedback from their instructors.

The most important problem for the students was technical problems when they tried to communicate via e-mail. 18 out of 90 students reported that due to technical problems they didn't believe that e-mails served its real aim and they suffered while using e-mails.

Moreover 14 students stated that using e-mails caused communication problems between themselves and their instructor. "Via e-mail, I believe I couldn't express myself clearly so my instructors' suggestions did not lead me effectively," was a statement from one of the participants. Also, 12 students expressed that their mails were not replied as quickly as they expected and they believed it caused a problem for them.

9 students believed that written information could not be as clear as the spoken one and sometimes due to written feedback, they misunderstood their instructor. They believed spoken feedback could be more effective than the written one and they preferred to have spoken feedback from their instructor. For instance, one participant stated that "Sometimes, I couldn't understand what my teacher had written, I believe written feedback is not as clear as spoken one."

Table 2 Negative Opinions about the Use of E-mail

Positive opinions	Number of Students
Technical problems	18
Cause communication problems	14
Can be replied more quickly	12
Information cannot be given clearly	9

CONCLUSION

Feedback is very important for our students. They want to get feedback in order to move on their studies. Sometimes we, as teachers, may have problems giving immediate feedback and we need to find different ways to help and to guide our students. Sometimes traditional ways are not enough for us to reach our students. In today's world it's necessary to use different technological devices to make our lives easier.

The results showed that students had positive opinions towards using e-mails as a feedback tool because while studying they wanted to have chance to contact with their instructors as quickly as possible and e-mails gave them the chance to do it. Therefore, they preferred to use e-mails.

On the other hand, when technological devices used it should kept in mind the technical problems that both students and teachers can face with. In this study technical problems were the main problem that students faced in this study.

For further study, similar study can be conducted with different students in order to find out whether similar findings will be obtained.

Moreover, in order to find out the effectiveness of using e-mail a comparative study can be conducted. While teacher uses traditional feedback giving methods with one group, he or she can use e-mail as feedback method and find which one is more effective.

USING SONGS AS AUDIO MATERIALS IN TEACHING TURKISH AS A FOREIGN LANGUAGE

Funda KESKİN
Istanbul University Foreign Language Department
fyamac@istanbul.edu.tr

ABSTRACT

The use of songs as audio materials in teaching Turkish as foreign language is an important part of language culture and has an important place in culture. Thus, the transfer of cultural aspects accelerates language learning process. In the light of this view, it becomes necessary to transfer cultural aspects into classroom environment in teaching Turkish as a foreign language. Songs are one of the instruments which provide students with the information related to target culture. In foreign language teaching, activities which are created by using songs contribute to the development of a lot of language skills from grammar to pronunciation. Therefore, these activities can be carried out in all classes ranging from very basic levels to advanced ones. Additionally, as widely known, music and melody have a positive impact in terms of reducing stress and anxiety. Considering the current literature, the use of activities involving songs in foreign language teaching has positive effects on students within their language learning process and further help them to be encouraged toward foreign language and culture. in this study, the place and the importance of songs as one of the tools to transfer culture and used in Turkish as a forieng language courses will be questioned, and sample activities will also be presented.

Key Words: Teaching Turkish as a foreign language, audio materials in language teaching, culture transfer, the use of songs in language teaching classes

1. Introduction

With the progress of technology, the development of educational tools for foreign language teaching has started to contribute significantly to student progress while learning a foreign language. Therefore, the efforts to adapt these tools, which are developed by the technology of our day, to class environment has become of greater importance. At the same time, the increase in the number of approaches to develop students' skill of communication and cross-cultural interaction is an indicator of the fact that songs are audial and written tools essential for foreign language teaching.

Utilization of visual and audial tools is effective in concretizing the learning process. Using these tools in class environment not only enables students acquire the desired information more quickly, but also makes the information acquired more permanent. According to Tarcan (2004), as multimedia consisting of tools appealing to human senses such as visual and audial tools used in foreign language teaching increase the amount of emotional input, the level and the quality of lingual skills of a person also increases. Accordingly, the quality and the quantity of the output such as writing and speaking skills, which are of utmost importance for language learning, becomes higher. From this point of view, songs, which are audial tools, are important resources for students while developing lingual skills.

2. The Influence of Songs in Foreign Language Classes

Using songs as tools for teaching a foreign language has many benefits. According to Lo and Li (1998), songs are able to change the monotonous mood in the class and with the smoothing effect of music, they provide a comfortable class environment so that students can develop their lingual skills more easily. Besides, utilizing songs in class environment amuses students, helps them feel relaxed and get rid of their negative attitudes towards a foreign language while learning a lingual structure through a song (Sarıçoban: 2000). In this direction, the amusing and relaxing mood brought by songs to the class eases the effects of certain emotional cases such as excitement, anxiety, lack of self-confidence and the feeling of being threatened, in addition to influencing learning process positively or facilitating it by stimulating the student emotionally (Kramsch 11).

In a survey conducted by Joly (1995), the question whether the in-class utilization of songs which were chosen in accordance with the goals of the lesson was helpful or not was directed to students attending a Japanese speaking course. The results of the survey show that the majority of the students favored using songs in the class. In the light of this view of students, it can be said that songs amuse students; they reduce the level of boredom existing in ordinary language teaching and increase student enthusiasm towards studying.

According to Cheung (2001: 57), as students more easily learn the things about which they have background knowledge, student motivation is increased when the elements belonging to the popular culture of the target language are involved in the class. Bringing a song listened by the student to the class environment increases students' desire to learn and enables them contribute to the process of learning by making use of their own musical knowledge.

Songs offer many codes that strengthen student memory such as choruses, rhymes and melodies (Maley: 93). Therefore, these codes in songs increase the functionality of songs in language teaching. When a student listens to and memorizes a song involved in the class, the lyrics are embedded in his/her long-term memory. Moreover, neurological researches have shown that musical and lingual processes occur in the same section of brain and that there are significant similarities between musical and lingual syntax (Maess, Koelsch: 2001).

Additionally, being authentic texts themselves, songs provide students with the opportunity of meeting authentic texts belonging to the target language. According to Schoepp (2001), as they feature examples of daily language, songs help students get prepared for the language they will encounter in daily life. Besides, as a part of daily life, they are the tools of informing the students about the culture of the target language. A song is a literary text and literary texts harbor cultural elements belonging to the language in which they are written.

When the relationship between literary texts and life itself is examined, it is seen that the reality of life and human conditions in literary texts are narrated by being processed in the inner world of the author. In this regard, literary texts have a significant role in comprehending human beings and society with their different aspects. In literary texts written in a foreign language, it is possible to find the reflection of the world of that language, a life which is stranger to us (Polat, 1993: 184).

In parallel with these views, songs, as a type of literary texts, reflect culture and transmit cultural values between people, societies and generations. Therefore, while learning a foreign language, a person can learn about a society and its culture through songs.

3. The Criteria for Selecting Songs in Language Teaching

As also mentioned above, songs are essential sources to be utilized during language teaching. Besides positive effects, there are of course difficulties encountered while using songs in language teaching. Terhune (1997: 8) lines these difficulties as follows:

1. Pop songs are not scientific. Therefore, some teachers and students do not think that they are effective tools in education.

2. As each student has a different way of learning, some students may have difficulty in studying through music.

3. Inefficient sound systems in schools may cause problems while listening to songs.

4. The types of music favored by students may not be matching with each other.

5. Songs which are not grammatical or those involving complicated sentence structures may confuse students.

6. In some songs, there may be embarrassing parts which cannot be explained to students.

7. Repetition of a limited number of words may cause the song to seem boring or ineffective.

According to Jensen (2000: 2), many teachers do not have sufficient knowledge about music and teacher training programs do not involve anything regarding how to utilize music in language teaching.

Another disadvantage of using songs is the lack of the ability to slow down the tempo of the song when a grammatically difficult part is playing, or to fasten it when there is the repetition of certain parts (Miller, 1999). Moreover, some teachers may think that they cannot sing, but using songs in the classroom for this aim does not necessitate any expertise in this field. Teachers can accompany the song while it is playing or in cases where students do not prefer to sing a song alone.

Despite these disadvantages that songs have, the number of such problems can be reduced if teachers have sufficient knowledge about using songs in the class. According to Terhune (1997), if they are used in classroom wisely and in a balanced way, songs can be perfect sources for teachers. For instance, students may think that songs do not have any educational significance as utilizing them leads students off the syllabus and the course book. For this reason, the teacher should involve certain activities which show that using songs in the lesson has a significant motive. Therefore, in order to avoid the misuse of songs, there are certain criteria to be considered for choosing the song to be utilized in the class.

While utilizing a song in classroom environment, the language of that song, age and language level of the students, areas in which students and the teacher are interested in should be taken into account. In order to utilize songs in the best way, a certain amount of attention is required. Sarıçoban (2000) recommends using songs which harbor frequent repetitions or a story or interpretations on life or cultural elements. Griffe (1992: 8) lists four elements to be considered while choosing a song to be used in the class as follows:

1. Classroom environment (number, age and interests of students; lesson hours)

2. Teacher (teacher's age, interest in music and aim to use the song in the class)

3. Classroom facilities (flexibility in lesson plan, classroom equipment)

4. Music (lesson plan and equipment such as the volume, sources of music, copying machine, board, etc.)

The content of the song chosen to be used in the classroom is also important. Some songs may contain embarrassing elements for students. Sarıçoban (2000) divides songs into two categories as those suitable for adults on advanced level of language and those appropriate for children. Meaningful and popular songs which also harbor cultural elements as well as grammatical patterns should be chosen for adult students on intermediate or advanced level, whereas more familiar or internationally-known songs should be selected for children. Griffe (1990) recommends using short and slow songs for students on beginner level. Crosswords, drawing or picture showing exercises can be conducted with such songs. For the students with a higher language level, long and fast songs which tell a story should be used. The song to be chosen should have a clear sound and it should be comprehensible; there should not be too many instruments played with a high volume in the song.

A song chosen should always contain a grammatical structure or a lingual subject. The diction of the singer should be clear so that the student will understand the lyrics more easily. The song should be chosen form a music genre favored by a major group of listeners. For example, if the teacher makes the students listen to only classical Turkish songs, then the students may feel bored with the lesson.

Applying these four criteria above during a lesson ensures that songs are optimally utilized in the class.

4. Activities that can be applied in Turkish as a foreign language classes through the utilization of songs

Activities that can be carried out with songs in foreign language classes can be classified in three groups as pre-listening, listening and post-listening activities. Here, a teacher should carefully think about what a student will do before, while and after listening. Below are some recommendations regarding these activity stages and what kind of activities a teacher can use in these stages.

4.1. Pre-listening activities

In this stage, the teacher ensures that students are ready for the listening activity to be carried out. According to Davenellos (1999: 14), the aim of this stage is to prepare students to a topic grammatically, educationally and psychologically. Before playing a song to students, it is necessary to introduce the topic, the keywords and the grammatical structure. In this stage, in order to activate students' background information, it may be suitable to ask the students to guess the theme of a song, to brainstorm about it, to present or to discuss the cultural information that the song includes or to state the keywords and the ideas in the song.

Pre-listening activities enable students to be aware of the purpose of listening to the song and to focus on the meaning of the song while listening. Besides, it is also possible to use songs by deliberately removing a part of their lyrics and to conduct activities in which students predict or derive the meaning of a word out of the context (Vandergrift, 1999: 172).

As pre-listening activities, Sarıçoban (2000) recommends discussing the theme, the title or the story of the song if there is one, informing students about the lingual points to be studied and using a picture to introduce the theme of the song.

Moreover, many activities such as predicting the theme of a song out of its title, putting the lyrics of a song in syntactical order, involving posters about the song and the singer and with the aim of raising awareness, asking students whether they have background knowledge about them and if the song has a video clip, playing it silently and asking students to make predictions about the theme of the song can be utilized in this stage.

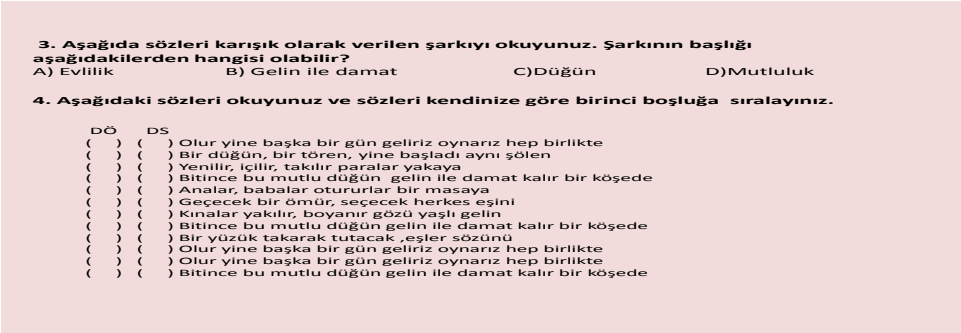
An example from an application regarding how to make use of a song of which theme is wedding ceremony, which is a cultural element, in Turkish as a foreign language classes is given below. In this application, the first step consists of pre-listening activities composed with the purpose of familiarizing students with the text.

Activity 1: What do the pictures remind you?

Activity 2: Write down the other words you have in your mind about marriage.

Activity 3: Read the disordered lyrics of a song below. Which of the options below can be the title of the song?

Activity 4: Read the lyrics below and order them for yourself by writing the numbers in the first gap.



3. Aşağıda sözleri karışık olarak verilen şarkıyı okuyunuz. Şarkının başlığı aşağıdakilerden hangisi olabilir?
A) Evlilik B) Gelin ile damat C)Düğün D)Mutluluk

4. Aşağıdaki sözleri okuyunuz ve sözleri kendinize göre birinci boşluğa sıralayınız.

DÖ DS
( ) ( ) Olur yine başka bir gün geliriz oynarız hep birlikte
( ) ( ) Bir düğün, bir tören, yine başladı aynı şölen
( ) ( ) Yenilir, içilir, takılır paralar yakaya
( ) ( ) Bitince bu mutlu düğün gelin ile damat kalır bir köşede
( ) ( ) Analar, babalar otururlar bir masaya
( ) ( ) Geçecek bir ömür, seçecek herkes eşini
( ) ( ) Kınalar yakılır, boyanır gözü yaşlı gelin
( ) ( ) Bitince bu mutlu düğün gelin ile damat kalır bir köşede
( ) ( ) Bir yüzük takarak tutacak ,eşler sözünü
( ) ( ) Olur yine başka bir gün geliriz oynarız hep birlikte
( ) ( ) Olur yine başka bir gün geliriz oynarız hep birlikte
( ) ( ) Bitince bu mutlu düğün gelin ile damat kalır bir köşede

The aims of these activities are to motivate students for the text and the lesson and to have them brainstorm about the text, by providing them with some ideas about the theme of the text before encountering it, since students may fail to focus on or be motivated for the text if they directly face the text without having any preliminary activities.

4.2. Listening Activities

Listening activities are directly related to the text and students are expected to carry out these activities in the course of listening. In this process of listening and by the guidance of the teacher, students control their comprehension skills and focus on listening to the text.

According to Peachey (2003), in order for students to get accustomed to the voice of the singer or the tempo of the song, they need to listen to that song at least for three or four times. Prior to listening, it is also necessary to grant students with a short period of time for reading the questions they are going to answer while listening.

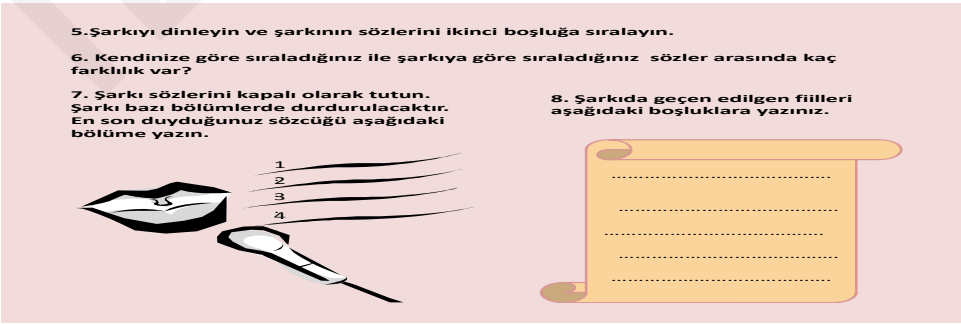
In this stage, activities such as removing certain parts of the text which are related with the grammatical form, word or pronunciation type in question, checking the accuracy of the predictions made about the song before listening, ordering the lyrics of the song, answering multiple-choice or open-ended questions about the song, picking the words that students hear in the song from a long wordlist given before listening, pausing the song and asking students to repeat the last word they have heard or correcting lexical, grammatical or syntactical mistakes deliberately involved in the lyrics.

Activity 5: Listen to the song and put the lyrics in order using the second gap.

Activity 6: How many differences are there between your order of lyrics and the order you have had after listening to the song.

Activity 7: Don't look at the lyrics. The song will be paused at certain parts. Write down the last word you have heard.

Activity 8: Write the passive verbs you have heard in the song in the gaps below.



5.Şarkıyı dinleyin ve şarkının sözlerini ikinci boşluğa sıralayın.

6. Kendinize göre sıraladığınız ile şarkıya göre sıraladığınız sözler arasında kaç farklılık var?

7. Şarkı sözlerini kapalı olarak tutun. Şarkı bazı bölümlerde durdurulacaktır. En son duyduğunuz sözcüğü aşağıdaki bölüme yazın.

8. Şarkıda geçen edilgen fiilleri aşağıdaki boşluklara yazınız.

1
2
3
4

In the activities presented above, the aims are to have students check the predictions they have previously made about the song, develop their listening and comprehension skills and internalize the grammatical structure they have learned. In this process, students are more into production. In this stage,

the emphasis is on how and with which elements students should approach texts in order to develop their comprehension skills. It is expected from students to carry out verbal and written tasks by sticking to the text and to progress the way they use the language from dependent to independent by dealing with the text in question with its various aspects.

4.3. Post-listening activities

Various activities for assessing the whole process of listening can be conducted in this stage. According to Davenellos (1999: 14), this stage consists of follow-up activities for developing speaking and writing skills.

In this stage, Sarıçoban (2000) recommends using activities such as reading a text about the singer or the theme of the song, commenting and interpreting the song and dramatizing the plot of the song. These activities may vary in accordance with the language level and the areas of interest of students. The teacher can check the answers of the questions from listening stage. For improving writing skills, students can compose a dialogue out of the words of the people in a song; they can summarize, continue the song, or rewrite the lyrics from the point of view of another person in the song. In order to improve pronunciation, students can sing the song individually, with another student or in groups. For improving speaking skills, students can talk about how they feel after listening to the song. Also, some questions can be directed to students with the aim of initiating discussions.

Activity 9: According to the song, what kinds of activities are there in a wedding ceremony? Summarize them.

Activity 10: What kinds of activities are there in a wedding ceremony in your country? Compare them with the activities mentioned in the song.

With these activities, students are expected to summarize the song, to practice writing by involving his/her culture in the class and using the lingual structure he/she has just learned. Students are more into production in this stage. What is expected from students is to carry out verbal and written tasks by sticking to the text and to progress the way they use the language from dependent to independent by dealing with the text in question with its various aspects. In the activity on the final step, lesson topics are quite flexible. The lesson is drawn away from fictional contexts to daily life. Students are expected to state their thoughts without depending on the text.

5. Conclusion and Recommendations

There are positive and negative views on the utilization of songs in foreign language teaching. It is seen that songs are used for many reasons by methods adopted in foreign language teaching. The facts that music soothes students and that melodies, rhythms and rhymes in a song facilitate language learning improve students' reading, writing, speaking and listening skills. Besides, music and songs are all authentic texts. These authentic texts act as significant sources for students to discover the culture of the target language and to improve their cultural awareness. In this study, which was carried out by taking these effects of songs as basis, activities that can be used with songs in Turkish as a foreign language classes are given and certain sample activities are recommended.

For foreign language teaching, if songs are carefully chosen by taking the audience, objectives, language level of students and song content into consideration and if deliberate activities are carried out, it is possible to make use of songs effectively. Utilizing songs this way provides an enjoyable experience not only for students but also for the teacher. Using songs along with such activities will have many advantages such as saving the lesson from being boring and monotonous and improving student motivation.

VIRTUAL COMMUNITY LET'S TAKE CARE OF THE PLANET

Teresa Mary Pires de Castro Melo
Professor at Universidade Federal de São Carlos – Brazil
teresamelo@ufscar.br

Abstract

This is the record of the activities held inside the *Virtual Community Let's Take Care of the Planet,* an internal project of the *Child-Youth International Conference Let's Take Care of the Planet*, it was executed by invitation from Brazil's Government, and brought about 600 young representatives from 47 countries, held in Brazil in June of 2010. The process of National Conferences in theses countries involved directly 85,258 schools and 13,153,229 people around the world and had as a final product the *Charter of Responsibilities Let's Take Care of the Planet*, written by those young delegates. The Charter suggests and guides global socio-environmental actions from local discussions and indications. This report introduces, in a general way, the steps of the conception, implementation and management process of the Virtual Community, which is a space built in the Internet for this world process and it has as goal to agglutinate the discussion, to exchange and register the International Conference process.

Key words: Internet; Environmental Education; Virtual Communities; Educommunication

Introduction

Environmental Education policies in Brazil are made and implemented by the General Coordination of Environmental Education (COGEA), which is composed by the Ministry of Education and the Ministry of the Environment. One of the actions of the COGEA is the Child-Youth National Conference for the Environment, which involves the school community in discussion about socio-environmental subjects to subsidize public policies in Environmental Education. From a constructivist and participative management process, the Conferences gather children and youth who research, identify socioenvironmental problems, take responsibility and propose local actions, and choose representatives who take the consensual ideas to other spheres. The representatives of all Federative Units elected by the youth get together in Brasilia (Capital City of Brazil) to compose the Charter of Responsibilities, which manifests discussions all over the country – this Charter is delivered to the Federal Government and then actions are initiated at the schools.

There has been three National Conferences: the first, in 2003, it got 15,452 schools and 5,658,877 people involved all over the country; the second in 2006, 11,474 schools and 3,801,055 people participated; the third, in 2009, 11,670 schools and four million people participated. Theses Conferences integrate the *Let's Take Care of Brazil* Project with the schools, public policy for which Environmental Education makes a

> […] commitment with changes of values, behaviors, feelings and attitudes, which must be done with the total inhabitants of each territory base, in a permanent and continued way for every one. An education which proposes the fomentation of continued processes that enable the respect for the biological, cultural and ethnical diversity, as well as the strengthening of the society resistance to a devastating model of human relations with themselves and with the environment. (Trajber & Sorrentino, 2007, p. 15).

A proposal from international observers who attended the II National Conference brought, in 2010, the International Conference Let's Take Care of the Planet (CONFINT), hosted by Brazil. Fifty-two countries, by invitation of the Ministry of Education of Brazil, organized National Committees in order to coordinate nationally the process at the schools. The process got 85,258 schools and 13,153,229 people involved around the globe. According to the General Coordinator of the International Conference:

> The Children and Youth International Conference for the Environment is included in the framework, mission and goals of the UN Decade of Education for Sustainable Development (DESD), 2005–2014. The main themes of the Decade are citizenship, community values, diversity, interdependence, sustainability, quality of life and social justice, all of which correspond to the goals of the conference. However, above all, the conference seeks to contribute to the incorporation of a new generation that constitutes a large portion of humanity and that is traditionally thought of as the future but that nevertheless lives, thinks and acts in the present. (Trajber, 2010, p. 76)

Delegates of age from 12 to 15 years old, from 47 countries, *were in Brazil in June 2010,* for the final step, which gathered 600 young people. As a result of the five days of interaction and discussion, the *Charter of the Responsibilities Let's Take Care of the Planet* was written by the delegates. It can be seen

at the following web address: http://carta.vamoscuidardoplaneta.net/en/.

The *Virtual Community Let's Take Care of the Planet,* the subject of this paper, is a space of registration, attendance, proposition, and continuity of this international process. The appropriation of the New Information and Communication Technologies establishes the possibility of a new mobility of interactive multidirectional and decentralized non-presence communication – a net communication. Thus, the Internet brings people who are geographically apart together, ignoring the boundaries of time and space, hierarchical structures, allowing the interactivity in real time, permanent update and immediate, dialogical and global access. So, physical-space-independent communities are brought up. When we think about virtual communities, we think about new places of interaction among people, making our social reach wider.

The virtual communities, with the intention of working systematically with teaching/learning or not, are non-formal and informal educative spaces. A Virtual Community is the gathering of people around the same interest, through the internet: all the participants are willing to learn, teach and share about the same subject and the mediation guides the activities upon this.

Partnerships and goals

The Project *Virtual Community Let's Take Care of the Planet* is a result of a partnership among Secretary of Continued Education, Literacy and Diversity (SECAD) of the Ministry of Education (MEC) and the Federal University of São Carlos (UFSCar), *campus* Sorocaba, Brazil.

The Federal University of São Carlos was created in 1968. It is located in the State of São Paulo and it is divided in three *campi*, of which the newest one is located in the city of Sorocaba (80 km distance from the Capital City of the State of São Paulo), and it has a general principle of Sustaintability. This *campus* holds activities linked to teaching, researching and extension that work in a systemic way in the environmental, educational, economical, social and cultural spheres looking towards a sustainable society. The proposal of a partnership with the Ministry of Education in this project has as basic principal the recognition that, in building a sustainable society, the preventive actions are more important than mitigable or adaptive actions and may the real preventive action be the *education to sustaintability.*

The general objectives of the Virtual community are: to give the participants an integration, discussion and composing environment; to advertise the *Charter of Responsibilities Let's Take Care of the Planet,* to follow the actions started from the Charter in the signatory countries; to bring reflection and dialogue upon the themes proposed in the International Conference and the educative process of the mediators students in the Community.

The result of this process, which can be seen at www.letstakecareoftheplanet.net, is managed in the open code platform WordPress MU (multi-user), using the plugin BuddyPress to implement the social network and it is involved in all the four official languages of the Conference: Portuguese, Spanish, French and English.

Methodology

Once the partnership and goals established and the project inserted in the bigger project of the International Conference, the *conception and implementation* of the website step started. Theses two steps, although may have the major part of its execution done, still reflect and are reflected by the current step, that will be called *mediation.*

For the conception and implementation of the Virtual Community Let's Take Care of the Planet people who had knowledge in communication management, group mediation, social network and free software, National Conference process and Educommunication formed a work group. This group, which includes UFSCar's Professors and specialized companies, initially held the activities described in this paper as: creation and organization of a website structure; development platform definition; preliminary research of material referring the International Conference; confection of specific content for the Community; definition and hiring of a hosting plan; data bank management; selecting and configuring Wordpress and plugins; researching and installing plugins and sequence tests to answer the demand and stability; layout execution from the existing CONFINT visual identity; dominium and hosting of the websites in all the four official languages. At the same time, a propagation strategy was developed and a connection with other participating countries was established in order to incorporate materials, experiences, addresses and information.

The project's management structure was developed from two supplementary and inseparable coordination groups: Ambience Coordination (dedicated to technology matters) and Mediation

Coordination (dedicated to the group responsible for the interaction and maintenance of the Community).

The Mediation Coordination was held by group composed by UFSCar professors and students and by a mediation specialized and Communication production company. The Virtual Community mediators team was initially composed by ten selected UFSCar-Sorocaba students, having a criteria the proficiency in the International Conference official languages, also found in the Virtual Community websites – Portuguese, Spanish, French and English.

Pedagogy, Biology, Geography, Tourism and Computer Science Undergraduate students compose the mediators group – it has attended to a capacity meeting with the purpose of introducing and integrating the group, understanding the project and its history, understanding its configuration and the whole group's function involved in this project. The Ambience Coordination held a capacity meeting concerning the usage of the system, general introduction of the platform, the usage of WordPress and the deepening of specificities of the tools involved in this project – content insertion, mediation and action as multipliers, aiming to stimulate the participation of new users thru the social network.

Later, thru weekly virtual meetings, the Mediation Coordination and the UFSCar's mediators interacted constantly to solve doubts, plan new implementations, report possible flaws and enhance other processes involved in the website updating dynamic.

Mediation had the principle of participative management. Throughout the project, the group was made author, sharing decisions, needs, difficulties and achievements. The principle of the self-summons was incorporated to the organization of work, allowing each participant, over time, to find out more activities with which they would sympathize the most, other than the ones needed to meet the updating flow of the Community. Thus the method of work led the mediators to

> Being responsible for the French language, turning me into author, creator and translator, allowing me to suggest any subject related to the Community and the languages inside the virtual work. (R. Castro, personal report, June, 2010).

The Mediation Coordination established as uneventful weekly meeting attendance, and virtual meetings during the holiday seasons took place thru tools such as *G-Talk* and *Skype* (a valuable experience that enriched the work with virtual interaction that the project required). At times, the meetings were held on Saturdays to ensure the presence of every one for a longer period of time.

> Because we attend to present weekly meetings, we don't spend too much time without gathering. Sometimes we meet on times other than the meeting, once we're no longer only colleagues, we also became friends. Sometimes, we also hold virtual meetings thru Skype or Gtalk, especially when we can't meet in person. Every meeting has its agenda. The most common subjects are about the homepage update, community projects, problems on the website, and appointments outside the University etc. During the meetings, one of the mediators is responsible for registering the agenda, and then, after the end of the meeting, he or she sends it to the others. (L. Oliveira, personal report, November, 2010).

The tasks carried out routinely throughout the project, described in general terms are: daily mediation of the Community; collecting and selecting continued content; observing and inserting other similar networks; development of promotional material; implementing tools suggested by users; material production – text, audio, video; technical support and Virtual Community website maintenance, interaction with the participants of the Community and a similar material research.

The group's first activity happened in the week following its formation, during the European Conference, a preparation to the encounter in Brazil. The group of mediators attended a meeting via Skype with the organizers in order to learn about the tool that was going to be used and also the translation dynamics and the Conference's interactions, which happened entirely virtually.

> Several young people participated with questions, answers, suggestions, experiences, among other things, so our job was to translate these ideas and eventually give some opinion and publish in the Community. (…) The European conference allowed me to open my mind at once and to see how aware of the subject the youth is, how seriously they take it and how much I have to enjoy this opportunity so I can grow up and learn more. (T. Santos, personal report, May, 2010).

This work, despite the little time have known each other and the project itself, had the following evaluation from one the organizers of the European Conference:

> Dear all, as you can see the exchanges are so many and so interesting, and their flowing is so good, thanks to the whole teams of translators and experts, so again, I AM IMPRESSED BY THE WORK YOUR DOING ALL, GREAT!!! No specific remark a part from keeping being so good and flexible all of you!! Any question you would like to raise, let me know! (L. Nicollet, in personal communication, May, 2010).

In addition to the established routine work, we highlight the following activities that also brought autonomy, reflection and authorship of the whole group of mediators.

Activities held during the Conference

Throughout the project, some activities were delineated from the ongoing assessments made by the group on its own work and from the demands/ opportunities arising in the Community. One of the most important terms of maturity of the group, experimentation and knowledge of the reality-focus of the project and appointing the new language/ tools for the virtual space was the attendance to the final phase of the CONFINT, held from the 29th of May to the 11th of June, 2010. Mediators and coordinators of the virtual community were involved in this present moment, in Luziânia (State of Goiás, Brazil).

The attendance aimed to promote the Virtual Community and to produce some material about the event in order to publish in the Community – this communication production, held under the Educommunication perspective, had as partnership the conceptual and methodological formation the non-governmental organization the *Cala-boca Já Morreu Project,* also responsible for the Educommunication are of the CONFINT, and also of the National Conferences.

Educommunication is a new knowledge and social intervention area that combines characteristic features of Education and Communication. The educommunicative practices use languages and technologies such as computer, internet, radio equipment, video, photo, or anything else, so that people will turn information consumers to information producers. This change, besides providing a democratization of the means of communication, strengthens the participants as individuals and as groups. Combining the educommunicative practices with Environmental Education added orientation to the Environmental Education General Coordination in Brazil. This orientation is explained by the fact that we learned that in the

> Building of environmental knowledge, the use of the languages and communication technologies was crucial to form the public opinion and our acquaintance about the subject. Environmental Communication pervades corporations, governments, nongovernmental organizations and Universities; it is present on the television, radio, newspapers and environmental networks formed around the world thru the internet (Lima &Melo, 2007, page 173).

and

> we also can be producers of this knowledge, inside a reality about which we reflect and only we understand (…) and publishing our knowledge has to do with using social communication languages: the radio, video, newspaper, handout, , the internet – whatever is available to any of these medias or to our access to the production of each one of them. (IDEM).

The Communication production perspective enabled the Virtual Community to directly participate of the all the three following activities.

Journalistic coverage of the event: producing and publishing the content – Seven audios, 20 videos, 12 texts and five photo albums were produced and published, in addition to the collection of material produced by the participants to the *decoupage,* editing and publishing in the Virtual Community.

Journalistic Coverage Workshop: offered in Portuguese, English and Spanish with six international facilitators and 33 delegates as participants, it was coordinated by the group. Five videos and 17 radio shows were recorded and then made available in the Virtual Community.

Live webcast: in order to share important moments of the Conference, 12 hours of important moments of the CONFINT (Opening Ceremony, Culture Festival, Reading of the Charter of Responsibilities and of the Musical Charter, Closing Ceremony at the National Museum, in Brasilia, as well as five other programs produced with delegates, chaperones and CONFINT organizers) were webcasted. The group was responsible for the implementation and management of the webcasting interface, which included a flow tool of *Twitter.*

> During the CONFINT I was surprised by myself. I became more active, didn't have to wait for others to tell me what to do, but I did it by myself. I believe CONFINT was an unforgettable experience, the cultural exchange was huge, I've deepened on the project, and I saw how engaged the other countries are, doing what is possible to have their youth learn. I wrote articles, made interviews, took photos and even made videos. (Vanessa Ito, Portuguese mediator, Geography student, personal report).

Besides the activities linked to Educommunication, the group also participated as language facilitators (youth who accompanied the delegations as translators) of the delegations of Egypt, Nepal, South Africa, Sri Lanka, Guatemala and French Guiana.

The people responsible for Community technological mediation followed the event aiming to assure the proper functioning of the website, to implement demanded improvements and to enable the live webcast, especially concerning the infrastructure (network and transmission settings).

Another demand from this moment was the *Charter of Responsibilities* space in order to publish and disseminate the Charter in all the four official languages, as well as the possibility of interaction so

ideas on how to disseminate the Charter of Responsibilities and to implement action would be registered. The blog also counts on the *Promote the Charter* tool, which helps the users to spread the Charter among their contacts. An online petition was created to enable internet users from all over the world to subscribe to the document.

After-Conference Activities

In July 2010, a weekend-long meeting appointment was dedicated towards the partial assessment of the project and to the planning of action for its continuity. Strengthened by the familiarity and by the work done during the Conference, coordinators and mediators began to add new activities to the routine activities, like the following ones.

Tutorials: tutorials on how to sign up, to blog and to join the groups were created. They were made by mediators as Screencasts. The Activity demanded an itinerary preparation, the used application mastering and translations.

Live Webcast: a pilot show was held in October and it evidenced the possibility of the Virtual Community start to broadcast TV shows produced by local groups, without the need of very sophisticated technologies. The mediators made the screenplay and broadcasted the Show live from the Pedagogy Laboratory of the Federal University of São Carlos, Sorocaba campus. An area in the website was developed with a proper interface so that the transmission player could be incorporated, using the free service *Ustream,* properly settled by the UFSCar team.

Bulletin: design development and programming bulletin with the possibility of text, audio and video0 insert. The *MailChimp* remittance tool settlement and full autonomy to insert content, the mediators group began their own to activate the subscribed users on the website thru the regular remittance of information.

Pilot Videoconference: the participation of the Environmental Education General Coordinator of the Ministry of Education, Rachel Trajber, the Brazilian group was formed by the mediators of the Virtual Community and 20 teachers and students of the Laranjal Paulista town, which recently held Municipal Conference *Let's Take Care of Laranjal.* Inserted in the MEC's Environmental Education public policy, this Conference is an extension project from the UFSCar-Sorocaba as well.

New Homepage: a new homepage was created from the suggestions of the group, during the assessment in July.

PICTURE 1 – with the restructuring, the homepage of VCP now operates more dynamically, allowing highlight content from various sources on the platform and showcasting the latest updates made by the users

The act of "doing" in the group was closely linked to the act of "thinking" the project and its own action, for that the meetings to conceptual and methodological deepening also contributed. As an instrument to register the individual processes, each mediator produced a report of their activities every month, in which report reflections were incorporated throughout the project. A Virtual space is being organized in a collaborative manner to bring together the reflexive texts that have been made by the group.

The following Academic Productions were produced and presented in 2010:

- During the *I Scientific Journey UFSCar Campus Sorocaba,* panels from mediators Romina Daisy Castro Rojas – *Facilitadores de la I Conferencia Internal Infanto Juvenil por el Médio*

Ambiente Cuidemos el Planeta and Samuel Coelho - *Oficinas de Educomunicação para a discussão e difusão de ações socioambientais globais.*

- Mediator Lívia Souza formulated her Completion of Course Work in which she analyses the responsibilities taken by the participants of the International Conference, as title *Vamos Cuidar do Planeta – Como? (Let's Take Care of the Planet – How?)*

The participation on the project the possibility of acting, for 15 days, in a world encounter with adolescents and youth allowed an academically meaningful experience to the mediators-students from UFSCar. Once the only criteria to the selection was the proficiency in a second language, it was made possible to each participant to deepen in themes such as communication technologies, social networks, environmental and cultural matters, communication production, management models, group relation – important matters to graduation training, no matter which.

A few considerations

This experience report was written before the end of the Project (31st of March 2011) and it will be necessary a larger period apart from the process so the reflections about the many possible interfaces presented throughout the work.

The issues related to the "vocation" of the Virtual Community, built in their interaction with the participants – originally conceived as a Learning Community and later settled as a Social Network. The practice pointed a few constraints and new possibilities, reorienting the meaning of the space.

One of these constraints concerned time – we treat different school time in the involved countries, as well as the different times of digital inclusion of the delegates of the CONFINT around the world. Thus, if a Learning Virtual Community has as differentiating factor pedagogical "intentionality", the assumed actions to this purpose need to be carefully built and proposed at a different pace – it is not possible to propose "steps" to be threaded together if not everyone has the same footsteps pace.

On the other hand, although the Community has the architecture for the possibilities of a Social Network, it "competes" with world social networks such as Facebook, Orkut and Twitter – The International Conference Let's Take Care of the Planet has it spaces in these networks, organized and fed by the participants. At the first look, we consider the local action as being more important campus than the global perspective, at this moment, for the lack of a gathering action on a planetary sphere.

Thus, at this moment of the still superficial assessment of the project, we reckon that the Community met its focus from two acting spheres: the proposition of new manners of interaction in this virtual space and research, organization and publication of the countries information about the continuity actions. We can state today that the *Virtual Community Let's Take Care of the Planet* is the space on the internet that gathers the most information of productions of the International Conference Let's Take Care of the Planet.

ABSTRACT

In Brazil, there are recent governmental policies to encourage implementation of e-learning as an alternative to improve the population education. One of this actions is being developed by University of Brasília/UnB which coordenated 23 projects of different academic sections. In Life Sciences, our team is involded in e-learning object development and a website; a course which integrates genetics and movies; and finally, an e-training process with our professors as a support in their undergraduate classroom courses. Related to e-trainning, 42% of our department are developing their own VLEs with our tutoring. Besides extensive tutoring, professors are showing preference in VLEs usage as a file library and they avoid virtual tests. We reflected that it is a matter of time and they will obtain command and security in the application of various resources and virtual tools in order to develop their VLEs.

INTRODUCTION

In Brazil, there are recent governmental policies to encourage the implementation of e-learning as an alternative to improve the population education. As an example of a government program we can cited "Universidade Aberta do Brasil-UAB" (www.uab.capes.br) which is a system created in 2006 and organized by public universities that mainly offer on-line college courses for brazilian people who have limited access to high education in the classroom module. In the context of the UAB, our team is linked to an enterprise to promote e-learning practices by professors in undergraduate classrooms. Since August 2010, University of Brasília/UnB coordenated 23 projects developed by different academic sections. In Life Sciences, our team is developing an e-learning object in genetics and a histological website www.histologia.unb.br; a course which integrates genetics and movies; and finally, an e-training process with our professors as a support in their undergraduate classroom courses.

The Department of Genetics and Morphology-GEM is composed of 22 permanent teachers and offers, in average, 27 courses/per semester to undergraduate students in a traditional way. Our university offers a virtual learning environment-VLE called "Aprender.UnB" based on Moodle software. In 2010, analyzing Moodle software usage by GEM teachers, we checked 20 VLEs. A careful analysis resulted some findings: (1) 8 VLEs were related to undergraduate courses; (2) 12 VLEs were related to research projects and others were VLEs created but not in use and (3) only 4 teachers are responsible by those 20 VLEs. With only 16% of teachers using e-learning resources, despite the fact that "Aprender.UnB" offers Moodle tutorial and online courses, we detected need for professional improvement.

METHODS AND PROCEDURES

INTERVIEWS

Semi-structured interviews were prepared to able us to understand teacher relationship with technological resources available in working place and outside it; to gather their views on e-learning; to know whether he/she had participated in any online course and, after more detailed explanations about the project, to encourage each one to participate in e-training, because it was based on voluntary adherence.

TUTORING

The 3 (three) tutors selected to attend e-training process are high school teachers, two biologists and a chemist. One of them, in addition to Biology, also has academic background in computacional field and e-learning experience as a student. The other ones had recent experience in using Moodle software. A prior training of these professionals was conducted, giving them opportunity and autonomy to continuously improve their Moodle knowledge. Step-by-step instruction files were developed by this group and are being applied with participants. Team meetings are held monthly to share individual experiences, to appraise activities, to discuss e-learning topics and to improve our team relationship.

E-TRAINING DESIGN

For each GEM teacher was provided a VLE in "Aprender.UnB" and appointed one tutor to accompany activities development until July/2011. The main goal is to prepare a VLE with freedom, aiming a product: a VLE as a support for an undergraduate classroom course. This strategy was used because our public is too busy with a diversified routine work. For these reasons, we did not opted for a collective process e-training but an individual one which each teacher could operate in a particular time elected by him/her. Interactive tasks are being stressed during e-training and stimulated to be used in VLE course with students.

RESULTS

E-TRAINING ADHERENCE

Although all interviewed professor (16) have joined to training process, just ten (10) are at final stage. Our team was very persistent in contact and encourage those 6 absent teachers, even no responses were obtained to explain their withdrawals. Thus, we speculated upon their reasons. It remained us a reflection on participants profile, their pedagogical background and their working routine. GEM professors are biologists, in majority, with only one with formal teacher training course (undergraduate degree). Master and PhD´s were obtained by research lab work in molecular biology, cell biology, histology or other biological field. As it was common in Brazilian universities (in present time, postgraduate courses have teaching training for masters and doctoral students), we have a group of professionals who have learned to be a teacher when they take a career at a university. These people are fitted in a cartesian curriculum, where pedagogical strategies are not discussed. During their student time, a majority had a cartesian academic preparation, with endless lectures and/or practices focused in teacher and overhead projectors. And as we note, they repeat this model.

The fact is that, in most cases, even with the rich experience gained over the teaching years, they continue to focus learning process on teacher and lectures, using Powerpoint slides (as substitute for considered old fashion transparency). This teaching model is rooted and the fact that undergraduate courses are face-to-face can be an obstacle for the professional to perceive virtual resource as a need, despite claims to the contrary when interviewed. Added to this set of features, we include professional self-interest and his/her list of priorities in the work routine.

However, the rate of 62% effective training is considered a success by our team. Of our 10 participants, 5 are involved in posgraduate programs, with two of them involved in a posgraduate program focused on science education. During e-training, three participants are acting, like virtual teachers, in Biological Science e-Learning graduate course supported by UAB and UnB.

e-TRAINING DEVELOPMENT

In contact with participants, the tutors have experienced different situations, with teachers who want frequent face-to-face training compared with participants who sporadically make questions (by e-mail or phone) about some aspect of Moodle. But we understand that each situation must be considered carefully and we do this on items related to e-training process.

VLEs as a file library

Without no one exception, VLEs of participants are being used, in priority, for files uploads and downloads such as slides classes and papers for a complementary reading or face-to-face seminars. Even

encouraged by tutors and learning to use tools and diversified resources, few participants make use of them.

The arguments, while clearly explained by participants, are related chiefly to time management at work. Some participants just do not want to increase the time they spend in front of a computer. Others argue that holding a forum, for example, would result in more work outside the time allotted for the undergraduate course and professional agenda is full of other obligations. We understand that e-learning is still a new experience in brazilian education system and a number of adjustments are being necessary to encourage teachers to explore the possibilities that a virtual environment gives use even like a support. We are aware that a professor career in an university requires professional involvement in administrative matters (such as heads of sectors, for example), economical issues (competition for financial supports and research labs management), scientifical issues (undergraduates and postgraduates students demands) in a diverse routine. Teaching activities have to fit into this day-to-day.

How to encourage these teachers to further explore a VLE potential in this panoram ? On curriculum matrix in which they are inserted, it still officially allowed to transfer 20% of meeting time to a virtual classroom. But we know that any activity in this virtual context, in fact, gives extra work. But given the current reality, our team is showing alternatives for participants, encouraging them to diversify resources and tools usage to provide students with exercises and tests.

VLE tests

Our findings include a resistance to insert virtual activities that compute in the final grade of each student. The arguments of the participants are related to the fear of plagiarism and the uncertainty about work authorship. Regarding plagiarism, we are convinced that it is an old problem in any school environment, and only aggravated by the fact that student has the information more easily via world wide web. In brazilian education system, it is common that the teaching and learning process is focused on content, with the student acting just as a receiver of information, with emphasis on memorization process. We considered that plagiarism has a direct relationship with an education system that trains students who read little (with a estimate of 4.7 books per year/per Brazilian student, including school books) and are little encouraged to develop their skills. We consider this problem without a solution until a radical change in the brazilian educational system takes place, which should help, in fact, the formation of citizens who are critical readers, enjoy reading, know to look for relevant information and know how to write with quality. We are conceived of a VLE can even help much in building this citizen, with the inclusion of activities that typically would not are applied in personal meeting because of lack of time. Regarding work authorship, a clear preference of teachers to conduct face-to-face tests are noticed, but we reflected that it is a matter of time and with improvement of teacher's relationship with the VLE they will obtain command and security in the application of various resources and virtual tools in order to develop qualified evaluation methods in a virtual environment.

Virtual Space as a Learning Environment: Two Case Studies

Ali Arya, Peggy Hartwick, Shawn Graham, Nuket Nowlan
Carleton University, Ottawa, Canada

Abstract
This paper addresses the issue of using virtual spaces as a learning environment. With the advances in e-Learning systems, the education community shows a growing interest in using online tools for educational purposes. The case studies presented in this paper demonstrate how a 3D Virtual Environment can be used as a learning tool by providing a virtual space that (1) allows people in different locations to interact, (2) gives users access to facilities not available physically, (3) enables activities that are not possible in physical settings, and (4) offers a variety of observation and measurement tools for performance evaluation and improvement. We demonstrate these advantages through two case studies that offer a framework for language learning for English as Second Language students and a simulated archaeological excavation site for History students, in the context of Carleton Virtual, a 3D virtual environment for Carleton University. Based on the results that show the advantages of using the virtual space as a learning environment, we argue that Virtual Space can be a new framework for learning.

1. Introduction

Providing universal world-class education and an innovative research environment, especially in a country as vast as Canada, requires prohibitive investment in resources to provide students and researchers with multiple physical spaces and environments suited for experimentation and collaboration. For example, physical facilities and spaces such as research labs and university campuses are location-dependent and only accessible to those in that geographical location. Likewise, some training and research activities require the development of complex simulated environments that are either too costly or impossible to arrange (e.g. training emergency personnel on handling major disasters). In addition, it has been recognized that innovative work requires collaborators to share tacit and explicit knowledge freely which requires the rich communication usually associated with face-to-face interaction, enabling people to transfer individually-held knowledge, and synthesize it to fashion new collective knowledge.

Digital media (i.e. computer-based systems) have been widely used to improve the educational and research experience by providing new means of processing and sharing information. However, while traditional information and communication technology (ICT) tools such as websites, email and messaging systems, have contributed to the speed of communication and dissemination of information, their ability to support knowledge creation and assimilation is still limited. Traditional ICT strips away the nonverbal cues that clarify messages, and does not provide the physical and linguistic "co-presence" that face-to-face communicators use to draw inferences about one another's knowledge [1]. Traditional ICT tools are also limited in their ability to simulate real-world experiences, critical for the assimilation of complex concepts.

Three-dimensional virtual environments (3DVEs) are graphical environments resembling 3D spaces where users control computer-generated characters (avatars) that represent them, while interacting with the environment and other users, and possibly with computer controlled characters. 3DVEs can contribute to an educational and research system by facilitating communication, collaboration, and simulation. 3DVEs provide an electronic surrogate for face-to-face interaction and allow the creation of simulated environments and experiences otherwise not possible due to high cost,

physical or logistics constraints. By providing a platform that closely resembles physical interaction, 3DVEs permit interaction with a computing environment and the work of other users, while creating the perception that one exists within the environment.

As discussed in the next section, various researchers have explored the advantages of 3DVEs as educational tools, but current 3DVE research and related technology still suffers from the lack of some particular features such as:
1- A thorough study of the advantages and applications of 3DVE technology
2- Advanced intelligent functionality such as dynamic content, integration with other tools, and performance evaluation tools
3- A new educational paradigm based on "virtual spaces"

In this paper, we present two case studies that together demonstrate general advantages of 3DVE technology. These two cases are a framework for language learning for English as Second Language students and a simulated archaeological excavation site for History students, both in the context of Carleton Virtual, a 3D virtual environment for Carleton University. We demonstrate that 3DVEs can be used as a learning tool by providing a virtual space with following advantages:
1- It allows people in different locations to interact.
2- It gives users access to facilities not available physically.
3- It enables activities that are not possible in physical settings.
4- It offers a variety of observation and measurement tools for performance evaluation and improvement.

The projects introduced here are part of a series of research project that together try to address the three missing features mentioned above. We briefly introduce our framework which already provides some of those advanced functionality. We also discuss our initial ideas on the educational paradigm based on virtual spaces. In the next section we review some related work. The general structure of our framework and particular structure and results of two case studies are the topics of the next sections. Finally, we will provide a discussion and some concluding remarks.

2. Related Work

Researchers have studied these virtual environments for education and health care. Davis et al. [2] proposed a community building approach for cancer patients, while Curran et al. [3] describe the Town of Mirror Lake, a virtual community for educating nurses and medical staff. Most of these researchers have noted that virtual communities have become more and more popular thanks to the familiarity of users, particularly younger generations, with digital online media. Second Life (http://www.secondlife.com) is a 3D virtual environment that has been widely used for social, educational, and commercial purposes. Twinity (http://www.twinity.com) and IMVU (http://www.imvu.com) are two other examples of virtual environments that target reconstruction of real cities and creating social meeting places, respectively. Boulos et al. [4] have provided a good review of potential uses of Second Life and other 3D virtual environments for health and medical education. They argue that 3D environments provide an immersive realistic experience that can combine communication, entertainment, training, and access to a variety of data types. On the other hand, serious and educational games, and the effect of story-based learning and empathic virtual characters have been studied by different researchers such as McQuiggan et al. [5] and Kenny et al. [6]. Other researchers [7] have tried to focus on the issue of community members and how they can differ based on gender, age, and race, and require different treatments.

Callaghan et al. [8] also report the use of Second Life for technology education. They notice the need for some simplifications (for example in teaching engineering equipments) which can be a problem but also mention partial integration with a content management system (Moodle) which is a considerable advantage. Danilicheva et al. [9] explore the educational values of 3D virtual worlds but from a storytelling point of view. Their work points to the value of artificial intelligence and also uses stereoscopic 3D to increase immersiveness.

The common conclusion seems to be that virtual communities may provide a more flexible and accessible learning experience, empower users (students, professionals, patients, etc) and enhance coordination of education/care services. Eysenbach et al. [10] on the other hand have argued that the advantages and disadvantages of using virtual communities for health and education still need to be studied. It should be noted that although very interesting and relatively successful in achieving their targets, none of the above mentioned approaches take advantage of all properties of digital media and provide an immersive virtual world with data collection features required for a quantitative analysis. Full audio/visual immersion and quantitative analysis are major missing parts in most of the existing approaches. Some other shortcomings are integration with web applications and real-time content update and web access from within the environment.

3. Carleton Virtual Framework

The cases studied and presented in this paper have been performed within the context of a web-based 3D virtual environment called Carleton Virtual (CV), designed for Carleton University (CU), Ottawa, Canada. Fig. 1 shows some views of our virtual environment, built using the web.alive technology (http://www.avayalive.com) by Avaya (http://www.avaya.com), which itself is based on web technologies and the Unreal Engine (http://www.unrealengine.com). As shown in this figure, CV provides spaces for lectures, various presentations, collaboration, social interaction and special activities. CV was designed to resemble the actual Carleton University campus. The design keeps some of the characteristic features and elements of the campus but allows modfications to improve the space usage and customize it for the virtual activities.

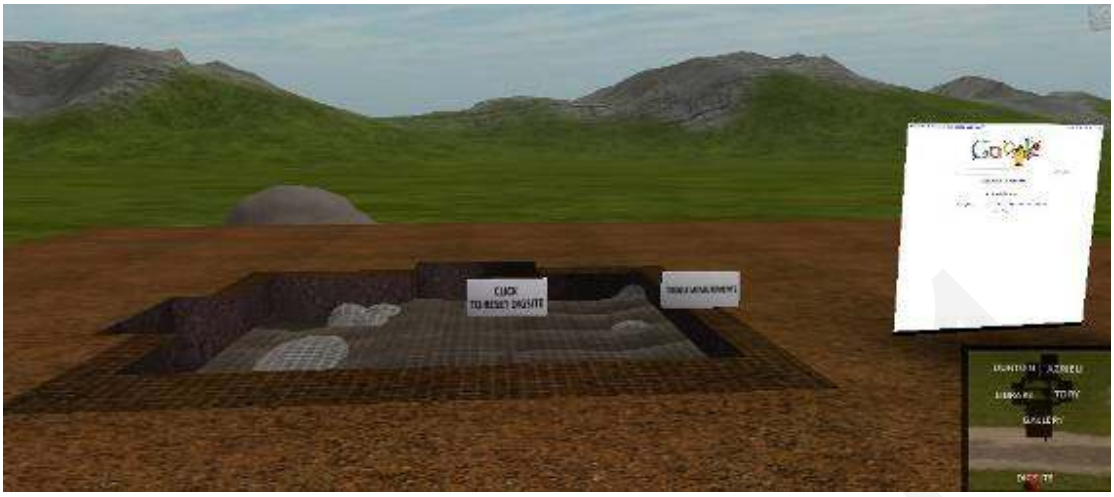

Fig. 1. Sample Views of Caleton Virtual

The content presentation is done through surfaces (screens) that can show videos, images, presentation files (supporting Powerpoint and PDF), and real-time web pages. This will allow instructors and other participants to easily access content and update it in real time while in the environment. The system allows 3D spatial audio. The sound level can be independent of distance (e.g. for speakers in the lecture hall) or change based on avatars distance (for local talks). At any time, users can know who can hear them, and also can control different audio features such as temporary mute. Different "areas" can be defined to simplify environmental control (e.g. private meetings) and behavioural monitoring (e.g. who goes where, etc).

General activities like lectures and collaboration involve tasks like presenting content in different forms, meetings, and social interaction. They are used in both case 1 and case 2. Special activities are those not commonly used by educators and students. The primary example is the excavation site discussed in case 2.

The implementation of this solution is broken down into three parts: (1) content, (2) telemetrics, (3) integration and deployment. The content is a set of 3D assets generated using standard software tools and environmental controls such as events, triggers, scripts, and volumes, defined using web.alive editor (which also serves as the tool to put together all the assets). Web.alive is based on the Unreal Engine by Epic Games (http://www.unrealtechnology.com) and supports a variety of different asset types. An overview of the telemetric instrumentation and data collection methodology is provided in the next sub-section to give insight into current and future potential of the system. Integration and deployment is done through web.alive server side tools in a web-based format.

In selecting the web.alive tool, the project gained access to a sophisticated and verbose logging system as well as a preconfigured set of analytic data and tools. In addition, the raw data affords the future potential of immersive learning focused analytics to help increase the overall effectiveness of education both within virtual environments and in real classrooms. Data is collected by the system on both the server as well as the client. For privacy reasons, the data collected on the server is limited to data which typically collected over the World Wide Web today such as source Internet Protocol (IP) address, user supplied name and action performed. On the client side, detailed logs are collected about encounters that occur within the environment – from individuals walking within

listening radius of each other (an encounter) to two or more individuals speaking to each other within listening radius at the same time (a conversation).

4. Archaeology Case

4.1. Background

The prototype immersive archaeological experience is built on the results of a 2003 excavation conducted by Shawn Graham (Carleton University) and Andrea Bradley (Institute for Field Archaeologists, UK) in Shawville, Quebec (Bibliographie de l'inventaire des sites archéologiques du Québec MCCQ 3453, rapport inédit). That excavation was conducted in the context of a community revitalization project, and was designed to introduce high school students to their community's heritage as a summer field school in archaeology. The excavation was directed with the intention of discovering the functional layout and extent of this brickyard on the property slated for development. We took the results of that excavation, and simulated one of the 2m x 2m trenches in the Carleton Virtual environment, creating soil layers, features, and artefacts in their relative correct positionings.

4.2. Task

In our initial assessment of the excavation, we wanted to explore whether or not the system made sense intuitively: if, in interacting with it, some appreciation of how archaeological knowledge is created was developed. A second aim was to understand how engaging it was, and what worked, or did not work, for the students in this regard. None of the student volunteers had any archaeological experience, aside from one introductory lecture on archaeological landscapes. The students were divided into two groups. One group was introduced immediately to the 3D simulation; the other group interacted with a 2D simulation developed by the Friends of Bonnechere Parks. The 2D simulation was selected for comparison as it is a well-developed example of archaeological outreach and a teaching tool expressly meant to address the same issues as our own prototype.

Both groups of students were given graphing paper and recording sheets, and instructed to talk aloud as they sought to understand what the site they were looking at represented. Afterwards, they were asked to complete a questionnaire, in order to enable cross-project comparability. These questions were assessed on a 5 point Likert scale, where the respondents indicated their degree of agreement with various statements:

4.3. Results

These results can be considered no more than anecdotal, of course. However by focusing our design on engagement, we seem to be reaching our initial group of use-testers at the level that we desired. The design of the simulation, and the affordances of immersive virtual experience, seem to be promoting the kind of emergent learning about archaeology that we should wish to promote to a wider public. When things broke in the excavation, or the students pursued a blind alley, they could hit the 'reset' switch, and start again. It was safe to fail, and thus promoted exploratory and constructivist learning. Both kinds of simulation had their strengths and weaknesses (see tables), but the 3D simulation seemed to elicit stronger agreement from our use testers when asked if it helped develop understanding; it also seemed to be a better environment for fostering group learning.

Table 1. Average Students Rating for 2D and 3D Archaeological Simulation

Questions were answered by rating from 0 (strongly disagree) to 4 (strongly agree)	3D	2D

1. I feel that I have learnt something by using this system.	3	1
2. The excavation simulation reveals believable information.	3.6	2.8
3. I found it difficult to find out information about the archaeological site.	1.4	2.6
4. The quality of the material presented was consistent.	3	1.8
5. I feel that using this system helps develop my understanding of fieldwork methods and techniques.	2.8	1.2
6. I found the system educationally stimulating.	3.4	0.8
7. I was easily able to identify material culture.	3	1.4
8. Tools provided allowed me to practice the theory relating to how archaeology creates knowledge.	2.4	1.8
9. Working in a group helped me understand the excavation process.	3.8	0.8
10. I found it useful to be able to identify where finds were located within the site.	2.8	1.8
11. The descriptions of the artefacts I found were reasonable.	3.2	1.4
12. I was able to find the tools and information I needed to maintain my context sheets.	1.6	1.8
13. I would have preferred to work individually using the system.	0.8	1.2
Average	**2.7**	**1.6**

5. Language Case

5.1. Background

This project was designed to give students in an Academic ESL class a unique opportunity to practice speaking and collaborating with their classmates using a common linguistic reference (English) in a risk-free environment. The 3D Carleton Virtual environment allowed students to collaborate in a space that was mutually convenient to the participants in terms of time and accessibility. This immersive learning opportunity made use of the existing Carleton Virtual (CV) framework. In particular, students collaborated in designated library rooms and final presentations were held in the Azrieli Pavillion.

5.2. Task

This project was piloted with an advanced English as a Second Language Academic (ESLA) class. To begin, students were introduced to the concept of virtual worlds and virtual environments through several assigned readings. This content helped them to understand basic issues and challenges associated with learning virtually or online. Additionally, these readings established some core academic and topic related vocabulary such as “virtual” and “immersive”. Students later attended a “virtual workshop” wherein they experienced firsthand the CV environment. Next, students were asked to choose between a *more traditional* group project and presentation or a *virtual* group project and presentation. Student groups then chose to compare two non-governmental organizations or two virtual learning platforms (these sub-topics related to broader course themes). Students in the *traditional groups* had to arrange to meet and plan on campus and the final oral presentation took place during a regularly scheduled class. Conversely, students in

the *virtual groups* committed to meet, collaborate and present exclusively in Carleton Virtual. All presentations included a reflective component and were evaluated.

Success of a virtual learning task depends on the task itself and the tools available within the immersive environment. As CV physically replicates a university classroom space, tools are not all that dissimilar to those tools students would normally use to work on traditional academic projects. But, what makes this experience unique is that the students can perform under the persona of their avatar anywhere and anytime.

The option to personalize one's avatar was also appealing to many students as they could alter such traits as hair, skin and eye colour. This simple act of fictitiously representing oneself (through a personalized avatar) generated spontaneous language production and even humour as group members commented on each others' changing appearance from day to day. Students liked the "game-like" scenario.

5.3. Results

The most positive outcome was seeing how student groups embraced this opportunity with new-found enthusiasm and energy (this project was introduced towards the end of term and so motivation was beginning to wane); this enthusiasm resulted in professional and well executed group oral presentations. Content was strong and delivery was well rehearsed as evidence in their formal stage presence, authentic and "true-to-life" avatar mannerisms, and well-timed delivery. In addition to increased motivation and task engagement, some learners in the virtual groups appeared less reticent presenting to other non-native speakers and actually demonstrated more initiative and problem solving skills than had been observed during group work in the traditional classroom. The 3D environment afforded students freedom and flexibility which motivated them to work more collaboratively in a "fun", risk free environment and consequently perhaps speakers were more comfortable speaking than in a traditional language classroom.

While student feedback was generally positive, there were some challenges. Overall learners liked that CV was more active and technologically attractive, and that communication was more similar to face to face communication compared to in other learning platforms. Challenges included technology and internet access, which were not always compatible or working.

It is important to note that this task was executed and piloted during a short period of time and at the end of term. Preliminary observations suggest that ESLA learners can benefit from immersive environments like CV, because they are fun, autonomous and relevant providing the task is challenging and generates opportunities for language production.

6. Conclusion

In this paper we have presented the results of two case studies on the use of 3D Virtual Environments as virtual learning spaces. The paper demonstrates how a 3DVE can be used as a learning tool by providing a virtual space that (1) allows people in different locations to interact, (2) gives users access to facilities not available physically, (3) enables activities that are not possible in physical settings, and (4) offers a variety of observation and measurement tools for performance evaluation and improvement. Each one of our two cases show a subset of these features. While the ESL course relies on interaction of people in different location and presentation of content virtually, the archaeology course is a good example of offering activities otherwise not available.

Further research is required to make better use of telemetric and analysis tools, and measurement data, in order to enhance the learning experience. Other types of educational activities such as science lab and also interaction with artificial intelligence-controlled characters are also among future objectives of our research.

ABSTRACT

In higher school informatics study courses it is important to check students' knowledge, skills and competences. To check them the authors offer tests with the attached files, by means of which one can check students' abilities to make a decision, or to solve the tasks common in study work and professional practice. The article justifies the need for such tests based on author's studies made. In the academic work it is important to make decisions which computer programs and software tools to use. Moreover, it is good if a student can make such a decision as quickly as possible. In the tasks are mainly used the data on health care research, which have been generated by a random number generator, based on statistical results of scientific publications.

INTRODUCTION

The aim of the university informatics study course is to help students acquire the necessary knowledge and skills to be used for studies and labour market. It is recommended by several documents – ECDL (ECDL, 2011), profession standards (RPS, 2011), university study guides and course descriptions (LOUISCR, 2011; RSU, 2011; RTU, 2011), requirements for the organization of university study work (HSEC, 2011; LU, 2011), etc. The authors have identified also students' and practising specialists' examples from research work. In informatics study courses it is important to assess students' knowledge, skills and competences objectively. The authors have dealt mainly with individual tasks and tests to be done during a semester. Each type of testing has its advantages and disadvantages. According to the authors' opinion, the advantage of individual tasks lies in its ability to check just that knowledge, skills and competences which are needed in the study work. However, results of independent work only partially depict students' knowledge, skills and competences, since a student is offered much time for decision taking. Correction of the work takes much time per student. In higher schools, as a rule, there is a great number of students, therefore the problem is topical how to ease the routine work of the teaching staff. Nowadays a widespread method for knowledge testing is the computerized test (PTC, 2011; Prokofyeva, 2007; Yevsyukova, 2009). If tests are made and used not considering contemporary advances in this field, they may turn into a dangerous tool, which gives way in producing a large scale illiteracy (Yevsyukova, 2009). Authors fully agree to this statement and are of the opinion that tests have to be worked out skillfully. In promotion thesis (Prokofyeva, 2007) suggestions are given for the grounded choice of testing methods and models. By authors' opinion these suggestions are often quite useful, however, sometimes they cannot be generalized. The main thing is to know clearly what exact knowledge, skills and competences have to be checked. For instance, authors want to check students' skills to make a decision, what methods to use in data or information processing and then to solve task.
There are arguments „for" and „against" in the use of tests (Yevsyukova, 2009). For example, argument „against":

- tests lower the teachers' role.
- tests do not allow to consider students' knowledge and its depth from every point of view;
- tests create ungrounded differentiation of students.

Arguments „for":

- tests are means of radical transformation of the study process and making it more technological.
- test lower the teaching process to be time-consuming.
- tests allow to evaluate students knowledge more objectively.

The tasks with variants of answers lower the value of tests and do not allow to provide the necessary level for testing one's knowledge in its depth. The use of different type tasks (e.g., tasks with freely formulated answers, tests to determine the adequacy, tasks to determine the right sequence (Yevsyukova, 2009) gives a possibility to considerably diversify the tests and provide such a level which allows to check the knowledge of students to a full extent.
Authors consider that both the tasks with variants of answers, as well as those done by help of ICT, have their advantages. Tasks with variants of answers make it easier to summarize and assess the results, while

the tasks to be solved provide the level of testing the depth of knowledge. This is the reason, why the authors propose to join the possibilities of tests and tasks/exercises, by attaching the work-file to the test. It may include the generated data, unformatted texts, etc.
In study work it is important to make decisions, which computer programs, tools or methods to use and then to solve the tasks. It is also important that there would be a great number of tasks and each student would be given a chance to solve a different task as to its content. There exist programs for teachers how to design tests (LIIST, 2011; MDS, 2011; TMP, 2011), in which they can adjust the questions with answer variants for any theme. But, in order to develop at least 50 questions with answer variants, one has to contribute a lot of work. Authors have found out in informatics study courses that the test questions with answer variants can be generated by means of an algorithm, developing a great number of questions in a short time. In the same way one can work out an algorithm and corresponding computer programs for student testing, where, from a great number of questions they are selected according to groups randomly. In the tasks there are used mainly generated health care study data. For health care students it is easier to learn ICT using generated data, since then the tasks are closer to the study program and labour market needs.

TASKS ON BOOLEAN OPERATORS

In the study process there is usually a need for the information search. In the search it is important to use appropriate key words and Boolean operators. To acquire the information search one can look for themes in profession standards (RPS, 2011), university study guides and course descriptions (LOUISCR, 2011; RSU, 2011; RTU, 2011). Some names of themes contain one word, some 2, 3 and also several words. The more words, the greater are the possibilities in work with Boolean operators.
Two key words X and Y are given, which have to be linked to Boolean operators, e.g., in the study subject „Psychosomatic medicine" the words *Stress* and *Theory*. In the process of the information search the following 4 basic activities are possible with these words.

1. „X Y " – finding of exact phrase.
2. X Y or X AND Y – finding the information, which contains both key words.
3. X OR Y – finding the information, which contains one or the other key word.
4. X NOT Y – finding the information, which contains the first key word, but does not contain the second.
5. Y NOT X – finding the information, which contains the second key word, but does not contain the first one.

Thus, from 2 key words, which are taken from profession standards, university study guides or course descriptions, one can make a 5-test task with 6 answer variants, offering all expressions as solutions (because for finding the information, which contains both key words, there are available 2 solutions), which can be mixed up in different sequence P_6=720 variants.
If there are 3 key words X, Y, Z, then it is possible to change the combinations of the mentioned activities. All the before-mentioned 5 activities can be looked upon as two for the following word pairs. X and Y – 5 options. For each activity one can combine a different activity in 5 variants – consequently, 5x5=25 options. In a similar way, looking at X and Z, Y and Z, all in all we get 75 possible tasks. The number of possible variants of answers, offering all expressions as solutions, we get 6x6x3=108. By performing the test it is impossible to look through all 108 variants of answers. According to the authors' opinion it is sufficient to select 5 variants, offering still one extra answer as the last one „Neither of variants".

TASKS FOR DATA SELECTION

On writing a study paper, especially Bachelor's or Master's papers, usually data tabels have to be used. From authors' experience, one has to work more often not with the whole selection, but with the data selected on certain conditions. According to the authors' studies, students usually do not have difficulties to select the data on simple conditions. Greater attention should be paid to complex conditions, in which Boolean operators are used. The ideas here are similar to those in the information search, however, some nuances differ.
Here are possibilities to create a lot of tasks. But, from authors' experience, the most important are with Boolean operators AND and OR and including or not including the interval end-points. For the data selection one can use several computer programs and tools, e.g., MS Excel autofilter or detailed filter, SPSS. The notion of an interval here is relative. Quite often it is important to consider whole numbers or

numbers with a certain number of decimal symbols. To solve such tasks with various kind of tools, a student must know how to write the intervals with elementary conditions, which contain the symbols <, >, ≤, ≥, combining them with Boolean operators AND and OR. Here, for example, are available the following variants of answers.

1. In value interval [a;b] – x≥a AND x≤b.
2. In value interval (a;b] – x>a AND x≤b.
3. In value interval [a;b) – x≥a AND x<b..
4. In value interval [a;b] – x>a AND x<b.
5. Values, cutting out interval [a;b] – x<a OR x>b.
6. Values, cutting out interval [a;b] - x≤a OR x>b.
7. Values, cutting out interval [a;b] - x<a OR x≥b.
8. Values, cutting out interval [a;b] - x≤a OR x≥b.

Thus, looking at the task types, we can make for one data variable 8 exercises with 8 variants of answers, offering the expressions as solutions. The number of tasks can be expanded, taking various a and b values.

Data selection can be determined by very many variables, but according to the authors' experience, it is very rare when more than two are necessary. Let us visualize a situation if the data have to be selected by 2 variables. In one data table with n variables 2 may choose $C_n^2=n(n-1)$ in 2 ways. Here one can combine each of 8 variants with each, but let us look at the variant when for both variables these are simple conditions. Let us label one variable by x and the second by y. By combining symbols =, ≠, <, >, ≤, ≥ and watching MS Excel autofilter, we get, for example, are available the following variants of answers.

1. x=a and y=b – in one variable from the down-falling list a and in the second variable from the down-falling list b.
2. x=a and y≠b – in one variable from the down-falling list a and in the second variable Custom, does not equal b.
3. x=a and y<b – in one variable from the down-falling list a and in the second variable Custom, less than b.
4. x=a and y>b – in one variable from the down-falling list a and in the second variable Custom, greater than b. ...

Continuing in a similar way – combining 6 symbols by 2 in a way that the symbol sequence is not important, one can get from two variables $C_6^2=15$ tasks with 15 variants of answers, offering the expressions as solutions.

DATA ANALYSIS

Writing study papers, especially Bachelor's or Master's papers, it is necessary to perform data analysis. Authors offer to classify the most important tasks in these papers according to the number of variables under survey. The main point is – a student must be able to make a decision what statistic indicators to calculate, to design graphs and to apply hypotheses testing methods. From authors' experience, most important is to consider one, two or three data variables, if more – much rarer.

For the data analysis of one column, the authors propose such a test task: which statistical parameters, graphics, hypothesis testing, research methods can be used for the respective column. Here, for example, are available the following variants of answers.

1. Average
2. Minimum
3. Maximum
4. Mode
5. Median
6. Quartile
7. Percentile
8. Range
9. Interquartile range
10. Variance
11. Std. Deviation
12. Skewness
13. Kurtosis
14. S.E. Mean
15. Frequency

16. Percent
17. Valid Percent
18. Cumulative Percentile
19. Histogram
20. Bar
21. Pie
22. Confidence Interval
23. Chi square test
24. One sample t - test

The number of tasks made depends on the number of variables in the data table. From the given ones it is sufficient to select 5 variants, offering still an extra one as the last one „Neither of variants". In order to answer to such type of questions, a student must know the scale of measurements (Nominal, Ordinal, Scale), what statistic indices and methods are allowed to be used for each scale of measurements.

For data analysis of two variables the authors recommend such a test task. Label one variable by x, the second by y. Various scales are possible (Nominal, Ordinal, Scale). What statistics by groups can one calculate, what graphics, hypothesis testing, research methods can be used for the respective columns? Here, for example, are available the following variants of answers.

1. x descriptive statistics, data split by y.
2. x – dependent variable, y – independent variable; independent samples t – test.
3. x – dependent variable, y – independent variable; paired samples t – test.
4. x – dependent variable, y – independent variable; one – way ANOVA.
5. x – dependent variable, y – independent variable; linear regression.
6. x – dependent variable, y – independent variable; logarithmic regression.
7. x – dependent variable, y – independent variable; quadratic regression.
8. x – dependent variable, y – independent variable; cubic regression.
9. x – dependent variable, y – independent variable; power regression.
10. x – dependent variable, y – independent variable; exponential regression.
11. x – dependent variable, y – independent variable; mean plot.
12. x – dependent variable, y – independent variable; scatter plot.
13. Bar group chart.
14. Spearman correlation.
15. Pearson correlation.
16. Chi – square test.

For the first 12 methods there can be acquired twice as many variants of answers, changing the places of x by y. In such a way the task content will change. For instance, for the stature, grouping by eye color, it is useful to calculate the descriptive statistics, but the eye color for the stature is not useful.

Then there will be acquired 27 variants of answers, from which one can select 5.

For data analysis of three variables the authors recommend such a test task.. Label one variable by x, the second by y, the third by z. Various scales are possible for variables (Nominal, Ordinal, Scale). What hypotheses testing methods can be used in respective variables?

1. Spearman correlation.
2. Pearson correlation.
3. x – dependent variable, y, z – independent variables multiple linear regression.
4. y – dependent variable, x, z – independent variables multiple linear regression.
5. z – dependent variable, x, y – independent variables multiple linear regression.

In one data table with n variables 2 can choose $C_n^3 = n(n-1)(n-2)$ in 6 ways. Analogue test tasks can be made also for more than three variables.

CONCLUSIONS

1. By means of authors' recommended algorithms one can make many test tasks even for a small number of key words and data variables.
2. It is possible to make many more different tasks by key words and tables. The authors summarized the most important standard tasks on the grounds of their studies and experience.

TITLE: WEB 2.0 TOOLS PROMOTING READING SKILLS AMONG UNIVERSITY STUDENTS

Presenter: Adam Forrester, Instructor, English Language Centre, The Hong Kong Polytechnic University, Hong Kong

Contact: ecadamf@gmail.com

ABSTRACT

This presentation investigates the use of Web 2.0 tools, including online voice recording technologies, online mind mapping and word cloud generators, to promote and monitor student reading for their academic studies in a course at an English medium university in Hong Kong. While it is straightforward to require students to read more, this creates a problem of how to monitor whether students are actually reading. In this pilot project, a variety of web 2.0 tools were used by students to share and record their reading as well as assist their vocabulary development, a welcome byproduct of reading more. The online component of the course used a course management system (moodle) with the blog on that system being utilised as a 'reading record'. The presentation aims to show how the project was implemented, as well as giving suggestions as to how it could be improved in the future.

WHAT ARE THE IMPLICATIONS OF FACEBOOK ON STUDENTS WHO ARE ENROLLED AT THE EASTERN MEDITERRANEAN UNIVERSITY?

Research Assistant Gülen UYGARER
Eastern Mediterranean University
gulen.uygarer@cc.emu.edu.tr

ABSTRACT

The aim of this research is to demonstrate the implications of "Facebook" on Eastern Mediterranean University students. The number of Facebook users has increased rapidly in recent years with reports of 500 million active users from different backgrounds. University students are the most active Facebook users. This study focuses on investigating implications of Facebook on university students. The researcher used a qualitative research method in this study. Instruments of data collection are observation, diary, and deep interview. The researcher interviewed 12 students (four Turkish Cypriots, four mainland Turks, and four foreigners). The interviews were conducted with undergraduate education students. The students were observed and asked to keep a daily diary about their Facebook experiences. Also, the researcher kept a daily diary about Facebook experiences as well with two students. According to students, Facebook provides good medium to make their lives easier in terms of their relationship. Nevertheless, Facebook also causes some problems in their relationships. Research findings also show that the students face difficulties related to time management when using Facebook. Students should be careful about time management while they are using Facebook. For further studies, researchers should continue to work on Facebook especially in terms of implications.

INTRODUCTION

Background of the Study

Facebook is social website that helps people to communicate with their friends and people collect information about each other. Mark Zuckerberg established this website in 2004. He studied at Harvard University. First of all, this website was established for students who are the students of Harvard University. After that, around the Boston's schools students have started to use Facebook and League of Ivy's schools' students have started to use it. All schools of USA's students have started to use. The students could only open account with school's e-mail addresses (edu, ac.uk, etc). Then, some high schools and companies joined in Facebook. All people can join Facebook with any e-mail addresses and age limitation. Facebook had 34.000.000 members since 2007. At the same time, Facebook became 7th website on worldwide because people visit it more than other websites. Besides, Turkish is more used language after English in Facebook. Facebook takes this name from "paper facebooks". Facebook has over 500.000.000 members. Site is always free for everyone. This website takes profit from (banner)' advertisements and groups of sponsorships. Users can publish their pictures, their interests, and publish daily news around worldwide. Moreover, they can send private message or can write on their friends' walls. Users of

Facebook can determine confidentiality of their profile. Authority of web chose Facebook as most successful Web 2.0 techniques. Some companies want to buy Facebook, nevertheless, Zuckerberg does not want to sell.

Web sites' properties

Photographs, Gifts, Bazaar Place, Pokes, Activities, Videos, and Foreign language option

Motivation of the Study

Facebook takes more attraction because before the wide spread of internetworking which led to the Internet, most communication networks were limited by their nature to merely let communication between the stations on the local network and the prevalent computer networking method was based on the central mainframe computer model. Facebook provides numbers of things to people whatever people want to do. Being user of Facebook becomes popular among several people who like to use internet and like to learn technology.

Aim and Objectives of the Study

The researcher wanted to search implications of Facebook on students' life who study at EMU because the researcher thought that Facebook affected people life in a bad way rather than good ways because of this reason, the researcher started to examine implications of Facebook on students' relationship who study at EMU.

Objectives of the study

- To learn why do students use Facebook
- To learn advantages and disadvantages of Facebook for students
- To learn impact of Facebook's games on students
- To learn Picture and Picture's comment importance for students
- To learn implication on students' normal life.

Significance of the Study

The aims of study were to show implications of Facebook on students' life. The researcher wished to learn students, who enrolled EMU, sustained which kind of implications and what are the results of implications on students. At the same time, the researcher desired to find positive angle of Facebook to learn why Facebook is more vital and indispensable. Facebook is an important medium in 21st century because numerous people use it and people affect from it in negative ways and positive ways, for this reason, doing investigation was essential about it.

Limitation of the Study

Limitation of study is that, the researcher determined to conduct research about implications of Facebook on only EMU students since the researcher was one of MA student of EMU. The study was done 2009-2010 education years. Numbers of students

were delimitation of study. For this reason, the researcher came across limited time problems. In this research, limited information was taken by the students. According to these reasons the research was affected and came across limited time opportunity to research and gathered information from sample of research.

METHODOLOGY

Aims of study were to indicate implications of Facebook on students' relationship who are enrolled EMU. The kind of research was qualitative. Qualitative research has grown out of diverse disciplines (anthropology, sociology, psychology etc.) that are marked by distinctive interest, theories, issues and research methods. In this research, Case study was preferred as research design. Population of this research was EMU's students.

Population and Sample

Sample of study was determined according to the researcher. The researcher chose sample in a convenience sampling. Gender identification was done. Also nationality differences were taken an account while choosing sample. Totally, 14 students were chosen for being subjects of this study. The researcher interviewed 12 students (four Turkish Cypriots, four mainland Turks, and four foreigners). The interviews were conducted with undergraduate education students. These students are used for interview. Two students are chosen for writing diary about Facebook with two female students. Also, the researcher writes diary. For providing confidentially, nicknames were given to students from one to fourteen.

Data collection procedure and Instrumentation.

Data collection procedure was qualitative. Data collections were done in EMU. First of all, the researcher talked with students who were chosen as sample and took their permission and took appointment for making interview.

For writing diary, the researcher took permission from two students to write daily diary, Also, these two students were observed by the researcher because they were in favorable environment to observe them. One of them was workmate of the researcher so that the researcher had chance to observe the student easy and one of them was friend so that come opportunities were available for the other student.

Data Analysis Procedures

For interview analyzes, first of all, all records were being written and which were being divided according to specific categories, namely, in thematic way. Also, for observation and diary, the researcher analyzed according to interviews' criteria in thematic way.

Ethical Issues in design, Data Collection, and Analysis

Researcher wanted to show implication of Facebook so that as can see previous section, specific students were chosen, all of them labeled by numbers from 1 to 14 . In respect of this research aim ethical issues in design data collection and data analysis

were done. Do not give any distribution, physical or psychological harm to anyone else during this research Each of them have one number, instead of using name, research used numbers for providing confidentiality . During this process, informed consents took important role that included verbal contract for all of participant in this research. Since, some situation would be happened and participant may want to give up study, contract that gives opportunities to be free for changing their decision about continue or give up study. Data collection boundaries of this research, all participants are voluntary, nevertheless, condition of making interview ,observation and writing diary of research affected participant while making interview, observation and writing diary.

ANALYIS AND FINDINGS

According to interview question's answers, observation and diary, Facebook has implication on students' life who study at Eastern Mediterranean.12 students were chosen for interview questions. Each students answered interview question one by one.

Spend time on Facebook: 1 of student claimed that s/he uses Facebook more than 5 hours. 1 of student claimed that s/he uses Facebook at least 1 hour.1 of student claimed that s/he uses Facebook 30 min in a week.2 of students claimed that they uses Facebook 4-5 hours daily.2 of students claimed that they uses Facebook 1 hours daily. 4 of students claimed that they use Facebook 3-4 hours daily.

Aims of using Facebook : Almost all claimed that they used to talk with their friends and their family. Only one of them mentioned that s/he used to play games and to talk with their friends and family.

Advantages of Facebook: Four of them claimed that Facebook provided cheap communication. Twelve of them claimed that Facebook provided to communicate easily with their friends, and their family's member. Two of them claimed that Facebook helped to spend their free time. Three of them claimed that Facebook helped to follow current events what happened in world. Four of them claimed that they could establish easily communication on Facebook. One of them claimed that Facebook provided opportunities to be social.

Disadvantages of Facebook: Five of them claimed that Facebook caused to spend more time. One of them claimed that Facebook caused to come across health problems. One of them claimed that Facebook caused to open to others and can be reachable for others. One of them claimed that Facebook caused to forget lesson and homework.

Games: Two of them claimed that games leaded to spend more time because of requirement of some games. Two of them claimed that games helped to find for talking topic with friends. One of them claimed that games provided to establish close relationship. One of them claimed that games did not provide any benefit/backward only provide to fill free time. One of them claimed that games did not lead to spend more time.

Chat-message: Eleven of them claimed that they used chat-message especially for reaching their friends to talk. One of them claimed that she/he did not use

chat/message, prefers to use other thing. Four of them claimed that they also talked with unknown people. One of them claimed that she/he used for talking opposite sex.

Picture: Eleven of them claimed that they generally thought positive things about Facebook. One of them claimed that she/he did not use their pictures. Eight of them claimed that they felt well after reading comment of their own pictures. Two of them claimed that they found unnecessary thing. One of them claimed that uploading picture was habit for him/her self

Video-Application: Three of them claimed that video-application helped to improve their relationship. Five of them claimed that video-application helped to learn certain things. One of them claimed that video-application helped to send message to someone. One of them claimed that video-application helped to reach other people and caused to learn what happen in the world. One of them claimed that video-application helped to get pleasure. One of student claimed that video-application was nice for him/her self. Two of them claimed that video-application was funny thing. One of student claimed that video-application helped to concentrate on their concerned area.

Being member of Facebook's group(s): One of them claimed that being member of group provided chance to find work. Six of them stated that being member of group provided suitable environment to gather information about certain things. Two of them noted that being member of group provided to share information with other members. Two of them claimed that being member of group provided to support their ideas. One of them claimed that being member of group provided to follow current things about their interests. One of them said that being member of group provided to meet new people.

The Impact of Facebook on normal life's relationships: Almost all claimed that Facebook affected their relationships in a bad way, they could not share time with their families. One of student claimed that Facebook leaded to be addicted and another one claim that Facebook reasoned to lose their friends.

Observation Analyze: Generally, students spent more time to talk with their Facebook's friends and to play popular Facebook's games such as Farmville.

Diary of the Researcher: The researcher mentioned what she did during the using Facebook. Generally, she used to spend free time, to take pleasure, to be aware of current activities, to play games, to chat with Facebook's friends. Facebook caused some backward to the researcher, for example, the researcher had health problems, became addicted and did not give enough importance on school stuff and came across some matters with her family about Facebook.

Diary of students: Students who were observed, one of them generally utilized Facebook to do similar things. For instance, the students was online during the two or three hours to checks own notifications and to find friends to contact. Also, the student preferred to use Facebook to play popular games.

In an each day, the second student, who was observed, spent more time to talk with his or her Facebook's friends, to play more games and to follow recent issue and

events on Facebook. Therefore, the second student claimed that "I have started to become addicted"

The results of interviews indicated that students can communicate with their friends, however, Facebook caused to spend more time and prevent to communicate with their families or others since students used their free times on Facebook instead of passing time with their families or other. As already mentioned, 12 students were chosen for interview. Almost all claimed that, Facebook took their time, the researcher agreed with students since and the researcher denoted on own diary as "I start to become addicted" like other subjects stated similar ideas. In addition to this, Facebook helped students to talk with their friends, to find their old friends, to meet new people and get pleasure from talking with others Approximately, large numbers of students stated that, playing games cause to spend more time and reasoned to be addicted of games. Because of some games leaded to become addicted according to the students. Also, according to interviews' records, Facebook helped to remember something, almost all students shared similar idea about getting information from application parts of Facebook and being members of some groups. Student 13 and student 14 wrote diary, student 13 stated, Facebook's games caused to be online specific time. And Student 1 and 2 shared similar idea about it. Moreover, student 14 claimed that need to be online all the time to discuss certain issue on Facebook. The researcher also made observation. During the observation, it was understood that people spent more time for Facebook. The results indicated that implications of Facebook can be seen since people's normal life affected from it, caused to health problem for people so that people cannot separate time for their offline relationship because of spending more time for Facebook.

According to the collected data, Facebook had important place on students` life. It affected their intimate relationships, their health, and their education life so on and so fourth. Since students spent more time on it and Facebook liked became part of their life and created second world for themselves. The researcher believes that people especially students who used Facebook, they can be addicted and isolated from normal life because of Facebook's facilities.

CONCLUSION

The researcher wanted to investigate Facebook's implications on students' life who study at Eastern Mediterranean University. The type of research was qualitative study and the approach of research was case study. First of all, the subject of research was determined, and information was collected to prepare interview questionnaire, then, literature reviews were done. After that, the researcher took permission to make interviews and interviews were done with 12 students . At the same time, observations were done, two students were observed and diaries were written about Facebook approximately during the one week what did the researcher and two students do on Facebook. The results of study show that, Facebook takes important place on students' life who study at EMU. Some of them gained benefit from it and unfortunately some of them affected badly. All objectives were found after the analysis of collected data. The researcher learned why did students use Facebook, the advantages and disadvantages of Facebook for students, the impact of Facebook's games on students,

the importance of Picture and Picture's comments for students and what are implications on students' normal life.

The purpose of study was that Facebook has implication on students' life who study at EMU. Because, nowadays, Facebook creates new dimensions on people lives especially on students who study university. Facebook causes to some problem for people. One of them was implications on students' relationships. Exactly, interviews' results demonstrate implications of Facebook, some statement of the students totally explained the aim of study. Shortly, Facebook has implication on students about a lot of things such as normal life's relationships. The researcher recommended that people should do time management well while using Facebook and avoid from being addicted of Facebook. People should try to take pleasure and benefit from Facebook. Also, people should not allow to Facebook affects them. For further studies, researcher can work with large numbers of students. Besides researcher can work with universities' staff to show that role of Facebook on their labour power and their routine activities. People should be aware of every danger since some innovation brings danger to people who use it.

WHY TURKISH PRE-SERVICE TEACHERS PREFER TO SEE POWERPOINT PRESENTATIONS IN THEIR CLASSES

Funda Savaşcı-Açıkalın, Ph.D.
Istanbul Universitesi
fsavasci@gmail.com

ABSTRACT

PowerPoint has become very popular presentation software used in educational settings. The literature indicates that the effectiveness of PowerPoint presentations is inconclusive and that students have positive attitudes toward PowerPoint presentation. However, the question why students prefer to see PowerPoint in their classes is still in discussion. Therefore, the purposes of the study are to investigate pre-service teachers' attitudes toward PowerPoint presentations, understand the reasons why they prefer to see PowerPoint presentations in their future classes, and their suggestions about the ways to improve the quality and usefulness of PowerPoint presentations. "Presentation Software Survey: Student Perspective" (Frey & Birnbaum, 2002) was used in order to collect data for this study. The survey contains 12- item Likert type questions and two open-ended questions. The data were collected from 211 pre-service teachers studying at three different departments in one of the large Turkish Universities. The findings of the study indicated that the majority of the participants prefer to see PowerPoint presentations in their future classes for helping them study for the course exams and providing the long term retention of knowledge. More than half of the participants suggest more visuals, pictures, and videos should be used in PowerPoint presentations.

Introduction

PowerPoint has become very popular presentation software used in business and educational contexts (Craig & Amernic, 2006; Szabo & Hastings, 2000). It is estimated that PowerPoint is used over 30 million presentations a day and its software is on 250 million computers on the world (Savoy, Proctor, & Salvendy, 2009). While PowerPoint lectures become more prominent in the higher education institutions (Brown, 2007; Craig & Amernic, 2006; DenBeste, 2003; Gier & Kreiner, 2009), there has been a debate about the advantages, benefits, and effectiveness of the software. Initially PowerPoint is designed to help structure both the content and the process of a lesson or lecture and prevent it from rambling (Hlynka & Mason, 1998; Savoy et al., 2009). Supporters of PowerPoint believe that PowerPoint helps to keep student's interest and attention to the lecture (Szabo & Hastings, 2000), improves students' learning (Lowry, 1999), and aids explanations of complex illustrations (Apperson, Laws, & Scepansky, 2006). On the other hand, Creed (1997) describes PowerPoint as a teacher-centered instructional tool that nourishes teacher-controlled lectures. Similarly, Tufte (2003) points out that PowerPoint reduces the analytical quality of a presentation, limits the amount of detail that can be presented, and often weakens the verbal and spatial thinking.

Likewise, the research studies indicated conflicting findings about the effectiveness of the PowerPoint in terms of improving student learning (Craig & Amernic, 2006; Levasseur & Sawyer, 2006). Gier and Kreiner (2009)' s study conducted on 73 undergraduate psychology students showed that when the students were actively engaged in the class and PowerPoint presentation was supported by content based questions, the information retention was increased. Szabo and Hasting (2000) conducted three studies to investigate the efficacy of PowerPoint lecturing and found a significant difference of students' grades between overhead lecture and PowerPoint lecturing in only their second study. They suggested that the efficacy of PowerPoint lecturing may be case specific rather than universal.

Other studies found no significant difference in students' academic achievement between the traditional lectures and PowerPoint supported lectures (Daniels, 1999; Savoy, Proctor, & Salvendy, 2009). Daniels studied with a group of students taking economy courses without desktop presentation programs (DPP) materials and a year later studied again with the same group of students taking another economy course with DPP materials. Daniels compared students' test scores and feedbacks and concluded that use of DPP neither improved nor hindered student performance. However, almost all of the students (98%) had positive attitude toward DPP materials and found DPP materials useful. Similarly, Savoy et al. conducted a study in the U.S. with 62 students enrolled in the human factors in engineering course in order to compare information retention from PowerPoint and traditional lectures. The findings

of the study also showed that no significant difference was found between PP group and the traditional group in terms of most of the assessment variables. In fact, the traditional group scored higher than the PP group at audio assessment variable.

Apperson, Laws, & Scepansky (2006) examined the impact of the use of PowerPoint on students' experience in the classroom. The findings of the study indicated that although there were no differences in grades as a result of the use of PowerPoint, organization and clarity, entertainment and interest, professor likeability, and good professor behaviors were enhanced with PowerPoint.

Bartsch and Coben (2006) investigated the effects of three types of presentations including transparencies, basic PowerPoint (only text) and expanded PowerPoint (text with pictures and sounds) on student learning and attitudes. Students preferred PowerPoint presentations since they believe they learned more from PowerPoint presentations. However, their course grades revealed a different conclusion that students came from the expanded PowerPoint lectures did worse on the exams and had greater dislike for slides with pictures which were not relevant. Other researchers have demonstrated that material such as irrelevant sounds (Moreno & Mayer, 2000), interesting but extraneous text (Schraw, 1998), and irrelevant pictures (Mayer, 2001, p. 113) can reduce comprehension.

Although the research about the effectiveness of PowerPoint supported lectures is inconclusive, studies indicate that students have positive attitudes toward PowerPoint (Apperson, Laws, & Scepansky, 2008; Can, 2010; Craig & Amernic, 2006; Kahraman, Çevik, & Kodan, 2011; Levasseur & Sawyer, 2006; Susskind, 2005; Uz, Orhan, & Bilgiç, 2010). Apperson, Laws, and Scepansky (2008) investigated student preferences regarding the physical structure of PowerPoint. Students completed a 36- item 7-point Likert scale survey and four open-ended questions indicated that they preferred the use of key phrase outlines, pictures and graphs, slides to be built line by line, sounds from popular media, or that support the pictures of graphics on the slide, color backgrounds, and to have the lights dimmed.

Perry & Perry (1998) surveyed with 98 students from computer information system and teacher education departments in order to determine students' preferences among four different types of presentations including multimedia, overhead transparency, chalkboard, and straight lecture. They found that a majority of them preferred multimedia presentations for several reasons including being more eager to attend to class, finding the course more interesting and more enjoyable and holding their more attention. They also believed that they learned better and easily understand the difficult concepts with multimedia presentations. Can (2010) studied pre-service teachers' attitudes towards the effects of use of teaching materials including overhead projector and projector on learning and found that students believe that use of overhead projector and projector brings some kind of change, prevents teaching from being monotonous, and helps making a lively, colorful teaching and learning environment.

In a recent study, Kahraman, Çevik, and Kodan (2011) investigated the students' attitudes toward the use of PowerPoint in terms of gender and departments. They collected data by using "attitude toward the use of PowerPoint" instrument from 653 students studying at different colleges in the same university. The findings of the study indicated that there was no significant difference of students' attitudes toward the use of PowerPoint in terms of gender, but there was a significant difference in terms of colleges. Students enrolled in the Faculty of Engineering had more negative attitudes towards the use of PowerPoint compared to other students at different faculties (education, economics and administrative science, and vocational higher education). Some students believed that PowerPoint presentation increase the retention of information in the mind by featuring visuals and increases their motivation by arousing attention and interest whereas others believed that PowerPoint becomes less effective and more boring if they were used more frequently than necessary and especially the use of PowerPoint carelessly and sloppily prepared cause distraction. Students at school of engineering also expressed that they did not like the PowerPoint presentations filled predominantly with mathematical expressions.

In another study, Uz, Orhan and Bilgiç (2010) collected data via using a Likert type survey developed by researchers order to examine pre-service teachers' opinions of the PowerPoint presentations. Data were collected from 684 pre-service teachers studying at different departments of colleges of education from four universities in Turkey. Participants in this study expressed partially positive opinions of the designs of PowerPoint slides and the effects on their learning. Students studying at department of computer education and instructional technologies expressed less positive attitudes while students from the department of education religion and ethics had more positive opinions of the use of PowerPoint. According to the results of the study, students agreed that PowerPoint presentations make courses more interesting and easy to follow. However, the findings of the study only came from students' responses on a Likert type survey. Thus, students were not given an opportunity with an open-ended questionnaire to explain why they prefer or not prefer to see PowerPoint in their future classes. In summary, the recent studies indicated that students found PowerPoint lectures extremely helpful to take

notes for exams (Frey & Birnbaum, 2002), excellent method of presentation that aided their learning (Clark, 2008), and still preferred PowerPoint lectures even though it was not affected their grades in a positive way (Bartsch & Cobern, 2003).

Although studies showed that student have positive attitudes toward PowerPoint even when their achievement is not positively affected, most of them merely focused on comparisons of students' attitudes in terms of gender and department (Apperson, Laws, & Scepansky, 2008; Can, 2010; Craig & Amernic, 2006; Kahraman, Çevik, & Kodan, 2011; Levasseur & Sawyer, 2006; Perry & Perry, 1998; Susskind, 2005; Uz, Orhan, & Bilgiç, 2010). However, the reasons why they prefer to see or not to see PowerPoint presentations in their classes and what they suggest how to improve the effect of PowerPoint are still in question. Therefore the purposes of the study are to investigate student's attitudes toward PowerPoint presentations, understand why they prefer to see or not to see PowerPoint presentations in their classes, and their suggestions about how to improve the quality and usefulness of PowerPoint presentations. In order to investigate these issues, the following research questions were generated.

1) What are attitudes of the Turkish pre-service teachers toward PowerPoint?
2) Why do they prefer to see or not to see PowerPoint in their classes? In other words, what are the reasons behind the attitudes of the Turkish pre-service teachers toward PowerPoint?
3) What do Turkish pre-service teachers suggest to improve the quality and usefulness of PowerPoint?

Methodology

Data Collection

In order to collect data for this study "Presentation Software Survey: Student Perspective" (Frey & Birnbaum, 2002) was used. The survey includes 12- item Likert type questions and two open-ended questions. The survey was translated to Turkish by the author and it was translated back to English by another Turkish scholar in order to increase the reliability of the translations. Based on comparisons and revisions, the final Turkish version of the survey was created. After converting the negative statements, the reliability of the survey was calculated as Cronbach's alpha = 0.82, which indicates that it is a reliable survey. Data for this study were collected in fall 2010.

Participants

The data were collected from 211 pre-service teachers (116 female - 95 male) in one of the large Turkish Universities. The participants were junior and senior students studying at three different teacher education departments (66 elementary, 84 social studies, and 61 science education). All the participants were voluntarily participated in the study. The survey was given to the participants in different classes. The participants generally completed the survey in 15 -20 minutes.

Data Analysis

The quantitative part of the data was analyzed by using SPSS (18.0). Descriptive statistics was calculated for each question. The mean scores for responses given to the survey questions were calculated (strongly disagree= 1, strongly agree= 5). The qualitative part of the data was analyzed by using inductive analysis.

Results

In order to answer the first research question, descriptive statistics was calculated. Table 1 shows the mean and the percentages of the responses given by participants to each statement. As seen in Table 1, the majority of the participants (89%) have positive attitudes toward PowerPoint presentations (Question 1, M= 4.01, out of 5). An analysis of the responses given for each statement also indicated that pre-service teachers have positive attitudes towards PowerPoint presentations. The qualitative data from the second part of the survey also confirmed this finding. The data analysis showed that vast majority of the participants (191 participants = 90.5 % of the total) would like see more PowerPoint presentations in their future classes.

In order to answer the second research question, both qualitative and quantitative parts of the survey were analyzed. Data analysis suggested that there are several reasons why pre-service teachers prefer to see PowerPoint presentations. One of the most significant findings of the study indicated that

students prefer PowerPoint presentations because a majority of them (89%) believed that they helped to study for course exams (M= 4.21, out of 5). More importantly, almost half of the participants (47%) strongly agreed with this view. Therefore, it was the most prevalent reason why pre-service teachers prefer to see PowerPoint presentations in their future classes. This popular reason may come from students' beliefs that it is enough to study handouts for preparing for exams.

The second widespread reason why pre-service teachers prefer to see PowerPoint presentations was their beliefs that PowerPoint presentations hold their attention (M=4.09). A majority of the participants (89%) agreed with that PowerPoint presentations hold their attention during the class. Another reason for pre-service teachers' preferences was the role of visual images presented in PowerPoint presentations on the retention of the content for exams. A majority of the participants (88%) believed that visual images presented in PowerPoint presentations help them to recall content during exams (M=4.01). Similarly, 77% of the students indicated that they do not prefer bullet-point, text-only PowerPoint presentations over presentations with audio, video, or graphics. Many students (84%) also believed that PowerPoint presentations help to emphasize key points during lectures (M=3.92) while 77% of the participants believed that professors who use PowerPoint presentations are more organized during their presentations.

	Strongly Disagree SD (%)	Disagree D (%)	Neutral N (%)	Agree A (%)	Strongly Agree SA (%)	Mean
1) PowerPoint presentations hold my attention.	2	7	2	**57**	32	4.09
2) PowerPoint presentations increase the likelihood of inappropriate classroom behavior.	13	**53**	17	16	2	2.42
3) I prefer traditional lectures using a blackboard or whiteboard to PowerPoint presentations.	25	**45**	5	14	11	2.41
4) Power Point handouts help me to take better notes during classroom lectures.	6	11	9	**54**	21	3.73
5) Handouts printed from PowerPoint presentations help me to study for course exams.	5	4	2	42	**47**	4.22
6) Professors who use PowerPoint presentations are more organized during their presentations.	4	6	10	**57**	24	3.91
7) I prefer bullet-point, text-only PowerPoint presentations over presentations with audio, video, or graphics.	29	**48**	5	9	9	2.21
8) Visual images presented in PowerPoint presentation lectures help me to recall content during exams.	5	5	2	**59**	29	4.01
9) I am less motivated to attend class when PowerPoint presentations are used during the lecture.	21	**53**	9	11	6	2.28
10) PowerPoint presentations help to emphasize key points during lectures.	3	6	7	**62**	22	3.92
11) I have a positive attitude towards PowerPoint presentations.	4	4	3	**64**	25	4.01
12) I am less likely to attend class when the professor posts PowerPoint handouts to the Web.	18	**39**	25	14	4	2.48

Table 1: Percentages of the responses given by participants for each statement.

Students' responses to the question why they prefer to see PowerPoint presentations were listed in Table 2. As seen in Table 2, a majority of the participants prefer to see PowerPoint presentations for several reasons. The most widespread response was the retention. Many pre-service teachers believed that PowerPoint presentations provide long-term retention of information and help them to understand the content. Here are the some examples of students' responses.

"I would like to see it more because PowerPoint presentations show the main concepts and help them stay in mind for longer period" (P#6).

"Yes I would like to see more because I believe they increase the retention of knowledge in mind" (P#46).

Taking notes more easily with PowerPoint was the second common response given by the participants. Many participants indicated that they prefer to see PowerPoint presentations since they provide a summary of the topics and highlight important points. Increasing their motivation, getting their attention were other popular responses provided by the participants. Participants also believed that PowerPoint presentations should be used since it is easier to prepare for exams with handouts. For example, participant #5 stated that "I think I am getting better prepared with both my notes and PowerPoint

handouts". There have been few students stated that they prefer to see PowerPoint if they are carefully prepared and properly used. For example, participant #7 stated that "sometimes I want to see; sometimes I do not because the most difficult topics can be passed quickly by pushing the buttons".

Although the majority of the participants stated that they prefer to see PowerPoint presentations in their future classes, few students (7% of the participants) indicated that they did not want to see PowerPoint presentations for several reasons. One of the reasons indicated by participants who did not want to see PowerPoint presentations was that PowerPoint presentations were not appropriate for every topic. For example, participants #18 stated that "I would like to see in social science (sözel derslerde) courses but not to see in science and maths courses (sayısal derslerde)". Other reasons given by the participants may listed as passing the slides too quickly, not being in detailed, using too much, not preparing properly, not being explanatory, not allowing discussion much, and distracting.

Students' responses to open-ended questions confirmed the findings of the survey. Very few students stated that they did not prefer to see PowerPoint presentations for some reasons such as sliding too quickly, being not appropriate for every topic, being not necessary always, using too much, distracting their attention. The participant #179 stated that "do not want to see because the presenter may not explain topics in detail and may be limited, it is unnecessary to see the same thing you heard". Six of the participants left unanswered to this question.

Students' responses	Frequency
Prefer to see because;	
Retention	53
Taking notes	39
Help to understand topics	38
Motivation	35
Getting attention	34
Visual effects/learning	31
Highlighting important points, summary	25
Entertainment	19
Planning well	17
Preparing for exams	12
Easy to follow	10
Time saving	7
Others (easy to prepare, concrete, active, achievement etc.)	5
Prefer to see with conditional	
If prepared to summarize topics	2
If prepared depending on needs	1
If use properly	1
If included interpretation	1
If it is explanatory	1
Not prefer to see because;	
Not necessary for some topics	4
Sliding too quickly	1
Not in detail	1
Too much used	1
Distracting	1
Not allowing discussion much	
No response	6

Table 2: Students' reasons why they prefer to see (or not to see) PowerPoint presentations.

In order to answer the third research question, open-ended questions in the second part of the survey were analyzed. Table 3 shows participants' suggestions of the ways to improve the effectiveness and the quality of PowerPoint presentations. One of the most prevalent suggestions indicated by more than half of participants (128 participants = 61 % of the total) was that more visuals including pictures, photos, videos should be placed in PowerPoint presentations to improve the quality and usefulness of PowerPoint presentations. For example, the participant #137 indicated that "more visuals, pictures, or videos should be used if there is only text, it can be boring". Another participant (#5) stated that "in order to become more useful, PP presentations should be supported by visual effects especially videos related to the content that helps us comprehend and increase our motivation". A number of the participants suggested that handouts should be given before the class so that students can follow during the lectures and take additional notes on it. For instance, the participant #88 stated that "If the handouts given beforehand, we will be able to add any explanation made by teachers on our handouts". Some other

participants indicated that they want to have handouts for preparing exams. Here are some examples of these responses.

"Handouts should be given in order to increase achievement on exams" (P#85).

"I believe that providing handouts helps not only learning but making study easier for exams" (P#75).

Suggestions	Frequency
Adding more visuals, pictures, videos, sound	128
Providing important points/key words Less information	36
Providing handouts beforehand	17
Not reading directly	9
Using appropriate font size	8
Not using always	7
Not being too long	7
Not passing slides quickly	7
Using appropriate colors	6
Connection to daily life	6
Being interesting	6
Providing student participation	4
Preventing technical problems	3
Balancing texts and images	3
Being fun	2
Others (darkness, music, prepared by students etc)	3
No response/idea	20

Table 3: Pre-service teachers' suggestions of the ways to improve the effectiveness of PowerPoint presentations

Making presentations interesting and fun was other suggestions made by some participants. Participants indicated that they did not want the instructor read the text directly without interpreting or giving examples from daily life. Some of the participants suggested that the instructor should provide enough time before going to the next slides, should not use PowerPoint presentations too much, and should provide student participation by either asking questions or having them participate in activities. Other suggestions were related to physical structures of PowerPoint presentations such as picking up appropriate colors, font size and text type for effective presentations. Twenty of the participants did not provide any suggestions for improving the quality of PowerPoint presentations.

Discussion

The findings of the current study provide valuable insights about why pre-service teachers prefer to see PowerPoint presentations in their future classes and what they suggest in order to improve the quality and effectiveness of the PowerPoint presentations. The results of the current study indicated that pre-service teachers have a positive attitude toward PowerPoint presentations and would like to see more in their future classes. This finding is consistent with the findings of other studies (Apperson, Laws, & Scepansky, 2008; Can, 2010; Craig & Amernic, 2006; Kahraman, Çevik, & Kodan, 2011; Levasseur & Sawyer, 2006; Perry & Perry, 1998; Susskind, 2005; Uz, Orhan, & Bilgiç, 2010).

Among many reasons why pre-service teachers prefer to see more PowerPoint presentations, the most significant and common one was pre-service teachers' beliefs that it is easier to prepare with PowerPoint handouts for exams. Students may think that it is enough to study PowerPoint presentations handouts for preparing on exams. This finding is also consistent with Frey & Birnbaum's (2002) study showed that students think PowerPoint presentations help them to study for the course exams. However, this situation may be considered as a disadvantage of PowerPoint presentations if students think that it is enough to study only handouts from Powerpoint presentations for the course exams. In the literature this disadvantage was discussed by Gier and Kreiner (2009) stated that students might falsely believe that if they study only what is on the PowerPoint slides that they will do well on the exams. This could be a reason why many studies did not find the significant effect of PowerPoint presentations on student learning (Apperson, Laws, & Scepansky, 2006; Bartsch & Cobern, 2003; Daniels, 1999; Savoy, Proctor, & Salvendy, 2009).

Another important finding of the current study was the common belief that PowerPoint presentations hold their attention. This point was consistent with Szabo & Hastings's (2000) study. However, the current study indicated that Turkish Pre-service teachers are more likely to have this belief than their counterpart in Frey & Birnbaum's study (2002). According to the current study, Turkish pre-service teachers are more likely to think that visual images presented in PowerPoint presentations help

them to recall content during the exams than their counterpart in Frey & Birnbaum's study (2002). This could be the reason why a majority of the participants in the current study suggested that they would like to see more visuals, pictures, diagrams, videos in PowerPoint presentations. In the current study, Turkish pre-service teachers seemed to be in favor of more visuals than texts, confirmed by Açıkalın's (2009) study indicated that Turkish pre-service teachers focus on more visuals on their Internet search.

The present study indicated that Turkish pre-service teachers would like to have handouts from PowerPoint presentations beforehand. However, the reason for this suggestion was not due to the lack of attendance as indicated by Frey & Birnbaum's (2002) study. Turkish pre-service teachers in the present study did not indicate that they were less likely to attend class when PowerPoint presentations used and handouts from PowerPoint presentation given by hand or posted on the web. In the current study, some suggestions made by Turkish pre-service teachers were discussed in the literature (Kahraman, Çevik, and Kodan, 2011) that PowerPoint presentations should be prepared carefully and used properly.

Conclusion

PowerPoint presentations are widely used in education and discussed in the literature. The literature indicates that pre-service teachers have positive attitudes toward PowerPoint presentations although the effectiveness of PowerPoint presentations is inconclusive. This situation brings an important question how to improve the quality of PowerPoint presentations in order to increase student learning. In terms of this aspect, the present study may have valuable contribution to the literature. Here are some suggestions based on the findings of the current study.

1. The quality of PowerPoint presentations depend on mainly the instructor. Instructors should have enough knowledge and ability how to prepare PowerPoint presentations in terms of not only physical structure but also the content. PowerPoint presentations could be turned to typical teacher-centered instruction if instructors do not provide student participation by either asking discussion questions or having students participate in activities.
2. PowerPoint presentations are valuable tools to get student attention at the beginning of the instruction. The most important point here is to keep students attention and interest during the instruction. Visuals including pictures, animations or videos related to content may be helpful to keep student attention until the end of the instruction. However, since unrelated visuals may reduce student comprehension, it is important to pick up appropriate visuals and make the connection with topics. Keeping the balance between the text and the visuals is a key issue to prepare effective PowerPoint presentations.
3. PowerPoint presentations can be more useful if they are clearly organized and briefly summarize the topic. PowerPoint presentations with longer text and slides can have students lost their attention and get boring. PowerPoint presentations should have less but important information.
4. Although PowerPoint presentations are well-prepared, they should not be used all of the times. PowerPoint presentations should be supported by a variety of student-centered methods in which students may actively participate such as activities, experiments, group works, case studies, and discussions.
5. Handouts from PowerPoint presentations can be given to students beforehand. However, if the instruction does not depend on only the PowerPoint presentation, students probably will not think that the course exam will be covered only the handouts from PowerPoint presentations given by the instruction. Therefore, in this way, the attendance problem indicated in the literature will be also solved.

Moreover, based on the findings of the present study, further research is needed in order to investigate the effects of visuals, photos, videos presented on the PowerPoint presentations on student learning and to compare any differences of student learning between students given to handouts beforehand and students who do not receive any handouts.

Abstract

This practice aims to teach students who have intellectual disabilities how to greet familiar people when they meet them. The purpose of this research is to see the effects of video modelling practice over the mental retarded students, when they meet familiar people. In this research, teaching the social skills to the students with mental retardations were evaluated with the effectiveness of teaching with video modelling, model of multiple probe design between subjects from research models of single subject design. In these research four students, whose ages range between ten to eleven attending a special education class at a primary school in Ankara and also have mental retardation are participated. The peers group consist of 3 girls and 2 boys who study at the same elementary school with the target students (all of them are 11 years old and continue their study at 5th grade class). Research findings were presented with video modelling in teaching students with intellectual disabilities Skill of Greeting Familiar People and acquire the skills to be effective after the end of the winning students in the application of these skills have shown that they continue to use. After the interviews done with the mothers and the teachers of the students about the results of teaching the skill of "greeting when meet familiar people" by video modelling, knowledge obtained is: they are satisfied with these skills to be taught to the students. They also expressed that the students have more interaction with their friends around them, more than earlier.

Keywords: Video modeling, social skills and intellectual disabilities.

Introduction

Social skills are important elements of behaviour for individuals to start and continue effective interaction. Social skills are defined as the ability to perform proper behaviour in social environments and play an important role in the establishment of interpersonal relations and realization of social objectives. Social skills make it easier for an individual to explain his positive or negative feelings in a proper way, defend his personal rights, ask for help from others when it is needed, and refuse inappropriate demands (Westwood, 1993).

It is possible to define social skills as the ability to interact with others in a specific social context. Social skills are learned behaviours that avoid negative reactions in interactions with other people and allow the possibility to receive positive reactions. But some individuals have problems gaining these behaviours (Cartledge ve Milburn, 1983). These individuals cannot interact well with the people around them because they lack these social skills (Avcıoğlu, 2005). As a result of this, the lack of social skills cause communication problems and also the individuals are not accepted by their peers (Karakuş, 2006).

Many social skills are generally learned unconsciously and in non-systematic way within peer groups and family. Individuals learn social skills by observing their families, other adults and their peers as a model. This is an unconscious and non-systematic learning method. But for the handicapped individual, this method is usually not valid. In other words, a individual with a disability cannot learn social skills by observing peers without a handicap. That is why social skills for handicapped individual are taught systematically and they need to be supported to use this ability (Thorkildsen, 1985). Thus, early intervention is required for the

development of social skills which are needed for social interaction. If early intervention does not occur, the individuals without social skills could be behind their peers in their social development (La Greca and Mesibov, 1979).
When teaching social skills to individuals, the observer must take care to define the necessary performance for their development and it is necessary to talk about these subjects (development characteristics of the individual, specifying the performance required for development) inside the programme. The first step in teaching social skills is to choose where to start according to the student's individual performance, and to choose what the priorities are for this individual. After deciding the priorities for the individual, an education programme must be developed (Westwood, 1993).
Many correction methods and educational programs prepared in this direction are used in teaching a social skill to an individual who has intellectual disabilities (Rustin and Kuhr, 1989). For example, Guralnik and Neville (1997) stated that for individuals in the pre-school period, using games to teach social skills can be effective. While Sargent (1991) suggests direct instruction, collaborative teaching, peer teaching, and cognitive processes method for all individuals, Wilson (2002) suggests verbal prompting, natural teaching and role playing games for teaching social skills. To develop social skills, while Pavlicevic and Ansdell (2006) recommend music therapy, Freeman, Sullivan and Fulton (2003) recommend the drama method.
When social skills are taught using different methods, visual support is often used (Genç 2010). The application of video modelling is the most widespread format in studies on the use of visual support (Genç.2010, LeBlanc, Coates, Daneshvar, Charlop-Christy, Morris and Lancaster, 2003). Teaching with video modelling is done by observing individuals who play a role in the video and take it as a model (Odom and Others 2003).
Nikopoulos and Keenan (2003) define video modelling as the occurrence of behaviour by an observer that is similar to the behaviour shown by a model on a videotape. Video modelling is the individual's target behaviours. It contains the observation of the video record of the model that illustrates the individual's target behaviours and contains the repetition of these behaviours (Charlop-Christy, Le and Freeman, 2000). The application of video modelling can be performed by anyone who participates in video recording (peer or adult) or observers as models (Nikopoulos and Keenan, 2006).
Video modelling is also defined as a process to change existing behaviour, or teach new behaviour with a non-living model and samples which are recorded on video (Dowrick, 1999). Consequently, video modelling includes watching a model in the video which helps the individual to change his behaviour or imitate the behaviour. In this process, first a skill is performed by a normal peer or adult and recorded to a video. Later in every teaching session this video is watched by the individual and later they are asked to imitate the same skill they watched (Le Grice, and Blampied, 1994). During the application of this method, generally individual are asked to pay attention to the video shown on the monitor in front of them. At the same time, the individual's behaviour while seated is rewarded (Corbett, 2003).
Video modelling, by decreasing educational tasks, reduces the needs for social interaction between the practitioner and individual. So it can be used easily not only by different practitioners but also by individuals with intellectual disabilities by themselves (Charlop-Christy, Le and Freeman, 2000). Additionally, another advantage of the method is it can be repeated as requested in the future to provide continuity of the skill taught and it can be used easily (LeGrice and Blampied, 1994). Because of this situation, it is possible to teach target behaviour and skills in an effective way to an individual with intellectual disabilities. This method can also be used in many environments, including in class or at home. It also contributes to learning the requested target skills and behaviour, facilitating the repetition of instant academic studies, providing feedback (Branham, Collins, Schuster and Kleinert, 1999), and providing an advantage in term of time (Rehfeldt, Dahman, Young, Cherry and Davis, 2003).
When this area has been researched it has been understood that video modelling is an effective way of learning motor behaviours, social behaviours, mathematic abilities, daily life skills and job skills for different types of disabilities (Nikopoulos and Keenan, 2006). Although video modelling is a very well known and widely used practice, it is not common in Turkey. In these studies, individuals with intellectual disabilities are taught pasta cooking skills Halisküçük (2007), services to the hotel floor Değirmenci (2010), teaching daily living skills Öncül ve Özkan Yücesoy, (2010) and the people who have autism problem are taught to be aware of bad people who may try to kidnap them (Akmanoğlu(2008). However, teaching social skills in individuals with deficiency in Turkey in recent years several studies have tested the effectiveness of different methods is seen between these studies, individuals with intellectual disabilities to become a model method based on the video that made the teaching of social skills has been encountered in any study. However, teaching social skills in individuals with deficiency in Turkey in recent years, several studies have tested the effectiveness of different methods is seen, Among these studies, individuals with intellectual disabilities to become a model method based on the video that made the teaching of social skills has been practiced in any study.
In this study answers to the questions below are being searched:
a) Is the teaching packet an effective way for students to gain, continue and generalize the skills of "greeting familiar people" to different people in different environments?
b) What are the opinions of the mothers and teachers in the school the students attend about the teaching of "greeting familiar people"?

Method

In this section, the research model, dependent variables, independent variables, participants, environment and equipment, study process, collection of data, and data analysis are given.

Research Model

In this research, the effectiveness of teaching social skills to students with intellectual disabilities with video modelling using multiple probe design between subjects from research models of single subject design. The experimental control of the research was provided with an increased occurrence with the implementation of training package based on video modelling at the starting level observed in the target students' interaction with their peers showed the target skills.

Independent Variable

The independent variable of the research is an education package prepared for the training of the target students "to greet familiar people" skills with the implementation of video modelling.

Dependent Variable

The dependent variable of this research is the learning level of the target students to greet people they are familiar with. The target skills are defined as follows and their learning level is evaluated accordingly: (1) to be aware of the familiar person when they encounter each other; (2) to approach the familiar person when they encounter one another; (3) to look at the familiar person's face; (4) to say words like "Good Morning/Hello/Hi"; and, (5) to wait for the answer from the familiar person.

Participants

The research consists of target students, peers, practitioners, and observers.

Target students

The participants in this research were four students of age ten or eleven who were attending a special education class at a primary school in Ankara and have a intellectual disabilities. Written permission documentation was taken from the parents for the students to be able to join the study which contained the following four items. 1) The students have never taken part in systematic learning related to the target skills that is the dependent variable of the research. 2) It is understood from the interviews conducted with the families and the teachers of the students that all four students need to learn the target skills. 3) It is expected for the students who participate in this research have some preconditioned abilities. 4) These abilities are listed below;

a) to have the visual ability to watch a video
b) to have a basic reading ability
c) to be able to join an activity for at least 20 minutes
d) to be able to focus on visual attractors for at least 15 minutes
e) to have receiving and expressing language abilities
f) to have minor and major muscular abilities which make the students able to show the target skills that they learned from the video they watched.

The teachers helped the researchers to select students who have the preconditioned skills as described above. Interviews were made with the teachers of the special education class where the students continue their study. By the end of the interview, three students who have the preconditioned skills were chosen. One reserve participant was also chosen in case the target student could not complete the research. The information about the students who participated in the research are described below. The target students' names used in this article are not their real names.

Orhan, 11 years old, studies in a special education class for intellectual disabilities students at an elementary school. He has the ability to perform self-care and daily living skills independently at a desired level. He has major and minor muscular skills that help him to perform the target skills independently at a level that is mentioned previous research. He follows verbal instruction independently. He can express himself with 4-5 sentences and he can answer the questions that are asked to him. He has reading and writing abilities. He can focus his attention on an event for a long period, and also works together with others and also in a group.

Efe, 12 years old, studies in a special education class for intellectual disabilities students at an elementary school. He has major and minor muscular skills that help him to perform the target skills independently at a level which is mentioned in this research. He has the ability to perform self-care and daily living skills independently at a desired level. He follows verbal instruction independently. He can express himself with 7-8 sentences, and he is able to make comments and answer questions. He has basic reading and writing abilities. He can focus his attention on an event for a long period. He can take responsibility and fulfil this responsibility independently.

Nurten studies in a special education class for intellectual disabilities students at an elementary school and is an 11-year-old student with a light level of intellectual disabilities. She has major and minor muscular skills that help her to perform the target skills independently at a level which is mentioned in this research. She has the ability to perform self-care and daily living skills independently at a desired level. She follows verbal instruction independently. She can express herself with 4-5 sentences and she can answer questions. She has a basic reading and writing abilities. She can focus her attention on an event for a long period. She can take responsibility and fulfil these responsibilities independently.

Ali is studying in a special education class for intellectual disabilities students at an elementary school and is a 12-year-old student with a light level of intellectual disabilities. He has major and minor muscular skills that help him to perform the target skills independently at a level which is mentioned previous research. He has the ability to perform self-care and daily living skills independently at the desired level. He follows verbal instruction independently. He can express himself with 7-8 sentences, is able to make comments and answer questions. He has basic reading and writing abilities. He can focus his attention on an event for long period. He can take responsibility and fulfil this responsibility independently.

Peers

The peer group consisted of 3 girls and 2 boys who were studying at the same elementary school as the target students (all of the peer group members were 11 years old and in the 5th grade). Two of these peers took a role in arranging the intervention sessions for the teaching video modelling. Three of the volunteer peers played the role of the peer's model to the target student in the research in the video the target student will watch. The peer and the target students have never known each other before. The Peers were chosen carefully and had similar features with the target student such as age and gender. The teacher provided input on the selection of the peers. The Peers in the research were never directed to Guidance and Research Center to be diagnosed, and consequently they were never diagnosed. The peers were selected based on their possession of the target skills and ability to participate as volunteer in this study. The Peers who participated in the research were not informed about the applications process and target skills.

Practitioner

The implementation of the target skills was performed by the special education teachers who work at the educational institution where the students were studying. The practitioner graduated from intellectual disabilities teaching programs and had been working for 5 years in the institution. They have experience working on social skills education. The person who will applied the application was briefed by the researcher, especially about the purpose of the research, dependent and independent variables, probe sessions (beginning level, daily probe, collective probe, generalization and monitoring sessions) and how intervention sessions are performed, behaviours of target student and how the practitioner will evaluate these behaviours, and how to use the video which will be used in the intervention sessions.

Observers

In the research, reliability data related to the dependent and independent variable were collected. Reliability among observers and reliability of the data in the application were collected by two special education teachers who graduated from intellectual disabilities teaching programs and finished their master degree in their field. Information on the following items were given to the observers of the research before they collected the reliability data:

a) the purpose of the research,
b) target skills and behaviours belonging to the target skills,
c) the strategy of education with video modelling,
d) intervention sessions,
e) probe sessions,
f) generalization sessions,
g) correct or incorrect presentation of the behaviour belonging to the target student skills
h) the expected reactions from practitioners in the situation of correct or incorrect presentation of the behaviour belonging to target student skills.

Environment and Equipment

The research was conducted in a gaming room which was permitted to be used by the institution where the target students were studying. The gaming room was a place where distracting stimuli were reduced and the students can sit and lay down comfortably as all places were covered by carpets. Data were collected for the beginning, probing, application and watching sessions of the students in the same environment. Data related to generalization were collected in the classes where the students were studying.

The following equipment were used during the research process: video clips where target skills were performed and peer modelling took place; external memory where the video clips were recorded; laptop; video camera; tripod; 82 inch TV; and, a control list including the target skills. Additionally, to reinforce the target students and peers who played in the video for the training of target skills, various toys and types of food were used.

The camera shots were taken with three peer models related to target skills before the study began and recorded onto a CD. The peer model was told that they would perform the skills of greeting familiar people when they met them, this event would be recorded, and later the events they performed would be watched by other peers for skill training. The peers were told their role and the tasks to model (what would they would do during the shooting) beforehand and they were recorded using the camera during the session. The video that was created was watched by three experts and their opinions were taken. All the experts expressed that the video images were prepared properly for the purpose of the training.

Study Process

In this section pilot study and study process are described.

Pilot Study

Before starting the research, a pilot study was completed for the purpose of obtaining information about whether the educational package using the video modelling prepared earlier was applicable or not. The educational package developed and the pilot study of the data collection instruments were applied to a student who has similar characteristic features to the target students. Cemil, the student who participated in the pilot study, was 10 years old and studies in a special education class at an elementary school in Ankara. In the student's school information it was written that he has a mild level of mentally disabled. The results of the evaluation made by Counselling Research Centre said that the student is intellectual disabilities and can be trained and prepared to continue his study in a special education class. He has major and minor muscular skills that help him to perform the target skills independently at a level which is mentioned in the research. He has the ability to perform self-care and daily living skills independently at a desired level. He follows verbal instruction independently. He can express himself with 7-8 sentences, is able to make comments and answer questions. He has basic reading and writing abilities. He can focus his attention on an event for a long period. He can take responsibility and fulfil this responsibility independently. He can work with others and study in a group. The pilot study was performed in the same gaming room where the study would be performed. At the end of the study, it was noted that the video clips that the peers are played role model in the video, which would be used in the training of social skills and the events are understandable, so the students could watch the video clips easily and they could join the events.

Baseline sessions

Baseline sessions were recorded using a video camera. The practitioners collected data for the baseline sessions by watching this video for the target behaviours inside the group (the target skills which were stated as the dependent and independent variables). The target behaviours were evaluated during the free game events between the target students and peers by observing the behaviours of interaction. In this stage, a video on the CD was not watched and no training was done. In this session, reinforcement was done verbally until the students' performance was at an acceptable level. In cases where the skills were not performed, or were not performed to an acceptable level, the situation was ignored. The practitioner asked the target students and peers to play a game about what they do when they meet familiar people and the students were told "Come on kids, let's play together" presenting the target warning and the students were asked to interact with their peers by playing the game. After the target stimulus was presented, the behaviours that occurred during the interaction between students and peers over 30 minutes were observed. Until stable data were obtained over 3 consecutive sessions for every single student, baseline data were collected. The probe sessions were conducted in a manner similar to the baseline sessions.

Intervention Sessions

The teacher's ideas were selected as the references for choosing the skills to be taught. To do this, first the teachers were asked to define which social skills the students needed and they had to order these skills according to the degree of importance. According to the skill "greeting when meeting familiar people" was defined as the priority skill that they needed. Because the research was done for students who are mentally retarded, the observer was aware that the students had never taken part in social skill education before the practice related with the target skill was performed. For this purpose, the mothers and the teachers were asked not to give any education related to these skills. The teaching of the target skill begun simultaneously and it continued as a teaching session for 30 minutes per day and 4 days per week. The intervention sessions, the criteria are met at the level of teaching up to three sessions of 100% has been maintained.

The videos were watched in the game room in the school that the students were attending. In the video model which was shown, there were three types of peer models. The sample activity related to the target skill was prepared by using the model peers. The model peers were instructed to perform the behaviours which took place inside the target skill and it was also indicated that they would be the model in this way. Before beginning the intervention sessions the practitioners introduced him/herself and the devices like TV and Video CD which would be used during the practice. And also a short explanation has been made about the target social skill. The students were told that they would first watch the video images about the target skill and then they will perform the behaviours which they saw on the video.

They were also told that the video images were a kind of game that was being played by their peers and after they watched that game they would also play this game, too. The practitioner also told the students that while playing the game both their peers and themselves had their tasks and they had to change these tasks in a specific order. Subsequently, explanations about the tasks inside the activities were given and questions were asked to understand if these tasks were understood in the correct way or not. The students were asked if they understood what they had to do while playing the game. In case the student did not understand what he had to do for a task a new explanation was made. The student was also told that if he/she completed the task in the correct way he/she would be awarded at the end of every session.

After being sure that the target student was fully concentrated on the practice and when he/she was ready, the practice began. The practitioner then told the students "First, let's watch what we have to do when we meet familiar people" and then they watched the video related with this subject. While watching the video explanations about the images were given to the student. For example: "Look. In the images we are watching now, there are students who are at the same age with you. Let's see what they are doing." After watching the video, the video was stopped and the students were told "Let's do what you have seen in the video, together" After that the students and peers were encouraged to do the processes defined in the activity together. The students and peers were

made to tell the story which they had seen in the video to each other and then the activity related with the target skill began. After the tasks were completed in an ordered way, the activity was finished. Afterwards the students were asked to summarize what was done in the activity and talked about where and how to use the skill inside the activity. The practitioner evaluated the ability of the students to perform the tasks during the practice and then provided feedback to them. The students were thanked for everything they did during the practice and the session was ended. This process was applied to all 3 students.

When the student performed the behaviour related to the target skills in the right way, the student's behaviour was reinforced verbally like "Bravo! You did what you saw on the video. Really good". When the student could not perform the behaviour, they made the student watch the skill's steps again. The practitioners asked them to repeat the behaviour of the target skills again after the student had finished the watching process. After watching the video again, if they performed the behaviour skill in the right way, the student's behaviour was reinforced verbally with the sentence "Bravo! You did what you see on the video really well", and (+) sign was put into the form in the column where "student can perform the skills at an acceptable level" was written. When a student could not perform any of the behaviour skills even after they watched the video twice, or even if they performed the skills required but not at an acceptable level, a (-) sign was put into the column where "could not perform proper behaviour, after they performed the behaviour skills with the practitioner correctly" was written, and they continue to watch the CD. This process was repeated until they could perform all the desired behaviours at an acceptable level.

Monitoring Sessions

Monitoring sessions were organized like the baseline sessions one, three and four weeks after the teaching session.

Generalization Sessions

To evaluate if the target skill was being generalized to different people and different environments for the target students, generalization sessions took place. Generalization data were collected five days after all the students fulfilled the standard requirements for 3 consecutive sessions. The teacher was informed about the practice in the generalization sessions. The video images were not shown to the students like it was in the intervention sessions. In the class environment the student was asked orally "what we do when we meet familiar people" and the student was requested to perform the target skill. The target student's performed skills were recorded at that time and the average points of these data were taken as the target skill's generalization data. The practitioner reinforced the target students with the reinforcements for the target skills which they performed.

Collection of data

In the research three kinds of data were collected in order: 1) effectiveness; 2) reliability; and, 3) social validity.

Collection of Effectiveness Data

All the sessions were recorded by using video cameras and the research data were collected by the practitioner by watching these records. In this research during the period of collecting efficiency data on the target skill, the correct and incorrect behaviours of the target students were recorded and the percentage of the correct behaviour rate was calculated. During the evaluation period of the target skill, data related to five different types of behaviours were collected.

1) Recognizing familiar people when the students meet them (posture, gestures and facial expressions)
2) Getting closer to the familiar people when the students meet them.
3) Looking at the face of familiar people.
4) Saying at least one of "Good Morning or Hello or Hi" and
5) Waiting for the reply from the familiar person.

In every session during the learning period, the ability to demonstrate the target skills was evaluated at every stated level.

In every case, student behaviours were classified as one of three types: 1) The student could not demonstrate the skill; 2) The student could show the skill but not at an acceptable rate; or,

3) The student could demonstrate the skill at an acceptable rate.

The percentage of the behaviours was calculated and the result data was processed graphically by putting "+" on the data collection form when the student demonstrated the skill at an acceptable rate or putting "-" on the data collection form for other cases.

Collection of the reliability data

a) Reliability among the observers, and b) Practice reliability data were collected as the reliability data in this research.

The inter-observer reliability data of the research was collected by two special education specialists who were granted master degrees from the division of intellectual disabilities education and special education. The observers of the research were educated as observers. The inter-observer reliability data were collected by the observers watching the video records of at least 30% of the sessions related to the start, practice, probe, generalization and permanence stages. The calculation of reliability among observers was done by using the formula [(consensus) / (consensus + dissent)] x100. For the target skill all three experimenter's reliability percentage related to the start, probe, generalization, practice and permanency level sessions was found as 100%.

The practice reliability data were collected with the form "greeting ability when meeting familiar people-education packet's practice reliability data collection".

Practice reliability data

a) the practitioner introduced himself and the tools like TV, video CD that would be used during the practice; b) the practitioner explained the instructional goal and the target skill to the students; c) the practitioner explained what kind of tasks the students would have during the practice and how they would officiate their tasks; d) the students practice where to focus on the video; e) the practitioner provided the video on the CD for the students to watch; f) the practitioner explained the images to the student while they were watching; g) Presentation of the skill directively; h) Providing the students to do the activities which are defined at the practice inside the video. i) Providing all the students to try the various roles inside the activity. j) asking questions about the group practice at the end of the activity. k) Providing the students to summarize the things they watched inside the video and the things they learned at the activity which they practiced and providing them to understand where they could use this knowledge. l) Giving appropriate reaction for the behaviours that the target students showed (the behaviour to be reinforced while it was shown at the acceptable rate, in case of the behaviour to be shown in a false way: repeating the period of learning by presenting video feedback) and m) The student's reinforcement behaviour of the participation behaviour was observed and according to these observations; the practiser's true behaviours were signed as "+" and false behaviours are signed as "-"to the form. Subsequently, the number of correct behaviours was defined and processed on the form by calculating the percentage. The practice reliability data was collected in all of the experimental sessions. In 30% of all sessions, practice reliability data were obtained by the observer (Tekin and Kırcaali-Iftar, 2001). The results of the practice reliability data was detected as 100% in every teaching packet that was related with the skill which was to be taught to a student.

The collection of the social validity data:
In this research interviews were done with the mothers of the students and the teachers at the school they attended to communicate the importance of being able to greet familiar person when they meet. After the research ended, images from the beginning and final periods of the research were shown to the mothers and teachers separately. The mothers and teachers were then asked to evaluate the appropriateness of the obtained results.

Data analysis
The data obtained by the social skill practice which was performed in this research were graphically resolved. Linear graphic technique is one of the graphical analysis techniques used to resolve the data. The points of the students related to their ability to perform the skill were shown in equal intervals between 0 and 100 on the y axis. Start, Teaching, Probe, Watch and Generalization data were numbered over the x axis and shown in equal intervals. The social validity data which were obtained by semi structured interviews done with the mothers and teachers were resolved with the descriptive analysis technique.

Results

In this section, the continuation results of the students to gain the target skill were integrated with results related with the generalization to different persons and environment. The idea about the social validity of this research of the intellectual disabilities students' mothers and their teachers who are joined this research also took place at this section. During the practice period the change from one stage to another stage was defined based on 100% measured fulfilment of the target skill.

Results related with levels of gaining the ability of greeting someone familiar, continuation and generalization
The results related with the levels of every single student who joined the research to gain the target skill to continue and generalize are shown in Figure 1.

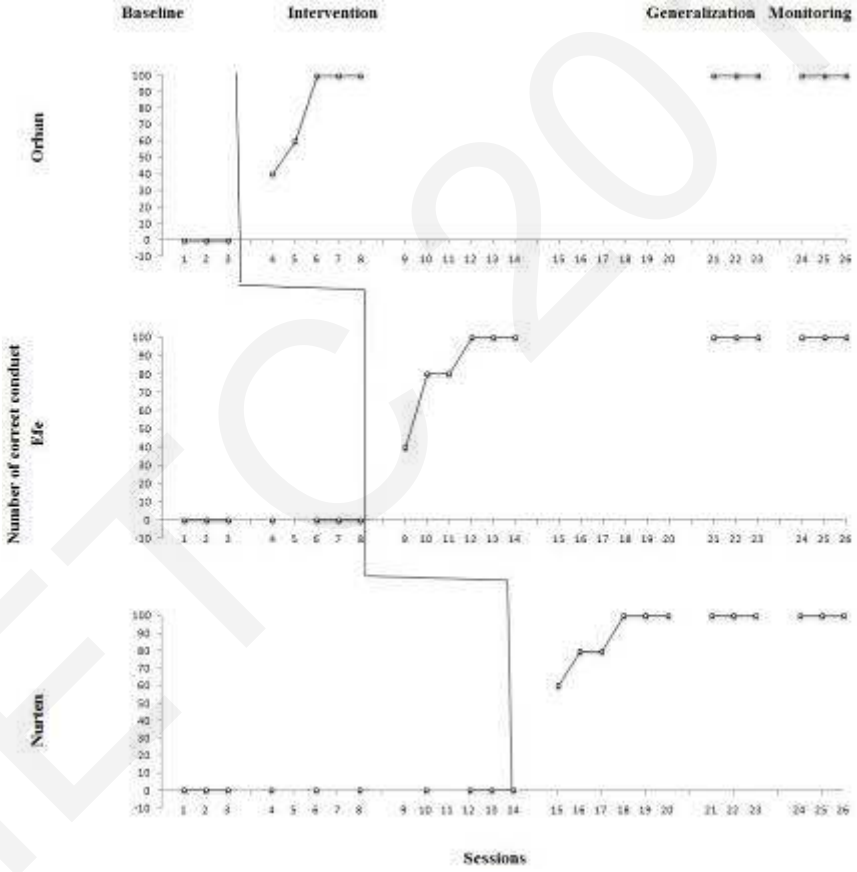

Figure 1.
Baseline, intervention, generalization and monitoring data sessions which is related with the student's target skill

As shown in the figure, at the beginning phase, the first student Orhan does not have the target skill. Because stable data were obtained in three start level sessions, the observer moved into the teaching phase of the target skill. The percentage of correct response for the target skill changes between 40% and 100%. Orhan performed the target skill which was organized at the practice phase's 3rd, 4th and 5th sessions at the acceptable level of 100%. The defined criterion was fulfilled and the skill's teaching phase was finalized because this level was performed at an acceptable level.
It is observed that the second student Efe does not have the target skill at the start level phase. The observer started teaching the target skill after stable data were obtained in three start level sessions. The correct response percentage changes between 40% and 100% for the target skill during the teaching phase. Efe performed the target skill at the practice phase's 4th, 5th and 6th sessions at the acceptable level of 100%. Because this performance is an acceptable performance, the defined criterion is fulfilled and the skill's teaching phase is finalized.

As is observed from the Figure, at the start level phase the third student Nurten does not have the target skill. Nurten's correct response percentage of the target skill in the teaching phase changes between 60% and 100%. Nurten performed 100% acceptable range of the target skill in the 4th, 5th and 6th sessions of the practice phase. Because this is a level of performance which is acceptable, it fulfilled the defined criterion and the skill's teaching phase is finalized. After the teaching related with the three students Orhan, Efe and Nurten is ended, it is observed that they have performed the target social skill at a 100% level which is the acceptable level.
As is seen in Figure 1, for all three students who have joined the research, it has been founded that all of their correct response percentage is 100% of the target skill in the generalization sessions to different people and different environment. It is observed that the teaching final data and the generalization data are at the same level for all of the target students.

The reviews of mothers and teachers about the social validity of the practice
In the research the practice's social validity is observed by asking the opinions of the students' mothers and teachers about the subject which generates the research's target skills teaching that is described as "greeting when meeting familiar people" and the subject that is defined as "teaching this strategy using a video model." According to these opinions, all the mothers and teachers of the students who joined the research are satisfied with the target skills being taught and the teaching to be done by an expert. Once again, they expressed that these skills being taught to the students are very important for them. They also expressed that it makes the students more social when they greet their friends and makes it easier for them to have more social interaction, and again these interactions help them to be more social. And the mothers and teachers also express that "Beyond their familiar friends, they have more new friends compared to the past." The parents and teachers also said that the students use this skill that was taught to them in their daily life, at home, at school and on the street.

Discussion
In this research the effectiveness of the subject "video modelling to teach the skill of greeting familiar people when they meet to mentally deficient students" is observed. The observer tried to understand the views of the students' mothers' and teachers' about the subject of the target skill's teaching studies conducted by video modelling and they obtained discoveries. At the end of the discoveries obtained from the research, it is understood that teaching using video modelling is effective for the target skill to be taught for the students. Additionally, at the end of the research it is understood that the students can generalize this skill to different environments and people and they can continue this skill after the practice ends also. The social validity data which was collected from the mothers and fathers of the students shows that, their opinion about the target skill's being taught to the students who are mentally retarded, is positive.
These results show similar specialities with other researches that are "skills of understanding emotions with the skills prepared of teaching studies with conducted video modelling" (Bernard-Ripoll, 2007), communication and speaking skills (Allison and Dorothea, 2010; Sansosti and Powell-Smith, 2008; Scattone, 2008; Sherer and others, 2001), emotion comprehension skills (Bernad-Ripoll, 2007), the skill of starting relationship (Nikopoulos and Keenan, 2003), the skills of playing games (D'Ateno, Mangiapanello ve Taylor, 2003; Paterson ve Arco, 2007), game-playing skills (D'Ateno, Mangiapanello ve Taylor, 2003; Paterson ve Arco, 2007), social interaction skills (Bellini, Akullian ve Hopf, 2007; Bidwell ve Rehfeldt, 2004; Kroeger, Schultz ve Newsom, 2007; Maiona ve Mirenda,2006) and decreasing and increasing inappropriate behaviours (Cihak, Fahrenkrog, Ayres and Smith,2010; Graetz, Mastropieri and Scruggs, 2006) over the subject of teaching studies with conducted video modelling.
Because video modelling is effective at teaching oral and motor behaviours, social behaviours, mathematical skill, daily life skills, job skills, skills related with safeness, attention disorder and coping with problem behaviours in different groups of disability, it takes place in the offered methods (Nikopoulos and Keenan, 2006). Because the teaching done with video modelling is a kind of visual teaching, it causes the target behaviour to be described clearly so it provides more advantages relative to the traditional methods and it gives the possibility for the practice to be more useful and effective. This makes things easier especially for the students who have disability. Teaching studies with video modelling also causes the care times for the subject that is studied to be longer and increases the care and interest. By this way it is understood that distract ion is minimized (Pierce and Schreibman, 1994). This state increases the motivation of the students and causes it to be a method that the students like (Screibman, Whalen and Stahmer, 2000). An advantage of this method is that it costs less than the method of using live models. The teachers can use these videos not only for the target students, but also for the students who have similar disability. Video clips give the possibility of presenting the critical steps of the skills again to the teachers. So the teachers can prepare a time period by using the videos that they can use again for being able to describe many functional skills. Because of this advantage video modelling method is an appropriate teaching strategy for mothers and fathers (Ayres and Langone, 2002; Banda Matuszyny and Turkan, 2007; Corbett, 2003; Graetz, Mastropieri and Scruggs, 2006). In this practice the number of intervention sessions can be reduced, which is one of the method's advantages. The state which causes this result is one of the strengths of the research.
The observer must evaluate the special characteristics of a student before he decides what to teach. The observer must decide which social skill to be taught and if the social skill to be taught is necessary or not for the student, according to the realization of the inadequate skills and the skills which the student already has. To define where to start the teaching of the skill must begin for the students and to define which skills have more priority just to observe what the student does or what the student does not do is not enough, it is also necessary to define what kind of social skills the student needs first (Cartledge and Milburn, 1986; Rustin and Kuhr, 1989). It could be said that one of the most important steps for the teaching practice done in this research to be effective is for the observer to define the inadequate and prior social skills and select the target skill according to this definition. The target skill which is "greeting when they meet familiar people" is one of the social skills that gives positive results for the students at school, home and also in other environments.
Another result of the research shows that, the students who have intellectual disabilities still continue to perform the target skill after the first time they obtained it, in the first, third and fourth weeks, at 100% level. Also in the generalization results, it is defined that the students could generalize this target skill for the different environment and different people at 100% level. The possibility of using video modelling which is thought to be used effectively and efficiently while educating the students who have special needs in recent years, presents the opportunity of different examples for the practitioner and the student and gives many benefits like high control, the ability to use the same models repeatedly and to be able to be use the videos personally during the period of being model. It is proposed that these benefits make it easier for the taught skills to be continuous and generalized (Rehfeldt and others, 2003). The results obtained from this research which is about permanence and generalization is consistent with this knowledge.

Based on these, it can be thought that the results of the research which are about the permanency and the generalization, can contribute to the literature of the effective teaching.
After the interviews were completed with the mothers and the teachers of the students about the results of teaching the skill of "greeting when meet familiar people" by video modelling, the knowledge obtained is that they are satisfied with these skills to be taught to the students. They also expressed that the students have more interaction with their friends around them than previously. This knowledge presents the importance of the social skill which is greeting ability that was mentioned by La Greca and Mesibov (1979), which is necessary for successful peer communication. In the same way, Knapczyk, Rodes (1996) and Westwood (1993) also mentioned about the importance of greeting and they emphasized it is a very important skill to be able to reach an average level of social adequacy and to have a successful social interaction. It is possible to say this practice's social validity is high based on these data. So it is also possible to say that the greeting ability which was taught in this practice is an important social skill and it benefits peer communication also.
According to the results, the following conclusions can be offered:
Both special education class teachers and general education class teachers can try video modelling for the teaching of different discipline subjects in the class environment for the appropriate behaviours to be increased and decreased. Seminars about how to do teaching by video modelling can be done for the teachers. The effectiveness can be researched by applying it over the development of the mental retarded students in different fields, and decreasing the inappropriate behaviours. For the purpose of increasing the generalizability of the research results, the research can be repeated in different environments by different researchers and by teaching different skills. In this research the results can be compared to each other by applying the teaching packet which was prepared for the mental retarded students, according to the video modelling method over different groups of retarded students. It can be observed if it differs or not during the phases of teaching social skills by video modelling to the students who are mentally retarded. Those phases are modelling, modelling acquisition, monitoring and generalization. It can be observed if it differs or not during the monitoring and generalization phases of video modelling related with the adult model and peer model and see if the effectiveness changes or not during these phases. Research can be done about the study of certain behaviours to be increased or decreased by the teacher centred traditional teaching methods and also about comparing this video model method in terms of effectiveness and efficiency. In addition to observing the effectiveness of the social skill teaching packet, qualitative analysis can be added and qualitative data can be collected. Finally in this research the social validity data are collected from the teachers and the mothers. In the advanced research it can be offered to collect social validity data from the students' themselves, their brothers and sisters, their friends and their fathers. This research has been limited to 3 students and their ability of "greeting when meet familiar people". In advanced researches this practice should be repeated by using different skills.
