Dear Guests…
Welcome to the 13th International Educational Technology Conference IETC-2013.
"The International Educational Technology Conference (IETC)" series is an international educational activity for academics, teachers and educators. This conference is now a well-known educational technology event and the number of paper submissions and attendees increase every year. It promotes the development and dissemination of theoretical knowledge, conceptual research, and professional knowledge through conference activities, the conference proceeding book, and the Turkish Online Journal of Educational Technology (TOJET). Its focus is to create and disseminate knowledge about the use of instructional technology for learning and teaching in education. This year, IETC-2013 received almost 400 applications. The conference academic advisory board accepted 235 applications.

The first of "The International Educational Technology Symposium (IETS)" and the second of "The International Educational Technology Symposium (IETS)" were held at Sakarya University in Turkey in 2001 and 2002. The third one was at Eastern Mediterranean University in the Turkish Republic of Northern Cyprus in 2003, and the fourth one at Sakarya University in Turkey in 2004. The fifth International Educational Technology Conference (IETC) was organized at Sakarya University in Turkey in 2005.The Sixth International Educational Technology conference was held in Turkish Republic of Northern Cyprus. In 2007, the seventh conference was organized at Near East University in the Turkish Republic of Northern Cyprus. After then The 8th International Educational Technology Conference was held at Anadolu University in Turkey in 2008. The 9th International Educational Technology Conference was organized at Hacettepe University in Turkey in 2009. IETC-2010 was organized at Bogazici University in 2010 in Turkey. IETC-2011 was conference organized at Istanbul University in 2011 in Turkey. IETC-2012 conference was organized at National Central University in Taiwan in 2012.

The International Educational Technology Conference aims to diffuse the knowledge and researches among academicians and lead to development in educational technology and instructional technologies.

Without the authors and participants, IETC-2013 would, of course, have been impossible. We would like to sincerely thank all of you for coming, presenting, and joining in the academic activities. We would also like to thank all of those who contributed to the reviewing process of the "IETC - 2013" conference papers, which will be also published in TOJET. And finally, we would like to thank Sakarya University – University of Malaya organizing team and The Turkish Online Journal of Educational Technology (TOJET) for successfully organizing and hosting "IETC-2013" in Kuala Lumpur, Malaysia. Last thank is going to Prof. Dr. Saedah Siraj for her warm hosting and for her great effort. She always tried to do her best.

We have lots of participants from 30 different countries. Should you have any enquiries regarding IETC conference, please do not hesitate to contact with us for any additional information you may require.

Finally, we would like to wish you all a pleasant stay in Kuala Lumpur - Malaysia and safe return back home. We hope that IETC-2013 will be a meeting you will pleasantly remember.

We hope to meet you again in IETC 2014 which will be held in Chicago, United States between 03-05 September 2014.

Thank you....

Abstract

In recent years, researchers reported that effective ICT integration requires teachers to acquire knowledge of technology, content, pedagogy and the intersection of these, known as TPACK (Mishra & Koehler, 2006; Archambault, & Crippen, 2009). This study specifically sought to answer: 1) What are pre-service teachers' perceptions of their TPACK mastery level before and after field experience; and, 2) Is there a significant difference of TPACK after field experience in schools? The TPACK survey instrument was adapted from Schmidt et al. (2009) and Archambault and Crippen (2009) and administered before and after their field experience to 107 pre-service teachers in a research intensive university programme in New Zealand. In addition, three student teachers were interviewed before and after field experience. These pre-service teachers scored highest in Content Knowledge (CK) and lowest in Technology Knowledge (TK) domains within TPACK at both before and after field experience. Paired-sample t-tests showed significant increases in most TPACK domains, namely, TK, PK, PCK, TCK and TPACK. Interviews and observations of three students clarified complex changes in knowledge of TPACK that linked to their experience in schools. The study continues to support the need for field experience while also adding caution to the interpretation of TPACK survey evidence given the strength of the student teachers' perceived knowledge before field experience. Further research is underway with a comparative survey in a programme that prepares teachers for secondary schools in Malaysia.

Keywords: pre-service teachers, TPACK, ICT Integration

INTRODUCTION

The integration of information and communications technologies (ICT) in teaching and learning remain as key issue in most educational institutions (Jones, Harlow & Cowie, 2003; Choy, Wong & Gao, 2008). A study of ICT implementation across all schools in New Zealand showed that ICT is implemented across all school types with differences in implementation between the primary, middle and secondary school systems (Jones, Harlow & Cowie, 2003). Bolstad's (2011) more recent synthesis of the future focus in the New Zealand curriculum indicates the increasing challenges of integrating ICT.

Therefore the preparation of teachers for New Zealand schools and in many countries worldwide includes preparation to enhance learning and teaching with ICT (Davis, 2010). However, it is important to note that many student teachers have inaccurate perceptions of their competence to teach before they gain experience in schools and such beliefs must be challenged throughout their programme; field experience is a particularly relevant strategy (Howey & Zimpher 1996; Knowles & Cole, 1996). Most if not all pre-service teacher education programmes include field experience in schools to provide a hands-on opportunity for pre-service teachers to put what they have learned into classroom instructions (Darling-Hammond & Baratz-Snowden, 2007; Smith & Lev-Ari, 2005). Field experiences provide "the first formalized opportunity for pre-service teachers to verify, challenge, and modify their preconceptions" (Knowles & Cole, 1996, p. 654). Within such field experience student teachers in the 21st century are also likely to gain experience with ICT in classrooms that enhance their understanding of the complex

interaction of digital technologies with content and pedagogical knowledge (Compton & Davis 2010). For this reason pre-service teachers' confidence to teach may drop in the process of becoming more competent. In other words, measures of pre-service teachers' perception of their competence to teach may drop as a result of all or part of their programme, particularly as they experience of the complexity of education during a field experience (Compton, Davis & Mackey 2009).

Effective ICT integration requires teachers to acquire knowledge of technology, content, pedagogy and the intersection of those (Neiss, 2005; Mishra & Koehler, 2006; Archambault, & Crippen, 2009). Therefore Technological Pedagogical and Content Knowledge (TPACK) model provides a useful theoretical framework for this study. The TPACK model was developed by Mishra and Koehler (2006), derived from Shulman's Pedagogical Content Knowledge (PCK) model. According to Shulman (1986) pedagogical content knowledge (PCK) is a "specific category of knowledge which goes beyond knowledge of subject matter per se to the dimension of subject matter knowledge for teaching". As for TPACK model, Technology Knowledge (TK) covers pre-service teachers' knowledge of technology tools to be used in teaching (Koehler et al., 2007). Pedagogy Knowledge (PK) is defined as knowledge in applying strategies to deliver the instruction which includes teaching approaches for assessing individual's learning needs, performance and strategies to present the content (Koehler et al., 2007). Content Knowledge (CK) is a subject matter knowledge in which teachers specialize. The intersection between three domains of knowledge produces Pedagogical Content Knowledge (PCK), Technological Pedagogical Knowledge (TPK) and Technological Content Knowledge (TCK). The PCK domain refers to knowledge of integrating effective teaching strategies with the content knowledge (Mishra & Koehler, 2006). TPK involves pre-service teachers' understanding of using technology with suitable teaching strategies. The heart of the suggested model is Technological Pedagogical and Content Knowledge (TPACK), which is described as knowing how to integrate technology within the subject matter in pedagogically sound ways (Mishra & Koehler, 2006). The TPACK model lays out the core knowledge; TK, CK and PK, and their intersections; PCK, TCK, TPK and TPACK to enhance teaching with technology (Mishra & Koehler, 2006). Pre-service teachers' perceptions of TPACK may be used to ensure effective integration of ICT in classroom instructions (Mishra, & Koehler, 2006; Schmidt, Baran, Thompson, Mishra, Koehler & Shin, 2010; Lux, Bangert, & Whittier, 2011). Studies have been conducted to measure teachers' TPACK development (Koehler & Mishra, 2005; Graham, Burgoyne, Cantrell, Smith, St. Clair, & Harris, 2009; Jimoyiannis, 2010), in-service teachers' TPACK (Archambault, & Crippen, 2009; Lee & Tsai, 2010; Jang & Tsai, 2012) and pre-service teachers' TPACK (Schmidt, et al., 2010; Lux, Bangert, & Whittier, 2011; Yurdakul, Odabasi, Kilicer, Coklar, Birinci, & Kurt, 2012). However, the majority of the TPACK survey studies were administered with teachers in the USA (e.g. Schmidt, et al., 2010; Lux, Bangert, & Whittier, 2011) and very few studies have been conducted outside the country (e.g. Jimoyiannis, 2010; Yurdakul et. al., 2012) and now in New Zealand. Therefore, there is a need for measuring pre-service teachers' level of TPACK in New Zealand to effectively integrate ICT in teaching. A reliable measure of TPACK could benefit the field by enabling a better understanding of the ICT in pre-service teacher education. This is very relevant with the planned increased access to ICT introduced above.

PURPOSES

The study reported in this paper is part of an ongoing research project examining pre-service teachers' use of ICT during field experience and their development of Technological Pedagogical and Content Knowledge (TPACK) mastery before and after completing the field experience in New Zealand and in Malaysia. In this paper, we limit our findings to one programme in New Zealand and seek to answer: 1) What are pre-service teachers' perceptions of their TPACK mastery level; and, 2) Is there any significant difference in pre-service teachers' perceptions of their TPACK mastery level before and after field experience.

METHODOLOGY

Research Design

This study used a mixed methods design which combined both quantitative and qualitative approaches for data collection and data analysis (Creswell & Clark, 2011). Methods of gathering data included: survey of a large sample. In addition to the surveys, three student teachers were interviewed during their field experience in different secondary schools; two majored in ICT and one in Social Studies. These three students were interviewed before

starting field experience and after completing field experience and also observed during the field experience by the first author.

Instrumentation

In order to survey the students' perception of their mastery level of TPACK before and after field experience, TPACK instruments developed by Schmidt et al. (2009) and adapted by Archambault and Crippen (2009) were further adapted to the New Zealand context. The final version of the New Zealand TPACK survey consists of 36 items that measure pre-service teachers' perceptions of TPACK with a five-point Likert-type scale: (1) strongly disagree; (2) disagree; (3) neutral; (4) agree and (5) strongly agree. A pilot study was conducted with pre-service teachers (N = 33) in New Zealand to test the reliability of the TPACK instrument.

Participants

The participants in the New Zealand study were enrolled in a Graduate Diploma in Teaching and Learning (Secondary) from a research intensive New Zealand university. A total of 107 respondents participated both in the pre-survey and post-survey. As summarised in Table 1 the sample comprised 62 females and 45 males. In terms of age 53 were between 21-24 years, 26 were between 25-29 years, 13 were between 30-39 years, and 15 were above 40 years. As for the major subject taken by the pre-service teachers in the teacher education program, the majority of the respondents took English or another language as their major (n=29); 16 pre-service teachers majored in Social Studies, while pre-service teachers majored in Science Education (n=14), Physical Education (n=24), Arts Education (n=12), Mathematics Education (n=7), or Technology Education (n=5). The Technology Education group included the two pre-service teachers with ICT major who volunteered for closer study.

Table 1. Profile of respondents based on gender, age and major

Profile		Respondents (N=107)
Gender		
	Female	62
	Male	45
Age		
	21-24	53
	25-29	26
	30-39	13
	>40	15
Major		
	Technology	5
	Arts Education	12
	Science Education	14
	English or Other Language	29
	Physical Education	24
	Social Studies	16
	Mathematics Education	7

Procedure for Analysis

Each TPACK knowledge domain subscale was assessed for internal consistency using Cronbach's alpha reliability technique. The difference between pre- and post- survey scores was analyzed using a paired-samples t-test via SPSS version 19.0. For qualitative data, case study analysis (Yin, 2009) was employed to examine pre-service teachers' development of TPACK mastery level. To analyze the interview data, the first step was to become familiar with the data; this was achieved by reading and re-reading the interview transcripts. Before a list was made of what were felt to be significant phrases, these phrases were examined for inter-rater reliability to identify patterns or themes that emerged from the data. One researcher coded the data and devised a clearly described coding system, which was then given to the two independent researchers. After initial coding, all interviews were independently

examined by the principal researcher. The themes emerged were then reviewed and discrepancies were discussed and resolved. All data are reported anonymously where possible and the three pre-service teachers were given fictitious names of Vanessa, Paige and Melinda. Both data sets were analyzed and merged during data interpretation for data triangulation to provide more information (Creswell & Clark, 2011).

FINDINGS

Quantitative Findings

Findings from pre-survey analysis showed the reliability coefficients of the constructs range from α=.70 to α=.87, as shown in Table 2. Based on the results, the alpha values of all TPACK scales indicated good reliability of the instrument, α>.60, (Hair et al., 2010). Results also indicated that all mean scores ranged from 3.44 to 4.31 as illustrated in Table 2. From the pre-survey analysis, the highest mean (M) of TPACK for the respondents in this study was for content knowledge (M = 4.22, SD = .46), whereas the lowest was for technology knowledge (M = 3.44, SD = .70). Similarly, for post-survey findings, the highest mean scores of pre-service teachers' perceptions towards their TPACK mastery level was for content knowledge (M = 4.31, SD = .48), whereas the lowest mean score was for technological knowledge (M = 3.61, SD = .68). However, the mean scores for all TPACK domains indicated an overall positive response to the scales. In other words, generally, pre-service teachers agreed that their level of TPACK before and after were above average. Although the mean score for technology knowledge was the lowest mean score among the seven domains of perceptions of TPACK, it was observed that pre-service teachers perceived that they had the necessary technology knowledge, sufficient enough for them to be able to apply TK during field experience.

Table 2. Reliability, mean scores, standard deviations, t-value and effect size of TPACK domains (n = 107)

Domains Subscales	Reliability	Pre-survey		Post-survey		t	Effect Size (Cohen's d)
		Mean	SD	Mean	SD		
TK	.87	3.44	.70	3.61	.68	2.25*	0.25 (small
CK	.80	4.22	.46	4.31	.48		
PK	.76	3.82	.45	4.11	.60	4.97*	0.55 (medium)
PCK	.70	3.86	.41	4.02	.52	2.46*	0.34 (small)
TCK	.85	3.78	.59	3.97	.61	2.61*	0.32 (small
TPK	.75	3.80	.51	3.92	.63		
TPACK	.82	3.64	.53	4.00	.61	5.16*	0.63 (medium)

Note: *. t-value is significant at p < .05; Cohen's d values were presented for TPACK domains with the significant difference

There was a small improvement between pre and post mean scores on all seven TPACK constructs (Table 2). In order to measure the significant differences between the two times of data collection, a paired-samples t-test was conducted to evaluate the differences in the mean of the pre-service teachers' TPACK mastery level before and after field experience with a total of 107 respondents. There was a statistically significant increase in the mean scores between the pre- and post-survey for TK, $t(106) = 2.25$, $p < .05$, $d = 0.25$; PK, $t(106) = 4.97$, $p < .05$, $d = 0.55$; PCK, $t(106) = 2.46$, $p < .05$, $d = 0.34$; TCK, $t(106) = 2.61$, $p < .05$, $d = 0.32$ and TPACK, $t(106) = 5.16$, $p < .05$, $d = 0.63$. Cohen (1988) defines effect sizes as small, $d = .2$, medium, $d = .5$, and large, $d = .8$. Therefore, the findings reported that the Cohen's d for TK, PCK and TCK indicated a small effect size and a medium effect size for PK and TPACK.

Qualitative Findings

The three female students who volunteered to be interviewed and observed were given pseudonyms: Melinda and Vanessa were ICT majors, while Paige was social studies major. All three perceived themselves as having good mastery levels of TPACK both before and after field experience. Vanessa with a major in ICT and minor in Economics, had more advanced uses of ICT because of her advanced knowledge of ICT and her

participation as a volunteer in an ICT project led by New Zealand Association for Computing, Digital and Information Technology Teachers. During the period of field experience, Vanessa was assigned to three associate teachers: 1 Economic and 2 ICT. Vanessa rated agree in all TPACK domains. However, after field experience, whilst TK, PK, PCK, TPK and TPACK remained at the same level, she rated a negative change in her CK and a positive change of her TCK. The negative change of her CK in the survey was supported in the third interview session after field experience. "[M]y economics part was quite old, and when I was teaching my year 13 economics…I was learning two or three steps ahead of the students and it was coming back… but because I don't use economics every day its quite rusty" Thus Vanessa needed to revise the work before continuing her teaching. Furthermore, "my economics associate [teacher]… was never around". In contrast, her ICT subject, "all of the content is not a problem for me at all, but in saying that there is still so much more - especially in my area that needs to be maintained and upgraded and so on". Vanessa stated that this knowledge developed throughout her field experience. She noted that her understanding of TPACK concepts was "getting there" and that her "…PK is improving all the time"; she further added that "we can't chop one of them out as we need them all", (Vanessa, 3rd interview, 2011).

Melinda was majoring in ICT and taking a minor in Mathematics and she was guided by three associate teachers: two Mathematics and one ICT. Melinda rated 'agree' for all TPACK domains before and after field experience. She further described that there was not much teaching involved during her field experience as the students had a group discussion on the project they were working on. Thus, "ICT use was not really there" which suggested her TK remaining at the same level as rated in the pre-survey. However, in the third interview session after field experience, Melinda agreed that she had improved more of her CK when they discussed the students' projects and during their revision period. She added that she was not able to enhance her content knowledge during her studies perhaps because the "student teachers have already done a degree (in most cases) on the subject they taught, thus they knew a lot about the content of that subject and they may just pick up new bits and pieces during field experience" (Melinda, 3rd interview, 2012). Additionally, she stated that there was a significant increase in PCK as she was able to solve students' misunderstanding of the concepts taught previously.

In contrast, Paige, who was majoring in Social Studies with a minor in Geography, rated 'agree' in all TPACK domains before field experience and remained 'agree' in all domains except for TCK and TPK which were rated as 'strongly agree' in the post-survey. The reason for this was clarified when she said that "We won't be an effective teacher if we were lacking in one of those areas". Furthermore, those three domains of knowledge were important and "I don't think there is one more important than the other", (Paige, 3rd interview, 2011). Paige continued that "I guess you could teach without technology if you had the other two, but the lessons would be probably more boring". She further commented that "[A]ll the feedback from students that I've received says that using technology in class makes it much more interesting". Paige noted that "if you have learnt what they [TPACK] are, then, you can develop it during teaching practice". Though Paige found that most of the time during her field experience she was unfamiliar with the topic, she tried to find out what was taught in school in the different year levels in that subject and to make sure that she learnt the topic before she got to teach the class. She was then able to teach the topic. She stated in relation to TK that "I have been exposed to ICT tools, and then I need to just have some time actually working on them and learning them practically".

DISCUSSION

The mean level of each TPACK domain was similar to that of previous studies (Koh, Chai and Tsai, 2010; Schmidt, et al. 2009). Contrary to the findings of Graham, et al., (2009), but consistent with those of Archambault and Crippen (2009), participants in New Zealand showed lower levels of TK before and after field experience than other domains of knowledge. Although the mean score for technology knowledge was the lowest mean score among the seven domains of perceptions of TPACK mastery level, results still indicated that the pre-service teachers in New Zealand perceived that they do have a certain level of technology knowledge. For example, they can keep up with the important new technologies and they can learn to use new software easily, -- technology knowledge they thought would be adequate enough to enable them to use ICT during their field experience. In spite of this, participants in New Zealand showed significant differences in their TK mastery level which indicates that they have developed their TK mastery level after completing field experience.

The small effect size of significant differences in TK within the New Zealand context aligned with the findings of Koh, Chai and Tsai (2010), who found that the participants indicated that they have the confidence in

integrating technology into their lesson plans, however, when it comes to the actual implementation, they faced issues, such as a lack of time and difficulties in reserving technology for their class. While pre-service teachers perceived that their CK were good in comparison with other domains, they showed no significant improvement of CK after field experience. In support of this finding, the contexts of the students interviewed provided evidence of the lack of opportunity to develop content knowledge while in the field. For example, Melinda noted that "student teachers have already done a degree (in most cases) on the subject they taught, thus they knew a lot about the content of that subject and they may just pick up new bits and pieces during field experience" (Melinda, 3rd interview, 2012). Having rated their initial CK the highest among all domains, it became less likely that the trainees would show significant development of their CK during their field experience, as compared to the significant pre- and post- field experience differences observed in most of the other domains of TPACK. The significant increase in technology-related domains; TK, TCK and TPACK within New Zealand context provide support for the recommendation of Archambault and Crippen (2009) to integrate technology throughout content courses including field experiences where the use of technology can be contextualized.

Understanding of TPACK components was not an easy task, nor developing the knowledge bases among pre-service teachers. It requires a comprehensive understanding of the core knowledge and interaction of the knowledge within the teaching context (Mishra & Koehler, 2006; Niess, 2005). Although pre-service teachers were confident about the complementary knowledge bases before field experience, their use of ICT during field experience was limited. However, the requirement to complete two teaching practices during this teacher education program is likely to have contributed to the significant improvement in many of the TPACK domains, namely, TK, PK, PCK, TCK and TPACK.

CONCLUSION

In conclusion, pre-service teachers in New Zealand rated their CK as the highest and TK as the lowest mean score in both surveys, indicating little change in their knowledge. However, as noted in the introduction, pre-service teachers often have inaccurate preconceptions of their knowledge and skill of teaching and this can explain the puzzling findings on the TPACK survey of New Zealand pre-service teachers. There was medium effect size in PK and TPACK and small effect size in TK, PCK and TCK. The interviews and observations of three students enhanced our view of changes in the pre-service teachers' perceptions of TPACK mastery level. Although the TPACK provides a model to guide effective integration of ICT into teaching, the implementation of these intersecting knowledge bases is a complex process that includes challenging students' preconceptions. Therefore, the survey findings and the three students interviewed suggest further research of TPACK development during field experience to build up students' knowledge of the three components and their interactions. Further research is underway with a comparative sample of pre-service students in a Malaysian teacher education programme.

A Case Study on the Effects of an L2Writing Instructional Model for Blended Learning in Higher Education

Lee So[a], Chung Hyun Lee[a]2

[a]Hankook University of Foreign Studies, 107 Imun-ro, Dongdaemun-gu, Seoul, 130-791, South Korea

Abstract

This case study explores EFL pre-service teachers' perceptions toward a prototype of the instructional model for second language (L2) writing in blended learning and the effects of the model on the development of L2 writing skills in higher education. This model is primarily founded on a process-oriented writing approach combined with various types of writing activities in both online and offline environments. It was observed that the participants of the study perceived the blended learning model to be useful and helpful for the improvement of their writing skills. In addition, it was found that the participants in the three focus groups received higher scores at the end of the study. Based on the main findings, modifications have been made to the model and further suggestions and implications are provided.

Keywords: Blended learning; L2 writing; L2 writing model; effectiveness; students' perceptions

Introduction

As second language (L2) writing is considered very complex for L2 learners, a need for systematic and comprehensive writing instruction is heightened. The teaching and study of L2 writing involves various factors: writing process, peer and teacher responses, writing activities, and writing instructions (Harmer, 2004; Raimes, 1983; Williams, 2005). Also, L2 learners are required to address content, organization, structure, and mechanics appropriately to convey meaning through writing at the same time (Brown, 2007; Tribble, 1996; Ramies, 1983). For L2 learners who do not have sufficient knowledge of the four writing components - content, organization, structure, and mechanics - L2 writing is very complicated and, consequently, they often encounter a number of difficulties. In order to resolve these problems, L2 learners are to be given a number of opportunities to write and a variety of writing activities and instructions in a systematic and organized manner. Although many L2 learners write and revise their drafts several times, they are still often unsatisfied with the writing process due to the limited number of class sessions and insufficient time in a conventional classroom. Thus, providing sufficient writing opportunities and environments for interaction and communication with peers and a teacher regardless of time or place, blended learning, which combines the positive attributes of online and face-to-face instruction, has been suggested (Grgurović, 2011; Nicolson, Murphy & Southgate, 2011; Yoon & Lee, 2010). In a blended learning environment, L2 learners are able to interact with peers and a teacher using a variety of computer-mediated communication (CMC) tools. Despite the promising features of blended learning, it is rarely employed in L2 writing class; furthermore, little research has been conducted on the teaching and learning of L2 writing or on the L2 writing process and instruction in a blended learning environment.

In order to implement a blended learning environment effectively and efficiently in L2 writing, a systematic and comprehensive instructional model is an integral element. In L2 writing pedagogy, it has been asserted that an integrated L2 writing approach combine the process approach and the genre approach with other aspects of writing and writing instruction (Min, 2011). Taking into account the current writing approaches and other aspects of L2 writing, as well as the attributes of online and offline environments, an instructional model for L2 writing in blended learning is urgently needed. Therefore, the purposes of the study are to examine the perceptions of L2 learners in higher education toward the prototype of the instructional model for L2 writing in blended learning

and its effects on the development of L2 writing skills and to suggest a proper model of L2 writing in blended learning. The research questions for the above purposes are as follows: 1) What are the students' perceptions toward the model?; 2) What are the effects of the model on the development of writing skills?; and 3) What is the appropriate model for teaching and learning L2 writing in a blended learning environment?

Blended learning and second language (L2) writing

Blended learning in language teaching and learning

Since blended learning was introduced to both the academic and corporate fields, there have been various attempts to employ blended learning in the language teaching field (Behjat, Yamini & Bagheri, 2011; Grgurović, 2011; Miyazoe & Anderson, 2010; Neumeier, 2005; Yoon & Lee, 2010). Featuring the combination of instructional modalities or methods, blended learning is defined as a system that combines face-to-face instruction with computer-mediated instruction (Graham, 2006, p. 5). Through the blended learning system, instructors and learners are provided with the benefits of enhanced pedagogical richness, the active use of teaching and learning strategies, multiple platforms for interaction and communication, and an increased access to knowledge (Graham, 2006; Osguthorpe & Graham, 2003).

In the English Language Teaching (ELT) field, Yoon and Lee (2010) further narrowed the term blended learning in ELT and defined it as "bringing together the positive attributes of online and offline education, including instructional modalities, delivery methods, learning tools, etc., in relation to language teaching and learning approaches and methods in order to reinforce learning process, to bring about the optimal learner achievement, and to enhance the quality of teaching and learning (p. 180)." This definition not only includes core themes of blended learning, such as the combination of instructional modalities, delivery methods and learning tools, but also emphasizes the necessity of association with approaches and methods of language teaching and learning.

In English as a Foreign Language (EFL) contexts like Korea, where language input is provided in formal classroom settings with a limited number of sessions, blended learning has been recognized as an alternative learning environment due to the increased time for language input and extended learning setting both online and offline (Lee & Pyo, 2003; Yoon & Lee, 2010). Murphy and Southgate (2011) proposed that for the design of blended learning systems and materials in language teaching contexts a wide range of teaching modes, tools, and resources be integrated to meet learners' needs and to achieve academic goals and learning outcomes. As Garrison and Kanuka (2004) indicated that learning experiences in blended learning are to be integrated, not simply mixed together, in language teaching or learning, a variety of activities and tasks are to be organized systematically in relation to the modes, tools, and available resources considering the language teaching and learning approaches and methods, learner characteristics and contexts.

Second language writing

In order to effectively write in L2, learners need to possess a variety of skills. Raimes (1983) presented nine features that produce a piece of writing: content, the writer's process, audience, purpose, word choice, organization, mechanics, grammar, and syntax. Tribble (1996) also suggested four types of knowledge that writers need - content knowledge, context knowledge, language system knowledge, and writing process knowledge - a daunting task for any L2 writer.

For the teaching and learning of L2 writing, various approaches have been suggested such as the controlled-to-free approach, the free-writing approach, the paragraph-pattern approach, the communicative approach, the process approach and the genre approach (Hyland, 2002; Raimes, 1983; Tribble, 1996; Williams, 2005). Of these, the process approach has been a mainstay of L2 writing pedagogy. Ever since Raimes (1985) identified that the writing process is recursive, the process of writing has been targeted by researchers. Williams (2005) suggested four stages of the writing process: getting started, creating the first drafts, revising, and editing. Williams asserted that L2 learners need to spend more time on all stages of the writing process and receive more discussion and feedback than native speakers (L1 writers). Likewise to Williams, Harmer (2004) suggested four main elements in the writing process: planning, drafting, editing (reflecting and revising), and the final version. These were presented via the process wheel, showing the many directions that writers can take. Tribble (1999) also

suggested the writing process is composed of prewriting, composing (drafting), revising, and editing, indicating that the whole process is not a fixed sequence but rather a dynamic and unpredictable process.

Although the process writing approach has been adopted in L2 writing classrooms, some critiques have been made: an L1-oriented process writing approach might be inappropriate for L2 learners in different social and educational contexts from L1 contexts (Delpit, 1988; Holliday, 1994). From this argument, a post-process approach in the post-process movement has been suggested (Atkinson, 2003; Trimbur, 1994) putting an emphasis on the genre, other aspects of writing and writing instruction, and a final product as well as the writing process. Min (2011) suggested a principled eclectic approach for foreign language writing instruction, indicating the integral need to search for the most effective and efficient approach to enhance students' writing skills. The principled eclectic approach adapts imported mainstream instructional approaches to local needs and stresses creations of local practices.

There have been a few studies addressing blended learning in L2 writing (Behjat, Yamini & Bagheri, 2011; Miyazoe & Anderson, 2010; Yoon & Lee, 2010). These studies indicated that blended learning environments foster interaction among students and teachers and have a positive impact on the development of L2 writing skills. Yoon and Lee (2010), particularly, in a Korean university setting, proposed a model for blended learning in L2 writing (BLW) and found that the model was received positively by students and that there was an increase in high test results.

Methodology

Participants

The participants of the study consisted of 51 English pre-service teachers in two universities in Seoul, Korea: H University and K University. The participants were enrolled in courses entitled "Logical Thinking and Writing in English" for pre-service teachers. This was a required course for pre-service teachers and taught by a bilingual Korean instructor. The course in H University was open to graduate students and the course in K University was open to both undergraduate and graduate students. A total of 25 graduate students enrolled in the course in H University, and 18 graduate students and 8 undergraduate students enrolled in the course in K University. H University's course comprised of 3 males and 22 females, K University's of 2 males and 24 females: a total of 5 males and 46 females.

The participants of both courses were divided into groups of four or five for the response activity. As focus groups, three groups in K University were selected to examine the improvement of the participants' writing skills and to gather qualitative data. The groups were heterogeneous in terms of writing proficiency level: high-beginning, intermediate, and high-intermediate. Their writing proficiency was based on their results from a pre-testing stage. The participants of the three groups (A, B, and C) are as seen in Table 1. Pseudonyms have been used to protect identities.

Table 1. Participants of three groups

Group	Name	Writing proficiency	Status	Gender
A	Eunsung	High-intermediate	Undergraduate	Female
	Mihye	Intermediate	Undergraduate	Female
	Sungjin	Intermediate	Undergraduate	Female
	Semi	High-beginning	Undergraduate	Female
B	Jihyun	High-intermediate	Graduate	Female
	Hyeyoung	High-intermediate	Graduate	Female
	Kyunghee	Intermediate	Graduate	Female
	Insung	High-beginning	Graduate	Male
C	Garim	High-intermediate	Undergraduate	Female
	Junghyuk	Intermediate	Undergraduate	Male
	Jungmin	High-beginning	Graduate	Female
	Miyoung	High-beginning	Graduate	Female

Data collection instruments and procedures

In order to obtain data for this study, quantitative and qualitative data were gathered. Quantitative data sources included a questionnaire that used semantic differentials of six bipolar adjective scales (0-5) with six items

of usefulness, easiness, interest, motivation, helpfulness and satisfaction of the prototype of the instructional model. The questionnaire was designed to measure participants' perceptions and was administered in class on week 16; 51 questionnaires were completed and returned.

Qualitative data sources included online and offline classroom observations, reflective journal entries, post interviews with three focus groups, and the focus groups' writing drafts of the pre-test, midterm, and post-test. The classroom observations were undertaken every week throughout the entire semester as non-participant observation in order to gather information on the participants' behaviours and interaction. Field notes and reflective observation logs were taken and offline peer response sessions of three focus groups were voice recorded. The participants were required to write reflective journals after producing a final draft in each writing cycle in order to reflect the writing process, comments from peers and teacher, writing activities and instruction. They were allowed to write the reflective journals in Korean. Focus group interviews were conducted at the end of the course as semi-structured interviews in Korean. The interviews were all voice recorded and notes were taken during the interviews. The interviews consisted of experience and behaviour, opinion and values, feeling, and background questions regarding previous experiences of English writing in blended learning and the model. The pre-test, midterm, and post-tests were given in week 1, 8, and 16 of the semester. The tests were to write an argumentative essay on the effectiveness of homework, the need of peer assessment in language learning, and the necessity of supervised night self-study, respectively. The 40-minute tests were administered in class and the participants were required to handwrite.

Implementing a prototype of the instructional model for L2 writing in blended learning

This study was conducted over two semesters from March 2012 to December 2012 in classes entitled Logical Thinking and Writing in English. The course at H University ran from March 2012 to June 2012, the course at K University from September 2012 to December 2012. Over 16 weeks, H University's participants met for two hours each week, K University's for three hours. For these courses, a prototype of the instructional model for L2 writing in blended learning was implemented (See Fig. 2). The model combines an offline class, where students meet in a conventional classroom, with an online class where students interact with others using CMC tools, such as e-mail, bulletin board system (BBS), blogs and chatting programs taking into account the recursive process of writing and writing activities as well as instruction.

Based on the process-oriented writing approach, the model possesses five stages: getting ready to write, drafting, revising, producing the final draft, and reviewing. In the first stage, students met in an offline class and, on selected topics, performed pre-writing activities such as listing, outlining, clustering, brainstorming and mind-mapping individually, in groups and as a whole class, using varied-multimedia tools. In the drafting stage, the students were to produce first drafts and upload them to each group's BBS in a class BBS. The students were required to conduct an online peer response session in each group, using a tag-line function in BBS, e-mail asynchronously or using chatting programs. After the online peer response sessions they were asked to revise their first drafts, produce a second draft, and upload it to the class BBS. In the revising stage, the students conducted the offline peer response sessions, collaboratively working on second drafts. The teacher also responded to students' second drafts and provided feedback for the students. In the fourth stage, the students produced the final draft based on feedback from peers and the teacher in the online environment and uploaded it to the class BBS. The teacher responded to the students' final drafts and provided feedback. After producing the final draft, the students wrote a reflective journal to reflect the writing process and feedback and comments from response sessions. The journal entries were also uploaded to the class BBS and recommended that they be shared to extend the learning experiences.

Finally, in the reviewing stage, they evaluated their final drafts and conducted group discussions based on the reflective journals. This stage is distinguished from the pre-existing writing process, such as the writing process suggested by Williams (2005), Harmer (2004), and Tribble (1996). In order to reinforce learning and writing experiences throughout the one cycle, the students need to be provided explicit opportunities for evaluating and reviewing what they did in the one cycle with peers and the teacher.

Method of analysis

Quantitative data from the questionnaire was analyzed using SPSS for descriptive statistics in order to investigate the participants' perceptions toward the instructional model for L2 writing in blended learning. Field notes and reflective observation logs collected through classroom observation were categorized into either description or reflection. The field notes and observation logs were analyzed descriptively. The collected reflective journal entries from the focus groups were read through by the researchers to investigate emergent themes regarding the perceptions toward the model. The instances of accounts were categorized into the perceptions toward the stages of the model and translated into English. The focus group interviews were also transcribed and translated into English. The interview transcripts were read through and then analyzed and categorized. The drafts of pre-test, midterm, and post-tests were scored using the rubric for academic writing based on the scoring rubric for paragraph writing (Yoon & Lee, 2010). The rubric consists of four main components: content (30 points), organization (30 points), structure (20 points), and mechanics (20 points). The drafts were scored by two raters, and Pearson's *r* for all the drafts was over 0.8 in this study.

Results and Discussion

Perceptions toward the prototype of the instructional model for L2 writing in blended learning

The participants were found to have positive perceptions toward the prototype of the instructional model for blended learning in L2 writing as seen in Table 2. They considered it useful (4.2745), interesting (3.3922), motivating (3.6667), helpful (3.9020) and satisfying (3.7843).

Table 2. Perceptions toward the model

Feature	N	Mean	SD
Usefulness	51	4.2745	.82652
Easiness	51	2.6863	1.17457
Interest	51	3.3922	1.09688
Motivation	51	3.6667	1.12546
Helpfulness	51	3.9020	1.13587
Satisfaction	51	3.7843	1.06421

The ample opportunities for writing and response sessions in online and offline environments were seen as the major benefits provided by the model. More than half of the participants (31, 60.8%) had not experienced process-oriented writing, indicating the participants were previously not given sufficient opportunities to write. This model appeared to provide the opportunities for producing multiple drafts, revising the drafts, giving and receiving peer feedback, and receiving teacher feedback. The following are excerpts from the participants commenting on the model.

Eunsung: At first, it was difficult and even scary: English writing. However, as I practiced writing and conducted peer response sessions, following the steps in this course, I realized that English writing was not that difficult. [Reflective journal (RJ)6]

Jungmin: I am absolutely satisfied with this course. Although I was very despondent due to my lack of writing skills, I thought the process-oriented writing was very interesting. This helps me study English writing by myself. [RJ6]

Semi: I liked the peer response sessions provided in this course, utilizing the class BBS and the mobile messenger application, Kakao Talk. Through these sessions, I could recognize mistakes and errors which I had not known before and widen my knowledge of English writing.

However, easiness (2.6863) was received as less positive than others. It can be attributed to the fact that most of the participants (39, 76.5%) had not had any previous experience of blended learning. They also seemed to have difficulties dealing with the content provided at each stage and considered L2 writing a difficult and challenging skill as seen in the transcripts of the interviews.

Jihyun: It is, of course, not easy to write multiple drafts and upload them to the class BBS in time.

Miyoung: I liked the contents addressed in the classroom, but I felt rushed to finish the tasks and activities. It would be much better if we had enough time to address the content and conduct the tasks and writing activities.

In Table 3, the participants had positive perceptions toward pre-writing activities in the getting ready to write stage. The participants considered the pre-writing activities useful (4.3922), easy (3.000), interesting (3.5294), motivating (3.8627), helpful (3.9216) and satisfying (3.9216). The participants were observed thinking of ideas and deliberating the organization of content during individual work, and enjoying discussing and sharing the results of individual work during group work in a non-threatening environment. Also, they appeared to appreciate further information and comments provided by the teacher. The following are the excerpts from the participants' reflective journals commenting on pre-writing activities.

Sungjin: I could gather a lot of information through the pre-writing activity, listing. Pre-writing activities have the merits in terms of producing better drafts through a variety of collected information. [RJ1]

Jungmin: I had recognized that mindmaps are a very powerful technique in writing, but I had rarely used them. I think organizing ideas and expressing them are part of a quite meaningful process. Also, I really liked the websites, such as http://www.okmindmap.com or http://www.lextutor.ca/ because they are useful. [RJ5]

Table 3. Perceptions toward pre-writing activities

Feature	N	Mean	SD
Usefulness	51	4.3922	.80196
Easiness	51	3.0000	1.14891
Interest	51	3.5294	.98697
Motivation	51	3.8627	.84899
Helpfulness	51	3.9216	.93473
Satisfaction	51	3.9216	.91309

Table 4. Perceptions toward writing multiple drafts

Feature	N	Mean	SD
Usefulness	51	4.3922	.69508
Easiness	51	2.3725	1.29554
Interest	51	2.9020	1.06311
Motivation	51	3.7059	1.06384
Helpfulness	51	4.2549	.84482
Satisfaction	51	3.9412	.98817

As shown in Table 4, the participants considered writing multiple drafts, drafting, revising, and producing the final draft performed in the while-writing stage useful (4.3922), motivating (3.7059), helpful (4.2549), and satisfying (3.9412). In particular, they were found to think it very useful and helpful to improve writing skills because it provided sufficient opportunities for writing practice. Although the participants found it difficult to write multiple drafts, they appeared to recognize the benefits of the process-oriented writing approach as presented in reflective journal entries.

Jihyun: As I wrote the drafts several times throughout the semester, it became more helpful for the development of my writing skills. I think the writing assignments and the instruction are both very necessary, and I appreciate this course since it helped me a lot. [RJ3]

Mihye: The biggest improvement this made to my writing was related to time. I usually spent a long time drafting, but I decided to produce the drafts fast, focusing on the drafts, and I could complete the drafts in one hour. [RJ4]

The participants' perceptions toward writing reflective journals are somewhat less positive than the other elements of the instructional model for L2 writing in blended learning as presented in Table 5. Despite its usefulness (3.7647), the participants showed a low level of interest (2.6471) and motivation (3.0392).

Table 5. Perceptions toward writing reflective journal

Feature	N	Mean	SD
Usefulness	51	3.7647	1.47768
Easiness	51	3.0392	1.26429
Interest	51	2.6471	1.45360
Motivation	51	3.0392	1.42774
Helpfulness	51	3.0784	1.26243
Satisfaction	51	3.2745	1.23415

It can be attributed to the notion that there was a lack of interaction among the participants and the teacher. Since writing reflective journals was considered personal and cognitive work, it remained in individual areas. Some had difficulties writing about the given areas and were overwhelmed and stressed after finishing the entire process. It was also suggested that the reviewing stage needed to be intensified with more explicit consolidation by the teacher to reinforce and to foster further learning as seen in the transcripts of the interview.

Mihye: I was stressed out about writing the first draft and further revising. Also, it was easy not easy to write the reflective journals and upload them to the class BBS.

Jihyun: I think this course could be much more helpful if the teacher consolidated the entire writing process and contents at the end of the cycle. Because we did not address the final drafts in detail, there were somethings that I could not fully understand.

Effects of the prototype of the instructional model for L2 writing in blended learning

As shown in Figure 1, the members of group A showed an increase in scores from the pre-test to the midterm, and the post-test. Eunsung, who is a high-intermediate level student, got 81 points in the pre-test, 86 points in the midterm, and 90 points in the post-test. Although she was knowledgeable of English writing, she seemed to be concerned about content and organization. She was found to recognize the importance of content and organization through process writing, often interacting with group members in response sessions provided in the drafting and revising stages. Mihye, who scored 71 points in the pre-test, also showed an increase of 10 points from the pre-test to the post-test. Mihye was a very hardworking student and completed each task and activity in the stages diligently. Not only did she gain higher scores in the midterm and post-test, but she also gained confidence in English writing and was satisfied with the model as seen in the transcript from the interviews.

Mihye: This course is absolutely helpful for improving individuals' writing skills. I feel a big sense of accomplishment in my writing. At first, I felt some pressure writing the first draft, but as I wrote more and more, I could produce the first draft fast and learn certain strategies. Through this course, I was able to gain confidence in writing and now I even consider myself a good writer.

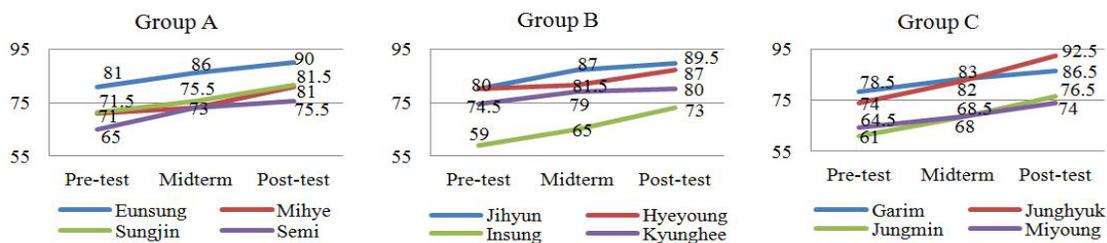
For all the members of Group B, there were increases of points from the pre-test to the post-tests as seen in Figure 1. Among the group members, Insung gained 59 points in the pre-test, showing a low level of writing proficiency. Insung seemed to have difficulties selecting appropriate words and organizing the content of drafts. However, as he produced drafts and revised them through received feedback from peers and the teacher with supportive explicit activities and instructions in the model, his writing skills improved, gaining six points overall from the pre-test to midterm, and eight points from the midterm to the post-test. The other group members, Jihyun, Hyeyoung, and Kyunghee, were all eager to respond to peers' drafts and participate in the writing activities as well as the writing process, and gained higher scores in the midterm and post-test.


Fig. 1. Scores of three focus groups

Every member in Group C showed increases of points from the pre-test to the post-test as well. Among the group members, Junghyuk's performance was notable. Junghyuk was not able to complete his composition in the pre-test in 40 minutes. The number of produced words was 132, and the number of produced sentences 10. However, he completed his mid-term and post-test composition with 276 words and 15 sentences, and 296 words and 19 sentences respectively. With the increase in quantity of words and sentences, the quality of drafts improved from the pre-test (74) to the post-test (92.5) stage. This improvement can be attributed to Junghyuk performing tasks and activities provided in the model and following the writing process. Junghyuk was observed to interact with other group members in class BBS, respond to peers' comments and explain the reasons for his writing through the tag-line function. He seemed to be able to acknowledge his weaknesses and thus tried to make as many revisions to the first and second drafts as possible. He also recognized that he could write faster than before and could arrange his ideas in more logical ways as this excerpt from his reflective journal states:

Junghyuk: I think I become more confident and relaxed while I am writing. Now, I organize my ideas and then start to write from these thoughts for more logical drafts. [RJ3]

Modification of the prototype of the instructional model for L2 writing in blended learning

Based on the main findings, the prototype of the instructional model for L2 writing in blended learning was modified as presented in Figure 2. In order to reduce the burden that the participants bear during the writing process of the model and to provide sufficient time to reflect the feedback from online peer response sessions, the task of revising the first draft and producing the second draft was moved from the drafting stage to the revising stage. The participants were observed to have too heavy a workload in the drafting stage: writing the first draft, conducting online peer response sessions, revising the first draft and producing the second draft all within one week. They seemed to be in a hurry to conduct each task and to not have sufficient time to reflect on comments from peers or to make decisions as to whether the comments were to be incorporated for revisions or not. By revising the locations of the first draft and producing the second draft, the students' burdens can be eased and ample time allowed for students to reflect on feedback and deliberate the revision process more thoroughly.

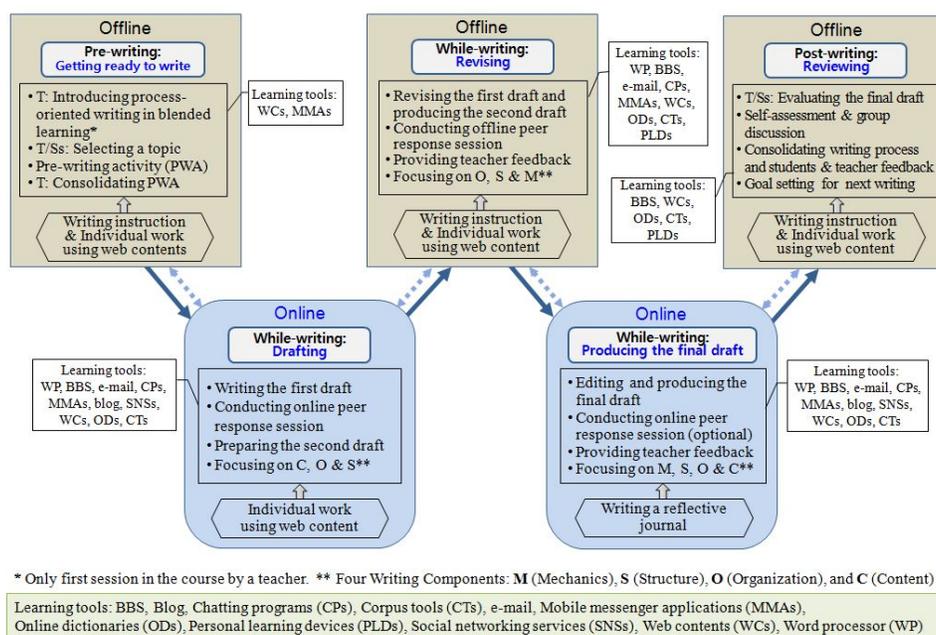
To reinforce the writing process and foster further learning after producing the final draft, online peer response sessions in the producing the final draft stage are to be added. The participants in the study were found to rarely address the final draft despite its importance as a product. In order to engage students' attention to the final drafts and promote interaction among the students, the online peer response session is to be added; however, this online peer response session should only be conducted if the students find it necessary. In addition, the reviewing stage is to be intensified to reinforce teaching and learning writing skills. In the prototype of the model, reviewing was conducted based on the reflective journal entries with evaluation of the final draft by the teacher and students. However, it was found to be insufficient for addressing the tasks and activities provided in the model, so consolidating the writing process and feedback from the students and the teacher and setting goals for next writing are included. The consolidation provides students with opportunities to review what they have learned in the writing process and to address the important points made. Goal setting also connects problems acknowledged in the writing cycle to improvements that need to be made for further writing cycles.


Fig. 2. The instructional model for L2 writing in blended learning

The participants in the study were observed to utilize varied functions of personal learning devices (PLDs) such as smartphones, iPads, or tablet PCs and mobile messenger applications (MMAs) for their response sessions as well as the drafting and revising stages. Using PLDs and MMAs did not require the participants to use computers, and consequently provided flexibility and mobility for communication and interaction regardless of time or place; thus, it is seen as essential to implement PLDs and MMAs as learning tools.

Conclusion

This case study was conducted to investigate EFL pre-service teachers' perceptions toward the prototype of the instructional model for L2 writing in blended learning and its effectiveness on the development of L2 writing skills and to develop a proper model of the instruction for L2 writing in blended learning. The main findings are as follows: First, the participants were found to receive the model positively. They considered it useful and helpful for the improvement of their writing skills; however, they found it somewhat difficult dealing with some of the tasks and activities provided in the model. Second, the model was found to be effective for the development of L2 writing skills. The model illustrates the writing process in five systematic stages and suggests a combination of writing activities based on the four writing components with varied learning materials and tools provided in online as well as offline environments. Due to the abundant opportunities to produce multiple drafts, the giving and receiving of feedback, and the explicit practicing of the four writing components, the participants were found to gain higher scores for the midterm and the post-test than the pre-test. Last, the prototype of the instructional model for L2 writing in blended learning was modified by reducing the students' burden, intensifying the reviewing stage to reinforce further learning, and adding the learning tools for the promotion of interaction and communication among the students and teacher.

For the effective and efficient implementation of this model for L2 writing classrooms, teachers or instructors need to carefully consider their students' learning environments and academic needs. According to learning environments and academic needs, this model could be implemented and modified. For example, the writing process can be shortened to a one week cycle for advanced students. The writing activities on structure can also be added for students who are not yet capable of producing accurate sentences. Teacher training needs to be conducted prior to the implementation of this model since it requires teachers to teach contents, respond to students' writings, interact with students through varied learning tools, facilitate interaction, monitor students' writing process, and manage time efficiently. Teachers, therefore, need to be prepared to effectively employ this model for their students in terms of utilizing learning tools as well as addressing contents.

Since this study was conducted as a case study, further research needs to be carried out with a large number of participants to provide a true experiment and investigation of its effectiveness. Furthermore, more studies need to be conducted with participants of other languages and varied proficiency levels to examine the impact of the model on the development of L2 writing skills.

Abstract

This paper provides a review of research trends and content analysis of studies in the field of YouTube that were published in seven major journals: *Turkish Online Journal of Educational Technology* (TOJET), *Educational Technology & Society* (ET&S), *Educational Technology Research & Development* (ET&D), *Computers & Education* (C&E), *Learning and* I*nstruction* (L&I), *Australasian Journal of Educational Technology* (AJET) and *British Journal of Educational Technology* (BJET). These articles were cross analyzed by published years. Content analysis was implemented for further analysis based on their research topics, issues category, research settings and sampling, research design, research method and data analysis. The results of the analysis also provide insights for educators and researchers into research trends and issues related to YouTube.

Keywords: YouTube; trends; content analysis.

Introduction

YouTube is the world's most popular online video site, with users watching 4 billion hours' worth of video each month, and uploading 72 hours' worth of video every minute (YouTube, 2013). YouTube began in February 2005 and was founded by Chad Hurley, Steve Chen, and Jawed Karim who named it "YouTube.com". Through the YouTube platform, people started to create a video-sharing website on which users could upload, share, and view videos.

Since then, YouTube has gained an audience of billions of users including educators and scholars. While the academic literature provides some evidence that YouTube has been studied and written about, little is known about priorities for YouTube research. This study employed trend analysis and content analysis method to obtain data on research topics, issues category, research settings and sampling, research design, research method and data analysis on articles published regarding YouTube in selected journals (Cheung & Hew, 2009).

Having started in 2005, YouTube has developed into a prominent online video-sharing destination. The millions of video clips on YouTube represent a broad spectrum of user interests including those of educators, scholars and researchers. YouTube EDU (http://www.youtube.com/edu) illustrates a portion of the growing academic presence on YouTube as colleges and universities establish institutional channels through which they share videotaped lectures and campus events. YouTube has become a topic of discussion and inquiry within the scholarly literature as educators and researchers grapple with questions about the possibilities and problems associated with social media (Chenail, 2008; Snelson, 2009, 2010).

1.1 Research Objectives

This paper is aimed at evaluating and identifying the trend and content analysis of studies in the field of YouTube that were published in seven major journals: Turkey Online Journal of Educational Technology (TOJET), Educational Technology & Society (ET&S), Educational Technology Research & Development (ETR&D), Computers & Education (C&E), Learning and Instruction (L&I), Australasian Journal of Educational Technology (AJET) and British Journal of Educational Technology (BJET). These articles were cross analyzed by published years. Content analysis was implemented for further analysis based on their research topics, issues category, research settings and sampling, research design, research method and data analysis.

The objectives to be achieved through this study are as follows:
1. What are research topics, research settings and samplings related to YouTube have been published in seven journals over the last 6 years?
2. What are the main issues categories and sources of articles related to studies on YouTube in the seven journals between 2007 and 2012?
3. What types of research design, research method and data analysis have been applied in the related article of YouTube?

1.2 Review on Studies of YouTube

In their research paper Mullen and Wedwick (2008) say that modern technology should be implemented into classroom instruction in order for students to develop the skills needed in our new digital society. Technology is considered as a major part of every aspect of our lives; it is no wonder that it is being seen more and more in schools. Educators have a responsibility to prepare students for the future and technology is a very real component of that future. The phenomenon of technology and preparing students for the future is at the forefront of education. It has become such an important topic that the New York State Department of Education has developed standards for educational technology. Over the past decade, these standards have been developed not only to implement technology into the classroom, but to ensure that by the end of eighth grade all students are computer literate ("Education technology" n.d.).

Incorporating technology into the classroom is not only for the benefit of the students, but for the benefit of the teachers as well. Technology can be used to help teachers be more interactive, effective, and engaging (Yu & Smith, 2008). According to the New York State Department of Education, educational technology is defined as "using multimedia technologies or audiovisual aids as a tool to enhance the teaching and learning process" ("Definitions and terminology" n.d.). Additionally, technology allows teachers to reach out to different types of learners (Gorder, 2008). Not all students learn the same way; with technology use teachers can adapt their lessons to a multitude of student needs. With such a mutually beneficial relationship, teachers should be willing to integrate technology into classroom activities. According to Juhasz (2008) YouTube is providing "access to what exactly? Democratization of what really?" The claims of Web 2.0 are only relevant if you happen to have a computer with broadband connection, and the majority of people in the world have no such luxury (Steven, 2003).

Although Web 2.0 holds some exciting possibilities for all areas of community media, and the sector is best placed to harness its full potential, new technologies can simply put a new face on an old problem (Juhasz, 2008). At the moment, rather than video tapes on the shelves of production companies gathering dust, the new trend is to upload the video onto YouTube for all the world to see, and let it sit there online, gathering "cyberdust".

Mullen and Wedwick (2008) wrote that anything from a music video to a political speech to an amateur movie can be found on YouTube. With such a wide range of applications, teachers are just beginning to unravel the potential benefits of using YouTube during a lesson. Anyone who accesses YouTube can search the large database of videos for his particular need, or a user can set up an account and save selected videos to that account (Mullen & Wedwick, 2008). If teachers search for videos in preparation for their lesson, they can save the video to the created account, thus eliminating time spent in class to search and select the correct video.

Methodology

This study examines related research relevant to YouTube in education in seven selected journals from 2007 to 2012. The seven selected journals were: *Turkish Online Journal of Educational Technology* (TOJET), *Educational Technology & Society* (ET&S), *Educational Technology Research & Development* (ETR&D), *Computers & Education* (C&E), *Learning and Instruction* (L&I), *Australasian Journal of Educational Technology* (AJET) and *British Journal of Educational Technology* (BJET). The journals chosen are widely accessed and have high impact factor based on the 2011 Institute for Scientific Information (ISI) Journal Citation Reports and based on its impact factor as released by Thomson Scientific 2011 Journal Citation Reports. There were a total of 4,319 document items from 2007 to 2012 published by these seven journals. Only papers identified as being of the type "articles" in the seven journals were analyzed. Publications such as "book reviews", "letters", and "editorial materials" were all excluded from this study. Finally, two research based articles related to YouTube were found from these journals. As a study on preparation of basic knowledge in the field of YouTube based learning which is still new in the context of education in Malaysia, this study was implemented in a limited scope. Two approaches to analysis were used in this study, namely trend analysis and content analysis.

The different databases were chosen due to the availability of certain journals and accessibility of the abstract and full text for the selected articles. The databases were; EBSCOhost, ProQuest Education Journals, Science Direct, Springer Link, Web of Science and Wiley Online Library. One search engine was also used for the purpose above. The search engine used was Google Scholar.

The first procedure in conducting this research is setting three items to search for the related articles in all databases above. They are: (1) Selected Journal Name for Journal Name, Publication Title or Journal/Book Title column, (2) YouTube for Topic or Title column and (3) 2007-2012 for Timespan, Year or Coverage column. This step is important to ensure standardization in order to search the related articles in spite of the different interface between all databases.

In total, 66 articles were identified from the first procedure. The next procedure consists of further comprehensive review which needs the researchers to examine the 66 articles carefully to determine the articles actually related to YouTube. Finally, a total of two articles were selected for the analysis.

2.1 Trend Analysis

Trend analysis of an article can show the periodic discussion taking place in a knowledge discipline (Erford et al., 2010). In the analysis of trend and frequency, justification for article selection is found in the seven journals. Descriptive statistics are used to analyze the articles related to YouTube published in the seven journals over a 6 year period from 2007 until 2012.

2.2 Content Analysis

Based on content analysis or the process of summarizing and reporting of written data (Cohen et al., in Cowan, 2011), the research topics in the articles selected for analysis were categorized according to key words in the given abstracts, issues discussed as well as research scope. Throughout the data analysis carried out, each category identified was further clarified using thematic analysis. At the end of the analysis, the categories of the articles are as follows:

1. Research topics
2. Issues category
3. Research settings and samplings
4. Research designs
5. Research Method
6. Data Analysis

3. Findings

3.1 Frequency and Trend Analysis

Based on frequency analysis, there were two articles listed in the shortlist related to the topic of YouTube. These two articles were in the *British Journal of Educational Technology* (BJET) and *Computers & Education* (C&E) for the period 2007 until 2012. Analysis of number of articles based on yearly periods is given in Table 1.

Table 1: Number of Articles Related to Studies on YouTube According to Selected Journals

Journal	Frequency	References
BJET	1	Chareen Snelson, Kerry Rice & Constance Wyzard, 2012
C&E	1	Karsten Krauskopf, Carmen Zahn & Friedrich W. Hesse, 2012

Analysis of the findings shows that frequency of articles related to YouTube are started to be researched in *British Journal of Educational Technology* (BJET) and *Computers & Education* (C&E). *Turkish Online Journal of Educational Technology* (TOJET), *Educational Technology Research & Development* (ETR&D), *Learning and Instruction* (L&I) and *Educational Technology & Society* (ET&S) and *Australasian Journal of Educational Technology* (AJET) have no research articles related to YouTube published within the period 2007 to 2012.

3.1 Content Analysis of Current Articles on Studies Related to YouTube

For the latest trend related to YouTube, this study also consider issues in the published articles in the seven journals, but only *Computers & Education* (C&E) and *British Journal of Educational Technology* (BJET) for the years from 2007 until 2012. Given the limitation of the date of publication, three articles related to YouTube were found. The selected articles were types of research based articles.

Research based articles are content analyzed based on several constructs such as title, source, sample, research design, instrumentation and type of data analysis used. Table 2 shows the result of content analysis of two selected articles related to YouTube according to research based articles.

Table 2: Content Analysis and Current Focus of Articles Based on Studies Related to YouTube

Article title	Research Topic	Issues Category	Research Setting and Samplings	Research design	Re-search Method	Data Analysis
1. Research priorities for YouTube and video-sharing technologies: A Delphi study	Areas in need of research	Obtain consensus from experts about areas that are most in need of research in video-sharing technology (Particularly YouTube).	17 experts Questionnaire in online	Quantitative Survey	Delphi Method	**Descrip-tive Statistics**
2. Leveraging the affordance of YouTube: The role of pedagogical knowledge and mental models of technology functions for lesson planning with technology	Potentials of digital video technology in school-based education	To integrate teacher knowledge of a technology with their professional knowledge about teaching. This paper described mental models of YouTube, lesson planning for using YouTube, barriers to using YouTube in the "ideal" way and mental models as mediators of pedagogical knowledge	This study was administered online and participants were recruited via a German online forum for pre-service teachers. Sixty (60) pre-service teacher users of the forum answered the questionnaire	Quantitative Survey		**Descrip-tive Statistics**

3.3 Content Analysis of Source of Articles Based on Studies Related to YouTube

The first article, "Research priorities for YouTube and video-sharing technologies: A Delphi study" is written by Chareen Snelson, Kerry Rice and Constance Wyzard and was published in the *British Journal of Educational Technology* in 2012. The second article, "Leveraging the affordance of YouTube: The role of pedagogical knowledge and mental models of technology functions for lesson planning with technology" was written also in 2012 by Karsten Krauskopf, Carmen Zahn, and Friedrich W. Hesse in the journal *Computers & Education* .

Table 3: Content Analysis of Source of Articles Based on Studies Related to YouTube

Article title	Source : (author, year, journal, page numbers)
1. Research priorities for YouTube and video-sharing technologies: A Delphi study	Snelson, Chareen, Rice, Kerry, & Wyzard, Constance. (2012). *British Journal of Educational Technology*, vol 43 No 1, 119-129.
2. Leveraging the affordance of YouTube: The role of pedagogical knowledge and mental models of technology functions for lesson planning with technology	Krauskopf, K., Zahn, Carmen, & Hesse, F. W. (2012). *Computers & Education, 58,* 1194-1206.

4. Discussion

In this section, the authors summarize and discuss the major findings and the results are:

1. Two research topics covered about areas are most in need of research in YouTube and potentials of digital video technology (YouTube) in school-based education. The first article determined seven priority categories in YouTube over the next five years. Seven categories were identified and ranked in order of priority: 1) users, groups and communities 2) teaching and learning 3) social/political impact 4) video creation/production 5) legal/ethical 6) media management 7) commercial interest. The second article found that participating pre-service teachers focused on YouTube as an audio-visual medium and as a searchable database with additional Web 2.0 features.

2. The research setting and sampling of the article title Research priorities for YouTube and video-sharing technologies: A Delphi study, are find 35 experts which had conducted empirical research studied and had multiple publications about YouTube. The 35 researchers were invited to participate in a Delphi study to determine YouTube research priorities. Then, 17 researchers are agreeing to take part in the study. The sample was involved in a three round Delphi process involving two cycles of online questionnaires and feedback reports. The optimal number of Delphi participants to include on an expert panel with suggestions from 10 to 30 (Anderson & Kanuka, 2003). The setting and sampling of the second article was administered online too and participants were recruited via a German online forum for pre service teachers. Sixty (60) pre-service teachers who were forum users answered the questionnaire.

3. The main issues categories and related to studies on YouTube in the seven journals between 2007 and 2012 are about to obtain a consensus from experts about areas most in need of research in video-sharing technology (particularly YouTube). The second article describes mental models of YouTube, lesson planning for using YouTube, barriers to using YouTube in the "ideal" way and mental models as mediators of pedagogical knowledge.

4. The research design for both articles is survey design. Research design of these articles are quantitative survey undertaken through online questionnaire.

5. Research method for first article is Delphi Technique which is to obtain consensus of experts in a three round Delphi process. The research method for the second article is survey technique using web based questionnaires (online) which consisted of three parts. The participants were recruited via a German online forum for pre-service teachers (http: //www.lehramtforum.de). Sixty pre-service teacher users of this forum completed the questionnaire. All participants will become educators at the secondary level. The three part questionnaire contain demographic questions (age, gender, high school grades), two scales measuring their general pedagogical beliefs and open questions.

6. Data analysis of these two articles involved descriptive statistics. Descriptive statistics refer to measures of central tendency or location (median, mean, mode, percentiles, etc) and measure of variation or spread (range, variance, standard deviation etc), graphs and charts are also useful tools to understand the characteristics of each variable (Rasimah, Puziwati, & Norizam, 2000).

5. Conclusion

In conclusion, this study reviewed seven selected journals published within six years between 2007 and 2012. These YouTube articles related only started to be studied of late, by 2012. This study could be affected by the setting of the studies based on their research topics, issues category, research settings and sampling, research design, research method and data analysis. Furthermore, there will never be a fit finding on the same issues researched and further studies always be needed to fill in the gaps between the last and the current studies. Frequency studying of YouTube increases in the current issues (2013). Study of YouTube can attract other researchers and will give more results besides affecting our educational system.

ABSTRACT

Non-Suicidal Self-Injury (NSSI) is a complex behavior. Many Web-sites devoted to NSSI are available and in this manuscript we have performed a content analysis, analyzing how NSSI is portrayed. From a clinical point of view, as suggested by Lewis and collaborators, the clinician while interviewing the patient should inquire about his/her online activities. More quantitative-based research is needed to shed light on this topic.

Key words: Internet; Non-Suicidal Self-Injury (NSSI); YouTube.

INTRODUCTION

Non-Suicidal Self-Injury (NSSI) is a deliberate, direct, reiterate and socially deprecable behavior resulting in destruction of one's own body tissue with no intention of committing suicide, even though it is associated with a high risk of considered or attempted suicide [1].

Even if there is a lack of an ambiguous and consistent terminology and NSSI remains an "umbrella term" rather than a precise self-defined nosological entity [2], despite many efforts of providing a systematic and comprehensive consensus (it is noteworthy mentioning the "Classification of Self-Injurious thoughts and behaviors") [3], interest in exploring NSSI is increasing in the scientific community, a growing body of evidence is accumulating and proposals for including NSSI in the forthcoming Diagnostic Statistic Manual (DSM) V version have been put forward [4-8].

Currently, according to the DSM-IV TR and ICD-10, a description of NSSI-like behaviors constitutes one of the items of Borderline Personality Disorder (BPD). However, NSSI has peculiar characteristics that enables to distinguish it from other mental disorders. From an epidemiological point of view, subjects affected by NSSI are usually in the 12/14-24 years range and the most common ways of self-injuring are self-cutting (generally on the inside part of the arms), head banging/punching and hitting walls, pinching, skin picking, scratching, and hair pulling [9]. The precise aetiology of NSSI is unknown, but a genetic background and biological impairments, such as alterations of brain morphology, of lipid plasma levels, of neurotransmitters (in particular, serotoninergic, dopaminergic and opioid systems) [10-12], as well as a story of child trauma and sexual abuse have been reported.

Experimental studies have shown how people suffering from NSSI are likely to use more online sites as a preferential platform for conveying their feelings and emotions, and moreover, the onset age of NSSI coincides with the peak of the Internet use and accessing [13]. Therefore, it is of vital clinical importance and relevance that the psychiatrists become aware of the NSSI-related online material, check their reliability [14-16], in order to be able to react to it and to discuss it with their patients. The new media can have a dangerous epidemic and "viral",

E-mail address: robertobragazzi@gmail.com

contagious effect on vulnerable subjects [17-23], and some scholars talk about a so-called "Werther effect", a "cybersuicide phenomenon" or a "virtual cutting edge".

Undoubtedly, NSSI 2.0 is a complex reality where web-sites can have a negative effect of reinforcement, or on the contrary can be used for healthier purposes, such as health education, self-managing and coping strategy.

In this preliminary report, we introduce the concept of "NSSI 2.0", that is to say the study of the Internet usage by subjects with NSSI, and its related representations. We have transcribed the YouTube videos related to NSSI and used content-analysis in order to analyze them and extract pertinent information. YouTube is having an emerging and clinically relevant role in the field of suicidology. *Ad hoc* web portals and surveys could be designed at the light of the reported results, for helping people with NSSI, while monitoring the extant online sites and videos.

MATERIALS AND METHODS

YouTube is an online platform that enables users to freely download, share videos and even to upload their own created videos. YouTube videos related to "autolesionismo" (Italian for NSSI) were mined, downloaded, transcribed, after removing duplicates or non-pertinent material. Content-analysis or textual analysis was performed using T-LAB® software. Content analysis is a scholarly methodology widely used in the social sciences for studying the content of communication – articles from journals and magazine, books, or videos, websites, etc. – from a qualitative point of view.

RESULTS

Most videos showed crude and dramatic images (Figure 1). The conceptual map showed that NSSI is strictly related to suffering, having problems, having ambivalent emotions (a sense of hate and of self-destruction), being alone, a strong need to talk with others, to share one's own feelings and being understood (Figure 2). Figures 3-5 show how these concepts related to NSSI cluster together (Figure 3 Sammon's stress technique, Figure 4 co-occurence graph, Figure 5 map of the main themes and semantic categories).

DISCUSSION

Being anonymous, NSSI subjects accept to use the Internet (forum, blogs, chat), easily speaking about their difficulties and problems, without experiencing stigma, marginalization. and however, according to a research carried out by Lewis and collaborators, even though promising and apparently helpful, these sites should be carefully monitored and validated by physicians and practitioners [24]. These sites are usually run by peers who, in some cases, have not succeeded to stop self-injuring. Moreover, the quality of the information about NSSI and the content itself are not always of high quality or corresponding to the truth: some videos of YouTube that we analyzed tried to deny that NSSI is disease and there is a need of a proper treatment, by normalizing it. This is clinically relevant since the spreading of not reliable, misleading and even dangerous information could lead the users to imitate this kind of behaviors.

CONCLUSION

Despite its limitations, this preliminary exploration showed that monitoring and checking the Web-based material concerning NSSI is of crucial importance. NSSI is an increasing phenomenon, probably due also to the reinforcement provided by the same digital technologies. From a clinical point of view, as suggested by Lewis and collaborators, the clinician while interviewing the patient should inquire about his/her online activities. More quantitative-based research is needed to shed light on this topic.

A content analysis of wikis in selected journals from 2007 to 2012

Norlidah Alias, Dorothy DeWitt[5], Saedah Siraj, Sharifah Nor Atifah Syed Kamaruddin,
Mohd Khairul Azman Md Daud

Department of Curriculum & Instructional Technology, Faculty of Education,University of Malaya,50603 Kuala Lumpur, Malaysia

Abstract

This paper provides content analysis of studies in the field of Wikis that were published in six major journals: TOJET, Educational Technology & Society, Educational Technology Research &Development, Computers & Education, Australasian Journal of Educational Technology and British Journal of Educational Technology. These articles were cross analyzed by published years. Content analysis was implemented for further analysis based on their research topics, issues category, research settings and samplings, research designs, research method and data analysis. The results of the analysis also provide insights for educators and researchers into research trends and patterns related to wikis.

Keywords: Wiki; content analysis; trends; patterns

Introduction

This study focuses on wikis, a social media tool for collaborative problem-solving. The feature of social media is that social interaction and dialogue between peers, as well as experts, is enabled. Scaffolding and modelling of learning behaviours for engaging the learners is provided (Andrews & Haythornthwaite, 2009).

A wiki is a collection of easily editable webpages, interlinked through hypertext systems for storing and modifying information (Guo & Stevens, 2011). Wiki, which means "quick" in Hawaiian, can be used for collaborative writing and problem-solving tasks. By providing a collaborative learning environment, learners can collectively contribute to the content while building the website and adding new pages. At the same time the content on the webpage can be edited by other users. As learners collaborate in publishing their work, they gather information, represent it in new ways, and generate novel ideas (Bonk, Lee, Kim, & Lin, 2009).

Wikis are a relatively new tool for teaching and learning. The first wiki was developed by Ward Cunningham in 1995 and was initially a form of database of information (Cunningham, 2012). Recently, wikis have been used as a social media tools for interaction and collaborative processes. The use of wikis has gained the interest among academicians who see the potential of the use of wikis for learning (Guo & Stevens, 2011).

There also seems to be an increase in the number of articles on the use of wiki for education in recent years with the interest in social media tools in recent years. Hence, the purpose of this paper is to determine the type of research and trends in the use of wikis in education. The investigation would answer the following research questions.

- What is the trend in the number of articles published on wikis from 2007 – 2012 in the selected journals in the field of educational technology?
- What are the focus areas of the studies in the selected journals related to in the field of educational technology?
- What are the research designs used in the research related to wikis in the selected journals in the field of educational technology?

The scope of this study would be limited to research related to wikis in the articles published in the selected educational technology journals from 2007 to 2012. The findings are relevant to researchers investigating the integration of technology, namely wiki in instruction, and for teachers who wish to explore effective and engaging methods of instruction using collaboration and social media tools.

Wikis for collaboration

Wikis have been used for collaboration for the construction of knowledge. Information can be shared with an audience in an online portal (Bonk, Lee, Kim, & Lin, 2009). This asynchronous communication tool is not merely used for knowledge transmission in learning through sharing of information, but transforms knowledge as the learners involved generate, share and reshape knowledge on the wiki (Bonk et al., 2009).

Learners gradually become experts as they participate in the active learning process while contributing to knowledge-building on the wiki (Bonk et al., 2009; Pifarré & Li, 2012; Zhang et al., 2007). As learners gather and evaluate the information and knowledge, they then manage the assimilation and application of the knowledge in finding solutions to problems (Biasutti & El-Deghaidy, 2012). At the same time their peers and instructors help scaffold the learner in this process to achieve expert status (Pifarré & Li, 2012; Whipp & Lorentz, 2009; Zhang et al., 2007). Hence, the culture of participatory learning in a collaborative environment for social interactions is afforded by wikis (Bonk et al., 2009; Pifarré & Li, 2012).

Mindtools

Computer applications can be used to promote meaningful learning and critical thinking. When computers and the applications are used in meaningful ways to organize and represent personal knowledge, they are considered as tools for assisting thinking, or mindtools. "Mindtools" are computer-based tools and learning environments that have been adapted or developed to function as intellectual partners with the learner in order to engage and facilitate critical thinking and higher order thinking (Jonassen, 2000; p.9)"

However, Jonassen's (2000) mindtools includes use in live conversation environments and computer conferences. Social media tools can be used to develop meaningful learning and critical thinking skills. These are called social mindtools (Nuutinen, Sutinen, Botha & Kommers, 2010).

Methodology

Sampling

Six journals were used for this research namely as Turkish Online Journal on Educational Technology (TOJET), Educational Technology & Society (ETS), Educational Technology Research & Development (ETRD), Computers & Education (CE), Australasian Journal of Educational Technology (AJET) and British Journal of Educational Technology (BJET). All of these journals were ISI-ranked journals and prominent academic journals in the field of 'Educational Technology'.

Procedure

Content analysis is a multi-purpose research method for analysing text data in a naturalistic setting (Hsieh and Shannon, 2005). The cognitive schemes, the values and intentions of the authors can be inferred from the data which may reveal underlying themes and associations (Duriau, Reger and Pfarrer, 2007). In addition, the multilevel analysis involved, makes it a rigorous and yet flexible enough methodology to employ (Duriau, Reger and Pfarrer, 2007; Hsieh and Shannon, 2005).

A content analysis of the selected journals was done using a deductive approach (Hsieh and Shannon, 2005; Mayring, 2000; Potter and Levine Donnerstien, 1999). The key concepts and variables for the initial coding categories was identified (Hsieh and Shannon, 2005; Potter and Levine-Donnerstien, 1999): impact, collaborative, learning, effectiveness, teaching, development, contributing factors, assessment and application. However, the disadvantage of using pre-specified categories in directed content analysis is that it is more likely that the participants are influenced to concur with the researchers' theories, opinions and expectations (Hsieh and Shannon, 2005).

Firstly, the operational definitions for each category were determined based on theory. Then, text in the journal articles is read to determine the categories of research areas and methods. Articles which cannot be categorised in the existing codes are given new codes (Hsieh and Shannon, 2005). The order and frequency of codes can be ranked.

Findings and Discussion

Analysis Frequency and Trends

The analysis of the trends in the selected journals in educational technology showed that only 49 articles related to wikis were published from the total of 4119 articles (Table 1).

Table 1. Frequency of articles published on wikis as a percentage of the total articles published from 2007-2012.

Journal Name	Total articles published from 2007-2012	Frequency of articles on wikis from 2007-2012	Percentage (%)
TOJET	438	5	1.14
ETS	587	13	2.21
ETRD	270	6	2.22
CE	1324	6	0.45
AJET	370	14	1.08
BJET	1130	5	0.44
Total	4119	49	

The highest number of articles related to wikis were published in AJET (14), followed by ETS (13), while the lowest was in TOJET and BJET (5 each). The total percentage of articles published on wikis from 2007-2012 in the selected journals was only 1.2%. This indicates that research on wikis is a new area and is yet to be explored in the field. However, the trend shows that there is an increase in the number of articles published on wikis over this period of time is data (Figure 1).

The main focus of research seems to be on the role of the wiki in collaborative learning (Table 2). Among others, the impact and effectiveness of wikis in teaching and learning, as well the applications of wikis in teaching were related areas of concern.

Most of the research used quantitative research designs, which employed surveys and experimental designs. There were fewer articles with qualitative designs (16 articles), and less using mixed methods (11 articles). There were 15 methodologies identified in the study (Table 3). Most of the researchers preferred survey methods, followed by experimental studies, and observation. Other methods used are cognitive mapping, casual comparative research model, phenomenology, review, content analysis and Delphi study.

Studies which used more than two methods employed was done by Yasemin Allsop (2011) using video recording, content analysis, survey and case study, while Guo, Liang & Chin (2012) chose survey, case study and interviews as their method for acquiring data. Meanwhile, Ertmer et. al (2011) used survey and interview, while Li, Dong & Huang (2011) did a survey and an experiment for their research.

Total	46	-

Descriptive data analysis seemed to be the favoured method (12 articles). This might be because there is a tendency for researchers to conduct qualitative research in the form of case studies, through observation, exploration and using triangulation of data (Table 4). The second highest frequency of choice of the study is descriptive data analysis and inferential form (10 articles) which uses surveys.

Thematic data analysis using research interviews and Delphi technique (9 articles) were as popular as a mix of quantitative and qualitative methods (9 articles). Among the studies were those with inferential data (5) and qualitative inductive methods (1 articles).

Implications

The use of wikis in learning has been shown to have a significant impact on learners. Wikis have been used to engage learners (Barry, 2012; Yoo & Huang, 2011) as learning is active (Biasutti & El-Deghaidy, 2012), and students are motivated in learning (Barry, 2012; Biasutti & El-Deghaidy, 2012) There is more effective feedback (Barry, 2012) and higher level thinking skills (Barry, 2012; Biasutti & El-Deghaidy, 2012) and creativity is developed (Baytiyeh & Pfaffman, 2010). Students are satisfied in using wikis for learning (Biasutti & El-Deghaidy, 2012).

One of the affordances of wikis is that it enables collaborative learning (Weaver, Viper, Latter & McIntosh, 2010). Collaborative learning occurs during social interaction through learners' unplanned responses and interactions within the community (Johnson & Johnson, 2004; Jonassen, Lee, Yang & Laffey, 2005). As learners share information and collaborate to achieve the learning goals, they assimilate the knowledge into their own personal knowledge structures (Kaye, 1992; Pallof, & Pratt, 1999).

Wikis have been used for collaborative writing (Moskaliuk, Kimmerle & Cress, 2012; Sukaimen & Picard, 2011; Woo, Chu, Ho, & Li, 2011). During collaboration, new knowledge is integrated into learners' prior knowledge, building new knowledge structures (Moskaliuk, 2012; Nuutinen, Sutinen, Botha & Kommers, 2010). Higher level thinking and reasoning skills are developed during collaborative problem-solving (Woo, Chu, Ho & Li, 2011; Snodgrass, 2011). Jonnassen's (2000) mindtools are used for enabling critical thinking. Hence, social media

applications, such as wikis, which are used for developing critical thinking skills are social mindtools (Nuutinen, Sutinen, Botha & Kommers, 2010).

Wikis have been shown to be effective for learning. Student performance has been shown to improve (Neumann & Hood, 2009). In addition, the use of wikis in instruction engages the learner (Neumann & Hood, 2009). Learners also perceive that wikis are useful for learning (Avci & Askar, 2011; Guo & Stevens, 2011). The research also shows that the factors which affect this positive perception is dependent on teachers attitudes towards technology use, the ease of acess to the wiki, and students' attitude towards the tool and the intention to use the tool (Guo & Stevens, 2011).

Research methodologies vary according to the research questions, and a variety of research methods and data analysis have been used. Design and developmental research approaches have been used in developing learning environments for collaborative problem-solving (Li, Dong & Huang, 2011; Shih, Tseng & Yang, 2008; Stough, 2010). The results of such research have given rise to s set of guidelines which can be used for developing learning environments (Stough, 2010).

Conclusions

There has been an increase in the number of articles written on the use of wiki for collaborative learning. The articles were mainly on research but employed a variety of research designs. The articles written from 2007 to 2012 covered several themes: learner engagement, collaborative learning, effectiveness, assessment and instructional design. This implies that this tool and its role in education is becoming more important and is being realised by the researchers in this field.

Cross-cultural studies need to be done to investigate the perceptions among students of different cultures in using wikis. Future research is needed to determine the impact of different cultures on the patterns of online interaction on the wikis. For example, in some research, learners are reluctant to delete what another has written (Yoo & Huang, 2011), In addition, building, managing and supporting communities of practice among users of wikis is another area to focus future research (Zhao & Bishop, 2011).The role of the learner, and of the pedagogical role of the instructor is important and needs to be clarified.

13th International Educational Technology Conference

A Literary Aspect in Micro Teaching Subject in French Education Department Yogyakarta State University

Indraningsih[6]

French Education Departement Yogyakarta State University, Karangmalang, Yogyakarta 55281, Indonesia

Abstract

Micro teaching subject is the training in the formation of teaching competence through actualizing teaching basic competencies. Micro teaching subject is an integral part of the course Practical Field Experience educational programs for students of UNY S1 which are performed on campus peer teaching model. Subject Teaching Materials for Micro Teaching have also been prepared from interesting sources shared that peer teaching job is not boring. Learning resources can be printed and electronic sources, as well as the physical, natural, social, and cultural. Thus, literary works in the form of poetry can be a potential source of learning to explore.

Keywords: micro teaching subject; peer teaching model; literary works

About Micro Teaching Subject

Micro Teaching subject is about training at an early stage in the formation of actualizing teaching competence through teaching basic competencies. Basically, micro teaching is a learning method based on the performance of the technique which is done by train components to teach basic competency in the learning process, so that prospective teachers are really able to master each component one by one or a few components are integrated in a simplified learning situations. Micro Teaching subjects are an integral part of the course Practical Field Experience S1 educational programs for students of Yogyakarta State University. Micro Teaching subject is performed on campus by peer teaching model (*Tim Penyusun Panduan Pengajaran Mikro*. 2013).

In practice, micro teaching activities include orientation, observation of teaching in schools or in institutions that will be used for practical field experience, as well as teaching practice with peer teaching models. Implementation of peer teaching models is considered the most flexible implemented before students do real teaching practice in the form of field experiences in schools. In Micro Teaching, students can practice to show basic competence which is limited and integrated teaching. Material, learners, as well as presentation time are limited. Micro teaching practice is also a means to appear bravely to face class, controlling emotions, set the rhythm of speech, and others. Micro teaching practice is carried out until the student competencies adequately mastered as a prerequisite to follow the practice of field experience in schools / educational institutions.

The important benefits of Micro Teaching Subject are (1) students are more sensitive to the phenomena occurring in the learning process when they become collaborators, (2) students are better prepared to undertake teaching practice at the school or educational institution, (3) students can do self-reflection on their competence in teaching, (4) students become more aware of teachers or educational staff profile so she can look as teachers or educator. To achieve these benefits, students are trained to (1) make the Lesson Plan, (2) master the basic competencies of teaching in a limited time, (3) master the basic competencies taught in an integrated manner, and (4) control of personality and social competence.

Micro Teaching Practice for students is trying to condition that he has a profile and appearance that reflect mastery of the four competencies are: pedagogic, personable, professional, and social. The number of exercises for each student is at least eight times with respect to the level of quality-controlled student competency achievement. In connection with these exercises, Micro Teaching is limited in the following aspects: (1) the number of students per group is 8-12 students led by two teachers, (2) subject matter, (3) a presentation of 15-20 minutes, and (4) competencies (knowledge, skills, and attitudes) were trained.

Prior to teaching practice in Micro Teaching Subject, students must make arrangements to teach the so-called Learning Implementation Plan. Learning Implementation Plan is a plan of action in the form of teacher learning step by step scenario of the activities to be conducted with student teachers. Scenario is related to the material the students will learn to achieve basic competency specified. Form and Learning Implementation Plan components may vary according to the characteristics of the field of study based on competency.

In relation to learning materials, students should understand that these materials are used to achieve the learning objectives and developed with reference to the subject matter contained in the syllabus. Learning materials is also closely linked to the learning resources. The selection of learning resources refers to the formulation in the syllabus developed by the education unit. Learning resources include a referral source, environment, media, speakers, tools, and materials. Learning resources is everything necessary in the learning activities, which may include textbooks, print media, electronic media, resource, natural environment, and so on.

Appropriate learning resources will be beneficial to the learning process. Obtaining the benefits that can be reached partly by way of selecting learning resources and learning materials as well as more interesting and delivered with the methods and techniques of teaching are more varied. One material that is interesting and important in learning French language is a matter of learning to use simple literary texts in French. Literary texts also have the potential to develop a more vibrant learning. Simple literary texts that can be used in Micro Teaching Subject, among others, is a poem and a mini-theatre (*notrepoésie.canalblog.com*).

Poem and Mini-Theatre in Micro Teaching Subject

Learning French is basically aims to develop the four language skills, namely *Compréhension Orale* (Listening), *Expression Orale* (Speaking), *Compréhension Écrite* (Reading Comprehension), and *Expression Écrite* (Writing). The four skills can be developed through teaching materials in the form of literature. Teaching materials in the form of a mini-theatre and a poem in French can be selected for supporting the activities of discussion, express opinions; identify all aspects of the language and its use, as well as the cultural context of the language user. Cultural context in this case is also useful to introduce "something new and unfamiliar" for peer students.

Teaching materials are first analyzed whether the text is appropriate or useful in terms of language and content. The text contains too much new vocabulary and grammatical structures are complicated to be assessed "scary" by the students. Therefore, the selected text as an example here is a simple text, with a vocabulary appropriate to the syllabus of high school French class (where students are subject Micro Teaching participants will do teaching practice), and uplifting to learn the French language further.

Broadly speaking, the process of learning French is done in the Micro Teaching subjects may be four steps: (1) preparation phase, (2) the presentation and discussion phase, (3) interpretation phases, and (4) training and application phases. The fourth phase was delivered within 15 minutes and, in particular, adapted to the language skills that are taught. In the preparation phase, students have to interact with literary texts to be read. This phase serves to activate their prior knowledge, recalling vocabulary that has been studied, and at the same time arouse their interest.

In the next phase or the second phase, the phase of the presentation and processing of text, students are guided to recognize the text contents. At that time recommended no interruptions during the process of reading progress. The aim is that the students are reading the text can begin to establish a preliminary understanding of the text as a whole. At this stage, the teacher can provide assistance through the instructions and complete the vocabulary exercises. The third phase is the phase or phases of interpretation used to reconstruct the meaning contained in the text. In this phase is also expected that the spontaneous reactions of the students, especially about the content of a new culture that emerged during the study.

In the training phase, students are trained to conclude in more detail the form and language elements that make up the work, for example in the form of exercises for vocabulary building. In addition, at the application stage guided students to creatively reproduce text into other forms of discourse, such as writing a new story by presenting different characters, arrange interviews with imaginary figures that he got from the text and write a short letter to the figures in the text.

Examples of the use of poem in Micro Teaching Subject can be seen from the following explanation. Poem used is the poem entitled *Hésitation* (Indecision) that contains vocabulary that has been understood by high school students and is a representation of everyday language, a prominent literary aspect of this poem is the rhyme used.

Hésitation

Poème de Richard Jalbert

Quatre ans trop tôt,
quatre ans trop tard,
c'qu'il faut rester de niveau
pour ne pas faire le grand écart,
déjà qu'à chaque sursaut
je me retrouve en encart
dans le grand livre des maux
et qu'à chaque chapitre, je crie "encore!"

Micro Teaching class in the French language competency training is teaching four linguistic competences, *Expression Orale* (Speaking), *Compréhension Orale* (Listening), *Compréhension Écrite* (Reading Comprehension), and *Expression Écrite* (Writing). Therefore, the following will be discussed how to teach the four competencies by using poetry as the taught material.

Compréhension orale competence

Students can practice the following steps: (1) read a poem with proper pronunciation, pauses and intonation according to the meaning of the poem (2) read the poem to the class, and (c) understand the general meaning of the poem. For the evaluation, the student practitioner can provide test form fields on hiatus sentence, e.g. by exercising vocabulary that learners vocabulary increases. Looking for options can be given in the evaluation synonym for Compréhension Orale, for example *niveau - classe, faire - passer, grand - épais, chapitre - partie*.

In addition, students can make inquiries experimentalist can measure the level of student understanding, for example: (1) *D'après vous, où est-ce que la situation se passe?*, (2) *Pourquoi est-ce que le narrateur crie "encore"?* Students practitioner can explain that any adjectives, adverbs, and some specific verbs useful to give a special character is also a person, an object, and place (Peyroutet, 1994: 8)

Expression orale competence

Competence in teaching, the student practitioner who acts as the teacher reads the rhythm slowly and peer students look at each word and sentence by taking into account the meaning of every sentence. Teachers ask questions orally and at the end of the teaching-learning process of peer students to explain the meaning of the whole poem orally. For evaluation, students can read this poem to the expression and appreciation of the support of the meaning of the poem. Expression of skill, live, pronouncing each word with the correct pronunciation competence of a student, can be assessed. Students should look at the reading process experimentalist and if there are pronunciation errors, they should correct it.

Compréhension écrite competence

In teaching competence, peer students look at each word and sentence by taking into account the meaning of every sentence. At the end of the teaching-learning process of students is to explain the meaning of the whole poem and write it in the form of a resume. For evaluation, student peer practitioner invites students to get together to discuss the poem or create a discussion group consisting of three or four students. Guided discussion was provoked by the core questions were distributed to each group.

 Expression écrite competence

Competence in teaching, prospective teachers facilitates peer students to write a short letter or short narrative writing as a form of reproduction. Peer students are given exercises as well as examples of how to paraphrase to share experiences and feelings during her school by taking the main idea of the poem *Hésitation*. Making paraphrase be simple or use a simple sentence patterns and conjunction are easy to find, for example, *et* (and) and *mais* (but).

Furthermore, with the same steps, students can use a mini-theater experimentalist its simplest form, the *jeu de rôle* or role playing to practice teaching in the Micro Teaching Subject. It should be emphasized is that both the poem and the mini- theater is very useful to foster a sense of courage, confidence, and cohesiveness in the classroom. Beauty aspects of language learning at the same time can be extracted from the two forms of literature that, through practitioner student's *jeu de rôle* also in the habit of sharpening social skills that will be taught in high school. There are many social skills that young people need to learn to achieve personal success. "*Merci beaucoup"* and *"s'il vous plaît*" may rightfully be viewed as part and parcel of the moral virtue of respect for others but they are also which social skills help one succeed in life (Kirschenbaum, 1995: 19).

Conclusion

Literary works in the form of a short poem or a mini-theater can be used in Micro Teaching Subject after adjusting for comprehension, especially vocabulary, and the existing syllabus. Mastery of the material will be more comprehensive, the material will be more attractive and thus more memorable lessons. Micro Teaching Subject in French Education Department in Yogyakarta State University is prerequisite courses that must be taken before the student went to the field for practice teaching. So, it is not exaggerating when this subject is enjoyable in accordance with the nature of literary works that are useful and fun. To achieve a sense of enjoy it actually practicing students should better prepare. However, preparations are more mature in the classroom Micro Teaching Subjects surely guarantee success practitioner students in the field. For students in the Micro Teaching Class, good job and get pleasure from your practice.

A Mobile Game-based Insect Learning System for improving the learning achievements

Chung-Ho Su[a], Ching-Hsue Cheng [b]7

a Department of Animation and Game Design, Shu-Te University, Yanchao, Kaohsiung Taiwan 824
b Department of Information Management, National Yunlin University of Science and Technology, Touliu Yunlin, Taiwan 640

Abstract

1. This paper aimed to investigate how gamified learning approach influence science learning achievement through a context-aware mobile learning environment and to explain effects on student learning outcome. A mobile learning environment has been developed based on MILS (Mobile Insect Learning System) gamified learning activity. A series of gamified learning activities based on MILS was developed and implemented in an elementary school science curriculum to improve student learning achievement and help students to actively engage in learning activities. A quasi-experimental design was used to investigate the effectiveness of gamification approach by combining game elements with the use of MILS in a real-world scenario. The response to questionnaire indicates that students valued the outdoor learning activities made possible by use of the smartphone and its functions. Pre- and post-test results demonstrated that incorporating mobile and gamification technologies into botanical learning process could achieve a better learning achievement than using non-gamified mobile learning and traditional instruction. In managerial implications, the results could provide parents, teachers, educational organizations to make related educational decision.

INTRODUCTION

In the last decade, the development of mobile phone industry, associated with the parallel development in Mobile Internet has been explosively swift: from the earliest voice phone to the current 3G smart phone which can serve as a mini-computer, telephone, or camera, and transfer data as well as audio and video files. The interaction with this ubiquitous devices and their use for learning purposes extend the traditional learning paradigm into a new phenomenon so-called mobile learning (m-learning). Preliminary research suggests that mobile devices can create more active learning experiences that improve student engagement, learning, and course retention (Joosten, 2010), and the use of new technologies can enhance motivation, which is a vital aspect of learning, deliver information when needed, and encourage to solve problems and satisfy curiosity (Sharples et al., 2002). Furthermore, much research has shown that the mobile device as a mobile guide can help student to increase their science and geographical knowledge as well as their motivation to engage in learning activities (Huang et al., 2009; Hwang et al., 2010; Zhang et al., 2010). Many educators have emphasized the importance and necessity of "authentic learning activities" in which students are able to work with problems from the real world (Hwang et al., 2010). Students participating in an m-learning environment can enhance their learning performance and improve their creativity (Cavusa & Uzunboylu, 2009). Furthermore, researchers have also indicated the difficulty of supporting and guiding learners in such environments that combine real-world and digital-world learning resources (Chu et al., 2010). Therefore, it has become an important issue to develop effective and easy-to-follow learning guidance models for context-aware mobile learning system.

Literature review

To set a cornerstone for a common understanding before constructing the research model, some related theoretical perspectives based on literature analysis results are briefly described in this section to serve as a common ground.

Context-aware mobile learning environment

Mobile devices have become more and more popular, which can facilitate data collection, process and analysis, and the high interactivity enabled by beaming makes collaboration and communication among students handy. A learning environment is so-called mobile learning (m-learning). Mobile technologies can meet higher order learning needs and realizing a more creative and learner-centered educational process (Joo & Kim, 2009).

Several studies have demonstrated successful experiments that support knowledge production and transmission among learners and educators through the use of mobile devices in the learning activities of various courses, such as natural science (Hwang et al., 2010a), social science (Chiou et al., 2010) and language courses (Ogata et al., 2009; Sandberg et al., 2011). For example, Chen et al. (2003) proposed a mobile learning system for scaffolding bird watching learning activity that enables students to take photos of birds with handheld devices and to communicate with teachers and other students in an outdoor wireless environment. Chu et al. (2008) conducted several outdoor learning activities in a butterfly ecology garden by integrating mobile learning environments with electronic library facilities to assist elementary students to observe and distinguish butterfly features in a science course. Lai et al. (2007) note the affordances that mobile technologies provide for experiential learning by allowing rapid "note taking" through photos, audio and video recording, and by supporting students through in field provision of learning materials and prompts to assist their development of abstract concepts. Also, Huang et al. (2010) developed a mobile plant learning system to facilitate student learning in an elementary-school-level botany course. Furthermore, recent findings in this research literature show that digital learning resources, alongside the real-world learning contexts, improve students' learning interest, motivation (Chen et al., 2003; Chen et al., 2009, among many others) and their learning achievement (Chu et al., 2010; Hwang & Chang, 2011, among many others).

Therefore, this study aimed to develop a low cost location-aware m-learning environment with appropriate learning activities that incorporate game elements, which should promote the development of problem-solving skills and to engage learning interest and increase learning achievement through adopting a game-informed approach to support learners' authentic learning experience.

Gamification

Mobile technologies can be used as powerful cognitive tools within constructivist approach to solve complex problems and to engage students in authentic and meaningful activities (Jonassen & Reeves, 1996). Educational gamification proposes the use of game-like rule systems, player experiences and cultural roles to shape learners' behavior. In the previous research study, Sandberg et al. (2011) found that many children used a trial-and-error strategy on play the games. For this reason, gamifying a course would be a great help to primary students by take advantage of the motivational power of games and apply it to the motivational problems in education so successful learning can take place (Prensky, 2001).

Methodology

This study tries to enlarge the scope of game-play in learning situation by adopting gamified learning strategy and combining game elements with well-designed mobile learning activities. The goal is to determine whether mobile technologies can support gamified learning approach, and learning strategies influenced achievement in the natural science course. The implementation of our solution proposal, called Mobile Insect Learning System (MILS). A series of learning activities geared toward integrating the game elements into course design was developed for the outdoor learning environment.

Research concept

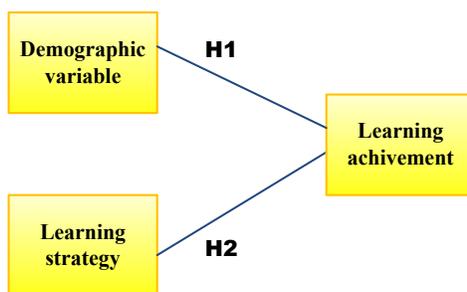
This section introduces the research design concept of our study, which applies the mobile insect learning system with game elements to facilitate the mobile learning activity in an outdoor educational environment. According to the use perspective, we designed an experiment in which students carry out the well designed gamified learning activity in a mobile learning environment. This study was based on a quasi-experimental. We divided students into three groups an experimental group and two different control groups that were formed from three classes. To evaluate the effectiveness of this approach, a mobile learning activity was implemented in the elementary school natural science courses in Kaohsiung Taiwan. Quantitative data analysis was also used to evaluate the students' Learning achievement. The study proposes a research framework relative to the effectiveness of learning achievement by adoption of different learning approach in a mobile learning environment as shown in Fig.1.


Fig.1 Research Framework

Tow major hypotheses are described as follows according to the research purpose and research questions:

H1: The demographic variables will affect the learning achievement positively.

H2: The students who receive different interventions show significant difference in individual learning achievement in an outdoor learning environment positively.

Design and Implementation

With MILS, teachers can create any number of teams for students, and create any number of specific, relevant goals and missions for that team to pursue. These include visiting learning area, observing learning target, and generally being social.

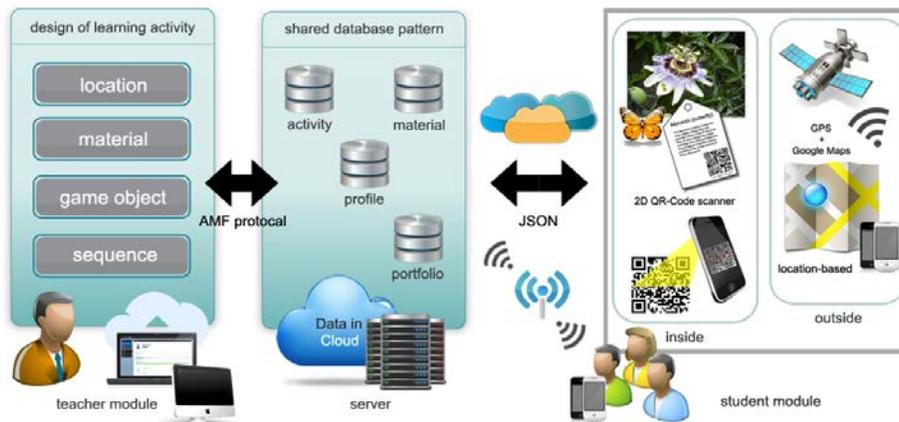
Fig.2 illustrates the framework of the MILS application, which is based on a standard server-client model and is composed of two modules. The client side and server side are connected through a conventional 3G or Wi-Fi network. The screenshot of system functions are shown in Fig.3. After login to the mobile learning application, students can browse the learning games nearby them and select one to participate, as shown in Fig.3(a). The system then sends students a new Quest reminder with instructions on how to start with the learning task, as shown in Fig.3(b). The learning contents were represented on the screen after students scanned the QR code of specific learning target, as shown in Fig.3(c). Students can view the learning objects, the NPCs (No Player Character), and the notes created by others according to their location in the learning area, as shown in Fig.3(d). All of the NPCs are essential to the main storyline and will guide students to the next steps in chatty, as shown in Fig.3(e). Students can create personal knowledge gained through firsthand observation and personal experience, as shown in Fig.3(f).


Fig.2 The framework of the MILS application

Fig.3 The screenshot of system functions for MILS application

Participants

The participants of this study were three classes of fourth grade students taught by same teacher in an elementary school in Taiwan, the teacher had been teaching in the school for more than three years. The age range of the students was 10-11. After studying the fundamental knowledge of insects in a natural science course, these participants were randomly assigned to three groups to participate separately in three different teaching methods with some learning objects and tasks. The participants of the experimental group used MILS application incorporate game-informed learning approach in an outdoor education environment. Before analyzing the research hypotheses, we examined the level of knowledge about insects in each of the three groups by using one-way ANCOVA (Analysis of Covariance), and we found it to be equivalent among the groups. The results of the pre-test showed that the experimental group (M = 71.059, SD = 8.352), the first control group (M = 72.235, SD = 10.036) and the second control group (M = 73.176, SD = 9.846) had no significant differences between them (F = .429, p = .652 > .05).

Research instrument

In order to evaluate the students' learning achievements and attitudes while participating in the different learning conditions, various data sources and methods were utilized, including pre-test/post-test design, questionnaires, and interviews with the teacher and students. The Cronbach's alpha value for internal consistency reliability of the pretest and posttest was .89. An acceptable alpha value was .7 or higher (Nunnaly, 1978) indicating a good reliability of the tests used in this study.

Data analysis and results

In this study, student toward natural science learning was measured and the effect of different teaching strategies on learning achievement in a natural science course was analyzed. There are totally 102 students participating in this study, of which 54 are male and 48 female, with the average age of 10-11 years.

Results of hypothesis test

For testing hypothesis H1, Table 1 shows the analysis comparison for the impact of demographic variables on the student's learning achievement. The result shows the experienced students were more enjoyment in the learning activities, and more satisfied with their learning achievement in the 'Understanding of Insects' learning activity than the non-experienced students. The students with different gender lead to differences in post-examination achievement (P=.044). The male students did have a higher learning performance than the female students in the experimental group. The students' subject interest also indicated a significant difference for post-examination achievement (P=.000), which means the students who are interested in insects lead to higher learning achievement than the students who are not interested in insects. Moreover, the prior experience with smartphones also leads to significant difference in post-examination achievement (P=.010). Based on the results of Table 1, the hypothesis 1 is significance.

For testing hypothesis 2, this study analyzed the differences between pre-examination, post-examination and learning strategies using one-way ANCOVA in order to eliminate the influence of the pre-examination. First, normality plots revealed that the normality assumptions were valid, and there was an interaction of minor degree between pre-examination achievement and the learning strategies (F=0.429,P=0.101), which indicated that the regression slopes of the three learning strategies were homogeneous, so the assumption of equality of variance was not violated. Since the homogeneity requirement was met, we were able to carry on with the ANCOVA analysis, as depicted in Table 2. The results show that using mobile learning with gamification approach can promote student's botanical knowledge and lead to differences in learning performance, after removing the influence of the pre-examination. The post-hoc analysis for the research model showed that achievement in using mobile learning with

gamification approach was higher than the achievement of conventional mobile learning and traditional instruction alone. The result shows that hypothesis H2 is significance.

Table 1 The t-test and ANOVA results for the impact of demographic variables on the student's learning achievement

Hypothesis	Constructs	Gender	Subject interest	Prior experience	Working off-campus	Games frequency	Time to play
H1	Learning achievement	t(-2.112)*	t(-4.535)*	t(-2.640)*	F(2.846)	F(2.365)	F(1.449)
	Comparison	M>F	Y>N	Y>N	—	—	—

		CG2	34	74.71	8.956			

EG= Experimental Group,CG1= Control Group 1,CG2= Control Group 2)* $P \leqq 0.05$ ** $P \leqq 0.01$ *** $P \leqq 0.001$

Conclusions & Findings

This study has investigated how different learning conditions affect student's learning achievement for botanical knowledge in an outdoor educational environment. Three interesting findings were summarized in the following:

(1) Learner characteristics affect learning achievement:

The results of questionnaire indicate that among the six demographic variables and learning achievement, subject interest were indicated as the important factor followed by gender ,subjects interests and prior experience. (See Table 1). This study supports the argument that male students have higher learning performances than females; experienced students have higher learning performances than those non-experienced students. Compared to male students, female students considered some instructional factors and learning activities more valuable than other learning factors. It can be naturally interpreted that female students and the students who are not interested in insects.

(2) The advantages of MILS:

The students in the experimental group satisfied the learner controlled pace of the learning process, and they thought the gaming mechanics in the structure of game play were organized and useful for assisting them to learn.

(3) The comparison of learning achievement with different learning strategies. Experimental group's students who use MILS have better learning achievement than other control groups in post-test.

Through gamification we can not only create a mindset that encourages students to try new things, to not be afraid of failing (Lee & Hammer, 2011), but also can enable students to engage in enjoyable experiences for the purpose of learning. In addition, gamification is an innovative approach to learning, and because new technologies and new applications are continuously emerging, it is still developing. Future studies must continue to examine the new mechanics and new applications associated with emerging gamification technologies.

A new dimension to teaching mathematics using iPads

Diana Audi [8a], Rim Gouia-Zarrad [a]

[a] Department of Mathematics, American University of Sharjah, P.O.Box 26666, Sharjah, UAE, Email:{daudi,rgouia}@Aus.edu

Abstract

Tablet PCs in its different forms such as Apple's iPad and Samsung's Galaxy which usually have a touchscreen or pen-enabled interface will with no doubt have a substantial effect on the future of education. They signal the opportunity for a transformation in how technology is used in schools, colleges and universities. The objective of the study is to identify the implication of using iPads in teaching introductory math courses and leverage their popularity toward an improved learning experience. The study was implemented in a first year Mathematics course at the American University of Sharjah (AUS). The main effectiveness of the approach was tested through a pilot class followed by a survey of undergraduate students taught by using the iPad in a completely paperless environment. The results from the pilot study are crucial for the implementation of a proposed study to be conducted during the 2013-2014 academic year. While the study explored the use of iPads in teaching mathematics at AUS, the lessons learned are relevant to any institution considering the use of similar technologies in the teaching of mathematics in the Middle East.

Keywords: Mathematics education, iPads, interactive tablets, technology for teaching.

1. Introduction

Studies have long shown that teaching mathematics is becoming more and more difficult. The challenge is to catch student's attention and interest in the subject. Obviously, there is a crucial need to incorporate new tools into the classroom to preserve the relevance of the educational institution (Pai, et al, 2012, Jelemenská, et al, 2011). Recently, there has been a growing interest in the use of tablets and more specifically iPads as a tool of promoting learning and teaching of mathematics. In fact, iPad creates an environment that facilitates students' learning processes (Banister, 2010, Enriquez, 2010). It also provides an interactive classroom with real-time feedback.

As the use of iPads in the classroom grows, there is a growing need to understand its impact on students' performance. Therefore, to date, the potential of iPads-based classroom is still vague and is being explored by many institutions. A number of recent reports have indicated that the use of iPads in the classroom is more effective than the traditional format of instructor-centered lecture and has a positive effect on the development of students' mathematical capacities. In this paper, the authors describe a pilot study conducted at the American University of Sharjah on undergraduate engineering students attending an introductory math course. Then we propose to address the questions:

- Can iPads facilitate and enhance students' learning of mathematics?
- How can the iPad open room for engagement and creativity?

2. Literature review

While the use of iPads in teaching is relatively new, many colleges and universities have been trialing its efficacy in the classroom. For example at Abilene Christian University (ACU) in Texas USA, iPads were used to deliver several courses. In fall 2010, Dr. Ian Shepherd and Dr. Brent Reeves designed Econ 261 class incorporating a digital textbook from McGraw-Hill. They studied the ACU's first all-digital class (Nilsson, et al, 2010). The program showed that iPads increase students' engagement and had a positive impact in academic environment. In Oklahoma State University, an iPad pilot program was conducted in five sections of two courses across two colleges to study

---

[8]Corresponding author.
E-mail address: daudi@aus.edu

how iPads affect student learning (Oklahoma, 2012). The collected data are uniformly positive and indicate that the iPad pilot was a very successful experience to a point that the university is considering the development of iPads for all students. Also in 2011 Kanda University of International Studies in Chiba, Japan conducted a case study investigated the integration of iPads into an existing English language curriculum. The findings indicate that the iPads are appropriate mainly in collaborative situations. Nonetheless, the institution's technological infrastructure, particularly the Wi-Fi network is a key factor for the iPads' effectiveness. Not only in the western countries, but also in the UAE, some universities are integrating these new technologies such as Zayed University, UAE University and Higher Colleges of Technology (HCT).

Although tablets are increasingly popular in education, there are still obstacles and barriers that may limit the use of them in the educational landscape and more specifically in teaching undergraduate mathematics. In fact, many colleges and universities adopted the iPads as an educational tool and as a standardized mobile device to integrate into curriculums without certitude that these tools are helping students in their learning process. Can we claim that iPads can make significant changes in the teaching of mathematics at AUS? Does this new e-tool provide opportunities to improve the engagement and motivation of students in math classes in the Middle East? To the best of our knowledge, there are no studies investigating the effect of iPads in teaching mathematics in Middle East. With this in mind, there is an emerging need to study the effectiveness of the iPads approach on teaching mathematics to undergraduate students in the region.

3. **Case study**

At the American University of Sharjah (AUS), during the fall semester of 2012, a research study was conducted to analyze the benefits of using iPads in teaching introductory mathematics course for engineering students. The teaching environment was completely paperless. The instructor had to ensure that a set of applications were installed on students' iPads prior to the starting of the class. These applications would aid in delivering the course content, conducting in class quizzes, referring to book materials and real time communication with students. The following apple applications were used:

- Nearpod: enables teachers to use their iPads to manage content on students' iPads synchronously. It combines presentation, collaboration, and real-time assessment tools into one integrated solution. Students receive content and submit their responses on the Nearpod application; the teacher monitors the classroom activities, and receives the result of each student.
- AirSketch: allows PDF documents or images to be annotated live and projected to the entire class. It can be used as an interactive whiteboard.
- Blackboard: allows the instructor to upload documents in any format, post announcements, upload media, course roaster, and possibly students' grades. The students can save these files on their iPads, and view them even if there is no internet.
- An iPad Application: allows the students full access to the E-text version of the book for bookmarking and other related notes.
- QuickOffice: allows the students to edit any word file, excel sheet, or power point presentations. These files were provided remotely by the instructor through Blackboard.
- Dropbox: allows the student to put all their files, documents, photos in multiple remote computers simultaneously after class hours for home editing.

In a class of 17 students, where the classroom has a wireless network, the instructor delivered the course content using iPads only. The material taught was about trigonometry: trigonometric identities and solving trigonometric equations. Students simply logged in the Nearpod session using their usernames and pins. This pin was provided by the instructor and once all students are logged in, the instructor has complete visibility of all the students participating in the class delivery. An implicit advantage of using iPads was a fast way to take attendance and monitor students' active participation in the class discussions when needed. The instructor prepared the power point presentation before class which was saved in a PDF form and then uploaded on Nearpod. During the class delivery, the instructor inserted some slides to represent some quiz questions to monitor student progress and learning outcomes. The students were given 5 minutes to answer every quiz question during the class delivery. The quiz questions were designed perfectly to match the learning outcome of every subpart of the lecture. At the end of the

lecture, the instructor saved the responseware data, and added it on the excel file for student performance monitoring. Although this was not utilized during the research experiment, one more advantage of this class delivery was that absent students can still join the class even if they were absent. All what they needed was a wireless connection on their iPads allowing them to see the class lecture notes and also take the quizzes that the instructor conducted in class. The instructor also used Air Sketch as a white board to do further calculations and explanations away from the PowerPoint lecture notes.

4. Preliminary results

In this study, we wanted to test whether using iPads would lead to better understanding of the class content and more interaction between the instructor and the students. A survey was conducted to all the students in the classroom. The study included a number of questions highlighting the students' feedback from the iPad experience.
One of the main advantages of the iPad classroom is the fact that the whole course delivery was not predetermined as the instructor adapts the lecture to the progress and the needs of to the students. Thus the lecture became dynamic and changed in real time. The quick feedback from the students using Nearpod was one of the major advantages of using iPads and boosted the content delivery. Overall most of the students found the iPad class engaging and agreed that the iPad class presents the class content in a better way.

5. Conclusion

The preliminary results presented in this paper, demonstrate that integrating tablet PCs specifically iPads in teaching introductory math courses for engineering students has a positive impact on average students. In fact, the use of the iPads, increases the interaction between the instructor and the students rending the class more dynamic and tailored in real time to the students' needs. In addition, it has been demonstrated that students are more engaged in the iPad class and keep concentrating till the end of the class. This initial result will be followed by a more in depth evaluation of the use of the interactive tablets conducted over a course length to confirm that this positive result will not fade once the initial excitement dissipates.

A Proposed Model of Photovoltaic Module in Matlab/Simulink™ for Distance Education

Zekiye ERDEM[a]9, M.Bilgehan ERDEM[b]

[a]*Sakarya University, Faculty of Engineering, Department of Electrical and Electronics Engineering 54187, Sakarya, Turkey*

[b] *Sakarya University, Faculty of Engineering, Department of Industrial Engineering 54187, Sakarya, Turkey*

Abstract

This paper define a circuit-based simulation model for a PV cell in order to allow estimate the electrical behavior of the cell with respect changes on environmental parameter of temperature and irradiance. An accurate PV module electrical model is presented based on the mathematical equations. The general model was implemented on MATLAB/Simulink environment, and accepts irradiance as variable parameters and outputs the I-V characteristic. A particular typical solar panel was used for model evaluation, and results was compare with points taken directly from the manufacturer's published curves and show excellent correspondence to the model. With this proposed module different types of PV modules could be developed and students could be investigate and learn the P-V or V-I characteristics easily. Furthermore, a by-pass diode is added to the PV cell design with this addition, in different insulation combinations will be able to investigate likewise partial shade.

INTRODUCTION

Recent developments in computer hard-ware and software now make it possible to provide students with interactive programs that can be considered as midway between regular labs and lecturers and that allow us to display multiple-view representations of given dynamic system, and some of its attributes, on the computer screen (Rosal, 2005) Virtual laboratories are recognized as an attractive complement to traditional engineering laboratories. Among other advantages, they do not require expensive and dedicated equipment, reduces the required time for instruction, and promote student involvement and learning (Muñoz & Díaz, 2010) MathWorks tools for technical computing and simulations widely used across various engineering and science disciplines. MATLAB Programming language and interactive environment well suited for computing, algorithms, data processing and visualization. Moreover, Simulink Environment is a practical tool for graphical and model-based simulation of dynamic systems (Eker & Cervin, 1999) (Nchez, Esquembre, Marti, Dormido, & Canto, 2005)(Swamy, Kuljaca, & Lewis, 2002)(Valera, Díez, Vallés, & Albertos, 2005).

The sun's heat and light provide an abundant source of energy that can be harnessed in many ways. Photovoltaic power systems convert sunlight into electricity directly. Research and development efforts are under way to improve efficiency and reduce cost of photovoltaic power systems in applications ranging from roof-top residential to large industrial or electric utility sites (Petreuş, Fărcaş, & Ciocan, 2008).Photovoltaic systems have become globally accepted as a practical and feasible tool for power generation. Researchers' efforts for facilitating PV systems utilization and their integration to currently available systems have been always inspired by the national goal of having renewable and clean energy sources. These efforts successfully solved many of the problems that are attached to PV systems (Mohamed, 2012) Therefore, for a student it is important to learn the characteristics and details about the PV systems before graduation. However, for colleges it is expensive to build a real PV system laboratory.

This paper define a circuit-based simulation model for a PV cell in order to allow estimate the electrical behavior of the cell with respect changes on environmental parameter of temperature and irradiance. An accurate PV module

electrical model is presented based on the mathematical equations. The general model was implemented on MATLAB/Simulink environment, and accepts irradiance as variable parameters and outputs the I-V characteristic. A particular typical solar panel was used for model evaluation, and results was compare with points taken directly from the manufacturer's published curves and show excellent correspondence to the model. With this proposed module different types of PV modules could be developed and students could be investigate and learn the P-V or V-I characteristics easily. Furthermore, a by-pass diode is added to the PV cell design with this addition, in different insulation combinations will be able to investigate likewise partial shade.

MATHEMATICAL MODEL OF THE PV CELL

Nomenclature

I &V	Cell output current and voltage
I_{ph}	Photon or light generated current
Io	PV junction saturation current
R_s	Series Resistance
R_{sH}	Shunt Resistance
T	Operating temperature
I_{SC}	Short circuit current at 25º C and under 1sun
G	Solar Insulation in W/m^2
G_{ref}	1000 W/m^2
K_I	Short ckt. Current temperature coefficient at I_{SCR}
T_{ref}	Nominal Temperature
N_p	Number of parallel connected cells
Ns	Number of series connected cells

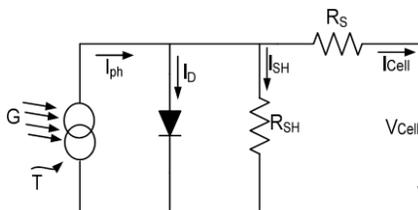
The simplest model of a PV cell consists of a current source in parallel connection with a diode as shown in figure 1. Photo current I_{ph} is directly proportional to solar radiation G. Temperature T and photo current I_{ph} have a linear relationship according to equation (1), where $I_{ph(ref)}$ is photo current which corresponds to reference temperature I_{ref}. Equation (2) gives photo current at reference temperature. is a constant given by (3). In equation (2) and (3) I_{ref} is the nominal radiation given by PV's constructor and I_{SC} is the short circuit current. All symbols are presented on figure 1 and used in equations refer to a single PV cell (Nema, Nema, & Agnihotri, 2009).


Fig 1. PV Cell equivalent circuit

The Mathematical Equations for PV Cell

$$I_{ph} = I_{ph(T_{ref})} \cdot (1 + K_0 \cdot (T - T_{ref})) \tag{1}$$

$$I_{ph(T_{ref})} = \frac{G}{G_{ref}} \cdot I_{SC(Tref)} \tag{2}$$

$$K_0 = \frac{I_{SC(T)} - I_{SC(Tref)}}{T - T_{ref}} \tag{3}$$

Diode's current is given by (4), where V_{Cell} and I_{Cell} are output voltage and current for a single PV cell respectively, I_o Io is diode's saturation current, V_T thermal voltage of it and R_S is in series resistance.

$$I_D = I_o \cdot \left[\exp\left(\frac{V_{Cell} + I_{Cell} \cdot R_S}{V_T} \right) - 1 \right] \tag{4}$$

Current I_{SH} through shunt resistance R_{SH} according to Ohm's law is equal to:

$$I_{SH} = \frac{V_{Cell} + I_{Cell} \cdot R_S}{R_{SH}} \tag{5}$$

Taking into account equations (1) – (5) and applying Kirchhoff's current law, I –V characteristic equation (6) is resulted for PV cell:

$$I_{Cell} = I_{ph} - I_o \cdot \left[\exp\left(\frac{V_{Cell} + I_{Cell} \cdot R_S}{V_T} \right) - 1 \right] - \frac{V_{Cell} + I_{Cell} \cdot R_S}{R_{SH}} \tag{6}$$

Substituting in (6) equations (7) and (8) which gives output voltage V and current I respectively for Ns in series and N_p in parallel PV cells and ignoring current through shunt resistance, equation (9) gives the general I – V characteristic for PVs. Equation (10) gives the output power of a PV module consisted of (N_s x N_p) cells.

$$V = N_S \cdot V_{Cell} \tag{7}$$

$$I = N_P \cdot I_{Cell} \tag{8}$$

$$I = N_P - I_{ph} - N_P \cdot I_o \left[\exp\left(\frac{V + I\left(\dfrac{N_S}{p}\right) \cdot R_S}{N_S \cdot V_T} \right) - 1 \right] \tag{9}$$

$$P = (N_S \cdot N_P) \cdot V_{Cell} \cdot I_{Cell} \qquad\qquad (10)$$

Equation (10) is able to be extended for a single PV array which consists of a number of PV modules and for a PV farm with many arrays.

Modeling The PV Cell and Different Input PV Modules

A. *PV Cell and PV Module Model*

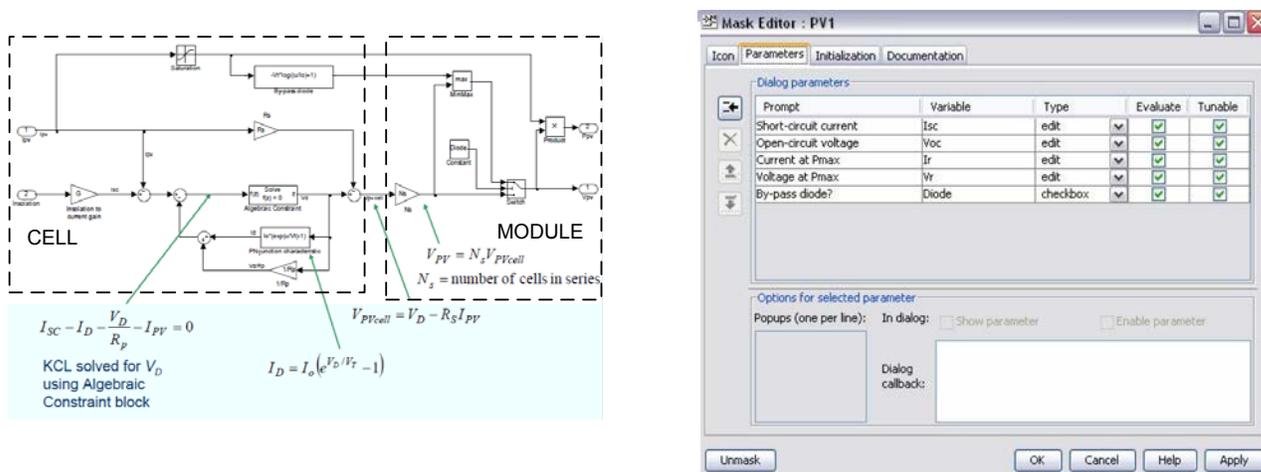
Due to the formulations in section 2 the interface model of PV Modules has been developed in MATLAB/Simulink environment. A parameter login screen is designed for different type PV modules which is shown in Fig. 2 (b). To prevent the hot spot and short circuit problems a by-pass diode is added as shown in Fig. 2 (b). In addition to the PV cell model also PV module is designed. A practical method is used while developing the PV module with a gain (N$_s$) block which can be seen in the right part of the Fig. 2 (a).


Fig 2. (a) PV Cell and PV Module design in MATLAB/Simulink (b) PV Module parameter login screen

B. *A Current-Input and Voltage-Input PV Module*

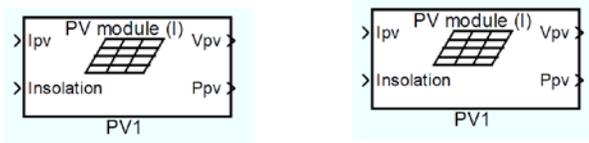
In Maximum power point trackers researcher has to be develop an algorithm and this algorithm could be different outputs like maximum current or maximum voltage, therefore designer or student could need different input PV modules for simulations. For this purpose, two types of PV Modules are designed for the user. With the current input and voltage-input PV modules provides a flexible environment to the user.


Fig 3. (a) Current-input PV Module   (b) A Voltage-input PV Module

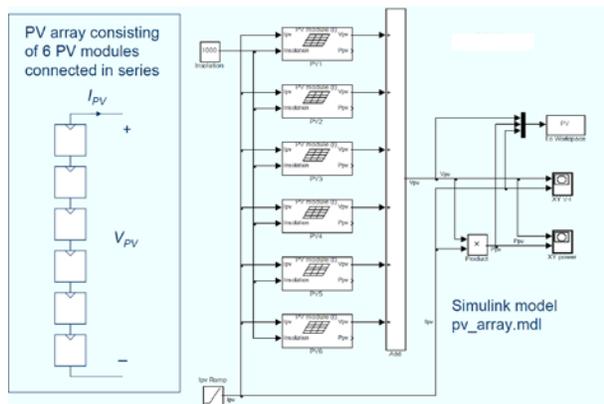
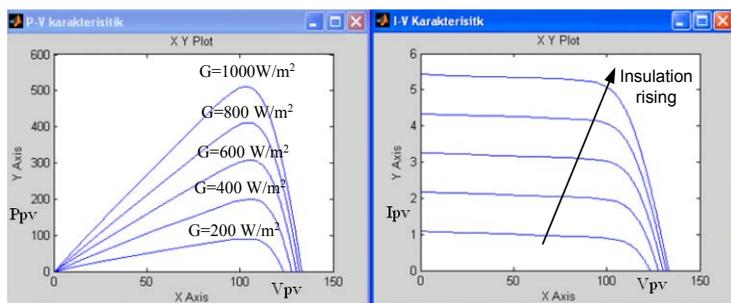
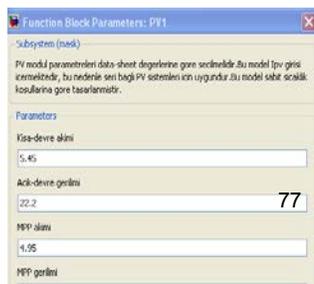
Determination of V-I and P-V Characteristics

Student can easily determine the PV characteristic with proposed PV modules with connecting them in series. For a realistic PV system simulation, it is better to connect series the PV modules. Fig. 4 shows the simulation between six series connected PV modules. In this fashion, the output power of the PV system is about 510 W. The output P-V and I-V characteristics in Fig. 5 are obtained from that simulation.


ed the characteristic curves

P-V and I-V characteristics are key points for understanding the PV systems. The need for the Maximum Power Point Tracker (MPPT) is acquired from these characteristics. It can be clearly seen from Fig. 5(a) that there are only one maximum power point in each power curve and the purpose of the MPPT's are operate the PV systems at these maximum power points in different insolation levels. In Fig. 5. (a) different power curves are occurs due to different insolation conditions. When the insolation level is raised the output power is raised continually until the insulation is reached its maximum level.


Reliability test of the model

The reliability of the system is tested with using real PV module parameters and the simulation results are compared with the data sheet values. The real data which is obtained from data sheet is login as shown in Fig. 6 (a) and the real parameters from data sheet are shown in Fig. 6 (b). Although, in the PV modules data sheets has plenty of parameters, with proposed model a few of them enough to develop a realistic PV module. To the login screen the short circuit current, open voltage, voltage and current values at the maximum power point values are entered as shown in Fig. 6 (a) and the real values from data sheet is given in Fig 6 (b).


PowerMax™ Ultra		80-P	85-P
Rated power [W]	P$_r$	80	85
Peak power* [W]	P$_{mpp}$*	80	85
Module efficiency [%]	η	12.7	13.4
Peak power voltage [V]	V$_{mpp}$	16.9	17.2
Peak power current [A]	I$_{mpp}$	4.76	4.95
Open circuit voltage [V]	V$_{oc}$	21.8	22.2
Short circuit current [A]	I$_{sc}$	5.35	5.45
Series fuse rating [A]	I$_{fuse}$	20	20

77

Fig. 6 (a) Parameter login screen with real data sheet values   (b) data sheet parameters

The maximum power for one module is 85 W and 6 module is connected in series which makes the total output power 510 W and voltage value is equal to 103.2 V. The comparison tables of the real data and the simulation results are given in Table 1 and 2 respectively.

Table 1. The real data results   Table 2. The Simulation results

Insulation	MPP Power (W)	MPP Voltage(V)	MPP current (A)	Insulation	MPP Power (W)	MPP Voltage (V)	MPP current (A)
1000 W/m²	510 (85*6)	103.2 (17.2*6)	4.95	1000 W/m²	510.8243	103.4057	4.9400

2. Partial Shade Condition Simulations

If a PV array is partially shaded by a building, a tree, and/or clouds as shown in Fig 7 (a), it becomes insufficient for conventional MPPT schemes to extract maximum power. If modules with different optimal currents, caused by uneven insolation, are connected in series-parallel, MPPs often appear in the power versus voltage characteristic.

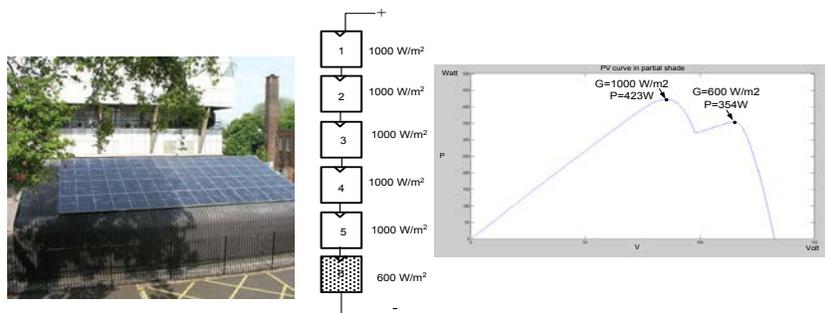
In our interface model it is also possible to make a shade condition simulation. In Fig. 7 (b) the sixth panel is exposed to a shade condition. The student only changes the insulation rate to see the effect of the partial shade condition to the PV system.


Fig 7. (a) Partial shade occurs because of a tree   (b) partial shade simulation results

Conclusion

An accurate PV module electrical model is presented and demonstrated in MATLAB/Simulink for a typical 60W solar panel. Given solar insolation and temperature, the model calculates the current for a given voltage. The results from the MATLAB™ model show excellent correspondence to manufacturer's published curves. Finally the model development was used to show the effect of: insolation, temperature, ideality factor and series resistances .This paper is the first step to develop a complete solar photovoltaic power electronic conversion system in simulation. The final objective is develops a general model to simulate the electrical behavior of the PV systems in a grid connected application. With this study students will be able to simulate the PV system without a laboratory.

A STUDY OF NETWORK LEARNING RESOURCE CENTER FOR ELEMENTARY SCHOOLS OF BANGKOK METROPOLITAN

Ruaysup Deshchaisri[a]* , Saroach Sopeerak[b]

[ab]*Educational Technology Department, Faculty of Education, Kasetsart University, Thailand.*

Abstract

This research is aimed to study factors effecting network learning resource center for the elementary schools of Bangkok Metropolitan. Those factors studied must have influenced the provision of effective learning center in academic institutions and must have facilitated the contribution of learning experiences among the community people while the learning media are always developed and the communication are made through the learning network which link the local academic institutions and urban areas. The population used in this study is 96 people of administrators, instructors and school personnel from 24 primary schools of Bangkok Metropolitan. The data has been analyzed by descriptive statistic methods which are percentage, mean and standard deviation in order to describe the results derived from behaviors forecasting using the data multivariate analysis regression. The results found are that:- 1) The first factor studied is emphasized on instruments which should be provided in the network learning resource center for primary schools of Bangkok Metropolitan are actually served to the students entering the center for self-learning with the most value 3.97 of mean (S.D. = 0.71) and the least mean is derived from provision of computer units in the center for students to search information themselves and for the coordination among schools with its average value 3.40 of mean (S.D. = 0.78). 2) The second factor is emphasized on application of languages used in information technology and educational communication for the learning administration in network learning resource center. It is found that there has been searching information from websites for teaching and learning preparation and there has also been usage of applied software programs for teaching methods which effect to the highest 3.93 of the mean (S.D. = 0.76) and the least is derived from using of information technology and education communication for producing learning media with average value of 3.58 of mean (S.D. = 0.99). 3) The third factor is emphasized on media and instrument used in the network learning resource center. It is found that there has been adequate personal computers provided by the academic institutions and those computers are applicable and up-to-date and there has also been sufficient compact and applied programs that effect the highest value 3.93 of mean (S.D. = 0.76) and the least value was found on the audio-visual media which have been supplied adequately at the average value of 3.30 of mean (S.D. = 068). 4)The fourth factor is about the supportive actions derived from network learning resource center towards the information technology and educational communication through academic activities and skills for teachers in schools or school groups of Bangkok Metropolitan. It is found that learning activities prepared by school instructors result the highest value 3.95 of mean (S.D. =0.76) and the inferior value is deprived from listening the instructors' comments and encouraging them for applying knowledge and skills in using media learnt from the network learning resource center to apply for further factual preparation of learning and teaching with its average value 3.93 of mean (S.D. = 0.76). From the study, it is clearly notified that the trend of network learning resource center for schools of Bangkok Metropolitan will be applicable under this convention:- Policy and Strategy Administration highly possible mean 3.93 (S.D. = 0.76) Building and Location Administration fairly possible mean 3.40 (S.D. = 0.78)Management and Finance Administration highly possible mean 3.79 (S.D. = 0.68) Personnel Administration highly possible mean 3.73 (S.D. = 0.69) Statistic and Reports Administration highly possible mean 3.97 (S.D. = 0.71) Public Relation Administration highly possible mean 3.58 (S.D. = 0.99)

Introduction

The required qualifications defined in item 3 of the purposes of Basic Education Standards issued in 2554 B.E.　are hereto:-

"Learners need to be educated as well as international education levels are provided and they are required to realize all steps of global alternatives and technology development. It is very important for learners to be trained with skills, management capability, communication methods and usage of modern technology.　Learners need to know how to revise their attitude and apply their working methods for appropriate areas and related parts of learning network resources of which the following basic procedures have been managed for related academic agencies:-

There has been provision or management of effective learning resources in academic institutions and community for being searching resources where experiences can be exchanged among academic institutions and with other communities.

The researcher has realized those problems occurring in those communities and has aimed to study factors affecting the format of network learning resources for elementary schools of Bangkok Metropolitan. Hopefully, this study will be advantageous and can be an approach for further developing network learning resources for　　　　　　elementary schools of Bangkok Metropolitan.

Objective

To study factors which influence the format of network learning resources for elementary schools of Bangkok Metropolitan.

Expected Outcomes

From this study, the factors influencing the format of net work learning resources for elementary schools of Bangkok Metropolitan will be recognized and its outcome will be used as developing approach by management levels for supporting the network learning resources.

Study Concept

These following independent and dependent variables have been defined for the study concept:-
There are 3 types of inputs in independent variables:

Inputs which are
- Inputs 1 include necessary information should be provided for network learning resources for elementary schools of Bangkok Metropolitan.
- Inputs 2 are the application of Information technology and educational media for being learning services within network learning center.

Contributing factors are readiness of media materials and equipment in the learning center.

Supplementary factors are learning centers which provide information technology and educational communication through activities provided for increasing skills for teachers in elementary schools of Bangkok Metropolitan.

Dependent variables are the format of network learning resources provided in elementary schools of Bangkok Metropolitan.

To study those factors, related documents and research articles related have been studied including the National Education Act of 2542 B.E., computer network systems, library network process, organization management,

personnel administration, physical services in learning center for network resources and other related foreign articles.

Study Methods
These following methods have been used in this study:-
Population used in this study is 96 people of 24 elementary schools of Bangkok Metropolitan including administration levels, teachers, academic personnel who have related responsibilities in learning services of each school where its format of the learning resource management is unclear.
Tools used in this study are questionnaire consisting of 6 parts:-
Part 1 – General information for the questionnaire respondents
Part 2 – Inputs
Part 3 – Contributing factors
Part 4 – Supplementary factors
Part 5 – Possible variables
Part 6 – Suggestions from the questionnaire respondents concerning possible formats for the network learning resources for elementary schools of Bangkok Metropolitan
To produce tools used in this study, these following processes were managed hereto:-
1. Studying document and research articles concerning the format of network learning resources for elementary schools of Bangkok Metropolitan
2. Designing questionnaire following to the study concept and the objectives of the study
3. Proposing of the designed questionnaire to the advisor for her comments which will be used for revising the appropriate contents, statements and language used in the questionnaire of which its consistency was reviewed by the specialist
4. Trying out the designed questionnaire to search for reliability of the questionnaire
5. Reliabilities of all questions set in the questionnaire was 0.812
6. Revising and editing before the complete set of questionnaire was printed out

Data Information Collection Method
The researcher herself propagates the approved questionnaire to collect data information. The duration for between propagating and collecting the questionnaire is 3 weeks and the researcher herself collect the number of questionnaire as set following to the number of population.

Statistics used for data analysis
Descriptive statistics which are percentage , mean and standard deviation was used for analyzing the data characteristics. After that the regression was used to analyze the data information and to forecast behaviors herewith:-
1. Independent variables of inputs influence the format of network learning resources for elementary schools of Bangkok Metropolitan showing the relationship between behavior forecast and information perception behavior with its statistic at .05.
2. Independent variables of contributing factors influence the format of network learning resources for elementary schools of Bangkok Metropolitan showing the relationship between behavior forecast and information perception behavior with its statistic at .05.
3. Independent variables of supplementary factors influence the format of network learning resources for elementary schools of Bangkok Metropolitan showing the relationship between behavior forecast and information perception behavior with its statistic at .05.

4. Dependent variables of possible format: the relationship between format of network learning resources for elementary schools of Bangkok Metropolitan and information perception behavior showing its statistic at .05.

Comments and suggestions
Comments for this study

1. There has been limitation in the number of population used for this study. In addition, duration for collecting data needs to be expanded also.
2. Some parts of population used in this study lack knowledge of the study information because the schools used for the study are pilot schools which lack learning resource centers and some data information collected is only imagery and it is not collected from actual practice.

   Suggestion for further studies

   Connection between each type of learning media used in the network learning resources and satisfactory of users need to be further studied for further appropriation.

A Study on student and teacher views on technology use

Buket Akkoyunlu[a], Semra Erkan[11b]

[a]*Hacettepe University, Faculty of Education, Beytepe, Ankara, 06800, Turkey*
[b]*Hacettepe University, Faculty of Education, Beytepe, Ankara, 06800, Turkey*

Abstract

In our day, technology plays a major role in almost all walks of life. Individuals of all ages make use of it in their daily lives. Researchers have also studied this phenomenon (Wyk & Louw, 2008:246; Akpınar, 2005:39; Alkan, 2005:28; Deniz, 2000:150). The views of individuals on technology use offer clues about the tools they consume. These views may vary. Used in all aspects of our daily lives, technology has also become part of the instructional process at schools. Student and teacher opinions are crucial in the effective and efficient use of technology.
The aim of this study is to determine the views of elementary school pupils (grades 1-4) and teachers on technology use. The study group consists of pupils from grades 1 through 4 and their teachers.
This is a descriptive study based on the survey model and quantitative research method (Karasar, 2005:25). Data will be collected by using a 3-point Likert type questionnaire prepared by the researchers. Frequencies and percentages were used in the analyses.

Keywords: Elementary school student, elementary teacher, technology use;

Introduction

In our day, technology plays an important role in almost all walks of life. Individuals of all ages make use of technology in their daily lives. This swift increase in technology use has also affected educational systems and technology entered our schools for different reasons. Technological gadgets are the easiest way of reaching information and they have taken their place among the most commonly used educational materials in schools. Where we once used overhead projectors, videos, TV sets, and radios in the education sector, these have undoubtedly been replaced by computers, projectors and smart boards. Smart boards are defined as an educational tool that allows teachers and students to use their knowledge with skills, repeat, interact with knowledge and respond to instruction. The components of a smart board system are a computer, a projector and a panel with active surface that acts like a blackboard. Connected to a computer, the smart board and projector are used in conjunction with a smart board software. This software allows the use of many ready-made drawings, formulas, images, maps and shapes during class (Dill, 2008).

Smart boards offer many facilities such as presentations, viewing videos and graphics, as well as the opportunity to retrieve what was on the board at a later time (Smith et al., 2005). As stated by Levy (2002), smart boards have the advantages of presenting learning resources and knowledge, explaining concepts and ideas, and facilitating interaction and activities in the instructional process. They thus support the instructional process, draw students' attention and increase their motivation.

According to the British Educational Communications and Technology Agency (BECTA) report (2007), smart boards are a beneficial tool of presentation that can be used to replace traditional and modern classroom resources (such as the blackboard, flipchart, OHP, maps, images, graphs, books, calculators and players); and that give one-click access to teachers to a bank of resources that would otherwise take years to collect and much space to store. Lewin, Somekh and Steadman (2008) state that smart boards make classes more visual and lively with their touch-screen characteristics, the ability of students and teachers to interfere, change and record things and their other features such as sound, video and animations, colors, images, and zooming in or out. SMART Technologies (2006) report also states that smart boards increase active student involvement in the learning process and their interaction with the course, encourage them to learn and support different learning styles

E-mail address: erkansemra@yahoo.com

Kennewell and Beauchamp (2007) argue that smart boards ensure more eye contact between students and teachers and thus ease classroom management, make learning fun, enhance involvement and enrich the environment. Cogill (2001) emphasizes that training is necessary if smart boards are to be used effectively in education, and that overuse can put students off learning. Adıgüzel et al. (2011) contend that if teachers use smart boards in the right way, students can develop more interaction with the course.

Looking at research results on smart boards, some state that, when used properly, they keep students happy to learn with them, make class time more efficient, help teachers maintain student interest and motivation, and ensure more effective instruction along with a cooperative learning environment (Sünkür, Arabacı and Şanlı, 2012; Ateş, 2010; Painter, Whiting and Wolters, 2005). However, there are other studies that discuss the problems that arise during the use of smart boards. Some of these are "lack of training on how to use smart boards for teachers, lack of support for teachers, lack of materials for use with smart boards, technical problems before and during smart board use, and the resulting fall in student motivation (Türel, 2011; Türel, 2010; Hutchinson, 2007; Hall and Higgins, 2005).

Smart boards have become very popular in the field of education recently, particularly in countries such as the UK, USA and Australia, attracting huge allocations in their education budgets. While 90% of classrooms in Japan and the USA are adorned with smart boards, 70% of EU classrooms have them. The Italian Ministry of Education started a project called "Digital Schools" (www.digiscuola.it) in 2010, with which they are making a great effort to increase the number of smart boards across the country and ensure their effective use with teacher training (Lai, 2010; Türel, 2010; Torff and Tirotta, 2010 and Holmes, 2009). These countries mostly use tools that resemble a traditional board but has a touch screen to interact with the user, and are connected to a computer. In Turkey, smart boards have recently become a popular tool of learning and teaching especially in elementary schools, and their use is on the rise both in public and private schools. The Fatih project initiated in 2010 intending to bring a new vision to the Turkish education system defines its overall goal as bringing computer technology (CT) tools to classrooms by the end of 2013 (MEB, 2012). The components of the Fatih project include the following five headings: hardware-software, e-content, use of information technologies and in-service teacher training. The project embodies the transition from "a computer for each school to a computer for each classroom" (Adıgüzel et al. 2011).

1.1. Significance of the Study

As mentioned before, smart boards have become popular in Turkish education agenda and are being used in many institutions. However, every technological tool comes with both advantages and disadvantages. This study examines teacher and student views on smart boards that have a big cost for the country by referring to other studies in the literature and the Fatih project. Examining the success of previous practices and teacher and student views is crucial. The study was conducted with 5th, 6th and 7th graders from a school that has been using smart boards for the past three years, and the teachers of these children. The concept of technology in the study is limited to smart boards.

The study sought answers to the following questions:

Problem Statement

What are student and teacher views about smart boards used in their classes?

Sub Problems

   a.   What are student views about smart boards used in their classes?
   b.   What are teacher views about smart boards used in their classes?

Method

Study Group

The study group comprises 5th, 6th, and 7th graders from a school that was using smart boards during the 2012-2013 school year, as well as the teachers of these students. The distribution of the students by gender and grade level is shown below in Table 1.

3.   Table 1. Distribution of students by gender and grade level

Gender	n	%	Grade Level	n	%
			5	69	37,7
Girl	105	57,4	6	65	35,5
Boy	78	42,6	7	49	26,8
Total	183	100,0	Total	183	100,0

Of the students in the study group, 57,4 % were girls and 42,6% were boys. Of these , 37,7% were 5th graders, 35,5% were 6th graders and the remaining 26,8% were 7th graders.

The distribution of the teachers by gender and subject area is presented below in Table 2.

4. Table 2. Distribution of teachers by gender and subject area

Gender	n	%	Subject Areas	n	%
Female	20	55,6	Turkish	6	16,7
Male	16	44,9	Science and Technology	7	19,4
			Social Science	6	16,7
			Mathematics	9	25,0
			Foreign Language	8	22,2

Of the teachers in the study group, 55,6% were female and 44,9% were male. Of these, 16,7% were Turkish teachers, 19,4% were Science and Technology, 16,7% were Social Studies, 25% were Mathematics and 22,2% were Foreign Language teachers.

The distribution of teachers regarding their smart board experience and use is given in Table 3.

Table 3: Distribution of teachers regarding their smart board experience and use

Smart Board Experience	n	%
3 years	18	50,0
2 years	12	33,3
1 year	6	16,7
Smart Board Use (Daily)	n	%
7 hours	7	19,4
5 hours	16	44,4
4 hours	13	36,1

Fifty percent of the teachers had been using smart boards for 3 years, while 33,3% had been using them for 2 years, and 16,7% for 1 year. On the other hand, 44,4% used it for 5 hours daily, 36,1% for 4 hours daily, and 19,4% for 7 hours daily.

Data Collection Tools

Student data were obtained by using the tool developed by Beeland (2002). This is a 4-point Likert type scale with 20 items with the following: 1: Completely Disagree, 2: Disagree, 3: Agree and 4: Completely Agree. Test reliability was ensured by a Cronbach Alpha coefficient of .71. Also, the researchers added the following questions at the end of the scale: "When a smart board is used, what are your favorite aspects of class?", "Is there anything

you don't like about smart boards? What?" and "Do you think you learn better when a smart board is used in class? Why?" and obtained the views of 18 (10%) randomly selected students from each class.

Data from teachers, on the other hand, were collated by the researchers by using a survey based on Beeland's (2002) measurement tool, which was a 5-point Likert type scale with 20 items. The points were as follows: 1: Completely Disagree, 2: Disagree, 3: Undecided, 4: Agree and 5: Completely Agree. Test reliability was ensured by a Cronbach Alpha coefficient of .69. The survey included questions such as: "How many years have you used smart boards?", "How many hours daily do you use smart boards?", "What difficulties do you face when using smart boards?" and "What are the advantages of using smart boards?".

Findings

The findings were considered and interpreted in the same order as the questions used in the study.
a)   *What are student views about smart boards used in their classes?*
Student views about smart board use were examined and the results are offered in Table 4.

Table 4: Student views about smart boards used in their classes

	$\overline{X}$	sd
I enjoy learning with smart boards		
I don't like being taught through smart boards*	3,21	,467
Using technology well helps finding a good job	3,79	,588
When smart boards are used during education, I focus better	3,81	,599
If my teacher used smart boards more often, I would study more	3,46	,557
I know that learning how to use technology gives me the opportunity to learn many new things	3,49	,663
I can learn many things when my teacher uses a smart board	3,75	,611
I enjoy courses taught through smart boards	3,89	,755
I believe that the more teachers use smart boards, the more I enjoy school	3,56	,550
I believe that it is important for me to learn how to use a smart board	3,87	,676
I feel comfortable using a smart board	3,78	,487
I enjoy using a smart board	3,87	,539
I don't think that learning will take longer when my teacher uses a smart board *	3,68	,599
I'm no longer apprehensive of using a smart board	3,91	,296
Using a smart board makes me nervous*	1,87	,536
Using a smart board is not nerve-wrecking	3,38	,616
By using technology, I can study as little as possible*	3,57	,622
It is difficult to use a smart board *	1,87	,911
I can learn more from books than I can from smart boards *	2,82	,627
I panic when I think about using a smart board *	1,86	,474
Total	3,36	,591

* Items 2, 13, 15, 17, 18, 19 and 20 are negative and inversely coded

It can be understood that students generally embrace the use of smart boards as they have mostly chosen the alternative *"Completely Agree ($\overline{X}$ = 3,36, sd=0,591)"*. The items for which the students chose "Agree" and "Completely Agree" were: "I enjoy learning with smart boards", "Using technology well helps finding a good job", "When smart boards are used during education, I focus better", "If my teacher used smart boards more often, I would study more", and "I enjoy courses taught through smart boards."

Students chose "Agree" for smart boards encouraging participation, making classes fun and interesting, and using time efficiently. Overall, they seem to think that technology use facilitates learning and is influential in finding a good job.

These results suggest that students are satisfied with learning through smart boards. This finding is in line with those of previous studies about using smart boards in the instructional process (Beeland, 2002 and Lewin et al., 2008).

The responses of students to the open-ended questions were as follows:

When a smart board is used, what are your favorite aspects of class?

Most students stated that they enjoyed the interactive feature of smart boards and the option of being able to write on them by using a marker or their fingers, and that they did not get bored during smart board use. They also said that learning through videos and other visuals is beneficial, and that smart boards enable them to use the Internet when there is a new concept they want to learn about.

"We learn by seeing and listening." A.K

"We learn without being overloaded with information, we can use the net when we want to". K. D

"We can copy what we do and share them with other classes or view them again ourselves" A. F

Is there anything you don't like about smart boards? What?

Students replied that visibility was compromised due to glare in sunny weather, they were not able to read materials written on A4 paper, they sometimes changes the screen upon touching the board accidentally, videos sometimes did not load and wasted their time, and teachers sometimes went over things too quickly.

"Videos shut down, which leads to time waste. When I'm writing on them my other fingers touch the board and cause problems" A.K

"Print sometimes moves, restarting the board after a power cut can take time, and using a marker can be difficult." K.D

"It can give us eye strain. Glare during early hours makes it hard to see the board. Our teachers sometimes teach too quickly, which tires us and makes it difficult to follow class." A. F.

Some teachers going over materials too quickly, the headache and eye strain that some students mentioned, and possible technological problems are similar to the difficulties mentioned in previous studies (Wall et al., 2005; Hennes, 2007).

Do you think you learn better when a smart board is used in class? Why?

Most students stated that smart boards are audio-visually rich and lead to better learning, and that their teachers come to class better prepared which leads to more interesting classes where they can learn better.

"The smart class facilitates our teacher's work and makes drawings clearer. I learn better with the smart board. Its Internet connection also supports our learning." A.K.

"I learn better with the smart board than with books. I understand things more quickly and find learning fun" K. D.

"Our teachers prepare for class, and we use the internet to reach videos and images and thus learn better." A. F.

In sum, students stated that they understood subjects more easily with a smart board owing to its print and drawing features, audiovisual opportunities and the internet connection. Considering student interest in visual, aural and tactile course materials, these findings are not surprising.

However, one student said during the interview that he was not able to learn with a smart board and that using it was a loss of time and led to some problems.

"I think it's a time waste to use a smart board, it gets noisy at times and stops me from learning. Instead of writing things down, we just view them on the board. Those with eye problems suffer. Also, I don't like it that my work or assignments are shared with the whole class on the smart board." C. B.

b.   What are teacher views about smart boards in their classes?

Teacher views on the topic were also examined and the results are given below in Table 5.

Table 5: Teacher views on their smart board practices

Smart boards...	$\overline{X}$	ss
help me use time efficiently	3,78	,663
interest and motivate students	4,21	,629
make my classes more interesting	3,98	,576
help me have more time for my students	3,43	,654
visualize the learning environment and bring concrete learning	4,50	,586
help me use computers and projectors more effectively than before	4,01	,473
encourage my students to participate more in my lessons	3,78	,417
help my students learn better	3,97	,473
have helped me change my instructional method	3,67	,668
are time consuming*	3,51	,554
help me enjoy my classes more	4,13	,581

are not appropriate for every subject*	4,28	,583
waste time when there are technical problems*	4,04	,630
help students understand topics better by using audiovisual materials	4,15	,595
are not significantly different from regular boards*	2,63	,710
make my classes more planned and organized	4,63	,531
are difficult to use*	2,50	,505
make classroom management more difficult*	2,65	,481
require too much time and effort for materials development*	3,71	,455
reduce student interest when overused*	3,65	,481
Total	3,76	,654

* Items 10, 12, 13, 17, 18, 19 and 20 are negative and inversely coded

It can be seen that teachers generally chose between *"undecided"* and *"agree" ($\overline{X}$ = 3,76, ss=0,654)"*. Those items that were marked as "Agree" and "Completely Agree" were: "interest and motivate students", "visualize the learning environment and bring concrete learning", "make students understand better with audiovisual materials", and "make my classes better planned and organized". However, teachers also stated that smart boards were not appropriate for every course and that they led to time loss when technical problems arose.

The responses of teachers to the open-ended questions are summarized below.

All teachers in the study group said that they made use of smart boards.

What are some difficulties you face when you use smart boards?

Similar to any technological system, problems may also arise when smart board systems are used. Teachers listed these problems as technical problems, the time needed to prepare materials, and their mismatch with some subject areas.

"They frequently require calibration, and their overuse may cause headaches or restlessness in students. It can sometimes take time to technically solve problems, which leads to a hubbub in class and waste of time, as well." A. K.

"I don't think they are very effective in courses such as Social Studies. They can, however, draw student interest with visual materials such as maps." D. N.

"It takes time to prepare course materials, I need to revise and correct them a lot." S. T.

"They cause loss of time when there's a technical problem (such as power cuts or calibration), and because we prepare to teach via the smart board, it takes time to shift to another mode" A. F.

What are the advantages of using smart boards?

The teachers listed increased student motivation and participation, efficient use of time, and effective learning owing to being visual as the advantages of smart boards.

"They attract student attention. They are particularly good with that in geometry" A.K.

"Because you prepare for class beforehand, you can use time very efficiently." D. N.

"They increase student interest and motivation; particularly when students are allowed to also use the board." S. T.

Conclusion

Technology is becoming ever more present in the instructional process. Different technological tools are in use in different countries and schools. Smart boards, which combine computers, projectors, smart screens and the internet are an example of these technologies and are becoming more and more popular.

Aiming to promote the use of smart boards in education and to examine student and teacher views on smart boards, this study found that students embraced smart boards, and "agreed" that these boards increased their involvement in classes, made their courses more fun and helped efficient use of time.

Teachers, on the other hand, "completely agreed" that smart boards interest and motivate students", "visualize the learning environment and bring concrete learning", "make students understand better with audiovisual materials", and "make classes better planned and organized".

Most students stated that they enjoyed an interactive board and being able to write with a marker or their fingers, learning with a smart board by watching videos and seeing, and being able to use the internet to check out new information. Teachers, on the other hand, mentioned enhanced student motivation and participation, better use of class time owing to prior preparation, and more effective learning with visual materials as the advantages of smart boards.

Students stated that smart boards have glare problems, they were not able to read materials written on A4 paper, they sometimes changed the screen by touching it inadvertently, videos sometimes do not load and cause time loss, and teachers sometimes rush through materials. Teachers mentioned technical problems (such as power cuts or

calibration), the time-consuming nature of materials preparation, and smart boards not lending themselves to use in every subject area.

As can be seen, despite technical problems and the time needed to prepare materials, smart boards are a viable educational solution to get students motivated and interested, to make lessons more efficient, and to support teachers.

Other studies are needed to make smart boards more commonplace in the country and reveal their advantages and benefits comprehensively.

A Survey on Teachers' Awareness and Attitudes on Computer-Corpus Data: An Assisted Technology-based EFL Vocabulary Selection and Instruction Source

Fatima Zohra Belkhir [12]

Abou-bekr Belkaid University, Faculty of Letters and Languages, Larocade 13000, Tlemcen, Algeria

Abstract

The present research paper focuses on the area of vocabulary teaching in the foreign language classroom. It attempts to highlight the way computer corpus data ease the difficulties involved in EFL (English Foreign Language) vocabulary teaching and learning. The paper aims at exploring the extent of awareness of EFL teachers to the concept of computer corpus-data, raising awareness on the efficacy of computer-corpus data in the area of EFL vocabulary selection and instruction and analyzing teachers' attitudes on the application of those data as a language source in selecting EFL vocabulary teaching materials.

Keywords: vocabulary; computer-corpus data; EFL teachers; awareness; attitudes

Introduction and statement of the problem

Learning a foreign language involves the development of different skills, namely, reading, writing, listening and speaking. Although specific skills may be focused on separately for pedagogical reasons, two elements are crucial to the process of acquiring and using a language: vocabulary and grammar (Celce-Murcia, 2001). However, the importance of grammar has been widely recognized in English Language Teaching (ELT) methodologies than vocabulary (Celce-Murcia, 2001; Nunan, 2001; Swan, 2002). This is because the latter was incidental to the main purpose of the target language teaching. In this respect, DeCarrico (2001:285) writes: *"vocabulary has not always been recognized as a priority in language teaching"*. In addition, Richards and Renandya (2002) affirm that vocabulary teaching and learning has been left to a position of secondary importance if compared with other fields of research in language teaching and learning. However, from the mid 1980s onwards, vocabulary becomes the area of interest of many investigators (Laufer, 1986; Carter, 1987, 1988; Sinclair & Renouf, 1988; Nation, 1990; Willis, 1990; Descamps, 1992; Nattinger & DeCarrico, 1992; Lewis, 1993, 1997; Read, 2000 etc.).

The growth of interest in vocabulary learning pushes many researchers to investigate its effectiveness on successful Second Language (SL) learning. For example, Laufer (1986) and Nation (1990) realize that many of SL learners' receptive skills (listening and reading) and productive skills (speaking and writing) difficulties result from an inadequate vocabulary. They also assert that even when learners are at higher levels of language competence and performance, they are still in need to vocabulary learning for this latter is a lifelong process. On their part, Richards J.C. and Renandya (2002: 252) find out that: *"Vocabulary is a core component of language proficiency and provides much of the basis for how well learners listen, speak, read and write. Without an extensive vocabulary… learners often achieve less than their potential and may be discouraged from making use of language"*. In the same context, Beglar and Hunt (2005: 7) confess that "*Vocabulary acquisition is a crucial, and in some senses, the central component in successful foreign language acquisition*". Accordingly, it could be argued that vocabulary is the keystone of successful Second Language and Foreign Language (FL) learning and its acquisition is the basic foundation of the target language proficiency since its knowledge pervades all four language skill areas and helps learners in both language comprehension and production. Therefore, words are perhaps the greatest tools teachers can give to their learners to do well, not only in their target language learning but more generally in life since words play an important role in expressing one's feelings, emotions, and ideas to others during the act of communication in

E-mail address: fatimazohraonline@yahoo.fr

today's complex social and economic world (Allen, 1983). It follows that language teachers in general and S/FL teachers in particular should attribute great importance to teaching vocabulary in their classes.

The present paper goes beyond that and sees FL vocabulary teaching more than presenting new words. For sure, this may have its position but careful consideration should be given to other issues. For example, EFL students see lots of words in a language class, some of them are taught at an early stage and other are taught later and some are used often while others are not. At this level, one should ask why should instructors teach some words and not teach others? On which aspects should they base their EFL vocabulary selection decisions? Is there any way or source on which teachers may rely to encourage students to learn a given word rather than another? Why some students are successful at vocabulary learning and others are not? These questions are more or less difficult and challenging to foreign language syllabus or textbook designers, teachers and learners to answer for the large amount of the English vocabulary itself and the foreign language little exposure in the learning environment. Given the challenge involved in EFL vocabulary selection and instruction, the present paper strives to solve and answer some of the above queries by highlighting the way computer-corpus data can ease the difficulties involved in EFL vocabulary selection and instruction which is the scope of this paper, but prior to this the researcher tries to answer some questions, like: what is meant by computer-corpus data? And what can computer-corpus data tell EFL textbook designers or teachers about vocabulary?

Computer-corpus data

A computer-corpus is basically a collection of written or spoken texts which are stored in a computer. Written texts (newspapers and magazines) can be entered into a computer from a scanner, a CD, or the Internet. Spoken texts as conversations are recorded and then transcribed so as to feed them into the computer database. Eventually, it becomes possible to analyse the language with corpus software tools to see how people really speak or write (O' Keeffee, McCarthy & Carter, 2007). According to many corpus-linguists (Sinclair J., 1991; Hunston S., 2002; McCarthy M. J., 2004; O'Keeffe, A., M. J. McCarthy, & R. A. Carter, 2007) computer corpus data can tell us about:

Frequency

It means which words and expressions are most frequent and which are rare. The frequency of words is shown and ordered in a frequency list. This latter, tells us what word and phrases are used most often i.e. high frequency words; and which are less used i.e. low frequency words. As far as teachers are concerned, frequency lists will be useful for us to make choices about what vocabulary to teach and in what order to present it to our pupils. For example, when one makes a look at some corpora like Brown Corpus or Cambridge International Corpus he may notice that idioms use is rare. Thus, as a teacher, he will teach idioms later in the language programme. On the other hand, he can notice which items in a large vocabulary set, people talk most about in order to give them priority in teaching. These may include names of colours, pets, clothing and health problems. Based on a sample of 4.5 million words of spoken data from Cambridge International Corpus it has been noted that *The* is the first word in the rank frequency list for the whole corpus; the five most common verbs (apart from parts of the verbs be, have and do) are *said, know, see, get*, and *made*; the most common nouns are *time, people, way, years, work, government, man, day, work,* and *life*; the most common adverb is *so*. One can also see which words are more frequent than other similar or related words: *Yeah* is more frequent than *yes*; also *is* more frequent than *too*.

Frequency lists can also provide very useful statistics to help textbook writers present grammar items in the best way. If we take example of the verb *must* and consider the hundreds of uses of must in the Cambridge International Corpus (Spoken Corpus), the results reveal that, on average, only 5 % of all its uses are connected with *obligation* (e.g., you must have a visa to enter the United States). Another 5 % are in expressions, such as *I must admit* and *I must say*. Yet, the crushing majority of uses of *must* are to express *prediction*, such as: that *must have been nice*; *you must be hungry*, etc.

Differences in speaking and writing

As we saw in the previous section, corpus tools can give teachers information about how frequent a word is in different corpora, therefore, they can compare the frequency of vocabulary in newspapers, academic texts and conversations. For instance, the word *probably* is about five times more frequent in conversation than in newspapers and ten times more frequent in conversations than in academic texts. On the other side, *however* is eight

times more frequent in newspapers than in conversation and over twenty times more frequent in academic texts than in conversation. Awareness of such differences helps teachers a great deal to decide on whether to insert and present vocabulary units in a written or spoken context.

Contexts of use

The corpus tells us about the situations in which people use certain vocabulary. Owing to this language source, it becomes possible to know whether an item of vocabulary is used by anyone and in whatever situation or particularly in more polite situations and relationships. Large corpora enable the possibility of presenting and using vocabulary appropriately for teachers and learners respectively. Examples are: formal and informal usage of expressions like *goodbye* and *see you*.

Collocations

The term *collocation* means a combination of two or more words often used together more frequently than would happen by chance. Collocation software enables us to find out all the words which are often combined with others (see figure 1). Computer-corpus data is very helpful for searching for collocations of verbs like: *have, get, make,* and *do* i.e. *delexical verbs*. As their name implies these verbs do not have a lexical meaning of their own. They rather take their meaning from the words that they collocate or are used with. Providing collocational knowledge to our students, by means of those data, will not only lessen their word-choice, but make them sound more native-like, too.

Make: sure, difference, sense, decision, mistakes, decisions, money, mistake, reservations, copies and effort.
Do: anything, something, things, job, well, nothing, work, whatever, aerobics, gardening, homework and laundry.

(Adapted from McCarthy: 2004)

Fig. 1. Collocations of the words make and do

Strategic use of vocabulary

Strategic vocabulary means the words and expressions that are used to organize and manage discourse. Written texts are easily found in newspapers, books, on the Internet, etc. and then used by teachers as models for teaching words and expressions that writers use strategically to organize their texts. These include conjunctions like *along with* and *however,* which organize ideas within and across sentences and adverbs as *first, secondly,* etc., which list ideas within a paragraph or text. Yet, it is not easy to find words and expressions that speakers use to manage their different talks. So how can we find them? Corpus software can answer this need since it analyses different conversations and orders frequency lists of the strategic vocabulary speakers use to manage their speech. These include expressions which linguists call '*vague language'* as: *or something, and that kind of thing* and *and stuff* that speakers use often informally instead of specific words to refer to things, activities, or situations. Other examples of strategic vocabulary of conversations are discourse markers like 'anyway' which speakers use with words like *so* and *well* to come back to the main point after an interruption. These strategies are not just extras or a plus in foreign language learning, but they are a must in creating "proper" dialogues and in creating "fine" relationships between speakers (Carter & McCarthy: 2006). Computer-corpus data, indeed, proves to have much to offer to EFL teachers and textbook writers especially while designing English vocabulary teaching materials that recently much attention is paid to as they pervade all four skill areas of listening, speaking, reading and writing.

Objectives of the research

From this research one aims to:

- Explore the extent of awareness of EFL teachers to the concept of computer corpus-data.
- Raise awareness on the effectiveness of computer-corpus data in the area of EFL vocabulary selection and instruction.
- Analyze the EFL teachers' attitudes on the application of computer-corpus analyses as a language source for EFL vocabulary selection and instruction.

Research questions

In fact, this research paper intends to answer problem area of this research by tackling the following questions:

- What language sources do EFL teachers usually rely on to teach about English vocabulary?
- How do EFL teachers qualify the existing EFL vocabulary selection sources and teaching materials?
- Are EFL teachers knowledgeable about computer-corpus data?
- What are teachers' perspectives regarding the application of computer- corpus data in EFL vocabulary selection and instruction?

Research methodology

Method

The choice of the method is mainly based on the problem of the investigation. In fact, the nature of the problem, the population and the looked-for data made the researcher decide on two methods. One chooses the descriptive and analytic methods because the work is mainly based on some definitions, mainly computer corpus-data and the description and the analysis of EFL teachers' attitudes on those data. That is, in order to report EFL teachers' perceptions on the impact that computer corpus-data has on English vocabulary selection and instruction, the researcher opts for the use of the aforesaid methods. Indeed, those methods enable one to adequately describe and analyze the collected data about the subject matter.

Sample population

To gather data about the EFL vocabulary teaching situation in general and teachers' attitudes on the application of computer corpus-data on English vocabulary selection and instruction; one needs a sample population of EFL teachers for the administering of a semi-structured interview. The population of teachers for this study is of 10 full-time teachers (6/10 are females and 4/10 males), who are charged with teaching English as a Foreign Language in the Department of Foreign Languages – Section of English – at the University of Tlemcen (Algeria). The research subjects were chosen at random because in random sampling, according to Brown (2001:72) *"each individual in the populations must have an equal chance of being selected"*, which reduces the effect of bias and enhances objectivity.

Research instrument

Following the requirements of the present research, one makes use of the *semi-structured interview* to answer the aforementioned research questions and to supply the research subjects with the needed information about computer corpus-data if teachers show unfamiliarity about those data. Yet, in introducing the semi-structured interview, the investigator and the interviewees discussed some inevitable points about EFL vocabulary teaching; like EFL vocabulary teaching goals and importance to foreign language teaching and learning milieu. All teachers confess the importance of vocabulary teaching in the foreign language classroom. Some explained that vocabulary knowledge makes EFL learning more effective as words are used in both language perception and production and relate its inadequacy to the students' low level of English proficiency. Accordingly, Beglar and Hunt (2005:7) write *"vocabulary acquisition is a crucial, and in some senses, the central component in successful foreign language acquisition"*. Others admitted that vocabulary is inevitable in teaching and that it should be presented, taught and recycled very often in and outside the classroom for vocabulary knowledge can ever be fully mastered.

To manage this interview, the researcher takes an interview schedule which lists the topics to be discussed out of beforehand determined questions. Yet, at the same time the investigator allows an elaboration in the questions and answers whenever needed. In collecting information, one writes down quick and abbreviated notes on the interviewees' answers as they code switch while speaking. Later on, the researcher summarizes the data gathered from each interviewee in order to organize and analyze the results in graphs.

Results and discussion

Results and discussion of the first research question

To see what language sources do EFL teachers use in order to teach about vocabulary, the following question was asked: Which language sources do you use to teach about the English vocabulary?

The results show that all teachers rely on the Oxford Advanced Learner' Dictionary and some vocabulary teaching books like, English Vocabulary in Use, as far as word knowledge and vocabulary activities are concerned. Yet, this query brought a hot debate between the interviewees so that two points of controversies rose up among the research informants. Some teachers (4/10) admitted that they hardly refer to vocabulary teaching books for the reason that their learners are adults enough to undertake their own vocabulary learning process. Other teachers (6/10), however, confessed on a planned vocabulary teaching is needed and added that vocabulary is inevitable in

teaching and that it should be presented, taught and recycled very often in and outside the classroom for vocabulary knowledge can ever be fully mastered.

Results and discussion of the second research question

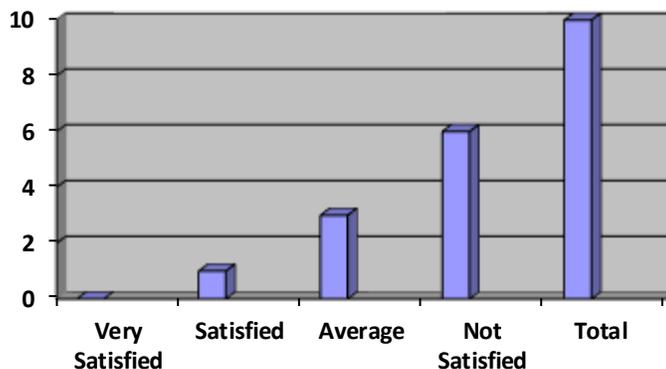
Subsequently, the informants were asked to answer the question: "How do you qualify the existing EFL vocabulary selection sources and teaching materials, if any?" to know whether or not they are satisfied with the EFL vocabulary sources and teaching materials they are currently using. The findings, in the graph below, show that the majority of teachers (6/10) are not satisfied by the English vocabulary teaching sources and materials they are currently using, unlike one teacher.   The rest of the respondents show a neutral attitude as they choose to say 'Average'. What is more is that this query sheds light on some EFL instructors' vocabulary teaching difficulties. Actually, those teachers who were not satisfied with the existing EFL vocabulary selection sources and teaching materials do relate their dissatisfaction to the problem of the outdated books in the library of the department and other times to the lack of vocabulary teaching books, to finally admit that they find the refuge in the Internet rather than the library to better their English teaching in general and that of vocabulary in particular.


Fig. 2. Teachers' satisfactory level on EFL vocabulary teaching sources and materials

Results and discussion of the third research question

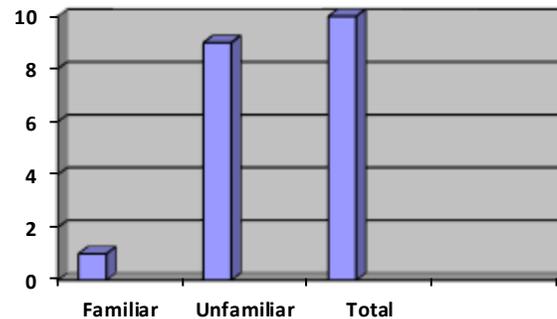
The third research question that the investigator endeavours to answer reads the following: Are EFL teachers knowledgeable about computer-corpus data? One aims from this question to introduce the notion of computer corpus-data to the research informants and to see whether or not teachers have prior knowledge about those data. In fact, once the researcher mentioned the idea of computer corpus-data and its investments in language analyses in general and vocabulary selection and teaching in particular, almost all research informants (9/10) reveal their unfamiliarity about those data (See Figure 3). Consequently, one has provided the sample of teachers with the relevant information about computer corpus-data in order to familiarize them and raise their awareness on the notion of those data. Furthermore, the supply of EFL teachers with the relevant information vis-à-vis computer corpus-data is fundamental since this made the collection of their attitudes on the application of those data as a source for EFL vocabulary selection and teaching possible.


Fig. 3. EFL Teachers' Familiarity or Unfamiliarity with Computer Corpus-Data

Results and discussion of the forth research question

In an attempt to answer and gather data about the forth research question which enquires on EFL teachers' attitudes a propos the application of computer- corpus data in EFL vocabulary selection and instruction, the researcher had asked the research subjects to rank their perceptions on the statements below using the five Likert-type scale.

- Statement 1: Computer corpus-data is the 'richest' language source that syllabus designers and textbook writers may relay on for presenting both current and authentic language content and teaching materials as far as EFL learners are concerned.
- Statement 2: EFL vocabulary is best analysed, selected, presented and taught with the aid of computer corpus-data analyses.
- Statement 3: Raising awareness about computer corpus-data language analyses and recommending its application in EFL vocabulary teaching and learning situations may not only enhance EFL teachers and learners' interest in vocabulary teaching and learning but do also improve their proficiency level as a whole.

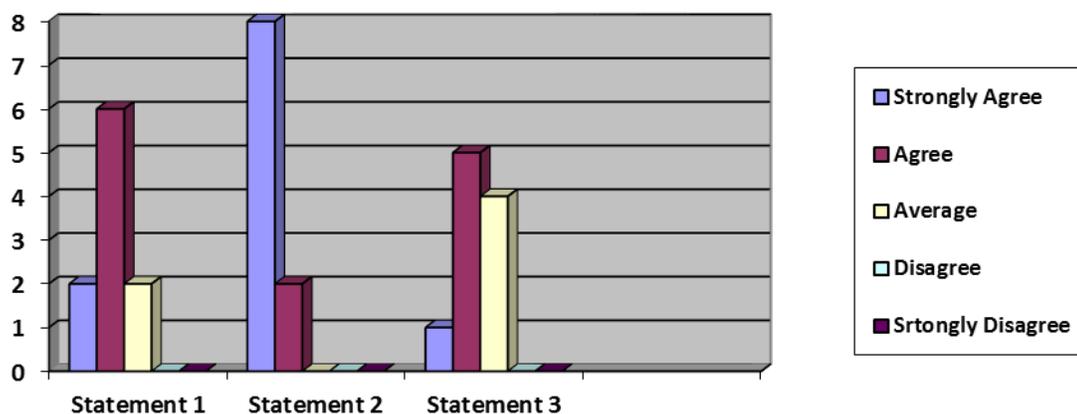
The findings show that the highest scores ranged between "Agree", "Strongly Agree", and "Agree" without leaving a single score to "Disagree" or "Strongly Disagree" as regards statements 1, 2, and 3 respectively. This means that the research informants do very often show agreement on the above statements as illustrated in the graph below:


Fig. 4. EFL teachers' levels of Agreement and disagreement on statements 1, 2 and 3

While discussing the above statements, the research informants were conferring positive attitudes towards the application of computer corpus-data as a source for EFL vocabulary selection in particular and English teaching in general. They added that its use would bring *"new and light breath"* to EFL teachers and learners alike. What is more, the interviewees admitted that their learners would *"enjoy"* the EFL class more than ever for they will deal with a more authentic language that they expect to meet in the international mass media or receive while visiting English-speaking countries or while chatting in text or speech with English native speakers and non-native English speakers by means of social networks (Facebook, MSN, Skype and the like). In due course, the research subjects confess on the effectiveness of computer corpus-data and make recommendations on its application in EFL vocabulary selection and instruction.

Conclusions and Implications

There is no doubt that learning a foreign language is strongly based on the learning of its vocabulary because a widely productive vocabulary is essential in enhancing the learner's four language skills (listening, speaking, reading and writing). It follows that teachers are advised to plan their English vocabulary teaching and enforce its recycling and testing as word knowledge encompasses EFL learners' receptive and productive skills and to emphasize the importance of word knowledge and vocabulary teaching in general in their EFL classrooms by explaining its efficiency to foreign language learning.

Now it is clear that the corpus massive collection of texts and conversations, that were previously unavailable, have given language researchers, syllabus designers and instructors access to a wealth of information for both spoken and written English in order to determine the words and phrases needed to fulfil the EFL learners' vocabulary needs for conducting conversations and writing passages more effectively. From this, it is highly advocated for syllabus designers and teachers to apply computer corpus-data as a source for EFL vocabulary selection and instruction in particular and why not EFL teaching and learning in general.

From this research, however, it has been discovered that though EFL teachers confess the significance of vocabulary teaching in foreign language learning they do not have the tendency to implicitly teach about vocabulary on their classrooms and to update their language teaching sources and teaching materials in general and that of vocabulary in particular since many of the research informants were unfamiliar with computer corpus data. And therefore, it is kindly requested for EFL teachers to update their teaching resources and materials for a better English teaching and learning.

Ad-hoc ağlar için araştırma ve eğitim amaçlı yeni bir benzetim aracı

Sinan Tuncel[a,13], Hüseyin Ekiz[b]

aSakarya Üniversitesi, Esemtepe Kampüsü, Sakarya 54187 Turikiye
bSüleyman Şah Üniversitesi, Hayriye Dumankaya Kampüsü, İstanbul 34865,Türkiye

Abstract

Modeling and simulation are acting a critical role in modern life because of development and evaluation of new systems and products, effective design, understanding how the new systems work and education of new technologies. Ad Hoc networks are composed of mobile nodes where a central authority doesnt exist or regular services in traditional networks are not provided. Topology and mobility is very important in performance of the network due to complexity and increasing size of the ad hoc network systems. In this study, a simulation tool has been developed for education and research on effects of complexity, scalability and mobility of the ad hoc networks. Simulation experiments have been carried out by using developed topology and traffic models. Besides, education of topic has been facilitated with graphical interfaces.

Keywords: Ad hoc, modeling, simülation, topology, mobility

Giriş

Mobil sistemler altyapı gereksinimlerinin düşük olması ve gezgin iletişim desteği nedeniyle geleneksel kablolu iletişime göre avantajlıdır. Cep telefonlarının iletişimdeki başarısından etkilenen araştırmacılar sabit altyapı olmadan haberleşme üzerine odaklanmışlardır. Bu yaklaşımın altında "gezgin Ad Hoc ağlar" (Mobile Ad Hoc Network - MANET) oluşturulması fikri yatmaktadır. Nihai hedef tamamen altyapısız gezgin ağlar kurmaktır [1]. Gelecekte MANET'lerin 4G mimarisinin önemli bir parçası olması beklenmektedir [2].

Hareketlilik özelliğine sahip kablosuz ağlar iki farklı yapıya sahiptir: İlk yapıda baz istasyonu olarak adlandırılan bir tür köprü bulunmakta ve gezgin düğüm baz istasyonu çevresinde bağlantı / iletişim kurmaktadır. İkinci yapı ise, genel olarak 'Ad Hoc' ağlar olarak bilinen altyapısız, gezgin, sabit bir yönlendiricisi olmayan ağlardır [2]. Ad hoc ağların ağ topolojisinin sabit olmaması, enerjinin değerli olması, düğümlerin biri birine kablosuz bağlantılarla bağlanması gibi bazı karakteristikleri vardır [3].

Ad Hoc ağlar gibi dağıtık sistemler, çeşitli teknolojiler kullanarak birbirleriyle iletişim yapan birimlerden oluşur. İletişim içerisinde bulunan sistemin uyarlanabilirlik, ölçeklenebilirlik, güvenilirlik gibi bir takım niteliklere sahip olması gerekmektedir. Artan karmaşıklık ve boyut nedeniyle ortaya çıkan sorunların üstesinden gelmek amacıyla geliştirilen çeşitli yöntemler bilgisayar ağlarının ihtiyaçlarına göre kullanılmaktadır. Bu yöntemlerin tasarım ve geliştirilmesinde modelleme ve benzetim araçlarının yeri büyüktür.

Yapılan çalışmada Ad Hoc ağların yukarıda belirtilen sorunların incelenmesi, tasarım alternatiflerinin araştırılması, farklı çözüm yaklaşımları üzerinde çalışılabilmesi ve eğtim amaçlı kulalnılabilmesi için Ad Hoc ağlarda topoloji ve hareketliliği gözlemlemek amaçlı bir benzetici geliştirildi.

Ad Hoc Ağ yapısı

MANET'ler "düğüm" olarak adlandırılan keyfi ve rastgele hareket edebilen platformlardan oluşur. Veri, kablolu ağlardan farklı olarak düğümden düğüme yönlendirilerek iletilir [2][4]. Düğümler rastgele ve keyfi olarak kendilerini organize ederek hareket etmekte serbesttir. Bu yüzden ağın topolojisi hızlı ve öngörülemeyen bir şekilde değişebilir [2].

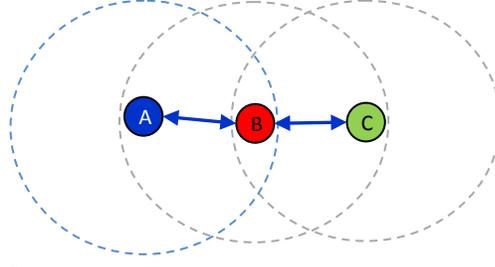
*E-mail address:*stuncel@sakarya.edu.tr


Şekil 1. Basit bir Ad Hoc ağ görünümü

Şekil 1'de basit bir Ad Hoc ağı görülmektedir. Şekilde A, B ve C ağdaki düğümleri, kesikli çizgilerle oluşturulmuş daireler düğümlerin radyo kapsama alanlarını, ok işaretleri ise bağlanabilirliği temsil etmektedir. Burada A düğümü ile B düğümü ve B düğümü hem A hem C düğümü ile, C düğümü B düğümü ile iletişim halindedir. A ve C düğümler birbiriyle iletişim kurmak istediklerinde bunu ancak B üzerinden gerçekleştirebileceklerdir.

Hareketlilik

Kullanıcılar için MANET'lerin en önemli avantajı hareketliliktir. Diğer taraftan güvenilir yüksek başarımlı iletişim sağlamak amacı ile üstesinden gelinmesi gereken bir sorundur [1]. MANET ağlar gezgin ve sabit düğümlerin karışımına sahip olabilir. Düğümlerin hareketliliği üç kategoride incelenebilir [5].

- Rastgele hareketlilik: Düğümlerin analitik uygunluk için keyfi olarak rastgele şablonlarda hareket ettiği (düzenli "Brown devinimi" olarak modellenen) kabul edilmektedir.

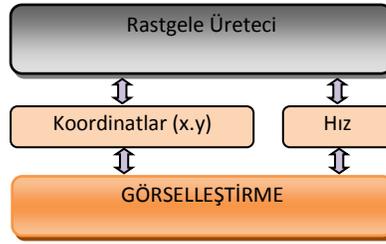
- Tahmin edilebilir hareketlilik (Predictable Mobility): Hareketli düğümlerin hareket kümeleri bilindiği varsayılabilir ve bu bilgi rota verisi için kullanılabilir. Hareketli düğümler veri transfer etmek amacıyla hareket etmezler ve bu yüzden yolları yönlendirme gereksinimleri ile çatışmaz.

- Kontrollü hareketlilik: Düğümlerin hareket örneği tamamen ağın kontrolü altındadır. Bu altyapı ağa mantıksal destek vermek gibi amaçlar için kullanılabilir.

BENZETİM ORTAMININ GELİŞTİRİLMESİ

Çalışma DEVS [6][7] modelleme ve benzetim yaklaşımı kullanılarak, gelişmiş kullanıcı dostu arabirimine sahip, tasarım, modelleme, benzetim ve eğitim amaçlı kullanılabilen DEVS-Suite ortamı [8] üzerinde geliştirildi. DEVS-Suite modelleme ve benzetim ortamı paralel DEVS formalizmine dayanır ve modüler, hiyerarşik, ayrık olaylı sistem ortamı, nesneye dayalı Java programlama dili kullanılarak gerçeklenir [9][10]. Java programlama dili, basitlik, %100 nesneye yönelim, hız, dağıtık çalışabilme, taşınabilirlik, vb. pek çok faydadan dolayı modelleyiciler tarafından tercih edilmektedir[11].

Topografya atomik modeli

Düğümlerin hareket kabiliyetine sahip olması birbiri ile olan bağlanabilirliğinin sürekli değişmesine sebep olmaktadır ve düğümler arasında mesaj trafiği için kullanılan bağlantıların dinamik olmasını zorunlu kılmaktadır. Bu dinamizmin kontrolünü her bir düğüme bırakmak gereksiz kod yüküne sebep olacağından dolayı MANET ağ ortamında bağlantıların kurulması ve kaldırılması işlemi Topografya adı verilen atomik modeli tarafından kontrol edilmektedir (Şekil 2).


- Şekil 2. Topografya atomik modelinin kavramsal modeli

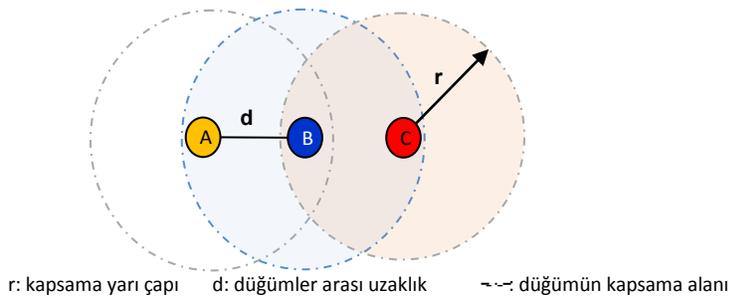
Oluşturulan atomik modelin belirlenen aralıkta periyodik olarak yerine getirdiği / yaptığı görevler aşağıdaki şekilde özetlenebilir;

- Düğümleri belirlenmiş hız ve yön bilgisine göre yeni koordinatlarına konumlandırır.
- Konumu değişen düğümün diğer düğümler ile kapsama alanı içinde olup / olmadığını kontrol ederek bağlantılarını tekrar kurar / kaldırır.
- Düğümlerin hareketleri ve bağlantıları görsel olarak ekranda güncellenir

Topolojideki değişimlerin modellenmesi

Hareketli düğümler kablosuz oldukları için bir başka düğümle iletişimi antenleri vasıtasıyla coğrafik olarak birbirlerinin kapsama alanı içinde ise kurabilir. Şekil 3'de A, B ve C düğümlerinden A düğümü sadece B düğümü ile iletişim kurabilirken, B düğümü A ve C düğümü ile iletişim kurabilmektedir.

Geliştirilen ortamında bir düğüm ile başka bir düğüm arasındaki iletişime iki düğüm arasındaki uzaklığın (d) hesaplanması ile karar verilir. Düğümler için belirlenen kapsama alanı hesaplanan uzaklıktan büyük ise düğümler arasında iletişim var kabul edilir ve bağlantı kurulur. Düğümler arası iletişimi etkileyen solma (fading), fiziksel ortamın şartları göz ardı edilmiştir.

r: kapsama yarı çapı   d: düğümler arası uzaklık   ⌐·⌐: düğümün kapsama alanı


- Şekil 3. Hareketli düğümlerde bağlantı kurulumu

Tasarlanan benzeticinin mobil ağlar için olması sürekli konumu değişen düğümlerin birbiri ile olan bağlantılarının da dinamik olmasını gerektirmektedir. Zamanın belirli bir anında iletişim halinde olan düğümler bir başka zaman diliminde farklı koordinatlarda oldukları için aralarındaki bağlantıyı kaybedebilmektedirler. Buda ağın topolojisinin devamlı değişmesine sebep olmaktadır. Değişken topoloji altında düğümlerin arasındaki bağlantıların kurulup kaldırılması DEVS-Suite ortamının sahip olduğu dinamik yapı (variable structure) sayesinde mümkün olmaktadır [12] [13].

Hareketlilik modeli

Normalde gerçek hayattaki hareketliliğin yazılım ortamına aktarılmasındaki güçlükten dolayı yapay hareketlilik modellerini kullanmak kaçınılmazdır. Ad Hoc ağlar için birçok hareketlilik modeli vardır (Random Walk Mobility Model, Random Waypoint Mobility Model, Random Direction Mobility, A Probabilistic Version of the Random Walk Mobility, vb.). Yapılan çalışmada, hareketlilik modellerinden Brownian devinimi prensibine göre çalışan "Rastgele Yürüyen Hareketlilik Modeli" (Random Walk Mobility Model) kullanılmıştır [14].

Geliştirilen ortamda 'topografya' adlı atomik modeli tarafından düğümlerin sınırları belirlenmiş 2 boyutlu düzlem üzerinde hareket etmeleri sağlanmaktadır. Düğümlerin hareketlerini rastgele bir koordinattan yine rastgele seçilmiş başka bir koordinata doğru rastgele bir hızla yapmaları koordine edilir. Hedefe ulaşan düğüm rastgele belirlenmiş değerlerle, yeni bir hedefe doğru hareketlerine devam etmektedirler.

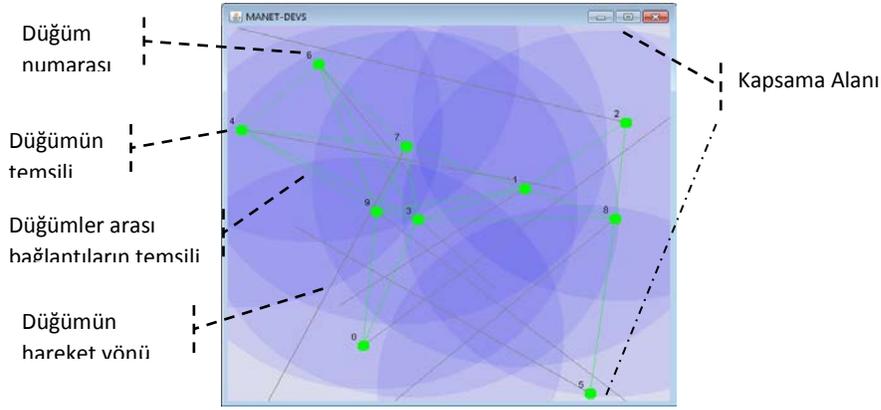
Topoloji Üreteci

Ağ topoloji üreteçleri gerçeğe yakın benzetim çalışmaları ve ağın başarım karakteristiklerinin incelenmesi için araştırmacılar tarafından sıklıkla kullanılmaktadır. Ağ topoloji yapısının iyi modellenmesi iletişim tekniklerinin analizi ve geliştirilmesi için esas teşkil etmektedir. Ağın başarımı önemli ölçüde topolojiye dayanır [15]. Bu nedenle topoloji üreteçlerinim karakteristik özellikleri üzerine çalışmalar yapılmıştır [16].

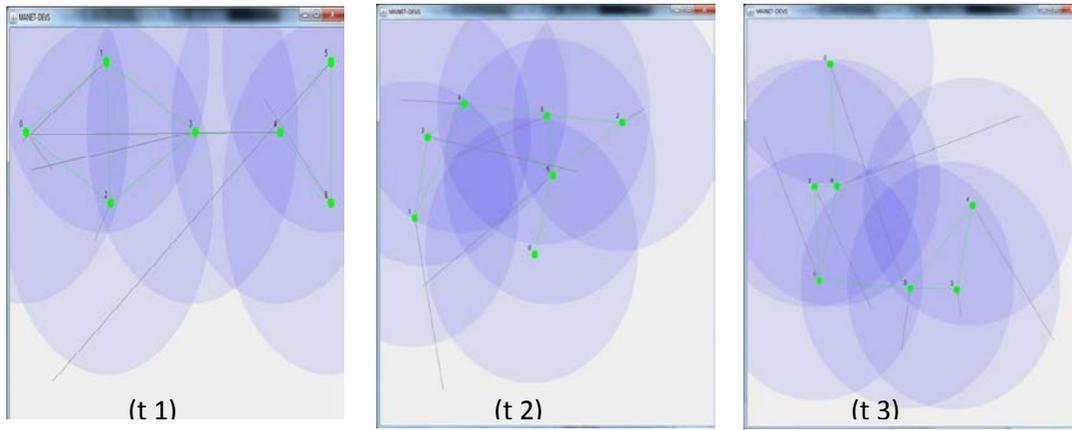
Yapılan çalışma birçok önemli topoloji modelini destekleyen, C++ , Java ile kodlanmış sürümlerinin bulunan ve açık kaynak kodlu olan BRITE (The Boston University Represetative Internet Topology Generator) topoloji üreteci ile entegre hale getirilmiştir.

Görsel Takip

Bir ağı oluşturan düğümlerin ağ üzerindeki konumu, kapsama alanları, hareket yönü ve hareketlerinin görsel takibini yapmak amacıyla "MANET Görüntüleyici" adı verilen bir modül tasarlanmıştır. Hazırlanan görüntüleyici bu hizmeti verebilmek için benzetimin çalıştırıldığı kaynakları kullanmaktadır (RAM vb.). Bu nedenle geniş ölçekli ağların benzetiminde ihtiyaç duyulan kaynakların verimli kullanılabilmesi için bu ara yüzün çalıştırılıp çalıştırılmaması BRITE topoloji üretecine entegre dilen bir buton ile kullanıcıya seçenek olarak sunulmuştur

MANET-Görüntüleyici ekranında 1m=1 piksel olarak kabul edilmiştir. Şekil 4'de 500 X 500 bir alanda 10 düğümden oluşan bir topolojinin ekran görüntüsü verilmiş ve bu ekran görüntüsü üzerindeki şekillerin ifade ettikleri manalar açıklama baloncuklarında belirtilmiştir


- Şekil 4. MANET-Görüntüleyicide 500 X 500 lük bir alanda topoloji dağılımı

7 düğümden oluşan hareketli bir ağın 3 farklı zaman dilimindeki konumlarını gösteren ekran görüntüsü Şekil 5'de görülmektedir.


- Şekil 5. düğümlü bir ağın takibi için tasarlanan ekran çıktısı

Sonuçlar ve Değerlendirme

Bu çalışmada Java programlama dili kullanılarak, MANET sistemlerin karakteristikleri üzerine, ölçeklenebilir, adaptif, farklı topolojilere sahip, benzetim ve eğitim çalışmaları yapılmasına yardımcı olan bir benzetici geliştirilmiştir. Bu çalışma sahip olduğu nesneye yönelik yapısı ile yeniden kullanılabilir bileşenlere sahip modeller geliştirilmesine ve platformdan bağımsız olarak kullanılmasına imkân sağlamaktadır. "java webstart" teknolojisi ile İnternet üzerinden yayınlanabilmesini / kullanılmasını sağlamakta ve İnternet kullanılarak uygulamaların paylaşılmasını, uzaktan eğitim gibi günümüzün ileri teknolojileri için elverişli bir altyapı oluşturmaktadır. Benzetim biliminin uygulamalı olarak kavranmasına ve öğrenilmesine katkı sağlamıştır. Sağlanan görsellikle düğümlerin, daha iyi izlenmesini / analizini mümkün kılarak iyi bir eğitim aracı olmasını sağlamaktadır. Ortamına entegre edilen, BRITE topoloji üreteci ile kod yazmaksızın büyük ölçekli topolojiler üretilebilmektedir.

Tartışma ve Öneriler

Geliştirilen benzeticide bir MANET'in hareketliliği modellenmiş, diğer bazı özellikleri basit kabullenmeler ve soyutlamalara tabii tutulmuştur. Bu soyutlamaların gerçeğe uygun bir şekilde modellenmesi ile MANET'in tüm yönlerini değerlendiren eksiksiz bir MANET benzeticisi geliştirilebilir.

Geliştirilen ortam web ortamına taşınarak popüler tarayıcılar üzerinden modelleme ve benzetim çalışmalarına imkan sağlanabilir. Web tabanlı ve uzaktan eğitim çalışmalarında faydalanılabilir.

Adjective identification in television advertisements

Normaliza ABD RAHIM[14]

Faculty of Modern Languages and Communication,
Universiti Putra Malaysia
drnormaliza@gmail.com

ABSTRACT

Learning the Malay language has been a challenging task for foreign language learners. Learners have to learn Malay grammar structure rules in order to write simple sentences. The word choice is important in constructing a sentence. Therefore, the study focuses on the use of adjectives in television advertisements among Korean learners at Hankuk University of Foreign Studies, Korea. The objectives of the study were to identify and discuss adjectives incorporated into the advertisements. The students involved in the study were ten male and female subjects from a Malay language class. The subjects had to choose one television advertisement and view it several times. They were given three weeks to identify and discuss the adjectives in the advertisements. The subjects were interviewed on their views about the adjectives in the advertisements. The interviews were video recorded and analyzed for the purpose of the study. The results of the study revealed that each subject managed to identify five adjectives per advertisement. They also managed to offer their views on the adjectives, which were not directly uttered by the models in the advertisements. It is hoped that a future study will focus on the use of adjectives via other means of media technology.

INTRODUCTION

Learning a foreign language is a challenging task for learners. Besides having to learn the language, they have to make sure that the foreign language that they learn is not influenced by their own language. Malay language is one of the many languages in the world and it has been introduced and taught at many universities around the world. Malay was taught to students willing to take the languages seriously, where the students will have to use the language in the working environment. Therefore, the choice of choosing Malay as a major or a minor at universities will prove that the students are willing to work in the Malay world either as an interpreter or translator. In addition, students could also work in countries, such as Malaysia, Singapore, Brunei and Indonesia. The Malay language is similar to other languages where it consists of linguistics features. The language is a study in terms of not only proficiency skills but also for sociolinguistic, pragmatics, semantics, psycholinguistics, linguistics and other skills. Therefore, the first major step for a student to learn Malay will be learning the basic knowledge of Malay language proficiency including listening, speaking, reading and writing as well as focusing on the grammatical rules of the Malay language. Moreover, learning Malay or any other languages will be interesting with the help of materials and task designs, which will arouse student interest in learning the language. Subsequently, with the boom of technology, educators will never fail to include the use of technology within the teaching and learning environments. Therefore, this study will focus on the use of technology as in television advertisements in identifying and discussing the adjectives identified.

LEARNING AND TECHNOLOGY

Learning the Malay language will also concentrate on the correct use of verbs, adjectives, determiners, adverbs, prepositions, conjunctions and others. With the knowledge of these words, a student will be able to understand the meaning of each sentence constructed (Nik Safiah Karim, Farid M. Onn, Hashim Haji Musa & Abdul Hamid Mahmood, 2008). According to Normaliza Abd Rahim (2012b), a sentence structure focuses on the basic knowledge

---

E-mail address: drnormaliza@gmail.com

of a simple sentence in the Malay language, such as Noun (N) + Verb (V); i.e., *Saya makan* (I eat). Since the translation from Malay to English seemed to show that it will not make a good and simple English sentence, the students therefore were advised not to think in other languages but in the Malay language. Hence, a simple sentence in Malay will show the understanding of the sentence by the students. For instance, *Dia lari laju* (He runs fast)means that the person is running fast and the word *laju* (fast) means that the person is *lari* (running) really fast. On the other hand, Malay compared to English consists of the same expression of adjectives. Therefore, students were often seen trying to translate the word into English in order to find the true definition. Jennifer Yamin-Ali (2011) postulates that the influence of other languages learnt besides the mother tongue language will have a big impact toward the automatic translation in the brain. Therefore, while learning a specific language, a person should not think in other languages for the sake of avoiding confusion in the word choice of a sentence structure (Ellis, 1997:95). As for the Malay language, a simple sentence to describe a Malay adjective can be instantly described by students. The sentence follows the rule of a simple sentence as in Noun (N) + Adjective (Adj). For instance, *Perempuan itu cantik* (The woman is beautiful) implies that the specific woman shown to the person is beautiful. Therefore, the correct use of the adjectives will also be stated in the sentence. Zaharani Ahmad & Nor Hashimah Jalalludin (2012) described the use of correct Malay grammatical rules. The study has given impact toward educators and students learning the Malay language. The study also disclosed evidences of Malay grammar structure rules, including the use of determiners, verbs, adjectives, adverbs, etc. The structure rules were discussed and proven to ensure that there would be no mistakes from future learners. The studies (Zaharani Ahmad & Nor Hashimah Jalalludin, 2012; Jennifer Yamin-Ali, 2011; Nik Safiah Karim et al, 2008) above showed that the use of simple sentence and Malay grammatical rules and the influence of other languages would give great impact towards learning a language. This study has taken into consideration on the perspective of learning a language using the correct use of words for Malay language learning among Korean learners. Here, it can be seen that this study concentrates on the word choice that involved adjectives using the technology in learning the Malay language.

Studies on the use of verbs, adjectives, adverbs, determiners, conjunctions and others were widely researched by Malaysian researchers. The researches were focused not only on native Malay speakers but also on other races in Malaysia as well as on foreign students. Brown (2000:35) postulates the principles of language learning and teaching that should be followed by both teachers and learners. The principles show the effectiveness of teaching any language and to make sure that the learning process is a success; students will be able to communicate in the target language and therefore understand the context. Yong Chyn Chye & Vijayaletchumy's (2012) research on foreign students studying the Malay language revealed that foreign students had made several lexical errors in the aspect of phonology. The research focused on the writing process for eight weeks and discovered that there were 182 spelling mistakes; in terms of phonology, the errors were found in terms of changing the different alphabets. This study revealed that foreign learners have difficulty in understanding the concept of a simple sentence in the Malay language. Malay grammar rules were not understood and therefore, errors (Corder, 1974:97) were made due to the influence of other languages. Goh Sang Seong (2011) has researched on the translation of Chinese and Malay languages. The study involved six translators in translating a Malay anthology, *Cerpen Pilihan Sastera Mahua III: Dalam Hujan Renyai*. The results of the study revealed that 10 Chinese verbs had 126 different meanings in the Malay language. The study concluded that the use of verbs in the Malay language has helped to identify meanings in the Chinese language. The studies on the use of foreign languages (Yong Chyn Chy & Vijayaletchumy, 2012; Goh Sang Seong, 2011) in language learning have showed that the involvement of foreign students and foreign language in learning the Malay language have given great impact towards foreign learners. The learners involved found that the errors can be overcome by learning the basic Malay sentence structure. This study has taken into consideration the involvement of the foreign students in learning the Malay language and also, considered the errors involved when dealing with the language barriers from their native language i.e Korean language.

Auzar (2012) stated that the use of technology has helped learners with their reading. The software that was created consisted of design, content and technical assistance to be used for the reading process. The subjects involved in the study consisted of 86 students from a school in *Pekanbaru*, Indonesia. The results revealed that the computer has helped in the process of reading and showed a significant difference compared to the conventional way of teaching. Jhy Wee Sew (2012) agreed with Auzar (2012) and stated that the use of technology allows the lesson to be more interesting. Jhy Wee Sew (2012) has researched the learning of Malay by utilizing the weblog, which has proven that learners were able to write in the Malay language. The use of simple Malay sentences was occasionally found. This way, the subjects were able to avoid making mistakes while writing in the Malay language. Other researchers also have concentrated on the use of technology in learning (Normaliza Abd Rahim, Arbaie Sujud, Nik Rafidah Nik Affendi & Siti Nur Aliaa Roslan, 2012; Normaliza Abd Rahim, Kamaruzaman Jusoff & Siti Nur Aliaa Roslan,

2011; Normaliza Abd Rahim & Nik Ismail Harun, 2011) in order to ensure that learning will arise the interest of students in their learning. The studies that involved the use of technology (Auzar, 2012; Jhy Wee Sew, 2012; Normaliza Abd Rahim et al, 2012; Normaliza Abd Rahim et al, 2011; Normaliza Abd Rahim & Nik Ismail Harun, 2011) above has given great impact toward this study that involved the use of technology in learning the Malay language. The Korean learners involved in this study will be able to use the technology to learn the new language. Therefore, the studies as stated above have helped in the process of choosing the appropriate materials in learning.

A number of studies conducted among Korean learners learning the Malay language were carried out by Normaliza Abd Rahim (2012a; 2012b; 2012c). The studies were carried out at Hankuk University of Foreign Studies, Korea. The samples involved male and female subjects from a few Malay language classes. Different types of materials and task design were used to ensure that learning the Malay language was effective. The materials were involved with the technology as well as the conventional way of teaching. The study on using simple sentences with verbs and adjectives were found in the study, which incorporated watching a Malay cartoon, *Upin* and *Ipin* (Normaliza Abd Rahim, 2012a). The study focused on identifying verbs and adjectives in the cartoon; the subjects were then involved in a discussion about the characters and storylines of the cartoon. Another study involved the use of antonyms in Malay sentences (Normaliza Abd Rahim, 2012b), which revealed that subjects used adjectives in the sentences. Although the subjects focused on the use of antonyms, they also used adjectives in their description (for example, tall: short), which proved that the subjects were able to identify not only the antonyms but also the use of correct adjectives. Moreover, another study on blog writing among Korean learners learning Malay (Normaliza Abd Rahim, 2012c) had showed that writings of subjects in the blog consisted of adjectives words. The words such as 'happy', 'beautiful', 'smooth', 'sad', 'fat', 'thin', 'tall', 'short' and others were evidence from the blogs. This result revealed that the subjects understood the use of adjectives in the blog in order to describe and express things around them. The studies involved Korean learners learning the Malay language by using technology (Normaliza Abd Rahim, 2012a; 2012b; 2012c) as stated above showed that Korean learners were motivated in learning the language. The technology involved in the learning process has given the subjects the chance in understanding and enjoy learning the Malay language. Therefore, this study has taken into consideration the results of the studies (Normaliza Abd Rahim, 2012a; 2012b; 2012c) and used the other means of technology via television advertisements to learn the Malay language.

Although the studies based on learning the Malay language had proven that they were steps to be taken in order to ensure the learning of the target language, it seemed that foreign learners tend to become confused in using the words in sentences. Here, the questions of the study were listed, 'What are adjectives related to the advertisements suggested by the subjects? What are the subjects' views on the adjectives related to the advertisements? Therefore, the objectives of this study were to identify and discuss the adjectives in advertisements.

METHODOLOGY
This study focuses on the use of television advertisement in identifying the Malay adjectives. This study also discusses the subjects' views and opinions about the adjectives stated. The study involved 10 subjects from a Malay language class at Hankuk University of Foreign Studies, Korea. The subjects were exposed with the Malay language course from the previous semester. The subjects were given a task to view one television advertisement for three weeks. They have to select and identify the appropriate advertisement for the purpose of the study. The subjects' were to identify and discuss the adjectives within these advertisements. They also had to discuss and give their views on the adjectives that were not directly stated in the advertisements. The subjects were interviewed and their views and discussion were video recorded. The views and discussion were analyzed for the purpose of the study. The discussion was analyzed by using the discourse analysis method (Brown & Yule, 1983). Brown & Yule (1983) have five features of discourse analysis. The features of discourse analyses that were related to this study were the method of language usage among the community, the understanding of the language in written or spoken, the understanding of speech, the understanding of functional language and lastly the understanding of the intentional written or spoken language. Therefore, this study will analyze the results by using all the features suggested by Brown & Yule (1983).

RESULTS AND DISCUSSION

Subject	Types of Advertisement	Adjective 1	Adjective 2	Adjective 3	Adjective 4	Adjective 5
S1	Cosmetics -Missha	Smooth (licin)	Fragrance (wangi)	Soft (lembut)	Fair (cerah)	Confident (yakin)
S2	Drinks -Coca cola	Sweet (manis)	Delicious (sedap)	Active (aktif)	Happy (gembira)	Gas (gas)
S3	Drinks -Kanu coffee	Sweet (manis)	Delicious (sedap)	Bitter (kelat)	Happy (gembira)	Relax (tenang)
S4	Cosmetics -Faceshop	Smooth (licin)	Fragrance (wangi)	Soft (lembut)	Fair (cerah)	Shiny (kilat)
S5	Fridge -Samsung	Beautiful (cantik)	Big (besar)	Cute (comel)	Cold (sejuk)	Fresh (segar)
S6	Mobile phone -Samsung	Thin (nipis)	Light (ringan)	Beautiful (cantik)	Easy (mudah)	Savings (jimat)
S7	Laptop -Samsung	Thin (nipis)	Light (ringan)	Beautiful (cantik)	Big (besar)	Confident (yakin)
S8	Fragrance –Glade	Fragrance (wangi)	Soft (lembut)	Clean (bersih)	Small (kecil)	Cheap (murah)
S9	Cosmetics -SKII	Smooth (licin)	Fragrance (wangi)	Soft (lembut)	Beautiful (cantik)	Fair (cerah)
S10	Detergent -Downy	Soft (lembut)	Fragrance (wangi)	Easy (mudah)	Liquid (cecair)	Clean (bersih)

Table 1: Choice of adjectives in advertisements.

Table 1 above showed the choice of adjectives in advertisement for each subject. Three female subjects (S1, S4 and S9) chose cosmetics advertisement from *Missha*, *Faceshop* and *SKII*. It seemed that all of the three subjects were wearing make-up to class and they admitted that they used the products every day. S1, S4 and S9 had the same adjectives pertaining to the products. They stated that the advertisement showed the adjectives 'smooth', 'fragrance', 'soft' and 'fair'. They added that the adjectives were clearly shown in the advertisement. All of the three subjects mentioned that the adjectives 'smooth' and 'fragrance' were explicitly shown by the model in the advertisement. The model had smooth facial skin with the index finger sliding down the cheek; the model also made it clear she had smooth face. The subjects also stated that the adjective 'fragrance' was clearly stated when there were another male model who had his eyes closed but opened them when he smelled the perfume around him. This showed that the subjects understood the meaning of the adjective 'fragrance' from the advertisement.

Hence, all subjects stated the adjectives 'soft' and 'fair' were mentioned in the advertisement. The subjects uttered that the two words were mentioned by the model in the advertisement. S1 stated that the advertisement portrayed the adjective 'soft' by having the model touch her cheek as well as with a piece of silk flying on her face, implying the softness. S4 stated that the advertisement showed the face of the model before and after applying the cosmetic, illustrating the softness after applying the cosmetic. The model also mentioned the word 'soft' in the advertisement. S9 uttered that the word 'soft' was mentioned by the model in the advertisement twice while touching both her cheeks. This was clearly understood as model's attempt to show the 'softness' of her skin.

On the other hand, all three subjects stated that the cosmetic advertisements had implications of the following adjectives: 'confident' (S1), 'shiny' (S4) and 'beautiful' (S9). S1 stated that the model in the cosmetic advertisement showed confidence after applying the product. The model was also seen smiling and walking confidently with her beautiful face. Hence, S4 stated the face of the model in the advertisement had clearly shown than it was 'shiny'. The 'shiny' face was clearly shown on the cheeks when the model was moving from side to side as well as when she smiled. In addition, subject 9 stated that the adjective 'beautiful' was dedicated to the beautiful model in the advertisement. The subjects mentioned that the model was really beautiful after using the product and the dress that she wore had made it clear that she was really beautiful.

On the other hand, two subjects (S2 and S3) selected an advertisement based on drinks. S2 chose a soft drink 'Coca cola' while S3 chose a coffee brand 'Kanu' as the advertisement. According to the adjectives from S2 and S3, both subjects stated the same adjectives 'sweet', 'delicious' and 'happy'. S2 stated that the adjectives 'sweet' and 'delicious' were clearly shown in the advertisement; further, it was obvious that the 'Coca cola' drink is sweet. Hence, the subjects also mentioned that the model had acted as if the drink was delicious when he was smiling happily after drinking from the bottle. S2 also mentioned that the advertisement gave her feelings of being 'happy'. This might be due to the fact that the model for the advertisement was from her favorite boy band and every time she viewed the advertisement, she would fell 'happy'. S3, who is a big fan of coffee, stated that the adjectives 'sweet' and 'delicious' were in the advertisement. He stated that the model in the advertisement had shown the 'sweet' and 'delicious' tastes of the coffee. He admitted that he tasted the coffee before and the adjectives were right. On the other hand, S3 also stated that the adjective 'happy' was clearly shown by the model in the advertisement. The model was seen smiling happily after every sip from the cup.

S2 uttered that the advertisement consisted of the adjectives 'active' and 'gas'. The subjects stated that the models in the advertisement showed a group of males who were dancing and moving actively after drinking the product. The subject also stated that the adjective 'gas' was clearly showed when bubbles formed after the drink was poured into a glass. Therefore, it was understood by the subjects. On the other hand, S3 said that the adjectives 'bitter' and 'relax' were in the advertisement as well. The subject admitted that he had tasted the drink and found it to be a bit 'bitter'. Since he liked it and with his knowledge of the drink, he stated that the adjective 'bitter' was suitable. S3 also stated that the adjective 'relax' was shown in the advertisement when the model was sitting on a chair while sipping the coffee. The model was seen as 'relaxing' and enjoying his moment with the drink.

Three subjects (S5, S6 and S7) selected an advertisement based on electrical products. S5 chose a refrigerator from Samsung, S6 a mobile phone from Samsung and S7 a laptop from Samsung. All three subjects chose Samsung products since Samsung produces a majority of electrical products and are also famous all over the world. S5, S6 and S7 stated that the advertisements portrayed the adjective 'beautiful'. They stated that the fridge, mobile phone and laptop were beautiful in the advertisements. They agreed that each of the products had its own beauty; the fridge was beautiful among other fridges, the mobile phone was beautiful among other mobile phones and the laptop was beautiful among other laptops. They mentioned that they had viewed similar products from different companies; however, they preferred the ones that they had chosen. This showed that the adjective 'beautiful' was reflected in the products. On the other hand, S5 also stated that the fridge from Samsung had adjectives such as 'big', 'cute', 'cold' and 'fresh'. He said that the adjectives were his perception when viewing the advertisement for several times. He mentioned that the adjectives were uttered by the model advertising the product. S5 also commented that the fridge was 'beautiful' and 'cute' as an interior object. He also said that when the model opened the fridge door, he could feel the 'cold' and 'freshness', particularly when the compartments were opened to show the 'fresh' vegetables.

S6 gave his views on the mobile phone from Samsung. He stated that the adjectives from the advertisement displayed the following words: 'thin', 'light', 'easy' and 'savings'. The advertisement presented graphics of different colors of mobile phones; the 'thinness' and 'lightness' of the phones were clearly shown. The side elevation in the mobile phones was seen in the advertisement, revealing the 'thinness' of the mobile phones. The subject also mentioned that he observed the adjective 'easy' when viewing the mobile phone advertisement. The applications of the mobile phone were portrayed as 'easy' to use and user friendly. S6 also stated that the use of the mobile phone proved 'savings' in terms of money where due to cheap calling costs. This provided implications that the mobile phone was affordable among university students.

Furthermore, S7 stated that the adjectives in the laptop advertisement were 'thin', 'light', 'big' and 'confident'. She stated that the advertisement had made her want to buy the product. The advertisement clearly showed the 'thinness' and 'lightness' of the laptop. The side view of the laptop had given her the assumption that the laptop was really 'thin'. When the model holding the laptop with one hand was shown in the advertisement, it directly showed that the laptop was 'light'. Moreover, the advertisement also portrayed the size of the laptop, which was big enough and suitable for people of all ages. Thus, the look on the model's face when using the laptop showed that he was confident with using the laptop. Also, the applications in the laptop had also made the subject feel confident.

S8 and S10 selected an advertisement related to a domestic product, such as a fragrance for the toilet and detergent for clothes. Both subjects stated that the products had the same adjective 'fragrance'. Both products consisted of a nice scent. The advertisements for both showed that there were flowers coming out from the products and these

flowers represented the nice scent of flowers. Furthermore, the subjects uttered that the models in the advertisements mentioned the word 'fragrance'. Both subjects also stated that the products resemble 'cleanliness'. S8 stated that the adjective 'clean' implies that if the smell is nice, the room would look 'clean' too. Hence, S10 uttered that the when the detergent was used on clothes, the clothes would also feel 'clean'. On the other hand, S8 stated that the adjectives in the fragrance advertisement were 'soft', 'small' and 'cheap'. She uttered that Glade fragrances consist of a 'soft' scent. She gave an example of a lemon scent, which was considered as being 'soft'. Moreover, she added that the fragrance was 'small' and can be placed anywhere in the bathroom. According to the subject, the fragrance was put on a shelf near the sink in the advertisement. Since the fragrance was 'small', the subject stated that the product would be 'cheap' and affordable for everyone. The subject was making a true assumption due to the evidence from the advertisement stating that the money paid for the fragrance is worth it.

As for S10, the other adjectives stated in the advertisement were 'soft', 'easy' and 'liquid'. The subject stated that the adjective 'soft' was shown in the advertisement when the model hugged the other model and felt the 'softness' of the clothes that used the detergent while closing his eyes. This showed the 'softness' of clothes after using the detergent. Furthermore, S10 uttered that the adjective 'easy' was in the advertisement. The subject stated that the feeling of 'easiness' was felt when the two models hugged each other. Also, the use of the detergent was seen as 'easy' to use when the model used only one cup of detergent for one load of washing. The subject stated that the combination of the detergent and softener had made the process of washing easier. S10 also mentioned that the product in the advertisement was in the form of 'liquid'. The subject stated that the advertisement clearly showed the detergent was poured out from the bottle in the form of 'liquid' and this had made the subject clearly identify the adjective. Moreover, the subject stated that the adjective 'liquid' had made viewers compare the product with other powder detergents.

To sum up, the study revealed that the subjects were able to identify several adjectives in the advertisements chosen. The study also revealed that the subjects managed to discuss the adjectives in the advertisement and offer their comments toward the related adjectives. The subjects seemed to be able to identify the adjectives that were not explicitly stated in the advertisements; however, they managed to give their assumptions based on their multiple viewings. It can be seen that the adjectives given by the subjects were suitable and relevant to the advertisement. It was clearly seen that the subjects understood the use of adjectives in advertisement; the success of an advertisement is based on the right perception of the viewers. The process of learning Malay adjectives was successful when the subjects managed to identify and discuss the adjectives in the advertisements. Therefore, learning processes with viable activities must be fully considered in order to have a successful lesson. The involvement of students with the help of technology will therefore create an active environment where the subjects are able to provide their views and opinions toward the task given to them.

CONCLUSION
The study implicates educators in considering television advertisements when teaching Malay adjectives. Educators will be able to provide other forms of advertisements in order to make the lesson more interesting and learner autonomy. Moreover, the study also implicates foreign students in learning the Malay language. Students might find it difficult to understand the language and with the task given to them in identifying the adjectives, the difficulty would be increased. Therefore, learning Malay adjectives would be more interesting when students are given the opportunity to identify the adjectives on their own. With this, students will better understand Malay adjectives. It is hoped that a future study will focus on the study on Malay adjectives with the use of other means of media and technology.

Abstract
The development of alternative energy fuel technology at present many are produced from biological resources, eg the manufacture of biodiesel and biodiesel as a fuel substitute for gasoline. This study aims to obtain biogas from chocolate rind that can be used as an alternative energy and find operating conditions that produce appropriate levels of CH4 in the standard Indonesian. The first stage is done by preparing 1 liter of raw materials chocolate rind and water are then mixed with a starter (cow dung) 10% of the volume of raw materials and the addition of yeast and grass after it is mixed until blended. Then put into containers/bottles that have been fitted hose, water manometer, and the gas holder. The research was done in stages with the conditions that you run. Variables that run is a comparison of raw material (1:1; 1:1.5; 1:2; 1.5:1; 2:1), observation time (5 days, 10 days, 15 days, 20 days, 25 days , 30 days), and the variable addition of grass (50 gr, 100 gr, 150 gr, 200 gr). From the results of this reasearch found the greatest level of 74.22% in comparison 1 (water): 1.5 (chocolate rind) with the addition of 150 g of grass while low levels of 60.04% in comparison 2 (water): 1 (chocolate rind) with the addition of 200 g of grass.

Keywords: Biogas, grass, yeast

INTRODUCTION

Biogas can be produced from a variety of decomposed organic materials, eg wastes from: household and industry which is parsed by the methanogenic bacteria that will produce biogas, which is mostly methane. Utilization of chocolate's rind is currently being cultivated as animal feed and organic fertilizer. As an alternative use of chocolate's rind, there have been several experimentals from several researchers, among others : the manufacture of oxalic acid chocolates rind (Rachmat, Alif, Yeni. 2005), which explains that the best yield of oxalic acid occurs at heating temperature 210 °C, research of pectin extraction from chocolates rind (Mariana, Tri. 2005), which explains that pectin derived from chocolate fruit have high levels of metoxil. Utilization of organic waste as raw material for other biogas, namely organic waste (Hudha, Istnaeny, 2007), that bacteria play a very important role in producing biogas from organic waste but requires the addition of grass as addition of carbohydrates. Research by Billah et al (2009) about producing a biogas from cow that have levels up to 74%.

Biogas (methane) can occur from the decomposition of organic waste that contains proteins, fats, and carbohydrates. Parsing is done by anaerobic bacteria in the fermentation process; therefore the vessel that is used to ferment this waste should be closed so that the air (O_2) does not enter into the biodigester which resulted in decrease of methane production.

This study aims to obtain biogas from chocolate rind that can be used as an alternative energy.

METHODS

Material Used: chocolate rinds purchased from Chocolate Garden in Wonosalam, Jombang. Distilled water as a solution for chocolate rind mixture that will be enumerated on thrasher (blender). Cow dung used as a starter, and the addition of other ingredients are yeast and grass.

---

[15] Corresponding author.

e-mail address: sri4tk@yahoo.com

Tools used: Consists of a digester tank (digester) equipped with a manometer, and a gas and water drainage system. Digester tank serves as the site of an overhaul of industrial wastes by bacteria through anaerobic fermentation process that produce a methane gas and compost.

Conditions set: one liter volume of materials (water and chocolate rind), giving starter as many as 10% of raw materials, add 25 ml of yeast

Variables were executed: Comparison of chocolate rind and water: 1:1, 1:1.5, 1:2, 1.5:1, 2:1.

Fermentation time: 5, 10, 15, 20, 25, and 30 days, the addition of grass: 50, 100, 150, and 200 grams.

Procedure: The raw materials which is a chocolate grind chopped in order to be uniform in size. After the chopping procedure, it continued with a dilution using blender and add water according to predetermined ratio. Stir until it mixed then add starter from a cow dung, yeast, and grasses according to the executed variable, then stir until mix evenly. The mixture of raw materials is then inserted into a bottle. Stir down after inserted into the bottle and after that observe the biogas product produced from anaerobic fermentation process in the time specified by means of gas produced using burnt matchsticks and blue color observed in the biogas produced.

RESULTS AND DISCUSSION

Concentrations obtained from this study can be said in accordance with Indonesia's National Standard namely between 50-70%, but the volume obtained is still a lot less because influenced by environmental conditions such as ambient temperature, pH, C / N ratio, total solids and mixing materials and how the placement of the bottle which is should not be positioned standing, it would be better positioned if the bottle tilted as it will have a larger surface area. The more surface area in the bottle, the greater the gas methane (CH_4) is produced.

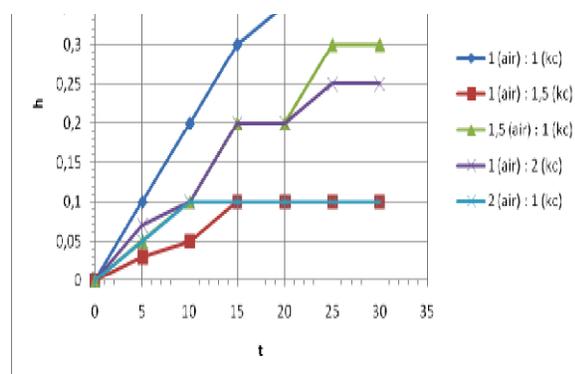
The highest concentrations of 74.22% was obtained at comparison of water and chocolate rind 1:1.5 with the addition of 150 g grass, while the value of the lowest concentrations of 60.04% obtained with the addition of 200 g grass. In ratio 1:1.5; 1.5:1; 1:2, and 2:1, the highest average concentrations found in 1:1.5 ratio and the lowest average concentrations are on 2:1 ratio. These results when compared with the research (Billah, 2009), the highest concentrations of methane (CH_4) obtained is 74% and the average value of the highest concentrations is in ratio of 1:1. This is caused by the difference in the ratio of C / N, and carbohydrate content between cow dung and chocolate rind. The difference in pH and starter or microbial that have the ability to decipher the ingredients to form CH4 and CO_2 from cow manure is better than the chocolate rind.


Figure 1. Fermentation time vs manometer height with variable of 50 g grass

Addition of 50 g grass, the highest volume obtained in 30th day with manometer height 0.4 cm, ratio of 1:1, while the lowest volume in 30th day with height of 0.1 cm found in ratio of 1:1.5 and 2:1 in both comparisons in 15th day and 30th day does not occur an increase in volume due to the mixing process is not perfect because the material is too thick. This viscous material has a high pectin content so it is necessary to do a process of breaking down pectin in advance to ease the process of fermentation. In previous studies (Billah, 2009) the highest biogas volume at 12th day with a value of 12.5 cm, due to the ratio of the number of microbial (starter) were used. Other factors that affect the volume of the temperature, because the temperature of 30-40 ºC bacteria can breed well. According to

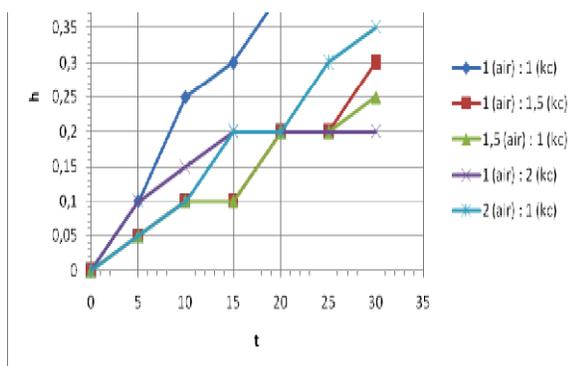
(Hudha, 2007), the role of bacterial is greatly affects fermentation process in production of biogas from organic material.


Figure 2. Fermentation Time vs Height Manometer with variable of 100 g grass

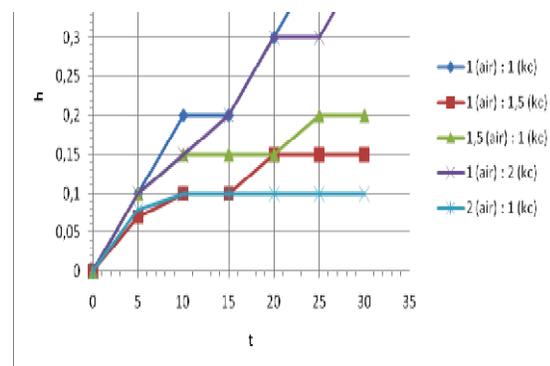
At addition of 100 g grass the highest volume occurred on 30th day with 0.45 cm height at ratio of 1:1, while the lowest volume at 30th day by 0.2 inches tall at 1:2 ratio, in both comparisons in 15th day and 30th day does not occur an increase in volume. In previous studies (Billah, 2009) the highest biogas volume occurred at 12th day with a value of 12.5 cm, due to the ratio of the number of microbial (starter) were used.


Figure 3. Fermentation Time vs Height Manometer with variable grass 150 grams.

At addition of 150 g grass the highest volume occurred on 30th day with 0.4 cm height at ratio of 1:1 and 1:2, whereas the lowest volume that occurred at 30th day with 0.1 cm height have a ratio 2:1 and at this ratio there was no increase in volume on 10th day until 30th day. In previous studies (Billah, 2009) the highest biogas volume at 12th day with a value of 12.5 cm height, due to the ratio of the number of microbial (starter) is used, the bacterial content of the cow manure is higher than chocolate rind.

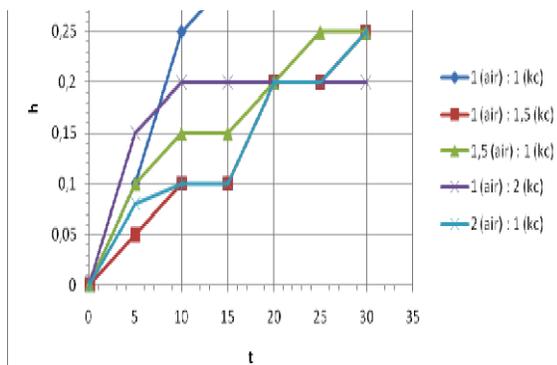
116   www.iet-c.net


Figure 4. Fermentation Time vs. High Manometer with variable grass 200 grams.

Addition 200 g grass give highest volume on 30th day with 0.3 cm height in 1:1 ratio and at this ratio there was no increase in volume on 15th day until 30th day. While the lowest volume at 30th day have 0.2 cm tall, 1:2 ratio and at this ratio there was also no increase in volume on 10th day until 30th day. In previous studies (Billah, 2009) the highest biogas volume at day 12 with a value of 12.5 cm is happened due to the ratio of the number of microbial (starter) were used. Other factors that affect volume was the temperature due to the bacteria can proliferate when the temperature was 30-40 °C, with that temperatures the biogas production process will run in accordance with the time, but it's different when the value of the temperature is too low (cold), then the time needed to become biogas will be longer than before.

Addition of 50, 100, 150 and 200 g grass have in common which is the highest volume occurred on 30th day at 1:1 ratio, while the lowest volume at 30th day have 0.2 inches tall at 1:2 ratio, and at this ratio there was no increase in volum on 15th day and 30th day.

CONCLUSION

In this study, the levels obtained are in accordance with the National Standard of Indonesia which is between 50-70% but the volume obtained was least when compared with previous studies (Mu'tasimBillah, 2009). The highest level of 74.22% was obtained on a 1:1.5 comparison of water and chocolate rind with the addition of 150 g grass.

Abstract

In parallel with the recent developments, education has also begun to use internet media. Internet usage has enhanced the quality of the education. This teaching systems have widened up to primary education. In our country, works and applications in this area have also increased and universities have included distance education into their systems. In this study, the contents of the circuit analysis course were developed according to distance education. Multimedia Technologies were exploited heavily in this work.

Key Words: Circuit Analysis, Distance Education, Multimedia;

Giriş

The use of internet technology has rapidly improved due to the use of computer increases. Internet is almost used in every field today.

Internet technology is realized that it can use in training system at the present time and it largely understood to be the facilitator in training system. Outside students of the group being trained in internet-based education is observed to benefit. This also has flexibility in terms of course.

Standardization efforts have started due to the spread of Internet-based teaching model in the whole world. As a result of these studies. For Learning Management Systems and all of components have been created standard. This studies are still continuing.

The aim of this study, after the technologies used for Internet-based training courses are to be prepared, examining the concepts and materials Electronics and Computer Education content development criteria, taking into account the contents of the distance education courses for Circuit Analysis.

Distance Education

Distance Education is economic and interactive education form regardless of time and place using information technology. Depending on the situation, it is realized as synchronous (simultaneous) and asynchronous (time-independent / asynchronous) in two ways.

In synchronous presentation, Users and servers are inside the application interactively through a live connection (Internet, satellite, etc.) in classroom environment simultaneously. Users can ask questions, discuss with each other or solve test.

Asynchronous presentations are Web-based educations. The user may participate at any time at any place the courses on the web, take the test and participate in activities. Courses may be repeated as requested. (Isman, 2008).

Some definitions related to distance education are as follows:

Distance education program is the name given to the study performs stand-alone training courses to help you prepare in a certain order of educational institutions and students (Isman, 2008).

Distance education provides access to education with satellite, video, audio, graphics, computer, multimedia technology with the help of electronic devices. USDLA, the teacher and the student are geographically remote from each other and said, this training program, the use of electronic means or written material and underline the need of

---

* Corresponding author. Tel.: +90-264-2957119
E-mail address: fatihc@sakarya.edu.tr

the printed materials. Distance education consists of two main parts including teachers and students in the field of teaching education. It provides access to education to other persons.

Distance education is to establish direct connection with the students. The distance learning program can be a method that replaces the forefront of the field of education, a program that can be interpreted as reinforcing the other methods (Isman, 2008).

Different time (asynchronous) teaching model

Participants will receive courses from anywhere at any time. In this case, all the activities from sign-examination of the course participants, course content be processed by the participants, subject to final examinations in the notes to be stored or subject teacher can able to make assignments, forums, whiteboard, chat rooms, electronic mail, providing a platform for communication between the participants and the teachers allowing a management program is necessary. This management program is called Learning Management System (ÖYS) and ÖYS program is a must of distance learning.

In this model, the publication of content delivery over the network forms other activities. Learning Management System (ÖYS) is a program that can be purchased in general as well as some institutions have developed their own applications. Today, largest shortcoming in this regard in Turkey and world is matching international standards in a wide range of different issues is the lack of quality content. Development of content fits these definitions are carried out by a team of crowded instructional designers, educators, writers, subject matter experts, audio, graphics, and computer experts. Quality and permanent education is interested with quality of developed content (Al & Orçun, 2004).

Simultaneous (synchronous) teaching model

In this method, in consequence of a teacher's course participants to tell and different places for targeted monitoring and participation in the course, the teacher told the course pursued by the participants in the course, the necessary equipment should be installed. While a teacher expresses courses in a class or in a studio, videos that broadcast live are delivered over the Internet with the appropriate software and hardware to the participants. Similarly, participants that watch courses in places have sufficient software and hardware and they can ask questions to teacher and can take answers. As you can see, in this method software and hardware infrastructure in monitored environments and presented courses compose main element. Here, the most important factor affecting learning content is described by the teacher in the classroom may not show much change the content of face-to-face training. Of course, plenty visual material of content will be more permanent (Al & Orçun, 2004).

Blended teaching model

In blending teaching, classroom education that will be used at a face-to-face education need to add with both methods above mentioned (Nicholson, 2002).

Different time teaching model from these teaching models form the basis of the study that we have done. The aim of this study, as well as this teaching model, student performs the learning process using Internet technologies.

Content Development Used Technologies and Concepts

Multimedia in the broadest sense, a computer-based application, the normal text, audio, images, graphics, animation, video, and supported the use of visual aids is the face of a user interface (Bourne, Harris, & Harris, 2005).

Traditional education in recent years, overhead projector, video, and etc. tools were used. One of the most striking developments is WWW in information technology today; normal text, graphics, images and sound are transmitted over the Internet is a network of multi-media. Web is capable of integrating from the materials in different formats in variety of environments. İt allows trainers to prepare an effective and efficient course (Bourne, Harris, & Harris, 2005).

Html

Hypertext Markup Language (HTML) documents how to connect to each other and determines how settle the text and images in the document and determines how settle the text and images in the document ve a system consisting of pieces of code called tag.

<BODY> .... </BODY> information between the post / commands (HTML code / source program) is created.

<CENTER>, <FONT>, <B> Sample HTML tokens / commands. HTML code is of no significance in the gaps left. The main thing, the formatting of HTML markers and environments.

Php

PHP is a scripting language and it is saved as PHP, PHP3 file extension after code is written in PHP editör. files written in PHP don't compile. A PHP interpreteris is only in Web Server to interpret scripts written in this language programs are available. This interpreter convert PHP scripts a format understood by the Web Server and sends.

```
1    <html>

2      <head> <title> This is my first Php Page </title></head>
3      <body>
4      <?php
5      echo ("Hi Evren");
6      ?>
7      </body>
8      </html>
```

5.

6.

7. Figure. 1. Php writing codes

Dreamweaver web design software

For programming languages such as HTML, Visual (visual) programming using the property editor programs which have been developed and ready-made objects. These programs are further simplified by using the HTML language, ready-made objects instead of program code used as images. Dreamweaver is one of the best of these programs. This program is a large, complex and interactive web pages, can be prepared. Dreamweaver is a professional web design package that is designed for web designers.

10.

An Adaptation of Circuit Analysis Course to Distance Education

Using the above-mentioned instruments, circuit analysis course notes that contain textual expressions is made more fun and intuitive for distance education students. Therefore animations are created and this animations will be able to watch again topics which do not understand gradually advanced.

Adapting sinusoidal function

11.

12.

    13.

    14.

    15.

    16.

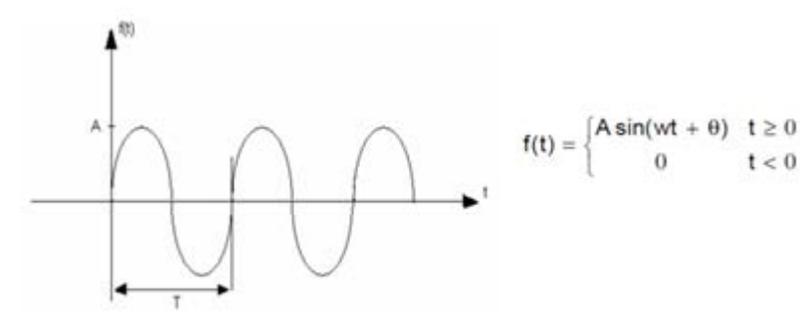
$$f(t) = \begin{cases} A\sin(wt + \theta) & t \geq 0 \\ 0 & t < 0 \end{cases}$$


Figure. 4. Sinusoidal function graph

The following definitions are made for the sinusoidal function: $f(t)=f(t+nT)$, n is about to be a constant, so sinusoidal function is periodic. T sinusoidal function's period, in contrast to the period is called the frequency. (A., Ferikoğlu, 2003).

$$T = \frac{1}{F} = \frac{2\pi}{w}$$

W is the angular frequency and the relation between with the frequency w=2□f. □□s called the phase angle of a sinusoidal function. A which is a constant shows the amplitude of the function. T's unit is second (s), f's unit is Hertz (Hz), w's unit is radian/second (rad/s), θ's unit is radian(rad) (A., Ferikoğlu, 2003).

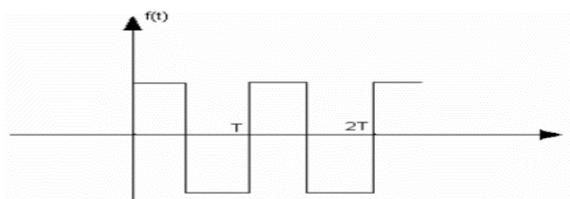
The following periodic functions are also commonly used, as well as sinusoidal function (A., Ferikoğlu, 2003).


Figure. 5. Square wave

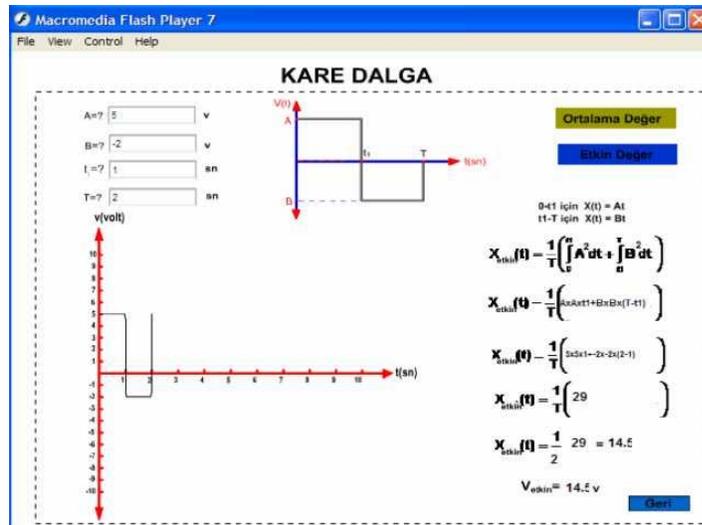
In study, distance education students select average and effective values. Sinusoidal and square waves is shown after textboxes are entered the required values.


Figure. 6. Square wave is plotted
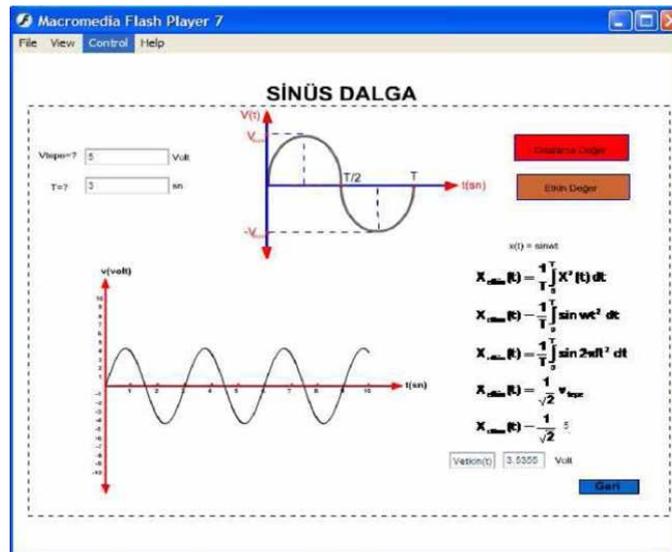

Figure. 7. The sinusoidal wave plotted after values have been entered

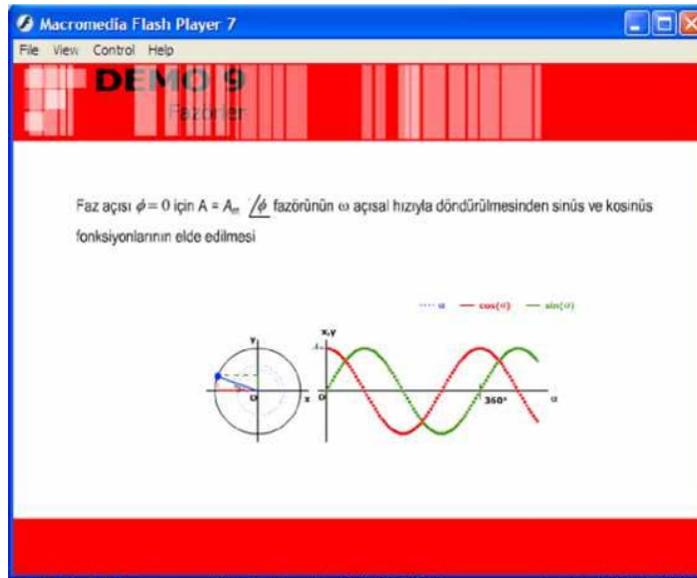
Animation is used to observe sinusoidal steady-state analysis's phase movement and angularly combined movement.


Figure. 8. Phase motion animation

Adapted to the application in the Internet environment

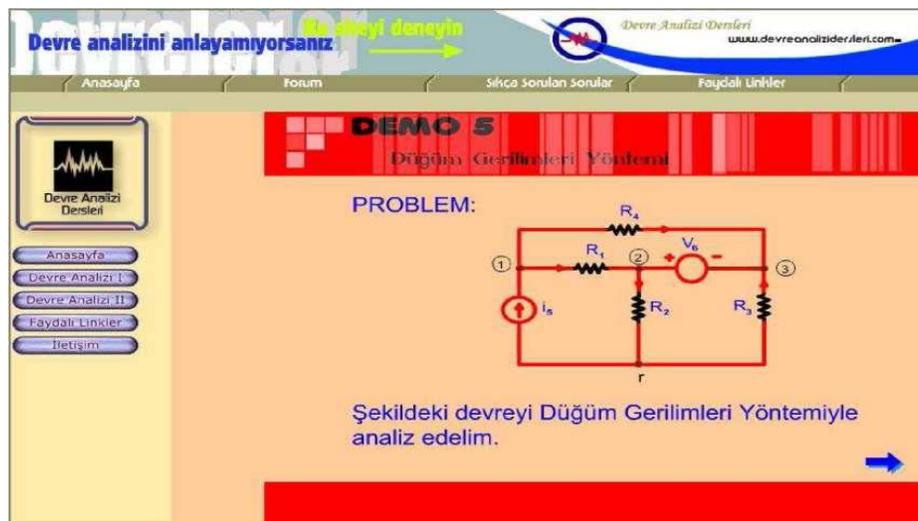
Our lessons were prepared to publish on the Internet. The application is a web page and can be used.


Figure. 9. Circuit Analysis course web page

Conclusions and Recommendations

In this study, A website that is easy usage, flexible and funny are designed to teach circuit analysis course over internet. this application also can be advanced by other methods. An example of this as ASP, PHP programs can be given. In the future, if ASP ,PHP etc. are used, it can be more interesting.

Aim of this study is to enjoy students and teach as interactive. Frame was used so that the user easily to reach the information. The right side section opens when the user clicks on the button on the left side. In addition, Student can return to the homepage from everywhere wherefore each page have homepaga button. In this way, leaving the user

to navigate the main topics on the page provided. design is given important in order to keep the user within the website. Forum is crated in order to discuss some of the issues among users. Subsequently users to be able to write their ideas on the web site put a guestbook. These are provided through the website to be more interesting.

Consequently, Circuit Analysis course at the beginning of the computer easy to understand and enjoyable for anyone who wants to learn how to Circuit Analysis Dersi'nin presentation via the web application has reached the desired goals and the application is fully reached the stage of completion. The imagination of the person who designed the site using the Web site way he wants can make it more fun by adding visuals. This entirely depends on the horizon of the person who designed the site.

Abstract

17. The term anatomy is coming from Greek Ana 'on, upon' and Temno 'I cut'. Today, the basis of anatomy education is the work performed on cadavers. However, due to difficulties in modern and alternative approaches to participate in the educational process, an essential element of today's educational process. In recent years for both time and training costs advantages and in order to ensure a healthy laboratory conditions, such methods, computer-assisted learning, simulation-based training, using true-to plastic anatomical models, plastination started to be used.

Keywords: Anatomy, Education, Technology, Cadaver, Plastination

1. INTRODUCTION

The human anatomy, one of the basic medical sciences, is one of the initial branches of medicine that studies the normal shape, structure and the organs of the human body as well as the structural and functional relations between these organs. Within an etymological frame, the term anatomy is formed by the combination of two ancient Greek words, Ana (remove) and Tomy (cut). It is expressed in the form of separation by cutting and removing. The term anatomy is 'Dissection' for Latin. Recently 'Dissection' is a term being used as a method for the examination of cadavers.

2. THE HISTORICAL PROCESS OF ANATOMY

Physicians need to know how the combination of all subsystems of the body works in harmony, in order to understand if there is a pathology in any part of the body or not. This is why anatomy is important for the medical education. When we look at the historical process of the anatomic studies, during the first period, we see the drawings of scientists that the internal organs of animals, as well as external images on the walls.

The first written records of Anatomy is said to have begun with Alcmeon from Craton 500 years before (Gürbüz, Karlıkaya & Mesut, 2004). The scientific and experimental style of today's medicine began at 3. Century BC. with the dissection experiments allowed by Ptolemy (Ronan, 2003). During this period, Herophilus, in particular on the work of the human anatomy, and Erasistratus exploration in dissection and physiology came into prominence (Lyons & Petrucelli, 1997; Garrison, 1921). To investigate the structure and the working system of the human body. Herophilus and Erasistratus make dissection on human cadaver in an objective manner firstly (Atabek & Görkey, 1998). After Erasistratus and Herophilus such scientists as Aristotle, Galleons, Avicenna, Leonardo Da Vinci, Andreas Vesalius, Claud Bernard have worked on the anatomy.

Knowledge of anatomy, from Hippocrates until Vesalius was obtained by the superficial structures of the human body and animal dissection. Along with Andreas Vesalius (1514-1564) dissecting desks have been introduced by physicians and medical students. Studies on cadavers formed the basis of anatomical education. Knowledge has increased rapidly as a result of these studies with human cadaver (Gürbüz, Karlıkaya & Mesut, 2004). In line with

* Corresponding author. Tel.: +90 312 304 32 05.
E-mail address: enkurt@gata.edu.tr

the recent technologic developments, today it has been started to be found difficult to study with the cadavers by the people and consequently the final developments led to the shift in the direction of the technology.

The method of "Parafinizasyon" has been developed by Deegener and Brendt in 1914, Hochstetter and Schmeidel in 1924. Since the structure of the samples are dry in this method, the natural image of them are shown as to be resistant to external forces. However, they are heat-sensitive and are not protected against flammability (Buyruk, Groen, Kempermann & Altuniçn, 1990). In 1977, Gunther von Hagens developed plastination, which has been more useful and increasingly used method at present. He organized an exhibition of plastination in Japan in 1995 for the first time. A similar exhibition was held in Istanbul, Turkey in 2010, and in 2012 another one followed it in Ankara.

3. DEVELOPMENTS IN TURKEY

Study of anatomy in Ottoman Empire began to show itself with 17th Century. The number of works written on this subject are quite rare, especially the ones containing pictures. One of them is Şemseddîn-i Îtakî's illustrated anatomy book, named 'Kitâb-ı Teşrîh-i Ebdân (Kâhya, 1996).

There was no significant attempt until the beginning of 19th century. From the beginning of the 19th century, The Head Physician Mustafa Behçet Efendi, prevail upon Sultan III.Selim to dissection which is part of the anatomy education. However, these attempts have not been very successful due to the prevailing circumstances. For the second time, during Mustafa Behçet's chief physician period, although the importance of anatomy was emphasized in medical education, the dissection could not be conducted because of the deep-rooted beliefs (Gürbüz, Karlıkaya & Mesut, 2004).

After 1839 anatomy has been included in the curriculum of education. Dr. Bernard from Austria has pioneered the start of training in anatomy. Initially, during the period of 'Tıphane and Cerrahhane-i Amire', it couldn't have been succeeded to work with cadavers for various reasons. However, with the establishment of 'Tıbbiye-i Adliye-i Şahane', Dr. Bernard wanted to carry out training activities on a cadaver in 1841. Only after having the permission of Sultan Abdulmecit, and the students had the capability to make a cadaver dissection (Erimoğlu, 1988, p.27).

Hristo Stambolski, who has been appointed to medical school in 1868 issued an atlas of anatomy in the same year and by translating from A. Jamin Mazhar Pasha published a book of Topographical Anatomy for the first time in Turkey as some of the frontier contributions to Turkish medical education (Erimoğlu, 1988, p.27).

In 1908, the method of "cadavers' cold storage preservation" by injecting formaldehyde was applied by Dr. Nurettin Ali Berkol (Erimoğlu, 1988, p.28). After the University Reform of 1933, the anatomy dissection education of medical students was continued by Prof. Nurettin Ali Berkol on the one hand and, on the other hand, Assoc.Prof. Hamza Vahit Göğen, Assoc.Prof. Mehmet Ali Oya and Assoc.Prof. Zeki Zeren prepared and presented a textbook of anatomy for the benefit of the students (Erimoğlu, 1988, p.28). After 1951, Dr. Zeki Zeren, worked for localizing the anatomy terms, and significantly contributed to the education system (Erimoğlu, 1988, p.29).

The apparent difficulty in the supply of cadavers since 1960, has reduced the number of cadaveric for education (Erimoğlu, 1988, p.30). Classical methods are applied in many medical schools in our country. The interactive methods, integrated into the education system and computer-based training systems increasing with time.

4. ANATOMY EDUCATION TODAY

The main purpose of the anatomy education for the student is to gain the required information by the practical way and use it properly. To reach this purpose, there are several methods of training.

Using the technology contributes learning even teaching. Using technology also increases motivation of the student. Thereby learning becomes more permanent (Mandıracıoğlu, Hassoy & Karababa, 2011, p.18). Moreover, using model, plastic model and computer assisted simulator technologies instead of traditional methods is preferred as a part of respect to privacy in medical ethics (Balcombe,2001).

4.1. Training with Cadaver:

Currently the practical studies on cadaver are forming the basis of anatomy training. The student can learn the macroscopic structures of anatomic formations, the relationships between them and their vicinity by touching and seeing in the studies on cadaver. However, the difficulties of finding cadaver for medical faculties, loss of form and degeneration of tissue in the post mortem term, diversifications in the structure, colour and smell as a result of the chemical usage for detection make the studies on cadaver unsuitable.

It is known that formaldehyde, the chemical material used on cadaver, causes irritation of respiratory tracts and eyes of people and determines several health problems. (Ohmichi, K., Komiyama, M., Matsuna, Y., Takanashi, Y., Miyamoto, H., & Kadota, T., et.al., (2006); Arts, Rennen & de Heer, 2006).

4.2. Training Based on Simulation:

4.2.1.   Simulation:
Simulation is described as comparing to real, imitating the attitudes those exists in reality (Patrik, 2002). Properties of simulators are valued depending on not only the similarity to the truth, but also the respond to the applications. It can be said that especially the more respond is sensitive, the more qualification is high-level (Mıdık & Kartal, 2010; Patrik, 2002; Maran & Galvin, 2003).

4.2.2.   Usage of Simulation in Medicals:
First important usage of simulation was Resusci-Anni created by technology and anaesthetists in 20th century (Mıdık & Kartal, 2010; Bradley, 2006; Ziv, Wolpe & Small, 2003). Later in sixties Abrahamson and Denson made a human simulator called "Sim Man". In this simulator it could be carried out: Heart beat, carotis pulse, imitation of human acts, mouth moves, winking, respond to intravenous applications and blood pressure measurement etc. However, it couldn't be produced serial because of those time conditions (Mıdık & Kartal, 2010; Bradley, 2006; Good, 2003). The third development was occurred by utilization of simulators by medical students and it was accepted globally after nineties. To follow on, these praxis were used in post graduated terms further in the clinical skills laboratories (Mıdık & Kartal, 2010; Bradley, 2006).

4.2.3 Benefits of Simulation:
Simulation supports one of the basic principles of bioethics "first do no harm" by providing students to notice their mistakes in different scenarios. Provides equal opportunities for each student (Patrik, 2002). In terms of the patients, it minimizes the risks of damage by the educational processes which would be held on them (Ziv, Small & Wolpe, 2000; Ziv, Wolpe & Small, 2003).

4.2.4. Weaknesses of the Simulation:
The most important weakness is not to replace clinical education, but only supports (Mıdık & Kartal, 2010).

4.2.5. Simulation Tools:
The simulations can be divided into two main groups: Low-tech simulations and High-tech simulations (Mıdık & Kartal, 2010).

4.2.5.1. Simulations Does Not Contain Advanced Technology ;
<u>Three-Dimensional Organ Models;</u> Like skeletal anatomy, lung, heart, larynx models, used in laboratories.

<u>Basic Plastic Mannequins;</u> These Models are used in the basic and advanced life support training and also can be used at physical examination, interventional training and wide range.

<u>Animal Models;</u> These models are used during the training of physiology.

4.2.5.2. Simulations Including High Technology;
<u>Screen-Based Simulations;</u> It is a kind of computer-assisted education (Rasmussen, Mason, Millman, Evenhouse & Sandin, 1998). It is known that different studies were carried out about these subjects. For example, Mary Rasmussen and her friends presented the three-dimensioned structure of the temporal bone virtually. In this way, the difficult and complex structure of this bone became easier and comprehensible by the virtual media (Langrana, Burdea, Ladeji & Dinsmore, 1997). Another study was carried out by Noshir Langrana and his friends. Here, a

simulator was generated which enabled the cancered tissues to be inspected. Today, it is possible to examine a variety of cancer types by the use of this simulator (Mıdık & Kartal, 2010).

Realistic, High-Fidelity Procedural Simulators; These are the simulators which imitate the parts of human body and focus on certain responsibilities (Bradley, 2006; Maran & Glavin, 2003; Mıdık & Kartal, 2010).

Realistic High-Tech Interactive Human Simulator; These are composed of models quitely resembling human and computer assistant. A realistic medium is maintained by computer assistant and they give the opportunity of managing these complex clinical situations to the students (Mıdık & Kartal, 2010; Good, 2003).

Virtual Reality and Haptic Systems; Technologic education requiring high-level computer assist which is used especially in surgery education (Maran & Glavin, 2003; Mıdık & Kartal, 2010).

4.3. Education by using cast models and plastination:
People gain knowledge by using visual, auditory and touch senses at most. It can be claimed that the usage of three-dimensioned plastic models in anatomy education raises the learning performance. On the other hand, although the complex structure of cadaver prepared by formaldehyde includes different variations, it may hide the details wanted to be given to the student. However, the subjects introduced by plastic models are easier to be learnt and comprehended by the student (Gültiken, 2012). The use of virtual materials in education, makes the concepts concrete, easy to understand and facilitate the chance of observation and re-using (Mandıracıoğlu, Hassoy & Karababa, 2011).

At the beginning of 20th century, anatomy lessons were taught by plastic models of organs. For example, German students have used these models since 1930's. Anatomist Dr. Gunther von Hagens, who is a researcher in Heidelberg University in Germany, worked for 10 years on development of plastination method in stead of plastic models since the middles of 1970's (Britta, 2012).

Plastination is a method which is formed by banishing oil and water from the subscribed body tissues and replacing them by polimerized materials and hardening the samples by shaping them out (Buyruk, Groen, Kemperman & Altuniçn, 1990). This operation should be carried out in about two and ten days after the death for resembling a living body (Britta, 2012). Highly substantial cadavers which are unwatered, scentless and real-like can be obtained by the use of polimers like resin, silycon and polyester in this method (Sugand, Abrahams & Khurana, 2010). The type of polimere used in the method determines the properties of the plastinized sample, like optic (transparent or opac) and mechanic (flexible or stable). Being unwatered, scentless and substantial, the plastinized samples preserve even their structural properties at the histologic level (Von Hagens, Tiedemann & Kriz, 1987).

Past studies indicate that students are more sensitive to models which are prepared by plastination. At the same time, it is concluded that the material prepared by plastination increases the learning ability (Latorre, Garcia-Sanz, Moreno, Hernandez, Gil, Lopez et.al., 2007). Another determined fact is that the plastinats are less damaged than plastic models. (Sugand, Abrahams & Khurana, 2010). Plastination method was also tried in Turkey, by using cheaper polimers like alkid resin in order to decrease the cost (Gültiken, 2012).

CONCLUSION

We are in an era of educational technologies being used today. Therefore, to engage the modern and alternative approaches into the educational process is an essential element of today's education sector. Teaching anatomy traditionally on cadavers in faculties of medicine is essential because they provide the opportunity of knowing three-dimensional structure and diversity of the body. But in recent years, the bodies as training equipment are being simulated by images, using computer-aided teaching methods; some plastic lifelike anatomical models or other recent methods such as the use of plastination are being used. The use of all these recent and technologically developed methods allows us to decrease both the required time for training and the cost of education. In addition to these contributions, ensuring the hygienic and healthy conditions in the laboratory environment is becoming a matter of preference as well.

The health problems, which the staff working in education may face because of the conventional cadavers' appearance and unpleasant odors caused by formaldehyde, allows working after removal from the pool wetness, are

of great importance considering the model and plastinates. However, all of these models, as it is known, may not create a suitable environment to monitor the anatomic variations of the human body and possible pathological structures. Consequently, although it seems to have some negative aspects dealt with, it is still considered to be appropriate, continuing the use of cadavers in education.

Abstract

Transfer of information from one point to another by using electronic signals to provide medical services is defined as telemedicine. Today, many people and intuition who want to get health care service through telemedicine consults the internet. Technically it would be possible to reach the database from the outside that contains the information so the protection of personal information and maintaining the confidentiality seems to be so difficult. Ethical problems usually emerge in the phase of protection of privacy. Therefore, on the one hand the use of technological means as scheduled, on the other hand the risks that may arise should be evaluated in terms of ethics.

Keywords: Health, Ethics, Technology, Telemedicine, Internet

1. INTRODUCTION

Increasingly, the Internet has become a part of our daily lives, the number of internet users in the world is nearly two and a half billion as of June 2012 and it is approximately close to 36.5 million people in Turkey (http://www.internetworldstats.com/stats.htm.). As internet usage is growing rapidly over the years, the internet brings a rapid increase in crimes and ethical violations with it. However, despite this, one of the leading uses of it is in health during daily life.

2. TELEMEDICINE

2.1. Description:
Telemedicine has been described in the form of 'use of information and communication technologies to transfer information the correct diagnosis, treatment, disease and injury prevention, continuing education of health professionals, individuals, or in any case affect the development of community health' by the World Health Organization (Feroze, 1996).
Also telemedicine is described by 'United State Institute of Medicine' in 1996 as 'Where the distance is a problem, the use of electronic information and communication technologies (two-way video, e-mail, smart phone, cordless tools and other telecommunication technologies) to provide and support healthcare (Milli Eğitim Bakanlığı, 2008).

According to Ministry of Health of the Republic of Turkey, telemedicine is 'With the widest range of definition to present the remote health services. Telemedicine includes providing services in the fields of radiology, pathology, and ultrasonography in information and communication technologies in health service delivery through the distance between the secondary and tertiary health care institutions. (http://www.saglik.gov.tr/ SBSGM/belge/1-15487/tele-tip.html).

2.2. Development:
Over time and with the development and getting cheaper of information and communication technologies, telemedicine has steadily expanded the range of applications. As a result of this expansion the boundary between the disciplines has obscured partly (http://halilaktas0.tripod.com/odev/ teletipnedir. htm). Looking across application areas in medicine today, cardiology, ophthalmology, radiology, pediatrics, dermatology, psychiatry, pathology, pulmonology, neurology, gastrohepatology, surgery stands out as the branches (Ertek, S., 2011).

Nowadays medical informatics which is almost become an essential concept at the past it was a concept if there would be better (DeShazo, J.P., LaVallie, D.L. & Wolf, F.M., 2009). Telemedicine applications not new in the world also have an increased importance in our country recent years. In applications of telemedicine especially Radiology plays an important role such rate of 57% . This applications provide an easy and fast access to information for health professionals (Erdoğmuş, P. & Erdoğmuş, B., 2003). It is reported that approximately 70% of all radiology practices in the United States is made in the form of teleradiology (Binkhuysen, F.H.B. & Ranschaert E.R., 2011).

The first application to telemedicine in the medical literature was created in the form of teleradiology system in 1950, by Canadian radiologists from Montreal Jean-Talon Hospital (Field, M.J., 1996, pp.36). In this regard, Ruggiero who conducted the world's first application said that, inspection results sent by the Jutra using coaxial cable In Montreal in 1959 (Ruggiero, C., 1998). Then, at the end of 1960 between The Logan International Airport Medical Center and Massachusetts General Hospital in East Boston Information communicated by establishing a microwave transmission line (Murphy, R.L.H. & Bird, K.T., 1974). The first application in Turkey was realized between Günmar MR Center, Gaziantep and Medart Medical Center, Ankara in 1997 (Erdoğmuş, P. & Erdoğmuş, B., 2003).

2.3. Application Areas:
Telemedicine, not only is used with the aim of remote monitoring and examination of patients in clinical practice, but also of medical education, management, and is also used in scientific research. When we look at the world for the intended use, diagnosis, education, management, scientific research, medical monitoring and treatment protocols, natural disasters, mobile applications, public health and preventive medicine such areas see used in application (Milli Eğitim Bakanlığı, 2008).

2.4. Purpose:
Ministry of Health of Republic of Turkey described the objectives of telemedicine listed as follows;
  a. Collection of all images and information about a patient in a common electronic field.
  b. The creation of a safe and fast way to share the information by relevant physician.
  c. To Digitize hospital processes.
  d. Use of information and communication technologies in the remote delivery of health care services.
  e. The creation of a digital hospital concept.
  f. Alleviating the shortage of experts in the field of medical imaging.
  g. Complicated cases, made a quick consultation.
  h. The provision of information and experience sharing among physicians.
  i. The creation of tools that help diagnose accurately and quickly.
  j. Ensuring the quality and precision of the evaluation of patients.
  k. Reducing hospital costs and increase productivity (http://www.e-saglik.gov.tr/ ERadyoloji. aspx)

2.5. Benefits:
Health care will be taken to the patients that away from medical centers; Remotely assess the condition of patients with the latest technology equipment and systems; Reduction in hospital costs and achieve savings in terms of time; Obtain information from the environment of the patients, and provide 24-hour service (Işık, A.H. & Güler, İ., 2010; http://www.teletip.com.tr/hak.asp); Bed due to shortening cycle more efficient use of the number of beds; Elimination of waiting periods will result in death; Specialist physicians able to reach a broader patient population and satisfied more patient; Provide expert support for health care personnel working in remote areas; Health-related statistical information can be obtained in a very short period of time (Milli Eğitim Bakanlığı, 2008).

3. ETHICAL PROBLEMS

The main ethical problem areas   are: Insufficient clinical information transfer to the opposite side, broken communication between doctor and patient, inaccurate and unclear reporting, security of personal health information maintained in electronic form, the reliability and risk of housing, How much the responsibility of the physician during the consultation with the patient will be, What will happen in the event of consultant physician disagree with the patient's physician, How to be and how to inform the patient informed consent (Gülhan, Y., 2006, p.138), the decrease in the control might be caused a defect in informing patients, using growing technology plays difficulties in autonomy, in own specific cases these technological developments might reasoning errors, decreases the concept of trust between doctor and patient (Doğan, H., 2006, p.103), During surgery applications who belong to the legal responsibility (Gülhan, Y., 2006, p.138).

Today, with telemedicine, many people and corporate who want to get health care consults internet site. As well as many health agency and health personnel which provides health services, share data and professional knowledge over the Internet offer. Technically, it may be possible to gain externally access to the database where the information is evaluated maintaining the confidentiality of the provided information and the protection of personal information seems to be difficult. Also the ethical problem arises in the stage of protection of privacy which stored on personal information. Capturing patient records by unauthorized persons may jeopardize the principle of the protection of private information of patients and may be able to misuse.

For one of the most important problem areas, to keep stored personal data that prepared electronically, the protection of health data and protection of private life have been various national and international regulations. According to this, The 12. Article of Universal Declaration of Human Rights declares that 'No one shall be subjected to arbitrary interference with his privacy, family, home or correspondence, nor to attacks upon his honor and reputation' (Resmi Gazete, 1949) and Article 8 of the Declaration of Lisbon on the Rights of Patients Published in 1981 and revised in 2005, declares that " Patient's has a right to expect from physician, to respect the confidentiality of all medical information about his private life' '(WMA Declaration of Lisbon on the Rights of the Patient, 2005). In the 4. Article of Declaration on the Promotion of Patients' Rights in Europe, Amsterdam 1994, "Protection of personal information, even after death, protect the patient's identity, the protection of patients' records from third parties" subheadings are listed (WHO A Declaration on the Promotion of Patients' Rights in Europe, 1994). Article 1 of the; Section 1 of the Convention on Biomedicine; it is specified that Protection of human dignity and the identity is given the responsibility of states and the rights must be secured (Resmi Gazete, 2003).

When we look at the national survey prepared for the protection of personal data we encounter the followings; Article 23 of the Patients' Rights Regulations entitled "disclosure of information" in 1998 (Resmi Gazete, 1998), Article 9 of Code of Professional Ethics in Medicine entitled "Confidentiality Obligation" and Article 31 entitled "Giving the patient on the patient and the use of information" in 1999 (Hekimlik Meslek Etiği Kuralları, 1998), Article 4 of Rules of Medical Ethics "Medical and dental surgeon, can not disclose the learned the secrets of the patients unless legal obligation" in 1960 (Resmi Gazete, 1960), 20th Article of The 1981 Constitution of Turkish Republic, entitled "Privacy and the Protection of Private Life" (Resmi Gazete, 1982).

With more cases in the forefront of technological opportunities, physician-patient communication and relationship between them was adversely affected. Because of this, physicians use of their own ability has decreased. This is manifested not only in the form less conversation with the patient, but also as a simple physical examination and diagnosis deprivation or to patients who may be treated to favor a more complicated treatment (Oğuz, Y., 2006, p.295). For example, today one of the most widely used methods for teleradiology patient and the physician are not talking a direct relationship with the clinical data disruption and feedback during the writing of this report and to be more sensitive to the physicians. Physicians are not faced with the patient and could not know the full details of patient's narrative, and even the need to stay away from relatively precise diagnosis and may wish to additional investigations. Thus, unnecessary labor, time and material loss arises (Gürkan, M., 2009).

Nevertheless the time spent and the cost is getting decreasing through telemedicine, also by leaving the classic methods in the physician-patient relationship decreses morale and confidence. By decreasing confidence the healing process negatively affected. This leads us to the technological methods can not be replaced, a well-established patient-physician relationship (Gürkan, M., 2009).

Another example is, in the classical system making it relatively difficult to falsify on radiographs and it can be perceived easy. However, the data generated in computer still can be changed via the computer, can be much easier than the conventional method. In addition, the presence of electronic data networks such as the internet or data during transmission over long distances where the security gaps that may occur in the form of unauthorized access so these information that should be kept confidential patient data seize by third parties or even offer of making changes on this data not only legal problems but also ethical problems (Gürkan, M., 2009).

In terms of medical ethics secrets of the patients can be contributed and we find a violation of the principle of "Confidentiality" (Gürkan, M., 2009). We can clarify this situation a few examples from real life. According to Gürkan; A health worker who may have access to medical information gave the information about four thousand HIV (+) patients to two newspapers. Elements of a company, the financial information of the patients were sold to another company that

distributes data. In June 2008, a bone marrow donor bank which has about thirty thousand identity information has stolen by copying files from the computer. In August 2000, 858 patient records confidentiality has been violated by the improper appointment (Gürkan, M., 2009).

4. CONCLUSION

The personal health data, have attempted to ensure with a variety of national and international regulations. Thus, on the one hand envisaged the use of technological opportunities as possible, on the other hand the risks that may arise should be evaluated in terms of ethics (Gürkan, M., 2009).

Remote reporting or evaluation of patient information is a fast-growing and inevitable phenomenon, which includes a variety of advantages and disadvantages. It is considered to be a high potential of additives for the use in accordance. However related to the field of technical, medical, legal and ethical regulations is considered to be needed (Gürkan, M., 2009).

Because of all this these problems those may arise during the implementation of telemedicine there are no regulations about who neglect or who will be responsible for damages. This is another problem area. Therefore, to overcome these deficiencies constitute legal regulations and ethical basis for these analyzes shall be performed (Gürkan, M., 2009).

In the circular "Data Security" which was published by the Ministry of Health of Turkey, stated that; security policy within the scope of personal health records; about data security, confidentiality, integrity and accessibility that the three basic principles to be taken into consideration and in the context of "System Security" traceability, identity testing, reliability, and not to be denied the four basic principles should be carried out (Sağlık Bakanlığı, 2005).

13th International Educational Technology Conference

Analysing the success of level determination exam according to the school type and lesson type that is represented by questions in the exam

Abdullah ÇAVUŞOĞLU[a], Baha ŞEN[a,19], Emine UÇAR[b], Murat UÇAR[b]

[a]Yıldırım Beyazıt University, Faculty of Engineering and Natural Sciences, Department of Computer Engineering, Ankara, Turkey
[b]Karabuk University, Faculty of Engineering, Department of Computer Engineering, Karabuk, Turkey

Abstract

The purpose of this study is to determine if there is any relation between level determination exam (LDE) point and the type of school and the points that student got from those lessons which are represented by questions in the exam. Randomly selected data belongs to 8th degree primary school students among whole Turkey are used as the sample data. To investigate the significance level of relationship between two variables independent of each other, first of all the correlation values between two variables has been examined and then some statistical tests has been applied.

As a result, it has been observed that there is a strong, meaningful and positive relation between the achievement of students on the lessons which are represented by questions in the exam and the LDE points. Furthermore, it has been observed that the type of school that students attend is also effective to the success and it has been seen that the students who attend private schools are more successful than the students in public schools.

Keywords: Student achievement, LDE,school type

Introduction

Education system is exam-oriented in Turkey. Understanding the factors that lead to success (or failure) of students at secondary education is an interesting and difficult problem. Therefore, determining the variables that are related to academic achievement of students have always been aroused the curiosity of the researchers. Often centralized placement tests and future academic achievements are considered as related concepts that are derivative of each other. The purpose of this study is to determine the importance level of variables that is considered to have an impact on student achievement and guide students' accordance with the objectives of education.

Many researches have been done in the country and abroad in order to determine the items that affect students' success in the exams. Understanding the factors (i.e., the predictor variables) that affect students' academic achievement is a critical input to understanding and improving the educational landscape. Many of the previous studies analysed this phenomenon one variable at a time. They tried to collect data, mostly from survey type instruments, to understand the relationship between a single factor and its impact on academic achievement. For instance, some researchers studied the correlation between academic achievements and parenting styles (Attaway & Bry, 2004; Steinberg, Lamborn, Darling, Mounts, & Dornbusch, 1994), others focused on socio-economic status (Goddard, Sweetland, & Hoy, 2000). Some others investigated the impact of teacher aid to academic achievement (Gerber & Fin, 2001) while others looked at the significance of different schools types (Carpenter, 1985). On the behavioural side, some researchers looked into the perception of personal control (Stipek, 1981), others looked into the efficiency of principals (Gentilucci, 2007), gender (Kelly, 1993), and locus of control (Bain, Boersma, & Chapman, 1983). Some of these studies found statistically strong relationships between the individual factors and academic achievement based on the limited data that they have based their studies on. Some researchers looked into a pseudo representation of academic achievement, namely the level of success in centralized placement test. Some claimed to have found strong relationship between test scores and family income. Their results pointed out that the level of income has a positive effect on test scores and further academic achievements (Carneiro, 2008; Yenilmez &

---

E-mail address: bsen@ybu.edu.tr

Duman, 2008).On the other hand, some other researchers have stated that income does not directly affect academic achievement, but affects the beliefs and attitudes of the family, which in turn affects the ultimate outcome (Davis-Kean, 2005). For instance, the families on a high income can afford to send their children to private schools, and provide them with additional private tutoring, which, at the end, may translate to higher academic achievement (in general, but not always).

According to the study of Morrison and McLntyre (1971), father's and mother's level of education and profession influence the children's educational achievements and plans positively and the size of family affects adversely. According to the survey of Balu and Duncan (1976), there is a high relation between the education level of male students and profession and education of their fathers. Especially the success in profession and social status of male students closely related with their father's profession and education. Another approach is to assert that qualitative and quantitative characteristics of the school do not have significant effect on student's educational achievements and student's achievement is determined by familial and other social factors out of the school (Coleman et all, 1966, Jencks et all 1972, Bowles ve Gintis 1976).

Purpose of the study

The purpose of this study is to determine if there is any relation between level determination exam (LDE) point and the type of school and the points that student got from those lessons which are represented by questions in the exam. For this reason, it has been investigated the relations between LDE points and the type of school and the points that student got from those lessons which are represented by questions in the exam

Methodology

In this section, the research group, data collection instruments and analysis is explained. The universe of the study is composed of students studying at 9th degree in 2010-2011 academic years. Randomly selected data of 5000 students in Turkey has been taken as sample. This data belonged to students has been gathered from e-school system of Group Head of Information Technology of Ministry of Education. By comparing LDE points, school types and scores that have been taken from lessons which are represented by questions in LDE of concerned students, it has been investigated whether there is a significant relationship between LDE and those compared variables. In order to reveal the relationship, statistical analysis such as frequency, percentage, correlation, standard deviation and arithmetic mean have been applied on obtained data.

Findings

For evaluation of the study, first of all the frequency distribution has been examined and the frequency distribution of students by school type is as in Table 4.1. As seen in Table 4.1, the percentages of students who attend public schools are more than the ones who attend private schools.

18. Table 4.1. The frequencies and percentages of the students according to the school types.

School Type	Frequency	Percentage
Public	3379	67,6
Private	1621	32,4
Total	**5000**	**100**

For evaluation of the study, mean, standard deviation, minimum and maximum values belonging to lessons which are represented by questions in LDE has been given in Table 4.2.

19. Table 4.2. The statistics of lessons which are represented by questions in the LDE.

Lesson Name	School Type	N	Minimum	Maximum	Mean	Standard Deviation
	Public	3379	16,8700	99,6000	64,0527	15,1487
Turkish	Private	1621	37,6300	100,0000	82,5508	11,7762
	Total	5000	16,8700	100,0000	70,0497	16,5830
	Public	3379	15,9433	99,3367	57,8722	17,7392
Mathematics	Private	1621	21,3733	100,0000	79,5701	15,3342
	Total	5000	15,9433	100,0000	64,9067	19,7993
	Public	3379	16,0567	98,9600	62,1648	15,7082
Science and Technology	Private	1621	28,7400	100,0000	81,4873	13,0453
	Total	5000	16,0567	100,0000	68,4224	17,4295
	Public	3379	15,7733	99,5000	62,4088	16,4952
Foreign Language	Private	1621	21,4967	100,0000	80,6188	14,0845
	Total	5000	15,7733	100,0000	68,3125	17,9113
	Public	3379	25,8933	100,0000	75,7803	12,8054
Religion and Ethics	Private	1621	31,2133	100,0000	90,7567	7,6589
	Total	5000	25,8933	100,0000	80,6235	13,3786
	Public	3379	22,1467	98,2467	65,1941	15,0773
Social Studies	Private	1621	42,3567	100,0000	83,2976	11,8446
	Total	5000	22,1467	100,0000	71,0633	16,4589

The distribution of LDE points according to the school type has been given in Table 4.3. The analysis of mean scores of LDE has showed that the students who attend private schools are more successful than the ones who attend public schools.

20. Table 4.3. The distribution of LDE scores by school type.

School Type	N	Minimum	Maximum	Mean	Standard Deviation
Public	3379	114,9200	488,8350	308,1991	72,9352
Private	1621	162,1490	497,8810	410,7904	62,8001
Total	**5000**	**114,9200**	**497,8810**	**341,4592**	**84,7295**

The results of correlation analysis between LDE points and the scores of lessons that are represented by questions in LDE have been given in Table 4.4. Findings have showed that correlation factors are close to each other. It has been observed that there is a quite high, significant and positive relation between LDE points and lessons that are represented by questions in the LDE by 0,01. According to the correlation factors, the highest level of relationship is between Science and Technology lesson and LDE point.

21. Table 4.4. The results of correlation analysis.

Discussion and Conclusion

The findings of the study show that the scores of lessons that are represented by questions in LDE taken by the students who attend private schools are higher than the students in public schools. The second result obtained from findings shows in parallel with the previous result that the students who attend private schools are more successful on LDE than the students in public schools.

Another significant result of the study is that here is a quite high, significant and positive relation between LDE points and achievements of the students on the lessons that are represented by questions in the LDE. In other words, the students who have high scores on these lessons are more successful in LDE.

Our previous study for predicting secondary education placement test result is revealed that previous test experience, whether a student has a scholarship, student's number of siblings, previous years' grade point averages are among the most important predictors of the placement test scores (Şen, Uçar & Delen, 2012).

13th International Educational Technology Conference

Analysis of Research in Programming Teaching Tools: An Initial Review

Syahanim Mohd Salleh[a,20], Zarina Shukur[a], Hairulliza Mohamad Judi[b]

aSchool of Computer Science, Faculty of Information Science and Technology, Universiti Kebangsaan Malaysia, 43600 UKM Malaysia
bSchool of Information Technology, Faculty of Information Science and Technology, Universiti Kebangsaan Malaysia, 43600 UKM Malaysia

Abstract

This paper describes preliminary results of research related to programming teaching tools. This study focuses on the key issues being highlighted in this research. Among the research questions of the study are: What are the important issues in programming teaching and learning research? What are the methods of the research? What kind of tools involved in programming teaching and learning? What is the level of programming involved? The study applies systematic review approach to 45 research papers derived from the ACM digital database, published between 2005 and 2011. The study found six issues related to programming teaching tools, and most of the issues concern on the techniques and methods used in teaching, learning and assessment. Regarding the level of programming involved, majority of the research focuses on introductory stage.

Keywords: Teaching tools; Programming; systematic review

Introduction

Various tools have been introduced in education process to enhance teaching and learning activities. These tools play important role for enriching students' learning experience on the learned subject. In programming teaching and learning, various electronic tools are available. These electronic tools are essential since programming software and environment are closely related to and require computer as a platform to implement and test the syntax of programming.

Programming process involves a combination of activities i.e. planning, designing, testing and debugging. To learn on how to develop a program, students need to understand the syntax of programming language. The complexity of programming and difficulty to comprehend program logic often lead to frustration and lack of motivation to learn programming (Caitlin Kelleher, 2005). According to Garner (2007), learning separation between theory and practical sessions complicate the learning process in this course. Eventually, these factors contribute to the high rate of dropouts in programming courses at most universities and colleges.

These problems have stimulated researchers to find ways to help students in learning programming. Among the top three topics in programming teaching and learning are issues related to programming tools (Sheard et al. , 2009). Available programming tools and environment such as Alice, BlueJ, Jeliot, Scratch and Greenfoot intend to facilitate teaching and learning in programming and to reduce the burden of instructor. Various learning strategies such as story telling, games in learning approaches, simulation and visualization techniques as well as pair-programming approaches are implemented to enhance student engagement and to develop creative thinking as one of the preparation strategy for students to become future producers, not just consumers of technology (Denner et all., 2012). Researchers in programming teaching and learning areas also give their attention to related issues for example students' attitudes toward programming and assessment activities in the process.

Although programming teaching and learning research has rapidly increased, there is little study to evaluate and synthesize the results of relevant research in this area, specifically within the context of programming tools. The objective of this paper is to identify the direction of recent research in programming tools usage in teaching and learning from 2005 to 2011. Four research questions were raised in this study: what are the current issues related to

tools in programming teaching and learning?, what are the adopted method in the research?, what kind of tools that were developed or used in programming teaching and learning?, and what are the level of programming involved?

Programming Tools

Programming consists of three main components: program, programming tools and programming language. As one of the key element in programming, programming tools play an important role in programming development and implementation. Programming tools provide the software or environment that allows programmers to give instructions, test them and implement the program. Ability and skills to use programming tools are considered as important and equivalent to skills in syntax and logic. In teaching and learning of programming, programming tools is one of the main topics that discuss issues related to pedagogy, curriculum and programming languages (Janet C. et al, 2011; Anorld, 2007; Judy, 2009).

Programming tools are supposed to assist novice programmers, students and instructors in developing programming skills. Though many of programming tools are available in market and most of them can be downloaded from the Internet and supported by most platforms, only a small number of them are suitable to be adopted in programming teaching and learning (Valentine, 2004). As a consequent, skills in using programming tools could be gained only through informal learning, trial and error process, using either Internet sources, help functions, or from insertion notes supplied by the software.

Program software developers are generally designed to meet the needs of professional and advance programmers. Usually, the software are equipped with complete set of concepts and complex functions. Due to limited experience and knowledge among novice programmers, it is very difficult for them to understand and use the functions. As a result, this complex functions are perceived as problem rather than solution that help them in producing program. Furthermore, complexity in software interface, difficulty to understand error messages display and warning messages are among the reasons why most programming tools are not suitable for the programming learning environment (Arnold et al, 2007). These hurdles distract and fade away the initial interest possessed by novice programmers or students.

This problem calls for innovative programming tools and environment suitable for teaching and learning purposes. Better learning can be achieved by using a tool that combines communications technology, active learning and visualization display. Jeliot3 is among programming tool architecture and features that support device from cell phones to interactive code that allow mobile users to contribute code and predict its performance (Andrés et al, 2004).

Research in programming teaching and learning has produced a variety of special tools to help students develop their program. Among the tools that are used in software programming including Alice and Jeroo, JPie, Alice, Karel Universe, Raptor, Iconic Programmer and Visual Logic (Power et al, 2006). In addition to focusing on the needs of students, educational programming tools are also designed with unlimited teaching methods to reduce the need for tutors and increase aid through the use of technology. Each innovation considers the features of the latest gadgets that have gained importance in the computer science education community.

Method in Systematic Review

The present study is performed using systematic review. Systematic review is a process for identifying, evaluating and interpreting research materials to answer a number of research questions (Kitchenham and Charters, 2007). The purpose of systematic review is to summarize the research by performing synthesis on research resources. In this study, the review was carried out in several activities. The activities involve:

- Identify research needs and devise a protocol study
- Build research questions
- Identify relevant literature by performing search on database based on teaching and learning programming research domain
- Select materials based on inclusive and exclusive criteria
- Extract data and evaluate the quality
- Synthesize evidence
- Interpret results and write reports

Database search on programming tools research papers was made using ACM digital library. ACM digital data base is selected as a source of information domain because the programming education are widely covered and published by ACM, including the publication of conferences i.e. ICER, SIGCSE, ITiCSE, ACE, SIGGRAPH and Koli Calling. Two keywords were used in the search process that refer to the study domain i.e. "Teaching and Learning Tool" and "Programming".

The research questions raised in the study and selection criteria that will be discussed shortly after this guide the researcher in performing systematic review.

Research questions

The study focus is to understand the practice of the researchers in programming teaching and learning using teaching equipment. This literature survey aims to obtain answers to the following four research questions:

Research question 1: What are the important issues in programming teaching and learning research?
Research question 2: What are the methods used in programming teaching research?
Research question 3: What kind of tools used in programming teaching and learning?
Research question 4 : What are the level of programming involved?

Inclusive and exclusive criteria

All selected research papers in this survey must meet inclusive and exclusive criteria. The following list is the inclusive criteria:

- Research papers published in conference or journal;

- Research papers published between the years 2005 - 2011;

- Research paper that discusses the topic of education tools in the field of programming.
While the rejection of a research papers are those that meet this criteria:

- Research papers published other than English;

- Research papers outside the domain of education tools in programming;

- Research papers that display only the abstract, without full access to the entire discussion;

- Double issue by the same author, describing the same topic, only the most recent publication will be taken into account in this study.

Results and Discussions of Systematic Review

This section describes the results of the analysis in the review. The obtained data will be the input of the synthesis process. Synthesis includes formulating the finding that will answer the research questions set out in Section 3.1. Search strategy used in the ACM database lists 52 publications related to programming tools (Table 1). However, after evaluating the research paper title and abstract, and after removing previous copies of multiple studies, only 45 papers were accepted for analysis. 88% of the initial research papers were included after paper screening based on titles and abstract. Seven research papers were rejected, which title falls outside programming education domain.

"Tool" or "instrument" keywords in most of the research papers refer to software, applications and programming environments. However, researchers may refer this string using different terms such as technology, management methods, research tools, and teaching approach.

22. Table 1. Paper review

Paper	Number
Total fulfill inclusive criteria	52
Total fulfill exclusive criteria	7
Total valid	45

Research question 1: Issues in educational programming research

Research in programming consists of a number of issues. Classification of papers within similar issue is conducted using a method proposed by Simon (2007). Simon (2007) classifies computing publications on four aspects of discussion: context, theme, scope and characteristics. Since the research questions for this study focus on the detail of research discussion, the classification is made based on the research theme. Simon (2007) suggests 16 dimensions of research issue under theme heading. As a result, six issues were identified in this study (see Table 2). Five important issues will be discussed separately here.

Table 2. Identified issues

Issue	Number
Techniques of teaching / learning / assessment	18
Teaching / learning / assessment tools	13
Ability / aptitude / understanding	7
Model and theory of teaching/learning	3
Research direction	3
Gender issue	1
Total	45

Techniques of teaching, learning, assessment

Regarding educational programming techniques of teaching, learning and assessment, the focus of relevant papers is to report the experience and describe teaching and learning methods. The various features and aspects of information technology (IT) are also reviewed to relate the best and pedagogical techniques that produce programming skills and confidence to students, including fragmentation of the programming process using small parts (Simon et al, 2007), visualization (Orni et al, 2010, Robin et al,2010, N. Baloian, et al, 2005), constructive (Naomi et al, 2008) and think-aloud approach (Naveed Arshad, 2009).

Among the formulations in this dimension are to construct clear programming teaching strategy to increase student learning outcomes (Carsten Schulte & Maria Knobelsdorf, 2007, Michael E. Caspersen & Jens Bennedsen. 2007, Jorge A. et al,2009). The design and testing of programming learning model are considered as important process to identify and understand how students experience certain learning method. This helps to explain the learning process and improve existing methods (Michael E. Caspersen & Jens Bennedsen, 2007, Eckerdal et al,2007). The implementation of active learning should not focus only on language syntax and programming logic (Carsten Schulte & Jens Bennedsen, 2006) in educational programming. Among the suggested activities are trouble shooting and breaking solution into phases (Simon Grayet al, 2007, and Quintin Cuttset et al, 2011) .

Teaching, learning and assessment tools

Under this issue, 13 papers fall into this research issue that discuss the process of teaching and learning, as well as assessment in programming course. These tools might be developed by the researchers themselves. A large number of studies measure the effectiveness of these tools in helping students to write the program and perform the solution (N. Baloian et al, 2005 and Susan H. Rodger et al, 2009) Similarly, many studies assess the impact and relationship between programming tool usage and performance (Juha Helminen and Lauri Malmi,2010 and Paul Denny et al, 2011).

The results show that the use of various software tools help student to program. Based on good performance positive response from student, there is evidence that the tools are accepted in the learning process (Orni et al, 2010, Reginamary et al, 2009, Fatima AlShamsi and Ashraf Elnagar, 2009, Ana Paula et al, 2010, Georgios Fesakis & Kiriaki Serafeim, 2009). Besides, tool support from technology and peer-learning are important in helping students to understand programming concept (Davor Čubranić et al, 2006).

Programming tools using visualization approach were found to be preferred by students (N. Baloian et al, 2005 and Susan H. Rodger et al, 2009). Meanwhile, game element makes learning programming more interesting to follow (Martinha Piteira & Samir R. Haddad, 2011 and Mary Flanagan et al, 2005). Programming animation and online application were among innovative element in the research (Jungsoon et al,2006).

Ability / aptitude / understanding

Programming complexity and ambiguity are among the reasons for lack of motivation among programming students (Päivi Kinnunen & Lauri Malmi,2008 and Paivi Kinnunen & Lauri Malmi, 2006). Among the concerns in handling laboratory sessions for this course is the effort to identify and rectify errors that might frustrate and discourage students. In the long run, students' attitude towards programming are at stake and consequently give a negative impact on exam scores (Emily S. at al, 2011) which in turn contributes to drop out in programming subjects.

In programming teaching and learning, students require clear and precise instruction and need peer support (Michael E. et al, 2007 and Naomi et al, 2008). Students' understanding in programming can be improved by paying attention to clear instruction activities and peer learning forum(Naomi et al, 2008), as well as applying concepts and knowledge through games (Martinha Piteira and Samir R. Haddad, 2011).

Research direction

Under this issue, this study identifies what researcher perceives as their future research in educational programming, including new issue and proposal (Petri et al, 2010). Research in this domain should not be limited to programming introduction level, and more research is required to synthesize the current study in educational programming and to explore educational technology such as distributed line environment and mobile learning (Judy et al, 2009).

Research question 2: Method used in research

There are nine identified methods used in the research paper, as in Table 3. Survey appears to be the most widely method that measures feedback and responses from instructors and students regarding the effectiveness of programming tools. Several methods were used in evaluating programming tools effectiveness and efficiency. This result implies that instructors are required to be more flexible, to use combination of traditional teaching approach with other techniques in classroom and laboratory to make the session more interesting (Carsten et al, 2010 and Carsten Schulte, 2008).

Table 3. Research method

Item	Number
Survey	14
Software design and development	9
Experience report	6
Comparison study	4

Meta Analysis/ Literature review	4
Program evaluation	2
Empirical study	2
Model and framework development	2
Case study	2
Total	45

Research question 3: Types of programming tools

The equipments used by instructors to help students in programming include visualization, simulation, and physical or online tools. Table 4 present the result. The analysis suggests visualization as the most widely used approach to clarify abstraction in programming (Juha Helminen and Lauri Malmi,2010, Aniket et al,2010, Quintin et al. 2011). Most studies concern on evaluation of programming tools rather than development of the tools.

In addition to programming tool, the use of management or support tool is also important, especially to assess students' work on programming, to record programming activities, and to communicate programming activities (S. Tabanao et al, 2011, Bronius Skupas and Valentina Dagiene, 2010, Davor et al, 2006). A large number of research papers (23papers) do not directly involve in using the tools. These papers discuss computing issues related to students' behavior and attitudes, dropout and failure factors, theory of programming tools, and modeling and analysis of programming teaching and learning .

Table 4. Programming tools type

Item	Number
Visualisation/ simulation	12
Support and management	6
Online tool	2
Physical tool	2
No tools involved	23
Total	45

Research question 4: Programming Level

All of the papers are related to education domain, in the context of programming teaching and learning (refer Table 5). They cover the basic concepts of programming or introductory programming including programming algorithms, selection, repetition structures, with two exceptions. These two papers discuss programming data structure. This result shows most of the reviewed paper concentrate on the basic level of programming in which novice programmers struggle to develop their understanding and skills.

Table 5. Programming level

Item	Number
Introductory programming	43
Data structure	2
Total	45

Conclusion

This study focuses on programming teaching tool and uses review analysis to determine important issues raised by recent research conducted on this topic. The findings are based on four research questions. They indicate prominent issues addressed by researchers such as the techniques and methods of programming teaching, learning

and assessment. These findings are useful for researchers to continue research in programming teaching tools in regard to this aspect.

Analysis of tajweed errors in quranic recitation

Surul Shahbudin Bin Hassan, Dr. Muhammad Azhar Bin Zailaini [21]

Ph.D Candidate UM cum Lecturer, International Islamic University Malaysia, Gombak 53100, Malaysia
Senior Lecturer Faculty of Education, University of Malaya, Kuala Lumpur 50603, Malaysia

Abstract

The aim of this study is to identify the various types of tajweed errors made by students during Quran recitation. This study was carried out on 20 students who took the Tilawah Al-Quran (Quran Recitation) level 2 course as part of their first degree programme at the IIUM. Analysis of the errors was carried out on recordings of the respondents' recitation using a comprehensive set of instruments to identify the type and category of errors comitted. Only errors that occurred at least 1% percent of the time are taken into consideration in this analysis. As a result, a total of six elementary errors have been found. It is hoped that this study will pave the way for a more effective method of teaching the subject of Quranic Recitation which continues to focus on the practical aspects of tajweed knowledge.

Keywords: Error Analysis; Tajweed; Al-Quran; Quranic Recitation;

BACKGROUND

The Tilawah Division is a division under the supervision of the *Centre for Languages and Pre University Academic Development* (CELPAD), International Islamic University Malaysia (IIUM), responsible for the Quranic Recitation programme for IIUM students. This Quranic Recitation course offered by the Tilawah Division is a compulsory pass course to be taken by every IIUM student in order to graduate. There are three courses being offerred by the Tilawah Division as follows: -

1. Basic Level (TQ 1000)
2. Intermediate Level (TQ 2000)
3. First Degree Level (TQ 3000, TQ 3010, TQ 3020)

In this study the writer will focus on the Quranic recitation of level TQ 2000 students only. This course is compulsory for students not majoring in Islamic studies or Arabic.

2. PROBLEM STATEMENT

The problem of poor Quran recitation skills is often discussed by teachers and researchers in the field of Islamic education. Saidi Mohd (2007) states that students weakness in Quran reading has already become an issue in the field of Islamic education for some time, and is still unresolved. Despite various efforts and innovative methods proposed by educators and researchers, this problem has yet to be overcome completely and it is considered to be the root cause of for overall student weakness in the Islamic Education subject in schools. The answer to this problem could conceivably be found through knowing the various errors and mistakes made by students in Quran reading. In fact, many matters would be resolved after the various mistakes made by students have been identified and classified.

This researcher has decided to conduct a pilot study on this particular problem on level TQ 2000 students at IIUM. Through this study, the various errors and mistakes in Quranic recitation can be described in a more systematic manner, thus paving the way towards overcoming the problem of poor Quran recitation skills.

3. OBJECTIVES

---

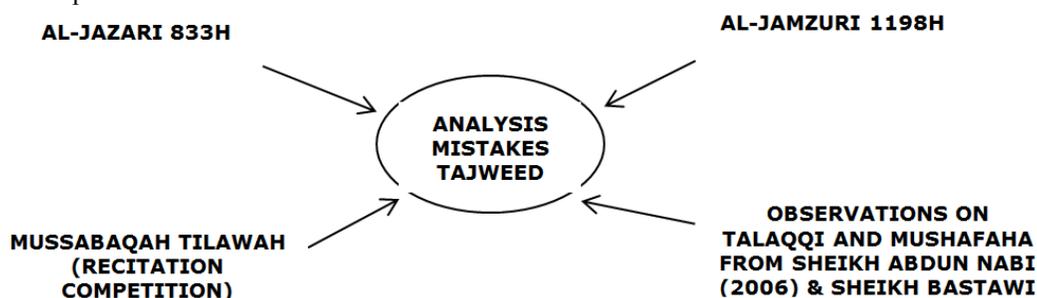
* Corresponding author. Tel.: +6-019-239-0698; fax: +6-036-038-8698.
E-mail address: surur@iium.edu.my

The objectives of the study are as follows: -

1. To devise a system to evaluate accurately the level of ability of Quranic recitation, especially among IIUM students.
2. To classify the mistakes made by the students, which are the most common mistakes, and which are the infrequent ones.
3. To develop a Quranic tajweed teaching guide going directly to the practical aspects of recitation, without burdening students with the theoretical elements of tajweed.

4. CONCEPTUAL FRAMEWORK

In order to obtain knowledge of the means to identify mistakes in Quranic recitation, a theory has been formulated based on the following source literature:-

Figure 1: Conceptual Framework


5. LITERATURE REVIEW

The writer has referred to the studies and writings of leading reciters throughout the ages. Among the writer's main sources are the writings of Al-Jazari (833H) and Al-Jamzuri (1198H) and other sources.

5.1. RULES OF TAJWEED ACCORDING TO AL-JAZARI (833H)

Al-Jazari (833H), through his verses, has clarified the Rules of Tajweed in the following areas: -
* Manner of correctly pronouncing the makhraj (articulation point) of a letter.
* Manner of corrcetly pronouncing the sifat (characteristic) of a letter.
* Errors in the implementation of al-Tarqeeq (thinning) and al-Tafkheem (thickening).
* Errors in the pronunciation of the letters ض and ظ during recitation.
* The Mutamathilan (Analogous Pair), Mutaqariban (Proximate Pair) and Mutajanisan (Homogeneous Pair)
* Pronunciation of al-Ghunnah (nasalization) and al-Izhar (without nasalization)
* Degrees of Lengthening - Mad (long) or Qasr (short).
* Manner of stopping (Waqaf) and restarting (Ibtida')
* Readings involving certain peculiarities of al-Rasm al-Uthmani, and
* Words which should be read in the manner of al-Raum or al-Ishmam.

5.2. RULES OF TAJWEED ACCORDING TO AL-JAMZURI (1198H)

Al-Jamzuri (1198H), through his verses, clarified the Rules of Tajweed in the following areas: -
* Rules of Nun Sakinah & Tanwin,
* Rules of the Doubled Nun & Mim,
* Rules of Mim Sakinah,
* Rules of Qamariyyah and Shamsiyyah,
* Mutamathilan, Mutaqariban, Mutajanisan,

- Rules of Mad Asli. (Natural Lengthening)
- Rules of Mad Fari'e (Secondary Lengthening) caused by hamzah
- Rules of Mad Al-Lazim (Compulsory Lengthening).
- Rules of Lengthening of Isolated Letters at the beginning of certain Suras.

5.3. SURVEY OF THE BOOK OF REGULATIONS OF THE (MALAYSIA ANNUAL) QURAN READING COMPETITION (1996-2006)

Among the sources which can be referred to for guidance for this study is the scoring guidelines for the jury at the annual national and international level Quran Reading Competitions. The Regulations, Terms and Scoring Guidelines for the National and International Level Quran Reading Competition cover the following categories: -

5.3.1. Matters which are considered in the Tajweed section (40 marks)

- the rules of nun and mim sakinah and tanwin
- the articulation point and characteristics of the letter
- the rule of doubled nun and mim
- the rules of ra and lam
- the rules of saktah (breathless pause), imalah and ibdal
- other rules of tajweed
- recitation according to the riwayah of Hafs by the way of al-Shatibi
- the rules of the mad asli (natural lengthening) and mad far'i (secondary lengthening)
- ability to render the riwayah perfectly
- ability to make uniform the length of madd
- ability to render the characteristic of ghunnah (nasalization) accurately
- accurate rendering of *wajh aula*
- perfect pronunciation of letters according to their characteristics

5.3.2. Matters which are considered in the Fasohah section (20 marks)

- lack of care in recitation
- lack of fluency in the articulation of letters, words and phrases
- lack of attention to vowel signs and doubling of letters
- error in *waqaf* (pausing) and *ibtida'* (starting)
- not paying due attention to the arrangement of verses
- lack of control of breathing during recitation
- reciting according to the Arabic *lahjah (accent)*
- careful and mindful (with *tadabbur.*) recitation
- recitation in keeping with the meaning of the verse.
- correct choice of *waqaf jibril* and *waqaf rumus*
- ability to recite a long verse in one breath

5.4. RESULT OF OBSERVATION SURVEY

The writer himself has endeavoured to learn Quranic recitation by way of *Talaqqi wa Musyafahah* with a direct line of transmission or *sanad* from *Al-Sheikh Muhammad Abdun Nabiy*, a lecturer in Qiraat science from Shubra, Egypt in 2004 and *Al-Sheikh Rif'at al-Bastayisiy* an expert in Qiraat from Tanta, Egypt in 2008, when both men were respectively resident in Malaysia.

6. RESEARCH DESIGN

The study was done quantitatively, involving 20 Level 2 students of the Tilawah al-Quran (Quranic Recitation) Course at the IIUM. The design of the study is as follows: -
A.   To construct an instrument to evaluate errors in Quranic recitation.
B.   To obtain samples of students' recitation.
C.   To analyse and evaluate the students' recitation.
D.   To make a summary of the types of errors in recitation.

7. DATA COLLECTION PROCEDURE

7.1. Selection of Verses for Recitation

The writer had to pick the most suitable verses for recitation - verses that would cover all the rules of tajweed for the purpose of evaluating the student's ability in tajweed. The total length of the verses chosen is equal to 2½ pages of *al-Quran Mushaf 'Uthmani* and the normal length of recitation of these verses is between 8 to 10 minutes. The verses chosen are: -

- Surah Maryam verses 1 to 7
- Surah al-An'am verses 73 to 81
- Surah al-Fiil verses 1 to 6
- Surah al-Kafirun verses 1 to 6
- Surah al-Lahab verses 1 to 5
- Surah al-Ikhlas verses 1 to 4
- Surah al-'Alaq verses 1 to 6

7.2. Recording the Recitation

The writer made video recordings of the recitations of 20 students from the course mentioned earlier. The recordings were made at the CELPAD Language Centre, IIUM, studio using their devices. The recordings were later copied into a VCD in order to facilitate the work of checking for mistakes in recitation.

7.3. Preparation of the Checklist Instrument

The writer had to prepare a list of all the rules of Quranic recitation and reproduce it in the form of a long checklist. As a result, a trial checklist set was created, as follows: -

1.	(Harf) Letter and (Shakl) Vowel Sign	4 items
2.	Waqf (Stopping) and Ibtida' (Starting)	6 items
3.	Makhraj (Articulation Point) and Sifat (Characteristic)	20 items
4.	Tarqiq (Thinness)/ Tafkhim (Thickness)	8 items
5.	Ghunnat (Nasalization)	21 items
6.	Mudood (Lengthening)	18 items
		Total **77 items**

7.4. Processing the Data

The writer had to give full attention to review one by one the errors detected when the recording of the student's recitation is played. The writer took on the average one hour to review every recording lasting approximately 8 minutes. Each recording has to be played several times in order to take note of every type of error heard.The data obtained are then reviewed and it was found that the instrument used had to be revised in order that the types of mistakes not found in the instrument could be categorized in a more systematic manner. The resultant refined data were then processed using Microsoft Excel 2003. The writer found that several types of errors occurred very infrequently, less than 1 percent (%) of the time, and decided that these categrories would be ignored in the process of analysis.

8. RESULTS OF THE RESEARCH

From the number of errors compiled, the following is the result of the analysis of the data from the study, arranged according to the number of errors found. Please look at the table below:-

Table 1: Category of Errors According to Percentage of Occurrence

Category of Errors	Errors	Percentage
1. Makhraj (Point of Articulation) and Sifat (Characteristic)	484	29%
2. Tafkhim (Thick) and Tarqiq (Thin)	379	23%
3. Ma'al Ghunnal (With Nasalization) and Bi La Ghunnah (Without Nasalization)	379	23%
4. Madd (Long) and Qasr (Short)	235	14%
5. Harf (Letter) and Shakl (Vowelling)	139	8%
6. Waqf (Stopping) and Ibtida' (Starting)	46	3%
Total	1662	100%

The detail review of tajweed errors analisis in the recitation of al-Quran is as follows:-

8.1. ERRORS OF PRONUNCIATION OF ARTICULATION POINTS AND CHARACTERISTICS OF LETTERS (29%)

Table 2: Category of pronunciation error relating to Articulation Point and Letter Characteristic

Types of Errors	Number of errors	%
Error in the pronunciation of the letters غ خ ع ح هـ ء	55	11
Error in the pronunciation of the letters ج ش ي /ض	49	10
Error in the pronunciation of the letters ص ز س	5	1
Error in the pronunciation of the letters ت د ط	99	20
Error in the pronunciation of the letters ث ذ ظ	22	5
Error in the pronunciation of the letters ل ر ن	6	1
Error in pronouncing Hams or Jahr	48	10
Error in pronouncing Syiddah, Tawassut, Rakhawah	17	4
Error in pronouncing Itbaq or Infitah	21	4
Error in pronouncing Qalqolah	105	22
Error in pronouncing Sofir	3	1
Error in pronouncing Istitolah	25	5
Error in pronouncing Inhiraf	4	1
Error in pronouncing Lin	18	4
Error in pronouncing Ghunnah	4	1
Error in pronouncing Khafa'	3	1
Total	484	

Among the examples of Articulation Point and Letter Characteristic errors found: -

Sample Verse	Explanation of Error
وَهَنَ ٱلْعَظْمُ	Error because the tongue was not extruded in pronouncing the letter ظ.
إِذْ نَادَىٰ	Error on the letter ذ because the tongue was not extruded and error on the letter د because the tongue was not pressed to the base of the upper teeth.
فِى تَضْلِيلٍ	Two mistakes on the letter ض viz: error in not reproducing the characteristic of Istitolah and in not reproducing the characteristic of Shiddah.
وَتَبَّ	Error in not rendering Qalqolah Kubra when stopping on the doubled (*mushaddah*) letter ب.

8.2. ANALYSIS OF ERRORS OF THICKNESS AND THINNESS (23%)

Table 2: Errors in the pronunciation of Thick and Thin Letters (*Tarqiq / Tafkhim*)

Types of Errors	Number of errors	%
Thickening a letter of istifal	228	60
Thinning a letter of Isti'la'	45	12
Thickening the pronunciation of thin Ra	21	6
Thinning the pronunciation of thick Ra	83	22
Thinning the pronunciation of Lam Jalalah	2	1
Total	379	

Among the example of errors of pronouncing thick and thin letters found:

Sample Verse	Explanation of Error
رَءَا ٱلْقَمَرَ	Error in thickening the letter م which should be thin. This is due to the influence of adjacent letters ق and ر which are thick.
مَآ أَغْنَىٰ	Error in thinning the letter غ which should be thick.
وَأَرْسَلَ	Error in thinning the letter ر when it should be thick.
وَمِن شَرِّ	Error in thickeing the letter ر when it should be thin.

8.3. ANALYSIS OF ERRORS INVOLVING NASALIZATION (23%)

Table 3: Category of Errors in the pronunciation of Nasalization (*Ghunnat*)

Types of Errors	Number of errors	%
Failure to conceal the Nun in Ikhfa' Haqiqi	73	19
Failure to pronounce doubled Nun with nasalization the length of 2 vowels.	51	13
Failure to pronounce Ikhfa' Haqiqi with nasalization the length of 2 vowels.	45	12
Not consistent in executing the rules of nasalization	33	9
Failure to pronounce doubled Mim with nasalization the length of 2 vowels.	32	8
Error of thinning the nasalization when Nun meets an Isti'la' (thick) letter	32	8
Error of pronouncing with nasalization where there should not be nasalization.	25	7
Failure to conceal Mim in Ikhfa' Shafawi	22	6
Failure to nasalise Idgham ma'al Ghunnah the length of 2 vowels.	17	4
Failure to nasalise Ikhfa' Shafawi the length of 2 vowels.	12	3
Failure to assimilate the letters on Idgham ma'al Ghunnah	10	3
Error of thickening the nasalization when Nun meets a letter of Istifal.	9	2
Failure to conceal (ikhfa') Mim on Iqlab (Ikhfa' Majazi)	7	2
Failure to nasalise Iqlab the length of 2 vowels.	6	2
Error of pronouncing nasalization longer than 2 vowel lengths.	3	1
Failure to assimilate the letters on Idgham bi la Ghunnah	2	1
Total	379	

Among the errors found related to nasalization (or its absence) are:

Sample Verse	Explanation of Error
فَلَمَّا جَنَّ	Error of not making nasalization for doubled (mushaddah) نّ and مّ which must be nasalized for the duration of 2 vowel lengths.
إِن كُنتُمْ	Error of not concealing (ikhfa') نْ nun sakinah which must be pronounced concealed, and with a thin nasal sound for the length of two vowels.
أَشْرَكْتُمْ بِٱللَّه	Error of not concealing (ikhfa') مْ mim sakinah which must be pronounced concealed by keeping the lips slightly apart.
لَمْ نَجْعَل	Error of nasalizing مْ mim sakinah when it is inappropriate to do so, when the rule is *Izhar Shafawi*.

8.4. ANALYSIS OF ERRORS IN LENGTHENING (*MUDUD*) (14%)

Table 4: Category of Errors in Lengthening (*Mudud*)

Types of Errors	Number of errors	%
Lengthening more than the proper length.	49	21
Lengthening letters which should not be lengthened.	45	19
Mad Lazim Kalimi Musaqqal not lengthened to 6 vowel lengths	29	12
The duration of various *madd* sounds not regular or well-proportioned	25	11
Mad Munfasil not lengthened to 4 or 5 vowel lengths	23	10
Mad Muttasil not lengthened to 4 or 5 vowel lengths	16	7
Shortening letters which should be lengthened	14	6
Mad Lazim Harfi Mukhaffaf not lengthened to 6 vowel lengths	13	6
Mad Asli not lengthened to 2 vowel lengths	5	2
Mad Silah Kubra not lengthened to 4 or 5 vowel lengths	5	2
Mad Asli Harfi not lengthened to 2 vowel lengths	4	2
Mad Lazim Harfi Musaqqal not lengthened to 6 vowel lengths	4	2
Mad Badal not lengthened to 2 vowel lengths	3	1
Total	235	

Among the examples of errors in lengthening found:

Sample Verse	Explanation of Error
أَتُحَٰجُّوٓنِّي	Error in not lengthening حَا and جُو which must be lengthened to 6 vowel lengths.
ٱلسَّمَٰوَٰتِ	Error in lengthening مَا and وَ more than 2 vowel lengths.
ٱلْأَوَّلِينَ	Error in not lengthening ءَ which must be lengthened 2 vowel lengths. This rule is also known as *Mad Badal*.
كٓهيعٓصٓ	Error in not regularizing the length of madd on 5 letters found in this word ك ، ع ، ص which must be 6 vowel lengths and هـ ، ي must be 2 vowel lengths.

8.5. ANALYSIS OF ERRORS OF PRONOUNCING LETTERS AND VOWEL SIGNS (8%)

Table 5: Category of Errors of Pronouncing Letters and Vowel Signs

Types of Errors	Number of errors	%
Errors in rendering fathah, kasrah, dhommah, sukun and shaddah.	43	31
Error of leaving out letters	42	30
Error of adding letters	34	24
Error of changing letters	20	14
Total	139	

Among the examples of errors found in this category:

Sample Verse	Explanation of Error
بِغُلَٰمٍ أَسْـمُهُ	Error in connecting two sakinah letters with the correct vowel sound, such as in this way: بِغُلَامٍ اسْمُهُ.
بَازِغًا	Error of changing the letter غا to عا.

8.6. ANALYSIS OF ERRORS OF STOPPING (*WAQF*) AND RESTARTING (*IBTIDA'*) (3%)

Table 6: Category of Errors of Stopping and Restarting the Recitation (*Waqf / Ibtida'*)

Types of Errors	Number of errors	%
Stopping / Repeating by drawing in breath	16	35
Restarting on a word which results in violation of the grammar of the language	10	22
Stopping on a word which results in violation of the grammar of the language	6	13
Stopping on a word which alters the intended meaning.	5	11
Stopping while pronouncing the vowel sound on the last letter	5	11
Starting on a word which alters the intended meaning	4	9
Total	46	

Among the errors of stopping and restarting found are:

Sample Verse	Explanation of Error
وَكَانَتِ ٱمْرَأَتِيٓ عَاقِرًا	Stopping on the word: ٱمْرَأَتِي. Then restarting from the word عَاقِرًا without repeating the word before it.
وَلَمْ أَكُنْ بِدُعَآئِكَ	Stopping by cutting of the breath in the middle of a word: بِدُعَآ-ئِكَ. and to restart without repeating the word in full.

9. CONCLUSION OF THE STUDY

From the analysis of the errors in recitation, it can be concluded that students' ability to implement the rules of tajweed is generally very low. Although they are able to read, they commit a lot of mistakes in recitation The total number of mistakes from the 20 respondents is high, numbering 1662 mistakes in all. This means that on average each student makes 83 mistakes during their recitation. A total of 29% of those mistakes constitute failure to pronounce letters correctly (according to their respective points of articulation and characteristics). Another 23% are mistakes in implementing the rule of *tarqiq wa tafkhim* (thick and thin) and 23% as well in implementing the rules of *Ghunnat* (nasalization or without nasalization). Errors in lengthening account for 14% of the errors of recitation. Errors in pronouncing letters and vowel signs correctly make up 8% of the total number of errors, and *waqf wa ibtida'* errors of stopping and restarting the recitation represent 3% of the tajweed mistakes in recitation.

13th International Educational Technology Conference

Are English language teachers in Saudi Arabia ready to integrate technology?

Nadeem Saqlain[22], Fawaz Al-Qarni, Needal Ghadi

Memorial University of Newfoundland, St.John's, A1B3X8, Canada
Memorial University of Newfoundland, St.John's, A1B3X8, Canada

Abstract

Saudi government is striving to integrate technology at all school levels. In many schools English language is being taught through modern digital technology. Intel program has been launched to integrate technology in teaching and learning in Saudi Arabia. Qualitative research study was used to investigate English language teachers' readiness to integrate technology in Sabt Al-Alaia, Aseer region in Saudi Arabia. 12 in-service English language teachers participated in this study. Data were collected through structured and semi structured interviews. We found five main themes, (a) Understanding of technology, (b) Use of technology for learning and motivation, (c) Types of technology, (d) Teachers' main concerns, and (e) Teachers' unawareness of Intel program. Participants complained about lack of funding, scarcity of technology in schools and paucity of proper training to use technology. Sabt Al-Alaia regional schools do not have access to technology as their counter parts in other regions of Saudi Arabia. However, all the participants were willing to use technology to teach English as a foreign language. The paper includes implications of evaluation findings, recommendations for policy and directions for further research.

Keywords: language, integration, technology, readiness, Intel program

Introduction

Education in the Kingdom of Saudi Arabia (KSA) commenced in 1932. There are three different school levels e.g. elementary school level (grade1 to grade 6), intermediate school level (grade 7 to grade 9) and secondary school level (grade 10 to grade 12). The education is compulsory for all males and females at the age of seven. Nowadays, according to the educational statistics, there are 330,500 schools around the Kingdom for both genders. Based on the culture and religion of Saudi Arabia, the educational system follows gender-based schools (Al-Hariri, 1987). However, there are two kinds of school systems, the private school system and the public school system. In the private schools students have to pay tuition fee while in the public schools education is free.

Since 2007, education in the Kingdom of Saudi Arabia has made significant achievements focused on providing educational opportunities for all individuals, despite the geographical scale of the Kingdom and the increasing population. Today, education in the Kingdom of Saudi Arabia is entering into a new phase, which focuses on quality of education, ensuring that students in the Kingdom's public education system are being prepared to deal with future challenges such as cultural diversity, economic changes, and globalization. They will be able to accomplish this by acquiring twenty-first century skills while maintaining the values and principles of Saudi society.

In keeping with the wish of King Abdullah bin Abdul Aziz to achieve development in the Kingdom of Saudi Arabia, a project to develop public education has been launched to act as a major support to the efforts of the Ministry of Education. This will carry out King Abdullah's vision that education is the foundation for building a knowledge-based economy and contribute to Saudi Arabia's move into the ranks of developed countries. It will also facilitate future participation for young people in building a progressive society across all fields (Ministry of Education).

English language is considered one of the most important foreign languages in Saudi Arabia. Students start learning English in public schools at grade 6. Some private schools, very few, have English curriculum from grade 1 and onward. The Ministry of Education is taking special measures to integrate technology in teaching and learning. This vision has developed since 2007 up to now to include Intel (to teach to learn) for future program, which focuses

E-mail address: nadeems@mun.ca

on the integration of all sorts of technologies in teaching and learning. Modern technology is being provided at all levels from elementary school to university level.

Sabt Al-Alaia is a governorate in the Kingdom of Saudi Arabia, which is located in the south of the Kingdom. Geographically, it is considered a part of Aseer region. The population of Sabt Al-Alaia governorate is approximately 300,000. There is an office for Education related to the directorate of Education in Bisha governorate, which is a leader governorate in that area, to direct the educational system in Sabt Al-Alaia. There are total 190 schools included 100 elementary school, 59 intermediate schools, and 31 secondary schools for males and females. In addition, there are 12 schools for disabled and 2 evening schools for those who can not attend schools in the day. There are 2181 teachers and 140, 00 students in the region. In our research we have focused on male teachers to avoid being in some ethical issues related to Saudi culture and religion (Al-Hariri, 1987).

Intel Program

The Intel Program is a worldwide project presented by the Intel Corporation with support from Microsoft Corporation. The main purpose for Intel Program is to integrate technology into education. Therefore, students and teachers will involve into the process of teaching and learning. Also, they will gain a high benefit from Intel Program to improve their skills either in teaching for the teachers or learning for the students. Moreover, students use available technology to present their ideas and research to their class. As far As the researcher mentioned that Intel Program is to integrate technology into education; therefore, the researcher should high light on the contents of this program. It includes eight units: the first one is teaching through projects, which focuses on Projects-based learning and the design of the unit. The second unite is planning unit; the main purpose of this unit is Curriculum-Framing Questions and ongoing evaluation process that is based on the student. The third one is to create methods for communication; this unit focuses on the Internet to support teaching and learning. The fourth unite is creating educational models, the focal point of this unit is to shed light on the results of the project from the perspective of the student. The unit number five is an assessment of student projects; this unit concentrates on the comprehensive and formative assessment. The sixth unit is planning for student success, which, focuses on supporting student self-direction. Unit number seven is to support technology; the key point of this unit is to focus on the role of the teacher in supporting the educational process. Finally, showing portfolios unity this unit focuses on participation in learning. To build these units; all teachers and students should work together to build them (Saudi Intel Web).

The objective of Intel Program Project in Saudi Arabia is to update various aspects of the educational process and its components to global standards, develop an integrated system to evaluate education and measure educational quality, and develop the various elements of the educational process. To achieve these goals the project will include comprehensive curriculum development using technology for foreign language teaching at secondary school level designed to respond to scientific developments and modern technology, meet the knowledge, professional, psychological, physical, mental, and living needs of students. It will also facilitate the professional development of teachers, preparing them to perform their educational duties so as to achieve the developed curriculum objectives, while preparing the educational environment to integrate technology, including Internet technologies and digital models into the curriculum. These factors combine to make the classroom environment more effective in achieving the objectives of learning (Minister of Education).

Teachers are an integral part of any educational systems (Bill, 1997). It is significant to know their concerns and issues through their perspectives. This research study is unique in its nature. Most of the research studies have been conducted in Saudi Arabia about main cities such as Riyadh, Jeddah, Makkah and Madina. Little is known about teachers' perceptions in small regions. The purpose of this study is to seek English teachers' beliefs about using technology for language teaching. The results of this study will be helpful for policy makers, English teachers in small areas and for the Ministry of Education, KSA. The study will investigate what are English teachers' concerns about using technology and how do they perceive technology.

Literature Review

Computer technology has changed every sphere of life (Hill & Hannafin, 2001). It is useful not only for learners but also for teachers (Saglam & Sert, 2012). Recently, the use of technology for teaching is an integral part of successful teaching (Almekhlafi & Almeqdadi, 2010). New technologies are influencing students' learning skills especially reading and writing (Barrel, 1999). Teachers' perceptions about integration of technology in teaching have not got enough attention of researchers (Bruce, 1997). Teachers' beliefs about using technology affect their attitude to use technology for teaching and learning (Almekhlafi, 1999). In Saudi Arabia English language teachers play very important role in teaching and learning (Khan, 2011). In his quantitative and qualitative research study

with Syrian high school English teachers Albirini (2006) found that teachers were worried about the devastating effect of technology in the form of internet and western cultural influence on Syrian culture. So, all the participants felt the need of locally created soft wares and computer programs to teach English as a foreign language.

Many educational leaders and policy makers claim that computers and related internet technologies represent important educational innovations (Howley & Wood, 2011). Recent studies have shown that the successful implementation of educational technologies depends largely on the attitudes of educators, who eventually determine how they are used in the classroom (Albirini, 2006).

Teaching and learning a foreign language through technology has become a new trend in foreign language education all over the world (Liu, 2009). Most foreign language teachers know very little about the effective use of technology in education. (Olphen, 2007). In their study of the attitudes of teachers in three middle schools, Atkins and Vasu (2000) found that teachers' concerns have a significant influence on the use of computers in the classroom. A recent study conducted by (Gilakjani, 2012) to identify the factors affecting teachers' use of technology concluded that teachers should be introduced to the types of computer technology and to aim at the usefulness and benefits of these resources in improving teaching and learning. In a related study, Buabeng-Andoh (2012) examined some of the factors that affect the adoption and integration of Information Communication and Technologies (ICT) into teaching, the author concluded that teachers' feelings, knowledge and attitudes among other factors influence their use technology within their classrooms.

Ewa (2005) found that teachers' beliefs were based on dilemmas' and concerns. However, the teachers were willing to use technology in order to benefit from it and to help their students. In a recent study, Saglam and Sert (2012) found that despite the lack of proper training English language teachers were willing to use technology for teaching. Some of them used some sort of technology to improve students' linguistic skills.
Odabasi (2000) found that teachers were familiar with technology. The participants described technology helpful to increase students' motivation and to improve students' learning. In their quantitative study with 100 Arab teachers, Almekhlafi and Almeqdadi (2010) found that teachers were integrating technology in their class activities. They used a variety of technology to promote learning among students. The only difference was the method of using technology among male and female teachers.

Research Design

Creswell (2009) defined qualitative research as "a means for exploring and understanding the meaning individuals and groups ascribe to social or human problems." Researchers using qualitative research often study issues in their natural settings, intending to interpret phenomena in terms of the meaning that respondents give to researchers (Kvale, 2009). Some scholars, such as Phillips and Burbules (2000), mention that researchers cannot claim absolute truths when studying the behaviours and actions of humans. Therefore, qualitative research is an approach that seeks to explore hidden issues and give meaning to them, chiefly by asking questions about phenomena and gaining a better understanding about them through the responses given (Maxwell, 1996). For this research study we relied on qualitative research approach for in depth understanding of English teachers' interests and concerns. This research study conducted in a bounded system. Sabt Al-Alaia region was chosen to carry out this research study. Therefore, we depended on case study design for the purpose of our enquiry.

Participants

The researchers have chosen fifteen male Saudi English language teachers purposefully because we cannot involve female teachers in the study for cultural and religion customs and traditions. Therefore, male researchers cannot interview women in KSA because it is against their culture and their beliefs. Fifteen male Saudi English language teachers were contacted from Sabt Al-Alaia region for this research study. Three of them refused to participate in the research study due to their personal reasons. Twelve in-service teachers participated in this research. All of them have teaching qualification from recognised Saudi universities. They teach at intermediate and secondary schools.

Data Collection and Analysis

Canadian Institutes of Health research (2010) stated that there are some ethical issues associated with educational research and obviously state the principles of ethics that should be followed by researchers including: Minimizing the risk of harm, getting informed consent, maximizing and protecting anonymity and confidentiality, and providing the right to withdraw. Kavale (2009) explained that ethics and interview had a strong relationship.

Hence, researchers need to focus on ethical issues while interviewing participants and ethical issues should be undertaken from the start to the conclusion. Therefore, one of the researchers contacted all the participants and took informed consent. The researcher also told the participants in details about his own role as a researcher and about the purpose of the research. The participants were informed that they could stop participating in the study at any time. Two of the participants refused to participate in the beginning. Remaining thirteen participants were willing and were very enthusiastic to express their views. They were well aware of digital technology. They were also informed that their names would not be used in the research study.

We use semi structured and structured interviews for data collection. Face to face interviews were conducted between Jun, July and August 2012. All the interviews were recorded and saved. Two teachers requested the questionnaire in advance. We send the questionnaire and they replied through e-mails. Their responses were also saved and printed on a paper. We coded the data and then wrote themes. To improve the accuracy we used the member check technique (Krefting, 1991). After identifying the themes we e-mailed the reports to the participants and they affirmed them within a week.

Findings and Discussion

Understanding of Technology

One of our main interests in this study was to know the participants' understanding of technology. It was clear from their responses that all the participants were acquainted with modern technology. Whenever they talked about technology they meant digital technology. One of the participants said,
"Technology means computer, projector, CDs and projectors".
Similarly another said,
"T.V, VCR, data show and laptops are all types of technology".

Use of Technology for Learning and Motivation

We were keen to know about their use of technology in the classroom. All were agreed that technology was helpful. This point of view was based on their previous experience at university level. All the teachers told that they used some sorts of technology in classroom. Most of them mentioned that they used technology to improve students' listening and reading skills. Seven of the participants mention that they motivated students through technology. Some of their samples are as follow;
"I like technology. It is really very helpful. First time I experienced it when I was at university. I use technology in my class as well"

"I use CDs to improve students' listening and reading skills and it works"

"When I use technology student enjoy it. It is very helpful to motivate students".
On the other hand participants also complained about lack of motivation from government side to integrate technology in classrooms.

Type of Technology

Another important theme was the type of technology, which was being used in Sabt Al-Alaia schools. During our semi-structured interviews eleven of the participants mentioned that they used Fawaz Al-Harbi CDs for listening and reading. Fawaz Al-Harbi CD is a CD project that designed by a person his name is Fawaz Al-Harbi. His CD included the ministry English curriculum. Fawaz Al-Harbi Just added sound and videos and some pictures to the curriculum. Also, he got assistance from native speakers to record the reading passages and the speaking parts by their voices. Therefore, many teachers prefers to use it in their classes because it assisted them in teaching the receptive skills (Listening and Reading) so teachers do not do much efforts in their classes, while in the productive skills (Writing and Speaking) it does not take please in Al-Harbi CDs.

They also told that they bring their own CDs and videos to use in the classroom. All the teachers expressed that they also used data show.
One of the participants said,

"I use Al-Harbi' CDs, you know Fawaz Al-Harbi. His CDs are good for listening and reading".

The other participant said,
"We have nothing to use in terms of technology except data show. So we use it occasionally".

Main Concerns

When we talked about their main concerns three sub themes appeared. First of all, all of the teachers were concerned about paucity of technology. They described that they did not have computers, language teaching soft wares, and internet connections for classroom.
One sample is as follow;

"I know what technology is. But the main problem is that we do not have technology in our school. I bring CDs to school. I myself buy it. We do not have funds to buy"

Secondly, they lamented for the lack of funding. They made clear that whatever they brought to school to teach they brought it from their own pocket. The third sub theme was lack of training. All the teachers emphasized on the need of training to use modern technology in the classroom. One of the participants said,

"We need computers, internet connections and proper training to use technology for language teaching".

Unawareness of Intel (to teach to learn) program

We were also eager to know teachers' awareness of Intel program. All the participants were asked about Intel program, its vision, and its implementation. It was serious identified by the participants. They expressed their bewilderment of Intel program. Only one teacher knew the program because he was transferred from another region where Intel program has already been commenced. One of the samples is as follow;

"I know nothing about Intel program. I use only CDs bought by myself. Our government has not provided us anything related to technology"

It is a positive thing that the teachers in Sabt Al-Alaia region have adequate knowledge of modern technology. They not only know digital technology but also use it. It is also note worthy that they are optimistic to use it in the future as well which supports Ewa (2005)'s point of view that teachers were willing to use technology in the future. Most of the teachers find it useful for students which validates Saglam and Sert (2012)'s statement that technology is beneficial for both. One critical issue appeared in this study which shows that Saudi English language curriculum in schools does not equally emphasize on all four skills. Eventually, teachers have to use privately made CDs which mainly focus on receptive skills (listening and reading). This also affirms Albirini (2006)'s finding that locally created soft wares can be useful. A very important issue appeared that Saudi English language curriculum does not much attention on productive skills (writing and speaking).

The teachers in this region have serious concerns. The scarcity of technology is a main issue which shows that Sabt Al-Alaia regional schools do not have same technology as other regions such as Riyadh, Makkah, Jeddah, Madina and Dammam posses. This point of view made clear when we asked about Intel (to teach to learn) program and all the participants nodded in negative except one. One teacher knew this program because he worked in Dammam region before coming to Sabt Al-Alaia region. Intel (to teach to learn) is a latest program of King Abdullah's government. The main purpose of this program is to integrate technology at school level in all schools of Saudi Arabia. It is clear that Sabt Al-Alaia regional schools need technology and funding. It is also visible that Intel program has not been introduced in Sabt Al-Alaia region. Finally, teachers need proper training to use technology. In his article,Khan (2011) recommends pre-service and in-service teacher training for English language teachers in Saudi Arabia. From above discussions it is crystal clear that English language teachers in Sabt Al-Alaia region are willing to integrate technology into their classes but they need technology and proper training to use it.

Further Research and Recommendations

Our study cannot be generalised to other regions or cities of Saudi Arabia. It is limited to Sabt Al-Alaia region. We also do not know about female English teachers' concerns and perceptions. In future studies, the

effectiveness of technology for langaue learning would be helpful. The effectiveness of Intel (to teach to learn) program has not been explored yet.

Our first recommendation is to provide modern technology in all schools in Sabt Al-Alaia region.

Our second recommendation is to provide proper training to in-service teachers to use technology for language teaching. Saudi Universities should offer a course at bachelor of education level to use technology for teaching.

Our third recommendation is to redesign English language curriculum at school level. In which all the four skills should have equal importance. Special attention should be paid to active skills as well. Proper soft wares and computer programs should be prepared to teach these skills.

Are Laptops Distracting Educational Tools in Classrooms

Falah Awwad[a,23], Ahmad Ayesh[a], and Sarah Awwad[b]

aUnited Arab Emirates University, Al Ain, P.O. Box 15551, United Arab Emirates
bMcGill University, 845 Sherbrook Street West, Montreal, QC H3A 0G4, Canada

Abstract

Laptop use for undergraduate students is increasingly becoming popular; it is often deemed a necessity. Students are using laptops for academic as well as non-academic activities. Researchers are debating on the effect of this trend on students' educational and learning outcomes. There is therefore a need for investigation in order to determine how efficient the use of laptops is in the educational process. The main purpose of this study is to investigate if laptops could be distracting educational tools inside classrooms during the learning phase of undergraduate students. A questionnaire was designed and completed by a random sample of students at the United Arab Emirates University's Colleges of Engineering, Science, and Information Technology. Data analysis showed that students used laptops mainly for academic as well as non-academic purpose which was indicative that laptops were indeed distracting tools in the classrooms.

Keywords: Laptops; Educational Tool; Classroom; Undergraduate Education.

Introduction

Laptops have become standard tools used by most university students. Furthermore, it is mandatory in many undergraduate colleges around the world for students to utilize them in their studies. The number of universities with plans for campus-wide computer adoption is quickly growing (Weaver & Nilson, 2005; Brown, Burg, & Dominick, 1998). E-learning design and simulation programs are the main drivers of the development in this field. In United Arab Emirates University (UAEU), it is a mandatory that each student, regardless of his/her major, to have a laptop; the campus is equipped with wireless network connectivity in all academic and non-academic facilities. The university policy is promoting the use of laptops in lectures in order to target the development more interactive type of classes and to enhance lecture delivery. Therefore, the UAEU campus was selected for conducting this study.

Many educators raised the issue that usage of laptops could be a source of distraction for students in classrooms and it should be carefully monitored. Indeed, some studies, such as the one done by Levine (2002a) & (2002b), suggested that instructors should have special softwares to control the students' use of laptops during class time. Kay & Lauricella (2011) investigated and compared beneficial and challenging laptop behaviors in higher education classrooms. Kay & Lauricella (2011) and Lindorth & Bergquist (2010) reported beneficial behaviors such as note-taking activities, in-class laptop-based academic tasks, collaboration, increased focus, improved organization and efficiency, and the possibility to address special needs. Challenges observed by Kay & Lauricella (2011) were as follows: distracting behaviors, instant messaging, surfing the web, playing games, watching movies, and decreased focus. However, beneficial behaviors were more often reported by Kay & Lauricella (2011) than challenging behaviors; the ratio of beneficial to challenging behaviors was 2:1. Kay & Lauricella (2011) concluded that actively integrating meaningful laptop activities into the classroom will increase the frequency of beneficial laptop behaviors. Indeed, a number of researchers have concluded that if the faculties do not make an active attempt to meaningfully integrate technology into the classroom, distractions and decreased performance are inevitable (Baron et al., 2008; Hall & Elliot, 2003; Kolar, Sabatini,& Fink, 2002; MacVay, Snyder, & Graetz, 2005; Weaver & Nilson, 2005).

The present study addresses primarily the question: could a laptop, which is considered an educational tool, be a source of distraction, specifically during classroom learning activities? In this paper, Section 2 and 3, respectively, present the methodology, results and analysis. Section 4 presents the conclusion.

Methodology

Participants

The participants recruited for this study are undergraduate female students from the United Arab Emirates University's Colleges of Engineering, Science, and Information Technology. This sample is deemed representative of the university's students since the official statistics of UAEU indicates that 74.9% of the students registered at UAEU during the 2010/2011 academic year, are female students (3,082 male students and 9,197 female students). The distribution of the students who participated in this study among the three colleges is as follows:

23. Table 1. Distribution of the student's sample among the IT, Science and Engineering Colleges

College	Number	Percent
IT	55	38.5
Science	30	21
Engineering	58	40.5
Total	**143**	**100**

Questionnaire

A questionnaire shown in Table 2 is developed to investigate the possible distracting effects of laptops in the classroom. Prior to the distribution of the questionnaire, reliability is calculated using the Cronbach's alpha coefficient which revealed that the questionnaire has an overall reliability of 0.77 indicating that the test is deemed reliable.

Table 2. Questionnaire used for the current study

Question No.	Question	(1) Strongly Agree	(2) Agree	(3) Neutral	(4) Disagree	(5) Strongly Disagree
1.	I use my laptop for academic purposes only (ex: note taking, finding information online, viewing the lecture notes etc.)					
2.	I use the laptop for chatting, checking my e-mail, playing games, or watching movies					
3.	I am more concentrated and focused when I can view the lecture notes on Power Point on my laptop.					

The questionnaire has been distributed to 143 students. Laptops are deemed to be effective in increasing educational learning if:
1) They are primarily used for academic purposes by students
2) They aren't used much for non-academic purposes
3) They help students in increasing their concentration in class
The above criteria for this study are presented in the questions 1 to 3 of the questionnaire in the respective order. The students are allowed to answer each question on a Likert scale from one to five; one being strongly agreed and five strongly disagree.

In order to conclude that laptops do not have distracting effects during classrooms academic activities, a standard of at least 70% of the students answering questions one and three with agree and strongly agree and at least 70% of students answering to question two with disagree and strongly disagree is preset. We select 70% as a standard for positive responses due to our judgment of the adequacy of this percentage to evaluate the results of our study.

Results and Analysis

Students Responses

The report below shows the response to each question and the designated percentages.

Table 3. Students' responses to Question No. 1

	Frequency	Percent	Cumulative Percent
Strongly agree	30	21.0	21.0
Agree	46	32.1	53.1
Neutral	33	23.1	76.2
Disagree	27	18.9	95.1
Strongly disagree	7	4.9	100.0
Total	**143**	**100.0**	

Table 3 shows that only 53.1% of the students either strongly agree or agree with question number 1, while 23.8% either disagree or strongly disagree. 23.1% of the students were neutral.

Table 4. Students' responses to Question No. 2

	Frequency	Percent	Cumulative Percent
Strongly agree	29	20.3	20.3
Agree	40	28.0	48.3
Neutral	36	25.2	73.4
Disagree	25	17.5	90.9
Strongly disagree	13	9.1	100.0
Total	**143**	**100.0**	

Table 4 shows that 48.3% either agree or strongly agree with question number 2, while only 26.6% of the students either strongly disagree or disagree. 25.2% of the students were neutral.

Table 5. Students' responses to question No. 3

	Frequency	Percent	Cumulative Percent
Strongly agree	25	17.5	17.5
Agree	49	34.3	51.7
Neutral	35	24.5	76.2
Disagree	20	14.0	90.2
Strongly disagree	14	9.8	100.0
Total	**143**	**100.0**	

Table 5 shows that only 51.7% of the students either strongly agree or agree with question number 3, while 23.8% either disagree or strongly disagree. 24.5% of the students were neutral.

Table 6. Correlations Tests

		v1	v2	v3
q1	Pearson Correlation	.680**	-.481-*	.379
	Sig. (2-tailed)	.001	.027	.090
	N	21	21	21
q2	Pearson Correlation	-0.243457	.688**	.140
	Sig. (2-tailed)	.288	.001	.544
	N	21	21	21
Q3	Pearson Correlation	.549**	-0.111344	.789**
	Sig. (2-tailed)	.010	.631	.000
	N	21	21	21

**. Correlation is significant at the 0.01 level (2-tailed).

*. Correlation is significant at the 0.05 level (2-tailed).

Test Reliability

In order to test the reliability of the questionnaire, a random sample of 21 students was selected from the three colleges. Those students answered the same questions, one week after the first completion of the questionnaire. The correlation between the two sets of responses is calculated as shown in Table 6. These tests show that the questionnaire is reliable.

Statistical Evaluation of the Effectiveness of Laptops for In-class Learning Enhancement

As we mentioned in Section 2 of this paper, at least 70% of the students answering questions one and three with agree and strongly agree and at least 70% of students answering to question two with disagree and strongly disagree was deemed essential in order for the use of laptops in the classrooms to be considered beneficial. In this section, we will test if the average percentage of students, who answered strongly agree and agree for the questions one & three, is greater than 70%. The cumulative percentage is entered and the average percentage is tested against 70%. The null and alternative hypotheses are as follows:

H_0: Average percentage of students selected strongly agree or agree for question number one and question number three is less than 70% (x<70%).

H_1: Average percentage of students selected strongly agree or agree for question number one and question number three is greater than or equal 70% (x≥70%).

Test statistics

One-sample T-test is used to test the likelihood that the results do not fit the null hypothesis. The results presented in Tables 7 & 8 show that the observed data set provides no strong evidence against the null hypothesis, i.e. based on the answers analyzed from the drawn sample, we can't say that the use of laptops in the classroom does not have distracting effects on the students learning.

Table 7. T-Test (One-Sample Statistics)

	N	Mean	Std. Deviation	Std. Error Mean
Cumul	3	43.800	14.9121	8.6095

Table 8. T-Test (One-Sample Test)

	Test Value = 70					
	T	Df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
Cumul	-3.043-	2	.093	-26.2000	-63.244	10.844

Variability Analysis based on One-Way ANOVA

In this section, we use one-way ANOVA to test whether the students from different colleges have significant differences in their opinions regarding the use of the laptop.

Table 9. ANOVA of Question No. 1 (I use my laptop for academic purposes only (ex: note taking, finding information online, viewing the lecture notes etc.))

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	1.173	2	.587	.432	.650
Within Groups	190.281	140	1.359		
Total	191.455	142			

Table 10. ANOVA of Question No. 2 (I use the laptop for chatting, checking my e-mail, playing games, or watching movies?)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	1.323	2	.661	.428	.653
Within Groups	216.230	140	1.544		
Total	217.552	142			

Table 11. ANOVA of Question No. 3 (I am more concentrated and focused when I can view the lecture notes on Power Point on my laptop?)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	2.445	2	1.223	.838	.435
Within Groups	204.366	140	1.460		
Total	206.811	142			

Tables 9, 10 & 11 show no significant difference in the responses to the 3 questions between the students of the three groups of students from the different Colleges.

Conclusion

In this paper, we investigated the question: are laptops distracting tools inside classrooms? This study showed that the majority of students were not using laptops in class for class-related material. Rather, most of the laptops' use was for non-educational purposes such as chatting, checking e-mails, playing games, or watching movies during educational lectures. This implies that laptops are likely a source of distraction when used by students in an educational setting. Based on this study, we recommend that the use of laptops in the classroom to be monitored in order to decrease students' distraction and enhance learning.

Attitudes towards the use of ICT Training Curriculum for Thai Elderly People

Snit SITTI [a,24], Srikul NUNTACHOMPOO[b]

a Asst.Prof., Department of Computer Science, Faculty of Science, Maejo University, Chiang Mai 50290, Thailand
b Information Technology Center, Maejo University, Chiang Mai 50290, Thailand

Abstract

Learning and using information and communication technologies (ICT) such as computer technologies and internet by the elderly is seen as an important demand for their integration in daily life and as a factor related to active aging. The aim of this research is to explore the attitudes of the elderly towards ICT literacy in the context of a training curriculum about the utilization of a personal computer platform such as introduction to computer, using Windows, internet: web browser usage, e-mail management, searching information, and Facebook. It is the result of an empirical study with a sample of 32 older people (65 years and older), consisted of retried employee from the schools and universities that took place in the centers for the elderly in the province of Chiang Mai in Thailand. They registered in the special short course training for the elderly at information technology center, Maejo University, Thailand. The data were collected through questionnaire. The data were analyzed by frequency, percentage and mean. They have more skill in ICT after learning course. The research findings indicate that the elderly who use ICT learning show more positive attitudes towards new technologies. They thought of training as a means of social participation and lifelong learning.

Introduction

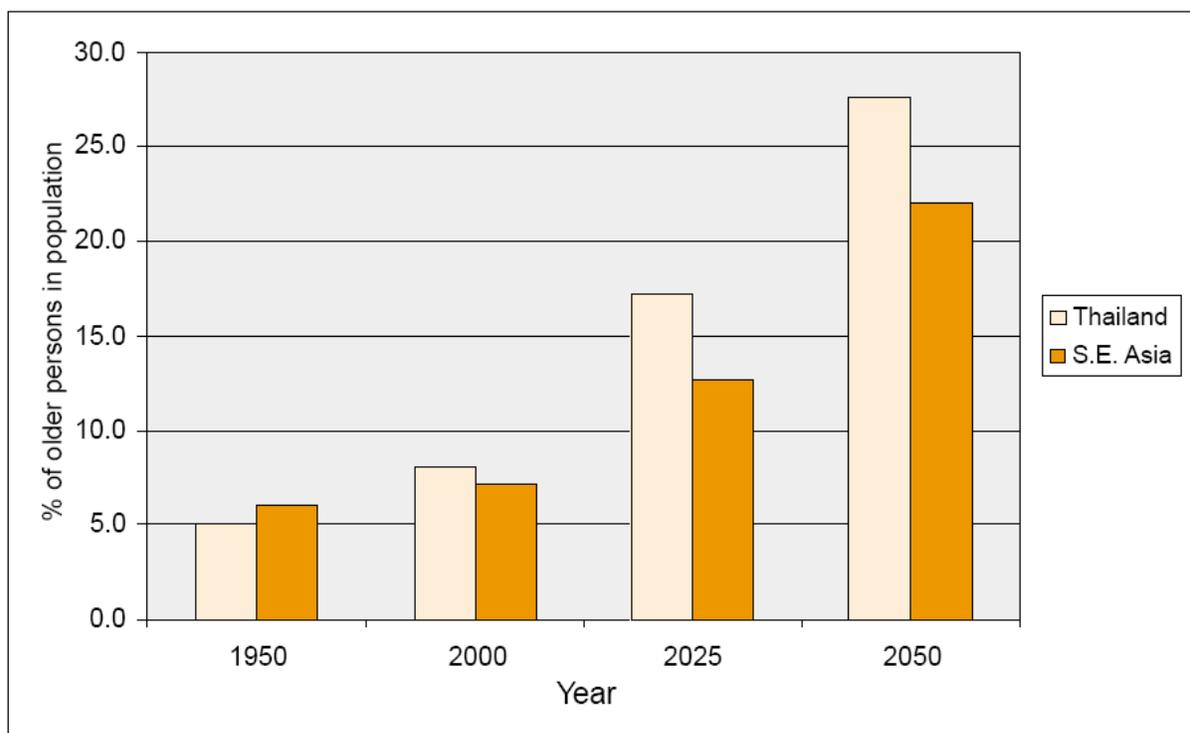
In Thailand, population ageing is defined as the increasing proportion of elderly people (60 years and above) in the total population. Thailand's population is rapidly ageing. In 1950, with 5 per cent of its population aged 60 years and over, Thailand ranked as the seventh most aged country among the eleven countries in South-East Asia. It has now moved up to be the second most aged country in the region (next to Singapore), with elderly people constituting more than 10 per cent of the population. This is a result of a relatively higher rate of increase in older population as a consequence of decline in fertility and improvement in longevity (UNFPA, 2006). The proportion of elderly people in total population will increase to 14.0 per cent in 2015, 19.8 per cent in 2025 and nearly 30 per cent by 2050. The population of elderly people will increase from the current 6.4 million to 9.0 million in 2015, 12.9 million in 2025 and exceed 20 million in 2050. (Figure 1)


Figure 1: Thailand is ageing faster than others in South-East Asia.

Sources: Institute for Population and Social Research, Mahidol University, Population Projections for Thailand, 2005-2025, 2006; and United Nations, Department of Economic and Social Affairs Division, World Population Ageing 1950-2050, Population Division, New York. 2002.

Moreover, ICT can help elderly people to improve their quality of live, promoting them to stay healthier, live independently for longer and if it this possible counteract reduced capabilities which are more prevalent with age that may allow them to remain active at work and/or in their society. Today ICT offers several solutions for elderly people for their independent living by managing their preferred environment by maintaining their independence and autonomy in order to enhance their mobility and quality of life, improving their access to age-friendly ICT and personalized integrated social and health care services. Ageing well and active ageing means for elderly people continue active and able to participate in social life and work. However, there are barriers, problems and constraints when elderly people use ICT (Amaro & Gil, 2011). Thus, they should to develop ICT literacy and skill for lifelong learning and social participation.

The Study

This study focused to develop the ICT training curriculum for Thai elderly people, to manage learning environment for training such as trainer, assistant trainer, content, practices, computer, training room etc. , and to evaluate attitudes towards the use of ICT training curriculum for Thai elderly people.

Objectives

This exploratory sought to study and evaluate attitudes towards the use of ICT training curriculum for Thai elderly people.

Methodology

1. Population and Sample
   1.1 Population of the study was retried employee from the schools and universities that took place in the centers for the elderly in the province of Chiang Mai in Thailand.
   1.2 Sample was selected by purposive sampling which composed of 32 elderly people for ICT training (65 years or older).
   2. Developing lessons and practices of ICT training curriculum for elderly people which were the trainer's handbook and learner's handbook for use in the ICT training. The ICT training curriculum composed of 5 topics which were synthesized from opinions' 5 specialists. The contents composted of 5 topics: 1) introduction to computer, 2) using Windows, 3) using internet, web browser usage, e-mail management, 4) searching information and 5) using Facebook. They needed to train as 1 day short course in the computer laboratory at information technology center, Maejo University, Thailand. The contents for presentation used rich multimedia for drawing attention and gave the highest effective learning (Sompong, 2012).
   3. Preparing research instrument was questionnaire which evaluated attitudes towards elderly people the use of ICT training curriculum for Thai elderly people. The questionnaire included 20 items and each item was accompanied by using a 5-point Likert Scale which begins with Strongly Disagree (1), Disagree (2), Undecided (3), Agree (4) and Strongly Agree (5), with 1 representing "strongly disagree" and 5 representing "strongly agree" for positive items. The questionnaire was validated by researcher. The questionnaire was pilot tested on a group of elderly people (30) who took the same course a semester before this study was conducted. The items were found and the reliability for the 20 items was established at .80 using the Cronbach's alpha coefficient, indicating good internal consistency.
4. Data collection and analysis
   4.1 The data were collected through the trainer's observation for ICT skill of elderly people and the questionnaire's attitudes towards the use of ICT training curriculum for Thai elderly people.

4.2 The data were analyzed by frequency, percentage and mean.

Results

After training course, the elderly people were given more skill in the use of ICT. They ware survey questionnaire to assess their attitudes towards use of ICT for elderly people. The sample size was 32 elderly people (N=32). The data were analyzed using statistical package program. The elderly people were 68.8 per cent female and 31.2 per cent male. They ranged in age between 65 and 80 years and average 66.4 years. The survey was conducted to evaluate elderly people on their attitudes and perceptions towards use of ICT training curriculum. Analysis on the survey items showed that the overall average means of responses towards these areas were positive attitudes the use of ICT training curriculum (Mean=3.84). The learners felt that these contents were suitable for the level of elderly people, could be integrated to real life.

Conclusions

In conclusion, the study was successful in demonstrating the importance of incorporating ICT learning approaches in order to enable elderly people to acquire ICT skills and presentation skills, and create a learning environment where they are engaged in the special contents and learning process. Here the results provide very positive attitudes and encouraging results for using ICT training curriculum in the computer training room, and would be an effective learning for elderly people in Thailand who are interested in enhancing ICT skills for social participation and lifelong learning. Moreover, the Thai population ageing is the increasing proportion of elderly people in the total population. This ICT training curriculum is suitable for the level of Thai elderly people.

Augmented reality in the higher education: Students' science concept learning and academic achievement in astronomy

Jung-Chuan Yen[a][25], Chih-Hsiao Tsai[b], Min Wu[a]

aDepartment of Mathematics and Information Education,
bDepartment of Information Technology
aNational Taipei University of Education, No. 134, Sec.2, Heping E. Rd., Da-an District, Taipei City 10671, Taiwan, ROC
bTakming University of Science and Technology, 56, Sec.1, Huan-Shan Rd., Nei-Hu District, Taipei, 11451, Taiwan, ROC

Abstract

The purpose of this study was to examine the effect of providing learners with diverse approach of simulation-based instructional design, 2D animation (2D), 3D simulation (3D), and augmented reality (AR) on students' moon phases concept learning and their academic achievement. There were 104 senior college students participated in this study. Based on ANOVA analysis, the result showed that: (a) all of the three approaches could enhance learners' performance on academic achievement, however, there were no significant difference between them; (b) students in AR approach outperformed the other two instructional design on moon phases concept learning; (c) students in 3D and AR approach demonstrate higher motivation and concentrate their attention on the learning tasks. This study provided insights for better understanding the design, theory and practice of e-learning through augmented reality technology.

Keyword: augmented reality; moon phases; concept learning; instructional design; empirical research

Introduction

With the continuous evolution of simulation-based instructional models, it has become possible for education researchers to introduce proper e-learning systems to enhance those learning tasks for which subject attribute and traditional models are ineffective (Yeh, 2004; Guo, 2007). Integrating the advantages of the authentic technologies to provide solutions unlimited by the real environment can resolve problems caused by the following circumstances: the concepts of some subjects may be excessively abstract; some subjects require dangerous experiments and operations; a certain subject may require long periods of time for recording and observation; the surroundings for observation cannot be easily constructed or meet the necessary requirements due to cost and technological limits or remote locations. Researches on simulation-based learning indicate that teaching aided by the operation of interactive 2D or 3D models can significantly help learners to understand spatial concepts (Shelton & Hedley, 2002). In addition, research into using augmented reality (AR) technologies to develop instructional materials desired by teachers and students have confirmed that AR materials can effectively enhance the academic motivation of learners and help them obtain better learning effects (Chen, Wu, & Zhung, 2006). Therefore, simulation-based e-learning system may help learners to obtain more diversified and abundant knowledge in order to construct a complete and correct conceptual framework (Hsu, 2008).

Nowadays, it has become a trend to utilize the characteristics of multimedia and computer aided instruction models for scientific concepts. Through research into the application of 3D animation and the teaching of the moon phases, Ma (2008) discovered that 3D animation instruction improved learners' immediate learning effects on the concepts of moon phases, but that it had no significant difference to the learning outcomes in delayed posttest. Moreover, Li (2010) adopted "Interactive Software of Lunar Phase" to conduct e-learning, proving that multimedia courseware had a significant improvement on the learning effects of concepts, such as the phenomena, causes and periods of the moon phases, as well as the motions of the earth, the sun and the moon. In addition, the learners' misconceptions of the moon phases can be clarified through the presentation of the multimedia. All the above

researches came to the same conclusion; by providing teaching materials, such as 2D and 3D animation, a simulation-based e-learning model is really helpful for improving the learning effectiveness of the concepts of the moon phases. However, more evaluations are still required to confirm whether other more authentic presentation modes, such as AR materials, can improve the learning effectiveness of abstract conceptual knowledge, such as the changes and periods of the moon phases.

This research aims to apply AR technology to develop a simulation-based concept learning system on the phases of the moon, as well as discuss the influence of different simulation-based instructional models on the academic achievement in astronomy. It hopes to lay a foundation for further researches into the application of AR on the concepts learning in the natural science field.

Augmented reality

AR has been widely applied in many aspects, including medicine, entertainment, education and interactive action guides. This study will integrate AR's application to nature and earth science, and is as follows:

With the Nine Planets system and Garden Learning system as the research content, the researches of Liu, Cheok, Mei-Ling and Theng (2007) helped to develop instructional materials using AR. According to their research, an AR instructional model can give a full demonstration of 3D virtual objects, which is a great advantage compared to narrative or static image-text types. The research results also indicated that this kind of instructional model can effectively improve learners' attention and learning outcomes. Shelton and Hedley (2002) compared the AR model of the Nine Planets with the traditional simulation material (including on-line 2D picture displays and 2D animation), and pointed out that AR model can save time spent by learners on practice and can also reduce the cost of materials designed. Moreover, learning with AR assisted technology, can provide learners with perceptual feedback and interaction, allowing them to understand the content better and reach the learning objectives more easily and less practice through actual interaction with the system (Milgram, Takemunra, Utsumi, and Kishino, 1994).

Billinghurst (2003) holds that the development of AR material supplies a unique education application model in which learners can interact freely with virtual objects in a real environment and acquire new knowledge that is not so easily imitated in a real environment. Kikuo and Tomotsugu (2005) consider that AR is a new pattern applied in teaching and has great potential for future development. This new and unique instructional method and strategy can help learners with little computing experience to interact easily. In addition, different from traditional learning content that only provides static texts and pictures, AR instructional model can lead learners directly to the essence of the learning content.

Eric, Mark, Graham and Barbara (2004) integrated five examples of AR teaching in their research to illustrate the advantages of AR teaching. These advantages include: (1) learners like this kind of instructional material; (2) as far as the courses about spatial concept relations are concerned, AR materials can help learners to clarify relative conceptions; (3) AR materials can better demonstrate knowledge about time concepts than traditional teaching materials; (4) virtual objects produced by the AR learning system are presented as 3D objects and learners can interact directly with these virtual objects; and (5) referring to the concept of constructivism, AR model can allow learners to change their native knowledge, independently.

In accordance with the above researches, applying AR to education has the following advantages:

- Novelty towards learning: AR learning uses new multimedia technology and presents diversified multimedia content through the system, which allows learners to acquire knowledge of concepts and increases their interest in learning. Aided by simulation-based materials, AR combines virtuality and reality to improve the interaction level, stimulating the learners' learning motivation and enthusiasm.

- Interaction with learners: With regards to relatively difficult abstract concepts, learners can practice repeatedly through the interactive operation process. This model can deliver the correct knowledge of concepts to the users. Even learners with little computing experience can improve their comprehension abilities and familiarity through this model.

- Establishment of spatial concepts: If the instructional material can make abstract spatial concepts visible and visualized, it will be of great benefit to learners in terms of promoting learners' understanding towards the spatial concept. AR materials are developed with the possibility of turning abstract to concrete and, thus, they can improve learners' learning effectiveness of spatial concepts.

-

Referring to the above three advantages which are about the AR's applications in teaching aspects, the content design of the instructional materials should be in accordance with the learning objectives and concepts that teachers wish to convey to their learners. The development of simulation-based materials should meet the requirements necessary to initiate the different experiences, sensorial stimulation or interaction of learners and even help them to visualize abstract concepts. It is expected that AR materials will help learners to establish correct scientific concepts.

Research method

This study aimed to discuss the influence of simulation-based materials on the learning effectiveness of the learning unit on the phases of the moon. Quasi-experimental research was adopted to replicate the students' learning effects in this study. In addition, through T tests on independent samples, this study obtained statistics for the effectiveness of different instructional design for the learning unit between learners using 2D animation materials (2D), 3D simulation materials (3D), and augmented reality materials (AR).

Simulation-based moon phases Materials

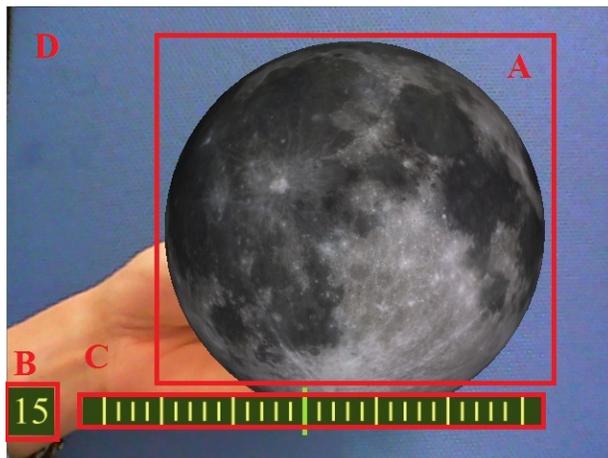
The 2D animation materials on moon phases used in this study were taken from the interactive animation software system on moon phases designed by Wang (2006) through Flash technology, has proven itself was a effectively 2D animation learning system. The 3D simulation system of moon phases was flowered from Google Earth. Tilting the image and flying through the moon in Google Earth suddenly makes the structure and relationships obvious to students. The moon's color stripes and zigzags become more lively and authentic before their eyes. All of these content and materials contains the learning objectives of the learning unit. The system overviews were shown in Fig 1.

24. Fig. 1: (Left) The 2D animation materials; (right) The 3D simulation materials

Meanwhile, this study developed its own AR materials using virtual reality technology based on the Total Immersion D'Fusion AR software package, 3D molding software Maya and 2D image processing software Photoshop. The process of material development is shown in Fig 2.

25. Fig. 2. The construction process of the Augmented Reality Materials of this study

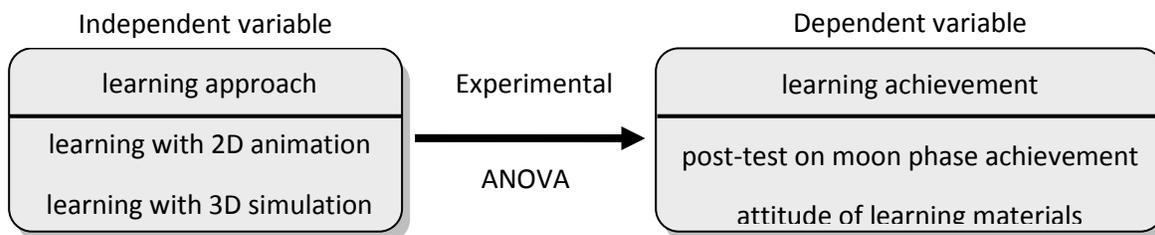
First, the 3D model was imported into D'Fusion AR using molding software Maya. Second, the D'Fusion CV was used to set the graphic cards' pattern, named AR tag, for camera identified. Then, 2D surface materials and system pictures were drawn and design by using Photoshop. Next, we using the D' Fusion AR package to process the above completed model, graphic cards and interfaces with the interactive program language Lua Scipt for advanced

interactive. Finally, the design for interaction and the setting of functional dimensions was completed and then upload all files to the learning system website. The system overviews were shown in Fig 3.


26. Fig. 3: (A) show 3D object; (B) show lunar calendar date; (C) each day of the month; (D) real world scenarios

It should be noted that the image resolution level of pictures influences the sense of reality of the 3D virtual objects displayed. Additionally, the charting of the adjustments in the moon's shadow area should be in accordance with the real shape of the moon.

Participants and Scenario

The present study investigated the effect of providing learners with diverse approach of simulation-based instructional model, 2D animation (2D), 3D simulation (3D), and augmented reality (AR) on students' moon phases concept learning and their academic achievement. The participants were 104 juniors students from an education college at a university in the north of Taiwan, including 41 male (39.42%) and 63 female (60.58%), enrolled in two selective course on "computer animation and applications." The samples were divided into three groups and randomly assigned to experimental conditions (AR group) and control group (2D animation and 3D simulation). Base on the simulation-based instructional design, the experimental group and control group adopted exactly the same procedures but different assistant materials. The experimental group (AR group) carried out the unit activities on moon phases with our AR materials. Meanwhile, the control group (2D and 3D group) conducted activities using 2D animation and 3D simulation materials. The research framework is shown in Fig 1.


27. Fig. 4. The research framework of this study

Firstly, the study ran a homogeneity of variance on the students' concepts of the moon phases among three group. Then, the research experiment adopted difference approaches of computer simulation materials to learn related concepts of the moon phases. The primary data collected for this study consisted of: (1) self-report collected from learners, in which after completing each stage of the experiment, they were asked to describe in 30 words the learning task and; (2) weekly interviews recorded by the instructor in class meetings throughout the course; and (3)

attitude questionnaire of learning materials; and (4) an online post-test achievement test on moon phase was conducted to examine participants' progress.

Two-stage questionnaire on the elementary school students concepts of the moon

This study applied two-stage questionnaires on the students' concepts of the moon, as designed by Lai (2002). It aimed to assess the learners' learning degree of the four major concepts in the unit on moon phases, including the phenomena, causes and periods of the moon phases, as well as the motions of the earth, the sun and the moon. It also aimed to analyze the changes in the learners' misconceptions from before the study and after the study. In order to clarify if the notions in the learners' minds were correct scientific concepts, this test applied the two-stage answer method. Two tests were done, specifically a pre-test and a post-test. The test-retest reliability method was applied and the related coefficients of all questions were significantly correlated ($0.41 \leqq r \leqq 0.78$), indicating a good test-retest reliability. The index of internal consistency (α) was 0.64, representing the acceptance level of test reliability. As for the validity, this test adopted content validity. Three professors from the Nature Department and two primary schools teachers were invited to examine the test content in order to construct the content validity of the test. There were a total of 16 test items. Each item of single choice included two parts, option and reason. Two scores were given if both the option and reason were right; otherwise, no score was given. The total score was 32.

28. Fig. 1. The learning scenario of research implementation

Research results and discussion

Different learning approach of concept learning effects was not significant

The Analysis of Variance (ANOVA) was conducted to examine the main effects of the different learning approach on the dependent measures. Significance level was .05 for data analysis. The descriptive statistics and summary of learning achievement are shown in Table 1. The achievement mean score of all three group indicated that the participants obtained positive progress toward the simulation-based learning. The mean score of the AR group (12.76) was slightly higher than that of the 2D animation group (12.63) and 3D simulation group (11.58). The effects of different treatment on participants' achievement were further analyzed by means of ANOVA.

29. Table 1. Descriptive statistics and summary of learning achievement in different approach

Learning Approach	N	Learning Achievement			
		Pre-test		Post-test	
		M	SD	M	SD
2D animation	36	7.95	3.28	12.63	3.77
3D simulation	35	7.92	3.23	11.58	3.45
AR simulation	33	8.03	3.39	12.76	3.91

First, the Levene's test of equality was conducted on participants' pre-test score of achievement toward simulation-based learning. The result was not significant ($F(3, 101) = .312$, $p = .817$). The homogeneity assumption that the error variance of the dependent variable is equal across groups was sustained. Then, the ANOVA summary of different simulation materials for the independent measures of participants' post-test score of achievement is shown in Table 2. The main effect of the ANOVA result was not significant ($F(3, 101) = 1.085$, $p = .216$).

30. Table 2. Summary of the ANOVA result

Source	Type III Sum of Squares	Df	Mean Square	F	p
Learning Approach	1478.649	2	359.550	1.085	.216
Error	32561.587	101	102.303		

*$p<.05$

Students in 3D and AR approach demonstrate higher motivation

Furthermore, an ANOVA was conducted to examine the main effects of the different learning approach on the learners' attitudes toward the simulation-based learning materials are shown in Table 3. The significance level was also .05 for data analysis.

31. Table 3: Summary of learners' attitudes on different learning approach

Attitudes	N	Descriptive Statistics		F	p
		M	SD		
2D animation	36	3.513	.510	3.212	<.01
3D simulation	35	4.509	.608		
AR simulation	33	4.775	.542		

The results showed that some striking effects of difference treatment on learners' attitudes toward simulation-based learning. The effects of different learning approach on the learners' attitudes were very significant (F=3.212, p<.01). Further check by the mean values found the AR simulation group (M=4.775) and 3D simulation group (M=4.509) scored higher than the 2D animation group (M=3.513). The data indicated that the learners perceived more authentic and more realistic outperformed the plain significantly while learning in the learning system with the mechanism of simulation-based design. The result was similar to the researches of Wu, Lee, Chang, and Liang (2013) and Yen, Lee, and Chen(2013). It is interesting and seems worthy to pay more attention on how simulation-based learning design could result in this outcome.

Conclusion

This study aimed to discuss the influence of different learning approach (2D animation, 3D simulation and AR materials) on the learning effectiveness of the concepts of moon phases and to analyze the learners' experiences when using AR teaching materials. Owing to this study was a pilot study, the teaching content of which chose only a few concepts related to moon phases as the operating variables. Therefore, the influence of learners' concepts and learning effectiveness other than changes of the moon phases cannot be predicted. Two experimental lessons of 70 minutes were given during this study. According to the data collected from the pre-test and post-test, the following conclusions were obtained.

Firstly, in terms of the influence of different approach of instructional design on the learning effectiveness of the concepts of moon phases, 2D animation, 3D simulation and AR simulation are all helpful for the improvement in learning. However, the differences among the three groups did not reach a significant level. It means that the AR materials on moon phases, as developed by this study, can improve learning effectiveness, but the advantages of AR materials require further exploration. A suggestion for future researchers is to fully understand and authentically display the knowledge content when producing AR materials. More importantly, a complete interactive operation mode that can improve the students' learning interests should be provided.

Otherwise, according to the observations and records of the learning experiences, learners in the 3D and AR simulation group had higher motivation levels and degree of concentration. This study deduces that the reason may be that these materials can provide a more intuitive interactive mode and present abstract concepts more authentically. Therefore, using AR materials can rise the students' learning motivation levels and their degree of concentration. We suggests that future researchers of AR materials explore these aspects further.

Augmented Reality-based Support System
for Teaching Hand-drawn Mechanical Drawing

Hirosuke HORII[26], Yohei MIYAJIMA

University of Yamanashi, Faculty of Engineering, 400-0016, Kofu, Yamanashi, Japan

Abstract

This research aims to reduce the time, effort and monetary cost needed for developing various educational materials for teaching hand-drawn mechanical drawing by replacing actual educational materials with virtual ones on an augmented reality (AR) -based support system. This system is used for training of sketching and orthographic projection drawing, and has following features. 1) The virtual educational materials constructed by using 3D-CAD are superimposed to a real-time camera image as AR objects. 2) Students can watch the objects from various directions by using a cubic-marker intuitively. 3) The objects are applied realistic textures similar to the actual materials.

INTRODUCTION

In this research, we developed an augmented reality-based support system for teaching hand-drawn mechanical drawing at a faculty of mechanical engineering of a university. Recent industrial products are mainly designed by using computer aided design system called, CAD. Therefore most of the faculties of mechanical engineering teach the mechanical drawing by using CAD. Though the above situation, our faculty thinks that it is necessary and important for the students to learn the hand-drawn mechanical drawing. So firstly we teach hand-drawn mechanical drawing, and after that we teach by using CAD. We think that learning the hand-drawn mechanical drawing is not only to learn the drawing skills, but also it is able to learn the stereognostic sense effectively. Here, we define the stereognostic sense as an ability of understanding a shape of three-dimensional object and then drawing it onto a two-dimensional drawing.

We are using mechanical parts such as gears, bearings as educational materials on teaching the hand-drawn mechanical drawing. Each student draws a mechanical part by using sketching or the third angle orthographic projection drawing, while he has the part in hand and watches it from various orientations. Through the above learning, he will have mastered the stereognostic sense. On the other hand, there are problems to maintain those educational materials. In order to give the materials to each student, we have to maintain various parts, but it requires the time, effort and monetary cost.

In this research we aim to reduce the above problems by replacing actual educational materials with virtual ones on an augmented reality (AR) -based support system. This developed support system overlays virtual materials on the digital camera image. Student can feel as if he had the actual material by watching the virtual object from various orientations by using the system. As the result, we can provide various educational materials for each student rapidly, easily and low cost.

This paper describes the structure of the system and then shows some demonstrations of the system.

DEVELOPMENT OF AR-BASED SUPPORT SYSTEM

This section describes the system configuration of the developed AR-based support system.

Overview and Structure

The developed AR-based support system recognizes a cubic AR marker from a digital camera image and overlays a virtual mechanical part made by 3D-CAD as educational material on the image.

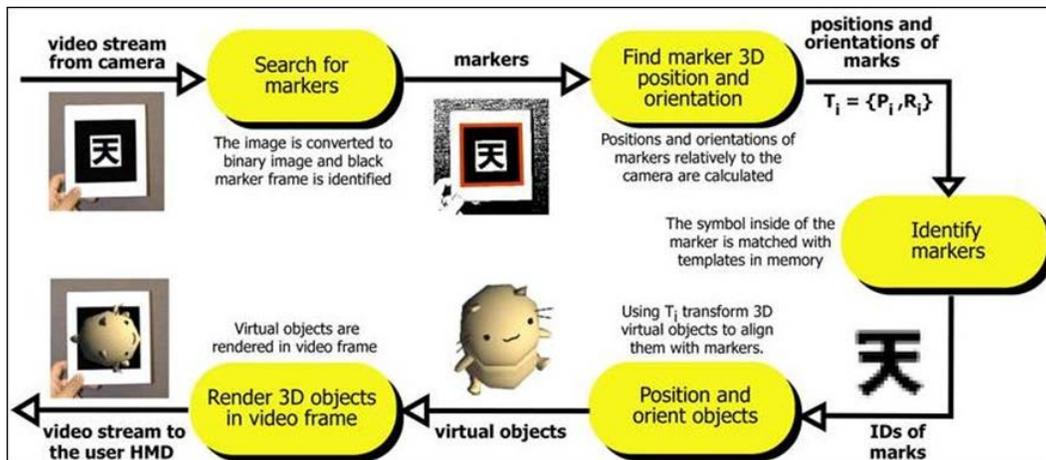
The hardware of the system is composed of a personal computer and a digital camera. The software of the system is constructed by using some programming library, such as ARToolKit, OpenCV and OpenGL. The ARToolKit is a programming library for implementing augmented reality application. A virtual object is overlaid on an AR marker taken by the digital camera. Position and orientation of the virtual object is defined by recognizing the position and the orientation of the AR marker. Figure 1 shows the procedure of how to overlay the virtual object on AR marker by ARToolKit.


Fig. 1. How to overlay a virtual object on an AR marker by ARToolKit

(Quote from http://www.hitl.washington.edu/artoolkit/)

Cubic AR Marker

The AR system displays virtual objects as if they existed on real world. In order to do so, the system needs to recognize the position and the orient of the objects. It is called registration. An example of a procedure of the registration to overlaying a virtual coordinate into a real coordinate is shown in Fig. 2. At the registration, the direction and the distance of a virtual object from a camera is calculated by recognizing edges of an AR marker using a binarized camera image.

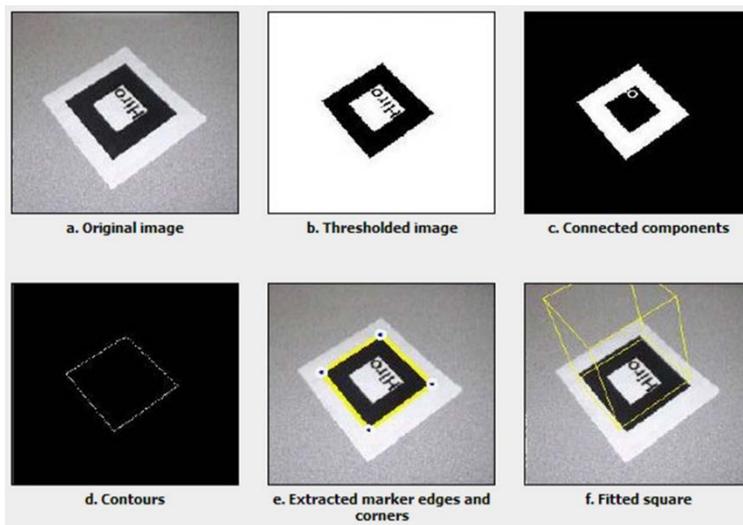
Our support system uses a cubic AR marker for the registration. The cubic AR marker provides recognition of every aspect of virtual object to the system. Each student takes the cubic AR marker in hand and watches it from various directions of front, back, top, under, left and right. It serves a user experience similar to holding an actual educational material in hand. A drawing of the cubic AR marker is shown in Fig. 3.


Fig. 2. How to recognize AR marker from camera image by ARToolKit

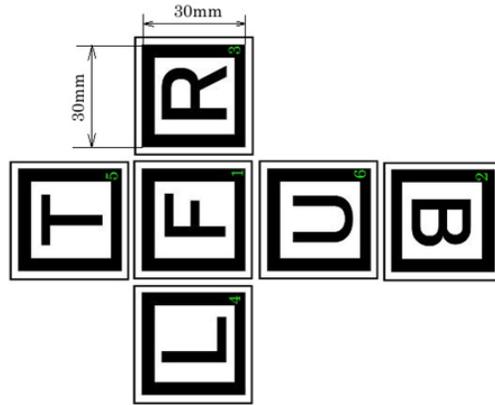
(Quote from http://www.hitl.washington.edu/artoolkit/)


Fig. 3. Drawing of cubic AR marker.

Realistic Texture of Material

Colors of materials which are expressed by setting various color tones provide realistic textures to the educational materials. The textures are set by using glMaterialv( ) function of OpenGL library. Various textures of materials are expressed by controlling the glMaterialv( ) function parameters, Ambient Light Reflection Coefficient (GL_AMBIENT), Diffuse Light Reflection Coefficient (GL_DIFFUSE), Specular Light Reflection Coefficient (GL_SPECULAR) and Shiniss Coefficient(GL_SHININESS). Some examples of these control parameters are shown in Table 1.

RESULTS

In this section firstly, we demonstrate some examples of the operation of the system, and then we show the effectiveness of the cubic AR marker and the expression of realistic texture.

Demonstration

The windows of the system are shown in Fig. 4. The upper is main window and it displays overlaid virtual object. The lower right window displays source image and the lower left window displays binarized image. Although the lower windows are not necessary at the actual use, we show them in order to explain our system here.

Four examples of the mechanical parts for educational materials are shown in Fig. 5. These examples of a knuckle joint, a gear, an L shaped bracket and a bearing holder were made by using CAD. The left object is the virtual mechanical part and the right one is the actual part. Each virtual object seems similar to the actual one.

Fig. 6. Recognition of orientation by using cubic AR marker.

Cubic AR Marker

Result of the recognition of each orientation by using a cubic AR marker is shown in Fig. 6. From the Fig. 6, we can confirm that the cubic AR marker recognized exact orientation and provided various aspect of the virtual object successfully. This result shows that students can watch any aspect of virtual object intuitively.

Realistic Texture of Material

Texture of each material is set by selecting any texture from a list on window shown in Fig. 7. When user selects any texture, the control parameters shown in Table 1 are used to paint the virtual object. Presently, we prepare 25 textures. Examples of any texture painted on virtual object are shown in Fig. 8.

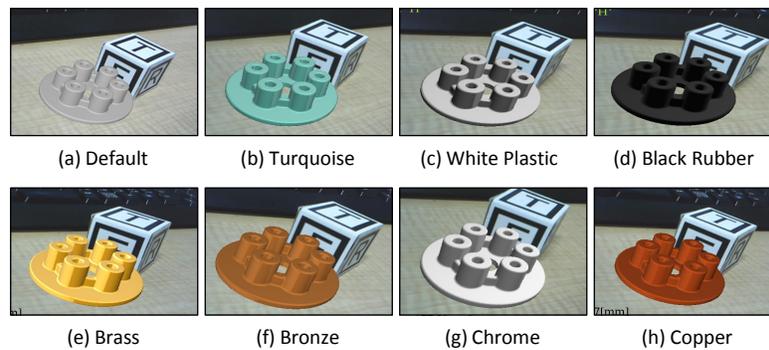

Fig. 8. Examples of texture.

CONCLUSION

In this paper, we showed an AR-based support system for teaching hand-drawn mechanical drawing. The virtual educational materials were made by using 3D-CAD. Easy and intuitive user experience was achieved by using cubic AR marker and realistic texture. As the result, this system achieved the reduction of time, effort and monetary cost for preparing various mechanical parts as educational materials by replacing actual materials with virtual ones.

Head-mounted display, HMD is becoming familiar in recent years. We think that implementing our system on HMD will improve usability and we aim it as our future work.

Abstract

Previous studies showed that automatic approach as a better approach to identify learning style in online learning because it is based on the actual students' behaviour pattern while learning. However, there are several methods in an automated approach can be used to identify learning styles and literature-based method is said to be practical by using LMS. Therefore the purpose of this study is to identify the learning style based on patterns of behaviour for 20 students who studied Interactive Multimedia course within LMS environment in the context of Malaysian polytechnic student. Patterns of behaviour were analyzed based on literature-based method. The Findings indicate the predicted and ILS learning style are different because it depends on the actual behaviour patterns of students. Therefore, identifying learning styles literature-based method is needed to ensure the measurement is based on actual student behaviour during online learning.

Keywords: Learning styles; automatic detection; literature-based approach;

Introduction

Learning style is not a new concept in education. It was started in the 1960s (Coffield et al., 2004; Dag & Gecer, 2009), but until now this area continue to be relevant in accordance with the development of educational technology primarily involves online learning adaptive learning feature (Akbulut & Cardak, 2012; Dung & Florea, 2012). Adaptive learning is matching the personality characteristics of students with learning materials and activities (Lee & Park, 2008). Practitioners and researchers in the field of education believe that by matching the materials and learning activities with learning styles can make learning easy and effective (Felder & Silverman, 1988; Graf, Liu & Kinshuk, 2010; Hsieh et al., 2011). In relation to this, learning style is one of the personality traits that are important in adaptive learning (Bajraktarevic, Hall & Fullick, 2003; Papanikolaou & Grigoriadou, 2004) and is predicted to be the contributor to the success of the online learning system (Lim, Morris & Yoon, 2006).

There are two approaches for identifying learning styles, which uses a collaborative and automatic approach (Brusilovsky, 1996). Automated approach is based on the actual behaviour patterns during online learning progresses, while the collaborative approach using a questionnaire to identify the learning style (Brusilovsky, 1996). Collaborative approach is considerably less accurate as current students answered the questionnaires it may be influenced by the nonchalant attitude (Schiaffino, Garcia & Amandi, 2008), students are not willing to give information (Joerding, 1999; Kobsa, 2002) and only measure to one specific point of time (Graf, Kinshuk & Liu, 2008). On the other hand, a research done by Zaidatun (2002) showed that not all student display the same learning style as obtained from collaborative approach during actual learning. While the process of identifying learning styles said to be more accurate with the automatic approach due to the information technology that can provide explicit information during online learning (Garcia et al., 2007; Graf et al., 2008). In relation to this, identifies automatically learning styles are very much in the present researchers of learner model because it can make the learner model more dynamic and comprehensive.

Considering learning styles using the automatic determination is not something new, but it has been introduced by some previous researchers (Garcia et al., 2007; Graf et al., 2008; Lo & Shu, 2005; Simsek et al., 2010), but this

study would like to see the differences between learning styles are identified in collaborative and automatic approach in the context of engineering students at one of the polytechnics in Malaysia. Therefore the objective of this study was to identify the learning style model of Felder and Silverman automatically using literatured-based method and to compare the findings obtained with style collaborative approach.

Learning Style

James and Blank (1993), define learning style as 'the complex manner in which, and the conditions under which, learners most efficiently and most effectively perceive, process, store and recall what they are attempting to learn'. By identifying students' learning styles, teachers could design classroom activities and provide learning materials that are in line with the students' learning styles (Felder & Silverman, 1988). In addition, students would be able to recognize their own learning strategies when they know the strengths and weaknesses of their learning styles (Felder, 1993)**.** There are many models of learning style refers to the variety and interest in the field of model designers. However according to Ozpolat and Akar (2009) there are five models of learning style that are often used by engineering students in the previous studies: Myers-Briggs Type Indicator (1978), Kolb(1984), Felder and Silverman (1988), Herrman (1990) and Dunn and Dunn (Dunn & Price, 1989). Nevertheless, the model that is used commonly is Felder and Silverman learning styles model (Akbulut & Cardak, 2012; Dag & Gecer, 2009). This model is able to analyze clearly the dimensions of learning styles based on a scale of range between +11 to -11 (Felder & Spurlin, 2005). In addition, the questionnaire (Index of Learning Style, ILS) also has acceptable reliability and validity (Litzinger, Lee, & Wise, 2005; Van Zwanenberg, Wilkinson, & Anderson, 2000; Zywno, 2003) and the model is also proposed suitable for use for online learning (Kuljis & Liu, 2005).

Felder-Silverman learning style model was exclusively designed for engineering students (Felder & Silverman, 1988). This model was to identify students' learning styles and help instructors to formulate approaches to teaching to be in line with a range of learning styles of students. There are five dimensions of learning style models: perception, input, organization, processing and understanding. However, there are only four dimensions found in the instrument used to determine learning styles (Felder & Soloman, 1997). According to the Felder-Silverman learning style, there are four dimensions of learning styles, namely: - (i) the perception or type of information that becomes a choice of someone while understanding a piece of information be it through sensory or intuitive, (ii) the most effective input or sensory channels that receive either visual or auditory perception, (iii) the active or reflective method of processing information and (iv) the sequence or global way a person understands a knowledge.

Richard M. Felder and Barbara A. Solomon created a Learning Style Index (ILS) in 1991 based on the Felder-Silverman learning style model (Felder & Spurlin, 2005). This ILS questionnaire consists of 44 items and was placed on the World Wide Web in 1997 (Felder & Soloman, 1997). The instrument was designed with only four dimensions of learning style models: active / reflective, sensory / intuitive, visual / verbal and sequence / global. Each dimension in the questionnaire has 11 items. ILS scale is a bipolar scale with option 'a' brings value +1 and 'b' gives value -1. The total score for each dimension produces a scale from +11 to -11 (Felder & Spurlin, 2005). Value scale of 1 to 3 shows a balance between the two learning styles in one dimension, value of 5 to 7 refers to moderate learning styles while value 9 to 11 illustrates strong learning styles.

Although the Felder and Silverman model has four dimensions of learning styles, this study however, would only focus on the dimensions of information processing which are active and reflective. Processing dimension describes how to process the favourite information of a person whether it is active (actively involved in learning) or reflective (make observation on their own). Students with active learning style are easy to understand information through learning activities that allow them to actively use the learning materials like doing experiments. Students with this type of learning style love to manipulative the learning materials, try and test something new, give opinions and discuss in group. However, the reflective learning style's students are more comfortable making observations by investigating and manipulating learning materials or activities on their own. Next, to match learning materials and activities with appropriate teaching styles, learning styles should be identified. The next sections will describe various approaches that can be used to identify students' learning styles in automatic approach.

Determination of Learning Style

There are several methods that can be used to determine the learning styles automatically. These methods are different from each other based on the attributes used (personality factors, behavioural factors, and so on), the technique used (bayesian networks, decision trees, fuzzy, etc.) and infrastructure system used (Learning Management System) (Özpolat & Akar, 2009). However, in this study will be discussed in terms of methods used in

identifying learning styles automatically. Previous studies have shown that there are two approach used to identify learning styles in automatic approach: data-driven method and literature-based method (Garcia et al., 2007; Graf et al., 2008; Lo & Shu, 2005). Data-driven method aims at building a model that imitates the ILS questionnaire and uses sample data to construct a model (Garcia et al., 2007). While the literature-based method is to use the behaviour of students in order to get hints about their learning style preferences (Graf et al., 2008). Neural networks (Lo & Shu, 2005), decision trees and Hidden Markov Model, fuzzy clustering (Latham et al., 2010) and bayesian networks (Garcia, et al., 2007) are the techniques that based on the data-driven approach. The literature-based method on the other hand uses only simple rule-based to calculate learning style from the number of matching hints (Atman, Inceoğlu & Aslan, 2009; Dung & Florea, 2012; Graf et al., 2008; Şimşek et al., 2010).

The literature-based method which was proposed by Graf, Kinshuk and Liu (2008) is said to be practical and widely used regardless the courses since the focus is more on the content of the objects such as quizzes, tests, assignments and forum which are the most featured items used in most open source learning management system (LMS) (Dung & Florea, 2012; Özpolat & Akar, 2009; Popescu, 2009). Besides that, the calculation of learning style in this study is based on the simple rules and does not involve the design of the system. Therefore, it could be used in all learning situations which are LMS based (Dung & Florea, 2012). Graf (2007) conducted a comparative study of both data-driven and literature-based methods and found that the literature-based method resulted in more accurate data of identifying learning styles compared to the data-driven method. However, the literature-based method has its own weakness where there is a possibility that there might be other patterns that are not taken into account in the calculation which are also the behavioural indicators of learning styles (Atman, Inceoğlu & Aslan, 2009; Dung & Florea, 2012).

Literature-Based Method

Literature-based method is a method for identifying learning styles based on the behavior when using the LMS, then the relevant behavior with features found on the learning style model to be determined. Because this study uses a model Felder and Silverman's learning style, then the characteristics and behaviour patterns should refer to the dimensions found in this model. In addition, the characteristics and behaviour patterns should be selected based on the characteristics of the most commonly used by instructors in the LMS and can provide many information. According to Graf and Kinshuk (2006), there are a number of features found in the LMS can be used to see patterns of behavior that are relevant to the learning style model of Felder and Silverman content, course outline, example, exercise, assessement and forums.

Based on the features that are available in LMS, the behavior pattern is matched with the learning style characteristics in the model Felder and Silverman's learning style. Based on a study done by Graf, Kinshuk and Liu (2008), students with active learning style expected to show behavioural patterns of online learning as follows**:-** (i) frequently send messages in the forum to ask questions and explain things, (ii) perform more exercise due to preference of testing and trying things out and, (iii) spend only little time on reading material like content object because of favour to retain information by doing something active with learned material. On the other hand, students with reflective learning style expected to show behavioural patterns of online learning as follows:- (i) participate passively by frequently reading the postings and rarely posting message in the forum due to the preference of think about the material and work alone, (ii) visit and spend more time on reading material to think and reflect about the material and (iii) Take longer time on exercise for reflecting on their result but expected to perform less exercise. After determining the relevant patterns of behaviour based on Felder and Silverman learning style model dimensions, threshold value is needed to classify the occurence of behaviour pattern.

In order to classify the occurence of such behaviour, the threshold used to categorize patterns of behavior based on the hint of 0 to3. The threshold value is used to determine whether the presence of behaviour pattern indicators is high (3), moderate (2), low (1) or no information about student's behaviour (0) with respective learning style. The threshold value is based on the value that has been adapted from the value suggested by previous researchers as well as the existence of actual student behavior refers to the structure used in the LMS course (Table 1).

Table 1. Behaviour pattern based on learning style dimension of Felder and Silverman

Features	Behaviour Pattern	Pattern Description	Threshold value	
Outline	outline_stay	percentage of time spent on outlines (based on a predefined expected value)	50%	75%
Example	example_stay	percentage of time spent on examples (based on a predefined expected value)	50%	75%
Content	content_visit	percentage of visited content object (based on the number of available content)	60%	80%
	content_stay	percentage of time spent on content object (based on a predefined expected value)	20%	45%
Exercise	exercise_visit	percentage of performed exercises (based on the number of available exercises)	60%	80%
	exercise_stay	percentage of time spent on exercises (based on a predefined expected value)	30%	50%
Forum	forum_visit	number of visit forum (per week)	8	12
	forum_stay	time spent in the forum (per week)	5 min	8 min
	forum_post	number of postings in forum (per week)	1	2

To determine patterns of behavior relevant to the dimensions of active and reflective learning style either it is high or low occurance, significant determination test used were two tailed t-test for normal distributed data and two tailed Mann-Whitney U test for non-normal distributed data. Table 2 shows the relevant pattern for active and reflective learning style.

Table 2. Relevant pattern for active and reflective learning style
(The "+" and "-" indicate a high and low occurrence of pattern)

Active	Reflective
content_visit (-)	content_visit (+)
content_stay (-)	content_stay (+)
exercise_visit (+)	exercise_visit(-)
exercise_stay (+)	exercise_stay (-)
example_stay (-)	example_stay (+)
outline_stay (-)	outline_stay (+)
forum_visit (+)	forum_visit (-)
forum_post (+)	forum_post (-)
forum_stay (-)	forum_stay (+)

Next, calculations for the determination of learning styles is based on the hints. As an example of the active dimension, the hint value is 3 when behaviour for visit exercise is high or visit the content is low. While the other hand is rather reflective dimension hint value is 3 when behaviour for visit exercise is low or visit the content is high. Similarly, the value of hints 2 and 1. Once the value of each behavior hints relevant to dimensions of learning style is determined, then the calculation to determine the learning style. Calculation of learning styles (ls_{dim}) obtained by calculating the sum of all hints for each relevant behavioural dimensions and divided by the total pattern of behavior as in formula 1, with sign ($h_{dim,\ i}$) obtained from each dimension (dim), behaviour patterns (i) and the total pattern of behavior (P_{dim}). This measure is then will be normalized from 1 to 0 using the formula 2. The normalized learning style (nls_{dim}) will be determined based on the threshold of 25% and 75%, for example, nls_{dim} smaller than 0.25 is "reflective", nls_{dim} between 0.25 to 0.75 is "balanced" and nls_{dim} greater than 0.75 is "active".

$$ls_{dim} = \frac{\sum_{i=1}^{P_{dim}} h_{dim,i}}{P_{dim}} \tag{1}$$

$$nls_{dim} = \frac{ls_{dim} - 1}{2} \qquad (2)$$

Methodology

To identify learning style by using literature-based method, the behaviour patterns of 20 electrical engineering students who were taking the Interactive Multimedia subject in their semester five were analyzed. The analysis took over 11 weeks of the whole learning process of a semester that covered up the 12 major sub-topics of the subject. The teaching of the subject utilized three types of learning materials: learning notes in the Sharable Content Object Reference Model (SCORM) format (12), examples (25), exercises (6) and forums (12). With reference to the relevant behaviour patterns and the threshold from Table1, hints for every student behavior pattern determined whether 3,2,1, or 0 based on Table 2 as described in section 4. Next, calculation of learning styles by using formula 1 and normalized the value using formula 2. While collaborative approach by asking students to answer ILS Felder and Silverman early in the semester before the online learning sessions begin.

In order to compare the learning styles obtained in collaborative and automatic approach, formula introduced by Garcia et al. (2007) have been used as in formula 3. Based on this formula, if the value obtained from collaborative approach (LS_{ILS}) is same with automatic approach ($LS_{predicted}$) then the formula is worth 1. If one of the values is balanced and the other is active or reflective then the formula will takes value 0.5. Finally, if the two values are mutually different from each other, then the formula takes the value 0. The value of the whole formula will be summed and divided by the number of students.

$$\text{Precision} = \frac{\sum_{i=1}^{n}(LS_{predicted_i}, LS_{ILS})}{n} \cdot 100 \qquad (3)$$

Result and Discussion

The purpose of this study was to determine the learning style using literature-based method. This method is based on the simple rule for calculating learning styles from indications gathered from students' behavior during an online learning course in LMS in the context of students' and different learning subjects. Next, the learning style using this method ($ILS_{predicted}$) will be compared with the learning style obtained collaboratively (LS_{ILS}). Table 3 shows the LS_{ILS} and $ILS_{predicted,}$ obtained from this study with comparative accuracy of 75%. Turns out that 10 students have the same learning style for both the calculation of the balanced approach (BAL) and active (ACT). While there are 9 students who have different LS_{ILS} and $ILS_{predicted}$, that is from active (ACT) / reflective (REF) to the balanced (BAL) and vice versa. BAL probability to become the ACT / REF or otherwise is high, as BAL is located between the ACT and REF, but for the ACT to be REF or otherwise is less common that is only one student in this study.

Table 3. Comparison of ILS Result to Predicted Result

No	ILS Result	Predicted Result	No	ILS Result	Predicted Result
1	BAL	BAL	11	BAL	BAL
2	*ACT*	*BAL*	12	*BAL*	*ACT*
3	BAL	BAL	13	BAL	BAL
4	*ACT*	*BAL*	14	BAL	BAL
5	*ACT*	*BAL*	15	*ACT*	*BAL*
6	*ACT*	*BAL*	16	ACT	ACT
7	*BAL*	*REF*	17	ACT	ACT
8	*ACT*	*BAL*	18	ACT	ACT
9	BAL	BAL	19	*ACT*	*REF*
10	ACT	ACT	20	*ACT*	*BAL*

While Table 4 shows the accuracy obtained by a number of researchers. According to Garcia et al. (2007) the accuracy of the comparison between active and reflective learning styles derived from the study was 58%. This value is relatively low because most of the students made little use (or no use) of chat, mail and e-mail features and

cause the number of experiences recorded in most cases was small and the behavior of the bayesian network was biased. However, for the other dimensions of learning styles are only 77% for the sensing/intuitive dimension and 63% for the sequential/global (Garcia et al., 2007). Thus, according to Graf (2007) which obtained 79.63% for comparing the accuracy of the dimensions of the active learning/reflective claimed that literature-based approach is better than data-driven based. Graf (2007) used 127 samples instead of Garcia et al. (2007) of 27 samples and each learning style dimension proposed by Graf (2007) consists of relatively high number of patterns compared to the model introduced by Garcia et al. (2007).

Table 4. Comparison with previous studies.

Modeling Approach	Subject	Web based /LMS	Study	Sampel	Precision for Active/Reflective
Data-driven	Artificial Intelligent	Web based	Garcia et al. (2007)	27	58.00%
Literature-based	Object Oriented Programing	LMS	Graf (2007)	127	79.33%
Literature-based	English	Web based	Atman et al. (2009)	17	83.13%
Literature-based	Mathemathic	LMS	Simsek et al. (2010)	27	79.63%
Literature-based	Multimedia Interactive	LMS	This study	20	75.00%

Studies conducted by Atman et al. (2009) has the highest accuracy comparison of 83.13%. Yet Atman et al. (2009) uses the web-based as online learning system and used the feature that has been built in the web-based such as introduction, form, example and exercise. Meanwhile, the study conducted by Simsek et al. (2010) is very similar to thiis study utilizing LMS to calculate the learning styles using the literature-based approach with the accuracy comparison of 79.63%. However Simsek et al. (2010) used features like the video content, PDF content, user profile and questionnaire to determine the patterns of behavior. Unlike Atman et al. (2009) and this study, Simsek et al. (2010) uses the threshold value which was proposed by Garcia et al. (2007) and Graf (2007) without having to make adjustments to the actual usage of the investigated comment in the course.

Overall, the studies conducted using the literature-based approach to identify the learning styles automatically, have the accuracy of comparison within the range of 75% to 83%. This difference may be due to a number of differences for each study in terms of features, relevant behavior patterns, samples, subjects learning and learning systems. Difference in the LS_{ILS} and $ILS_{predicted}$ much anticipated since there are some things that allows these differences, such as students who are not proficient using the LMS may take a long time while using certain features or students may have changed their learning styles dimensions due to the features that they are comfortable with on online learning. Thus by identifying learning styles automatically through actual behavior during the online learning, provide true information of student learning styles. In addition, this information is said to be less error prone as it is analyzed in a period of time compared to data the collected in a collaborative manner, referring to one spesific point of time.

Conclusion

Literature-based method for identifying learning styles automatically, can help teachers identify learning styles based on real behavior patterns of students during online learning, more accurately. This method uses a simple rule-based mechanisms for identifying learning styles based on the behavior pattern hints corresponding to the characteristic dimension of learning styles of the Felder and Silverman model. Information about the learning styles is used in matching it with learning materials and activities in adaptive learning. Therefore, to ensure the appropriateness of this matching accuracy identifying learning styles should be noted.

Blended learning in foreign language teaching

Marta Gluchmanova[28]

Technical University of Kosice, Bayerova 1, Presov, 08001 Presov, Slovakia

Abstract

The paper deals with practising the blended learning in foreign language teaching at the Faculty of Manufacturing Technologies in Presov (Slovakia). The author states that traditional forms of foreign language teaching at present are not very attractive for university students. The term blended learning can be applied to a very broad range of language teaching and learning situations. It can be commonly applied to a foreign language course where all the students meet with the teacher in a face-to-face class, but in which the language course includes a parallel self-study component such as a CD-ROM or access to web based materials. This kind of approach of the foreign language teaching is desirable.

Keywords: blended learning, learning environment, foreign language teaching;

Introduction

The rapid advances in technology have changed the way students now learn. Technology, which is a part of students' everyday lives, changes very fast. Universities need to provide 21st century learning environments that promote highly mobile, self-directed, and personalised learning. The term technology covers a wide range of recent technologies, such as the internet or CD-ROMs. It is also includes the use of computers as a means of communication, such as chat and email and many other environments which enable teachers to enrich their language courses. In this connection I could ask the question: How can we, as educators, effectively integrate technology in our language teaching to cater for specific learning needs? or Do new technologies have the potential to transform education by replacing current teaching methods? The latest technological innovations, key interpersonal skills for customer relations, real people talk about their work in technology are very important in the foreign language teaching, too. The students can use online interactive exercises to revise and recycle language (Glendinning, 2007). For example, you can share ideas and experiences with other like-minded teachers. Thoughts about use of new technologies show us some of the most varied and divided questions in language education and classroom practice. On a far side of that divide are idealists who believe that new technologies can radically transform language education. To the idealists, digital tools provide means for viewing various media, collaborative network learning, and so forth. To others, new technologies are a great equalizer; nearly anyone can construct a level of product that a few years ago was only within the capacity of a few people with specialized training.

Blended learning in foreign language teaching

New technologies have revolutionized our conception of knowledge – from something some people might have, to something which everyone should be able to find. The distinction has grown exponentially since the early days of the Internet. Before its inception, students relied on the language education that was relatively fixed in its knowledge content. Computer-based language learning in its various generations has acted to open up the world of knowledge to everyone and its most powerful variant, online blended learning, has become a catalyst that has enabled huge changes in what is learned and who is able to learn it (Sharma & Barret, 2007).

For this purpose Moodle Learning Management System (LMS) has been adopted by the Technical University of Košice (Slovakia) as one of the e-learning platforms. Moodle is an open source LMS and has become very popular among teachers at the Faculties as a tool for creating online dynamic web sites for their students. I suppose that The Faculty of Manufacturing Technologies will be successful with using Moodle in foreign language teaching to deliver online courses and to supplement traditional face-to-face classes (known as blended learning). Moreover, Moodle offers a wide variety of tools that can make language course delivery more effective. It provides an easy way to upload and share materials, hold online discussions, give quizzes and surveys, and record grades. The term blended learning can be applied to a very broad range of language teaching and learning situations (Bielousova - Gluchmanova, 2011, pp. 5-95). It can be commonly applied to a language course where all the learners meet with the teacher in a face-to-face class, but in which the language course includes a parallel self-study component such as a CD-ROM or access to web based materials. Use of these elements may be optional. The foreign language teachers at the Department of Humanities (Faculty of Manufacturing Technologies) prepare for their students a wide range of foreign language materials in three languages: English, German and Russian. Because of they are the students of Technical University, they prefer teaching technical materials which is closely connected with their study branches and study programmes. It means they try to use online materials with specification for manufacturing technologies, computer aided manufacturing technologies, manufacturing management, industrial technologies operations, etc. (Bielousova, 2008, pp. 695-700). They practice blended learning opportunities which incorporate both face-to-face and online learning opportunities. The degree to which online learning takes place, and the way it is integrated into the teacher's plan, can vary across the faculties and the departments. The strategy of blending online learning with university-based instruction is often utilized to accommodate students' diverse learning styles and to enable them to work before or after school in ways that are not possible with full-time conventional classroom instruction. Online foreign language learning has the potential to improve educational productivity of the students by accelerating the rate of learning, taking advantage of learning time outside of school hours, reducing the cost of instructional materials, and better utilizing teacher's time. This form of study is very appreciated not only by full time students in bachelor and engineering study, but mostly by part time students or foreign students who attend foreign languages within the exchange programmes, such as Erasmus mobility of students. The Common European Framework of Reference for Languages, abbreviated as CEFR, is a guideline used to describe achievements of learners of foreign

languages across Europe. It plays a central role in language and education, helps to define language proficiency levels and interpret language qualifications (Rohalova, 2007, p. 299). Concerning managing learning and managing students is necessary to consider the basic principles of effective classroom management how to generate ownership of the classroom, while establishing a positive learning environment, how to organize students effectively to facilitate different task types basic teaching strategies that lead to successful English (or German and Russian) lessons, how to implement these strategies in the classroom. Regardless of the own level of expertise when it comes to information and communication technology (ICT), there can be no doubt that the students you teach will have more knowledge of and access to such technologies than ever before.

Planning to teach a foreign language lessons place a sequence of technical topics into a long-term plan. Some teachers will say that there is no substitute for experience, therefore, until you have gained that experience, detailed and focused planning is an essential part of preparing a successful lesson. Our students are prepared for international labour trade, so it is necessary to be creative and innovative. Creativity and innovation in foreign language teaching and learning discusses what creativity is and offers a rationale for why it is important outlines aspects of creative and innovative teaching and learning in foreign language teaching. It includes a creative curriculum framework for technically oriented students, creative language classrooms and creative experimental work identifies, some creative and innovative language activities and approaches, particularly – using ICT.

I would like to stress a wide range of electronic language-teaching materials which are available to the contemporary teachers. The main topics that have been selected to meet the needs of our students or technical materials for the classroom deals with e.g. traditional and advanced manufacturing processes, engineering materials, operating machines as well as computer aided manufacturing or computer aided design, engines, welding, safety at work, environmental problems, internet terminology, etc. They can be downloaded from the Web and carried into the access to a computer with an internet connection. Yet others can be accessed from CD-ROMs. This range of electronic material available to today's language teacher is frequently referred to as blended learning. Combining manufacturing technology and coursebook support is practiced in foreign language teaching at my department. Nowadays, the coursebook is just one component in a suite of technical material, which may include both CD-ROMs and online exercises. Selecting the best mix of chosen technical materials for a course is nowadays an increasingly important part of the teacher's role at my department. Recently, the range and variety of support special technical material offered by publishing companies has grown tremendously. One particular product, the Macmillan English Campus, offers existing ways of integrating online material into courses, as a complement to paper-based material or an alternative. Enterprising foreign language teachers can also create their own interactive materials, especially which is closely connected with the special technical topics during student's study.

What is very appreciated nowadays by both, teachers and students, it is a wide range of using electronic dictionaries. They are available to teachers and students, and can be a useful addition to any language course. Their capabilities allow the user to look up words quickly, and they have a wider range of functions than their print equivalents. The students can use them if they are not certain with the meaning of some technical terms, their definitions or description. The dictionaries often have additional examples, too. An electronic dictionary can help students in the area of pronunciation, and the inclusion of sound files and audio clips is an exciting key feature. The Macmillan English Dictionary also includes a Sound Search function, which enables students to perform searches using the phonemic symbols. The pronunciation is sometimes difficult for Slovak students, especially in English, so the pronunciation function is very helpful for them (www.merriamwebsteronlinedictionary.com).

In considering the use of electronic materials and learning environments, language teachers should bear in mind: how the electronic technical material fits with the aims, outcomes and objectives of the proposed learning experiences: Why am I using this technical material? What connections can I make between the electronic technical material and curriculum expectations? For example curriculum contains news from the field of science and technology which are the part of international magazines (www.iht.com). At the beginning of the foreign language lessons students prepare and present the most interesting and important news from the field of manufacture and technology. They try to choose the latest ones. Next, it is necessary to have in mind the connections between the electronic technical material and learning theory: How does the resource match my beliefs about foreign language learning?, the connections between the electronic technical materials and student learning needs: How will my students engage with the resource? How does it support identified learning needs, etc.? I think that this question is very important, because one of the main aims of foreign language teaching is to prepare the students of the Faculty of Manufacturing Technologies for their future careers and their future jobs as technologists, engineers and technicians. Next question can include students specific pedagogical practices needed to support the use of the electronic technical material during the foreign language teaching and learning experience: What information, skills

and strategies do the student need to engage with the chosen technical material? What explicit modeling and scaffolding of the necessary knowledge, skills and strategies do I need to offer? How will they be able to analyse, interpret, synthesise and evaluate the input provided by the electronic technical material? Later the chosen technical electronic materials available to support language teaching will continue to change and expand. What is critical, though, is that teachers have a clear rationale for the use of any suitable, especially technical materials within foreign language teaching and learning experiences (Tomlinson, 2011, s. 349-350).

Conclusion

Before I finish, I would like to summarize that in a blend approach, we would separate the role of the foreign language teacher and the role of the used technology. A blended approach sees the role of language teacher and prepared and used technology as complementary. I suppose that an artificial intelligence is not yet sufficiently developed to cope with real-world interactions in any but predictable exchanges, and there is no danger of it replacing the language teacher.

In conclusion, we have seen that the term blended learning can have a range of meanings. I have mentioned only a few of them which are used by the language teachers at my department. The results of using technology are very interested. It has brought a new dimension in foreign language teaching. Blended learning is defined as referring to a foreign language course which combines a face-to-face classroom component with an appropriate use of technology and the suitable materials. I have suggested that the technology can be integrated into the language lessons, or be used by students outside the classroom for further practice, and to complement the taught element of the language course at all.

Blog Kullanımının Eleştirel Düşünceye, Kalıcılığa Ve Akademik Başarıya Etkisi

Aslıhan BABUR YILMAZ[a],[29]

ᵃAmasya Universitesi, Bilgisayar Teknolojileri Bölümü, Bilgisayar Programcılığı Programı,05100, "Amasya", Turkey

Özet

Çalışmanın amacı, blog kullanımının öğrencilerin eleştirel düşünme becerilerine, akademik başarılarına ve bilgilerin kalıcılığına etkisini araştırmaktır.

Araştırma, 2009 – 2010 Eğitim – Öğretim yılında, Bolu Gazipaşa İlköğretim Okulu' nda Bilişim Teknolojileri Dersinde yapılmıştır. Bu araştırmada "öntest-sontest-izleme testi kontrol gruplu desen" kullanılmıştır. Blog kullanımının öğrencilerin eleştirel düşünme becerilerine etkisini araştırmak amacıyla, Kritik Davranma Düzeyi Belirleme Ölçeği(öntest) uygulanmıştır. Blog, deney grubunun ders işleme sürecinde kullanılmıştır. yaklaşık 6 haftalık süre sonunda, eleştirel düşünme becerilerinde değişiklik olup olmadığını incelemek amacıyla son-test (kritik davranma düzeyi belirleme ölçeği) uygulanmıştır. Deney ve kontrol gruplarının akademik başarılarını ölçmek amacıyla araştırmacı tarafından hazırlanan 5 soruluk sınav uygulanmış olup, deney ve kontrol gruplarının bilgilerinin kalıcılığını ölçmek amacıyla aynı sınav 45 gün içinde tekrar uygulanmıştır. Bu süreçte veri toplama araçlarından, deney grubunun yorumları(öğrenci yorumları) ve öğretmen günlüğü ile ek veriler toplanmıştır.

Yapılan uygulama sonrasında sontest sonucuna bakıldığında, deney ve kontrol gruplarının eleştirel düşünme becerileri arasında istatistiksel olarak anlamlı bir fark olmadığı görülmüştür. Ancak verilerin nitel analizleri incelendiğinde, blog ortamının öğrencilerin eleştirel düşünme becerilerini geliştirdiğine dair sonuçlara ulaşılmıştır. Öğretmen günlüğünden elde edilen bilgilere göre, öğrencilerin sordukları sorulardan, yaptıkları yorumlardan blog ortamının eleştirel düşünme becerilerini geliştirdiğini söylemek mümkündür. Akademik Başarı Testi sonuçlarına göre deney ve kontrol grubunun akademik başarı puanları arasında anlamlı bir farklılık bulunamamıştır. Kalıcılık Testi sonucuna göre deney ve kontrol gruplarının kalıcılık puanları arasında anlamlı bir ilişki bulunmaktadır. Kalıcılık puanlarına dair ortalamalar incelendiğinde deney grubunun daha yüksek bir ortalamaya sahip olduğu dolayısıyla, kalıcılığın deney grubunda daha fazla olduğunu söylemek mümkündür. Bulgulardan yola çıkarak uygulamaya ve ileride yapılabilecek bilimsel araştırmalara dair öneriler sunulmuştur.

Anahtar Kelimeler: Ağ günlüğü, Eleştirel düşünme

Abstract

The aim of this research is to determine the effect of the using of blog on student's critical thinking skills, academic achivement and retention of information.

Research was held on the İnformation Technology course in 2009-2010 academic year, in Primary school of the Gazipaşa in Bolu. At the study, "pre-test post-test permanence test control group design" has been used. The aim of to determine the effect of using of blog on student's critical thinking skills, the Measurement of Determining Level of Critical Behavior, has been implemented as pre-test. Blog is used in the process of processing the experimental group's lessons. approximately at the end of 6 weeks, the Measurement of Determining Level of Critical Behavior has been implemented as post-test to examine if there is a change in the critical thinking skills of the students. An exam prepared by the researcher that includes 5 questions has been implemented on experimental and control groups to measure their academic success, and after 45 days the same exam has been repeated to check the knowledge retention of experimental and control groups. During this process, the data collection tools have included comments of experimental group (comments of students), and supplemental data collected via teacher's blog.

After the implementation, the results of post-test have demonstrated that there is no statistically significant difference between critical thinking skills of experimental and control groups. However, the qualitative analysis results have shown that weblog environment develops the critical thinking skills of students. According to the students' questions and comments on teacher's blog, it is possible to say that weblog environment develops the critical thinking skills of students Academic Success Test results have indicated that there is no significant difference between the academic success scores of experimental and control groups. Retention Test results have shown that there is no significant relationship between the retention scores of experimental and control groups. The mean of experimental group's retention scores have been higher; therefore it is possible to say that the experimental group has more knowledge retention. As a result of findings, suggestions have been made about applications and scientific researches that will be conducted in the future.

Giriş

'Eleştirel düşünme' ve 'yaşam boyu' ve 'yaşam çapında öğrenme' hedefleri dünyada bir çok toplumun eğitim hedeflerindendir (Mason, 2008). .Bireyler, bilgiye olan ihtiyaçlarını her geçen gün daha çok hissetmekte, daha üretken, daha verimli ve daha mutlu olmanın yollarını aramaktadırlar. Bu nedenle teknolojinin, bilginin ve dolayısıyla bireylerin hızlı gelişimine bağlı olarak eğitim sisteminin değişmesi, gelişmesi gerektiği açıktır.

Toplumlar, hazır bilginin aktarıldığı, ezberlemesi beklenen geleneksel öğrenci yerine bilgiye ulaşma yollarını bilen, öğrenmeyi öğrenmiş ve grup çalışmasını benimsemiş bireylere gereksinim duymaktadır. Bu nedenle, eğitim sistemlerinde köklü değişikliklerin olması kaçınılmazdır. Buradan yola çıkarak, uzun yıllar boyunca içeriği "kesin doğru" kabul edilerek yoruma kapatılmış öğretim programlarının topluma katacağı fazla bir şey kalmadığını söylemek mümkündür.

Saban' a göre (2004), günümüz okullarından ve öğretmenlerinden beklenen en önemli görev, topluma yaratıcı, eleştirel ve çok yönlü düşünebilen, öğrenmeyi öğrenen, problem çözebilen, kendi öğrenmesinden sorumlu olan ve sağlıklı kararlar verebilen bireyler yetiştirmektir.

Facione (1997) bu konuda şunları belirtmektedir:

> Eleştirel düşünme becerileri ve eğilimlerinin geliştirilmesine özen göstermek ilk ve orta öğretim müfredatının bütün düzeylerinde öğretimsel bir hedef olmalıdır. Eleştirel düşünme eğilimlerini geliştirme ve sebepler sunma ve değerlendirmede ısrarcılık, ilköğretim okulu eğitiminin bütüncül bir parçası olmalıdır (Akt. Özdemir,2005).

Yapılan araştırmalara göre "Eleştirel düşünme", okul sıralarından iş hayatına kadar hayatımızın her döneminde sahip olunması gereken başlıca özelliklerden biridir. Eleştirel düşünme becerilerine sahip olan, bireylerin mevcut düşünme sistemlerinin dışına çıkarak bağımsız düşünebilen, paylaşımcı, edindiği bilgileri hayata geçirebilen ve böylece bireysel ve dolayısıyla toplumsal gelişime katkı sağladıklarını söylemek mümkündür.

Eleştirel Düşünme

Bireylerin yaşamında eleştirel düşünme becerilerinin rolü büyüktür (Lin, Hmelo, Kinzer & Secules, 1999). Eleştirel düşünmenin amacı, sorgulama yeteneğini öğrencilere kazandırabilmektir. Bu yetenek in vd diğerlerinin belirttiği gibi, bir yaşam felsefesi olarak görülmelidir. Eleştirel düşünme becerisinin doğuştan gelen bir özellik olmadığı, öğretilebilir, anlatılabilir ve rahatça uygulanabilir bir sistem olduğu göz önünde tutulduğunda, bu konuya verilmesi gereken önem daha da artmakta hatta eğitim ve öğretimin temel amaçlarından biri haline gelmektedir (Kürüm, 2003).

Eleştirel düşünme becerisi, bireyin ne yapacağından, nasıl yapacağına, neye inanacağına kadar geçen süreci etkiler (Evancho, 2000).

Norris(1989) eleştirel düşünmeyi, öğrencilere daha önceden bildikleri her şeyi uygulamaları ve kendi düşünceleri doğrultusunda uygulamalarına yön vermek olarak tanımlamıştır.

göre eleştirel düşünme; geçerli çıkarımları yapabilme, tümdengelimli muhakeme ve değerlendirme yapabilme becerilerinin bir bileşkesi olarak tanımlanmaktadır. Onlara göre eleştirel düşünme; problem çözme, sorgulama ve araştırma davranışlarını kapsayan bir süreçtir ve bu süreç hem beceri hem de tutum olarak ifade edilmektedir (Watson ve Glasser, 1980).

Epstein'e (1999) eleştirel düşünmeye farklı açıdan yaklaşmıştır. Eleştirel düşünme, bilgiyi ve çok fazla insanı içinde barındıran dünyaya karşı bir savunmadır.

Chafee' ye göre (1988) eleştirel düşünme, algıladıklarımızı açıklığa kavuşturmak, geliştirmek ve dünyamızı anlamak için diğer insanların düşüncelerini dikkatli bir biçimde inceleyerek yaptığımız etkin, amaçlı ve organize edilmiş çabalarımızdır.

Öğrenenler, eleştirel düşünme durumunda kişisel çaba sarfetmeli, dikkatli ve istekli olmalı, içinde bulunulan durumla birlikte kendini gözlemleme içinde bulunmalıdırlar (Facione, 1990). Eleştirel düşünme becerisinin durağan bir süreçte kazandırılması beklenemez. Bireyin içinde olduğu, aktif bir süreç gerektirir ki birey eleştirel düşünmenin zihinsel becerileri olan analiz, sentez ve yansıtma gibi beceriler kazanabilsin (Schafersman, 1991).

Eleştirel düşünme akımının öncülerinden Paul ve Elder (2001), bireylerin eleştirel düşünme becerilerini geliştirmelerini sağlayabilmek için, eleştirel düşünme öğelerinin belirli disiplinler ve konu alanları içinde işlenmesi

gerektiğini savunmaktadır. Bu nedenle Bilişim Teknolojileri dersi kapsamında araştırma yapılma gereği duyulmuştur.

Neden Blog?

Bloglar sosyal ağ sistemlerinden biridir. Blog, düzenli olarak güncellenebilen ve son metinden ilk metine doğru kronolojik olarak sıralanan bir internet sitesidir (O'Reilly, 2007). Bloglar kullanılarak başka bloglara ya da sitelere bağlanmak, farklı kullanıcı gruplarıyla bilgi paylaşmak mümkündür (Koçoğlu, 2009).

Bir blog, metin, hipermetin, resimler ve linkler (diğer web sitelerine bağlantılar) içerir. Blog, karşılıklı konuşma (conversational) formunda, bir dokümantasyon,(metin, video, ses ve bunların kombinasyonu olan her türlü iletişim kurmaya yarayan materyalleri) olarak kullanmaktadır. Ve genellikle özel bir "ilgi alanına" odaklanmaktadır. Blog kitle iletişim araçlarını etkileyerek, iletişimin önemli ve popüler bir aracı olarak ortaya çıkmıştır (Akar ,2006).

Blog, yazarın konu hakkında fikirlerini yayınlamasına ve yorumlanmasına, bugünden düne kronolojik bir sistemle verileri düzenlemesine, arşivlemesine imkan sağlayan web siteleridir.

Okuma ve yazma, matematik ve fen gibi disiplinler olmak üzere bütün akademik disiplinler için gerekli olan temel nitelikleri sağlamaktadır. Blog, dijital ortamlarda okuma ve yazma ile desteklenen uygulamalardır. Nasıl ki kâğıtlardan okuyarak, kâğıtlara kalemlerle yazarak okuma yazma nitelikleri geliştiriliyorsa, blogleriyle de bu nitelik geliştirilebilir. Öğrenenlerin, ilkokul çağından bu yana kullandıkları defterler yerine kendilerine birçok konuda esneklik sağlayan "sanal defteri" tercih edeceklerini söyleyebiliriz.

Bilindiği gibi internet ortamı 7 den 70 e birçok insanın ilgisini çekmektedir. Bu tür bir ortamın parçası olan blog uygulamalarıyla öğrenenlerin derse olan ilgileri de pekiştirilmektedir.

Blogları beş türe ayrılmaktadır (Gilchrist, 2007):
- İçsel blogleri (yalnızca kurum çalışanlarını hedeflemektedir),
- Dışsal blogleri (genel kamuoyu üzerine odaklanmaktadır),
- Tematik blogleri (belirli olaylar ya da projelerle bağlantılıdır),
- Desteklenen blogleri,
- Kişisel blogleri.

Blog kullanıcıları ise Goldman ve Schmalz, tarafından şöyle sıralanmaktadır (Goldman ve Schmalz, 2007):
- Kişiler: Kişisel ya da profesyonel amaçlar için,
- Gruplar: Kentsel, dinsel, eğitimsel, sosyal, eğlence için,
- Kurumlar: Kamu ve özel sektör,
- İşletme ve Endüstri: Yasal, finansal, spor, eğlence,
- Devlet Yönetimi: Tüm düzeylerde.

Altun (2005) 'a göre blog içeriği oluşturma şekli teknik açıdan, medya türü ve kullanım amacına göre sınıflandırabiliriz.

Bu bilgiler ışığında "Neden Blog?" sorusunun cevabı açıktır.' Bilgi oluşturma, yapısı gereği, ilişkilendirici, iletişimsel ve etkileşimsel yapıdadır Altun (2005).

Tekinarslan (2008)' a göre ;
- Blog ortamının kullanımı kolaydır.
- Öğrenenler, yazı becerilerinin geliştiğini belirtmektedir.
- Ortamda bilgiye ulaşmak zevkli bir iştir.
- Geleneksel yöntemlerle ders işlemek yerine, farklı ortam kullanmak olumlu etki yaratmıştır.

Yöntem

Çalışma Grubu

Araştırma, Bolu Gazipaşa İlköğretim Okulu 2009-2010 öğretim yılında gerçekleştirilmiştir. Araştırma örneklemi beşinci sınıf toplam 68 öğrenciden oluşmaktadır. Deney grubuna toplam 32 öğrenci dâhil edilmiştir ve bu öğrencilerin % 56,2' i kız, %43,7' i erkek öğrencidir. Kontrol grubuna dâhil edilen öğrenci sayısı ise 36'dır. Bu öğrencilerin de % 52,7'i kız, % 47,2'i erkek öğrencidir.

Veri Toplama Aracı

Bu çalışmada aşağıdaki veri toplama araçları kullanılmıştır.

- <u>Kritik Davranma Düzeyi Belirleme Ölçeği</u>: Soner Mehmet Özdemir(2007) tarafından eleştirel düşünme becerilerini ölçmek amacıyla 5 likert tipi ölçek olarak hazırlanmıştır.

- <u>Öğretmen Günlükleri</u>: Araştırmacı tarafından kaydedilmiş olup, öğretmenin gözlemlerini yansıtmaktadır. Bu veri toplama aracı öğrenenlerin eleştirel düşünme becerilerinde gelişme olup olmadığını test etmek amacıyla kullanılmıştır.

- <u>Öğrenci Yorumları</u>: Öğrencilerin blog ortamında yaptıkları etkinliklerden, yorumlardan oluşmaktadır. Bu yorumlar blog ortamının kullanılmaya başlandığı ilk günden incelenmeye başlandığında, öğrencilerin eleştirel düşünme becerilerinin gelişimi hakkında araştırmacıya bilgi sağlamaktadır.

- <u>Akademik Başarı Testi</u>: Bu veri toplama aracı, örneklem grubunun akademik başarılarını ölçmek amacıyla konu alanı uzmanları tarafından hazırlanmış olup, 4 açık uçlu ve 6 madde içeren 1 uygulama sorusundan oluşmaktadır.

- <u>Kalıcılık Testi</u>: Kalıcılık testi soruları başarı testinin aynısı olmakla birlikte kalıcılığı ölçmek amacıyla başarı testinin uygulanmasından yaklaşık 6 hafta sonra uygulanmıştır.

- <u>Öz Değerlendirme Formu</u>: Öz değerlendirme formu, Bilişim Teknolojileri kitabında her ünitenin sonunda bulunan, uzmanlar tarafından hazırlanmış, konunun öğrenci tarafından anlaşılıp anlaşılamadığını ortaya çıkarmaya yarayan formdur. Bu form 3 dereceli anahtar ile (evet, bazen, hayır) derecelendirilmiştir.

BULGULAR VE TARTIŞMA

Eleştirel Düşünme Becerileri İle İlgili Bulgular

Deney grubu (60,56) ve kontrol grubu (60,44) eleştirel düşünme becerileri ön-test puanları arasında 0,12 puanlık bir fark vardır. Bağımsız örneklem t-testi ile bu farkın anlamlılık düzeyi incelenmiştir. Deney ve kontrol grupları öntest sonuçlarına göre ortalamalar arasındaki fark anlamlı bulunmamıştır (t(66)=0,054; p>0.05). Buna göre iki grubun eleştirel düşünme becerilerinin deney öncesi birbirine yakın düzeyde olduğu söylenebilir.

Deney grubu (61,54) ve kontrol grubu (60,22) eleştirel düşünme becerileri son-test puanları arasınki fark incelendiğinde, istatistiksel olarak anlamlı bir fark bulunamamıştır (t(65)=0,433; p>0.05).

Akademik Başarı İle İlgili Bulgular

Deney ve kontrol grubunun akademik başarı puanları arasında anlamlı bir farklılık görülmemektedir (t(62)= 1,317; p>0,05). Ancak ortalamalar incelendiğinde deney grubunun başarı testi sonuçları ortalamasının (52,22), kontrol grubunun başarı testi sonuçlarına(47,16) göre daha yüksek olduğunu söylemek mümkündür.

Bilgilerin Kalıcılığı İle İlgili Bulgular

Deney ve kontrol gruplarının kalıcılık puanları arasında anlamlı bir ilişki bulunmaktadır (t (68)= 2,088; p< 0,05). Kalıcılık puanlarına dair ortalamalar incelendiğinde deney grubunun (54,25), kontrol grubuna göre (46,62) daha yüksek bir ortalamaya sahip olduğu dolayısıyla, kalıcılığın deney grubunda daha fazla olduğu söylenebilir.

SONUÇ VE ÖNERİLER

Eleştirel düşünme becerilerini ölçmek amacıyla deney ve kontrol gruplarına uygulanan ön test-sontest KDDBÖ sonuçlarına göre, blog ortamının eleştirel düşünme becerilerini geliştirmeye yönelik olarak anlamlı bir etkisi bulunmamıştır (p=0,67). Deney ve kontrol gruplarının erişi puanları incelendiğinde sonuç anlamlı çıkmıştır (p=0,049). Her ne kadar ortalamalar arasındaki fark çok küçük ve manidarlık düzeyi düşük olsa da bu sonucun bir dönemlik bir uygulama ve sınırlı bir örneklem ile elde edildiği ve eleştirel düşünme becerisini etkileyen çok fazla dış

değişken olduğu da göz önüne alınırsa elde edilen sonuç önemli görülebilir. Ayrıca nitel verilere göre, blog ortamıyla işlenen dersin, grubun eleştirel düşünme becerilerini geliştirdiğini söylemek mümkündür.

Öğrenciler blog ortamı sayesinde yorum sorularına kısa cevaplar vermek yerine, diğer arkadaşlarının düşüncelerini ele alarak ve araştırma yaparak kendi düşüncelerini oluşturduklarını belirtmişlerdir. Aynı zamanda duydukları, okudukları bilginin her zaman doğru bilgi olmadığı ve bu bilgileri de sorguladıklarını belirtmişlerdir. Dolayısıyla öğretmen günlükleri ve öğrenci yorumları incelendiğinde, blog ortamının öğrencilerin eleştirel düşünme becerilerini geliştirdiğine dair sonuçlara ulaşılmıştır. Buradan yola çıkarak blog ortamının öğrencilerin eleştirel düşünme becerilerine olumlu katkı sağladığını söylemek mümkündür.

Deney ve kontrol gruplarının akademik başarılarını ölçmek amacıyla ABT uygulanmıştır. ABT sonuçları incelendiğinde blog uygulanan deney grubunun ortalama başarı puanı (52,2), kontrol grubunun başarı puanından (47,1) yüksek olsa da bu fark istatistiksel olarak anlamlı bulunmamıştır (p=0,19). Blog uygulamasının akademik başarı puanlarına anlamlı bir etkisi olmadığını söylemek mümkündür.

ABT' den yaklaşık 6 hafta sonra uygulanan kalıcılık testi sonuçlarına göre deney grubu ortalamasının (54,2) kontrol grubu ortalamasından (46,6) yüksek olduğu ve aradaki farkın da anlamlı olduğunu söylemek mümkündür (0,04). Öğrenci bilgilerinin kalıcılığının sağlanmasında blog ortamının kullanılması, kullanılmayan ortama göre daha etkilidir.

Öğrenci yorumları incelendiğinde blog ortamının öğrenciler üzerinde olumlu etki yarattığı gözlemlenmiştir. Öğrencilere göre ağ günlüğü ortamı; birbirleriyle yardımlaşabildikleri, farklılıkları keşfetmelerine yardımcı olan, anında dönüt sağlanabilen, birbirlerine tavsiyelerde bulunabildikleri, sınırlı bilgiyi kullanarak yaratıcılıklarını ortaya çıkarabildikleri, birbirleriyle ya da öğretmenle iletişim kurabilmelerini sağlayan, birbirlerine rehberlik yaparak, öneride bulunabildikleri, öğretmenin öğrencilere rehberlik ederek öğrencileri kolaylıkla yönlendirebildiği, konu tekrarı sağlayarak bilgilerinin kalıcı olmasına yardımcı olan, dersten keyif almalarını sağlayan (ders içi motivasyonu arttıran), bilgilerini devamlı güncellemelerine ve yeni bilgiler edinmelerine imkan sağlayan etkili bir öğrenme ortamıdır.

Günümüzde insanlar bilgilerin güvenirliklerini sorgulamadan bilgileri olduğu gibi kabul etmektedirler. (Swartz ve Parks, 1994). Bu durum bireylerin eleştirel düşünme becerilerinin zayıf olduğunu göstermektedir. Bu araştırma dahil olmak üzere yapılan araştırmalar incelendiğinde, bireylere eleştirel düşünme becerilerinin kazandırılabilmesi için blog gibi uygun eğitim ortamı hazırlanmasının gerekli olduğu savunulabilir.

Bridging the Digital Divide among Public High School Teachers: An Adopt-a-school Experience

Arnold R. Lorenzo[30a], Blessie U. Lorenzo [a]

[a] Institute of Education, Tarlac College of Agriculture, Malacampa, Camiling, Tarlac, Philippines

Abstract

This study evaluated the iSchools Project implementation in the public high schools in the Province of Tarlac, Philippines. It is a development project of the Commission on Information and Communications Technology (CICT) that supports the effort of the department of education in promoting ICT in education. Its goal is to bridge the digital divide among public high school teachers and students by providing ICT literacy through access to digital applications in education. The component of the project includes provision of ICT equipment, capability building and strengthened local support. This paper also determines the problems encountered by the public high schools in the implementation of the project.

This study made use of the CIPP model developed by Donald Stufflebeam. The CIPP stands for the core concepts of the model: Context Evaluation, Input Evaluation, Process Evaluation and Product Evaluation. The respondents were the teachers under the adopt-a-school program of the Tarlac College of Agriculture (TCA) who were recipient of the project. Survey questionnaires supplemented with interview and observation were used in the gathering of data. The data gathered were tabulated, organized, analyzed and interpreted using appropriate statistical tools.

Keywords: technology, teacher training, education, ICT integration

INTRODUCTION

Information and Communications Technology (ICT) in the Philippines is a milestone in the educational system. It opens a wide variety of opportunities both for teachers and students. Transferring of information, data collection and researching are the multiple benefits that people can get from ICT, but still it is a dream to many. Most public schools in the Philippines have no ICT facilities and most teachers are not ICT literate which results in the poor students and school's performance.

iSchools project is one of the flagship projects of the Commission on Information and Communications Technology (CICT) which supports the efforts of department of education to integrate ICT in education. Its long-term goal is to contribute to the efforts of the Philippine government in bridging the digital divide by developing an educational digital network that equips all public high school teachers and students with ICT literacy as well as provide them access to relevant digital content and applications in education that they can use to make learning effective.

iSchools focuses on integrating ICT in education towards strengthening classroom learning and instruction by expanding access to various sources of information. In so doing, the project hopes to enhance the capability of public high school students throughout the Philippines to successfully compete with their peers for jobs and other opportunities in the expanding global knowledge economy.

The CICT, through its eQuality program for State Universities and Colleges [SUCs] such as Tarlac College of Agriculture (TCA), joined hands in implementing the iSchools project, from choosing a pilot site, social preparation activities, deployment, capability building for teachers, and progress monitoring.

Under the iSchools project, schools were provided with twenty [20] computer units, server, printer, projector, air-conditioning unit, wireless router, one year free internet connections, as well as relevant educator training in the use of ICT in education. Strengthened partnerships with Local Government Units (LGU), Parents Teachers Association [PTA] and other local educational stakeholders are also part of the components of the project.

The iSchool's project has ended its implementation, hence, evaluation of the project is deemed necessary. Evaluation of this project is an integral part of the development process to determine the effectiveness of the program which can be the basis of improving future activities.

1.1 Statement of the Problem

This study evaluated the iSchools project implementation in bridging the digital divide among public high school teachers in the province of Tarlac, Philippines.

Specifically, this study was sought to answer the following questions:
1. How is the iSchools project evaluated in terms of:
   1.1 Project Administration?
   1.2 Project Components?
   - 1.2.1   iSchools Laboratory,
   - 1.2.2   Capability Building for Teachers,
   - 1.2.3   Local Educational & Institutional Support?
   1.3 Project Delivery System? and
   1.4 Project Effectiveness?
   - 1.4.1   ICT Literacy of Teachers,
   - 1.4.2   ICT Integration in Education,
   - 1.4.3   Client Satisfaction?
2. What are the problems encountered in the implementation of the iSchools project?

1.2 Significance of the Study

Evaluation is an inherent part of any process to gauge the strengths, weaknesses and effectiveness of any program. This study evaluated the implementation of the iSchools project in the Philippines in attaining its objective which is to bridge the digital divide among public high school teachers and to integrate ICT in education. Likewise, this study evaluated the components of the project which include the provision of the iSchools laboratory, capability building for teachers and strengthened local educational support. It also determines the problems encountered in the implementation of the project.

The result of this study will serve as an assessment in determining the strengths and weaknesses of the iSchools project which will be used as a benchmark in improving the implementation of future projects. The project administrators, beneficiary public high schools and other stakeholders of educational system will be benefited through the various informations that may be derived from this study.

The implementers of this project will make use of the findings of this study a basis in improving aspects of project needing improvement. This includes improvement on the project management, project implementation, project components, capability building for teachers, utilization and maintenance of the laboratory and sustainability of the project. The beneficiary public high schools which include teachers, students, parents and community will utilize the findings in adapting measures to help the administrators in implementing the project successfully and to make use of the project in integrating ICT in education to produce quality, competitive and ICT literate graduates.

1.3 Scope and Delimitation of the Study

This study focused on evaluating the implementation of iSchools project in the public high schools under the adopt-a-school program of the Tarlac College of Agriculture in the province of Tarlac, Philippines. The evaluation focused on project administration, project components, project delivery system and project effectiveness. This study also determines the problems encountered by the recipient schools in the implementation of the project.

1.4 Definition of Terms

- **Capability Building for Teachers.** It is one of the components of the iSchools project which is composed of five ICT trainings for teachers. Trainings include Computer and Internet Literacy Course [CILC]; laboratory management; library management & information system and website development.
- **Client Satisfaction.** It is the acceptability of the teachers of the recipient public high schools on the components of the iSchools project such as the provision of iSchools laboratory, capability building of teachers and local educational support.
- **Commission on Information & Communications Technology [CICT].** An executive branch of the Philippine government under the office of the president that implements the iSchools project which supports the efforts of the Philippine government and the Department of Education to integrate ICT in public high schools.
- **ICT Integration.** The process of incorporating ICT in all aspects of education. It is the application of ICT productivity tools such as computer units, application programs, internet applications and relevant educational resources of all learning areas to improve the teaching – learning process.
- **ICT Literacy.** The competence and expertise of the teachers in utilizing ICT equipment and productivity tools in improving the teaching-learning process. It includes the use of computers, application programs, internet connection and other ICT equipment in the preparation of instructional materials, reports, lesson plans and in teaching-learning process.
- **Project Administration.** It is the application of knowledge, skills, tools, and techniques to describe, organize, oversee and control the iSchools project implementation. It includes the development of project design and implementation guidelines, management of trainers training and educators training, implementation of project quality measures, monitoring and evaluation, and all related activities to successfully implement the iSchools project.
- **Project Components.** The project package that was received by the recipient public high schools. This include iSchools laboratory *[20 desktop, UPS, 1 printer, DLP projector, air condition unit, wireless router, 1 year internet connection, Edubuntu Software],* Capability Building *[Sustainability Planning, Computer and Internet Literacy Course + ICT for Education, Laboratory Management, Website Development Training, and Library Management]*, all expenses paid by the project, and strengthened partnerships with collaborating agencies.
- **Project Delivery System.** This refers to the process of utilizing the iSchools laboratory in integrating ICT in education in all learning areas of the basic education curriculum.
- **Project Effectiveness.** It is a measure of whether and to what extent set goals have been achieved. This refers to the products of the iSchools project which include ICT integration in education, ICT literacy of teachers and the client satisfaction of the iSchools Project.
- **Tarlac College of Agriculture (TCA).** A state college which served as a partner of CICT in the implementation of the iSchools project in the public high schools in Tarlac, Philippines.

1.5 Conceptual Framework

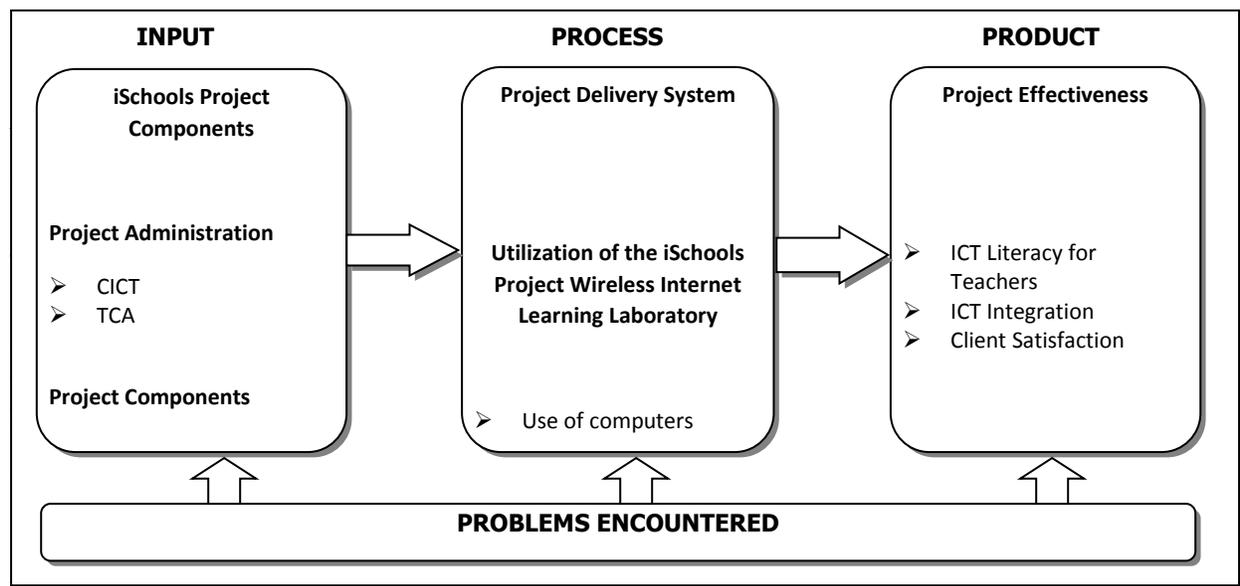
This study made use of the CIPP model developed by Donald Stufflebeam in 1971. The CIPP stands for the core concepts of the model; Context, Input, Process and Product. This model recognizes types of decisions encountered in education planning, programming, implementing of projects and recycling. This model is suitable for this kind of evaluation because on this concept, evaluation is for improvement of the project. [Stufflebeam 2002].


Figure 1. Paradigm of the Study

In the light of this study, the CONTEXT evaluation revealed the issues and problems encountered in the implementation of the iSchools project in Tarlac Philippines. This provided feedbacks on the project project administration, project components, project delivery system and project effectiveness, which are used for the implementation of the project. The INPUT evaluation was on the components of the iSchools project given to the beneficiary schools. The project includes iSchools laboratory, capability building for teachers and strengthened local educational support. The PROCESS evaluation involved the utilization of the availed project components. The availed facilities and trainings to various public high schools should be used to integrate ICT in education. The computers, internet and other educational software's should be used by the teachers in all learning areas to improve teaching-learning process. The PRODUCT evaluation was concerned with the project effectiveness. It was the attainment of the goal of the project which is the ICT literacy for teachers, ICT integration in education and client satisfaction.

2. Methods and Procedure

This chapter presents the description of the subjects, data gathering tools and procedure, and statistical treatments used.

2.1 Respondents of the Study

The respondents of this study were the teachers and principals of the recipient schools under the adopt-a-school program of Tarlac College of Agriculture (TCA).

2.2 Data Gathering Instruments

Survey questionnaires supplemented with interview and observation were used as tools in gathering data. Survey questionnaires were prepared based on the project scope plan of the iSchools project.

Evaluation questionnaires on ICT literacy for teachers and ICT integration were based from the CICT assessment evaluation sheet on ICT Skills survey based on the National ICT Competency Standards [NICS] for teachers.

2.3 Data Analysis

The data on the evaluation of project administration, project components and project delivery system were interpreted using means, weighted means and verbal description. Frequency counts and ranks were used to present data on the problems encountered by the teachers in the implementation of the iSchools project.

3. Results and Discussion

3.1 Project Administration

Administration of the iSchools project was done by the Commission on Information and Communications Technology (CICT) and its partner State College, the Tarlac College of Agriculture (TCA) in Tarlac province.

The data show that in terms of project administration, the CICT which is the prime mover of the project was evaluated as *very satisfactory*. This indicated that the CICT did well in managing the project as a whole and in conducting activities related to iSchools project management such as project project briefing and training of trainers. This could be because the project has competent personnel, functional organizational structure, and has enough funding and resources which made the implementation successful.

The TCA as co-administrator of CICT in implementing iSchools project in the PHS level was rated also *very satisfactory*. This shows that TCA, with its pool of experts, performed well in implementing the project as partner of CICT. This could be attributed to the fact that the CICT conducted training courses and trainers training as part of the project management activities, to equip the TCA personnel the necessary knowledge and skills in conducting activities related to the project.

3.2 Project Components

The basic iSchools project components include the provision of iSchools laboratory, capability building for teachers, and strengthened local educational support.

Result shows that the provision of the iSchools laboratory was rated as *very satisfactory* with a composite mean of 4.25; the capability building for teachers was rated as *very satisfactory* with a composite mean of 3.53; while local educational support was evaluated as *satisfactory* with a composite mean of 3.40.

This shows that the quality of the iSchools project components was acceptable to the recipient public high schools; the training activities were implemented well, and the supports from local educational stakeholders were attained. The project components were rated very satisfactory because the project has enough funding. Personnel involved in the project were trained and properly compensated. Also, recipient principals and teachers were very cooperative and stakeholders were supportive of the project. This further shows that project was not just a computerization project but it was a development project where support and participation of local educational stakeholders were necessary in attaining the project goals. Cooperation, commitment and support to the sustainability of the project were the key measures to the success of the project. For these reasons, the project components were very satisfactory.

3.3 Project Delivery System

This shows the utilization of the project on the different beneficiary schools after the project implementation. The result shows that in terms of utilization of the iSchools laboratory**,** it was evaluated as *very satisfactory* with a mean score of 4.25. This indicated that the iSchools laboratories were utilized frequently by the teachers. The study revealed that most of the respondent teachers utilized the iSchools laboratory everyday and once a week or more in their teaching – learning process.

With regard to the laboratory usage in different learning areas, the respondents evaluated it as *very satisfactory* with a mean score of 3.78. This shows that the iSchools laboratory was utilized by teachers of different subject areas in teaching.

The ICT equipment in education was evaluated as *excellent* with a mean score of 4.46. This manifested that the equipment given by the project were very much suitable in integrating ICT in education.

The productivity tools in education were evaluated as *very satisfactory* with a mean score of 3.43. This shows that edubuntu (open source software) and its application programs were relevant to the needs of teachers and students for education. The rating was quite low although very satisfactory because teachers need to shift from the use of proprietary software such as microsoft into edubuntu software. Adopting this alternative lessened the expenses of the government in providing ICT to the public schools in the Philippines.

In terms of ICT integration using the laboratory, the evaluation was *satisfactory* with a mean score of 3.40. This indicated that the iSchools laboratory was effective means in integrating ICT in education although the obtained score was not quite high. This could be because some teachers still find difficulty in integrating ICT on their lessons and can hardly shift from the traditional approach to the use of ICT.

3.4 Project Effectiveness

It shows on the result that the project was evaluated as *effective* in terms of ICT literacy and ICT integration with a mean scores of 3.33 and 2.77 respectively; while the client satisfaction was evaluated as *moderately effective* having a mean score of 3.44. In summary, the iSchools project effectiveness was evaluated as *effective* obtaining a grand mean score of 3.18. This result shows that the project in general was effective in attaining its objectives which is ICT integration in education and to bridge the digital divide among public high school teachers in Tarlac, Philippines. This was proven by the result of evaluation on the project outcomes such as ICT literacy, ICT integration and client satisfaction.

3.5 Problems Encountered in the Implementation of the iSchools Project

3.5.1 Problems Encountered in the iSchools Laboratory

The problems encountered are classified into its sub-components which are hardware, software and internet connectivity problems.

The problems related to hardware are Uninterrupted Power Supply [UPS] failure; not functional workstations; weak router signal; and not functional air-con unit. This implies that the partner SUCs should monitor this problems and report immediately to the supplier since these units are covered by suppliers' warranty.

The problem related to software is the frequent bagging down of operating system. This can be resolved by reinstalling the edubuntu system which is the task of the designated laboratory managers who were trained to do the activity. However, when this happens, if affects the teachers and students who are suppose to be using the units. This implies that there should be regular schedule of laboratory maintenance to avoid problems on the frequent bagged down of operating system.

The problems on internet connection are no internet connections; slow internet connections; and fluctuating internet connection. This shows that many of the recipient public high schools in Tarlac province are not provided with internet connection. These schools are those located in areas where there is no service provider either DSL or broadband connection. These schools are part of the plans of the CICT to provide internet connection using satellite signal which is still on the process.

3.5.2 Problems Encountered in the Capability Building for Teachers

Capability building is one of the components of the iSchools projects. Teachers are provided with free trainings on Computer and Internet Literacy Course [CILC]; laboratory management; library management & information system and website development.

The problems on the capability training are: no hands-on training on internet; no echo training for teachers; no follow up training for teachers; lack of hands-on exercises and short training period for Computer and Internet Literacy Coursce (CILC); very fast pacing of training and lack of skills learned on website development training. This implies that the project implementers should look into these problems especially the hands on training on internet since this is critical for the teachers in looking various educational resources available in the web. This problem occurred because the computer and internet literacy course rollout training was conducted when most schools are not yet given internet connection.

Also, the problem on no echo training for teachers should be taken into consideration because it is significant in the goal of the project which is ICT integration in education. This problem occurred because during the CILC training, only two [2] teachers per learning area participated the training together with the laboratory managers, principals and librarians. After the training, it was expected that these teachers who attended must echo the training

to other teachers to equip them also the knowledge and skill needed for ICT integration. In some schools, this did not happen and this was the reason why many teachers remained ICT illiterate.

3.5.3 Problems Encountered on Utilization, Maintenance and Sustainability of the iSchools Laboratory

The result shows that most of the problems on utilization are on the difficulty of using edubuntu *(open source software)*. This is because it requires little adjustments on its functions and environment, and teachers were accustomed in using proprietary *[microsoft]* software. It shows also that there were problems on insufficient number of computer units. The provision of 20 computer units and server was not enough for the public high schools especially in big schools where population was big. The problem was not only on students but also on teachers because the higher the enrolment the school has, the more faculty and the more computers are needed.

With regard to maintenance and sustainability of the iSchools laboratory, the most common problem was the repair and maintenance cost. Repair was not much problem because laboratory managers were trained to the activity however; replacements of parts such as mouse, keyboard, and ink for printer were the problems. Electric bills, payment of internet connection after the one year free, and payment for security personnel were also problems on the maintenance of the project. It reveals also that there were problems on technical support from the supplier. Some schools experienced problems on technical support from the supplier, if there was assistance given; it took patience and perseverance to wait for their delayed action.

4. Conclusions

- The CICT and TCA as the administrators of the iSchools project in Tarlac, Philippines have a *very satisfactory* performance in terms of project administration. They did well in managing the project and other related activities. The TCA as co-administrator with its pool of experts, performed well in implementing the project in the PHS level.
- The iSchools project components are *very satisfactory*. The iSchools packaged are acceptable to the recipient public high schools; the training activities are implemented well; and the supports from local educational stakeholders are attained.
- The iSchools project delivery system is *very satisfactory*. The iSchools packaged provided to the recipient public high schools in Tarlac, Philippines are utilized in accordance with its purpose of building ICT literacy and interest of public school teachers to integrate ICT in education and improve the teaching and learning process.
- The iSchools project is *effective* in attaining its objectives of building ICT literacy and interest to the teachers of recipient public high schools in Tarlac, Philippines.
- The problems encountered by the recipient public high schools related to hardware are: UPS failure, not functional workstations, not functional air-condition and weak router signal. While in software problem, the most common is the frequent bagged down of operating system. And in internet connectivity, the problems are: no available internet connection provider in the area, slow internet connection, and fluctuating internet connection.
- The problems commonly encountered by recipient schools in educators training are: no hands-on training in internet, no echo training for other teachers, no follow up training for teachers, short training period for CILC and lack of hands-on exercises.
- The problems encountered by the recipient schools in the utilization of the iSchools laboratory are: difficulty on the use of edubuntu, insufficient number of computer units, limited access to laboratory and no available laboratory personnel. and
- The problems encountered on maintenance and sustainability of the iSchools laboratory are: no technical support from the supplier, no available ink for the printer in the market, and no replacement of defective parts and units.

5. Recommendations

- All iSchools activities including trainers training and educators training for teachers may be done if possible during weekends, vacation or summer to avoid interruptions of classes on the part of SUC partners and recipient public high schools.

- Project monitoring to recipient public high schools be done regularly to keep track of the progress of the project and assist the schools in any problems related to the project.
- More durable, quality and cost efficient ICT equipment be provided to lessen the problems of recipient schools on repair and maintenance and electricity bills.
- Stable and fast internet connection should be provided to all recipient schools before the conduct of all capability building for teachers.
- ICT integration training be provided to the teachers of recipient public high schools to equip them skills in integrating ICT on their lessons;
- The principal or school head of the recipient schools should monitor and encourage all the teachers to utilize the iSchools laboratory and not only for computer education subject.
- The follow up training be conducted for the teachers to enhance their mastery of skills necessary for ICT integration.
- The supplier should respond immediately to the problems on repairs and replacement of parts and units which are covered by warranty to make the laboratory always functional for ICT integration.
- The CICT should provide also technology leadership and management training for principal or school heads of the recipient schools to equip them skills in taking advantage of ICT in improving their school based management.
- Similar project be given also to elementary schools to help the teachers improve their teaching and learning through ICT.
- Similar study be conducted to other recipient public high schools in other provinces/regions of the Philippines.

13th International Educational Technology Conference

Bütünleşik kentsel gelişme stratejisi ve eylem planı çerçevesinde yaşam kalitesinin artırılmasında yerel yönetimlerin rolü

Prof. Dr. Halil İbrahim Aydınlı, Arş. Gör. Salih Çiftçi, Nesrin Şentürk, Arş. Gör. Leyla Çiftçi

haydinli@sakarya.edu.tr, slhciftci@gmail.com, nsenturk@sakarya.edu.tr, leylac@bartin.edu.tr

ÖZET

Ülkemizde kentlerin gelişmesi, büyümesi 1950'li yıllardan itibaren başlamıştır ve köylerden kentlere doğru olan göçlerin artmasıyla hızlı bir kentleşme süreci ortaya çıkmıştır. Kontrolsüz gelişen hızlı kentleşme süreciyle birlikte toplum hayatını olumsuz yönde etkileyen işsizlik, konut, yabancılaşma gibi birçok sosyal probleme ek olarak kentsel gelişme stratejisi ve kentsel yaşam kalitesinin artırılmasına yönelik faaliyetler de ciddi uğraş alanları içerisinde değerlendirilmektedir.

Hızlı kentleşmenin doğal bir sonucu olarak kuralsız bir şekilde artan kent nüfusu, kentlerde yaşayanların sosyal, ekonomik, psikolojik yapılarında olumsuz değişikliklere neden olabilmektedir. Sosyal, ekonomik ve politik etkenlerin, kentleşme süreci ve kentsel yaşam kalitesi arasındaki ilişkide önemli olduğu bilinmektedir.

Anahtar Kelimeler: KENTGES, Kentleşme, Kentsel Yaşam Kalitesi, Yerel Yönetimler

ABSTRACT

Turkey's urban development, growth began in the 1950s and the increasing migration from villages to cities with rapid urbanization process has emerged. With the process of developing an uncontrolled rapid urbanization negatively affect the social life of unemployment, housing, urban development strategy of alienation, in addition to the many social problems and to improve the quality of urban life in the fields of activities are considered a serious endeavor.

Deregulated as a result of rapid urbanization increasing the urban population living in urban areas, social, economic, and psychological structures may lead to unfavorable changes. Social, economic and political factors, the relationship between the process of urbanization and urban quality of life is known to be important.

Keywords: KENTGES, Urbanization, Quality of Urban Life, Local Governments

GİRİŞ

Küreselleşme süreci ve gelişen teknolojiye bağlı olarak kentlerin değişime uğraması, kentsel yaşamı değiştirmektedir. Farklı kesimlerden insanların yaşadığı kentlerde artık toplumlardan çok bireyler ön plana çıkmaktadır. Kentte yaşayanlar, yaşadıkları kentte var olan değerlerin kendi yaşantılarını kolaylaştırıcı ve yaşanabilir kent standartlarının var olmasını istemektedirler. Kentsel yaşam içinde her bireyin kendine özgü bir konumu bulunmaktadır ve bu konuma göre haklar ve sorumluluklar taşımaktadır. Bu haklar ve sorumluluklar çerçevesinde birey kendine bir yaşam alanı geliştirmektedir. Bu alan, bireyin sosyal hayatında anahtar rol oynamaktadır (Aslanoğlu, 1998: 86).

Kent yöneticileri, kent sakinlerinin kentsel yaşamdan beklentilerini karşılamak ve kentsel yaşam kalitesini artırmak amacıyla sürekli bir çalışma içerisindedirler. Bu amaçla kendi içindeki veya dışındaki birimlerle işbirliği gerçekleştirmeye çalışmaktadırlar.

Başta merkezi ve yerel yönetim kuruluşları olmak üzere kentte yaşayanlar, özel sektör kuruluşları, sivil toplum kuruluşları vb. tüm aktörler arasındaki ilişkiler ve toplumsal/kurumsal ilişkilere dâhil olma kentsel yaşam kalitesinin artırılmasında önemli bir rol oynamaktadır.

KENTSEL YAŞAM KALİTESİ'NİN TANIMI VE ULUSLARARASI ÖLÇÜTLERİ

Pacione'nin; bir bireyin ya da grubun algılanan ya da göstergelerle tanımlanan iyilik durumu (Pacione, 2005: 673) olarak ifade ettiği yaşam kalitesi, hiç şüphesiz kişilerin yaşadığı kent ve çevre koşullarıyla ilişkilidir. Kentlerin, sürekli bir değişim ve dönüşüm içinde olması beklentileri ve gereksinimleri de değişken yapacağından yaşam kalitesinin standart bir tanımını yapmak zorlaşmaktadır. Bu anlamda yaşam kalitesi; sosyo-ekonomik durumlara bağlı olarak değişebilen, farklı gereksinim ve beklentiler doğrultusunda, bireyin düşünce ve duygularına göre şekillenen bir kavram (Şimşek, 2010: 376) olarak niteliği taşımaktadır.

Sekizinci Beş Yıllık Kalkınma Planı'nın öngördüğü ve 1996-1998 yılları arasında Çevre Bakanlığı tarafından DPT'ye hazırlattırılan Ulusal Çevre Stratejisi ve Eylem Planı'nda (UÇEP) yaşam kalitesi; bedensel, ruhsal, zihinsel ve kültürel gelişme üzerinde olumlu etkileri olan etmenlerin niteliği ve niceliği ile bu etmenlerden yararlanma biçimi ve düzeyi (DPT, 1999: 2) olarak tanımlanmıştır.

Kentsel mekânın artmasına paralel olarak kentsel yaşamdaki hızlı değişim sürecindeki gelişmeler, yaşam kalitesi kavramını kentsel alanda da ön plana çıkaran olgulardır. Yaşam kalitesi kavramını etkileyen üç önemli faktörün olduğu belirtilmektedir. Bunlardan birincisi; iletişim ve bilişim teknolojisindeki gelişmelerdir. İkinci faktör; küreselleşme sürecidir. Yaşam kalitesini etkilediği ifade edilen son faktör ise; insan hakları, insani değerler, kişilik kavramı, insanın her şeyden önemli bir varlık olarak ortaya çıkması, eğitim ve yaşam düzeyinin yükselmiş olması gibi gelişmelerdir (Koçel, 2010: 372). Bu faktörler gerek doğrudan gerekse dolaylı yoldan, kentlerin ve kentleşmenin dinamikleri üzerinde etki edebileceği gibi bunun yanında kentsel yaşamı etkileyen gelişmeler olarak da değerlendirilmektedir.

Kentsel hayatı içinde barındıran ve çok boyutlu bir kavram olan kentsel yaşam kalitesi doğal, yapay ve sosyal çevreyle de ilgilidir. Bu anlamda kentsel yaşam kalitesi kavramı; kentleşme ve çevre sorunları, kent plancıları, mimarlar, yerel yönetimler gibi konularda uzman ve ilişkili olan kişilerce geliştirmiştir (Yavuzçehre, 2006: 185).

Kentsel yaşam kalitesinin ölçütleri belirlenirken kullanılan yöntemlerin başında uluslar arası kuruluşlar tarafından yapılan tanımlamalar gelmektedir. Dünya Bankası; yaşam kalitesini "kişinin kendi amaçlarına, beklentilerine, standartlarına ve çıkarlarına göre bir kültür ve değer sisteminde kendi yaşamını algılaması olarak tanımlamıştır. Birleşmiş Milletler sözlüğünde ise yaşam kalitesi; "gelir ve üretimin niceliksel ölçümünden öte sosyal göstergeler ile insanların mutluluğunu ölçen" bir kavram olarak tanımlanmıştır (dictionary.reference.com/browse/quality+of+life, 17.04.2013). Yine uluslar arası bir kuruluş olan ve özellikle Avrupa Birliği üyesi ülkelerin yaşam kalitesini belirlemek için çalışmalar yapan EUROFOUND, yaşam kalitesini; toplumsal yaşamı ilgilendiren toplum içinde genel iyi olma hali ile alakalı olan geniş bir kavram olarak tanımlamıştır (eurofound.europa.eu/areas/qualityoflife/index.htm, 17.04.2013).

Kentsel yaşam kalitesi fiziksel çevre, sosyal çevre ve ekonomik çevre gibi özelliklerin bir araya gelmesiyle ilişkilidir. Kentte yaşam maliyeti ve alım gücü gibi özellikler ekonomik çevre kalitesini oluşturmaktadır. Yaşam biçimi, eğitim ve sağlık hizmetlerine erişebilme, ister örgütlü ister gönlü olsun toplumsal faaliyetlerde bulunabilme, güvenlik, aidiyet duygusu, kimlik ve yerellik gibi unsurlar sosyal yaşam kalitesini oluşturmaktadır. Kentin içme suyu, yol, park, kanalizasyon gibi alt yapı hizmetlerinden kentin sahip olduğu imkânlardan ve sunulan

hizmetlerin düzeyine kadar pek çok unsur da fiziksel yaşam kalitesini oluşturmaktadır (Kaya, 2007: 35). Bu anlamda kentin sahip olduğu fiziksel yaşam kalitesi daha geniş bir anlam ifade etmektedir (Emür ve Onsekiz, 2007: 369).

Kentsel Yaşam Kalitesinin Uluslararası Ölçütleri

Kentsel yaşam kalitesi, kentlerin sahip olduğu yaşanabilirlik derecesiyle doğrudan ilişkilidir. Bu anlamda yaşanabilirlik kriterlerinin yerine getirilmesi kentsel yaşam kalitesinin sağlanmasında da öncelik taşımaktadır. Dünya Bankası tarafından hazırlanan "Kentsel Çevre Öncelikleri Raporu"na göre; kentleri yaşanabilir kılmak için alınması gereken önlemler şu şekilde sıralanmıştır:

- Çevresel bozulmanın kaynaklarını ortaya çıkarmak

- Kent yoksulları için temel çevre ve barınma hizmetlerine ulaşabilirliği kolaylaştırmak

- Çevresel tehlikelerden etkilenme oranını düşürmek

Yine aynı raporda yaşanabilir kent; sağlıklı ve onurlu şekilde yaşanan bir çevre olarak tanımlanmıştır (Dünya Bankası, 2001: 1).

Genel olarak kentsel yaşam kalitesi, kentte yaşayanların kentten beklentilerinin karşılanmasıdır. Kentlilerin beklentileri merkezi veya yerel idarelerle ilişkili olabileceği gibi kentte var olan diğer aktörlerle de ilişkili olabilecektir. Kentlilerin kentten beklentileri ise şu şekilde sıralanabilir;

- Kentte temel alt yapının kurulmuş olması

- Güvenliğin sağlanmış olması

- Hastalıklara karşı sağlık ve esenliğin sağlanmış olması

- Dinlenmeye yönelik park ve oyun alanlarının varlığı

- Kültür merkezi ve kütüphane hizmetlerinin sunulması

- Kendini geliştirme ve boş zamanı değerlendirmeye yönelik hizmetlerin sunulması

- Sosyo-ekonomik ve kültürel nedenlerden dolayı oluşabilecek uyumsuzlukların giderilmesi

- Suçların önlenmesine yönelik tedbirlerin alınması

- Zararlı, patlayıcı ve yanıcı maddelerin depolanması

- Sağlıksız, tehlikeli sıvı ve katı atıkların toplanması

- Yapay çevre ve doğal çevre dengesinin gözetilerek alt yapı çalışmalarının planlanması

- Yol, cadde ve sokakların yapımında yaşlı, çocuk ve engellilerin göz önüne alınması

- Kent içi ulaşımın planlanması

- Sağlık, trafik başta olmak üzere çeşitli konularda bilgi sağlayan işaret, yazı ve görsel araçların yeterli olması

- Sürücülerin dikkatini dağıtacak ve yayaları tehlikeye sokacak levha ve araçların düzenlenmesi

- İlan ve reklam panolarının görsel kirlilik ve fiziksel tehlike yaratmayacak şekilde yapılmış olması

- Cadde ve sokakların geceleri yeterince aydınlatılması

- Altyapı tamir ve bakım çalışmalarında uyarı işaretleri ve diğer bilgilendirme araçlarının kullanılmış olması

kentsel yaşam kalitesinin ölçütleri arasında sayılmaktadır (Ünlü, 1994: 63).

1996 yılında Birleşmiş Milletler tarafından İstanbul'da düzenlenen İnsan Yerleşimleri Konferansı'nda kentsel yaşam kalitesinin ölçütleri şu şekilde belirlenmiştir (HABİTAT-II, 1996).

- İnsanın beden ve akıl sağlığı için gerekli koşulların sağlanması,

- Sağlıklı çevre koşullarının sağlanması (içilebilir su, temiz hava, gürültünün önlenmesi gibi),

- Kentin gereksindiği enerjinin ucuz, kesintisiz ve çevreyi kirletmeyecek biçimde sağlanması,

- Doğal afet tehlikelerine karşı gerekli önlemlerin alınmış olması,

- Kentin dünya sistemiyle bütünleşecek haberleşme ağlarına bağlı olması,

- Kent mekânının kullanılması ve kentin yarattığı fırsatlara ulaşılmasında eşitsizliğin ortadan kaldırılması

- Yeterli altyapı standartlarına erişilmesi

- Kentin içindeki ve çevresindeki doğal ve tarihi varlıkların korunması

- Yeşil alanların varlığının korunması ve yeni yeşil alanlar üretilmesi

- Yaya bölgelerinin geliştirilmesi

- Kentte yaşayanların çok zaman kaybetmeden ve kent içi ulaşımlarını ucuz bir şekilde gerçekleştirebilmeleri

- Gürültü düzeyinin insani boyutlar düzeyinde belirlenen seviyeyi aşmaması

- Kentsel altyapıların, ulaştırma araçlarının ve binaların engellilere uygun olarak tasarlanması

- Kentte yaşayan erkek, kadın, çocuk herkesi kapsayacak şekilde her bireyin dinsel, siyasal inançlara bakmadan temel ihtiyaçlarının karşılanması

gibi ölçütler HABİTAT-II konferansında belirlenmiştir ve aynı yıl hazırlanan Türkiye Ulusal Eylem Planı'nda yer almıştır.

KENTSEL YAŞAM KALİTESİNİN ARTIRILMASINDA YEREL YÖNETİMLERİN ROLÜ

Yerel yönetimler, merkezi yönetimle beraber kentsel alanda aynı halk kitlesine hizmet etmesine rağmen yerel yönetimlerin görev ve hizmetleri doğal olarak merkezi idare tarafından belirlenmektedir. Dolayısıyla yerel yönetimlerin görev ve sorumlulukları kendi imkânları dâhilinde kendilerince değil, merkezi idare tarafından hukuki zemine oturtulmaktadır.

Kentsel yaşam kalitesi şüphesiz kentte üretilen ve sunulan hizmetlerin etkililiğiyle doğrudan etkilidir. Çünkü söz konusu bu hizmetlerin yürütülmesinde yerel yönetimleri daha etkin hale getiren unsur yeni yönetim anlayışıdır. Bu yeni yönetim anlayışının merkezinde kentsel yaşam kalitesinin artırılması vardır. Bu anlamda yerel yönetimler de kentsel yaşam kalitesinin artırılmasına odaklanmışlardır (Torlak ve Özdemir, 1999: 113). Vatandaş odaklı yeni

yönetim anlayışının bir sonucu olarak halk, yaşam kalitesinin artırılması amacıyla yerel yönetimlerin daha etkin olmasını istemektedirler (Sezer, 2008: 170).

Kentte yaşayanların gelir seviyeleri ve oturma alanları, yönetimden beklentileri de farklılaştırmaktadır. Alt gelir grubuna ait olan ve kenttin kenar mahallelerinde oturanlar alt yapı ve ulaşıma yönelik beklentiler taşımaktadır. Gelir durumu daha iyi olanların ise yönetimden beklentileri kültür, eğlence ve dinlence alanlarıyla ilişkilidir. İster alt gelir grubunda olsun ister yüksek gelir gurubuna ait olsun kişilerin hizmet sunumundan beklentileri hizmetin zamanında ve kaliteli sunulmasıdır (Başaran, 2007: 208).

Kentsel yaşam kalitesinin sağlanabilmesi için gerekli olan ölçütler incelendiğinde, bu ölçütlerin neredeyse çoğununun yerel nitelikli olduğu görülmektedir. Dolayısıyla kentsel yaşam kalitesinin artırılmasında yerel yönetimler ve özellikle belediyeler daha etkin konuma gelmektedir. Örneğin İl özel İdaresi 6. maddesi ve Belediye Kanunu'nun 14. maddesi kentsel yaşam kalitesiyle ilgilidir. Kentsel yaşam kalitesi konusunda belediye ve yerel yönetimleri doğrudan yetkili kılarken yanı zamanda kanunen de sorumluluk yüklemektedir.

Avrupa Kentsel Şartı da yerel yönetimleri kentsel gelişmeden sorumlu tutmuştur ve bu konuda yükümlülükler getirmiştir. Kentsel sorunların çözümü ve geliştirilmesi gereken stratejilerde yerel yönetimler sorumlu tutulmuştur. Çünkü kentsel gelişmenin niteliksel özellikleri yaşam kalitesiyle doğrudan ilgilidir (Erbay ve Yener, 1999: 81).

Kentsel alanda yaşam kalitesini sağlamak ve artırmak için katılım vazgeçilmez bir araç olarak değerlendirmektedir. Katılımın sağlanabilmesi ve kolaylaştırılması için kentlilerin; yerel yönetimlerin almış olduğu kararların hangi aşamalardan geçtiğini, kararların oluşumuna, değişimine ya da gerçekleştirilmesine katılabileceği konusunda bilinçlendirilmesi halkın katılımını kolaylaştıracaktır. Katılım ne denli geniş ve kapsamlı olursa alınan kararlar da o denli etkili olacaktır (Koçak, 2009: 141).

BÜTÜNLEŞİK KENTSEL GELİŞME STRATEJİSİ VE EYLEM PLANI ÇERÇEVESİNDE YAŞAM KALİTESİ VE YEREL YÖNETİMLER

Kısaltılmış adı KENTGES olan Bütünleşik Kentsel Geliştirme Stratejisi ve Eylem Planı; yapısal sorunların çözümüne, sağlıklı, dengeli ve yaşanabilir kentsel gelişmenin sağlanmasına yönelik ilke, strateji ve eylemleri ortaya koyan ve bunların uygulama esaslarını belirleyen ve bir

eylem programına bağlayan ulusal bir dokümandır. KENTGES; ülkemizin mekânsal planlama, yerleşme ve yapılaşma konularında Cumhuriyetimizin 100. yılı olan 2023 yılını hedef alan bir kentleşme ve imar vizyonudur (KENTGES, 2010: 2).

Dokuzuncu Kalkınma Planı 2010 Yılı Haziran Programı'nda ve Orta Vadeli Program'da, Kentlerin Yaşam Standartlarının Yükseltilmesi ve Sürdürülebilir Gelişmenin Sağlanması öncelikli politika olarak belirlenmiş ve bu amacı gerçekleştirmek için bu planın hazırlanması öngörülmüştür (DPT, 2009).

KENTGES'in hazırlanması katılımcı bir süreçle gerçekleşmiştir. Özellikle 2009 Kentleşme Şurası, eylem planının hazırlanmasında önemli bir kaynak oluşturmaktadır. Bunun yanında eylem planının hazırlanmasında;

- Kentleşme Şurası Komisyon Raporları ve Sonuç Bildirgesi,

- DPT Müsteşarlığınca yürütülen Sürdürülebilir Kalkınmanın Sektörel Politikalara Entegrasyonu Projesinde yer alan Türkiye'de kentleşmeye ilişkin tespit ve değerlendirmeler, kentleşme alanında sürdürülebilirlik çerçevesi, yaklaşım ve modeller,

- Dokuzuncu Kalkınma Planı, Orta Vadeli Program, Yıllık Programlar, Özel İhtisas Komisyonu Raporları, Ulusal Strateji Belgeleri,

- BM'nin Habitat, Mekânsal Planlama Rehberi, Gündem 21 ve ilgili strateji ve eylem planları

- Avrupa Kentsel Şartı, Avrupa'nın Mekânsal Gelişmesi için Rehber İlkeler, Avrupa Mekânsal Gelişme Perspektifi ve diğer Belgeler

söz konusu eylem planının hazırlanmasında dikkate alınmıştır (KENTGES, 2010: 3).

Kentlerimizin yaşanabilirlik düzeyinin, mekân ve yaşam kalitesinin yükseltilmesi ile ekonomik, sosyal ve kültürel yapılarının güçlendirilmesine yönelik yol haritasının oluşturulması KENTGES'in temel amacı olarak belirlenmiştir. Eylem planının temel stratejileri ise üç ana eksende gruplandırılmıştır. Bunlardan bir tanesi kentlerin yaşam kalitesinin artırılmasıdır (KENTGES, 2010: 3).

Bütünleşik Kentsel Gelişme Stratejisi ve Eylem Planı'nda, yaşam kalitesinin artırılması için ilişkili olduğu politikalar şu şekilde sıralanmıştır;

- Planlama Sitemi, Kurumsal Yapılanma ve Yerel Yönetimler

- Kentsel Teknik Altyapı ve Ulaşım

- Kentsel Dönüşüm, Konut ve Arsa Politikaları

- Afetlere Hazırlık ve Kentsel Risk Yönetimi

- Koruma, Mekân Kalitesi ve Kentsel Tasarım

- İklim Değişikliği, Doğal Kaynaklar, Ekolojik Denge ve Enerji Verimliliği

- Kentsel Yoksulluk, Göç ve Sosyal Politikalar

- Bölgesel Eşitsizlik, Yerel Kalkınma ve Rekabet Edebilir Kentler

- Kentlilik Bilinci, Kültür ve Eğitim

- Yerel yönetimler, Katılımcılık ve Kentsel Yönetim

Bütünleşik Kentsel Gelişme Stratejisi ve Eylem Planı yaşam kalitesinin artırılmasını sürdürülebilirlik ile eş değerde tutulmuştur ve kentlerin yaşam kalitesinin artırılması için geliştirilmesi gereken stratejiler, hedefler ve eylemler sıralanmıştır. Buna göre;

➢ Yerleşmelerde sürdürülebilir bir makroform oluşturmak

➢ Sürdürülebilir ve çeşitlendirilmiş arsa ve konut üretimini ve sunumunu gerçekleştirmek

➢ Merkezi iş alanlarının, alt merkezlerin ve mahalle merkezlerinin sürdürülebilir politikalarla geliştirilmesinin ve canlandırmasını sağlamak

➢ Sürdürülebilir kentsel ulaşım sistemini oluşturmak

➢ Kentsel altyapı plan, proje ve yatırımlarını mekânsal planlarla bütünleştirmek

➢ Yerleşmelerde sosyal donatı ve hizmetlerin dengeli dağılımını sağlamak

➢ Mekânsal planlarda açık ve yeşil alanları sistem bütünlüğü içinde geliştirmek

➢ Doğal ve kültürel varlık ve değerlerin korunmasını sağlamak

➢ Sosyal, kültürel ve ekonomik boyutlarla bütünleşik bir kentsel yenileme ve dönüşümü sağlamak

➢ Afet ve yerleşme risklerini azaltmak

➢ Yaşam ve mekân kalitesi yüksek, güvenli yerleşmeler oluşturmak

➢ Kent kimliğini korumak ve geliştirmek

➢ Kentlerde, çevreye duyarlı bir yaşam ortamı oluşturmak (KENTGES, 2010: 49-52).

kentlerde yaşam kalitesini artırmak için eylem planında yukarıdaki hedefler belirlenmiştir.

Kentsel yaşam kalitesinin artırılabilmesi için gelişme stratejisi eylem planında kurum ve kuruluşlar arasında uyum ve eşgüdümü sağlayacak bir merkezi otoritenin bulunması zorunlu görülmüştür. Bu anlamda yaşam kalitesinin artırılması için merkezi yönetim düzenleyici ve denetleyici rol, yerel yönetimlerin ise yerel planlama ve uygulama alanlarında rol oynaması gerekmektedir.

Kentsel hayatın en önemli aktörlerinden biri olan yerel yönetimlerin yaşadıkları sorunlarda yaşam kalitesini olumsuz yönde etkilemektedir. Bunlar arasında öncelikli sorunlardan biri belediyelerde ve il özel idarelerinde alanında uzman teknik eleman eksikliğidir. Yerel yönetimlerin mali kaynaklarının yetersizliği ve öz gelirlerinin arttırılamaması da hizmetlerin etkin şekilde yerine getirilmesinin önünde ciddi bir engel oluşturmaktadır. Bu anlamda yerel yönetimlerin kapasitesinin artırılması yaşam kalitesinin sağlanmasında büyük önem göstermektedir (KENTGES, 2010: 8).

Bütünleşik Kentsel Gelişme Stratejisi ve Eylem Planı'nda kentsel yaşam kalitesinin artırılabilmesi için yerel yönetimlerle ilgili olan hedef, strateji ve eylemler şu şekilde sıralanmıştır:

➢ Yerel yönetimlerin hizmet sunumunda şeffaflık, hesap verebilirlik, katılımcılık ve verimliliğin esas alınması

➢ Kentleşme, imar ve planlamayla ilgili bakanlığın yerel yönetimlere rehberlik eden ve denetleyen yeni bir yapıya dönüştürülmesi

➢ Genişleyen görev, yetki ve sorumluluk alanlarıyla uyumlu bir şekilde yerel yönetimlerin kapasitelerinin artırılması

➢ Yerel yönetimlerin kapasitelerinin artırılabilmesi amacıyla; Belediye Kanunu, Büyükşehir Belediye Kanunu ve İl Özel İdaresi Kanunu'nda ve ilgili diğer kanunlarda düzenlemelerin yapılması

➢ Yerel yönetimlerde teknik elemanlara yönelik mesleki ve teknik eğitim programların düzenlenmesi

➢ Yerel yönetimlerce hazırlanacak olan kentsel yaşam göstergelerini içerecek sayısal veri tabanı ve izleme sistemlerinin Ulusal Mekânsal Veri Portalı aracılığı ile kamuoyuna açık tutulması ve sürekli olarak güncellenmesi

➢ Kentleşme ve imar konularındaki uygulamaların AR-Ge çalışmaları ile desteklenmesi

➢ Nitelikli kentsel yaşam çevrelerinin oluşturulabilmesi için katılımcı proje geliştirme süreçleri gibi mekanizmaların uygulanması ve bu amaçla yerel yönetimlerin meslek odaları, sivil toplum kuruluşları ve üniversitelerle iş birliği yapmaları önerilmektedir

➢ Beş yıllık imar programları ile yerel yönetimlerin stratejik planları arasındaki ilişkinin güçlendirilmesi ve uyumlulaştırılması

➢ Kentsel dönüşüm uygulamalarında yerel yönetimlerin belirlenen usul ve esaslara göre yöntem kullanması

➢ Dönüşüm ve yenileme uygulama süreçlerine yerel yönetimlerin etkin katılımı

➢ Güvenli ve tehlikesiz bir kentsel alan için yerel yönetimlerin polis ve diğer kurumlarla işbirliği gerçekleştirmesi

➢ Sosyal yardıma muhtaç olanların belirlenip ihtiyaçların karşılanarak kent yaşamına kazandırılması çalışmalarının yerel yönetimlerce aktif olarak çalışılması

➢ Yerel yönetimler tarafından gençlerin kentsel yaşama katılımı için programlar geliştirilmesi

➢ Mekânsal planlama süreç ve kararlarında yerel yönetimler tarafından katılımın ve denetiminin sağlanması

gibi hedef ve stratejiler belirlenmiştir (KENTGES, 2010: 14-44).

SONUÇ

20. yüzyılın ikinci yarısında itibaren yaşam kalitesi üzerine Birleşmiş Milletler, Avrupa Birliği ve Avrupa Konseyi gibi organizasyonlar tarafından uluslararası seviyede birçok çalışma

yapılmıştır. Bu çalışmalar genel olarak, kentsel yaşam kalitesinin yükseltilmesi amacıyla eylem planlarının hazırlanması ve yürütülmesi için stratejiler geliştirmektedir.

Birleşmiş Milletler (BM) İnsani Yerleşimler Programının düzenlediği konferanslar: 1972 Stockholm Çevre Konferansı, 1976 BM Kanada HABITAT I Zirvesi, 1992 BM Rio Yeryüzü Zirvesi, 1996 BM İstanbul HABITAT II Zirvesi, 2000 BM New York Milenyum Zirvesi ve 2002 BM Johannesburg Sürdürülebilir Kalkınma Zirvesi gibi organizasyonlar kentsel yaşam kalitesini de içermektedir.

Yaşam kalitesi üzerine Avrupa Birliği (AB) düzeyinde yapılan anlaşmalar ve konferanslar; AB'nin temel kuruluş antlaşması olan 1957 Roma Antlaşması. Avrupa Birliği tarafından kabul edilen; 1987 Avrupa Tek Senedi, 1993 Maastricht Antlaşması, 1988 Yerel Yönetimler Özerklik Şartı, 1992 Avrupa Kentsel Şartı, 2004 Avrupa Peyzaj Sözleşmesi ve 2007 Leipzig Sözleşmesi kentsel yaşam kalitesini yükseltme amaçlı düzenlemeler yapmıştır.

Türkiye'nin de üyeleri arasında bulunduğu Avrupa Konseyinin, kentsel yaşam kalitesinin yükseltilmesi amaçlı ve sonuç alan başarılı çalışmaları olmuştur. Avrupa Konseyi kurulduğu günden günümüze insan hakları ve yaşam kalitesi gibi konular üzerinde çalışmalar yapmıştır ve ayrıca Avrupa Birliğini bu konuda bilgilendiren, destekleyen ve teşvik eden kurumların başında gelmektedir.

Tüm bu gelişmelere rağmen kentsel yaşam kalitesi ve ölçütleri ülkemizde yeni yeni oluşmaya başlamış bir olgudur. Kentsel nüfusun sürekli bir artış göstermesi, kentsel alanda sunulan hizmetlerinde çeşitlenmesine sebep olmuştur. Çünkü kentte yaşayanların sayısı artıkça talepleri de doğal olarak artmıştır. Modern hayatın gerektirdiği şartlar neticesinde kentlilerin, kentsel ihtiyaçların karşılanmasına yönelik beklentileri de artmıştır. Kentte yaşayanların ihtiyaçlarının karşılanması ve yaşamdan elde ettikleri doyumun artırılabilmesi için yaşam kalitesi ölçütlerinin dikkate alınması gerekmektedir.

Kentsel yaşam kalitesinin tanımı ve kapsamı her ne kadar uluslar arası kuruluşlarca tanımlansa da içeriği ve öncelikleri açısından ülkeden ülkeye değişebileceği gibi kentten kente de farklılık göstermektedir. Her ne kadar kentte yaşayanların beklentileri ve ihtiyaçları aynı olsa da öncelikleri açısından farklılık gösterebilmektedir. Kentte yaşayanların gelir durumları beklentilerin öncelik sırasını etkileyebileceği gibi kişilerin psikolojik ve sosyo-kültürel yapıları da şüphesiz etkili olabilmektedir. Yine kentte var olan problemler ve çözülemeyen sorunlar da

kentsel yaşam kalitesini etkilemektedir. Yerel yönetim birimleri kentte yaşayanlar, sivil toplum kuruluşları, özel sektör ve kamu kuruluşları ile birlikte kentsel yaşam kalitesini artırmak için çaba göstermelidirler. Buna ek olarak gerek uluslar arası kentsel yaşam kalitesi ölçütlerinin sağlanması yolunda gerekse KENTGES'in hazırlanması sırasında olmazsa olmaz olarak görülen katılımın sağlanması için yerel yönetimler öncülük etmelidirler.

13th International Educational Technology Conference

Career Adaptability and Intention to Leave among ICT Professionals: An Exploratory Study

Safiah Omar[a,31], Fauziah Noordin[b]

Abstract

Adaptability was found to be the important trait for employees to survive in their career especially in the ICT industry which involved with consistent work changes, creative thinking, and advanced technological upgrading. Although organizations supposed to encourage career adaptability among the employees, previous studies showed that it will encourage employees' turnover rather than retention. In order to generalize the previous findings into Malaysian work context, this study explored whether career adaptability would have such influence on intention to leave the organization and the career. Findings of this study found that career concern, career control, career curiosity and career confidence were negatively correlated with both intentions to leave. However, only career control and career confidence were found to be significance in explaining the study model in multiple regression analyses. Implications of this study and recommendation for future studies were discussed.

Keywords: career adaptability, intention to leave, ICT professionals

INTRODUCTION

The uses of Information and Communication Technology (ICT) have been increasing in the world of business and education. Technological advancement today has passed beyond cables and wires where the means of communication now can be done from just about anywhere. Office works can be done from home, meetings can be conducted virtually and educational classes can be handled from two thousand miles away without having to have students sitting in front of the teachers. However, the technological advancement would not be continued without the people who make it possible which are the ICT professionals. The issue of high turnover rates among these professionals continues to rise especially in Malaysia (*Malaysian Employers Federation*, 2012). These professionals also have the tendencies to leave the ICT career itself (JobStreet.com, 2010).

The issues of intention to leave among the ICT professionals in Malaysia has been paramount to both the studies in academic and industrial. The gap between the turnover rates of ICT as the highest in the list (75.72%) with the second highest is 43.32%. Such big gap required immediate attention for researchers to conduct such studies that can lead to lessen the turnover rate in the near future. On a similar note, the new generations seems not to be interested to take ICT as their career plan (MDec & Synovate, 2011). Therefore, in order to determine the current situations of turnover issues in ICT industry, the aspects of intention to leave among the ICT professionals was examined. It is also important to look at the potential antecedents that can contribute to reduce the level of intention to leave. Tracing back with the work among ICT students, Der Vyver (2009) suggested that students in ICT programs need to be adaptable in order for them to complete their study courses and to enter the ICT career successfully. In line with the theory in determining individual's decision to participate by March and Simon (1958), career adaptability represents the ease of movement that will influence the decision to leave. Hence, this study used an exploratory approach to test whether having adaptability in career will lead to reducing the level of intention to leave among the ICT professionals in Malaysia.

Intention to Leave

Intention has been recognized as the immediate to actual behavior (Sommer & Haug, 2010). Sheeran (2002) provided evidence that there is significant correlation between intention and behavior. Hence, this study measured the intention to leave in order to determine the final outcome which is the real leaving. Although having intention to leave will not necessarily lead to actual leaving, the thought of leaving itself will affect organizational performances because it contributed to work inefficiencies and absenteeism (Kivimaki et al., 2007).

The issues of intention to leave in ICT industry do not just occurred recently. It began since the early 2000s with the burst of dot-com bubble in the US. Although the salaries and benefits associated with this career continue to increase, the number of employee's leaving did not decrease. This is also happening in Malaysia where the numbers of ICT graduates who continues working in the same field are now decreasing (Wong, 2010). There are few types of turnover which are changing from unit to unit, organization to organization and finally the most severe case is leaving the current career for other career (Krausz, Koslowsky, Shalom, & Elyakim, 1995). Thus, it is timely to examine the current state of the ICT professionals whether they are having high or low intention to leave both their organization and the ICT career itself.

Previously, the relationship between career adaptability and intention to leave was tested and the relationships were positive (Ito & Brotheridge, 2005). This means that the increasing of career adaptability will also increase the intention to leave. Although the relationship seems to encourage intention to leave, the study was only measured intention to leave the organization. This study however extends the intention to leave to leaving the career. As the key to survive in ICT field (Van Der Vyver, 2009) career adaptability in this study aspects is expected to encourage individual to stay in ICT career. Thus, this constructs of career adaptability is relevant to be studied in determining the antecedents to lessen the turnover issues.

Career Adaptability

Career adaptability is defined as "the attitudes, competencies and behaviours that individuals use in fitting themselves to work that suits them" (Savickas, 2005, p. 45). Career adaptability is a plan for unforeseen events that involves an individual undertaking in handling changes (Rottinghaus, Day, & Borgen, 2005). It also deals with how an individual constructs a career where it involves with adjusting to vocational development tasks, occupational transitions, and personal traumas by solving problems that are usually unfamiliar, often ill-defined, and always complex. Originating from the work of Super (1980) in career maturity, career adaptability was introduced by Savickas (1997) where the adjustment would be more suitable to be used among working adults. Career maturity denote the fact that adolescents could peak at a level of maturity, as displayed in their career-related competencies and attitudes whereas career adaptability implies an ability that may either improve or deteriorate during the life span (Super & Knasel, 1981). In other words, an adolescent may become progressively more mature in terms of careers, whereas an adult may, due to psycho-social circumstances, be less or more adaptable during different stages in their careers. Adult career is characterised not only by the entry into, training for and working in an occupation, but relates also to the setbacks faced whilst working and the adaptability required to cope with the changing world circumstances (Savickas, 2005).

Career adaptability has been suggested as a key competency in career success generally (O'Connel, McNeely, & Hall, 2008) which enable individuals to effectively implement their self-concepts in occupational roles, thus creating their work lives and building their careers. Savickas (2005) developed a career construction theory's model of self-regulation for social and developmental with a set of specific attitudes, beliefs, and competencies which is known as the ABCs of career construction. These four syndromes of attitudes, beliefs, and competencies constitute career adaptability and represent resources for self-cultivation. The adaptive individual is conceptualized as (a) becoming *concerned* about the vocational future, (b) taking *control* of trying to prepare for one's vocational future, (c) displaying *curiosity* by exploring possible selves and future scenarios, and (d) strengthening the *confidence* to pursue one's aspirations (Savickas, 2005). Hence, the dimension for career adaptability is also known as the 4C's which are career concern, career control, career curiosity and career confidence.

Career concern involved with the individual views about the current career and how the future career will be like. It emphasizes preparation and planning for the career in the future. Career control is associated with the responsibility of a person to construct his/ her own career (Savickas, 2005). Individual with career control can decide on which job and career that should be taken based on his/ her own. Even though they can listen to other people's advice, the final decision will be made by the person's own decision. Career curiosity reflects the ability of a person to explore and finding information that are related to the development of the career (Savickas, 2005). People with high career curiosity normally will do large amount of research such as reading journals, brochures of training and development, asking expert advice and many more activities associated with developing the undertaking career. Finally, career confidence derived from the self-confidence (Rosenberg, 1989) which denotes the striving for success by encountering challenges and overcoming obstacles. The level of career confidence will determine the ability to solve problems related to work tasks.

The potential connection of the relationships between career adaptability and intention to leave was taken by the work of Ito and Brotheridge (2005) and Der Vyver (2009) using the underlying theory by March and Simon (1958). The theory stated that for individual need to consider the level of desire of movement and ease of movement in order to decide whether to stay or to leave an organization. Desire to move consists of commitment and satisfaction while the ease of movement was the availability of job market elsewhere (Anderson & Milkovich, 1980). The theory was then extended in recent work among IT professionals in Singapore where the antecedents for desire to move and ease of movement was modified to suits the current work situation (Joseph, Ng, Koh, & Ang, 2007). Career adaptability was inferred to influence job mobility (Trevor, 2001) and akin to flexibility (Wessel, Ryan, & Oswald, 2008) which contributed to the ease of movement for individual to leave the organizations. However, because there was previous evidence that stressed on the importance of adaptability in order to survive the ICT world, this relationship between career adaptability and intention to leave need to be further examined.

METHOD

The quantitative method is used in this study in order to explore whether there are relationship existed between career adaptability and both intention to leave the organization and the career. It also aimed to measure the relationship (if any) between career adaptability and both intention to leave based on past researches that has been established in the west which reported on the existence of this particular relationship.

2.1 Participants
The study samples were consists of 303 ICT professionals from Selangor and Kuala Lumpur. The sampling frame was taken from the lists of World Class Status listed by Multimedia Super Corridor (MSC). The samples work nature ranging from and not limited to networking, software development, system technician and etc. There were 59% males and 41% females. 63% have bachelor degree18.6% have master degree and 1.7% obtained professional courses.

2.2 Measures

2.2.1Intention to Leave
The instruments used for intention to leave were taken from Alam and Mohammad (2010). There were three items which covering the aspects of searching, thought and intend. For example 'Presently, I am actively searching for other job'. The same instrument was used to measure intention to leave the organization and intention to leave

the career. The words that referred to leaving the organization were modified in order to give meaning to leaving the career. For example 'Presently, I am actively searching for *other career than ICT*'. The instrument use 7-points scale where 1 represent 'strongly disagree' and 7 represent 'strongly agree'. The cronbach's alpha for intention to leave the organization is .88 while intention to leave the career is .92.

2.2.2 Career Adaptability

To measure the four C's of career adaptability (concern, control, curiosity and confidence), this study adopt the instruments from Savickas (2008). This instrument was chosen because it has been thoroughly studied by Savickas and his colleagues where the replicating of different settings was done in various countries such as US, Europe and Australia. The questions required the respondents to select from scale 1 to 7 where 1 referring to 'very not strong' and 7 referring to 'strongest'. The internal consistency result for the constructs of career concern, career control, career curiosity and career confidence are .89, .89. .82, and .88 respectively.

2.3 Analysis

The responses obtained from the respondents in measuring their intention to leave and career adaptability were analyzed using SPSS version 20. The data was first analyzed for the means in order to determine the level of the respondents' intention to leave and career adaptability. The data was then further analyzed for correlation and regression to test the relationships that might exist.

RESULTS

3.1 Descriptive Statistics

The mean score for all variables are at moderate level. The respondents have higher intention to leave the organization (M=4.13; SD=.88) compares to intention to leave the career (M=3.53; SD= .85). This shows that the possibility of the ICT professionals to leave the organization is much higher than they are to leave the ICT career.

Career curiosity achieved the highest mean score (M=5.13; SD= .97) within the career adaptability constructs followed by career confidence (M=5.13; SD= .95). The ICT professionals are curious have confidence in their career. The average mean score for career adaptability construct is 5.07 which indicated that these ICT professionals are moderately adaptable into their ICT career.

Table 1: Mean score for Intention to Leave and Career Adaptability

Dimensions	Mean	SD
Intention to Leave Organization	4.13	.88
Intention to Leave Career	3.53	.85
Career Adaptability		
Career Concern	4.95	.87
Career Control	5.05	.97
Career Curiosity	5.14	.97
Career Confidence	5.13	.95
Average for Career Adaptability	*5.07*	

Note: 1.00 – 3.99 = low; 4.00 – 5.99 = moderate; 6.00 – 7.00 = high

3.2 Correlation

Correlation results shown in Table 2 stated that the relationships between the constructs of intention to leave and career adaptability were significant negatively related. All results were significant at .01 levels. In intention to leave the organization, it was highly correlated with career control (r= -. 478) followed by career confidence (r= -.466). The highest correlation between career adaptability constructs and intention to leave the career is for career confidence (r= -.447) followed by career control (r= -.427).

Table 2: Correlation results between ITLO, ITLC, career concern, career control, career curiosity and career confidence

Variable	1	2	3	4	5	6
1. ITLO	1					
2. ITLC	.791**	1				
3. Career Concern	-.441**	-.381**	1			
4. Career Control	-.478**	-.427**	.739**	1		
5. Career Curiosity	-.432**	-.384**	.694**	.739**	1	
6. Career Confidence	-.466**	-.447**	.693**	.781**	.766**	1

**. Correlation is significant at the 0.01 level (2-tailed).

3.3 Coefficient for the predictor of variables

Using stepwise analysis, Table 3 showed the coefficient results for career adaptability and intention to leave the organization. In model 1, only career control is significant with the t-value at -9.430 ($p < .001$). The standardized Beta coefficients for career control and intention to leave the organization is -.478. The R square is .228 significant at .ooo level. This means that the proportion variance of intention to leave explain by 22.8% of career control. For model 2, career control (B= -.291; $p < .001$) and career confidence (B= -.239; $p < .01$) were significant with intention to leave the organization. Career concern and career curiosity were both removed from the model tested due to the insignificant results. The r square for model 2 is .250 ($p < .01$). This means that in model 2, 25% of intention to leave the organization was explained by career control and career confidence.

Table 3: Coefficient results for career adaptability and intention to leave the organization

		Coefficients[a]				
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	7.736	.390		19.850	.000
	ccontrol	-.714	.076	-.478	-9.430	.000
2	(Constant)	8.200	.415		19.769	.000
	ccontrol	-.435	.120	-.291	-3.638	.000
	cconfidence	-.365	.122	-.239	-2.991	.003

a. Dependent Variable: itlo

The same analysis was carried for intention to leave the career. Referring to Table 4, only career confidence was significant with intention to leave the career (B= -.447; $p < .001$) with the t-value of -8.66. The r square for the first model is .20 significant at level .000. In the second model, career confidence (B= -.291; $p < .001$) and career control (B= -.200; $p < .05$) were found to be significant with intention to leave the career. The r square for the second model is .215 significant at .015. The second model showed that 21.5% of intention to leave the career was explained by career confidence and career control.

Table 4: Coefficient results for career adaptability and intention to leave the career

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	7.082	.417		16.990	.000
	cconfidence	-.692	.080	-.447	-8.666	.000
2	(Constant)	7.374	.430		17.135	.000
	cconfidence	-.450	.127	-.291	-3.556	.000
	ccontrol	-.303	.124	-.200	-2.442	.015

a. Dependent Variable: itlc

3.4 Regression

Table 5 shows that the regression for model 1 and model 2 between career adaptability and intention to leave the organization. Both models were significant at level .000. The F value for model 1 is 88.9 while for model 2 is 50.11. The first model only consists of career control while model 2 consists of career control and career confidence. Career concern and career curiosity were both removed from both models.

Table 5: Regression analysis for career adaptability and intention to leave the organization

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	145.086	1	145.086	88.931	.000[b]
	Residual	491.064	301	1.631		
	Total	636.150	302

	Total	653.917	302			

a. Dependent Variable: itlc

b. Predictors: (Constant), cconfidence

c. Predictors: (Constant), cconfidence, ccontrol

DISCUSSION

The results indicated that the relationship between career adaptability and intention to leave the organization and intention to leave the career existed. In contrast with previous studies where career adaptability and intention to leave were positively correlated (Ito & Brotheridge, 2005), this research found that the relationships were significantly negative. This means that having career adaptability will prevent the ICT professionals to have intention to leave for both the organization and the career. However, this research findings can be used to support previous research where it was found that student of ICT program in higher learning required being adaptable in order to cope with the study modules and to survive in the ICT field (Van Der Vyver, 2009). The existence of adaptability in career is just an extension of having adaptability in studying ICT courses. Perhaps due to the constant changes and the advanced complicated technical upgrades required individuals who venturing into this line of work to be able to cope with the turbulent work environments. This ICT industry also required individual to have critical thinking, creative work skills and expert in some tactical knowledge. Therefore, such adaptability skills need to be taught since during the studies level at the higher learning institutes.

Although Ito and Brotheridge (2005) found career adaptability to be quite problematic for organization as it encourages job-hopping, this has only been tested in Canada among the federal civil services. Their study does not represent the ICT industry especially within Malaysian work context. Cultural and individual personality differences are the elements that might contributed to the difference results found in this current research. Therefore, findings of this study will contribute to the body of knowledge where it entails that ICT organizations should encourage career adaptability without having the worries of employees' turnover.

Even though all career adaptability constructs were significantly correlated with intention to leave the organization and the career, further tests in multiple regressions analyses showed that only career control and career confidence are able to significantly explain the intention to leave for both organization and career. Whereas, career concern and career curiosity were both found to be not significant to be included in the study models. Individual who has sense of confidence in their career would also have the potential to have the control in determining the career directions that they are choosing. Individual with these attributes able to adapt to constant changes in work environment and pre-prepared with uncertainty within work related (Savickas, 2005). This will reduced the feelings that can contribute to leaving the organization or the career such as giving up, loosing self-esteem, job dissatisfaction, work-conflicts and etc.

CONCLUSION

Findings of this research indicated that career adaptability appear to have influence on ICT professionals' intention to leave the organization and intention to leave the career. The higher career control and career confidence that the ICT professionals are having, the lower their intention to leave will be. Career adaptability that could lead to employees' retention is a field still underexplored, especially in the Malaysian setting. An extension of this study in

looking at the relationships between career adaptability with intention to leave aspects within the same ICT field or other industry through a qualitative method, or a blend of both qualitative and quantitative methods can be helpful in providing in-depth understanding of this issue. Thus, more focus should be emphasized on the career adaptability-variables involved, specifically in studying the employees' career retention. It is also suggested that adaptability should be tested among the students in higher learning institutes in regards to relating it to the level of the students' study engagement/participation. This is because the skills of career adaptability cannot be developed in overnight. The adaptability skills in career need to be consistently developed and it must start as early as in higher learning institutions.

Comparison of the Use of Social
Network in Education between North and South Cyprus

Fezile Işık[32]

Near East University, North Cyprus

Abstract

The purpose of this study is to determine and compare the use of social networks in education of two private secondary and post-secondary schools in North and South of Cyprus with a focus on the possible differences and similarities. The use of social networks in education was investigated as new common classrooms in this study. A qualitative method of research was used to gain an insight deep understanding of the participants' experiences, related to semi-structured interviews and observations. The study group consisted of 35 teachers interviewed by the researcher. The data was collected over the period between January and April 2013. Consequents showed that the two schools at both sides of Cyprus share common elements than differences, regarding the use of social networks in education. Significant difference between the two schools was that there was no school policy for using social networks in education in North although the teachers were positive to use social networks. However social networks were used for communication under the school policy in the South although the teachers were negative to use social networks in education. The similarities of North and South is to use SNs for communication, not for education and to avoid abuse of students for not knowing privacy and security matters and to promote teachers to spend more time and effort in eliminating inappropriate materials regarding lessons, and also to promote parents to appreciate the use of SNs in education. The difference between the North and South is that although using SNs for communication is school policy in the South, it is not a school policy in the North. Although North school teachers have positive perceptions for using SNs in education, the South teachers have negative perceptions.

Keywords: Education, social networks.

Introduction

Education is an ongoing phenomenon of a person until death and it has political, social, cultural, and economic diversities. Education is a process which affects people to gain society standards, belief and way of living. Education is continuous, dynamic, comprehensive, multi-dimensional, scientific, objective-oriantated, limitless and cultural. Production and sharing of knowledge is accelerated by the developing technology and according to the needs of individuals (Tiryakioğlu & Erzurum, 2011).

Education is important for modern life (Arap, 2010; Uzgören & Uzgören, 2005), in order to change the behavior of the individual via experience throughout life (Çetin, Çakıroğlu, Bayılmış & Ekiz, 2002). Education is an investment in changing attitudes of an individual. Formal education is a planned system at the schools however informal education is applicable everywhere and not planned. Education is a social and cultural process which is lifelong learning (Göksan, Uzundurukan & Keskin, 2009). Education aids students, communities and business life (Semerci, 2003).

The Internet becomes more widespread, common use of various applications originated from technology that has come into question. Among these, Web 2.0 applications like Youtube, Facebook, Twitter, Wikis and Blogs facilitate the following of the information, enhance the interaction between knowledge communities due to its attractive features as being interactive and anytime and anywhere (Odabaşı, Mısırlı, Günüç, Timar, Ersoy, Som, Dönmez, Akçay, & Erol, 2012). The global use of the Internet has developed in recent years and now impacts all aspects of society from business, education to social activities. (Leitch & Warren, 2011)

Education and technology play an important role in providing efficiency to human life (Seferoğlu, 2006). The most significant indications of the knowledge era are science, rapid technologic changes and globalization (Gedikoğlu, 2005; Karasar, 2004). Knowledge is the capital of human being. Nowadays, it is a necessity to communicate to large populations as there is huge demand for quick communication (Karasar, 2004). Advancement of the web technologies is correlated to increase of memberships of social networks. Online collaborative networks are a network that brings people together for a mutual aim (Acun, 2010).

One of the latest developments are online social networks. Nowadays, many social networks are appearing and shaping the way that people communicate, interact, collaborate, work and even learn (Gülbahar, Kalelioğlu & Madran, 2010). Social networks started out as a hobby for some computer literate people and have become a social norm and way of life for people from all over the world (Flad, 2010). Sharing of the videos, photos, texts and sounds can be possible by using the SNs, at the same time, online games which are embedded in them lead to growth in interest in these sites (Kert & Kert, 2010). Nowadays there are many social networks as Facebook, MySpace, Twiter to provide communication to their users (İgman, Kiyici, Tercan, Kiper & İgbulan, 2010). Facebook assisted courses facilitated the aspects in sharing and cooperation; access to the lecturer; visualizing the course content for some students. However, there were also some students having negative opinions about the application (Keleş & Demirel, 2011).

Social networks are used not only for social networking and entertainment, but also for access to information (Tonta, 2009), for educational purposes (Gülbahar, Kalelioğlu & Madran, 2010), for learning and for carrying out professional work (Tonta, 2009). Social networks have an important educational potential with their interaction and communication tool (Ekici & Kıyıcı, 2012). Globalization, educational requirements in whole life, and intense and fast improvements in communication technologies had deeply and widely effected the educational institutions (Karaca, 2008).Social networking can be transformed to educational networking (Eteokleous, 2012).

Educators started using SNs in education due to the fact that SNs are mostly used by youngsters and students and that SNs provide rich interaction opportunities. SNs enable teachers to get information about their students and better communication. SNs have relation with constructive and pedagogical approaches, and supports active and social learning, and implementation (Keleş & Demirel, 2011). Online social networking can be regarded as a platform allowing teachers and students to communicate and collaborate on school subjects and projects outside the classroom. Teachers can post school related works on these online communities and students can further enrich their learning experiences by teaming up with their class mates to work on assignments and projects (Khedo, Elaheebocus, Mocktoolah, Suntoo, 2012).

Widespread use of information and communication technologies has changed learning environments. These kinds of changes forced learners in being online or blended learning environments as well as face to face. It has seen as a result of both lifelong learning and knowledge society which learners must have developed digital proficiency (Atici & Polat, 2010).

The social network tools via internet provide a wide range of opportunities for educational activities. As an educator, it is important to experience good examples of technology integration into curriculum with students (Gülbahar & Kalelioğlu, 2010).Through the social networks, users re-define themselves, involve in various social relations and even re-shape their teaching or learning process. Providing new opportunities and conveniences in educational settings, the rapidly developing information and communication technology, play crucial roles for providing a learning environment for schools, as well as for the societies (Özmen, Aküzüm, Sünkür & Baysal, 2011).

At present, social networks are developing usually outside the formal educational activities (Acun, 2010); they have an important educational potential with their interaction and communication tools (Ekici & Kıyıcı). Most of the students are highly aware of social networking and have the ability to use computer and internet with Web 2.0 tools which are very important for education (Uçak & Çakmak, 2010).Social networks can be used in education processes for improving communication skills of students and teachers, expanding participation, empowering peer support, realization of collaborative learning. Social media also provides facilities which are enriching the learning and teaching processes with text, video, audio materials, supporting learning, teaching and evaluation processes (Toğay, Akdur, Yetişkin & Bilici, 2012).

Many educational institutions have taken advantages of social networking websites for maintaining their teaching and learning activities (Tinmaz, 2012). The introduction to the concept of social networking, the discussion turns towards the exiting definitions of knowledge, leading to the question of what and how we are attempting to accumulate, manage and share knowledge resources through applications of online social networking (Benson, Morgan, & Tennakoon, 2012).

Educators must have a clear vision and guidelines for doing so, or they will face serious technical and legal pitfalls. Schools have a role to play in educating students about safely and appropriately using such sites (Davis, 2008). Teenagers and young adults have especially embraced SNs as a way to connect with their peers, share information, reinvent their personalities, and showcase their social lives (Flad, 2010). In order to develop learning communities with increased student engagement, educators are increasingly adopting the use of social networks to supplement teaching and learning in both fully online as well as traditional classroom learning environments (Buzzetto-More, 2012). In this context, online social network environments are effective sites which can be used as constructive and social cognitive learning sites. Theoretical approaches are based on individual orientation, interaction with environmental factors and self-control (Kert & Kert, 2010).

There are many challenges facing the use of social networking in education such as privacy, real friendship, taking up time, flexibility, repeatability, convenience and accessibility and miscommunication. The privacy is one of the obstacles that faced the use of social networking in education. SNs have effect on health of individuals, due to spending a lot of time. Flexible learning expands choice on what, when, where and how people learn. Social networking is easy and quick in term of accessing accessibility, reviewing, updating, editing; anytime, anywhere. Scholars praise social-networking tools for their capability to attract, motivate and engage students in meaningful communicative practice, content exchange, and collaboration (Zaidieh, 2012).

Though many arguments can be made about the possible risks of adolescent social networking, it is important to point out the benefits of these websites as well in order to promote education, keep students updated with assignments, offer help to those in need, provide an outlet for teens to express. In general, the Internet and social networking sites can be a positive influence (Flad, 2010)

Social networking sites, as well as other new forms of communication technology, are also a concern to many school professionals because of the level of distractions during instruction time and have a negative impact on the learning environment. They create within the school such as forbid the use of handheld technology during school or that block certain social networking websites (Flad, 2010). Teachers are increasingly finding themselves in trouble for their use of social media in and out of the classroom. Teachers most frequently are getting in trouble for posting inappropriate contents during their personal time (Papandrea, Mary-Rose, 2012). Parent-child conflicts have also become more of an issue since the sudden escalation of online social networking and causes distress in the household and may ultimately lead to a barrier between parent, child, and communication about school work and grades (Flad, 2010).

Based on the litreture a set of questions were derived regarding the use of SNs in education as new common classrooms, the kinds of networking used, the use of SNs in and out of the school time, the reason of why teachers started using SNs, the age group of the teachers that use SNs, the lessons for which SNs are useful, the students learning affection of SNs, the teachers and students skills improvment by SNs, the policy and criteria for using SNs, the communication one to one and one to many with SNs, the advantages and disadvantages of using SNs and the sharing of information with parents, the perception on SNs and F2F in education. The specific purposes of this research was to compare the use of Social Networks (SNs) in secondary and post secondary education at two private schools in North and South of Cyprus.

Objective

The purpose of this study is to determine and compare the use of social networks in education of two private secondary and post secondary schools in the North and South of Cyprus and the importance of such comparison.

Method

A qualitative method of research was used to gain an insight of deep understanding of the participants' experiences, relying on semi-structured interviews and observations. The study group interviewed by the researcher, consisted of 35 teachers from two secondary and post secondary private schools; one in North and one in South. The data was collected over the period between January and April 2013 with a pregranted permission. The interview schedule consisted questions which were set up after a thorough study of litarature on the use of Social networks in education. Each interview took approximately half an hour. The tape-recorded interviews was transfered to a transcript. Thematic coding was based on the relevant literature.

Findings

SNs as New Common Classrooms

Physics, Mathematics, Science and computer studies (ICT) teachers of North claimed that SNs are used during lessons and out of the classroom for sending and reminding deadlines of homework, getting answers, giving feedback and sharing selected youtube materials. The ICT teacher said that he used selected youtube materials, during the lesson at the technology lab which is equipped with smart-board, projectors, internet access and computers for year 11 and year 12. Physics, Mathematics and English teachers claimed that SNs could not be used for education but they could only be used as education tools. They prefer to use only traditional methods for education which was face to face. All the South school teachers said that they had to use school group facebook in order to send students homework, questions and reminders on assignments and exams, and for communicating with parents about the school activities. Most of the South school teachers especially ICT, French, English and Mathematics teachers stated that they did not use SNs for education because they did not like technology and believed that it would not be helpful for learning so they did not encourage students to use SNs. Science, Greek and psychology teachers claimed that they used youtube during the lessons, yet they prefer face to face education. One of the teachers complained that even if they wanted to use SNs for education the school would not provide them the infrastructure.

Kinds of SNs used

Most of the North school teachers said that they used facebook as a class and email to post homework and to share selected youtube materials and videos to visualize their lessons, ask questions or answer the students' questions especially during the exam period. The students under year 11 did not have the opportunities to use technology room or lab so they used SNs only out of school. Most of the South school teachers used school group facebook.

The Necessity of Using SNs

North school teachers claimed that SNs were useful in following technology improvement and communication with students, in order to attract their attention for lessons, in visualizing science experiments which they could not do at the school lab due to limited infrastructure and to guide senior students about undergraduate education in abroad. The case was similar for South school teachers.

Timing of SNs In and Out of School

North school teachers said that there were limited infrastructure and internet access in their classrooms especially for students of under year 11, so they could not use SNs in the school. They used SNs out of the school if the students had facebook and email account and if they got their parents' permission to access internet or their parents could provide internet and computer at home. Most of the South school teachers claimed that they mostly used school group facebook out of school having inadequate infrastructure in most classrooms.

Age Group of Teachers

Most of the North school teachers said that although the age is not very important for using SNs, the teachers under 30 were more familiar with technology because they were born with it and teachers over 30 were more reluctant to use any form of technology because of not having confidence. Some of the older teachers had never used SNs for education, but at the same time there was a teacher over 60 who not only used SNs, even taught young teachers how to use SNs. Most of the South school teachers claimed that younger teachers were more familiar and confident to use SNs whereas teachers aged over 30 had negative thoughts and fear about SNs.

Lessons Where SNs is Used Most

North school teachers stated that SNs were useful especially for Language, Science, Physics, Biology, Mathematics and ICT lessons. Some teachers claimed that SNs were useful for all lessons summarizing, especially during exam period. Others said that SNs were not useful for Mathematics because they could not solve equations through SNs. South school teachers said that SNs were more useful for theoretical lessons. One teacher said that SNs were good for all the lessons, some South school teachers claimed SNs were not good for Mathematics and one teacher believed that SNs were not useful for any lesson.

Skills Improved by SNs

North school teachers claimed that SNs improved teachers' skills. Some teachers claimed that SNs improved their skills by accessing other teachers' lessons through the internet and learning and teaching methods. South school teachers claimed that SNs did not improve their skills.

Policy and Criteria

North school ICT teacher believed that it should be forbidden to open any other computer programs or sites during computer lesson. Other teacher stated that she had her own self policy for communicating with graduates. Some believed that there should be a school policy for using SNs. South school teachers claimed that privacy, honesty and security were important policy issues.

One to One, One to Many Connections

North school teachers said that it would be possible to communicate both one to one and one to many between teachers and students. Some teachers said it was quite easy to send individual instant messages from facebook to students and to ask them questions and get answers. Some teachers said SNs are good for one to one dialogue with their colleagues, for sharing ideas about the lessons or news. North school teachers said that SNs are good for students who are not good at lessons and do not have confidence within themselves to communicate in the class. South school teachers said SNs are good to keep teacher in touch with students through SNs either one-to- one communication or one-to-many and even students who are not confident enough to participate.

Communicating with Parents Through SNs

North school teachers said that they prefer to communicate with parents through the schools in the formal way face to face (F2F) communication. In this way teachers talked with real parents and not somebody else hiding behind the computer. Some teachers were reluctant to communicate with parents through SNs because conversation could turn into an argument. They believed communication with parents should be done formally by school through weekly reports or emails. South school teachers said that they communicated with parents through email which was used as the formal communication way and they also had group facebook for students and parents. Some said that if the parents neglected their children, teachers could inform them about the students' improvement with SNs.

Advantages and Disadvantages

Advantages

North school teachers said that SNs had a lot of advantages for education such as finding material from youtube, sharing with students and colleagues worksheets, power point presentations, links, and enrich their perception on the lesson. Some said that students did not have to take notes during lesson. Some said that SNs provided communication between teachers and students out of school times. Teachers said that students could learn anywhere, anytime and at their own speed and also retrieve lessons. Some teachers said that SNs should be promoted by the ministry of education or by the school not by teachers individually. Some claimed that there was not enough infrastructure to perform lab experiments, so they used youtube to visual the experiments. One said that SNs should be used in a more casual and friendly atmosphere to support communication between students and teachers. Furthermore they said that students felt more confident to contribute to the lesson via SNs. South school teachers

said that they could find different kinds materials from youtube, videos, worksheets, power points presentations, links and share them via the SNs. Some teachers said that by using SNs they saved time for students which not have to take notes during lesson. Some said that shy students were encouraged via SNs. Some said they informed parents about activities, announcements, events of the school. One teacher said "An advantage of SNs is that a teacher can see from pictures if a student smokes and try to convince them that smoking is a dangerous habit".

Disadvantages

North school teachers said that students lost their concentration and wasted a lot of time by watching pictures, playing games and chatting. Some teachers claimed that student should first learn about privacy, security and then start using SNs in productive and correct way of education. Some said that they needed more effort and more time to select the appropriate materials from the internet. Teachers also claimed that parents did not give permission to their children for access to internet because they did not have economic power to afford it. Some teachers said that only year 11 and 12 students were given the opportunity to use the technology room. Two teachers were reluctant to use the SNs because of the information, photos security and privacy issues. One teacher said "We should be careful about privacy to avoid the example of the teacher who misplaced her inappropriate photos on facebook and she was dismissed from her job and soon after she committed suicide" and he added that "We can see many bad examples on youtube about student abuse". Another teacher said "Once a student got my photos from facebook and changed it for having fun and they abused our facebook friendship, so I am afraid to use SNs after this experience". South school teachers claimed that students created fake accounts, used bad words, had concentration problems and some got addicted using SNs without control. Additionally they said that students relied too much on internet, they did not pay attention to the lesson. Some teachers said that although they could share power point and youtube links with students, if parents do not give permission to their children to access internet it will bring difficulties for using SNs and students would not feel good. Some parents were against social networking but if SNs was used as compulsory parents would be able to follow the school's decision. One teacher said there are many scandals because people share inappropriate pictures at facebook.

The Perception On SNs and F2F In Education

North school teachers said that "F2F is the most important way of teaching but we need to use blended education. We feel, we touch, we understand students' problems and emotions with F2f, but with SNs we just have a screen in front of us and we don't know if s/he plays games". Some teachers said that SNs provided them opportunity to connect with other teachers, labs, different fields and countries and share their knowledge and experiences throughout the world and carry out F2F education to a better level. Most said that F2f has social importance and improves students' social capability. SNs are not being used during the lessons efficiently. South school teachers said that traditional F2F method was the best way for improvement. One teacher said that each one of the teaching methods provided different relationship between teachers and students and combination of F2f and SNs would be the most appropriate system to be used.

Conclusions

SNs are not commonly used both in North or South schools. However SNs are used by some teachers for individual purposes in North. In South there is an official policy to use SNs in schools. Either way there is limited infrastructure and limited use of SNs out of lesson due to parents' negative perception that cannot afford internet expenses. It was very interesting to see that both school ICT teachers did not believe SNs were useful for education and South schools' language teachers did not like to use SNs at all. In both sides some students did not have self-confidence to communicate F2F to use SNs and vice versa. North and south school teachers find SNs useful only if combined with F2F education and feared to use facebook.

Teachers of both schools used SNs as a guide for undergraduate education information overseas for year 12 students. SNs were useful to communicate with their students, to draw attention to their lessons, to visual science experiments, to wish them good luck for the exams. The use of SNs was obligatory at the South school, for teachers to communicate and inform their students about homework, exams and activities and also for posting materials. Both school teachers under 30 years of age were more familiar with technology compared to the teachers over 30, although there are exemptions.

Both school teachers had common beliefs that F2F education was the best traditional teaching way with using five senses but when there is a screen between the students and the teachers when using the SNs in education teachers could not know if the students played games or did other activities while online. Both the North and the South school teachers had common beliefs that blended education to carry F2F education to higher level although SNs were not used in education. SNs provide both one-to-one and one-to-many communication between students and teachers for both sides. Students who have not enough confidence to participate to the lessons, they feel more comfortable to participate through SNs.

SNs are useful for language, science and theoretical lessons but not for mathematics or computer studies according to both school teachers. North school teachers insisted that SNs were useful for all kinds of lessons. However in the South there was a contradiction. There was not a policy or criteria for using SNs for North and South school teachers. However, South school teachers insisted on security, privacy, formal communication, sharing appropriate photos, and efficiency and productivity of SNs in education.

There were general worries in North and South schools' teachers for security and privacy problems but there is a demand to have updated computer knowledge use of internet facilities for teachers and students in both sides. There was concern for the loss of students' concentration and time and parents' negative perceptions to SNs and internets in general.

North school did not use SNs for the communication with parents and the South school had school policy to use facebook for the communication with parents. SNs would be a real time saver if used in education appropriately to provide unlimited sources and materials for teachers and students in North. SNs improved and enriched teachers and students' perspectives in the North school teachers. SNs could be the best way to extend education time and also to remind students of their homework in North.

Discussions

There are parallel findings between the research of Gülbahar & Kalelioğlu (2010) and this research and that the social networks provide a wide range of opportunities for educational activities.

Buzzetto-More's (2012) research is parallel to this research that educators are increasingly adopting the use of social networks to supplement teaching and learning online as well as traditional classroom learning.

Zaidieh's (2012) research has common findings that SNs have effect on health of individuals due to spending a lot of time with social networks but at the same time SNs provides flexible learning, expands choices as what, when, where and how people will learn.

Flad's (2010) research has common arguments with this research that there are possible risks of adolescent social networking. It is important to point out the benefits of these websites to promote education, to keep students updated with assignments, to offer help to those in need, provide an outlet for teens to express.

Kert & Kert's (2010) research have similar findings with this research that online social network environments are effective sites which can be used as constructivist and social cognitivist learning sites based on individual orientation, interaction with environmental factors and self-control in online interaction.

The research of Dwyer, Hiltz and Passerini (2007) and this research have common findings that trust is not a necessary factor in the building of new relationships on SNs, yet trust is very important for face to face relationship.

The research of Zaidieh (2012) shows similar to this research results that there are many challenges facing the use of social networking in education such as privacy, real friendship, taking up time, flexibility, repeatability, convenience and accessibility and miscommunication.

Ministry of Education policy should be effective in application of face to face education and teachers should have training on SNs safety and security in order to have competency and comfort in using SNs. ICT teachers could be a very important link between teachers and students and the safety of use of SNs in education.

Computer aided education

Can Cemal Cingi [33]

Instructor, Anadolu University, Eskisehir, 26470, Turkey

Abstract

While all sort of written information were widely used in education, studies showed that visual perception is very important in learning. For this purpose new teaching strategies were developed using computer. The aim of this paper was to emphasize roles of computer in education and to make a comparison of computer aided education vs. traditional education. Computer aided education (CAE) system is a key to improve the effectiveness and the quality of education system. Computer education forms a part of the school and college curricula, as it is important for every individual today.

Keywords: Computer Aided Education; Computer Aided Education's Advantages; Computer Aided Education's Materials; Comparison between Computer Aided Education and Traditional Education; Education

Introduction

Computer aided education eases the process of learning. Life without computers would seem almost unimaginable for many individual using computers daily.

Computer aided education (CAE) is not a new fact. In the early 1960s, Stanford University psychology professors Patrick Suppes and Richard C. Atkinson experimented with using computers to teach math and reading to young children in elementary schools in East Palo Alto, California. Stanford's Education Program for Gifted Youth is descended from those early experiments. In 1963, Bernard Luskin installed the first computer in a community college for instruction, working with Stanford and others, developed computer-assisted instruction (Wikipedia). Usage of computer in data communication has commenced in 15th Century. Most of the individuals in 15th Century were extremely ignorant.

Computer aided education eases the process of learning. A life without computers would seem almost unimaginable for many individual using computers daily. Traditional teaching methods and course contents have all been affected by the introduction of computer technology.

Therefore, one case study quoted for showing importance of computer-aided education. Ath. Kehagias and Pan. Vlachos has a research called Melon project for Melon foundation grant to their project, which is fulfilled in The American College of Thessaloniki. They choose American College students for their diverse educational backgrounds. They wanted to design courses, which will teach to the students basic mathematical knowledge

E-mail address: ccc@anadolu.edu.tr

(necessary for follow-up courses); and , They want to relevance them to mathematics. And They though thing to keep a fine balance between showing more technical (in which case students will be alienated) and too simple (in which case students will lose interests in the course). Then they organized a course which they can use computer in class. by They using some software packages such as Microsoft Excel and Mathcad. At the end of the course they had also found that it computers did play a positive role, in "sweetening mathematics"; and. And they have found that CAE students were better at it than traditional ones (Kehagias&Vlachos, 1999).

In this paper, types of computer aided education were mentioned such as autonomy, model creation, demonstration, game model, storytelling model, virtual reality, animation, e-books, user created content and distance education. Designing materials for creating computer aided education; text, color, illustrations, sound, video, and characteristic of the learner were also explained. Advantages of computer-aided education (CAE) and comparison for CAE and traditional education were also discussed.

2. Types of Computer Aided Education

Traditional teaching methods and course contents have all been affected by the introduction of computer technology. Education is the main step of all disciplines and should be carried out seriously. In our competing world every individual should learn more and fast in order to take a front row in this competition.

Education is defined as the process of forming an individual identity, becoming sociable and gaining economic effectiveness. It is also the process of constructing the balance between human and the environment by interaction, which has many aspects (Aydın&Sütçü, 1999).

Education is a fundamental part of differentiating from a simple living creature to a thinking human being taking part in social, economic and industrial world. In this highly competing world it is getting more and more important to learn more and faster.

Education is a complex process in which both human and technical resources should be utilized in a carefully balanced way. Traditional teaching practice, learning methods and course content have all been affected by the introduction of computer technology. The challenge is to develop and use modern learning environments in education while the curriculum of university education is continuously evaluated and modified to both include new ideas, thinking and learning methods, and to eliminate redundant material (Kızıl et al, 2004).

Encyclopaedia of Britannica described the word "Education" as follows, which is very difficult to accept today: "Education is a discipline that is concerned, in this context, mainly with methods of teaching and learning in schools or school like environments as opposed to various informal means of socialization" (Britannica Online Encyclopaedia).

As we know and use distance education by means of computers now, the definition of a highly trusted Encyclopaedia became incorrect. Actually changing time and technologies even made the difference in definitions of Encyclopaedias.

It is very well known that learning gets easier if the information could be given by a combination of different sources at the same time as sound, picture and words. It starts with the alphabet only with letters and letters with pictures. It is obvious that if it is possible to teach letters with motion and sound concomitantly, it will be easier to learn. Beside this teaching advantage it will bring another differentiation, which is willingness to learn. Autonomy may be described as the willingness or self-determination of every individual to study and to learn.

Various techniques were described and analysed in order to improve education methods, because it is almost obligatory to learn more in less time in this competing world. This is the aim of many research groups to provide a teaching method for faster learning and better understanding.

Traditional teaching methods and course contents have all been affected by the introduction of computer technology. Education is the main step of all disciplines and should be carried out seriously. In our competing world every individual should learn being quickly in order to take a front row in this competition.

It is very well known that learning gets easier if the information could be given by a combination of different sources at the same time as sound, picture and words. It starts with the alphabet only with letters and letters with pictures. It is obvious that if it is possible to teach letters with motion and sound concomitantly, it will be easier to learn. Beside this teaching advantage it will bring another differentiation that is willingness to learn. Autonomy may be described as the willingness or self-determination of every individual to study and to learn.

Regardless which theory we believe, computer aided education is of importance for sure. Different application areas of computers are examined and evaluated according to the changing needs and improving technology. New devices and methods have been developed besides autonomy, model creation, demonstration, game model, storytelling model, virtual reality, animation, e-books, user created content, distance education and online education and for sure they will be more development in near future.

3. Designing Computer Based Education Materials

Computers have a wide range of education materials contrary to traditional tools. Text is still the most important tool to transfer information. But there are many different additives to text in computers such as colour, graphics, sound, animation, third dimension and interactive sections.

Moreover, in preparation of the computer-based learning materials the characteristic of the learner has great importance. Different learners will respond to stimuli in a range of ways so it is important to be aware of the characteristics of the group you are designing for. You can't design same material to adult and child.

Alan Clarke summarized these factors in details. The factors, which may influence the learners' response, include age, computer literacy, previous experience of computer-based learning, gender, educational experience, learning skills, physical characteristics, reading age, knowledge of the subject and first language (Clarke, 2001).

The best way to transfer knowledge is text. Although computers have various possibilities, text is the most condensed way of giving theoretical information. Computers have many advantages when preparing reader friendly text pieces and when reading pre-prepared texts. Arrangements of paragraphs, headings and subheadings are important parts of text preparation.

Selection of fonts is a very important subject. The font of a storybook that is prepared for elementary school children should be different than a postgraduate master degree paper. A scientific paper should also have different letters than a joke book.

Moreover colours are very important in our daily life, psychology and mood. Actually the human eye can recognize millions of colours. So colours may be used to draw attention to important points. Setting the same colour for related topics may also be helpful.

Colour is a powerful motivating force. People will often judge coloured products as having a higher value and quality than the equivalent monochrome products. It is an important way of gaining learners' attention, reinforcing key points and segregating information (Clarke, 2001).

4. Advantages of Computer Aided Education

The advantages of computer-aided education can be overviewed in various topics. But for me the most important ones are correction and update possibility of the education materials. Computers in education provide us quick information processing and very importantly the saving of paper.

The roles of computers in education may be summarized as follows.
* The initiation of education may start earlier in preschool children which were not able to write and read yet
* It will be more interesting and attractive to use a colourful software with animations than reading a book especially I children
* Computer education module can help students deeply understand the content with diagrams, pictures and movie clips when needed.
* Softwares are easy to carry, copy and distribute

* Instruction manuel

* Decrease of labour

* Chance of sharing personal experience, ideas and new methods

* Chance of searching in seconds

The uses and advantages for this system are endless. For example, teachers are encouraged to use edutainment computer-based learning for introducing students to new or difficult lectures or concepts. Times, tables or grammar are incorporated into platform games that use positive reinforcement to encourage children to move onto new difficulty levels. Children are able to pick which times, tables or grammatical problems they wish to tackle in the session. This interactive element is essential to ensure children feel they have some control over their education (Roschelle et al., 2005).

5. Comparison of Computer Aided Education vs. Traditional Education

Computer aided education system is a key to improve the effectiveness and the quality of education system. Conventional education system, which is using a book or hardcopy material, can easily make the student to feel bored and complicated to understand what they have learnt in class. The information need to be digging out from the whole bunch of the book out of nowhere and this might consumes a lot of time. Differ from the computer aided education which is much easier to amend and update the material. Besides, Computer aided education system can reduce publishing and distribution costing. Therefore it worthwhile to replace the existing of the conventional education system with computer aided education (Sabariman, 2008).

Another issue is changing time and changing habits. Traditions, fashion and preferences change from generation to generation. While I am very comfortable with computers my parents are using them with minor problems whereas my grandparents have major difficulty in using them.

Computers have revolutionized common man's life and have brought a dramatic change in the life of every human being. Plentiful information is available on the Internet that can be read by means of a computer. Hence one might not want to be deprived of this new world of information. The information is inclusive of all aspects of knowledge. It ranges from preliminary facts in science to philosophy of life. Almost everything that the books once carried is now accessible through a computer. Everything that the textbooks have is now just a click away! (Oak, 2008).

Information can be presented in different forms over a computer. Information can be in the form of an audio recording or a video clip. Computer teaching is thus much more than just making students read from the screen. It is about providing them with a learning system wherein they can view pictures, watch videos and listen to speeches or lectures. It is about making the process of teaching and learning, interesting and interactive.

According to Manali Oak's paper, writes "teachers are irreplaceable", but on the other hand life conditions necessitated teaching with computers which may be accepted as virtual teachers. Another extension of this situation is distant education. Distance education may be accepted as third revolution in education. It is obvious that it is the last stage of computer aided education (Oak, 2008).

Ath. Kehagias and Pan. Vlachos has a research related with this subject, which is fulfilled in The American College of Thessaloniki. They choose American College students for their diverse educational backgrounds. They want to design courses, which will teach to the student's basic mathematical knowledge. They want to relevance them to mathematics. And they think to keep a fine balance between showing more technical (in which case students will be alienated) and too simple (in which case students will lose interests in the course). The problem is worsen because in some of our classes we teach concurrently two groups of students: the first group will major in the Liberal Arts and the second in Business Administration.

To fix the above problems, they have found it necessary to continuously engage in curriculum reform. They have been especially interested in computer aided education (CAE) to increase both the learning material and teaching process. They have experienced with software packages such as Microsoft Excel, Mathcad and Scientific Notebook as well as with HTML-based hypertexts for three years.

Their efforts for emphasized conceptual understanding, through the use of graphical and numerical approaches. In particular, in the Calculus course they have used numerical and graphing experiments (in Excel and in Mathcad). They have also experimented with various teaching strategies: we have taught traditional, classroom-based courses, as well as courses almost exclusively taught in the computer lab; they have used collaborative assignments and individual take-home projects.

They have also noticed that students are eager to participate in classroom activities in computer-intensive classes. On the other hand, they have found that when teaching a computer-intensive class the students may become quite proficient in the use of computers and mathematical software, without grasping the mathematical concepts in which are ultimately interested.

Their main goal during this phase was to familiarize us with the symbolic math software Mathcad and with teaching computer lab-based courses. They chose Mathcad because of its combination of symbolic math operations with "live" computation (i.e. changes made at some part of a document result in immediate update of the whole document). They found this feature very useful both for demonstration by the instructor and for experimentation by the students.

According to their work's results, it appears that CAE did not make a difference as far as concepts understanding

is concerned. More specifically, CAE students were better at conceptual understanding both at the beginning and at the end of the course; but, on the average, they improved at the same rate as traditional students. However, CAE did make a difference regarding general mathematical performance both in absolute and differential terms. CAE also made a difference regarding the attitude of the students to the course (i.e. students liked the CAE course better than the traditional one). Statistics and numbers do not tell the whole story. So it is useful to briefly relate our informal experiences. They definitely felt throughout the course that CAE students were more active and interested than the traditional ones.

They also find it computers did play a positive role, in "sweetening mathematics". They have found that, the CAE classes developed so much momentum, it is particularly important to plan class activities and teaching strategies very carefully so that the learning process does not degenerate into an exercise of computer gaming. Also, they think that some lecturing is still necessary, even in the CAE course; they do not want to revert to 100% lab course because if they revert.

Regarding mathematical performance, they did feel that on the average CAE students were better and remained so at the end of the course. Statistical analysis offers a further significant insight: not only were CAE students better in absolute terms, but they also improved more than traditional students (Kehagias&Vlachos, 1999).

Finally, regarding the understanding of mathematical concepts, they have found that CAE students were better at it than traditional ones. This is substantiated by statistical analysis, which further reveals however, that there was no difference in differential improvement. In other words, statistics suggests (and as of now we have no grounds to dispute this), that CAE students were originally better at conceptual understanding and remained so at the end of the class. A scenario which they found plausible after consideration of the statistical analysis and their subjective experiences is that better students were drawn to the CAE course than to the traditional one. This seems to be supported by the statistically significant difference in GPA between the CAE and traditional students (Kehagias&Vlachos, 1999).

In conclusion, course was a useful improvement over the traditional course and they intend to refine and repeat it. Teaching Mathcad to CAE students created an overhead, which was partly compensated by spending less time in teaching traditional techniques of differentiation and integration.

6. Conclusion

Computer aided education eases the process of learning. A life without computers would seem almost unimaginable for many individual using computers daily.

Internet, which is the source of all kind of information, can play an important role in education. As it is an

enormous information base, it can serve as a source for a wide variety of subjects. Search engines are very helpful in reaching the target. It is usually possible to reach the headed information when the clues or keywords were obscure. This is another advantage of computers to thick textbooks.

The importance of computers is evident today and having the perfect know-how of computers can only propel one's career in the right direction. Today, computers are a part of almost every industry. They are no more limited to the software industry. They are widely used in networking, information access, data storage and the processing of information. So why not introduce computers early in education? Introducing computers early in education lays the foundation of most of the major competitive careers. Computers play a significant role in one's personal and professional life (Oak, 2008). Computer aided education has the advantage of easy teaching, better learning, free repetition and furthermore all sort of distance education.

In final, I defenced computer aided educations superiority again with supporting a case study. Ath. Kehagias and Pan. Vlachos has a research called Melon project for Melon foundation grant to their project, which is fulfilled in The American College of Thessaloniki. They choose American College students for their diverse educational backgrounds. They want to design courses, which will teach to the students basic mathematical knowledge (necessary for follow-up courses), They want to relevance them to mathematics. And they think to keep a fine balance between showing more technical (in which case students will be alienated) and too simple (in which case students will lose interests in the course). Then they organize a course which they can use computer in class. They used some software packages such as Microsoft Excel and Mathcad. At the end of the course they also find it computers did play a positive role, in "sweetening mathematics". And they have found that computer aided education students were better at it than traditional ones.

Computer animation in teaching surgical procedures

Can Cemal Cingi [34]

Instructor, Anadolu University, Eskisehir, 26470, Turkey

Abstract

Animation is a developing and interesting visual communication instrument. It may have multipurpose functions such as entertainment, advertisement and education. The aim of this paper is to investigate the use of animation in teaching theoretical medical information and especially surgical procedures. Three, animations were planned and created about endonasal surgery focused on procedures which are known as difficult to understand. Then a group of 20 medical students were taught with this animation whereas a second group of 20 students were taught by theoretical information and plain figures. Different evaluation questions were asked in order to clarify the benefit of the animations in learning. Then the second group was taught again by using the animations. It is concluded that animation is a very useful tool to teach difficult procedures in medicine especially in teaching complex topics.

Keywords: Animation; Medical Education; Education Materials; Teaching; Teaching Methods

Introduction

Medicine may be the most interesting and important field of science, but it is extremely difficult to study and learn. Although learning a main concept may be sufficient in other disciplines, medical students must learn many details, must understand all mechanisms, and must study hundreds of pages. They must understand details and attempt to remember them forever.

In addition to texts, pictures and posters are widely used to explain medical information and surgical procedures. However, it is often difficult to verbalize procedures. Instructors must provide theoretical information and then explain the steps of the procedure. Diagrams used for this purpose may be insufficient. Thus, it is important for students to complete internships and residencies to learn the practical details of medicine.

Although many types of written information are widely used in education, studies have shown that visual perception is very important. For this purpose, new teaching strategies have been developed using figures, pictures and videos. Recently, education centers have begun preparing animations for both teaching and practice.

Many studies have examined this topic. Fallman said, "Learning consists of acquisition of information that is provided by the, in this case, virtual environment. Training, on the other hand, involves mainly responses from the user on the environment itself. Training arises from actions carried out by the user on the environment, while learning results from contextual factors" (Fallman, 2008).

Aydın stated, "In medicine, training will improve by operating on virtual argons, and training for pilots will benefit from VR training materials that will enable the user to saw or drill wood and build a project before attempting to use the real equipment" (Aydın, 2005).

Animation is a developing and interesting visual communication instrument. It may have multiple functions, such as entertainment, advertisement and education. For example, animation may be a useful tool to plan a new nose prior to rhinoplasty or to teach surgical maneuvers. The aim of this study is to investigate and quantify the use of animation to teach theoretical medical information, especially surgical procedures. Three animations were planned and created for endonasal surgery. These animations focused on procedures that are known to be difficult to understand.

2. Materials and methods

2.1. Study groups

Our study group consisted of 40 medical students between the ages of 21 and 29. The participants included 20 males and 20 females. They were divided randomly into two groups of 20 participants.

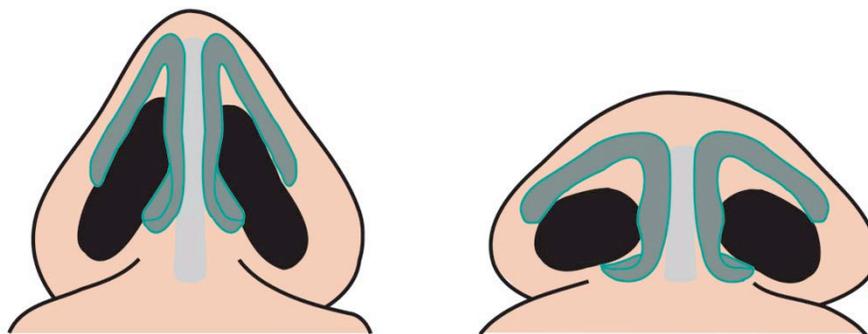
2.2. Educational material

Three tasks were prepared for rhinoplasty maneuvers. The two sets of educational materials included theoretical information with figures and the same information with animations. The steps of the surgical maneuvers were explained in both sets.

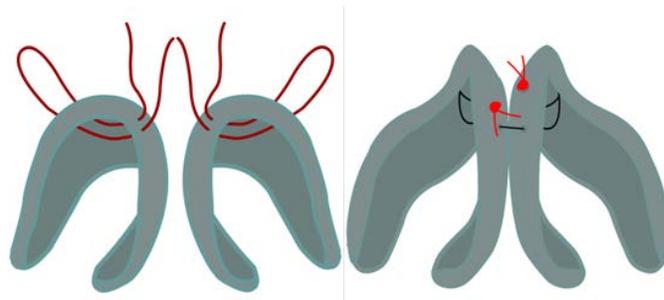
The two groups of subjects were given educational materials including either theoretical information with figures or the same information with animations. Twenty minutes later, each student was asked questions related to the subject. Then, the students were asked to explain the main idea of the educational material.

In a second step, the first group, which received theoretical information with figures, was given the second educational set, consisting of the same information with animations. Then, the students had the opportunity to compare the difference in the two materials. Finally, the students were asked the same set of questions a second time to evaluate the influence of the second set of educational material.

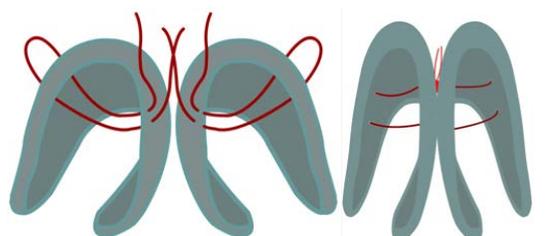
Task I: Alar cartilages are very important in the constitution of the nose. They may vary in shape and hardness, and they provide the projection of the nose. The nasal septum is an important support for the nose projection. The

aim of this task is to show how septum or columellar grafts affect the projection of the nose and to focus on the influence of projection on the shape and position of the nostrils.


3. Fig. 1. (a) The relationship between the shape of the alar cartilages and the nostrils;
(b) The relationship between the shape of the alar cartilages and the nasal valve angle

Task II: Dome suture is a very important binding to narrow the tip of the nose. It also serves as an important support to provide symmetry for the nose. The level of this suture is an important issue because this level affects the tip position. When the dome-binding suture is placed high, the tip becomes sharper, and the rest of the cartilage flares and looks wider at the middle portion.


4. Fig. 2. (a); (b) The narrowing effect of the dome suture

Task III: When the dome-binding suture is placed 3 or 4 mm lower than the highest point of the tip, the tip looks slightly wider but more natural, and the rest of the cartilage becomes closer.


5. Fig. 3. (a); (b) The narrowing effect of the dome suture at a lower localization

2.3. Evaluation Questions:

After the educational period, the subjects were asked to explain the tasks in detail. The study group was asked questions related to the data. A jury was established, and this jury evaluated each subject's knowledge about the tasks that were explained.

The topics were as follows:
1. The shape and the position of the alar cartilages
2. The correlation between the position of the alar cartilages and the nostrils
3. The effects of the alar cartilages on nose projection
4. The correlation between dome binding sutures and the width of the tip
5. The correlation between dome binding sutures and alar flaring
6. Where to put the suture to prevent a pinched nose
7. Where to put the suture to narrow the nostrils.

2.4. Self-Evaluation of the Subjects:

Each subject evaluated the educational material on a scale of 0 to 10, with 0 indicating the worst and 10 indicating the best.

3. RESULTS

The age and sex distribution of the study groups and the evaluation of the students and the jury are shown in tables 1 and 2.

Table 1. Age, sex distribution and evaluation grades of study group I

No	Age	Sex	Evaluation by students after instruction with theoretical information + figures	Evaluation by jury after instruction with theoretical information + figures	Evaluation by students after instruction with animations
1	22	f	4	4	9
2	22	m	5	5	9
3	21	m	5	4	10
4	21	f	6	5	8
5	21	f	4	6	8
6	21	f	5	4	8
7	21	f	6	6	9
8	21	m	5	5	9
9	21	f	6	6	10
10	21	f	3	5	8
11	21	m	7	5	10
12	21	m	3	5	8
13	21	m	4	5	8

14	21	m	4	6	9
15	21	f	5	6	9
16	21	f	5	4	9
17	21	f	6	7	10
18	21	f	4	5	9
19	26	f	5	5	10
20	28	f	6	8	9

6.

Table 2. Age, sex distribution and evaluation grades of study group II

No	Age	Sex	Evaluation by students after instruction with animations	Evaluation by the jury after instruction with animations
1	21	f	6	9
2	21	m	7	8
3	21	f	9	7
4	21	m	10	8
5	21	m	7	9
6	22	f	7	9
7	22	m	8	9
8	25	m	9	8
9	25	f	9	8
10	26	f	10	8
11	26	m	7	9
12	28	m	6	9
13	28	f	6	8
14	27	f	9	7
15	28	m	9	8
16	28	m	10	8
17	25	m	7	7
18	29	m	6	9
19	21	m	9	9
20	21	m	10	8

The grades of the second group are much higher than the grades of the first group. The second group of subjects, who were given information with animations, showed a better learning curve then the first group. They explained the main idea of the education much better than the first group. The difference is statistically significant ($p<0.001$) for the evaluations of the students and the jury.

The first group, which received the theoretical information with figures, was given the second educational set, consisting of the same information with animations. Then, this group had the opportunity to compare the difference between the two materials. The fifth and seventh columns of the first group show their comparison, which is statistically significant ($p<0.001$). All of the students concluded that animation is a useful educational material.These data were not available for the second group because they were initially educated with the theoretical

information supported with animations. Therefore, they could not compare both methods. However, their higher grades may be considered proof of the benefit of animations for education.

4. DISCUSSION

It is well known that education is the first level of influence in all disciplines. Medical education is particularly important because the subject of this study involves human life. Thus, before beginning to work on the human body, one must learn as much as possible. We suggest that theories of cognitive development and education may support the importance of animations and virtual reality (VR) in medical education and training. VR provides an exciting educational medium to explore information and to explore oneself. VR provides a training environment that is rich and responsive and that permits the direct evaluation of educational theory. The central educational issue for VR involves the transfer of experience (Bricken, 1990). Increasing numbers of researchers and educational practitioners believe that VR technology offers significant benefits to support education and training. For some of these researchers, VR's ability to facilitate constructivist-learning activities is a key issue (Bricken, 1990). Turkish noses often have humps so many people in Turkey seek rhinoplasty. Due to the unique nasal structure in Turkey and other Mediterranean countries, rhinoplasty is a very common procedure that should be mastered by all ear, nose and throat surgeons.

In practical practice, issue it is obvious clear that it is easier to that we all can learn easier by watching a procedure than by reading that about it. we see rather than that we read. But of course, in both we need theoretical knowledge is needed prior this step. I agree with Brick (Bricken, 1990) in that the idea that "animations and VR technology offers strong benefits to support education and training". Many authors have stated similar ideas on this same topic (Bell&Fogler, 1905;Alexiou et al., 2004).

Practical experience is an important component of the educational process. However, the time and economic resources required for to establish scientific laboratories is outside the scope of many institutions. A solution to this problem may be found in the adoption of virtual laboratories, which can be an important educational tool to address the lack of practical experience in education (Bell&Fogler, 1905).

I agree with the author that practical experience is an important component of the educational process. However, it is extremely difficult and dangerous to teach surgical procedures practically. Thus, before students begin surgical interventions, it is important to fully teach the procedures. Animation can be a helpful tool for this purpose. Other surgical interventions have been taught by animations in recent years (Ullrich et al.,2009; Henderson&Ali, 2007), and new studies will be published on this topic in the near future.

Animations and virtual reality are more efficient that training on real patients. These methods eliminate the risk that students will harm patients while attempting to learn new skills. They also eliminate the time restraints of

waiting for specific types of cases and allow the trainees to practice independently. Furthermore, using virtual patients for training is less expensive and less offensive than training on animal models.

5. CONCLUSION

The importance of education is clear in all disciplines. Education in medicine has particular importance because the material involved in this subject is human life. Thus, before beginning work on the human body, medical students must learn as much as possible.

Teaching materials are useful in all scientific fields, but they are especially important in medicine. It is extremely difficult and dangerous to teach surgical procedures in practice. Therefore, before students begin surgical interventions, it is important that they are completely familiar with the procedures. A theoretical education is usually not sufficient for complete comprehension. Visual devices such as diagrams, drawings, and pictures can be utilized for this purpose.

Animations of anatomical structures and surgical procedures are helpful educational materials. When we compared the efficacy of various education materials, we observed that animation was an effective teaching tool.

Further studies should be performed to improve this type of educational material. Cooperation among various disciplines, such as medical doctors and visual art creators, is particularly needed.

Computer Based Courseware in Learning Mathematics: Potentials and Constrains

Ong Boon Han[1], Noor Dayana Binti Abd Halim[2], Rio Surmani Binti Shariffuddin[3], Zaleha Binti Abdullah[4,35]

[a] Ong Boon Han, University Teknologi Malaysia, [b] Noor Dayana Binti Abd Halim, University Teknologi Malaysia, [c] Rio Surmani Binti Shariffuddin, University Teknologi Malaysia,[d] Zaleha Binti Abdullah, University Teknologi Malaysia

Abstract

Computer Based Learning (CBL) in teaching and learning process is becoming a phenomenon in the educational field. CBL serves to establish more effective learning situations than traditional teaching methods. However, research studies show that most teachers do not make use of CBL to contribute and further improve the quality of learning environments. This paper discusses the potential of CBL and its' constrain regarding this issue which is focusing on the barriers of integrating the technology in the teaching and learning process among the Malaysian teachers and also in learning Mathematics.

Keywords- Computer Based Learning; technology; Mathematics.

Introduction

In general, Mathematics is a compulsory subject for all the primary and secondary school students in Malaysia. Nowadays, educators take opportunities to harness the power of computer technology in helping students to learn Mathematics. Using computers to help students to learn Mathematics through the use of courseware is becoming common in Malaysia. There is much educational software available for teacher to use in teaching and learning. Some of them are even free in terms of money and downloadable through the Internet known as freeware (Teoh, 2009). CBL in Malaysia has emerged as an instructional technology with the potential to overcome the limitations of traditional media in supporting the prospect to provide learning environments with strong visual elements (Nordilah, 2010). Nevertheless, it is not to replace traditional educational methods which are usually carried out by chalk and talk (Nordin and Fatimah, 2011).

Eventhough CBL is being implementing, teachers still remain central to the teaching and learning process (Martin, Khaemba and Chris, 2011). Computer is just an additional aided learning tool for teacher in some areas that require more attention. The educational software in the market is an alternative method to assist teacher in teaching, apart from the traditional way of teaching (Noordin and Fatimah, 2011). Therefore, CBL become most exciting innovation in the educational technology. CBL is a set of programming instructions which is used in instructional process to develop certain predefined skills for the students' mastery over the subject content. It generally refers to a specific programmed which is designed to teach (Vansia, 2012).

Computer Based Learning in Malaysia

Computer based learning refers to the use of the computer as a tool for facilitating and improving instruction. CBL programs use tutorials, drill and practice, simulation and problem solving approaches to present topics and to test the student's understanding. CBL uses a combination of multimedia element which is combination of text, graphics, sound and video in the learning process. It is especially useful in distance learning situation. It is also integrated the use of Internet or intranet in the process of teaching and learning. According to Lee (2012), CBL improves students' attitudes, motivation and academic achievement.

The history of CBL in Malaysia starts from the year of 1999. In 1999, Smart School was commenced. It is a learning institution that has been systemically reinvented in terms of teaching and learning practices and school management in order to prepare children for the information age. Most of the teaching and learning practices in Smart School have been carried out through ICT initiatives. The Smart School solution package includes ICT-enabled learning courseware for Bahasa Malaysia, English, Sciences and Mathematics. Presently, the whole courseware package has been distributed to all Smart Schools in Malaysia. It was aimed to produce analytical and creative students with widespread use of computers in school. Its concept was to develop thinking students with information technology tools playing an important role in the teaching and learning process (MSC, 2007).

In 2003, courseware became one of the support tools in the *"Implementation of Teaching Science and Mathematics in English"* program which known as PPSMI. PPSMI is an initiative to teach Science and Mathematics subjects in English rather than Bahasa Malaysia. The purpose of this initiative is to allow students to be better connected to the rest of the world, as English is a universal language. It will allow students to move seamlessly shift from their primary and secondary education into international tertiary institutions. In 2009, Education Minister announced the abolishment of PPSMI. According to the Deputy Prime Minister Tan Sri Muhyiddin Yassin, PPSMI will be abolished in 2012 after discovering that the policy failed to achieve the objective of improving students' proficiency in English while it (policy) has also affected the performance of students, especially in the rural areas.

Potential of CBL in Learning Mathematics

There are recent studies reveal that CBL serves to establish more effective learning situations than traditional teaching methods which involve teacher presentation, question and answer techniques, and discussions (Ragasa, 2008). The use of computer in conjunction with effective teaching strategies has great potential in the teaching and learning process (Hoon, Chong and Azilah, 2010). According to Lee (2010), the courseware constructed in her research showed positive effect on students. She claims that CBL improves students' attitudes, motivation and academic achievement. In addition, the research conducted by Janier, Afza and Wan Fatimah (2008) is also receives a positive feedback too.

The reason for this is that the CBL enables the students to progress at their own pace and provides them with appropriate alternative ways of learning by individualizing the learning process (Hoon, Chong and Azilah, 2010; Ong and Ruthven, 2010; Mudiana, *et* al., 2011). Moreover, Vansia (2012) stated that CBL has ability to provide quantifiable and instantaneous feedback for its users. Besides, CBL motivates students to learn better by providing them with the immediate feedback and reinforcement and by creating an exciting and interesting atmosphere (Sharina, Fatimah and Mazyrah, 2010).

There a lot of research been conducted to prove the positive effect of CBL in learning mathematics. Research conducted by Liao (2007) proved that CBL had a positive effect on individuals by comparing 52 research studies carried out in Taiwan in his meta-analysis study. In 2009, Mahmud, Arif and Lim (2009) created a courseware called 'G-Reflect'. The focus of their study was to develop and evaluate a courseware, 'G-Reflect' on students' achievement and motivation in learning Mathematics. The courseware was developed using Geometer's Sketchpad (GSP) software. The research indicated that students were motivated in learning mathematics and performed better than students taught in the conventional method. He further suggested the mathematics' topics that suitable to use the GSP software in teaching and learning activities in the secondary school Mathematics syllabus such as Translation, Rotation, Dilation, Polygons, Perimeter and Area, Coordinates, Graphs of Function, Circle, Trigonometry and Linear Equations.

In the same year, Teoh and his colleagues (2009) study the cognitive effects, in terms of the gain scores and time-on-task of a computer courseware by using mastery learning and collaborative strategies. A total of 262 Form Four students interact with two Matrices courseware. The students were randomly selected from four suburban secondary schools. For each school, three classes were chosen randomly. They are randomly assigned to the Computer-assisted Cooperative Learning (CCL) treatment, Computer-assisted Mastery Learning (CML) treatment, and Computer-assisted Cooperative Mastery Learning (CCML) treatment. All students had not been exposed to the topic of Matrices. The whole lesson on Matrices took four to six hours to finish. Students took a test after each subtopic. Students in CML complete all formative tests or quizzes independently. If CML students fail, they would

receive supplementary instruction and corrective activities immediately until the requirement is met. Students in CCL and CCML groups undergo all designated cooperative learning activities. CCL students received no corrective activities but if CCML students fail, they will receive supplementary instruction and correction activities immediately after each question until the requirement is met. Each student in CCML must wait until all members in the group have achieved the level of 80%. The achieved students are encouraged to help the others. This study showed that, CML and CCML are effective learning tools. If the time allocated for the learning process is longer, CCML would be the most ideal strategy otherwise CML is generally preferred in the learning process.

Furthermore, in 2010, S-Reflek courseware was developed by a researcher (Lee, 2010) to enhance the achievement of the higher lever thinking and the motivation in learning Mathematics of the student. S-Reflek was developed by using Geometer's Sketchpad program which allowed students to learn the topic of Reflection, a Mathematics Form 2 subject, using hands on and minds on. The research applied Problem Based Learning (PBL), an active learning's strategy which supports the constructivism theory. Through PBL, students would learn based on problems given and they would solve the problems with the aid of computer software. This would give students the opportunity to explore knowledge in their own pace. A number of 180 respondents were involved in this study. The research showed that PBL with S-Reflek increase the students' level in mastering the topic of reflection and improved their achievement. Students were able to explain in details about the concepts of reflection after the learning process and master higher lever thinking after the learning process. Thus, the learners' motivation level was considered as high motivation. To sum up, the application of PBL strategy with S-Reflek showed positive effect on students.

Next, in 2011 a research carried by Noordin and Fatimah (2011) utilised the Van Hiele's levels for teaching and learning Lines and Planes in 3 Dimensions. Based on an early study, students had been identified of having problems in visualising figures. To overcome this problem, a multimedia courseware was developed based on a framework that utilised Van Hiele's Geometric model for visualizing 3D models. A testing was conducted with 60 high school students aged 14-year old to measure the courseware's effectiveness as an aid for visualising 3D models. The results showed that the students had demonstrated the ability to visualise and enhance their understanding on the topic after learned using the courseware.

In the same year, the research of Zuraini and Fatimah (2010) evaluated on the effectiveness and usability of a 'Li2D' courseware. The interactive learning environment provided by 'Li2D' enabled students to visualize the movement of the locus and steps in constructing the locus. A total of 63 Form Two students were involved in the study. The students were divided into two groups which are control and experimental. The experimental group had to interact with 'Li2D' courseware as part of the learning activities while the control group used the conventional learning methods. Usability evaluation was accomplished based on four constructs of usability, which were efficiency, learn ability, screen design and satisfaction. The research also conducts an evaluation on the multimedia elements. The results showed that the experimental group performed better than the control group in understanding the Loci in the topic of Two Dimensions. In a nut shell, from several recent studies above proved that the use of computer in conjunction with effective teaching strategies has great potential in the teaching and learning process.

Constrain in applying CBL in Mathematics

Integrating technology in teaching has been a challenge to teachers since they need to make effective use of it in order to develop student's independent learning skills and enhance students' learning. It also influences the way mathematics is taught and learn. In addition to that, it provides the way for developing independent learning skills and an alternative for learning. For instance, to solve a problem in mathematics, students need to explore ideas, see the relationship between concepts and finding a solution to a problem. With the advancement of multimedia technology, the problems can be solved (Lee and Kim, 2012; Zuraini and Fatimah, 2010). However, research studies show that most teachers do not make use of the potential of ICT to contribute to the quality of learning environments, although they value this potential quite significantly (Smeets, 2005).

The Malaysian government believes that using courseware can increase student engagement and motivation, providing students with a greater level of individualised instruction (Barrow, Debraggio and Rouse, 2008; Chong, Horani and Daniel, 2005). The Ministry's Technology Education division had prepared Smart School courseware for self-directed learning, individually-paced, continuous and reflective. Students thought that Smart School

courseware was attractive, highly interactive, and usable and it has a potential to replace the conventional teaching and learning materials but the surrogate user especially the teachers had thought otherwise (Jaafa, 2008). Therefore, in order to achieve better result, some courseware need for improvement and development for future utilisation (Murni, 2006). In addition, it was found that only 12% of the 609 students claimed to have frequent use of Smart School courseware in school (Jaafa, 2008). According to the research conducted by Lee (2010), the findings revealed the need for improvement in mathematics courseware for future utilisation as individual differs in traits such as skills, aptitudes and preferences for processing information and applying in real world situations.

There are lots of barriers for teachers to integrate ICT in teaching. To begin with, the findings from Goktas, Yildirim, and Yildirim (2009) indicate that a majority of teachers believe that the main barriers for integrating ICT are lack of in service training, lack of appropriate software and materials, and lack of hardware. Furthermore, teachers are lack of access to computers and negative attitudes toward the integration of technology in teaching (Chong, Horani and Daniel). Some of them fear of change (Mishra and Koehler, 2006). In fact, many teachers still fear using ICTs, and thus they are reluctant to integrate them in their teaching (Martin, Khaemba and Chris, 2011). They have contributed to the limited impact of computer-based learning tools (Kay and Lauricella, 2011).

According to the report of "Integrating ICT-Based Content in Teaching and Learning Mathematics", MSC Malaysia (2007) believes that there is not enough time and that there is too much content to cover for examination require consideration on what really matters in teaching. It is also supported by Kay (2011) and Goktas, Yildirim and Yildirim (2009) that time constraints is one of the factors teachers are unwilling to integrate ICT in teaching. Beside, studies and observations in schools provide consistent evidence that teachers show minimal or inappropriate use of ICT applications in mathematics teaching and learning at all levels (MSC, 2007). Only a few teachers are confident in using a wide range of ICT resources. Then, the limited confidence affects the way the lesson is conducted (Martin, Khaemba and Chris, 2011).

Moreover, according to Lee (2010), many instructors claim that the courseware is ineffective for certain students. The researcher claims that courseware has some strong factors that may de-motivate the learners (Lee and Kim, 2012). Some of the factors are unattractive presentation, boring style of writing, undefined/ambiguous learning objectives, irrelevant content, content that is too simple or too complex and too much to grasp in one go (Lee and Kim, 2012). The next barrier is the interface designs that fail to support learning and also presents unattractive presentation (Norfadilah, 2010). According to Norfadilah (2010), interface design for existing courseware should be improved to support the quality of learning experiences. It includes the level of interactivity and the availability of the interfaces to interact with the users. As suggested by Samah et al. (2011), the interactivity function should be considered by instructional designers in order to develop learning materials. So that external conditions of learning such as feedback and attentions devices will be meet the students' need. Besides that, the lack of knowledge about the role of interface design by the designers in the development process is also the reasons that most acknowledged (Norfadilah, 2010).

Yet, sometimes the problem is the way the courseware is used as a tool for teaching and learning (Bortolossi, 2012). The way CBL is applied in teaching and learning can affect its effectiveness. Therefore, new studies are needed to clarify the effect of CBL in contemporary students' environment (Hassan, 2008). Besides, it is needed to study the courseware whether it meets the requirements before it is being used (Mutalib, 2008). In fact, CBL allows the educators to expand their repertoire of methods, tools and strategies beyond those that are frequently used in the classrooms. So, in relation with that, the courseware needs to be tested (Mudiana, et al, 2011).

Conclusion

From the discussion above, it is shows that computer technology and developed courseware give significant effects on students' learning especially in Mathematics. However, there are many problem faces from many aspects such as from teachers, from the courseware itself and so on. Thus the question of what are the effective criteria for computer based mathematics learning courseware remain unanswered. However, The Ministry's Technology Education division had prepared courseware using the Smart Schools budget of RM53 million (Chong, Horani and Daniel, 2005). Since the Malaysian government has contributed lots of money and afford in integrating ICT in education, the question is worth answering. So, to better understanding what are the main construct of the aspects to be concerned to design and develop the mathematics learning courseware need to be investigated. When the effective

criteria have been identified, it is hope that the learning courseware will be designed and developed that best fit the needs of all parties and furthermore can be used as a tool for teachers in order to teach mathematics in school.

13th International Educational Technology Conference

Constructing a comic to communicate scientific information about sustainable development and natural resources in mexico

AQUILES NEGRETE[36]

Universidad Nacional Autónoma de México (UNAM)
Centro de Investigaciones Interdisciplinarias en Ciencias y Humanidades (CEIICH)

Abstract

Nowadays sustainable development is a subject of particular relevance due to the Earth's environmental crisis, for which humankind is to a large degree, responsible. A possible way of addressing sustainable development is science education and communication. In principle, a society that is aware of environmental problems will be more participative than an uninformed one, and more committed and efficient when putting in practice measures to mitigate the environmental crisis. Sustainable development is a matter that concerns the Mexican public in terms of biodiversity and ecosystems conservation which in turn is relevant both to the country and to the entire planet.

The importance of communicating science by means of narrative forms has been suggested by several authors (McKnight, 2010; King, 2007; Schank et al, 2002; Korkmaz, 2011; Frisch, 2010; Lanza and Negrete, 2007; Negrete and Lartigue, 2004). In this research I propose that comics represent an opportunity to communicate scientific information to low literacy communities and I also present an example of the use of comics in communicating information about the sustainable use of the Mayan Nut in rural areas in Mexico.

Introduction

In general, one of the greatest problems faced by governments in developing countries is letting the general public know about the programs and services that they develop. Creating a new policy is not enough if the policy stays at the desk where it was developed or if the information is conveyed to the public through conferences and leaflets that use technical and scientific jargon with which the public is not familiar. Consequently, it is of paramount importance that besides defining and implementing public policies, governments communicate the scientific knowledge emerging from research to the population that will benefit from it. To do so, it is important to use the appropriate channels of communication. In order to present knowledge to the public it is fundamental to use every day language, focusing on people´s daily lives and using elements with which they are familiar, to enable them to construct meaning and promote long term memory for the knowledge in question.

In the particular case of Mexico, it is essential to appreciate that the general public has a relatively high level of illiteracy and little interest in reading. The Mexico´s population is approximately 100 million (INEGI, 2005) of which; the majority has less than eight grades of basic education (Op. cit.). Out of each 100 inhabitants of more than 15 years of age, 11 females and 7 males are illiterate. UNESCO recommends the reading of 4 books a year per individual in order to guarantee an appropriate national level of culture and social development. But in Mexico the per capita reading mean is only 0.2 books per year (Marcín, 2005).

Although the Mexican mean reading level is low, given the total population of the country, the total number of readers is still considerable. What the majority of the public reads is light or "junk" literature (Malvido, 1993). Evidence of this is the large circulation of magazines with themes encompassing gossip of show-business people, fashion, and comics with tasteless themes (sex, gossip, sensationalist stories, etc).

Currently, the comic is one of the most preferred communication media and provides the principal reading access for millions of Mexicans (CANIEM). In 2002, comics represented 33.5% of all the total number of publications in the country (López, 2003). "*Libro Semanal*" (Weekly book) and "*Libro Vaquero*" (Cowboy Book), are two of the most widely read comics in Mexico. More than half a million copies of each are sold each week and, on average, each copy is read by five individuals. Thus, five million readers are reached by these publications per week. The two comics combined, sell more than 40 million copies per year (López, 2003), placing them among the country`s five weekly magazines with the highest circulation (Gutierrez, 2001). The widely accepted status of comics among readers in Mexico makes them a very attractive means to approach the local general public.

México, as well as many other developing countries, needs new ways to communicate sustainability in low literacy situations. The evidence found in literature suggests that comics offer an opportunity to communicate scientific information in a reliable way (Wright, 2001; Weitkamp, 2007; Iacono and de Paula, 2011), to reach audiences with low literacy level in México (CANIEM; López, 2003; Gutierrez, 2001) and they represent a good vehicle to convey environmental issues to low reading capacity audiences (Jansen, 2008).

Comics are an interesting means to convey information as they include narrative as well as pictorial forms of representation. Narratives and images facilitate learning, thanks to the schemas that individuals possess from both languages as well as to the emotional response that visual and literary resources evoke (Greenfield, 2000; Erdelyi and Stein, 1981). Additionally, image and narrative contribute to learning because they act as mnemonic elements that prevail in an individual's long term memory (Mcloud, 1993).

Taking into account the evidence suggesting that comics represent a possible media to communicate scientific information, I planned a study in two parts: (1) developing a comic and (2) testing it for memory and learning.
In developing the comic I found the following problem: how to ensure that purpose-written comics properly follow comic books conventions?

Propp´s narrative model (Propp, 1968) has been suggested as a way to analyze modern narratives (Landau, 1984; Harré *et al.*1999). Propp suggested that fairy tales can be understood by using only four principles: (1) the functions of characters are stable elements in a tale, (2) the functions known in a fairy tale are limited, (3) the sequence of functions is normally the same in every story and (4) fairy tales are of one type with regard to the structure. According to Propp, functions are acts, episodes or entrances of people of various sorts. He further claimed that fairy tales are based on 31 functions (acts or episodes), which are summarised in *Table 1*.

Not every story will include all the functions proposed in the classical work by Propp (1968), but the ones that are incorporated will normally appear in the order in which they are presented in *Table 1*. In Proppian analysis, the functions are played out in seven 'spheres of action': the villain, the provider, the helper, the princess, the king, the dispatcher, the hero and the false hero. Functions and spheres of action constitute an ordered set. Their presence or absence in any particular story allows their plots to be classified. The plots take four forms: development through struggle and victory, development through the accomplishment of a difficult task, development through both of the previous categories and development through neither of them. The important point that Propp is making is that when we work with stories we are dealing with discernible and repeated structures (Hawkes, 1977).

In previous research (Negrete, 2011), I analyzed the Mexican "Libro Vaquero" and "Libro Semanal" comics. From the analysis of the narrative structures of *Libro Vaquero* and *Libro Semanal* it was possible to conclude that the structure of the comics fits remarkably well in the one proposed by Propp. Both comics present a similar structure in terms of dramatic structure, plot, characters, spheres of action and functions. The analysis of narrative structures of these popular Mexican comics suggested that classical simple structures are the most effective way to construct attractive comics for the Mexican general public. The explanation seemed to rely on the fact that people are familiar with classical narratives. That means that schemas to guide the interpretation pre-exist in the individual and foster understanding.

	Function	Description
I	Absentation	Family member absents him/herself
II	Interdiction	An interdiction is made to the hero
III	Violation	Hero violates interdiction. Villain appears
IV	Reconnaissance	Villain or hero attempts reconnaissance
V	Delivery	Information about victims is delivered to victims
VI	Trickery	Villain attempts deception of victim
VII	Complicity	Victims submit to deception
VIII	Villainy	Villain causes harm to family members
IX	Mediation	Misfortune or deficiency is made known
X	Counteraction begins	Hero agrees /decides on counteraction
XI	Departure	Hero leaves home
XII	Donor's first function	Hero is tested
XIII	Hero's reaction	To donor
XIV	Provisional receipt	Of magic agent
XV	Guidance	Spatial transfer of hero is made to vicinity of object of search.
XVI	Struggle	Hero and villain are in direct combat
XVII	Branding	Hero is marked
XVIII	Victory	Villain is defeated
XIX	Liquidation	Initial misfortune or deficiency is made good
XX	Return	Hero returns
XXI	Pursuit	Hero is pursued
XXII	Rescue	Hero is rescued from pursuit
XXIII	Unrecognized arrival of hero	At home or in another place
XXIV	Unfounded claim by false hero	Hero is at home
XXV	Difficult task	Proposed by false hero
XXVI	Solution	Task is achieved

XXVII	Recognition	Hero is recognised, often by special sign
XXVIII	Exposure	False hero is exposed
XXIX	Transfiguration	Hero is given new appearance or possessions
XXX	Punishment	Villain is punished
XXXI	Wedding	Hero marries, ascends throne or is rewarded

Table 1. Fairy tale functions proposed by Propp (1968)

Taking into account the findings on the structure analysis of the Mexican popular comics I developed a comic, using Proppian structure, involving a particular issue of importance in México: The Mayan Nut (*Brosium sp.)*.

Brosium (commonly named as Ramón) is a native tree of the rain forest in Mexico, Central, South America and the Caribbean. It produces an easy to collect and nutritive seed. The *Brosium seed* was used as food in pre-Columbian cultures. Its pulp, seed and seedlings are also very important for the fauna of tropical forest ecosystems in which the tree species live. The *Brosium* represents a food source for many human communities in south eastern Mexico. The seed of this tree is rich in fibre, calcium, potassium, folic acid and vitamin A and B. It represents an important source of proteins, due to the fact that its amino acid composition is very similar to that found in meat. It also has medical properties: it is a source of iron, tryptophan (a natural relaxation agent) and has lactogenic properties (helps women to produce milk during lactation) (Mayan Nut Institute, 2012).

Brosium constitutes a social, economic and conservationist alternative to the agricultural production systems that are now destroying our forests, because this tree produces large amounts of seeds, reducing the need for deforestation, burning, pesticides, fertilization or irrigation. It functions to protect the soil, water reservoirs and biodiversity. It produces four times more food than corn per hectare and can be stored, contributing in this way to food reserves (Op. cit.).

Nowadays communities in south eastern Mexico that previously utilized this resource, have to a large extent, abandoned its use. In its place they clear forests to use trees as firewood and to use the land for agriculture. In these communities a comic could be of help in communicating information about how to use and conserve this native species. This, in turn, could contribute (through the generation of economic resources) to alleviate the problems of poverty, unemployment, malnutrition, loss of self-esteem of rural women (by providing them employment) and reversing outgoing cultural and environmental degradation. Also if science communication comics are effective, this model could easily be replicated and spread to other areas of Mexico and Central America with a very low cost/benefit ratio.

Developing the Comic

To produce a comic that includes information about the Mayan nut, I developed the following procedure:

To generate the narratives I researched recent literature about sustainability, sustainable harvest, biology and ecology of *Brosium* sp. With this information I constructed a table entitled the "list of main active principles", implying the information about *Brosium* that I wanted to convey to the communities using the comic as a "vehicle" (as a metaphor of the active principles and the vehicle in a commercial drug). *Table 2* shows the basic scientific concepts to be included in the comic (active principles).

I developed the dialogues for the new comic using the Proppian structures identified in the two popular Mexican comics, combined with the "main active principles" and information obtained via interviews directly with the people in the communities.

Sustainability
1 Sustainable harvest

Table 2. Main active principles, scientific facts to be communicated in the comics

Images: As mentioned before, in a previous research I analyzed *El Libro Vaquero* and *El Libro Semanal* in terms of narratives and imagery (*Negrete, 2011*). In order to preserve, as much as possible, the style and language of these two popular comics, I emulated their content regarding for example the total number of images, images per page, number of characters per image, images dedicated to sensual encounters, sex implicit images, etc. (*op cit.*). Finally I constructed a story board and a consulting designer produced the images imitating the style of the comics mentioned above. I adapted the appearance of the characters as well as the settings (buildings and landscape) to the rural landscape.

The new comic, "Sustainable Love" is a narrative about a woman (Jesusa, the heroine) whose father (the king) died. She is forced to decide whether to immigrate with her boyfriend to the United States or to stay and work the land inherited from her father. The land is rich in local forest species including the Mayan nut trees (Ramonales). She has a friend (Maria, the helper), a biologist who is trying to convince her to stay in the village and use the Mayan nut to earn a living. Jose Carlos, María´s boyfriend (the villain and the princess), who just came back from the US wants to convince her to emigrate with him. Ramiro, Jose Carlos` friend (helper), arrives in the same bus as Maria's boyfriend. His aim is to use the area as a study site for his ecological research. Ramiro and Maria fall in love with each other and Jesusa convinces José Carlos to stay in the village and start a family.

Appendix I shows the comic that was developed using this methodology. Dialogues were written in Spanish, a translation to English is alongside the original comic. Table 3 shows the spheres of action played by each character in the comic.

Characters	Spheres of action
Jesusa	Heroine
María and Ramiro	Helpers
José Carlos (Boyfriend)	Villain and princess
Jose Carlos	Princess
Jesusa´s father	King

Table 3. Spheres of action played by each character in the comic.

Jesusa´s goal is to convince José Carlos to stay in the village. José Carlos plays a double role in the narrative. He is the villain because he tries to convince Jesusa to leave the place (his intent is contrary to Jesusa´s) and he also represents Jesusa´s prize if she wins the struggle. Ramiro represents a "helper" for Jesusa in the sense that he contributes to make Jose Carlos change his mind and decide to stay in the village. According to Propp's classification the comic´s plot would be like the development through "struggle and victory". Table 4 shows the functions included in the comic.

Propp's Functions	Description
Mediation	Jesusa`s father is dead. He asks Jesusa, just before dying, to keep his lands for her and their descendants.
Struggle	Jesusa struggles with José Carlos to decide whether they should emigrate to the United States and sell the land or to keep the property and use the Mayan nut products to make a living.
Victory	Jesusa decides to stay and convinces her boyfriend to remain with her.
Wedding	They agree to start a family together and cultivate the Mayan nut.

Table 4. Functions included in the comic.

Learning Study

In order to obtain feedback on the effectiveness of the comic, obtained with this method, to communicate the desired "active principles", the comic was presented to volunteers in a rural community (in the state of Morelos in México) with similar characteristics as those of the studied communities (with no specific scientific background, low scholastic level, rural area, etc.). Immediately after reading the comic they were asked to answer a questionnaire. In average it took 30 minutes to read the entire comic. The sample consisted of 45 individuals between 20 to 50 years of age (25 females, 20 males).

The effectiveness of the comic in communicating information was assessed through the RIRC method. The RIRC method explores the effectiveness of a narrative (and other formats) in communicating scientific information using four independent memory tasks to asses learning (Negrete, 2009; Negrete and Lartigue 2011). This method assesses an individual's ability to retell, identify, remember and contextualize scientific information presented to them in narrative form. The input consists of a qualitative complex stimulus (a story narrative or another text format) and the measurement is performed using questionnaires. The structure of the questionnaire used for this research can be seen in Table 5.

Questions	Questions	Intention of the question
Retell the story (Retell)	1	To measure how much the participant remembered about the story as a whole and which parts of the story were better remembered (science *vs*. narrative).
Multiple-choice (Identifying)	3	To assess how much of the information given in the story the participant was able to identify.
Short answer (Remember)	5	To test how much of the scientific information the participant was able to remember and retell.
Hypothetical situation (contextualise)	4	To determine if the participant was able to put the information in context and apply or extrapolate the knowledge (learning).

Table 5. Structure of the questionnaire.

Results obtained using the RIRC method

In all of the memory tasks the participants were able to remember more than 50% of the scientific content included in the comic (Table 6 and Figure 1). According to previous results using the RIRC method with narratives, scores of more than 50% on the four memory tasks, represent good performance (Negrete 2005; Negrete, 2011). Although this is an exploratory study and more research with this comic is needed, the fact that participants were able to remember this amount of scientific information suggests that this narrative was well understood and remembered by the participants.

Retell	Identify	Remember	Contextualize	
51	63	70	63	%*
2.8	.8	1.3	1.5	STD

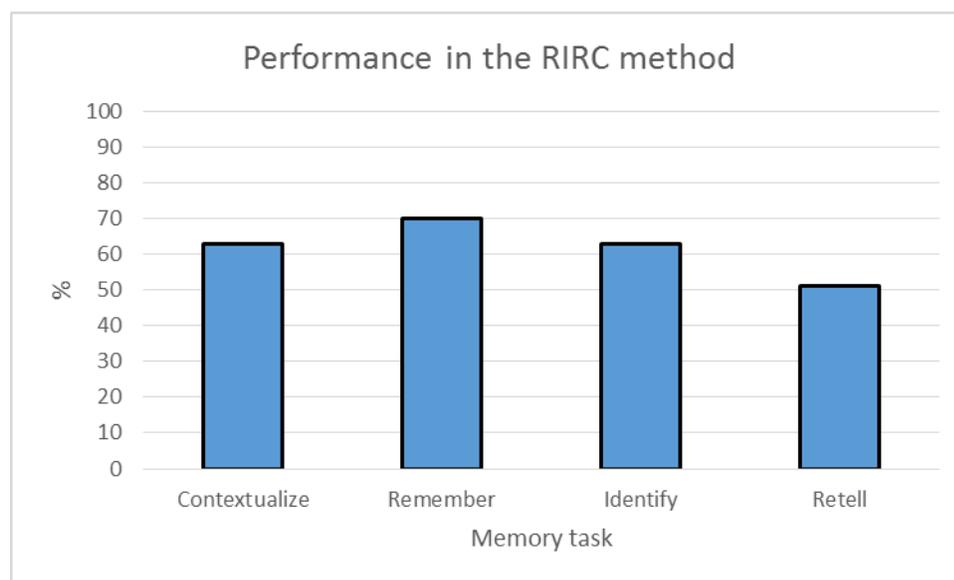
*The percentage represents a measure of how close to the ideal the groups performed.
Table 6. Performance of the participants responding the questionnaires after reading the comic.


Figure 1. Performance of the individuals compared to the ideal mark for every memory task.

Future work and research

The next step on this research is to use and study the comic in the communities that it was designed for (Cuzalapa, municipality of Cuautitlán, Jalisco and Chulavista community, municipality of Bahia de Banderas, Nayarit).

In the future, it would be interesting to generate more comics with this same methodology to communicate information in other areas of scientific knowledge. For example, at present, I am working on a project that involves generating a comic book to convey scientific information about diabetes and obesity, which together with HIV/AIDS are major health problems in Mexico.

Conclusion

The analysis using the RIRC method suggests that comicss narratives are a good way to reach low literacy audiences with socially worthwhile messages. The results also suggest that the comic generated in this research was quite effective in communicating scientific information. These results, compared to previous studies using other narratives, show a good performance and therefore a good understanding and retention of the scientific information included in the narrative.

The Mayan nut in Mexico is an important natural resource as food, medicine and because of its ecological relevance. There is simple scientific information about natural resources and conservation that could encourage communities to make a sustainable use of *Brosium*. Comics could represent an ideal media for communicating such knowledge to communities in a reliable way.

In this research I propose that popular comics can, for certain audiences, be used as a tool to communicate scientific information to a large population in an understandable, memorable and enjoyable way. In the case of Mexico, they represent a unique opportunity to communicate scientific information about sustainable development and natural resources to a large sector of the population with low literacy levels, often very difficult to reach through other means.

Acknowledgements

I would like to acknowledge and thank Dr. Cecilia Sanchez and Karina Perez for their participation in the making of the "Sustento de Amor" comic and Jesus Elías García for the design of the comic images.

13th International Educational Technology Conference

Continuing with the promise of "scratch" in the applied linguistics classroom

Clarisa Garcia Quan[37], Ph.D.

Associate Professor
University of Guam
College of Arts and Social Sciences
Division of English & Applied Linguistics

Abstract
Students and student-teachers of applied linguistics (LN400/G) taught at the University of Guam continue to explore the promise of SCRATCH, a free downloadable program from MIT (Massachusetts Institute of Technology). For the past three fall semesters, students and student-teachers were required to design class projects with Scratch. They were instructed to integrate principles of second language teaching/learning and or other subfields of applied linguistics into their projects, and told that they should be able to use these in the language, literature, or other content area classroom. A CD Rom of their individual projects, accompanied by written reports evaluating SCRATCH, were submitted at the end of each semester. In Fall 2012, students were required to integrate their computer projects into their lesson plans for elementary, middle, and or high school students. This presentation will propose criteria for evaluating students' computer projects and summarize their evaluations of and comments about MIT's SCRATCH computer program.

Keywords: communication, barriers, technology

In the 21st century, technology has become an integral part of students' lives, and, by extension, a vital part of many effective educators' teaching and lesson plans. Students of Applied Linguistics at the University of Guam were required to design SCRATCH computer projects starting Fall semester 2010, after the instructor attended a conference on educational technology. Students were told to consider some practical applications of the program to second or foreign language learning theories by, for example, integrating the SCRATCH technology project into possible classroom lessons not only in foreign language teaching, but also in teaching in the content areas like literature and social studies. They were told that their projects had to reflect their creativity, imagination, (multi-)cultural / ethnic sensitivity, and teaching ability.

They were told that this computer program could help put them on the cutting edge of teaching and learning, and as a result, hopefully be better teachers to their present and future students.

What is SCRATCH? SCRATCH is a programming language that enables anyone to do graphics, animation, interactive games, music – the possibilities are endless. The SCRATCH Program consists of a sprite (and other) characters, & a list of commands that can be added to a project to say and or do whatever is to be taught. All commands are listed on the side of the program in the form of puzzle-like pieces that can be added to the script. Developed by MIT Media Lab's Lifelong Kindergarten Group, with support from organizations and businesses like the National Science Foundation, Microsoft, Google, and Intel, SCRATCH was designed to stimulate and encourage

---

E-mail address: risaquan@gmail.com

anyone interested, from children to adults, not only to think critically, logically and creatively, but also to work collaboratively. Posted sample programs and tutorials on the net can be invaluable to those who wish to learn using the program.

In these tough economic times, SCRATCH is an attractive option for educators because it gives student-teachers a chance to learn doing hands-on basic programming as well as apply the theories they have learned in class, to actual lessons that put those theories to the student and classroom test.   Most importantly, it is free: anyone can download it from the net. Even though the program was originally intended for younger learners to learn basic programming, I wanted to see what university students of applied linguistics could do with this MIT-generated program since it is gratis and easily downloadable from the net, to help their present and future students with the acquisition of a second language, or the learning of content areas like literature. [Mention ScratchEd for teachers].

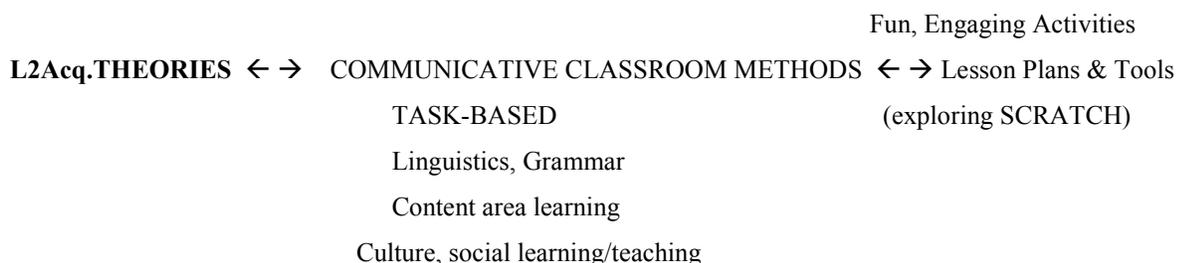
For the past three years, the program has been an integral part of the work required of the university's applied lx students. None of them have a computer programming background. They ranged from computer and or technology-challenged, to those who thrive on tinkering with what a computer program can do to improve teaching delivery!

Applied Linguistics at the University of Guam (LN400G) is a one-semester, 3-month undergraduate/graduate course that ESL, English, and secondary education majors take. Although the course surveys the main subfields of Applied Linguistics, the first half of the semester covers second language acquisition theories, e.g., Cross-linguistic Influence or CLI (Kellerman 1995, Odlin 2003) –the weak version that remains from the controversial Contrastive Analysis Hypothesis (Lado 1957); Krashen's (1981, 1982, 1983, 1985, 1997) theory with its bundle of five hypotheses – Monitor, Acquisition vs. Learning, Affective Filter, Input i+1, and Natural Order Hypotheses; Cognitive Theory (McLaughlin 1987, Scovel 1999, R. Ellis 1997); Social Constructivist Theories (Long 1996, 2003); Inter/Intralanguage/Fossilization Theories (Selinker & Lamendella 1979, Long 2003), and Eckman's (1981, 2004) Markedness Differential Hypothesis from Universal Theory (Chomsky(an) and language universals and typology (Greenberg, Ferguson).

Below is a suggested model of the relationship between L2Acquisition theories and
 communicative classroom methods in the applied linguistics class projects:

COMMUNICATIVE COMPETENCE IN A FOREIGN LANGUAGE CLASS (Hymes 1974)

Fun, Engaging Activities

L2Acq.THEORIES ← →   COMMUNICATIVE CLASSROOM METHODS ← → Lesson Plans & Tools
TASK-BASED   (exploring SCRATCH)
Linguistics, Grammar
Content area learning
Culture, social learning/teaching


H.D. Brown (2007) enumerated five characteristics of an ideal communicative language teaching classroom (q.v., Hymes 1972 on communicative competence).

1. Lesson plans should cover all the components of communicative competence, i.e., cultural, social, and not just grammatical nor linguistic.

2. Language activities should be authentic, functional, meaningful, as well as fun and interesting, so that learners are drawn into the world of foreign language learning and not lost by the wayside.

3. Fluency and accuracy are both important goals; but, to keep communication channels flowing and open, accuracy sometimes may have to be sacrificed in favor of fluency, even if the fluent sounding speech is less than perfect grammatically!

4. Lessons must be geared to helping develop students' ability to function in real-life situations, beyond the classroom.

To this list, I will add a sixth:

5. Activities must support establishing rapport and collaboration in the foreign language classroom. Instructor-student as well as student-student relationships must be, as much as possible, positive. Learning a second language is facilitated when stress is minimal. There is nothing wrong with learning a language or learning to teach a language in a relaxed but competitive environment – a worthwhile goal.

The question then is, where does SCRATCH belong in these communicative competence teaching requirements? How can it help learning in the classroom? At home?

Criteria for evaluating students' projects are in process of being developed. They involve examining how the individual projects tie in with the theories of foreign language acquisition and communicative learning methods. Questions asked are:

I. The theory or hypothesis behind the project

    A. Reasons for choosing a particular project

    B. The L2Learning theory / hypothesis that "jives" with the program design or that the
        design addresses

II. Use of the Scratch Program

    A. The simplicity/complexity of the programming project: mastery or lack thereof?

    B. The planning vs. the execution: any technical problems with the program or content?

III. Execution and Communicative Goals in the Classroom

    A. User-friendliness of the program for the intended audience

    B. Fun and appropriate for learners/students/intended audience

    C. Task based? Goal oriented?

    D. Any Cultural sensitivity or awareness and social rules addressed beyond grammar or declarative knowledge?

    E. Are activities (content, inputting responses) age-appropriate with regards to the intended
        audience?

IV. Adjustability and Modifiability

    A. With the basic design of the program remaining unchanged, can the lesson content be
        modified for use in other content areas?

B. Any bugs? Glaring problems?

The first year of the SCRATCH project was exploratory. I divided the class of twelve into groups of 3 or 4; each group worked collaboratively and submitted only one project each. The most knowledgeable naturally became group leader. This first year project was the most basic, yet showed the great cultural and ethnic sensitivity. Among their projects were the following:

1. Sirena the Mermaid legend of Guam narrated and illustrated by a
   student/artist who insisted on doing the mixed media artwork
   herself, with Guam locales serving as the background
2. Teaching colors in Tagalog/Pilipino – with a plane flying and droning in
   the background; background applause when answer is correct
   encourages students to answer questions
3. A lord of a castle giving commands to a knight using TPR – setting: castle
   with a lady in the background
4. Teaching vocabulary words in Chamorro – with Chamorro cartoon
   characters
5. A few lines from Shakespeare's *Romeo and Juliet*, with
   local-looking characters & setting.

In the second and third Fall semesters, every student was required to program his or her own project, although they were encouraged to work in groups to help each other out, or for "knowers" to help others. A student from the previous year was invited to speak to the class, give advice, and answer questions about the program. This knower-helping-novices approach apparently helped students a lot.

Second year Fall 2012 semester projects can be divided into the following groups:

1. Interactive Storytelling
2. Illustrations, Sing-a-longs for identifying body parts
3. Drills
   a. Identification /counting of objects
   b. Editing Grammar and Punctuation
   c. Ballerina Coordinating Conjunctions
   d. Max the Monkey and Homophones
4. Teaching Methods: Total Physical Response: a knight, a lord, and his princess
5. Interactive poetry: composing cinquain interactively
6. Sociolinguistics: illustrating Irving Goffman's response cries and uptalk (XXXX).

Attachments in the appendix illustrate some of these programs.

Finally, students were required to critique SCRATCH as a program and classroom tool. The table below summarizes their comments.

UOG Applied Linguistics Students' Comments about SCRATCH

POSITIVE COMMENTS	NEGATIVE COMMENTS
1. Fun!	1. Very time-consuming
2. Great learning experience	2. Not easy to use/learn in the beginning
3. A useful tools for educators who want a different teaching method in the classroom	3. Hard to coordinate sounds, movements
4. A creative alternative to Powerpoint, lectures, chalkboards, with the teacher talking all the time!	4. Takes a few days to learn and feel comfortable with the program
5. Allows teachers to be very creative	5. UTube videos and tutorials were too basic
6. Middle and high school students can use SCRATCH to do presentations, have fun, create games themselves	6. Commands are hard to learn; challenging for teachers who are not programming-savvy!
7. No limit as to what it can do	7. Takes a lot of patience and time that teachers may not have
8. A useful tool for ESL/EFL students as well as native speakers of English 9. Teachers placed on the cutting edge of technology!	8. *What if classrooms don't have computers?*

Students' suggestions for improving SCRATCH include the following:

1. Make it more user-friendly because colorful and inviting interface belies the
   complexity of the scripts needed to make a functional product
2. Simplify the tabs: there are too many tabs and dozens of options: hard to know
   where to start to move a sprite from points A to B- so simplify the commands!
3. Simplify complex terms that are hard for ordinary people to translate to layman's
   terms
5. Make tutorial more user friendly!

With SCRATCH's new version 2.0 coming out in May 2013, hopefully, some of the students' concerns will be addressed. Meanwhile, students of Applied Linguistics at the University of Guam will continue to create SCRATCH projects that are relevant to L2Acquisition theories and communicative teaching methods. As in the three previous years, they will continue to present these at the University of Guam's Annual Regional Language Arts Conference in November of every year.

Abstract
Cyber security plays on important role to guarantee and protect people who use internet in their daily life. Some cases take place around the world that people get inconvenience condition when they access and use internet. Misuse of internet becomes a current issue which some cases take place including a university. Advantages of using internet in the university of course assist the student to get some information in internet. However, they have to be protected in order to feel convenience when use internet.

Keywords: Cyber Security, Internet

Introduction

Internet is becoming an important thing in people daily life and has grown at an explosive rate (Pratap Singh and Bagdi, 2010). According to International Telecommunication Union (ITU) (2013), internet users (population) around the world are over 2.7 billion, which corresponds to almost 40% of the world's population. In the developing countries, people who use internet is around 31% of the population, compared with 77% in the developed countries (ITU, 2013).

Basically, internet was used to military, defense contractors, and a university research purpose. However, in recent years, it has been developed to multi-purposes including information, communication, leisure, shopping, education, e-social activities, financial, job seek, homepage, file share service, and download (Kisa, 2011). Those internet usage purposes bring both advantages and disadvantages for people and their community. In terms of disadvantages of internet use such as illegal contents, online fraud, identity theft, espionage, sabotage, cyber terrorism, and cyberstalking (Boateng, 2011), (Department of Economic and Social affairs, 2012), (Greitzer and Frincke, 2010), (M. Arif Mansur and Gultom, 2005), (Suhariyanto, 2012), cyber security is therefore needed to guarantee people who use internet to be safe.

Theoretically, cyber security has to fulfill 3 (three) critical points: measure to protect information technology; the degree of protection resulting from application of those measures; and the associated field of professional endeavor (Fisher, 2009). The three critical aspects of cyber security play an important role to protect a personal data of every person, government, and businesses. Those data are pivotal because they can be misused or manipulated by other person for criminal purposes.

---

[38] Corresponding author.

E-mail address: manis_ck@yahoo.com

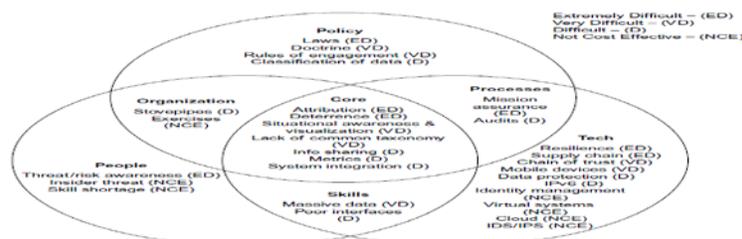
Internet misuse and manipulation are mostly committed by young and adult people especially people who in level senior high school and university students. In South Sulawesi for example, some Hasanuddin University students in 2011 committed financial fraud (Indonesia Hackers, 2011). The crime usually intended to the personal information stored on personal data forms in computer, such as credit card number and ATM PIN numbers. They were then arrested by the police and should face suing for their committed crime.

Complexity of definition of cyber security

It is quite difficult to define what does cyber security mean? The difficulty definition arises from several reasons and tends to be complex. (Fisher, 2009). According to Eric A. Fisher, "there are many components of cyberspace and many potential components of cyberspace" to be used in order to determine the cyberspace's meanings. (Fisher, 2009).

The meaning of cyber security tends to be decided in different context. In some cases, it refers to economic terms or in social and cultural terms or even in politic and military terms. As it is commonly used, "cyber security refers to 3 (three) things:

1. A set of activities and other measures intended to protect — from attack, disruption, or other threats — computers, computer networks, related hardware and devices software, and the information they contain and communicate, including software and data, as well as other elements of cyberspace. The activities can include security audits, patch management, authentication procedures, access management, and so forth. They can involve, for example, examining and evaluating the strengths and vulnerabilities of the hardware and software used in the country's political and economic electronic infrastructure. They also involve detection and reaction to security events, mitigation of impacts, and recovery of affected components. Other measures can include such things as hardware and software firewalls, physical security such as hardened facilities, and personnel training and responsibilities.
2. The state or quality of being protected from such threats;
3. The broad field of endeavor, including research and analysis, aimed at implementing and improving those activities and quality."(Fisher, 2009).

According to Rich Rosenthal's Cyber Assure Program (Andress, 2011), the complexity of definition of cyber security can be drawn as if:


Source: Rich Rosenthal's Cyber Assure Program

The mapping as shown in figure 1 draws complexity of definition. There are 7 (seven) elements, namely as policy, organization, core, processes, people, skills, and technology, that influence security in cyberspace. Those elements essentially has connection one to another. They have to be developed in one system to create security in the area of cyber space. For example, people as an actor of internet use have intention and skill to use internet in appropriate ways. However, if other elements do not support their intention, it means that they cannot get any advantages from it or otherwise.

According to Andress (2011), some of elements of cyber security issues definition as mentioned in figure 1 are categorized as extremely difficult (ED). They are laws, threat/risk awareness, attribution, deterrence, mission assurance, and resilience and supply chain. Other elements are classified as very difficult (VD) and difficult (D). Classification of those elements actually shows that cyber security plays important role to create "peace" in using internet. Indeed, it is realized that it is not easy-job to reach it.

Cyber Security: Rule of Use Internet

Internet user is growing dramatically in variety generation and the purpose of using internet then is done in various ways as explained above. The number of internet users in Indonesia for example is increasing every year. According to Internet World Stats (2010), commercial internet services commenced in Indonesia in 1995 and coming into 2008, Indonesia had an estimated 25 million Internet users. It is predicted that in the beginning of 2013, the number of internet user in Indonesia is becoming bigger than in 2008. Guharoy and Morgan (the Jakarta Post, 2012) furthermore states that internet users in Indonesia is climbing dramatically in the last two years, "20 percent of Indonesians 14 years of age and older now access the Internet every month. That's over 30 million people, and growing steadily each month. But we need to remember two important facts that characterize the usage. First, roughly 10 of the 30 million users access the Internet via their mobile phones. Second, roughly 70 percent of those 30 million users visit Facebook and twitter each month, making it the most popular address in the country".

This fact actually is not surprising because computer and its function including internet as introduction have been introduced since the young people in elementary school. It means that the Indonesian young people especially university students have skill to access internet but they are also potentially to misuse or to be misused by the internet. Presence of internet for students in university actually helps them to get a lot of information related to their tasks. The information is provided in forms of book online and journals. Both books and journals give an easy task for the students to finish their tasks particular when they conduct their final paper to be graduated. However, a lot of cases of misuse the internet function also conducted by university students. Plagiarism is one of the most internet misuse conducted by the students. They tend to copy some materials to their tasks but they do not mention the author's name. Other internet misuse can be found such as illegal contents, online fraud, and identity theft.

According to National Research Council (2003), there are 3 (three) classes of attack that addressed to internet, as following:
1. Service disruption; it causes a loss of service and can result from disabling of networks through a variety of attacks such as denial of service (DoS) and destruction of information.
2. Theft of assets; it misuses critical information on a large enough scale to have major impact.
3. Capture and control; it involves taking control of cyberspace and using them as a weapon.

Those classes of attacks are then classified as cybercrime and also have been modified in various modus. Those modus in fact threaten all human beings activities including infrastructure. To handle and to prevent those crimes, cyber security plays important role to guarantee people to use internet safely.

As we known, cyberspace compiles a huge range of related elements of cyberspace activities and it is therefore cyberspace activities are potentially at risk. To eliminate or dismiss the risk, protection of cyberspace infrastructure is needed in order to stop hackers to commit their crimes. The protection of the infrastructure must cover internet hardware, telecommunications infrastructure, computing devices as control system and computing devices as desktop computer (Fisher, 2019). Andress (2011) furthermore stipulates that to eliminate the risk is not only protection to the infrastructure (hardware) but also must protect the software.

Protection of software is intended to help everybody to use computer/internet safely. It is because so many computers are used in homes and businesses. The computer operating systems and email programs are two aspects

of computer/internet that is vulnerable to be attacked and exploited. Case of computer worms that attacked Microsoft Windows operating system in 2003 was a proof to see that the protection of software is needed to protect the internet user (Scheiner); or other sample of a worm (spionage) took place in 2010, when a worm called stuxnet was launched to attack the Iranian nuclear program (Farewell and Rohozinski, 2010).

Both protection of hardware and software are the main point of cyber security. They are able to guarantee people to use internet safely. People will use internet to support their activities without any worry to negative impacts of internet. However, both protections must be implemented and embedded in national and international strategy (regulation) to reach its goals. In United States, for example, it can be found National Strategy for Homeland Security. The purposes of this strategy are to prevent cyber attacks against critical infrastructure; to reduce national vulnerabilities to cyber attack; and, to minimize the damage and recovery time from cyber attacks that do occur (Anonymous, 2003); or another example in Canada, its national strategy is placed on three pillars: securing government systems; partnering with the private sector; and helping Canadians to be secure online through awareness raising (Deibert, 2012).

In terms of Association of Southeast Asian Nations (ASEAN) in which Indonesia one of its members, its regional strategy is put in the area of economic and security cooperative comprised of 10 member nations from Southeast Asia. According to its Roadmap for an ASEAN Community 2009-2015, it has effort to combat transnational cybercrime by fostering cooperation among member-nations' law enforcement agencies and promoting the adoption of cybercrime legislation. In addition, the road map calls for activities to develop information infrastructure and expand computer emergency response teams (CERT) and associated drills to all ASEAN partners (United States Government Accountability Office, 2010). To develop information infrastructure as one of the ASEAN' roadmap, Indonesia continues to complete Indonesian Law Number 11/2008 Concerning Information and Electronic Transaction. One of its efforts is enacting some Government Decree such as the Government Decree No. 82/2012 Concerning Maintenance System and Electronic Transactions.

Those regulation strategies as implemented in domestic law each country essentially show huge effort of them to create convenience and comfortable environment to internet user to feel safely. Those regulations also must be completed every time to respond some changes related to using internet. So cyber security goals can be reach and are able to eliminate and dismiss negative side of internet usage as discussed above.

Conclusion

Internet has become a global phenomenon; numerous advantages and disadvantages (crimes) are being gotten and committed through the internet. To cope with both advantages and disadvantages, cyber security is needed to guarantee people to use internet safely, particular to young people including university students. Cyber security covers hardware and software infrastructure that is supported by national and international strategy and regulations.

Design and development of a Sustainable Tourism Indicator based on human activities analysis in Inle Lake, Myanmar

Ismael Abedin Ingelmo[39]

UNEP- Tongji IESD College of Environmental Science and Engineering, Shanghai, P.R. China.
College of environmnetal Science and Enginnering, Tongji University, Shanghai, P.R. China

Abstract

Inle Lake encompasses immense cultural and biological features, it is the second biggest Lake in Myanmar and it is home to different ethnic groups such as Intha, Pa-O and Shan people that have been making the lake their source of revenue for several decades. Conversely, some of the activities being performed by these communities have caused diverse environmental challenges for the lake. The risk of losing part of the lake ecosystem, including local endemic fish, snails and migratory birds has been increasing in recent times. Though, there is a lack of leadership and control over these actions. Tourism is one of these key activities that can either be a difficulty or an answer to the lake ecosystem conservation. To analyze the range of actions within the lake, this document develops a methodology that analyzes and places the main hazardous activities in one scheme, it evaluates its social, economic-social and ecological cumulative impacts, and refer the main stakeholders involved in it. The outcome information from the study aims to facilitate information analysis to formulate strategies to switch from harmful activities on the lake towards Sustainable Tourism actions. The research paper indicates the methodology of incorporating data into the indicator table and its value as Sustainable Tourism analysis tool for different stakeholders, the analysis tool aims to be a sample for other case studies analyses.

Keywords: Sustainable Tourism; Human Activities, Inle Lake Myanmar; Sustainable Tourism Indicator.

Introduction: Ecotourism and Sustainable Tourism

The significance of questioning the controversial definition of Sustainable Tourism (ST) (Honey, 2008) and distinguishing it from the term Ecotourism that have been implemented in media as blooming solution to achieve Sustainable Development (SD) (Allen, 1993; Isaacs, 2000; Maclaren, 2002) is fundamental when exploring human activities in tourism and its effects on the Natural Ecosystem. The widely accepted term of Ecotourism (Valentine, 1992; Carter, 1994) defined as: *"Responsible travel to natural areas that conserves the environment and sustains the well-being of local people"* by International Ecotourism Society (TIES) (1990) has been declared incomplete by authors as Ziffer (1989) or Isaacs (2000) due to its insufficiency, thus, this shortened designation tolerates unrelenting abuse of natural resources by mass tourism. Furthermore, Allen (1993), Blamey (2001) Maclaren (2002) and other contemporary authors shaped broader definitions to illustrate the misapprehension between their visions on ecotourism and Nature Tourism. Nonetheless, most of these explanations as well cannot embrace a comprehensive approach for most of the elements related to Tourism and Sustainable Development (Honey, 2008). World Tourism Organization *(*WTO) and United Nations Environment Program (UNEP) (2005) had defined ST as: "*Tourism that takes full account of its current and future economic, social and environmental impacts, addressing the needs of visitors, the industry, the environment and host communities*" This definition addresses the three main elements of Sustainability: Economic, Environmental and Social (UN, 1987). Concerning the social component of ST description, WTO-UNEP rationalization is divided into two main factions: (1) the visitors and (2) the host

E-mail address: ismabedin@hotmail.com

communities. The interrelation between these two target groups with natural environment is critical for the development of SD in Tourism (Koeman, 2002; Pierre ,Walter and Reimer, 2011), primarily to address matters as environmental impact reduction, cultural preservation, promotion of community livelihood and visitor satisfaction (Honey, 2008; Fredline, 2006).

This paper investigates the interrelationships between these two social elements, connecting human activities with ecological environment. Inle Lake is selected as a case study in this investigation because of its particular circumstances: it encompass a fragile and rich eco-habitat, there are previsions of vast tourism affluence and the local community is getting disrupted from their usual habits (UNESCO, 2008; BEWG, 2011) This study aims to create an understandable framework to analyze human activities impacts related to ST by defining the critical social indicators involved on it, computing the cumulative impact for the main activity groups and creating strategies and alternatives to implement ST efficiently.

Inle lake: Customs that pollute the environment

Inle Lake in Myanmar: Ecological Significance

The physical heritage, cultural expressions and biological environment of Myanmar are attracting more tourists every year (UNESCO, 2008). This fact has been generating vast international and national tourism investment and speculation that is threatening the ST Myanmar industry (ADB, 2012). A large part of Myanmar, including Inle Lake, is situated within the Indo-Burma Biodiversity Hotspot and is one of the 34 richest and most threatened flora and fauna reservoir on the planet (IID, 2012). There are about 1,027 species of birds, 300 mammals, 425 reptiles and amphibians and about 7000 plants recorded (BEWG, 2011). Thus, it is significant for the country to create a comprehensive framework to develop SD and preserve its natural ecosystem.

Inle Lake, also known as Inlay Lake, is positioned within southern Shan Plateau in central Shan State and is one of the main sightseeing attractions within Myanmar (IID, 2012). The Lake and its environs was converted into a officially protected bird sanctuary in 1985. The Steering Committee of Inle Lake Conservation was formed in 1992. Additionally, the Lake was designed one of the Earth's 200 most valuable eco-regions in 1998 as well as being designated as ASEAN Heritage Site in 2004 (BEWC, 2011).

Endangered Endemic Species of Inle Lake

 In order to generate appropriate ST measures it is important to identify local eco-habitat elements where tourism actions are executed. The fragile Inle Lake ecosystem is the natural habitat to 9 native fish species in 3 endemic genera, additionally, it is home for above 20 species of gastropods (snails), 2 cyprinid genera (*Sawbwa and Inlecypris*) and 16 of 31 species appear to be endemic in Inle Lake and its surroundings. Fish species include the Inle swamp eel (*Chaudhuria caudata*) and Inle barb (*Sawbwa resplendens*). The Inle carp *(Cyprinus Carpio intha*) is a cultural character of *Intha* community, this fish specie, locally known as *nga-phein* has been an important food for this community until recently (IDE, 2012; ADB, 2006). However Inle carp population has been diminishing in recenttimes, one of the reasons seems to be the reduction of water clarity due to sediment and euthropication (Su and Jassby, 2000). Other reason for this native fish declining appears to be about two invasive fish varieties that have been seen in the lake, *Grass carp* and *Labeo rohita* that could deplete native species (Retrieved from WWF, 2013). Furthermore, Inle lake also encompasses an important Birds Sanctuary with 240 bird species recorded(57 forest birds and 43 water fowls). The lake and wetland are the nesting places of endangered Sarus crane (*Grus antigone*) included in vulnerable class species by IUCN Red list (2007). Any activity involving remedial actions without Strategic Environmental Assessment (SEA) in the lake's ecosystem can have irreversible consequences in losing some of these endemic native species.

Inle Lake Environmental reports: Inle Lake shrinking causes

Recently, numerous environmental reports have been emerging with reference to Inle Lake from different organizations, such as, Asian Development bank (ADB) (2006); Burma Environment Working Group (BEWG), (2011), Institute of Developing Economies (IDE) (2012), United Nations Educational, Scientific and Cultural Organization (UNESCO) (2008), United Nations Development Program (UNDP) (2012), Institute of International Development (IID) (2012) and others. A number of these studies overlap each other in data analysis. Consequently, outcomes are not efficient, generally resulting in wasting economic and human resources whereas the lake eco-system remains being depredated.

For instance, according to an estimation from Sidle, Ziegler, and Volger (2007), from 1935 to 2000, the net open water area of the lake declined from 69.10 to 46.69 km2, reducing 32.4% of its capacity. A survey of the lake's dimensions conducted by Myanmar Land Records Department in 2007 revealed that it's surface area   is about 163.17 km2, of which 62.16 km2 was open water surface area. Both of these information were published in the year 2007 and have a disparity of 15.47 km2 in size. Most likely this gap is produced because both reports didn't mention the climate circumstances in the lake environs and the period of time when it was considered. Indeed, previous analysis from ADB (2006) stated that the lake is situated within a tropical monsoon quarter with three main seasons: rainy, dry, and hot, with different rain patterns that makes the size of the open water area vary. Precipitation exceeds 5cm a month from April until November, it peak point is in August, through characteristic precipitation of 20cm. This rain pattern affects both local community, tourist activities significantly and therefore, lake's reproductive biology. (BEWG, 2011; IDE 2012) Cooperation between report editors can contribute to identify efficiently the overall circumstances within the lake and its environs.

Sources of lake shrinking are also debated, but most of the reports agree that the main reason largely resides on sedimentation. Sidle et al. (2007) analyzed the alterations on the exposed water surface vicinity of Inle Lake, their analysis states that large quantity of sediments have been deposited on the lake in a short period of time; this is attributable to different human activities. The main sources of siltation are:

(1) *Deforestation,* There are three main reasons of deforestation on the hills in the catchment:
- Shifting agriculture, in the upstream
- Wood fuel, used by local communities
- Livestock Production

(2) *Floating gardens*[40]: Typically the gardens are 'shifted' to the edge of the lake after their fertility exhaustion . Thus, this activity contributes notably to the loss of the lake open water area.

(3) *Residential/Tourism*: Residential and tourism development within the north area of the lake results in the creation and deposition of more siltation because of soil disturbance and their proximity to the lake. Unprocessed sewage discharging, that includes petroleum derivates and detergents, contribute considerably to the lake ecosystem degradation trough sedimentation, turbidity, eutrophication, and pollution (Sidle et al, 2007)

(4) *Mining*. The Tigyit coal mine, is on the watershed 13 Km from the Lake, it is Myanmar' major open pit coal mine, it generate approximately 2,000 tons of coal on a daily basis. As well, there is a coal combustion energy plant in Tiygit,. Contaminated water from the mine and waste from the power plant run through the Balu creek into Inle Lake. Conversely there not exist relevant assessment on the environmental impacts of this activities on the lake (BEWG, 2011).

---

[40] Floating gardens are based on hydroponic farming in floating islands of decomposed grasses, reeds and marsh plants. The islands (locally known as *ye-chan*) are usually around 2 meter (m) wide and 40 m long. By trimming these islands annually, *Inthas* continue floating gardening year-round by growing vegetables. Floating gardening is a very productive and economically beneficial practice. In recent years, a high yield variety of tomato was introduced from Thailand and Inle has become a major production area of tomatoes, supplying the whole country (ADB, 2006; Sidle et al., 2007).

Community Sectors and related Human Activity

Inle Lake is situated in *Nyaung Shwe* Township. It holds 36 village areas, encompassing 444 villages, 32,139 households, and according some reports, an estimated population of more than 160,000 people inside the lake and its environs (IID, 2012; IDE,2012). Population includes diverse ethnic groups (Table1).

7. Table 1. Population Breakdown from Nyaung Shwe Township, Data Source: UNDP (2008)

Ethnic Group	Percentage
Intha	70%
Pa-O	10%
Bamar	3%
Taung Yo	2%
Shan, Myanmar, Others	15%

The number of individuals residing within the lake is complex to calculate due to diverse reasons such as lack of updated census in Myanmar, undefined lake boundaries and seasonal migration. It is roughly estimated that population that live in inundated areas are between 60,000 and 100,000 individuals (IID, 2012). Large proportions (about 90%) of these households are regarded as rural. The major ethnic group within the lake is Intha. The income distribution along the township, illustrates that agriculture, specially tomatoes, account for more than half of the income of the lake households (Table 2). Tourism is relatively a new way of income, so it isn't measured as a separate category in this report; hence there are no accurate estimations on that.

8. Table 2. Income Distribution in the Lake and community involved. Data Source: IDE (2007)

Activity	Income	Community
Agricultural Activities	50%	Intha, Shan, Taungyo, Myanmar, Others
Small Scale production/ Manufacturing	30%	Intha, Shan,Pa O, Others
Local Business	10%	Intha, Shan, Myanmar, Others
Trading	7%	Intha,Shan, Myanmar, Others
Fisheries	3%	Intha, Shan, Others

Tourism of Inle Lake

There does not exist reliable long term data about tourism in the lake, existing accessible statistics are not accurate. Some rough estimations have been made by IID (Figure 1), representing the gaps of dissimilar information sources. They state that in the year 2012 Inle Lake received roughly 300,000 visitors, of which half of them were international. Forecasts predict the number of visitors will double within the following three years (IID, 2012). There have been no imperative needs to address tourism impact in recent years due to the reduced amount of visitors. Previous tourists were believed to have little economic, environmental and social impact. Nonetheless, some opinions estimate that in recent times the tourism industry within the lake accounts for about 50 million USD a year (Personal communication, Joen Kristensen, Director and Representative at Institute for International Development (IID), 2013).

Phaung Daw U pagoda festival is held in September every year, it is a distinguished celebration in the country. There is a large flow of international, national, and regional visitors, they stopover within the lake in this short period of time where all travels and numerous marketplace are happening on the water. Because of the celebration, larger disposal of solid waste is deposited into the lake, contributing to its pollution. This problem can be solved by raising awareness in this rush moment of the year, which can help to extend environmental awareness for the tourists, local communities and social entities involved in it.

There is a need to differentiate the impact from different tourist target groups, such as domestic and international visitors, with its diverse costumes and habits. It is important to raise an enclosed strategy that encompasses the

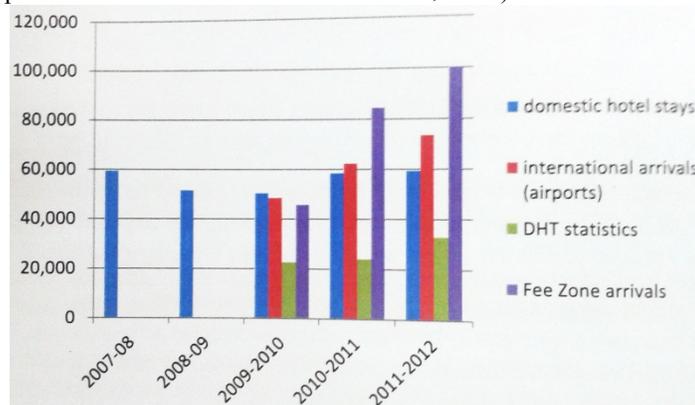
groups' main activities to minimize their impacts. Many of their cumulative impacts are very similar, such as sewage disposal, water footprint and food, usage of motorboats as transportation in the lake (plying of motor boats result in oil/lubricant spillage), etc. However, there exist some cultural differences on tourist activities, including different waste disposal behaviors. International tourists generally are aware of waste disposal habits, whereas local tourists should be well-informed and enforced to practice sustainable waste disposal behaviors. (Personal communication, Achim Munz, Resident Representative at Hanns Seidel Foundation, 2013)


Fig. 1. This graphs illustrate the differences on statistics from four
different data indicators on the lake. Source: IID 2012

Finding accurate indicator of human activities impact within the lake

ST Indicator Methodologies and Approaches

Once acknowledged the eco-habitat and social elements within Inle Lake, it is important to recognize the group of people undertaking each activity that is affecting the lake's environment (Table 2). There exist numerous investigations on ST indicators. Several of them failed to formulate a comprehensive approach of all factors involved on ST. A number of studies are focused on the environmental parts of ST as the one by Colin and Jon (2007). Some other investigations carried out a scale to assess the social impact of tourism within communities (Fedline, 2006), however, they failed to address environmental problems of ST. There are some other researches that addressed the complexities of all issues involved on ecotourism, including human activity analysis, but they only provide a limited scope for the case study where they are working on, as Zambrano Et al. (2010) carried out in Costa Rica or Wuver and Attuquayefio (2006) did in Ghana.

Most of these ST studies have been targeted for specific scientist groups, their outcomes are not entirely comprehensible and available for broader audiences, such as tourism industry, environmental advocates, tourists, media and concerned citizens. Ultimately, the focal point of this research paper is centered on the "decision-makers understanding". The decision-makers have the authority to choose the implementation of the policies that will have repercussions on the actions done by local population and tourists of one specific area. This fact will influence on the promotion of specific activities (Tin et al. 2009). Hence it is important to offer this decision-makers precise understandable information to encourage them to take decisions that support ST activities.

For instance, to implement correct measures on ST, it is necessary to emphasize that the major environmental problems in the lake are direct or indirectly caused by human beings, therefore, an association of human-environment should be constantly present to monitor human activities on physical environment. A carrying capacity index should be created and implemented. Carrying capacity in the context of tourism is defined by Cooper (1998) as "*the ability of a site or region to absorb tourism use without deteriorating*" yet, nowadays there is not existing a unanimously established explanation for it, neither a standard methical process for assessing it (White et Al, 2006)

The intrinsic challenges in the establishment of carrying capacities are the lack of understanding and consciousness of the concept regarding ST. In a comprehensive method, Koeman (2002) in an assessment report for Vietnam Tourism Ministry, split up Tourism carrying capacity into four branches: Physical, Biological, Psychological, and Social. All are related to the number of visitors/tourists to a site or area.

(1) *Physical* is the actual number of visitors a site can hold.
(2) *Biological* is the point at which environmental degradation occurs to the extent that it is irreversible or unacceptable.
(3) *Psychological* is the point at which the tourists feel the quality of their experience is damaged by the number of other tourists and/or their behaviors.
(4) *Social* is the level at which the local inhabitants of the site (possibly the tourist attraction themselves) feel disrupted, intruded upon.

Koeman (2002) as well, states that carrying capacities comprise qualitative as well as quantitative features, subsequently, there not exist precise figure for it. However is it essential that an effort is prepared to reach at some evaluation of the carrying capacity of each area, employing the best techniques and information obtainable.

Two main issues need to be addressed in this definition. First, the number of individuals that visit one place is significant (Physical branch), although, the activity that each of them performs on this place should be defined. It is significant to target what kind of tourists are visiting the lake and what activities they execute, trying to measure their cumulative impact. Other significant issue to state is that, current capacity is divided into four branches, but not all of them have same significance. Human-nature dualism should always be concerned, from a SD approach, biological factor should account for great part of the indicator. Every human activity should correspond with its impact on natural habitat.

ST Comprehensive framework to analyze Inle Lake human activities and its related impact

Human activities influence flora and fauna at numerous diverse stages of biological organization, arraying throughout habitats, communities, populations and individuals. Impacts can vary from small and momentary to harsh and long-lasting (Tin Et al. 2009). Accordingly, human activities measurement consists on a long process that requires uniformity on the analysis where lot of data need to be collected. An applicable study divides the classification of human activities as (1) research studies, addressing some specific subject with short term outcomes and (2) monitoring studies, involving quantifying changes in characteristics of resources over long period of time. (Robert Et al. 2006). A comprehensive ST Activities Indicator should encompass these two areas: (1) capable to explain specific questions in short term that determines the path toward actions and (2) able to be reused in the future when circumstances change and compare their results to predict future trends. The proposed framework in this paper attempts to create a clear methodology to address Inle lake's key human activities and its related impacts. Moreover, it aims to be used as reference for human activity indicator analysis in Tourism areas, flexible enough to acclimatize to other tourism destination studies and determined enough to maintain consistency in the methodology. Hence, every study appraised through this methodology would add value to the analysis tool in a process that follow these steps:

(1) *Identify the environmental–social problems that affect the lake.* Based on data research, questionnaires, interviews, experiments and related information.
(2) *Categorize the major human activities* that are the source of environmental-social problems, not necessary by specifying the whole compendium of all activities, but by encompassing a spectrum that can cover the activities that create the environmental-social problems identified previously.
(3) *Classify which community* or social group is responsible for each activity. Stating a clear identification of the ones that are responsible for the most "pollutant" activities
(4) *Input all this data in the Human Activities Indicator Table* .By the criteria of Table3,input data on social-ecological cumulative impact in Table 4. Previous analysis would help to categorize

(5) *Scrutinize* for every negative impact which activities and community of people are related (Table 3) Share it with interested parties, stakeholders and public.

(6) *Create a strategy* based upon the data analysis, targeting the groups of people that cause the impact, and encouraging them to transform the specific activities that are the source of the hazards.

(7) *Monitor* its effectiveness by updating the new data on the excel table through the time.

3.3 Indicator framework

Every activity is composed of quantitative and qualitative aspects. Firstly, recognizing the core human activities involved on the lake is essential to retrieve as much as environmental, social and economical data. This is classified in a list that shapes a scope to identify the main environmental degradation causes related to the lake. This list helps to identify the community actions responsible for the environmental problems. The outcome information should include three different types of data: environmental cumulative impacts, human activities and groups of people related to those impacts. All of these records are incorporated in Human Activities Indicator Table (Table 4) according to the criteria of Table 3 to analyze every group of human activities previously categorized.

9. Table 3. Tool analysis for the lake. Evaluation analysis

Impact	Evaluation	Feedback
Activity helps to reduce impact in this and most of the activities	5	Activity Performs well
Activity that helps to reduce impact in this activity but creates impact in others	4	Appraise other activities' negative impacts
Neutral, circumstances will not change due to activity	3	Neutral,
Activity creates more impact in this activity but create impact others	2	Appraise other activities' positive impacts
Activity creates negative impact in this activity and others	1	Activity need important appraisal.

To quantify the social ecological impacts created, Ecological Footprint (EF) has been chosen as biological indicator due to its major coverage of biological facts. EF is divided here into five elements : bio-reproductive land, bio-reproductive sea, energy land, built land and biodiversity (WWF, 2002). Furthermore, Human Impacts are divided in physical, psychological and social elements (Koeman, 2002). Due to limited time and capacity constraints, the examination of the impact of the activities of Inle lake in this paper, on both biological and social areas, may not be self sufficient in certain aspects. The objective of this paper is to disseminate the methodology of the usage and understanding of Human Activities Indicator Table (Table 4)

The process of input numbers in the table is very sensitive. A scale should be determined based on quantitative and qualitative information analyzed on this and previous case studies. The basic evaluation data determined for this appraisal is defined in Table 3. This table rates human activities from 1 to 5. Rating 1 means vast degradation of eco-habitat in the activity analyzed and other activities, 2 means negative impact in the activity investigated but other positive and/or neutral impacts in other activities, 3 means that the activity does not present positive or negative impacts when is developed, 4 means the activity analyzed creates good impact in some aspects but negative and/or neutral impacts in other activities, and 5 means that the activity creates good impacts in this aspect and also help to generate good impacts in other parts.

10. Table 4. Tool analysis for the lake.

Activity Group	Target Groups	% $	HI Physical	HI Psycologycal	HI Social	NI Biorep. Land	NI Biorep. Sea	NI Energ. Land	NI Built Land	NI Bio diversity
Floating garden	Intha, Shan, tourists, others	50%	4	4	4	2	2	3	2	1
Shifting agriculture	Pa-o, Intha, Shan	1%	3	3	4	1	2	2	3	1
Fishing	Intha, tourists	4%	4	5	4	2	2	3	3	2
Fuel wood	Intha, Pah-O, Shan, Myanmar	2%	3	2	4	1	2	1	2	2
Mining activities	Government Shan, others.	3%	1	1	3	1	2	1	1	1
Pagodas, temple	Monks, Tourists	2%	3	3	4	2	2	2	2	2
Residential.Building	Intha, Shan , Ministry, others	3%	3	2	4	2	2	2	2	2
Local Manufacturing	Intha, Pa O, others	20%	4	5	5	4	4	4	3	3
Trading	Shan, others	7%	3	3	4	2	3	3	2	2
Hotel	Tourist, hoteliers	10%	4	4	3	2	2	2	2	2
Boat Taxi	Intha, Shan, others	5%	2	5	4	2	2	2	3	3
Other tourism Attractions	Tourism, Shan, Intha	2%	4	4	4	2	2	2	2	2
Bird sightseeing	Tourist, Shan, experts	1%	4	5	4	4	4	4	4	4

Once the data is recorded on the Human Activities Indicator Table (Table 4), its apparent an understandable scope of the key pollutant activities related to tourism in the area, as well as its economic importance, the social communities that are performing each of these activities and the evaluation of the activity impacts that they create. Thus , this table helps to understand the overall situation of the lake. Different target groups can analyze and review the information on the table and add is as a tool to help to formulate strategies to minimize its impact by efficiently know who is creating it with the activities they perform.

As an outcome on the research in Inle Lake human activities we can observe that, for example, cultivating floating gardens is economically and socially beneficial for both local population and tourists. On the other hand, it creates great impacts on bio reproductive land (including wetland) and biodiversity (endemic species risk). The social groups that are involved in this activity (Shan, Intha, tourist and others) should change some patterns of their actions, or either switch to other non-impact activities with similar economical benefits. It should be developed in a way that is beneficial for the local communities, tourism and reduces its impact on the Inle Lake's water resources. Then, the decision makers involved in this activity should examine alternatives to address the environmental and social challenges, one of the alternatives is to encourage Sustainable Tourism, as it is economical beneficial, and can help to preserve the lake eco-habitat. Human Activities Indicator Table can be a tool for decision makers to help understanding the overall social, economical, and environmental situation of the lake while saving time and

economic resources. The outcome information can be re-examined during and after implementation of measures, as a result, the evaluation of the lake could be processed faster.

Conclusion

Human Activities Indicator Table has been developed in this paper by the measurement of relevant activities related to Inle Lake in Myanmar. The methodology to analyze and incorporate data in the indicator on this case study exemplify the complexity of Inle Lake particular circumstances. Every case study is different, and human activities involved on them fluctuate. To attain this two facts, the usage of this indicator encourages itself to be a tool to compare human activities from different case studies, moreover, it aims to be used as a effective monitor tool by updating applicable information of tourism activities. The analysis of the outcome data can help to implement efficient measures, on the economic, social and ecological situation of the area analyzed.

This document explain the Human Activities Indicator Table as an instructions manual to incorporate data and read it. However, the analysis and methodology to incorporate data on the table should develop further by generating additional standards and case studies data comparison. To do that, the tool its accessible to help to promote Sustainable Tourism (ST) for any party interested in developing it.

Design and development of Webquest for Physics Module by employing Isman Instructional Design Model

Norlidah Alias[41], Dorothy DeWitt, Saedah Siraj

Department of Curriculum & Instructional Technology, Faculty of Education,
University of Malaya, Kuala Lumpur, 50603 Malaysia

Abstract

The study was aimed at designing and developing a web-based teaching courseware, Webquest, for secondary school Physics module by employing the Isman Instructional Design Model and to test the effectiveness of the module. The paper draws attention to the design principles of the Isman Instructional Design Model. The prototype module was tested among a teacher and 4 students. The findings from interviews with the teacher and students show a positive response in attracting the students' interests toward the topic. The module was then implemented with 30 participants. In the evaluation phase, students' achievement score instrument was used to collect data for this study. The pre-posttest design conducted suggested that the module is effective.The findings from this study suggest that the Isman Instructional Design Model which pays attention to instruction from the learner's perspective than from content perspective is suitable in designing and developing Webquest for Physics module in the secondary educational setting in Malaysia. The findings of this study are expected to provide insights into promoting teaching and learning of Physics based on Webquest.

Keywords: Isman Instructional Design Model; Webquest

Introduction

Technology is used in education for two main reasons: as a tool for increasing the effectiveness of instruction and to integrate technology into the curriculum (Gülbahar, Madran, & Kalelioglu, 2010). A webquest is a research activity that requires the learner "to collect information about a subject using the web" (Sharma & Barrett, 2007, p. 24). Webquests are a very common way of using Web resources to research a variety of topics, and if appropriately used can trigger the situations necessary to develop both written and oral communication (Laborda, 2009). Recent studies have indicated that Webquest has a very high potential as a tool in teaching and learning (Alshumaimeri & Almasri, 2012; Laborda, 2009; Segers & Verhoeven, 2009), enhancing students' potential (Allan & Street, 2007; Zacharia, Xenofontos, & Manoli) and creating a positive learning environment (Allan & Street, 2007; Chang, Chen, & Hsu, 2011; Kleemens, Segers, Droop, & Wentink, 2011).

Webquest is a relatively new tool for teaching and learning. The model of Webquest was first developed by Dodge (1997) which consists of six components: introduction, task, information, process, evaluation and conclusion. WebQuest, which makes students access the web to complete a task or solve a problem, elicits higher-order thinking rather than simple information searching and recall (Gülbahar et al., 2010). Research done by Allan and Street (2007) on the impact of a knowledge by pooling WebQuest in primary initial teacher training, shows that WebQuest has the potential to promote high order learning within different disciplines in higher education. It also creates a new enviroment in learning. Most of studies on Webquest used quasi-experiment as the research design (Alshumaimeri & Almasri, 2012; Chang et al., 2011; Halat, 2011; Segers & Verhoeven, 2009; Hsiao, Tsai, Lin & Lin, 2012), while only a few on design and developmental research (Gülbahar et al., 2010; Norazah Nordin & Ngau Chai Hong, 2009).

Gülbahar et al., 2010 developed a web-based interactive system, Web Macerasi, for teaching-learning and evaluation purposes, and to find out the possible effects of the system. The study has two stages. In the first stage, a

[41] Corresponding author.
E-mail address: drnorlidah@um.edu.my

WebQuest site was designed as an interactive system in which various Internet and web technologies were used for infusing technology into the teaching and learning process. The Web Macerasi site was used for project work by 92 prospective students who attended different courses in different years. For collecting thestudents' perceptions about the implementations of the system, a questionnaire of WebQuest effectiveness and a focus group interview guide were developed. Next, the first phase of the study was concluded, and theWebQuest system was updated based on the data gathered from students. In the second phase, 27 students from a different course used the system, and their perceptions were collected through the questionnaire and analyzed. It was found that the students favored the technology-supported media, were more willing to collaborate, found the feedback very useful, and agreed on the positive contribution of planned works. Consequently, the WebMacerasi site was found to be successful and to have been used effectively in terms of its aims.

The same scenario operates in Malaysia as only a few studies have focused on the design and development of Webquest. Norazah Nordin and Ngau Chai Hong (2009) developed a WebQuest for ICT secondary school subject. The main objective of the study was to develop teaching aids based on webquest and to evaluate students' perception towards it. Questionnaires were used to evaluate between face aspect and teaching and learning content structure of the WebQuest developed. The results of the study shows that the overall presentation of the WebQuest entitled Computer System is suitable and interesting for teaching and learning of the subject. It can be implied that Webquest has potential as a tool in teaching and learning. However, not much literature on Webquest has explored its potential in the design and development of Webquest for Physics module. Hence, this study was aimed at designing and developing a Webquest for Physics module in secondary educational setting by using Isman Instructional Model and to test the effectiveness of the WebQuest module.

2.The Aim of Research

The aim of this research is to design and develop a WebQuest Physics module according to the Isman Instructional Design Model in the secondary educational setting and to test the effectiveness of the module. In order to achieve this aim, we set two research objectives. The first objective is to describe the design and development of a Webqusest module by employing the Isman Instructional Design Model. The second objective is to test the module effectiveness by pre/posttest design and interviewing 4 students.

This study seeks to answer the following research question:

- Is a WebQuest Physics module developed by employing the Isman model effective?

3. Significance of the Study

The results of the study can be used by educators to determine the effects of Isman model in the design and development of a WebQuest module in the secondary educational setting in Malaysia.

4.Scope and Limitations

In this study, a sample size of 30 students at an urban secondary school in the state of Selangor was selected as the population reflected the proportion of the multiracial communities in Malaysia.

5.Instruments

The instrument is two multiple choice tests used for pretest and posttest. This test was designed to analyze students' achievement on "Charles's Law" and "Boyle's Law". There were 50 items in these two instruments. The content of the instrument was validated by three Physics teachers while the language was validated by two language teachers with more than 10 years' working experience.

6. Theoretical Framework

6.1 Employing Isman Instructional Design Model in Developing of a Physics Module Based on Learning Style and Appropriate Technology

The major goal of the Isman Instructional design Model is to show how to plan, develop, implement, evaluate and organize full learning activities effectively to ensure competent performance by students (Isman, 2011). The theoretical foundation of the new model comes from behaviorism, cognitivism and constructivism views. Firstly, Isman (2011) used realationship between stimulus and response, the reinforcement factor and designing environmental condition in behaviorism theory to motivate more in this model. Secondly, motivation, intellectual

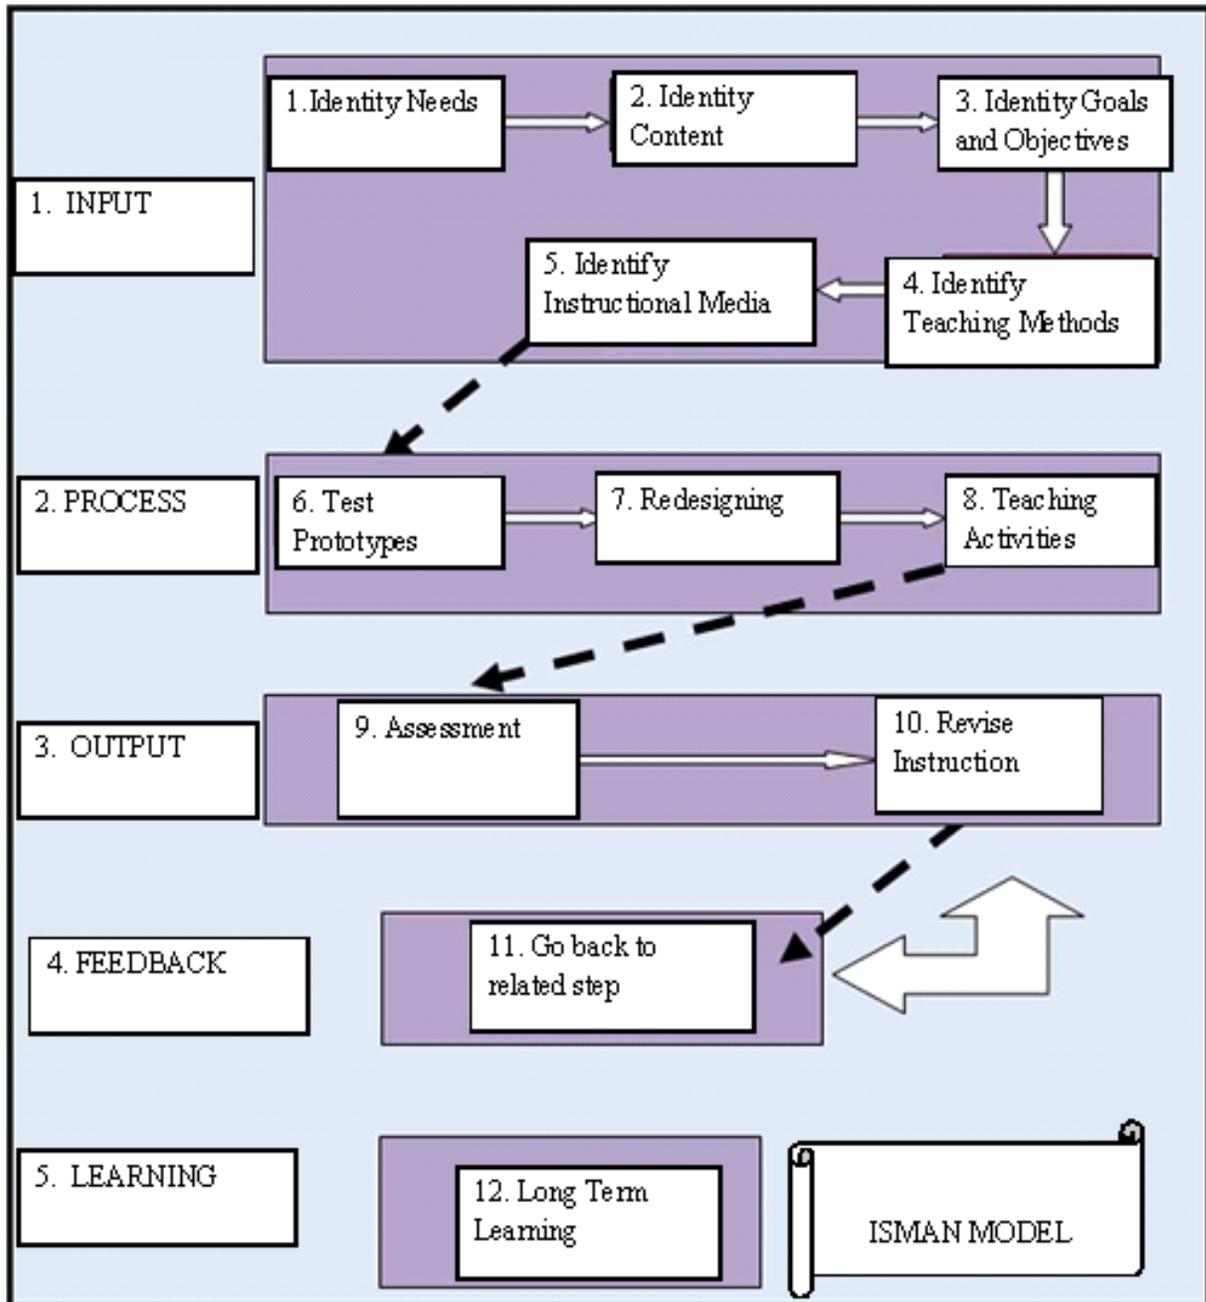
learning process, experiences and contents in Cognitivism theory are used in this model to motivate students to learn more in this model. This model is interested in how to store information into long term memory, hence instructional activities are designed in this model. The Isman model also uses constructivism which pays attention to personal applications. Isman model was implemented on 100 graduate students at the faculty of education at Eastern Mediterranean University in North Cyprus with the purpose to analyze the effects of the model on academic achievement (2005). The findings of the research indicates that Isman model was implemented successfully in instructional activities in the experimental group and affected academic achievement and so, it may be said that this model could be implemented to design instruction. Norlidah Alias and Saedah Siraj (2012) employed the Isman model effectively in the design and development of Physics module based on learning style and appropriate technology in the Malaysian secondary educational setting. Hence, the researchers aim to employ Isman model in the design and development of WebQuest Physics module and to test the effectiveness of the module. The Isman Instructional Design Model is described in a five-step systematic planning process. These are input, process, output, feedback and learning as shown in Figure 1.


Figure 1: Isman Instructional Design Model (Isman, 2011, p.139)

6.2 Steps in the Isman Instructional Design Model

The first step in the Isman model is input. The input step involves identify needs, identify contents, identify goal-objectives, identify teaching methods, identify evaluation materials, and identify instructional media. Isman (2005) states that the main goal of first step is to identify factors for input. In this research, we use a panel of experts to identify the input for the WebQuest module based on six components of the WebQuest: introduction, task, information, process, evaluation and conclusion.

The expert panel consisted of five individuals, two Physics master teachers, one ICT master teacher, a Professor in Physics Education and a head of department of curriculum and ICT in a local university. The experts review suggested that a WebQuest Physics module be developed on two topics on gas laws such as "Charles's Law" and "Boyle's Law".

An example of WebQuest Physics module is as shown in Figure 2 and Figure 3.

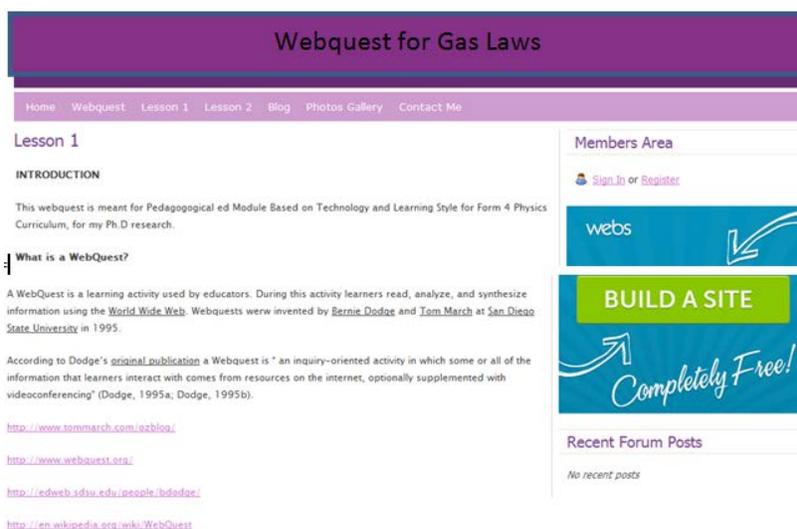
The second step in the Isman model is process. The process step involves testing prototypes and redesigning of instruction and teaching activities. We also used the expert panel to redesign the Webquest Physics module produced.


Figure 2: Main Page of Online Module of Webquest Website.
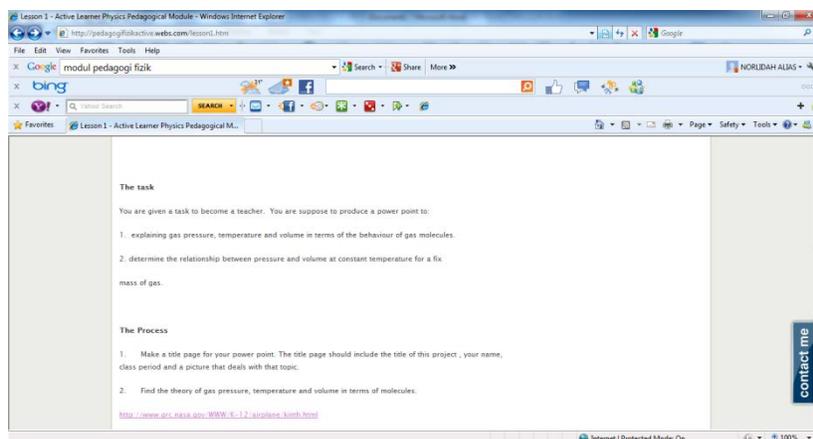

Figure 3: Main Page of the task and process in the Webquest Website.

The third step in the Isman model is output. The output process involves testing and analyzing results. To determine student learning, educational measurement and evaluation process should be implemented by teachers. In this research we tested the prototype by implementing the modules with a teacher and 4 students.

The fourth step in the Isman model is feedback. The feedback process involves revising instruction based upon the data collected during the implementation phase. If, during the phase, teacher finds that students are not learning what the plan wanted them to learn, or they are not enjoying the learning process, teacher will try to revise and improve some aspect of their instruction to enable the students to accomplish their goals. In this research, we revised the instruction according to the teachers' and students' comments.

The final step in the Isman model is learning. The learning process involves full learning. In this process, teachers want to ensure that their students have learned what the instructional plan wanted them to learn. This is when the pre/posttest was conducted to test the module effectiveness. Employing of the Isman model to design and develop a WebQuest Physics module is documented in work logs as illustrated in Table 1:

Table 1: Use of Isman model to design and develop a Physics pedagogical module

Steps	Work log	Descriptions
Step 1 Input	Identify needs Identify contents Identify goals-objectives Identify teaching methods Identify evaluation materials Identify instructional media	Designing Physics module based on WebQuest Designing the webpage Designing six components of the WebQuest: introduction, task, information, proses, evaluation and conclusion were designed.
Stage 2 Process	Testing prototypes Redesigning of Instruction Teaching activities	Using expert panel to redesign the WebQuest website produced.
Stage 3 Output	Testing Analyze Results	Implementing the WebQuest module with a teacher and 4 students.
Stage 4 Feedback	Revise Instruction	Revise the comments given by students and teachers.
Stage 5 Learning	Learning	Pre/posttest was conducted to test the effectiveness of the WebQuest module.

7. Results

The effectiveness of the WebQuestPhysics module by employing the Isman model was analyzed. Findings from the module evaluation conducted among 30participants suggested that the module is effective. A *t*-test was performed to determine if there were significant differences in achievement scores between the groups. Table 2 shows the results of *t*-test comparison of pre/posttest achievement for the WebQuestPhysics module.

The effectiveness of WebQuestmodule developed using Isman model

Findings from module evaluation conducted among 30 participants suggested that the module is effective.

Table 2: *t*-Test comparison of pre/posttest achievement towards WebQuestPhysics module

	Pretest (n = 30)	Posttest (n = 30)	*t*-value	*p*	Effect size
Mean	52.07	55.03	5.55	< .05	0.69
SD	18.18	16.58			

Table 2 shows that there is a significant difference between pretest (mean = 52.07, *SD* = 18.18) and posttest (mean = 55.03, *SD* = 16.58) marks, *t* (29) = 5.55, *p* < .05. The mean scores indicate posttest have significant higher achievement toward the WebQuest Physics module than pretest.

8. Implication and Conclusions

This paper has described an effort to design and developed a WebQuest Physics module in the Malaysian secondary educational setting by employing the Isman model. In addition, the effectiveness of the modules was tested and it was found that the module was effective for learners. It indicates that the Isman instructional model was implemented successfully in the design and development of the WebQuest Physics module in the Malaysian secondary educational setting. The outcome of this study will hopefully enhance the process of teaching and learning Physics in secondary educational setting by utilizing WebQuest.

Developing sustainable relations with internal and external stakeholders in universities: vision and mission views

Dr. Ömür Hakan KUZU[a,42], Prof. Dr. Hakkı GÖKBEL[b], Prof. Dr. Hasan Kürşat GÜLEŞ[c]

aSelçuk University, Beyşehir A. A. Faculty of Tourism, Konya, Turkey
bSelçuk University, Faculty of Medicine, Konya, Turkey
cSelçuk University, Faculty of Business Administration and Economy, Konya, Turkey

Abstract

The basic mission of the universities in the current century has been undergoing a transformation since the last two centuries. This transformation also affects the degrees of emphasis on missions with the content. Community service missions have been taking precedence over education and research missions in 21st century universities. Also current missions have been re-designed by integrating each other and the key elements such as strategy and sustainable development. The biggest difference of this design from the earlier models in universities is effective and permanent participation of the internal and external environmental conditions to this process. The success of this participation is possible by making the participation of the students, academic and administrative employees as internal stakeholders and alumni, business, central and local governments and civil society organizations as external stakeholders to the processes in higher education more functional.

In this context the subject of this study is researching the internal and external stakeholders view on mission and vision of Selçuk University's surveys data in the axis of a conceptual model designed for developing sustainable relations with a comparative method. In this study first, university and stakeholders relations are discussed with conceptual dimension and changing process's components. In the second part of the study, the questionnaire prepared in the form of case study and applied to university's internal and external stakeholders has been analysed in comparison. In the last part of the study, the process and system suggestions have been developed for building up planned and sustainable relationships with internal and external stakeholders through analysed findings.

Keywords: stakeholder, sustainability, university

Introduction

In the later 20th century and in the beginning of 21st century, important developments have been occurred on roles and functions in Higher Education Institution, especially university, organization structures. These developments are possible to deal as developments which occur in markets and being in financial difficulty because of reducing the government support gradually, increasing the competition and globalization. Globalization, the first one of these developments, is a development to influence on all countries, companies and universities because of being integrated to go beyond the national limit of knowledge, technology and capital. Creating the knowledge and fast developments occurred in diffusion process have caused pressure on universities and accelerated the competition between universities and universities and other institutions (Smit, 2002: 6; Aalerud, 2004: 15).

The issue that the governments don't make fund-raising for higher education, the second development is, has turned an international fact and the universities have had an expectation on the subject of solving the social and economic problems from governments. Over against, government has had more quality higher education services expectation from universities. But, reducing the financial support has caused a confidence crisis between government and universities (Smit, 2002: 7). The mentioned reduce on government support, have caused that the institutions develop the own source of income in way of various methods as new or higher tuition fee, research scholarship, industry and enterprises and research agreement and private education programs (Gumbort and Sporn, 2001: 10). The other side, education and investment cost have continued to protect the high level and the highest performance presentation which will be possible less sources, have obligated to be managed the universities by basic management-finance principles (Kozeracki, 1998: 1).

The third development is that labour shows alteration of student and institution requirements in recent 20 years. In economy and society, enterprises oriented knowledge have created the ever-growing and ever-changing labour market, universities have been expected to be brought the skilled studies for these markets. The main purpose of the universities have turned to gain the business opportunity, higher valued knowledge in society, skill, manner and behaviours for their students (Smit, 2002: 8).

Finally, period of change of higher education has made reconstruction subjects current issue in higher education institution. Reconstruction of higher education is the result of reform process occurred on knowledge and communication and importance of economic globalization, technical and socio-economic knowledge. At the same time, reconstruction is opportunity and threat interaction arose by being developed the run models and reconstruction the higher education institutions and reshaping the competition, fundamental change in education needs (Salmi, 2002: 8-12).

Fundamental change paradigm which influences reconstruction of higher education may be summarised as follows (Aktan, 2007):
- Quality assurance and accreditation
- Transparency and accountability
- Autonomy –academic freedom
- Differentiation
- Flexibility and specialization
- Entrepreneurialship and innovation
- Stakeholder participation
- Close relation with society
- Knowledge age learning and pedagogy system
- International cooperation

Four fundamental function and purpose of higher education which these paradigms influence may be ranked as follows (Taylor ve Miroiu, 2002: 9):

- The individuals are grown up with equipment which can use mental potential in the highest level and realize themselves along their lives, contribute the society and provide to improve their personality completely and freely.
- To allow to be used usefully for society and economy, by providing to be shared and being understood, increasing the knowledge.
- To generate the economic conditions based on compatible and sustainable knowledge in local, regional and national level.
- To contribute that generating a citizenship sensibility which the individual may improve freely themselves and democratic society.

Developments of fundamental mission, which have been explained above, in current century in universities have caused to realise a historical change for last two centuries. This change influences the orders in significance level with mission context. The current missions have been planned again with key aspect as strategy and sustainable development, being articulated with together. The biggest difference of former university models of this plan is activated and sustainable participation of environmental conditions in and out of university. This participation's success looks possible to make more functional that participation of alumni, business world, central and local governments and civil society organizations, which ocur the external environment, in higher education process as external stakeholder and students, academic and administrative staff who occur the internal environment of the university as internal stakeholder.

In the consequence of all developments, stakeholders, higher education institutions and their missions have been become different as stated above. Reducing the government role in higher education and increasing relatively the private university role have caused that the universities have been integrated with society much more. But, disadvantage of this tendency has been occurred and being departmentalized and social responsibility have become a threat to them. Management of university in dilemma and becoming overladen with request of stakeholders make current issue that the universities are managed well in stakeholder management sensibility of university (Jongbloded, Enders & Salerno, 2008).

The stakeholders of universities separated as internal and external, individual and partner, academic and not academic. Between these stakeholders, academic personal looks the most important internal stakeholder because of being core of scientific production. The other key stakeholder is students from being related to customer input technology sensibility of higher education (Rothschild & White, 1995). The students, who are output of universities at the same time, appear in society and sectors make essential active participation of external stakeholders in decision process of universities (Jongbloded, Enders & Salerno, 2008).

In the following sections, firstly it has been developed a conceptual model which participation of stakeholders to overcome the changes of universities has evaluated within change paradigms. Statement set, which has been occurred with component of model, has been presented as a case study and dealt with comparatively vision and mission preferences related to fundamental internal and external stakeholder of universities. Finally, process and system proposal have been developed on the point of stakeholders relations of universities.

Aim of The Study and Methodology

It is aimed to be contributed to explainability of stakeholder participation within conceptual model, which has been shown as follow, within the context of period of change in higher education which has been evaluated in introduction. Firstly, a statement set has been generated by specialist by using stakeholder analysis and case study which are one of the qualitative research methods within conceptual model in this study. Secondly, comments of internal and external stakeholders which obtained by means of the mentioned questionnaire, aimed at potential mission and vision statement of university, has been evaluated comparatively.

Model has been designed with the thought that sustainable and quality oriented stakeholder cooperation is an important issue for higher education institution. Therefore, model takes part sustainable and quality component in up and down position. *Accountability* and *improvement* which have two fundamental aims of quality and quality assurance have been used in the meaning of content in higher education (Hamalainen ve Jakku-Sihvonen, 2000). Therefore, quality has been associated with institutionalization case and generated the content of academic and institutional autonomy on the base of transparency and accountability management. A sense of social responsibility includes in order to be developed the sustainable relations with society on model in consequence of continuous improvement philosophy in quality.

External dynamic of higher education under the mentioned two fundamental components, taking part in model. These dynamics has been shown as;

- Cooperative development and internationalization
- Competition
- Recognition

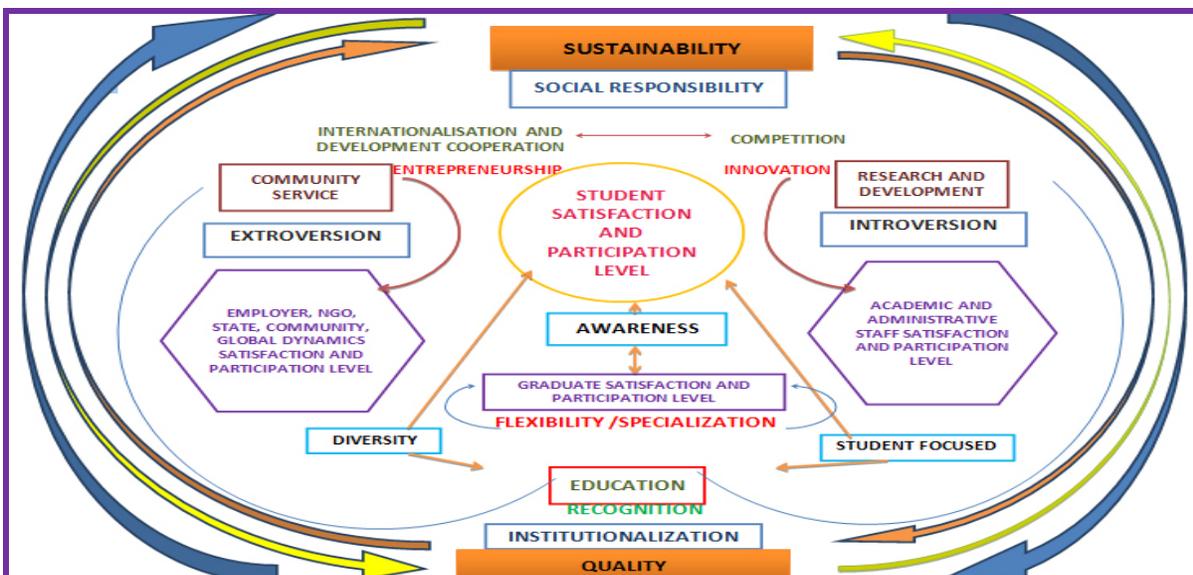
These three dynamic are market conditions which globalization influence the higher education institution. Under these conditions, cyclical interaction of three dynamics and three missions, which are shown with social service, research-development and training and education missions, being fundamental mission of university, three fundamental missions has been included on model in order to take the opportunity. According to model, it is required get into strategic partnership and competition, internationalization and sectorial ad international cooperation, recognition has been determined as a fundamental and central problem area as European Higher Education Area (Lisbon Recognition Convention-1997 and Bucharest Declaration-2012) (EHEA, 2012).


Figure 1.Stakeholder participation and satisfaction cycle

The participation and satisfaction levels by the basic stakeholders of the university are given within the framework of conceptual model. The satisfaction of students having an important role among internal stakeholders and their active participation into this higher education process due to the fact that they are the input, outcome and the self of the model is placed in a central position. The satisfaction and participation levels of students and graduates are classified as "awareness", the participation of academic and administrative staff by the internal stakeholders as "introversion", and the employer, non-governmental organizations, government, society and global dynamics by the external stakeholders as "extraversion". It is also emphasized that there is a circular relation among the elements in order to make an evaluation between internal viewpoint and external viewpoint in an interactive way and the key concepts have been determined as "innovation" for an exit gate to the introversion, "entrepreneurialism" for extraversion and "flexibility and specialization" for a consciousness raising education service.

Case Study: Selçuk University

Selçuk University was established in 1975. Being one of the most rooted universities throughout the country, it is ranked as the 10th university among 170 universities in total in accordance with the ranking by 2012 SCIMAGO Scopus. Also known as the second largest university with a population of almost 70.000, the University is consisted of 22 faculties, 7 graduate schools, 23 vocational high schools, 6 institutes and 1 state conservatory.

One part of the several stakeholder analyses conducted to arrange a Strategic Plan for 2014-2018 in the university is made though determining the vision and mission by the participation of stakeholders. In this study, the opinions of internal and external stakeholders of the university in terms of their vision and mission statements and their comparison are taken as a case study.

The stakeholders of the university are separated into two groups as internal and external stakeholders. The internal stakeholders are analysed separately as academic staff, administrative staff and students. The external

stakeholders are included in the analysis as managers of public and private sector, managers and employees of public and local administrations, managers of employer unions as the chambers of industry and commerce and non-governmental organizations. In the below section, the stakeholders are separated as students, academic staff, administrative staff and external stakeholders and their opinions on the vision and mission statements of the university are given and the findings are also investigated through comparisons.

3.1. Vision and Mission Opinions by Internal & External Stakeholders

At the time of this survey (initial period of 2012-2013 academic year), there are 74.832 enrolled students, 2.680 academic staff and 1.225 administrative staff in the university. The survey involves the participation of academic staff, administrative staff, students and managers from public, private and non-governmental organizations. Table 1 indicates the distribution of vision and mission statements of both internal and external stakeholders:

Table 1. Distribution of vision and mission selection by internal and external stakeholders at university

Vision and Mission Terms	Academic	Administrative	Student	External
In top 500 world-class universities	965	423	28.754	81
Competitive	896	399	4.233	80
Entrepreneurialial and innovative	1.040	472	3.442	80
Caring the historical values	880	423	1.242	77
Highly regarded	922	429	1.188	74
Self-confident	892	395	697	74
Institutionalized	1.042	463	747	72
Transparent and Participative	990	427	348	71
Honoured to be his/her student	1.032	432	678	71
Student-centred	802	326	641	70
Fair and reliable	1.004	473	392	70
Respectful to different and innovative ideas	986	430	167	70
Continuously changing and developing	983	455	373	66
Basing on scientific thoughts	1.073	416	122	65
Interrogative and researcher	985	394	143	65
Creating a value	913	389	207	65
Respectful to the social values	930	435	268	64
Initiator and leader	879	392	303	59
Socially responsible and sensitive to environment	943	418	255	59
Preferred by the students, preferable for graduates	1.064	425	719	58

3.2. Comparison of Vision and Mission Selections by Internal and External Stakeholders

When Table 1 is examined, it is seen that 1.073 people among the academic staff state that vision and mission concepts must "*base on scientific thoughts*". This concept is followed by the ones *"Preferred by the students, preferable for graduates", "Institutionalized", "Entrepreneurial and innovative", Honoured to be his/her student"* and *"Fair and reliable"*.

It is seen that 473 people among the administrative staff state that vision and mission concepts must be "fair and reliable" and this concept is followed by the ones *"Entrepreneurial and innovative"* and *"Institutionalized"*

It is seen that 28.754 people among the students state that vision and mission concepts must be *"in top 500 world-class universities"* and this concept is followed by the ones "*Competitive*", *"Entrepreneurial and innovative", "Caring the historical values", "Highly regarded", "Self-confident"* and *"Institutionalized"*.

The external stakeholders of the university state that vision and mission concepts must be *"in top 500 world-class universities"* and this concept is followed by the ones *"Continuously changing and developing"* and *"Preferred by the students, preferable for graduates"*.

Table 2 indicates the first three statements made when making the most and the least selections among vision and mission statements by the stakeholders.

Table 2. Comparison of initial and final three in vision and mission selections of stakeholders

Visions and Missions	Academic Staff	Administrative Staff	Student	External Stakeholders
Most preferred three statements	-Basing on scientific thoughts	-Fair and reliable	-Being in top 500 world-class universities	-Being in top 500 world-class universities
	-Preferred by the students, preferring for graduates	-Entrepreneurial and innovative	-Competitive	-Continuously changing and developing
	-Institutionalized	-Institutionalized	-Entrepreneurial and innovative	-Preferred by the students, preferring for graduates
Least preferred tree statements	-Student-focused	-Student-focused	-Basing on scientific thoughts	-Student-focused
	-Initiator and leader	-Creating a value	-Interrogative and researcher	-Transparent and Participative
	-Caring the historical values	-Initiator and leader	-Respectful to different and innovative ideas	-Self-confident

According to Table 2, the distribution of internal and external stakeholders within the group and their comparative weight levels are respectively as follows: *"in top 500 world-class universities", "Preferred by the students, preferable for graduates"* and *"Institutionalized"* for *the most preferred* vision and mission expressions; "Student-focused" and "Initiator and leader" for *the least preferred* ones.

Results

It is seen that academic staff puts a great importance on scientific thought, institutional conscious and institutionalization statements in their vision and mission statements. This result is different from the statements "competitiveness, innovation and entrepreneurialism", which are regarded as important by the university students. It is believed that high levels of awareness are quite effective in the selection of the statement "Basing on the scientific thought" by the academic staff. Students also have similar preferences when selection their vision statements in terms of institionalization and institutional conscious.

It is seen that administrative staff makes a reference to a "fair and reliable" understanding of administration. It is also important to see that administrative staff selecting the "entrepreneurial and innovative" statements in the same way with the students also selects "institutionalized" statement as a vision and mission in parallel to the opinions of academic staff.

It is also expressed in the vision and mission statements of the university students that the statements "competitiveness, innovation and entrepreneurialism", a trivet of being a world-class university in the centre of internationalization and globalization, are given importance by them. It is also expressed that the expectations of students in Selçuk University are quite high in terms of their rank among other universities, their preferability and familiarity; its re-organization and development with other innovations and minimization of concerns on employment within the cooperation between university and industry. The emphasis the students made upon historical values indicates that there is a perception on recognizing the local wealth within globalization; and the preferences of dignity, self-confidence and institutionalization also indicate that there are expectations to canalize the rooted potential history of Selçuk University into brand recognition and professionalization.

External stakeholders share the same opinion with the students by selecting the statement *"in top 500 world-class universities"*. In addition to this, they also have similar opinions with the academic staff in terms of the statement *"Preferred by the students, preferable for graduates"*.

Another important result of this study is that no stakeholders other than the students preferred the statement "student-focused". It should also be stated that the statement "student-focused" is not also preferred by most of the students.

It is also seen in the vision and mission statements preferred most by the university stakeholders following the findings of this study that levels of perception and awareness play an important role. The grounds for this opinion can be seen in the statements of both academic staff as "scientific thought" and of administrative staff as "fair and reliable".

The selection of "institutionalization" by the academic and administrative staff can be related to their sensitiveness in such issues as autonomy and professional organization. The expectations of benefactors from the university services can be concluded as internationalization and brandization because students are external stakeholders are in the centre of conceptual model of stakeholders as *"in top 500 world-class universities"* and due to their external position.

In this context, these issues are recommended to compose a stable strategic plan and program for the university by developing systematic and sustainable relations among the university stakeholders and within the framework of these relations:

- It is also possible to gather data by collecting opinions of internal and external stakeholders of the university via focus group discussion, workshop and search conference to get better results from the selections of vision and mission realized via stakeholder analysis and survey methods. Besides applying these methods separately for each stakeholder, common meetings for stakeholders can also be organized.
- Such surveys assessing the awareness and perception levels of the same stakeholders by basing on their vision and mission statements preferred most can also be applied. In this way, wrong perception problems will be removed in the vision and mission expressions of stakeholders, as the levels of conscious and awareness of the stakeholder selections are determined.
- Such informative meetings can be organized on "student-focused" subject for stakeholders mainly and "innovation" for students, "transparency and participation" for external stakeholders and "leadership" for employees. Relative negative ideas and their reasons can be interrogated on these concepts, which are the basic elements of becoming a world-class university and 21st century understanding of university.
- Stakeholders are encouraged to participate in all strategic administrative processes of the university as in vision and mission selections. An online data entry and sharing mechanism can be developed via some software to make this participation continuous and systematic and for its sustainability.
- An administrative unit can be established to account for senior administration and stakeholders in order to make qualitative and quantitative evaluations via a mechanism to be composed of stakeholder opinions, thereby increasing the visibility and awareness studies in this issue. In this view, an autonomous platform and in horizontal organization model, similar to the internal auditing unit or quality assessment, in which both internal and external stakeholders can meet as "Participatory University Center".

These can be recommended for future studies by following the opinions of stakeholders when selecting the vision and mission of the university investigated herein:

- The concepts of vision and mission can be presented for the evaluation of stakeholders with broaders and explanatory statements.
- The external stakeholders profile can be diversified primarily with graduates.
- Quantitative analysis methods can be diversified by the application of qualitative methods on the evaluations of stakeholders in a common platform first.
- Comparative examinations can be made with the stakeholders' analysis in other universities.
- Notification of stakeholders on such issues as universities, changes and new tendencies and evaluative processes can be increased on a regular and systematic basis.

13th International Educational Technology Conference

Development of an integrated learning environment with knowledge management for cultivating student critical thinking skills

Yen-Ting Lin[a], Min Jou[a43]

[a]*Department of Industrial Education, National Taiwan Normal University, 162, He-ping East Road, Section 1, Taipei Taiwan 10610, R.O.C*

Abstract

With the development of information technology and popularization of internet web-based applications, students nowadays are prone to rapidly browse information, making them incapable of analyzing or integrating information received. Hence, knowledge management and critical thinking skills have in recent years become an important topic in tertiary education. In order to develop student critical thinking skills, this study proposed a learning environment integrating web applications based on a knowledge transformation model. Students should be able to undergo a knowledge transformation process to strengthen critical thinking skills by using popular web applications integrated in the proposed learning model. To evaluate the effect of the proposed approach, 40 university students were invited to participate in a semester-long experimental course. The students were then evaluated after the course. Results showed that the proposed approach was able to effectively improve student critical thinking skills. In addition, students were also satisfied with the courses and teaching methods implemented in the experimental course used in the study.

Keywords: Knowledge management, critical thinking, web application

INTRODUCTION

Increased popularity of computers and Internet connectivity allowed students to easily obtain and share information. Hence, students are increasingly prone to scan and skim over information rapidly, and as a result, many were unable to analyze or integrate information, affecting their higher order thinking, creativity and their abilities to think critically. Thus, knowledge management that emphasizes knowledge creation, application, acquisition, sharing and internalization became an important research topic in recent years (Ungaretti & Tillberg-Webb, 2011). Continuous exchange of explicit and implicit knowledge was used to train students in higher levels of thinking skills and achieve the objectives of knowledge transformation. The principles of knowledge transformation referred to in this study were based on the theories of knowledge creation proposed by the Japanese scholars Nonaka and Takeuchi (1995). When members of an institution share knowledge through interactions and exchanges, the value of the knowledge would be elevated initiating knowledge transformation and creation in the entire organization.

The era of Web 2.0 also saw the emergence of many Internet services and programs such as Flickr, Wikis, WordPress and Google. These services are accessible and free, and their easy-to-use interfaces and powerful functions made them extremely popular. Many of these services have also become indispensable tools for some. Many papers have therefore pointed out that these Internet services and programs have the potential as useful educational tools for students and instructors in carrying out meaningful educational activities (Lin, & Jou, 2013; Schneckenberg, Ehlers, & Adelsberger, 2011; Thompson, 2007).

With this background in mind, this study has proposed an educational environment with a knowledge transformation model that integrated Google services. The objectives of the proposed environment would be to help promote student critical thinking skills and knowledge management processes. In order to assess the effectiveness of the proposal, an experiment was conducted in a college-level course that utilized the proposed environment in a Taiwanese university. Results showed that both instructors and students were pleased with the proposed approach, and the approach had effectively improved student critical thinking skills.

Literature Review

Teaching students how to think critically has become an important topic in education (Astleitner, 2002; Facione, 2007; Paul, 1995). This is because critical thinking is a basic element in knowledge development (Yeh, 2009). One of the most well-known definitions of critical thinking was made by Ennis (1991) who defined critical thinking as "reasonable reflective thinking that is focused on deciding what to believe or do" (p. 1-2). Moore and Parker (2009) provided another definition for critical thinking as "the careful application of reason in the determination of whether a claim is true" (p. 3).

In order to facilitate student's critical thinking skills, several researchers have identified argumentation as a key process in critical thinking and must be carried out through peer interaction and collaboration involving knowledge sharing and knowledge co-creation (Norris & Ennis, 1989; Moore & Parker, 2009). Moreover, engaging in social interactions, each student provides opportunities and resources for other participants to discuss and construct knowledge collaboratively that may cause disequilibration, knowledge inconsistency, opposability of perception and ideas, and inadequacy of logical reasoning and strategies for individual, which will facilitate higher-orfer thinking skills, such as critical thinking skill (Slavin, 1992; Yu, Liu, & Chan, 2005).

Additionally, a reflective mind is the hallmark of critical thinking (Schroyens, 2005). Thus, many research concluded that improving self-awareness and mindfulness would help develop reflective practices (Collier, 1999; Tillema, 2000; Yeh, Huang, & Yeh, 2011), provide adequate feedback, and improve self-awareness and mindful learning (Titone, Sherman, & Palmer, 1998). Some investigations also pointed out that interaction with other participants may help improve self-reflection, idea exchange and further development for mindful learning (Steele, 2001).

Approach of an integrated learning environment with knowledge transformation model

This study proposed an educational environment with Google services based on a knowledge transformation model, SECI (Socialization, Externalization, Combination, Internalization) model that would encourage learners to go through the process of knowledge transformation with Google services to improve their critical thinking skills. Figure 1 shows the educational environment framework. Google services used by this study as educational tools include Google Plus, Docs, Blogger and Sites. The tools would help learners undergo the four processes of

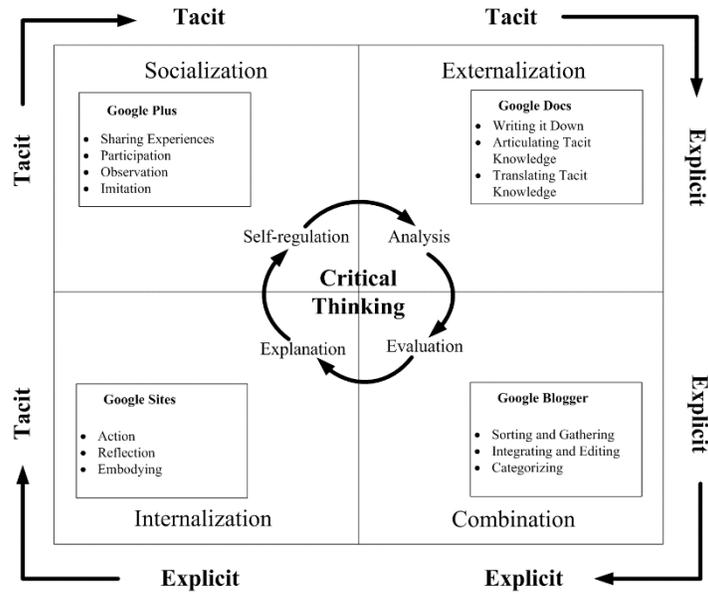
socialization, externalization, combination and internalization where tacit and explicit knowledge would be continuously transformed from one form to another in a knowledge spiral. The process would then help to improve critical thinking skills. The following describes the processes in detail:


Fig. 1. A web application supported knowledge transformation model

- Socialization

Socialization is a process where tacit knowledge is transformed into another form of tacit knowledge. The process incorporates communication, observation, adaptation and practice to share and absorb knowledge, passing it on through subtle or immersive influences to create new personal tacit knowledge. In order to promote student observation and adaptation in socialization, this study incorporated Google Plus to construct webpages for the instructed course. Course participants would form study groups and socialize via the course webpage to improve student-instructor and student-student interaction and exchange of information. Students could also implement self-discipline via the socialization process (Piaget, & Garcia, 1974).

- Externalization

Externalization takes place when the individual uses text, analogies, pictures, film or other media to transform personal experience, techniques and other tacit knowledge into explicit knowledge. This study incorporated Google Docs to help students analyze and externalize their tacit knowledge. Students would be able use various functions provided by the service to use texts, pictures and other explicit media to externalize their tacit knowledge and create explicit knowledge.

- Combination

In combination, individuals systematically analyze, categorize and combine existing explicit knowledge with explicit knowledge received through different types of information media or language symbols. This study utilized Google Blogger to help learners analyze, categorize, combine, structuralize, and evaluate existing explicit knowledge. As students compose blog articles to share with their instructors and peers, they would be systematically combining and presenting various types of explicit knowledge.

- Internalization

Internalization is the process where explicit knowledge is transformed through symbolization and specification into tacit knowledge. To facilitate this process, this study used Google Sites to assist student collaboration as well as interaction. Students would use Wiki-based mechanisms in Google Sites to conduct collaborative projects with their peers. We hoped that the processes of organizing and compiling data would allow reflective processes for the students to internalize explicit knowledge into tacit knowledge.

The focus of the proposed approach was to facilitate knowledge transformation amongst the participants and enhance their critical-thinking skills through continuous interchange of knowledge sharing, internalization, and co-creation via class-based and online learning activities.

Experiment

Research instrument, measures and goals

Feedback questionnaires were utilized in order to evaluate the impact of the proposed learning environment to students in terms of instruction and learning. The questionnaires included assessments on student critical thinking and satisfaction of the proposed environment. A detailed description is provided in the following text:

- Critical thinking: This study implemented the traditional Chinese version of the California Critical Thinking Skills Test (CCTST) Form A to assess student critical thinking skills (Facione, 1990). The CCTST is a 34 item, multiple-choice test designed for college students, graduate students, and adult professionals. The maximum obtainable score in CCTST was 34 points. The CCTST assesses five areas of critical thinking (analysis, evaluation, inference, induction, and deduction), and the test was implemented before and after the students undergo the learning environment. The internal consistency of CCTST Form A, measured by Kuder-Richardson Formula 20 (KR-20), is 0.70.
- Satisfaction: This study utilized an SSQ (Student Satisfaction Questionnaire) with a five-point Likert scale to assess student satisfaction (Biasutti, 2011). The questionnaire was divided into 3 sections – Google services, Didactic Material, and Professor.

Experimental design, participants and procedure

To evaluate the proposed integrated learning environment, the environment was used in a semester-long course (17 weeks) on product design and assessed through a quasi-experiment. The participants were 40 university students with an average age of 20 years. Course content and lesson activities include professor lectures, class discussions, online discussions, after-class exercises and practical projects.

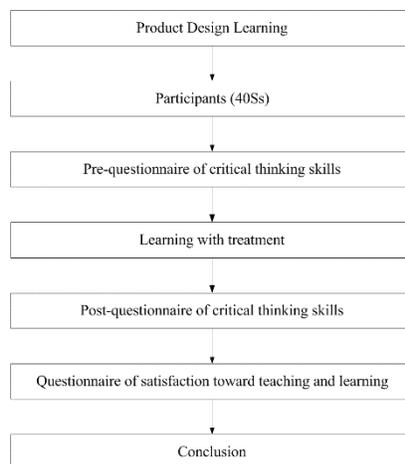
Figure 2 shows the experimental procedure. Students would fill in a CCTST Form A questionnaire at the beginning of the course. Relevant literature observed that most students were relatively unclear on the means of incorporating similar programs in their learning environment, even though they were seemingly adept in internet services and applications through daily use and exposure (Ng, 2012). Therefore, instructors would first provide students with correct user concepts and the guidelines of incorporating Google services into class activities, and give extra help for the few students who had never used Google services before. A course page was also constructed and administered by the course instructor on Google Plus before classes formally begin. The course page would help extend the time and space for student-instructor and student-student interaction, even when outside the physical classrooms and lesson times. With the conclusion of the course, students would fill in a second CCTST questionnaire form and SSQ form to evaluate their feedback on the entire course.


Fig. 2. Experimental process

Experiment

Critical thinking survey

Participating students were asked to take a CCTST Form A questionnaire before and after undergoing the learning activities to help assess their critical thinking skills. Preliminary analysis results revealed that the mean and standard deviation of the post-test (16.00 and 2.32) were slightly better than those of the pre-test (15.35 and 3.13). Additionally, a paired t-test was used in order to assess differences between student critical thinking before and after the learning activities. Results of the analyses, as shown in Table 3, show that student critical thinking increased significantly after going through the learning activities.

Table 3. Paired-samples t-test on the critical thinking skills of the students

	Group	N	Mean	S.D.	$t(39)$
Critical Thinking Skills	After participating in the learning activity	40	16.00	2.32	-2.292[*]
	Before participating in the learning activity	40	15.35	3.13	

[*]$p<.05$

Student satisfaction survey

Student Satisfaction Questionnaire (SSQ) was used to assess student feedback on the proposed approach. The Cronbach's alpha value of the questionnaire items was 0.855. Table 4 shows the statistical results. Cronbach's alpha

values for the three factors of Google Service, Didactic Material and Professor were 0.881, 0.870 and 0.831 respectively. Hence, we could see that students showed high degrees of satisfaction with respect to Google services, the didactic materials as well as the professor's instructions used during the learning.

Table 4. Students' satisfactions towards the learning process

#	Item	SA & A (%)	Neutral (%)	D & SD (%)	Mean
	Google service				
1	I like seeing other students interact with materials I had posted on each Google service	55.0	35.0	10.0	3.53
2	Use of Google services helped me share ideas with the other students	65.0	22.5	12.5	3.78
3	My group was able to come to a consensus by using Google Services	50.0	27.5	22.5	3.45
4	I had learned through information exchanges with other students via Google services	62.5	32.5	15.0	3.50
5	Use of Google services promoted knowledge transformation	70.0	17.5	12.5	3.70
6	I felt comfortable seeing other students reply or edit content I had posted	62.5	30.0	7.5	3.63
	Didactic Material				
1	Was clear	60.0	27.5	12.5	3.73
2	Was useful	65.0	25.0	10.0	3.73
3	Was challenging	72.5	25.0	2.5	3.90
4	Provided ideas for learning	67.5	17.5	15.0	3.70
5	Was connected to my background	80.0	15.0	5.0	3.98
	Professor				
1	Was friendly towards individual participants	60.0	32.5	7.5	3.75
2	Was dynamic and energetic in leading the learning activities	70.0	25.0	5.0	3.90
3	Made participants feel welcome in discussions	66.5	27.5	10.0	3.75
4	Encouraged participants to express ideas	65.0	25.0	10.0	3.78
5	Stimulated cooperation between participants	65.0	17.5	17.5	3.63
6	Stimulated formation of the online community	65.0	22.5	12.5	3.73
7	Gave feedback during activities	72.5	22.5	5.0	3.85
8	Gave appropriate suggestions	72.5	22.5	5.0	3.80
9	Helped in solving problems	65.0	27.5	7.5	3.73

Discussion

Participants developed critical thinking skills described in previous sections during their participation in the proposed integrated learning environment. The positive impact of the course was a result of several factors, such as the implementation of an appropriate pedagogical approach, an interactive technology tool, clear and organized didactic material, opportunity for participant collaboration, and support and feedback provided by the online tutor (Blass & Davis, 2003; Garrison & Anderson, 2003). In order to provide a clear discussion of these elements, this research shall evaluate the results based on three contexts – social, knowledge and technology.

Social context

Instructors play important roles in facilitating learning processes and implementing a learner-centered approach in the educational environment (Bower & Hedberg, 2010). In this study, the course instructor would stimulate and promote student interaction and collaboration in lectures and the online platform. The instructor would play the role

of an observer and encourage students to express personal thoughts and give appropriate feedback to students as required instead of providing traditional one-sided lectures. The Professor section in the SSQ investigation allowed us to know how students felt about the professor's role. Students provided positive feedbacks for the professor in terms of encouraging student discussion and expression of personal opinions, promoting peer collaboration, and guiding students in various learning activities. Additionally, results in the Google service section of the SSQ indicated that students were largely pleased when interacting with their peers via Google services. Therefore, in addition to the instructor, technology also played an important role in the social aspect. The online environment was simple yet efficient, expediting collaborative work, experience sharing, and peer support in the interdisciplinary project (Biasutti, 2011; Bliuc, Ellis, Goodyear, & Piggott, 2011; Bold, 2006; Hew & Cheung, 2008).

Knowledge context

Knowledge construction is not confined to an individual. Rather, it is a social process carried out between individuals, groups and organizations. The task of sharing individual knowledge or information after learning requires students to translate (encoding) and recall (retrieval) information as needed (Nonaka & Takeuchi, 1995). In the process of knowledge sharing, learners must figure out which information is important and worth sharing, and determine the methods of sharing it effectively. To accomplish the tasks of encoding and retrieving, students have to engage in various forms of information-processing activities such as rehearsal, organization, or elaboration in order to clarify relationships between pieces of information and compare newly acquired information to previous personal cognition (Gagne, 1985; Wittrock, 1979). The participants felt knowledge transformation processes in the proposed approach helped them create, share, transfer, and acquire knowledge mainly by social interaction. CCTST results concluded that participant critical thinking skills had improved. Participants were also engaged in searching for different knowledge aspects (concepts, ideas, videos, and pictures) that could be included in their interdisciplinary projects and were motivated to use Google services as a modern didactic tool.

Technology context

Despite the developments and popularization of modern technologies, they would often negatively affect the teaching and learning effectiveness of instructors and students (Zheng & Yano, 2007). From the teaching perspective, it appeared that different characteristics and functions of technology have the potential in helping instructors design a variety of teaching plans. However, inconsistencies in personal preferences and skills of the instructors would result in wide ranges of teaching performance and environments. Similarly, from the learning perspective, different technological preferences and skills amongst learners would also result in differences in learning attitudes and performance. It is therefore important for educators to eradicate or lower technological barriers imposed against students and instructor. Teaching activities must only incorporate appropriate technologies to make effective teaching and learning possible. In this research, Google services were applied with the objectives of helping students transform their knowledge. Student feedback on the effectiveness of the application in knowledge creation, sharing and transformation was assessed by a specific section titled "Google service" in the student SSQ. The section consisted of 6 items, and the resulting score was 3.60 out of 5.

Conclusion

This study proposed an integrated learning environment with knowledge management model to develop student critical thinking skills. An experiment was conducted in a product design course at a university in Taiwan. Two questionnaires were used to assess participant feedback. Results of the questionnaires revealed that the participants appreciated the use of the proposed approach to support the course.

Contribution of the proposed environment to knowledge transformation and critical thinking

Internet popularity and developments are increasing rapidly in the modern society. Students now enjoy extremely accessible information, and became increasingly prone to rapid browsing or skimming of information. This superficial intake of information negatively affected higher levels of thinking skills and significant gaps in critical thinking skills amongst students. As a result, students were unable to flexibly use what they had learned to solve daily problems. To tackle this issue, this study proposed an integrated learning environment that could help students

go through knowledge transformation processes, thereby promoting their critical thinking skills. The proposed approach could also provide significant assistance in training corporate and industrial professionals in the future. Additionally, the proposed learning environment could be used for other courses. Tertiary education is the cradle of corporate professionals. Only by improving student abilities in critical thinking would we be able to augment research and development capabilities of our corporations and industry and improve the competitiveness of our economy.

Limitations and future work

A limitation to this study was that the approach could not be conducted in a traditional classroom as not every student owns tablet PCs or smart phones. However, this issue should be resolved in the future with the increased popularity of such mobile devices. Another limitation was that although the majority of the participants were familiar with web applications in their daily lives, few understood the means of using these applications to support their learning (Ng, 2012). Therefore, course instructors had to give students explicit instruction and information on the educational uses of web applications.

Finally, the future direction of this study would be to apply appropriate web applications in strengthening the proposed learning environment for various subjects, disciplines and educational pedagogies. Further investigation would allow us to analyze specifically the learning effects amongst participants and develop suitable solutions to support the proposed approach by using application program interface (API).

Abstract

The purpose of the paper is to discuss the application of the Delphi technique in the research design of developing a valid and reliable ICT (Information & Communication Technology) competency standard for teachers. Much investment has been placed on organizing ICT training programmes for in-service teachers but the effects of teaching and learning practices in the classroom have not achieved expected outcomes. In addition, allegations from teachers highlighted that the training programmes are inadequate to completely meet the needs of ICT competencies. Hence, an ICT competency standard is necessary and timely to be developed to serve as a guide for organizing ICT training programmes. The Delphi technique is a research approach used to obtain a consensus opinion from experts using a series of questionnaires. This study was carried out with the purpose to obtain a consensus opinion from the experts on the types of important ICT competencies to be mastered by secondary school Science and Mathematics teachers, and ultimately develop the ICT competency standard for Malaysian Science and Mathematics teachers. The developed competency standard using the Delphi technique is valid and reliable.

Keywords: ICT competency; Delphi technique; Science and Mathematics

Introduction

ICT (Information & Communication Technology) is proven of being able to provide new learning opportunities among students by making learning fun and simplifying the process of constructing new knowledge (Dooly, 2009). In addition, teacher's quality is another main determinant factor in the learning of students (Ololube, 2006). Therefore, school teachers should equip themselves with ICT knowledge and skills to design new learning environment which is termed as ICT-rich learning environment. Various types of professional development programmes relating to ICT implementation have been organised for in-service teachers with the objective to upgrade ICT competencies among teachers, and subsequently bringing change to their teaching and learning practices, such as integrating ICT in classroom teaching and learning effectively (Borko, 2004). Some examples of ICT training programmes organised for teachers are Intel Teach to the Future project (Toh et al., 2006), smart teacher training courses, 14-week professional development programme, and one-year expert certification training course (Asariah, 2009).

Are the aforementioned programmes effective? To answer this question, some past research were studied and it is found that most of the ICT training programmes did not achieve the expected outcomes set by the organisers, and moreover the needs of the participating teachers were left unfulfilled (Wan Zah et al., 2009; Fong et al., 2009; Toh et al., 2006). In other words, after teachers return to schools from the traning programmes, there are not much changes of behaviour in their teaching practices when being observed. The past research findings support Cuban's claim (2000) that much investment had been placed on organising ICT training programmes but only minimal usage and changes were implemented. What is the reason behind?

The fact to be emphasised here is that most of the ICT courses offered in the ICT training programmes lack of uniformity and the curricula were designed according to the organisers without following any ICT competency standards, such as International Society for Technology in Education (ISTE) National Educational Technology

Standards for Teachers (ISTE 2000; ISTE 2008), European Computer Driving License (ECDL, 2007), European Pedagogical ICT License (EPICT) (Hojsholt-Poulsen, 2005) or UNESCO ICT Competency Standards for Teachers (UNESCO, 2008). It is clear that practices in the past did not manage to solve problems faced by teachers. Therefore, corrective actions are needed urgently.

In view of this phenomenon, this study was conducted to identify the types of important ICT competencies required to be mastered by Malaysian teachers. This study was carried out using the modified Delphi technique to ascertain elements needed in the content of ICT competency standard. This paper explains the research design used in the study in developing a valid and reliable ICT competency standard for teachers.

Research Design

The research design used to develop ICT competency standard for Science and Mathematics teachers is shown in Figure 1. It encompasses three stages, which are the stage of designing research instrument, the stage of validating instrument and the stage of developing ICT competency standard.

	Preparing initial draft for ICT competency standard for Science and Mathematics teachers (main category, competency ...)	• Analysis of overseas ICT competency standard guidelines

Malaysian ICT Competency Standard for Science and Mathematics teachers

Determining the criteria for the assessment of ICT competencies among Science

Implication

Curriculum & Developing the Modules of ICT training

Competency-Based Assessment System

Figure 1: Research Design of Developing ICT Competency Standard

The Delphi technique is defined as a communication structure used to discuss and assess an issue critically (Linstone & Turoff, 1975). It is a qualitative method introduced as a way to allow a group of experts to discuss and make decision on policy without having to meet face-to-face (Goodman, 1987). According to Lang (1998), the Delphi technique has already become a research methodology in helping researchers to formulate plans for the future. The rationale of using the Delphi technique is its cost and time effectiveness in achieving desired results (Helmer, 1983). When conducting this study, it involved iterative distribution of questionnaires to collect opinions from a selected group consisted of experts. This technique is employed with the purpose to identify consensus opinions relating to a specific topic (Talbot, 1995). Although opinions of this expert group which gathered collectively seem to be subjective, they are considered more reliable and the results are more objective compared to views gathered solely from an individual (Helmer, 1983).

The Delphi technique is designed to optimise the use of group opinion and minimise the quality of conflict interaction within group (Lang, 1998). Therefore, the following four basic characteristics need to be fulfilled if the researcher intends to use this approach, which are:

1. Structured questioning in which questionnaires are used. With this method, moderator is able to control the whole research process and foster more concrete results.
2. Meaningful iteraction of questionnaires is performed numerous rounds to allow panelists to re-evaluate their responses.
3. Controlled feedback in which it is achieved by giving overall group response to the panelists in rounds (except Round 1). This means that all the responses of the panel group are considered on the subsequent rounds of assessment.
4. Anonymity is an important characteristic because every panelist has the freedom to express his/her views without feeling pressured from other more powerful group (Rowe & Wright, 1999).

The Delphi technique has already been applied to solve problems in education field, for instance, it was used to determine research areas in distance education (Zawacki-Richter, 2009), to determine secondary school future curriculum (Saedah & Azdalila, 2008), to design m-learning curriculum (Ahmad Sobri, 2009), and to determine unversity teachers' ICT competencies in online learning (Espasa, Guasch, & Alvarez, 2009) and so on.

Designing Main Category, Indicators and Items

The structure of ICT competency standard employed in this study follows the standard structure of ISTE National Educational Standards for Teachers (2000; 2008). It comprises the following sections:

1. Main Category – It encompasses general aspects of the teachers' knowledge and skills pertaining to the teachers' job spesifications.
2. Indicators – It illustrates the desired quality of a professional teacher.
3. Items – It is used as the assessemnt criteria to obtain evidence of applying the knowledge and skills in actual practice.

The Main Category of ICT Competency Standard

Referring to the structure of ICT competency standard, the first question "What are the main categories of ICT competencies to be included in the teachers' ICT competency standard?" was asked. Analysis was performed on eight sets of existing ICT competency standard guidelines for teachers. These include European Computer Driving Licence (ECDL) (ECDL, 2007), European Pedagogical ICT License (EPICT) (Hojsholt-Poulsen, 2005), Computer Proficiency for Teachers developed by the Ministerial Advisory Council on the Quality of Teaching (MACQT, 1997), Minimum Standards for Teachers-Learning Technology (Education Queensland, 1997), and Queensland ICT Continua (Education Queensland, 2003); International Society for Technology in Education (ISTE) National Educational Technology Standards for Teachers (ISTE NETS-T 2000; ISTE NETS-T 2008) and UNESCO ICT Competency for Teachers (UNESCO, 2008). Based on the results of comparing the eight sets of ICT competency guidelines, approximately ten main categories were listed (Ch'ng et al., 2008a).

Subsequently, document analysis was conducted as a step to determine the important categories in the context of a nation, and in this paper Malaysia is referred specifically. The documents that were investigated include Smart School Flagship Applications: The Malayisan Smart School A Conceptual Blueprint (Smart School Project Team, 1997), Education Development 2001-2010: Integrated Planning for Generating Education Excellence (Malaysian Ministry of Education, 2001), Formulation of the National Education Blueprint, 2006-2010 (Malaysian Ministry of Education, 2006), ICT Literacy for Secondary School Guideline (Malaysian Ministry of Education, 2007) and so on.

Therefore, the researcher decided to focus the scope of this study on six main categories in designing the draft of ICT competency standard for teachers, they include: (1) Knowledge in ICT Operation, (2) Planning and Designing Learning Environment, (3) Smart Pedagogy, (4) Assessment and Evaluation, (5) Lifelong Learning, Practice and Productivity, and (6) Social, Moral Values and Issues.

Important ICT Competency Indicators

The subsequent steps include performing literature review on the findings of local research, exploratory interview and comparing technique toward the ISTE 2000 standard guide to outline the statements for ICT competency indicator division.

Literature Review

Past research done in Malaysia such as Fong & Ng (2005), Toh et al. (2006), Chong, Sharaf, & Jacob (2005), Kamisah, Lilia & Subahan (2006), Mas Nida, Moses & Wong (2009), Fong et al. (2009) and so on, were studied to obtain ideas about the types of knowledge and ICT skills that are already mastered, yet to be mastered or needed to be mastered among the in-service teachers. These form an important benchmark for the teachers' ICT competencies.

Exploratory Interview

Exploratory interviews were conducted among school teachers to obtain information about the teachers' experiences in implementing ICT at school level, without the intention to make any comparison. The findings of the exploratory interviews (refer to Ch'ng et al., 2008b) are advantageous as they help in developing competency statements and important items which are used to reflect the actual needs, the barriers and the usage of ICT in schools among teachers.

Comparing The Standard Guides

Based on the information gathered from literature review and exploratory interviews, there are 24 subcategories suggested to be identified as the ICT competency indicators for this study. Comparing technique together with the existing ICT standard guidelines are used as the basis to classify subcategory group.

Then, the process of outlining specific statements for each competency indicator is initiated. The models of competency standards of ISTE NETS for Teachers (2000) and ISTE NETS for Teachers (2008) were selected to use as the fundamental framework to outline the statements of competency standard indicators. The formulation of the statement of competency indicators was administered using the methods of comparing and modifying upon the use of terminology, word or sentence structure to conform to the needs and suitability.

The Measurement Items of ICT Competency Standard

There were four workshops organised to write and classify items gathered from literature review. The research instrument was designed based on the constructs of ICT competencies (main category and competency indicator). There were 20 research assistants consisted of ICT experts, lecturers and Science and Mathematics teachers participated in these workshops. The research instrument referred were obtained from the past research such as Norizan (2003), Scheffler & Logan (1999), McCoy (2001), Dakich (2005), Fong & Ng (2005), Namlu & Odabasi (2007). With this method, different types of sample items were collected and reviewed for the development of ICT competency items. The outcomes of this series of workshops resulted in the drafting of a list of measurement items.

Pilot Study

Pilot study was carried out among school teachers. The objective of the pilot study is to identify the weaknesses of the instrument. Thirty Science and Mathematics teachers were selected randomly. A set of instrument for the pilot study was developed. The questionnaires prepared include open questions and likert scale questions. The questionnaires were printed and there were three sections in the questionnaires, which were:(1) 6 main categories, (2) competency indicators and (3) ICT competency items. Respondents were invited to assess the suitability of main categories and statements of ICT competency indicators to convert into ICT competency standard for teachers. The items were in the form of open questions whereby the respondents were required to write their views and comments about the statements contained in the questionnaires. The respondents' comments in the pilot study were taken into account for modifying and eliminating the list of items to ultimately develop the Delphi technique research instrument.

5. Validating Instrument

Subsequently, two sessions of round-table discussion were arranged to obtain validation from the experts in respect of determining categories, ICT competency indicators and items which were outlined earlier. The partcipants for the round-table discussion were invited using snowball sampling where all the participants were invited by the researcher's supervisor with reference to their expertise. The participants consisted of ten lecturers from local university with expertise in educational technology, Science education, Mathematics education, distance education and psychology education. Besides that, another four in-service secondary school teachers from the field of Information Technology, Science and Mathematics were invited for the round-table discussion. This process is important to confirm the validity of the items with regard to the constructs. At this stage, one set of the drafts of ICT competency was reviewed. It consisted of 6 main categories and 24 competency indicators.

6. Developing Round 1 Questionnaires

The content of the draft of ICT competency standard together with the measurement items produced through the qualitative research procedure were used to develop Round 1 questionnaires. This approach is regarded rational, intuitive or theory-based. Items used in Round 1 questionnaires were generated from the concepts of theory which were identified following several procedures discussed earlier.

7. Forming The Delphi Panel Group

According to Adler & Ziglio (1996), the members of the Delphi panel should meet four conditions as stated below:
        1. possess extensive knowledge and experience in the research problem,
        2. are committed to involve,
        3. have spare time to participate in the research process of the Delphi technique,
        4. possess effective communication skills.
For this study, the criteria set for selecting the Delphi panel were all local educators with extensive experience and expertise in using ICT in the classroom. The snowball sampling technique was used to identify individuals who were qualified to be invited and appointed as the Delphi panel of this study (Skulmoski, Hartman & Krahn, 2007).

In fact, there is flexibility in determining the sample size of the Delphi panel. According to Skulmoski, Hartman & Krahn (2007), the number of panel in the past research range from approximately 4 to 171 "experts". However, Dalkey (1975), finds that 15 experts and above can maximise reliability and minimise group error on the degree of consensus.

As exemplified in this study, there were 33 experts appointed as the Delphi panel. They were local university lecturers in the field of education and educational technology; university/college lecturers in the field of Science and Mathematics, university/college lecturers from other fields but with extensive experience in using ICT to execute professional tasks and they were ICT daily users to support teaching and learning practices; and also school teachers who used ICT in classroom at least three times per week. In addition, the selected candidates affirmed their full commitment to this study using the Delphi technique.

Procedure of Modified Delphi Technique

Immediately after forming the Delphi panel, every member of the Delphi panel was contacted whether face-to-face, or via telephone and email. The panelists were given brief explanation regarding the research objectives and the expectation from them. This included giving access link to the research instrument website. In actuality, the expert panel has the flexibility to give their responses online or using printed questionnaires or using questionnaires in the form of MSWord attached in the email. The Delphi panel was given seven days to answer the questionnaires for Round 1. Two days before the due date of giving Round 1 response, a reminder email was sent by the researcher to remind the panel members about their incomplete tasks. However, the duration was extended for another three days to wait for the responses from the panel members who were unable to return the questionnaires in time.

All the data collected in Round 1, was analysed and adopted to develop questionnaires for Round 2. New items were included in the Round 2 questionnaires based on the suggestions given by the experts in Round 1. Face validity and content validity were checked by the researcher's supervisor.

Delphi Round 2 questionnaires were prepared in two forms: in MS Word file and printed questionnaires. Delphi panel individual feedback together with the data analysis of group feedback were prepared by the researcher in Round 2 questionnaires. They were then printed and distributed or emailed. Panel could refer to the comments of other panel, and the group median value, inter quartile range and personal rating in Round 1. They then justified whether the values in the earlier round were significant or some modification needed to be made upon their respective ratings in this Delphi round. All the panel members were given five days to respond. Two days before the due date of giving Round 2 response, a reminder email was sent by the researcher to remind the panel members about their incomplete tasks. However, the duration was extended for another three days to wait for the responses from the panel members who were unable to return the questionnaires in time.

Delphi Round 3 questionnaires were prepared in two forms: in MS Word file and printed questionnaires. The format was similar to Round 2 questionnaires, except the number of items in this round was limited to only eight items. Face validity and content validity were checked by the researcher's supervisor. All the panel members were given seven days to respond in view of three public holidays fell within the period.

As the example of this study, three rounds of the Delphi technique were practised. Round 1 was performed to collect additional input and comments from the expert panel about the initial list of ICT competencies compiled through qualitative research method such as document analysis results, literature review, exploratory interview, pilot study and round-table discussion. Round 2 was executed to obtain validation for items in Round 1 and to obtain consensus from the experts, and to distribute new items and suggested ideas from the panel in Round 1 for the first time. Considering all the items in Round 2 had reached consensus, the implementation of Round 3 was merely to validate the panel's responses on the additional items (contained in Round 2 questionnaires). In Round 3, it was found that consensus from the experts was achieved for all the items and hence the Delphi round stopped (Delbecq, Van de Ven, & Gustafson, 1975).

Delphi Data Analysis

Immediately after forming the Delphi panel, every member of the Delphi panel was contacted whether face-to-face, or via telephone and email. The panelists were given brief explanation regarding the research objectives and the expectation from them. This included giving access link to the research instrument website. In actuality, the expert panel has the flexibility to give their responses online or using printed questionnaires or using questionnaires in the form of MSWord attached in the email. The Delphi panel was given seven days to answer the questionnaires for Round 1. Two days before the due date of giving Round 1 response, a reminder email was sent by the researcher to remind the panel members about their incomplete tasks. However, the duration was extended for another three days to wait for the responses from the panel members who were unable to return the questionnaires in time. All the feedback and comments collected in three Delphi rounds were recorded. The quantitaive data was analysed using Statistical Package for Social Sciences (SPSS) v. 16 and MS Excel.

The degree of importance and consensus are justified after each Delphi round before making interpretaion. The group response median value and the inter quartile range distribution are usually referred as the reference for the degree of importance and consensus in the past research (Norizan, 2003; Saedah & Azdalida, 2008; Ahmad Sobri, 2009). For the example of this study, the analysis of consensus data of the experts was done based on median, inter quartile range and quartile deviation on Round 1 data, Round 2 data and Round 3 data.

After the median value, inter quartile range and quartile deviation are identified, the subsequent analysis technique is classifying items according to the consensus level and importance level. For this study, the concensus level is divided into three levels (high, medium and no consensus) and importance level is divided into two levels (very high and low). To determine the consensus level which are: high (if quartile deviation is less than or equal to 0.5), medium (if quartile deviation is in between 0.5 and 1) and no consensus (if quartile deviation is more than 1); and the importance level which are: very high (in which the median value is 4 and above) and low (in which the median value is less than 3.5). For this study, items which obtained very high importance level and also high consensus level were used to develop ICT competency standard and ICT competency assessment criteria.

Reliability and Consistency of Experts' Responses

Young (2007) suggests that researcher can evaluate the consensus obtained in Round 1 and Round 2 to present to the panel as a measurement of reliability. If after Round 2, it is found that consensus has been achieved, it can then be assumed that researcher has done well on the summary of panel's feedback gathered in Round 1.   With this method, researcher has concrete reason to support the assumption that the acceptable one reliability degree is fulfilled (Fish & Busby, 2005).

Consistency refers to the stability of response. For this study, the response pattern of local Delphi experts was observed in the perspective of response consistency between rounds. This is important for acceptable data reference quality or reliability. In the research of Ahmad Sobri (2009), the Wilcoxon Match-pairs Signed-ranks test was used to identify the consistency of experts' responses between rounds. This test was also used in this study for data between Rounds 1 and 2, Rounds 2 and 3.

Results and Discussion

The Delphi results of the study are presented in Table 1 and Table 2. Table 1 presents indicator statements found to be rated high importance and achieved high consensus level. These are items that achieved quartile deviation (Q.D) value of less or equal to 0.5 with median of 4 and above.

Table 1. Delphi Results: Indicators with High Importance Rating and High Consensus Level

Indicator	Median	Q1	Q3	IQR	QD
1: KNOWLEDGE IN ICT OPERATIONS					
1A – Show understanding and application basic ICT-related concepts and skills.	4	4	5	1	0.5
1B - Demonstrate constant development and enhancement in the latest ICT-related knowledge and skills.	4	4	4	0	0
2: PLANNING AND DESIGNING LEARNING ENVIRONMENT					
2A - Design and prepare suitable and relevant ICT-integrated lessons to cater to students' diverse needs.	4	4	5	1	0.5
2C - Select and evaluate appropriate curriculum materials.	4	4	5	1	0.5
2D - Plan the usage and management of curriculum materials in lesson activities.	4	4	5	1	0.5
2E - Plan strategies to integrate ICT in lesson activities and manage student learning.	4	4	5	1	0.5
3: SMART PEDAGOGY					
3A - Use ICT assisted instruction to enhance students' meaningful learning.	4	4	5	1	0.5
4: ASSESSMENT AND EVALUATION					
4A – Apply ICT in assessing student learning of subject matter using a variety of assessment techniques.	4	3	4	1	0.5

4C – Apply evaluation criteria to assess students learning, communication, and productivity.	4	3	4	1	0.5
5: LIFELONG PROFESSIONAL LEARNING, PRACTICE AND PRODUCTIVITY					
5A - Use ICT to engage in ongoing professional development and lifelong learning.	4	4	5	1	0.5
5B - Continuous evaluation and reflection on the use of ICT that supports meaningful learning.	4	3.5	4.5	1	0.5
5C – Apply ICT for "just in-time learning" (JIT) to enhance productivity.	4	3	4	1	0.5
5D - Use ICT to communicate and collaborate with colleagues, parents, and other communities to nurture student learning.	4	4	5	1	0.5
6: SOCIAL AND MORAL VALUES AND ISSUES					
6A - Understand the moral and ethical issues concerning the usage of ICT.	4	4	5	1	0.5
6B - Inculcate and practice moral values regarding ICT application.	4	4	5	1	0.5
6D - Promote and support safe and healthy use of ICT tools.	4	4	5	1	0.5
6E - Provide all students with fair equitable access to ICT resources.	4	4	5	1	0.5

A total of 17 indicators achieved high importance rating and high consensus level. It was found that all indicators that were proposed under 2 main categories: (i) knowledge in ICT operations, and (ii) Lifelong Professional Learning, Practice, and Productivity are regarded as important competencies for Science and Mathematics teachers.

Based on the number of indicators listed according to each main category in Table 1, the findings show that the emphasis is toward competencies related to the three main categories such as Planning and Designing Learning Environment (4 indicators), Lifelong Professional Learning, Practice, and Productivity (4 indicators), and Social, Moral Values and Issues (4 indicators). This followed by main category related to Assess*ment and Evaluation* (2 indicators)*,* except for category *Smart Pedagogy* which was rated 1 indicator for high importance and high consensus level.

Table 2 presents the items that achieved high importance rating with moderate consensus level. These items achieved quartile deviation values of more than 0.5 and equal to 1 with a median of 4 and above.

Table 2. Delphi Results: Items with High Importance Rating and Moderate Consensus Level

Indicator	Median	Q1	Q3	IQR	QD
2: PLANNING AND DESIGNING LEARNING ENVIRONMENT					
2B – Refer to contemporary ICT-related educational research in the preparation of lesson plans.	4	3	4.5	1.5	0.75
3: SMART PEDAGOGY					
3B - Employ ICT to support students' diverse needs in self-paced, self- assessed, and self-directed strategies.	4	3	5	2	1
3C – Apply ICT to develop critical and creative thinking skills.	4	3	5	2	1
3D - Manage student learning activities in an ICT instructed environment.	4	3	5	2	1
3E - Integrate ICT in various instructional strategies.	4	3	5	2	1
4: ASSESSMENT AND EVALUATION					
4B - Apply ICT to generate data on students' achievement, to interpret results and communicate findings; so as to improve instructional practice	4	3	5	2	1

and to maximize students' learning.					
6: SOCIAL AND MORAL VALUES AND ISSUES					
6C - Identify and discuss the impact of ICT on the society.	4	3	5	2	1

It was found that there are 7 indicators which achieved high importance rating with moderate consensus level. All these indicators are listed under 4 main categories such as Planning and Designing Learning Environment (1 indicator), Smart Pedagogy (4 indicators), Assessment and Evaluation (1 indicator), and Social and Moral Values and Issues (1 indicator).

The expert panel of this study agreed that teachers should be competent to refer to research in relation to ICT-based education for their lesson plan preparation, but this has only achieved moderate level of consensus based on the analysis report of the expert consensus views. It was explained that the reason behind this circumstance is due to this practice increases teachers' burdens when writing lesson plans. Nonetheless, the expert panel acknowledged that it is important for teachers to possess the competency as the research findings are a good source for innovative ideas to ease the process of integrating ICT in teaching and learning activities.

The expert panel of this study affirmed that teachers should be competent in using ICT to support self-paced, self-directed, self-assessed learning among students and to inculcate independent learning, but this has only achieved moderate level of consensus based on the analysis report of the expert consensus views. It was explained that the huge student number per class is an additional burden for teachers. Nonetheless, the expert panel acknowledged that it is important for teachers to possess this competency.

It is interesting to note that though the expert panel agreed "*Apply ICT to develop critical and creative thinking skills*" is an important competency indicator, this has only achieved moderate level of consensus based on the analysis report of the expert consensus views. To view from different perspective, the expert panel of this study has exhibited high level of consensus that this competency is very important to be considered as a criterion in assessing teachers' ICT competencies.

It is also interesting to note that though the expert panel agreed on the importance of teachers should be competent in using ICT to generate student performance data, interpret students' results, communicate analysis and findings to improve students' learning, this has only achieved moderate level of consensus based on the analysis report of the expert consensus views. There were opinions highlighted that the tasks should be taken over by Learning Management System (LMS), but the present system at school level is unable to generate student performance data automatically. Teachers still have to record the test marks by hand and prepare the report cards for parent signatures. Also, there were opinions indicated that this competency is only relevant if schools are equipped with LMS. Looking at the existing situation, this competency is not needed at present time.

From another aspect, the expert panel agreed that teachers should be competent in managing learning activities in ICT (3D) teaching environment and integrating ICT with different teaching strategies (3E). Teachers should also be competent in discussing the impacts of ICT toward society in the classroom (6C), but based on the analysis report of the expert consensus views all these three indicators have only achieved moderate level of consensus.

For the purpose of this study, these indicators were not considered in the development of ICT competency standard for Science and Mathematics teachers.

Based on the findings of this study, there was no item that achieved quartile deviation of more than 1 or the value of median which is less than 4. In other words, no items was rated not important or no consensus.

Only statements which achieved high consensus level and high rating were used in the establishment of the ICT competency standard for this study. After analyzing all the 24 indicators proposed in the preliminary research, the researchers are able to identified high importance with high consensus statements to be used in developing the ICT competency standard.

Limitations of the Study

The appointed Delphi panel experts for this study comprised of local Malaysian academics only. The number of Delphi rounds used for this study is only three rounds. Every round of the Delphi strategy is limited to only seven to ten days duration for responses from the experts. The results of this study cannot be generalized among all Science and Mathematics teachers in other nations.

Conclusion

This paper presents the research method from preparing the initial draft of ICT competency standard for Science and Mathematics teachers to the development process of the Delphi research technique instrument. It includes competency statements such as main category, competency indicators and items represent skills and competencies. Document analysis, exploratory interview, literature review and pilot study are all done for the purpose. Modification of the initial draft of competency statements is completed based on the round-table discussion. The draft of ICT competency standard and measurement items are finalized and the validity is obtained through the Delphi technique. Data is then analyzed to check for the consistency of experts' responses between rounds. Instrument developed from the Delphi technique research findings is also examined and it obtains validation from the experts in educational technology for the content validity and construct validity. The research procedure using the Delphi technique is rigorous and hence the developed research product is valid and reliable. This paper has provided a clear discussion on all aspects such as selection of expert panel, development of Delphi questionnaires and data analysis technique used to identify types of important ICT competencies to be mastered by school teachers. After the analysis of data using the Delphi technique, a set of ICT competency standard for teachers is developed together with a list of ICT competency assessment criteria for the Ministry of Education, organizers of ICT training programs and Science and Mathematics teachers.

Abstract

This research explores that the instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of university students as well as its impact in the classroom on learning and teaching, especially in student's problem-solving skill and practices that refer to awareness, connection, and contribution process as part of the learning efficacy improvements. In this process, web technology particular social networking site has a necessary role to engage and integrate knowledge and learning activities within the problem based learning (PBL) process. In this respect, this research aims to study and develop the appropriate instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life by the 10 experts' opinion. The research results exhibited that the instructional model based on connectivism learning theory via web-based learning was appropriated and raised the level of problem-solving skill among students.

Introduction

There is a need for students to learn these important learning and innovation skills in order to be successful in the work and life. For the 21st century skills, the students need to be taught to facilitate their success in the future. Students need to attain the "3R's & 4C's"—Reading, Writing, Arithmetic, Critical thinking and problem solving, Creativity and Innovation, Communication, Collaboration —which are the most important and necessary 21st century skills as defined by businesses, economists, and education experts (Partnership for 21st Century Skills, 2011).

In Thailand, education reform for the 21st century that will lead to a unity of purpose and action among Thai and international educators to realize the goals set forth in the National Education Act (NEA) of B.E. 2542 (1999). This education reform is a move toward student-centered learning and a student-centered classroom. The intentions of NEA aim to improve education on the basis of lifelong learning, social contribution in education, and the development of new content and learning processes. According to Fry (2002), the issues of quality standards, learner-centered approaches, the role of the private sector, and structural reform in decentralization of education to local organizations are significant in this Act. Four new factors have been added to streamline education reform,

including (a) quality of the new generation of Thais; (b) new generation of teachers; (c) new generation of educational facilities and centers; (d) new educational administration system which aims at decentralization. Specifically, Section 24 of the Education Act outlines what must be done to improve education performance: (a) arranging learning in line with the students' interests, aptitudes and individual differences; (b) training students in thinking abilities, especially critical thinking; (c) organizing learning activities that draw from authentic experiences; and (d) promoting situations where learners and teachers learn together.

An aspect of student-centered learning involves questions learners themselves generate from direct experiences. In student-centered learning, the teacher has a number of roles, including scaffolding questions of students when needed in order to make the initial questions more accessible to answering and anticipating sufficient time and tools that help learners pursue their own questions.

In addition to addressing these key issues of education reform in Thailand, indeed in international education, we also focus our attention and resources on the goal of promoting Thai teachers to reach their potential as skilled teachers using teaching methods that engage their students with the result that students love to learn through self discovery. The goal of the education reform is to instill learners with skills that are compatible with the changing economic landscape in the 21st century skills (e.g., critical thinking and problem solving, communication, collaboration, and creativity).

ICT has become an indispensable part of the 21st century. Having basic ICT skills is now seen as an important attribute that students should possess in order to be successful in life. Because of the digital age, there is new learning theory which related ICT workplace and the 21st century skill. It is the connectivism learning theory.

Connectivism learning theory (Siemens, 2005, 2006) and connective knowledge (Downes, 2006) as ways to understand and explore learning in the digital age are timely and particularly useful, both in what they offer and what they question. The idea of organizations as cognitive systems where knowledge is distributed across nodes traces back to the perceptron and is directly borrowed from connectionism, "a paradigm in cognitive sciences that sees mental or behavioral phenomena as the emergent processes of interconnected networks of simple units". The network metaphor allows a notion of "know-where" (the understanding of where to find the knowledge when it is needed) to supplement to the ones of "know-how" and "know-what" that make the cornerstones of many theories of learning.

Siemens (2005) states the eight principles of connectivism, which are also currently through Siemens' writings in Wikipedia.

  1. Learning and knowledge rests in diversity of opinions.
  2. Learning is a process of connecting specialized nodes or information sources.
  3. Learning may reside in non-human appliances.
  4. Learning is more critical than knowing.
  5. Maintaining and nurturing connections is needed to facilitate continual learning.
  6. Perceiving connections between fields, ideas and concepts is a core skill.
  7. Currency (accurate, up-to-date knowledge) is the intent of learning activities.
  8. Decision-making is itself a learning process. Choosing what to learn and the meaning of incoming information is seen through the lens of a shifting reality. While there is a right answer now, it may be wrong tomorrow due to alterations in the information climate affecting the decision.

Siemens (2006) proposed connectivism taxonomy that a staged view of how learners encounter and explore learning in an ecological leaning community or networked manner. The taxonomy begins with the basic and moves to the more complex:

1. **Awareness and receptivity** – at this level learners acquire basic skills for handling information abundance, have access to resources and tools. (e.g., internet, blogs, wikis, aggregators)

2. **Connection-forming** – at this level learners begin to use tools and understanding acquired during level 1 to create and form a personal network. Learners are active in the learning ecology/space in terms of consuming or acquiring new resources and tools. Selection (information filtering) skills are important. Affective/emotive factors play a prominent role in deciding which resources to add to the personal learning network.

3. **Contribution and involvement** – at this level learners are fairly comfortable within their self-created network (though instructors or teachers may continue to guide and direct their access to particularly valuable resources toward intended educational competencies or outcomes). The learner begins to actively contribute to the network/ecology – essentially, becoming a 'visible node'. The learner's active contribution and involvement allows other nodes on the network to acknowledge his/her resources, contributions, and ideas – creating reciprocal relationships and shared understandings (or, if wikis or social bookmarking is used, collaboratively-created understanding). The learner should also be capable of choosing the right tool for the right learning task. For example, the learner may opt to take a course, attend a conference, solicit a mentor, or subscribe to blog feeds – all based on what the learner needs to know, do, or believe. Selecting the right element within the learning ecology is valuable in ensuring the efficiency and effectiveness of the learning process.

4. **Pattern recognition** – at this level the learner is "network aware" and competent. As a dynamic participant in the ecology, the learner has moved from passive content consumption to active contribution. Time in the network has resulted in the learner developing an increased sense of what is happening in the network/ecology as a whole. Having mastered the basics of being a participant, the learner is now capable to recognize emerging patterns and trends. Experience within the network has resulted in the learner understanding the nuances of the space (online or physical). The longer the learner spends in the learning space, the more adept she/he will become at recognizing new patterns or "changing winds" of information and knowledge.

5. **Meaning-making** – at this level the learner is capable of understanding meaning. What do the emerging patterns mean? What do changes and shifts in trends mean? How should the learner, adjust, adapt, and respond? Meaning-making is the foundation of action and reformation of viewpoints, perspectives, and opinions.

6. **Praxis** – at this level, the learner is actively involved in tweaking, building, and recreating their own learning network. Metacognition (thinking about thinking) plays a prominent role as the learner evaluates which elements in the network serve useful purposes and which elements need to be eliminated. The learner is also focused on active reflection of the shape of the ecology itself. The learner may engage in attempts to transform the ecology beyond his/her own network. Praxis, as a cyclical process of reflection, experimentation, and action, allows the learner to critically evaluate the tools, processes, and elements of an ecology or network.

Connectivism is a theoretical framework for understanding learning. In connectivism, the starting point for learning occurs when knowledge is actuated through the process of a learner connecting to and feeding information into a learning community (Kob and Hill, 2008).

The problem solving skill as an individual thought process because the previously learned law can be applied in solving problems in any situations (Jonassen, 2003). It is also deemed to be a new type of learning and is the result of application of knowledge and procedures of the problems (Mc Gregor, 2007). Generally, each individual requires knowledge and skills to solve problems (Taconis et al., 2000). Halakova and Proksa (2007) stated that the solution of problems in any subject area is a highly complex human behavior. This matter is documented in a large number of studies and articles which have appeared in journals of research and teaching. It has reflected a new interest regarding how students solve problems. Problem solving has always been a stumbling block for students who are studying chemistry, and most of the teachers in the field of chemistry are aware of this. According to Jawhara (1995), problem solving activities can open opportunities for students to learn freely. In their own ways, students will be encouraged to investigate, seek for the truth, develop ideas, and explore the problem. Students are also trained not to be afraid to try various ways to solve problems, as well as having the courage to make decisions, act on the decisions and be responsible for the products of the action. The experiences gained through problem solving will help our students to become progressive, creative and ambitious. These features are necessary in order to face the challenges of becoming a developed country based on science and technology (Lim et al., 1999). Problem solving is also deemed to be what is done by an individual when faced with a question or situation where the solution is not available. In seeking a way out from any obstacle, students should think, make decisions and use specific strategies. Therefore, to achieve this, the activity of thinking and skills to rationalize a solution plays an important role. It will require students to generate and induce a systematic and logical thinking. This ability requires students to follow certain steps and logic because it requires a revision to determine the reasonableness of a settlement. Thus, any successful attempt will encourage a students' positive attitude towards problem-solving skill.

According to Reid and Yang (2002), a problem exists when a person feels the gap between where it is and where it should be but do not know how to cross the gap. This broad definition also covers social issues and what might be stereotyped exercises by problem-solving trainers. Students' problem solving abilities is the desired result after

going through the process of continuous education as emphasized in the National Education Philosophy and Philosophy of Science Education. Troubleshooting is also the highest hierarchy of learning by Gagne (1985) and problem solving ability reflects the level of student learning. According to Robinson (2003) the ability to solve problems is being considered as an integral part of each science course. In addition to strengthening and clarifying the principles taught in each lesson, systematic approach to problem solving enable students to learn better.

Furthermore, they will have to explain their thoughts and thus promote intellectual development. This ability enhances students' opportunities when they are faced with daily lives problems. Although the benefits of problem solving as an educational tool has long been known, appreciating the skills, techniques and procedures required for effective problem solving have not been adequately taught specifically. This teaching method is significant in order to address and solve problems involving new situations.

Concurrently, application of knowledge and skills which are based on connectivism learning theory and ICT will enable students to make decisions and solve problems in life more effectively. As a result, they will be able to explore the treasures of nature, adapt to the environment, make innovative creations, and even manage to overcome problems and difficulties. Hence, these visions become one of the goals emphasized in the national curriculum, especially in science education.

Interest in this approach to learning has been maintained because fundamental ideas underlying PBL have related directly to connectivism taxonomy concepts about teaching and learning in ICT, and to ongoing debate about the nature of professional practice. By framing courses around "real" problems in the context of "real" practice, PBL has presented a coherent and practical approach to learning which incorporates "active" rather than "passive" approaches to the development of critical thinking skills, problem-solving skills, experiential and social learning in the form of collaborative inquiry based on engaging with authentic problems, and more dynamic interactions between teachers and learners based on respect for students prior learning and experience (Hendry, Frommer, & Walker, 1999; McPhee, 2002)

Thus, the main purpose of this study is to analysis and design learning activities styles to be appropriate with the learners that integrated with the concept of connectivism learning theory and problem based learning. The question then becomes, "How to develop the appropriate instructional model based on connectivism learning theory; and to what extent the online learning environments were associated with certain learner characteristics". The expected benefits are the appropriate model that is the systematic approach to enhance university student's problem-solving skill. More over the results of quality assessment of instructional model that is body of knowledge to develop the problem-solving skill of students. In addition the results can be the information to support the higher education systems policy.

Objective

This exploratory sought to study, develop, utilize, and evaluate the instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of higher education students.

Methodology

The research procedure includes three phases:
The first phase: Studying the instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of higher education students (Rampai and Sopeerak, 2011).
 1. Analyzing the elements of connectivism learning theory are included the elements of the connectivism taxonomy states (Awareness & receptivity, Connection-forming, Contribution & involvement, Pattern recognition, Meaning-making, Praxis).
2. Analyzing the elements of social networking are included the elements of web-based learning, learning management system (LMS) with social media, m-learning (tablet & smart phone).
3. Analyzing the elements of ICT for daily life are included ICT competency- the body of knowledge and skills an individual must possess at a recognized level of competence in specific ICT for daily life.
4. Analyzing the elements of the 21st century skills: problem-solving skill by using problem-based learning (PBL) process.
5. Integrating the elements of connectivism taxonomy, social networking, ICT competency for daily life, and problem-solving skill.

The second phase: Developing the instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of higher education students.

The third phase: Evaluating the instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of higher education students by using focus group discussion method. The participants of this study were specialists who were involved in curriculum and instruction, instructional design, information and communication technologies from universities in Thailand. There were ten experts focus group discussion in accreditation the developed instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of higher education students.

Results

After the ten experts' focus group had evaluated the developed instructional model, they suggested the opinion that the design instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of higher education students is developed to be in the high level of appropriateness. The instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life was appropriated with the quality of learning, as called "pbCONNEC model", detail are as follow:

1. The learning input is including the Conceptual framework and Motivation.

2. The online learning processes are driven connectivism (Awareness, Connection, and Contribution) within the problem-based learning or PBL approach (Problem assigned, Identify what we need to know, Learn what we don't know, and Apply it to solve the problem).

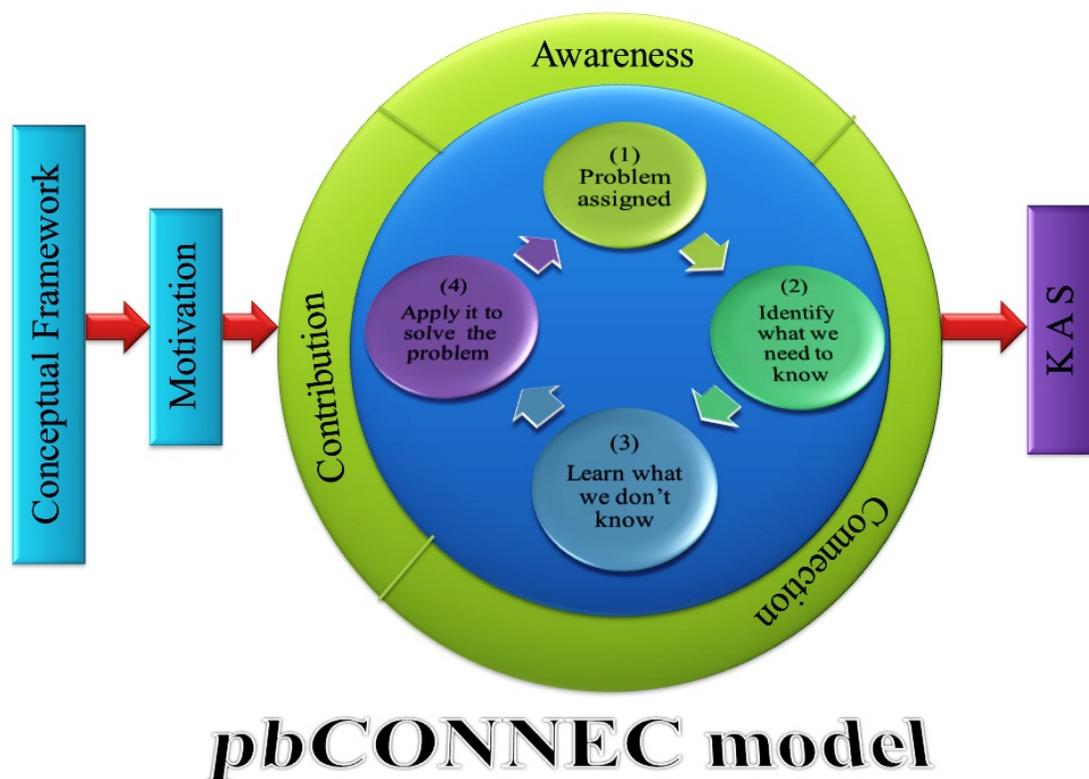
3. The learning outcomes consist of Knowledge, Attitude, and Skill (Figure 1).


Figure 1: pbCONNEC model, the instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of higher education students.

Conclusions

The research results exhibited that the instructional model based on connectivism learning theory to enhance problem-solving skill in ICT for daily life of higher education students was appropriated and fit to the quality of education. The study was successful in connectivism learning theory the importance of incorporating problem-solving skill

approaches in order to enable learners to acquire the 21st century skills, and create a learning environment where they are engaged in the dynamic contents and process. Here the results provide very suitable and encouraging results for using ICT for daily of higher education student.

Abstract

The objective of this paper is to discuss the framework and the conceptual model in the development of an E-portfolio system for Malaysia Skills Certificate (MSC). The framework and conceptual model presented in this paper are based on readings and literature review undertaken by evaluating and re-arranging the facts from the previous studies. There are five concepts to be discussed: (a) element of MSC E-portfolio, (b) model of MSC E-portfolio, (c) system development life cycle (SDLC) model, (d) open source software Mahoodle, and (e) virtual learning space (VLS). In the vocational education system of Malaysia, the portfolio is used as a document to evaluate the level of students' knowledge and achievement, where it still uses paper based portfolio. Paper based portfolio is static and limited in sharing information with others. Process management, evaluation and updating materials are also difficult. It is hoped that this framework and conceptual model will contribute towards the development of an appropriate an E-portfolio system to be applied in the vocational education system of Malaysia.

Keywords: E-portfolio, Malaysia Skills Certificate, vocational education

Introduction

A variety of teaching and learning concepts that integrate ICT had been introduced in recent times such as e-learning, multimedia aided training, blended learning and more. E-portfolio is a instructional product that uses ICT-based e-learning. It can store all kinds of information in digital form, it is flexible and can be accessed at anytime and anywhere (DiMarco, 2006; Ku & Chang, 2011; Montgomery & Wiley, 2008; Stefani et al., 2007). E-portfolio is the result of the transformation of a previously written portfolio which has long been used in assessing the activities of one's personal and professional evaluation. The difference is that E-portfolio are easier to use in publishing information and it can also be used as a learning tool where users can share ideas and information with other users via online (Bullock & Hawk, 2005; Handa et al., 2011; Kilbane & Milman, 2005).

The use of a printed portfolio is seen as not relevant to be applied in the current education. This is because the printed portfolios are static, are limited in sharing information with others, the management, evaluation and updating process of the materials are difficult and unable to improve the professional skills (McAllister & Hauville, 2010; Stefani et al., 2007). On the other hand, the electronic portfolio has many advantages compared to the printed portfolio such as, the ability to save and organize material more easily, sharing of information, enhances the professional skills, enhances the generic skills of graduates and facilitates the search for information (Bhattacharya & Hartnett, 2007; Halstead & Sutherland, 2006; McAllister & Hauville , 2010).

In the vocational education system in Malaysia, the portfolio is used as a document to evaluate the level of knowledge and performance of students, where the use is still in the traditional way which is paper-based and this limits the storage to mere artifacts. According to the Ministry of Education, improving the delivery of existing vocational education should be done by expanding the online implementation (Ministry of Education Malaysia, 2011). As such, one way is to use E-portfolio in teaching and learning programs (Boyle, 2011; Cameron, 2011; Carroll et al., 2007; Handa et al., 2011; Mcallister & Hauville, 2010; Rodriguez-Donaire et al., 2010). It aims to improve the quality and innovation in vocational education system through the use of ICT to create an interactive education system. In facing the challenges of globalization, the vocational education system must be open and flexible, where it should focus on the use of technology in teaching and learning process (Neal, 2011).

However, the development of E-portfolio requires an appropriate framework to meet the needs of the education system (Albert, 2006; DiMarco, 2006; Young & Morriss, 2007). A detailed study should be done to produce an E-portfolio system which is compatible, easy to use, user-friendly, attracts the interest of teachers and students as well as meeting the standard of the vocational education system. Therefore, this study was conducted to produce an appropriate E-portfolio system for MSC to be applied in the vocational education in Malaysia. It is done to upgrade the existing skills training system, in order to enable the country to produce skilled work force that have more quality, highly knowledgeable, innovative and competitive.

Methodology

In designing the E-portfolio system, the researchers need to understand the concepts and basic design of the E-portfolio (Ku & Chang, 2011). Thus, researchers need to have a framework that can be used as a guideline in developing the E-portfolio system. For this study, researchers focused on the formation of the MSC E-portfolio model and then develop the E-portfolio system MSC. The researchers combined the two phases in a single framework.

In the first phase, the modified Delphi study approach was used in the production of E-portfolio system elements. The modified Delphi technique is a procedure of finding consensus among experts using questionnaires in anon-face-to-face manner (Wiersma & Jurs, 2009). The modified Delphi technique proposed by Wiersma and Jurs (2009),was applied in this study, where the process begins with questionnaire of survey subjects' exploration. This is because the issues in the first round of the Delphi method were sufficiently defined by the researchers. Next, a survey was done to produce a MSC E-portfolio model. The survey instrument developed through the modified Delphi study was used and distributed to MSC trainers. This study is important in creating an E-portfolio model that is appropriate and can be applied in the skills certification system in Malaysia.

The second phase involves the development of the MSC E-portfolio system using the system development life cycle model of Dennis et al. (2008). The main goal is focused on producing an E-portfolio system that serves as the learning management system, APEL and students' competency assessment. Here are the five processes involved in

the development of MSCE-portfolio system adapted from the system development life cycle model of Dennis et al. (2008), namely:

Process 1: Analysis

In this phase, the analysis is performed to determine the needs of the generated system. The analysis is performed on the user criteria, software and hardware. The user criteria analysis is done to identify specific requirements, user interface, performance benchmarking of software and system features required by the user. The software analysis is conducted to determine the hardware and software specifications requirements that are used in developing the system. Further analysis is done to determine the required hardware equipment in the development of E-portfolio system.

Process 2: The Design of the System

The process of designing the system is divided into three main divisions which are designing the information, interaction, interface and presentation. The designing process begins with identifying available information content, and how to implement the content and information that needs to be conveyed. The process of interaction design refers to the process of designing software in terms of structure or pattern of travel of the software. Next is the interface design and presentation which emphasize the needs of the users because the production of displays is for users' view. The main elements in the interface are the background of the screen, control buttons and icons, text, graphics, audio, video and animation.

Process 3: The Design and Development of Database

Database is the part where users store, modify and delete data. A good database is the one that is easily accessible and manageable (Newman &Landay, 2000; Sklar, 2011). This phase describes how data storage is done on the computer using the software. Then, the storage structures and access paths for database files are determined to get the best data presentation.

Process 4: The Development of Application

This phase begins only when the system design has been completed. This involves the production of a real system based on the system design by performing the coding of system using the software. At the level of application development, the planning done previously are turned into programming and able to test it. At this stage a lot of things need to be taken into account to ensure that the aspects of the developed system are accurate. The topics highlighted in this phase are: (i) the application of behaviorist theory, (ii) the application of cognitive theory, (iii) the application of constructivist theory, (iv) setting the main menu, (v) determining the navigation, (vi) determining and loading the content (vii) developing the arrangements and links, (viii) developing interactive features, (ix) determining the programming applications, (x) setting the authoring tools (xii) determining the graphics / audio and (xiii) preparing the user guide.

Process 5: The Evaluation of the System

The system evaluation is done to test the feasibility of the technical aspects of the system, the content and the use of learning theories. The evaluation is a formative evaluation. Formative assessment is done to collect data that can be used to improve the system so that it meets the requirements of teaching and learning. A software that has been built, have to go through the testing process and it is essential to ensure that the software meets the specifications set (Allen, 2007; Reigeluth & Carr-Chellman, 2012). Once the data from the formative evaluation is obtained, it is analyzed to identify existing problems in the developed E-portfolio system. The findings will be used to improve and make changes on the system.

A conceptual framework of E-portfolio system

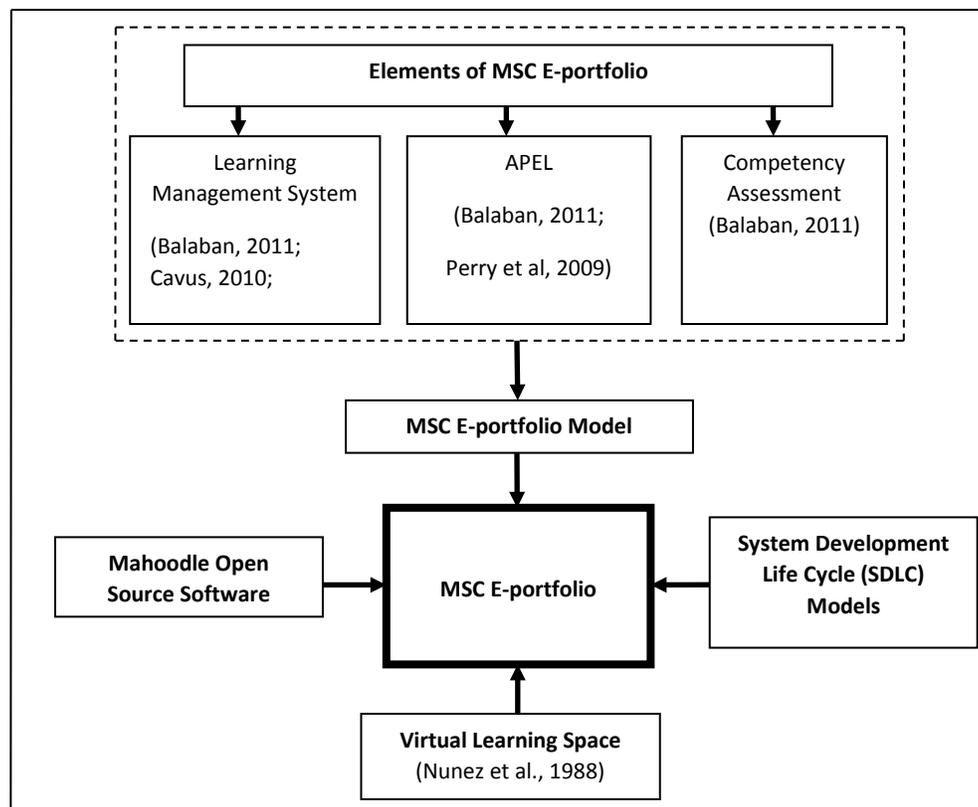
The conceptual framework set out in Figure 1 comprises five elements: (i) the elements of MSC E-portfolio (ii) MSC E-portfolio model, (iii) the system development life cycle model of Dennis et al. 2008, (iv) Mahoodle open source software and (v) the virtual learning space Nunez et al. (1988).


Fig. 1. The conceptual framework of MSC E-portfolio

- **The elements of MSCE-portfolio.** The elements of MSC E-portfolio are formed by the literature reviews of: (i) E-portfolio model of Balaban et al. (2011), (ii) the E-portfolio model of Ku and Chang (2011), (iii) the APEL model of Perry et al. (2009), (iv) the LMS model of Cavus (2010) and (v) the MSC document portfolio. The analysis of literature review found that E-portfolio can be used as a learning management system (LMS), accreditation of prior experiential learning and competency assessment. The important elements contained in the LMS are: (i) self-reflection, (ii) interaction, (iii) the project / assignment, (iv) the communication space, (v) the online and offline learning material, (vi) planning and (vii) evaluation. APEL contains nine elements which are: (i) the accreditation process, (ii) personal information, (iii) academic information, (iv) the information on skills, (v) the information on experience, (vi) verification of evidence, (vii) the communication space, (viii) the progress update, and (ix) verification. While the important elements in the assessment of competency are: (i) the artifacts storage space, (ii) applications for employment, (iii) the progress update, (iv) verification and (v) evaluation**.**

- **The MSC E-portfolio Model.** The E-portfolio should be developed according to the needs of the education system (Bhattacharya & Hartnett, 2007; Balaban et al., 2011; Handa et al., 2011). The MSC E-portfolio model is produced after the modified Delphi study is conducted in which the elements that have been verified by experts are used in the formulation of the questionnaire. A survey is done in order to produce a MSC E-portfolio model. The MSC E-portfolio model must be produced as a confirmation of the new system to meet the needs of users (Ku& Chang, 2011). The model is then applied in the development of MSC E-portfolio system.

- **The model of system development life cycle (SDLC).** This SDLC model helps in standardizing the process of software system development so that important steps are not missed (Dennis et al., 2008; Kocherla, 2012; Royce, 1970). The model consists of phases and useful information in the development of a system. In designing MSC E-portfolio system, SDLC model by Dennis et al. (2008) is used. The process begins with analysis, system design, design and database development, development of system and testing and evaluation of the system.

- **Mahoodle open source software.** Mahoodle open software is a combination of Mahara and Moodle software. The Mahara software is the best E-portfolio software compared to other software (Himpsl & Baumgartner, 2009; Toro-Troconis & Hemani, 2009). Among them are that the Mahara software:
  - (i) is the most balanced software and easy to handle compared to Drupel-Ed, Elgg, Factline, Fronter, Sakai, Taskstream, PebblePad, ePET, Premier IT, Giunti Labs, NES and Wordpress.
  - (ii) have the best efficiency in choosing, collecting, organising, presenting and publishing data compared to Drupel-Ed, Elgg, Factline, Fronter, Sakai, Taskstream, PebblePad, ePET, Premier IT, Giunti Labs, NES and Wordpress.
  - (iii) can be diectly used after the first installation. Other software such as Drupel-Ed, Elgg, Factline, Fronter, Sakai, Taskstream and Wordpress requires additional installation in order to provide complete functioning of E-portfolio software.

Meanwhile, the Moodle software is the best LMS software compared to other LMS software (Al-Sharif & Zedan, 2008). The Moodle software:
  - (i) has the best capability and meets the characteristics of a learning tool compared to Desire2 Learn 8.1, KEWL, ANGEL Learning Management Suite (7.1), eCollege, The Blackboard Learning System, Claroline 1.6, Dokeos 2.1.1, OLAT, Sakai 2.3.1, A Tutor and Boddington.
  - (ii) has the strongest support for aid tools such as administration tools, course delivery tools and content development tools compared to Desire2Learn 8.1, KEWL, ANGEL Learning Management Suite (7.1), eCollege, The Blackboard Learning System, Claroline 1.6, Dokeos 2.1.1, OLAT and Sakai 2.3.1.

The combination of both these software is done to create an E-portfolio system that is more comprehensive and multi-purpose.

- **Virtual learning space (VLS) Nunez et al. (1988).** The VLS model by Nunez et al. (1988) serve as the basis for the development of E-portfolio, which are divided into four main elements: (i) knowledge space (the information needed to learn), (ii) collaboration space (working together to learn with others), (iii) consulting space (teachers provide tutoring for learning and if there are doubts) and (iv) experiment space (practical work for students to acquire knowledge and skills). The objective of VLS is to develop a learning system that can provide support, where students can learn with each other, share resources and ideas.

Conclusion

The use of existing E-portfolio at this time seems to work only as a repository of artifacts without connecting to the actual learning process (Ku & Chang, 2011). As a result, although the created E-portfolio can provide convenience and comfort to the users, but it still cannot achieve the actual goal behind the use of E-portfolio. Zeichner and Wray (2001) described seven questions that must be asked before building E-portfolio which are: (i) what is the purpose of the E-portfolio?, (ii) who makes the decision, what should be included in the portfolio?, (iii) how the evidence in the portfolio will be managed?, (iv) what are the types of artifacts that can be stored in the E-portfolio?, (v) what kind of info can be placed by the teachers during the teaching and learning process?, (vi) how the portfolio should be evaluated? and (vii) what should happen to the portfolio once it is completed? While Lorenzo and Ittelson (2005) stated that the questions that should be considered by any institution in using E-portfolio in teaching and learning are: (i) should the E-portfolio need to be a platform to record the students' work?, (ii) how long should the E-portfolio be kept in an institution after graduation of the students?, (iii) who should have E-portfolio?, (iv) how an institution promote and support the use of E-portfolio?, (v) how the E-portfolio are evaluated and is it valid and reliable? and (vi) how an institution encourages the reflection on the use of E-portfolio? When an institution chooses to use E-portfolio system for teaching and learning, it is important to understand and define the concepts and elements of E-portfolio required to meet the needs of an institution (Jafari, 2004; Sweat-Guy, & Buzzetto-More, 2007). To produce a system that integrates technology, it requires meticulous planning. Due to that reason, a framework and a detailed model of development is required to ensure that the E-portfolio produced to meet the needs of consumers and educational institutions.

Abstract

Era in which we live is known and referred as digital age.In this age technology is rapidly changed and developed. In light of these technological advances in 21th century, schools have the responsibility of training "digital citizen" as well as a good citizen. Digital citizens must have extensive skills, knowledge, Internet and technology access and schools must guide the students to be a digital citizens. Ribble and Bailey (2007) described the digital citizens features in schools that need to have in nine touchpoints. Based on these points, this research is aimed to develop a scale about digital citizenship.

Keywords: digital age, digital citizen, digital citizenship

INTRODUCTION

Strongly expanded information and communication technology (ICT) has changed life, people and era. Anymore, ICT has become the sine qua non of our lives. Upon this change, using digital tools is increased, primary requirement for individuals is being to use ICT effectively not only for entertainment but also searching for and sharing information, communication, access, law and consumption.

The changing era with ICT has led to the exchange the characteristics of individuals and upon this the characteristics of   the community. Digital era that digital tools are widely used is endeavoring to create digital citizens from the digital society. Schuler(2002) defined digital citizens as "the characteristic of a genuine digital city". Digital citizen is generally identified as "those who use the Internet regularly and effectively" (Mossberger, Tolbert & McNeal, 2011).

Digital citizen must have some characteristics such as understand human, cultural, and societal issues related to technology and practice legal and ethical behavior; advocate and practice safe, legal, and responsible use of information and technology; exhibit a positive attitude toward using technology that supports collaboration, learning, and productivity; demonstrate personal responsibility for lifelong learning; and exhibit leadership for digital citizenship (Ribble, 2008). A Common Sense Media White Paper(2011) explained that digital citizenship means the ability to use technology competently; interpret and understand digital content and assess its credibility; create, research, and communicate with appropriate tools; think critically about the ethical opportunities and challenges of the digital world; make safe, responsible, respectful choices online To understand the characteristics of digital citizens and digital citizenship clearly, based on previous works (Ribble, Bailey & Ross, 2004, Ribble & Bailey, 2004a, Ribble & Bailey, 2004b, Ribble & Bailey, 2004c, Ribble & Bailey, 2005), Ribble & Bailey(2007) described nine areas of behavior that digital citizenship must have: access, commerce, communication, literacy, etiquette, law, rights and responsibilities, health and wellness, security(self-protection).

Digital citizenship goals for the 21st century are educate, empower and protect (Common Sense Media White Paper, 2011). Ribble & Bailey(2007) explained these three as respect(etiquette, access, law), educate(communication, literacy, commerce) and protect(rights and responsibility, safety/security, health and welfare).

Being digital citizen is more important thing in nowadays. Therefore in education there are some key features to make the students digital citizens for looking at the 21st century digital citizenship goals. These key factors are student learning and academic performance, student environment and student behavior, student life outside the

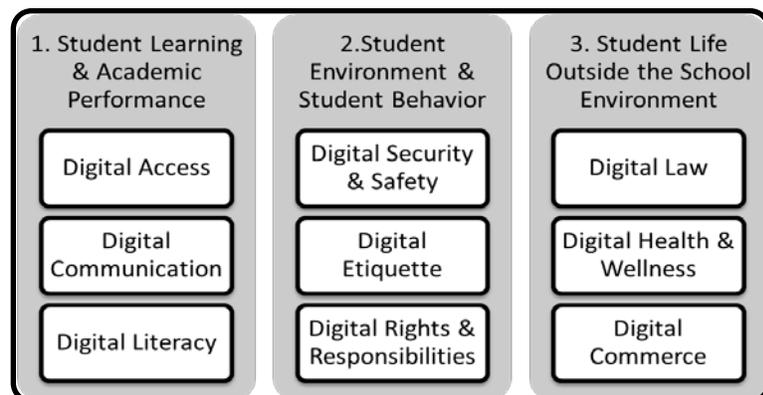
school environment. Ribble & Bailey(2007) sorted the nine areas of behavior for making up digital citizenship under these three keys.


Appendix A. Fig. 1. Digital Citizenship Touchpoints (Ribble & Bailey, 2007)

Appendix A. Student Learning & Academic Performance
1. Digital Access: full electronic participation in society.
2. Digital Communication: electronic exchange of information.
3. Digital Literacy: process of teaching and learning about technology and the use of technology.

Appendix B. Student Environment & Student Behavior
4. Digital Security (self-protection):   electronic precautions to guarantee safety.
5. Digital Etiquette: electronic standards of conduct or procedure.
6. Digital Rights & Responsibilities: those freedoms extended to everyone in a digital world.

Appendix C. Student Life Outside the School Environment
7. Digital Law: electronic responsibility for actions and deeds
8. Digital Health & Wellness: physical and psychological well-being in a digital technology world.
9. Digital Commerce: electronic buying and selling of goods.

This era which people must have digital citizenship features, education and students are important for doing this. Hence the aim of the research is to develop a scale about digital citizenship based on Ribble & Bailey(2007)' s digital citizenship nine touchpoints for analyzing students.

Method

Population

   The population of this study constitute of students of the Faculty of Education of Sakarya University in the 2012-2013 academic year. The population consists of a total of 4395 students. Participation in the study was on a voluntary basis. Convenience sampling method was used in the study. Totally 229 students from the undergraduate

program in Elementary Teaching, Pre-school Teaching, Turkish Teaching, Religion and Ethics Education filled out the questionnaires.

Data Gathering Tool

Developing a scale is the aim of this study. For developing the Digital Citizenship Scale (DCS), first literature was reviewed and item pool was created based on Ribble & Bailey(2007)' s digital citizenship nine touchpoints. Four experts evaluated these items and accordance with the experts' recommendations, the scale was created as 34 items. This scale was applied to the participants and reliability and validity analyses were performed.

The 34-item scale was developed as five-point Likert-type scale. The students answered the items by selecting one of the "Strongly Agree", "Agree", "Neutral", "Disagree", "Strongly Disagree" options.

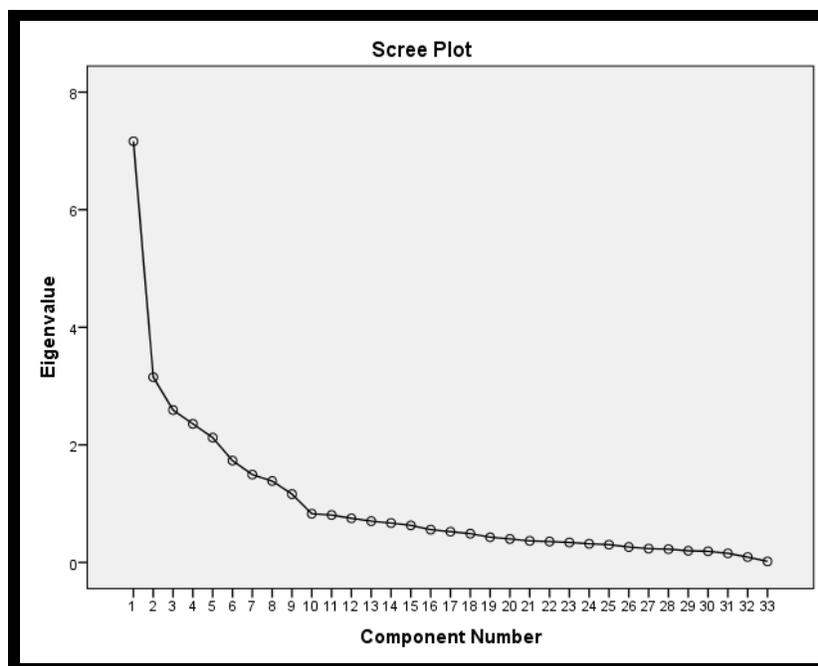
Data Analysis

SPSS 21 statistical software was used for performing construct validity and reliability analyses. For analyzing construct validity, exploratory factor analysis was used. Nine factors were found in the exploratory factor analysis. Moreover internal consistency coefficients were used for examining the reliability of the scale. After validity and reliability analysis the scale has 33 items.

Findings

Validity

For analyzing construct validity of DCS, exploratory factor analysis was used. Stevens(1996) explained "the purpose of exploratory factor analysis is to identify the factor structure or model for a set of variables.". According to this purpose, first, Kaiser-Mayer-Olkin (KMO) coefficient and Bartlett sphericity test were used for analyzing suitability of the data for factor analysis by exploratory factor analysis (EFA). KMO coefficient gives the information about the suitability of the the data matrix for the factor analysis, the suitability of the data structure for factor extraction and this coefficient is expected to be higher than .60 (Büyüköztürk, 2007). In the analysis the KMO value for the DCS was found .75. Also the Bartlett test determines the relationship between the variables on the basis of partial correlations, and the calculated chi-square statistic is expected to be significant (Büyüköztürk, 2007). The calculated chi square statistic was $\chi2 = 3336, 213, p. = .000$ in the Bartlett sphericity test. KMO coefficient and Bartlett sphericity test indicate that the collected data are suitable for the factor analysis.

Firstly, items are categorized under nine factors with eigenvalues over 1 and the communalities of the items varied between .541 and .907 in the results of exploratory factor analysis (EFA).


Appendix B. Fig. 2. Scree Plot

As a result of the EFA, scree plot showed that the scale has nine factors. Eigenvalue of the factors and the total variance explained supported this structure.

Appendix C. Table 1. Eigenvalue of the factors and the explained variance

Factors		Items	Eigenvalue	% of Variance
Factor 1	Digital Literacy	8,9,10,11,12,13	7.163	21.707
Factor 2	Digital Law	25,26,27,28	3.151	9.548
Factor 3	Digital Rights & Responsibilities	21,22,23,24	2.593	7.856
Factor 4	Digital Communication	1,2,3,4	2.357	7.142
Factor 5	Digital Security	14,15,16	2.123	6.432
Factor 6	Digital Commerce	32,33,34	1.732	5.247
Factor 7	Digital Access	5,6,7	1.494	4.527
Factor 8	Digital Etiquette	17,18,20	1.384	4.195
Factor 9	Digital Health & Wellness	29,30,31	1.163	3.523

Eigenvalue of the first factor is 7.163, eigenvalue of the second factor is 3.151, eigenvalue of the third factor is 2.593, eigenvalue of the fourth factor is 2.357, eigenvalue of the fifth factor is 2.123, eigenvalue of the sixth factor is 1.732, eigenvalue of the seventh factor is 1.494, eigenvalue of the eighth factor is 1.384, eigenvalue of the ninth factor is 1.163. Moreover the first factor explains 21.707% of the total variance, the second factor explains 9.548% of the total variance, the third factor explains 7.856% of the total variance, the fourth factor explains 7.142% of the total variance, the fifth factor explains 6.432% of the total variance, the sixth factor explains 5.247% of the total variance, the seventh factor explains 4.527% of the total variance, the eighth factor explains 4.195% of the total variance and the ninth factor explains 3.523% of the total variance. The total explained variance of the scsle is 70.178%.

Second, varimax rotation technique was used in order to facilitate the disclosure of important factors. Item 19 was removed from the scale because item's factor loading showed that it was also under the two factors. The factor

loadings are between the lowest .558 and the highest .889. The total explained variance values of the scale and factor loadings show that the scale is successful in explaining digital citizenship.

Appendix D. Table 2. Results of the exploratory factor analysis

Item	Communalities	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5	Factor 6	Factor 7	Factor 8	Factor 9
i13	,703	,731								,306
i9	,577	,667								
i8	,556	,603

i31	,794									,856
i30	,738									,739
i29	,693									,738

Appendix E. *Loadings are values above .30.

Appendix F.

Reliability

For the reliability of the DCS, Cronbach's Alpha internal consistency coefficient was calculated. As a result of the analysis, the Cronbach's Alpha value of the scale is .85. According to the factors, the Cronbach's Alpha value of the Factor 1 is .78, the Cronbach's Alpha value of the Factor 2 is .84, the Cronbach's Alpha value of the Factor 3 is .80, the Cronbach's Alpha value of the Factor 4 is .79, the Cronbach's Alpha value of the Factor 5 is .85, the Cronbach's Alpha value of the Factor 6 is .84, the Cronbach's Alpha value of the Factor 7 is .90, the Cronbach's Alpha value of the Factor 8 is .70 and the Cronbach's Alpha value of the Factor 9 is .70. The .70 or higher calculated reliability coefficient for psychological scales is considered sufficient in terms of the reliability of the scale (Büyüköztürk, 2007). Thus, the Digital Citizenship Scale and its factors developed have a high reliability level. This finding indicates that the scale is able to distinguish between students' digital citizenship or not.

Conclusion

In this study, a scale was developed to measure the digital citizenship levels of students of a faculty of education. First, item pool was created after reviewing the literature and receiving expert opinion. Then the 34-item scale was applied to students of the Faculty of Education of Sakarya University in the 2012-2013 academic year. Reliability and validity analyses were conducted on the data collected from 229 students from the undergraduate program in Elementary Teaching, Pre-school Teaching, Turkish Teaching, Religion and Ethics Education.

For examining validity of DCS, exploratory factor analysis was used. The EFA showed that all the items had high factor loadings and items are categorized under nine factors. The nine factors in the DCS explained 70.178% of the total variance. The total variance explained and the factor loadings show that the scale is successful in capturing digital citizenship level. Thus, it can be safely argued that the scale provides a valid measure of digital citizenship.

To examine the reliability of the scale, the Cronbach's Alpha value was calculated. The value calculated was high (.85), which showed that the scale has high reliability.

In conclusion, the reliability and validity analyses conducted show that the DCS developed is an effective measurement tool that can be used to study about digital citizenship. The scale can be used in future studies.

Do undergraduates use their personal computers to support learning?

KwongNui Sim[48] & Russell Butson

University of Otago, Dunedin 9016, New Zealand

Abstract

Computer activity data was extracted from the personal laptops of eighteen third-year students who self-reported as being skilled computer users. The analysis of the data revealed that non-academic use of students' personal computers was significantly higher compared with academic use. This was the case concerning the discrepancies between what students' self-reported as their level of use compared with their actual use. The findings illustrate that personal computers were not as crucial to undergraduate academic study as expected. In addition, the findings offer important insights into the benefits—in understanding actual practice—of using data-capturing techniques aimed at gathering naturally-occurring data.

Keywords: academic work; actual practice; e-learning; higher education; non-academic work; personal computer; self-report of practice; study habit

Introduction

The use of Information and Communications Technology (ICT) has grown enormously in the last 10 years with computers and smart devices becoming indispensable to our daily lives. Personal computers are seen as vital for those wishing to engage in higher education (Charter Colleges and Universities Participating in the National Higher Education ICT Initiative, 2003). While this is a claim that few of us would refute, we have very little research on how students are using their personal computer devices to support their academic practice (Sharpe,

Benfield, Lessner & DeCicco, 2005). Furthermore, much of the research pertaining to student learning is based on perception data rather than data concerning their actual practice. This scoping study thus sought to address this gap by exploring the possibility of capturing naturally occurring data from students' personal computers through installing software that tracked predefined aspects of use (e.g. Library database, Learning Management System, Word, etc).

Method

Participants were selected based on a set of criteria. Approval was then gained from the participants regarding the installation of the software on their personal computers, and data was extracted at the completion of the first quarter of the semester. The idea of naturally-occurring data, gathered as a result of students using their computers, was seen as an accurate method of revealing application types used and their computer technology engagement when studying over the first six weeks of the fieldwork period. In this way we were able to focus on the context(s), the extent to which software applications and web services were used to support undergraduate academic practice with personal computers - at what times and for how long. This approach offered what appeared to be an ideal way to capture students' actual use of their personal computers, as opposed to the traditional approach of soliciting post-event recollections through surveys and interviews.

Participants and Recruitment

Forty third-year students enrolled in undergraduate degree programmes were randomly selected for participation. Thirty students who showed their interest were invited to undertake a short questionnaire to gain some understanding of their perceived use of, and abilities with, computer technology. The questions appear in Table 1.

8. Table 1. The five questions in the questionnaire

1	Is access to a computer really important for your university study?
2	Which of the following best describes you?
	a. I love technologies and am among the first to experiment with as well as use them before most people I know.
	b. I usually use new technologies when most people I know do and sometimes I will be one of them.
	c. I am sceptical of new technologies and use them only when I have to.
3	Please indicate the ratio (within 10) of how much you use computers in your studies compared to other aspects of your life.
4	How do you rate your ability to use computers?
5	What is your skill level for the following?
	- using the university library website - computer maintainese
	- spread sheets - internet information searching
	- presentation software - evaluating the reliability and credibility of online sources
	- graphics software - using digital information from various access

Question one sought the participants' views on the importance of computer access for their university study, while question two asked how proficient participants were in the use of technology in their daily lives. These two questions were necessary to indicate the participants' views on the importance of personal computer use in their undergraduate lives. Question three invited the participants to self-rate on the extent of computer usage between study and non-study. This question was important to compare the students' self-reported practice and provide data against which to compare their actual practice that gathered through the extracted computer activity logs. Question four requested a more general rating of participants' overall perception of their computer skills. Question five required the participants to rate their abilities in different aspects of computer usage. These last two questions

determined the participants' computer 'savvy-ness'. In addition, the results of these two questions were used for final selection of participants for this dataset in this study.

Of the 30 who replied, 25 self-reported as average or expert computer users to question four. 18 (male-9 and female-9) with the highest scores (average or expert in at least four specific computer usages in question five) were recruited. All 18 participants' questionnaire replies were summarised and the data was assembled in the format of tables. Any remark provided by any participant was noted down for analysis reference. The questionnaire replies were kept as a preliminary dataset to compare participants' self-reports and their actual use of personal computers in academic practice.

Computer Activity Data

The Computer Activity Data was a core dataset. These data were gathered using a free software programme, ManicTime, which is known as "Personal time management software for logging and tracking work hours" (Mininday, 2009). ManicTime resides in the background of the computer reducing its intrusion on users' normal computer use. The core benefit of using ManicTime for this study was its function as a personal, time-tracking tool, thus providing monitoring at a rudimentary level. ManicTime only tracks the software programmes that are being used, the websites visited (through capturing the Uniform Resource Locators - URLs) and the documents that are accessed (for example "Assignment_1.doc"). At the same time, it records the duration of time the students engaged in these activities. The data gathered in this way was not reliant on the students keeping records and thus yielded more authentic information than could be gained from asking students about their computer usage.

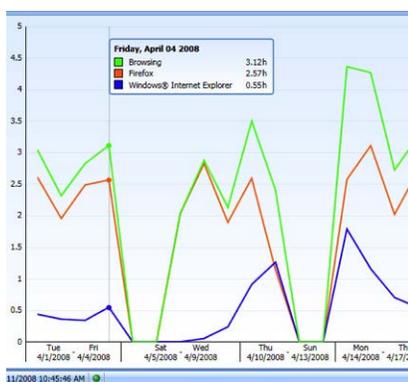
ManicTime was downloaded onto each participant's computer and configured to record the programmes or websites used, as well as documents accessed, at what dates/times and for how long, over the first six weeks in semester one. All the participants were invited to attend a briefing session where the software was explained and training was given on software functions; this included the ability to turn it on/off and delete any record. All those who were invited, attended the briefing session. The software captured the programmes and web services that students were using on a regular basis. The information was calculated "on the fly" and available for viewing by the student by clicking on an icon on the task bar. ManicTime is a detailed computer activity tracking application. At the click of an icon situated in the task bar, live data is presented in both tabular and graphical forms. These displays include the top applications used, top documents accessed, and computer usage within a certain duration. An example of the displays is shown in Figure 1.


Fig. 1. Computer usages by duration and top applications used within duration (Mininday, 2009)

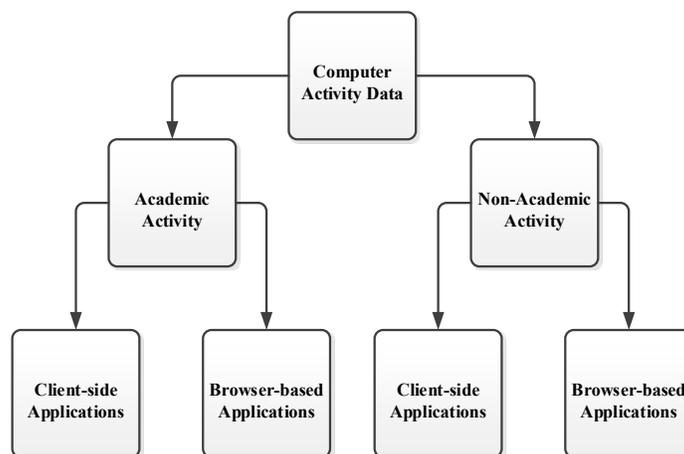
Computer Activity Data Analysis

At the end of the first six weeks of semester one, the lead researcher (the first author) met with each of the 18 participants to extract their computer activity dataset. This included figures and tables of Day, Duration, Top Applications, Top Documents, Top Computer Usage and some Custom fields.

The extracted computer activity data was then imported to Microsoft Excel for calculation and generation of more targeted tables and figures according to categories. This involved reducing the dataset to the top three software applications and web services used. Categories were generated based on the data captured.

A summary of the categories is shown in Figure 2.


9. Fig. 2. Generation of categories from the computer activities

As shown in Figure 2, the filtered dataset was divided into two categories titled Academic Activity and Non-Academic Activity. Academic Activity refers to software, documents or web services that were related to the participants' academic study. Non-Academic Activity includes all other uses, such as banking, entertainment sites, Facebook groups, etc. The distribution of the categories was not difficult given that all the URLs and file names accessed were recorded in the computer activities list.

The Academic Activity and Non-Academic Activity categories were then divided into Client-side Applications (e.g., Microsoft Office) and Browser-based Applications. Client-side Applications refers to all the built-in application programmes on personal computers used for different purposes. Browser-based Applications include website services (e.g., Blackboard) and website pages (e.g., Wikipedia).

In summary, this dataset traced the students' actual use of personal computers (software applications, web-based services/pages and documents) for their daily undergraduate academic practice as documented by the software programme.

Findings

Participant Selection Data

The participants were selected based on self-reports of their degree of computer literacy. This was measured using the responses to the five questions relating to computer use and perceived aptitude with computer technology listed in section *2.1* above. Of the 25 students who rated their computer use/aptitude as average to expert, 18 with the top highest scores were selected to undertake the study.

In question one, students were asked to state whether they agreed, were neutral or disagreed with the claim 'Access to a computer for university study is important'; all but one of the participants selected the 'Agree' option. The one participant who did not make a selection chose instead to make a comment: "A computer is important when you have poor teachers. You will have to teach yourself to learn." - An interesting comment from a person who had reported being an expert computer user.

The second question aimed at ascertaining the students' overall confidence and interest in adopting new technologies. Of the 18 students, only five regarded themselves as early adopters, with the majority (n=10) stating they saw themselves more as followers than as early adopters when it came to using new technologies. The remaining three, while comfortable with technology, considered they were sceptical when it came to new technologies.

Question three explored how the students used their personal computers for both academic (study) and non-academic use (other aspects of life). Nine of the 18 felt they had a balanced approach to computer use for academic and non-academic purposes with the other nine stating they were more likely to use their personal computer for academic than non-academic purposes (see Table 2).

Table 2. Student self-perception measure of their academic and non-academic computer use (Q3)

Participants	Percentage (%)	
	Academic Use	Non Academic Use
1	60	40
2	60	40
3	70	30
4	50	50
5	50	50
6	50	50
7	50	50
8	50	50
9	50	50
10	40	60
11	40	60
12	40	60
13	40	60
14	40	60
15	40	60
16	40	60
17	30	70
18	20	80

Question four asked students to self-rate their ability in using computers. All 18 reported their ability as average to expert. As for their ability in using specific computer applications (question five), all 18 students rated themselves as average to expert users against a list of common software programmes and web services.

Computer Activity Data

As shown in Figure 2 above, the computer activities list was divided into client-side applications (e.g., Microsoft Word or Windows Media Player) and browser-based services (e.g., Blackboard or Facebook). At the level of application use, the computer activities revealed the most popular application was the browser, with browser-based use considerably higher than client-side software programmes (average = 96.59%). The top three browser-based services were Facebook and YouTube which accounted for about 52.74% of students' overall computer usage, with Google (average = 2.92%) the next on the list. As for client-side applications, Microsoft Office was ranked the highest (average = 7.18%) followed by the file management application, Windows Explorer (average = 4.92%), and Adobe/Foxit Reader (average = 3.48%). Table 3 below shows the total use of client-side software and browser-based services retrieved from every participant's computer activity data.

Table 3. Student use of client-side software and browser-based services

	Percentage (%)	
	Client-side Software	**Browser-based Services**
1	13.42	86.58
2	98.86	1.14
3	12.25	87.75
4	19.05	80.95
5	17.53	82.47
6	12.05	87.95
7	14.21	85.79
8	13.93	86.07
9	3.87	96.13
10	26.25	73.75
11	24.70	75.30
12	21.00	79.00
13	14.31	85.69
14	27.95	72.05
15	47.15	52.85
16	44.72	55.28
17	17.65	82.35
18	22.03	77.97

The computer activities were then divided into two main categories: Academic and Non-Academic Work (this includes both client-side software and browser-based services). Table 4 below shows the actual practice of how participants used computers in their studies compared with how they used them in other aspects of their life.

10. Table 4. Computer activities for comparison of academic vs non-academic use

	Percentage (%)	
Participants	**Academic**	**Non-academic**
1	10	90
2	90	10
3	10	90
4	10	90
5	20	80
6	10	90
7	10	90
8	10	90
9	10	90
10	10	90
11	20	80
12	10	90
13	10	90
14	10	90
15	10	90
16	10	90
17	10	90
18	10	90

The problem of using self-reports to express practice in regard to computer use is highlighted by the discrepancy found between the self-perception questionnaire data (Table 2) and computer activity data (Table 4). From the questionnaire data, students perceived that they either struck a balance in the use of computer technology between study and other aspects of life or had a higher computer technology usage for study. The actual practice (computer

activities), however, revealed the opposite. Seventeen out of 18 of the students used computer technology 80%-90% more in other aspects of life (non-academic use) than in academic work (compare Table 2 and Table 4).

In summary, Computer Activity Data revealed:

11. the difference in usage between the top-ranked client-side software programmes (Microsoft Office 7.18% and Window Explorer 4.92%) and browser-based services (YouTube and Facebook 52.74%).
12. the high percentage of browser-based services use among undergraduate students (average of 96.59% among 18 participants).
13. the high non-academic use of personal computers in undergraduate students' actual practice compared with their academic use (average of five times more on non-academic use).

Discussion

The findings showed that while most of the participants reported that their use of computers was predominately for academic purposes, the computer activity data of actual use revealed the reverse. This highlights the considerable disparity between what students think they are doing and what they are actually doing when it comes to computer usage.

The difference between the students' use of client-side software applications (low use) and browser-based services (high use) as shown in Table 3, would suggest that undergraduates are less reliant on the various software applications installed on their laptops than they are on the browser to access the World Wide Web. The data also showed that daily, non-academic use of their personal computers was significantly higher compared with their academic use (Table 4). Given the high level of belief and confidence expressed by the participants regarding the importance of computer technology in higher education, it might be logical to assume that they would be avid users of both client-side software and web-based services for academic use. Instead, the data showed that a dominant use of personal computers by these undergraduate students is for socialising (social networks, such as, Facebook, and email), personal web services (Trading sites and online banking) and entertainment (YouTube, music and movies). The low level use of academic-related software/web services compared with non-academic use sends a clear message that for these 'computer savvy' third year students, personal computers were not as crucial to their academic study as was expected or as current research has argued (Aspden & Thorpe, 2009; Dahlstrom, 2011; Guidry & BrckaLorenz, 2010; Smith & Caruso, 2010).

This study suggests that for these participants there appears to be something about academic practice that is not conducive to technology use. Given that the predominate use of apps by these students outside of their academic practice is 'social', could it then be assumed that the 'social' is missing from academic practice? These findings are somewhat perplexing given that much of the literature regarding students' use of personal computers highlights the prominence of these devices for academic use with a number of these studies claiming that personal computers now play a significant role in supporting undergraduate study (Aspden & Thorpe, 2009; Dahlstrom, 2011; Guidry & BrckaLorenz, 2010; Smith & Caruso, 2010). So why did the findings from this study differ significantly from previous studies? Most studies on student use of computers in higher education rely on perception data, often gathered via surveys and questionnaires. The perception data gathered from students in the current study - questionnaire data - were similar to the findings presented in the literature. However, the data gathered from student's actual practice – computer activity data - showed something very different.

The difference between the students' beliefs about their personal computer use and their actual computer use highlights that self-report data reliant on post-event recollections should not be relied on to represent actual practice. Studies employing perception data might have led to the assumption that the extent of computer use to support higher education study was high. However, the naturally-occurring data captured in this study revealed computer use for academic purposes was very low.

Limitation

It must be acknowledged that some participants viewing the computer activity data that was being captured were surprised (e.g., duration of time on Facebook) and did state they were going to change their behaviour as a result. Such behaviour awareness was not expected at the beginning of the study. The awareness, however, did not appear to change behaviour dramatically, but it did provide a degree of self-awareness regarding their computer usage

which could have resulted in minor change. Students also had the ability to turn the software application on or off, as well as the ability to delete activities. We were not sure to what degree students actually employed these options.

Conclusion

Drawing on actual practice data, this study was an initial attempt to understand the role personal computers play in supporting undergraduate students' academic practice. The aim was to discover the manner in which undergraduate students integrate technology into their learning, and the ways they use technology to support and develop autonomous learning. This study explored the potential of methods focused on capturing naturally occurring behaviour in comparison with gathering post-event recollections through student self-reporting. It is hoped that the findings generated from this study will help inform the growing literature on undergraduate student use of computer technology. The findings are relevant to the broader tertiary population in that they will help to engender awareness of a different way to understanding research into student behaviour. Further, the study adds another voice or aspect to the growing interest in the role and impact that computer devices are playing in education.

Acknowledgements

The study presented in the paper has been derived from one of the datasets in KwongNui Sim's MA research project completed at Higher Education Development Centre, University of Otago, New Zealand in 2012.

E-Learning Environment for Hearing Impaired Students

Hisyamuddin Hashim[a], Zaidatun Tasir[a,49], Siti Khadijah Mohamad[a]

[a]Universiti Teknologi Malaysia, Faculty of Education, 81310, Skudai, Johor Bahru, Malaysia

Abstract

14. The usage of technology within the educational department has become more vital by each year passing. One of the most popular technological approaches used is the e-learning environment. The usage of e-learning environment in education involves a wide range of types of students, and this includes the hearing impaired ones. Some adjustment or enhancement needs to be implemented within the e-learning environment, based on the needs or the adaptability of the hearing impaired students accordingly. This paper reviews some of the past researches on the usage of the e-learning environment for hearing impaired students for the past decade or so.

Keywords: E-learning, hearing impaired

INTRODUCTION

There are a lot of disabled individuals who have the right to get the best education as they can get, just like their normal peers. Hearing impaired (HI) individuals are among those of people with disabilities that deserve the same rights. Hearing impaired individuals, particularly hearing impaired students, usually acquire the same level of mental capability as the normal hearing students in terms of studying. The term *'deaf and dumb'* is not practically to be used since the hearing impaired students are only lacking of their hearing capability not their intelligence level (Schwartz, 2002). Therefore, they will be undertaking the same subjects or courses in any education departments or institutions as those taught to the normal hearing students of the same age. However, a problem could occur for the hearing impaired students if the technique used by the teachers or instructors in teaching them is as the same used for normal hearing students. Therefore, the usage of technology is vital in preparing the HI students with appropriate learning environment, since by using technology, the HI students could access sound in their own suitable way (Berndsen & Luckner, 2010).

E-learning environment is one of the most used technique for educational purpose and this includes the education for HI students. However, most e-learning environment available does not particularly can be useful to the HI students due to its feature which is lacking in terms of adaptability to the HI students. They often encounter problem in accessing the information available in terms of understanding it and using it in a proper manner (Fichten, Ferraro, Asuncion, Chwojka, Nguyen, Klomp & Wolforth, 2009). Therefore, in order to assist these HI students in accessing the information correctly, the e-learning environment needs to be developed and designed according to the needs of the HI students by adding or enhancing some features within the e-learning environment.

Discussion on Selected Papers

In this section, we present the review of past researches on the usage of the e-learning environment for hearing impaired students starting from the year 2005 until the year of 2012. Table 1 below shows the list of the studies related to the issue concerned. We begin the review with the brief explanation on the each study, followed by the approaches, limitations and also some valuable directions for future studies.

14.1.1. Table 1. List of studies that focused on the hearing impaired e-learning environment

Author(s)	Year	Participants	Contents	Approach Techniques
A.S. Drigas, D. Kouremenos	2005	Deaf adults	E-commerce and Technologies of Internet	Virtual classroom, Animation, Video streaming (sign language) and conference, Chat rooms
Katja Straetz, Andreas Kaibel, Vivian Raithel, Marcus Specht, Kaludia Grote, Florian Kramer	2005	Deaf adults	Mathematics and Reading / Writing	Video streaming (sign language) and conference, Chat rooms, Enhanced visualization, Template Block
Javier Bueno, Soldedad Garcia, Reca Borego, Raul Fernandez	2007	10 profound prelingual deafness, 1 severe prelingual deafness, 1 HOH (all secondary school level)	Basic Computing	Knowledge database, Text adaptation, Image, Video streaming (sign language)
Ng Chee Kyun, Liew Yeong Tat, Iqbal Saripan, Ahamad Fauzi Abas	2007	Blind and deaf students	General Education	Video conference, Voice-to-text
S. Khwaldeh, N. Matar, Z. Hunaiti	2007	Deaf students	Mathematics	Virtual classroom, Video conference, Image, Subtitles, Chat rooms
Asma Al-Osaimi, Hadla Alfedaghi, Asmaa Alsumait	2009	42 deaf and HOH students	Kids Education	Enhanced user interface
Maha Al Bayati, Karim Hussein	2009	HI students	General Science Topic	Video streaming (sign language and finger spelling), Image
Mona Nasr	2010	Deaf / HOH students	Chinese Sign Language	Virtual classroom, Interactive and social tools, Video conference, Chat rooms
Megan Hastie, Dimity Dornan, Nian Chen, Richard Smith	2011	HI children fitted with hearing technology	Language (listening and speaking)	Auditory-Verbal Therapy (A-VTs)
Matjaz Debevc, Zoran Stjepanovic, Andreas Holzinger	2012	22 deaf and HOH people	Computer Literacy	Video streaming (sign language and subtitles), Animations

Brief explanations of each study

Generally, all the studies stated in Table 1 cover a wide range of educations or subjects taught for different types of hearing impaired students and how well the approaches used to design the e-learning platform changed according to the needs, usability and adaptability of these special students. The first study conducted by Drigas and

Kouremenos (2005), concerns about a learning management system (LMS) which offers the Greek Sign Language videos for each text block in the learning environment. The system satisfied the deaf learners' needs by providing the bilingual information (text and sign language), high level of visualization and learning with peers through the video conferencing. Next, is about the study done by Straetz, Kaibel, Raithel, Specht, Grote and Kramer (2005) which using the same approaches as in previous study. In this article, the authors made an effort to explain in details about the supposed-to-be-content template in order to convey the knowledge efficiently to the deaf students. An intensive research on e-learning content adaptation for deaf students has been studied by Bueno, Fernandez del Castillo, Garcia and Borrego (2007). The problems faced by deaf students when reading text are compiled and tested with several recommendations to adapt text in an e-learning Computing course which later shows a promising result on the level of understanding among those students. Kyun, Tat, Saripan and Abas (2007) have come out with friendly flexi e-learning system which enables both blind and deaf students to study together with the normal ones to support the "Education for All" objective. The system also can assist the bidirectional communications among user. Furthermore, there is also a research in Jordan where, this is the first time the system for deaf ever implemented in that country and it focusing on how the ICT technologies can assists in bringing the interactivity to the deaf classroom (Khwaldeh, Matar & Hunaiti, 2007).

Next, Al-Osaimi, AlFedaghi and Alsumait (2009) report some guideline for designing e-learning programs for deaf children aged between seven to thirteen years old, which based on deaf children and their teachers' feedbacks. There is a need for this guideline since the existing e-learning programs were not age-appropriate and cause difficulties for children to interact with. Instead of focusing on the e-learning tools alone, Al-Bayati and Hussein (2009) have studied about the impact of e-learning modules of tutorial lessons for HI students towards their motivation in learning the subject. Seven experimental tutorial e-lessons were developed and tested which resulting some positive outcomes towards enhancing HI students' motivation. Next, Nasr (2010) has concerned about enhancing the e-learning environment for deaf and HOH pupils by steering many learning facilities like interactive and social set of tools. The proposed paradigm is hoped to increase the usability and interactivity within virtual learning environment for disabled users. Hastie, Dornan, Chen and Smith (2011) have taken the technology a step further by inventing an e-learning system which able to train children with cochlear implant to listen and speak due to the chronic shortage of Auditory-Verbal Therapists world-wide. Last but not least, Debevc, Stjepanovic and Holzinger (2012) have developed an adapted e-learning environment for people with disabilities and the usability and pedagogical effectiveness of the e-learning course are evaluated using a Software Usability Measurement Inventory and Adapted Pedagogical Index method.

Approaches

The needs, usability, and adaptability always take presidency every time a researcher wants to develop an appropriate e-learning platform for HI students to learn efficiently. The technologies and techniques used must in line with these three aspects and among the popular approach used in all ten studies mentioned above are video streaming, chat rooms, video conference, text adaptation, voice-to-text, and interactive and social tools.

The video streaming application is the core medium for knowledge transfer to happen, mainly by using the sign language. Hence, several specifications like the resolution, frame format, file format, and frame bit rate must be taken into account in ensuring the quality of the sign language video presented to the HI students are clear enough to be recognized by them (Khwaldeh, Matar & Hunaiti, 2007). The accessibility of e-learning also found to be increased when spoken text and other sound information are presented together inside the video. Besides its potential in improving the reading skills among deaf students, it will also enable them to learn more independently (Debevc, Stjepanovic & Holzinger, 2012).

An integrated communication component consisting of chat and video conference enables the HI students to communicate and involve in the collaborative task (Drigas & Kouremenos, 2005; Straetz et. al; 2005). This is the medium where HI students can clarify their ideas and share information (Khwaldeh, Matar & Hunaiti, 2007). The interface of the e-learning environment itself plays a vital role in shaping the contents to be easily understood by the HI students. A familiar and interactive yet effective interface of the e-learning environment could boost up the learning experience of the HI students hence their performance (Al-Osaimi, Alfedaghi & Alsumait, 2009). Straetz et al (2005) used a designed templates block for different parts of each page included in their developed e-learning environment. The parts of the page are for example the header or the content layout. The template blocks used are fixed throughout the e-learning environment so that the users will be familiar with the environment

A knowledge database system is an approach proposed by Bueno et al (2007) in their e-learning. Knowledge database can be described as a dictionary mainly focusing on translating any difficult terms to be understood by the HI students to the more easier form to be understood by them. Finally, a rather unorthodox approach used by Hastie et al (2011) by using an auditory verbal therapy (A-VT) to be cooperated within an e-learning environment was found to be worked out well especially in terms of helping children who used to have knowledge of language they used to use during their lives before the loss of their hearing.

Limitations

There are several limitations allocated in terms of the usage of e-learning environment for HI students. First of all, it involves the teachers or instructors knowledge regarding the e-learning technology itself. During this modern times, most of them are probably adequate with the knowledge however there are several group who might not acquire this kind of knowledge. Secondly, in terms of the necessary infrastructure needed in making sure the usage of e-learning environment for HI students to be succeeded. Certain schools or institutions might not be enriched with all the infrastructure needed in developing the e-learning environment. Finally, in terms of the users itself, the HI students would probably find it difficult to cope with a new learning environment since they are very used to the usage of conventional classroom learning environment. They will have to be taught first on how to use technology generally in their daily learning activities so that it can be effective.

Future Directions

The implementation of e-learning within the HI learning environment is hopefully to be broaden up by years not only in terms of the technology itself but also in terms of the awareness level of how this approach could be very effective and useful to the HI students generally. E-learning designers should be aware of the existence of the users with hearing impairment and will try to develop an e-learning environment which will be effective to both normal hearing users and hearing impaired users. Finally, the usage of technology for HI students in terms of learning should be widen up not only by using an e-learning environment but also other available technology that is seemed appropriate to be used according to their disability.

Conclusion

The usage of technology should be capitalized especially for educational purposes, not only for normal students but for the disabled students as well, particularly the HI students. Their difficulties in using the conventional learning method should be taken as an opportunity for the e-learning developers and researchers in helping them by creating a learning environment that could help them in a variety ways. The development of any e-learning environment should help them in boosting their motivation level and at the same time enhancing their performance in learning any subjects or courses available in schools or learning institutions.

Educational Implication of Reflection Activities Using SNS in Cooperative Learning

Sang-Yon Kim, Mi-Ryang Kim[50]

Icheonsadong Elementary School, 124-87 Kyoungchungdae-ro, Daeweol-myeon, Icheon-city, Gyeonggi-province, 467-854, Korea
Department of Computer Education, Sungkyunkwan University, 25-2 Sungkyunkwan-ro, Jongno-gu, Seoul, 110-745, Korea

Abstract

This study aims to verify educational effects through students' reflection activities by applying Social Network Service(SNS), recently started to be used as one of teaching-learning methods to cooperative learning situations. Specifically, for cooperative learning, it proposes to figure out how reflection activities including sharing, conversations and discussions about prompt and ongoing learning contents in virtual space of SNS affect on students' learning and to explore educational availability and methods of SNS. For subjects of the study, 6th grade students of elementary school in Icheon, South Korea were selected and both experimental group and control group consist of 20 students, respectively. Reflection activities using SNS were conducted in the experimental group for 6 weeks in total. Classting, an aspiring educational SNS tool was used as the instrument for the study and students' impressions were qualitatively analyzed during the research. As the result of the study, the effect of academic achievement in cooperative learning became higher through reflection activities, there was positive effect by applying SNS to learning situations and educational implications and possibilities of SNS were suggestible.

Keywords: Reflective Activity, Collaborative Learning, Social Network Service(SNS), Classting Application

Introduction

Cooperative learning is a teaching-learning method to learn through interactions between members by consisting a small group with collective purpose. Especially, based on collaboration, it alleviates undesirable educational effects in over competitive situation and attempts emotional and cognitive interaction between students. Cooperative learning is a teaching-learning method to foster students' learning and socialization(Cohen, 1994) and emphasizes student-student interactions(Johnson & Johnson, 1994).

Cooperative learning, unlike traditional teaching method led by teacher, a collective student working which learners directly participated in learning with active interaction and have interdependences in learning(Cohen, 1994). Accordingly, cooperative learning aims to improve both students' learning and socialization at same time and effects of social elements for it should be greater.

And if Social Network Service(SNS) is applied to cooperative learning in order to apply its social interaction element and to improve effectiveness in learning, it will be helpful for better collaborative problem-solution ability. SNS plays a role of the space of communications and thinking activities facilitation by free sharing and discussion between users(Lim, 2010) and its educational application can be very potential because it is an 'interactive communication using collective intelligence'.

In this context, the study conducted reflection activities using SNS with cooperative learning for improving students' reflective thinking ability. Because SNS focuses on relationship-oriented communication and is available for sharing information and communication, it can be greatly applicable to cooperative learning which learners continue to participate in learning situations and solve problems through communications between them. And reflection starts from inconsistence between existing knowledge and new information and this inconsistence is from

---

social contexts of interactions with others (Lee, 2003), reflection activities using SNS may prompt interests for learning and its continuance.

Reflection means looking back to what was done by an individual and thinking of it in depth. A learner experiences a process to interpret and to organize new contents for integrating it to his/her knowledge structure in learning situation and then continuous reflection is required for it(von Glasefeld, 1996). That is, learner modifies his or her wrong thoughts and beliefs through reflection in learning process and transforms cognitive structure by including newly acquired information to it. Since these reflective thinking and reflection of learner are generated from interaction process of sharing opinions with colleague members(Lin, 2001; Silvers, 1998) and students justify or modify their own thoughts through collaborative reflections in social communications of sharing and negotiating thoughts and opinions with others and achieve learning experiences, web-based learning environment should offer strategies and instruments to support learners' collaborative reflections(Lee & Kim, 2003). For this, the study selects SNS as an instrument to facilitate collaborative reflections and reflective thoughts in cooperative learning. SNS provides opportunities to know quickly others' written thoughts and opinions based on relationship-oriented interaction and the contents can be available for checking in real time. These characteristics of SNS keep naturally contexts of learning and support learner's collaborative reflection with others.

The study aims to figure out, for cooperative learning, how reflection activities including sharing, conversations and discussions about prompt and ongoing learning contents in virtual space of SNS affect on students' learning and to explore educational availability and methods of SNS.

Theoretical Backgrounds

Cooperative learning and educational application of SNS

Johnson and Johnson (1994) defines cooperative learning is a learning method through interactions including sharing learning experiences between learners from setting goals for learning to evaluation on it. To induce successful cooperative learning, teaching-learning method with consideration of characteristics of cooperative learning is required and Jefferies (2003) emphasizes roles of teacher and technologies for factors to facilitate cooperative learning. In relating to this, concerns for application of SNS in the educational field haven increased with discussion on learning process focusing on social relations and technologies (Greenhow & Robelia 2009; Selwyn, 2009). SNS is an online community to share various thoughts and experiences based on relationships between users and a system to support cooperative learning in social factors of interaction and interdependence. Studies on educational application of SNS have been increasingly trends and according to Yue et al.(2009), learners can form online community using SNS and achieve given goals for learning through this. Usefulness, entertainment and interaction of characteristics of SNS induce users' participation activities and contribute to continuous and normative immersion to SNS, as a result. If these participant characteristics are applied to cooperative learning, it may be effective to reflection activities and learning. When students build a communication system, reflection activities to modify their own wrong thoughts and beliefs and to integrate newly acquired knowledge to their cognitional structure may be available for focus, control and participation on learning, induce naturally immersion to learning process and increase satisfaction and accomplishment for it.

Cooperative learning and reflection activities

Cress and Kimmerle(2008) explains a process that individual learner shares and learns his or her and other's own knowledge and expands collaborative knowledge in cooperative learning environment using wiki. In this environment, learner experiences cognitional conflicts in the process of arranging his or her knowledge and accepting and internalizing others' knowledge and experiences and maintain cognitive equilibration through Paget's 'assimilation' and 'accommodation'(Cress & Kimmerle, 2008).

Reflection activity is a process of self-examination and assessment on knowledge and information critical to making a decision by learner (Meziorw, 1990). Learner can understand and apply learning contents in depth through broader understanding and critical thinking on knowledge by reflection activities. Nowadays, reflection activity is considered as a process that learner shares and negotiates his or her learning experiences and knowledge with others and assesses and modifies them unlike the conventional concept of reflection focusing on learner's inner self-reflection and critical thinking(Richards, 2001). The scholars also point out that reflection activities are generated during cooperative learning process of interaction with others (Lin, 2001).

Research Methods

The subjects of the study

The study conducted reflection activities using SNS on 6th grade students of elementary school in Icheon, Korea. A cooperative learning group is defined as a learning community autonomously consisting of four students with purposes of deep understanding on curriculums, deep learning and effective achievement of goals of learning. The experimental group consists of 20 students for using SNS. The members had offline meeting and posted the studied contents on Classting group note and had reflection activities on them. On the other hand, the control group randomly consisted of 20 students who did not use SNS in their daily life and had offline study group activities. Among them, students who did not participate faithfully in reflection activities using SNS were excluded. In total, 40 students (20 students for the experimental group and 20 students for the control group) participated in this study.

The instrument for the study

The study used Classting, a class SNS for reflection activities using SNS. Classting is a class SNS to support teaching and learning and it is available for sharing various information including writings, photos and videos with classmates by using smart phones and computers. Services provided by Classting consist of 'Wall' for sharing opinions or thoughts, 'News Board' for noticing class news or messages to students, 'Photo Album' and 'Video Room' for sharing photos and videos, respectively.

In this study, reflection activities using Classting were suggested gradually with motivation sources, learning sources and reflection activities suitable for class subjects. Students engage in learning activities using smart phones and compose reflection diaries. Videos shared on Youtube and related to the class were used for motivation. Students can watch directly the videos on their smart phones by clicking links. Learning sources were suggested as short and interesting video to help student study intensively for short time. After the activities, students composed reflection diaries and these diaries are available for communications with others in form of comment. Teachers may provide feedbacks using the form of comment, as well.

Analysis of a teaching-learning case using SNS

Class activities announcements

Currently, most elementary school websites offer notice board and announcements and messages are usually posted. However, the platform is usually based on PC and difficult for application on a daily basis. However, this function is more efficient and easier for students and their parents using SNS in smart phone environment.

Fig. 1. Class activities announcements case

FAQs

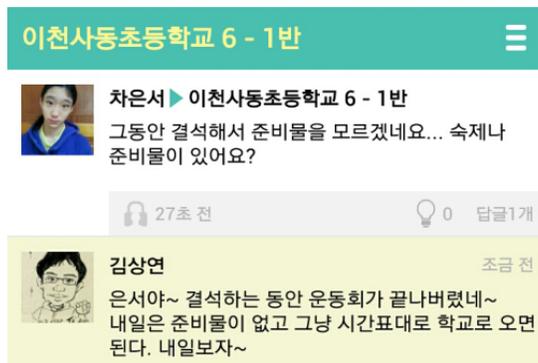
Even though it always happens, there are students who call for questions via cellular phone once or twice a week. Teachers may miss calls from students because of meetings and other assignments. In that case, if students post questions on SNS, teachers can comment on it and provide answers when they are available. And it may lead improvement of satisfaction on school education.


Fig. 2. FAQ case

Life counseling

Some students have things not to share with anybody in their school lives. A student may want an individual counseling but school activities are based on collective ones and then SNS can be used for individual counseling with students.

Fig. 3. Life counseling case

Review activities

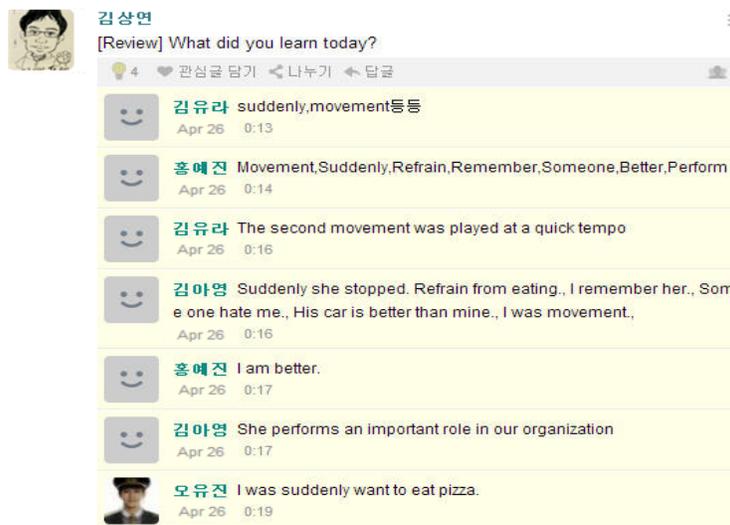
It is to summarize the progress of class work of the day in 150 characters by subject. It offers an opportunity for reviewing studies of the day in their own simple methods to students. Because the knowledge can be composed in student's own way, it can be excellent review activity.


Fig. 4. Review activities case

Reflection activities after assessment

It is about impressions and thoughts about difficulties on team problem-solving activities, their improvements, difficulties and improvements on self-directed learning process, other comprehensive learning activities.

Fig. 5. Reflection activities after assessment case

The Results of the Study

Students' impressions on using SNS with real-time feedback such as Classting for their studies were collected and analyzed by subjective questionnaires. As a result, students were very satisfied with easy access to class information and counseling for studies and school life which were unavailable in face-to-face situations. They also expressed satisfaction in use of new lecture instrument such as Classting. It seems to show educational availability of SNS as

an instrument of participation, communication and collaboration. As the results of analysis of reflection activities using SNS in cooperative learning, students' impressions and opinions are as follows:

"It was fun to see various sources such as videos and I could have a chance to think of my study habit again, posting the relevant contents. The best thing was to share my idea with my classmates"

"I had doubt on Classting at first: 'What is it and how can it be used efficiently?' But it was very impressive that I can post my opinions regardless of space and time if I can use smart phone or internet. It was also great that my value changed through this experience."

"The most impressive thing was to exchange one's opinions by comments on one theme. And video was best because it was made for easier understanding."

However, there were some students' concerns and complains about class management using SNS.

"I prefer class with paper notebooks and textbooks. To use computer is too difficult for me. So it is a burden to study via Classting..."

"Choi Sang-Min, who is next to me, didn't reflection activity. He did something else. I wanted it but I could stand the temptation."

These students felt difficulties in using SNS because they were familiar with conventional class with paper notebooks and textbooks and suggested their relative sense of alienation compared to those who used SNS actively. It is a significant consideration to use SNS for education in future. And side-effects including engaging in games, cacao talk, and internet surfing or calling during the class due to increase in students' use of smart phones should be carefully studied.

Discussions and Conclusion

This study reviewed effects of reflection activities using SNS on students' learning activities. Classting application was selected to support cooperative learning reflection activities and availability of SNS as a support instrument of reflection activities were examined by applying it to cooperative learning in the experimental group for 6 weeks in total.

As the results of analysis of reflection activities by students who used SNS, it has differential characteristics compared to the existing web-based environment for cooperative learning and learners reached to learning based on social factor of 'relationship'. That is, SNS is a facilitating instrument not only for learning activities but also social relationships such as friendships and encouragements between members. These results are consistent with study results by Greenhow and Robelia(2009) and Selwyn that SNS induces both formal and informal learning based on social relations between learners.

Accordingly, by summarizing results of the study, conclusion makes the following suggestions.

First, SNS has potential to explore collaboratively solutions of tasks by members and to provide cooperative learning environment for accomplishing collective goals of learning. Learners examined their learning experiences critically through reflection activities using SNS and performed cooperative learning to achieve collective goals of learning through discussions with others. Second, SNS seems to have positive affects on cooperative learning as an instrument to support reflection activities. Learners reminded their learning experiences through reflection, recomposed past experiences related to learning and then reassessed and internalized lessons. In this process, SNS supported cooperative learning focusing on social factor of 'relationship'.

The study has its own limits as follows: First, due to data from few participants, the results of the study are not easily generalized. Second, external variants on instrument to support cooperative learning, SNS were not considered. There were barely considerations and analysis on the instrument and environment including level of students' SNS use, methods to approach to SNS such as smart phone and PC and frequency of SNS participations. For future studies, these factors should be supplemented and considered to conduct positive research to prove educational effectiveness of SNS as learning support instrument and learning environment. Third, learners' diverse

cognitive and emotional variants should be considered, as well. And, finally, to apply cooperative learning in class, closeness, friendship and relationships between students should be figured out and adjusted.

Effect of English Short Sentences Memorization on the Speaking Skill and the E-learning of English

Ikuo Kitagaki[51]

Tokyo City University, Tokyo 158-8557, Japan

Abstract

The paper discusses an effect of English short sentence memorization on the speaking skill using an e-learning then suggests to implement the method when making an e-learning of English. In the e-learning discussed in the paper, the system selects a learning task among the learning task set at random then present to the student on the PC display. The student memorizes the English short sentence shown there. The procedure is done consecutively. We conducted a pre/post test measuring the speaking skill before/after the learning task. As a result, we discovered that the improvement was observed in nearly seventy-five percent of cases.

Keywords: English speaking skill; learning effect; educational evaluation

Introduction

We have developed an English e-learning system aiming the enhancement of the speaking skill. The main feature of the system consists of three steps: English short sentence memorization, practice of pronunciation and prompt oral translation.

The first step is the most important thus it is discussed in this material. Although the learning procedure is detailed in the next section, if the procedure is repeated, it may be possible for the student to do the prompt oral translation easier for the given Japanese.

This paper reviews the previous experiment relating the e-learning of English implemented for the enhancement of the speaking skill(Kitagaki, 2009). Then we conducted an experiment on how much memorization of English short sentences is effective on the enhancement of English speaking skill. We here show the effectiveness of the method proposed here.

There are supposed to be two methods for enhancing the English speaking skill: social interaction and memorization(Ma and Kelly, 2006; Nakamura, 1993). We here regard the memorization as its methodology.

Methodology Comparison

The detail procedure of proposed method is shown in Figure 1 and explained below:

(1) The computer displays a Japanese short sentence as a learning task on the computer screen as shown in Figure 2.
(2) The student orally translates it into English.
(3) The student operates the computer to display the correct answer.
(4) The student memorizes the correct answer.

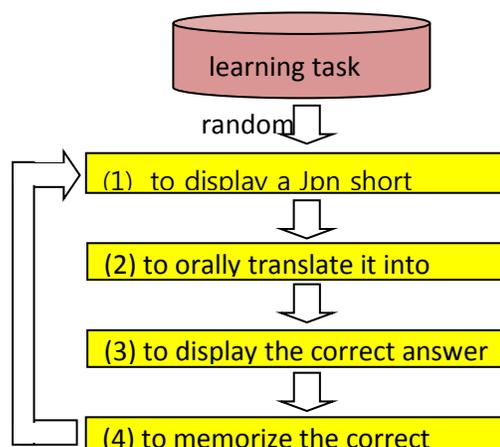
These four steps are repeated. Because the number of the learning tasks in the task set are limited to around sixty, one task will be selected several times in a long


Figure 1 Random selection of a task

---

[51] * Corresponding author.
E-mail address: ikuo@media-mirai.com

run. As a result, with the repetitive task learning, the student will be able to memorize all the English sentence then to do the prompt translation for the prepared task.

For the learning method mentioned above, we have conducted the experiments on methodology comparisons in our previous researches.

As to the educational evaluation, two aspects are discussed in general: competency and emotion.

As to competency aspect, it is possible for students to memorize the relevant short sentences only with a paper without a computer. We have experimented the effect in the two case: proposed computer method and the paper method for the same learning contents. The effect of English short sentences memorization on the enhancement of speaking skill has been found in both methods. From the comparison, we found no significant difference in them.

Figure 2 Learning task displayed

As to emotion aspect, on the other hand, two methods have been compared: randomly selected task and sequentially selected task. From the questionnaire survey among eleven students, eight students have answered that random method had the preference on sequential method.

Experiment planning and the evaluation

The experiment follows the procedure shown in Figure 3:

We have prepared two kinds of task set A and task set B for each of level 1 and 2. Only task set A served as the object of memorization. On the other hand, task set B served as the pre/post test, which means that the tasks for pre-test are the same as the one for post-test. Task set A for each of level 1 and level 2 includes sixty-five tasks and fifty-five tasks, respectively, and task set B for each of level 1 and 2 includes ten tasks, where level 1 is easier than level 2.

Figure 3 Proposed

Here show the example of the short sentence.

Level 1: *This house is designed solid. It will hold up well against earthquakes.*

Level 2: *Smoke not only disrupts your vision, it can prevent you from normal breathing. In case of fire, you must escape promptly without getting caught up in smoke.*

Seven students served as subject. Six students among them practiced the task set A for level 1 and 2. One student practiced the task set for level 1 only. In the pre-test administration, we presented each task in Japanese to them one by one and let them orally translate it into English. All the answers were recorded in the digital.

In the practice of memorization, thirty minutes were used in a day. We set the accumulative learning time to 300 minutes which took nearly two weeks. The procedure in the pre-test administration is the same as in the pre-test. As a result, we obtained seven ten-responses for level 1 and six ten-responses for level 2 in the total.

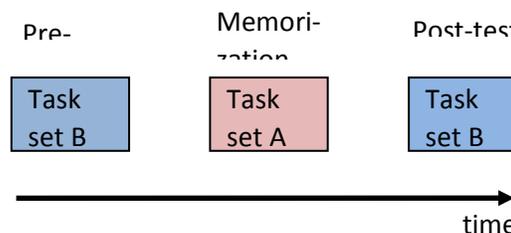
In the evaluation, three English natives A(Female), B(Male) and C(Male) served as the


Table 1 Comparative evaluation-frequency-

Level	Evaluator	X>Y	X~Y, X<Y
1	A	52	18
	B	53	17
	C	51	19

(b) similarity

Level	Evaluator	X>Y	X~Y, X<Y
1	A	56	14
	B	48	22
	C	50	20
2	A	47	13
	B	42	18

evaluator. They listened to each responses for pre/post-test in pair then evaluated them in terms of which is better in *fluency* and *similarity*.

Fluency: How much fluent is the oral response?

Similarity: To what degree is the response similar with the correct answer in their contents?

Table 1 shows the result of *fluency* and *similarity* for each of three evaluators. From Table 1, it was discovered that nearly seventy-five percent of the case got the improvement in its frequency.

And the hypothesis that the frequency of "post-test response is better than pre-test response" is the same as that of the other cannot be adopted statistically in all cases($p<0.05$, df=1).

Conclusion

From the experiment proposed here, we got a significant information suggesting that English sentence memorization has an effect on the enhancement of the speaking skill, which may give a user of the proposed e-learning the educational hint/motivation. When the feature of an English e-learning is designed, it ought to be considered that memorization as an educational methodology is efficient in order to enhance the speaking skill.

Effective Factors for Accomplishment in Training Teacher Profession Experience of Faculty of Education Students Rajabhat Maha-Sarakham University Thailand

Tiwarat PRASERTSUNG[52]

Department of Educational Technology, Faculty of Education, Kasetsart University, Thailand
15.

Abstract

Objectives of the research are 1) studying effective factors for accomplishment in training teacher profession experience of faculty of education students. 2) studying accomplishment in training teacher profession experience of students and population target that is teacher supervision faculty of education Rajabhat Maha-Sarakham. 85 peoples from target group by random methods. Research questionnaire was an equipment collected the data. Research results that teacher supervision agrees with all factors in high level $\bar{X}$=4.23.Mostly factor which teacher supervision agrees with is provide factor for accomplishment in training teacher profession experience ($\bar{X}$=4.35). 2nd is supplement effective factors for accomplishment in training teacher profession experience ($\bar{X}$=4.28). 3rd is inputs effective factors for accomplishment in training teacher profession experience ($\bar{X}$=4.21) and achievement in training teacher profession experience that is agreed by teacher supervision in high level ($\bar{X}$= 4.098).

Keywords: Effective factors, Training teacher profession experience.

Nomenclature

A   Effective Factors for Accomplishment

B   Training Teacher Profession Experience

C   Graduated student

Introduction

There are many problems of Thailand education management that are causing of heavy education reform. An important problem is trouble with teacher and educational personnel that came from the manufacturing, the development and maintenance of standards of teaching constitution of Kingdom of Thailand of B.E.2540 section 81 so the government determined provision for teacher professional development and National Education Act of B.E. 2542 section 9(4) had established provisions for the support to teacher profession standards, lecturers, educational personnel as teacher-lecturers- education personnel continuing development that are principles and rationales for specification method, teacher profession development which are a part of educational reform. (http://www.moe.go.th/wijai/teacher.htm, 14/03/2556). Assessment of teacher capacity must be operated access to teacher professional or development from the beginning. For example, in other country determined a new teacher must passed teacher evaluation test that could be tough in school.(Pimpun Dechakupata and Pornthip Keangkhun,2551) In addition Bandhij Chudwiroj (2550) researched about capacity building of teaching of students. The study result, that found teaching capacity of students in preparation and planning for teaching, the teaching and learning that focuses on students, and the evaluation of teaching is only moderate level by the teacher manufacture course.(Reference by Nuttapon Rumphai,2554)). From reasons and importance of the issues which lead to the concept in the study of factors that affected to the achievement in training teacher profession experience of student Faculty of education Rajabhat Maha-Sarakham University are a way into questions that are the method

of Research for the Foundation. Information for develop education management system of teaching profession students of government agencies and institutions that was consistent with the policy.

Objectives

1. Study the effective factors for accomplishment of training teacher profession experience of students.
2. Studying the accomplishment of training teacher profession experience of student.

Methodology

1. Population and sample. Audience demographics for studying the effective factors to accomplishment of training teacher profession experience is the university supervisor of faculty of education Rajabhat Maha-Sarakham University total = 85 people.

2. Instruments used to collect data. Tools used in this study was a questionnaire created by the researcher which were submitted by to the university supervisor to get some information that affected to accomplishment of training teacher profession experience. The questionnaire consists of 5 procedures.

Section1:Personal data. Section2:Effective factors for accomplishment of training teacher profession experience. Section3:Other related factors about the field work experience of student teacher. Section4: Reinforcing factors about the field work experience of student teacher. Section5:Accomplishment of the field work experience of student teacher.

3. Data Analysis. This research has analyzed data using the computer program package to determine the mean and standard deviations.

Results

Section1 : Effective factors for accomplishment of training teacher profession experience. 1)Professional Teaching Standards : The university supervisor agrees with leading factors influencing with accomplishment of training teacher profession experience in highest level. ($\bar{X}$=3.93 and S.D.= 0.90) 2)Teaching practices curriculum : The university supervisor agrees with leading factors of teaching practices curriculum influencing training teacher profession experience in high level. ($\bar{X}$=3.93 and S.D.=0.90) 3)Processes of teacher profession experience training : The university supervisor agrees with leading factors of processes of teacher profession experience training influencing training teacher profession experience in high level. ($\bar{X}$=3.84 and S.D. = 0.82)

Section2 : Other related factors about the field work experience of student teacher.1)Institutions target : The university supervisor agrees with Conductive factors of Institutions target influencing training teacher profession experience in high level. ($\bar{X}$=4.20 and S.D.=0.85) 2)Aspects of learning environment: The university supervisor agrees with Conductive factors of aspects of learning environment influencing training teacher profession experience in high level. ($\bar{X}$=4.30 and S.D.=0.88) 3)Cost : The university supervisor agrees with cost conductive factors influencing training teacher profession experience in high level. ($\bar{X}$=4.31 and S.D.=0.79)

Section3 : Reinforcing factors about the field work experience of student teacher. 1)Information and communication technologies for learning :The university supervisor agrees with Information and communication technologies for learning-reinforcing factors influencing with training teacher profession experience in high level. ($\bar{X}$=4.35 and S.D.=0.72) 2)System for the field work experience of student teacher: The university supervisor agrees with System for the field work experience of student teacher- Reinforcing factors influencing with training teacher profession experience in high level. ($\bar{X}$=421 and S.D.=0.85)

Section 4 : Accomplishment of the field work experience of student teacher. 1)Learning Management : The university supervisor agrees with Learning Management-Reinforcing factors influencing with training teacher profession experience in high level. ($\bar{X}$=4.11 and S.D.=0.82) 2)Teaching practices : The university supervisor agrees with Teaching practices -Reinforcing factors influencing with training teacher profession experience in high level. ($\bar{X}$=3.93 and S.D.=0.812) 3)Features of a teacher : The university supervisor agrees with Features of a teacher-Reinforcing factors influencing with training teacher profession experience in high level. ($\bar{X}$=4.05 and S.D.=0.776) 4)To accept of the Academies: The university supervisor agrees with to accept of the Academies - Reinforcing factors influencing with training teacher profession experience in high level. ($\bar{X}$=3.94 and S.D.=0.92)

Recommendations

1. Faculty of education Rajabhat Maha-Sarakham University has to studied the opinion from student for information, problem and method to resolve it for student.

2. Faculty of education Rajabhat Maha-Sarakham University has to studied the opinion from personnel's Institutions are target for considered desire – objectives - basis problems to student's preparation.

13th International Educational Technology Conference

EĞİTİMDE BİLGİSAYAR ETİĞİNİN İNCELENMESİ

Ebru ALBAYRAK[53]

Sakarya Universitesi, Eğitim Bilimleri Enstitüsü, Sakarya, Türkiye

Özet

Eğitimde teknoloji kullanımının hızla yaygınlaştığı günümüz dünyasında teknolojiden elde edilen yararların yanı sıra ortaya çıkan risklerin artması da kaçınılmaz olmuştur. Bu risklerden biri etik sorunudur. Etik, doğru ve yanlış insan davranışlarını kapsar ve bu davranışları bir disiplin içerisinde inceler. Yaşamın her alanında olduğu gibi bilgisayar teknolojisinde de belli etik kurallar bulunmaktadır. Bu kurallar insanların teknolojik haklarını ve bu hakların sınırlarını belirleyen fikri mülkiyet, erişim, gizlilik ve doğruluk gibi unsurlardır. Ancak günümüzde bu durum insanlar tarafından yeterince anlaşılmamıştır ya da bilinçli olarak etik kuralların dışına çıkılmaktadır. Bunun sonucunda masum insanlar zarar görmekte ve bazen zarar gördüğünü bile anlamamaktadır. Eğitim sistemi içerisinde de öğrenciler kendi haklarının nerede sonlanıp diğer insanların haklarının nerede başladığı konusunu anlamayabilmektedirler. Bu yüzden küçük yaşlarda olumsuz durumlar içerisine girebilmektedirler. Bu konuya açıklık getirmek amacıyla bu çalışmada etik kavramının anlaşılması, sınırlarının belirlenmesi, bilgisayar etiğinin ne olduğu açıklanmış, alanyazında yer alan çalışmalar da incelenerek eğitimde bilgisayar etiğinin ne derece anlaşıldığı ve bu konuda hangi çalışmaların yapıldığı tespit edilmiş ve bu duruma yönelik öneriler getirilmiştir.

Anahtar Kelimeler: Etik, Bilişim Etiği, Bilgisayar Etiği.

INVESTIGATION OF THE COMPUTER ETHICS IN EDUCATION

Ebru ALBAYRAK

Sakarya University, Institute of Educational Sciences, Sakarya, Turkey

Abstract

The use of technology in education rapidly spreading in today's world. Therefore the risks about technology was inevitable. This is one of the risks that of ethics. Ethics covers the right and wrong of human behavior and examines the human behaviors in a discipline. As in all areas of life, there are certain ethical rules in computer technology. In order to clarify this issue, what computer ethics is, understanding of ethical concept, determination of boundaries was explained and by examining the studies in

[53] Corresponding author.
email address. ealbayrak@sakarya.edu.tr

the literature, it was revealed what means computer ethics education for students. Finally some suggestions have been made for the findings.

Keywords: Ethics, Information Ethics, Computer Ethics.

1.GİRİŞ

Günümüzde teknolojide meydana gelen gelişim ve yayılım hızının artmasıyla birlikte toplumun bu değişime uyum sağlaması gitgide zorlaşmaktadır. Bu konuda bireyleri koruyan kanun ve yönetmeliklerin oluşturulması ise zaman almaktadır (Özpınar, Kazaskeroğlu ve Öz, 2010). Bilişim teknolojilerini kullanarak diğer insanların haklarını ihlal eden bireyler henüz yeni çıkan kanunlardan haberdar olamamakta ve yaptıklarının yanlışlığının yeterince farkında varamamaktadır. Böyle bir durumda etik kavramının ve bilgisayar teknolojilerinde etik kuralların bireylere öğretilmesi daha büyük bir ihtiyaç haline gelmekte ve bu konuda eğitim kurumlarına önemli görevler düşmektedir. Bilgisayar etiğinin anlaşılabilmesi için öncelikle etik kavramının tanımlanması, bu konuda ileri sürülen kuramların ortaya çıkarılması ve bilgisayar teknolojileri etiğinin ayrıntılarına inilmesi gerekmektedir.

1.1 Etik

•

Bireylerin olay ve durumlar karşısında gösterdikleri tepkiler toplumdan topluma ve kültürden kültüre değişkenlik göstermektedir. Çünkü bir toplumda kötü olarak algılanan bir olay başka bir toplumda kabul görüyor olabilir. Yine de bu durum diğer insanları rahatsız edebilir. Bu yüzden etik kavramının sınırları tüm toplumlarca çizilmeli (Kuzu ve Becit, 2008) ve ortak etik kurallar belirlenmelidir

Literatüre bakıldığında etik kavramı ile ilgili birçok tanımlamalara rastlanmaktadır.
"Yunanca ethos sözcüğünden türetilen etik (töre) insanın toplumsal ölçekle geçekleştirdiği ve başkalarını etkileyen sonuçları olan davranışları/eylemleri/yapıp etmeleri ve bunları biçimlendiren düşünme süreçleri ile ilgilidir" (Büyüköztürk ve diğerleri, 2012:26). Bir başka deyişle etik, bireyin neyin doğru ya da yanlış olduğunu ayırt etmesini sağlayan davranış kurallarıdır. Etiğin sahip olduğu ilkeler bireyin tüm hayatı boyunca etkileşim içinde bulunduğu aile, okul ve dini kurumlar gibi birçok yerde bireye öğretilir. Kişi etik kurallara uygun davrandığı zaman olumlu duygular hisseder. Aksi halde yaptığı iş kişiye rahatsızlık verir (Aypay, 2009). Etiğin amacı kişiyi eğiterek toplumda kendine uygun bir yer bulmasını ve ahlaklı, bilinçli, üretken ve mutlu olmasını sağlamaktır. Etiğin başka bir amacı ise toplum içerisindeki bireylerin karşılıklı anlayış ve güven ilişkisi içerisinde olması ve sosyal ve ekonomik dengenin sağlanmasıdır. Eğitim kurumları ise etik kuralları merkeze alan adil ve dürüst yapısı ile öğrencilerin güvenini kazanan örgütlerdir (Marşap, 2006).

1.2 Etik ve Ahlak arasındaki farklılıklar nelerdir?

•

Toplum içerisinde günlük konuşmalarda etik ve ahlak kavramları aynı anlamda kullanılabilmektedir. Ancak aslında ahlak ve etik arasında bir takım farklılıklar bulunduğu düşünülmektedir.

"Günlük dilde ahlak (moralite), sıklıkla kişisel yaşamla, özellikle cinsel alışkanlıklar ve kurallarla ilişkilendirilir. Çoğu filozof "etik" sözcüğünü ahlakın felsefi olarak incelenmesi anlamında kullanarak etiği daha üst düzey bir felsefi düşünce haline getirir. Genellikle etiği uygulamaya yönelik "Burada ve şimdi ne yapmalıyım?" gibi ahlaki soruları daha geniş, şematik ya da kuramsal bir bakış açısında incelemek üzere, bunları sormanın ötesine geçmesi bakımından ahlaktan farklı olduğu düşünülür. Ve bu, etik ile ahlakı birbirinden ayırmanın bir yoludur" (Haynes, 2002:19). Yine bir başka ifade ile etik , "ahlak üzerine söz söyleme etkinliği" olarak tanımlanmıştır. (Aydın, 2006). Etik ile ilgili olarak bilgisayar teknolojilerinde üç türlü kavramla sıklıkla karşılaşmaktayız. Bunlar bilgisayar etiği, internet etiği ve bu iki kavramı kapsayan bilişim etiğidir.

1.3 Bilişim Etiği

•

Bilgisayar, iletişim ve ağ / internet ortamlarında uyulması gereken kuralları tanımlayan normlar ve kodlar kısaca bilişim etiğini ifade eder. Bu norm ve kodların temel amacı, kişilerin maksimum fayda ve minimum zarar ile bu ortamları kullanmasını güvence altına almaktır. Buna göre bilişim etiği, tüm "bilişim toplumunu" ele aldığı gibi, bireysel olarak da kişisel bilgisayarların kullanımı esnasında uyulması gereken kuralları düzenler (URL1). Bilişim teknolojileri ile toplumda meydana gelen değişim ve geçiş dönemlerinde, etik kuralların eğitimde yer alması toplumun değişen dünyaya uyum sağlama ve düzenini korumasında yardımcı olacaktır (Aksal, 2011).

Bilişim etiği başlığı altında yer alan bir takım alt boyutlar bulunmaktadır. Bunlar Fikri Mülkiyet, Bilişim Teknolojilerinin Toplumsal Etkileri, Güvenlik ve Kalite ile Doğruluktur Bunlardan Fikri Mülkiyet kavramına aynı zamanda Telif Hakkı denilmektedir (Erdem, 2008). Telif hakkı üretilen bilgi veya düşüncenin kullanımı ve dağıtım haklarının belli bir kişi ya da kuruma verilmesidir (Erdem, 2008). Telif hakkı mülkiyet kavramını temel alan bir kavramdır (Atabek, 2006). Bu yüzden bu kavram sadece etikle değil aynı zamanda hukukla da ilgili bir konudur. Ancak bazı durumlarda bu konu yasaların ötesinde kalmakta ve etik dışı davranışların önüne geçilmesi daha da zorlaşabilmektedir (Uysal ve Odabaşı, 2006).

Bilişim Teknolojilerinin Toplumsal Etkileri, bilişim etiğinin toplumda ne kadar uygulanabildiği ve topluma nasıl bir etkisinin olduğu ile ilgilidir. Toplumda yaygın olarak kullanılan teknolojinin etik dışı kullanımının çok ciddi sonuçlar doğurabileceğinin farkındalığının artırılma ihtiyacı her geçen gün daha da artmakta ve toplum düzeninin bozulmaması için insanların eğitilmesi gerekmektedir. Bu konuda okulda ya da halka açık olarak verilen seminerler büyük yararlar sağlayabilir.

Güvenlik ve Kalite konusu kişilerin bilişim teknolojileri kullanımında güvenliğinin ve gizliliğinin sağlanması ile ilgilidir. Özellikle web üzerinden yapılan tüm işlemlerin izlenebilmesi ve bu durumun insanlar aleyhinde kullanılması büyük huzursuzluklara sebebiyet vermektedir. Bu durum ise özel hayatın gizliliğinin sağlanmasını engellemektedir (Erdem, 2008).

Doğruluk ise veri girişi hatalarından kaynaklanan yanlış bilgilerle ilgili olduğu gibi bireylerin kendileriyle ilgili bilgilerinin doğruluğunu kontrol etme hakkıyla da ilgilidir. Yanlış veri girişi kasten yapılmış olabileceği gibi yanlışlıkla da yapılmış olabilir (Mollavelioğlu, 2003, s.21:akt Uysal ve Odabaşı, 2006).

1.4 Bilgisayar Etiği

Bilgisayarın doğru amaçlar doğrultusunda kullanımının sağlanarak bu konuda yaşanan olumsuzlukları gidermek için etik kurallar ve ilkeler bu konuda insanlara rehberlik etmektedir (Aksal, 2011). Bu amaç doğrultusunda Uluslar arası Bilgisayar Etik Enstitüsü, Bilişim teknolojilerinin uygun kullanımı amacıyla, "Bilgisayar Etiğinin 10 Emri"ni yayınlamıştır (URL2):

1. "Bilgisayarı başkalarına zarar vermek için kullanmamalısınız.
2. Başkalarının bilgisayar çalışmalarına burnunuzu sokmamalısınız.
3. Size ait olmayan bilgisayar dosyalarını incelememeli/karıştırmamalısınız.
4. Bilgisayarı hırsızlık yapmak için kullanmamalısınız.
5. Bilgisayarı yalancı şahitlik yapmak için kullanmamalısınız. (örneğin, sahte log dosyaları)
6. Ücretini ödemediğiniz lisanslı bilgisayar programlarını kullanmayınız ve/veya kopyalamayınız.
7. Başkalarının bilgisayar kaynaklarını izinsiz ya da karşılıksız kullanmamalısınız.
8. Başkalarının bilgisayar çıktılarını kendinize mal etmemelisiniz.
9. Yazdığınız programların ya da dizaynını yaptığınız sistemlerin toplumsal sonuçlarını göz önünde bulundurmalısınız.
10. Bilgisayarınızı her zaman saygı kuralları çerçevesinde kullanmalı ve diğer insanlara saygı duymalısınız."

-

1.4 Eğitimde etik

-

Teknolojinin insan hayatına girmesi her ne kadar teknolojiden yararlanma amacıyla gerçekleşmişse de kötü amaçlar için kullanımı toplum düzenini bozucu sonuçlar doğurmaktadır. Bu yüzden bilgisayar etiğinin öncelikle eğitim sisteminde daha fazla yer alması ve öğrencilerin bu konuyu etkili bir şekilde öğrenmeleri sağlanmalıdır (Odabaşı ve Uysal, 2006). Bu eğitimi verirken bilgisayar etiği ile bilişim etiği ve internet etiği gibi ilgili kavramların öğretilmesi ve etik ihlalini oluşturan durumlara yönelik farkındalığın sağlanması ve etik dışı davranışların önüne geçilmesi gerekmektedir (Odabaşı ve Uysal, 2007).

Ben-Jacob (2005) Amerika Birleşik Devletleri'nde üniversite öğrencileri ile yaptığı araştırma sonuçlarına göre bilgisayar etiğine yönelik tutum ve bilgi ile ilgili ihtiyaç duyulan bazı durumlar belirlenmiştir. Bu durumlar aşağıda sıralanmıştır;

1. Etiği kavrama ve ilgili bilgisayar ve bilgisayarla iletişim sistemlerini kapsayan tüm sosyal ve yasal konuları bilme.
2. Bilgisayar etiğinin bilgisayar bilimleri, genel eğitim bilimleri ve üniversite öncesi eğitim müfredatlarına entegre edilmesi.
3. Online eğitime katılmadan önce etik konularını bilme.

Literatür incelendiğinde eğitimde bilgisayar etiğinin ne derece anlaşıldığı ile ilgili bir takım veriler bulunmaktadır. Kaya ve Durmuş (2011) araştırmalarında kızların erkeklere göre 1. sınıfların ise 4. sınıflara göre bilgisayar kullanımında daha etik davrandıkları bulgusuna erişilmiştir. Bu durumun daha fazla bilgisayar ve internet kullanımından kaynaklandığı düşünülmüştür.

Erdem (2008) ve Uysal (2006)'ın araştırmalarında da bilgisayar etiğinin bayanlarda erkeklere göre daha fazla olduğu bulgusuna ulaşılmıştır. Gezgin ve Çuhadar (2012) ise benzer olarak internet etiği konusunda bayanların daha fazla farkındalık gösterdiği bulgusuna ulaşmıştır.

Başka bir araştırmaya göre ise öğrencileri etik dışı davranışlara iten en büyük sebep çevre ve arkadaşların etkisidir. Birilerinin zarar görmeyeceğine ve yakalanmayacağına olan inanç ise başka bir sebeptir. Çalışmada etik dışı davranışların eğitimli ailelerin çocuklarında daha az görüldüğü bulgusuna ulaşılmıştır. Yine çalışmada etik konularında eğitim almış olan kişilerin eğitim almamış olanlara nazaran daha etkin ve bilinçli cevaplar verdiği görülmüş ve etikle ilgili eğitim verilmesinin etik davranışlar sergileme eğiliminde artış sağladığını göstermektedir (Özpınar, Kazaskeroğlu ve Öz, 2010).

Ülkemizde bilgisayar etiği konusunda geleceğin bilgisayar öğretmenleri olan Bilgisayar ve Öğretim Teknolojileri Öğretmenliği Bölümünde yapılan araştırma sonuçlarına göre ise etiğin eğitimde yeterince yer almadığı görülmüştür. Araştırma kapsamında ulaşılabilen 21 üniversiteden sadece ikisinde seçmeli olarak Bilgisayar Etiği dersi verilmektedir. (Kuzu ve Becit, 2008).

2. Sonuç

Yapılan araştırmalarda görülüyor ki günlük hayatta bilgisayar kullanımının her geçen gün daha da artması bilgisayar etiğinin ihlalini de artırmaktadır. Çünkü bilgisayar teknolojisi, onun kullanımıyla ilgili verilen eğitimden daha hızlı bir şekilde bireylerin hayatına girmektedir. Bu yüzden bilgisayar etiği ile ilgili bireylerin bilinçlendirme çalışmaları daha geniş kitlelere yayılmalı, bu konuda sadece resmi kurumlardan değil, diğer resmi olmayan kuruluşlardan da yararlanılması gerekmektedir. Eğitimin temelinin ailede atıldığı göz önünde bulundurulursa etik konusunda en önemli görevin ise ailelere düştüğü ve bireylerin etik konusunda bilinçlenmelerinin daha etkili bir şekilde gerçekleşmesi için ailelerinde bu konuda farkındalığının artırılması ve eğitilmesi önerilmektedir.

Electronic Portfolio Increases Both Validating Skills and Employability

Mustafa Jwaifell[54]

Al-Hessein Bin Talal University, Ma'an, The Hashimite Kingdome Of Jordan

Abstract

E-portfolios have a greater potential to alter higher education at its very core than any other technology. E-portfolios serve as an alternative evaluation of the learners' educational improvements. Universities would favor better information about what employers' thoughts about e-portfolios, what they would like as evidence about students skills, how employers think they should be structured and the formats they would prefer. E-portfolios can also be helpful in searching for jobs and employees. Since an e-portfolio includes information about the learner professional skills. With the cooperation between universities and other formal recruitments, human resources can be managed through easy tools for seeking and employing youth

Key words: Electronic Portfolio; Higher Education; Arab Universities; Employability

Introduction:

The use of electronic portfolios in higher education has begun to receive increasing attention. Institutions such as the American Association of Colleges and Universities have focused on Portfolios in courses, programs, learning outcomes, and student evaluation. Colleges of Education, have a long history of accreditation reviews and standards for content areas as well as professional standards for teachers. Funding issues and competition in the college market are driving Colleges of Education to gather data in large quantities that showcase their graduates for future employment opportunities (Franklin, 2005). Electronic Portfolios serve as a mean of authentic assessment to demonstrate a teacher's proficiency as well as students.

In the Arab world, unfortunately, educational institutions still lack some of the basic skills and knowledge needed to work with technology in their classrooms, to model the effective use of technology, and give opportunities to their students to show and gain skills that qualified them to increase their employability, while electronic portfolio with its different types allow flexibility so that the teacher can measure a specific skill of his own students. The portfolio assessment is the systematic collection of the student's work measured against predetermined scoring criteria. These criteria may include scoring guides, rubrics, or rating scales (O'Mailley & Pierce in Gomez, 2000).

Some emerging research suggests that electronic portfolios can help students learn how to develop their identities as being professionals (Alvarez & Moxley, 2004; Schatz & Simon, 1999; Schatz, 2004). Thus portfolios can be applied in the educational settings for a variety of purposes such as evaluation and assessment, career development, and for demonstrating students' learning experience and growth over time.

2. Definition of Electronic Portfolio:

Electronic portfolio can be: digital presentations of skills and competences, online records of achievement, and action plans with opportunities for reflection; all these have been in use in education for nearly a decade. Tools and systems built for these purposes are now numerous. Many institutions view the electronic portfolio as a replacement for traditional high stake assessment, the object of the exercise being coverage of all standards and criteria. In some institutions, the emphasis on enhancing online résumés, really misses out being on major benefits of the electronic portfolio such as, 'power in the process' and reflective thought leading to deep learning. You do

E-mail address: jwaifell@yahoo.com

obtain tangible products throughout the '*process*,' examples include online résumés; however intangible products are arguably more important in a system designed to facilitate learning (Tosh & Werdmuller. 2004).

Electronic portfolio can be used more than an assessment or learning tool, it can be used as a life-long learning and collaborating tool. In this point of view, many definitions take place in the literature. However, there is a distinction between electronic and digital portfolio: an Electronic Portfolio contains artifacts that may be in analog form, such as a video tape, or may be in computer-readable form; in a Digital Portfolio, all artifacts have been transformed into computer-readable form. An electronic portfolio is not a haphazard collection of artifacts (i.e., a digital scrapbook or a multimedia presentation) but rather a reflective tool that demonstrates growth over time (Barrett, 2000). The National Learning Infrastructure Initiative (NLII, 2004) defined electronic portfolio as: a collection of authentic and diverse evidence, drawn from a larger archive representing what a person or organization has learned over time on which the person or organization has reflected, and designed for presentation to one or more audiences for a particular rhetorical purpose.

Cooper & Love (2001) defined portfolio in general as an organized compilation of artifacts that demonstrates learning and achievement and includes exegesis that articulates relevance and meaning. While Barrett (2005) defined electronic portfolio as the uses of electronic technologies as a container, allowing students/teachers to collect and organize portfolio artifacts in many media types (audio, video, graphics, text); and using hypertext links to organize the material, connecting evidence to appropriate outcomes, goals or standards.

In overall, types of information might be stored in electronic portfolio, may shape its definition, Banks (2004) stated types of information that electronic portfolio can contain:

Table 1: Electronic portfolio content (Banks, 2004. P. 6)

Type	Examples
Coursework	Ranging from brief notes to extensive assignments. May be in any medium, for example, text, images, sound, video. May be school homework, college assignments.
Assessment work	May include diagnostic, formative and summative assessments.
Other pieces of work or 'artifacts'	For example, presentations, job or course applications, CVs.
Achievement of individual learning outcomes	May be formally or informally recorded
Aggregated records of achievement, accreditation and credit towards awards	Qualifications, awards (and credits towards awards), certificates, completion of courses.
Evidence for assessment	Including evidence for assessment of prior learning
Planning and reflection	Journal entries, learning agreements, personal development plans, individual learning plans.
Notes and annotations on other entries.	Formal or informal: made by the learner, or by teachers, mentors. Including verification of entries. .
Skills and competencies	Taken from to a particular framework, for example, for a job, or informally recorded
Outcomes of appraisals, interviews, etc.	With tutor, employer, for example. Self-assessments and appraisals. Peer-assessments and appraisals

Images captured on the move	Mobile devices, such as phones, can be used to capture and annotate images for an e-portfolio.
Links between entries	Pieces of work contributing to an award: planning to achieve particular skills, etc.
Entries shared with peers	E-portfolios can support peer group earning, with shared assignments, and commentary on each other's work and ideas.

The definition most likely for what the researcher finds out is that electronic portfolio is a web-based container which allows archiving, linking, collaborating, storing, and publishing student's work.

3. Purposes of electronic portfolio:

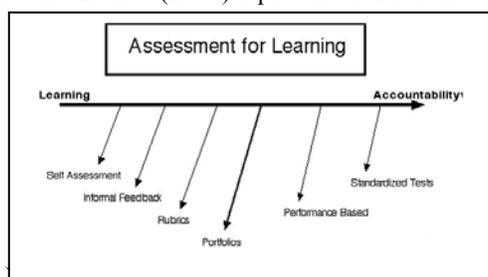
Types of electronic portfolios are different mainly in the area to which they are related according to the purposes of it. Electronic portfolios can be: as an assessment tool, for marketing or employment, and to document the growth for learners. Figure 1 presents Barrett (2005) representation for an assessment for learning continuum.


Figure (1) assessment for learning continuum Barrett (2005) P. 6

The main purposes of electronic portfolio are to serve as a container for the artifacts, selected for representing the learners' growth, skills and products. Wolf & Dietz (1998) stated three purposes for portfolio according to its models: 1) Learner Portfolio 2) Assessment Portfolio, and 3) Employment Portfolio. Where Learner portfolios are personalized collection of teachers work and the main purpose is to advance teachers' learning and setting a reflection and variety of information that reflect the development of their work and their learning. Assessment portfolios are selective collection of teacher work and standardized assessments containing samples of teacher work. The primary purpose of this type of portfolio is to evaluate teacher performance. Employment portfolios are customized and attractive collection of information given by teachers to prospective employers; these portfolios contain generally a résumé and certificates.

4. Types of electronic portfolio:

There are different types of portfolio including assessment, employment, learning, and teaching portfolios, the formats depend on the purpose for which it is developed (Bhattacharya and Hartnett. 2007), three types of portfolio are often described: a 'learning' portfolio which documents a student's learning over time, a 'credentials' portfolio for registration/certification purposes, and 'showcase portfolio' for applying for jobs. (Duffy, Anthony, and Vickers, 2010), while Duffy et al (2010) mentioned that Nairn *et al*. (2006, p.1520) identify nine different types of portfolio based on the definition of a portfolio as 'a record of learning that focuses on a student's work and his/her reflection on that work'. But the most commonly electronic portfolios created by students, mentioned in Chang, Tseng, Yueh, and Lin (2011), are combination-based, content item-based, work-based, course unit-based, and time-based. The combination-based type incorporates the advantages of other tabulation types, while the content item-based and work-based types are better for clearly classifying data and step-by-step organization of it.

When determining the type of portfolio to be purchased, adapted, or developed, the institution must question the very nature of their electronic portfolio and can be an individualized self-assessment tool that is not constrained by student learning outcomes or, rather, a powerful piece of the assessment equation that links artifacts and reflections to learning goals and objectives. (Buzzetto-More & Alade. 2008)

Portfolios are useful in educational contexts for both *summative* and *formative* purposes (Cooper & Love, 2001): 1) Summative portfolios focus on learning outcomes and contain evidence that shows the range and extent of a student's skills. A summative portfolio demonstrates learning outcomes rather than the process of learning. If the intention is to assess a student's skills or knowledge then the assessment is summative, and 2) The main role of a formative portfolio is to show the processes of learning in which a student has engaged. If assessment is concerned with learning process, the assessment should be formative.

Summative portfolio-based assessment has three main distinct forms; the competency based portfolio, the negotiated learning portfolio, and the biographic profile, or record of achievement. The main forms of portfolio are: 1) The competency-based or outcomes-based portfolio, 2) The negotiated learning portfolio, 3) The biographic portfolio as a record of achievement, and 4) The formative portfolio.

5. Electronic Portfolio Components:

An electronic portfolio is seen as comprehensive enough to include any piece of information about the student. Therefore there are many types of information components that could be included in an e-portfolio reflecting the person's accomplishments. For instance, work achievements might be included like; letters of recognition, awards, and certificates. Others could be concerned with professional and academic accomplishments, such as journal entries, articles, manuals, projects, courses descriptions, samples of effective and reflective writing, and significant papers. E-portfolios can also include artistic professions like artistic performances and writing stories. Research record is significant as well to be mentioned in e-portfolios, for example: case studies, evidence of data collected and evaluation form all practicum/field experiences. Resumes, professional correspondence and letters of reference add more specific details about the person's career.

6. Electronic portfolio advantages and disadvantages:

The advantages of electronic portfolio are beyond educational use, it can be selectively accessed by other interested parties like employers for instant. McNaught, Lam, & Chan, present the strengths and weaknesses of electronic portfolio according to its types, but it can be concluded that most of e-portfolio are relevant to how the students can access through Learning Management Systems or Web 2.0, while they still in general more effective than other assessing tools.

Electronic portfolios focus more on 'authentic learning experiences' that reflect real-world's overall life. It help students document their work, electronic portfolios help provide better way of measuring students learning that would be more accurate and electronic portfolios help educational institutions communicate with 'today's undergraduates' whose life is based more on technology and internet. (Reese and Levy. 2009)

Duffy, Anthony and Vickers (2010) summarized those advantages and disadvantages of Electronic portfolios, some of these advantages are:
1. The links are an advantage in a range of materials, with ease of access to the linked resources and the richness of the resulting student portfolio, but the student focus group was not convinced of the added value to what might be termed 'hypertext learning style'.
2. Specific e-portfolio packages provide template tools that may encourage a better output; for example, a CV builder. There are also tools and templates that may aid reflective practice; for example, the templates for skills analysis and training needs
3. E-portfolio tools and the capacity of some packages to produce different portfolios may be an advantage in meeting various distinct objectives of portfolio production, including evidence of achievement and of reflection and of progress.
4. Specific e-portfolio packages may have an additional advantage in the generation of web folios (portfolios on the web) and different versions of portfolios for different audiences; however, students have to be persuaded these are necessary.
5. Some PDP e-portfolio packages also support placement management but only one e-portfolio package we found was specifically designed both for placement management and placement portfolio building.

While the disadvantages where:

1) There may be cost, buy-in and take-up problems of e-portfolios for placement where they are not in widespread and successful use in a university before their introduction to portfolio assessment in placement.

2) E-portfolios may have practical problems for some placements, owing to remote access to network drives and employer 'buy-in'.

3) Template-based e-portfolios may become too restrictive for many students as they get more skilled at writing reflectively and at constructing portfolios. I

4) Students may find it unwieldy to use the e-portfolio package for placement if it gets heavily populated with 'assets' as part of a progress file from school through university to the workplace. Generic e-portfolios have to be populated with assets or attributes that have to be drawn down in different combinations on different forms for different purposes and there is some evidence that students do not find this sufficiently flexible. They prefer to use common tools to construct what they want when they want it. These tools are easier to use remotely and where no local area networks are accessible. The materials produced by common tools may be easier for the author to retain ownership of, post-university.

5) If the institution has decided to implement a system to support PDP, then it is sensible to consider using it in placement; however, students appear to value the paper product, and some employers will only look at a paper version, or at least one that can be simply emailed.

7. Tools and Open sources for electronic portfolios:

Open sources may give a solution; they can be integrated in Learning Management Systems (LMS), some of these open sources are worldwide adopted by universities, such as:

Sakai: The Sakai Project began in 2004 when Stanford, Michigan, Indiana, MIT and Berkeley, US, began building a common Courseware Management System and now it is the choice of over 160 educational institutions. The software enables users to design, publish, share and view portfolios of work. It can create structures to help users reflect on their learning and development. Summative feedback and export report facilities are also included in the system (http://sakaiproject.org)

Mahara: Funded by New Zealand's Tertiary Education Commission's e-learning Collaborative Development Fund, Mahara was a collaborative venture in 2006, involving Massey University, Auckland University of Technology, The Open Polytechnic of New Zealand, and Victoria University of Wellington. It enables users to collect, reflect on and share achievements and development online. It features a weblog, résumé builder and social networking system, connecting users and creating online learner communities. The system can be used with Moodle. The software was the winner of New Zealand Open Source Awards 2008 (http://mahara.org/)

Elgg: is an award-winning open source social networking engine that provides a robust framework on which to build all kinds of social environments, from a campus wide social network for your university, school or college or an internal collaborative platform for your organization through to a brand-building communications tool for your company and its clients (http://elgg.org)

The table below, shows the most recommended products that help in creating electronic portfolios (Himpsl and Baumgartner. 2009)

Table 3: The most recommendable products

Product	Provider	Type	license
Drupal ED	Funnymonkey	I	OS
Elgg	Curverider	A	OS
Epsilen	BehNeem LLC	M	PU
Exabis	Exabis Internet Solutions	L	OS
Factline	Factline Webservices GmbH	I	P
Fronter	Fronter International	L, I	U
Mahara	eCDF New Zealand	M	OS
Movable Type	Six Apart	I	OS
PebblePad	Pebble Learning Ltd	M	PU
Sakai	The Sakai Foundation	L, I	OS
Taskstream	Taskstream Inc	M, I	PU
Wordpress	Aoutomattic	A	OS

Key to column "type": • M: E-Portfolio-Management-Software products deliberately offered to institutions as E-Portfolio software) • L: LMS/LCMS with integrated E-Portfolio functions ("learning platform" with E-Portfolio elements) • I: integrated systems respectively software families
(various CMS with rather "indirectly" possible Portfolio functions) • A: other systems, respectively kinds of software
Key to column "license": • OS: open-source • P: commercial with all-inclusive offer • U: commercial with licenses per user • PU: commercial with a combination of P and U

8. Electronic Portfolio and Employability:

Employers seeks the most convenient manpower, electronic portfolio can represents what the graduates' skills are. In Canada and the USA, individual student portfolios are the preferred methods for recording employability skills (Little, 2003). Universities would favour better information about what employers' thoughts about electronic portfolios, what they would like as evidence about the students skills, how employers think they should be structured and the formats they would prefer. Some universities offer web-based portfolios to students so they can manage their own portfolios, but to be effective students need guidance from careers services and/or academic staff to complete these (Precision Consultancy, 2007).

9. Conclusions:

By way of concluding, it can be said that e-portfolios serve as an alternative evaluation of the learners' educational improvements. In other words, they include learners' academic accomplishments and learning achievements; which, on their turn, reflect the kind of skills that have been acquired by the learner throughout the educational process. Thus, educators will be able to evaluate their students and come up with an almost detailed documentary' of the learner's outcomes.

E-portfolios can also be helpful in searching for jobs and even in looking for employees. Since an e-portfolio includes information about the professional skills of the learner, it would work as a representative summary of the job seeker. However, there must be a sense of cooperation between the learning management systems and employers, in the sense that e-portfolios will be used as web-based sources through the open sources; and then employers will have the opportunity to search the web looking for their man power.

Employing Microsoft Live@edu Cloud Platform to Assist in Teaching Chinese Reading for Junior High School Students

Shi-Jer LOU[a], Chia-Liang CHO[a], Chih-Cheng TSAI[b], Ru-Chu SHIH[a,55]

Abstract

This study aimed to explore junior high school students' learning attitudes and effectiveness through employing Microsoft Live@edu to assist in teaching Chinese reading. Quasi-experimental approach was used and a total of 63 8th grade students were divided into the experimental group (N=32) and control group (N=31). The collected data were analyzed with descriptive statistics, paired t-test, one-sample t-test, multiple regression, and ANCOVA. The results of the study show that the students' reading attitude was enhanced in terms of cognition, affection, behavior, interaction, and reflection through using Microsoft Live@edu to assist in teaching Chinese reading. Regarding the reading learning effectiveness, the scores of the post-test are higher than the pre-test for both groups. The scores of the students in the experimental group are higher than of the control group. Finally, the students in the experimental group show greater progress in discussions and feedback and analysis of Chinese readings.

Keywords: Live@edu cloud platform, learning effectiveness, reading instruction, web-based assisted learning

Introduction

In early December 2010, the PISA Programme for International Student Assessment) reading assessment report was released, 15-year-old boys' reading literacy in Taiwan ranked the last among the three Chinese-Mandarin speaking countries and regions. This result not only alerts reading education in Taiwan but also dropped a shocker showing the reading education between Taiwan junior high school students and International reading literacy has a massive gap. At the teaching site, the researchers observed that most of the students like surfing the Internet, the computer seems to have become an indispensable tool in the student's life. Thus, the researchers believe that if the Internet can be used to carry out the teaching of reading and enhance students reading motivation, attitude, and effectiveness, Internet will become the key of the auxiliary reading education. In order to explore the influence and effectiveness of implementing the online teaching platform on reading Instruction, the Microsoft Live@edu platform was used to assist in reading instruction, and PISA tests were used as teaching contents. Thus, the purposes of the study are to explore the teaching process of using Microsoft Live@edu platform, to analyze its influence on junior high school students' reading attitude and learning effectiveness and to compare the students' learning effectiveness of Microsoft Live@edu platform instruction and traditional reading instruction, as well as to investigate the relationship between learning attitude and learning effectiveness through using Microsoft Live@edu platform.

Literature Review

In 2006, the International Reading Literacy Study (progress in international reading literacy study, PIRLS) defined reading literacy as cultivating reading understanding and mastering written language ability, being able to construct meanings from a wide range of articles, learning from reading, participating in school reading community activities and obtaining joy from reading. Pan (2008) also proposed culture, creativity, and communication, as the 3 core values for reading. As a result, reading should enable students to read various types of materials, in accordance with the order of reading comprehension process and use their own life experiences to cultivate basic reading literacy and problem-solving skills, thereby enhancing their interest in reading and to build their own reading values.

Regarding studies on exploring reading learning attitudes and reading learning effectiveness, Brown (2011), Burrows (2012) and Rojas-Drummond (2012) found there was a significant increase on students' reading effectiveness through different reading instructions. Chang (2004) pointed out that attitude is an individual holds a persistent and consistent behavior tendency toward people and things, including behavioral, emotional and cognitive

---

tendency. Wigfield & Guthrie (1997) suggested that there was a link between reading attitude and reading motivation. Students' positive learning attitude can be increased through assisting them to obtain the sense of achievements and satisfaction of reading learning (Hsu, Hsu, &Wang, 2008). Sun & Lin (2007) state that Internet learning is based on learning theory with emphasis on the use of information and communication technology, eliminating the learning time and space constraints, and providing learners situational teaching. Online learning can construct a digital scenario to improve learning motivation and effectiveness through autonomous learning, interactive and innovative learning, simulative learning, and accumulative learning. Therefore, internet-assisted instruction can provide students with vivid teaching contents, shared teaching resources, and various learning styles.

In our study, reading effectiveness refers to students can accurately understand the meanings of the articles and link their prior knowledge to generate additional understanding through reading teaching activities. Some previous studies indicate that students' reading learning effectiveness can be significantly enhanced through internet-assisted learning (Zorigian, 2009; Ismail et al, 2011; Ivory, 2011; Zaid, 2011). Thus, this study aims to explore the effects of integrating Microsoft Live@edu cloud platform with cooperative learning for assisting in teaching Chinese reading for junior high school students.

Methods

This study adopts quasi-experimental design with purposive sampling. A total of 63 8th grade students participated in the study and were divided into the experimental group (n=32) and the control group (n=31). The Microsoft Live@edu cloud platform was used in the experimental group and traditional in-class reading instruction was used in the control group. The Reading Attitude Learning Scale contains cognitive, affective, behavioural, and overall domains. The learning satisfaction questionnaire contains teaching method, quality of learning, learning interaction, learning assessment, learning reflection, and overall performance. The 5-point Likert scale was used in both scale and questionnaire. The content validity of the both scale and questionnaire were established by two experts in the related fields. PISA 2006 reading test questions were modified by the researchers and then used as the pre- and post-tests in this study. The content validity of the modified PISA reading tests was also verified by four senior Chinese teachers. Live@edu cloud platform provides learners an online space for storing and retrieving information and data freely through SkyDrive, Office, Messenger, Hotmail, and so on. The SkyDrive of Microsoft@edu cloud platform was used to conduct reading instruction in this study. Figure 1 shows the entry page of SkyDrive of Live@edu cloud platform.

Fig. 1 The entry page of SkyDrive of Live@edu cloud platform

Collected quantitative data were analysed by descriptive statistics, one-sample t-test, paired sample t-test, multiple regression, and ANCOVA. Qualitative data includes teaching reflection, students' reflections, group discussions, and abstracts of reading assignments.

Results and Discussions

The result of the pre-test and post-test scores of the experimental group analyzed by paired-sample t-test reached the significant level, p=.000<.05, indicating the students of the experimental group have made significant progress on reading through the Live@edu cloud platform learning and instruction. In addition, the pre-test scores of the PISA reading test questions were treated as covariates, the post-test scores of the PISA reading test questions were treated as the dependent variable, and groups were treated as the independent variables in the ANOCVA. The results of ANCOVA show that the learning effectiveness of the experimental group is better than the control group (p=.027<.05), indicating Live@edu cloud platform can effectively provide the experimental group students a communication platform to share and discuss ideas, questions, thoughts, and reflections and thus to enhance their abilities in obtaining useful information to improve their reading effectiveness.

Table 1: Results of one-sample t test of the students' reading attitude scale

Domain	Test value=3		
	t	df	Sig. (two-tailed)
Cognitive	9.16***	31	.000
Affective	5.73***	31	.000
Behavioral	6.37***	31	.000
Overall	8.31***	31	.000

***p<.001

Table 1 shows the results of one-sample t test of the students' reading attitude scale. The four domains of the reading attitude scale obtained p=.000<.05, indicating the experimental group students have made a significant progress on cognitive, affective, behavioral, and overall performance.

Table 2: Results of one-sample t test of the students' learning satisfaction

Domain	Test value=3		
	t	df	Sig. (two-tailed)
Teaching Method	10.17***	31	.000
Quality of Learning	8.11***	31	.000
Learning Interaction	6.65***	31	.000
Learning Assessment	5.58***	31	.000
Learning Reflection	6.68***	31	.000
Overall performance	8.45***	31	.000

***p<.001

Table 2 shows the results of one-sample t test of the experimental group students' learning satisfaction for the five domains. All the five domains obtained p value of .000<.05, indicating the students have made a significant progress in areas of teaching method, quality of learning, learning interaction, learning assessment, learning reflection, and overall performance.

Table 3: Results of Pearson product-moment correlation coefficient on the four factors

	Learning Effectiveness of Reading	Reading Attitude
Reading Attitude	.473**	-
Learning Satisfaction	.435*	.649***

*p<.05 **p<.01 ***p<.001

Table 3 shows the results of Pearson product-moment correlation coefficient on the four factors of reading, including learning satisfaction, learning effectiveness of reading, and reading attitude. The results show that there are significantly positive correlations among reading attitude, learning satisfaction, and learning effectiveness of reading, suggesting that the higher the students' reading attitude, learning, the higher the learning effectiveness. Also, the results of multiple regression analysis show that reading attitude obtained positive value of β, indicating learning effectiveness of reading can be positively predicted by the reading attitude.

Additionally, the results of teaching reflections show that there are more errors on the abstracts and contents of reflection writing in the early stage of the experiment. After providing writing guidance to the students, the students have made significant progress on both the abstract and content of reflection writing. After the three rounds of experimental teaching, the students' reading comprehension ability and effectiveness are significantly progressed through online reading learning. Finally, compared to the tradition reading instruction, the results of Live@edu cloud platform learning show the students have learned more and learned efficiently through student-teacher discussions and interactions and peer feedback on the platform. The students also pointed out that their reading ability has been improved and the frequencies of interacting with classmates have been increased as well, indicating implementing the Live@edu cloud platform to reading instruction is interesting and successful.

Conclusion & Suggestions

(1) Conclusion

The results of this study show that the students had significant progress on their reading scores through Live@edu cloud platform assisted learning, which is in accordance with findings of studies by Zorigian, 2009, Ismail, 2011, Ivory, 2011, and Zaid, 2011. Compared with the traditional instruction of Chinese reading, the students' learning effectiveness of the Live@edu cloud platform group is significantly higher than the traditional reading instruction group. In terms of reading learning attitude, the experimental group students show significant positive reading attitude and learning satisfaction after the experimental teaching. That is, Live@edu cloud platform assisted Chinese reading learning can effectively enhance the students' reading attitude and learning satisfaction. Additionally, the experimental group students show a significantly positive correlation between reading learning attitude and reading achievement, indicating the more positive the learning attitude, the higher the reading learning outcomes. Finally, the contents of the reading summaries of the students in the Live@edu cloud platform-assisted group are more substantial than the traditional teaching group.

(2) Suggestions

In order to reduce the instructor's teaching load, a reading teaching social network can be established to provide a forum for teaching related subjects discussion, modification, and thus to construct an ideal reading teaching model to enhance students' learning interest in Chinese reading. In addition, the instructor should strengthen the group discussions and feedback, so that the students can obtain feedback and suggestions to increase their reading comprehension. Finally, when errors of the Live@edu cloud platform occur, the instructor should make a quick report to Microsoft in Taiwan, so that network administrators can provide immediate assistance and to improve the function of the platform and thus the students can obtain better learning outcomes.

Enhancement of the 21st Century Skills for Thai Higher Education by Integration of ICT in Classroom

Nutteerat Pheeraphan[56]

Department of Educational Technology, Faculty of Education, Srinakharinwirot University, Bangkok 10110, Thailand

Abstract

This research studied the effect of integration of information and communication technology (ICT) in classroom for enhancing 21st century learning skills which included collaboration, communication, information literacy, media literacy, and ICT literacy. In this study, based on learning theories and student-centered approach, integration of ICT included four effective functions; dynamic content presentation, information access, creation and sharing, interaction and reflection. Seven educational technology experts evaluated these functions by an assessment tool. The evaluation showed that the integration was appropriated. The integration was then applied into teaching and learning process throughout the course to study the effect. 69 undergraduate students and 22 graduate students in two different 4-months courses were target studied. The students were assessed themselves by a 21st century learning skill assessment tool before and after courses. The results showed that integration of ICT in classroom could enhance the 21st century learning skills for both undergraduate and graduate levels significantly with high effect size.

Keywords: 21st century learning skills; ICT integration; Higher education

Introduction

In the 21st century, Information and Communication Technology (ICT) accelerates global competition and collaboration. Information, knowledge and innovation drive and reshape the industrial economy, businesses and workplaces. Advanced economies need people who can adapt and contribute to organizations, products, and processes and also have skills to keep learning and adjusting to change (Kay, 2010). The Partnership for the 21st century skills (2009) also proposed that the students in today's world must have the essential skills to be successful in the 21st century life and workplace, such as information, media and technology skills, communication and collaboration skills, and critical thinking and problem solving skills.

Thailand also recognized the importance of the above subject. Therefore, the reform of education was enacted by The National Education Act issued in 1999. The Act provided principles and challenging guidelines for the provision and development of Thai education in order to prepare all Thai students for a learning society, leading to advanced economies. The educational reform thus focused on learning process and utilization of technologies in education essentially to improve quality of teaching and learning (Office of the National Education Commission, 2004). After this Act, many organizations and institutes have ICT master plans for reforming learning process and utilization of technologies for education. Effective ICT is very necessary to be successful not only in studying but also in careers and lifelong learning (Stacey, Smith, & Barty, 2004). A great number of researches also confirmed that the usage of ICT in teaching and learning could enhance student skills in many ways, for example thinking ability, self-direction, self-regulation, communication and collaboration skills (Yang, 2009; Jou & Lin, 2012; Sitzmann, Bell, Kraiger, & Kanar, 2009; Enriquez, 2010; Ian, 2010; Li, 2010; Irwin, Ball, Desbrow & Leveritt, 2012; Punya, Chris & Danah, 2013). With ICT, students are able to access, share, analyze, and present information gained from a variety of sources and in many different ways. The use of ICT provides opportunities for students to work both collaboratively and independently. Therefore, the role of ICT within the curriculum is not only to enhance the learning experiences of students but also to help them develop the skills essentially to participate effectively for working in group, and developing team spirit, cohesion, and social values.

Nevertheless, the report from Office of the Education Council (2011) showed that the skills of university graduates weren't suitable for the workplace and the changing of ICT organization even though the latest survey in 2008 about the use of ICT in academic from National Statistical Office (2009) found that percentage of using ICT in higher education was really high compared with other academic levels. The survey also stated that only 26.9% of teachers used ICT in the classroom and used ICT just 9.6 hour/weeks for presenting contents. Moreover, the result from synthesis of online learning research in Thai's higher education between 1999 to 2009 (Pheeraphan & Sompong, 2011) also found that researches mainly focused on the development of learning outcomes through learning achievement (89.47%), and slightly focused on critical thinking and problem solving (12.28%), self-directed learning (4.38%) and collaboration (1.75), respectively.

Therefore, enhancement of the 21st century learning skills for Thai higher education by integration of ICT in classroom is necessary and important to be investigated.

Objective

The research was to study the effect of integration of information and communication technology in classroom for enhancing the 21st century learning skills which included collaboration, communication, information literacy, media literacy, and ICT literacy.

Literature review

In the 21st century, an ICT-driven age, students are expected to become productive digital people, to effectively learn for a lifetime, to have higher order thinking skills, to have collaboration and communication skills with others, and to become competent in technology use (information literacy, media literacy, and ICT literacy) (Kay, 2010).

ICT is one of powerful tools to utilize 21st century skills (Pearlman, 2010). However, providing available technologies does not help to change teaching methods or the level of learning outcomes. Effective use of ICT

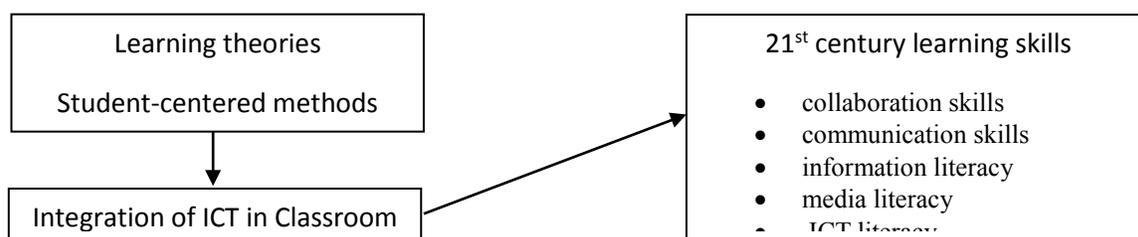
integration in classroom requires appropriate pedagogies. Pedagogies of ICT integration not only can enhance learning but also can have the potential to transform learning. Effective integration of ICT provide tools and environments that support active learning, exploring and experimenting, thinking and working creatively, constructing and creating new knowledge, reflecting and planning, using feedback and self-assessment, communicating with others, supporting and developing collaborative projects, working interactively in classroom and public. Therefore, integration of ICT into teaching and learning process will empower teachers to focus on (1) student-centered approach, (2) active and interactive learning, (3) connecting with learner experiences and needs, and (4) development of critical and ethical understandings of the value of the use of ICT (Ministerial Council on Education, Employment, Training and Youth Affairs, 2005). Researches also showed that learning theories (behavior, cognition, constructivist, and socially situated learning) and student-centered methods (active learning, project-based learning, and collaborative learning) can be a catalyst to incorporate digital literacy in an effective way (McDougall & Boyle, 2004; Watson, 2006; Woollard, 2005, Holmes & Gardner, 2006). Therefore, approaches to ICT integration in teaching and learning were subsequently described of different ways with varying degrees of success. Therefore, integrating ICT approach in a particular subject can assist pedagogy on types of objectives set for teaching-learning and evaluation. This approach is useful to enhance ICT literacy skills and the underlying pedagogy allows students to further develop essential skills based on learning environment (Khirwadkar, 2007), see Fig. 1.


Fig. 1 Research Framework

However, when teachers have to integrate ICT in classroom, some teachers may feel stressed trying to keep up with ICT and also struggle in using ICT. They have had neither the preparation nor the support that enables them to stay out of the trap. It's just because that they think of ICT in terms of nouns (PowerPoint, Youtube, or Facebook), not in terms of verbs (presenting, sharing, and communicating) (Fisher & Frey, 2010). Therefore, in this research, functions of technology were focused on for integration of ICT in classroom more rather than just the tools or forms of technology.

Research methodology

This study was divided into 2 phases as shown below.

Phase I: Studying the integration of ICT into classroom on the 21st century learner skills for higher education. The tasks could be listed as follows.
1. Analyzing the learning theories and the student-centered methods to be used for integration of ICT in classroom.
2. Analyzing the ICT pedagogical principles and the characteristics of contemporary technology that teachers and students familiar with.
3. Defining the scope of the 21st century skills.
4. Developing the integration of ICT into the classroom.
5. Assessing the integration of ICT by the ICT experts via assessment tool.
Determining Index of Consistency (IOC) used to evaluate the consensus of the experts' opinion

Phase II: Studying the effect of integration of ICT into classroom for enhancing the 21st century learning skills for higher education. The tasks could be listed as follows.
1. Integrating ICT into course design and learning activities in two courses:

Group1: For undergraduate students in Media Innovation and Information Technology for Educational Communication course.

Group2: For graduate students in Technology and Research for Knowledge Construction and Communication course.

2. Performing quasi-experimental study using one group pre-posttest design.

The target studies included:

Group1: 69 undergraduate students of the third year pre-service teachers in general science and social science major who registered in Media Innovation and Information Technology for Educational Communication course of the 1st semester, 2012 academic year at faculty of Education, Srinakharinwirot University, Thailand.

Group2: 22 graduate students of the first year educators in evaluation and research major who registered in Technology and Research for Knowledge Construction and Communication course of 1st semester, 2012 academic year at faculty of Education, Srinakharinwirot University, Thailand.

3. The first day of the course activity, the target studies were self assessed their 21st century skills by the 21st century skills assessment tool.

4. Conducting activities that integrate ICT into teaching and learning process throughout the semester.

5. The last day of the course activity, the target studies were self assessed their 21st century skills again by the 21st century skills assessment tool.

6. Inferential statistics by t-test paired for each group was used to compare the data between before and after the course activity.

7. Calculating the effect size (d) to determine the power of effected. The criterion and interpretation (Cohen, 1988 see in Libsey & Wilson, 2001) was as follows.

$$d \leq .20 \qquad \text{small effect}$$
$$.21 \geq d \leq .79 \qquad \text{medium effect}$$
$$d \geq .80 \qquad \text{large effect}$$

Results

Phase I: The results of studying the integration of ICT into classroom on the 21st century learner skills for higher education can be described as follows.

Based on the 7 experts' consensus, the integration of ICT in the classroom on the 21st century learning skills for Thai higher education including 4 associated functions was appropriated, see Fig. 2.

Function I: *Dynamic content presentation* is the usage of ICT for delivering knowledge and experience via presentation program with multimedia (text, picture, animation, sound, and video) such as Microsoft PowerPoint or Keynote together with various activities such as classroom discussion, think-pair-share, demonstrations, simulations, reaction to video, individual assignments, and group works.

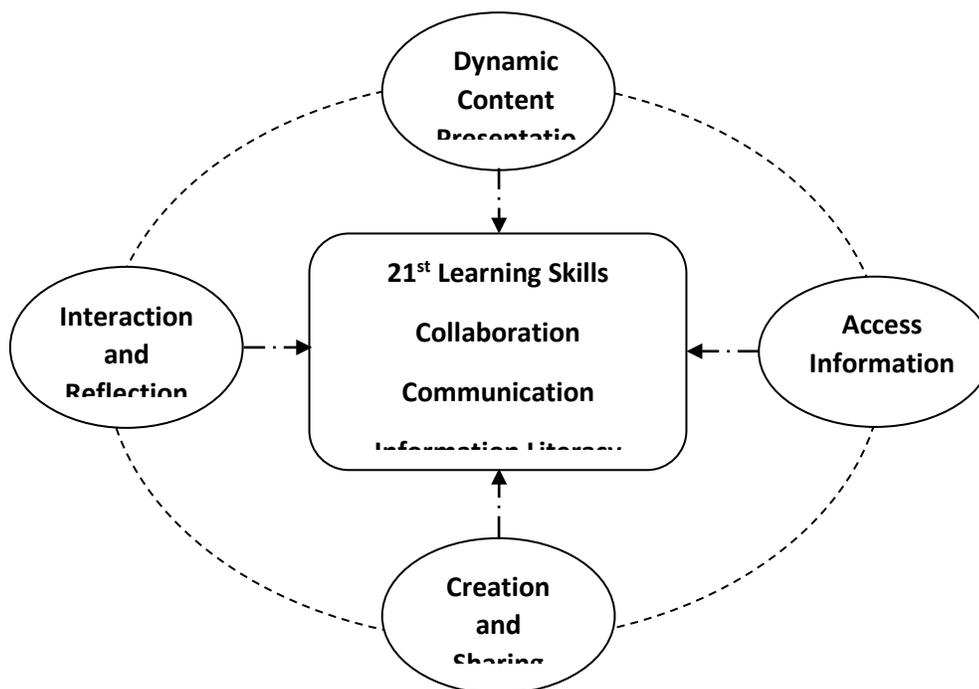
This function can respond to individual learner perception and can engage students to be more active learners. In this way, students will learn how to present their works powerfully.


Fig. 2 Four associated functions of ICT integration

Function II: Access Information is the usage of ICT for accessing the information by exploring, searching, understanding, analyzing, and synthesizing the information from resources around the world via search engines such as Google, Yahoo Search, AltaVista, and etc.

When students explore of ideas, select the useful information, evaluate and construct knowledge, these ICT activities enable students to develop the type of cognitive processes and help teachers to use ICT to foster significant learning experiences. Moreover, students can realize understanding and appropriate usage of information based on law and ethic.

Function III: Creation and Sharing is the usage of ICT for creating and distributing students' projects not only in the classroom but also in public. Some types of product can be a research paper

or a presentation, or a video clip, or a blog, or a portfolio. The examples of using ICT are journal writing for individual activity via Blog, sharing group project on Dropbox, publishing slide presentation on 4share or creating movie clip published on YouTube.

The significance is that students will learn to be good audiences and good peer reviewers because they learn to comment and assess their friends' projects. They will get advice and feedback from audiences inside and outside classroom. It will also encourage student to be more competitive on their group projects. For example by journaling in Blog, the students will learn how to be a producer. They have to synthesize the information that they grab from the Internet. In this way, it will change the role of students from users to become creators in cyber world with responsibility and ethics.

Function IV: Interaction and Reflection is the usage of ICT for encouraging the relationship between teachers and students. ICT nowadays has various formats (text, voice, and face), times (asynchronous and synchronous), forms (private contact and public contract) and relationship (one to one, one to many, and many to many). ICT also provides powerful tools for teachers to know the students as an individual person and get some advice for them personally. Moreover, the more interaction between the teacher and the student is, the more student engagement with their learning will be. Likewise, the more they get feedback fast, the more they become active.

FaceBook, Skype, and Email are examples of some powerful ways to help teacher to know individual student even in overcrowded classroom. Students can easily exchange the personal opinion, knowledge, and group activity without barrier in times and places. Also, students can communicate with their team members on their group projects with respect. Blog is another example that can help teachers to know and understand what are inside the ideas of their students. By using Blog, the students will know each other through reading and interacting with their friends.

Integration of 4 associated Functions:

When teachers integrate these four associate functions of ICT in their teaching and learning throughout the semester, it can enhance the 21st century learning skills as follows.
- Collaboration skill is the ability to work effectively with others, to be respectful for the value of the member, and also to be responsible on the group works.
- Communication skill is the ability to compose, view and communicate the ideas to others in order to understand via oral or written.
- Information literacy is the ability to access, use, analyze, and evaluate of information appropriately with responsibility and ethics.
- Media literacy is the ability to access, use, analyze, evaluate and create media in different forms with responsibility and ethics.
- ICT Literacy is the ability to use digital technology, communication tools to locate, evaluate, use and create information.

Phase II: The result of the effect of integration of ICT in classroom for enhancing the 21st century learning skills can be described as follows.

- Group1: Undergraduate students
  After integration 4 associated functions on Media Innovation and Information Technology for Educational Communication course, the result showed that 64 undergraduate students were enhanced the skills at the .01 level of significance with large effect (d=1.36), see Table 1.

Table 1. Comparison of the 21st century learning skills assessment of undergraduate students

Self-assessment	n	$\bar{x}$	S.D.	t	p	d
Before semester	69	92.23	12.29	9.75**	.00	1.36
After semester	69	107.94	10.71			

**p < .01, d= effect size

Table 2 shows that when considering each skill for undergraduate students separately, it was obvious that integration of ICT could enhance ICT Literacy (d =1.56), Media literacy (d =1.26), and Information literacy (d =1.11) at the .01 level of significance with large effect. The students also were enhanced at the .01 level of significance with medium effect on Communication skill (d =0.77) and Collaboration skill (d =0.58) respectively.

Table 2. Comparison each 21st century learning skills by self-assessment of undergraduate students

21st century skills	n	Before semester		After semester		t	p	d
		$\mathcal{X}$	S.D.	$\mathcal{X}$	S.D.			
Collaboration skill	69	23.85	2.72	25.35	2.46	4.21**	.00	0.58
Communication skill	69	16.07	2.92	18.25	2.76	5.73**	.00	0.77
Information literacy	69	17.18	2.90	20.20	2.54	8.01**	.00	1.11
Media literacy	69	16.81	2.94	20.25	2.51	8.65**	.00	1.26
ICT Literacy	69	18.30	3.87	23.89	3.27	9.89**	.00	1.56

**p < .01, d= effect size

- Group2: Graduate students
  After integration 4 associate functions on Technology and Research for Knowledge Construction and Communication course, the result showed that 22 undergraduate students were enhanced the 21st century learning skills at the .01 level of significance with large effect (d =1.78), see Table 3.

Table 3. Comparison of 21st century skills assessment of graduate students

Times assessment	n	$\mathcal{X}$	S.D.	t	p	d
Before semester	22	94.50	6.89	6.98**	.00	1.78
After semester	22	109.81	10.01			

**p < .01, d= effect size

Table 4 shows that when considering each skill for graduate students separately, it was obvious that integration of ICT could enhance on ICT Literacy (d =1.60), Information literacy (d =1.55), Media literacy (d =1.38), Collaboration skill (d =0.95), and Communication skill (d =0.94) at the .01 level of significance with large effect respectively.

Table 4 Comparison each 21st century learning skills by self-assessment of graduate students

21st century skills	n	Before semester		After semester		t	p	d
		$\bar{X}$	S.D.	$\bar{X}$	S.D.			
Collaboration skill	22	24.36	1.46	26.00	1.95	3.17**	.00	0.95
Communication skill	22	16.51	1.73	18.54	2.50	3.18**	.00	0.94
Information literacy	22	17.22	1.87	20.22	1.99	4.53**	.00	1.55
Media literacy	22	17.22	1.90	20.68	2.98	5.05**	.00	1.38
ICT Literacy	22	19.13	2.88	24.36	3.61	6.24**	.00	1.60

**$p < .01$, d= effect size

Conclusion

Four associated functions of ICT in teaching and learning were appropriated and could enhance the 21st Century learning skills. It was designed underlying pedagogical methods which were led to become mastery in knowledge and skills in the same frame faster (Dede, 2010). Therefore, the students not only mastered in subject matter knowledge but also enhanced the 21st century learning skills at the same time. The results from two groups showed that there is significant difference between self-assessment skills before and after semester. Moreover, the effect sizes from two groups showed that integration of ICT in classroom through 4 associated functions affected not only the digital literacy (information literacy, media literacy, and ICT literacy) but also collaboration and communication skill as well.

It should be noted that the effectiveness of ICT integration collaboration and communication skill possibly depended on learning activities that students encountered. In this study, both groups were assigned only one group project. If the students get involved in more group activities, the collaboration and communication skill should be improved accordingly. It is therefore suggested that every subject should integrate four associated ICT to enhance the 21st century learning skills continuously to prepare the students to meet the needs in careers and lifelong learning for advanced economies.

For future study, another important 21st century learning skills such as creativity and innovation skill, critical thinking and problem solving skill should be investigated on how integration of ICT can enhance them.

Expectation towards Cooperative Education Management of Rajamangala University of Technology Isan Thailand

Thanasarn SERMSUK[57]

Department of Educational Technology, Faculty of Education, Kasetsart University, Thailand
16.

Abstract

The purposes of this research were to find 1)the expectation of cooperative education management of Rajamangala University of Technology Isan. 2)the opinion toward factor in cooperative education management of Rajamangala University of Technology Isan. 3)the comparative analysis of cooperative education management of Rajamangala University of Technology Isan by using qualitative research with technique EFR(Ethnographic Futures Research). The 20 samples consisted of educational institution group, enterprise group, Cooperative Education Associate group, parent group by purposive selection. The data collected by using semi-structured interview of expectation of cooperative education management of Rajamangala University of Technology Isan by principle, concept and theory of attitudes, expectations and cooperative education management. The data was analyzed by using content analysis. The research findings revealed that **:** 1)the samples expect to the cooperative education system and believe that a good opportunities to use cooperative education system in educational management of Rajamangala University of Technology Isan, it is useful to create learning opportunities for students and employment of graduates who graduated from. University have to define standard educational management, curriculum standard and cooperative education system in accord with cooperative education management 2)the samples criticize that the budget factor, to develop system of Information and Communication Technology for learning and measurement and evaluation of various cooperative education for learning are factor in promoting the success of cooperative educational management of Rajamangala University of Technology Isan. 3)the comparative result of cooperative education between Rajamangala University of Technology Isan and Suranaree University of Technology show that Rajamangala University of Technology Isan must prepare to enter in cooperative education management; the education policy, the standard and process of cooperative education, the implement of cooperative education, the cooperation with enterprises, the success factors in cooperative education management, the future direction and trends and the risks and challenges of current and new power. In addition to university administrator, cooperative education program, effective management, to prepare student before the establishment of cooperative education process and to prepare international cooperative education.

Nomenclature

A   Expectation

B   Cooperative Education

C   Cooperative Education Management System

Introduction

Rajamangala University of Technology Isan (RMUTI) is one among them which focuses on developing occupations and technology with purposes of promoting academic and professions emphasizing practice, research, producing industrial/technical education instructors, giving academic services in science and technology, maintaining arts and culture, and providing opportunities for students who finish vocational education to continue their study at degree levels. Rajamangala University of Technology Isan comprises 5 campuses with 12 faculties. Main campus located in Nakhon Ratchasima Province with 4 faculties; Faculty of Business Administration, Faculty of Engineering and Architecture, Faculty of Fine Arts and Industrial Design, Faculty of Sciences and Liberal Arts. Work Based

Learning with enterprise group, is a way to the learning management of the Faculty of Science and Arts, is suitable field experience for professional graduates, create and support learning for hands-on graduates. Cooperative education is a part of the learning management for create and develop student to be hands-on graduates. Therefore, to create of learning model under work-based learning with enterprise group to be suitable field experience for professional graduates, according to the concept of cooperative education management with the determination of Rajamangala University of Technology Isan, that produce practical or hands-on graduates based on the need of the local area and the country of Thailand. For this reason, researcher require to study the expectation towards cooperative education management of Rajamangala University of Technology Isan.

Objectives
    1. The expectation of cooperative education management of Rajamangala University of Technology Isan.
    2. The opinion toward factor in cooperative education management of Rajamangala University of Technology Isan.
    3. The comparative analysis of cooperative education management of Rajamangala University of Technology Isan.

Methodology
    1. Population and sample. The population in this research is a specialist or stakeholders, who manage cooperative learning of faculty of science and liberal arts. The sample by purposive selection are 20 people to 7 groups of specialist or stakeholders, who manage cooperative learning of faculty of science and liberal arts, group1 : educational institution(administrators), group2 : educational institution (operator), group3 : educational institution(learning management undertaker), group4 : enterprise (administrators), group5 : cooperative education associate(cluster), group6 : student (professional experienced student) and group7 : parent (parent of professional experienced student).
    2. Instruments used to collect data. Cooperative learning management related research were adapted to develop the study of the expectation of towards cooperative education management of Rajamangala University of Technology Isan. 1)Data collection of activity and coordination. 2)Related data. 3)Voice and audio recording devices, such as camera. 4)A semi-structured interview, divided into 3 parts; part1 : principle concept and management of cooperative education. Part2 : standards curriculum and process of cooperative education. Part3 : success factor of cooperative education. 5)The questions of the in-depth interview.
    3. Data Analysis. This research has analyzed data using semi-structured interview technique EFR (Ethnographic Futures Research), Benchmark's comparison in-depth interview and present a descriptive essay.

Results
    1. The result of the expectation towards cooperative education management of Rajamangala University of Technology Isan. 1.1 Expectation towards cooperative education management of Rajamangala University of Technology Isan; 1)Curriculum : The sample expect to have cooperative education in the curriculum along to philosophy of the university, that is to produce practical graduates. 2)Student : The sample expect hands-on graduates based on the need of the labour market under the determination, that is to create manpower with technology expertise for occupations and professions. 3)Educational institution : The sample expect supported student to cooperative education, such as educational system, scholarship and job opportunity after school education. 4)Enterprise : The sample expect, that the enterprise is able to create learning efficiently and to get more opportunity than field experience program. 5)Enterprise administration : the sample expect obviously policy and emphasized cooperative education, especially encouraged and supported manpower and budget. 6)Supervisor : The sample expect, that student is followed up and evaluated and create outer community cluster. 1.2 Expectation towards standards curriculum and process of cooperative education; 1)Cooperative education standard : The sample expect, even though cooperative education standard is able to process in educational institution and enterprise, the minimum standard is not able to process in a short time. Furthermore educational institution will drive educational institution standard in the enterprise. 2)Curriculum standard : The sample expect, that the university is having cooperative education in the curriculum of a university by assigned policy of the develop and improve curriculum to be in accord with cooperative education. 3)Cooperative education process : The sample expect, that pre-cooperative education process encourage and support professional student and administrator to learn and understand the cooperative education. In addition to, the measuring and evaluating of cooperative education are assigned clearly, distribute and present later.
    2. The result of the factor towards cooperative education management of Rajamangala University of Technology Isan. 1.1 Success in cooperative education management : the sample agree with 5 factors : 1)The main factor of

success, the university and the enterprise become "cooperative education partnership" clearly and continually with policy and plan, that they reflect mission and task. 2)The factor of cooperative education concept is main element of university curriculum and cooperative education standard. 3)The factor of job and personnel determination take responsibilities for cooperative education. 4)The factor create cooperative education process efficiently. 5)The factor of the measuring and evaluating between educational institution and enterprise for the measuring and evaluating, so it was estimated problem and obstacle and develop.

   3. The result of comparative research in cooperative education management of Rajamangala University of Technology Isan. The result showed, that Rajamangala University of Technology Isan should be developed cooperative education management guideline; 3.1 Cooperative education policy : 1)Laying the foundation and continuous improvement. 2)The educational philosophy of the University. 3)The vision, mission, objectives, regulations, declared and allocated budget. 3.2 The standard and process of cooperative education : 1)The cooperative education standard. 2)The cooperative education process. 3.3 The cooperative education operation : 1)The structure of cooperative education organization. 2)The management of cooperative education organization. 3)The clearly purpose of cooperative education operation. 4)The educational quality assurance of cooperative education. 5)The system of cooperative education administration. 6)The operation of cooperative education standard. 7)The evaluation of cooperative education learning. 3.4 Cooperation with the enterprise : 1)Promotion to the enterprise of the cooperative education operation. 2)Creating the enterprise cluster. 3)Communication for collaborative learning. 4)Benefit of the enterprise. 3.5 The success factors of cooperative education management : 1)The university and the enterprise become "cooperative education partnership", that it is a mission and task with clearly and continually policy and plan. 2)As a main part of the educational system operate along cooperative education standard and educational standard of the university. 3)To be determined the division and personnel of the cooperative education administration and management for university and enterprise. 4)To create readiness of the cooperative education management. 5)To follow the evaluation with the cooperative education management for solution and improvement. 6)To bring information and communication technology for cooperative education operation completely. 3.6 The expected direction and future prospects : 1)Expanding network of partners developed through cooperative education. 2)Expanding cooperative education in the establishment. 3)Creating a cluster of partners to ensure the cooperative education success. 4)Promoting and support international cooperative education. 3.7 The risks and the challenges of current and new power : 1)Prepare for change in various contexts.2)Educational policy of the cooperative education. 3)Change the style of learning. 4)Labor market, monopoly and the specific needs of the labor market. 5)The employment of graduates. 6)Strengthening of the cooperative education cluster. 6)Cooperative education standards and operation (minimum standards and promoting standards). 7)Educational quality assurance. 8)The quality of graduates along to higher education of TQF (Thailand Qualifications for Higher Education).

Recommendations

   1. Recommendation policy : 1)The clearly policy of cooperative education management include in every dimension of the management, base on cooperation of all sectors in the university, such as faculty and department, and get ready for international-cooperative education management in ASEAN. 2)Creating cooperation cluster for the cooperative education management of Rajamangala University of Technology Isan in the beginning, that it have to combine with high administration of the university to extend cooperation, support and encouragement the enterprise network in both formal and informal of academic and vocational cooperative network for cooperation in the cooperative education management. 3)Cooperative education learning become a part of educational curriculum of Rajamangala University of Technology Isan.

   2. Recommendation : 1)To operate the responsible organization, education management and education coordination according to cooperative education management of Rajamangala University of Technology Isan, such as policy, structure, management, budget, place and staff, for the effectiveness and efficiency operation. 2)To operate the enterprise network, that it have to combine with administrative, council committee, teacher, alumni, expert, honorary graduate, etc. 3)To promote and support the creation of knowledge, understanding and guideline cooperative education management according to staff in educational institution and enterprise, teacher, student and parents include educational curriculum, cooperative education standard, cooperative education process, cooperative education measure and evaluation, presentation and exhibition later.

   3. Recommendation for further research : 1)Research should be a model for the cooperative education management of Rajamangala University of Technology Isan and covered in terms of management structure, operations, budget etc. 2)To study cooperative learning of educational institution, enterprise, cooperative educational cluster, supervisor, student and parent to develop the effectiveness and efficiency learning model later. 3)To study research for creating new knowledge, applying and integrating guideline, principle, concept and new

theory with structure of work based learning or cooperative learning according with context of Thai-learning context, such as the research of the developed cooperative learning model along Buddhism to cooperative education management of Rajamangala University of Technology Isan.

Columbia University
10027 New York, USA

Abstract
The goal of this study is to understand how students' attitudes are connected to their mathematics learning. This investigation was specific to web-based homework in developmental courses in the community college environment. The mixed-methods approach was used to analyze the relationship between students' attitudes and mathematical achievement. The findings from the survey questionnaire showed mixed responses from the students on the benefits and disadvantages of the web-based homework. Additionally, cluster analysis results showed the relationship between the three groups of students and their differences in mathematics attitude. The results suggest that students with lower and average mathematics achievement had a more positive in attitude towards using the web-based homework system compared to the high achieving students. Based on the results, it can be noted that web-based homework plays an important role in students' attitude possibly because of the immediate feedback that improves understanding.

Keywords: Web-based homework; Attitude; Achievement University; Developmental algebra

1. Introduction

Students who enrolled in college level mathematic courses seem unprepared to complete the courses especially college algebra (Hodges & Kennedy, 2004). This is based on their high school grades and college placement examination scores. Colleges help these underprepared students with the developmental or remedial mathematics courses. After completing these compulsory developmental courses with satisfactory grades, students are then allowed to enrolled in their college mathematics classes.

A study done by Hoyt and Sorensen (2001) , reported that between 30- 90% of in-coming college students require developmental mathematics classes before they begin college level mathematics classes. Even with extensive developmental mathematical courses, a large number of students were unable to succeed in college algebra by getting the D, W or F grades known as the DWF rate (Brewer, 2009). The average passing rate for college algebra in the United States is between 40- 50 % (Herriott, 2006).

To address this issue, reforms in college algebra should be given priority. Nonetheless, large scale reforms in these mathematics courses face difficulty as colleges and universities structure these programs based on certain theoretical and practical considerations (Baxter Hastings et. al., 2006). In most college algebra classes, the pedagogical framework are lectures given by instructors and homework assigned to students. If these effective pedagogical strategies can fit within the traditional lecture based classes, the college mathematics community would

---

[58] Corresponding author.
E-mail address: rkleong@um.edu.my

support this change (Brewer, 2009). This study intends to blend the intervention called web based homework within the traditional framework and explore students' attitudes and achievement in developmental algebra. .

2. Web based homework

Homework is assigned to students by instructors to be completed at home. This is particularly relevant in mathematics classes. Students require the opportunity to practice the skills they have just learned. Observing examples provided by instructors in mathematics classes are insufficient to help students acquire the necessary procedures in solving a mathematical question. Students require feedback from instructors after completing their homework. This step is important in knowing whether the students understanding is correct when solving problems. Students are then able to adjust their approach after realizing their errors from the feedback obtained. This is known in the mathematics education field as the attempt-feedback-reattempt cycle (Zerr, 2007).

However, at the college level some students do not attempt the homework problems given by their instructors. This causes the students to miss the opportunity to solve the homework questions on their own. Without this important component, students would not know the correctness of their solutions and obtain the necessary feedback from their instructors. In addition, some instructors might not be able to collect their students' homework and grade them due to time constraint (Brewer, 2009). Finally, even though the first attempt have been graded, students might not receive the feedback in a timely fashion and students fail to re-adjust their understanding of the concept (Jacobson, 2006). In short, the students do not obtain the maximum benefits of completing the homework in an algebra class.

One way to improve the attempt-feedback-reattempt cycle in a traditional homework is by using the web-based homework. The web-based homework or online homework, in general refers to a system of computerized homework problems that is available online with the capability to automatically grade answers and provide immediate feedback on the correctness of the solutions (Jacobson, 2006; Kinney, 2001). In this study, the web-based homework used follows closely the aspect of this definition. The homework system contains similar questions that are available in an algebra textbook and also questions with different degree of difficulty. Questions vary in different forms of true or false, open ended questions, regular exercises and challenging questions. Completed solutions would be automatically graded by the homework system once the answers are submitted. Students have the option to save the answers and complete one whole section of an exercise before submitting them. To assist students having problems solving the homework, a few examples similar to the question asked are shown. This helps the student understand the steps involved in answering the questions. Short video lectures are also provided for students to revise the algebra concepts. The online homework system is able to generate similar questions of a particular concept from the large database of questions.

3. Objectives and research questions

The aim of this study was grounded in our goal to understand how students' attitudes are connected to their mathematics learning and performance. This investigation was specific to web-based homework in developmental courses (i.e. remedial) in the community college environment. Some of our initial questions, answered using mixed-methods, centred on gaining a better understanding of how mathematics attitudes of community college students

impeded their progress in developmental mathematics courses (Author & Author, 2011). Findings from this study suggest that attitudes about web-based homework have significant implications on how students engage with and use web-based homework in online learning environments, thus the re-development of positive attitudes about mathematics at this late stage is essential.

Empirical and critical perspectives are applied in this research study based on factors surrounding lower income, immigrant, and racial/ethnic minority student success in community colleges. In general, students' difficult and often ill-equipped transition from high school to community college (Conley, 2007, 2010), especially lower-income students and urban students of colour (Roderick, Nagaoka, and Coca, 2009), positions them on a track for failure. With the advent of advanced web-based technology to track and aid students in mathematics, we are required to persistently investigate the usefulness of such platforms in developmental mathematics contexts. The present investigation was situated along three primary areas: (1) examining associations between attitudes and achievement, (2) understanding students' attitudes about web-based homework, and (3) increasing student outcomes. In a larger context, this study also seeks to add to discourses about developmental education in community colleges (Bailey, 2009).

The purpose of this study was to understand how students' attitudes are connected to their mathematics achievement. The study focuses specifically on the web-based homework in developmental algebra courses at the community college level. This study sought to answer the following research questions:

1. What are the benefits and disadvantages of web-based homework programs in developmental algebra, specifically as they relate to student learning?

2. What associations exist between students' attitudes and beliefs about web-based homework and their achievement in developmental algebra?

3. What differences exist between high achieving, "middle" achieving, and low achieving students in regard to their attitudes?

4. Theoretical Perspectives

The perspectives and ideas presented here allowed us to utilize former research as a means to contextualize and outline the modes of inquiry applied in this study. One additional goal of this study focused on continually challenging notions of "what works" in diverse mathematics classrooms and generating more active discussions about student experiences, their attitudes, behaviours, and their resulting achievement in developmental mathematics courses. Cooper (2007) noted that opinions about homework, not necessarily web-based homework, and the positive effects on their achievement were varied. Brewer & Becker (2010) conducted a quasi-experimental, post-test design study to examine the effectiveness of online homework(OHW) versus traditional-textbook based homework(THW). The results showed that low-skilled students who utilized OHW exhibited higher mathematical achievement that the low-skilled students who utilized THW.

Within the mission to advance the mathematics learning and increase mathematics achievement of lower income students and students of colour enrolled in community colleges (Zimmerman et al, 2011), more research

focused on supporting beneficial and positive experiences is needed. Given that the use of web-based homework platforms is becoming a standard practice in developmental algebra courses in community colleges, the research described in this study is both important and appropriate.

5. Research Methodology

This study used the mixed-methods research; phase 1 focused on quantitative component, phase 2 focused on qualitative component. A survey questionnaire was utilized to inform the researchers about the attitudes and beliefs of students on the web-based homework in the developmental algebra classes. The survey instrument consists of a 40 items questionnaire using a five point Likert scale. Items 1 to 15 focuses on mathematics beliefs, items 16 to 30 concentrates on attitudes towards web-based honework and items 31 to 40 couses on the usefulness of the web-based homework. Qualitative component (phase 2) asks for individual student thoughts about web-based platform from the open ended responses in the survey instrument.

To ensure the reliability of the survey questionnaire, a pilot test was conducted to obtain the reliability coefficient. The reliability coefficient method used was the Cronbach's alpha. The Cronbach's alpha coefficient value of the survey items was 0.76.

To answer the first reseach question, data from the open-ended responses in the survey instrument were analyzed. Students shared the benefits they obtained while using this web based homework system. The disadvantages of the homework system was also obtained from the students in the developmenal algebra classes.

For the second research question, quantitative methods such as cluster analysis and analysis of variance (ANOVA) were used to analyze the data. Cluster analysis identifies groups of samples that behave similarly or show similar characteristics. In this study, cluster analysis was used to explore the number of student groups from the sample. The ANOVA technique was used to determine whether there were any significant differences among the clusters. ANOVA investigated the relationship between students' mathematics attitudes and beliefs and mathematical achievements (as measured by a standardized examination). If the ANOVA analysis was significant among the clusters, the researcher also conducted a Tukey post-hoc test to determine where the differences existed.

For the third research question, quantitative methods such as discriminant analysis and analysis of variance (ANOVA) were applied . Discriminant analysis is the reverse process of the multivariate analysis of variance (MANOVA). The purpose is to determine variables that would "discriminate" the groups. In this study the independent variables are the survey items while the dependent variable are the clusters/groups.

The web-based homework used in this study is WebAssign. It is an online homework and management system that delivers an automatic grading solution.

5.1. Participants

Participants of this study are from a community college in an eastern state in the United States. Students are mostly Black and Latin. In this study, data was collected from 78 participants. The majority of the students are taking this mathematics course as a requirement for their graduation and usually as a pre-requisite for other courses. Most of the students are full time students but some of them work outside class time to pay for their college fees. Data collected from students in a developmental algebra course.

6. Results

The first research question in this study states: What are the benefits and disadvantages of web-based homework programs in developmental algebra, specifically as they relate to student learning? The results from the survey questionnaire indicated mixed responses from the students on the benefits and disadvantages of the web-based homework. Students who liked the web-based homework generally mentioned the easy accessibility. In addition, the convenient of accessing the homework online and they could attempt the questions wherever they are. Some students preferred to attempt the questions late in the night or early in the morning depending on the available time. Many students mentioned that the instant feedback received from the homework system on the correctness of the answer was beneficial. The step by step solution provided for certain questions was very helpful in students finding their mistakes. This helps students who get frustrated easily when they are unable to spot the errors they made while attempting the question. One student even said that "This online homework system gave me a great study guide for questions and a way to work on them to perfection." A few students also praised the tab buttons in the homework system that was useful such as the "Practice It" and "Master It". Furthermore, what the students liked was the many features in the program that includes some video lectures and the how the program helped them in learning.

Some of the disadvantages mentioned by the respondents include the emphasis not on the working but just the final answer and how to get the right solution after trying a few times. The homework system only gives a feedback of right or wrong for most of the questions attempted. One common feature of this program that frustrate students especially when the error exists in their solution or when inputting mathematical symbols in the answer column. One student even mentioned about the difficulty of inserting the answers in the fraction form. Furthermore, the program does not provide sufficient feedback on what parts of the answer were incorrect in a specific problem. Citing one very specific example in the graphing of points, one student mentioned that the program is very rigid and does not let you plot the points easily.

Now we move on to the second research question: What associations exist between students' attitudes and beliefs about web-based homework and their achievement in developmental algebra? To answer this research question, quantitative methods that include cluster analysis and ANOVA was utilized. Cluster analysis results showed the relationship between the group of students and their mathematics attitude. From the analysis, there were 3 groups of students. Students in Cluster 1 rate survey items on attitudes and beliefs on the web based homework highly. Students in Cluster 2 and Cluster 3 had rated more items on attitudes and usefulness of web based homework system highly. Cluster 1 consists of 12 students. Cluster 2 had 29 students while Cluster 3 had 37 participants. The ANOVA analysis utilized the Tukey post-hoc test to compare the mean differences between the clusters. Using the Tukey post hoc test, the result showed that Cluster 1 students had high mathematics score, Cluster 2 students had average mathematics score while Cluster 3 students had a low mathematics score.

The third research question of this study was "What differences exist between high achieving, "middle" achieving, and low achieving students in regard to their attitudes and outcomes?" From the discriminant analysis, Cluster 1 students rate item Q2,Q17,Q21,Q29 and Q31 highly while Cluster 2 and 3 students rate Q6, Q16, Q22, Q24, Q26, Q36, Q38, Q39, Q40 highly. Results from the post-hoc test indicated that Item 16   discriminates "middle" achieving students (Cluster 2) and low achieving students (Cluster 3) while Item 28 discriminates

"middle" achieving students (Cluster 2) and low achieving students (Cluster 3), also discriminates high achieving students(Cluster 1) and low achieving students (Cluster 3).

7.   Discussion

This study investigates how students' attitudes are connected to their mathematics learning. Specifically, it examined learners' attitudes and beliefs about web-based homework in one developmental algebra course at the community college setting. It probed certain student demographics and whether the mathematics achievement had any relationship with the attitude towards the web-based homework tool. This study also explored the benefits and disadvantages of using the web based homework platform from the students' perspective in learning algebra.

The first research question comprised of the usefulness of the web based homework system. Results from the survey questionnaire showed mixed responses from the students on the benefits and disadvantages of the web-based homework. Students who liked the web-based homework generally mentioned the convenience, the many features in the program that includes some video lectures and the how the program helped them in learning. Some of the disadvantages mentioned including the emphasis not on the working but just the final answer , how to get the right solution after trying a few times and just getting a feedback of right or wrong.

The results suggest that students with lower and average mathematics achievement had a more positive in attitude towards using the web-based homework system compared to the high achieving students. These findings are similar with the notion that low-skilled students who obtains more benefits than high-performing students from the usage of web based homework (Wooten, 2013). Based on the results, it can be noted that web-based homework plays an important role in students attitude possibly because of the immediate feedback that improves understanding.

This study provided some evidence that web-based homework such as Web Assign used in developmental algebra class maybe more beneficial to the students to receive immediate feedback through the automatic grading system. Furthermore, this study indicated that the use of the web-based homework provides more opportunities and motivates lower performing students in learning algebra. This is consistent with the findings of the study of the usage of the web-based homework in the first semester calculus class (Zeer, 2007).

Exploring E-Decision Making Competence through Online Self Determination Platform

Pi-Shan Hsu[a,b,59], Kuo-Hung Tseng[c], Ko-Li Chang[b]

a Ching Kuo Institute of Management and Health, Keelung, Taiwan
b Fooyin University, Kaohsiung, Taiwan
c Meiho University, Pingtung, Taiwan

Abstract

Based on the self-determination theory, we can promote the learner self- determination ability to affect their learning achievement. This research is different than the traditional on-line platform designed; we used self- determination theory as a learning approach, and design the online platform for students' self determination. According that, the online-self determination platform has the characteristics, such as: having a learning path for self-determination, strengthening the sense of independence, providing a diagram for cognitive loading theory (CLT), promoting abilities of self-assessment, diagnosing learning situation, using online discussion and interaction to construct a social group.

Keywords: self-determination, e-decision making, cognitive load

Introduction

As a result of information communication science and technology progress, learning levels have reached to a boarder content, learners' decision making and abilities to implement their informative professional skills is very important for nowadays. Enterprise's managerial talents need the professional faculty who is specialized for decision-making. Therefore, the most important goal of online education is to promote learners independent decision making in this fast changing information communication science and technology evolution.

Self-determination theory is gradually internalizing and conforming into one kind self-motivated or self-determination in action and value, and it will affect the students' learning achievement by promoting learners' abilities on self-determination. Therefore, this research is different than the traditional on-line platform designed; we used self- determination theory as a learning approach, and design the online platform for students' self determination to promote students' ability into the positive learning achievement. For the future plans, we decide to implement situational questions, which can determine students' abilities of e-decision-making, into the platform, and exam students' e-determine abilities.

Literature Review

This research is going to discuss self-determine theory, the e-decision making competence, as following:

Self-Determination Theory

The self-determination theory is the organized by a motivation (Deci & Ryan, 1985) which emphasis:
1. The importance of human development and self regulation with human's inner resources;
2. The transfer progress of the non-inner motivation into self-determination;
3. The transfer progress of how the social environment gets influenced.
Deci and Ryan (1985, 1991, 2000) extended traditional motivation theory into inner and outer perspectives, which implement three psychological needs, such as, autonomy, competence, and relatedness. These three

psychological needs emphasis the idea where human will use their self-determination to make different regulation. Motivation regulation is a continuous concept, which is from non- and outer- motivation transfer into the inner motivation. This progress represents our self determination level, which could affect our individual's behavior into a group's behaviors.

The internalized motivation refers to the progress of transferring non- and outer- motivation into inner motivation (Deci & Ryan, 2000). The internalized only happens when individual accept and transfer other different values and approach, and the individual can assimilate these differences into his/her own use (Ryan, Connell, & Grolnick, 1992). According to the level of internalized, it will turn to the different characteristic of behavior (Ryan, Connell, & Grolnick, 1992; D'Ailly, 2003). If we can apply self-determination theory into educational situation, it will emphasize the influences of individual's self-determination behavior from the social and environment content. Individual's self determination theory focus on the learner's inner resources to promote his/her motivation and enhance the learning achievement.

According to the self-determination theory, we can expect the inner motivation influence learners' continued positive behavior (Deci & Ryan, 1985). If we can satisfy individual's autonomy, competence, and relatedness, the fountain of self-determination will be continued through inner motivation and even outer motivation (Deci & Ryan, 1985).

If the three psychological needs can be satisfied, learners' self regulation will be enhanced, and it will cause learning positive outcomes. Otherwise, the teachers will need to control students' learning, control regulation will be enhanced, and it may cause the negative learning outcomes. Therefore, the research implements self-determination theory as learning approach in the online platform, and we wish to use this platform design to promote students' learning outcomes and their e-determine competences.

E-decision making

E-decision competences refers to have the critique thinking, the problem analysis and the solution, and students can make good use of the information, the e-system, technology or tool to assist decision-making ability. E-decision making competences include the ability of information processing and problem thinking, and the ability of problem thinking includes critique thinking and mental training.

To develop students' e-decision making in e-information technology environment, we can use context cognition technique to assist problem thinking and decision making (Weill & Ross, 2004; Clark, 2005; Albitz, 2007) . The e-decision-making refers to the situation when the challenge comes, people will know how to think, how to use logic reasoning and manage all of the questions, and this can be used in e-information processing by definition, deposit, apraisal, management, conformity, innovation and communication. If this match user's mental training in the standardized work, we can see the best decision outcomes.

Method

This research is trying to develop self-determination online platform, and the situational questions, which implement in platform, are designed to evaluate e-decision making. In order to develop the indicators of e-decision making, the research use hermeneutics approach. Hermeneutics approach focus on the concept where researchers continue reasoning and constructing the important and reprehensive indicators (Hong, 1997).

However, the construction of e-decision-making indicators does not elaborate in this research category, this research focuses to conform "the self-determination theory" in the development of online platform designed.

SDT On-Line Learning Platform Construction

The purpose of developing SDT online learning platform is to evaluate learners' learning achievement on e-decision making. The content of this research platform is constructed by situational questions, which will guide learners to make correct decision from their information ability. The interface of this platform re based on the self-determination theory. Learners will use self-determination learning approach to promote their e-decision competences.

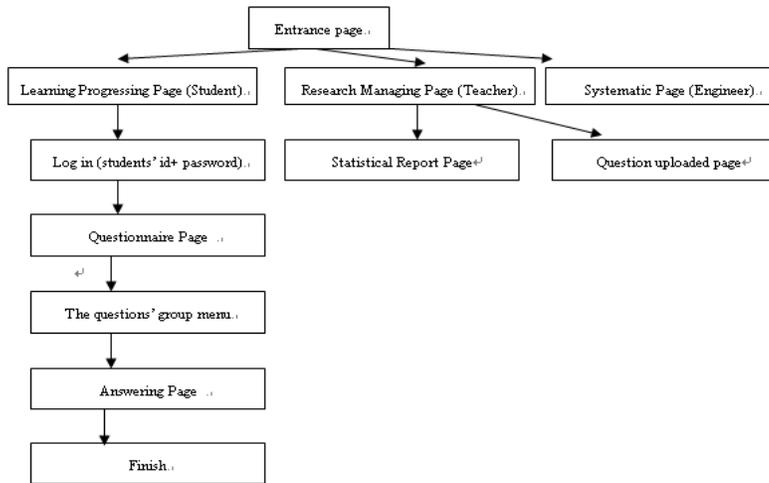
The self-determination on-line platform includes three big page functions: Learning Progressing Page, Research Managing page, and Systematic Page. The self-determination online learning platform construction shown as Fig. 1:


Fig.1 SDT on-line learning platform construction

Learning Progressing Page (Student).

The learners used their student number and the password to enter the system, and they will follow the steps to choose their questions to answers. All of the responds will be recorded in the system. The questions are based on situational context, learners will be given a situation question, and we expect learners will choose the way to solve the problems. Each situation may have at least 7-8 questions. Each question matches one indicator of e-decision making. After learners finish the test, we will know their ability level on e-decision making.

Research Managing Page (Teacher).

The basic purpose of research managing page is for teacher to upload the questions, and for researchers to search learners' grades. All of the grades will be settled into Statistical Report Page, and it will analyze students' grading and cognitive loading theory.

Systematic Page (Engineer).

The purpose of systematic page is for engineer to write the platform, because the SDT platform is using the system developmental approach, where the system will be adjusted during the study time. The engineer will provide the system draft, and after testing the draft, the engineer will adjust the platform until the system meets the requirement.

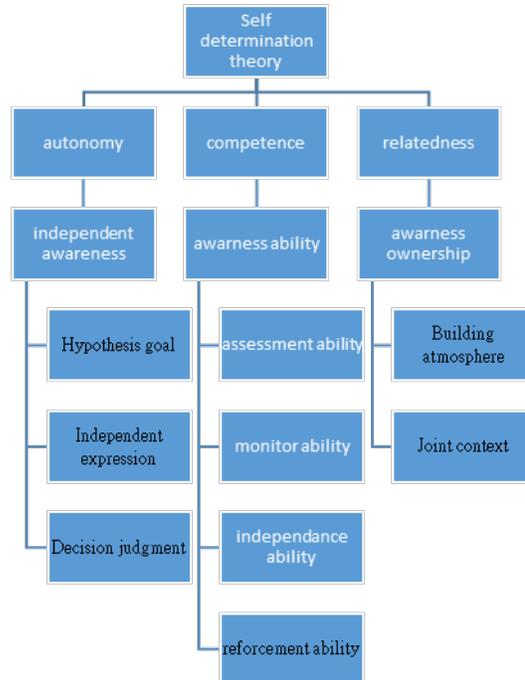
Self-determination should include three psychological needs: autonomy, competence, and relatedness, the theory construction shown as Fig. 2:


Fig. 2 Self-determination theory construction

Based on Fig. 2 construction, the ideas of designing of self-determination theory on SDT platform as following:

In order to strengthen the learner the independent feeling, system's design will mainly enable the learner to aim at study condition. Learners will decide their own study way, and by using the platform, the learners can strengthen ability of the setting their hypothesis goal, the independent expression, the decision judgment.

In order to satisfy learner's competences feeling, system's design will mainly give a chart for the learner learning effort curve. This chart enables the learner diagnose their study condition.

In order to meet the relatedness demand, the system has joined the discussion area. Participants can use the discussion area to build the social group atmosphere. The teacher and the learner by the discussion area can create relatedness demand.

According to the above statement, the research's platform design need contain the following several functions:

Function of the self-choice.

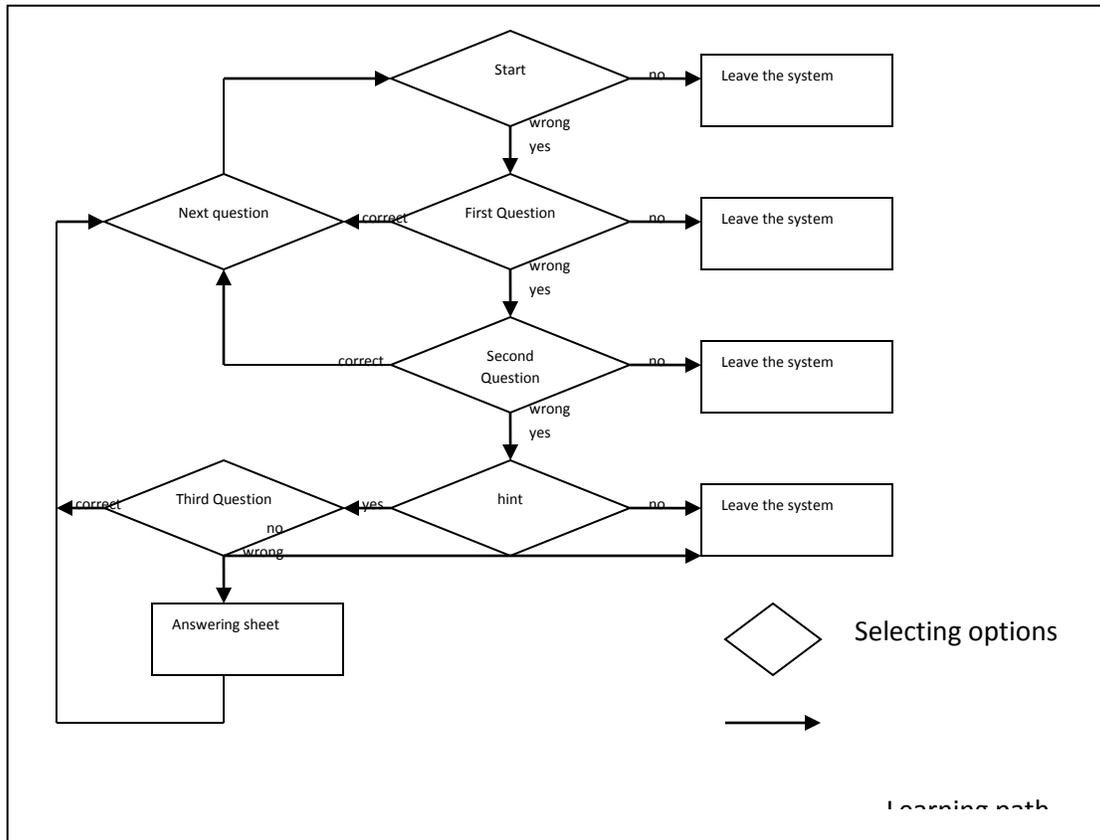
The research uses the multi-layered type structure to construct the study (Hsu, Chang, & Wu, 2009; Hsu, & Chang, 2011). The system will provide a hint if students continue answer two questions. Every question provides students options, and students can choose the option by knowing him/herself needs. The questions flow chart can see as Fig. 3.


Fig. 3 The questions flow chart

Functions of Learning Effort Curve.

This research used the learning effort curve (Hsu, Chang, & Wu, 2009; Hsu, & Chang, 2011), as the Fig. 5 shown. The system can analyze learners' dynamic and real time learning effort curve and the system use the user-friendly interface to let students understand their learning effort curve. We hope we can use this chart to provide a view for students to understand their own learning ability and situation, and students can adjust their learning path to enhance their learning ability.

Function of on-line immediate discussion area.

Learners use the online immediate discussion area to interact with other and group, and it can cause group's relatedness. This research used system developmental approach. The research will first provide the system draft, and after testing the draft, the research will adjust the platform until the system meets the requirement. By using the discussion area, the participants will have feedback of the system-uses, and it will provide information for engineer to adjust the platform.

Conclusions

This research used the self-determination approach to design an online learning platform. With the comparison of other learning platform, the characteristic of this platform are as following:

This is a blended learning platform with learning and evaluation functions. The platform used multi-layered type structured to provide students' feeling of independence while students can choose their own learning path from the platform.

11.2. Within the students' learning progress, platform can provide the learning effort curve, which can promote students to evaluate their own learning ability, and students can diagnose their learning situation in order to provide the appropriated adjustment for their own learning ability.

11.3. The platform provides the online immediate discussion area where participants (learners, teachers) can use the online discussion area to interact and to construct a social context of relatedness.

For the future plan, we will use the hermeneutics approach to develop the indicators of e-decision making. The indicators will be implemented into the situational questions which will be applied into the learning platform.

Factor Influencing the Critical Thinking of Teacher Students Studying at the Faculty of Education in Suratthani Rajabhat University

Chawakit Thongnuypram[60]

Assoc.Prof.Dr.Saroch Sopheerak

Kasetsart University, Thailand.

Abstract

The objectives of this research aims to study. 1) To study the level of critical thinking teacher students and 2) To study the relationship between the key factors contributing factors to the critical thinking of student teachers. The target of this research in Suratthani Rajabhat University of Faculty of Education. Given the size of the sample using a table of Krejcie and Morgan (1970) had a sample of 348 people with a simple random sampling Proportion of students choosing to study the 7 program in 1-5 curriculum teaching regular tool used to collect data. The questionnaire scale. Independent variables include factor contributing factors. Variables such as critical thinking, confidence coefficient alpha of the scale was the order. The statistics used to analyze the data for the IOC (Index of Congruence: IOC) is an analytical test percentage. To the difficulty (p) and discrimination (r) of the test for the reliability of the test by means of a ditch rider - Richard Anderson, using the formula. The quality of the query using the t-test (Sombut Taikumrear 2546: 95) and for the reliability of the questionnaire. The scale using the method of coefficient alpha Cronbach (Boonchom Srisaart 2545: 99). The statistics used in hypothesis testing. By using SPSS programs to calculate the correlation coefficient of Pearson (Pearson Product Correlation Coefficient) (Sutthiwan Peerasaksophon. 2548-156) for the correlation coefficient (Kerlinger and Pedhazur. 1973: 75), and the significance of the correlation coefficient using F-test (Kerlinger and Pedhazur. 1973: 73)

Keywords: Silence • Multicultural Classrooms•Young Malaysian Children•Identity•Ethnographic Case Study

This study revealed that mean score on the critical thinking of every group were at moderate level. The mean scores of the fifth-year students was higher than that for fourth-year students. In addition, the mean scores of fifth-year students in the Bachelor of student teacher Program was the highest among the five group. The relationship between the key factors contributing to teaching and learning policy and management course teaching. And reinforcing factors. Environment in the classroom. Social media and learning resources, culture, family and community traditions. That affect the critical thinking of students, teachers. Analysis of the relationship between variables. (Correlation) found that the main factor in the teaching. Factors associated with media and learning resources. Significant at 0.01 and is associated with Factors contributing to the policies / programs, cultural traditions, and community factors. Significant contributing factor to 0.05, Policy / Program. Factors associated with media and learning resources. Significant at the .05 and family factors. Factors associated with cultural traditions and community significance of the correlation coefficient was 0.01 with a .400 .432 .502 .312 and .444, respectively.

Principle

Thinking is the brain processes the human potential is very high, and is the cause of man different from animals other from the past, humans have an interest in the idea and was trying find explanations about. The underlying idea. In regard to a variety of human learning (Tiasana Khaemmani and others 2544: 5) that are essential to human life greatly. A normal, happy and successful life as a result of effective thinking the same failure. Damage and mistakes that occur as a result of one of them. Thinking it was the best way to solve human problems. Therefore strongly advised to turn their attention seriously. To develop and strengthen their ability to think, particularly children and youth. (Prapansiri Susaorat 2551: 1) The ability to think is a skill that the students would need to have. Because the broader perspective of looking realistic. Can decide accordingly. Adapt to the changing social conditions and maintain the quality of life and happiness in the world. Globalization (Surang Kotrakul 2550: 316), in

line with the National Economic and Social Development Plan No. 10 (BE 2550-2554) in the strategic development and social reintegration of wisdom and Thailand. learning The main idea is based on people-centered development. Because the final goal is to get the benefits and impacts of the development. Meanwhile, it has driven the development. Towards the desired goal. Need to improve the quality of people in all dimensions to balance the mind, body, ability, knowledge and skills. Equipped to provide both moral and knowledge that lead to critical thinking rationally. (Office of the National Economic and Social Development. 2551: website) The learning process, according to the National Education Act 2542 (Revised 2545) is considered the most important lessons. To encourage students to develop their natural and full of potential. All learners. Have the ability to learn and develop themselves. It is important to promote the idea. By providing education and relevant agencies to take action. Cognitive coping skills to handle the situation and the application of knowledge to solve problems. (Ministry of Education 2545: 8) and Basic Education Curriculum 2544 also requires that all students who graduate each student must pass a knowledge based group learning and group 8 also. provide an assessment of critical thinking, reading and writing. To desirable learning and development activities in accordance with the Education (Department. 2545: 143), the National Education Act 2542 (Revised 2545) also provided. A system for quality assurance. To improve the quality and standards of education at all levels. Which standards the students have four clearly defined standards that provide students with the ability to think critically. Critical thinking is a creative synthesis. Thinking and visionary. (Commission of National Education. 2544: 18).

External quality assessment results across the nation. By the Office of Basic Education Standards and Quality Assessment. (ITD), the evaluation found that the quality was good. But there are certain standards that are lower than the estimated 50 percent improvement in the standard or the standard class 4 learners capable of critical thinking. Critical thinking is a creative synthesis. Thinking and visionary. (Secretary of Education. 2548: 122-125) the results of the assessment to reflect that. To the students at all levels of education. In particular, critical thinking (Analytical Thinking), which is the basis of higher-order thinking (Higher - Ordered Complicate Thinking) on children's development and training as well as expertise and would be able to develop advanced ideas effectively. quality and performance (Suwit Mulka. 2550: 108), critical thinking (Analytical Thinking) is the foundation of learning and living. Individuals with the ability to think critically. Have different capabilities than others. Both the intelligence and the conduct of life. Critical thinking is the basis of this ensemble. Is thought to classified information. Elements of things. Whether it is the story of the various divisions to find out the truth, the essence of the story elements or principles that may be latent in all things, or appears clearly. Including correlation and Linkages of things that relate to how Principle have any ideas as to lead to the conclusion. Application. The predicted or predicted things correctly. Criteria used to judge a reason. It is a skill that anyone can develop. The important skill is to observe the comparison. Prediction and application of assessment classified category. Classification Assumptions and logical conclusion. (Prapansiri Susaorat 2551: 48), the ability to think critically (Analytical Thinking Ability) is to promote and develop the thinking skills of several factors such as learning. Atmosphere of shared learning of the students. All the teacher to the learner. Which is in the form of questioning, observation, inquiry and factors within the age range of learners. (Prapansiri Susaorat 2551: 53), consistent with Levin (Lewin) to explain that learning involves "Life Space" of the individual, which includes the physical environment, such as people, animals, objects, locations, and environmental psychology such as Propulsion (Drive) motivation (Motivation) goal (Goal) and interest (Interest) The behavior of the energy and direction. What is in their interests and their needs to be a positive force. While attention to what is beyond the power is removed. Learning occurs when individuals are motivated or driven to act toward their desired destination (Tiasana Khaemmani and others 2544: 10-11; According to Gestalt. 1912) corresponds to Piaget (Piaget), which explains the development of the children in each phase occurs continuously from lower to higher levels without skipping competition. However, some development may occur faster or slower. These developments occur naturally, but the environment. Culture and traditions as well as how to maintain life may contribute to the development of different children. Thought processes of the individual behaviors associated with intelligence. In particular, the ability to reason. Which is the ability to think. To a conclusion or what the rules of (Sangduean Thaweesin. 2545: 102-103; According to Sternberg. 1985).

The critical thinking. Already Production student teachers is the same. Laying the basis for a student teacher. It is a very important part. Because the teachers develop a cause linked to student results in the next great idea. Because of the above. Researchers are interested in the factors that affect the critical thinking of students, teachers, Faculty of Education, York University. Because these students will be prepared to leave the teaching profession. And to encourage students to engage in learning. This will give the students the critical thinking. This is to help teachers plan instruction accordingly. And efficiency in learning. And is another reason for the study population was a group of student teachers. Because they are consistent with the National Economic and Social Development Plan No. 10 (BE 2550-2554) focused on the development of a high quality. The development of

critical thinking. Information and support to educational institutions. Should any curriculum activities to promote And develop basic skills in the trade. To develop the ability to think critically. And more efficient.

Purpose of the research.
1. Study to investigate the level of critical thinking. Of teacher students.
2. To study the relationship between the key factors contributing factors to the critical thinking of student teachers.

The importance of research.
The knowledge gained from this research can be used as a guide in developing a learning management. Media management teaching. Classroom teachers to use in teaching proper. Of issues. And the factors influencing critical thinking. Faculty of Education, University of London student teachers.

The scope of the research.
This research is a study of the factors influencing critical thinking. Of teacher students. By a study of the factors influencing critical thinking. In teaching and learning in the classroom is comprised of three key elements and factors contributing factors. The framework follows.
1. Population used in the study.
This research study has selected lowland population including students, teaching courses 5 year 2nd semester 2555 academic year Faculty of Education, York University.

2. Samples used in the research.
The researcher of this study include sample student teacher semester course of 5 years to 2 years in 2555 the Faculty of Education, York University 1-5 years 348 people.

The variables studied.
The variables studied. Variables used in this research.
Variables include the factors influencing critical thinking.
Variables including achievement, critical thinking.

Variable definitions
1. Factor refers to the teaching and learning in the classroom, the curriculum, course syllabus and lesson plans. By instructors. Undergraduate. Program teacher for 5 years.
2. Factors contributing to development plan policy program at the Faculty of Education. Or university prepared for student development. Instructor
3. Factors mean media education. Facilities. Atmosphere of learning. Environment for teaching and learning in the classroom. And learning resources both inside and outside the classroom.
4. Teacher students means students enrolled in undergraduate courses. Faculty teaching courses for 5 years Suratthani Rajabhat University.
5. Their critical thinking refers to the ability to think like a target. Judgment and self-directed. Is thought to result from the fact that there is reason As well as the context in which the prudent foresight thinking skills by focusing on what I believe should include the following six elements.
5.1 Defining the problem means to define and understand the problem, consider the problem to determine disputes or ambiguities. Including the definition of a word or message. The problem is we as a starting point for critical thinking.
5.2 Data collection refers to the collection of data related to the problem. Arguments or vague information from various sources. Including information retrieval or knowledge of existing user experience. So, how to gather the information needed for critical thinking and self-observation and observation and data collection necessary to report the observation of others.
5.3 The information system refers to the reliability of sources of information and consider the adequacy of the information system. Meanwhile, it must evaluate the accuracy and adequacy of the information gathered will lead to a reference or not. The information gathered by the system to distinguish the data. Distinguish. Between clear and vague information. Information related to the data that is not relevant to the issue. Identifying assumptions. To be grouped. And prioritization of data to use as a guide in setting assumptions.

5.4 refers to the assumptions underlying the conclusion of the arguments by which the data are organized and linked into consideration. Relationship. In order to determine inference seems to be that. Of the data appears to be possible in any direction. In order to select the most feasible approach.

5.5 The principal logic inference by means of choosing the most reasonable means of information and evidence available. Logic way of thinking is a skill needed for summary judgment. And critical thinking skills of critical thinking.

5.6 assessing rater means to assess the reasonableness of the inference to the conclusion, by using logic. Conclusions must be evaluated according to whether or not reasonable and the conclusions that can be applied or not. The consequences will be. If the data has been changed and need to go back and discover more information. Existing data again. According to new hypotheses and conclusions. Concluded that the process of critical thinking is a process that combines the different aspects together to understand the problem by considering to make clear what. Is the real problem. Arguments or vague information for the compilation issues. Make clear what is the real problem. The sequencing problem. To eliminate the problem, the real issue may not go out. Separation issues. Including the definition of a word or message. Defining the problem is a process that is the beginning of critical thinking. Encourage people to start thinking, realizing that there was a problem or dispute or vague information. Trying to find the right answer. Reasonable to understand the problem.

Conclude

Conclusions presentation factors that affect the critical thinking. Of teacher students. The researchers will present the aims of the research. Summarized as follows. The relationship between the key factors contributing to teaching and learning policy and management course teaching. And reinforcing factors. Environment in the classroom. Social media and learning resources, culture, family and community traditions. That affect the critical thinking of students, teachers. Analysis of the relationship between variables. (Correlation) found that the main factor in the teaching. Factors associated with media and learning resources. Significant at 0.01 and is associated with Factors contributing to the policies / programs, cultural traditions, and community factors. Significant contributing factor to 0.05, Policy / Program. Factors associated with media and learning resources. Significant at the .05 and family factors. Factors associated with cultural traditions and community significance of the correlation coefficient was 0.01 with a .400 .432 .502 .312 and .444, respectively.

Discussion.

Of this research. To the purposes of the following discussion.

1. The correlation coefficient between the criterion variable is of critical thinking on key variables and factors contributing factors showed a positive correlation with the assumption set. And statistically significant at the .01 level.

2. Considering predictors into the equation to predict the critical thinking that. Factors in the classroom environment. As a result, most predictors. Predictors is a minor factor in the culture and community. Predictors and the third is the main factor in the teaching. This is consistent with other findings as follows.

Considering the sample into the equation to predict the thinking huff perception found to comply with the findings of Duangkamon Phonak (2545: 98-99) studied the variables affecting critical thinking. three years of secondary school students in Bangkok. The results showed that: 1) the correlation between the independent variables, including the level of student locus. And reasoning ability and classroom level variables Siraya including teaching quality of teachers. And qualifications of teachers with the critical thinking of students is between .344 to .822, with all the values of the correlations between the independent variables and the classroom level critical thinking of students are statistically significant. And confidence, critical thinking, students with the highest value is 0.822 and is statistically significant at the .01 level, the relationship between teacher education and critical thinking are minimum. 344 and is statistically significant at the .05 level, 2) the independent variable is the level of confidence in their students. Reasoning ability and critical thinking affect the statistical significance level of 0.01 and a regression coefficient is 0.750 and 1.033, respectively, and the prediction was 72.02 percent, 3) independent variables. classroom teaching quality of teachers is affecting critical thinking statistically significant at the .01 level, and also affect the regression coefficients of the locus of control of students' level of statistical significance. 0.05 and the regression coefficient is 2.135, and -0.045, respectively, with the predicted performance of 15.51 percent and 20.55 percent respectively of the teacher education does not affect the critical thinking. Regression coefficient of the locus of control of students. And the regression coefficient of a locus affecting critical thinking statistically significant at the .01 level, and findings may Pensiri CU (2546: 125-127) studied patterns. causal relationship of the factors that affect the critical thinking of students at three major findings was that The causal relationship of the factors that affect the critical thinking of students, 3 are consistent with empirical data. Model created to explain the

variance in the dependent variable for critical thinking has 8 percent of monitoring blend of fit, and (AGE1) was 0.94, the chi-square value of 130.89 with the Freedom 129 at significance level 0.44. variables that directly affect the students' critical thinking and reasoning ability. Personality Science. Apply. Variables that affect both directly and indirectly with the student's critical thinking and classroom atmosphere. Democratic parenting. Teaching behaviors of teachers. Including the findings of the Vedic Nan Brave (2548: Abstract) studied the factors that influence the ability of critical thinking of the students in the first class area office of education. And vocational students. Office of Vocational Education. Tuesday: A multiple group analysis. The results show that Variable with a direct effect on the ability of critical thinking of students at key stage 4 and Diploma students, including parenting style democracy. Ability of critical thinking of students at key stage 4 and Diploma students including teaching behaviors of teachers. The third prediction is a key factor in the teaching. This is consistent with the findings of McCrink (1999: 3420-A) to study the effects of teaching and learning styles of learners affect critical thinking. Sample is. Senior students beginning in Miami, United States 79 of the instruments used to measure critical thinking is a test of critical thinking of Watson and Gesser results showed that the method of teachers affect teachers who teach critical thinking than usual. And is consistent with the findings of Marra (1997: 1215-B) to study the relationship between the ability to think critically. Apply. And authority within the faith - their external locus of control were found to be positively correlated with the ability to think critically. They also found that Study mode used to think and try to give the students practice their critical thinking and high achievement.

Suggestion

1. Feedback on the findings to use.

The results of the analysis of the factors that affect the critical thinking of students, teachers, Faculty of Education, York University found that the variables that affect the critical thinking. Therefore, it could be variations. The results of the research to develop the student as a person known to the students critical thinking. In addition to critical thinking. It is also a valuable and legitimate rights of the students that have been developed. Considered a necessary condition for the provision of education and as a sign of the party receiving the education or learning it.

2. Suggestions for further research.

2.1 There should be a study of factors affecting critical thinking. In other tertiary institution. To see if students in tertiary institutions. That there are factors that affect the critical thinking. Different or not.

2.2 Other factors should be studied as a form of learning that is appropriate. Family environment factors. The actual situation. Problems that are associated with critical thinking or not.

2.3 should be the other way around. In addition to the tests and quizzes to accompany the study to obtain more extensive data such as observation, interview, interrogation and trial individually.

2.4 Should the analysis method (Path Analysis) in relation to indirect factors. That affect the critical thinking to know what factors are related and indirect impact on critical thinking.

13th International Educational Technology Conference

Factors Affecting the Behaviors of Yasothon Community Leaders in Receiving Information and News.

Kanokon Ruenruethai[a,61] , Saroach Sopeerak[b]

[ab]Educational Technology Department, Faculty of Education, Kasetsart University, Thailand.

Abstract

The objectives of this research are to study factors affecting the behaviors of Yasothon community leaders in receiving information and news and to study the possibility in receiving news of community leaders in Yasothon Thailand. The studying factors in promoting news, and knowledge, communication, and attitude, the researcher wants to know if all are related to at least one behavior of perceiving data or not. The sample of the study is community leaders in Yasothon Thailand who work for 60 subdistrict administrative organizations for 120 people. In obtaining the sample group.Data is analyzed by descriptive statistics, analyze the correlation by using Pearson and Chi-Square and prediction by using regression means.

The study, it is shown that 1. The studying factors result in promoting news and knowledge. As of knowledge, communication, and attitude, the researcher finds that all are related to at least one behavior of perceiving data by Sig = .00 It is revealed that there is at least one independent variable which is significantly correlated to dependent variable prediction. From examining, it can be concluded that an independent variable which is a main factor results in promoting news, knowledge. As of knowledge, communication, all are predictably related to at the behavior of perceiving data by Sig = .05.

2. The studying factors result in promoting news and knowledge of community leaders in Yasothon and are linked with at least one behavior of perceiving data by Sig = .00. It is shown

that there is at least one independent variable which is significantly correlated to dependent variable prediction. From examining, it can be summarized that an independent variable which affects the behavior of receiving news from various media is predictably related to the behavior of perceiving data by Sig = .05.

3. The studying factors result in promoting news and knowledge of community leaders in Yasothon. As of knowledge, communication, and attitude, the researcher finds that all are related to at least one behavior of perceiving data by Sig = .00. It is revealed that there is at least one independent variable which is significantly correlated to dependent variable prediction. From examining, it can be concluded that an independent variable which affects news promoting and knowledge of community leaders in Yasothon is predictably related to the behavior of perceiving data by Sig = .05.

Keywords: receiving information, information and news.

Introduction

In present days, the progress of technology has important role in human's life regardless of age and gender. Radio/television, newspaper, internet, billboard, and bulletin are used widely for the purpose of

---

E-mail address: r_kanokon@hotmail.com

inter-communication. Receiving and promoting the information bring about the development-- economic, societal, political and governmental --which is necessary to consider various factors. All of 20 community colleges are the institutions which provide higher education below bachelor degree, and also organize the vocational training courses, according to ministerial regulations 2003. Each community college, therefore, performs a duty which is in accordance with the educational development plan about expanding the educational institutions and enhancing the quality of education. This will lead to the enhancement of the quality of life and of national security under multi-culture, including teaching and learning participation of all sectors and educational system management in the effort to make an effectiveness of education and to create an employment.The researcher has realized the importance of this issue. Therefore, the study will contribute to the benefit and be the guideline for promoting information, and for encouraging people in community to learn more from information and news in the near future.

Objectives/purposes

To study the factors which affect the behavior of Yasothon community leaders in receiving information and news.

To study the possibility of receiving information of Yasothon community leaders.

Hypothesis

The studying factors result in promoting news and knowledge. In terms of knowledge, communication, and attitude, the research is to find if all are related to at least one behavior of perceiving data.

The studying factors result in promoting information and knowledge of community leaders in Yasothon province. The research is to find if these factors are related to at least one behavior of perceiving data.

The studying factors result in promoting information and knowledge of community leaders in Yasothon province. The research is to find if these factors are related to at least one behavior of perceiving data.

Methods

The research " Factors Affecting the Behaviors of Yasothon Community Leaders in Receiving Information and News" is conducted by the following process

1. The sample are 120 community leaders in Yasothon province, who are the members of 60 subdistrict administrative organizations.
2. Tools in this study is questionnaire that created by the researcher. Some parts are from the other research but are adapted to be more suitable for the sample, and to cover variables and objectives of the study. By doing this, the researcher studied from many texts, documents and related research. The questionnaire consists of 6 parts, which the reliabilities is by 0.86
3. Data collection by the questionnaire which has been send to the samples and returning to the researcher. The number of questionnaire is equal to the amount of the sample.
4. Data analysis
   - The analysis by descriptive statistics, such as percentage, arithmetic mean, and standard deviation to describe the features of the data.
   - The analysis of correlation coefficient in examining the correlation
   - The analysis of data statistics of behavioral prediction by using regression means.

Results

Part 1 The main factors resulting in promoting information, news, and knowledge of the community leaders in Yasothon province in Thailand.

The main factors resulting in promoting information, news, and knowledge of the community leaders in Yasothon province, in the aspect of knowledge, the highest average score is the number 4. You have the capacity to exchange the knowledge, with the answer: high level (= 3.91). The second highest average is the number 2. You have the capacity to search for knowledge from learning sources, with the answer: high level   (= 3.86

Part 2 The contributing factors resulting in behavior of receiving information from various channels

The study finds that among various channels of information, highest average score is the number 4. Internet, with the answer: highest level (= 4.70). The second highest average is the number 1. Television/radio, with the answer: the highest level (= 4.56).

Part 3 The additional factors resulting in promoting information and knowledge of community leaders in Yasothon province

The study shows that the additional factors which result in promoting news and knowledge of community leaders in Yasothon province, in terms of organization's policy, the highest average score is the factor number 4. Monitoring and evaluation for the outcome of promoting news and knowledge, with the answer: high level (= 3.92). The second average is the factor number 3. Support and encouragement to promote the news and knowledge, with the answer: high level (= 3.88). In terms of policy, the highest average score is the number 1. There is an acceptance of news and knowledge promoting, with the answer: high level   (= 3.99). The second highest is the number 2. There is a support and participation in promoting news and knowledge, with the answer: high level (= 3.96).

Part 4 The outcomes of promoting information and knowledge of the community leaders in Yasothon province.

It is shown that in terms of acceptance, the highest average score is the number1. I am informed about the news and events, and always adapt the knowledge to use in my every life, with the answer high level (= 4.08). The second highest is the number 4. I am enthusiastic to know the new information and knowledge from the institutions or organizations, with the answer: high level (= 4.03).

Part 5 The results of the analysis from the data statistics of behavioral prediction by using regression means.

From the analysis of the main factors which affect the promoting of information and knowledge by regression means, in terms of knowledge, communication and attitude, it shows that all are predictably correlated to the behavior of perceiving data. The Sig = .00 is found in the study, which means that there is at least one independent factor which is significantly related to dependent variable prediction. From examining all cases, it can be concluded that the independent variables of the main factors result in

promoting news and knowledge. In terms of knowledge and communication, all are predictably related to the behavior of perceiving data by Sig. at.05.

From the analysis of the contributing factors which affect the behavior in receiving information from various channels by regression means, all are correlated to the behavior of perceiving data. There is at least one independent factor which is significantly related to dependent variable prediction. From examining all cases, it can be concluded that the independent variables of contributing factors result in the behavior of receiving information from various channels. All are predictably related to the behavior of perceiving data by Sig.at.05.

From the analysis of the additional factors resulting in promoting information and knowledge of community leaders in Yasothon province by regression means, the additional factors are correlated to the behavior of perceiving data. From examining all cases, it can be concluded that the independent variables of additional factors which result in promoting information and knowledge of community leaders in Yasothon province are predictably related to the behavior of perceiving data by Sig.at.05.

From the analysis of the outcomes of promoting information and knowledge of community leaders in Yasothon province by regression means, the factors are correlated to the behavior of perceiving data. There is at least one independent factor which is significantly related to dependent variable prediction. From examining all cases, it can be concluded that the independent variables of the outcomes which result in promoting information and knowledge of community leaders in Yasothon province are predictably related to the behavior of perceiving data sig. at. 05.

SUGGESTIONS

1. For the future study, it should be a comparative work between each group of fundamental variables in order to know if the factors are significantly related to each one or not.

2. Apart from the factors in this study, the other factors should be considered as well such as the external factors of individual who will promote the information and knowledge, for example, the content, the channels and media for promoting the knowledge

3.The study should be conducted in the other provinces to see if the results are the same.

Factors Influencing the Development in English Pronunciation Skills Training in Primary Students of Schools in the Primary Education Services Area Office in Bangkok.

Premrudee SRIUDOMKIJ [a,62], Advisor: Assoc. Prof. Dr. Saroch Sopirak [b]

[a]Ph.D. Student in Educational Communications and Technology, Kasetsart University, Thailand.
[b]Educational Technology Department,Faculty of Education , Kasetsart University,Thailand

Abstract

This research is conducted for the purpose of; 1) Studying the factors which influences the development in English pronunciation skills training in primary students of schools in the Primary Education Services Area Office in Bangkok 2) Studying the possibilities of the development in English pronunciation skills in primary students of schools in the Primary Education Services Area Office in Bangkok. The cross section in this research includes 200 primary education level English language instructors from 37 schools in the Primary Education Services Area Office in Bangkok. This research was conducted from February-March 2013, using 5 point rating scale questionnaire as research methodology, and using Percentage, Average, Standard Deviation, and Regression

The research results are;

1) Most of the Primary education level English language instructors in the Primary Education Services Area Office in Bangkok are ready for the usage of new technologies as the instruction media and most students prefer and ready to make use of electronics devices in learning English language.

2) Factors which influences the development in English pronunciation skills training in this study; 1) The main factors which are instructors, students, and teaching method 2) The influential factors which are duration and frequency of learning and teaching 3) The environmental supportive factors which are the equipment from all of the tests. It can be concluded that independent variable influences English pronunciation skills training in primary students with a predictive correlation at 0.05 level of statistical significance.

Keywords: English pronunciation skills

Introduction

Nowadays, there have been English programs in various levels of schools in Thailand; primary, secondary and higher education levels. The purposes of doing that are to improve 4 skills in learners: listening, speaking, reading and writing. Particularly, speaking skill is the most essential talent to be used for effective communicating with other fellows on earth. Basically, this can influence the country development and academic institutions need to manage learning programs according to the Basic Education Curriculum of 2551 B.E. and it has to include all the 5 significant capabilities of learners in it. The most significant skill is communication skill which is composed of listening, speaking, reading and writing of foreign languages. However, Thailand education system managed nowadays is not in accordance with personal and social requirements. The more expectation required by all levels in society that education needs to play major roles in preparing Thai people to be able to compete with people in other countries, the bigger problem in education circle can be obviously seen. The most frequent argument made in all levels is why learners graduating each level even primary, secondary or higher education cannot speak fluent English. This major problem can be caused from many factors such as instructors, learners, learning atmosphere and other factors influencing the English speaking.

The researcher has realized importance of such matter and has therefore studied those factors affecting the improving skill in English pronouncing skills of students in primary schools of the Primary Education Service Area

in Bangkok. It is expected that the study results can be advantageous and be further approach of English teaching improvement in Thailand.

Objective

To study those factors affecting the improvement of English pronouncing skills of primary students in Primary Education Service Area Office in Bangkok.

Methodology

Population
Total 200 English instructors in elementary schools administrated by Primary Education Service Area Office in Bangkok have been used as population in this study.

Research Instruments
Two types of questionnaires were designed for collecting data from the respondents: the first type was checklist questionnaire concerning demographic data and another one was 5-point Likert type scales to study factors influencing the improvement of English pronunciation. The questionnaires were tried out to find reliabilities of them and the reliable values of all questions made in questionnaires were 0.789.

Data Collection and Analysis
The researcher collected data information from the inspected and approved questionnaires from all kinds of population which was 200 English teachers in 37 primary schools of the Primary Education Service Area Office in Bangkok. The duration between propagating questionnaires and collecting back was 3 weeks in February and the data was analyzed in March 2013. Upon collection and inspection of all collected questionnaires, the data were analyzed through descriptive statistics which were composed of percentage, mean and standard deviation that were used to explain the data characteristics. The correlation of data was analyzed to find correlation coefficient by using statistics designed by Pearson Chi-Square and the data Regression were used to forecast behaviors of data.

Results

General Information of the Respondents
From all 200 population used in this study, 26 per cent of it are male and 74 of it are female with age ranges 20-39 years as highest at 30 per cent and the less is 38.50 per cent is the range between 30-49 years. The population with ages between 40-49 years estimated at 11 per cent and the population with ages above 50 years estimated at 20.50 per cent. Of all population, 44 per cent directly graduated English teaching and 56 per cent of them graduated other subjects. Average 73 per cent of all population had their own electronic media in the form of smart phones, 86.5 per cent of population had their own electronic media in the form of computer tablets and average 79 per cent of population had their own electronic media in the form of computer laptops. Average 81 per cent of all population knew the software programs assisting in English pronunciation; 19 per cent of all population did not know the software programs assisting in English pronunciation. Average 80.5 of all population used to use software programs assisting English pronunciation and 19.5 per cent of all population have never used software programs assisting English pronunciation.

Factors influencing English pronunciation skills of primary students in primary schools of the Primary Education Service Area Office in Bangkok
The overall means showing at 4.21 (S.D. = 0.56) of which individual factor was clarified and it was found that students talked English during the class hours showing highest means which were 4.65 (S.D. = 0.47). The second values were from students enjoying English pronunciation in classes as high means which were 4.43 (S.D. = 0.49). The students' attitude towards modern technology used in classes showed high means which were 4.42 (S.D. = 0.49). Students whose grades were better than ever showed high means which were 4.28 (S.D. = 0.63). Students' abilities in using modern technology showed high means which were 4.14 (S.D. = 0.55). Students presenting their courage in pronouncing English showed high means which were 4.08 (S.D. = 0.72). Students' cooperation in class activities and homework showed high means which were 3.98 (S.D. = 0.61). And the least mean values were from students' pronouncing English fluently which showed means of 3.77 (S.D. = 0.59)

Conclusion and Discussion

From this study, it is found that primary students of primary schools of the Primary Education Service Area Office in Bangkok have high level of readiness for learning modern technology. Therefore, English teachers have to be prepared for using modern technology, electronic media and updating their education all the time and they need to realize the importance and advantages of the usage of electronic media in teaching English including selecting appropriate electronic media for their students. Hopefully, further comparative studies of each variable, factor, and background will be performed to get the correlation of each one. Moreover, other factors above this research such as families and students' parents should be studied. Also the same kind of this study should be done with other groups of schools such as bi-lingual schools or schools in other provinces to get comparison results to this research.

Factors Influencing the Success of Rajamangala University of Technology Thanyaburi's Ubiquitous Learning

Suchitra Yodsaneha[a,63], Saroach Sopeerak[b]

[ab]*Educational Technology Department, Faculty of Education, Kasetsart University, Thailand.*

Abstract

The purposes of this descriptive research were to explore factors influencing the success of Rajamangala University of Technology Thanyaburi's Ubiquitous Learning. Participants in this study were 556 Bachelor's degrees of Rajamangala University of Technology Thanyaburi (RMUTT) students' from 11 faculties and stratified random sampling method were used to select the subjects. Data were collected from online questionnaires. The descriptive statistics used to analyse data were frequency, percentage, mean, and standard deviation. The test of assumptions used linear multiple regression equation at the statistically significant level 0.05. The results revealed that the predisposing factors Influencing the success of RMUTT's Ubiquitous Learning was knowledge (X_1), enabling factors were infrastructures (X_4) and learning equipment (X_6) and reinforcing factors were electronics learning policy (X_8) and stakeholders (X_9). The multiple correlation coefficient (R) was 0.73 with 53% of ability to predict the factors influencing the success of RMUTT's Ubiquitous Learning and formed the forecasting equation as follows: $\hat{Y} = 0.31 + 0.21X_1 + 0.11X_4 + 0.08X_6 + 0.28X_8 + 0.25X_9$

Keywords: U-Learning ; Ubiquitous Learning; Active Learning

Introduction

The world is changing rapidly from as an industrial to an information and media-driven economy. As the world around us becomes smaller, and communication and media become more global and more diffuse, the very nature of society and of who we are as human being is quickly being defined by our ability to be both consumer and producer of knowledge. (Bill Cope and Mary Kalantizs, 2009)

Our society is in the midst of paradigm shift from mass media-based society to personal media-based society, driven by the digital revolution. Mass media and communication media are converging to form massively connected personal and everywhere media. In the personal and everywhere media, the interaction of people, artifacts, and the environment contributes to the emotional and entertaining experience in the daily life. (Masa Inakage, 2007)

Ubiquitous learning or u-learning is a new learning paradigm, anywhere and anytime learning referring to any environment that allows any mobile learning devices to access the learning and teaching contents via wireless networks in any location at anytime. (Saadiah Yahya et al.,2010) The portability of computers and computing devices has blurred the traditional lines between formal and informal learning. (Bill Cope and Mary Kalantizs, 2009) Rajamangala University of Technology Thanyaburi (RMUTT) is focused on science and technology curriculum. Teaching and learning literates with technology changes that the one of policies of the RMUTT's strategic plan. (RMUTT, 2009) RMUTT supports teachers and students using instructional media for teaching and learning through intranet and internet. To provide infrastructures, wireless network, around RMUTT for support Ubiquitous Learning in the future.

E-mail address: phasure@hotmail.com

Objective

The purposes of this descriptive research were to explore factors influencing the success of Rajamangala University of Technology Thanyaburi's Ubiquitous Learning.

Methodology

Sample of the Study

The sample of this study were 556 Bachelor's degrees of Rajamangala University of Technology Thanyaburi (RMUTT) students' from 11 faculties and stratified random sampling method were used to select the subjects.

Research Instruments

Online questionnaires were developed for collected data from the respondents which 2 types; the first was checklist about demographic data and the second was 5 point Likert type scale about the factors influencing the success of Rajamangala University of Technology Thanyaburi's Ubiquitous Learning. The internal consistency (alpha) coefficient regarding the reliability of the scale has been calculated as 0.97.

Data collection and analysis

The study took online questionnaires as a research instrument during February 4 -25, 2013. The descriptive statistics used to analyse data were frequency, percentage, mean, and standard deviation. The test of assumptions used linear multiple regression equation at the statistically significant level 0.05.

Results

Demographic data

The findings reveal that majority of participants were Faculty of Business Administration students' (27.21 %) and freshmen (29.68 %). Almost of the respondents were females (70.49 %). The most frequently used internet average about 4-7 hours/week (33.57 %) and using internet more than 7 years (64.84%). The purposes of using were to connect the social network (92.23%) and to learn online (56.71%). The participants' belonged laptop (88.16 %) and smart phone (69.26 %). They preferred blended learning (62.37%) and connect with teachers via social media (57.24 %)

Factors Influencing the Success of RMUTT's Ubiquitous Learning

The findings of predisposing factors influenced the success of RMUTT's Ubiquitous Learning were: the attitude factor was the most at high level ($\bar{x}$ = 3.81,S.D = 0.55), the knowledge factor was same at the high level ($\bar{x}$ = 3.73,S.D = 0.55) and economics factor was natural level($\bar{x}$ = 3.39,S.D = 0.72). The enabling factors were found; instructor factor was the most at high level($\bar{x}$ = 3.66,S.D = 0.65), the learning environment factor was at high level($\bar{x}$ = 3.61,S.D = 0.62), the learning equipment factor was at high level ($\bar{x}$ = 3.57,S.D = 0.76), and the infrastructure factor was at natural level ($\bar{x}$ = 3.30,S.D = 0.76). The reinforcing factors were found; stakeholder factor was the most at high level ($\bar{x}$ = 3.64,S.D = 0.66), and electronics learning policy factor was at high level ($\bar{x}$ = 3.57,S.D = 0.64).

The test of assumptions that the predisposing factors, enabling factors and reinforcing factors influenced the success of RMUTT's Ubiquitous Learning.

Table 1. Simple linear regression analyses correlation of factors that influenced the success of RMUTT's Ubiquitous Learning.

	R	R Square	Adjusted R Square	Std.Error Of the Estimate
Success of RMUTT's U-Learning	0.73	0.53	0.53	0.46

As depicted in table 1, the value of R square was 0.53 which indicates the correlation 53% of the predisposing factors, enabling factors and reinforcing factors influenced the success of RMUTT's Ubiquitous Learning

Table 2. Multiple regression coefficients of the factors influenced the success of RMUTT's Ubiquitous Learning.

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Bata		
(Constant)	0.31	0.15	-	2.12	0.034
Knowledge factor (X_1)	0.21	0.04	0.18	5.13	0.000**
Infrastructure factor (X_4)	0.11	0.03	0.13	3.72	0.000**
Learning equipment factor (X_6)	0.08	0.03	0.10	2.64	0.000**
electronics learning policy factor (X_8)	0.28	0.05	0.27	5.61	0.000**
Stakeholder factor (X_9)	0.25	0.04	0.25	5.74	0.000**

* $p \leq 0.05$, ** $p \leq 0.01$

As depicted in table 2, the multiple regression coefficients indicates that the predisposing factors influenced the success of RMUTT's Ubiquitous Learning at the statistically significant level at .01 was knowledge factor (X_1) , infrastructure factor (X_4), learning equipment factor (X_6), electronics learning policy factor (X_8) and stakeholder factor (X_9), that formed the forecasting equation as follows: $\hat{Y} = 0.31 + 0.21X_1 + 0.11X_4 + 0.08X_6 + 0.28X_8 + 0.25X_9$.

Conclusions and Discussion

The predisposing factors Influencing the success of RMUTT's Ubiquitous Learning was knowledge , enabling factors were infrastructures and learning equipment, and reinforcing factors were electronics learning policy and stakeholders that related Danail Dochev and Ivo Hristov (2006) suggest that e-Learning demands high bandwidth broadband, new high quality graphical environments, the introduction of new and innovative services in handling digital content. e-Learning services also require interoperable networks, such that the content could be accessed through different channels in a seamless fashion by the end users. The participants suggest how to success in online learning the learner should plan and continue self-discipline of learning.

Factors Influencing the Success of Web-based Training for Teachers of The Secondary Educational Service Area Office 30.

Issaree Sirisorn[64] , Saroach Sopeerak[ab]

Educational Technology Department, Faculty of Education, Kasetsart University, Thailand.

Abstract

The purposes of this descriptive research were to explore Factors Influencing the Success Web-based Training for Teachers of The Secondary Educational Service Area Office 30.. Participants in this study were 315 teachers of The Secondary Educational Service Area Office 30 from 2,398 teachers and stratified random sampling method were used to select the subjects. Data were collected from questionnaires. The descriptive statistics used to analyse data were frequency, percentage, mean, and standard deviation. The test of assumptions used linear multiple regression equation at the statistically significant level 0.05. The multiple correlation coefficient (R) was 0.921

Keywords: Web-based training ; e-Learning; Active Learning

Introduction

Education is the most important basis for developing countries. Hence educational institutions have to emphasize on improving teachers' skills of creating teaching media for their teaching methods which are the main keys for educational development. Nowadays, educational institutions, which are responsible for Thai educational management, have increasingly encouraged teachers to create their own teaching media. It is recommended that the most effective personnel development is training as it takes minimal time and it answers the problems and requirement of both personnel and organization.

The Secondary Educational Service Area Office 30 is one educational agency which has been assigned to monitor 37 schools in Chaiyaphum Province area. Although the distance between schools is quite far away and the transportation is inconvenient, there has always been training activities have always been provided to support and promote improvement of teachers' knowledge. Therefore the researcher is interested in studying factors affecting the Web-based training for teachers under the Office of Secondary Education Service Area 30 with an objective to further improve teaching competency of teachers of The Secondary Educational Service Area Office 30.

Objective

The purposes of this descriptive research were to explore factors influencing the success of web-based training for teachers of The Secondary Educational Service Area Office 30.

Methodology

Sample of the Study

The sample of this study were 315 for Teachers of The Secondary Educational Service Area Office 30 from 2,398 teachers and stratified random sampling method were used to select.

Research Instruments

Tools used in this research are questionnaires created by the researcher with 5 parts and they consist of 68 items with 0.921 of reliance.

Data collection and analysis

The study took questionnaires as a research instrument during February 10 -20, 2013. The descriptive statistics used to analyse data were frequency, percentage, mean, and standard deviation. The test of assumptions used linear multiple regression equation at the statistically significant level 0.05.

Results

Demographic data

General information of all samplers used in this study: 200 female equal 63.5 %; 88 samplers with average ages = 35-44 years estimating 27.39 %; 140 samplers with their monthly income above 40,001 Baht estimating 44.4%; 233 samplers with bachelor degree as highest level of education estimating 74 %; 156 samplers holding the position of teachers of special expertise estimating 49.5 %; 73 samplers have been working as civil officers for 11-15 years estimating 23.2 %; 121 samplers have used computers for 6-10 years estimating 38.4 %; 121 samplers have used the Internet for 6-10 years estimating 34.8 %t; 124 samplers use the Internet at least 3 hours a day estimating 39.4 %; and 288 samplers have their own personal computer (at home) estimating 91.4 %.

Factors Influencing the Success of Web-based Training for Teachers of The Secondary Educational Service Area Office 30

1.   Searching the reliance of the questionnaires studying factors affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30, the reliance of 0.921 was found.

2.   Knowledge information resulting Web-based training achievement of teachers under the Office of Secondary Education Service Area 30, it results high value with the mean of 3.60 (S.D. = 0.65). After considering individual item, it was found that teachers' abilities in searching the learning resource reflect the highest value with the mean of 3.87 (S.D. = 0.83). The second highest value is obtained from the ability of collecting information and summarize knowledge management with mean of 3.74 (S.D. = 0.77) and the lowest value is from languate skills with average mean value of 3.26 (S.D. = 0.82).

3.   Attitude information influencing the Web-based training achievement of the teachers under the Office of Secondary Education Service Area 30 was found the high value of mean 3.9 (S.D. =0.73). Individual item was considered and it was found that computer sets could provide teachers with comfortibility at the high level of value with mean of 4.22 (S.D. = 0.82). The second highest value was represented that more advantages gained by teachers who could use computer with its mean value of 4.14 (S.D. = 0.71). The lowest value was gained from the using of computer which was considered easy with the average mean value of 3.37 (S.D. = 0.85).

4.   Skill information affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 was found that it reflected high mean value of 3.77 (S.D. =0.78). Individual item was analyzed and it was found the using Excel program for calculating reflected the high mean value of 4.38 (S.D. =0.82). The second mean value was found from using Power Point Program in presentation with high mean value of 3.83 (S.D. = 1.10) and the minimal mean value was found from using Microsoft Word in typing with average mean value of 3.35 (S.D. = 1.07).

5.   Input information affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 was found high with average mean of 3.60 (S.D. =0.61). The highest value concerned attitude which reflected high value of average mean 3.93 (S.D. =0.73). The second was skill with its high value of average mean 3.77 (S.D. = 0.78) and knowledge with its high value of average mean 3.60 (S.D. = 0.65) respectively.

6.   Age information affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 was found high with average mean of 3.56 (S.D. = 0.85). Individual item was clarified and it was found that ages resulted training, developing and using information technology with its high mean value of 3.62 (S.D. = 0.92). The second value was found from studying ages effecting searching information and its procedure with its average mean value of 3.59 (S.D. = 0.94). The minimal value was obtained from styding on ages resulting stability in working by using information technology with its average mean value of 3.56 (S.D. = 0.85).

7.   Gender information affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 resulted the medium value with average mean of 2.87 (S.D. = 0.98). Individual items were analyzed and it was found that gender resulted in attitude, preference, and popularity in Web-based training with the medium average mean of 3.04 (S.D. = 1.12). The second was found on gender resulting in adapting themselves to the Web-based training with aveage mean value of 2.89 (S.D. = 1.09) and the minimal value was obtained from gender resulting stability in working using information technology with average mean value of 2.77 (S.D. =1.00).

8.   Education information resulting the Web-based training of teachers under the Office of Secondary Education Service Area 30 was found with high value of 3.55 mean (S.D. = 0.86). Individual item was clarified and it was found that the educational background resulting the Web-based training and developing of information technology with high mean value of 3.61 (S.D. = 0.87). The second value was derived from studying the educational background resulting leaning and traning activities with its high mean value of 3.58 (S.D = 0.92). The minimal value was obtained from studying oneducation levels resulting searching and collecting data information and its procedure with high mean value of 3.50 (S.D. = 0.91).

9.   Experience information resulting the Web-based training of teachers under the Office of Secondary Education Service Area 30 was found that experiences affected highly with the mean value of 4.12 (S.D. = 0.76). Individual items were studied and it was found that the highest value was from studying experiences resulting learning management through Web-based training which reflected high mean value of 4.15 (S.D. = 0.79). The second value was from studying experiences resulting abilities in adapting themselves for Web-based training with mean value of 4.14 (S.D. = 0.78). And the minimal value was from studying experiences resulting the leaning and training activities with high mean value of 4.09 (S.D. = 0.83).

10.	Information of numeric factors influencing the Web-based training of teachers under the Office of Secondary Education Service Area 30 was found high mean value of 3.53 (S.D. = 0.65) and was found that experiences resulted highest mean value of 4.12 (S.D. = 0.76), ages reflected the second highest mean value of 3.56 (S.D. = 0.85) and gender affecting the minimal mean value of 2.87 (S.D. = 0.98).

11.	Structural factor information affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 was found high with its mean value of 3.93 (S.D. = 0.91). The result was found that there was Internet system installed in schools with high mean value of 4.14 (S.D. = 0.89). The second highest value was found on Information Technology Center provided in schools for Web-based training facilities with its mean value of 3.98 (S.D. = 0.93) and the minimal mean value was found on adequate computer sets provided in schools with its mean value of 3.79 (S.D. = 1.11).

12.	Policy factor affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 was found high with its mean value of 4.02 (S.D. = 0.83) and it was found that there was good support and promotion given by management levels for Web-based training with its high mean value of 4.14 (S.D. = 0.89). The second item was found on policy given by management levels to encourage participation in Web-based training with its high mean value of 4.09 (S.D. = 0.83) and the minimal mean value was found on budget allocated by schools for Web-based training with its mean value of 3.90 (S.D. = 0.99).

13.	Training result through Web-based training done by teachers under the Office of Secondary Education Service Area 30 was found high with its mean value of 4.03 (S.D. = 0.76). Individual items were clarified and were found that saving of time on travelling showed the highest value of its mean 4.26 (S.D. = 0.79). The second mean value was found on incomplexity in training because reviewing could be done as many times as required with its mean value of 4.21 (S.D. = 0.88). The minimal value was derived from studying the factor of imlimitation on time and place with its mean value of 3.81 (S.D. = 0.8).

14.	Results derived from analyzing relationship among important factors affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 were found that following variations reflected the results of Web-based training of teachers under the Office of Secondary Education Service Area 30 which had positive relationship with primary variations that could be imputs such as knowledge, attitude and skills and it had coefficient linear multiple regression = 0.633.

15.	Results derived from analyzing relationship between important factors affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 were found that the important factors affecting directly the Web-based training of teachers under the Office of Secondary Education Service Area 30 with its statistic variation at 0.05 which are knowledge (k) had Sig. value = 0.003; attitude (a) had Sig. value = 0.000 and skill (s) had Sig. value = 0.094. This could be concluded that 2 important factors which are knowledge and attitude result entirely the Web-based training of teachers under the Office of Secondary Education Service Area 30.

16.	Results derived from analyzing relationship between numeric factors affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 were found that following variation was the result of Web-based training of teachers under the Office of Secondary Education Service Area 30 with its positive relationship with primary factors that became numeric factors which were ages (ag), gender (sx), education (e) and experiences (ep) with its coefficient linear multiple regression of 0.343.

17.	Results derived from analyzing relationship between numeric factors affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 were found that there was statistic result shown at 0.05 of the numeric results of Web-based training of teachers under the Office of Secondary Education Service Area 30 and the statistic result was the numeric factors affecting the Web-based training of teachers under the Office of Secondary Education service are 30 with its Sig. value = 0.000; ages had its Sig. value = 0.042; gender (sx) had its Sig. value = 0.502; education (e) had its Sig. value = 0.409; and experience had its Sig. value = 0.000. It could be concluded that 2 numberic factors which were ages and experiences resulted the Web-based training of teachers under the Office of Secondary Education Service Area 30.

18.	Results derived from testing relationship between supportive factors affecting the Web-based training of teachers under the Office of Secondary Education Service Area 30 were found that following variations were the supportive factors which resulted the Web-based training of teachers under the Office of Secondary Education Service Area 30 and had its positive relationship with the primary variations which are supportive factors such as structural and policy factors and with its coefficient linear multiple regression of 0.58.Results derived from analyzing relationship between supportive factors affecting Web-based training of teachers under the Office of Secondary Education Service Area 30 were found that supportive factors resulted the Web-based training of teachers under the Office of Secondary Education Service Area 30 with its statistic value at 0.05 that could be allocated on

Structure (st) with its Sig. value = 0.957; and Policy (po) with its Sig. value = 0.000. This could be concluded that supportive factor based on policy affected directly the Web-based training of teachers under the Office of Secondary Education Service Area 30.

Conclusions and Discussion

From the study of factors affecting the Web-based training for teachers working for the Office of Secondary Education Service Area 30, these following results can be discussed: the achievement expected from the Web-based training of teachers under the Office of Secondary Education Service Area 30 has been in high level or at the mean level 4.03 (S.D. = 0.76). Because of this Web-based training, teachers who have been trained can freely learn things themselves everywhere all the time according to the statements made by Pratchayanan Nilsuk (2542: 84) and Sanrat Horpaisarn (2544: 95) that in each training, trainees have to be centralized to get new things directly. Trainees can also choose things to learn as flexibly and comfortably as they can with no limitation on time and location. They can review lessons and contents all the time and that can make trainees feel free and comfortable to learn.

Factors related the Utilization of Instructional Media and Innovation of Nursing Instructors at Boromarajonani College of Nursing, Suphanburi, Thailand

Akom Phosuwan, RN,MS[a],[65], Saroch Sopeerak, PhD[b], Supaporn Voraroon, MS[a]

[a]*Boromarajonani college of Nursing, Suphanburi, Thailand*
[b] *Associate Professor in Educational Technology Department,Faculty of Education ,Kasetsart University,Thailand*

Abstract

Educational technology has been benefits for both educators and university students. However, most educators are lack of knowledge to utilize an instructional media and to produce innovation as instructional tools. In this research was aimed to explore the utilization of instructional media and innovation and to describe the factors related to the usage of instructional media and innovation of nursing instructors in Boromarajonani College of nursing, Suphanburi, Thailand. The purposive of 40 subjects were included in this study. The research shows that nursing instruction produced the instructional media and innovation once a year. Picture, graphics and multimedia projectors were the most often used by nursing instructors. There was a significant difference between the factors related to the utilization of instructional media and innovation. It was included the policy, resources (r= .335) and knowledge to produce instructional media and innovation   (r= .315). The recommendation of future research will be specifically focus on the appropriated technological model usage in nursing education.

Keywords: instructional media utilization, diffusion of innovation in nursing

Introduction

The rapid growth in educational and communication technology becomes one of ours instructional tools for educators. Back to the last ten decade, the overhead projector, transparency, CD-ROM and others Medias were used as instructional tools. Some technologies are still using in the university while some tools are obsolete. Because the changing in teaching method, most educators need to enhance their skills for the best effective teaching style to benefit students. Technologies are the potential tools for instructors to motivate and to engage their students in learning. For instance, it will help students improve their learning skills such as drills and practices, information inquiry, participatory learning, and enhancing their responsibilities. This is why educators need to know how to adapt the effective teaching tools for using in classroom. However, there are many factors influent the adoption and implementation of educational technology in nursing college because most nursing educators have least knowledge in educational and communication technology. They may think in different perspective than people who are in the education technology field. In addition, most educators need to develop the innovation to improve the effectiveness of teaching method in their area, instead of the only use instructional media. In order to success to adopt instructional media and to produce the innovation in nursing colleges, most nursing instructors need to accept the technology and innovation.

A review literature has been found the factors effected the instructors' usage of innovation in Kalasin province are knowledge, type of innovation, attitude and need toward innovation, and budget. Nongluk (1996) found the factors that affect the motivation of the instructional media production in English teachers are attitude. Also, Suvaree (2000) claimed that the effectiveness of instruction, convenient usage and producing, responsibilities and knowledge were effected the usage of media. In addition, Thitiya (2003) found that the factors affect the acceptance of instructional media usage are workload, need of training, supported materials, and guideline. In contrast, Woranat (2004) found that age and education level related to the usage of instructional media. Then, the main factors of his study were knowledge and the availability of media. Factors related the usage of instructional media usage in

Corresponding author. Tel.: +66830881812
E-mail address: akomph@hotmail.com

vocational education, Bangkok province were teaching experiences and supported materials. On the contrary, sex, age, education, knowledge of media usage, and attitude weren't related to the usage of media, Hathaichanok (2005).

Much research in recent year has focused on what factors effected the usage of instructional media and the results are inconsistent (Teerapong(1991); Patchamon(2003); Saroch(2004); Sudarut(2005); Orawan(2007); Atcharaporn (2008)). Also, most research has explored in different level of education such as the primary school, secondary school, vocational school, and university. In contrast, there is less research has been identified what factors related to utilization of instructional media and innovation in nursing education. Then, research need to be explored the limitations factors as barriers for adopting educational technology in nursing organization.

Methods

The purpose of this research study were to determine the factors related to the utilization of instructional media and innovation of nursing instructors at Boromarajonani college of nursing, Suphanburi, Thailand. The Independent variables were included three domains; the basics factors, the associated factors, the supported factors. The basics factors were sex, age, teaching experiences, workload and education. Also, the associated factors were knowledge to produce instructional media and innovation, attitude toward the production and usage of instructional media and innovation, the barrier to produce the instructional media. In addition, the supported factors were the policy and the supported material to produce the instructional media and innovation. Finally, the dependent variables were the utilization and usage of instructional media and innovation.

Setting and population
The target population of this study were 40 nursing instructors recruited from Suphanburi Nursing College in Thailand. Most of them are willing to participate in the study.

Instruments
The online questionnaires of the factors related the utilization of instructional media and innovation adopted in this study were included 6 sections; the basics information, Knowledge in producing and using of instructional media and innovation, attitude toward the utilization of instructional media and innovation, the barrier toward the utilization of instructional media and innovation, the policy and supported material to produce the instructional media and innovation, and the utilization of instructional media and innovation. The content validity was done by three experts in educational technology. Cronbach's reliability coefficient of this instrument was 0.79 when it was examined from several subjects who work in the related fields.

Procedure
Once the project was approved, the investigator asked the permission from the director of the Nursing College to collect data. Then the investigator coordinated with the faculty at the school of nursing to ask nursing instructors if they were interested in being research subjects. Once nursing instructors who were interested in this study were selected, the investigator sent information to participants to show them how to participate in this study. Before participate in this study, subjects have to agree term and condition as part of the research agreement.

Analysis
Data analysis was consisted of descriptive and inferential statistics. Descriptive statistics included the mean of the information on the questionnaire. To answer research question on what factors related the unitization of instructional media and innovation, the Pearson correlation was analysed.

Human subjects
Risk/Benefits
There are minimal risks related to completing the study. However, there were no unpleasant consequences to subjects. Subjects may find some questions distressing, but they can stop participating at any time. The benefits of this study are that nursing instructors can be able to identify factors related to the usage of educational technology in nursing.

Disclosure/Consent Process
When nursing instructors agree to be subjects, they can read the agreement of this study via an online instructional Web site. This study is voluntary, and there are no negative effects for the subjects if they decide not to participate in this study.

Confidentiality Assurances

All information on the research subjects are kept in a secure place. Data records of this study are kept until investigators finish data analysis.

Results

The results in this study are presented into seven sections; 1) Basics information, 2) Knowledge of innovation and instructional media production, 3) Attitude toward producing and using instructional media and innovation, 4) The barrier toward the instructional media and innovation production and usage, 5) The policy and supported materials to producing instructional media and innovation, 6) The instructional media and innovation usage, and 7) Factors related the utilization of instructional media and innovation. The details in each section can be described below.

1) Section 1 Basics information
   The age average of population is 37.70 years. The youngest and the oldest people are 23 and 68 years old in order. People who have the longest teaching experience are 34 years and the shortest of teaching experience is only one year. The mean of workload per week is 6.18 hours.

Table 1 Basics information by age, teaching experience and workload per week

Type of information	Mean	S.D	Min	Max
Age	37.70	8.77	23	68
Teaching experience	10.50	7.60	1	34
Workload (per week)	6.18	1.26	3	8

Table 2 Basics information by level of education and department

Type of information	Number(N)	Percentage (%)
Education level		
Bachelor Degree	6	15
Master Degree	32	80
Doctoral Degree	2	5
Type of Department		
Adult and aging	9	22.5
Community health nursing and	10	25
Community health nurse practitioner		
Basics Nursing	6	15
Obstetrics nursing	6	15
Pediatric nursing	5	12
Psychiatric and mental health nursing	4	10

The maximum number of education level are people who earn master degree (N=32) and the lowest level of education are doctoral degree (N=2). The community health nursing and health practitioner department are the highest number of people (N=10) and the lowest number of people is psychiatric and mental health nursing department (N=4).

2) Section 2 Knowledge of innovation and instructional media production
   The results show that the knowledge of usage instructional media innovation production in this setting is average. Most people have basics knowledge about what the instructional media and innovation are. However, most of them have less knowledge about how to evaluate the effectiveness of instructional media and innovation.

3) Attitude toward producing and using instructional media and innovation

The overall level of attitude toward producing and using instructional media and innovation in this study is high (Mean=4.30, SD=0.48). The instructional media and innovation can effectively help students learning (Mean=4.58, SD=0.50).The population perceive that instructional media and innovation make students understand what they teach (Mean=4.68, SD=0.47). In addition, it can be used as media to describe the difficulty contents. Moreover, the usage of instructional media and innovation makes classroom more interesting (Mean=4.63, SD=0.69)

4) The perceived barriers toward the instructional media and innovation production and usage
The results show that the overall score of the perceive barrier is average (Mean=3.05, 0.47). The population perceive that they don't even have more time to produce an innovation (Mean=3.88, SD=0.86) and they don't have professional staffs to guide them how to develop an instructional media and innovation (Mean=3.73, SD=0.96).

Table 3

Items	Mean	SD	Level
knowledge and experience	3.58	0.90	High
Staff	3.73	0.96	High
Budget	3.28	1.15	High
Supported materials	3.50	1.18	High
Motivation	3.45	0.85	High
time	3.88	0.76	High
Overall	3.45	0.85	High

5) The policy and supported materials to producing instructional media and innovation
The overall score of the policy and supported material to produce instructional media and innovation is high (Mean=3.78, SD=0.56). They perceive that nursing college has the policy to encourage instructors to develop instructional media and innovation because of its benefits for learning (Mean=4.25, SD=0.54).

6) The instructional media and innovation usage
The frequency of using instructional media for teaching is 1 to 5 times per week and nursing instructors develop an innovation one time a year. The overall score of using instructional media and innovation is high (Mean=3.90, SD=0.38). The types of instructional media usage are printed media and graphics, media projector, instructional media and innovation.

7) Factors related the utilization of instructional media and innovation

Table 4

Variable	2	3	4	5	6	7	8	9
1. Instructional media and innovation usage	-.94	-.147	-.217	-.007	.315*	.25	-.068	.335*
2. Age		.622*	-.153	.423**	.087	.125	.250	-.318*
3. Teaching experiences			-.435**	.528**	.075	.069	.036	-.204
4. Workload				-.017	.039	-.064	.079	-.132
5. Education level					.233	.005	.108	.082
6. Knowledge						.131	.040	.100
7. Attitude							0.54	.151
8. Perceived barriers								-.326*
9. Policy								

*p < .05, **p < .01

The table shows the results of factors related to the utilization of instructional media and innovation of nursing instructors in Boromarajonani College of nursing, Suphanburi, Thailand. The variable that has positive relation is the policy and supported materials ($r=.335$, $p < .05$). In addition, another variable that has a positive relation is knowledge to develop instructional media and innovation ($r=.315$, $p < .05$)

Conclusions and recommendations

The study shows the factors related the utilization of instructional media and innovation of nursing instructors at nursing college. The policy and supported materials, knowledge of instructional media and innovation are the positive relation to the media utilization. The organization policy is one of the factors that effected instructor's usage of instructional media (Warut, 2005). The results in this study are benefits for director of nursing college to encourage nursing instructors to develop innovation and instructional media using in classroom. Also, the executive directors may plan to employ professional staffs to adopt the innovation with nursing instructors. In addition, training nursing instructors how to develop and utilization of instructional media is very important for them to understand the advantage educational and communicational technology in nursing. The future research should explore the appropriated model using in nursing education and research should identify what kind of instructional media and innovation affected learning achievement in nursing students.

Acknowledgements

I would like to express my gratitude to my team research. Also, I would like to thank the participants in my survey, who have willingly shared their precious time during the process of collecting data. Thank you my parents for their endless love.

Abstract

This paper investigates writing system reforms which occurred in Kazakhstan during the Soviet, Post Soviet periods and since the country gained independence. This paper will also focus on social and political factors of development and formation of current Kazakh writing system and will also deal with in-depth study of factual experience of Kazakh-Turkish High School system on providing education in four languages.

Keywords: multilingualism, trinity of languages, language policy,

INTRODUCTION

Kazakh (Қазақ тілі, Qazaq tili) is a language native to Kazakhstan, the Yili Kazakh Autonomous Prefecture in Western China, as well as Kazakh communities in Mongolia, Afghanistan, Tajikistan, Turkey, Turkmenistan, Uzbekistan, Iran, Russia, and the Ukraine. Kazakh is a member of Kipchack branch of Turkic languages, closely related to Tatar and Kyrgyz, and more distantly Modern Turkish, and has been influenced over centuries by Mongolian, Tajik-Persian, Arabic, and Russian.

Turkish is the most widely spoken and published on Turkic language and shares most of its grammar and base vocabulary with Kazakh. Establishing a working knowledge of Turkish will ease your transition into Kazakh, both in the sense of linguistic elements and better access to materials. It will also open you to the many bookshops across Turkey that carry a sizable array of books and resources on Turkic languages.

Russian, on the other hand, is the co-official language of Kazakhstan and is the inter-ethnic language of communication, education, and business throughout both Kazakhstan and the entire former Soviet Union where most Kazakh and other Turkic speakers live. Also, many Kazakh are more comfortable communicating in Russian in certain contexts (i.e. science, technology, news, etc.) and Kazakh in others (culture, music, daily life, etc.).

Moreover, Kazakh, like other Turkic languages has an extremely complex system of grammar and word formation:

- Kazakh has Subject Object Verb (SOV) sentence structure: Mary market-to went (Mary went to the market); John Frank-from old book bought. (John bought an old book from Frank).
- Kazakh observes agglutination: It strings suffixes together to form long words rich in meaning and syntax.

Kazakh observes vowel harmony: A system whereby vowels have to agree with one other based on complex sound/phonology rules.

After several alphabet and language reforms the Kazakh language has been modified both in terms of national writing system and phonologic rules.

2. Chronological formation of Kazakh writing system

Kazakhstan is geographically located at the junction of European and Asian continents containing multiethnic and multicultural society respectively. It also possesses a peculiar place in Central Asia as being a host for a number of Turkic, Asian and European cultural and political organizations and events.

Historically, Kazakhs have changed the alphabet several times and used different types one after another, i.e., Old Turkic writing (VIII c. – XIII c.), Kazakh writing based on Arabic letters (XI c.), Proposals of Kazakh alphabet based on Russian graphics (XIX c.), (Arabic) alphabet designed by A. Baitursynuly (1912 - 1929), Latin alphabet (1930 - 1940) and Cyrillic based Kazakh writing (1940 -).

2.1   Old Turkic writing (VIII c. – XIII c.)

Memorials with Old Turkic writing have been found in several regions of Kazakhstan like Talas, Karakorym, Taraz, Pavlodar, Essyk, Shemonaikha, Ertys and were mostly used for grave stelae, border signs or graffiti of all sorts. Old Turkic writing is more-or-less alphabetic, and is inscribed from right to left in rows running from bottom to top (Amanzholov 1998).

2.2   Kazakh writing based on Arabic letters (XI c.)

This writing was adopted together with Islamic religion. People gained literacy in so called *madrassah* where religion-based teaching took place. Two types of writing were used later: Khadim (means *old*) – XVI-XVII, written literary works common for Turkic people, chronicles and documents with historical base belong to this type of writing. The second type of writing was called Jadid (means *new*) which was used in local newspapers of that period "Turkistan ualayati (means *Turkistan province*)" and "Dala ualayati (means *Steppe province*)" (Mamyrbekova 2001).

Kazakh was first written with the Arabic script during the 19th c. when a number of poets, educated in Islamic schools, incited revolt against Russia. Russia's response was to set up secular schools and devise a way of writing Kazakh with Cyrillic alphabet, which was not widely accepted. By 1917, the Arabic script was reintroduced, even in schools and local government. In 1927, Kazakh nationalist movement sprung up but was soon suppressed. At the same time the Arabic script was banned and the Latin alphabet was imposed for writing Kazakh. The Latin alphabet was in turn replaced by the Cyrillic alphabet in 1940 (Simon Ager, accessed March 14, 2013 at http://www.omniglot.com/writing/Kazakh.htm).

2.3   Proposals of Kazakh alphabet based on Russian graphics (XIX c.)

As the writing based on Arabic letters was used among Turkic people including Kazakh led to two different dimensions. Firstly, the Arabic letters represented Islamic religion; relatively it contradicted the *Tsarist* policy regime and later the Soviet regime consequently. Secondly, the Arabic letters were insufficient to represent some specific Kazakh sounds. This circumstance needed either further development of the current alphabet or alphabet change. The former was supported by some Russian linguists like: N.I. Ilminski (as in Table 1), V.V. Katarinski, A.E. Alektorov aiming at replacing the current alphabet by Cyrillic one with missionary purposes (Ilminski 1883). Relatively, the same idea was supported by Kazakh scholar Y. Altynsarin with educational purposes. The latter was supported by some of Kazakh scholars like A.Baitursynuly (1912-1929), who proposed the project of improved Kazakh writing based on Arabic letters.

Table 1. Kazakh alphabet based on Russian letters proposed by N.I. Ilminski (1876)

8 vowels	а (ä), é (е); ы, і; о, ö; у, ÿ,
19 consonants	п, б, м, w, т, д, н, ж, з, ш, с, р, л, j, ќ, ѓ, њ.

2.4   (Arabic) Alphabet designed by A. Baitursynuly (1912 - 1929)

A.Baitursynuly was the first Kazakh philologist who researched the sound system of Kazakh language and worked out his own alphabet on the basis of Arabic letters which had been used in Central Asia. He dedicated his valuable work to improve the Kazakh writing by means of clearing and protecting it from the influence of other

languages and designed synharmonic national alphabet as a result. At the same time A. Baitursynuly's writing was called Kazakh national writing as in Table 2. Later on, Arabic based letter was banned, even politically accused due to shift to Latin alphabet which impeded the progress of Kazakh national writing.

Table 2. A. Baitursynuly's alphabet (1912)

2.4 *Latin alphabet (1929 - 1940)*

All Central Asian countries including Kazakhstan used very similar languages using Arabic letters and the differences could be interpreted as language dialects rather than separate nationalities. Fierman (2009) claims that during the period of using Latin alphabet as the main writing system, Central Asian countries, including Azerbaijan but not Tajikistan had the tendency to replace Arabic and Persian borrowings by Turkic words.

New Kazakh Alphabet based on Latin alphabet was officially adopted in 1930 (Table 3).

Table 3. New Kazakh Alphabet based on Latin alphabet

Aa-ا	Bв-ب	Cc-ش	Çç-ج
Dd-د	Ee-ه	Əə-ٵ	Gg-گ
Ɋq-ع	Hh-ھ	Ii-ىٴ	Jj-ي
Kk-ك	Ll-ل	Mm-م	Nn-ن
Ŋŋ-ڭ	Oo-و	Өө-ٶو	Pp-پ
Qq-ق	Rr-ر	Ss-س	Tt-ت
Uu-ٷ	Vv-ۆ	Yy-ٸ	Zz-ز
Ьь-ى			

Year by year new words entered from Russian into Kazakh and initially all new words were spelled and pronounced according to Kazakh sound system, but then with the decision of Central Executive Committee the Russian words entered into Kazakh had to be spelled and pronounced genuinely as in Russian. This led to the entry of particular Cyrillic letters into writing system of Latin based Kazakh Alphabet. Additionally, (Sebba 2003) argues that

"trends toward closer relationships between the various Turkic-speaking groups - and particularly, links between the Turkic-speaking peoples of the USSR and Turkey itself – attracted suspicion in Moscow. The cultural link created by the simultaneous Latinisation of Turkey and Central Asian Communities of the USSR may have set alarm bells ringing in Moscow and turned the policy of the Communist Party in favour of Cyrillicisation, which followed almost as soon as Latinisation was complete." (page 4)

2.5   Cyrillic based Kazakh writing (1940 -)

Several reasons led to replacement of Latin alphabet by Cyrillic one:
- Prevent integration of the USSR Turkic people with the Republic of Turkey, which followed different ideology and policy;
- Accusation of the founders of Kazakh writings based on Arabic and Latin letters as the 'public enemy' (T. Shonanuly, K. Kemengerov, K. Zhubanov, E. Omarov, O. Zhandosuly, N. Torekulov);
- Necessity of forming one state (USSR), common state writing (Russian language and writing) of peoples under one capital city (Moscow);
- Mastery of new terms only through Russian language;
- Diversity of written orthography.

   Thus, Cyrillic based Kazakh writing was officially adopted upon improving its draft proposed by S. Amonzholov in 1940 (Table 4).

Table 4. Kazakh Cyrillic Alphabet.

Kazakh Cyrillic Alphabet					
А	Ә	Б	В	Г	Ғ	Д
Е	Ё	Ж	З	И	Й	К
Қ	Л	М	Н	Ң	О	Ө
П	Р	С	Т	У	Ұ	Ү
Ф	Х	Һ	Ц	Ч	Ш	Щ
Ъ	Ы	І	Ь	Э	Ю	Я

       Cyrillic alphabet has been used for more than 70 years in Kazakhstan. To certain extent the Kazakh language has been modified during this period with the impact of Russian language. Moreover, during the Soviet period the proportion of Kazakhs was not only less than a half of the overall population, but also the significant number of Kazakhs became Russian-speaking. As a result, the linguistic factor of the Cyrillic alphabet has led to weakening of the language and national identities of Kazakhs.

3. "Trinity of languages" state programme

   The number of native Kazakhs has increased significantly with the President Nursultan Nazarbayev's initiatives to encourage the return of Kazakhstanis living abroad to their home land since the country gained its independence (Smagulova 2008). The state language policy has also been discussed several times by the government and has been reflected in several state documents and papers. This has been considered separately in the national constitution and in the "Law on languages" (Smagulova 2008). Since 2007, a new dimension has taken its course in the state language policy which emphasizes "trinity in languages" issued as a project by Ministry of Culture, which considers using Kazakh, Russian and English languages as a medium of education in schools (Gaipov 2011). In this respect, 32 trial schools have been selected to adopt trilingual educational system. Since the adoption of "Trinity of languages" state program in 2007, it has widely been discussed in various domains like mass-media, conferences and other meetings of related experts. Respectively, though the system and strategy of tri-lingual education have not been specified in trial schools accurately, its framework has been proposed:
- The purpose is to form an individual who is able to communicate in Kazakh, Russian and English languages and is able to gain knowledge through these languages;
- Science subjects at trial schools have to be taught in English;
- Initially, the experienced science subject teachers from Kazakh-Turkish High Schools had to visit and cooperate with trial schools in order to share with their experiences;

- Kazakh, Russian and English languages are taught from the 1st Grade up to the 11th Grade in Kazakhstani Secondary Schools. Furthermore, Higher Education System is also considered to provide tri-lingual education, where students are given more opportunities to integrate with international educational institutions.

"Trinity of languages" state programme has been referred and emphasized in several official decrees and programmes. Particularly, "Functioning and developing languages in 2011-2020" state programme and the President Nursultan Nazarbayev's message to the people "Kazakhstan-2050" define the aims and goals of "Trinity of languages" state programme pragmatically.

4. Factual study of Kazakh-Turkish High School experience

Kazakh-Turkish High Schools (KTHSs) established in 1992 on the agreement of presidents of Turkish Republic Turgut Ozal and the Republic of Kazakhstan Nursultan Nazarbayev and consequently co-funded by Kazakhstani State and Turkish Foundation have been providing education in four languages: Kazakh, English, Russian and Turkish under the coordination of Kazakh-Turkish Educational Foundation (KATEV – Kazak-Türk Eğitim Vakfı). Currently, to the best of my knowledge 32 Kazakh-Turkish High Schools function in different regions of Kazakhstan. 19 of KTHSs are purely boys' classes, 7 KTHSs – purely for girls, 2 KTHSs – mixed (boys and girls together), 2 Nurorda International Schools (NISs) - mixed, 1 Kazakh-Turkish College of Economics (KTCE) - mixed and 1 Kazakh-Turkish Multi-profile College (KTMC) – mixed. 29 of KTHS educational establishments provide dormitories except for KTHS for girls in Astana and 2 NISs. Generally, pupils finishing the 6th Grade can apply to KTHSs and follow the admission procedure the rules of which was set by the Ministry of Education in 2010 (Ministry of Education order No: 399). Unlike standard KTHSs the primary school pupils can apply to NISs and can study for 11 years up to Higher Education level, whereas the former provide education from 7th to 11th Grades and takes 5 years. The KTCE and KTMC have different admission procedure from the other two types given that pupils who finished the 9th Grade can enter to this type of colleges.

4.1 Teaching process at Kazakh-Turkish High Schools

Due to its limited number of positions (places) pupils are selected on the basis of entrance examination's results, which is unusual occasion in terms of general secondary system of Kazakhstan. First of all, all applicants have to take examination which is consisted of 100 multiple-choice based questions which measure applicants' logical-thinking skills and language skills and abilities. The successful applicants are invited at the beginning of summer term vacation to stay at the dormitory of KTHS and study for a week. Math, Logics, Kazakh, English and Turkish are taught during the week, participants write daily quizzes and finally are interviewed by the admission board. In addition to classes, a monitor and group-advisor are appointed for each group in order to carry out social activities for participants, which give them opportunities to know more about participants' behaviour, skills, abilities and personal characteristic peculiarities. Depending on results of daily quizzes and the interview the successful pupils are selected. Afterwards, parents of successful applicants who were admitted are invited to KTHS to introduce them with its education system. The curriculum of KTHSs is prepared by KATEV and approved by Ministry of Education in the Republic of Kazakhstan. It is noticeable that there are two major languages distinguished in teaching two groups of subjects, i.e., science subjects are taught in English whereas social subjects are taught in Kazakh. Three significant points can be mentioned in this case, which are considered to be positive features of multilingual education:

1. Pupils acquaint with the second and third languages as medium of education at the age of twelve or thirteen where pupils build multilingual skills and knowledge on already formed first language identity;
2. The significant number of subjects are taught in the first language and provide the improvement of proficiency in first language which influence the positive development in second and third language acquisition (see Cummins, 1981);
3. The classification of subjects according to the language medium of instruction at KTHSs well matches with the '*content-driven language programmes*[1]' developed by Met (1998);

As far as pupils are admitted from different schools both Russian-medium and Kazakh-medium classes in the 7th Grade the classes are devoted to English, Turkish, Kazakh, Russian, and terminology studies on the second half

---

[1] In these programmes, content is taught primarily or exclusively through the medium of the second language, and student mastery of content may share equal importance with the development of language proficiency (see Myriam Met - 1998).

of the year. The 7th Grade is likely the most important stage of education process both for pupils and their parents at KTHSs, because pupils have to stay in the dormitory and only at the weekends they go home as a rule. Moreover, 7-8 lessons are conducted a day, which seem to be a heavy load for pupils. However, if the education process taken as a whole and considered in details one may see how well the mental and physical development of pupils overlaps. Tutor and advisor appointed by the vice-principal for social affairs cooperatively provide guidance for pupils. Tutor is engaged mostly in dormitory and extra-curricular activities, and advisor deals with pupils' school achievements, meeting with parents, arranging additional lessons or office-hours in case pupils show low achievement.

As mentioned before, KATEV maintains a centralized coordination of educational process at all KTHSs. Textbooks are also selected by KATEV. Before the educational year starts either in June or August KATEV organizes training-educational seminar compulsory for all *rotation-based*[2] teachers for about 10 days. As a rule, the teachers are divided into groups due to the subjects they teach (E.g. Chemistry, Biology, English and others). The seminar programme is designed in a way that teachers exchange with their knowledge and experience, also professional teacher-trainers are invited for conducting sessions sometimes. Furthermore, all the teachers at KTHS take teachers' knowledge examination once a year which includes TKT (Teacher's knowledge test), Olympiad based questions, theory of education and the knowledge of English. During the educational process, 7th – 10th Grades pupils have to write *centralized test of knowledge (GDS)*[3] by the end of each quarter, as a result KATEV makes the list of GDS results and send it to KTHSs. By doing so, every KTHS compete with each other. The pupils who reach the absolute 1st place among all KTHSs in Republic are provided grants, and they are not charged the dormitory and meal fees. Similarly, the 11th Grade pupils have to write *Pre-Unified National Test (UHD)*[4] by the end of each quarter. The 7th-Grade pupils have to be successful in taking the *final test (baraj)*[5] in order to succeed to the 8th Grade, otherwise in case failure he / she has to retake the course in summer and test in its turn.

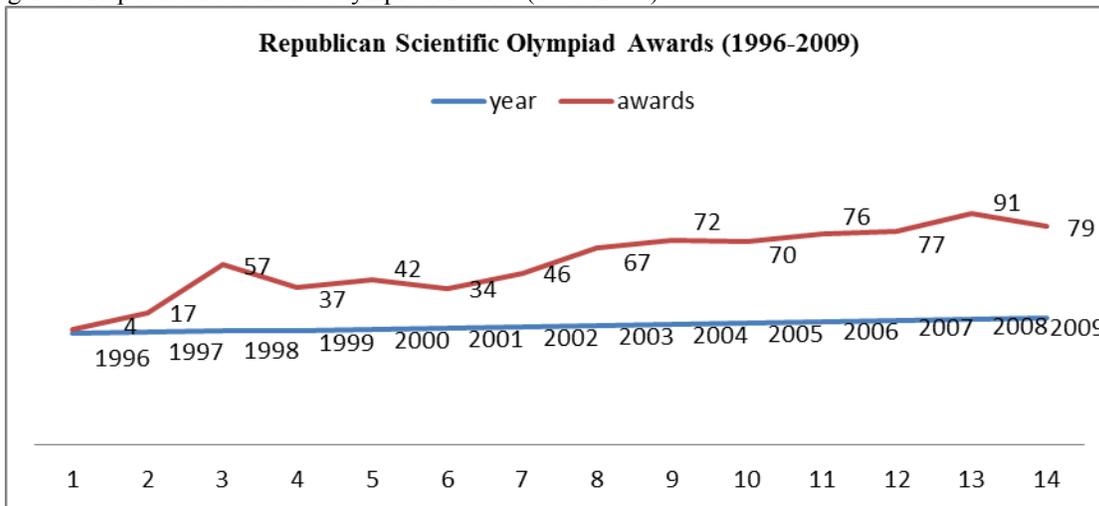
4.2 Scientific work at Kazakh-Turkish High Schools

Scientific Olympiads and projects gain high importance at KTHSs. A responsible Olympiad coordinator is appointed among teachers in every KTHS. Olympiad coordinator designs schedule for Olympiad preparation classes and self-study hours. KATEV sends *Pre-Olympiad Tests (ODS)*[6] in every two weeks and the Olympiad coordinator gives the exam to *Olympiad studying pupils*[7] . The results of Pre-Olympiad Tests are sent to KTHSs by KATEV in the form of charts listed from up to down based on results. The Olympiad studying pupils are motivated to complete both as among the peers in KTHS and among other KTHSs. Preparation programme for Olympiad is fixed in academic calendar of KTHSs and held all year round. Eventually, School subject Olympiads are organized by Regional Educational Departments throughout the secondary and high schools all over the Kazakhstan in the 3rd quarter. Pupils from KTHSs usually demonstrate high level of achievement. KATEV, in its turn uses the results of these Olympiads as one of the indicator of achievements among KTHSs.

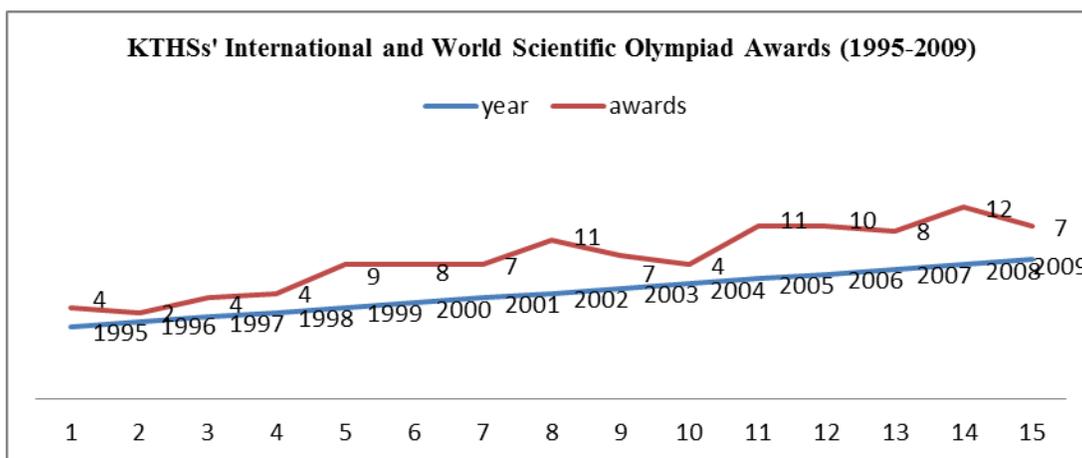
The successful winners of regional Olympiad are promoted to the next stage of the Olympiad, which is called Republican Scientific Olympiad. In most cases among the participants, KTHSs' pupils contest with each other. The chart of Republican Scientific Olympiads are given from 1996 to 2009 in the *Figure 1*.

---

[2] Rotation-based – those teachers who are employed by KATEV with terms of rotation and given position at KTHSs.
[3] GDS – (GenelDeneme Sınavı) from Turkish means 'General testing exam '.
[4] ÜHD – (ÜniversiteHazırlıkDeneme) from Turkish it means 'Preparation Test for University Entrance Examination'.
[5] Baraj – From Turkish means minimum required level of test.
[6] ODS (OlimpyatDenemeSınavı) – From Turkish means 'Pre-Olympiad Test'.
[7] Pupils selected for specific subject Olympiad due to his / her certain background, interests, skills and abilities.

Figure 1. Republican Scientific Olympiad Awards (1996-2009)


The above graphics shows the process of 14 years in which the success of KTHSs in Scientific Olympiads particularly organized by the Ministry of Education grows gradually with some ups and downs in short-term periods of timeline but it seems to maintain a stable progress in respect to long-term period. On the other hand, *Figure 2* shows the winners of World and International Scientific Olympiads from KTHSs.

Figure 2. KTHSs' International and World Scientific Olympiad Awards (1995-2009)


The given graphics above shows the achievements of KTHSs in International and World Scientific Olympiads representing the Republic of Kazakhstan in an international arena. Unlike the results of Republican Scientific Olympiads in the World and International Scientific Olympiads the process neither is more stable, which reflects nor decrease neither increase in terms of progress for the last 10 years period. This can be explained by the fact that the number of finalists promoted to participate the World and International Scientific Olympiads are both small and limited which may result in static range of insignificant changes in the process.

5. Conclusion

The goal of this paper has been to provide separate study of Kazakh alphabets used one after another at different periods of time. Social, political and linguistic factors of changing and using several alphabets have been discussed. As a result, Kazakh sound system has undergone significant modifications due to several changes of alphabets. Because, different types of letters have been insufficient to present Kazakh peculiar sounds. This paper has also focused on factual study of KTHSs, attempting to describe total educational process at KTHSs as a whole and with

some focus on its peculiar multilingual medium of instruction. Since, Kazakhstani Government has decided to develop multilingual educational system and set up multilingual schools the role of KTHSs needs consideration. However, this paper reflects more facts about peculiar features of KTHSs and it is essential to extend the scope of the research involving the pupils, parents and teachers at KTHSs in order to maintain more specific focuses on its characteristic points and aspects. Finally, the ideas discussed in this paper should serve as the initial step for further research of developing language and alphabet by improving state language policy and educational system in the context of globalization.

17. Abstract

The present study aimed at exploring the overall Malaysian and Jordanian teachers attitudes toward schooling usage and personal usage of computers, and testing The following hypotheses: (1) Teachers attitudes toward schooling usage and personal usage of computers would not be significantly related to gender, (2) Teachers attitudes toward schooling usage and personal usage of computers would not be significantly related to the culture (country), and (3) Teachers attitudes toward schooling usage and personal usage of computers would not be significantly related to the interaction between gender and culture. A total of 369 Malaysian and 342 Jordanian English teachers were participated in the present study. Computer Attitude Scale (CAS) developed by Troutman (1991) was adapted and validated for both countries. The means suggest that participants have high level perceptions about the personal usage and schooling usage of computers. Furthermore, teachers in both sexes and from different countries have high levels of perceptions toward personal usage and schooling usage of computers. For Malaysian samples, MANOVA results indicated that: males and females are similar in their attitudes toward the personal usage and schooling usage of computers. For Jordanian samples, MANOVA results indicated that: males and females are similar in their attitudes toward the personal usage and schooling usage of computers. Finally, Malaysian and Jordanian teachers were similar in their attitudes toward schooling usage and personal usage of computers. In conclusion, attitudes toward computer usage are unrelated to culture and gender.

Keywords: Attitudes, Jordanian teachers, Malaysian teachers, Personal usage, Schooling usage

Introduction

Cross-cultural comparisons are needed to give a better understanding of teacher's attitudes toward (Information and Communication Technology) ICT usage in different national cultural backgrounds. Despite the economic agenda driving the adoption of the ICT, little cross-cultural educational research has been done to explore attitudes toward ICT usage. Most research on gender differences in the Internet or ICT usage has been done in Western countries. But, if gender is a social construct one cannot presume that it will be express in the same way everywhere (Li & Kirkup, 2007, p. 302). The ICT may be a global technology but teachers work in local/national contexts, and have differences in other aspects of their identities; one of the most important of which is gender identity. Research with young adult's shows that information technology, as an activity, was found to be male stereotyped. Women are less likely to be attracted to computer courses and to a computer-related career (Li &Kirkup, 2007).

Earlier findings identify the symbiotic relationship of technology (ICTs) and society. The creation of a technology does not occur in a vacuum but instead encompasses social and cultural phenomena (Davies, 1988, p. 163). Collis (1999) argues that culture is a critical factor in influencing people's acceptance and use of Internet-based learning resources. The earlier findings suggest that, in different cultures, people might have different perceptions about ICT (Li & Kirkup, 2007; Brosnan & Lee, 1998; Makrakis, 1992; Martin, Heller, & Mahmoud, 1992; Omar, 1992). For instance, Li and Kirkup (2007) found that attitudes toward Internet usage between Chinese and British students were cultural and gender related. Brosnan and Lee (1998) indicated those students attitudes

---

[67] Corresponding author. Tel.: +603-79675170
E-mail address: chin@um.edu.my

toward computers and their usage of them were cultural related. In another study, Makrakis (1992) confirmed that attitudes toward computers are cultural related. Furthermore, Omar (1992) found that students in the United States held more positive attitudes to computers than their Kuwait counterparts. Martin et al. (1992) found that children from American and Soviet had similar positive attitudes to computers.

Gender differences in attitudes toward computers usage have been well documented. Most research on gender differences of ICT usage has been done in Western countries (Li &Kirkup, 2007). But, if gender is a social construct one cannot presume that it will be expressed in the same way everywhere. Therefore studies of gender differences in attitudes toward ICT usage in different cultural contexts need to be carried out. This paper reports research carried out with Malaysian and Jordanian teachers, which investigated their attitudes toward computers, to explore what, if any, gender and culture differences were observed between the two countries/cultures. The teachers in these two countries have been taught in different educational systems, live in different political systems, speak different languages, and have different views on the value of ICTs. But how national cultures influence teacher attitudes toward computer usage needs to be explained theoretically and investigated systematically. In this paper, we hypnotized that:

1. Teacher's attitudes toward computer usage would not be related to gender.
2. Teacher's attitudes toward computer usage would not be related to culture.
3. Teacher's attitudes toward computer usage would not be related to the interaction between gender and culture.

2. Methodology
2.1 Samples
A total of 369 Malaysian English teachers and 342 Jordanian English teachers were participated in the present study. Jordanian sample includes 113 male and 229 female; primary teachers (46%) and secondary teachers (54%); bachelor holders (67%) and master degree holders (33%). Malaysian sample includes 114 male and 247 female; primary teachers (69%) and secondary teachers (31%); bachelor holders (59%) and master degree holders (41%). Table 1 shows samples distribution by country, gender, stage level, and qualification.

Table 1. Samples distribution by country, gender, stage, and qualification

			No. 0f students	Percentage
	Gender	Male	113	33
		Female	229	67
Jordanian	Stage	Primary	157	46
		Secondary	185	54
	Qualification	Bachelor	228	67
		Master	114	33
	Gender	Male	122	33
		Female	247	67
Malaysian	Stage	Primary	256	69
		Secondary	113	31
	Qualification	Bachelor	219	59
		Master	150	41
Total			**711**	**100**

2.2 Instruments

Computer Attitude Scale (CAS) developed by Troutman (1991) was adapted to Jordanian and Malaysian environments. The scale compressed 51 statements representing attitude towards computers usage. Participants responded to the CAS using a five-point scale of strongly disagree (1), disagree (2), neutral (3), agree (4), and strongly agree (5). Furthermore, the negative items were reversed coded. Computer Attitude Scale (CAS) includes two subscales**:**

2.2.1 Attitude toward Personal Use of Computers (ATPUC) Subscale

The ATPUC subscale to measure in-service teachers' attitudes toward personal usage of computers. This subscale compressed 19 items to measure in-service teachers' feelings towards computers, teachers' beliefs about the usefulness of computers in their life, perceived comfort level or difficulty of using computers, and behavioural intentions and actions with respect to computers. As such, the possible marks range is from 19 to 95 with a mean of 57. The reliability of this subscale is 0.79 as reported by its authors and calculated by split-half method and

corrected by Spearman Brown Prophecy Formula. The inner consistency coefficient determined by the alpha correlation is 0.89.

2.2.2 Attitudes toward Schooling Use of Computers (ATSUC) Subscale

The ATSUC subscale compressed 32 items to measure teachers' attitudes toward the usefulness of computers in school environments, the feasibility of using computers in instruction and management, affective outcomes of computers in schooling, and the dependence of society on a computer-literate citizenry. The possible marks range is 32 to 160 with a mean of 96. The reliability of this subscale is 0.92 as reported by its authors and calculated by split-half method and corrected by Spearman Brown Prophecy Formula. The inner consistency coefficient determined by the alpha correlation is 087. Also**,** the inner consistency coefficient of CAS determined by the alpha correlation is .91.

Thus, the results show that the alpha coefficients for all subscales were significantly high, suggesting that the internal reliability index of the two constructs and the entire scale is adequate. In addition, the results of inter correlations showed that each subscale correlates significantly with another subscale and the entire scale. According to Harrison, Seeman, and Behm (1991), this result provides at least further evidence for the consistency of the entire scale and for the convergent validity of each subscale. All subscales correlate significantly at the $p < .05$ level and the coefficients range from 0.39 to .59. This suggests that the two constructs (i.e. schooling use and personal use) were fairly independent to be used as independent variables. This allows us to examine the computer attitudes of students by each subscale.

3. Results

Overall profile of the Jordanian teachers attitudes towards computer were measured in terms of personal and schooling use. The mean scores and standard deviations were used to explain the participant's attitudes profile. As can be seen in Table 2, the results of the descriptive statistics indicated that Jordanian teachers attitudes towards computer as indicated by the mean scores is 3.74 for personal use and 3.70 for schooling use. The means suggest that participants have high level perceptions of the personal and schooling use of computer.

Overall profile of Malaysian teachers attitudes towards computer were measured in terms of the personal and schooling use. As can be seen in Table 3, the results of the descriptive statistics indicated that Malaysian teachers attitudes towards computer as indicated by the mean scores is 3.73 for personal use and 3.68 for schooling use. The means suggest that participants have high level perceptions of the personal and schooling use of computer.

Table 2. Descriptive statistics of Jordanian teacher's attitudes towards personal and schooling usage of computer

Gender			Schooling	Personal
	Male	Mean	3.75	3.79
		S.D	13.17	11.19
	Female	Mean	3.67	3.72
		S.D	16.41	11.27
Total		Mean	3.70	3.74
		S.D	15.44	11.25

Table 3. Descriptive statistics of Malaysian teacher's attitudes towards personal and schooling usage of computer

Gender			Schooling	Personal
Gender	Male	Mean	3.75	3.77
		S.D	13.59	10.99
	Female	Mean	3.64	3.73
		S.D	14.14	11.18
Total		Mean	3.68	3.73
		S.D	14.15	11.18

A multivariate analysis was conducted to investigate the effects of gender on Jordanian teacher's attitudes towards computer usage. In order to evaluate multivariate significance, Wilks Lambda statistic was used. The results indicated no statistically significant effect of gender on the combined dependent variables (F(4, 339)= .98, Wilks lambda= .99. p= .38).

In order to investigate on which dependent variables Jordanian participants in different group of gender differed in their attitudes towards computer use, multivariate analyses of variance between groups was conducted. Table 4 shows the summary results of MANOVA analysis. As we seen in table 4 males and females are similar in

their attitudes toward schooling usage of computer $F(1, 340)= 1.93$, $p>0.05$; and personal usage of computer $F(1, 340)= 1.08$, $p>0.05$.

Table 4. Summary Results of MANOVA analysis of Jordanian teachers attitudes toward computer usage by gender

Source	Component	Type III Sum of Squares	df	Mean Square	F	Sig.
Gender	Schooling	459.00	1	459.33	1.93	.17
	Personal	136.80	1	136.80	1.08	.30

A multivariate analysis was conducted to investigate the effects of gender on Malaysian teacher's attitudes towards computer usage. In order to evaluate multivariate significance, Wilks Lambda statistic was used. The results indicated no statistically significant effect of gender on the combined dependent variables ($F(2, 366)= 2.86$, Wilks lambda= .99. $p= .06$).

In order to investigate on which dependent variables Malaysian participants in different group of gender differed in their attitudes towards computer use, multivariate analyses of variance between groups was conducted. Table 5 shows the summary results of MANOVA analysis. As we seen in Table 5 males and females are similar in their attitudes toward schooling usage of computer $F(1, 366)= .88$, $p>0.05$, personal usage of computer $F(1, 366)= .87$, $p>0.05$).

Table 5. Summary Results of MANOVA analysis of Malaysian teachers attitudes toward computer usage by gender

Source	Component	Type III Sum of Squares	df	Mean Square	F	Sig.
Gender	Schooling	110.69	1	110.69	.88	.36
	Personal	108.51	1	108.51	.87	.35

A multivariate analysis was conducted to investigate the effect of teacher's culture (country) on their attitudes toward computer usage. The results indicated that males teachers in both countries are similar on computer usage *(F (2, 708) = .05$, Wilks lambda = 1.00, $p=.95$)*; females teachers in both countries are similar on computer usage ($F (2, 708) = 1.57$, Wilks lambda = 1.00, $p=.21$). Furthermore, the results indicated that no significant effect of the interaction between country and gender on teachers attitudes towards computer usage *(F (2, 708) = .24$, Wilks lambda = 1.00, $p=.79$)*.

In order to investigate on which dependent variables Malaysian and Jordanian teachers in different group of gender differed in their attitudes towards computer usage, multivariate analyses of variance was conducted. Table 6 shows the summary results of MANOVA analysis. As we seen in Table 6, males from both countries are similar on their attitudes toward schooling usage *(F (1, 709) = .00$, $p>.05$)* and personal usage *(F (1, 709) = .08$, $p>.05$)*; females from both countries are similar on their attitudes toward schooling usage *(F (1, 709) = 2.92$, $p>.05$)* and personal usage *(F (1, 709) = 2.28$, $p>.05$)*. Teachers from both countries are similar on their attitudes toward schooling usage *(F (1, 709) = .22$, $p>.05$)* and personal usage *(F (1, 709) = .12$, $p>.05$)*. Results revealed that no significant effect for the interaction between gender and country on teachers attitudes toward schooling usage *(F (1, 709) = .20$, $p>.05$)* and personal usage *(F (1, 709) = .01$, $p>.05$)*.

Table 6. Summary Results of MANOVA Analysis to compare between Malaysian and Jordanian teachers attitudes toward computer.

Source	Component	Type III Sum of Squares	df	Mean Square	F	Sig.
Male (both countries)	Schooling	.07	1	.07	.00	.99
	Personal	9.37	1	9.37	.08	.78
Female (both countries)	Schooling	720.42	1	720.42	2.92	.09
	Personal	313.62	1	313.62	2.28	.13
Country	Schooling	48.36	1	48.36	.22	.64
	Personal	14.49	1	14.49	.12	.73
Gender*Country	Schooling	42.71	1	42.71	.20	.66
	Personal	1.45	1	1.45	.01	.92

4. Discussion

In general, teachers from both countries hold positive attitudes toward personal and schooling usage of computers. The overall positive level of computer attitudes could be attributed to the availability and accessibility to ICT given to teachers in both countries. Moreover, the Ministry of Education (MOE) in both countries has given approval to implement ICT in education. Therefore, the two governments have facilitated computer integration in schools to improve the usefulness of the teacher's education on a personal and national level. Implementing ICT in ways that may have shaped their ICT attitudes in a positive direction, and contributed towards increasing home computer ownership among them, which could have promoted greater opportunities with ICT (Teo, 2008).

Moreover, the reason for these high attitudes toward computer usage can be attributed to high usage of the computer and its various applications in instruction and being assigned homework and various tasks requiring computer usage. The moderate emotional response mean scores for participants were indicative that they were likely to be less anxious about future usage of the Internet (Abedalaziz, Jamaluddin, & Chin, 2013).

Further, results revealed that Malaysian and Jordanian teacher's attitudes toward computer usage are unrelated to gender. These findings are consistent with the earlier studies (Abedalaziz, Jamaluddin, & Chin; Teo, 2008; Cavas et. al, 2009). Moreover, North and Noyes (2002) felt that increased usage of computers for teaching and learning in schools has worked against the development of gender differences. Contrary to the findings of these studies, previous studies reporting sex related differences in attitudes toward computer (Adebowale et. al., 2010; Sainz et. al., 2010; Avraham, 2005; Graff, 2003; Brosnan & Lee, 1998**;** Shashaani, 1993).

Further, results indicate that teacher's attitudes toward computer usage are unrelated to culture and to the interaction between gender and culture. This is expected as the respondents were teachers and their search in the Internet would have been related to the fulfilment of their educational tasks.

Gender Equality in Online Learning: The Case of UP Open University

Percia V. Secreto[68]

Office of the University Registrar, University of the Philippines Open University
Los Banos, Laguna, Philippines

Abstract

In line with its mandate to provide wider access to quality higher education, the UP Open University takes full advantage of the use of web-based technologies as tools for teaching and learning. It introduced online tutorials in the delivery of content in 2001 as means of providing academic support to its students. In recent years, the UPOU utilizes the modular object oriented dynamic learning environment (MOODLE) as its learning management system thus making teaching and learning at UPOU fully online. This paper examined the gender equality among students enrolled in the UP Open University online vis-à-vis the introduction of online learning. A five-year enrolment trend (2006-2011) was analyzed and presented in graphs to compare the enrolment of male and female students. Results showed that there is a steady increase in enrolment in most UPOU programs which could be attributed to the growing popularity of online learning and distance education among Filipino students. Data further showed that female enrolment is greater than its male counterparts in the fields of education, communication, health and management sciences. Males, on the other hand, dominate in IT-related programs. This study concludes that whilst female constitutes greater share in the enrolment (63%), there is clear indication that online learning appeals to both genders. With the increasing literacy and access to web-based applications that are gender-neutral, online learning is expected to gain more recognition as an alternative mode of education in the years to come.

Keywords: online learning; gender equality; ICT

---

1. INTRODUCTION

With the introduction of internet two decades ago, ICT-related activities were predominated by males. Not only are males more interested in ICT, numerous research findings likewise illustrated that males were heavier users of computers, had positive attitudes about computers and thus performed better than females in ICT literacy (Herring 2001 cited in Reinen and Plomp 1993; Volman and Eck, 2001). During those years, various studies further revealed that there was a significant disparity in terms of access and technology literacy in favor of males. In the 1990s, females were at first diffident about using the computer and they were reluctant to learn the use of the internet. However, the expansion and commercialization of internet made it possible for this technology to be less intimidating and easier to use for females Nevertheless, creation and administration of the web continued to be the male's dominion as they were the technically-inclined individuals whereas females as low-level users of technology (Herring, 2001).

The male's predominance over the computer and the internet had greatly declined in the recent years with more and more females gaining greater interest in ICT activities. Thus, gender inequality in terms of access and technology literacy had diminished to a great extent as these new technologies become an indispensable aspect of learning, work and everyday life. Over the years, these differences have slowly and entirely ceased to exist.

Herring (2001) noted that the internet promoted greater gender equality and became instrumental for bringing women online in the mid 1990s. She added that internet suits the female because it is "clean, safe and can be used indoors". With the emergence of the web and email technologies – the web as a source of information and email as a medium of communication, have captured the interest of women because of their increasing practical significance in computer supported learning (Gunn, 2003). Communicating online, Gunn observed that women tend to be more collaborative and intimate, while men are more of the confrontational type. Because of this inherent communication style of females, they are more likely to develop interpersonal relationship online.

Studies made by Markauskaite (2006) revealed that while males have more experience with ICT, there were no significant gender differences in terms of ICT literacy and there was no apparent disparity in students' participation in online learning for both genders. Evidently, the gap between male and female students was the level of

[68] Secreto, Percia V.. Tel.: 00 63 49 536-6001 to 06; fax: 00 63 49 536-0106
E-mail address: percia.secreto@upou.edu.ph

confidence about their technical capability with males unsurprisingly more confident than their female counterparts. This could be attributed to the fact that females spent lesser time in computer activities than males did. In terms of time spent on the web and the computer, a case study conducted by Gunn (2003) reported that women did not have "priority access" to the computer at home. Further studies revealed that males spend more time in computer use and put study as one of their priorities.

More recent studies conveyed that the gap between the number of male and female online has greatly decreased with more women taking advantage the Internet as a mode of communication. Internet has been described as an electronic meeting place where individuals can meet equally regardless of gender (Monteith, 2002). As internet becomes a balanced and neutral environment, Herring (2001) projected that the number of females who goes online will continue to increase thus giving them more power not merely in terms of number but in technical facet as well that will shape the nature and uses of the internet with women not just users but as administrators as well.

To assume that the Internet has the ability to create gender equality is parallel to saying that men and women are equal offline (Herring, 2001). Monteith (2002) predicts that "gender issues in cyberspace are likely to persist as long as they also exist offline"

1.1 ONLINE LEARNING

Due to family and work commitments, students find it difficult to pursue a degree via the conventional mode of learning. Internet-based instruction is gaining recognition as an alternative mode of learning. Online learning addresses the demand to provide education to those who could no longer be accommodated in campus due to limited facilities and physical resources. There is a seemingly growing demand for online learning in the past years which was also brought about by the rising development in web-based technologies. Online learning also offers flexibility to students to study on their own pace and space as contrasted to the traditional classes.

More significantly, online learning provides equal opportunities to all students. Jolliffe, Ritter and Stevens (2001) described web-based learning as the "delivery of and access to a coordinated collection of learning materials over electronic medium". Online learning or web based learning makes use of a web-server to deliver the materials, a browser to access them and RP/IP and HTTP protocols to mediate the exchange.

Jolliffe, Ritter and Stevens (2001) also mentioned that online learning takes place in both synchronous and asynchronous environment. Communication between facilitator and learners happens at different times in asynchronous environment while synchronous communication takes place in real time such as video conferencing.

Recent studies showed a growing number of females participating in online learning. According to studies, females tend to approach learning in a more "connected ways" where collaboration is emphasized over competition. This connected learning style gives more importance to "relationships, empathy and careful listening" (Monteith, 2002). Whereas Grossman and Grossman (1994) noted that while females prefer directions and working with people, males prefer learning environment which allows them to work independently. This gives females the advantage to become more adept with online learning where collaborative learning is encouraged.

Further studies revealed that the evident gap between male and female students was the level of confidence about their technical capability with males unsurprisingly more confident than their female counterparts. Markauskaite (2006) observed that females manifested anxiety and less confidence about their ICT competencies. It is important to some extent that online learning institutions deal with this ICT –related gender inequality which is rooted basically from the difference in characteristics than the gender per se (Markauskaite, 2006). Aside from offering equal access to computer, it is essential for online learning institutions to provide both male and females students adequate and effective support mechanisms to assist both genders become successful online learners.

1.2 UP OPEN UNIVERSITY

The UP Open University is the fifth autonomous university of the University of the Philippines System. Established in 23 February 1995, it is mandated to provide wider access to quality higher education. UPOU offers baccalaureate and post-baccalaureate degree programs and non-formal courses by distance education. It contributes towards upgrading the quality of educational system of the country by developing, testing and utilizing innovative instructional materials and technology, and sharing these with other colleges and universities through cooperative programs.

As an open and distance learning institution UPOU have maximized the power of web-based technologies for teaching and learning, as significant tools for the teaching and learning process. In 2001, UPOU introduced the online tutorial in its course delivery as an alternative to face to face tutorials in the learning centers. Recently, UPOU makes use of a free source elearning software - the MOODLE (Modular Object-Oriented Dynamic Learning

Environment) as its learning management system. MyPortal is the university's virtual classroom which allows UPOU students and teachers to interact online through discussion boards and chat rooms and submit assignments online.

Although UPOU adopted the online mode of course delivery, the UPOU learning centers continue to provide administrative support to the learners. These centers, equipped with networked computers, serve the learners by providing them access to computers and web technologies.

2. METHODS

This paper examined the gender equality among students enrolled in the UP Open University online vis-à-vis the introduction of online learning. A five-year enrolment trend – First Semester AY 2006-2007 to Second Semester 2011-2012 was analyzed and presented in graphs to compare the enrolment of male and female students.

For easier reference, the UPOU programs were grouped into six academic fields: Liberal Arts, Communication, Teacher Education, Management Sciences, Information Technology and Health Sciences. The programs under each field are presented in Table 1. Enrolment in each field was also analyzed in relation to male-female ratio.

Liberal Arts	Communication	Teacher Education	Management Sciences	Information Technology	Health Sciences
Associate in Arts	Master of Development Communication	Diploma in Language and Literacy Education	Diploma in Research and Development Management	Bachelor of Arts in Multimedia Studies	Master of Arts in Nursing
	Doctor of Communication	Diploma in Mathematics	Diploma in Environment and Natural Resources Management	Diploma in Computer Science	Master of Hospital Administration
		Diploma in Social Studies Education	Master of Environment and Natural Resources Management	Master of Information Systems	Master of Public Health
		Diploma in Science Teaching	Master of Public Management		
		Master or Arts in Education			
		Master of Distance Education			
		PhD In Education			
		Professional Teaching Certification			

Table 1. UPOU Programs Under Each Field of Study

The only one program under the Liberal Arts, the Associate in Arts program is the first pre-baccalaureate degree offered by UPOU. AA prepares individuals to pursue a bachelor's degree, whether in the sciences or the arts. It was first offered in the First Semester AY 1998-1999.

There are eight teacher educations programs offered by the university. Since its founding in 1995, one of UPOU's main thrusts is to uplift the quality of education in the country by training elementary and secondary school teachers. UPOU has inked partnership with institutions and individuals to provide scholarship to those who are enrolled in these programs.

Both AA and teacher education programs are offered by the Faculty of Education.

The management and health science programs are offered by the Faculty of Management and Development Studies. The management sciences filed has four programs currently offered primarily focused on research, environment and public management disciplines while three are health sciences programs including the nursing program which is one of the programs of UPOU with high enrolment every term.

The Faculty of Information and Communication Studies, on the other hand, is responsible for the offering of communication and IT-related programs. As a cyber university, the UPOU takes in pride in offering IT related programs that cater to students who are in the undergraduate, diploma and master's levels.

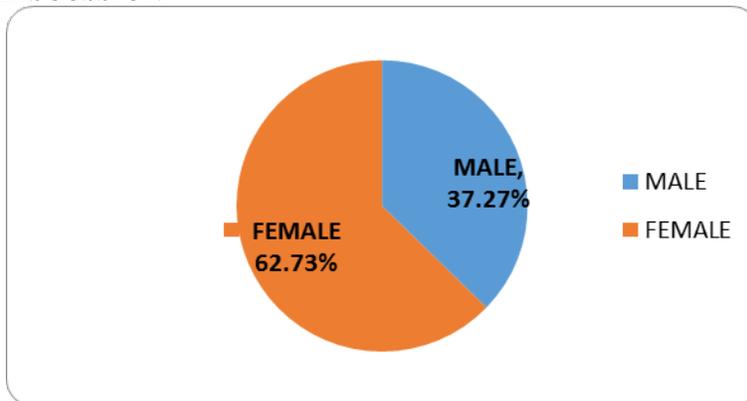
3. RESULTS AND DISCUSSION


Figure 1: Enrolment Distribution by Gender, First Semester 2006-2007 to Second Semester 2011-2012

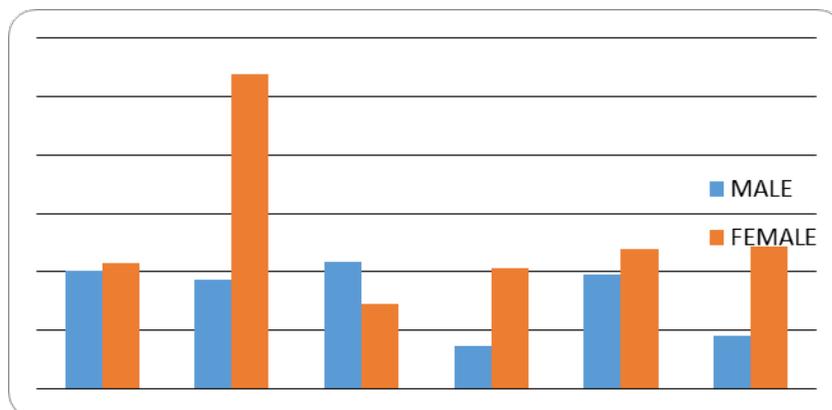
Figure 1 shows that more females (62.73%) had enrolled in various UPOU programs than males (37.27%). The results support the claims of Herring (2001) that the number of females online will continue to escalate. Another factor that could be attributed to this is the number of teacher education programs offered by the university. Currently there are eight programs under the teacher education category and majority of those enrolled in this field are females as shown in Figure 2.


Figure 2: Enrolment by Field, First Semester AY 2006-2007 to Second Semester AY 2011-2012

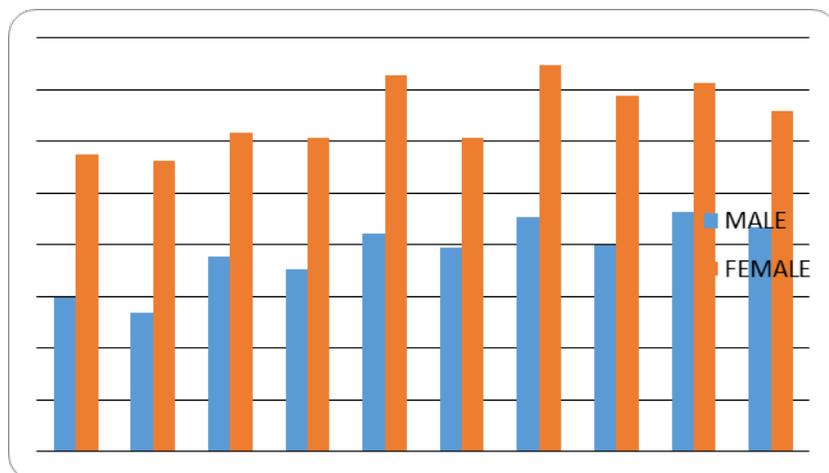
It appears that in almost all UPOU programs, females are dominant both in terms of enrolment by field (Figure 2) and enrolment per term (Figure 3). With the exemption of information technology, females dominate in almost all fields of study. Recent researches reveal that there is an increasing number of females who are becoming interested in computer and internet. The results also validate the pioneering research on internet usage in the Philippines which reveals that there are more women online than men.


Figure 3. Five-year Enrolment Trend, First Semester AY 2006-2007 to Second Semester AY 2011-2012

Figure 3 further shows that female enrolment is consistently higher than male enrolment in the period of analysis though both genders showed an increasing trend throughout the five-year period. Female enrolment registered the 1,000 mark while male only reached the 600-800 mark in enrolment. The highest female enrolment of 1,498 is recorded in the First Semester AY 2009-2010.

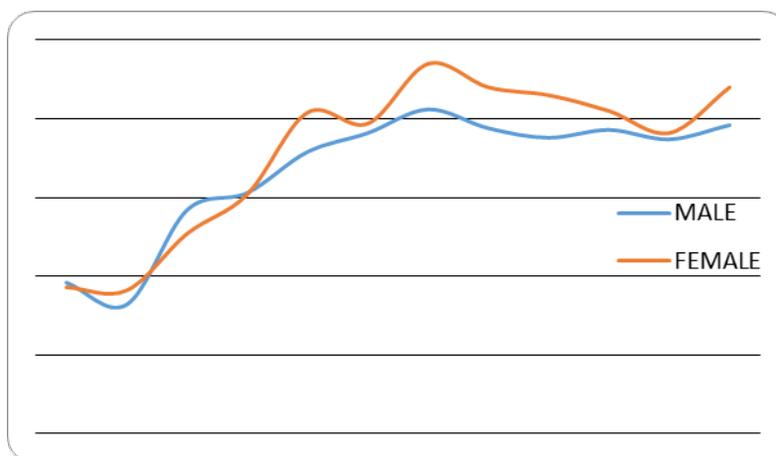
The succeeding sections of this study present the analysis of the enrolment trend by gender through enrolment comparisons of the different programs offered by UPOU.


Figure 4. Enrolment Trend in Liberal Arts (AA) Program by Gender, First Semester AY 2006-2007 to Second Semester 2011-2012

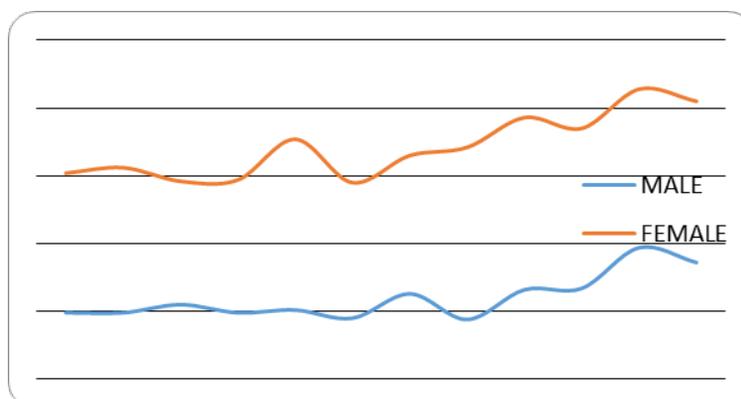
Figure 4 shows that the AA program is slightly dominated by male students during the first semester, AY 2006-2007, and 2007-2008. However, it is dominated by females during the second semesters of the said period, and had been consistently dominated by females in the last four academic years. Interestingly, the program has shown as increasing enrolment for both male and female students throughout the period of analysis. This could be attributed to the growing popularity of distance education and online learning especially to individuals who have not yet completed an undergraduate degree but are already in the work place. During these years, AA is the only undergraduate program offered by UPOU.


Figure 5. Enrolment Trend in Communication Programs by Gender, First Semester AY 2006-2007 to Second Semester 2011-2012

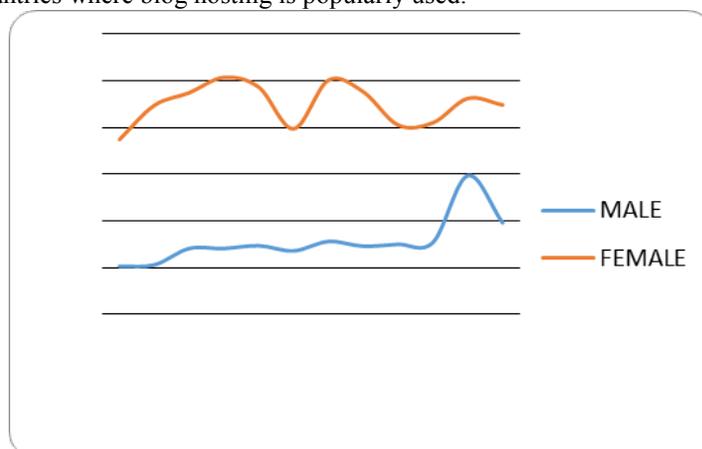
The graphs in Figure 5 reveals that there is a significant discrepancy in the enrolment of male and female in communication programs. Female are consistently dominating the student population from 2006-2011. The graphs also show a slightly increasing trend in the enrolment. The slight increase in 2011 enrolment was a result of the offering of the Doctor of Communication program, which further reinforces the enrolment in the communication field. It is interesting to note that there are recent studies conducted in the Philippines that show that females are getting more technologically-savvy by showcasing their communication skills through internet blogging. According to LiveJournal, 68% of the bloggers in the Philippine are females. The same journal notes that the Philippines ranks 7th among the top 15 countries where blog hosting is popularly used.


Figure 6. Enrolment Trend in Education Programs by Gender, First Semester AY 2006-2007 to Second Semester 2011-2012

Figure 6 shows that the teacher education programs enrolment are dominated by female students throughout the given period of analysis. The enrolment in teacher education programs in UPOU is largely influenced by the fact that majority of the teachers particularly in the basic and secondary schools are females in the Philippine educational systems. Notably, teacher education program has been one of the main priority programs of UPOU since its foundation in 1995.

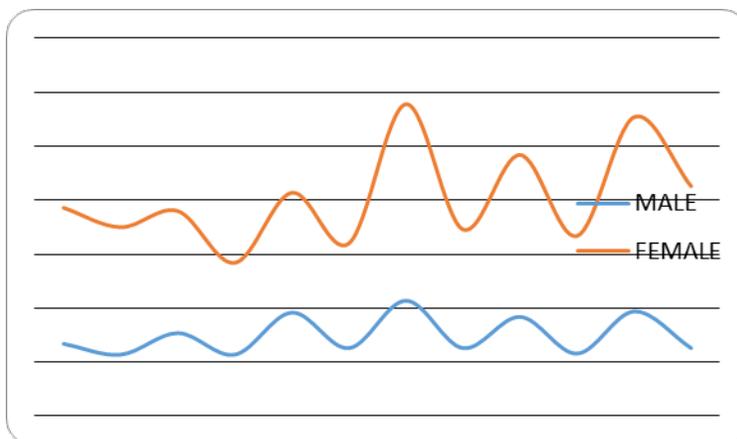
Enrolment is likewise observed to increase when scholarship funds are available to students. UPOU has partnered with institutions and individuals to provide scholarships to teachers with the purpose of improving the quality of Philippine education.


Figure 7. Enrolment Trend in Health Sciences Programs by Gender, First Semester AY 2006-2007 to Second Semester 2011-2012

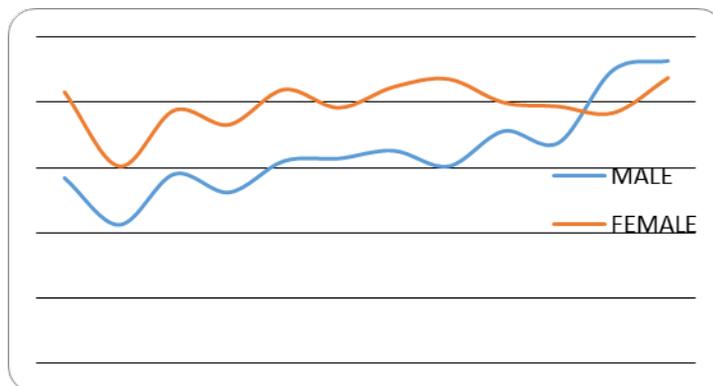
Enrolment in health sciences programs are dominated by females. Figure 7 reveals that there is a relatively high attrition rate in the health sciences programs. There is seemingly higher enrolment in the first semester and enrolment gradually drops in the second semester. Moreover, health sciences programs do not accept new students during the second semester. In terms of enrolment distribution, female group takes the bigger share in the enrolment from 2006-2011.


Figure 8. Enrolment Trend in Management Programs by Gender,First Semester AY 2006-2007 to Second Semester 2011-2012

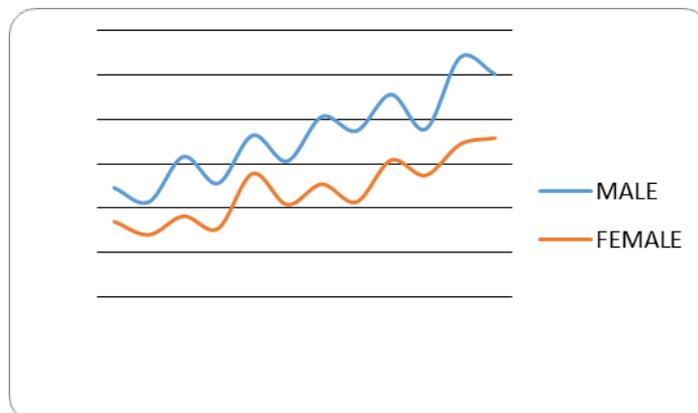
Figure 8 shows that while academic years 2006-2007 to 2009-2010 reveal a greater share of the female enrollees, there is a gradual shift in the enrolment trend in AY 2011-2012, wherein the number of male enrollees surpassed the female enrollees. The shift in the enrolment trend is expected to persist with the offering of the Diploma in Land Valuation Management program in 2012, where more males are expected to enroll.


Figure 9. Enrolment Trend in IT-related Programs by Gender, First Semester AY 2006-2007 to Second Semester 2011-2012

While enrolment in most UPOU programs is greater in the female population, enrolment trend in IT programs shows otherwise (Figure 9). This is the only field where males dominate the enrolment. It is also significant to note that enrolment in IT programs have manifested consistent increase in enrolment over time. There is a clear indication that enrolment in this field will continue to increase in the future as more and more students are becoming more interested in the field of ICT.

4. CONCLUSION

Results of this study support the recent findings that there is an increasing number of females who are becoming interested in online learning. In fact, enrolment in UPOU shows that females take a greater share in the student population in almost all programs offered by the university. This study is likewise consistent with reports from previous studies which illustrated that males remain the technologically-inclined individuals and more interested in IT programs as shown in the enrolment trend in ICT-related programs. A study conducted in UK further revealed a decline in the number of women taking IT subjects, and the IT -industry remains dominated by men (Gunn, 2003).

Overall, results showed that there is a steady increase in enrolment in most UPOU programs which could be attributed to the growing popularity of online learning and distance education among Filipino students. Data further showed that while female enrolment is greater than its male counterparts in the fields of education, communication, management and health sciences, males, on the other hand, dominate in IT-related programs. This study concludes that whilst female constitutes greater share in the enrolment (63%), there is clear indication that online learning appeals to both genders. With the increasing literacy and access to web-based applications that are gender-neutral, online learning is expected to gain more recognition as an alternative mode of education in the years to come for both male and female learners.

As a final point, methodologies involved in online learning and teaching process should address the differences in terms of learning styles, communication skills and potentials and goals of both genders to ensure that they are both given the opportunity to learn and eventually achieve their educational goals. To acquire the full benefits of what online learning has to offer, the student's IT skills and literacy should be harnessed by providing sound and effective administrative support by online learning institutions.

Abstract

Technological changes are considered as a significant factor for the development of societies. This change has led to society's going beyond in addition to pervasion of value judgments pertaining to cultural, political and especially economic aspects and formation of internationally shared and valid structures. The development of technology, world's being smaller and increasing of its population rises the mutual dependency of us with the people whom we may never see in life. In this process, which also affects the educational systems, "Global Citizenship" comes to the fore in accordance with these developments as a model dealing with the problems of not only his own nation but also those of the whole humanity.

In this study, which was carried out in literature review model, global citizen development ability of Social Sciences Instructional Programs through new communication media like social networks within the context of the relation between technology and society will be analyzed.

Keywords:Social Networks, Global Citizenship, Information Technologies,Globalisation, Social Sciences Programs

Introduction

Change is a continuous being stage that comes against us during the history of mankind whatever its quality, direction and effect may be. Change can also be defined as differentiations from a previous stage. However traditional and conservative they may be, all societies and cultures are in a continuous stage of change. Against many opinions, technology is a concept that showed itself with a rising acceleration from the very beginning of mankind rather than coming into being with the 21st century (Çalık and Çınar, 2009). Since the very beginning, mankind has tried to understand and ensure the conditions to survive, started to use their experiences to fight against nature and among themselves with the formation of groups which can be defined "social". The primitive life's getting free from this vicious circle which is in a way out of history has become with the invention of fire, wheel and the advancement of civilizations and etc., and all these actually have led us reach the contemporary technology age (Bulut, 2011: 1).

Technological change are seen as important effects in the development of mankind. The factor that puts a society in leading rows of civilization is mostly the high speed of technological change. The statement of "Technology is the pushing power of change." (Özkalp,2008: 315) shows the relationship between technology and change actually. Some philosophers state that the changes in technology are the sources of all social and cultural changes (Ergil, 2012: 264). Thanks to technological advancements, now, all kinds of information are being reached rapidly; new global economies are being formed with economical developments; all social systems are being

changed with social changes in a way to form new social reactions (Çalık ve Sezgin, 2005: 57). New technological advancements form the basic concepts of globalization which can also be defined as the spreading of cultural, political and especially economical norms and states, and moral values and formation of international common and valid forms. That's why technology is one of the main tools for globalization.

Globalization is defined as some events happening in one place effecting the events in other places by these effects the social relations gaining density worldwide (Yılmaz ve Horzum, 2005:106). Technology has made the world smaller by making faster the distances and time. Communication and transportation technologies acquire new bounds and forms of expression and form new areas hard to be controlled by the states. As seen in recent events in middle east, named the "Arabian Spring", dictatorials of almost half a century long were ended by uprises and resistances of some dissidents organized via Facebook. For example social networks played an important role in the turnover of Husnu Mubarek in Egypt. Social networks getting more widespread thanks to technology has almost become the unseen place of political activists. Globalization as an interaction that is related with events, facts and societies in the world where technology is the main factor and accelerates it. This change, interaction provided the concept of globalization to start and accelerate since it became more widespread together with technological developments. Thomas Friedman who divided the globalization process into periods says that the first period of globalization starts with the dense relationships of European people with the new world in America and eastern societies (Aggarwal, 2011: 58). The concept of globalization was first used in in a manuscript in The American Journal of Sociology in 1966 (Kaya ve Kaya, 2012: 82). It is of course important how and when the concept of globalization started but the most important thing is the role of globalization in social interaction and change and the role modal the curricula offers in as our subject matter.

Changes in the form of the society, the differentiation of population, economical transformation, forms of family and the changing of lifestyles are just some of the important changes the globalization caused. Together with these developments globalization caused, there has been a need for changes and transformations in citizenship perceptions and a reformation in locality-universality, identity-diversity and similar relations. Therefore, the citizenship transformed into locally and universally activities. In globalization process, different perspectives in citizenship literature and a rise of cosmopolite ideas have emerged. Thus new concepts and understandings of citizenship emerged and a new area formed suitable for the discussions of new alternative concepts like European Citizenship, Urban Citizenship, Global Citizenship. In this process which also effects our education system, is the concept "Global Citizenship" our preference or is it a result put in front of us? Off course it is not easy for us to give a certain answer. However, there is the fact that today people cannot escape from global events and their results. Moreover, no society in the world can get back from the crossroads they turned before. However, societies and individuals have a problem or a homework of preserving their freedom and future from the power holders of modern world. As biologists state the semipermeable cell membrane the beginning of life, if the cell membrane was full-permeable, it would change and not be able to survive independently; if it wasn't permeable it would get rotten in itself and wouldn't be able to stay as it was. States must find ways of profiting these changes for their own societies and the world while compromising the changes in correctly and on time and preventing the raceless culture changes despoil themselves. Educational organizations and curricula are forming the basics for this in long terms. In primary

school level, very important duties are on the social sciences courses, which is responsible for growing good citizens, in growing global world citizens that enrich themselves with new views without losing their identity and are in harmony with global changes in a way special to themselves and their nations. Definitely, some changes must be made in both the teacher education institutes and primary school curricula. Social networks forming a global citizenship awareness in students who don't speak the same language is open to debates. Because of this, English Language literacy must be acquired to students. This also makes some serious changes in foreign language teaching and teaching design compulsory.

The development of technology, the world getting smaller and the rising of world population rises the boundedness between us and people we would never see. Over usage of aerosol in Europe may cause the ozone layer get thinner and rise cancer events in Chile. Destruction of rain forests in Brazil may cause global warming and some of touristic islands drained with sea water. A technological development in Switzerland effects the quality of life in Turkiye. 300 vote in America effects the process of peace in Middle East. The rising need for energy in China causes a rise in energy prices worldwide and even changes the consumption habits of people (Argüden, 2006). In this correlation atmosphere an individual who earns his life with the fishing has to deal with global events as he deals with the lake he fishes and his home near it and the events in his own country.

All these effects of globalization loads some responsibility to all people. We have to fulfill these responsibilities if we want a better future, a more livable world, and a more peaceful life. Actually this interaction, which makes all living things, events and phenomena correlated, is the proof of this must. Then, if the problems in the world has become global in the context of this responsibility, at least we must grow responsible citizens who would address collectively all these problems in the global context. All these factors brought out the model of "Global Citizen". Global citizenship emerges as the addressing to the common problems of humanity like mass poverty, hunger, and war and as a response for the search of identity that the globalization caused. In this context, a world citizen or a global citizen must be the one who thinks common problems must be in responsibility of all nations and all people (Alpaslan, 2008: 142). Global citizenship includes in the widest means all people in the world encountering difficulties mainly in trading, technology, and environment and the applications about how world citizens of the future will be prepared these encounters (Gibson et al., 2008: 11).

The concept of global citizen is used for someone who has knowledge, skill and understanding in global scale in his lifestyle and understanding of life while he has no belonging to a world in legal means(Kan, 2009: 896). Global citizenship has no relation with legal means according to the citizenship model of Preston also (Lagos, 2002). A sociological global citizenship and a lifestyle may be stated as a different perception and approach of the world and humanity. According to Stokes, the concept of global citizenship defines an identity and activity of citizenship that exceeds the citizenship of national states and boundaries of it.

The role of England in putting the global citizenship education into education curricula is significantly big. With this education, issues like especially cooperation among continents and countries, curing poverty in the world, cooperation between cosmopolity and multiculturalism, and human rights are emphasized. In developing the understanding of global citizenship especially the world famous center of England: Oxfam which is a worldwide

development and education organization has been effective (Schattle, 2008:77-78). In the curricula, a wide range of lessons like global citizenship, language learning, environmental awareness, intercultural responsibility, world history and literature, and technological literacy are present.

Oxfam defines global citizen as follows. A global citizen:

- Is aware of a large world and his role as a citizen of it.
- Values diversity and respects it.
- Understands the world, technologically, environmentally, economically, politically, socially, and culturally.
- Is furious about social injustice
- Participates in communities in local to global levels.
- Is ready for all activities to make the world a more just and sustainable place.
- Takes responsibility of his actions. (Oxfam, 2006).

The most important issue about global citizenship in educational curricula is social sciences curricula. With the effect of globalization, growing both national and global citizens is an important part of social sciences education. According to Erden, social sciences is a work area in which basic knowledge, skills, attitudes, and values are given (Erden, no date: 8). Then a good and responsible citizen must be equipped with knowledge, skills and behaviors for not only his society but also in a global scale. Social sciences education curricula is the discipline to fulfill this. Equipping new generations with attitudes and values necessary for global events will be done with this curricula. It is important in developing social sciences curricula to take into consideration the factors related with global education (Taş, 2004: 31-32). Attitudes and values needed for global developments must be formed without compromising self values and othering. Because belief and culture scheme of no society does accept this.

Today people talk about the cultural aspect of globalization also. The most important aspect of cultural dimension is education. The concept of "Globalization in education" refers to common qualities in education. An individual being in a globalizing ground brings out some problems with it. First of these problems is about how suitable is the attitudes and values acquired about global issues to the societies. It is off course impossible to produce a global view in all issues. For those who think the opposite, reminding Karl Poppers famous words will be nice: "Those who think they found the universal truth, desire that others also share this truth. This is the source of all totalitarisms and despotisms." "(Özlem,1999: 123). We won't be as generalizing as Popper. Definitely there are many areas where common responses and global behaviors can be developed. But, we mustn't forget that in many issues the societies have rights or truths of their own. Because, there is a social mechanism that shapes an individual's world of ideas and spiritual side and that himself belongs to. Then our self values must be in the center of the global citizenship model. Education of social sciences in our country is in an enough level to fulfill this model.

Now, citizenship education makes necessary the understanding of citizens sensitive to global issues and problems without limiting themselves to national scale. National Council of Social Sciences of the USA also emphasizes on global citizenship while stating the qualities of effective citizens. Among these qualities; the statement: "knows the history and traditions of his own nation and the people in the world and is aware of events

and problems effecting humanity" are the indicators of this (NCSS, 2013). Social sciences curricula in our country also have the responsibility to grow people who describe, understand and try to solve the developing and changing problems of the country and the world (Durlu, 2008: 501). The item in the general aims of social sciences curricula as: "shows sensitivity to issues that is related to his country and the world while knowing that he is a part of humanity" is an obvious indicator of this (MEB, 2005). All these as shown above is a result of social, psychological, and environmental events getting purged in to each other that surround people. Then, generally the whole education, specially the social sciences curriculum must attribute to the education of this global individual (Öztürk&Dilek,2005: 86).

Results

As seen above global citizenship education is suitable to the nature of social sciences. Man theme that will ensure the understanding of global citizenship is present in the aims of social sciences courses. Social sciences curricula helps individuals to put themselves aside and understand the world objectively, knowing himself as not only the citizen of his country but also the citizen of the world, and adding the universal responsibility to national responsibility. Thanks to this responsibility individuals acts for the common profit of the whole humanity and feels responsibility for all humanity.

Conditions, products and areas can be understood only by one side when they are evaluated by themselves only. However if they are taken together and for a social aim some issues that haven't been seen before may emerge. At this point, in the context of curricula, "Global Citizenship" education must be evaluated through social networks. In order to accomplish this individuals must be able to reach virtual communication grounds in schools and classes and these grounds must give the chance to reach a lot of different cultures and understandings. For this, technological literacy education must be taken seriously. Because, with this education, individuals and groups come together in new communication grounds, get awareness of the selves and evaluate the states and conditions they are in.

Indonesia

Abstract

This article aims to explain how is the address terms (how to say hello) in Indonesian language, and how to explain its use for students in schools. The use of address term is very important subject to discuss, due to the fact that many students' errors are still found in the use of address terms in schools ranging from elementary to college.
The data used in this article are address terms in Indonesian language (there are some address terms in Indonesian language). The analysis was done by describing the address terms in a dialogue, both in the planned meeting and unplanned. The uses of address terms are described in a context (the use of address terms may depend on the status of a person: age, social status, etc.). This description is expected to be a reference when the teacher explains the address terms in Indonesian language teaching. To achieve the maximum teaching Indonesian language, one that can be taken is to teach the intensive use of address terms in Indonesian sentences by using the mthode 'role play' and the media 'audio visuel'. Educating the student with address terms in schools, not only will create students who have the ability to speak Indonesian, but also create their attitudes to behave in the social life politely.

Keywords: Language. Address term. Teaching

1. INTRODUCTION

How important language for human is not to be doubted. This can not only be proved by pointing to the use of language in everyday life, but also by pointing to the high attention of scientists and practitioners to the language. Similarly, their attention to the matters related to the shape and forms of addressing. It means that the value and function of the use of the address terms in Indonesian language are those that needs to get attention. It needs to be understood by teachers in formal education. The students' understanding of the address term and its use in preparing Indonesian sentence are very important because they have a function within the framework of Indonesian grammar and social functions.

As stated by Edward Sapir (1884), that language is not only to determine the pattern of culture, but also to determine the manner and the way of the human mind. In relation with their statement, the Indonesian language is considered a major effect on culture and decisive thinking of individuals, and a great influence on culture and determining beings of culture. Cultural

attitudes are closely related to language attitudes.The language attitudes will be reflected in cultural attitudes. Thus it can be said that the attitudes and behavior of Indonesia people, as well as the manner of address will appear in the address term being used. Based on this fact, I am interesting to discuss more about the form and the function of addressing in Indonesian language and how the students learn the address terms in Indonesian language teaching. .

2. FORM AND FUNCTION OF ADDRESS TERMS

Kridalaksana (2008), stated that address term is a word utterances used to address someone, address others as interlocutors. He say that address terms that the speakers use to designate the person they are talking to while they are talking to them. Addressing someone in a community depends on the relationship between them and it reflects the socio-cultural system which is based on indigenous communities.

In terms of function, Kramsch (1998) says that the address term is a way of referring to someone in linguistic interaction done directly. Forms of address analyzed by different speakers in different situations, as well as its maxims to explain the selection of terms made by speakers, such as the use of first name, title, the familiar (intimate). The forms of address used in a community are depending on the local cultural community, the term is known as address terms. In a society, when we are faced to a hierarchical structure, there are other forms of address that need to be understood. Each member of a group hierarchy uses certain address, such as a group at the bottom of the hierarchy prefers the term indicating familiarity, whereas the upper group prefers the use of formal terms. Someone who is at the bottom of the hierarchy will reduce the difference in status of those who are above, but people who are at the top of the hierarchy would keep enlarging the difference. This needs to be understood and explained to the Indonesian learners.

There is a specific rule in expressing address terms. Rule of addressing by Ervin Tripp (1972) is relating to the rules and principles of co-occurrences alternation. Alternation rule is about how to address relates to the selection of lexical elements that are tailored to the characteristics of the person addressed; the characteristics mark the relationship between the speaker and the nature of the underlying situation. This rule is paradigmatic. Alternation rule is used as a tool to determine the choices addressing used in verbal communication; it is also used

to control the selection of the linguistic elements of the whole speech. The use of the rule of alternation in choosing addressing by vertical kinship, is a way to see the lineage from bottom to top. Co-occurrences rules relating to the eligibility form addressing with other forms. The use of certain words adapted to the situation and status of the person addressed. This rule is syntagmatic. Alternation rule consists of a number of social conditions such as situations characterized by status, rank, and the identity of the situation i.e. a state court, a faculty meeting or congress, etc. In the institution of army, for example, the situation is characterized by rank, while the identity refers to honors such as doctors, judges, professors, and so on (Keraf, 1997).

3. TEACHING THE ADDRESS TERMS

Creative teacher would always use a variety of teaching technics that correspond to the teaching objectives. Similarly, in the Indonesian language learning which includes materials related to the address terms, one of teaching technic that can be used effectively is a role play. This technic can be used after the teacher show the subject that be taught in a video. By a role-play technic, the students are expected to develop skills and a good language attitude, be able to practice the forms of address terms in Indonesian according to the context of user. Teachers' role is to motivate, to facilitate, and to guide students in the activity of a role play in the dialogue materials which contains the address terms.

What we can do with the role play is as follows.

3.1   *Participation of The Student In Determining The Situation of The Role Play.*

On this occasion, the student can chose and determine the situation of role play, like   the role play that will be held between the teacher and student, doctor and patient, or an older person and a younger person. Thus the forms of address terms must also be adjusted. The general classification of the types of addressing include proper names, pronouns, kinship, title, rank and position (Wijana :1991, Kridalaksana: 1982) Teacher and student can chose the diction of the address terms, for example the use of 'kinship', as shown in the following discourse.

Ani   : *Jalan-jalan pagi **Pak*** ?
           (Go for a walk sir?)
Pak Ali   : *iya **(nak)***
           (Yes I do)

Forms of addressing 'pak' (father) spoken by Ani is addressed to Mr. Ali, suggesting that Ani is unrelated. This address term is undertaken by Ani because Ani meets Mr. Ali and she knows Mr. Ali. Ani uses the address term 'sir', because Ani is younger than Mr. Ali and Mr. Ali are married (and has children). Or it could be also Ali is a teacher or someone who has a position. Similarly, the use of the address term 'nak' (kids) used by Mr. Ali, Mr. Ali shows he is older than Ani, or the age of Ani is the same with Ali's child.

The other address terms that the student can use is the proper name i.e. the name of the person addressed. The form indicates that the address term addressed to the younger person or a person with an equal age with the speaker. As shown in the following speech.

Bu Nanik : *Teruru buru Nadia*
             (Are you in a hurry, Nadia?)
Nadia   : *Iya bu, terlambat….,sudah jam 7 pagi*
             (Yes Mrs. Nanik, I am late, it is 7 o'clock)
Nadia   : *Mari bu Nanik..*
             (See you Mrs. Nanik)

The other address terms is 'Nominal form' (noun or a noun equivalent) such as *tuan, nyonya, nona, encik, Yang Mulia*, that shows the distance between the addresser and addressed. It also shows the hierarchy of the addresser and addressed, it might be the addressing of the superiors to subordinates or in the contrarary from the bottom to the top. The address term is shown in the following discourse.

Pelayan : *Tuan mau minum teh atau kopi*?
             (What do you want sir?, tea or coffe)
Tuan   : *Kopi, jangan lupa gula sedikit*
             (Coffe, with a little sugar)
Pelayan : *Baik Tuan*
             (Yes sir)

In the discourse above, address term 'tuan' (master)' is used by a servant to address his master. It shows that the addresser (servant) has a lower status than the addressed. Furthermore, the master(addressed) answers without using a special address term, but

directly in terms of the core of the conversation

3.2 ***Participation of The Student In Determining The Sum of Students Involved In A Group of Role Play.***

The sum of the participant in the role play could be only two or more students. For example: for a dialogue with the topic in an hospital, between the doctor and the nurse, then engaged in role play only two students. In addition, the teacher facilitates the students to identify the address terms that are estimated to present in the conversation/role play, as shown in the following discourse.

Suster   : *Lelah dokter*?
     (Are you tired doctor?)
Dokter   : *Iya habis operasi dua pasien*
     (yeah, I've just finised operated two patiens)

A nurse (suster) addressed by using the title: doctor (dokter). It shows that address terms have addressed the profession as a doctor, in addition, the addressed answers without mentioning the title of addresser, it could also indicate that the addresser (doctor) has a higher degree than the addressed (nurse). Addressing by using this title is to show that people who accosted have a power or have a higher degree than the addresser.

The other role play that the students demonstrate is the address term using the name by people who has higher rank than the one who is addressed, as shown in the following discourse.

Pak guru   : *Nanik,* **kamu** *jangan terlambat ke sekolah besok pagi ya* ?
     (Don't be late to go to school, tomorrow morning)
Nanik   : *Baik pak (Guru)*
     (Yes sir)

The other address term that can be taught by teacher is zero characteristic, it is an address term without naming the names, titles, or other pronoun, but directly to the case or the activities

being carried out by the person who addressed. The address term is as shown in the following discourse.

> Mira   : *Mau ke mana*?
>   (Where are you going/)
> Nina   : *Ke kantor pos*
>   (Post office)

From the above discourse it appears that Mira addresses with '*Mau ke mana*? (where are you going). The address term used by Mira is anonymity. But Nina understands that the greeting is addressed to her. This could be happen, because at that time, which is in front of Mira is Nina, Mira look towards when Mira addresses Nina.

3.3   *Directing Students To Do Some Drilling To Identified Address Terms*

This step is to familiarize students with the use of forms such address terms. The teacher asks the student to make a repetition for a dialog that they see on video. The teacher separate students in several groups and make each group role the same dialog. For example, the class has 6 groups. After seeing the video, each group have to demonstrate the same dialog to see the comparison which group is the best (to motivate the students). Another way is by making the communication between the teacher and the student, as shown in the following discourse:

> Bu guru : *Sini, duduk sini aja gak usah di belakang, terlalu jauh*
>   (Sit down here, don't be in the back side, it's to far)
> Siswa   : *Baik bu*.
>   (Yes Mrs.)

The narration above explains that a teacher asks the student to sit in front. The teacher addressed the student with a starting point of speech with words 'here' (*sini*). The students understands what the teacher means due to the gesture of teacher by appointing the place to be occupied by the student. The words of deistic or pointer : ''s*ini'* here, '*situ'* there, '*Ini'* this. These addressing are often used in the speech without the subject. The sentence directly addressed to the speaker.

3.4   *The Teacher Facilitates The Students To Do Role-Play Performance In Front Of The Class.*

The teacher facilitates the student for making the class more lively and not monotonous. The teacher gives some differents dialog for every group and they play the dialog in front of the class.

3.5   *Teachers And Students Evaluate The Results Of Student Performance.*

At the end of the class, teacher and all of students discuss about what the students get after the class. It can be an input for the teacher for the next class.

4. CONCLUSION

From the form of addressing above, we can say that the address terms used in the Indonesian language is more variable. Many choices of words can be used as an addressing. In Indonesian language teaching, teachers should provide good examples and exercises to use many kinds of address term. A lot of words (dictions) can be choosen as address term.

Regarding to the importance of the meaning, value and function of the address term in Indonesian language, it is essencial to give more attention to the teaching process both by the Indonesian language teacher and the others who intend to develop the teaching of Indonesian language. One effort that can be done by teachers in propagating the correct use of address terms by the students is teaching in class by using the role play and audio visual. Language skills that can be developed with the role play is speaking, especially in interpersonal and transactional dialogues. For Indonesian teachers good luck and I hope that this article can inspire teachers in teaching the address terms in Indonesian language.

Acknowledgement

This article was written based on the observation and experience of the author in daily communication activities of Indonesian society. And the analysis of this paper is based on the study of theory drawn from multiple theories. This paper also prepared specifically for *International Educational Technology Conference 2013* in Malaysia. Therefore on this occasion my thanks are extended to the experts who have helped me to perfect this paper and also thanks to the committee for giving me the opportunity to present this paper at the seminar IETC 13-15 Mai 2013 in Malaysia.

Abstract

Use of video in Malaysia is seen as having a bright future because technology development is expanding even more now. Thirty articles related to use of video on students with autism have been investigated. Only 12 articles have been selected as appropriate for use as references for this study. This article looks at the future prospects of impact of video on learning of students with autism in Malaysia. The focus of this study is the use of video by experts, identifying behavior of students with autism in their use of video and determining the limitations of video and ways to overcome them. This study uses the Fuzzy Delphi approach to achieve consensus of experts on the focus of study. The findings show that usage of video is extremely effective on students with autism besides shaping the behavior desired. Although video has its limitations, these can be overcome in various ways as suggested by the experts and researchers.

Keywords: autism; video

1. Introduction

Autism in children is defined as children living in a world of their own. According to Leo Kanner (1943) autism refers to individuals who lack the capacity to adapt themselves to their environment in the normal way. Currently, one challenge in the Malaysian education system is to shift the paradigm toward change in approach to the latest learning using technology, ICT such Facebook, YouTube, video, Twitter and others as alternative approaches. Special needs teachers need to look for new ideas and teaching aids which are attractive and suitable such as video for teaching students with autism.

Video is a technology for capturing, recording, processing, transmitting and playback of moving pictures such as celluloid film, electronic signals or digital media. According to Banda (2009) video or video model refers to a recording of an individual who becomes a perfect behavior model for viewing and being followed by a student with autism to change the behavior of the student. The video model also is defined as change in behavior in the observer to fit the behavior displayed by the model in a video (Nikopoulos & Keenan, 2004).

Literature review and research on usage of video by special education teachers for students with autism in Malaysia still has not been done. Hence this study was carried out to identify the impact of video on learning of students with autism in Malaysia in future. Preliminary analysis carried out by the researchers through reviewing 30 articles from the Web of Science showed that all studies carried out overseas were focused on case studies on students with autism and not studies on teachers to obtain information on techniques for using video, impact of video usage and the strengths and weaknesses of using video in teaching students with autism.

Video model in general had been suggested as an effective strategy to teach various skills to students with autism (Delano, 2007). In Malaysia the use of video in learning by students with autism is still at low level. Hence it is timely for this study to be done especially to study the view and consensus of experts on the impact of video use by special needs teachers on learning of students with autism in Malaysia.

[71] * Corresponding author.
E-mail address: drnorlidah@um.edu.my

Jowett (2012) supported the use of video for helping and facilitating the learning of students with autism. Kevin Michael (2005) also proved that researchers could use video to teach various social and functional skills. The majority of past studies indicate that video models have succeeded in being used for learning in children with autism for behavioral modification, including daily life skills, social skills and communication skills (Banda, 2009; Monica, 2007). According to Stephen (2010), video model is an approach based on observational learning which is an effective learning strategy for students with autism who are incapable of improving in certain skills.

Through teaching playing skills to students with autism via video modeling, small group and observational learning, Arzu Ozen and Sema Batu (2012) found that video modeling was effective in teaching sociodramatic playing skills. Through the video modeling approach the students were found to enjoy learninge, and were aided in better understanding the content of learning. Besides that, Hine and Wolery (2009) found that it was clear that following several exposures to video, students with autism developed capability in using toys to play properly and could adapt themselves to other children.

Hence, this study details the findings of a research study using interview and questionnaire as instruments on experts drawn from lecturers, and experienced special needs teachers to study the future impact of video usage as an approach for learning in students with autism. Besides that, the experts also identified that there was a lack of usage of video by experts as a strategy for teaching students with autism.

2. Purpose of Study

This study is aimed at obtaining the views and consensus of experts on the impact of video on the learning of students with autism in Malaysia.

3. Objectives of the Study

This study is aimed at:
1. Getting the opinion of experts on the use of video in teaching and learning of students with autism.
2. Obtaining the views of experts in identifying the behavior of students with autism toward learning through video.
3. Obtaining the views of experts regarding the limitations of video use for special needs learning and ways to overcome the limitations.

4. Research questions

This study was implemented in order to answer the following research questions:
1.   To what extent is video used in teaching students with autism?
2.   What is the behavior of students with autism when learning with video is being carried out?
3.   What are the limitations of video and how do we overcome them?

5. Methodology

This study uses the Fuzzy Delphi approach that is still new in the context of education in Malaysia. It was introduced by Kaufman and Gupta (1988). Fuzzy Delphi is a combination within the Delphi technique which contains several steps that must be followed to attain consensus from experts. Its process is fast and it reduces the number of cycles in the Delphi technique. Evaluation uses the value from 0 to 1 (Binary Terms).

The Fuzzy Delphi technique was chosen for this study because the validity of the Delphi approach is in doubt if researchers fail to select real experts. This results in boredom in experts who have to undergo repeated surveys. The number of experts is too small to evaluate/measure something big (Saedah Siraj, 2008).

Another factor that prevents the Delphi technique from being used is that the study is time consuming and requires repeated cycles, gives rise to inaccurate and incomplete data and the decision reached by experts depends on individual competency and is very subjective (Bojadziev & Bojadziev, 2007).

Implementation of the study was a two-step process; first, was a process of interviews involving 6 experts from Federal Territory, Penang, Malacca and Selangor aimed at developing the themes for the study. From the themes derived, a set of questionnaires was produced. The questionnaire was then distributed to 20 experts including the 6 experts interviewed earlier to identify the themes. Literature review showed that there was no study using Fuzzy Delphi approach in this field; existing studies were more focused on case studies and experimental studies.

6.   Findings

Data obtained from the first, second and third interviews were collected and then subjected to thematic analysis. Three themes were identified, namely:

1) Use of video in teaching students with autism.

2) Behavior of students with autism during video learning.

3) Limitations of video and ways to overcome them.

Each expert had teaching experience of more than 15 years besides having deep knowledge of special needs education and agreed to take part in in interviews and answer the questionnaire in this study. Twenty experts in special needs education were selected for this study; they were lecturers in public universities, officers from the Special Education Unit, Senior Assistant for Special Education, and Special Education teachers from Kuala Lumpur, Selangor, Malacca and Penang.

The questionnaire for the study had undergone one cycle of Fuzzy Delphi approach. All the data involved were analyzed based on Triangular Fuzzy Number and Defuzzification Process. The score for each question was arranged according to a hierarchy.

Table 1: Expert Agreement Scores for What Video Means

Item	Score	Ranking
1.1	15	1
1.2	14.599	2
1.3	13.667	4
1.4	13.466	5
1.5	13.833	3

Referring to Table 1, the majority of experts agreed with item 1.1 with a score (15) showing that video is appropriate as a technology for recording an event. The experts were less in agreement with item 1.4 with a slightly lower score (13.466); the item was on video as a recording of human action. This item was to elicit the view of experts on what video means.

Table 2: Use of video in teaching and learning

Item	Score	Ranking
2.1	12.166	2
2.2	8.366	4
2.3	12.466	1
2.4	10.666	3

Referring to Table 2, the majority of experts agreed with item 2.3 with a score (12.466) showing that they use video in teaching and learning for students with autism. Item 2.2 with a score of 8.366 earned the minimum score and was on "never before used video in teaching and learning". The researchers managed to answer the first research question by referring to Table 2.

This shows that the researchers have succeeded in obtaining high consensus on the use of video in teaching and learning for students with autism. It cannot be denied that video is a very useful communication tool and teaching aid for special needs teachers in this country.

Table 3:

Item	Score	Ranking
3.1	13.1	2
3.2	13	3
3.3	12.466	4
3.4	11.033	6
3.5	11.533	5
3.6	13.266	1

The findings of the study show that item 3.6 with a score of 13.266 clearly reflects that any topic to be taught depends on the interest of the student. A small number of experts responded to item 3.4 with a score of 11.033 showing the importance of documentaries.

Table 4: Behavior of students when learning with video

Item	Score	Ranking
4.1	12.466	1
4.2	12.166	2
4.3	9.6	4
4.4	11.866	3
4.5	12.166	2

With reference to Table 4, the majority of experts agreed with item 4.1 with a score of 12.466 showing that students are more active and exhibit interest during teaching and learning. Experts did not agree with the statement that students with autism did not give response when teaching and learning with video was carried out.

The behavior of students can be shaped by using video during teaching and learning. Students can give focus during the use of video technology.

Table 5: Emotions in learning with video

Item	Score	Ranking
5.1	13.3	1
5.2	10.566	3
5.3	12.1	2
5.4	8.966	4

Students with autism showed emotions of happiness when video was used in learning in item 5.1 with a score of 13.3. There were experts who still did not identify the students' emotion for item 5.4 with a score of 8.966.

Table 6: Helpfulness of video

Item	Score	Ranking
6.1	11.933	1
6.2	11	2
6.3	8.9	4

6.4	9.4	3

Referring to Table 6, the majority of experts agree with item 6.1 with a score of 11.933 that video is very helpful in the learning of students with autism. Not many experts agree that video was less helpful for item 6.3 with a score of 8.9.

Table 7: Limitations of video

Item	Score	Ranking
7.1	12.6	1
7.2	9.3	2
7.3	8.766	3

Table 7 shows expert findings for item 7.1 with a score of 12.6 indicating that the majority agree that video has its limitations. Students with autism need direct touch, they mimic or practice echolalia and are so involved in video that they refuse to follow writing activities.

Hence, in video usage, teachers need to plan the use of video in a scheduled manner to overcome such problems.

Table 8: Suggestions for using video in learning for students with autism

Item	Score	Ranking
8.1	14.4	1
8.2	10.566	8
8.3	11.166	7
8.4	11.166	7
8.5	11.766	5
8.6	10.433	9
8.7	13.3	2
8.8	12.9	3
8.9	11.433	6
8.10	12.566	4

Experts agreed with the suggestion in item 8.1 with a score of 14.4, that selection of video is important according to the student's level. A minority of experts somewhat disagreed with item 8.6 with a score of (10.433); the item related to building and recording the actions of a good student and displaying it for students with autism to follow.

The views of experts suggest that choosing and searching for videos suitable for the capability level of students with autism is the main factor in overcoming the limitations of video usage. Apart from that, other factors to take into account in overcoming the weaknesses of video include: the Special Education authorities must cooperate with the Autism Society of Malaysia to produce teaching and learning tools, increase the number of teaching aids in video form, increase the number of documentary stories because they reflect the reality of life, share with friends in other schools if they have video series suitable for use in T&L, TV / LCD screen must be big and easily viewed by all, the volume must be appropriate, and duration of viewing must not be too long, teacher must give explanation during the video screening and get ready real objects for the students during the video screening.

7.   Implications and Recommendations

In general the study shows that video usage has an impact on teaching and learning in students with autism. For the researchers, even though the Fuzzy Delphi technique is difficult to implement it gives a lot of inspiration and raises enthusiasm. The experience undergone and narrated by the experts was enough to make the researchers aware that care and gratefulness are the keys to effective teaching and learning through video.

The findings show that use of video among experts was encouraging although there existed limitations of resources, time and place. The preparation of place or location of video usage must suit the surroundings. The Ministry of Education and Teacher Training division should run courses and training sessions and provide materials in an intensive way to special education teachers who implement teaching through video by adapting the curriculum design in future.

Tips or suggestions from experts for teachers facing students with autism include: sharing of knowledge between NGOs and departments; for example, teachers attending seminars to unearth ideas for developing videos for students with autism. The approach of interactive video for special needs education for students with autism should be created in the state educational technology division with cooperation from lecturers and special education teachers. Traditional learning theories need to be adapted with the future curriculum because the pattern of learning to be used on students will change with time. It is undeniable that each approach has its strengths and weaknesses. Hence use of video for teaching and learning must be done in a structured, appropriate and objective manner.

According to the experts' view, the behavior of students with autism can be controlled while learning through video is in progress. Use of ICT on students with autism can help them develop understanding of teaching and learning and attract their attention, especially for videos containing positive and noble values. The teaching and learning process must be present during the viewing through question and answer sessions between teacher and student regarding what they have viewed. Indirectly this will create two-way communication that benefits the student in terms of language and social interaction.

When teachers use video, writing activities and sharing must be done in between viewing because this indirectly will encourage students with autism to cooperate with teachers in the hope that the students will continue watching the video and that the students' interest will be easily attracted. The likes of students with autism need to be widened; those who like only one activity should be encouraged to like varied activities in order to expand their minds. For example, the topic in a video should not just focus only on what interests them.

Teachers need to be aware and improve or make comments on improper behavior of the students during the video screening. The use of ICT has to be expanded to students with autism. Raising the motivation and interest of students will ensure attention on learning.

Any limitation can surely be overcome in some way. Findings of this study show that limitations exist in the usage of video in learning. Experts viewed that students with autism are easily influenced by mimicry and do not focus on other activities. Repeated exercises to develop focus and non-verbal responses should be encouraged. Use of video under teacher supervision and use of mind challenging videos so that they are not easily bored and do other activities during the viewing sessions will create an interesting learning environment. High functioning students with autism are given opportunity to make documentaries with guidance from teachers and their output will be shown in class.

Besides that, active involvement of parents in learning using video needs to be encouraged. Teachers need to exchange ideas with parents regarding this approach. Teachers should also be ready to answer if the students ask about what is being shown. Teachers need to share with parents any information or needs that must be fulfilled for their children.

Teachers need to plan the self-learning of students with autism to encourage the development of new ideas. Learning via video can lessen the mistakes in learning. The capability of students with autism to explore something being viewed is very encouraging and should be exploited for better outcomes.

Implementation Review of Professional Education of Teachers (PPG) as the Implementation of Quality Management Function

Isti Hidayah[72]

Central of Teachers Professional Education, Semarang State University, Semarang- Central of Java, 50229, Indonesia

Abstract

The purpose of this study was to assess the input, process, and output implementation of PPG program in-service in Study Program of Teachers Education in Primary Schools as the evaluating action towards program implementation, as well as implementation of quality improvement management function. Best practices of execution of PPG Program in-service in PGSD Study Program that can be applied towards similar program execution and or next program is Classroom Action Research (CAR) proposal arrangement as part of workshop activity of learning tool development (Subject Specific Pedagogy) and as well as integrated part from PPL (internship at school) execution.

Keywords: PPG Program; Study of input, process, and output

1.   Introduction

Government Regulation number 74 Year 2008 about Teacher, stated that teacher must have academic qualification, competency, and educator certificate. In subsection 4 Government Regulation number 74 year 2008, it is strongly suggested that educator certificate for teacher is obtained through professional education of teacher that is carried out by college which has accredited education personnel procurement programs, both carried out by government and society, and established by government. Regarding to the issue, in accordance with regulation of Minister of National Education number 9 year 2010 that has been set about Program of Professional Education of Teachers for teachers in-service. From the execution of the program, it has been set an implementation guideline of PPG program for teachers in-service.

Semarang State University (UNNES) as one of LPTK that has been set as the program executor with 19 study programs and for 2011, UNNES has carried out the program with PGSD Study Program. To determine the quality of program implementation, it needs to be evaluated. Evaluations do not stop until the determination of program implementation result, but at the same time to identify problems or obstacles that arise in the process of program implementation. Evaluation results, the achievement of target program, the existing barriers, needs, and issues that arise in the stakeholders (students, professors, teachers, tutors, principals, and managers), according priority to be analyzed and studied further as program improvements / planning in the period / semester / next academic year. This evaluation is very essential, to improve the quality of national education through the provision of human resources (HR) that is a qualified teacher, and professional. Meanwhile, the condition of teachers is still alarming. Data from SIMPTK showed that 84% of primary school teachers in the state unqualified (Dharma, 2009:10).

Management is a series of events that point to the collaborative efforts between two or more people to achieve the goals set (Arikunto, 2008:3). According to Henry Fayol, a series of activities is a management function which includes planning, organizing, commanding, coordinating, and controlling, which further solidified these functions into the planning, organizing, leadership, and control (Robbins, 2003:4).

Quality improvement of an organization / unit which is ongoing or continuous is the application of the principles of total quality management. According to Sallis (2006), it is explained that in the operational quality management there are several factors that must be considered, namely: the existence of continuous improvement, setting standards of quality, cultural change (change of culture) to be creative and independent, that is organizational change bottom up, and approaches to the users themselves (keeping close to the customer). Implementation of total

---

quality management does improvement continuously in order to achieve satisfaction or meet the needs of users (stakeholders).

Tampubolon (2000:66) explained that there are two levels of quality management, namely: strategic quality management and technical quality management. Strategic quality management is a top-level management that produces quality services that are strategic, long-term, and wide-ranging. Technical quality management is under the level of quality management that produces services that are technical. Levels of technical quality management is spearheading the success of an organization in achieving quality, because of the services or products produced acceptable final straight, felt, and utilized by users.

2. Method of the Study

Stages to be carried out in this study were (1) to develop a research instrument as program evaluation instrument includes input, process and output, (2) data collection, (3) data analysis, including data grouping based on variables and type of respondents, data tabulation based on variable of all respondents, present data, and calculations performance. A statistical technique in this research is descriptive statistics. Descriptive statistics were used to analyze statistical data in ways that describe or depict the data that has been collected as without intending to apply to the general conclusions or generalizations (Sugiyono, 2008:147). Instrument was developed based on standards applicable to the PPG program in-service (Rustad, 2011:40-43).

In analyzing the data, the researcher would also pay attention to the principles of quality management, a review of the planning, process, and evaluation, product evaluation and process evaluation. The referred analysis was evaluating evaluation (meta-evaluation) (Brinkerhoff, 1986:204-221). The instrument used to reveal the necessary data was a questionnaire to reveal research subject perception towards the program implementation.

3. Results and Discussion

Input components in the execution of PPG program in-service for PGSD Study Program include: curriculum, program participants, lecturers, teachers, guidance teacher, and school partners. Based on perceptions from participants program of curriculum component availability in the PPG program in-service of PGSD study program was indicated by the percentage of 100 (100%), but not so with the results shown on the perception of human resources involved in the program implementation (Guidance Lecturer, Instructor, Guidance Teacher, and Headmaster / Teacher). Availability of curriculum components in the PPG program in-service of PGSD Study Program according to non participant human resources was by 50%. While the assessment of curriculum quality (compliance standards) was better but has not reached the criteria very well (4.60 out of a maximum score of 5).

Quality of PPG program in-service participants of PGSD Study Program based on human resources evaluation involved in the implementation and assessment program by the participants themselves gave no different evaluation. Participants' perception gave an average score of 4.36, whereas human resources assessment by non-participants was 4.53.

Availability or existence of associated components with the presence of the Guidance Lecturer and or instructor based on PPG in-service program standard of PGSD Study Program according to participants was 94%, while according to another human perception involved (Guidance Lecturers / Instructors, Guidance Teacher, Headmaster, and Teacher) was 40%. Meanwhile, the quality of existence Guidance Lecturers according to the participant as well as other human resources involved were not much different, namely 4.57 according to participants and 4.75 according to non human resource participants, and this included more than a good criteria.

Availability or existence of components associated with the presence of Guidance Teacher as in PPG program standards in-service PGSD Study Program by participants was 97%, while according to another human perception was involved Guidance Lecturers / Instructors, Guidance Teacher, Headmaster, and Teacher) was 78% . Meanwhile, the quality of existence Guidance Teacher according to the participant as well as other human resources involved were not much different, namely 4.44 according to participants and 4.77 according to non human resource participants, and this included more than a good criteria.

Partner school is a school where the participants of PPG Program in-service are having device implementation that has been developed in the Workshop (SSP). Partner schools are determined by LP3 (Development Institute for Professional Educators) Semarang State University. Partner school is a school that has had a MoA with LP3. Availability of components related to the existence of partner schools and the quality as perceived by the participants was 92% with more than good quality (4, 51). Meanwhile, according to other human resources was 80% with more than good quality (4, 38). The availability and quality of learning facilities that are used in the implementation of the PPG program in-service of PGSD Study Program was 97% with criteria of "good" (4.1). Meanwhile, according to Human Resource (respondents) who are involved were 80% with more than good quality (4, 38).

PPG program in-service implementation process in PGSD Study Program include: the implementation of the instructional development workshop, intership at school (PPL), evaluation and competency tests. Based on a review of the data that had been done, the evaluation of the implementation of the PPG program in-service of PGSD Study Program has done at the end of the process and program implementation activities. Evaluation process was conducted on the participants while the participants performed appropriate curriculum activities, for example, during the learning and development workshops for participants intership at school (PPL) at the partner school. While the evaluation at the end of the PPG program participants carried out in the form of the end of the workshop assessment and PPL. It can also be said that the assessment of the competence of the participants through a combination of both (process and product). Furthermore, it can be explained that the assessment of the participants in the workshop SSP include: assessment during the workshop activities, the ability of academic field of study from participants, peer teaching abilities of participants, participant competencies, RPP (learning plan) SSP workshop results, and CAR proposal. PPL assessment includes: teaching practice, non-academic activities, social and civic competence, portfolio, PPL reports, and CAR implementation reports. The evaluation of monitoring program implementation was carried out by the Monitoring and Evaluation Team conducted by the Quality Assurance Team Semarang State University. Monitoring and Evaluation activities were carried out 2 times that was the midterm and end of the program.

Results of research, especially the availability or feasibility of components or indicators on the input, process, and output the results indicate a difference between the perception or assessment by participants and other human resources (Instructor / Lecturer, Tutor, Principal / Partner School Teachers), while the assessment towards the quality of the availability or feasibility input, process and output do not differ much. The differences are predictable because of socialization or underprepared preparation. Socialization program is complete with component inputs, processes, and outputs a program that will be implemented resulting in uneven perception or understanding are not the same. Participants have the perception of the existence towards the component input-process-output almost 100% caused by the program participants are those who are undergoing the stages in the program, although initially not or do not understand or do not know.

All the components that will be implemented in the program should be prepared before the program and should be disseminated to all stakeholders. In accordance with the quality management function, then a program will be qualified when planning and organizing functions are already prepared and clear. All that will be involved obviously work to be done, and even all the tasks or plan should not be implemented, although the actual task. A plan will be used as a guide in the work or carrying out the program.

Quality assessment results both by participants and human resources involved in the implementation of the program provide results with more criteria than just "good", but have not reached the criterion of 'Good One'. Quality improvement should be carried out continuously and sustainably. Referring to the principles of quality management, it is to provide for the implementation of quality assurance for PPG Program in-service of PGSD Study Program, it is needed some attention and improvement.

Constraints in the implementation of PPG program in-service of PGSD Study Program which is prominent and need special attention without neglecting other constraint is PPL implementation in conjunction with preparation time of National Examination (UN). In accordance with the Guidelines for Professional Teacher Education (Directorate General of Higher Education, 2010:24-26) explained that, PPL system applied clinical supervision approach and reflective action in the form of cycle with sustainable principles, structured, and relevant to the RPP.

4. Conclusion

Based on the results of the study and discussion of this research, it can be concluded the following.

- Differences in perceptions of the availability or feasibility component input, process, and output due to socialization programs which are not optimal.

- The weaknesses or barriers that exist in the implementation of PPG program in-service include preparedness plans of program activities that are not optimal; implementation of PPL, which coincided with the 2nd half at the partner school cannot run smoothly, because it coincides with activities related to school activities preparatory UN (National Exam), and PPG does not have program online system to expedite the implementation of the academic program PPG

- Best practices in the administration of PPG Program in service of PGSD Study Program that can be applied to the implementation of a similar program or next program is: involvement of Guidance Lecturer and Teacher since the development of learning tools until intership at school; CAR proposal as part of the learning device development workshop (SSP), as well as an integrated part of PPL implementation gives benefit in coaching teacher competence as professional teacher; role as the team's quality assurance as monitoring and evaluation team in the implementation of the PPG program in service of PGSD Study Program provide quality assurance to the program implementation, and assessment of the competence of the participants carried out by several related components (instructor / Lecturer, Tutors, Principal / Teachers who are competent, professional and related workers), and is determined from several components (processes and products)

- Supporting factors that can be recommended for implementation in the PPG program in service of PGSD study program are: the existence of quality assurance team as a monitoring and evaluation program team; understanding or perception of the same and the right of participants and human resources involved to the component input, process, and output program.

- Model evaluation of programs that can be recommended is the evaluation towards the inputs, process, and output which is done sustainably.

Suggestions that can be recommended from the results of this study are:

- Each design activities in the program implementation should be designed and prepared carefully in the beginning before the program runs, and it should be understood exactly with the same perception

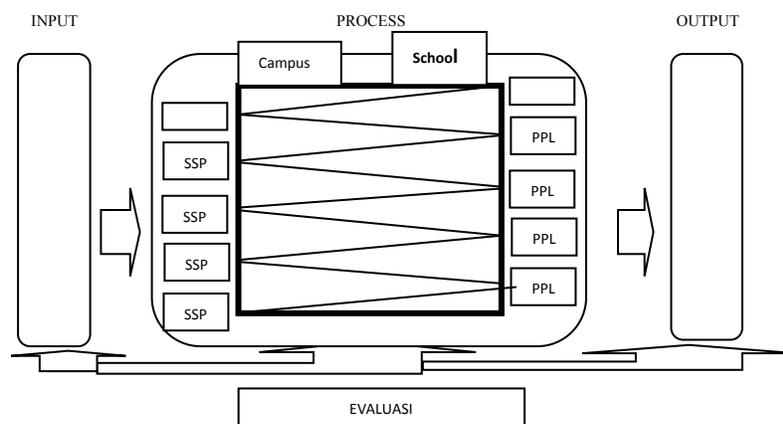
- Further studies are required to compare the effectiveness of evaluation model implementation with block and non block pattern (Figure 1).


Figure 1. Non Block Pattern

Improving the Levels of Geometric Thinking of Indonesian Secondary School Students Using Geometry Learning Video Based on van Hiele Theory

Mohd Salleh Abu[73,a], Zaid Zainal Abidin[b], Baharuddin Aris[c]

[abc]*Universiti Teknologi Malaysia. Faculty of Education. Skudai.81300. Johor Bahru Malaysia*

Abstract

Learning difficulties in geometry are commonly associated with the students' detriments to progress through sequentially the respective van Hiele's levels of geometric thinking. Various forms of ICT-based learning are commonly used to improve such vital progression. However, such approach are impractical in many parts of Indonesia largely due to the acute limitations of ICT infrastructure and lack of pre-requisites and conducive ICT-oriented learning environments. This research reports an attempt to assist post junior high school (SMP) Indonesian students in Parepare, South Celebes to ease the problems. An educational video called Video for Geometry Learning (VGL) was designed and developed based on van Hiele's model of geometric thinking. VGL consisted of three learning modules, each was designed and developed using van Hiele's model of thinking aided by specifically crafted Guzman-oriented visualisation activities. Each learning module comprised of learning activities designed to assist students to progress through sequentially the first three levels of van Hiele geometric thinking respectively, namely Level 0 (L0), Level 1 (L1) and Level 2 (L2). A quasi-experimental of pre versus post-test approach was adopted to measure the effectiveness of VGL among three groups of 90, 60 and 30 students representing L0, L1 and L2 respectively. An adapted version of van Hiele Geometry Test (vHGT) was used to measure the students' van Hiele scores on Geometry for SMP (called vHGT scores) as well as to determine the levels of geometric thinking (LGT) of each student before and after the use of VGL. Both the improvements of vHGT scores and the progression of LGT were used to evaluate the effectiveness of VGL. Analyses of means and paired-sample t-test performed on the vHGT scores derived from the whole sample as well as each sub-group strongly indicated that VGL has effectively assisted them in improving the vHGT scores. Similar analyses performed on the LGT also indicated that VGL has managed to assist the post-SMP students to progress through sequentially the respective levels of LGT.

Keywords: van Hiele Theory, Levels of Geometric Thinking, Video for Geomtery Learning

Introduction

The van Hiele theory developed by Piere Marie van Hiele and Dina van Hiele-Geldof in the 1950s had been internationally recognized and affected the teaching of geometry in schools significantly. Russia and the United States are instances of countries that changed their geometry curriculum based on the van Hiele theory. Previous researches done showed that the application of van Hiele theory in geometry lesson brought about positive implications. In a study by Casbari (2007), it was proven that the van Hiele model is effective in motivating students and in creating a better environment for teaching and learning of geometry. Van Hiele theory has been commonly used in many ICT-based geometry education applications such as geometry Sketchpad, geo explorer, Cinderella and 3D CABRI (Liang & Sedig,2010).

However, due to the limitation of infrastructure development and inappropriate curriculum, ICT-based applications are not fully accessible *in some places*. In the context of Parepare, a small city in the province of South Celebes, Indonesia, a preliminary study has been done on the usage of available technology-based educational infrastructure and teachers' ability in incorporating ICT in lessons prior to this current study. It was discovered that internet connection is only available to 9 out of 14 (60%) secondary schools. Moreover, it was also discovered that

---

[73] *Corresponding author Tel: +60-197523500
E-mail: salleh@utm.my

the ratio of computer to student was 1:50, and 10 out of 52 (23.8%) of the available math teachers have not acquired basic skills in using ICT in classroom teaching. Furthermore, 44% of the teachers stated that they have not used ICT in classroom teaching at all, and the information that geometry learning applications are available in the internet is known only by one single teacher among the 52.

Due to the limited technology-based educational infrastructure, the geometry lessons in Parepare are generally taught using the conventional method. Geometrical forms are drawn on the board or merely shown through the shapes of simple things. Consequently, the visual aspect, one of the most important aspects in geometry lesson, is lost Gusman (2008) stated that visualisation is the very basis of geometry learning. This is in line with van Hiele's theory which places the visual introduction of things as the first stage in its five-stage geometry thinking level.

Conventional geometry teaching contributed to the low potential in learning geometry among students in the junior high. This situation is evident in a preliminary study on the third-year junior high students in Parepare who, at the time, would be sitting for the National Examination soon. Among the 277 students who were sampled, it was found that the general score for basic geometry questions was 54 out of 100. Through analysis of the geometry questions, it was discovered that only 12.6% who managed to correctly answer questions on the introduction of geometry shapes.

Based on this issue, this study will produce an alternative learning tool by utilizing the available infrastructure (video+VCD) to help the third-year students to remember/understand the geometry lessons that had been learned since their first year. This tool will summarize all the topics on geometry taught in junior high in one learning module by incorporating the van Hiele-based teaching activities and utilizing multimedia in the making of the module into a learning video in order to maximize the visual process in learning.

van Hiele Theory

Developed in 1957 by Piere Marie van Hiele and Dina van Hiele-Geldof, Van Hiele Theory had been published in 1973 by Freudenthal in his book "Mathematics as an Educational Task" (Usiskin, 1982). Thereafter, a few research had been conducted that showed a connection between students' geometry ability and van Hiele's geometry thinking level. Senk (1989) discovered a positive relationship between the ability to write the geometry verification and students' geometry level. Afterwards, Mason (1998) found that geometry thinking level can distinguish the high-ability students from the low-ability students in geometry learning. With respect to the significance of van Hiele's geometry thinking level, Atebe and Schafer (2008) stated that it is the framework in evaluating students' geometry thinking. According to Van Hiele theory, there are five major steps to understand geometry topics (Usiskin, 1982) namely: Recognition (L0), Analysis (L1), Order (L2), Deduction (L3) and Rigor (L4). Each step is described as follows:

(a)   Level 0 (L0: Recognition).
This level is also known as the basic, the holistic and the visual level. At this level, students can only recognize geometrical shapes based on their visual characteristic. Apart from focusing on the geometrical shape of the objects, students are likely to see the object as a whole; hence they do not pay any effort to understand deeper characteristic of the objects

(b)   Level 1 (L1: Analysis)
At this level, students involve their analytical thinking in order to understand the concepts of the given objects. For instance, students are able to study the objects by observing, measuring, experimenting, drawing and building the objects. Nevertheless, students at this level are not capable of explaining the relationships among different geometrical objects.

(c)   Level 2 (L2: Order)
This level is also known as the level of abstract/rational, theoretical, correlational and informal deduction. At this level, students are able to correlate between different geometrical shapes, and to recognize general characteristic of particular objects and to explain it in hierarchical way.

(d)   Level 3 (L3: Deduction)
This level is known as the formal deduction level. At this stage, students are able to make the connections between one geometrical object with another. Furthermore, they have already known how to sequence geometrical objects correctly.

(e)   Level 4 (L4: Rigor)
At this level, students are able to debate by giving explanations and making comparisons on axiomatic geometry system. They are also able to understand deductive reasoning.

This study only focuses on the first three levels as suggested by previous researchers who stated that learning activities in primary school and secondary school began at L0 to L2 (Crowley,1987; Teppo, 1991; van de Walle, 2004). Van Hiele (*1959*) suggested that students' geometry thinking level depends on neither their age or their maturity but rather on the lessons received. Hence, among the aspects needed to be focused on are the method and arrangement of the lessons in the classroom. Based on van Hiele's suggestion, there are five phases of learning (Usiskin, 1982):

(a) Phase 1: Information. At this stage, a two-way teacher-student interaction is essential in understanding certain geometrical shapes such as making observations, asking questions and understanding the vocabulary for that particular geometrical shape.

(b) Phase 2: Orientation. Students explore the topic about geometry as arranged by the teacher. The activities involved should enable students to identify the geometrical shape that is to be learned. Therefore, for students to master the level, they have to be assigned simpler tasks.

(c) Phase 3: Explanation. Based on previous experiences, students are to express their opinions and discuss about the geometrical shapes that had been observed. At this stage, teachers act merely as facilitators.

(d) Phase 4: Free Orientation. Students are able to solve more complicated problems such as open-ended problems. They gain experience by finding their own solutions or by completing tasks. Much of the relationships among objects are clarified through the interaction among students when making investigations.

(e) Phase 5: Integration. Students survey and summarize what they have learned by making connections among the geometrical shapes. The teachers assist students in making a synthesis on each of the geometrical shapes. However, the form of synthesis done will not be affecting the geometrical concepts that had been learned at all.

Casbari (2007) claimed that the use of van Hiele's model in learning geometry can improve students' academic performance, motivate students, and create a much simpler environment in the teaching and learning of mathematics. In addition, Mayberry (1981) suggested that secondary school teachers have to be trained to understand the van Hiele thinking level to improve students' van Hiele geometrical thinking level. In parallel to this, a few researchers have discovered the importance of van Hiele theory in explaining schoolchildren's learning of geometry (Brown, 1999; Baynes, 1999; Chong, 2001; Tay, 2003; Noraini.et.al, 2004).

Using Video in Learning

To apply the Video Compact Disk media in learning, teachers must first choose the appropriate materials for the program or learning requirements. This is followed by preparing the CD player and television set and after adequate introduction to the learning materials, the CD is played. The number replays depends on the needs and how fast the students are able to digest the learning materials. This method has been widely used in delivering lessons that utilizes numerous pictures, text, voices or animation. There are also several other reasons this method is widely used, such as: (1) the video can be played repeatedly, (2) the video show can be fast forwarded or slowed down, (3) there is no specific requirements for space, (4) its operation is relatively easy, (5) the VCD piece can be used repeatedly.

The importance of using video in learning as presented by Baggett (1984) stated that by using video as a learning media, students are not only able to make a mental representation from the semantic understanding of a story in either audio or visual form but when presented together, each source gives an additional information and completion which helps students in remembering symbols or pictures naturally. In line with that, Cennamo (1993) emphasized that a video presentation has to be designed for the purpose of improving students' mental *ability* and involving them in active learning. Among the previous researchers who discovered the importance of using video in learning, especially in mathematics, are (Choi, 2005) and (Yeong, 2006).

Research Overview

There are over 100 different models of Instruction System Design (ISD), for instance the nine stages of teaching aid development process by Dick and Carey in 1996, the three stages of linear development by Seels and Glasgow in 1998, the eclectic model for evaluation program by Morison et al. In 2004, the 4C/ID model by Bollen in 2006, and the R2D2 model by Botturi et al. in 2007. However, most of the models are a form of the generic ADDIE model which is an acronym for Analyse, Design, Develop, Implement, and Evaluate (Allen, 2006). Hence,

the five stages in the ADDIE model is utilized in this study. The research design for this study is as summarized in Table 1.

Research Method

Selection of the study's subject began with the introduction of potential subject of study. First of all, each SMP graduate in Parepare's van Hiele geometry thinking level had been identified by measurement and categorization (in Stage 1) using van Hiele Geometry Test (vHGT). The vHGT used is the standard vHGT by staff from Cognitive Development and Achievement in Secondary School Geometry (CDASSG) (Usiskin, 1982).

Based on the vHGT results, a sub-group of students who are representatives of the three basic category in van Hiele geometry thinking level (Level 0 (L0), Level 1 (L1), and Level 2 (L2)) were selected for this study. The randomly selected subjects from each group were students who had studied geometry for three years prior to the vGHT. Selected groups will go through the teaching and learning process using VGL in the classroom. The teaching and learning session will be conducted in three meetings (90 minutes per meeting) that will be held during the students' break after taking the national examination. During the learning session, subject will be shown a video and do things (interactive) with guidance from the video. After the next learning session, they will be measured again using vHGT (post-test).

Table 1: Research Design

Stage	Elaboration of Research Procedures
Stage 1 (Preliminary study + Analysis of important information)	a. Data collection on the infrastructure of each junior high school (SMP) in the district of Parepare, especially the ones used in the process of teaching and learning mathematics. b. Analysis of KTSP Mathematics Syllabus (Silabus KTSP Matematik) for junior high school (SMP) and high school (SMA) students. c. Investigation of the more complicated topics on geometry in teaching and learning through interviews with senior math teachers and a few students. d. Data collection and analysis of the geometry thinking level for students graduating from SMP in the district of Parepare using the van Hiele geometry level test (pre-test).
Stage 2 (Designing VGL)	a. Introduction and understanding of the van Hiele geometry thinking level. b. Identification and classification of lesson topics for practice. c. Designing module in appropriate order based on the content and learning objectives. d. Summary of learning activities in the learning module based on van Hiele geometry thinking level (Module 1, module 2, and module 3) e. Designing of learning practice based on learning phase and van Hiele's geometry thinking level.
Stage 3 (Development of VGL)	a. Development of learning module according to students' thinking level (Module 1, module 2, and module 3) b. Development of learning module and activities with computer which is then video-recorded into a CD or DVD. c. The video record is known as Video for Geometry Learning (VGL)
Stage 4 (Execution of VGL)	a. Classification of students according to their geometry thinking level. b. Random selection of 90 students from Level 0 group, 60 students from Level 1 group, and 30 students from Level 2 group. c. Execution of VGL in classrooms of 30 students each with level-appropriate module. Each module will be applied in three meetings (90 minutes per meeting).
Stage 5 (Evaluation of VGL)	a. Execution of van Hiele geometry test (post-test) on all students in each group. b. Analysis of pre-test and post-test results for evaluation on the extent to which VGL is able to help students in improving their van Hiele geometry thinking level.

Based on the vHGT results, a sub-group of students who are representatives of the three basic category in van Hiele geometry thinking level (Level 0 (L0), Level 1 (L1), and Level 2 (L2)) were selected for this study. The randomly selected subjects from each group were students who had studied geometry for three years prior to the vGHT. Selected groups will go through the teaching and learning process using VGL in the classroom. The teaching and learning session will be conducted in three meetings (90 minutes per meeting) that will be held during the students' break after taking the national examination. During the learning session, subject will be shown a video and do things (interactive) with guidance from the video. After the next learning session, they will be measured again using vHGT (post-test).

The answers to the questions in the vHGT pre- and post-test will be evaluated using two methods. The first method is called vHGT score to measure the difference in the average scores of pre and post test, the second method is called LGT Score to measure the progress of LGT students after learning with VGL in the classroom. Score vHGT assessed by giving a value of 0 for respondents who answered incorrectly and a value of 1 for respondents

who answered correctly, while LGT score assessed using methode have developed by Usiskin, known as the "3 correct of 5" method. This means that if a respondent answers at least 3 out of 5 items correctly in any of the vHGT subtests, the student is considered to have mastered the level. The total weighted marks by Usiskin (1982) are as follows:

1 mark for group criteria on items 1-5 (Level 1)

2 marks for group criteria on items 6-10 (Level 2)

4 marks for group criteria on items 11-15 (Level 3)

8 marks for group criteria on items 16-20 (Level 4)

16 marks for group criteria on items 21-25 (Level 5)

The scores obtained by the students are calculated based on the marks that had been determined by Usiskin in the 32 possible answers in determining the students' geometry thinking level table. The effectiveness of VGL is further investigated by dividing the students' improvement in geometry thinking level into four categories as shown in Table 2.

Table 2: Categories of Improvement in Geometry Thinking Level

Category	Explanation
Improvement between levels	Improvement of van Hiele geometry thinking level occurs in sequence (for example, from L0 to L1 or from L1 to L2)
The Skipping Phenomenon	Improvement of van Hiele geometry thinking level does not occur in sequence (for example, from L0 to L2 or from L1 to L3)
Improvement within a Level	There is no improvement of van Hiele geometry thinking level but an increase in the geometry thinking level score is obtained
No improvement	There neither improvement in van Hiele geometry thinking level nor in the geometry thinking level score

Data Analysis and Results

Data analysis of the geometry thinking level (PBG) score from the pre- and post- test obtained is as shown in Table 3

Table 3: Descriptive Statistic of Students' vHGT Score

	Mean	Deviation Standard	r	t	Sig (2-tailed)
Pair 1 Pre-test	7.32	2.341	.975	-9.030	.000
Post-test	9.37	2.954			

The results in Table 3 shown that the average and standard deviation of the post test increased when compared with the pre-test. Another matter that is obtained from the above table is the significant stages of $\alpha = 0.05$ level, then Ho is rejected because a significant stage in the schedule $(0.000) > 0.05$. Meaning mean pre-test and post test differed significantly.

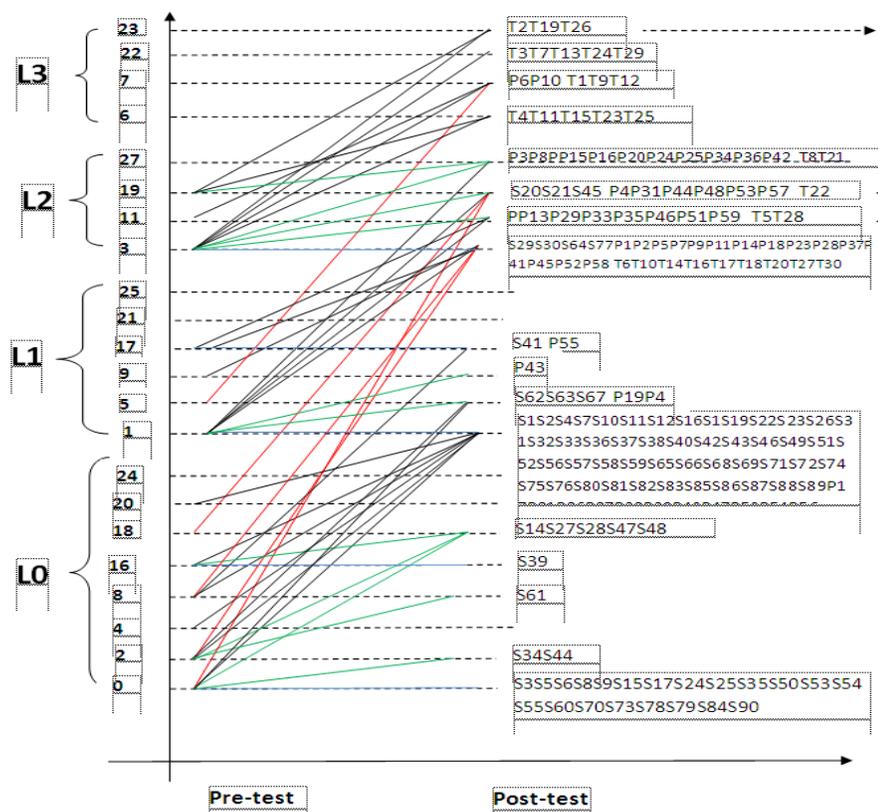
The development of van Hiele geometry thinking level is further investigated by plotting a graph to observe the improvement of van Hiele geometry thinking level in each student from every level.


Figure 1: Development of Students' LGT Before and After Total Utility of VGL

Table 4: Number and Percentage of LGT Increase After Implementation of VGL in Learning According to the Categories

Cohort of Students According to LGT (Before Implementation of VGL)	Increase in LGT (After Implementation of VGL)							
	Between Levels		Within Level		The Skipping Phenomenon		No Improvement	
	N	%	N	%	N	%	N	%
L0 (N = 90)	53	58.9	8	8.9	7	7.8	22	22.4
L1 (N= 60)	41	68.3	4	6.7	2	3.3	13	21.7
L2 (N = 30)	16	53.3	5	16.7	0	0	9	30
Overall (N= 180)	110	61.1	17	9.4	9	5	44	24.4

Table 4 shows that 75% out of 180 student respondents who had utilized VGL in learning showed LGT improvement, either between levels, within a level, or underwent the skipping phenomenon. Nevertheless, there are 24.4% students still who did not show any kinds of LGT improvement after learning.

From both of the results and graft above shown, it is clear that majority of the students showed improvement in their geometry thinking level following lessons in the classroom where VGL is implemented. It means that this tool is helpful in assist to improve the van Hiele geometry thinking level among the SMP graduates.

Discussion and Conclusion

The study shows the effectiveness of VGL in improving the van Hiele geometry thinking level of SMP ninth grade students in Parepare. The results of the data analysis shows that out of 90 students in the L0 group sample, 60 of them showed improvement. In L1 group which consisted of 60 students, there were 43 who showed improvement, whereas in L2 group which consisted of 30 students, 15 of them showed improvement. The types of improvement shown were improvement between levels and the skipping phenomenon.

A part from that, the data analysis also shows that there are still a number of students who did not show any improvement in the thinking level after utilizing the VGL. Some of the explanations for this occurrence are listed below:

    a. Some students still find it difficult to analyze the connection between the geometrical shapes

    b. There are students who have not understood the concept transition from two-dimensional geometry to three-dimensional geometry.

    c. There are students who are not able to interpret the figures in geometry lesson.

    d. There are students who still face difficulties in making their own definition of the geometrical shapes.

Based on the findings, there are a few suggestions and recommendations for future research, i.e.

    a. VGL is recommended for districts with similar situation and environment as Parepare in the hope of improving the LGT of SMP ninth grade students.

    b. Further development of VGL, especially the module 2 so that upon completion of the module, students are able to read charts and analyze the properties of the geometrical shapes.

    c. Further development of VGL, especially the module 3 so that upon completion of the module, students are used to the concept application and classification of the basic geometrical shapes.

Improving Turkish language training materials: Grapheme-to-phoneme conversion for adding phonemic transcription into dictionary entries and course books

Özgün KOŞANER[74a], Çağdas Can BİRANT[b], Özlem AKTAŞ[b]

aDokuz Eylul University, Faculty of Letters, Department of Linguistics, Izmir 35260, Turkey
aDokuz Eylul University, Engineering Faculty, Computer Engineering Department, Izmir 35260, Turkey

Abstract

Course materials for teaching Turkish as a second language lack information about the pronunciation of Turkish. These materials have chapters about the alphabet and the pronunciations of the letters, but they lack notation as phonemic transcription. Also Turkish dictionaries lack phonemic transcription information with the false belief that Turkish alphabet is a phonemic one. However there is not a one-to-one correspondence between the letters in the alphabet and the phonemes of Turkish. In this respect, this study aims at developing a grapheme-to-phoneme/allophone conversion tool for Turkish. The output of the software can be used in course materials for teaching Turkish as a second language, and Turkish dictionaries for learners.

Keywords: dictionary; course materials; phonemic transcription; grapheme-to-phoneme conversion

Introduction

Turkish language has become very popular due to Turkey's great potential as a global actor and as a gate to newly emerging markets in the Central Asia. The US government has included Turkish in the mission-critical languages list of the CIA (CIA Values Language Capabilities Among Employees, 2009) and the US universities (Boston University, Texas A&M University, University of Pittsburgh, etc.) have started new programs on Turkish history, culture and history or improved their existing ones. These recent developments caused Turkish to be a promising language for the future and many students from all over the world started to learn Turkish both in their own countries and in the government and private institutions in Turkey. To meet the need for learning Turkish as a foreign language, many universities in Turkey have started graduate programs on Teaching Turkish as a Foreign Language (Dokuz Eylul University, Istanbul University, Hacettepe University, Yildiz Teknik University, etc.). However, the learning materials, especially Turkish dictionaries lack one of the most important information about a language, the pronunciation. Turkish course materials have chapters about the alphabet and the pronunciations of the letters but they lack notation as phonemic transcription. Also the Turkish dictionaries lack phonemic transcription information with the false belief that Turkish alphabet is a phonemic one. However there is not a one-to-one correspondence between the letters in the alphabet and the phonemes of Turkish. In this respect, this study aims at developing a grapheme-to-phoneme/allophone conversion tool for Turkish to resolve the problem mentioned above. The output of this software will be directly accessible by the user and will be intelligible for any language teacher familiar with the phonetic symbols used in IPA (International Phonetic Association) alphabet.

The study is organized as follows: first some basic definitions of the concepts frequently used in the study and the linguistic data which is used as the basis of the study are given. Later a brief review of the literature on grapheme-to-phoneme/allophone conversion is presented. Following the literature review the algorithm of the software developed in this study is discussed in detail. At the last section the output and overall performance of the software is presented with examples.

Basic Definitions and Turkish Linguistic Data

In order to explain the grapheme-to-phoneme/allophone conversion process some basic concepts to be used in the study are presented to explain what we intend in using these concepts.

Graphemes and Turkish writing system

A grapheme is the minimal contrastive unit in the writing system of a language, which may be realized in several forms and usually enclosed in angle brackets (Crystal, 2003). For instance the grapheme < a > may be realized as *A,* a, or *a.* Turkish alphabet have 29 letters; however Turkish writing system comprises of 32 graphemes, 29 letter forms represented in the Turkish alphabet and the graphemes < â >, < î > and < û >, formed by adding the circumflex (^) diacritic on graphemes <a>, <i> and <u> (TDK Yazim Kilavuzu, 2013).

Phoneme

A phoneme is the smallest distinct sound unit in a language (Matthews 1997) capable of distinguishing meaning. For instance phonemes /s/ and /ʃ/ distinguish the words sap and şap. Various sources (Ergenç, 2002; Özsoy, 2004; Göksel & Kerslake, 2005) present different classifications and therefore different numbers of phonemes for Turkish. In this study we manage a unified approach and combine the data from all of these resources. In our classification there are 32 phonemes in Turkish sound system. The equity between the number of graphemes and phonemes should not misguide us to the conclusion that Turkish has one-to-one correspondence between graphemes and phonemes, since some graphemes may represent more than one phoneme. The list of Turkish phonemes is presented in the table below, with the corresponding graphemes and examples.

19. Table 1. Phonemes in Turkish

Graphemes		Phonemes
Uppercase	Lowercase	
A	a	α / a
B	b	b
C	c	ʤ
Ç	ç	ʧ
D	d	d
E	e	e
F	f	f
G	g	g / ɟ
Ğ	ğ	*
H	h	h
I	ı	ɯ
İ	i	i
J	j	ʒ
K	k	k / c
L	l	ɫ / l
M	m	m
N	n	n
O	o	o
Ö	ö	ø
P	p	p
R	r	r
S	s	s
Ş	ş	ʃ
T	t	t
U	u	u
Ü	ü	y
V	v	v
Y	y	j
Z	z	z
Â	â	*
Î	î	*
Û	û	*

* These graphemes do not have phonemic correspondences; however they may cause phonological events such as lengthening the vowel.

As it can be seen in Table 1, Turkish phonemes and graphemes do not always present one-to-one correspondence. Some graphemes represent more than one phoneme, and some graphemes do not have phonemic correspondence, they may have allophonic correspondence which will be discussed in following sections.

Allophone

An allophone is an audibly distinct variant of a phoneme (Matthews, 1997). Allophones are related sounds which are derived from the same phoneme. For instance Turkish phoneme /n/ has three variants, in other words three allophones [n], [ŋ] and [ɲ]. These variants are used with regard to the phonetic environments they occur as below:

<sen>   [sɛ̃n]
<tank>   [tʰɑ̃ŋk]
<cenk>   [ʤɛ̃ɲc]

This allophonic variation is represented as allophonic rule, which covers all allophones of a phoneme and their conditions for occurrence. The allophonic rule for the allophone of /n/ is as follows:

/n/   →   [n]   /   +_____, _____+
              [ŋ]   /   V[back] _____ C[velar, plosive]
              [ɲ]   /   V[front] _____ C[palatal, plosive]

The rule above states that phoneme /n/ transforms into (→) allophones ([n], [ŋ] and [ɲ]) in the phonetic environment (/) stated. Accordingly;

allophone [n] occurs at the syllable boundaries (+), namely at the beginning of a syllable and at the end of a syllable, as in *nasıl* and *sen*
allophone [ŋ] occurs after a back vowel (V) and before a velar plosive consonant (C), as in *tank*,
allophone [ɲ] occurs a front vowel and before a palatal plosive consonant, as in *cenk*.

As it can be seen from one example, Turkish phonology has many nuances for most of the phonemes. The phonemes and their allophones are presented with their examples in Table 2 below. Due to space limitations the allophonic rules, explained with an example above, are not presented in detail.

Table 2. Allophonic Variation in Turkish

Graphemes		Phonemes	Allophones
Uppercase	Lowercase		
A	a	ɑ	ɑ a ɑ̃ ã
B	b	b	b
C	c	ʤ	ʤ

Û	û	*	*

<ğ> Grapheme issue in Turkish

The grapheme <ğ>, read as "*yumuşak ge*" (soft g), lacks a corresponding consonantal sound in standard Turkish, although it is pronounced as a voiced velar fricative in some dialects (Göksel & Kerslake, 2005: 7). Ergenç (2002) and Göksel & Kerslake (2005) describe the effects of <ğ> in detail. These effects can be summarized as below:

It lengthens the preceding back vowel in when it is in syllable-final or word-final position. The lengthening effect is represented with the symbol ː in the IPA phonetic alphabet: *yağmur* [jɑːmuɾ], *dağ* [dɑː];
It may be pronounced as a palatal glide when the preceding vowel is a front one: *eğlen* [ejlẽn];
It is inaudible between identical back vowels, lengthening the first vowel: *uğur* [uːɽ]; *siğil* [siːl];
If it is between two vowels and these vowels have different distinctive features, in other words they are not identical, it causes a vowel shift. The vowel shift is represented with the symbol · in the IPA phonetic alphabet: *ağıt* [ɑ·ɯt], *öğe* [ø·ĕ].

Syllable and syllable structure in Turkish

Syllable is the basic unit of speech or pronunciation (Bussmann, 1998: 1155). Studies on G2P and also phonology show that in most cases information about the position of a syllable boundary is necessary to define the proper domains for phonological and phonetic rules (van den Bosch & Daelemans, 1993; Demberg, Schmid & Möhler, 2007). As it mentioned in the literature, in Turkish syllable is mostly the domain for phonological rules and allophonic variation. For instance a vowel preceding a nasal consonant in the same syllable becomes nasalized. However a vowel preceding a nasal consonant does not change into a nasal vowel.

gün [gỹn]
günü [gy.ny̆]

As it can be seen in the examples above, the vowel /y/ (ü), becomes nasalized when it precedes the consonant in the same syllable; but it same vowel preceding the same consonant, but this time in another syllable (syllable boundary is presented with full stop), does not change into its nasal counterpart. In order to define the phonemes and the allophonic variation more accurately the syllable structure should be taken into consideration. Özsoy (2004) gives a detailed account of syllable in Turkish; and this study used the rules presented in Özsoy. The structure of the syllable in Turkish can be summarized as below (Özsoy, 2004: 97-98, 101):
Turkish has six different syllable patterns:

```
V          o
CV              bu
VC              aç
CVC             tok
VCC             alt
CVCC    sarp
```

Consonant clusters comprise of two consonants and are limited to two consonants only: *Türk, *plan,*

Turkish syllables are mostly open syllables. When a word ending in a consonant is added a suffix beginning with a vowel re-syllabification process occurs and the consonant at the end of the first syllable shifts into the next syllable and becomes onset. *aç – ım → a + çım*

Turkish has some borrowing syllable structures for loanwords.

```
VCC                 aks
CCV                 pro
CCVC        spor
CCCVC       Strazburg
```

Literature Review

In order to convert the graphemes into phonemic symbols a computer process called the Grapheme-to-Phoneme conversion is used. Grapheme-to-Phoneme (G2P) conversion is a basic module of any text-to-speech system, which converts a written text to synthesized speech signal. G2P is the task of converting a string of graphemes (letters used in writing) to a string of phonetic symbols (letters used to represent speech sounds) (Demberg, Schmid & Möhler, 2007: 96). G2P has application in many areas such as speech recognition, automatic dialogue systems, and in transliteration systems (systems which provide conversion from one alphabet system to another; e.g., from Cyrillic to Roman).

In the literature there are numerous G2P studies for various languages, in which G2P systems are both used as modules in text-to-speech systems and as independent software (Daelemans & van den Bosch, 1993; Kienappel & Kneser, 2001; Demberg, Schmid & Möhler, 2007; Bisani and Ney, 2008). The G2P systems developed in these studies are also used in the transliteration of languages with different orthography.

G2P systems are also present in the national literature (Salor, 1999; Bozkurt, 2000; Sak, 2000; Şayli, 2002; Salor, 2005; Sak, Güngör & Safkan, 2006; Görmez & Görmez, 2008; Yılmaz, 2009; Akbulut, Adıguzel & Yılmaz 2011). However all of these systems are parts of text-to-speech or speech-to-text systems and their outputs are available for the computer systems only and cannot be accessed and used by the user.

There is one valuable resource on Turkish pronunciation "Konuşma Dili ve Türkçenin Söyleyiş Sözlüğü", a pronunciation dictionary by Ergenç (2002). However, this publication is available only in printed medium and it requires great effort to digitize this publication through OCR methods. Therefore it cannot be used easily in course materials and in Turkish dictionaries.

Method

When the literature on Grapheme-to-Phoneme conversion is reviewed it can be seen that this task can be performed using either rule (knowledge) based approach or a data-driven approach (Kienappel & Kneser. 2001):

Rule based approach;
requires great effort and expertise, and explicitly coded, language-specific, linguistic knowledge sources,
cannot be applied to new tasks and languages easily,

has inherent problems with maintenance, it is difficult to change some of the rules without introducing unwanted side effects.
demonstrates impressive performance for some tasks,

On the other hand, data-driven approach;

requires spelling of words with their associated pronunciation in a phonemic or phonetic alphabet
is highly flexible
is automatically produced for a language according to the rules implicit in the training data, without explicit modelling of linguistic knowledge

In rule based approach to the design of grapheme-to-phoneme modules, explicitly coded, language-specific, linguistic knowledge sources are necessary for performing the task. However, great effort and expertise are required to set up such a module and to adapt this module to a new language or task (Kienappel & Kneser, 2001). In data-driven approach which uses supervised learning techniques, based on a corpus of transcribed words, the same even better performance can be achieved, without explicit modelling of linguistic knowledge (van den Bosch & Daelemans, 1993). But modules, developed using this approach, are applied to corpora, thus require annotated data (a database of word-pronunciation pairs) to be at hand already. (Daelemans & van den Bosch, 1993).

In this study we implement the rule-based approach to G2P since there is not any transcribed or machine readable corpus of words in Turkish to enable us to implement a data-driven approach. Only resource for this purpose is the "Konuşma Dili ve Türkçenin Söyleyiş Sözlüğü", a pronunciation dictionary by Ergenç (2002). However, this publication is available only in printed medium and it requires great effort to digitise this publication through OCR methods. Instead, we intend to start from scratch, building a customisable architecture that will store the inventory of graphemes from Turkish alphabet, phonemes and phonological rules from phonology in a database.

Rule-based G2P software for Turkish

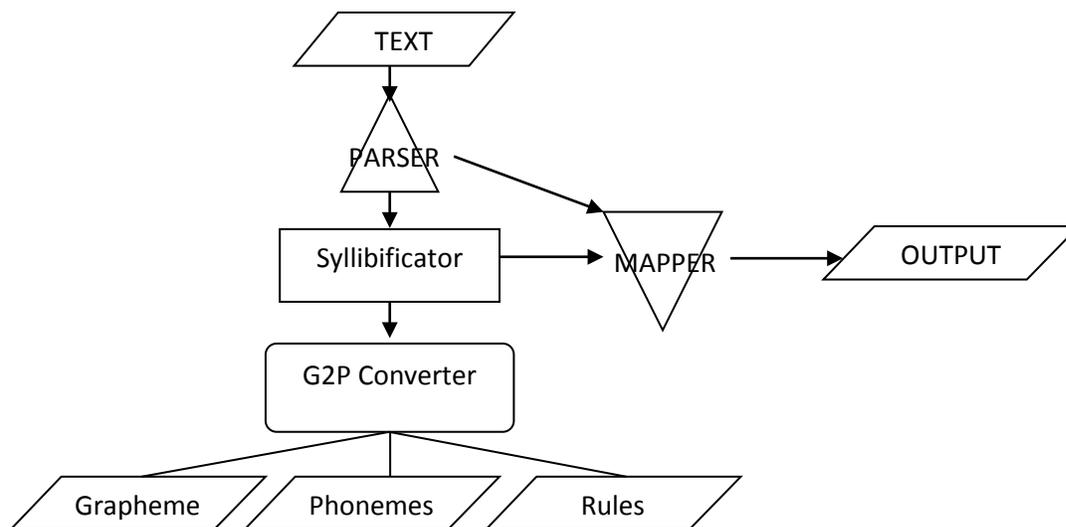
The architecture of the software developed is as follows:


Fig. 1. The architecture of G2P Software

According to this architecture, in the G2P conversion tool for Turkish, the *Parser module* in the first step takes as its input any Turkish text and it parses this body of text into sentences and into words.

In the *syllabificator module*, these parsed spelling of the words are split into their syllables, since in most cases information about the position of a syllable boundary is necessary to define the proper domains for phonological and phonetic rules (van den Bosch & Daelemans, 1993; Demberg, Schmid & Möhler, 2007).

Later in the *G2P converter module* the graphemes in these syllabified words are matched to their phoneme symbols using the phonological rules stored in the inventory.

In the last stage, a *Mapper module* matches the word spelling and phonemic transcription in pairs and produces as its output a corpus of words with their transcription.

Parser Module

The parser module uses the sentence boundary detection algorithm proposed by Aktaş (2006) and Aktaş & Demir (2006) to parse the plain text files into sentences and words. It stores this annotated data in XML format. This module runs online as a web-service.

Syllibificator Module

This module splits the parsed words into their syllables using a syllabification algorithm developed using the phonological rules mentioned above.

In order to evaluate the accuracy rate of the syllabificator module 5000 words (two or more syllables) from TDK Turkish Dictionary were randomly chosen. The evaluation results are as below:

20. Table 3. Accuracy Rate for the Syllibificator Module

Number of Words	5000
Number of incorrectly parsed syllables	22
Number of Correctly Parsed Syllables	4978
Accuracy Rate	*99.56*

As mentioned before syllabification is necessary to define the proper domains for phonological and phonetic rules, and in Turkish phonology in most cases syllable boundaries are important in defining the phonemic environment, namely the context a phoneme occurs.

G2P Converter

G2P converter module takes the parsed and syllabified words as its input and using the data from the inventory sets for graphemes, phonemes and phonological symbols it converts the graphemes into phonemes according to the phonological rules. This module first maps the graphemes to their corresponding *phonemic* symbol in the alphabet of the IPA. After this first step the module applies the phonological rules on these phonemic symbols and returns the final symbols that are altered according to the allophonic variations represented in the rules. The module makes use of three sets of data in its operations, namely the inventory of graphemes, the inventory of phonemes and the inventory of phonological rules

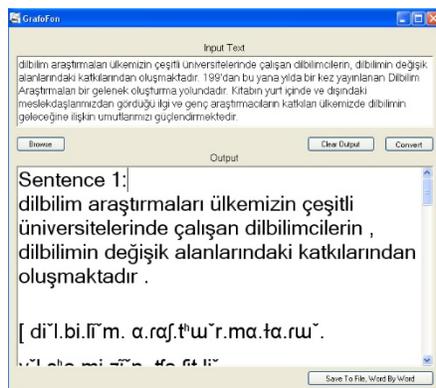
Mapper

Mapper module takes the parsed text and the output of the G2P module as its inputs and pairs these data into a corpus of words with their transcription, with and without syllable marking full stops (.).

Overall evaluation of the G2P software for Turkish

The software was implemented following the structure mentioned in the previous chapter, after building up the inventory of graphemes and phonemes. Later, the phonological rules were gathered from the resources and encoded in a way that the software could understand these rules.

The software uses UTF-8 Unicode encoding system in presenting the IPA symbols for phonemes due to Unicode's widespread support for IPA symbols and for the ease of use for the end-users who are most probably familiar with the symbols in the IPA.

The software takes any pieces of text as input through an "Input Text" box or from a plain text file encoded in UTF-8 Unicode encoding. Then it converts the graphemes in this "Input Text" into phonemes and displays the results in an "Output Text" box. The user may save the results in a plain text file. The screenshot of the program is given in Figure 2 below.


21. Fig. 2. A screenshot of the G2P software user interface

The software saves the output word by word, with each word's phonemic transcription, both with and without syllable boundaries. This saving method is preferred for future studies; especially a G2P system that uses data-driven approach for the process. Thus, the output of the program is saved in such a structure that any data-driven G2P software can access the grapheme data, the phoneme data and, in addition, the syllable data of the words in the text file. The screenshot of the resulting text file is presented in Figure 3 below.

22. Fig. 3. A screenshot of the output file

The software was tested using a 1000 word sample selected from the Turkish dictionary of TDK. The words comprised of two syllables minimum. The 1000 words selected for the sample contained 7894 graphemes. The results of the accuracy evaluation on the software's output are given in Table 4 below.

23. Table 4. Accuracy rate of the G2P software

Number of Words	1000
Number of Graphemes	7894
Number of Correctly Parsed Graphemes	7588
Number of Incorrectly Parsed Graphemes	306
Accuracy Rate	*96.12*

Conclusion

The software implemented in this study is a rule-based grapheme to phoneme system that converts graphemes of Turkish into their corresponding phonemes. The process of implementation comprised of gathering the list of graphemes, phonemes and phonological rules into a database. The resulting software is tested on a word list comprising of the entries of The Turkish Dictionary obtained from TDK. The results of the program are successful and the list of words with their phonetic transcriptions will be presented to TDK to be used in their online dictionaries. The output of the program may be used in text-to-speech and speech-to-text systems which have become popular recently. The output can also be used course materials in Teaching Turkish as a Foreign Language programs or other linguistic research on phonological properties of Turkish Language. The G2P software developed in this study is a rule based G2P system and thus is the first step in grapheme-to-phoneme conversion process for Turkish. The software may give way to other software, for instance data-driven G2P implementations or may be used as an embedded module in text-to-speech systems.

Incorporating Mind-maps in Cell Biology Lectures - A Reflection on the Advantages and Potential Drawback

Foong May Yeong[75]

Department of Biochemistry, Yong Loo Lin School of Medicine, National University of Singapore, MD7, 8 Medical Drive, Singapore 117597

Abstract

Mind-maps have been advocated to be a useful learning tool for students. For Mind-maps to be effective, students have to learn how to use them and then construct their own maps. In this report, I describe my use of Mind-maps as a simple but useful tool for integration into teaching slides during Cell Biology lectures for providing students an overview of the topics that they are learning, orientating students during lectures with respect to the progression of the lesson and for showing links between topics. I highlight the strengths and potential weaknesses of such an approach.

Keywords: Mind-maps, Presentation, Overview, Orientation, Student learning

Introduction

The use of Mind-maps or Concept Maps has been proposed to be useful for promoting active-learning of Biology among students (eg. (Allen & Tanner, 2003; Morse & Jutras, 2008; Odom & Kelly, 2000)). For such an approach to work, students have to be taught how to use and construct the maps. It is also useful to provide timely feedback to students on their use of Concept Maps to fully exploit the advantages of the tool (Morse & Jutras, 2008).

I have been teaching a large-class Cell Biology module which was shared by two other lecturers. Due to time-constraints and the student numbers of about 250 - 280, I was not able to provide close supervision of Concept Mapping as we do not have teaching assistants in our module (Morse & Jutras, 2008). Moreover, because the time constrains, peer-evaluation was not tried. Given that Cell Biology is challenging both at the breadth of the subject matter and the amount of details that are accumulating from the fast-paced research in the field, I therefore chose to use Mind-maps as a presentation tool to provide not only the overview of the topics, but to highlight to students where the lectures are in relation to the main ideas I was teaching.

Essentially, the Mind-maps allowed me to zoom-in and –out of the topics as the lectures went on, providing me a tool to supplement my Powerpoint slides to present ideas and concepts to the students. I could demonstrate to the students how I use the Mind-map tools to organize my thoughts. This should provide students with a framework for understanding the topics I was teaching and how the topics connect to one another. Students can add details to the overview maps that they can use as quick revision tools. I also encourage students to try out the Mind-map programs for themselves to determine if they find it useful for making their own maps when they are doing their revisions.

Software Used

Given the large class with students from different background, the guidelines I used to choose suitable software for use are that it should be free and that it should not be restricted to any particular operating systems. FreeMind (freemind.sourceforge.net/) and Xmind (http://www.xmind.net/) are examples of such tools that fit these criteria. This was important because in addition to my using them as presentation tools, I also hoped that some students might find it useful as a learning tool.

Both the software are relatively similar and I used them interchangeably depending on the need such as whether I wanted a simple map (FreeMind is sufficient) or if I wanted the maps presented as a fishbone, logic chart or

---

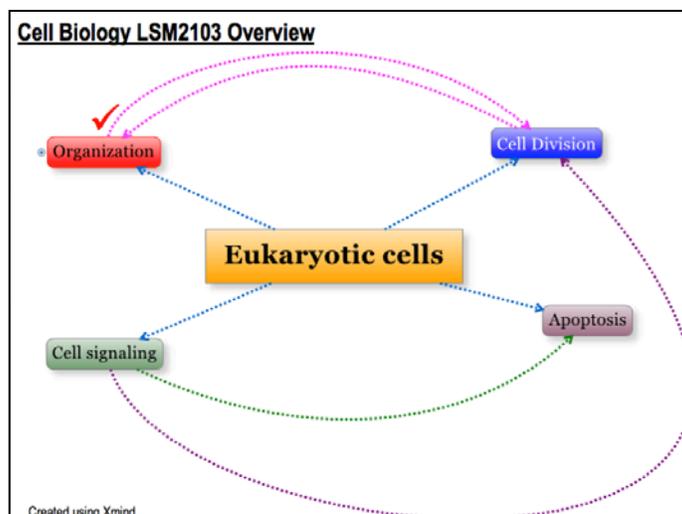
E-mail address: foong_may_yeong@nuhs.edu.sg

organizational chart (Xmind has more choices). Students were introduced to these two softwares briefly at the beginning of my series of lectures. It was explained to them that I was using the software as a *presentation* tool to provide overviews and summaries of the topics I was teaching.

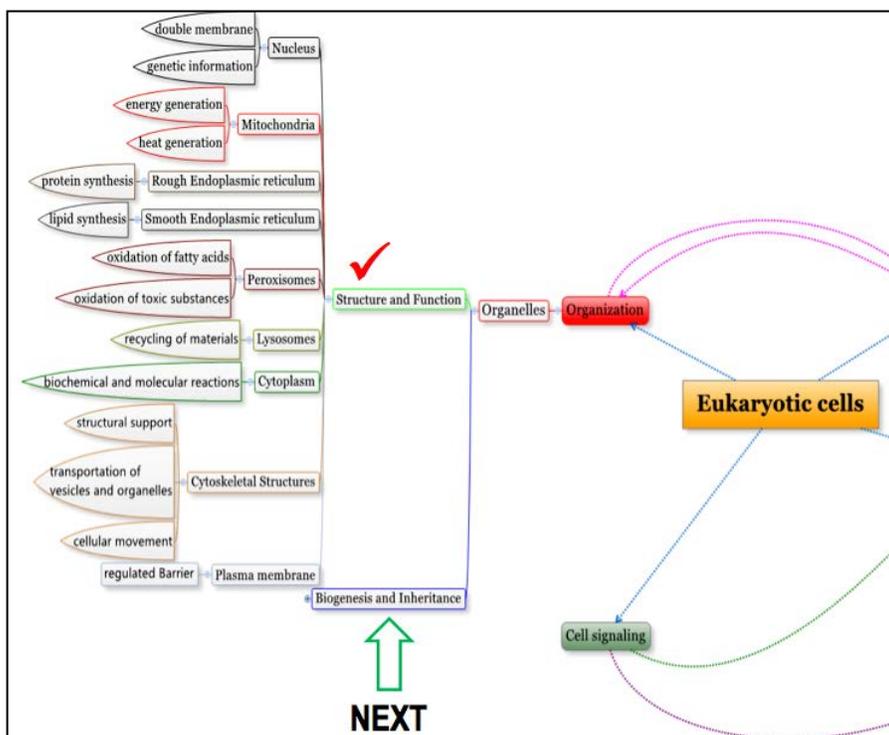
I also highlighted that some students might find it useful as a *learning* tool, but that they have to construct their own maps for the maps to be effective. To help students use the Mind-map software, I also made a screen recording (recorded with QuickTime) (data shown in the virtual presentation) that I uploaded at the Integrated Virtual Learning Environment (IVLE) site showing how to use the software for students interested in using it as a learning tool for themselves either for the Cell Biology module or any other modules they were taking.

Examples of use

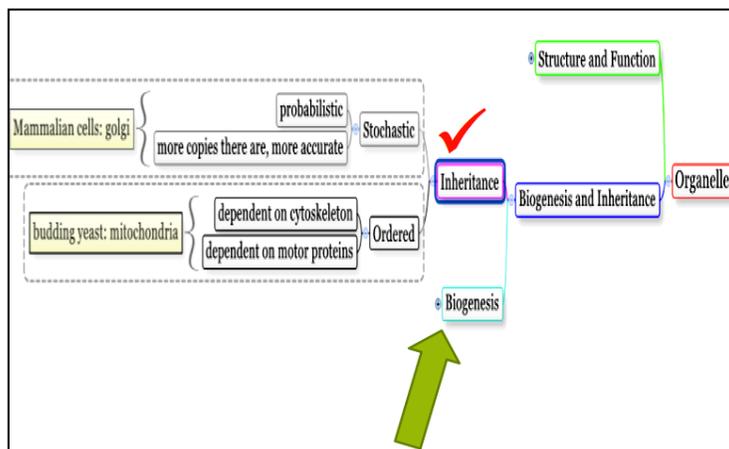
At the start of my series of lectures, I showed a figure with the module topic at the center of the Mind-map (Figure 1) and the key subjects that are essentially the four main areas that will be covered in the module (Figure 1). The red tick indicated the topic just covered by my co-lecturer.

Fig. 1. Main topics as shown in the Mindmap figure inserted into the Powerpoint slide


To zoom into the details of what has been taught as a way to help student recall the previous lectures, the Mind-map can be expanded to show more. For example, for each organelle, I highlighted their key functions (Figure 2, left panel). It was also easy to indicate on the same Mind-map the new subject matter for the lecture of the day (Figure 2, green arrow).

Fig. 2. Expanding a node in the Mind map.


At the end of the lecture, the Mind-map was shown again, but with expanded nodes to indicate what it was that had been covered in the 2-hour lecture (Figure 3, red tick). This will help put into context what we had just taught the students and how that related to the previous topics.

Fig. 3. Topics covered during the day.


Unsolicited Comments from Students on Mind-maps during End-of-Semester Feedback

Although no formal survey was carried out to obtain the students' thoughts on the use of the Mind-maps, it was interesting to note that in the students' feedback at the end of the semester that the students made mention of the Mind-maps in favorable light. Mostly the students either stated that the Mind-maps were useful or they alluded to

"summary figures" as being beneficial for their learning of concepts as well as for following the lectures and use the Mind-maps as quick study guides. One particular student mentioned that he is normally averse to using Mind-maps as a learning tool personally but found the Mind-maps presented as effective as a summary tool.

It should be noted that with a class size of 250 – 280, these few comments should not be taken to be representative, but that the Mind-maps made an impression on the students who provided the comments voluntarily. These are comments that would only serve to provide some hints as to how the Mind-maps were useful to students.

Table 1. Examples of <u>unsolicited</u> students' comments on Mind-maps

1. "…the use of Mind-map is helping students to know which part of the lectures that are being taught"

2. "Her teaching of the Mind-map , although I am one who dislike using such techniques,is very effective in summarizing all the concepts taught during the lecture"

3. "Like how she makes use of the mind map to help everyone see where we are now so we don't get lost"

4. "Mind-map is very useful to highlight the main points"

5. "good Mind-maps in the notes"

6. "…and she has a summary mind-map page. I think this is effective in giving and overview on what has been coverd so far"

7. "the Mind-map helped give me an overview of the content covered"

8. "Mind-maps and the breeze recordings were useful"

9. "mind mapping ways are really helpful in our learning"

10. "Her use of Mind-maps is extremely helpful in studying and revising"

11. "Provides Mind-maps that allow students to link subject to entire process"

12. "her Mind-maps or the way she teaches us link between ideas is very useful"

13. "Notes are good too, especially the Mind-maps"

14. "Provides useful Mind-maps which links content together"

15. "promotes good studying habits like making Mind-maps"

Reflections on the use of the Mind-maps

At the personal level, I found that the Mind-maps were a good tool to represent the concepts I wanted to teach my students, as the programs such as Xmind allowed me easily to create concept-maps that could be expanded and collapsed to show overviews and details of Cell Biology. It was also easy to copy and paste the Mind-maps as figures into Powerpoint slides so that the maps are incorporated into my lectures. With such an ease of use, I imagine it would also not be difficult for students who are generally more technologically savvy and who want to use the programs for their own learning, especially if they want to construct their own maps.

More importantly, the positive comments from the various students (Table 1) on their impression of the Mind-maps were encouraging to me as it showed that the Mind-map used as a presentation tool could help students in the way I had intended. This is especially so for the use of Mind-maps to provide a good framework for students to orientate themselves through the lectures that can sometimes be rather overwhelming in terms of the content.

A potential drawback of this usage of Mind-maps can be seen from the comments such as #10 or #11 or #14 (Table 1). These comment appear also to be positive in terms of how students think they benefited from being able to see links between topics so that they do not learn each topic in isolation. However, on reflection, I think that having me make the links between topics for students might potentially impede active-learning in students if they do not gradually learn to make their own associations between concepts in Cell Biology. Indeed, Mind-maps should be useful for encouraging conceptual and active-learning in students (Allen & Tanner, 2003; Knight & Wood, 2005; Michael, 2006; Morse & Jutras, 2008). If students become over-reliant on the teacher to make the Mind-maps for them, a possible problem could be that they use the Mind-maps I created merely as materials for studying. As such, even though the use of Mind-maps in my lectures seemed to be an approach that students welcomed, modifications

on how they are used need to be made to fully capitalize on the strengths of such a tool not only for presenting ideas, but also for promoting active-learning in students (Wood, 2009).

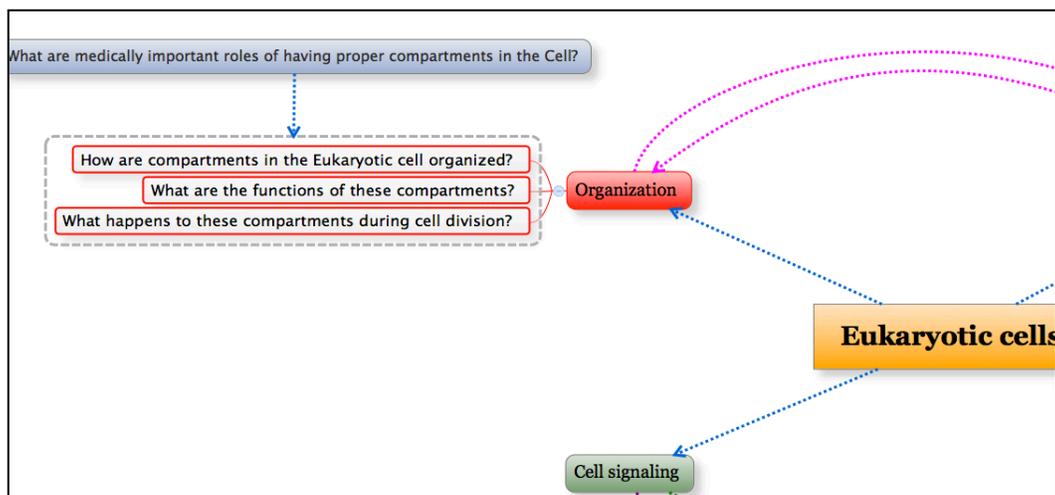
Future improvements in applying Mind-maps

The figures of the Mind-maps shown during the lectures were in fact screen shots of the Mind-maps on my computer that I then copied pasted onto Powerpoint slides. This has the advantage that when I uploaded the slides at IVLE for the students, the Mind-maps are directly found in the slides. This was especially useful for students who did not use the Mind-map programs because they were unsure how to use them. However, this was a cumbersome way of presenting the map as compared to using the programs and showing the expansion and collapse of individual nodes to highlight connections between topics. Xmind has a portable version that would allow one to present the Mind-maps at the lecture theatre from a thumb-drive without having to pre-install the software at the computer that one is using in the lecture theatre. This is helpful as there might be administrator protected-rights on several of these computers that might forbid me from installing the Mind-map programs. By presenting from the Mind-maps directly, one can click on various nodes easily to draw students' attention to specific points of interest. The Mind-maps can then easily be export as image files or Pdfs that can be uploaded at IVLE for students.

Another improvement would be to incorporate figures and diagrams of cellular components or processes into the Mind-maps. This will help me better represent ideas as compared to merely using words and phrases in the Mind-maps shown above (Fig 1 – 3). Xmind allows one to do that rather effectively. The figures will enable students to better visualize the structure and processes occurring in the Cell as they learn about the concepts.

It is also critical to address the issue of active-learning (Wood, 2009) that students should be encouraged to do in relation to the use of Mind-maps to make links between topics. While I use my Mind-maps for presentation, a partial Mind-map could be distributed to students who are interested to use it as a starting point to learn to create their own maps or start from afresh. This should not be a completed Mind-map, but rather, one in that provides a framework for students to construct their own Mind-maps. By omitting certain facts in the maps, students will have to think about the links that they find among the different topics. For example, a Mind-map with questions could be used as a starting point to motivate students to think about the topics taught in context of functional processes in Cell Biology (Figure 4). I could provide such maps at the beginning of each lecture for students to review what they had learnt in the previous lesson before I begin on a new lecture. They can also use such question-based maps their self-constructed Mind-maps to fill in details that they judge to be important in their self-constructed maps. These maps could then be peer-reviewed at least so that students can get feedback on their conceptual understanding (Morse & Jutras, 2008). As such, a discerning use of Mind-maps should be the strategy to allow me both to present critical ideas in an effective way in class and at the same time, provide enough motivation for students to learn actively on their own by constructing their own maps. It would be useful to set-up surveys to gather feedback from more students as to their experience with Mind-maps. This will provide me with practical information as to the habits of the students such as whether they are contented to use my Mind-maps or if they are motivated to create their own. Any difficulties or resistance to using Mind-maps could also be revealed and such information will be beneficial to me for improving upon how to encourage students to test out the Mind-mapping programs.

More significantly, it might be valuable to set-up experimental tests to determine if the use of Mind-maps in my lecture slides actually helped with student learning. For instance, I could teach initial topics without using Mind-maps and conduct pre-tests to determine if students can make connections between topics. I could then incorporate the Mind-maps into subsequent other lectures and perform post-tests to see if the students' ability to make links across topics is improved. One could also perform such tests after students progressed to the next level of their degree program and check if such skills in making connections between topics are retained. Such tests could be further combined to examine if students who use such Mind-mapping tools are able to learn better than students who do not. The data gleaned from such a study can be shown to subsequent students so that they can consider better whether they want to try out the Mind-mapping software for themselves.

Fig. 4. Question-based Mind-map to encourage Active-learning in Students.


Summary

In summary, the use of Mind-maps as a presentation tool that allowed me to provide topic overviews as well as to drill down into topic details, had indeed been a positive experience for myself and the students who provided comments on them. It would however, be worthwhile to further improve upon the usage of the Mind-maps during my lectures in my subsequent semesters, bearing in mind the potential drawback of using this without at the same time engaging the students in creating their own maps. Students will be encouraged to make use of such Mind-map programs to explore by their own experience, if making their own maps to link concepts give them a better grasp of the different topics taught to them. Ultimately, the aim is to achieve a good presentation of the subject to students but also to get more students who will provide comments such as in #15 (Table 1).

Influence of E-Portfolio Supported Education Process to Academic Success of the Students

M. Fatih BARIS[76a], Nilgün TOSUN[b]

ᵃNamık Kemal University, Vocational School of Technical Sciences,Tekirdag, Turkey

ᵇTrakya University, Faculty of Education, Edirne,Turkey

Abstract

Problem Statement: In recent years usage of e-portfolio in education has become the topic of many researches. In these researches it is generally emphasized the influences of e-portfolio to the learning attitude, academic success and usage of information technologies.

Purpose of Study: In this work the influence of e-portfolio supported education process to the academic successes of 10th grade students of Tekirdag Technical and Industrial Vocational High School has been studied. Within the scope of the research, e-portfolio supported education in test group in Vocational Development course and traditional in-class education was applied in control group in 2nd semester of 2010-2011 academic year.

Method: Control Group Trial Model with pretest and posttest was applied.

Findings and Results: While assessing the findings from the work it was benefited from SPSS 17.0 package program for statistical analyses. Kolmogorov-Smirnov normality test was applied in order to see whether the difference between pretests and posttests of test and control groups. In comparison of quantitative data t-test and Mann Whitney U test was used. Conclusions and Recommendations: According to the findings obtained at the end of the research, academic success posttest scores of the students in test group was higher comparing to that of students in control group. Based on these findings it was reached to the conclusion that e-portfolio supported education process influenced the success of students in positive way.

Keywords: e-portfolio, academic success, internet

1. Introduction

Education technologies are the leading among the factors directly effective on education and learning methods. Along with the development of education technologies learning, researching and homework preparation habits of the learners show difference. Internet and computer are the latest technologies used by the learners. Especially such tools as search engine, blog, forum, social network and e-portfolio presented by the internet have opened a quite different world of teaching and learning. Teachers also began to use these tools efficiently for measurement and assessment. The tool used widely to monitor the development of learners is e-portfolio.

Different from traditional portfolio it is easier in e-portfolio to send, access and re-arrange over internet. Its replication and reproduction takes less time. However its preparation might take longer time. Sometimes its preparation can be more expensive and even be more boring. Along with this preparation of e-portfolio is an effective way in showing learnt technology skills and gaining new skills (Heath, 2005).

Increasing in number, e-portfolios might include such files in different formats like text, graphic, video, sound, photograph and animation. Students can research the files in this format proportionally with their skills in using internet, can organize and can add to their e-portfolios (Fiedler&Pick, 2004).

Tolley (2008) made the definition of e-portfolio by reckoning its features. These features are given as the following:

1. *It is portable:* It is not embedded into any institution or registered virtual learning environment.

---

[76] Corresponding author.
E-mail address: mfbaris@yahoo.com

2. *It is personal:* It is 'owned' by the user and is customisable to the user's age, stage and style.
3. *It is generic:* It is not modelled on any particular curriculum delivery system nor content.
4. *It is Web 2.0:* It should be compliant with all generic formats within the application.
5. *It is MIS-free:* It is not under administration information system infrastructure of any institute.
6. *It is 'light':* It is not a permanent repository of all of a user's files, rather a 'transit camp'.
7. *It is lifelong:* Ownership must be maintainable as a continuity, '5-95'.
8. *It lifewide:* It is capable of being used by all ages and abilities through a wide range of assistive templates.
9. *It is accessible:* It must recognize common standards of accessibility in terms of both outputs and inputs.
10. *It is Credible:* It supports digital safety standards determined by Bologna Process.

Considering above mentioned features it can be seen that e-portfolio has many benefits in terms of learners and teachers. Such features of it like it is compatible with Web 2.0 technologies, it can be arranged in custom and general mode, its content is variable, it can be used lifelong, it can be used in many places other than education, it is reliable and accessible enables easiness both for the learner and the teacher. For instance teachers may request from their students more sweeping and flexible works. They may request private works from each student and may provide better works with feedbacks. And learners would be able to easily record their works they made at any time in their lives whether these works are about education or business or private interest. Furthermore it can be accessed to rich contented works that include sound, graphics and video easily.

Many works have been made regarding the application of e-portfolio which is used at every segment of life to education. Erdogan (2006) researched the place and importance of assessment based on the portfolio. Furthermore student success of portfolio based assessment in foreign language education and the influence of the attitudes of students towards the course have been reviewed. At the end of the research it was found that portfolio had no influence towards the success and attitudes of students regarding the course yet it might have an influence on writing skills. On the other hand, when solving the answers given by students to ten questions it has been reached to the conclusion that they are content with e-portfolio application, they tried to produce better quality products, they took more responsibility regarding their training, they exhibited positive behavior towards learning yet much time consuming portfolio activities push them a lot and it is a compulsory that students should be trained regarding the formation and assessment of portfolio.

Kazan (2006) expressed that he aimed to set forth in detail how Electronic Development File applications can be used in Turkish Education System. At the end of the research it was determined that students had no anxiety regarding their marks, individuality and self-determination was achieved, they learnt to share, their self-reliance increased in the end of e-portfolio application. Ozyenginer (2006) made a research with 2nd grade students of the Department of Computer in Buca Anatolian Vocational High School and Vocational High School regarding the electronic portfolios which covers the 2005-2006 academic year fall semester. Within this one semester period students prepared an e-portfolio regarding the hardware course and at the end of the process they assessed themselves with electronic portfolio. At the end of the work all students passed and showed a success over the average (4,40 over 5). Cayirci (2007) examined the influence of Web Based Portfolio (WBP) on verbal and quantitative courses of primary school 7th grade students. At the end of the research it was revealed that WBP application increased the academic success of students on both verbal and quantitative courses yet it was seen that the increase of success in verbal courses (167,89) was higher than that of quantitative courses (83,29%) (F(1; 66) = 62,028 and P = ,000).

Erice (2008) researched the effects of electronic portfolio on students whose English language skills are at intermediate level. Based on data made before and after the application it was indicated that the students in electronic portfolio group were more successful in writing skills comparing to students who keep portfolio as file. Basciftci (2011) researched the influence of portfolio in "Journey to the Interior Structure of Living Things" which is primary school 6th grade Science and Technology course, to the success of the student and the durability of the knowledge. At the end of the research, benefiting from the portfolio in the teaching of Science and Technology course subjects increased students' success, memory levels and attitudes towards Science and Technology lesson substantially. It was reached to the conclusion that usage of portfolio in science and technology course was more successful comparing to the usage of classical description method.

The purpose of the research is to provide the students studying in the fields of Information Technologies and Electricity- Electronics Technology in Tekirdag Technical and Industrial Vocational High School to efficiently learn the concepts and skills within the context of the course named Vocational Development and to make assessment by using e-portfolio at the end of education process. For this purpose primarily an e-portfolio interface

was designed. Integrated to a social network (Facebook) this e-portfolio interface was opened to the access of students.

To sum up in this work it was aimed to examine how e-portfolio assessment process influences the success of students and to make a comparison of the processes in traditional in-class education and e-portfolio supported education processes.

Used in all fields of life, e-portfolio is also one of the current education technology tools. This work is regarded as important in terms of the subjects given below:

- E-portfolio usage in education.
- Influence of e-portfolio application process to the success of the secondary school students.

1.

2. Material and Method

2.1. Problem

In this work an e-portfolio applied education and assessment process was realized in order for the constitution of more meaningful and permanent education lives in Vocational Development Course. At the end of this process it was sought answers to below mentioned questions:

1. Does e-portfolio application used by integrating to Facebook social networking site in order to support conventional in-class education activities, have any contribution for students to learn the concepts and skills in Vocational Development course in a more efficient way?

2. Does e-portfolio application used by integrating to Facebook social networking site has any contribution for any change in behaviors of students towards e-portfolio in a more positive manner?

Research Model

In this study Pretest-Posttest Control Group Trial Model was used among experimental pattern types. The pretests used in the research were applied to students in the beginning of 18 weeks work and their academic presence was determined. After the research continued throughout the second semester of 2010-2011 academic year posttests were applied to students once again. Personal Information Questionnaire was filled by the students before the formation of the groups at the beginning of the research.

2.2. Population and Sample

Work group of the research is constituted of students of the Department of Information Technologies and Electricity-Electronic Technology who are in 10th grade in Technical and Industrial Vocational High School in the province of Tekirdag in 2010-2011 academic year. Tekirdag Technical and Industrial Vocational High School embodies 3 different school types. These schools are Industrial Vocational High School, Technical High School and Anatolian Technical High School. Application groups were randomly selected enabling researcher to control the application. While the groups are being constituted it was aimed to include students from different school types and different fields. Distribution of students according to their field, school type, class and group is given on Table 1.

Table 1 Distribution of students according to their field, school type, class and group

Class	10-G	10-H	10-I	T-10B	AT-10A	AT-10B	TOTAL
School type	Industrial Voc. High School			Technical High Sch.	Anatolian Technical High Sch.		
Group	Control	Control	Test	Control	Test		
Field							
Information Technology			36			30	66
Electricity-Electronics Technology	41	37		32	26		136
TOTAL	114			32	56		202

114 students from Industrial Vocational High School, 32 students from Technical High School and 56 students from Anatolian Technical High School and totally 202 students attended to the application. 66 of the subjects were the students of Information Technologies and 136 of them were Electricity- Electronics Technology. While 92 of the students took place in test group on which e-portfolio supported education application was made, 110 of them took place in control group on which traditional in-class education was made. Only one of the students in control group was a girl. Distribution of test group according to the sex was shown on Table 2. As also seen on table all of the students studying in Electricity- Electronics Technology were male students. On the other hand 11 of the students in Information Technologies were female students while 81 of them were males.

Table 2 Distribution of test group according to sex

Sex	Female	Male
Field		
Information Technology	11	55
Electricity-Electronics Technology	0	26
TOTAL	11	81

2.3. Data Collection Tools

Personal Information Questionnaire: This questionnaire was constituted by the researcher to collect data regarding personal information, computer and internet and social network usage periods of students besides their demographic information.

Academic Success Test: Developed by the researcher, this test was used to determine readiness levels of students and their academic success levels after the application. For this test, Personal Development and Communication in Business Life modules determined by the Ministry of Education were used as a resource. 41 questions were prepared to include the determined targets. This 41 questions of multiple choice test was applied to 400 students who studied Vocational Development course in 2009-2010 academic year. Article difficulty and article distinctive values were determined to find out the questions to be included in academic success test among the prepared questions. Considering the 12 articles whose distinctive values were less than 0,2 and the targets prepared in the beginning of the application and also considering the article distinctive values and difficulty indexes 4 articles and totally 16 items of articles were removed from the test. As a result, Academic Success Test which is used to determine the presence level of the students before the education and to determine the efficiency of the application after the education was totally constituted of 25 articles.

2.4. Collection of Data

While certain part of the questionnaires and scales used in the research was realized paper-based, the other part of it was made by using Google survey tool. Paper based data were transferred to electronic environment by using Google survey tool and saved to MS Excel environment.

2.5. Analysis of Data

While assessing the data obtained from the work SPSS 17.0 package program was used for statistical analysis. Kruskal Wallis test was used in the inter-group comparison parameters that show abnormal distribution in the case of quantitative data when there is more than two groups and Mann Whitney U test was used in determination of the group that cause difference. Results were dually assessed within 95% range and at $p<0,05$ significance level.

3. Findings and Results

In this section of the research, quantitative and qualitative data obtained as a result of experimental studies were interpreted in line with goals.

Regarding the problems; pretest and posttest results of the academic success test of the test and control groups were given in Table 3.

Table 3 Academic success test results of test and control groups

	Test		Control		t	p
	Average	Ss	Average	Ss		
Academic Success (pretest)	60,696	12,905	50,764	14,856	5,021	0,000**
Academic Success (posttest)	70,935	12,675	62,655	14,297	4,315	0,000**
p	t= 7,59; 0,000**		t= 7,83; 0,000**		**p<0,01	

As a result of t-test made in order to determine whether the academic success (pretest) score averages of the attendants of the research showed a significant difference or not, the difference between group averages was statistically found to be significant (t=5,02; p=0,000<0,05). Academic success (pretest) scores of the students in test group were found to be higher than the academic success (pretest) scores of the students in control group.

As a result of t-test made in order to determine whether the academic success (posttest) score averages of the attendants of the research showed a significant difference or not, the difference between group averages was statistically found to be significant (t=4,31; p=0,000<0,05). Academic success (posttest) scores of the students in test group were found to be higher than the academic success (posttest) scores of the students in control group. The

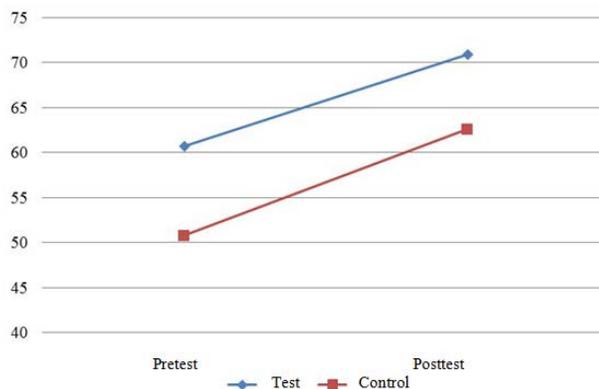
graph belonging to the academic success pretest and posttest results of the students in test and control group is given in Fig. 1.


Fig. 1. The graph regarding the academic success pretest and posttest results of the students in test and control group

In order to see whether the difference between pretest and posttests of test and control groups firstly Kolmogorov-Smirnov normality test was applied. As a result of the test ($p<0.05$, $p=0.016$) it was seen that the difference was abnormal. For this reason, as a result of Mann Whitney U test made in order to determine whether the difference between the results of academic success pretest and posttest results of test and control groups was significant or not, no significant difference was found.

Even though the results obtained regarding the problem of the research were not statistically significant, examining the higher academic success posttest scores of the students in test group it can be said that e-portfolio supported education process influenced the success of the students positively.

While this result corresponds to the results of certain works it shows difference with some. With the works of Ozyenginer (2006), Kazan (2006), Cayirci (2007), Erice (2008) and Basciftci (2011) it was seen that academic success of the students studied with the help of e-portfolio was higher than that of students studying with traditional method. The work of Erice (2008) was applied to English course and it was reached to the conclusion that e-portfolio increased the writing skills of students. The work of Cayirci (2007) which deals with whether the selection of quantitative or verbal course is important in e-portfolio application is remarkable. In this work the application was made in Vocational Development course which is a verbal lesson. However in the application of Cayirci the courses of Science and Social Sciences were selected. At the end of the research academic success of the students in both e-portfolios supported courses were higher than that of those studying in traditional methods and it was seen that the increase of success in verbal course was higher than that of quantitative course. It is also a matter of question for what type of courses –verbal, quantitative- would the e-portfolio applications can be more fitting. In the work Erdogan (2006) it is seen that there is no significant difference between the academic success and attitudes of students who either study with e-portfolio support or who study with traditional methods. The reason why the results of the work applied to English course in the preparation class of Maltepe Military High School and the results of this work is that because students study English intensely in preparation classes and unless they succeed there is a risk of dismissal from the school.

E-portfolio applications are not just related to the academic features of the students. Besides enhancing their knowledge it also supports the enhancement of students' perception and skills. Not only the information and skills regarding the course selected in e-portfolio applications but their information and skills regarding the information technologies also show improvement.

4. Conclusions and Recommendations

E-portfolio is an archive in which executed works are stored and exhibited. It is thought that this feature of e-portfolio might have drawn the attention of students. While the percentages regarding the fulfillment of homework in traditional education and students' interest level regarding these homework are pretty low, in e-portfolio application the interest showed to homework are is pretty high. While the students especially those studying in industrial vocational high schools showed reckless attitude regarding the homework, it is observed in this study that a pretty high feedback was taken in this work.

The following should be taken into consideration when using e-portfolio in education:

- Compatibility of the application with course content and goals should be taken into consideration.
- Students' information technologies literacy levels should be determined beforehand.
- Compatibility of the works requested from the students with their education levels, their information technologies usage skills and the goals of the course should be taken into consideration.
- Students' attitudes towards the applications should be determined beforehand.
- Application process should be described to the student in best manner considering especially those who behave negatively.
- During the application good and bad works should be shared with students in certain periods and certain mistakes should be corrected.
- Assessment criteria of the works should be determined in a well manner.
- In order for the students to assess the works of each other different criteria should be determined and should be motivated regarding the assessment of the works of each other.
- Group works should be promoted and while determining the works to be made during the application period it should be paid attention for the presence of at least one group work.
- An environment to which students may attend to the application other that their homes and technological infrastructure should be provided.

The suggestions for those who shall make research and application regarding the usage of e-portfolio in education are given below.

1) Sample e-portfolios can be reviewed for e-portfolio design.
2) Works can be made regarding the usage of e-portfolio applications in vocational education and especially in the field of information technologies.
3) The usage of e-portfolio in primary, secondary and higher education can be researched.
4) Advantages and disadvantages of e-portfolio application can be set forth by reviewing previous application results.
5) Convertibility of e-portfolio applications to a corporate format can be examined.

* This study was prepared by practicing upon the Doctorate thesis of Mehmet Fatih BARIS titled "*Integration of The E-Portfolio into a Social Network and Analysis of Results*".

13th International Educational Technology Conference

Information technologies in the postindustrial society

Wiesław Hładkiewicz[77], Piotr Gawłowicz

University of Zielona Góra
Poland

Abstract

New IT technologies, and in particular the Internet have become at present an alternative media channel. The emergence of new technologies changes the forms of communication. Computer networks exert impact on the development of the public domain in which the debate between citizens and authorities. A new international public sphere arises, and thanks to the Internet, the discussion concerning various problems takes place independently of time and space, but above all it crosses national borders. Computer data basis provide better access to reliable information. Yet unequal access to information triggers new factors dividing societies into those which are better or worse informed or those who can take advantage of information thanks to education or technology skills. Hence the following question arises: how to meet the requirements of the development of the global IT society?

New solutions concerning hardware, software and telecommunications combining a great number of subjects ranging individual users, through local communities, universities, enterprises, governmental agencies to international corporations into one global network.

Keywords:

Great transformation

The contemporary society undergoes a significant transformation which can be summarized in the form of the diagram below:

Agricultural society

Industrial society

Post-industrial society

IT society

Source: author's research

The transformation introduces a new order of world perception , the perception of basic social values, social and political structure as well as strategic institutions (parliaments, governments, legal systems etc.)

IT Society

The tempo at which the IT market develops brings us increasingly closer to the IT society. The trend has been confirmed by John Nesbitt (Nesbitt, 1997) who combines the development of the global IT society with information transfer, distribution and application.

The IT society is a new type of society in which information management, quality and transfer constitute

---

[77] Corresponding author.
E-mail address: adamilciow@interia.eu

the principle factors of competitiveness in industry and services. A society becomes an IT society when it reaches the level of development requiring the adaptation of the techniques of information storage, processing, transfer and use and creates a special multi-media structure which serves such purposes.

EU (1993) and G-7 (1995) established the principles governing the IT society. These include general access to communications and IT technology, service providers and cooperation irrelevant of one's place of living and new competitiveness solutions.

The Internet in the multicultural society

The Internet has become a new 'forum' in the sense designated to the word by the ancient Romans. In the past the agora was open to the general public of the polls, where decision were made concerning politics, economy or religion. At present we can talk about the electronic agora.

The young generation of the Internet users, apart from taking advantage of it for day-to-day purposes (school, home, street), apart from the obliging and generally approved values, principles and norms of life, have developed their own standards of the cyber-space. And just like children learn norms with age and experience, new Internet users have to acquire the rules governing the Internet.

Not only young people are active in respect of disseminating culture by means of the global computer network, but also acknowledged and respected institutions whose primary aim consists in the preservation of the monuments of culture. The Internet provides various opportunities of visiting museums, libraries, ethnographic museums, art galleries or national parks. Magazines and newspapers offer website service. According to B. Chmiel this form of publication constitutes an important aspect of the acquisition of knowledge i.e. the readers of electronic publications choose their own paths, which requires more active involvement.

THE IMPACT OF TECHNOLOGICAL INNOVATION ON PUBLIC LIFE

BUSINESS   EDUCATION   LOCAL GOVERNMETN   SOCIAL LIFE

Tele-work   e-learning

Source: the author's research

IT technology

The dynamic access to the broadly understood IT technology constructs 'a global IT society' W.T. Bielecki (2001) observes that 'in the IT society information and resulting knowledge, as well as IT technology constitute the basic factors of development. Information, Communication Technologies. Electronic Business gain in significance. Fisher rightly identified several categories of computer use:
   1) Data processing in business
   2) Information storage and search
   3) Production planning and automatics
   4) Modeling social, economic and political processes.

The application of IT provides new management instruments. At least one of the chapters of books on organization and management focuses on IT systems. The forthcoming period is frequently referred to as the IT Era in which IT technology guarantees common communication. (Kosielnicki, Sroka, 1999). The concept of IT may be misunderstood. Particular publications (Beyon-Davies 1999, Kisielnicki, Sroka 1999, Osmahska-Furmanek 1999. Stefanowicz 1998) offer various definitions. For instance: The concept

of Information technology applies to the hardware and software supportin information processing i.e. computers, communications networks, operational systems, data base management systems, etc. IT is synonymous of the technology of the information system' (Beyon-Davies 1999) 'IT means a scientifically justified system of the application of IT tools for the purpose of storage, transfer and access to information (Stefanowicz 1998).

The interpretation of the meaning of the concept of technology assumes 'scientifically justified use of technical means' i.e. verified on the basis of academic standards and comprising the following two elements: technical resources and the knowledge of the use of such resources (Stefanowicz 1998).

IT as the science of information processing deals with automatics. It covers a broad spectrum of issues related to information processing, collection, storage, processing, presentation of information, construction ad the technology of hardware and information processing systems.

IT systems can be described as multi-level structures enabling users to transform input information into output by means of appropriate models and procedures. The information determines decision making processes (Kisielnicki, Sroka 1999). Beyon-Davies (1999) present three levels of IT systems: informal, formal and technical (referred to as IT).

According to Osmahska-Furmanek (1999) IT covers such elements as:
- social communication by means of IT systems
- social and ethical aspects of human activity in IT
- information analysis and synthesis (processing, selection and the formation of a cohesive image from diversely located pieces of information)
- the application of IT tools and means
- system and data security

The above considerations present the scope of IT.

Computer Science

Computer science is a relatively new branch. Its emergence is connected with the introduction of digital processing machines and their implementation. Computer science covers the entire spectrum of issues related to collection, storage and access to information, the research on the principles governing such processes as well the provision of methods and tools for rational information processing.

Information systems

The IT marketing systems are increasingly more frequently perceived not only as elements of the information policy of enterprises, but also as elements system of information. They form the basis of e-marketing and stimulate e-commerce.

The function of IT marketing systems are subject to constant change. In the US economy Business Process Reengineering constitutes the core element of management. It is identified with the location of the customer in the very heart of the organization. IT marketing systems integrate all management functions in companies (Unlod 2001).

In the first half of 1980s, the view prevailed according to which computer technology exerts limited impact on management. At present the world of business amplifies the tempo of the IT revolution and technology development. What does the change involve? They include the diverse IT society, new relations between business and customers, changes in the organization of work places, increased market competitiveness, the appearance of new global networks.

The above phenomena influenced the changes (crisis) in traditional marketing. The most important include: inappropriate attitude to customers, high expenditure on promotion, marketing departments falling behind new trends, demanding customers, shortening of the product life cycle, market globalization, the appearance of new distribution channels (Unlod 2001, pp 38-40).

Hence the application of modern IT technologies, e-market and virtual business have become of paramount importance to modern enterprises. Entrepreneur increasingly more eagerly take advantage of modern marketing instruments i.e. data-base marketing management, interactive use of multi-media or IT based customer service management.

Conclusions

The development of IT systems can be understood as the principle factor of the information focused revolution. The process has already started and according to the World Bank 'global tele-economics will arise with the next generation' (Whitehorn 1996) This is the result of progress which occurred ofer the last dozen of years in IT and electronic media. We have just entered the 'Information Age' and 'information society.

The process results from developmental changes in three principle spheres: hardware, software and telecommunications. Yet, the changes demand a deeper insight presented in Diagram 1 below:

HARDWARE   SOFTWARE   TELECOMMUNICATIONS   INFORMATION

IT

CUSTOMER USER

COMPUTER SCIENCE

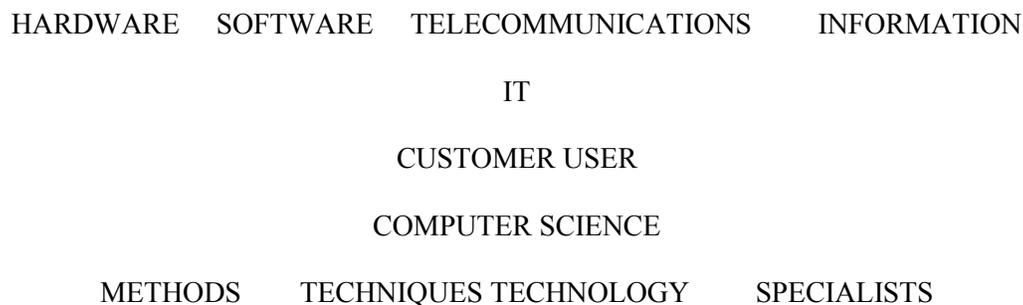
METHODS   TECHNIQUES TECHNOLOGY   SPECIALISTS


Diagram 1: the relations between users, IT and computer science

Not only business but all customers - users or societies trigger the tempo of the information revolutions. IT meets the demand, while the computer science provides solutions for customers. Hence the education of specialists, the development of new methods, techniques and technologies as well as customer care are of paramount importance. Such changes facilitate the transformation of post-industrial societies into information societies.

Innovation Models of Indonesian Learning in Multicultural Society

Ida Zulaeha[78]

Department of Indonesian Language and Literare
Faculty of Language and Art
Semarang State University
50229 Semarang, Central Java, Indonesia

Abstract

This research was aimed to resulting innovative models of Indonesian learning the ICT integration in the context of a multicultural society. This research design was Research and Development. The data were collected during 6 months through observation, interviews, and test to teachers and students of Junior High Schools in Central Java. The research finds out that there are two models of Indonesian learning integrated with ICT, namely multi-culture-based group investigation and social inquiry models, be accompanied learning devices. The multi-culture based group investigation model is used to learn to write paper, and the model of social inquiry is used to learn to write a drama text integrated with ICT. Meanwhile, learning device model includes syllabus, lesson plans, teaching materials, ICT-based learning media, and learning evaluation instruments. In this model the students have the opportunity to get more actual information and upload their work creatively and independently. This model can be effectively used because teachers can check the students work and give feedback via e mail, facebook and then the students can upload their works on the school blog.

Keywords: models of learning, the context of a multicultural society, ICT-based

1. Introduction

Indonesian is the key unifying Indonesian nation which consists top of various groups of society and cultural. Java community has a different culture with Sunda community. Merchant community has a different culture or customs with employees. Coastal communities have a culture or customs that are different from rural communities. In the context of such a society, learning Indonesian, especially at Junior High School that the students come from different groups of people who have diverse cultural require models are innovative. Innovation of models learning has become very important with the needs of modern society in obtaining information and solve communication problems. Ease, speed, and accuracy of the information needed by modern society can be met by utilizing ICT. Therefore, learning Indonesian in the context of a multicultural society that uses media ICT more effectively broaden the knowledge and experience of the students will be cultural diversity in society (Zulaeha, Rokhman, & Faridi, 2010).

In the Indonesian subjects, the students learn writing scientific papers and drama texts (BSNP, 2006). Writing scientific papers is one language competence, whereas writing is one of the drama texts compose competence. Scientific work is a work based on the results of observations, review of, or research in a particular field that are prepared in accordance with certain rules and systematica. Language is scholarly and polite. Its contents should be accountable (Hasnun 2009:41-42). Scientific paper is a kind of essay that contains a set of ideas that results obtained in accordance with the scientific nature. The students of Junior High School be taught a skilled writing scientific papers in the form of reports. Writing scientific papers through the stages of prewriting, writing, and post writing. Drama texts is that according to the content of expression language, syntax, and pragmatic is an entity that presents

---

[78] Corresponding author.
E-mail address: zidazulaeha@gmail.com

conflicts between characters in the dialogue written to be staged. Drama text written by considering stages: preparation (prewriting), stage of incubation, illumination, and verification/evaluation. The competence was studies using innovative learning model that is more effective.

Scientific papers and drama texts written by students is the result of observations, thoughts, and their expression of the multicultural situation and conditions in the local community. The message delivered by the students through the scientific paper and the drama text is multicultural values that they understand. Then, understanding it through discussed with the teacher to get approval. Understanding about of multicultural values appropriate to the situation and condition of the people is important so that they can coexist with others in the community.

Model of learning is a conceptual framework that describes a systematic procedure in organizing learning experiences to achieve specific learning objectives and serves as a guideline for teachers in the planning and implementing learning activities (Joyce & Weil, 2000). Learning models that integrate multicultural Indonesian provide more opportunities for students to learn more by using ICT as a resource for information, send a draft paper for review by teachers and friends, and disseminate the work produced. The use of ICT in the teaching of writing scientific papers and writing text drama can be implemented in various forms in accordance with its function in education. Indrajut (2004) argued that information and communication technology in education has seven functions, namely: as a storehouse of knowledge, as a learning tool, as an educational facility, as a standard of competence, as administrative support, as a tool for school management, and as an educational infrastructure.

Innovation in the learning interpreted as a a new effort in the learning process, using a variety of models. Dryden & Voss (1999) argued that the 'new' in the innovation that is what is not yet be understood, accepted or implemented by the recipient innovation. The learning process involves humans (students and teachers) that have distinctive characteristics, namely the desire to develop themselves, progress and achievement. There are four functions that must be performed in his teacher as a motivator (Miarso, 2007). First, arousal function or evoke the urge students to learn. Second, the funtion expectancy concretely explain to the student what to do at the end of the lesson. Third, the incentive function, the reward teachers for student achievement in order to stimulate the next achievement. Fourth, disciplinary function, the teacher helps students kilter behavior. The fourth function meruapakan important reason to use innovative models in the context of learning Indonesian in multicultural communities that integrate ICT.

2. Model-Based Investigation of Multicultural Groups in Learning Writing a Scientific Paper Integrating ICT

Research and development has been done by Zulaeha, Rohman, and Faridi (2010) produced models based multicultural group investigation include the goals and assumptions, syntagmatic, social systems, the reaction system, support system, and the impact of instructional and accompaniment.

Objectives and Assumptions

1. Model of ICT-based investigative group is a series of operational framework that is used as a guide for teachers to facilitate students learn to work together cooperatively in groups. Among members of the group interact to achieve cognitive competence through intellectual activity and affective competencies,

namely positive feelings toward one another despite different cultures, build positive relationships with friends of different cultures, and improve self-esteem. Model-based investigative group multicultural characteristics, namely (1) the purpose and assumptions, (2) syntagmatic Multicultural Model-Based Investigation Group, (3) social system, (4) support systems (5) principles of management / response, and (6) the impact of instructional and accompaniment (Zulaeha , Rokhman, & Faridi, 2010:45-50).

Syntagmatic Multicultural Model-Based Investigation Group

Model inivestigasi group developed, implemented with seven steps, namely: topic selection, cooperative planning, implementation, analysis and synthesis, presentation, evaluation and re-creations. Re-creation is the novelty of the research. The addition of this step is to explore and improve the competence of individual students optimally. Syntagmatic Multicultural Model-Based Investigation Group.

- Selection of topics

Learning activities begins with the selection of multicultural topics offered by the teacher concerned with the cultural identity of a group, ethnicity, race or tribe; habits; traditions and patterns of behavior. The topics include: 'buka luwur', 'sedekah bumi', clean village, the Islamic New Year celebration, 'dandangan', 'punden', Chinese New Year, 'mitoni', school culture, beliefs, and so on.

- Cooperative planning

Teachers communicate the objectives, materials, time, pace, and final results are expected from the students, as well as the assessment will be applied. With the help of teachers, students plan how to collect data and other learning activities, such as browsing the internet and libraries as well as conduct investigations.

- Implementation

Students carry out the plans that have been made with the strategies and learning different sources. Students explore the way an investigation of issues / concepts that will be studied. Investigation can be done in various ways, such as reading, observation, interviews, conduct experiments, browsing through the internet, and so on. Investigations carried out in groups in accordance with the agreements. During the investigation process, students can communicate with teachers via e-mail, yahoo massenger, or facebook. Communication through the internet can help students who have difficulties in the process of preparing scientific papers.

- Analysis and synthesis

Students analyze and process the information gathered to be presented through discussion and question and answer. Analysis and synthesis can be done outside of school hours by e-mail, yahoo Massenger, and facebook to a teacher or friend group with teachers through e-mail, yahoo Massenger, or facebook. Communication through the internet can help students who have difficulties in the process of preparing scientific papers.

- Presentation of the results (presentation)

Each group prepared a 5-10 slide power point presentation materials. Time presentation of each group 10-15 minutes. After listening to the presentation, another group responded politely guided one group representative. During the presentation, the teacher assess the presentations, make comments and suggestions for improvement, either repair material and the manner of presentation.

- Re-creation, is a novelty in the model group investigation of learning to write scientific papers in a multicultural context. Her student recreation scientific papers produced by a creative work, such as articles, poems, or posters appropriate events and activities that have been studied. Results of re-creations sent via e-mail and will be displayed or blog loaded on the specified teacher.

- Evaluate, an attempt to measure objectively and give value to the achievements have been planned in advance. Seriousness assignment, investigation, critical and logical thinking skills in giving the views / arguments, willingness to cooperate and shared responsibility are aspects considered during the learning process. The students were invited to assess the advantages and disadvantages of scientific work and the results of re-creations developed by another group with a criteria that has been prepared teachers.

Principles of Management / Reaction

In the classroom, teachers act as consultants and providers of hostile criticism. Teachers guide the group through three stages, namely (1) the problem-solving stage, (2) phase of classroom management (3) the meaning of the individual phases. Students should feel the comfort, security, protection, cooperation, mutual assistance, mutual respect, mutual respect between teachers give students, students to teachers, and students with other students.

Social System

Prevailing social system and takes place in this model is democratic. Group activities that occurred starting from the direction of the teacher. Classroom climate characterized by a process of interaction that is the deal. Learning is characterized by joint activity showed a reciprocal relationship between teachers and students and the students with other students. Students and teachers have a role (status) and act (act) in accordance with the norms or rules made by mutual consent. Class is part of the mikrososiologi that examines life in the school of social groups with the overall dynamics that occur in it. In the classroom there is a combination of individuals who form a social group that is organized and has a complex function and role in education eyeglasses. Meet the definition of classroom social group because a group of people who have a shared awareness of membership and will interact with each other. With the application of the model group investigation, students are expected to work together in heterogeneous groups.

Support system

Means of support necessary to implement this model is everything that touches the needs of the students to explore a variety of information is appropriate and necessary to carry out the process of problem solving. The system in question is supporting infrastructure, school culture and multicultural society. Infrastructure needed to support ICT-based learning is a multimedia laboratory / computer, hotspot, LCD projectors, school libraries, digital libraries, and others. School culture is a culture that is applied in schools that get used all the school community appreciates the diversity, technological literacy and reading culture. All the carrying capacity is expected to optimize learning and ICT-based multicultural context. Existence perpstakaan schools, computer labs and the hotspot would not just there but the completeness of the origin is a necessary tool utilization. School libraries should provide encyclopedias, dictionaries and books necessary for learning and ICT-based multicultural context.

Impact of Instructional and Accompaniment

The use of models investigative group based multicultural in learning to write scientific papers have impact instructional positive, the student can achieve competence to write scientific papers properly; solve problems multicultural with constructive, and work together in groups. In addition, the impact of accompaniment using this model is that students can solve problems independently with the group, the opinions and dignity of others of different cultures, and sensitive to the problems of multicultural around him.

3. Social Inquiry Learning Model in the Context of Multicultural Writing the Dramatic Texts Integrating ICT

Research and development has been done by Zulaeha, Rohman, and Faridi (2010) produced model social inqury include the goals and assumptions, syntagmatic, social systems, the reaction system, support system, and the impact of instructional and accompaniment.

3.1 *Assumptions and Objectives*

Social inquiry learning model with the guidance is intended to prepare students to find a concept or phenomenon through observation, collection of data and draw conclusions. Guru is not a conduit of information and students as recipients of information, however, teachers making lesson plans or steps of problem analysis. Students have investigation to discover the concepts. The main purpose of the model with the guidance of social inquiry is the development of thinking skills. This model was developed on the basis of principles: discovery, excavation theme, asking, liveliness, evaluation, diversity of learning resources, openness, cooperation, and tolerance.

3.2 Syntagmatic

- *Orientation*

Teachers provide an illustration of the appreciation of drama and materials before students practice writing drama texts. Teachers serve a multicultural video titled "sociology Out of The Box" lasted 9 minutes the players were students. Video was themed cultural differences that still unites friendship. This activity is conducted to train students sensitivity to social problems faced. Teacher directs the students to recognize the culture that is around them and how they feel about the cultural diversity. Students are expected to define their own elements of drama as well as builders in the text captures this cultural diversity into the theme of the drama texts. After that, the teacher gives some examples of text to be analyzed student teen drama.

• Hypothesis, is a temporary answer to the problem of a se-dang studied. Estimates as a hypothesis not just any estimates, but should have a solid foundation to think, so the hypothesis is raised that is rational and logical. Logical thinking ability is affected by the depth of insight and breadth of experience possessed. Thus, individuals who have less insight into the hypothesis will be difficult to develop a rational and logical and not skilled in formulating the problem.

- Explanation of Terms, is clarified that all group members can understand the subject matter covered. Each group are free to name asalakan accordance with multicultural themes. The students look up the definitions of terms in the text of the drama over the internet. Searched term on the internet including the prologue, text side, scenes, round, epilogue, dialogue, etc.. Once students know the definition of the term in the text drama, will facilitate the

understanding of the text entry drama.Dengan teacher, the students in each group discuss the questions raised, so as to have the same hypotheses and ideas can specify the text to be written drama.

- Exploration

Students did explore social phenomena and multicultural. Each group discussed the issue of cultural differences, to overcome these differences. Then identify the steps to write text drama, discuss, and pour the results of these discussions into a drama text in accordance with the theme they have chosen. Drama texts written by the students is still a draft, for further consultation via e-mail teacher.

- Verification

Verification is the process of determining the answer to that is considered acceptable in accordance with the data or information obtained by data collection. The students collected data from the discussion, find various cultural differences that exist around them, find solutions together counteract the problems that can arise due to cultural differences. Once the data is collected, they perform data analysis. Social berinkuiri jams occur frequently when students are not guided is appreciative of the subject matter. It's usually not appreciative ditunjukkan oleh ketidakgairahan symptoms in the study.

- Guided practice

Teachers guide students to write text drama outside school hours by utilizing e-mail and facebook adjust to students' abilities. Teachers receive e-mails that have been sent by students. E-mail that contains the text of the draft was examined by the drama teacher. This is done because the drama text written by the students are not at all so. Improvements are given in the form of the elements that will be assessed, eg the number of rounds, writing dialogue, giving the side text, writing setting accuracy, and text elements in the multicultural drama. E-mails that have been input by teachers, students resent the email to immediately rectified. In addition, teachers also receive mentoring through facebook.

- Generalization

Generalization or conclusion is formulated to describe the findings obtained based on the results of hypothesis testing. Students who have improved the draft immediately collect their drama text is final. At this drama text collection or print out a hardcopy. It aims to make it easier to teacher assessment.

Social System

Teachers help students to combine the event with the expected ideal conditions. Students still have freedom in an open discussion during the orientation phase and formulate hypotheses. Discussions were held with the heterogeneous grouping of students based on gender, religion, social status, and ethnicity. The students are aware of the condition of the existing cultural diversity in their classrooms. Background underprivileged students, assisted by students who are able to borrow the internet facility at home.

Reaction System

Students to search information through a search engine google. Cooperation conducted among students with other students when the discussion. E-mail and facebook as a medium for interaction between teachers and students outside of instructional hours. The draft text written drama students sent to the teacher via e-mail. Once given a

review, the draft is send back to the e-mail addresses of students. ICT used as media and means of more intensive coaching.

Impact of Instructional and Accompaniment

2. Instructional impact in the socio-guided inquiry learning model is (1) drama students write text in accordance with the steps to write correct, (2) can be sensitive to multicultural issues, (3) can pour ideas and ideas through the written text plays a multicultural context, and (4) active use of ICT in teaching writing drama texts.

3.

4. Conclution

Based on the above description can be concluded that the ICT-based language learning innovation made possible with the ICT-based learning. The device includes: (1) the conceptual framework SBC, (2) syllabus-RPP, (3) teaching materials, (4) media / visual aids, and (5) evaluation of learning. One form of learning and the development of innovative teaching materials is the development of a model investigation group in learning to write scientific papers ICT-based multicultural context. Development of the model is intended as a guide that contains the basis in the development, the principles of the model, the characteristics of the model, model design, teaching materials, scenarios, assessment and closing. Principle investigative group models include (1) the principle (2) democracy, (3) cooperative, (4) collaborative, (5) constructivist and (6) investigation. This principle is derived from the results of the respondents' answers to the statement of needs analysis. Model investigation group that developed the form of seven steps which include: the selection of topics, cooperative planning, implementation, analysis and synthesis, presentation, evaluation and re-creations.

In order to improve the utilization and development of innovative learning and teaching materials and language-based information communication technology (ICT) is oriented to the needs of students' communicative competence have submitted suggestions that the product of the results of this development can be used as a step in the world of schooling in the use of advanced science and technology . ICT is carried through in this study undoubtedly students, teachers, schools, governments, and stakeholders can be motivated or moved again in advancing education. In addition, competition is increasingly fierce global world makes ICT is no longer an expensive item, but it kind of needs to be met. On the other hand, the limitations of the model generated in this study provide further opportunities for research that can be used as a complementary study of the results that have been generated in this study.

Instructional relationships within a web-based learning environment: Students' perceptions in a Malaysian classroom

Mai Neo[79a], Ken T.K. Neo[b], Thian-Li Lim[c] Heidi Yeen-Ju Tan[d] & Wai-Jing Kwok[e]

[a-e] Faculty of Creative Multimedia, Multimedia University, Cyberjaya 63100, Malaysia

Abstract

The tertiary education in Malaysia like many countries in the South-east Asia region has gone through a huge transformation since the enhancement of web technologies. With the easy access of Web 2.0 tools, learners are able to engage in meaningful social interaction that can be harness into the educational context. The shift towards active student-centred learning strategies has allowed educators to continuously transform their classroom into a more active and interactive learning environment. This study investigated the instructional relationships, created by the use of web 2.0 and multimedia technologies and using Laurillard's (1993) Conversational Framework, between the teacher, students and technology. Results showed that using web 2.0 as a mediating component in the instructional process was interesting and effective for the student learning process and the Conversational Framework was successfully adapted in this learning environment.

Keywords: Malaysia, Laurillard, web-based learning, instructional relationships, multimedia, collaborative learning

Introduction

Malaysia's government has taking several initiatives to increase the role of science and technology education to achieve a develop country status by the year 2020 with a comprehensive 30-years plan to ensure that Malaysia becomes a developed nation in the new millennium to produce citizens who can apply knowledge in new domains and in different situations. The development of Information and Communication Technology (ICT) has given a tremendous boost in supporting new modes of delivery in training, teaching and learning within the last thirty years (Samuel & Zaitun, 2005). The utilization of ICT tools in education is increasingly felt in recent times and the utilization can bring a lot of advantages to both teacher and learner. ICT change the way teachers delivers content to students and students learn.

Research has shown that the traditional approach to teaching is of limited effectiveness (Jusoh & Jusoff, 2009), as emphasis is placed on theory without any practical and real life time situations (Ishak, Ariffin, Rosseni & Kari, 2002). This may lead to inadequate capability of handling different kinds of situations when students go out to the real world. In the traditional classroom, teacher is the one who delivers the lecturer content and controls the whole instructional process and the students listen to the lecture. Learners play a little part in their learning process and the learning mode tends to be passive. It has also been found by many teachers and students in most universities that the conventional lecturer approach in classroom is of limited effectiveness in both teaching and learning. Tan (2000), further noted that in order to address the development in education, there is a need to change the content of curriculum and the mode of delivering this curriculum to students. Laurillard (1993), stated that there is a need to look into university teaching and learning to promote effective teaching and learning and proposed a framework that emphasizes the importance of dialogue between student and teacher rather than the transmission of information from teacher to students which was used as a guide to design this study.

Addressing the issue of the passivity of students within traditional classroom settings has led to the development of student-centred learning environments and using constructivist learning approaches which are focused on giving the students control over their learning process and to develop their skills in active learning and problem-solving. As such, these approaches greatly affect the dynamics in the classrooms and the relationships between the students and

the teachers (Jusoh & Jusoff, 2009). Laurillard's Conversational Framework (1993) has been shown to be a framework that addresses the limitations of conventional teaching, and focus on the instructional relationships, defined as the "...l*earning process that will affect one another between teacher, student and technologies and how their roles changes in multimedia-mediated learning environment*" (Laurillard, 1993), that emerge from the learning environments.

With the introduction of multimedia and web 2.0 technologies into the curriculum, these relationships become even more complex, sophisticated and deeper. Such inclusion of multimedia technologies into the classroom has changed the educational landscape and introduced important changes in the educational system and impact the way learners communicate information with each other (Muller, Lee & Sharma, 2008). With Web 2.0 technologies, educators can further ensure that students have access, collaborate, reflect on their learning, and be engaged with technology (Herrington & Kervin, 2007, Jusoh & Jusoff, 2009, Laurillard, 2002). However, technology alone will not replace intuition, good judgement and problem-solving abilities, and thus, there is a need for educators to adjust their pedagogical suit to the new kind of learner they are encountering in this new generation of digital-savvy students. According to Laurillard (1993), there are four main aspects of the teaching-learning process: (a) The teacher's concepts, (b) The teacher's constructed learning environment, (c) the student's concepts, and (d) The student's specific actions.

This study investigates Laurillard's Conversational Framework in the context of a technology-backed classroom centred around a multimedia- and web-based project, to study these instructional relationships between students, teachers and the technology. The marriage of technology and a learning framework that emphasizes active participation through conversations and experiential learning would provide a deeper insight into these instructional relationships and create a community of learners mediated by multimedia and web 2.0 technologies.

Web 2.0 and web-based learning in the classroom

Web 2.0 is becoming the tools of choice to be use in education, particularly with the net generation (Jones & Cross, 2009). Web 2.0 technologies including social networking sites such as Facebook, MySpace, Twitter, blog, content sharing site such as Youtube and Flickr change learners from passive to active. Web 2.0 empowers students, engage students and enhance communication skills with others, increase peer learning and to inculcate lifelong learning (Barnes & Tynan, 2007). Understanding how students learn today is important for teachers to understand not only for how to teach digital students but more importantly, for how teachers reach them (Prensky, 2001). Web 2.0 technologies including social networking sites such as Facebook, MySpace, Twitter, blog, content sharing site such as Youtube and Flickr change learners from passive to active, and are therefore becoming the tool of choice. According to O'Reilly (2007), Web 2.0 provides richer user experiences than web 1.0. Web 2.0 is a new generation of web-related technologies and standards. The current era of the Web is all about two-way communication, collaboration and the classroom is an ideal place to utilize these technologies (Ishak et. al., 2002).

With the expanding lexicon of Web 2.0 applications, the landscape of education has evolved from using technology to teach to using technology to construct knowledge. The current student body too has evolved to a more techno-savvy and techno-hungry users as social networking tools have become part of their social lives (Windham, 2005). As such, the need to include these techno-social tools into the classroom has become the focus of many research studies in the educational field. The advent of multimedia technology has also created a new arena in learning. Educators are beginning to switch their attention into the new directions through technology resources to motivate learning. In the process of multimedia learning and interaction, students were influenced by the way the material is structured, presented and processed and enabled them to participate and be involved with the content of the application (Kim & Gilman, 2008). With these emerging technologies, students were expected to learn in various ways other than the traditional "chalk & talk" teaching method. Moore (2008) urged teachers to consider a role to change by using projects as learning strategies and multimedia creates ideal environments for such activities in which learners are engaged in their learning process. In addition, web learning has become common in classroom teaching with most of the higher education institutions engaging in web learning or some form of online teaching.

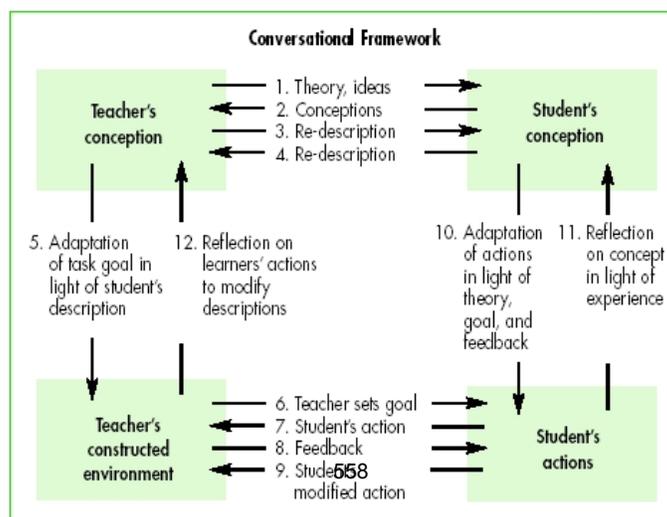
Laurillard (1993) states that, "*as an information and retrieval system, it [the Web] is a very well-designed medium*" and can be used in addition to classroom teaching. In order to strengthen the face-to-face engagements between peers, stronger links between in-class and online environments needed to be created. In developing the student

learning experiences, it is crucial to remember that an online connection is an important factor in forming a meaningful relationship and that physical interaction with peers is essential (McCarthy, 2010). Web 2.0, which includes social networking sites such as Facebook, MySpace, Twitter and blogs, empowers students, can engage students and enhance communication skills with others, increase peer learning and support in-class interactions (Barnes & Tynan, 2007). According to Hear (2006), the impact of web 2.0 is visible and teachers have started to use and explore the potential of blogs, social networking, and other social software which can empower students learning and create new way of thinking and learning opportunities. These tools allow teachers to share and discuss innovations more easily and, in turn spread good practice. It also allows students to become selectors, creators and collaborators while teachers have adopted the role of content shepherd, environment provider and facilitator, and enables them to interact and shift from passive learners to active and creative participation in multimedia content.

Laurillard's (1993) Conversational Framework was developed as a way of capturing the iterative, communicative, adaptive, reflective and goal-oriented actions with feedback that were necessary to support the complete learning process. The framework aimed to support the learning process by developing students' understanding through reflection and adaptation in relation to a goal-oriented task, with feedback which are operated on a discursive level (discussion, conception, negotiation between teacher and students), where dialogues between teacher and student take place, and on an experiential level. (practice, action, application), where the process of adaptation and reflection of the discursive level occur.

The framework aimed to optimise the learning process by supporting the student in developing their understanding through reflection and adaptation in relation to a goal-oriented task, with feedback. It requires students to iterate through a cycle of attending, questioning, practising, adapting their actions, using feedback, reflecting, and articulating their ideas. Educators have used this framework as a basis to explore communication and discussions between students (Phillips & Luca, 2000) and of the mix of web technologies used in teaching. With the interaction and feedback gained from the teacher, students are encouraged and supported to understand the concept and objectives of their tasks and proceed to experiential level, which is where students will then implement their ideas and reflect on what they have done. It is the level where students involved themselves, and experience critical thinking skills, problem-solving skills and communication skills. The framework allows them to iterate through a cycle of attending, questioning, practising, adapting their actions, using feedback, reflecting, and articulating their ideas (Laurillard, 2002). As such, this Conversational Framework is adapted for this study to investigated these relationships when mediated by Web 2.0 and multimedia technologies.

Designing the web-based learning environment with Laurillard's Conversational Framework

In this study, the learning environment was designed based on Laurillard's conversational framework. Laurillard maintains that the learning process must be constituted as a dialogue between teacher and student. Students are learning face to face in the class as well as learning using technology at their convenience time and place. Laurillard (1993) emphasized the importance of students getting feedback from their learning through reflection and adaptation in relation to a goal-oriented task, with feedback which is operated on two levels: discursive (upper half of the framework) and experiential level (lower half of the framework). On the discursive level, it is where all the discussion, conception, negotiation between teacher and students occur. With the interaction and feedback gained from teacher, it is to make sure that students understand the concept and objectives of the project and proceed on experiential level, which is where students work on their assignment. It is the level where students involved themselves, and experience which required critical thinking skills, problem-solving skills and


communication skills. Figure 1 shows Laurillard's Conversational Framework and Figure 2 shows the framework mapped to the learning environment.

Laurillard's Conversational Framework (1993, 2002)	Integrating Laurillard's conversational framework into learning environment
1. Theory, ideas	1. Teacher brief on multimedia project to students in the class and what they need to do.
2. Conceptions	2. Student asking teacher on the project conception and requirements
3. Re-description	3. Teacher explains to students on what they do not understand in details
4. Re-description	4. Students re-describe what teacher had explained to make sure they understand
5. Adaptation of task goal in light of student's description	5. Teacher design and adapt the learning environment based on discussions
6. Teacher sets goal	6. Teacher set the project's requirement
7. Student's action	7. Students working on project based on teacher's requirement
8. Feedback	8. Teacher gives feedback on students's work during in-class consultation hours or through web learning, Facebook and blog
9. Student's modified action	9. Students make amendment on their works based on teacher's comments and feedback
10. Adaptation of actions in light of theory, goal, and feedback	10. Students work on their projects based on the understanding during discussions
11. Reflection on concept in light of experience	11. Student's action reflect on their understanding
12. Reflection on learner's actions to modify descriptions	12. Teacher modify the project description based on reflection of learner's action

Fig. 1 Laurillard's Conversational Framework (Source: Quinn & Reid, 2003)
Fig. 2: Mapping Laurillard's Conversational Framework into learning environment

This study took place at Multimedia University (MMU) and this learning environment applied to MCC 0023, Computer Graphics 2 course. The participants were 1st year students (Alpha year) from Faculty of Creative Multimedia (FCM). This course took 8 weeks to complete, total consist of 3 credit hours. These were students with little or no background in design foundations. The students' ages ranged from 20-26 years old and consisted of 154 students (N=154) included mix of male and female. They came from different background and different races, consisted of Malay, Chinese, Indian and international students. The students were given a class project where The course design required students to form groups of 6 persons in a group and come up with a calendar design of their own choice. One group leader will be selected from each group. The calendar will have all 12 months and each member will be in charge of 2 months. In addition to the calendar, each group were required to create a blog to post and document the making of their calendars. The documentation would include the ideation of the calendar and each of the months created. Students were encouraged to include their designs, sketches, ideation, and references to create the calendar. These blogs would be update continually on their work on their progress, ideation, information sharing, and would be maintained by each of the team members and team leaders. These blogs could be view by all the other members in class to comment and share opinions. Students now had the opportunity to share their ideas as well as their progressions with their fellow group members while cooperate with one another in order to complete the assignment. Here students would be able to reflect on their work and make any necessary improvements before submitting their final application. Figure 3 shows an example of a group's blogging progress, and Figure 4 shows an example of their final work.

Fig. 3: Students blogging on their progress on the calendar development
and their peers' comments during the collaboration

Fig. 4: The final output from one student team

Data analysis and results

A questionnaire was administered to gauge the student's perceptions and attitudes on the learning environment. Questionnaires were measured in the Likert-type scale, the ranges for Likert-type scale are 1 - Strongly disagree, 2 - Disagree, 3 - Undecided, 4 - Agree and 5 - Strongly Agree and adapted from Burdett, (2003). The results of the survey were broken down into means (M), Standard Deviation (SD), and Percentage (%) of favourable responses (i.r., scored between 4 and 5 on the scale). The results are presented according to the following categories: 1) Teamwork and collaboration, to gauge how well they communicated and collaborated with each other, where the effectiveness of student communication and collaboration would impact the instructional relationships among the students, and is presented in Table 1, and 2) role of the teacher, which would shed light on the interrelationships between the students and the teacher when in this learning environment, and presented in Table 2. The data was analysed with SPSS 18.0 and each category yielded a Cronbach Alpha of over 0.8, making them reliable (Lim, Khine, Hew, Wong, Shanti, and Lim, 2003). Student comments were also solicited to further support the findings.

Table 1: Survey items on teamwork and collaboration

No	Items in the survey	(M)	(%)
1	I was able to cooperate with my leader	3.99	76.7
2	Class discussions generated close relationships between the students, teacher and vice versa	3.98	75.8
3	I enjoyed group discussions with my peers	3.92	76.7
4	I was able to cooperate with my team members	3.91	75.9
5	Class discussions helped me to understand the topic better	3.91	77.5
6	I learnt something from peer's feedback	3.86	72.4
7	I was not afraid to speak out my opinions in my group.	3.80	64.7
	Cronbach's Alpha =0.858		
	Student comments: 1. *"Able to communicate with the leader, share and compare ideas and thoughts."* 2. *"Great. We were able to communicate easily and finish work on time."* 3. *"We had fun and good discussions. We enjoy working in the group."* 4. *"Good. We have some problems at the beginning but after that we manage to solve it."* 5. *"We have good relationship. Communication is the best to maintain our relationship."* 6. *"My relationships with them are great. We share our opinions and suggestions to improve our project."*		

Results from Table 1 showed that 77.5% of the students enjoyed having class discussions to help them understand their topic better (Item 5, M=3.91). 72.4% of students reported having learned from their peer's feedback (Item 6, M=3.86), and being able to cooperate with their leader and team members (Item 1, M=3.99, 76.7% and Item 4, M=3.91, 75.9%). Furthermore, students enjoyed group discussions with peers (Item 3, M=3.92, 76.7%), which generated closer relationships among them, as they were able to contribute and voice their opinions (Item 2, M=3.98, 75.8%, and Item 7, M=3.80, 64.7%). The survey results were also supported by student comments, which showed that student found communications among their peers and leaders contributed considerably to their relationships and collaboration process.

Table 2: Survey items on the role of the teacher

No	Items in the survey	(M)	(%)
1	The teacher played an important role in this class	4.22	91.4
2	Communications between the teacher and students were important to me	4.03	81
3	Conversations between teacher and peers were important to me	3.91	74.1
4	I enjoyed class discussions with the teacher	3.90	75.9
5	I learnt something from the teacher's feedback	3.88	75.9
6	I learnt best when I interacted with teacher and peers	3.85	74.2
7	I enjoyed gave responses when the teacher asked questions	3.53	49.1
	Cronbach's Alpha =0.866		
	Students' comments 1. *"As a consultant, source of advice and progress monitor."* 2. *"To guide and help the students to understand better."* 3. *"Act as a guide for our studies. Students have to take the initiative to learn for themselves."* 4. *"Give us lecturer, explanation and as a consultant. Give us more useful information and tutorial."* 5. *"The one who we can refer to when we have problems."* 6. *"Motivate students; widen student's point of view and knowledge."*		

Results from Table 2 showed that 91.4% of the students preferred to have teacher in the classrooms (Item 1, M=4.22). Students also reported that communication and conversations with the teacher were important to them (Item 2, M=4.03, 81% and Item 3, 74.1%). Class discussions with the teacher were also enjoyable (Item 4, M=3.91, 75.9%) and students enjoyed giving responses when teacher asked questions (Item 7, M=3.53, 49.1%). Students learn from teacher's feedback (Item 5, M=3.88, 75.9%) and reported learning best with class discussions with

teacher (Item 6, M=3.85, 74.2%). Student comments solicited also supported these findings, as students commented on the various types of assistance they received from the teacher during their learning process. It was evident from the results that students saw the teacher still playing an important role in the learning environment.

Discussion and conclusion

From the results of the study, students showed that they were motivated to learn in this learning environment. They had fun and thought that it was interesting to do web-based multimedia project with their peers. By working collaboratively in a group to complete the project they were able to gain real life working experiences and learned to communicate and collaborate with one another. They acted as creative learners and active learners, and gave their opinions and ideas in the group, something which was lacking in the conventional teaching and learning classrooms, and was consistent with Burdett's (2003) finding that working collaboratively improves the learning process, builds friendships and sharing workloads. Students took on the role of supporter and helper to their peers to help solve problems together. Findings also showed that communication was everything, thus supporting Laurillard's framework for conversation and dialogue. From the finding from the survey, 91.4% of students stilled preferred having the teacher in the classroom. Students reported that the teacher played an important role in their learning and enhanced the learning environment. However, in this environment, the role of the teacher evolved, as students preferred that the teacher act as helper, guidance and reference for them to help and assist them in explaining the multimedia project, learning content, and for providing them feedback, thus supporting Ashe & Bibi (2011) who stated that in such learning environments, the teacher's role evolves to become providers of information, creators of communication spaces, facilitators of discussions, and designers of the environments. In addition, students found themselves in a two-way learning where communication and feedback occurred in the classroom as well as in web learning environment through blogs between them and the teacher, and amongst themselves as well, which facilitated increased productivity and collaboration. Their relationships became more transparent and dynamic, and the web 2.0 technology became an enabler for them to solve problems, communicate and collaborate. Giving and getting feedback was important to students, unlike in conventional classrooms, where the transmission of knowledge only occurs from teacher to students. With web 2.0 tools, students are able to obtain information anytime and anywhere. It moved from teacher-centric teaching to student-centered learning. Learning using web 2.0 showed the student learning process was more fun, challenging and motivating to them. Students were highly motivated to learn using technologies as they became active in the learning process. They showed that they were more willing to learn and explore in order to learn the content. They took the initiative to find out the answer for the problems, and became more confident in their learning. Learning using web 2.0 in the classroom had a positive impact on student learning process. The findings thus extends the conventional teaching and learning to include the dialogue and feedback between teacher and students and between students to students, consistent with that of Phillips & Luca (2000), to provide educators with better understanding of the impact of technology on the teaching and learning process and their roles in new learning environments. Figure 5 presents the conceptual model of the instructional relationships in this learning environment, culled from the results of using Laurillard's (1993) framework.

"Act as a guide for us...we can ask the teacher we don't understand and she will give us feedback."

"To motivate and guide students learning in multimedia environment."

"The teacher was there to guide us and help us."

"Teacher playing an important role. She is the one who motivate us to learn more about multimedia."

"Teacher assists us learning in multimedia learning environment."

Fig. 5: The instructional relationships between teacher, students and technology

The study also showed that Laurillard's (1993) Conversational Framework was an effective instructional guide for creating discourse and dialogue among the learners and the teacher. Mapping the framework to the group project and supported by web 2.0 technologies, to create this learning environment further strengthened the value the framework as practical guide to building engaging learning environments.

Integrating Project Based Learning Environment into the Design and Development of Mobile Apps for Learning 2D-Animation

Nurul Farhana Jumaat[a], Zaidatun Tasir[a][80]

[a]*Department of Educational Sciences, Mathematics and Multimedia Creative, Faculty of Education, Universiti Teknologi Malaysia, UTM, Johor Bahru, 81310, Johor, Malaysia*

Abstract

A widespread use of mobile devices such as smartphones, iPad, and Android tablet were known as rapidly growing trends among students in higher education. With thousands of applications or apps that are available via Apps Store and Google Play market, there are wide variety of applications or apps that meeting the vast needs among learners nowadays. Yet, it is quite a challenge for instructional designer to adapt with specific instructional learning setting in the design and development of mobile apps. This article focuses on integrating project-based learning environment into the design process and development of mobile apps for learning 2D-animation.

Keywords: Mobile learning; project based learning; instructional system design ; R2D2 model

Background of Study

With the abundant of apps in the App stores and Google Play, the effectiveness of those apps towards students' learning is questionable since learning is closely related to the instructional design of learning materials. It marks the importance for instructional designer to begin with well-structured learning materials by incorporating the learning objectives and teaching strategies as suggested previously by Moore and Kearsley (1996). This paper focuses in integrating project based learning environment into the design and development of mobile apps for learning 2D animation. We believe that, mobile apps that promote learning in the current market are highly beneficial to the students. It support self-paced learning environment where students could learn anywhere and at anytime according to their own preferences. In this paper, the apps are mainly developed for masters' students who are enrolled in Educational Technology programme in one of the university in Southern Peninsular of Malaysia. Students in the programme are required to complete one subject that will be exposed them with knowledge and skills in developing 2D-animation or multimedia applications using Adobe Flash software.

On the other hand, we are also aware that integrating project based learning environment means to offer authentic learning experience among students in which it proposes students to learn by taking part on every project or tasks provided. Besides, as nature of most authoring-based subject, it highly requires students to participate and involved in 'hands-on' activities as this subject require them to establish their technical skills rather than on theory basis.

Project based learning environment

Project based learning involved authentic learning environment (Eskrootchi & Oskrochi, 2010) that enables learners to construct knowledge in authentic context (Papanikolou & Boubouka, 2010). Such learning environment is highly believed to be the best approach that could facilitate learners to have full control throughout their learning process. It requires students to complete certain tasks and exposed them to investigate possible ways to complete the task (Kwok &Tan, 2004). From such experience, students are able to generate their own thinking skills and make them realize that there are few alternative ways to solve a problem. Present study incorporated project based learning environment in the design and development of mobile apps for students whereby the apps act as an educational tool that reflects task based on project. The apps consist of step-by-step video tutorial of practical and technical skills in developing 2D animation with Adobe Flash software. Project-based learning is actually reflects

the Theory of Constructivism by John Dewey (1916). It explains how learners construct knowledge by getting involved in the process of learning and experience it at the first place.

Mobile apps for learning

The use of mobile devices has transformed the way people communicate, access, and giving information (Bolorizadeh, Brannen, Gibbs & Mack, 2012). The rapid developments of apps have shifted the way information delivered especially in educational field to adapt with the current technology and to be used in teaching and learning. Interestingly, one study reported that student preferred to use mobile devices as technology supported educational tool because it is more accessible, more portable and newer technology (Sung & Mayer, 2012). Undoubtedly, there are numbers of apps that have been developed as a technology tool to support learning nowadays. Present report by NMC Horizon stated that mobile apps are the fastest growing trends in mobile technology in higher education (Johnson, Adams & Cummins, 2012).

Design and Development of Mobile Apps

Mobile apps for learning 2D animation is a mobile tutoring apps that provide users with information, interactive examples and step-by-step self designed video tutorial that will assist students on creating and developing 2D animation tools and creating multimedia courseware applications with Adobe Flash software. In this study, we plan to develop four apps that assist students in learning. The apps are mainly developed for Master's students who were enroll in Educational Technology programme in which most of them are teachers and part-time students. They are expecting such mobile apps in which they can have access anywhere and at anytime.

In this study, the R2D2 model was used as instructional guideline in the design and development of learning 2D animation apps. R2D2 stands for Recursive, Reflective Design and Development model developed by Willis (1995). This instructional design model lies on the constructivist principle. It is a non-linear model compared to ADDIE model and Morrison, Ross and Kemp model in terms of its flexibility. In this sense, it allows the designers to acknowledge the relationship between each stage of the design process and enable them to revisit each step in regulatory order (Willis, 1995). It is fluid and versatile model (Beldarrain, 2008). The R2D2 model had also been revised by Willis and Wright (2000). R2D2 is the suitable model as this model was based from constructivist theory of learning.

The R2D2 models developed by Willis (1995) offered a constructivist development model that is an alternative to the traditional model. Unlike the other model, R2D2 proposed a recursive approach, allowing the instructional designers to examine the development process in any order. They may revisit the process and make decision and make amendment and changes if needed (Chen & Toh, 2005). It is also a reflective model by means the designer must seek and consider feedback from other sources. The last principle is the participatory design in which this model offers both experts and users to contribute to the development process.

The main components of this model consist of three focal points:
i. Define Focus,
ii. Design and Development Focus, and
iii. Disseminate Focus.

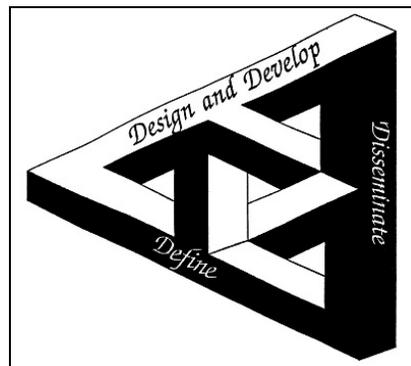
The components of R2D2 are as appear in Fig 1. It shows that this model has no beginning or ending and there is continuous interaction between those three focal point (Dick & Carey, 1996). It also shows that R2D2 is a non-linear process; it is a spiral process in which the tasks will be addressed many times.


Fig. 1. Components of R2D2

Define Focus

Unlike the traditional instructional design, there is no need to establish an objective at first point because to Willis (1995), what is more important is to involve end users, the teachers and students in the design process. Define focus has three activities including, a) Creating and Supporting a Participatory Team, b) Progressive Problem Solution, and c) Developing Phronesis or Contextual Understanding.

2.2.1 Selection of Development Environment

The development environment consists of three main characteristics: a) Power, b) Flexibility and c) Accessibility. As for the tool of the design, current software programs, Adobe Flash Professional CS5.5 were selected as the development environment. The software includes 2D authoring tool that support for creating interactive and dynamic multimedia content and also provide support for publishing mobile applications or apps for iOS and Android market. The software also provides powerful and accessible programming language, known as Actionscript. This programming language is easily accessible even to those who are not familiar with coding opens to develop the project with the software. Thus, this development environment is adequately powerful, flexible and accessible for experimentation and exploration of alternatives. In this study, Adobe Flash Professional CS5.5 was selected as development environment to create iPad apps that serve as a technology tool to support students in learning Authoring System subject. Adobe Flash Professional CS5.5 provides support for publishing mobile for iOS platform. Designer need to modify the publish setting and select AIR for iOS.

Then, a researcher will continue with the design process. Firstly, it started with the components of learning environment such as preparing the storyboard, the interface and also the instructional strategies. Table 1 indicates the outlines of each developed apps and its descriptions on learning topic, project based tasks and integration of project based learning criteria by Larmer (2012), embedded for each app.

Table 1. An example of a table

Apps	Learning Topic	Project Based Learning Criteria	Project Based Task	Learning Outcome
1	Introduction to Adobe Flash • The apps contain information of Introduction to Adobe Flash CS3. Several topics covered in the apps such as Flash's Interface including its tools and functions, Example of applications in Flash, Types of Interactions in Flash and requirements needed in learning Adobe Flash CS3.	• The project sets up a scenario or simulation that is realistic.	• Interactive example of several interaction elements in Adobe Flash such as the use of button, hotspot, drag and drop activity and types of text in Adobe Flash.	• Students are exposed with the basic understanding of Adobe Flash for instance, the software interface, the tools include and each functions. Students also are given with comprehensive information of types of interactivity offers in Flash, and various examples of multimedia applications that can be developed with Flash.
2	Drawing in Flash • The apps contain information and step-by-step video tutorial of Drawing tools and drawing techniques in Adobe Flash CS3. Several topics covered in the apps such as Basic Drawing: Creating Simple object & text, Basic Colouring and Drawing button in Adobe Flash CS3.	• The project meets real world situations beyond the classroom setting, or the products that students create can be used by real people. • The project focuses on a problem, issue or topic that is relevant to learning content. • The project sets up a scenario or simulation that is realistic. • The project involves tools, tasks or processes in real settings.	The tasks involved the students to produce several products including: • Drawing a building. • Drawing a cartoon. • Drawing a company logo. • Drawing menu buttons.	• At the end of the acivities, students will be able to construct their creativity by developing their own products based from the information and video tutorials embedded in the apps. • Students are able to identify tools and appropriate drawing techniques and skills needed upon completion from these authentic tasks.
3	Creating Animation • The apps contain information and video tutorial on basic tools and functions in creating animation with Adobe Flash CS3. Topics covered including types of symbols and various types of animation techniques that can be developed with Adobe Flash CS3. This app basically exposed learners on how to animate an object or graphic in Flash.	• The project meets real world situations beyond the classroom setting, or the products that students create can be used by real people. • The project focuses on a problem, issue or topic that is relevant to learning content. • The project sets up a scenario or simulation that is realistic. • The project involves tools, tasks or processes in real settings.	The tasks involved the students to produce several products including: • Creating a movie clip of butterfly flipping its wings • Paper aeroplane flying in specific path • Simple animated cartoon	• At the end of the activities, students will be able to construct their creativity by developing their own products based from the information and video tutorials embedded in the apps. • Students are able to identify tools and appropriate animation techniques and skills needed upon completion from these authentic tasks.
4	Application of Interactivity • The apps contain information and video tutorial on types of applications that can be develop using Adobe Flash CS3. This topic expose learners to develop interactive applications based on Flash core language that is Actionscript.	• The project meets real world situations beyond the classroom setting, or the products that students create can be used by real people. • The project focuses on a problem, issue or topic that is relevant to learning content. • The project sets up a scenario or simulation that is realistic. • The project involves tools,	The tasks involved the students to produce several products including: • Creating simple quiz • Creating drag and drop activity • Creating simple educational courseware	• At the end of the activities, students will be able to construct their creativity by developing their own products based from the information and video tutorials embedded in the apps. • Students are able to developed simple multimedia applications and practice the techniques and skills needed upon completion from these

<table>
<tr><td>tasks or processes in real settings.</td><td>authentic tasks.</td></tr>
</table>

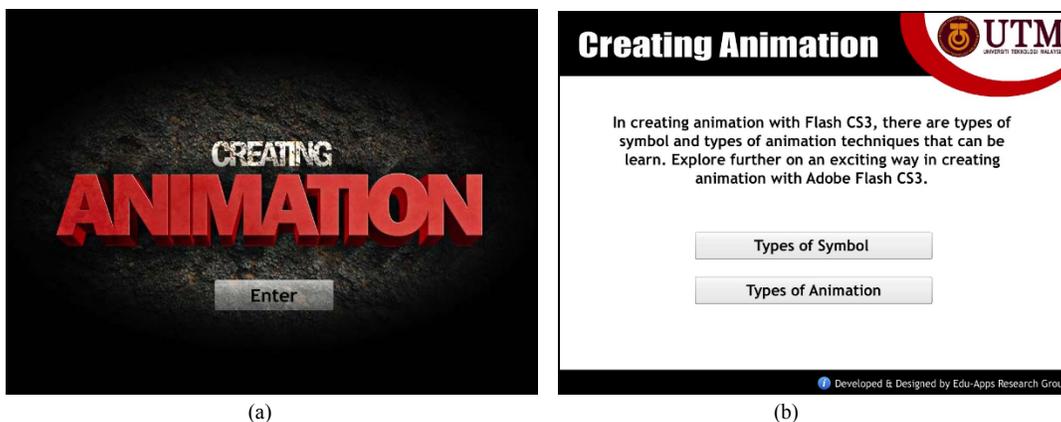
Upon the completion of preparing the learning materials, instructional designer will proceed with producing a single path prototype. The single path prototype examines the operational and navigational structure of the apps. A researcher had developed a simple prototype of the apps to ensure that the program runs smoothly from the beginning to the end. A researcher than proceed with alpha version, a completed apps that soon be provided to the students to provide feedback. In this study, a researcher had conducted a preliminary investigation (PI) whereas the apps were distributed to the students and a set of open-ended questions were prepared for students to provide feedbacks and opinion regarding the contents of the apps, the operational features and also the navigational structures. Feedbacks and opinions were gathered and several changes have been made before proceed to beta version. For example, in alpha version, the apps were embedded with video tutorial to assist student in learning, however students suggested providing a video tutorial with playback button. This will enable them to have full control over the video. For instance they would play, pause, stop and repeat the video according to their preferences. The alpha version was revised and with beta version, the apps were introduced as Version 1.0.0.

2.2.2 *Cooperative inquiry*

In R2D2 model, team members could cooperatively discuss and gathered materials in order to improve and enhance the learning environment. This continuous process requires members to reflect together and providing feedback based from their own experience because each member, the designer, subject expert, instructor and students will reflect based from their own point of view. In present study, each student's opinion and feedback on alpha version of the apps were reviewed and several changes have been made to suits student's need. This is known as one-on-one evaluation. Same goes to subject matter expert, who have a done a review on the accuracy and comprehensiveness of the contents delivered in the apps. These are all important to assured that the materials being prepared are in accordance with student's preferences.

2.2.3 *Product design and development*

In this study, four iPad apps were developed as instructional tool to facilitate students learning in Authoring System subject. As mentioned earlier, these apps were developed with Adobe Flash Professional CS5.5. In R2D2 model, Willis (1995) had listed out several components involve in the product design and development including: a) surface design, b) interface design and c) instructional strategies. The surface design refers to several aspects like the typography, language and graphics used in the study.

Besides focusing on the surface design, project designer also focuses on the aspects of interface design. The interface design highlights several criteria including the 'cosmetic' part of the project, usability, user interaction, navigation, user experience and also system support. For example, the use of text, button and graphics to show learners which section they are in. Adams *et al.* (2008) stated that the interface design is as important as it will support general features as example, to make a simulation engaging and easy to use for the users, and the types of controls that could enhance students' engagement in learning. Moreover, Oppermann (2002) also agreed that the presentation of the content is important as it will permit the learners to interact with content efficiently.


(a)   (b)

Fig. 2. (a) Interface design; (b) Main Menu

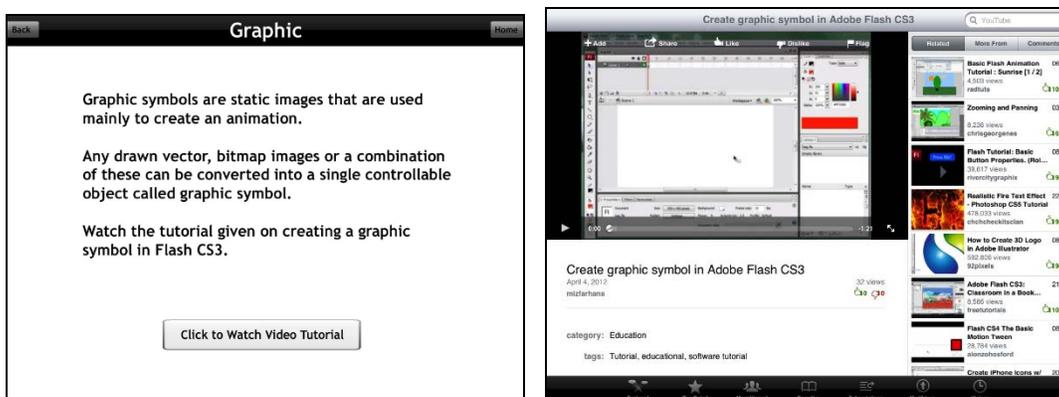
The apps also embedded with a step-by-step video tutorial along with audio narration to assist students in learning Authoring System subject. The playback button were provided for the video tutorial so that the students will be able to navigate the video according to their preferences whether to play, pause, stop or replay the video. Fig 3. shows the example of embedded step-by-step video tutorial.


Fig. 3. (a) Lesson Topic; (b) Self designed step-by-step video tutorial

Disseminate Focus

Dissemination focal point in R2D2 model focuses on the final packaging, diffusion and adoption of the iPad apps. This step is about distribution the apps to the students and it is essential to ensure that technical components in the apps are functioning. Diffusion and adoption is about helping the teachers and students to adapt the material to the local context.

24. Fig. 3. Developed apps as an educational tool in classroom

Conclusion

This paper provides a comprehensive overview of the design and development of learning 2D-Animation apps that is convincingly expected to supplement the learning of developing animation among novice learners. The learning 2D animation apps is designed and developed in an organized and systematic process within the context based on R2D2 model. The integration of project-based learning in the design and development of the apps suggests that it could facilitate learners to have a dominant control of their own learning process.

Interacting with Screenagers in Classrooms

Seo Young Yoon[a], June Lee[a], Chung Hyun Lee[a][81]

aHankuk University of Foreign Studies, 107 Imun-ro, Dongdaemun-gu, Seoul, 130-791, South Korea

Abstract

The differences in communicating methods between teachers who have learned to study in paper based context and students who are more familiar with screen based context can cause problems in classrooms. This paper discusses issues and concerns in interacting with students who grew up surrounded by multimedia and digital devices, in other words, screenagers, in classrooms. Based on the recent projects and research findings, four key themes are discussed regarding interacting through personal learning devices, communicating with the students in the way they do using social media, appropriate amount of exposure when using audiovisual resources, and possible side effects of using personal learning devices. Finally, teachers' roles and responsibilities in dealing with screenagers are discussed, and suggestion for using teaching models and teacher training are provided.

Keywords: Screenager; interactivity; personal learning devices; teachers' roles

1. Introduction

There always have been frustration and difficulties in understanding when it comes to communicating to teenagers. But there seems to be more than just generation gap and misunderstanding when trying to interact with the students in the 21st century. The students in classrooms now have been surrounded by multimedia and digital devices since they were very young, and they are very comfortable with high-technology and using small screen devices, hence the term—screenagers. These screenagers read information provided on screen instead paper, write using keyboards or keypads instead of pen or pencil, and they can tap into immeasurable amount of information on the Internet without having to physically get to the library. They freely use multimedia for instantaneous communication, multi-tasking, and information management in nearly all aspects of daily life. Therefore, teachers have to keep in mind that it is not simply generation gap or misunderstanding, but the means of communication itself for the young people have undergone radical changes. In choosing appropriate ways of teaching the screenagers, suitable communication methods needs to be taken into consideration as well as the characteristics of screenagers.

There are many countries where high-technology and multimedia play an essential role in the society, and South Korea is one of them. In most homes and schools, high-speed Internet connection is available, and most people, including children, use cellular phones. Taking advantage of the groundwork of nationwide information technology, digital textbook, personal digital media, Internet Protocol TV (IPTV), and others have been explored for possible use in education in last five years. Specialists in education and technology have been trying to find effective and efficient teaching methods and techniques for the screenagers. What is more, research projects using such multimedia tools have been concentrated on investigating the appropriate functions of learning devices, development of applicable teaching methods, a high level of interactivity, changes in students' academic performances, motivation and attitude, and suggesting solutions to problems that may arise when using the tools in classrooms. Based on these researches and projects, this paper discusses what the researchers have found as well as the lessons learned about screenagers in classrooms, focusing on the following four key themes: 1) interacting through personal learning devices (PLDs); 2) communicating as students do through social media; 3) appropriate amount of time for using moving pictures; and 4) possible side effects of using PLDs.

2. Interacting through Personal Learning Devices (PLDs)

In 2005, the development of digital textbooks was instigated with the funding from the South Korean government. By 2009, digital textbooks for 10 subjects including Korean, English, social studies, mathematics, science, music for 5th grade, and Korean, mathematics, social studies, and science for 6th grade were developed. The implementation of digital textbooks began with 5 experimental schools in 2006, and by 2010, they were put into service in 112 schools. From 2015, teachers and students are to use digital textbooks in the language classrooms at elementary and secondary schools nationwide, and learning tools in the smart learning environment are to follow (C. H. Lee, 2012). Extracurricular support for cyber home learning system (CHLS) using videoconferencing for the digital textbook has been developed and has shows positive results according to research findings (Lee, Yoon & Lee, 2013)

The reasons for using digital textbooks are due to rising need for a change in educational environment and up-to-date pedagogy that is more suitable for screenagers. PLDs and shared displays have been found to promote student participation and interaction while improving learner articulation process as well (Liu, Chung, Chen & Liu, 2009). Digital textbook provided through tablet PC is implemented, therefore, as an evolved form of learning materials for the screenagers. Digital textbooks use the same content as the printed textbooks along with multimedia contents such as video clips, animation, virtual reality, access to search engines, and a variety of interactive tools. The hardware used for digital textbook is tablet PC networked to the teacher's computer and the electronic blackboard. Students can use electronic pens to take notes or highlight contents in the textbooks and save them for later viewing (KERIS, 2008). The digital textbook not only expands the possibilities for learning, but it makes what was impossible with printed textbook possible. For example, video clips of interviews with authors can show students what the authors had in mind in more personal manner than via paper. Augmented reality technology or animation of volcano eruption can visually assist science lessons. In foreign language classes, authentic audio and video files can provide much needed ample exposure to the target languages.

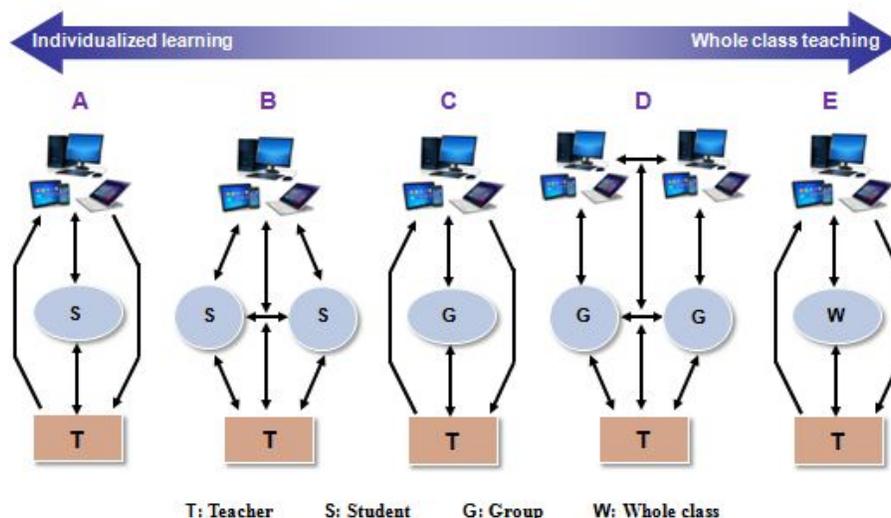
An appropriate use of multimedia tools and resources like digital textbooks and web contents can make classrooms come alive, but then again, that does not mean that it always increases students' comprehension and cognitive ability. Multimedia alone cannot substitute the role of teachers, replace the humanness of classroom interaction, nor take the place of firsthand experience (C. H. Lee, 1988, 2012). Therefore, appropriate and high quality interaction patterns, students-content, student-student as well as student-teacher interaction need to be ensured and enforced through suitable application of multimedia tools and resources. Figure 1 shows how PLDs can be used for various types of interaction among teacher, individual student, groups, whole class, and PLDs in individual learning as well as whole class teaching. For example, interactive composing tools can be used in music classes where students can compose musical pieces and play them using variety of musical instruments. Also in math classes, students can solve problems on their respective table PCs. Teachers can click on students' computers from the teacher's computer to take a look at how they are doing. The teacher can also display a specific student's tablet PC screen on the electronic blackboard for the entire class to see. The individual students can then compare the process of solving mathematical problems with their peers. By sharing their thought processes and knowledge with each other, students can engage in both reception of knowledge and active production through engaging in interactive learning.


Figure 1. Interaction patterns using PLDs in the classroom (Based on Lee, 1998)

There is an assortment of PLDs available for classrooms like tablet PC, personal digital assistant, portable media player, and cellular phone to name a few. In employing PLDs in the classroom, the interaction patterns need to be maximized regardless of the type of PLDs and functions. Appropriate use of PLDs in classrooms have been reported to promote learner collaboration and interaction and provide enrich learning experience (J. Lee, 2012; Roschelle, 2003; Zurita & Nussbaum, 2004). When the teachers successfully make the most of PLDs while providing maximized interaction, it will bring about positive changes to the students' performance and the quality of education in schools.

3. Communicating as students do through social media

The majority of students in Korea carry cellular phones with them wherever they go. Cellular phones are primarily used for communication purposes, but some students use them for more than just communication. The advance and evolution of cellular phone technology has allowed users to listen to mp3 files stored in their phones to listen to songs, study foreign languages, or record voices. Most phones now allow users to take pictures as well as record videos, surf the Internet, and watch Internet lectures through digital multimedia broadcasting services. Recently, the expansion of smartphones enabled numerous academic applications to be used by students and teachers both in and out of the classroom. Students can search for the nearest library and the availability of books before they actually go to the library to rummage through the shelves, and visually impaired students can download applications that read books aloud for them.

In the flood of applications and functions that are made available via cell phones or smartphones, the most popular and the most frequently used ones are, needless to say, Short Message Service (SMS) and Mobile Messenger Application (MMA). It is common to see students sending SMS or MMA messages in school, in restaurants, on the street, and even in classes. The one way to overcome the communication gap is actively engaging in communication using the methods that the target group uses. If students use SMS or MMA to carry on interaction, it means that it is worth considering SMS or MMA as a potential tool of student-teacher interaction. In fact, incidents of South Korean public school teachers successfully building relationships and taking communication to a meaningful level with teenagers using SMS have been reported (Lee, 2007). The interactions reported were meaningful in that they were more than mere increase in number of messages, but the content of communication was genuine. In other words, students felt more personal to the teachers who are willing to communicate in the way that they do and were willing to open up to the teachers who seem to understand them.

Affective domains regarding knowledge and skill acquisition such as students' attitude, beliefs, underlying emotions can affect learning significantly (Brown, 2007). Also intimacy to the teachers cause students' affinity seeking behaviors in a variety of context and positively affect students' performance in respective academic subjects, and ultimately, school life in general (Mottet, Richmond, & McCroskey, 2006). It is also found that learners are given the opportunities to be creative and produce information when they were given the chance to apply the knowledge they have learned in the manner they are familiar with, such as in networked environment or

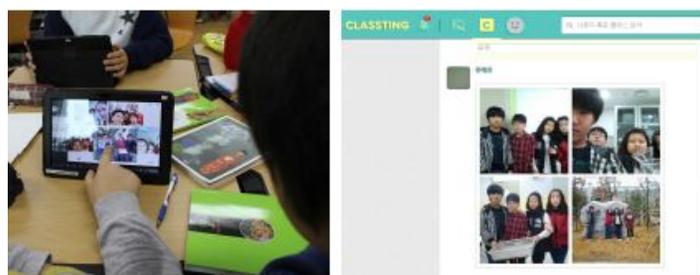
online environment (Beghetto, 2007: Burleson, 2005; Sawyer, 2006; Tuomi, 2007). If a teacher can successfully communicate to the students using SMS or MMA to reinforce genuine student-teacher interaction, it may lower students' affective filter and promote enhanced learning environment. To promote such effect, SMS component of cellular phone can be used as a tool for individual counseling, and social media such as MMA, Tweeter, and blogs can be used as group counseling or group communication tools for the whole class. Figure 2 shows how 6th grade students used camera application, picture editing application and Social Network Service (SNS) application in their smartphones to conduct a group project in science class (J. Lee, 2012). J. Lee (2012) reported that the students were able to successfully complete their projects on comparing and contrasting of objects of their choice and suggest possible usages without technical difficulties. PLDs provide group and individual communication tools such as e-mail, SMS and MMA messages, Bulletin Board System (BBS), and chat. Moreover, instantaneous application, and students' familiarity, cellular phone and social media seem to be more efficient and effective for communication purposes.


Figure 2. Group project using PLDs and SNS (J. Lee, 2012, p. 47)

4. Amount of time for using moving pictures

In order to get in touch with screenagers, more and more teachers are turning to TV programs, videos files, and DVDs to use as teaching resources in classrooms. To assist these teachers and to enhance the quality of education through ample provision of academic programs and resources, the government began installing IPTVs in all South Korean public elementary and junior high schools since the fall of 2009. Unfortunately, the teacher perspectives on IPTV have not been positively so far. Some teachers have complained that the remote control operated IPTV is complicated to use, and others wanted control panel to be linked to the teacher's computers. Surprisingly, the biggest issue with IPTV that the majority of the teachers addressed was not the technical unfamiliarity or difficulties. They questioned the educational value of using audiovisual contents for a prolonged time in class and pointed out the length of video programs to be the biggest problem (Lim, Kim, Han, & Ko, 2009). It is difficult to find time to have students-teacher interaction outside of the classroom, and student-teacher interaction mostly takes place in the classroom. Accordingly, many teachers were unwilling to sacrifice in-class students-teacher interaction time by showing audiovisual contents for prolonged time in classrooms.

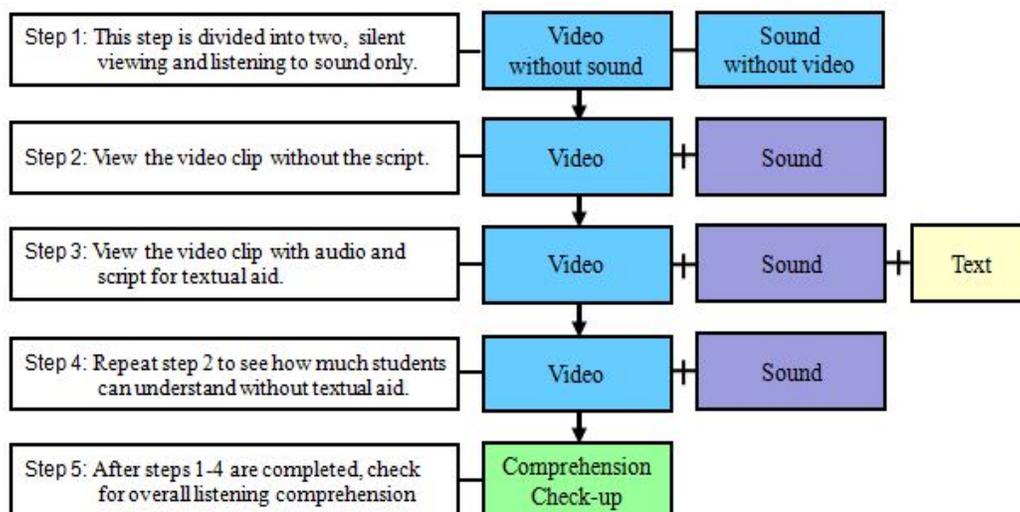
When it comes to the most preferred web contents by Korean elementary school teachers, it was found that the 3 minute video clips from the major Korean broadcasting companies and foreign news programs related to the contents addressed in the textbooks were the most one (Lee, 2004). These short 3 minute video clips related to the contents found in the national curriculum are provided to the teachers as educational resources. The teachers found them useful for focusing students' attention on the content, activating schema, and bringing together the lesson for follow-up activities. When DVDs or TV programs are used in reality, they are too long to allocate class time to check for comprehension, not to mention discussion or interaction. Audiovisual contents can be very useful in classes, but it seems that too much of it can do more harm than none. To conduct a class using short video clips, Lee (2004) suggests a thorough and effective listening class can be conducted in language classrooms using 3 minute video resources in Figure 3. It can be seen that each step serves to promote learners' listening skills using video, audio, as well as textual aid.


Figure 3. Five stages of using video effectively (Based on Lee, 2004)

5. Possible side effects of using PLDs

The digital textbook used in Korea displays the contents through monitors and projectors and use the wireless Internet just like PLDs. It seems to be helpful in teaching and learning as well as communicating to the students. Moreover, when the level of exposure to electromagnetic wave was measured, and the result showed that it was less than that of tablet PC. It seems to be effective and appropriate for the screenagers, but it is not a cure all, and there are downsides to it. When 40 elementary school students who have used digital textbook for more than 1 year were asked if they have experienced discomfort while using the digital textbook, some students have complained of eye fatigue, stiff neck, shoulder pain, fatigue, dizziness, drowsiness, and lethargy when using the digital textbooks (SeoMoon et al., 2009). Therefore, the students were advised to keep a distance of at least 50cm from the screen to prevent health risk and take frequent breaks from staring at the monitor for a prolonged period of time. Also, a study on children's interaction with tablet PCs, it was reported that when students use individual tabletop display and there was no shared display available in the classroom, there were possibilities of loss of eye-contact as well as unaware of visual focus (Scott, Mandry & Inkpen, 2003). The availability and arrangement of technical devices in classrooms need careful consideration in actual implementation.

Using screens and monitors introduces learning environment that is completely different from using printed textbooks. Such environment can be effective, efficient, and convenient; but it needs to be acknowledged that it may cause computer-related health problems if used excessively. Bright screens and monitors causing eye fatigue and eye sensitivity are one example of it. Many of these health problems can be avoided with proper training and forming good habits such as having good posture and stretching constantly.

The good news is that there are new technologies and electronic devices being developed like flexible displays using e-ink, and smartpens that electronically save the handwritten notes. The introduction of such technologies and being aware of possible health risks may alleviate many health problems and concerns that current PLDs seem to cause. Despite how convenient digital technologies seem, as teachers, both students' mental and physical well-being need to be taken into consideration, and the time and amount of PLDs usage should be carefully considered in using PLDs in classes.

6. Conclusions

What teachers know for sure about screenagers is that teachers do not know enough about them. The things teachers know are limited to the external descriptions like screenagers use the Internet and cellular phones all the time, they prefer audiovisual presentation over textual, they put an emphasis on emotion and sensation, and they are used to quick access to information online. But screenagers do not stare at screen just for the sake of doing so. They seek genuine interaction through SMS and look for group identity through BBS.

Some teachers use SMS or MMA to build student-teacher relationship and win their trust, and others use blogs and Twitters to reach out to their students. When experienced and qualified educators and teachers are clearly

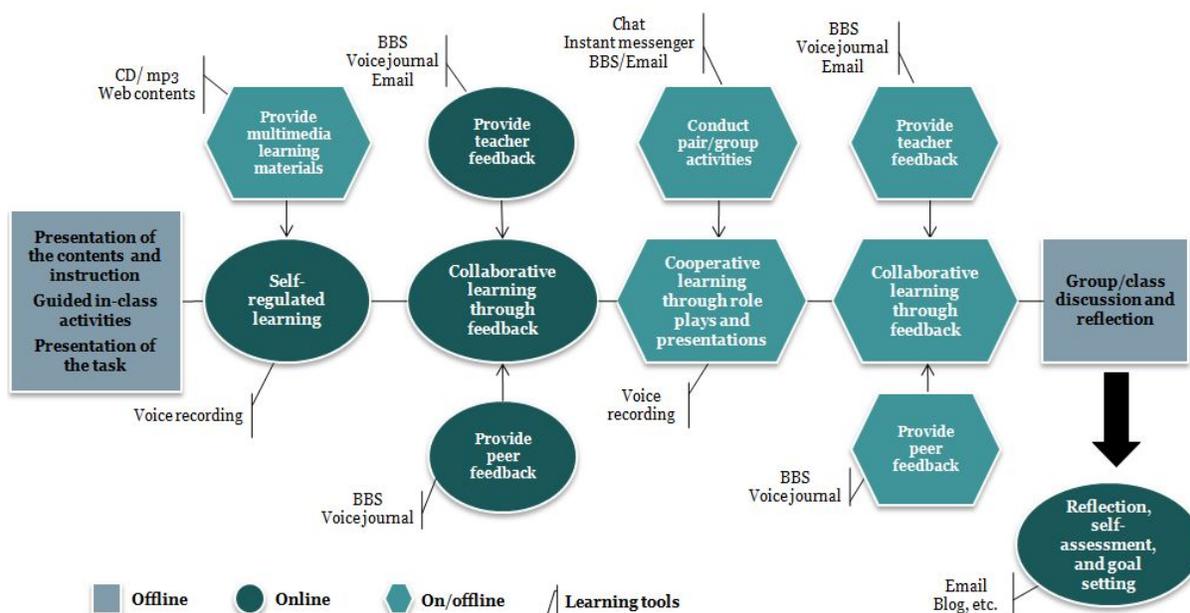
informed of the needs, preference, and learning styles of this distinct and unique generation, appropriate and effective teaching methods and teaching models can be developed and made available for improving the quality of the classrooms. Kangas (2010) presented Creative Playful Learning (CPL) model using technology to provide interesting educational contents in highly technology enriched environment. It aims to let learners play with technology in learning environment as they normally do in their daily lives. In order to use teaching models using technology, such as CPL model, the teacher has to be aware as the students are in using technology including PLDs and SNS, and teachers must be able to navigate the technology enriched environment with ease. Many teachers are now aware of the possibilities that online environment offers, and they are turning to blended learning models as well. An example of such teaching model is seen in Figure 4. Yoon (2011) presented a blended learning model for teaching spoken language skills using online and offline multimedia tools that are generally familiar to teachers and students using both asynchronous and synchronous communication. The model allows different types of learning to occur such as independent self-regulated learning, collaborative learning, and cooperative learning while promoting various types of meaningful interaction among teacher-students, teacher-whole class, and student-student. In this model, meaningful interaction is permitted in and out of the classroom using various multimedia tools which allow more focus and guide during in class task. It was found to be helpful for large classrooms because the students felt that they were given more personal attention by the teachers through interaction on PLDs and SNS. Teachers, in turn, should be able to take the model, make necessary modifications based on sound theories, and apply them to their own classes.


Figure 4. The optimal BLS model (Yoon, 2011)

As Prensky (2001) claimed, the teachers now are digital immigrants whereas the students are digital natives, and the bizarre circumstance of immigrants trying to teach the natives is what is going on in schools. That of course, does not mean that the immigrants should give up and leave the natives own their own. What needs to be kept in mind is that the screenagers are students. They have lots to learn, and so far, they lack experience and knowledge and need teachers to guide them. That is why meaningful interaction between students and teachers is needed, and teachers need to learn the language of screenagers to communicate with them. When teacher presence was strong, and interaction was directly felt, students reacted as desired; however, when the teacher presence was taken away, even when the technical interactivity was there, the students did not meet the pedagogical goals as desired (Kennewell, Tanner, Jones & Beauchamp, 2008). Teachers must be well aware of the importance of using technology in the way the students do, but teachers must also take the responsibility to control and make appropriate use of technology for effective learning to occur. Therefore, proper teacher training programs based on hands-on practice are needed so that teachers can use, evaluate, and modify teaching methods and instructional models for application of multimedia and PLDs, and ultimately design and develop syllabus and contents for their classroom needs. The teachers need to rise up to the challenge of the current times. Teachers who can meet the needs of the

learners are teachers who can bring about changes in their learners. In order to do so, they must take responsibility to evolve into knowledgeable teachers who can use multimedia and SNS efficiently and effectively.

Internet memes as an information dissemination tool for libraries: the Ateneo de Manila University experience

Karryl Kim A Sagun[a][82]

^aAteneo de Manila University, Katipunan Avenue, Loyola Heights, Quezon City 1108 Philippines

Abstract

An increasing popularity of Internet memes can be observed particularly among college students. Websites such as 9gag, Reddit, and 4chan provide a venue for these memes to be visited by the general public. Having observed this trend, the Rizal Library of the Ateneo de Manila University embarked on a strategy to use Internet memes as an information dissemination tool. The initial phase involved creating social media accounts for the Rizal Library to serve as the initial source of information. After which, various marketing strategies were implemented to amplify the followership of the aforementioned accounts, therefore increasing the figures of the targeted audience. The final phase involved creation of the memes and the evaluation of results. After the completion of the project, statistics reflected an exponential growth in the reach of the advertisements posted by the Rizal Library, with the audience themselves contributing to the information dissemination process. This can be supported by the enhanced usage of the services and collections which were promoted using memes.

Keywords: Internet memes; information dissemination; libraries; social media; Ateneo de Manila University; Rizal Library; Philippines

Background

The Rizal Library of the Ateneo de Manila University kept itself occupied in the past years by continuously building its collection and improving its services. It prides itself in its unique special collections, namely, the Ateneo Library of Women's Writings (ALIWW), a collection of manuscripts and other realia by and about influential Filipino women, the American Historical Collection (AHC), with materials from the American regime in the Philippines, and the Pardo de Tavera Library and Archives, which houses donated materials from influential Filipino families, and is considered a rich collection of materials on Philippine culture. During the past half decade, it has managed to construct two buildings for its expanding collection and growing number of users. Aside from that, it keeps itself abreast with current library practices, such as e-collections, ubiquitous access for library materials, and various digitization projects for preservation and access purposes. However, despite these efforts, statistics reflect low usage for library materials. Announcements also have a very small reach, with very few students knowing about training schedules, changes in hours, and events in the library. Management decided it was high time to give more importance to marketing. Aside from exploiting the gains from the various expenses the library has incurred to service its clients, it is also important to conduct marketing for institutions such as the Rizal Library to gain political, social, and economic support. (Naikwadi & Chaskar quoting Kotler, 2012). The move was not only necessary; it was also long overdue. The institution then hired an Assistant to the Director for Special Programs and Events in 2011 to focus solely on marketing and promotions. She started with getting to know the different market segments, and found out that the largest mass of the client base was not being marketed to: the undergraduate students. This group was found to be composed of millennials, born between years 1980 to 2000, the era of the computer, and are proficient in working with technology. (Beekman, 2011) They are further described by Solheim (2012) as individuals who "grew up with video games and tend to interact over their smart phones." In the same article it was said that social media plays a vital role in their lives.

It has been evident in the social media sphere that Internet memes have been gaining popularity during the past few years, with websites such as 9gag, Reddit, and 4chan providing venues for these memes to propagate. Masterpasqua (2010) defined memes as "bits of information that replicate themselves; they can exist in brains as

---

* Corresponding author. Tel.: +632 426 6001 local 5559; fax: +632 426 6001 local 5564.
E-mail address: ksagun@ateneo.edu

well as in any number of other storage devices, from books to the Internet." Thus, it is natural or innate for a meme to replicate itself, even those found on the Internet. This has been the premise of this study: that memes can prove to be an important information dissemination tool for libraries—particularly for promotion of its collection and services as well as for circulating important announcements. Furthermore, Bell (2013) described the importance of using memes in her column, Belltones. According to her, "students of all ages are in tune with popular culture and love tie-ins that show teachers, librarians, and other educators are as well." She adds that memes appeal to people across different age groups. This information served as the basis for the marketing *plan of attack* to use social media and Internet memes as an information dissemination tool in the Rizal Library. The strategy was implemented by the second semester of academic year 2011-2012.

Marketing via Internet memes

2.1 Preparation of Social Media

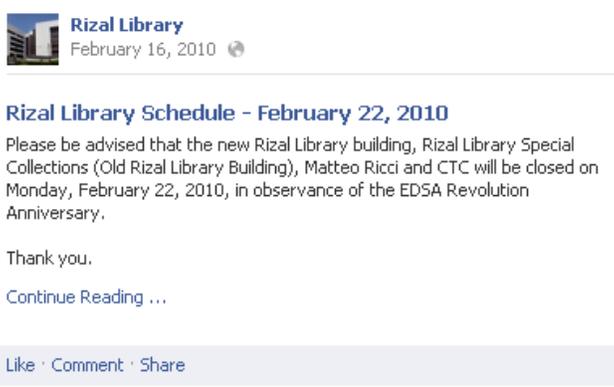
While the Rizal Library did have its own Facebook and Twitter accounts since 2010, the use of these accounts was not very utilized. The Facebook account had only 2,000 likes, while no more than 900 users were following its Twitter account. This is a far cry from the University's approximately 10,000 students. Moreover, the accounts were being used to post traditional announcements, with a formal status update informing the community of changes in schedule, public holidays, among others.


Fig. 1. Sample of social media announcements before strategy implementation

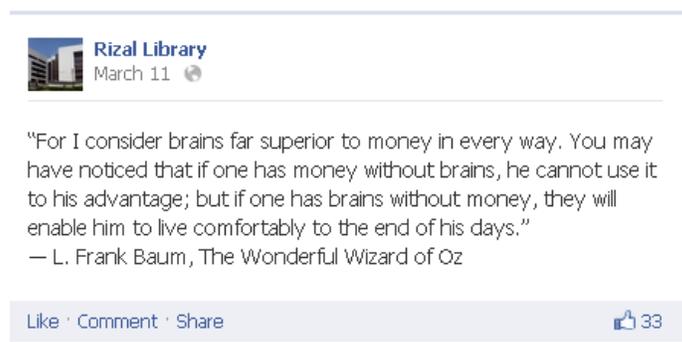
To improve its utilization, various marketing activities were conducted in 2011 to increase the followership of these accounts. Updating the accounts regularly was the first step conducted. Posting quotes from books, asking engaging questions to help initiate interaction, and holding contests from time to time were performed by the Library.


Fig. 2. Sample of social media announcements beginning strategy implementation

Followership doubled at this time, and it was evident that the market was ripe for picking—there were enough people to see and share the memes as they are posted.

2.2 Implementation and Results

The strategy initially targeted the most resource-intensive yet underutilized services of the Rizal Library: 1) EBSCO off-campus online database access, and 2) Readers Advisory Service. Being an institution from a third world country, subscribing to EBSCOhost databases and technology services entailed a huge chunk of the institution's budget. It was still, however, found highly important by the Library as it is the "the most-used, premium online information resources for tens of thousands of institutions worldwide, representing millions of end-users." ("EBSCO Publishing", 2011) Readers Advisory Service, on the other hand, was very expensive in terms of labor, as three professional reference librarians were hired to conduct this service.

The strategy employed to use Internet memes was further utilized to market openings for student assistantships, changes in schedule, and new collaborative spaces within the library. In 2011, posters of these memes were posted on the social networking sites of the institution. These were augmented by printed posters situated inside strategic places within the building, such as elevator waiting areas, computer terminals, and doorways.

2.2.1 Marketing Underutilized Services

EBSCO off-campus online database access would allow students to view and download e-articles in the comforts of their own home. Thus, the library is able to provide service even after the working hours of its employees. While this is a useful service for students, there is still room for improvement in terms of usage statistics. Pre-implementation, there were only 1,417 password requests. This reflects low usage if these figures will be compared to the 10,000 students of the University. In the same manner, Readers Advisory Services, or one-on-one consultations with librarians is one of the standard reference services offered by academic libraries, yet the Rizal Library only garnered two during the year 2010-2011.

26. Table 1. Usage of Underutilized Services

Service	Pre-implementation	Post-implementation	Increase
EBSCO Off-campus Password Requests	1417	1972	39%
Readers Advisory Requestors	2	52	2500%

After implementation of the project, a significant improvement in usage of the two services was observed, as password requests increased by 39%. On the other hand, the number of Readers Advisory requestors recorded a 2500% increase, rising to 52 sign-ups in 2011-2012, after the strategy has been implemented.

27.

28. Table 2. Extent of Reach of Memes for Underutilized Services

Service	Likes	Shares
EBSCO Off-campus Access	406	285
Readers Advisory Service	545	147

The memes for the two aforementioned services were posted on the Rizal Library's social networking accounts. The poster for the EBSCO off-campus access garnered 406 "likes" and 285 "shares" on Facebook, while the poster for Readers Advisory Service acquired 545 "likes" and 147 "shares".

2.2.1 Use of Memes for Announcements

The Rizal Library has had openings for student assistants for the past couple of years, but had no applicants for the posts. In the same manner, students were being informed by the library of changes in schedule, but only a few have been reached by the said announcements. Thus, it has been decided that the same strategy implemented to promote the aforementioned underutilized services be used for important announcements as well. Results show a positive outcome, as post-implementation, the institution has received 91 applicants and counting.

29. Table 3. Extent of Reach of Memes for Announcements

Service	Likes	Shares
Term Break Opening	317	71
Roodeck Study Hall Availability	119	105
Student Assistantship Program	251	75

In applying memes to its announcements, the Rizal Library has achieved a farther-reaching effect for its posts, with its audience "sharing" or "reblogging" the posts, hereby helping extend the reach of the announcements. Announcements have also increased their reach exponentially, with 317 "likes" and 71 "shares" for the term break schedule announcement, and 119 "likes" and 105 "shares" for the availability of the Roofdeck Study Hall.

Conclusion

Memes proved to be a very effective means of conveying a message to the Rizal Library's clients. With an expanding followership for its social media accounts, and a continuing popularity for Internet memes, the Rizal Library intends to continue using this medium to promote its other services and collection. In the same manner, the institution shall continue to use memes to post announcements and exploit the multiplier effect of this method. The Facebook account of the Rizal Library now has over 7,000 likes, and its Twitter account has garnered over 5,000 followers, and an increasing trend is foreseen for the academic years to come.

Abstract

The aim of this study is to analyse problematic internet usage of university students according to pyscho-social features (loneliness and shyness) and gender. Survey model is used for this research. To collect data; personel information form, problematic internet usage scale, UCLA-loneliness scale and shyness scale were applied for 601 students who are from different Departments of Faculty of Education at Fırat University. To analyse these data correlation, t test, one way variance (ANOVA) analysis and Scheffe test were used. Results revealed that problematic internet usage was significantly associated with loneliness (r=.35) and shyness (r=.31). Furthermore, there were significant differences between problematic internet usage and independent variables (gender, loneliness and shyness). The results of the study were discussed together with the results of different studies and suggestions were made.

Keywords: Problematic internet usage, loneliness, shyness.

Introduction

Today which is called technology era, it is a reality that technology makes our lives easier. Internet comes first among these technologies which makes our life easier. Besides providing easy access to information, internet offers online shopping, online banking and communication by social networks. While providing these facilities, it has some risk factors which can effect our lives in negative ways. The most important of them is the problematic usage of internet as a risk of human life.

Beard and Wolf (2001) defined problematic internet usage (PIU) as use of the internet that creates psychological, social, school, and/or work difficulties in a person's life. PIU is a multidimensional syndrome consisting of cognitive and behavioural symptoms that result in negative social, academic, or professional consequences (Caplan 2002, 2003; Davis, 2001; Davis, Flett, & Besser 2002; Morahan, Martin & Schumacher, 2003, cited in Caplan, 2005). According to Young (1996) problematic internet users who spare little time for real people in life prefer to spend time alone on computer. The definition of problematic internet usage focuses on variations in one's life.
A variable which studied with problematic internet usage is loneliness. Loneliness is generally defined as being physically alone in a society. A person can feel the loneliness despite being with others. Thus, the reason of loneliness is because of insufficient social relationships and satisfaction taken from these relationships (Buluş, 2007). Engelberg and Sjoberg (2004) have found that there is a positive relationship between internet addiction and loneliness and negative relationship between social episodes and internet addiction. Nalwa and Anand (2003) has

---

found that addicted internet users are much more lonely comparing non addicted ones. Whang, Lee and Chang (2003) reported that Internet addiction group had higher degree of loneliness and depressed mood compared with the non-addicts group. In a different study, Deniz and Tutgun (2010) found that there is a correlation between loneliness levels and problematic internet usage of prospective teachers studying at education faculties.

Another variable which studied with problematic internet usage is shyness. Definition of Melchoir and Cheek (1990) is that shyness is an anxious preoccupation of the self in response to real or imagined social interaction and is associated with heightened self-consciousness during self-presentation and evaluation situations. Yuen, Lavin, Weinman and Kozak (2004) applied online questionnaire to assess Internet dependency and shyness. The results demonstrated the predicted interaction such that shyness level for nondependents did not differ online or in face-to-face (FTF) interactions. However, dependents' shyness was greater in FTF interactions relative to online interpersonal exchanges. The research Yang and Tung (2007) applied in Thaiwan shows that students with personalities characterized by dependence, shyness, depression and low self-esteem are more likely to become addicted than students without these characteristics.

Aim of study

The aim of this study is to examine problematic internet usage of university students at the age of 16-24, which are the most common internet users' age range in Turkey (Turkish Statistical Institute, 2012) , according to pyscho-social features (loneliness and shyness) and gender.

2. Method
2.1. Sample

The sample group of this study is 601 students from different Departments of Faculty of Education at Firat University. 328 (%54,6) of the students are female, 273 (%45,4) of them are male, average age of students is 22,35 (Sd:1,07).

2.2. Instruments

Problematic Internet Usage Scale (PIUS): The PIUS was developed by Ceyhan, Ceyhan and Gürcan (2007) with the assumption that the severity of Internet use shows continuity from normal to pathological use. The PIUS consists of 33 items rated on a five point scale. The high scores on the scale indicate that an individual's Internet usage is too unhealthy in that it may affect his or her life negatively and it may increase the tendency to addiction. According to the validity and reliability studies, the PIUS is a valid and reliable instrument which can be used to measure university students' problematic computing behaviour (Ceyhan, Ceyhan & Gürcan, 2007). In the present study, the internal consistency coefficient of the scale was computed as .91.

UCLA Loneliness Scale (UCLA-LS): UCLA Loneliness Scale was developed by Russell, Peplau and Cutrona (1980); the validity and reliability of its adapted version is tested by Demir (1989). The scale measures the overall feelings of loneliness in individuals through a self-report Likert-type scale comprised of 20 items. 10 of these items are positive statements and the rest are negative statements. The scale reports range from 20 to 80 where higher scores mean a higher degree of feelings of loneliness. Reliability of the scale is reported as .96. In the present study, the internal consistency coefficient of the scale was computed as .85.

Shyness Scale (SS): The SS used in the study was developed by Cheek (1983) as a revision of the original shyness scale developed by Cheek and Buss (1981). It measures the inhibition and discomfort that people experience in the presence of others. The scale contains 13 items, each of which consists of five response options in a Likert-type format and anchored by ''very uncharacteristic or untrue, strongly disagree'' and ''very characteristic or true, strongly agree.'' The Cronbach alpha reported for the revised scale was .90. Shyness scores on the revised scale were also correlated substantially (r= .68) with the aggregated ratings of subjects' shyness as provided by three to five close friends and family members (Leary, 1991). The scale was translated into Turkish, and reliability and validity studies of the scale were carried out with a Turkish sample of 300 university students (Gungor, 2001). The result of the construct validity study, using principal component analysis with varimax rotation, showed that the scale had one identifiable dimension. After this study, a new form of the scale consisted of 20 items. The result of the reliability study showed that the test-retest correlation coefficient was .83. Gungor (2001) reported internal consistency reliability for the scale as .91. In the present study, the internal consistency coefficient of the scale was computed as .89.

2.3. Procedure

Survey model is used for this research and to collect data; personal information form, PIUS, UCLA-LS and SS were applied to students from different Departments of Faculty of Education at Fırat University. UCLA-LS and SS were categorised by using mean and standard deviation as low, middle and high. Correlation test, t test and one way variance (ANOVA) were used in this study. Furthermore, to find out the differences among groups, Scheffe test was used.

3. Findings

Table 1. Means, standard deviations, correlations, and alpha reliabilities for variables.

	1	2	3	Cronbach's Alpha
1.PIU	1			.91
2.UCLA-LS	.35*	1		.85
3. SS	.31*	.50*	1	.89
Mean	70,9	39,3	54,5	
Standart Deviation	20,7	9,8	15,4	

*p<.01

As seen in Table-1, the results indicated that there is a positive relationship between problematic internet usage and loneliness (r=.35). It has been found that there is a positive relationship between problematic internet usage and shyness (r=.31). Furthermore there is a positive relationship between loneliness and shyness (r=.50).

Table 2. Means, standart deviations and t values of problematic internet usage of university students according to gender

	Gender				
	Female (n=328)		Male (n=273)		
	$\overline{X}$	Sd	$\overline{X}$	Sd	t	p
PIU	68,4	20,9	73,8	20,1	-3,249	.001*

*p<.05

Table-2 show that there is a significant difference between males and females in relation to problematic internet usage (t(599)=-3,249; p<.05). When these results analysed, it is seen that problematic internet usage of males ($\overline{x}$=73,8, Sd=20,1) is higher than the females ($\overline{x}$=68,4,Sd=20,9).

Table 3. Means, standart deviations and F values of problematic internet usage of university students according to levels of loneliness

	Levels of Loneliness								
	Low (n=113)		Middle (n=380)		High (n=108)		F	p	Difference H>M H>L
	$\overline{X}$	Sd	$\overline{X}$	Sd	$\overline{X}$	Sd			
PIU	63,3	17,7	70,4	20,1	80,2	22,5	19,582	.000*	M>L

*p<.05

As seen in Table-3, the result showed that significant difference was found between problematic internet usage and levels of loneliness (F(2-598)= 19,582; p<.05). Scheffe test was performed to determine the groups which caused difference. The results showed that problematic internet usage is higher for the student who feel lonely in high level when it is compared with middle and low levels. Furthermore, problematic internet usage is higher for students who feel lonely in the middle level than who feel in the low level.

Table 4. Means, standart deviations and F values of problematic internet usage of university students according to levels of shyness

	Levels of Shyness								
	Low (n=103)		Middle (n=401)		High (n=97)		F	p	Differences H>M H>L
	$\overline{X}$	Sd	$\overline{X}$	Sd	$\overline{X}$	Sd			
PIU	63,8	19,6	71,2	19,4	77	24,5	10,713	.000*	M>L

*p<.05

As seen in Table-4, the result showed that significant difference was found between problematic internet usage and levels of shyness (F(2-598)= 10,713; p<.05). Scheffe test was performed to determine the groups which caused difference. The results showed that problematic internet usage is higher for he student who is shy in high level when it is compared with middle and low levels. Furthermore, problematic internet usage is higher for students who is shy in the middle level than who is in the low level.

4. Results and discussion

This study examined the relationship between problematic internet usage and pyscho-social features (loneliness and shyness). Furthermore, problematic internet usage was examined according to independent variables (gender, levels of loneliness and shyness).

When the problematic internet usage was examined according to gender, there was a significant difference between males and females in relation to problematic internet usage (t(599)=-3,249; p<.05). When this result was analysed, problematic internet usage of males ($\bar{x}$ =73,8, Sd=20,1) was higher than the females ($\bar{x}$ =68,4 Sd=20,9). This finding is consistent with the finding in literature (Bakken, Wenzel, Götestam, Johansson & Øren, 2009; Balta & Horzum, 2008; Bulut-Serin, 2011; Choi, 2001; Li & Chung, 2006;Odacı & Kalkan, 2010; Tahiroğlu, Çelik, Uzel, Özcan & Avcı, 2008). The reason of higher problematic internet usage of males can be considered as effect of culture. Male in Turkey can access internet easier than female in Turkey. Some other studies show that there are no significant difference between male and female users (Ceyhan, 2010; Hall & Parsons, 2001; Ferraro, Caci, D'Amico & Blasi , 2007; Subrahmanyam K & Lin G., 2007). In another study, Doğan, Işıklar and Eroğlu (2008) found that the level of problematic internet usage of females were higher than males.

When the relationship between problematic internet usage and loneliness of university students was examined, it was found that there was positive moderately relationship (r=.35). Besides when the problematic internet usage is examined according to levels of loneliness, it was found that there was significant difference (F(2-598)=19,582; p<.05). According to this significant difference it was found that problematic internet usage was higher for the student who felt lonely in high level when it was compared with middle and low levels. Furthermore problematic internet usage is higher for students who feel lonely in the middle level than who feel in the low level. One hand these findings are consistent with the findings other studies in literature. (Batıgün & Hasta, 2010; Bozoğlan, Demirer & Şahin, 2013; Caplan, 2007; Engelberg, & Sjoberg, 2004; Esen, 2010; Moody, 2001; Nalwa & Anand, 2003; Odacı & Kalkan,2010; Özcan & Buzlu,2007; Wang, Lee & Chang, 2003). On the other hand some studies' results are not consistent with the results obtained from this research. (Dittman, 2004; Subrahmanyam & Lin, 2007). According to these results, it was mentioned that as the level of feeling loneliness gets higher, problematic internet usage gets higher too and there were positive significant relation between loneliness and problematic internet usage. The reason of relationship between loneliness and problematic internet usage can be thought as a result of accepting people of internet without any condition. Furthermore, spending time on the internet limits the time for face to face relationship with other people. This situation causes low social interaction and loneliness in society. According to Moody (2001), although internet is used as communication tool, it affects people's social being in negative way.

When the relationship between problematic internet usage and shyness of university students was examined, it was found that there was positive moderately relationship (r=.31). When the problematic internet usage is examined according to levels of shyness, it was found that there was a significant difference (F(2-598)= 10,713; p<.05). According to this significant difference it was found that problematic internet usage was higher for the students who were shy in high level when it was compared with middle and low levels. Furthermore problematic internet usage was higher for students who were shy in the middle level than who were in the low level. These findings are consistent with the findings other studies in literature (Caplan, 2002; Chak & Leung, 2004; Ebeling-Witte, Frank & Lester, 2007; Yang & Tung; 2007; Yuen et al., 2004). Internet may be so attractive for shy individuals because they disguise their identities easily and live less anxiety in internet. This situation may increase the possibility that those individuals may isolate from the social life.

An increase in problematic internet usage due to the increase in loneliness and shyness level, which influence interrelationship among individuals negatively, is a notable finding of this study. In accordance with these findings, individual or group counselling can be provided for students to improve their interpersonal capabilities. Also, Implementation of social skills education may be effective in reducing loneliness and shyness. Furthermore, these programs may have indirect effect in prevention of problematic internet usage.

ᶜTunceli University, Vocational High School, "Tunceli", Turkey

Abstract

With the advent of the computer technologies, we are increasingly encountering these technologies in every field of life. The fact that the computer technology is so much interwoven with the daily life makes it necessary to investigate certain psychological attitudes of those working with computers towards computers. As this study is limited to the impact of technology on education, anxiety, out of certain psychological attitudes, was investigated within it. The investigation was on the vocational high-school students' computer-related anxiety, and as a data collection instrument, the Computer Anxiety Scale was used. The Computer Anxiety Scale was conducted on 265 students receiving education at various departments in the Tunceli Vocational School of Tunceli University. It was observed as a result that gender is a variable that did not make any meaningful difference for the computer anxiety, while the type of education received, grade, receiving computer education and having a computer may mean meaningful differences in terms of various sub-factors and the whole scale itself. It is necessary to determine the level of computer anxiety, and keep it under control while receiving computer education or while learning with computers.
Keywords: Undergraduate study, Computer anxiety, learning with computers, Vocational High-school students

INTRODUCTION

With the advent of the computer technologies, we are increasingly encountering these technologies in every field of life. The fact that the computer technology is so much interwoven with the daily life makes it necessary to investigate certain psychological attitudes of those working with computers towards computers. One of these psychological attitudes is computer anxiety. Howard and Smith (1986) define the computer anxiety as "*the tendency of a person to experience a level of uneasiness over his or her impending use of a computer*".

In the relevant literature, the anxiety is mentioned together with such behaviors as keeping off computers, abstaining from computers and computer phobias. The computer anxiety is classified as a special kind of anxiety, and such various types of it as sense of frustration, possibility of shame, disappointment and experiencing fear of obscurity are mentioned (Orr, 2009). Moreover, such findings as that the computer anxiety leads to decrease in success and in effort for success (Phelps and Ellis, 2009) seem to have been obtained. Keen (1998) mentions the existence of a social dimension for the computer anxiety, and states that such expressions during learning as "*you cannot do it*", "*you cannot be successful*" are effective on the computer anxiety. Saade and Kira (2009) emphasize that feelings like disappointment, frustration, worry, etc. will affect not only the interaction with computers but also productivity, learning social relations and individual welfare in general. In addition, Çakıroğlu (2009) dwells on the computer anxiety in terms of human physiology, and claims that the computer anxiety has some symptoms like sweating, dampening of hands, stomachache, difficulty in breathing or feeling of suffocation, palpitation and strain of lips. Other than the computer anxiety, frustration, regret, disappointment and feeling of panic are said to be other affective hinders that computer instructors encounter (Burkett, Compton and Burkett, 2001).

All of the above-mentioned research findings clearly show that the computer anxiety should be taken into account in learning activities conducted with computers. In this study, the computer anxiety was dealt with in terms of the

E-mail address: mtuncer@firat.edu.tr

students of Vocational school. Thus, the general aim of the study can said to be the investigation of the Vocational school students' computer anxiety. In accordance with this aim, the Vocational school students' opinions about the computer anxiety were compared in terms of such variables as gender, type of education received, grade, experience of computer education and having a computer.

METHOD

The design of this study can said to be a survey model. As Karasar (2009:76) puts it, it is aimed to describe past or present situations in the survey model. The survey model is resorted to in the case of larger samples differently from other research designs (Büyüköztürk et al., 2008:177).

The sample of the study consists of 265 students receiving education at various departments of the Tunceli Vocational School of Tunceli University. 200 of these students are females (75.5 %), and 65 of them are males (24.5 %). 160 of the students are in the first year (60.5 %), while 105 of them (39.5 %) are in the second year of their study. The students are from 7 different programs. The ages of the students range from 16 to 28, and the age mean is 22.13.

The data collection instrument used in the study is the Computer Anxiety Scale developed by Heinssen, Glass and Knight (1987), and adapted by Tuncer (2012). As a result of the adaptation of the scale, it was observed that the scale is made up of 13 items and three dimensions. Altogether with this three-factor structure of the scale, 56.045 % of the total variance is explained. The scale is made up of these three factors: anxiety due to lack of learning, anxiety due to fear of making mistakes and uncertainty-based anxiety. The Cronbach's alpha coefficient for the whole scale is .75.

FINDINGS

The student's opinions gathered with the application of the Computer Anxiety Scale were compared in terms of such variables as gender, type of education received, grade, experience of computer education and having a computer. The independent groups t-test results of the students' opinions about the computer anxiety in terms of gender variable are given in Table 1 below.

Table 1: Comparison of the Opinions about Computer Anxiety in terms of Gender

Dimension	Gender	n	$\overline{X}$	SS	Levene's test			T test	
					F	p	df	T	p
Anxiety due to lack of learning	Female	200	4,02	,85	1,433	,232	263	1,068	,286
	Male	65	3,90	,80					
Anxiety due to fear of making mistakes	Female	200	2,87	1,09	,105	,746	263	-,789	,431
	Male	65	2,99	1,07					
Uncertainty-based anxiety	Female	200	3,09	,93	,359	,550	263	-,685	,494
	Male	65	3,18	,92					
The Whole Scale	Female	200	3,45	,62	,774	,380	263	,005	,996
	Male	65	3,45	,56					

As it is seen in Table 1, the opinions about the computer anxiety were compared in terms of the gender variable, and no meaningful difference was observed in any dimension of the scale and in the whole scale itself.

Another variable that was investigated within the study is the type of education received. There are two groups of students in this regard: the students attending school in daytime (Normal education) and those ones, which entered the school with relatively lower exam-marks, attending school in the evening (Evening education). The results of the independent groups t-test, by which the students' opinions were compared, and of the Mann Whitney U test, which is resorted to when the distribution is not homogenous, are summarized in Table 2 below.

Table 2: Comparison of the Opinions about Computer Anxiety in terms of the Type of Education

| Dimension | Education type | n | $\overline{X}$ | SS | Levene's test | | df | T test | |
					F	p		t	p
Anxiety due to lack of learning	Normal ed.	172	4,10	,77	5,311	,022*	263	U=6931,50	
	Evening ed.	93	3,79	,92				p=,008*	
Anxiety due to fear of making mistakes	Normal ed.	172	2,90	1,09	,000	,988	263	,032	,972
	Evening ed.	93	2,89	1,07					
Uncertainty-based anxiety	Normal ed.	172	3,12	,89	,948	,331	263	,031	,975
	Evening ed.	93	3,11	,99					
The Whole Scale	Normal ed.	172	3,50	,55	5,684	,018*	263	U=7790,00	
	Evening ed.	93	3,36	,69				p= ,205	

*p<.05

According to Table 2, there is only a meaningful difference of opinions, in terms of the education type, in the "anxiety due to lack of learning" factor of the scale in favor of the students of normal education (U=6931.50, p<.05). No other meaningful differences were observed in other dimensions of the scale in terms of the education type variable.

The grade of study was determined to be another variable that should be investigated within this research study. For, it was aimed to investigate the state of computer anxiety of both those who had just started receiving undergraduate study and taking information technologies courses, and those who would be graduated in a short time with a relatively more informed mind in this sense. The results of the independent groups t-test which compares these students' opinions about the computer anxiety in terms of the grade variable are given in Table 3 below.

Table 3: Comparison of the Opinions about Computer Anxiety in terms of Grade

| Dimension | Grade | n | $\overline{X}$ | SS | Levene's test | | df | T test | |
					F	p		t	p
Anxiety due to lack of learning	1st Year	160	4,07	,811	,778	,379	263	1,818	,070
	2nd Year	105	3,88	,871					
Anxiety due to fear of making mistakes	1st Year	160	2,98	1,05	,927	,336	263	1,453	,147
	2nd Year	105	2,78	1,12					
Uncertainty-based anxiety	1st Year	160	3,00	,88	,994	,320	263	-2,447	,015*
	2nd Year	105	3,28	,97					
The Whole Scale	1st Year	160	3,49	,61	,003	,956	263	1,091	,276
	2nd Year	105	3,40	,61					

As a result of the analyses, there is only a meaningful difference of opinions in the "uncertainty-based anxiety" dimension of the scale in favor of the second-year students (t(263)=-2,447, p<.05). No other meaningful differences were observed in other dimensions of the scale in this regard.

There were also comparisons of those students who had somehow received computer education before and those who had never received any computer education before. Thus, it was thought that there could be an answer for the

question "Does having a knowledge of computers affect the computer anxiety?". In the analyses done in this sense, it was observed that there is only a meaningful difference of opinions in the "anxiety due to fear of making mistakes" factor of the scale in favor of those who had not received any computer education before (t(263)= -2,752, p<.05). The results of this analysis are given in Table 4 below.

Table 4: Comparison of the Opinions about Computer Anxiety in terms of Experience of Computer Education

Have you received any computer education?		n	$\bar{X}$	SS	Levene's test		T test		
					F	p	df	t	p
Anxiety due to fear of making mistakes	Yes	140	2,75	1,11	1,688	,195	263	-2,752	,006*
	No	125	3,11	1,01					

The last variable whose effect was investigated within the study is the case of having a computer. The computer anxiety-related opinions of those who have a computer and those who do not have any were compared and summarized in Table 5 below.

Table 5: Comparison of the Opinions about Computer Anxiety in terms of having a Computer

Do you have a computer?		n	$\bar{X}$	SS	Levene's test		T test		
					F	p	df	t	p
Anxiety due to fear of making mistakes	Yes	107	2,58	1,06	,170	,681	263	-3,919	,000*
	No	158	3,10	1,05					
The whole Scale	Yes	107	3,40	,49	8,621	,004*		U=7588,500	
	No	158	3,49	,67				P=,035*	

The analyses show that there are meaningful differences of opinions in the "anxiety due to fear of making mistakes" dimension of the scale (t(263)=-3,919, p<.05) and in the whole scale itself (U=7588,500, p<.05) in favor of those who do not have a computer.

DISCUSSION

On evaluating the overall findings of the study, it was identified that gender is a variable that did not make any meaningful difference for the computer anxiety, while the other variables may mean meaningful differences in terms of various sub-factors and the whole scale itself. This finding regarding gender is opposite to the findings of the study carried out by Chen (1986). Chen (1986) concludes that males have more positive attitudes towards computers than females, and they have less computer anxiety. On the other hand, Loyd, Loyd and Gressard (1987) claim something totally opposite to this idea. Rosen, Sears and Weil (1987), Tuncer (2010) and Badagliacco (1990) conclude in parallel with this research that gender is not effective on the computer anxiety.

Upon the comparisons in terms of the grade variable, a meaningful difference was found on behalf of the second-year students in the "uncertainty-based anxiety" dimension of the computer anxiety scale; whereas Tuncer (2010) concludes that there is no any meaningful difference in terms of the computer anxiety according to the grade variable.

Another find of the study is that having experience of computer education is effective on the computer anxiety. There is a meaningful difference of opinions on behalf of those having not received any computer education in the "anxiety due to fear of making mistakes" factor of the scale. According to Chua, Chen and Wong (1999), Harris and Davison (1999), Computer training courses or computer education reduce the computer anxiety temporarily. However, according to Gos (1996), Safford and Worthington (1999), the computer anxiety increases with the increase of skills in this sense. According to Arıkan (2002) and Akkuş (2004) the computer anxiety decreases with the increase of computer experience.

Learning in this sense is negatively affected with the increase in such anxieties as failure to accomplish the learning task, encountering bad situations, inability to achieve the objectives (Başaran 2005: 411). Therefore, while receiving computer education or learning with computers, to determine the level of the computer anxiety and to keep it under control will enhance learning productivity.

Khatam Al-Quran in Islamic Education Curriculum in Malaysia

Surul Shahbudin Bin Hassan, Dr. Muhammad Azhar Bin Zailaini[85]

Ph.D Candidate UM cum Lecturer, International Islamic University Malaysia, Gombak 53100, Malaysia
Senior Lecturer Faculty of Education, University of Malaya, Kuala Lumpur 50603, Malaysia

Abstract

This study intends to explore the role played by J-QAF and Islam Education teachers in achieving the objective of complete recitation of the Quran (Khatam al-Quran) by primary school pupils. The study is focussed on teachers involved in the teaching of J-QAF first level pupils in 2005, now in their fourth year of primary school. The teachers involved have used the best possible strategy and technique in their lessons in order to ensure that Muslims pupils would be able to accomplish Khatam al-Quran while at primary school. Among fourth year pupils, there are some who have achieved complete recitation. However, this has been accomplished through a combination of the pupils' recitation at home as well as in school. Although some pupils have completed, there are still (many) pupils at the level of Iqra' books 1, 2 and 3. So this study is intended to discover the reality of the teaching of J-QAF since it was introduced in 2005.

Keywords: Khatam Al-Quran; Islamic Curriculum; Malaysia

INTRODUCTION

The J-QAF programme was based on an idea proposed specifically by the Prime Minister of Malaysia during his visit to the Ministry of Education Malaysia on the 30th of December 2003. The proposal was considered in detail at a J-QAF seminar organized by the Ministry of Education from the 3rd to the 5th of March 2004. The J-QAF programme was implemented on an experimental basis in a pilot project for 3 months ending in July 2004. The Prime Minister subsequently agreed for this programme to be implemented from school year 2005.

The J-QAF programme is an effort to strengthen Islamic Education through special emphasis in the teaching of the Jawi script, the Quran, Arabic Language and Fardu Ain at the primary school level. The implementation of this programme involves the use of its own distinctive curriculum, models and modules. Specialist teachers are used for remedial teaching, guidance, skill development, strengthening, enrichment and subject appreciation among pupils. The implementation of the programme uses the present timetable allocations.

Nevertheless, this study will only focus on matters related to the Khatam al-Quran (Complete Recitation) programme in primary schools and on the role of teachers in achieving this objective.10 pt) Here introduce the paper, and put a nomenclature if necessary, in a box with the same font size as the rest of the paper. The paragraphs continue from here and are only separated by headings, subheadings, images and formulae. The section headings are arranged by numbers, bold and 10 pt. Here follows further instructions for authors.

1.1. J-QAF KHATAM AL-QURAN MODULE

According to the "Panduan Dasar dan Pelaksanaan J-QAF" (J-QAF Policy and Implementation Guide), JAPIM (2008), the recitation of the Quran is currently being taught as part of Islamic Education under the category Quran Recitation guidance. However it does not stress learning until completion of the Quran because that would require continuous guidance using an adequate number of teachers in proportion to the number of pupils, using the *talaqqi* and *mushafahah* approach (that is, by a method of learning where each student directly faces his teacher, who shall listen to the student's recitation, correct any mistakes, and demonstrate the correct and proper way of reciting). As such, the subject of Islamic Education in schools is only geared towards the ability to recite the Quran, while the aspect of complete recitation of the entire Quran (khatam) is not emphasized but left instead to society to deal with.

2.1. PROBLEM STATEMENT

According to the "Panduan Dasar dan Pelaksanaan J-QAF" (J-QAF Policy and Implementation Guide), JAPIM (2008), the recitation of the Quran is currently being taught as part of Islamic Education under the category Quran Recitation guidance. However it does not stress learning until completion of the whole Quran because that would require continuous guidance using an adequate number of teachers in proportion to the number of pupils, using the *talaqqi* and *mushafahah* approach (that is, by a method of learning where each student directly faces his teacher, who shall listen to the student's recitation, correct any mistakes, and demonstrate the correct and proper way of reciting). As such, the subject of Islamic Education in schools is only geared towards ability to recite the Quran, while the aspect of complete recitation of the entire Quran (khatam) is not emphasized but left instead to society to deal with.

In order to achieve the objective of Khatam al-Quran at the primary school level, several Khatam al-Quran modules have been introduced into the J-QAF programme:-

A.   6 Months Khatam al-Quran model during the Teaching and Learning (T & L) time-period for the first 6 months.
B.   Recitation of Quran guidance during the T & L period for the second 6 months.
C.   Tasmik Module outside the T & L period.
D.   Regularly scheduled Quran Literacy camps outside of school hours

2.2. SURVEY OF BOOKS FOR IMPLEMENTING THE MOE J-QAF PROGRAMME

The J-QAF Khatam al-Quran programme consists of 4 models as follows: -

A. 6 months Model implemented according to the established guidelines using the currently allocated time period for Islamic Education (IE). This model will use the *talaqqi* and *mushafahah* approach.   Pupils who have yet to acquire the ability to recite the Quran will be taught using the IQRA' method, while those who can already recite will be allowed to proceed using the 6 month Khatam al-Quran model. The 6 month Khatam al-Quran model will use the time allocated for IE, that is 4 periods (a week) for the first 6 months each year, from Year One to Year Six. At the same time, those pupils who have yet to acquire the ability to recite the Quran will continue using the IQRA' method.

B. Quran Recitation Guidance is a continuation for the **6 month Khatam al-Quran model** described earlier**.** In the second 6 month period, Quran Recitation Guidance will use 3 periods (a week) for Year One and 2 periods for Year 2 to Year Six. The following is a summary of the allocation of time for the two activities above throughout the year:-

Table 1 Allocation of time for the 6 month khatam al-quran and recitation guidance

Year	First 6 months (Khatam al-Quran)	Second 6 months (Recitation Guidance)
Year 1	4 periods a week	3 periods a week
Year 2	4 periods a week	2 periods a week
Year 3	4 periods a week	2 periods a week
Year 4	4 periods a week	2 periods a week
Year 5	4 periods a week	2 periods a week
Year 6	4 periods a week	2 periods a week

C. The Tasmik Model is carried out outside of normal school hours depending on the suitability (of the time), convenience of pupils and availability of Tasmik teachers comprising J-QAF and IE teachers, as well as teachers of other subjects who have the ability**.** The Tasmik teachers have to be officially appointed by the school. The Tasmik Model is a programme for guiding and recording the progress of pupils through the Iqra' method books and the pupils' individual recitation based on a scheduled programme to enable each pupil to complete the recitation of the whole Quran.
    Among the objectives of the Tasmik model is to guide the pupil to recite the Quran with tajweed and subsequently for the pupil to achieve recitation of all 30 parts of the Quran during his years in primary school. This

is a programme to strengthen the 6 month Khatam al-Quran model and the Recitation Guidance programmes outside of the normal school time-table.

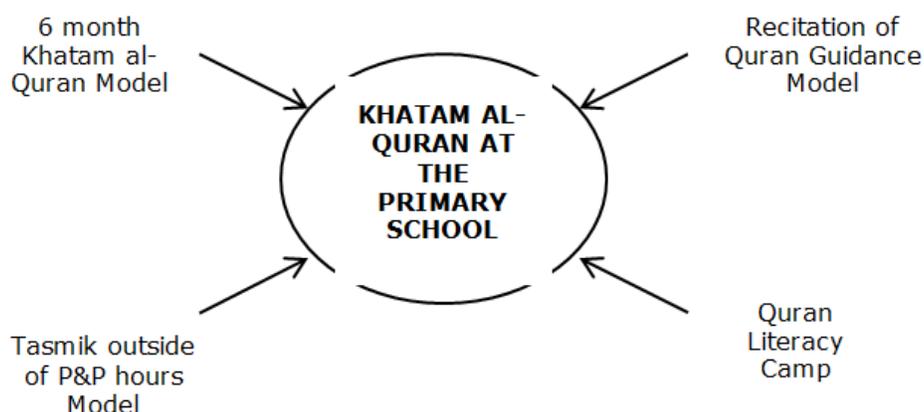
D. The Quran Literacy Camp has been likewise created as a strengthening activity for the Tasmik Model above. It has been created to overcome the problem of weak pupils who are still at the level of the Iqra' books 1, 2 and 3, while the other pupils in general are already able to progress to recite the Quran proper. The weak pupils will be identified by means of a screening test so that only the weak pupils are selected to participate in the camp and thus special attention can be given to them. The time for holding the camp will be determined by the school concerned. Usually the camp is held during the weekend or during school vacation.

2.3. LEARNING OBJECTIVES OF THE J-QAF KHATAM AL-QURAN MODULE

From interviews with MoE sources, the MoE is hopeful that by means of the the Khatam al-Quran subject pupils will have the ability:

A.   To recite the verses of the Quran, articulating correctly every letter from its point of articulation.
B.   To recite the verses of the Quran by applying correctly all the rules of Tajweed
C.   To recite the verses of the Quran smoothly and fluently.
D.   To complete the recitation of the whole Quran while at primary school.

All the four objectives mentioned above shall be attempted through the 4 teaching and learning strategies of the J-QAF Khatam al-Quran model as in the table below: -

Table 2: J-QAF Teacher's Teaching Strategy


3. PARTICIPANTS AND PLACE OF STUDY

This study has been carried out as a **case study** in order to enable the researcher to investigate and make detailed observations as suggested by Fraenkel (1996). As such, the teaching strategies and techniques can be looked at in depth although the study involves only a small number of respondents. In this study, the most important factor in determining the researcher's choice of participants/ respondents and locations is that the teacher comes from a school that was involved in J-QAF first layer in 2005, where the pupils should be in year 4 (in 2008). The following is a list of the schools served by the teachers who were interviewed: -

- A teacher from Sekolah Kebangsaan Toh Indera Wangsa Ahmad, Batu Gajah, Perak who was involved in the J-QAF first layer, 2005. There are 1429 pupils in the school and the number of Muslim year 4 students is 182. This school has a total of 6 Islamic Religious Education teachers and the number of J-QAF teachers is 7. The respondent/ participant is the writer's own younger sibling who has served as an Islamic Education teacher at various national primary schools for 18 years.
- A teacher from Sekolah Kebangsaan Seri Aman, Pokok Assam, Taiping, Perak nvolved in the J-QAF first layer, 2005. There are 680 pupils in the school and the number of Muslim year 4 students is 83. This school has a total

of 7 Islamic Religious Education teachers and the number of J-QAF teachers is 6. The participant is also a younger sibling of the writer's who has served as a J-QAF teacher since it was introduced in 2005.

- A teacher from Sekolah Kebangsaan Riam Batu Dua, Kem Sri Miri, Miri, Sarawak. There are 515 pupils in the school and the number of Muslim year 4 students is 49. The participant is the wife of an acquaintance of the writer's who has served as a J-QAF teacher since it was introduced in 2005.
- A teacher from Sekolah Kebangsaan Bandar Samariang, Kuching Sarawak. There are 1403 pupils in the school and the number of Muslim year 4 students is 184. The participant is an acquaintance of the writer's who has served as a J-QAF teacher since it was introduced in 2005.

The writer took the opportunity to interview all the above respondents during the 2008 Eid al-Fitr holidays, when all the respondents were back in their hometown.

4. STUDY FINDINGS

4.1. TEACHING STRATEGY FOR J-QAF KHATAM AL-QURAN MODULE

The writer finds that there are only 2 Khatam al-Quran modules employed as the main teaching and learning strategy by J-QAF teachers. Other activities mentioned in MoE sources are actually sub-modules to stabilize the 2 main modules as follows: -

- The Khatam al-Quran model during the T & L time-period for the first 6 months followed by the Recitation of Quran Guidance during the T & L period for the second 6 months
- The Tasmik Module and the Quran Literacy Camp outside the T & L period. and scheduled outside of school hours.

4.2. TEACHING STRATEGY FOR KHATAM AL-QURAN MODEL DURING T & L PERIOD

From interviews with the 4 respondents from the 4 schools which have been directly involved in the J-QAF programme since 2005 the writer finds that: -

- The Khatam al-Quran model was implemented during the Islamic Education T & L period 4 times a week for the first six months of the year, from January to June each year. The teaching strategy that was carried out was the BIG (*bacaan ikut guru)* or (Repeat After Me) technique. This means that what is intended by Khatam al-Quran is complete recitation of the Quran by repeating after the teacher. The teacher will recite a portion of the Quran, and the pupils will then repeat after him in unison. The division of the verses and surahs for the BIG activity has managed to follow closely the syllabus included in the J-QAF teaching guide book prepared by the MoE.
- For pupils in Year 1, the first 6 months will be allotted for teaching the lessons from the Iqra' books 1, 2, 3, 4, 5 and 6. Generally the pupils will be able to complete the Iqra' books by repeating after the teacher. For the second 6 months, the period for Recitation Guidance will be filled with recitation of the Quran according to the BIG technique from Surah al-Fatihah, followed by Surah al-Baqarah, and so on until the whole Quran is eventually completed in Year 6. From the writer's observation, until September 2008, the BIG recitation of the pupils in Year 4 has reached Surah al-Hajj, which is in the 17th part of the Quran, as indicated by the syllabus.
- For schools which have less than 600 pupils, the number of IE and J-QAF teachers must be at least 12, in order to achieve an almost perfect implementation of the Khatam al-Quran teaching module. Every classroom of between 35 to 40 pupils will be handled by 2 or 3 IE and J-QAF teachers. The first 15 minutes will be allotted for BIG recitation according to the syllabus, while the second 15 minutes will be used for group recitation led by the 2 or 3 teachers as mentioned. Pupils will be divided into 3 groups: good, medium and weak. This technique is used to ensure that all pupils would be able to recite the Quran and be corrected by teachers. This is the normal method of teaching for every class using the J-QAF Khatam al-Quran module.
- A problem which might arise is if the school has more than 700 pupils while IE and J-QAF teachers number not more than 12. Every classroom will in fact be led by only one Khatam al-Quran teacher. How then can the BIG programme be implemented well throughout the year? For those pupils whose are already good, there will of course be no difficulty keeping up with their teacher's recitation; as well as some of those moderately good pupils. But what about the weak pupils? The BIG programme for the whole year would surely go to waste. Nevertheless, at least all the pupils would have have heard every verse of the Quran recited to them by

the   teachers,   although   they   could   not   repeat   after   the   teachers   well.

- The BIG (Repeat After Me) method has been used to overcome the problem of uneven pupil achievement within a single classroom or school. Not all pupils are able to follow the lessons of the Iqra' books 1, 2, 3, 4, 5 and 6 well during the first 6 months of Year 1. If the pupil fails to achieve the level of recitation upon entering the second 6 month period of Year 1, this failure will persist without end although the pupil has reached Year 4

4.3. TEACHING STRATEGY FOR TASMIK MODEL OUTSIDE T & L PERIOD

The Tasmik model was introduced to help pupils achieve complete recitation of the Quran individually (not in groups, such as BIG). At the same time the Tasmik model also helped to overcome the problem faced by pupils who could not keep up with the rate of progress as planned in the syllabus.

From interviews with the 4 respondents from the 4 schools which have been directly involved in the J-QAF programme since 2005 the writer finds that: -

- The Tasmik model is implemented outside the official school hours. This is proven when IE and J-QAF teachers will come early or leave late, 30 minutes to 1½ hours earlier or later than the official school hours.
- According to a survey that was carried out, pupils generally do not rely solely on recitation in school. Most of the pupils who recite the Quran at home will continue their recitation during the Tasmik session in school. The teacher will keep a record of the pupil's recitation in a record book meant for this purpose provided by the MoE. This record book will then be brought home for parents, family members or whoever is supervising the pupil's recitation outside school hours to keep track of the pupil's progress. According to the study respondents, many Year 4 pupils have already the ability to read the Quran (well) while some have already completed the recitation of the whole Quran through recitation in and out of school hours, going beyond the original target.
- The writer finds that in most districts in Peninsular Malaysia there are Quran and Fardhu Ain (KAFA) classes conducted outside schooling hours. This makes the school teacher's job easier and enables the pupil to accomplish Khatam al-Quran earlier. The situation is, however, different in Sabah and Sarawak. Both the respondents who served in Sarawak say that in Sabah and Sarawak the Quran and KAFA classes are not performing well. Most pupils recite the Quran only in school. Outside of school hours, it depends on the parents. Those parents who are concerned about their children's progress will themselves teach their own children to recite the Quran. Some of them send their children to a mosque or surau to recite the Quran after Sunset prayer. According to information received from respondents, the writer concludes that there are districts or states which do not have KAFA programmes, in Peninsular Malayusia as well as in Sabah and Sarawak.
- The success of the Khatam al-Quran model in primary school is very much dependent on the number of pupils, and the number of IE and J-QAF teachers in the school. Based on the interviews, we find that schools which have 600 or fewer pupils show a commendable level of success. Generally speaking, all the schools which have been following the J-QAF programme since 2005 were supplied with 12 or 13 IE and J-QAF teachers each Schools which have more than 700 pupils will show failure and there is a lot of dissatisfaction among the IE and J-QAF teachers in the implementation of the programme. In schools with a high pupil population, the respondents say that there are pupils who are still at the Iqra' books level 1, 2, or 3. According to IE and J-QAF teacher evaluation, a pupil must be at Iqra' books level 4, 5 and 6 to be categorised as one who already has the ability to recite the Quran.
- Among the reasons for the failure to achieve the target of the Khatam al-Quran module is the lack of cooperation from the pupil's own family in not allowing the pupil to stay back after official school hours. They prefer their children to be at home rather than participate in the Tasmik programme after official school hours This situation becomes more acute if the pupil has no other Quran recitation activity at home. It is bad enough that the parents themselves do not know how to recite, they would not even bother to send the child to a neighbour or the local community centre to help the child recite the Quran.
- The reality is that there exist in all schools some pupils who are very weak mentally. Not only are they not able to recite the Quran, they cannot even recognize letters and numbers. Pupils in this category are not just stuck at the level of the Iqra' books 1, 2, 3 but they should be placed far below that. However, the very dedicated IE and J-QAF teachers never give up on these children. They use various ways to teach these Islamic buds using various techniques such as flash cards, Alif Ba Ta videos and so on. These pupils will be placed together in a group and given more intensive guidance during the Tasmik period compared to other pupils.

Through the interviews we learn that the Quran Literacy Camp is the last resort for IE and J-QAF teachers to help weak pupils to be able to recite the Quran. After failing in all the planned modules above, selected pupils will be brought to join the Quran Literacy Camp. The camp is held periodically according to a schedule determined by the school authorities. Usually the camp is held during weekends or during the school term break. The location of the camp is the school itself and therefore the costs are minimal. There are schools which hold these camps annually as festive occasions with a large budget, courtesy of the school's Parent-Teacher Association. At the same time there are also schools which have no need to hold a camp because, thankfully, there is no pupil "qualified" to take part. Praise be to Allah.

5. CONCLUSIONS AND RECOMMENDATIONS

5.1. STRATEGY OF TEACHING BY J-QAF KHATAM AL-QURAN TEACHERS

From the research data obtained in the study, the writer notices that the success of the J-QAF programme in primary schools has been achieved as a result of the mutual cooperation of the IE and J-QAF teachers. They spend between 32 to 36 periods a week, plus many extra hours outside the official school hours to ensure the success of the J-QAF programme. The IE and J-QAF teachers, in implementing the Khatam al-Quran module, divided it into to 2 principal activities, namely activity during the T & L periods and activity outside the official schooling hours. The modules that are used to achieve the target of enabling all pupils to complete recitation of whole Quran during their time in primary school, can be summarised as follows: -

- The BIG (*bacaan ikut guru)* (Repeat After Me) teaching strategy that is implemented during the T & L time-period for 6 months and the Recitation of Quran Guidance throughout the year.

- The Tasmik teaching strategy based on *talaqqi* and *mushafahah* technique (that is, the teacher deals with each pupil individually) implemented outside the official school hoursg. This strategy this strengthened by the Quran Literacy Camps held on a regular basis to overcome the pupils' weaknesses.

5.2. THE ROLE OF THE MINISTRY IN ACHIEVING THE OBJECTIVE OF J-QAF

The Ministry of Education (MoE), through the Islamic Education Division, has been cooperating very well in the effort to ensure success of the J-QAF programme in primary schools. From the interviews the writer is informed that every pupil is supplied with the Iqra' books and a "mushaf tajweed" - demonstrating praiseworthy commitment (on the ministry's part). The writer would like to commend the Malaysian Education Ministry in implementing the J-QAF programme which is centred on increasing the value of human capital to equip Muslims with adequate spiritual provisions. The MoE's efforts can be further strengthened by increasing the number of J-QAF teachers, to a ratio of 1 teacher for every 10 pupils in a school, as originally proposed.

5.3. THE ROLE OF THE SCHOOL IN ACHIEVING THE OBJECTIVE OF J-QAF

It is hoped that schools would continue to give strong commitment and take practical steps to ensure the smooth running of J-QAF programmes in schools. There is still a lot more room for improvement on the part of schools in ensuring the success of their J-QAF programmes. Any problems faced can be overcome by regular discussions and continuous monitoring of pupils and teachers. Teachers are the pillars of support for the success of the J-QAF programme, hence they should continue to raise their level of professionalism from time to time. They are advised to be fair, honest, trustworthy, disciplined and dedicated in carrying out their teaching duties. The successes achieved by pupils in the J-QAF programme are also the teachers' permanently abiding achievements.

5.4. THE ROLE OF THE COMMUNITY IN ACHIEVING THE OBJECTIVE OF J-QAF

The family is the most important institution in educating children. Parentsnshould be mindful of their children's development. It is suggested that parents should be willing to sacrifice time and money to ensure their children's success since their children are their future assets. From this study, the writer finds that the Khatam al-Quran programme is very much related to the Quran and Fardhu Ain classes (KAFA) held at the local community centres. Not all districts or states in Malaysia have KAFA classes as a means to improve the pupil's self-development outside the official school hours. Therefore the writer would like to recommend those communities that have yet to

organize any KAFA activity to do so urgently, even if only in a surau (prayer hall) or local community hall. To carry out about such programmes as KAFA is a religious obligation incumbent upon the community as a whole (fard kifayah) which should not be taken lightly by Muslims living in that community.

Abstract

The objectives of this research were to: 1) study the general information about the administration problems and needs of Thai Community ICT Learning Center; 2) develop the strategic plans for the implementation of theThai ICT Learning Center projectwith the cooperation and needs of the community members and among the communities; and 3) evaluate the learning strategic plan and learning activities in the regional training of the participant from four regions.

The research sample included 30 Thai Community ICT Learning Centers (Thai Tele-Center) in four regions of Thailand: Central, Northern, North-eastern, and Southern regions. There were 104 respondents who served as participants in the Community Content Creation and Media Production Training. This training was conducted in order to enhance their potentials to develop the contents in the Thai Community ICT Learning Center such as video and animation in websites. The research instruments used in gathering data composed of two questionnaires, one for Community ICT Learning Center problems and needs, and another for the participants asking about the training and learning activities.

The research methodology involved five steps: 1) survey on management, problem, and needs of Thai Community ICT Learning Center using a questionnaire; 2) development of strategic plan to enhancethe potential of Thai Community ICT Learning Center in learning management for the community based on the survey results; 3) training of selected Thai Community ICT LearningCenter members; and 4) evaluation of the the output and outcome of the training and learning activities.

Findings showed that Thai Community ICT Learning Center had no problems with regard to the equipment and infrastructure. The centers where were supported by the local organization such as the community authorities. They did not have any problem with regard to financial support. However, in case of the services, almost of the center managers and committee members came from the other community organizations, so they only work part-time in managing the centers. The strategic plans developed and approved by the Ministry of ICT could be used for enhancing the services. Each center needed to learn more how to generate and prepare   the contents to use through the internet. Lastly, the research found that the participants who attended the training workshop on the content generation project had high satisfaction level with regard to the training. They noted that the knowledge and practices gained from the training were applicable to their work and enhanced their potentials. Moreover, they could create content and engage in media production to support the community learning management services in Thai Community ICT Learning Center.

Keyword: learning management; Thai Community ICT Learning Center; ICT center management

Introduction

The concept of Thai Community ICT Learning Center(TC-ICTLC) or Thai Telecenter was founded in Thailand in2001-2002. Since then, many organizations had supportedtheir activities. The Ministry of ICT policy emphasized to develop Thailand to be the Knowledge Base Society such as the National Electronic and Computer Technology Center (Nectec) of Thailand, Canadian International Development Agency (CIDA), Community Organization (DevelopmentInstitue (CODI) and the World Bank. There were also projects launched continually on one temple one learning center (OTEC) and Information Community (i-Community).After a short period of development, Thai Community ICT Learning Center(or Thai Tele Center), had been established in 2007 with the support of the Ministry of Information and Communication Technology (MICT). From 20 centers in the beginning, the Center had expanded throughout the country with almost1887centers in 2013
(www.thairtelecenter.org) These centers were located in four regions in North, Northeast, Central, and South regions of Thailand.

The Thai Community ICT Learning Center is generally managed by the CEO of the organization where the center is located (e.g. school, temple, Local Administrative Bureau). A community board is also created to help advise the tele-center management on lead policies and to increase the transparency of the tele-center's activities.

email address: fedunrs@ku.ac.th

The board members often provide moral support and some supervision of the tele-center, if requested. The management team intends to strengthen the role of the community board to be more concrete and participatory, which is expected to improve operations. Financing The MICT sponsors the equipment procurement, training of operators and operational costs for a period of one year, after which the centers are expected to be self-sustainable. (http://www.connectaschool.org/?q=node/1859)

The Thai Community ICT Learning Center was established to develop the lifelong learning of people in the community by using ICT as the tools. However, there were limitations and issues in the management and services offered such as lack of the participation with the organization and agency in the remote area. The center could not integrate ICT application to enhance the full potential in the community. This may come from the difference in the eco-geography and social diversity of their communities. It was necessary to study and investigate the vision, expectation, and needs of the people in the community to determine the proper activities about the ICT application.

The other significant limitation of the center involved the community it served which the center could not search, collect, and gather knowledge, content or other local wisdom, which would be very useful to them in sharing their knowledge through the media and channels of the community. Therefore, ways to manage their learning about ICT to support their really life could not be determined.

Objectives

This research aimed to: 1) study the general information about the administration problems and needs of Thai Community ICT Learning Center; 2) develop the strategic plans for the implementation of the Thai ICT Learning Center project with the cooperation and needs of the community members and among the communities; and 3) evaluate the learning strategic plan and learning activities in the regional training of the participants from four regions.

3. Review of Related Literature

One of the main issues in community development is the application of ICTs on how to further enhance communities. Communities face the challenge of maintaining their identity and improving the condition of their members in a changing world. Meanwhile, many functions and responsibilities are being devolved to the local level, as part of moves towards decentralisation and delocalisation. In this context, the power of ICTs can be fully exploited to promote local development. For many remote communities, ICTs are a means for communicating with the outside world and getting in touch with news from outside, but also for letting the world know about these communities and their people. (International Telecommunication Union, 2005).

One way to bring ICTs to indigenous communities is to develop digital community centers that should be considered in implementing such centers (Newhouse, et al, 2002). This emphasizes the need to create an enabling environment for sustainability through public policy, careful planning, creation of local content and most important through direct involvement of the indigenous people being served. Therefore, the involvement of the in the Information Society is embedded in their use and adoption of ICTs. It is clear that the "digital divide" can turn into a "digital opportunity". Moreover, infrastructure and technology are generally the most dominant factors in the ICT development practice. These are also essential elements that need to be considered to match to any given locality. Therefore, the ICT development stage should be enable the analysis of needs and condition in the selection of appropriate technology to match the community's circumstances. The selection and deployment of the technology to be used has to be tailored to benefit indigenous communities.

ICT Learning Center organization in the community can be achieved success, it needs to carry out intensive reflection and organizational work of the team. This concerns the organization leader and the committee members who have high leadership competencies which could be developed to the good performances by training. So, training strategies may be one of the ways to develop the skills of ICT Learning Center's members in the communities.

4. Scope of the study
4.1. This study focused on the Thai Community ICT Learning Center from the four regions of Thailand (Central, Northern, Northeastern, and Southern).

4.2. The strategic plan would be developed based on the basically data and the related documents which would distribute to every centers to try out then evaluation was employed finally.

4.3 The training courses were done to strengthen the content generation and creation of the centers to match their needs. Training evaluation was done by using a questionnaire.

5. Methodology

5.1 Samples of the Study

The respondents of the study came from the four regions of Thailand. In determining the number of samples, the location, management, and size of the centers were first considered. The centers were classified as either extra-large, large, medium, or small. Overall, 104 respondents from 30 centers in Thailand were included in this study.

5.2 Research Instruments

Three research instruments were constructed and used in this study. These included a structured questionnaire, an observation form about the training, and an evaluation questionnaire for the training course. Most of instruments had been pre-tested to check on validity before gathering data.

5.3 Data collection

The following were the steps conducted in gathering data.

1) The researcher gathered data about the problems, needs, and some administration issues in the Thai Community ICT Learning Centers. Thirty centers in the four regions of Thailand were surveyed.

2) The strategic plans were developed and distribute to 30 selected centers. The centers selected three activities from the plan for implementation in the 4 regional centers. Afterwards, evaluation was conducted by the researcher.

3) The training course was arranged for 104participants by the researcher. This training focused on the content creation courses for center staff in four regions.

4) The activities of the strategic plan and the training courses were evaluated by the researcher.

5.4 Data analysis

Data were analyzed using SPSS for windows. Descriptive statistics such as mean, standard deviation, and percentage were used. Qualitative data analyzed by using thematic.

6. Research Findings

Part I: General Information about the Administration Problems and Needs of Thai Community ICT Learning Center

1. The Thai Community ICT Learning Centers

The majority of Thai Community ICT Learning Centers were large-sized (L) (36.70%).The centers mostly opened offices every day. The computers and other equipment and facilities were enough to serve the clients of the centers. Most of users were government offices and private sectors such as non-formal education promotion office, community colleges, and schools. In addition, most of members of the administrative board of the center were representatives from public and private sectors such as schools, and those that offer vocational and religion classes. The regular meeting of the board depends on the chairman. The budgets of the center were not an issue. The centers have an average of 1-100 users per day. Most of them were 13-18 years old. They got the news through official letters from the Ministry of Information and Communication Technology (MICT) as well as via e-mail and website of MICT(www.thaitelecentre.org) and www.ict4you.net.

2. The Data and Knowledge about Local Wisdom and Occupation of Community to Content Creation Course

Table 1 reveals the data and knowledge in local wisdom and occupation of community to content creation course. Thai Community ICT Learning Centers' emphasized the need for a content creation training course because this could be very useful in designing and gathering content creation activity. Some participants also noted

problems like staff training, administration, infrastructure, facility, staffs, budget, co-networks and participation of members.

Although findings show that the center needed content creation course was at the low level, surveys indicated that there were less local content in their websites as well as they lack local wisdom in the center. In addition, they were not able to use ICT to empower people in the community because databases or knowledge banks and backups were not available in the community.

Table 1 Data and knowledge in local wisdom and occupation of community to content creation course.

Activity	Size			
	S Mean	M Mean	L Mean	XL Mean
1. Enhancing the information system to increase administrative efficiency of knowledge and local wisdom for research and retaining the culture and arts in community	1.31	1.33	1.25	1.24
2. Promotion and diffusion of ICT utilization in community by the new technology for community stability development	1.57	1.37	1.47	1.43
3. Implementationof ICT-Based Applications	1.64	1.43	1.46	1.50
- occupations	1.51	1.38	1.35	1.42
- administrations	1.72	1.32	1.31	1.33
- services	1.78	1.62	1.69	1.71

Part 2:The strategic plan of Thai Community ICT Learning Centers

Tables 2- 5 summarizes the strategic plan developed based from the survey data gathered from the Community ICT Learning Center. In general, this included 4 strategies.

Table2. Development of the quality of life, community, environment, and national stability strategy

Planning	Project/Activity	Output/Indicators
1. Enhancing the stability of economy and occupations for people plan	1. The ICT based learning & sharing for wealthy project 2. The promotion of leadership & administration project 3. The promotion of local wisdom &occupations for people project	1. Percentage of occupations& employment 2. Percentage of increasing benefit for people 3. Value of overall economy
2. Developing the quality of life, community, healthy, and security in life and property plan	1. The enhancement of ICT knowledge for quality of life project 2. The knowledge enhancement of community network for quality of life development project 3. The promotion of alternative energy using & production project	1. Percentage of ICT using via community network system 2. Percentage of hole happiness in people & community 3. Number of alternative energy using & production in household
3. Conservation of Thai identity for ASEAN community plan	1. The promotion of conservation knowledge for historic and cultural in 4 regions of Thailand project 2. The promotion of basic English language skills project 3. The promotion of learning for cultural in ASEAN community project	1. Percentage of knowledgeable people in Thai historic 2. Percentage of knowledgeable people in basic English language skills 3. Percentage of knowledgeable people for cultural in ASEAN community

Table3. Leadership in the use of ICTs to increase efficiency of administration (e-Management)

Planning	Project/Activity	Output/Indicators
1. Providing the infra-structure for efficiency administrative plan	1. The multimedia learning classroom project 2. The development of ICT system for community administrative (e-Community) project	1. Statistic of customer services 2. Satisfaction of customer services
2. Providing hi-speed internet for administration& services in community plan	1. The extension of computer network services project 2. The diffusion & public hearing of laws & regularity information project	1. Statistic of computer network services 2. Satisfaction of computer network services in laws & regularity information
3. Providing the software, tools & equipment system for administrative & service plan	1. The promotion & supporting in innovative production research project 2. The organization of agricultural information center	1. Amount of innovative production research project 2. Statistics of people who participate

Table 4. Creating and enhancing the capacity of ICT human development (e-Manpower)

Planning	Project/Activity	Output/Indicators
1. Enhancing & promoting staff in ICT learning plan	1. The enhancing capacity of people to readiness in national software contest project 2. The ICT based co-operative of community network project	1. Amount of software in national software contest project 2. Statistic of people participating in national software contest
2. Enhancing of information sharing in staffs for increase the ICT resource capacity plan	1. The organization of learning center for science & technology diffusion in community project 2. The transfer of expert's technology in co-network & resource sharing project	1. Satisfaction of customer services 2. Amount of expert's technology in co-network & resource sharing
3. Increasing efficiency of learning service via electronic media system plan	1. The organization of white IT service classroom for youth project 2. The development of ICT in local office (e-Tambon)	1. Satisfaction of customer services in white IT service classroom 2. Efficiency of e-Tambon System

Table 5. Opportunities to increase capacity and enhancing the learning standard of people with electronic media (e-Learning)

Planning	Project/Activity	Output/Indicators
1. Making policy to promote media creation for learning community plan	1. The workshop training for video on demand in local wisdom documentary project 2. The development of local wisdom database for continually learning project	1. Satisfaction of trainee 2. Efficiency of local wisdom database
2. Promotion of staffs & volunteers to develop & use electronic media (e-Content) to continue community learning plan	1. The organization of ICT knowledge bank	1. Efficiency of organization of ICT knowledge bank 2. Satisfaction of customer services in organization of ICT knowledge bank
3. Promotion & cooperation of public & private sector to e-Contents co-creation for community learning plan	1. The development of e-Learning media to increase capacity in agro-industry project 2. The development of e-Training in occupations course for people project	1. Efficiency of e-Learning media & e-Training 2. Satisfaction on e-Learning media & e-Training

In summary, these four strategies had been used by the 30 centers and found that some of the strategies could be used for enhancing the strengthening for community ICT Learning centers. However, the implementation had to determine the proper strategies to fit the needs and circumstance of the ICT Learning Center in the community.

Part 3: The Output of Training Course in ICT Learning Management Project

1) Basic Information of the Participants

There were a total of 104 respondents who participated in the training courses in Enhancing the Potential of Thai Community ICT Learning Center Training Project. Overall, there were 56.73 percent male and 43.27% percent female. Most of the respondents' age ranged from 26-35 years old (41.34%). In addition, more than half of them were graduated college (57.69%) and were government officers (51.92%).

2) The Level of Satisfaction of the Participants on Training Inputs

The participants' satisfaction level were divided into three parts: input, process, and output. Table 6 shows that there was a high level of participants' satisfaction with regard to the input factor of The Learning Management in Enhancing Potential of Thai Community ICT Learning Center Training Project (mean = 4.07). The highest satisfaction level were observed in the place for training which the participants regard as suitable and convenient (4.29), while the lowest satisfaction was observed in the number of days (1 day) conducted for the training (3.38).

Table 6.Participants' level of satisfaction with the input factor of the Learning Management in Enhancing Potential of Thai Community ICT Learning Center Training Project.

(n = 104)

Satisfaction Items	$\overline{X}$	S.D.	Level of opinion
1.Food and drink are enough and suitable	4.31	0.73	high
2.The place for training is suitable and convenient	4.29	0.75	high
3. The process of training	4.24	0.61	high
4. Appropriate technology are used in the training	4.17	0.66	high
5.The materials for training	4.12	0.74	high
6. The contents of the training are suitable for participants	4.07	0.62	high
7.The number of days for training	3.38	0.87	moderate

3) The Level of Satisfaction of the Participants on the Training Process

Tables 7 shows that the level of satisfaction of the participants with the process factor in the Learning Management in Enhancing Potential of Thai Community ICT Learning Center Training Project was high (mean=4.31). In general, all satisfaction items reported a high level. The highest mean was observed in the attentiveness and voluntary service of the trainers and officers (4.58). On the other hand, the lowest mean was observed in the suitability of the duration or time of the training (3.78).

Table 7. Participants' level of satisfaction with the process factor of the Learning Management in Enhancing Potential of Thai Community ICT Learning Center Training Project.

(n = 104)

Satisfaction Items	$\overline{X}$	S.D.	Level of opinion
1 The trainers and the officers are attentive and served voluntarily.	4.58	0.53	highest

2. The trainers can advise and answer the questions clearly and correctly	4.47	0.56	high
3 .The trainers and the officers can address and solve the problemsof the participants	4.44	0.57	high
4 .Get more valuable and benefit from the knowledge	4.40	0.62	high
5 .Giving the chance for sharing an opinion and inquiry	4.39	0.66	high
6 .The information and the knowledge that participants get is correct	4.37	0.61	high
7 .The media equipment for training are up-to-date	4.21	0.62	high
8 .Theprocess for training is suitable	4.19	0.61	high
9 .The duration/time of training is suitable	3.78	0.81	high

4) The Level of Satisfaction of the Participants on Output of the Training

Table 8 shows that the level of opinion from participants' satisfaction with output factor of the Learning Management in Enhancing Potential of Thai Community ICT Learning Center Training Project was high (mean = 4.04). The highest mean was observed in the applicability of the knowledge gained from the training in the work of the participants (4.34), while the lowest mean was seen in the knowledge of the participants before attending the training (3.18).

Table 8 Participants' level of satisfaction with the output factor of the Learning Management in Enhancing Potential of Thai Community ICT Learning Center Training Project.

(n = 104)

Satisfaction Items	$\bar{X}$	S.D.	Level of opinion
1. The knowledge from training can be applied to work	4.34	0.53	high
2. There is a confidence to apply the knowledge from the training to the work of participants	4.18	0.65	high
3. The knowledge from training can be applied to daily life	4.17	0.61	high
4. The knowledge from training can be transferred to the community members	4.17	0.65	high
5. Participants can serve as consultant to the community members after the training	4.13	0.68	high
6. The knowledge gained after attending the training	4.12	0.70	high
7. The knowledge of participants before attending the training	3.18	1.16	moderate

The results of the training showed that the participants have strong positive impacts from the training course. The participants gained a lot of knowledge that can use in their work. The training curriculum and materials were practically designed and produced to address the participants' needs, and impacts were created to fit with the future endeavors of the trainees. The positive comments and feedbacks noted by the participants included the following: 1) The training materials and handouts were comprehensive; 2) The trainers were experienced and experts on the topics discussed; 3) The venue of the training and the learning environment was satisfactory; and 4) The class and group exercises were very useful and interesting. However, the participants noted that they needed more days for the training so that they can practice and apply the lessons discussed in the training.

7. Discussion and conclusion

1) Even though the ICT Learning Centers did not needed in the content creation from the research result,, but the evidences showed that most centers   lacked of the content and local knowledge storage so the center's staff had to develop to enable and collect data and distribution by using ICT in the community.

2) Four strategic plans should be implemented and create the opportunity to the community by selecting the strategic plans to implement depend on the context and the characteristics of the indigenous people in the community.

3) The research showed that the voluntarily training courses were successful in the empowered potential strengthening of the center staff. Therefore, they could create the indigenous contents and mediated their knowledge to the public by using ICT as a tool. The government though Ministry of ICT should focus to set up the activities in the ICT learning center in the future.

Abstract

This paper examines the effectiveness of blended learning among students in form four (grade 9) in learning of history. A survey of literature on the subject found that although a number of studies were devoted to the use of blended learning (Bonk & Graham, 2006; Duhaney, 2004; Garrison & Kanuka,2004; Singh & Reed, 2001), in the teaching of history in school there seemed to be very little evidence of detailed examination to determine learning outcomes and an account or mechanism of how the subject is learnt. In the present study reflective and collaborative learning supported by scaffolding provides an attractive glimpse of blended learning - the employment of face-to-face teaching approach and the use of blogs by groups of students on the Twitter platform, in the teaching-learning interaction throughout the lessons. A mixed-method approach was employed with survey, interview, and text analysis for data gathering. Qualitative text analysis of the interview script analysis clarified the different merits students perceived from each activity. The variations provided by the blended course design served well in meeting challenges set in the learning outcomes and learning standard, and the learning environment was found to be enjoyable for the students. We also discovered that students had positive perceptions of the blended course design.

Keywords: Blended learning; history learning; learning outcomes; Blog; Perceptions of blended learning.

Introduction

The rapid rise of Internet technologies in the past few years led to the opening of alternative and non-traditional learning opportunities across various levels of education and training (Bonk & Graham, 2006; MacDonald & McAteer, 2003). The change involved a wide range of innovations in teaching learning approach, one of which is blended learning whereby a variety of models was employed. Typically all of them basically involved in combining face-to-face and online learning (Bonk & Graham, 2006). Owing to the flexibility as well as the richness in the possibility of remodeling of the approach, interest in blended learning has grown rapidly (Boyle et al., 2003; Duhaney, 2004; Thorne, 2003).

Blended learning has a number of definitions. It may be any learning program where more than one delivery mode is being used with the objective of optimizing the learning outcome and program delivery cost (Singh & Reed, 2001). In short, it describes a variety of teaching which integrates both face to face and online delivery methods (Chew et al., 2010). Blended learning is attractive and realistic because it combines the traditional classroom approach with the online learning model. The mode of delivery modality of blended learning provides an efficient and effective educational experience for learners, with the added value of increased learner accessibility to programs; hence it is also possible to apply the blended model in innovative ways to increase both student learning outcomes and reduce instructional delivery costs (Dziuban et al., 2004). A stern reminder to educationists is that blended learning technology should not be used to replace the teacher or instructor because "students never learn from technology per se; they learn from the strategies teachers use to communicate effectively through the technologies" (Singh & Reed, 2001, p. 5).

Literature Review

Blended learning in the current form has come into the scene for over a decade. According to Chew et al. (2010) researchers and practitioners considered that blended learning is currently in embryonic form of its development. Its development to the current stage is much influenced by highly interactive technologies, such as gaming and simulations (Dede, 2005). A good example of the blended learning development came from the University of Central Florida (UCF). Since 1998 it has been using a similar definition for its blended learning courses termed mixed mode courses (Dziuban et al., 2004).

At this juncture an important question raised is whether blended learning is more effective than other learning environments. Many of the studies looking into the three instructional environments -- traditional face to face learning, blended learning and fully online learning -- show mixed results. Dziuban et al. (2004) using course outcomes such as grades show that blended learning students performed better than those in fully online and in some cases those in traditional face to face learning but then there are significant differences among the disciplines. However Reasons et al. (2005) found that students in blended courses performed less effectively than those in fully online courses on grades and tests. Garrison and Kanuka (2004) in their survey on blended learning showed that students believe that they are learning from discussions but their actual performance is only slightly positive and not statistically significant. Further study by Vaughn and Garrison (2005) did not find any evidence that blended learning improved student cognitive performance. A recent experiment of a course taught in all three modalities concluded that fully online was the best of all the approaches, being better than blended and face to face learning environments (Reasons et al., 2005). In short the evidence on the effectiveness of blended learning is inconclusive.

Conceptual Framework

In implementing blended learning one requires a well-supported approach that includes a theory-based instructional model (Dziuban et al., 2004). According to Alonzo et al. (2005), ideally blended learning focuses on the individual learner and is based on social constructionist theory where students work cooperatively to readjust learning as an effective course. The acquisition of new knowledge and experience is reinforced through activities using a scaffold approach to help students practice and acquire new skills. During the activities each student working cooperatively constructs meaning of his or her own. To support the constructivist approach, a learning community belonging to specific grades as groups should be formed. Through a process of collaboration guided by teachers, learning is constructed, not by individuals but by the group (Alonso et al., 2005)

In a traditional face-to-face learning environment, one of the more common methods of constructing group meaning is through discussion. The teacher typically begins the discussion by posing a question. The teacher then invites members of the class to make an impromptu response. Other class members then respond to the first student, and a discussion develops. In this way, students are exposed to several perspectives, and the answer to the original question is constructed for each learner based upon the individual's assessment of the group's responses. In a blended learning environment, however, this discussion format can still be adapted and enhanced. The discussion could be held synchronously, in group chat, or could be held asynchronously, in a forum to which learners post responses. In a blended environment, students have the capability of responding to several points at once. Since an asynchronous discussion can continue over a longer period, students can take time to formulate responses, and can respond to a particular part of a comment, even if the discussion has taken another route.

The majority of public education in the United States over the next 10 years will be in the form of blended learning in which fifty percent of high school courses will be face to face and the other fifty percent will be delivered online; in fact six emerging models for blended learning have been identified in K-12 (Picciano & Seaman, 2008). A good model is provided by one of the schools in Denver in which face to face delivery is supplemented by an online environment in which courses are conducted from a DPS server using the Moodle learning management system. The trend in using blended learning will most probably be adopted in many countries throughout the world. The choice of online platform will be quite a challenge as there are even now many in the offing.

Online platforms such as Twitter, Facebook, Tumblr, Pownce, Jaiku, Edmodo, and Cirip.ro. can be used to publish and edit online brief text, and also images. A micro blogging platform such as Timsoft for example, offers a platform with many educational uses, for information and knowledge management, course enhancement,

delivering entire online courses, and collaborative projects in schools and communities. On the contrary, Twitter, a popular social media was designed for general purposes, but could be used in education when users employ it as online learning spaces and tools to work out how to teach in the different contexts. When conducting a literature class using the online learning environment Miles (2011) raised a question with regard to what an online space makes it possible by way of teaching that the normal face to face method cannot do. One effective answer to this is that in the context of his experiment online spaces allow students to role play one of the characters from Charles Dickens's Bleak House. This study has adopted a blended learning modality in which face to face classroom meetings were supplemented by asynchronous online unstructured learning environment in which students freely and cooperatively interacted in question and answer, discussion and intermittently responded to assignments provided by their teachers. Through this process they would build meanings of the events and episodes related to the subject learned.

4. The problem

Face to face learning environment remains to be the main teaching and learning mode in most of our schools and will remain so in in the future. However, due to the limitation and constraints involved in ensuring effective learning, other modes of learning are introduced and these include the recent development in the use of online learning such as blogs, Wiki and forum (Miyazoe & Anderson 2012), educational computer and video games (Aldrich, 2004; Watson et al., 2010), simulated learning (Dede, 2005; McKenna et al., 2010) and blended learning (Chew et al., 2010).The potentials of these learning environments to improve learning have been positive as shown by many studies (Bonk & Graham, 2006; Dziuban et al., 2004; Miles, 2011). Since variations in applying these modes are vast (Miyazoe & Anderson, 2012), hence the findings are also varied depending on the subject areas investigated, the modes and also the online platform employed.

One subject that seems to be neglected both in its content organization and teaching mode in schools today is history. It is of no surprise that since the 1980s educators have voiced their opinion that the teaching of this subject in schools failed to meet expectations (Brophy & Good, 1969; Shulman, 1986). Britt and Aglinskas (2002) contended that most history in school provides simple narratives that do not acknowledge the controversies surrounding historical topics. In recent years history teaching began to adopt other learning environments in conjunction with the face to face learning mode and this enables historical controversies be discussed and argued. Watson et al. (2010) employed video games to teach the history of World War II and Lyons (2005) used online learning to teach United States History. They found that students learned better and discovered the subject interesting using these methods. However, there is still doubt with teaching using face to face and online in the form of blended learning (Dede, 2005; Reasons et al., 2005; Vaughn & Garrison, 2005). Since the problem of understanding history as taught in schools at present is a serious one (Brophy & Good, 1969; Shulman, 1986), therefore there is a need to overcome this shortcoming and with the introduction of blended learning students may find history more meaningful. It is therefore important to explore both the process and the meaning students created as they experienced blended learning.

5. Research Questions

Based on the problems posed and the considerations of using blended learning three research questions were raised. These were:

1. Is there a change in the understanding of history in the context of students being able to:

   a. evaluate events and their relationship in order to understand the interplay of change and continuity in history

   b. locate sources and select evidence to support arguments, and develop a critical attitude of abstract generalizations and opinion

   c. offered by historians on the topic and thus making own judgment on the generalizations.

      d.   offer alternative answers to the established facts, opinion and judgment about the events.

2.   What are students' views of history after following the blended learning mode?

3.   Is collaborative and constructivist approach through blended learning much more satisfying and meaningful than following the lesson in the face to face approach only?

6. Methodology

Two classes of 32 and 38 students from each class in form four (grade 9) were exposed to the same blended learning course in history. There were altogether 12 class meetings, each lasting 45minutes. The objectives of the course were for the students to improve their understanding of history of the British intervention in the Malay State of Perak. By understanding it means that the students should not only be able to narrate episodes and recall events leading to the intervention, or accounting for the causes and effects after the intervention but they must also be able to make judgment of the episode and the events vis-a-vis evaluating the events from different sources and different perspectives, reformulating the episode and posing a different interpretation of the events and attempt to arrive at the conclusion as to the validity of the historian's interpretation of the events, its causes and effects and finally provide suggestion in which the event may be averted.

Each week there were four face-to-face instruction and out-of-class online learning activities which include forum, additional notes and materials, short discussions and short assignments to be completed with group assists and feedback among the students and the teachers. The online activities took place both in the school computer laboratory and also at home if online facilities are available. Despite the availability of many miniblog platforms such as Edmodo, Twitter was used as a platform for the group involving students and two teachers of history. Throughout the course, the teachers as in the face to face learning environment participated in the online activities and at the same time observed what was happening in the system. In terms of procedure, the students were allowed short practice sessions on online tools in class prior to the assignments.

Owing to the nature of the study, data gathering and analyzing were not only carried out at the end of the course but continuous data gathering, sorting out and analyzing were also done during the course. Class face to face observations were also carried out on two occasions. Interesting points raised in the face to face class observations and online day transactions were recorded, analyzed while the study was carried out. Focus group interviews (Patton (2002) were conducted at the end of the study. Students in groups of five to six participated in semi-structured interviews. Areas of questioning include student perception of using miniblog in learning of history, the experiences they went through, the view they have about history and also the teaching and learning of history, the process in which historians should go about in establishing historical abstractions. A qualitative approach was employed to describe and to provide a triangulated interpretation of the learning process, the learning outcomes, and the perception on history and history teaching and learning (Creswell & Plano Clark, 2007).

7. Results

On the first question with regard to whether there is a change in the understanding of history in the context of students being able to evaluate events and their relationship in order to understand the interplay of change and continuity in history, there was some evidence in the later part of the lesson in both face to face class sessions and the transactions in the forms of discussions, note exchanging and questions and answers in the blogs that the students showed some indications of understanding the temporal concept as the underlying structure of history. In both online and face to face class sessions, for example, the students took some time to discuss whether the absolute power of Sultan Abdullah could withstand the power of the British imperialists. They compared the events to those taking place before during the Malacca Sultanate which succumbed to the Portuguese or the Dutch in Java.

In one of the forum series one question was raised by a student; "Can the Malay lords and other dignitaries using daggers and spears stop the British who come with gunships and big guns?" Another student related to the episode of the fall of the Malacca Sultanate in 1511 by noting; "The Malay ruler must remember how the people of Malacca fought the Portuguese and finally the Malays lost, fast and quick!" One student reacted; "How much attempt made to save Perak by the Malay chieftains, unavoidably it will fail because western imperialists determine to conquer us.

They will do whatever they can to subdue the local people." Although signs of understanding history began emerging through the concept of interplay of change and continuity as depicted in historical events and episodes which is the subject building block, the meaning making of history was still unstable and needed to be reinforced.

With regard to understanding history in the context of locating reliable sources and critical selection of evidence to support arguments and assertions the students did show some degree of understanding in that in their discussions and questions and answers both online and during face to face classroom contact were not only voluminous and lively but also indicated efforts to refer to a variety of sources. On what roles played by Raja Ismail and other nobilities such as Maharaja Lela and Dato' Sagor in Perak during the troubled 1870s for example, some students provided answers like these lords were opportunists waiting if they could get British support. They did provide some credible evidence but other students disputed their assertions, and in turn proposed those nobilities were Malay patriots or strategists or even pacifists. The sources of their evidence varied from different books such as *History of Perak*, online search to stories both fiction and oral.

Regarding development of a critical attitude of abstract generalization and opinion offered by historians on the topic and thus making own judgment on the generalizations, it was found that though there were signs that students were critical with the conclusions or explanations offered by historians, they however were unable to counter the generalizations made or the opinion suggested by historians. In the case of the topic raised, the general agreement among historians was that intervention was inevitable as the tide of imperialism was at its height. Evidence offered by historians was clear. In terms of student learning there was a positive development that students were much more critical of the idea that intervention was inevitable. They felt that if Perak had an able ruler intervention could be avoided. This could be seen in what happened to Malay states such as Terengganu, Kedah and also Siam. They did provide examples and proposed reasons or hypotheses but found difficulty in coming up with reliable sources. This may be due to their lack of exposure to literature on the subject.

For the students to offer alternative answers to the established facts, opinion and judgment about the events they had to master the earlier learning outcome that is develop a critical attitude of abstract generalizations and opinion offered by historians on the topic and thus making own judgment on the generalizations. The students in their deliberations on blogs attempted to provide alternative explanations to the episode studied. However, these explanations were flawed with inconsistencies of accounts and facts. As suggested, the lack of exposure to a wide range of literature might explain why an alternative explanation was not forthcoming.

Data on students' views of history after following the blended learning mode came from two sources. The first source was from both the amount of information and the nature of information being exchanged through the discussions among themselves and with their teachers both online and during face to face interaction; and the second data source was from the focus group interviews. From the first data source it can be said that the students showed signs of changing their view of history. Before following this lesson through blended learning they thought that history is about facts and fixed episodes, already fixed by a group of experts known as historians. Students should see, understand and believe history as depicted by historians. As they went through blended learning they cooperatively constructed meanings to events and relate in them in the form changes and continuity in relation to time. What has been established and believed as history could still be changed and this made history inconclusive. In the interview many students did say that they had different views of history after having been given the opportunity to say their opinions and to disagree with the assertion and conclusions made earlier. They think the subject was alive as conclusion and assertion could be altered as long as there is credible evidence to support the assertion. One group of students asserted that; "At least now we don't have to listen to narration of events and accept what and why things happened this or that way. We now can get involved in shaping what and why things happened".

Another group of students mentioned that: "We enjoyed seeing the subject alive, Now we don't learn about dead people or events, already past and gone, we think history offers avenue for people to discuss, and to argue without ends...not until they are satisfied with the evidence and the conclusion made". The idea that history was not fixed but alterable made the student feel that it was different from before in which their involvement was passive. From the students' responses it can be perceived that there was a slight shift of belief about history from being simply facts to ideas proposed by people in the area.

The data for the question on whether students felt much more satisfying and meaningful following the lesson in the collaborative and constructivist approach through blended learning than from the face to face approach came

from focus group interviews. Most of the groups mentioned that their engagement online in the form of note exchange, raising questions and suggesting answers, explaining and elaborating points of contention, giving support and encouraging fellow students to keep on engaging helped in their face to face class context in that they were much more prepared. By being in constant contact with friends and teachers and having ideas put forward getting support from teachers and friends really they found blended learning helpful and satisfying. One student stated that; "You learn easier because you are not alone. You are always in the company of your friends. They are very helpful".

8. Discussion

Face to face learning is limited by time. Most school subjects including history require more time for students to engage in the subject together with other students. Since history is based on interpretations of events and episodes it is one subject which needs to constructed with credible and convincing evidence. History as taught in the past due to the constraint of time and the approach adopted did not allow students to deliberate and propose conclusion about events and episodes. Owing to the need to accept facts presented the subject not only caused learning drudgery but also stifled the object of learning history, that is creating the understanding of change and continuity in the context of time- temporal relationship. The introduction of constructivist approach together with the idea of working cooperatively was timely in that history should be a meaningful subject and the students should feel they can contribute in the process of meaning making of events and episodes.

Blended learning offered students more time and in the form of variety of contextual exchange such as forum, discussions, quizzes, short brainstorming and even jokes. Even with this short experiment one can see positive signs emerging that students began to understand that history was about meaning making and they had the roles to play. With their active involvement they would be able to dispute earlier interpretations of a specific historical event and propose a new interpretation. Being able to reinterpret history or even to follow argument why a specific assertation was made was a new experience to the students. Thus history was viewed much more positively as a school subject and its learning was made much more enjoyable.

School learning always puts pressure on students apart from providing very little returns in terms of learning experience to students. Blended learning releases pressure on the students and also on the teaching staff. A variety of learning modes could be explored and this would enable student learning experience to be enriched. As shown in this study the students found the blended learning environment embedded in the constructivist-cooperative framework was helpful and supportive. Much of their potentials were able to be actively demonstrated both through online and face to face interaction.

9. Conclusion

As a case study, this study has limitations in how well its results generalize to other situations. However, these results can still be used as information of how it is possible to pursue teaching particularly history in a much more positive and interesting way. Further research definitely needs to be conducted in a more structured way to ascertain which modality of the blended learning is effective for which subject and which learning situation. As noted in the online transactions there was no guidance provided perhaps with some controls better approach could be gained to guide implementation. With more transactions going online, face to face meeting becomes more important in terms teachers and students not only to clarify and crystallize evidence, argue for the decision and provide judgment as to the validity of historical interpretation made; but also to seek and pose more problem if any are to be investigated.

Learning Style in A Personalized Collaborative Learning Framework

Nuzulla Mamat[88], Norazah Yusof

Software Engineering Department, Faculty of Computing, Universiti Teknologi Malaysia Johor Bahru (UTM JB), 81310 Johor Bahru, Malaysia

Abstract

This paper aims to discuss learning style implementation into an e-learning environment. The relationship between learning style and adaptive system is identified and connected. Elements gained from traditional learning style researches are adapted into e-learning system to support Personalized Collaborative Learning (PCL) online learning environment. PCL embed Human Computer Interaction (HCI) elements in its environment. Learner model in terms of learning style, learners' needs and references are smaller, hence it should be broadened to integrate more personalized features into an adaptive system. Therefore, knowledge/materials sharing, question well formation and freedom option support the design of depth personalization into adaptive system like iYu to balance between Personalized Learning Environment (PLE) and collaborative learning. Apart from that, theories overlapping, generalization and time constraints are among the factors that may cause failure to e-learning system effectiveness. In addition, learners' learning style is found to be dynamic during a learning process or self-reflection occurence in PCL framework. Results showed that learners were able to reflect and discover themselves with the presentation of iYu user interface.

Keywords: learning style; online learning environment; Personalized Collaborative Learning (PCL), user interface

Introduction

Existing systems such as Social Networking Sites (SNSs) are not able to clarify specifically learning style according to their provided learning environment. Each learner possesses different unique learning style. Therefore, an appropriate learning environment platform need to be constructed in order to suit learners' varied learning style. Most traditional learning style researches can be converted into online learning style research to design an online learning environment. There is also a need to embed HCI features in a learning environment framework to enhance learners' performance in terms of detecting early learning style and its change when they login to or logout from a particular system. Online persona relationship with learning style is not really emphasized in several SNSs. If combined, learning style can also be studied to enrich online persona rubrics development. Studies on online learning environment are needed to analyze relationship between online persona and early/last detection of learners' learning style. Online persona and learning style are related to learner identity and learner mood. In addition, online persona, learning style, learner identity and learner mood are related to learners' whole selves (learner model) either in their class or outside class.

Several issues identified for learning style include:
  i. the "one size fits all" teaching method which is contrast to learning style overlaps varied theories either in traditional researches or integration of it into any adaptive systems
 ii. generalization of many learners' learning style and learning preference to personalization or deep personalization into adaptive system
iii. time barrier during class/lab hours cannot give ample time/opportunities for learners to reflect on their learning for task-based activities
 iv. learners' and teachers' time response duration may not be the same, hence affect both sides performance
   The key features for iYu system invention are also identified as follows:
  i. knowledge sharing wealth: by personalization (learners' themselves) and collaboration (with peers)

E-mail address: nuzulla3@gmail.com, norazah64@gmail.com

ii.   knowledge question depth: by climbing thinking ladders steps

iii.   knowledge search freedom: by discovering learners' selves, learning and future career search manipulation

In addition, PCL framework for an online learning environment can be built based on the integration of PLE and Computer Supported Collaborative Learning (CSCL). PLE refers to adaptive system approach to recognize wider/unique scope of learner model (not limited to learning style and group formation only) to provide customizable learning to learners. Meanwhile, CSCL falls under collaborative learning where learners are required to complete tasks within groups. CSCL refers to a much intense area of collaborative learning using computer. Several CSCL tools identified from various researches are used to enhance interaction between learners and their peers, lecturers or online facilitators. Clustering method is applied in order to recognize group representative in PCL framework (Li and Zhao, 2008).

Learning Style

Learning style is always associated with intelligent and adaptive system. Adaptive system links either learners' needs or preferences into adaptive system. And adaptation refers to personalization. Learning style metrics are often found in educational researches and are integrated into adaptive system to enhance learner intent and participation as well as learning performance. Scopes of learning style in e-learning researches can be wider and not limited to attachment of it into systems only. The overlapping of learning style type and many learning style theories makes it difficult for system designers to test system to a particular matched learning style discovered by them. Thus, a framework is needed to solve the issue by providing several important components of an adaptive system in a personalized learning environment. Below is a table built by the author to summarize different researches found on learning style (refer Table 1):

30. Table 1. Learning style integration in adaptive system

Title	Authors	Issues	Contents	Results	Future Works
Experiences of learning styles in an intensive collaborative course	Alaoutinen et al. (2012)	Pedagogical framework goal is to achieve learning objectives by an e-learning and gives design emphasis on the whole learning model, course design and activity management of it which can be normative or descriptive depending on its teaching methodology.	E-learning must follow the latest trend due to learners' interest on a particular popular features and the rise of new learning style like up-to-date. Pedagogy approach can be used either alone or by mixed methods (traditional/engagement) such as personalized learning, collaborative learning and problem-based learning. Learners' cultural background and learning style are also inserted as crucial elements in the designed Code Camp as an educational concept which pays attention to time usage and cooperative learning.	Code Camp offers collaborative learning in an intensive course which is considered as today's trend and has flexibility provided to learners. Learners' preference based on learning style is compared to Code Camp components like intensive co-operation, free application, help, short lecture, demonstration, information retrieval, practical task and instant feedback. Code Camp is observed as a place for learners to reflect, express ideas, learn quickly, do open-ended task, listen for lectures, think reflectively and critically and get continuous facilitation.	Code Camp can also be used for other courses to teach practical skills. Apart from that, Code Camp should be enhanced from curriculum integration, skill/level integration, optionality, better teaching method verification to generalization of it to other fields.
Learning style model for e-learning	Hamada (2012)	Freedom and social emotional aspects and learners' learning preference collective view	Learning style model helps learners in finding their own learning preference. An adaptive and intelligent	Enhanced Learning Style Index (ELSI) where new components are	Evaluation should be done to test system integration and

systems		need to be given proper attention in designing an e-learning system.	system assist learners to perform better with four system easiness in terms of user-friendly interface, e-learning integration, collective view of learners' preference in learning (based on gender) and access/use.	built based on learners' learning preferences. Hamada's (based on culture) old system applied automata and computation theory that caters the needs of all learners, but learners face problems in terms of manipulation.	model reliability.
A study of a learning style index to support an intelligent and adaptive learning systems	Hamada et al. (2013)	Learners and their learning materials are given proper attention to generate adaptive system. It is because, adaptive system could refer to various learning model existence.	ELSI is an improved system of Hamada's (2012) work that uses automata and computation theory. ELSI applies fuzzy-like evaluation system to evaluate its realistic dimension of social and emotional dimension. The social and emotional dimension is emphasized based on five skills related to feelings, moods, social awareness, collaborative skill and decision making skill.	Rapid growth of learning push integration of adaptive system to a new level. Educational system in some countries shifts from collectivity to individuality. Most learners have well-balanced learning preference. ELSI embraces several components such as animation, hypertext introduction, Finite State Machine (FSM) simulator, Turing Machine (TM) simulator, self-assessment, chat and visual automata example.	Due to ELSI integration to intelligent and adaptive e-learning system, further follow-ups are needed to improve the automata integration.
Learning style as a factor which affects the quality of e-learning	Marković and Jovanović (2012)	Challenges in designing good e-learning frameworks are discussed such as learning style type and tool hour to relate content with varied learners and content domain level.	Quality, time and interaction, content display tool are important for better online learning. Liaw and Huang (2007) frameworks consist of two e-learning environment sub-elements (characteristics – information sharing and satisfaction – positive perception with increased learner participation level) as well as learners' characterization and activities (knowledge sharing and experience). There are three adaptation/personalization of e-learning such as adapted system (system customization design phase), adaptable system (user requirement and intervenion) and adaptive system (continuous process of meeting users' needs).	Learning style plays significant role in e-learning and instructor must be prepared with different teaching methodology (frameworks).	Testing system is built based on learners' preference. A recommendation representation is also provided.

Methodology

The designed iYu system interface used participatory design method in determining its usability and manipulation. Respondents whom were involved in this study are second year learners from Faculty of Computing, Universiti Teknologi Malaysia, Johor Bahru (UTM JB). They had taken basic English course and are also attending advanced English class when the experiment were conducted. The respondents' data were analyzed quantitatively and qualitatively while their performance was observed for nearly two weeks. Items for both quantitative and qualitative data asked learners about their experience with iYu system use to evaluate it effectiveness in measuring reflective and critical thinking. Apart from that, constant online facilitation and semi-authentic materials were also provided to ensure learners could finish their tasks conveniently. SNSs like Facebook and its Messenger, Short Message Service (SMS) and e-mail were also used as additional tool in increasing learner participation level as well as interaction quality either in real-time or delayed discussion.

Implementation of Proposed Learning Style into iYu System

A PCL environment can be defined as integration of PLE and collaborative learning where it provides caring approach to learners while working in group. The scope of Dunn and Dunn's (1999) "five stimuli which includes smaller components called elements" is narrowed by taking physiological stimuli with perceptual elements only such as Visual (V), Auditory (A) and Kinaesthetic (K) excluding Tactual (T) element. iYu interface design as displayed in the following figure (refer Fig. 1) applied the proposed learning style with the integration of V, A and K characteristics (refer Table 3). The proposed learning style had been compared and matched with the selected psychological stimuli components and there is overlapping of learning style such as one characteristic representing two learning style types. They were obtained from previous data collection before designing the actual iYu interface design to fulfil users' current needs. The interface design is also influenced by PLE and CSCL principles. Several principles of PLE are injected/embedded into CSCL principles to come out with a new PCL framework in nurturing a good reflective thinking and critical thinking. The PLE and CSCL principles are also matched with learning style adaptation in learners' activities and teaching materials in terms of presentation (El-Bishouty et al., 2008; Kirschner et al., 2004; Dunn and Dunn, 1999). Among the principles applied in designing the PCL framework (refer Table 2) include:

Table 2. PCL framework principles

Framework adaptation	Authors	Principles
PLE	El-Bishouty et al. (2008)	• Learners routine must be recorded • Web-based • Learners can interact either with chat or delayed discussion • Constant feedbak and facilitation must be provided • Materials originality
CSCL	Kirschner et al. (2004)	• Learning objectives/outcomes are written in lesson plan • Interation type had been determined • Step-by-step approach to achieve class goal • Group size, interation type, activities and e-learning structure must be taught beforehand • Computer interation verification as learning improvement learner participation level increment must be proved
Learning Style	Dunn and Dunn (1999)	• Characteristics of learning style type must be applied and integrated into task and framework (for instance, VAK)

The Feathers menu represents thinking layers that could help generating reflective thinking and critical thinking at the same time. Although the participatory design method data was obtained from small sample of learners' population, the students managed to discuss and collaborate with their peers along the learning process quite well. From the author observation, the respondents:

- could climb thinking level ladder
- could finish system exploration within one hour approximately
- could complete all tasks within one to two hour/hours with two to six logins
- who are reflective learners performed well with good response and feedback
- are last-minute learners were positive and has the intention to use the system repeatedly
- enjoyed using the system to discover themselves and plan their future

Fig. 1. iYu index page interface design

Table 3. iYu interface design proposed learning style

Type/Keyword of Proposed Learning Style	Description/Characteristics of Learning Style	Features in iYu Interface Design
Easy	- Simple - Simple yet colourful for easy understanding and memory - Easy study	- Layout - Avatar mood - Makes it easy for learners to view menus and profiles
Exercise	- Answers questions if encounter problems - Studies through exercise	- Problem angle - Train learners by exploring themselves online - Feathers and Profiles menus help learners in providing professional guide for career search - Train learners by exploring themselves online
Experience	- Learns through past years - Takes experiment to fulfil a theory	- Learners can learn at their own pace in Profile Linkage and Feathers

		• In Feathers and Profiles, learners can develop their own reflective and critical thinking
Last Minute	• Performs only when under pressure • Studies a day before a test • Studies last minute with study group for revision • Always studying at the last minute	• Learners can finish system familiarization depending on their own time set • Could help learners train their mind within limited time
Reference Search	• Finds references from books • Probes questions when do not understand a topic • Seeks for answer from lecturers	• Original, Share Half and Share Part assists learners in realizing their own original idea • In Interview and Feathers, Peer Review and Peer Remark helps learners to gain some feedback from their lectures and/or peers
Smart	• Studies basic stuffs/materials • Smart, but in a hard way	• Feathers Why? 1 feature help learners in generating basic idea on a subject • Feathers three Why? features help learners think in a smart yet complex way
Summary	• Makes short notes for every special topic • Jot down notes in very simple keywords on a very small paper	• Feathers, Profiles and My Identity layouts applied summary type by providing small textboxes in each interface
Up-to-date	• Cool style • Trendy	• Certain Social Networking Sites (SNSs) like elements
Relaxed	• Rests after studying activities like listening or watching audio/video • Relaxed, but organized	• Uploaded audio and/or video help learners to relax • Lounge feature help learners identifying their learning type using a nice interface

Conclusion

The paired version of PLE and CSCL could form PCL framework based on learner model metrics expansion. As a results, learning style cannot be hidden, but the association of it with several other components must also be emphasized in designing an adaptive system. New principles of PCL to evaluate justified framework that focuses on labelling concept and deep personalization can be proposed in the future. Future works should include or enhance iYu adaptive user interface manipulation to a new level such as labelling, deep personalization, flow and technique. Apart from that, iYu system must also be tested to other courses learners to differentiate data analysis results based on demographic background in order to maintain and improve iYu system performance as well as its effectiveness to them.

Learning Styles of Teacher Education Students: Basis in Improving the Teaching - Learning Process

Arnold R. Lorenzo [89a], Blessie U. Lorenzo [a]

[a] Institute of Education, Tarlac College of Agriculture, Malacampa, Camiling, Tarlac, Philippines

Abstract

This study was conducted to look on the learning styles of the teacher education students which served as basis in improving the teaching and learning process. Specifically, it described the students' socio-demographic profile and their learning styles. The implications of learning styles to the instruction process were also given as well as some proposed strategies to improve the instruction process which is congruent to the learning styles of the students.

This study was anchored on Howard Gardner's Theory of Multiple Intelligences which states that human beings have nine different kinds of intelligence that reflect different ways of interacting with the world. The types of intelligence that a person possesses (Gardner suggests most of us are strong in three types) indicates not only a persons capabilities, but also the manner or method in which they prefer to learn and develop their strengths.

Results of the study showed that majority of the respondents are 16-17 years old; belong to a family with Php10,000 and below monthly income; with 4-5 siblings in the family; parents are high school level or high school graduates; and fathers are engaged in farming while mothers are housewives.

Learning styles of the students in terms of learning environment showed that majority prefers to learn in a quiet environment; well lighted room; with cool temperature; sitting in soft chairs or pillows; and in informal setting. In terms of emotional preferences, majority are self motivated; prefers to study lesson one at a time; prefers to study without being reminded; and prefers to be told exactly what and how to do things. In terms of social preferences, most prefers to study and learn by pair. In terms of physiological preferences, most prefers to learn by doing things; eating or munching while studying; prefers to study in the morning; and with less break and movements. While in terms of psychological preferences, majority are analytic or they prefer to learn sequentially and reflective or they take time to make decisions.

Keywords: learning style, teaching-learning process, teacher education students

INTRODUCTION

Nowadays, people live in a new world. Almost everything is different now compared few years ago; the kinds of music the students listen, the dance, the instruments and technology that carries the music, the TV shows that they patronize, the games they play, the language they use, their styles of learning and even values they possessed. The world now is truly technology driven, where instead of being a mere tool for civilization, it poised to become its master.

Every student is unique and has genius potentials. Teachers know this but they overlook or ignore it especially those who grew up exposed to conventional learning theories and traditional teaching methods. Teachers should learn to recognize, acknowledge and respect the learning style aspects of students' innate tendencies.

Learning style is the way in which each individual learner begins to concentrate on, process, absorb and retain new and difficult information (Dunn and Dunn Learning Style). A personal style is the biological and developmental set of characteristics that makes identical instructional environments, methods and resources effective for some learners and ineffective for others.

Recent studies revealed that when teachers develop and expand their instructional methods and techniques according to the individual learning styles of their students, there is marked improvement in their performance and

---

[89] Corresponding author.
E-mail address: jorizarl@gmail.com

achievement and a drop in the number of disciplinary problems. Hence, this study was conducted to determine the learning styles of teacher education students which served as basis in improving the teaching-learning process.

1.1 Statement of the Problem

This study was conducted to look on the learning styles of the teacher education students which served as a basis in improving the teaching - learning process. Specifically, this was conducted to answer the following questions:

    1.1.1. How are the students described in terms of their socio-demographic profile such as:

        a. gender,
        b. age,
        c. average monthly family income,
        d. number of siblings in the family,
        e. educational qualification of parents, and
        f. occupation of parents?

    1.1.2. How are the students described in terms of their learning styles?

    1.1.3. What are the implications of student's learning styles to the teaching - learning process?

    1.1.4. What strategies may be proposed to improve the teaching - learning process?

1.2 Significance of the Study

Given responsive environments, resources, and approaches, students attain statistically higher achievement and test scores in congruent or matched rather than dissonant or mismatched treatments. This implies that if the instructional situation is organized in a manner that takes advantaged of the student's learning styles, the rate and quality of learning will be improved.

The learning style preferences of students differ significantly from each other. It is important that teachers know the styles of their students so that they can connect their teaching styles. Through this, the teacher may choose compatible instructional strategies that may be used in teaching suited to the styles of the learners. This may be the basis of choosing learning activities that will suit to their preferred learning styles to further improve their performance.

1.3 Scope and Delimitation of the study

This study was conducted to determine the learning styles of the teacher education students; their socio-demographic profile; the implications of learning styles to teaching-learning process; and proposed strategies to improve the teaching-learning process.

1.4 Theoretical Framework

This study was anchored on Howard Gardner's Theory of Multiple Intelligences. According to Gardner, human beings have nine different kinds of intelligences that reflect different ways of interacting with the world. Each person has a unique combination or profile. Although people have all nine intelligences, no two individuals have them in the same exact configuration -- similar to the fingerprints. This established a classical model by which teachers understand and teach many aspects of human intelligence, learning style, personality and behavior, both in education and industry. It provides absolutely pivotal and inescapable indication with regards to people's preferred learning styles, as well as their behavioral and working styles, and their natural strengths. The types of intelligence that a person possesses (Gardner suggests most people are strong in three types) indicates not only a persons capabilities, but also the manner or method in which they prefer to learn and develop their strengths and their weaknesses. Developing a person's strengths will increase their response to the learning experiences, which helps them to develop also their weaknesses.

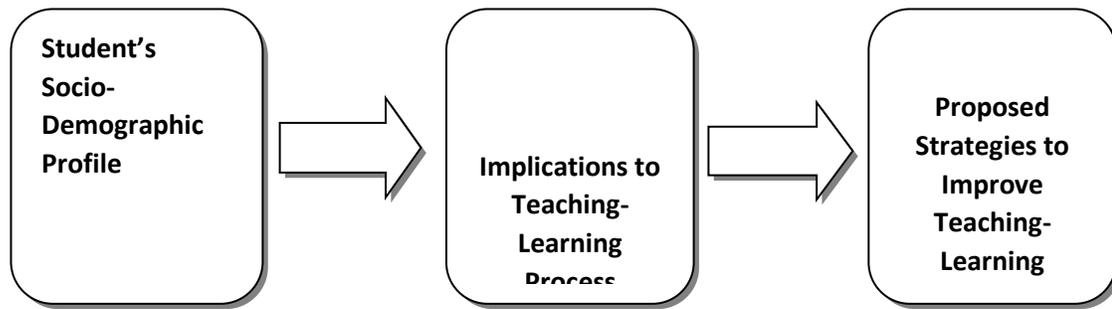
In this study, the researchers conceptualized that the students' learning styles have implications to the teaching – learning process which may serve as a basis in proposing strategies to improve teaching – learning process. When instructional situations are organized in a manner that takes advantage of the learning styles of the students, the teaching - learning process will be improved. Hence, the student's performance will also be improved.


Figure 1. Conceptual paradigm of the study

2. Methods and Procedure

2.1 Research Design

The descriptive method of research was used in this study. It is descriptive because it described the socio-demographic profile and learning styles of the students.

2.2 Respondents of the Study

The teacher education students of the Institute of Education, Tarlac College of Agriculture, Camiling, Tarlac, Philippines enrolled during the school year 2011-2012 were the respondents of the study.

2.3 Data Gathering Instrument and Analysis

Learning style questionnaire adapted from the Center for Learning Styles, Philippines supplemented with interview was used in gathering data from the respondents to determine their learning styles.

The data gathered were analyzed using frequency counts and percentages. The implications were based on results of the study as well as the proposed strategies.

3. Results and Discussion

31. 3.1 Students' Socio-Demographic Profile

32. Table 1. Distribution of Students' Socio- Demographic Profile

Profile	Frequency	Percentage
Gender		
Female	127	87
Male	19	13
Total	**146**	**100**
Age		
16-17	48	33
18-19	42	29
20-21	38	26
22 above	18	12
Total	**146**	**100**
Average Monthly Family Income		
10,000 and below	89	61
10,001 to 30,000	45	31
30,001 to 70,000	7	5
70,001 to 140,000	5	3
Total	**146**	**100**
No. of Siblings in the Family		
Only Child	5	3
2 – 3	52	36
4 – 5	59	40
6 – 7	20	14
8 and above	10	7
Total	**146**	**100**

Table 1 shows the socio-demographic profile of the respondents of the study. It shows that in terms of gender, majority of the teacher education students are female which is comprised 87% of the sample population, while 13% are male. This further shows that teacher education courses are still the most preferred courses among the female students.

In terms of age, majority of the students are 16 -17 years old which is 33% of the sample population, while 29% are 18-19 years old and the rests are twenty years old above. This shows that there are more young students which represent the freshmen and sophomore students than junior and senior students. Meanwhile, with regards to average monthly income, majority has Php10,000 & below monthly family income which is 61%, while 31% have Php10,000-30,000 average monthly family income. Based on the data, very few of the respondents have income beyond Php 30,000 which manifests that in terms of economic conditions in life, majority of their families belong to poverty line. With regards to the number of siblings in the family, the data show that 36% have 2-3 siblings, while 40% have 4-5 siblings. There are 14% of the respondents who have 6-7 siblings in the family while 3% are only child and 7 % have 8 and above siblings in the family. This reveals that most of the respondents belong to medium size family. The result is consistent with the common observation that if the parents are both professionals and both are working, they usually have small family size.

Table 2. Distribution of Parents' Educational Qualification

Educational Level	Father		Mother	
	F	%	F	%
Elementary level/graduate	31	21	31	21
High School level/graduate	65	45	59	40
College level/graduate	44	30	51	35
Post graduate level/graduate	6	4	5	3
	146	**100**	**146**	**100**

Table 2 reveals that most of the parents of the respondents are high school level or high school graduate which is comprised of 45% for father and 40% for mother. It was followed by parents who are college level or college graduate which is comprised of 30% and 35% respectively. Some of the parents are elementary level which is comprised of 21% both of the fathers and mothers. Very few parents attained the graduate and post graduate levels.

Table 3. Distribution of Parents' Occupation

Occupation	Father		Mother	
	F	%	f	%
Farmer/Forestry/Fisherman	89	61	21	14
Teacher/Instructor/Professor	2	1	11	8
Police/Soldier	1	1		0
Businessman/Entrepreneur	10	7		0
OFW	1	1	9	6
Driver	14	10		0
Barangay Official	4	3	2	1
Government Employee	2	1		0
None	23	16		0
Housewife		0	103	71
Total	**146**	**100**	**146**	**100**

Table 3 shows that in terms of parent's occupation, majority of the fathers are generally engaged in agricultural activity such as farming and fishing while majority of the mothers are involved in housekeeping. It is observed that some of the mothers are teachers, OFW, and Barangay Official. Among the father's occupations other than farming are Driving, Government Employee, Barangay official, Overseas Workers and Entrepreneurs. There are also father's who are not employed. This further shows that majority of the respondents belong to a family whose source of livelihood is basically agricultural activities such as farming and fishing.

3.2 Learning Styles of Teacher Education Students

3.2.1 Learning Environment Preferences

Table 4. Learning Styles of Students in terms of Learning Environment Preferences

Environment	Learning Preferences	f	%
Sound	Prefers to study/learn in quiet environment	82	56.16
Light	Prefers to study/learn in bright light	102	69.86
Temperature	Prefers to study/learn in cold environment	71	48.63
Design	Prefers to study/learn when sitting in soft chair or pillows	82	56.16
Setting	Prefers to study/learn in informal setting	81	55.48

Table 4 shows the various elements that affect the learning environment of students. It includes the element of sound, light, temperature, design and setting. Result shows that in terms of sound element, majority of the students (56.16%) prefer to study in a quiet environment. It is also observed on the data that some students prefer to study with sound such as soft music as background while studying.

Light is a basic requirement in studying especially inside the classroom, however, the level of lights preferred by students while studying varies. Majority of the students (69.86%) prefer to study and learn bests with bright light. Very few students prefer to study in a low or in a dim lighted environment.

In terms of temperature, 48.63% of the students prefer to study in a cool temperature. It is observed that very few students prefer a warm temperature while significant proportion of the respondents has no preferences, or they can study either in warm or cool environment.

Meanwhile, in terms of design and setting, majority of the students (56.16%) prefer to study while sitting in soft chairs and in informal setting which is comprised of 55.48% of the respondents. They found it easier to concentrate and focus on their studies if they are relax and comfortable while studying.

Teachers, as facilitators of learning should consider these elements and be flexible in organizing classrooms to address the learning environment preferences of the students. Considering these elements may possibly improve the teaching - learning process because this will provide conducive environment for the students to learn.

3.2.2 Emotional Preferences

Table 5. Learning Styles of Students in terms of Emotional Preferences

Emotional Element	Learning Preferences	f	%
Motivation	Self motivated	71	48.63
Persistence	Starts and finish assigned task	99	67.81
	Prefers to study/work on one task	83	56.85
Responsibility	Prefers to study/work independently without being reminded	82	56.16
Structure	Prefers to be told exactly what and how to do things	73	50.00

Table 5 shows the various elements that affect the emotional preferences of students. It includes motivation, persistence, responsibility and structure elements. Result shows that in terms of motivation, 48.63% of the students are intrinsically motivated while the rests are either motivated by parents or by their peers and teachers. Most of the students are happy and they feel good if they do well in their studies.

In terms of persistence, majority or 67.81% of the students are persistent in doing their tasks. They try to finish what they have started and they like to get things done first before starting new task. Majority or 56.85% also prefers to study lesson one at a time rather than working on different task simultaneously.

In terms of responsibility, majority of the students (56.16%) prefer to study/work independently without being reminded of their activities. They are responsible for their own academic learning. However, significant proportion of the students prefers to be frequently reminded and given feedbacks to finish their task.

Meanwhile, with regards to structure, 50% of the respondents prefer to be told exactly what and how to do things while the other students prefer to be given the objective and left alone to do things on their own ways.

Teachers, as facilitators of learning should consider these elements in facilitating, providing and monitoring learning activities of the students. Considering these may possibly improve the teaching and learning process because this will address the emotional preferences of the students in relation to their ways of learning.

3.2.3 Social Preferences

Table 6. Learning Styles of Students in terms of Social Preferences

Learning Preferences	F	%
Prefers to study and learn alone	52	35.62
Prefers to study and learn by pair	56	38.36
Prefers to study and learn with peers or group	38	26.02

Table 6 shows the elements that affect the social preferences of students in studying. Results show that 38.36% of the students prefer to study and learn by pair. They want to study with other students or with small group of their friends. However, 35.62% of the students prefer to study alone without other students. They can concentrate more if nobody interrupts them while studying. The rests of the students prefer to study with their peers or with a team. They like studying with lots of friends or students sharing ideas with them. Results implied that teachers should provide varied learning activities ranging from individual, paired and group activities to meet all the social preferences of students in studying.

3.2.4 Physiological Preferences

Table 7. Learning Styles of Students in terms of Physiological Preferences

Physiological Element	Learning Preferences	F	%
Perceptual Strength	Prefers to learn by doing things	54	36.98
Intake	Prefers to eat or drink while studying	76	52.05
Time of Day	Prefers to study/learn in the morning	66	45.20
Mobility	Prefers to study/learn with less break and movements	68	46.57

Table 7 shows the elements that affect the physiological preferences of students while studying. It includes the element on perceptual strength, intake, time of day, and mobility. Results show that in terms of perceptual strength,

36.98% of the students prefer to learn by manipulating or doing things. Significant proportion of the students also prefers to learn by visual and auditory. They like seeing and hearing things to retain more information.

In terms of intake, majority of the students (52.05%) prefer to have something to eat or chew while studying. Munching of finger foods while studying helps them to concentrate on their studies. Very few students prefer not to eat while studying.

The time element is related to the energy level of the students to study at different time of the day. Result shows that 45.20% of the students prefer to study and best learn in the morning. This shows that these students are active to study and learn in the morning. Many students also prefer to study in the evening while very few prefer to study in the afternoon. The result is similar with the common observation that most students are sleepy in their classes during afternoon.

With regards to mobility, it is concerned with the extent to which the movement of the body while involving in a learning task. Result shows that 46.57% of the students prefer to study with less break and body movements. They prefer to stay or sit in one place until they finish their tasks. However, there are also students who prefer to move constantly, changing their body positions while studying.

Teachers, as facilitators of learning should consider these elements in the preparation of instructional materials, classroom management and providing learning activities. Considering these may possibly improve the teaching and learning process because this will address the physiological preferences of the students in relation to their ways of learning.

3.2.1 Psychological Preferences

Table 8. Learning Styles of Students in terms of Psychological Preferences

Psychological Element	Learning Preferences	f	%
Analytic	Prefers to learn sequentially – one aspect at a time	87	59.58
Reflective	It takes time to think before making decisions.	67	45.89

Table 8 shows the learning styles of the students in terms of psychological preferences. Result shows that 59.58% of the students are analytic or prefer to learn sequentially or one at a time. They like to know the details or the step by step process to get things done.

Also, significant proportions of the students are reflective in nature, which is comprised of 45.89% of the students. These students take time to think and evaluate various alternatives before making decisions. Results show that in terms of psychological preferences, majority of the students are analytic and reflective thinker. This implies that teachers should provide activities suited to their psychological preferences to improve the teaching and learning process.

3.3. Implications of Learning Styles to Teaching - Learning Process

3.3.1 The Teacher

Every student is unique; each student learns best in different ways. Every teacher therefore, knows how to identify the ways (modalities, preferences, styles) in which individual students learns best and then uses this information in planning activities and arranging learning situations to connect his teaching style to the learning styles of students. This will serve as basis in choosing appropriate teaching strategies, teaching materials and in organizing activities that will accommodate the learning styles of the students, to improve the rate and quality of learning.

It is suggested that teachers may guide and motivate students to identify and utilize their preferred learning styles and to take deliberate advantage of those preferences. If teachers can show students the variety and versatility of learning styles by providing experiences in different teaching styles, the resulting awareness and expansion of student learning styles may better allow students to meet the demands of academic teaching methods and assignments (Grasha, 1972). Thus, one goal of instruction could be to help students identify and assess their individual learning styles. Another could be to allow students to sample unfamiliar teaching and learning styles. Indeed, a teacher who can "purposefully exhibit a wide range of teaching styles is potentially able to accomplish more than a teacher whose repertoire is relatively limited" (Smith & Renzulli, 1984, p. 49).

3.3.2 The Students

Each student should know and understand his/her learning preferences and uses this understanding in choosing learning activities provided by the teacher. Knowing his own learning style implies that he is responsible in monitoring, motivating and controlling his own behavior because he knows how he learns best.

3.3.3 The Classroom Setting

Classrooms should have variety of furniture and equipment to accommodate learning environment preferences of the students. It should allow flexibility when it comes to layout and different from typical classroom with rows and desks. It should have facilities for individual work, work by pair and small group sessions. Arrangements should promote an atmosphere that reflects informality and friendly environment.

Moreover, the understanding and use of different teaching styles by the instructor, as well as the awareness of individual learning styles by the student, may influence success in the classroom.

3.3.4 Instructional Materials

The teacher should spend time in selecting, developing and maintaining variety of instructional materials as well as references to accommodate the individual preferences of students. Some students need materials for visual and audio while others need materials for tactile or kinesthetic activities. Instructional resources and materials should be designed based on the learning styles of the students and to facilitate mastery of learning objectives.

3.4 Proposed Strategies to Improve Teaching - Learning Process

Learning Preferences of Students	Suggested Strategies
Learning Environment Preference	
Sound	➢ The school should always maintain a quiet environment by providing policies that will regulate the entry of noisy vehicles inside the campus especially during class hours. ➢ Students discipline should be strengthened by providing regular counselling to noisy students. ➢ Student lounge or centers be made available and functional to accommodate students without classes. ➢ Proper classroom management must be observed by teachers to avoid disturbance of other classes. ➢ Schedule of events in the Gym and other assembly areas other than school activities may not be allowed during class hours.
Light	➢ Well lighted classrooms should be maintained by the teachers and school officials all the time. ➢ Curtains and other furniture that obstruct light to enter the classrooms should be minimized.
Temperature	➢ Provision of adequate electric fans or air con unit in every classroom be considered. ➢ Standard number of classes per classroom be maintained. ➢ Orientation of the sun be considered in the construction of school buildings.
Design and Setting	➢ Provision of comfortable chairs for students in every classroom may be considered. ➢ Arrangement of chairs other than rows and columns may be considered to create informal setting.
Emotional Preferences	
Motivation	➢ Teachers should recognize student's achievements by using praises and good comments. ➢ Feedbacks on the performance of the students should be provided by returning test papers and other assessment tests. ➢ Teachers should encourage their students to learn to make them feel that somebody cares for them.
Persistence	➢ Teachers should provide activities which are realistic and attainable within the given period of the lesson. ➢ Teachers should monitor the progress of students in doing their learning activities.
Responsibility and Structure	➢ Opportunity for the students to work independently and decide for themselves should be considered by the teacher.
Social Preference	➢ Variety of learning activities for individual work, for pair activity and for group activity may be provided for the students.
Physiological Preference	
Perceptual Strength	➢ Activities that will allow students to get involve in doing things to apply what they learned may be considered by the teacher in preparing activities.
Intake	➢ The school may allow students to chew gum or munch finger foods while in the classroom but be sure to remind them to maintain cleanliness all the time.
Time of Day	➢ Lectures and discussion activities may be scheduled in the morning while kinesthetic activities be scheduled in the afternoon.
Psychological Preferences	
Analytic	➢ Teachers should provide clear and step by step procedure and instruction to students in doing their activities.
Reflective	➢ Teachers should provide opportunity for students to develop their higher order thinking skills which may develop their reflective thinking.

4. Conclusions

Based from the results of this study, the following conclusions were drawn:

- Majority of the respondents are female; 16-17 years old; with 10,000 and below average monthly income; and belong to a family with 4-5 siblings. The parents are high school level/graduate; and most of the fathers are farmers while most of the mothers are housewife.
- The teacher education students prefer to study in quiet, well lighted, cool, relax and comfortable, and informal setting environment.

- The teacher education students are motivated by their own selves, persistent, prefers to do task one at-a-time, prefers to study independently without being reminded frequently, and prefers to be told exactly of what and how to do things.
- Most of the students are tactile, prefer to eat or chew while studying, active in the morning and prefer less break and movements while studying.
- Majority of the students are analytic and reflective thinker.

5. Recommendations

In the light of these findings, this study recommends that:
- Faculty and officials of the college should continue finding ways to improve the physical plant and facilities of the college in order to provide the most conducive environment for the students to learn.
- Teachers should develop a thorough understanding of the learning style elements and the learning styles of their students to effectively facilitate the learning process.
- Teachers as facilitators of learning should plan and organize instructional activities based on the learning preferences of the students to improve the rate and quality of learning.
- Instructional environments, resources, strategies and approaches of teachers should respond to the diversified learning styles of students.
- Further study related on this topic is recommended.

LEGO MINDSTORMS Uygulamalarının Eğitsel Açıdan Etkilerinin İncelenmesine İlişkin Bir İçerik Analizi Çalışması

Barış ÇUKURBAŞI[a][90]

[a]Bartın University, Faculty of Education,74100, "Bartın", Turkey

Özet

Araştırmada, LEGO MINDSTORMS ürünleri ile gerçekleştirilen uygulamaların eğitsel açıdan etkilerini incelemek amaçlanmıştır. Bu doğrultuda Web Of Knowledge, EBSCOHost, ProQuest Dissertation Publishing ve Yükseköğretim Kurulu Başkanlığı Tez Merkezi'nde konu ile ilgili alan yazın taranmış ve ulaşılabilen çalışmalardan ölçüt örneklemesine göre belirlenen ölçütlere uyan 17 çalışma içerik analizi yapılarak incelenmiştir. Analiz sürecinde çalışmalar amacı, örneklemi ve süresi ve sonucu ölçütlerine göre incelenmiş ve kodlamalar yapılmıştır. Yapılan kodlamalar temalaştırılarak yorumlanmıştır. Yapılan araştırma sonucunda LEGO MINDSTORMS ürünleri ile en çok ilkokul ve ortaokul öğrencileriyle çalışıldığı ve çoğunlukla fen, matematik, teknoloji ve mühendislik alanlarıyla ilgili olarak çalışmalar yapıldığı görülmüştür. Öğrencilerin motivasyonlarının, özgüvenlerinin, başarılarının arttığı; yaratıcılıklarının geliştiği ve LEGO MINDSTORMS ürünlerinin etkili bir öğretim aracı olduğu elde edilen sonuçlar arasındadır.

Anahtar Kelimeler: LEGO MINDSTORMS, LEGO-LOGO, FIRST LEGO Ligi, eğitim.

Abstract

The Purpose of this study is to examine the effects of educational aspects of applications realized with LEGO MINDSTORMS products. In this direction, review of the literature on the subject was in Web of Knowledge, EBSCOHost, ProQuest Dissertation Publishing and The Council of Higher Education. Content analysis can be reached the 17 studies that meet the criteria determined by the sampling criteria. Analyzed according to purpose of the study, samples and implementation time and results of the study the analysis process. Research results show that primary school and secondary school students with LEGO MINDSTORMS products were attempted and mostly science, mathematics, engineering and technology fields have been studied. Increase students' motivation, self-confidence and success; develop students' creativity and LEGO MINDSTORMS products are an effective teaching tool results obtained.

Keywords: LEGO MINDSTORMS, LEGO-LOGO, FIRST LEGO League, education.

GİRİŞ

LEGO, çeşitli renklerdeki yapı parçalarından oluşan, üzerindeki girinti ve çıkıntılar vasıtasıyla birbirlerine kolayca kenetlenebilen ve hemen hemen her nesnenin inşa edilmesine olanak veren bir oyuncak çeşididir. LEGO üretimi başladığı 1932 yılından itibaren sürekli olarak kendisini geliştirmiş ve hemen hemen her alanda LEGO parçaları ile çocukların yapılar inşa etmesini sağlamıştır. LEGO çocukların bireysel şekilleri tanımalarına ve farklı şekillerle eşleştirme yapma becerilerini geliştirmelerinde katkılar sağlamaktadır (Yu, Harrison, Lu, Li, & Wang, 2011). Ayrıca LEGO setleri, eğitsel olarak tartışmasız çok geniş kullanım alanına sahip; genellikle uygun bütçeli, dayanıklı, tekrar tekrar kullanılabilir ve her öğrenci seviyesine uygun setleri olan oyuncaklardır (Kim ve Jeon, 2009). 1980'li yıllara gelindiğinde, LEGO eğitsel ürün departmanı kurulmuştur (Mortensen, 2012). LEGO eğitsel ürün departmanı kurulması ile birlikte çocukları eğitici LEGO setleri üretilmiş ve kullanılmaya başlanmıştır. Teknolojinin giderek gelişmesine ve eğitim alanındaki artan ihtiyaçlara yanıt vermek üzere 1998 yılında programlanabilir LEGO parçalarının üretildiği LEGO MINDSTORMS (LEGO Beyin Fırtınaları) birimi kurulmuştur. Bu doğrultuda LEGO parçaları ile robotik sistemler oluşturulmasının temeli atılmıştır.

LEGO MINDSTORMS

Programlanabilen bir LEGO parçası ve o parçaya diğer LEGO parçaları ile birlikte monte edilerek, bir robotik ürün ortaya koyan ve programlanmış görevleri yerine getiren LEGO MINDSTORMS ürünleri 1998 yılında üretilmeye ve kullanılmaya başlanmıştır. İlk LEGO MINDSTORMS ürünü olarak RCX adı verilen programlanabilir bir parça üretilmiştir. RCX bir bilgisayar aracılığıyla programlanıp yönetilebilen; üzerinde küçük bir ekran, üç giriş aygıtı bağlantı portu, üç çıkış aygıtı bağlantı portu, dört buton ve kızıl ötesi (IR) iletişim sensörü olan bir bilgisayardır (Ferrari, Ferrari, & Hempel, 2001).

LEGO MINDSTORMS ailesinin bir üyesi olan RCX, 2006 yılında yerini ikinci jenerasyon robotik ürün olarak adlandırılan NXT'ye bırakmıştır. Tıpkı RCX robotik sistemlerde olduğu gibi NXT robotik sistemler de servo motor ve çeşitli sensörlerle birlikte LEGO parçalarının birleştirilmesiyle meydana gelmektedir. Bir adet bilgisayar bağlantı portu, bir adet kablosuz bağlantı aygıtı, bir adet şarj edilebilir bataryası, yedi adet bağlantı portu ve dört adet işlem butonuyla birlikte üzerinde LCD ekranı bulunan NXT, 32 bit ARM7 mikroişlemcili akıllı bir mikrobilgisayardır (LEGO, 2012). Ayrıca bluetooth ve wireless bağlantıları sayesinde de kablosuz iletişim olanağı sağlamaktadır. NXT ile birlikte kullanılan motor, sensör ve bağlantı araçları sayesinde oluşturulan robotik sistemler üstün yeteneklere sahip birer robot gibi programlanan görevleri yerine getirmektedirler.

LEGO MINDSTORMS NXT teknolojisinden önce birçok programlama dili ile program parçacıkları yazılabiliyor olmasına rağmen, NXT teknolojisi ile birlikte LOGO (Language Of Graphical Output) programlama dili kullanılarak program parçacıkları hazırlanmaya başlamıştır. Bu şekilde LEGO-LOGO uygulamaları olarak isimlendirilen aktiviteler meydana gelmiştir.

LEGO MINDSTORMS ürünleri ile birlikte bilgisayar destekli yazılımlar kullanılarak soyut kavramlarla ilgili benzetimlerin ve öğrencilerin aktif bir şekilde öğrenme sürecine katılmalarına imkan veren canlandırmaların kullanılması ile öğrencilerin anlamakta güçlük çektikleri kavramları zihinlerinde daha kolay yapılandırmalarını sağlayabilen bilgisayar destekli öğretim uygulamalarına bir yenisi eklenmiştir (Karamustafaoğlu, Aydın, ve Özmen, 2005). LEGO-LOGO uygulamaları kullanılarak dünya genelinde birçok eğitim-öğretim aktivitesi düzenlenmektedir (McDaniel, 2004; McWhorter, 2008; Beisser, 2006; Mojica, 2010; Tian, 2007; Adams ve Keene, 2005; Jarvinen, 1998; Chambers, Carbona ve Rex, 2007; Hamada ve Sato, 2010). Ancak Türkiye'de çok az LEGO MINDSTORMS ürünleri ile gerçekleştirilmiş eğitim-öğretim aktiviteleri bulunmaktadır (Çayır, 2010).

Araştırmanın Amacı

Araştırmada, LEGO MINDSTORMS ürünleri ile gerçekleştirilen uygulamaların eğitsel açıdan etkilerini incelemek amaçlanmıştır.

YÖNTEM

Araştırmada nitel araştırma yöntemlerinden doküman incelemesi kullanılmıştır. Gözlem, görüşme ve doküman analizi gibi nitel veri toplama araçlarının kullanıldığı, olguların doğal ortamında gerçekçi ve bütüncül bir biçimde ortaya konmasına yönelik nitel bir sürecin izlendiği araştırmalara nitel araştırma yöntemleri; araştırmacının ihtiyaç duyduğu veriler için veri toplama araçlarını kullanma gereği duymadan; doğrudan araştırılması hedeflenen olgu veya olgular ile ilgili olarak bilgileri elde edebileceği dokümanların analiz edilmesiyle gerçekleşen nitel araştırma yöntemi türüne de doküman analizi denilmektedir (Yıldırım & Şimşek, 2008). Araştırmanın amacına ulaşılması hususunda verilerin analizi sürecinde doküman incelemesi türlerinden içerik analizi yapılmıştır.

Araştırmada doküman incelemesi yapılacak çalışmalar Web Of Knowledge, EBSCOhost, ProQuest Dissertation Publishing ve Yükseköğretim Kurulu Başkanlığı Tez Merkezi'nde LEGO-LOGO uygulamaları ve FIRST LEGO Ligi gibi LEGO MINDSTORMS ile gerçekleştirilen ve eğitim-öğretim sürecine yönelik olan son beş yılda (1 Ocak 2008 - 31 Aralık 2012 yılları arasında) yapılmış çalışmalar taranmış ve ulaşılabilen çalışmalar araştırmanın amacı doğrultusunda analiz edilmiştir. Araştırmanın amacı doğrultusunda doküman analizi yapılacak çalışmalarda incelenecek ölçütler belirlenmiş ve bu ölçütlere göre analiz gerçekleştirilmiştir. Bu ölçütler şu şekildedir:

- Çalışma amacı
- Örneklemi ve süresi
- Çalışma sonuçları

Araştırmada amaçlı örnekleme yöntemlerinden ölçüt örneklemesi kullanılmıştır. Bu bağlamda alan yazın taraması yapılırken "LEGO MINDSTORMS", "LEGO MINDSTORMS NXT", "LEGO-LOGO", "FIRST LEGO League" ve "LEGO-LOGO uygulamaları" anahtar kelime olarak girilip arama gerçekleştirilmiş ve son beş yıl içerisinde yayınlanmış olan araştırmalar taranmıştır. Ulaşılabilen çalışmalardan eğitim-öğretim sürecine yönelik olmayanlar ve deneysel bir süreç içermeyenler araştırmaya dahil edilmemiştir. Bu şekilde gerçekleştirilen taramalar sonucunda 17 çalışma (Chambers, Carbona & Murray, 2008; Behrens ve diğ., 2010; Cruz-Martin ve diğ., 2012; Coxon, 2012; Çayır, 2010; Sullivan, 2008; Gomez-de-Gabriel, Mandow, Fernandez-Lozano & Garcia-Cerezo, 2011; Jewell, 2011; Jim, 2010; Nugent, Barker, Grandgenett & Adamchuk, 2010; Mojica, 2010; Kato, Hattori, Ivai & Morita, 2012; McWhorter, 2008; Ramli, Yunus & Ishak, 2011; Karp, Gale, Lowe, Medina & Beutlich, 2010; Kim & Jeon, 2009; Tse, 2009) araştırma kapsamında incelenmiştir. Doküman analizindeki ilk olarak çalışmalar belirlenen ölçütlere göre incelenmiş ve kodlamalar yapılmıştır. daha sonra kodlamalara ve ölçütlere bağlı olarak elde edilen bulgular temalaştırılmış ve yorumlanmıştır.

BULGULAR

Bu bölümde veriler, içerik analizi yapılırken göz önünde bulundurulan ölçütlere göre sıralanarak verilmiştir.

Çalışma amaçlarına ilişkin bulgular

Araştırma dahilinde incelenen araştırmaların amaçlarına ilişkin yapılan içerik analizi sonucu elde edilen temalar Tablo 1'de görülmektedir. İncelenen makaleler kapsamında LEGO MINDSTORMS ürünleri kullanılarak gerçekleştirilen çalışmaların büyük bir kısmı mühendislik alanı ile ilgili kavramların öğretimi içermektedir. Bu alanın dışında fen, teknoloji, matematik ve dil öğretimine ilişkin çalışmalar da bulunmaktadır. Ayrıca öğrencilerin üstü düzey öğrenme becerilerinin, bilimsel süreç becerilerinin, anlama becerilerinin ve yaratıcılıklarının geliştirilmesi ile ilgili uygulamaları da kapsamaktadır.

33. Tablo 1. Çalışma amaçlarına ilişkin temalar

Temalar
Kavram öğretimi gerçekleştirme
Öğrenmeyi test etme
Beceri geliştirme
Yarışma ile öğretim
Gerçek dünya görevlerini yerine getirme
İlgi ve motivasyonu sağlama/arttırma
Tutum geliştirme
Algıyı belirleme
Yaratıcılık geliştirme

Araştırmalarda genel olarak öğrenci motivasyonlarındaki, LEGO MINDSTORMS ürünlerine ilişkin algı ve tutumları, LEGO MINDSTORMS ürünleri ile gerçekleştirilen öğretim faaliyetlerine yönelik algı ve tutumları belirlemek, öğrencileri yarıştırarak öğretmek ve gerçek dünya görevlerinin LEGO MINDSTORMS ürünleri ile yerine getirmek ve bunun sonuçlarını incelemek amaçlanan diğer öğeler arasındadır.

Çalışma örneklemleri ve sürelerine ilişkin bulgular

Araştırmalarda gerçekleştirilen uygulamalar 40 saat ile 2 yıl arasındaki bir süreç aralığında gerçekleştirilmiştir. Genel olarak çalışmanın kapsamına bağlı olarak mühendislik ve fen alanlarında gerçekleştirilen çalışmalar 6-8 hafta

aralığında, gerçek dünya görevlerini yerine getirme ve teknoloji, matematik, dil öğretimi gibi alanlarda gerçekleştirilen uygulamalar ise 5-8 gün aralığında gerçekleştiği bulgularına ulaşılmıştır.

Araştırmalarda çalışılan örneklemlere ilişkin bilgiler Tablo 2'de verilmiştir.

34. Tablo 2. Çalışma örneklemlerinin yaş dağılımları

Yaş Aralığı	Kişi Sayısı
9-12	662
13-16	598
17 yaş ve üstü	253

Tablo 2'de de görüldüğü gibi en çok 9-12 yaş aralığındaki öğrencilerle çalışmalar gerçekleştirilmiştir. İncelenen 17 çalışmadan dokuzunda 9-12 yaş arasında öğrencilerle çalışılmıştır. Diğer çalışmalardan beşinde üniversite öğrencileriyle, üçüyle de 13-16 yaş arasındaki öğrencilerle gerçekleşmiştir. Özellikle 11-13 yaş aralığındaki öğrencilere yönelik olarak daha çok çalışma; 20 yaş ve üstündeki bireyler için ise daha az çalışma yapıldığı elde edilen bulgular arasındadır.

Çalışma sonuçlarına ilişkin bulgular

Araştırma sonuçlarına ilişkin bulgular Tablo 3'te verilmiştir.

35.

36.

37. Tablo 3. Çalışma sonuçlarına ilişkin temalar

Temalar
Ölçülen beceriler gelişti.
Öğrenme arttı.
LEGO MINDSTORMS etkili bir öğretim aracıdır.
Öğrenci başarısı arttı.
Teori ile pratik arasındaki öğrenme boşlukları (Learning gap) giderildi.
Öğrencilerin güven duyguları gelişti.
LEGO MINDSTORMS gerçek dünya uygulamaları için ideal bir araçtır.
Erkek öğrencilerin daha başarılı olduğu
Kullanımı kolay
Yaratıcılığı geliştirir.
Motivasyonları artırıcı
Ölçülen algılar gelişti.
Ölçülen tutumlar gelişti
Özgüveni artırdı

Araştırma kapsamında incelenen çalışmaların tamamında incelenen durumlara ilişkin pozitif sonuçlar elde edildiği görülmüştür. Kazandırılması hedeflenen becerilerin gelişmesi ve öğrenmelerin sağlanması incelenen çalışmalar arasında en sık rastlanılan sonuçlardır. Gelişen beceriler arasında programlama becerisi ve bilimsel süreç becerileri, mühendislik alanıyla ilgili beceriler, sosyal becerileri ve üst düzey eleştirel düşünme becerileri bulunmaktadır. Ayrıca, LEGO MINDSTORMS ürünlerinin kullanımının kolay olduğu ve öğrencilerin yaratıcılıklarının geliştirildiği, gerçek dünya uygulamalarının bu ürünlerle etkili bir şekilde yapılabildiği ve bu ürünler sayesinde öğrenci başarısının arttığı elde edilen bulgular arasındadır.

LEGO MINDSTORMS ürünleri ile derslerde anlatılan teorik bilgiler ile pratik yapılması arasında meydana gelen öğrenme boşluklarının (learning gap) giderilebileceği ve bu ürünlerin etkili bir öğretim aracı olduğunun yanı sıra,

öğrencilerin derse ve robotik aktivitelere yönelik ilgi ve motivasyonlarının arttığı, algı ve tutumlarının olumlu yönde geliştiği elde edilen diğer bulgulardır. Ayrıca öğrencilerin kendilerine ve akranlarına olan güvenlerinin arttığı, LEGO MINDSTORMS ürünleri ile akran öğretiminin ve işbirlikli öğrenmenin sağlanabildiği bulgularına da ulaşılmıştır.

SONUÇ VE TARTIŞMA

Araştırmada literatürde var olan ve son 5 yıl içerisinde LEGO MINDSTORMS ürünleri kullanılarak gerçekleştirilen çalışmalar taranmıştır. Rastlanılan çalışmalardan eğitsel amaçlı olan ve deneysel desenler kullanılarak gerçekleştirilen çalışmalar seçilmiştir. Bu doğrultuda seçilen 17 çalışma amacı, örneklemi, süresi ve sonucu içerik analizi yoluyla incelenmiştir.

Dünya genelinde LEGO MINDSTORMS NXT setleri kullanılarak birçok alanda çok sayıda eğitim-öğretim aktivitesi gerçekleştirilmektedir (Kim, 2011). Bu çalışmaların büyük bir kısmının hedeflerine ulaştığı ve başarıyla sonuçlandığı yapılan literatür taramasıyla görülebilmektedir. Ancak LEGO MINDSTORMS ürünleri ile gerçekleştirilmiş eğitim-öğretim aktivitelerinin önemi Türkiye açısından henüz tam olarak bilinemediği düşünülmektedir. Ayrıca eğitim ortamlarında bu ürünlerle gerçekleştirilerek yapılan çalışmaların sayısı oldukça azdır. Türkiye'deki durumun aksine uzunca bir süredir dünya genelinde birçok eğitim-öğretim kurumu LEGO-LOGO uygulamaları ile LEGO MINDSTORMS ürünlerini kullanarak eğitsel aktiviteler gerçekleştirmektedir. Bu sayede öğrenciler daha küçük yaşlardan itibaren birer bilim insanı, mühendis, sanatkar gibi düşünmeyi öğrenerek gelecekleri için önemli olan pek çok beceriyi daha önce kazanmaktadırlar (Çayır, 2010).

Yapılan içerik analizi sonuçlarına göre çalışmaların büyük bir kısmı ilkokul ve ortaokul öğrencilerine yöneliktir. Bu durum LEGO MINDSTORMS ürünlerinin genellikle çocuklara hitap eden oyuncaklar olmasından ve eğitsel açıdan bu ürünlerin en etkili olacağı kitlenin çocuklar olarak görülmesinden kaynaklandığı söylenebilir. Ayrıca çocuklar LEGO MINDSTORMS ürünleriyle çalışırken olumlu yönde motivasyona sahip olmaktadırlar (Karp, Gale, Lowe, Media & Beutlich, 2010). Lise ve üniversite düzeyinde yapılan çalışmalar daha çok mühendislik alanında gerçekleştirildiği görülmüştür.

İncelenen çalışmalarda görüldüğü gibi LEGO MINDSTORMS setleri ile yapılan çalışmalar genel olarak bir süreç gerektirmektedir. Analiz sonuçlarına göre bu süreç 40 saat gibi bir sürede olabileceği gibi 2 yıl gibi uzun bir süreç de gerektirebilmektedir. Ancak genel olarak bir LEGO MINDSTORMS ürünleri kullanılarak gerçekleştirilecek çalışmaların 5-8 hafta arası bir sürede yapılabileceği düşünülmektedir.

Çalışmaların büyük bir kısmı öğrencilerin öğrenmelerini sağlamayı ve amaçlanan becerileri geliştirmeyi amaçlayan çalışmalardır. Ayrıca motivasyon, tutum, algı ve ilgi gibi öğrenci özellikleri de incelenerek/geliştirilmeye çalışılarak daha etkili öğrenme ortamları sağlanmaya çalışılmıştır. Araştırma sonuçlarının tamamında olumlu olumlu sonuçlar alındığı görülmüştür. LEGO MINDSTORMS ürünleriyle gerçekleştirilen LEGO-LOGO ortamları öğrenciler için konforlu, eğlenceli ve kendilerini rahat hissettikleri bir ortamlardır (Jarvinen, 1998).

Eğitsel bir araç olarak LEGO-LOGO uygulamaları öğrencilerin bilimsel prensipleri daha iyi anlamalarını sağlamak için önemli bir rol üstlenmektedir (Chambers, Carbona ve Murray, 2008). LEGO MINDSTORMS ürünleri ile büyük oranda mühendislik, fen, matematik ve teknoloji alanlarında çalışmalar yapılmıştır. Bu alanlar uygulamaya dönük alanlar olduğu için öğrencilerin LEGO MINDSTORMS ürünlerini kullanarak bu alanlar kapsamında edindikleri teorik bilgileri uygulamaya geçirerek öğrenmelerini daha kalıcı ve etkili hale getirilebilirler. Hamada ve Sato tarafından (2011) gerçekleştirilen çalışmada öğrencilerin robot hareketlerini gözleyerek öğrenebildikleri sonucuna ulaşılmıştır. Gerçekleştirilen başka bir çalışmada da öğrenme fırsatlarını artırmak için LEGO-LOGO temelli uygulamalar geliştirilebileceği öne sürülmüştür (Aufderheide, Krybus, & Witkowski, 2012). Öğrenciler bilgisayar programcılığı, mekanik tasarım, fizik, matematik, hareket, çevresel faktörler ve işbirlikli grup ortamında problem çözme konularında yaratıcıklarını keşfedebilmektedirler (Chambers, Carbona ve Rex, 2007). Ayrıca LEGO MINDSTORMS NXT ürünleri gibi robotik öğrenme ortamları aktif öğrenme ortamı sağlamaktadır (Ramli, Yunus & Ishak, 2011). LEGO-LOGO uygulamaları ile öğrenciler kendi öğrenmelerinden sorumlu hale gelmektedirler ve kendi kendilerine öğreneceklerinden dolayı daha anlamlı öğrenmeler sağlanmaktadır (Hiltunen ve Jarvinen, 2000). Bu bağlamda incelenen çalışmalarda ulaşılan LEGO MIDSTORMS ürünlerinin etkili bir öğrenme aracı olduğu sonucu bu ürünlerin eğitim-öğretim sürecinde kullanılması hususundaki önemi göstermektedir.

LEGO MINDSTORMS uygulamaları öğrencilerin anlamakta güçlük çektikleri kavramları zihinlerinde daha kolay yapılandırmalarını sağlamaktadır (Karamustafaoğlu, Aydın, ve Özmen, 2005; Çayır, 2010). Bu uygulamalar vasıtasıyla öğrenciler takım çalışması ile iletişim becerilerini geliştirme fırsatına sahiptir ve daha bağımsız, kendine güvenen öğrenenler olmaya başlamaktadırlar (Church, Ford, Perova, & Rogers, 2010). Ayrıca bu ortamlar ile

öğrencilerin hem kendi kendilerine ve kendi öğrenme hızlarında öğrenmeleri hem de grup çalışmasıyla öğrenmeleri açısından etkili ortamlardır (Akçay, Aydoğdu, Yıldırım, ve Şensoy, 2005).

Lindh ve Holgersson tarafından (2007) yapılan araştırmaya göre problem çözmeye yönelik etkinlikleri seven öğrencilerin başarılarında artma olduğu görülmüştür. Bu bakımdan LEGO-LOGO uygulamalarının eğitim-öğretim ortamlarında kullanılmasının öğrencilerin başarılarını da olumlu yönde etkileyeceği söylenebilir. Ayrıca, bu etkinlikler sayesinde ortaya çıkan öğrenme ortamları ile de öğrencilerin yaratıcıklarının gelişmesine olumlu yönde etkilenmektedir (İşman, 2003). Öğretmenler, LEGO MINDSTORM NXT robotik setleri diğer LEGO setleriyle birlikte kullanarak, sınıftaki öğrencilerin bireysel ihtiyaçlarına göre öğretimi planlayabilme imkanına sahiptirler (Gregory & Hammerman, 2008).

LEGO MINDSTORMS ürünleri kullanılarak gerçekleştirilecek yarışma faaliyetleri ile de öğrencilerin öğrenmeleri, becerileri geliştirmeleri sağlanabilir. Özellikle FIRST LEGO ligi (FLL) olarak isimlendirilen ve LEGO MINDSTORM NXT setleri ile gerçekleştirilen yarışma bu hususta büyük öneme sahip olduğu düşünülmektedir. Türkiye'de eğitim-öğretim ortamlarında gerçekleştirilen LEGO MINDSTORMS uygulamalarının azlığından dolayı bu yarışmanın gerçekleştirilmesi ve yarışmaya etkin katılımların sağlanması öğrencilerin gelişimlerine katkılar sağlayacağından ötürü önem arz ettiğine inanılmaktadır.

Öğrenme fırsatlarını artırmak için LEGO MINDSTORMS seti temelli uygulamalar geliştirilebilir (Aufderheide, Krybus, & Witkowski, 2012). Dünyada çok yaygın kullanımı ve birçok avantajı olmasına karşın eğitim-öğretim ortamlarında gerçekleştirilen LEGO MINDSTORMS uygulamaları ülkemizde henüz olması gerektiği seviyeye ulaşamamıştır. Araştırma kapsamında seçilen 17 çalışmadan sadece bir tanesi Türkiye'de gerçekleştirilmiş olması bu durumu desteklemektedir. Bu sebepten dolayı okullarda LEGO MINDSTORMS ürünleri ile gerçekleştirilecek uygulamalara gerekli olanakların sağlanması ve desteklenmesi öğrencilerin bilişsel ve motor becerilerinin olumlu bir şekilde gelişmesi sağlanması açısından önerilmektedir.

Abstract

The aim of this study is to analyse loneliness of university students according to mobile phone addiction, daily phone use time and gender. Survey model is used for this research. To collect data; personel information form, problematic mobile phone use scale, and UCLA-loneliness scale were applied for 527 students who are from different Departments of Faculty of Education at Fırat University. To analyse these data; correlation, t test, one way variance (ANOVA) analysis and Scheffe test were used. Results revealed that loneliness was significantly associated with problematic mobile phone use (r=.35) Furthermore, there were significant differences between loneliness and independent variables (gender, mobile phone addiction and daily phone use time). The results of the study were discussed together with the results of different studies and suggestions were made.

Keywords: loneliness, mobile phone, mobile phone addiction

INTRODUCTION

Loneliness is one of the most common feelings that individulas could experience in their lives. Loneliness is a negative emotion that comes about through a discrepancy between desired and achieved levels of social contact (Perlman & Peplau, 1981). According to Lopata (1969), loneliness is an emotion experienced by an individual who wishes for a level of contact unlike from the one currently encountered. The multiplicity of social relations does not matter but the quality of them is important. However, having more social relations may not always derive individuals a profit in social life**.** According to Masi, Chen, Hawkley, & Cacioppo (2011), an individual may be lonely in a crowd or socially contented while alone. When studies are analysed on loneliness, it is seen that loneliness is associated with some variables. Loneliness is related to the variables of depression (Anderson, & Arnoult, 1985; Brage,Meredith, &Woodward, 1993; Ceyhan, & Ceyhan, 2011; Nangle, Erdley, Newman, Mason, & Carpenter, 2003; Rotenberg, & Flood, 1999; Ünal, & Bilge, 2005; Wang, Yuen, & Slaney, 2009; Wei, Russell, & Zakalik, 2005; Yaacob, Juhari,Talib,&Uba, 2009), stress (Yaacob, Juhari,Talib,&Uba, 2009), internet addiction (Durak-Batıgün,&Hasta, 2010; Esen, & Siyez, 2011), shyness (Anderson,&Arnoult, 1985; Erözkan, 2009; Baş,2010), alexithymia (Koçak, 2003; Özdemir, Güreş, &Güreş, 2011; Qualter, Quinton, Wagner, & Brown, 2009), self-esteem (Brage, Meredith, & Woodward, 1993; Güloğlu, & Karaırmak, 2010; Sübaşı, 2007; Yaacob, Juhari, Talib, &Uba, 2009), hopelessness (Chang, Sanna, Hirsch,&Jeglic, 2010; Kırımoğlu, Filazoğlu-Çokluk, & Yıldırım, 2010; Pehlivan, Ovayolu, Ovayolu, Sevinç, & Camci, 2012; Ruchkin, Eisemann, & Hägglöf, 1999), social anxiety (Johnson, Lavoie,&Mahoney, 2001; Sübaşı, 2007). In recent years, the other variable which has studied together with loneliness is mobile phone addiction. (Jin,&Park, 2012; Reid,&Reid, 2007; Şar, 2013; Takao, Takahashi,& Kitamura, 2009; Wei,&Lo, 2006).

In addition to being a means of communication and having rapidly spreading use around the world, mobile phones, in particular the new generation of smart mobile phones, are technological tools due to offering many functions, such as providing short message service (SMS) to users, taking photos, playing games, using the Internet, connecting to social networks, providing navigation services, having a video player functionality, watching TV and shopping. Arslan and Unal (2013) indicated in their study that Faculty of Education students have widely used their mobile phones for the purpose of talking, messages, MP3/music, game, photo / camera and the Internet. They also remarked that students have taken quite a lot of time to use their mobile phones. Considering the facilities that a mobile phone provides to individuals as mentioned above, these facilities can be handled at the same time as the needs of individuals. While normal use of mobile phones is to restrict individuals' use of mobile phones in

accordance with their needs, problematic use of mobile phones occurs due to the fact that individuals aren't able to restrict their use in accordance with the needs. The findings of some studies have indicated that problematic use of mobile phones has negative effects.. Ha, Chin, Park, Ryu ve Yu (2008) found that the excessive user group experienced more depressive symptoms, difficulty in expression of emotion than the comparison group did. Furthermore, excessive user group had higher interpersonal anxiety, lower self-esteem, higher score on the Internet Addiction Scale (IAS) than the comparison group. In Şar's (2013) study, the problematic phone use increases as talking time increases, however increase of talking time decreases loneliness level in teenagers. Jin and Park (2012) found that more face-to-face interactions were associated with lower levels of loneliness; however, more cell phone calling was associated with greater loneliness. Reid and Reid (2007) revealed that lonely people preferred calls and rated text such as short message service (SMS, or text messaging) as a less intimate method of contact. According to Takao, et al. (2009) it is conceivable that lonely people are eager to maintain contact with their peers through frequent calls so as to fulfill their loneliness. We therefore would expect that higher or problematic phone use is predicted by loneliness.

Mobile phones offer many possibilities presented by the Internet and computers. While computers and the Internet may cause loneliness of individuals, may mobile phone cause loneliness of individuals? In this context the purpose of the study is to examine loneliness of university students in terms of daily use of mobile phone, mobile phone addiction and gender.

2. METHOD

2.1. Participants
The sample group of this study is 527 students from different Departments of Faculty of Education at Fırat University. 372 (%70,5) of the students are female, 155 (%29,5) of them are male, avarage age of students is 20,8 (Sd:2,8). All of participants had mobile phone (%100).

2.2. Instruments

UCLA Loneliness Scale (UCLA-LS): UCLA Loneliness Scale was developed by Russell, Peplau and Cutrona (1980); the validity and reliability of its adapted version is tested by Demir (1989). The scale measures the overall feelings of loneliness in individuals through a self-report Likert-type scale comprised of 20 items. 10 of these items are positive statements and the rest are negative statements. The scale reports range from 20 to 80 where higher scores mean a higher degree of feelings of loneliness. Reliability of the scale is reported as .96. In the present study, the internal consistency coefficient of the scale was computed as .85.

Problematic Mobile Phone Use Scale (PMPUS): The Problematic Mobile Phone Use Scale developed by Bianchi and Phillips (2005) was adapted to Turkish by Şar and Işıklar (2012). In the frame of adaptation works, the scale items were primarily translated into Turkish and then the opinions of nine specialists were taken, and the translation was improved in line with those opinions. The English and Turkish forms generated were filled out by 30 undergraduate students having a good command of English with 2-week intervals. The correlation value between English and Turkish forms was calculated as 0,78 and both scales were accepted equal. The scale was applied to 300 students for validity – reliability studies. For Turkish form of the scale, Cronbach Alpha coefficient for internal consistency was calculated as 0,94 and reliability co-efficient as 0,88. As a result of these values obtained, Turkish form of the scale was accepted as reliable and valid. The scores that may be gotten over a 5-point likert type scale with 27 questions vary between 27 and 135. As the scores that are gotten over the scale get higher, the mobile phone addiction increases.

2.3. Procedure

Survey model is used for this research and to collect data; personal information form, PMPUS, and UCLA-LS were applied to 527 students from different Departments of Faculty of Education at Fırat University. PMPUS was categorised by using mean and standard deviation as addiction group (M+1Sd) and non addiction group (M-1Sd). Correlation test, t test and one way variance (ANOVA) were used in this study. Furthermore, to find out the differences among groups, Scheffe test was used.

3.FINDINGS

Table 1. Means, standard deviations, correlations, and alpha reliabilities for variables.

	1	2	Cronbach's Alpha
1. UCLA-LS	1		**.85**
2. MPA	.35*	1	**.95**
Mean	37,2	59,2	
Standart Deviation	9,7	21,6	

*p<.01

As seen in Table-1, the results indicated that there is a positive moderately relationship between mobile phone addcition and loneliness (r=.35).

Table 2. Means, standart deviations and t values of loneliness of university students according to gender

	Gender					
	Female (n=372)		Male (n=155)		t	p
	$\overline{X}$	Sd	$\overline{X}$	Sd		
UCLA-LS	35,8	9,4	40,6	9,4	-5,311	.000*

*p<.05

As seen in Table-2, there is a significant difference between males and females in relation to loneliness (t(525)=-5,311; p<.05). When these results analysed, it is seen that loneliness of men ($\overline{X}$ = 40,6, Sd=9,4) is higher than the women ($\overline{X}$ =35,8, Sd=9,4).

Table 3. Means, standart deviations and F values of loneliness of university students according to daily phone use time

	Daily use												
	<1 hour[A] n=139		1-3[B] n=245		4-6[C] n=97		7-9[D] n=22		10≥[E] n=24		F	p	Differences
	$\overline{X}$	Sd	$\overline{X}$	Sd	$\overline{X}$	Sd	$\overline{X}$	Sd	$\overline{X}$	Sd			E>A, D>A C>A, B>A
UCLA-LS	34,9	9,3	37,2	9,7	39,1	10,1	39,6	10,2	40,9	7,3	4,072	.003*	

*p<.05

As seen in Table-3, the result showed that significant difference was found between loneliness and daily phone use time(F(4-522)= 4,072; p<.05). Scheffe test was performed to determine the groups which caused difference. According to this significant difference, students who have mobile phone use 10 or over ten hours, 7-9 hours, 4-6 hours and 1-3 hours were found to have more loneliness score than those who have mobile phone use less than 1 hour per day.

Table 4. Means, standart deviations and t values of loneliness of university students according to addiction   group   and   non addictiction group

	Mobile Phone Addiction					
	Addictin group (n=93; %17,6)		Non addiction group (n=77; %14,6)		t	p
	$\overline{X}$	Sd	$\overline{X}$	Sd		
UCLA-LS	39,5	9,1	35,7	11,4	-2,399	.018*

*p<.05

As seen in Table-4, there is a significant difference between addict and non addict in relation to loneliness (t(168)=-2,399; p<.05). When these results analysed, it is seen that loneliness of addicted students ($\overline{X}$ = 39,5, Sd=9,1) is higher than the non addicted ($\overline{X}$ =35,7, Sd=11,4).

4. Discussion

Loneliness of university students was examined in the current study in terms of mobile phone addiction, daily use of mobile phone and gender. When literature is analysed, the literature has revealed that studies on mobile phone addiction do not have too much background. In addition, studies on mobile phone addiction related to loneliness are quite a few. In this context, this study may be important for the literature.

When loneliness of university students was examined according to gender, loneliness scores of male($\bar{x}$ =40,6, Sd=9,4) students were found higher than the scores of female ($\bar{x}$ =35,8, Sd=9,4) students. The results of some studies are similar to the results obtained from this study (Erözkan, 2004; Karaoğlu, Avşaroğlu, & Deniz, 2009; Wiseman, Guttfreund, & Lurie, 1995). In addition, some studies revealed that loneliness scores of female students were higher than the scores of male students (Kutlu, 2005). Some studies also indicated that there were no significant differences between the loneliness scores of male and female students (Baş, 2010; Gürsoy, & Bıçakçı, 2006; Sezer, Tekin, & Aldemir, 2011).

According to another finding of the study, there was a significant difference between loneliness of university students and daily use of mobile phone (F(4-522)= 4,072, p<.05). According to this significant difference, students who have mobile phone use 10 or over ten hours, 7-9 hours, 4-6 hours and 1-3 hours were found to have more loneliness score than those who have mobile phone use less than 1 hour per day. Şar (2013) found that there was a significant difference between daily phone use time and loneliness. According to Şar's (2013) study, the issue of problematic phone use increases in parallel with increasing time of speaking on the phone, but the loneliness decreases.In another study, Jin and Park (2012) found that more cell phone calling was associated with greater loneliness. Pierce (2009) found that On average, 35–40% of teens reported using cell phones/text messaging and online social sites between 1 and 4 h daily, 24% reported using IMs 1–4 h daily and only 8% reported using email between 1 and 4 h daily. Females tended to use cell phones/text messaging and online social sites more so than did males. Hong, Chiu and Huang (2012) found that there was medium positive correlation between mobile phone addiction and mobile phone usage behavior.

According to the results obtained from the study, 17.6% of university students participated in the research is addicted to mobile phone. There was a significant difference between loneliness of university students and mobile phone addiction (t(168)=-2,399; p<.05). Loneliness scores of students who have been addicted to mobile phone ($\bar{x}$ =39,5, Sd=9,1) were found to be higher than those of non-addicts ($\bar{x}$ =35,7, Sd=11,4).This result supported Kraut and his collegues' claim. Kraut et al. (1998) had claimed that pathological use of the new technologies reduces the individual's social implication in the real world and, as a consequence, his or her psychological well-being, because it produces the kind of isolation, loneliness and depression the individual wants to ease by connecting to the Internet. Chen's (2006) result indicated heavy mobile phone users meet their friends less. Ha et al., (2008) found that the excessive user group experienced difficulty in expression of emotion than the comparison group did. Furthermore, excessive user group had higher interpersonal anxiety than the comparison group.

Considering the features of mobile phones, especially smart mobile phones, recently introduced, it is seen that these kinds of mobile phones are not only manufactured to provide communication. These mobile phones include many features presented by the Internet and computers. In this context mobile phones offer a great opportunity, especially for young people who use the Internet. Individuals who have such a great opportunity can interact with mobile phones almost everywhere (at home, at school, on the bus, on the street, in the café, in the canteen, in bed, or even in the toilet). Individuals who have engaged in mobile phones constantly may be exposed to a decrease in the time allocated to other social relations, especially relations based on face-to-face interaction. This situation may also make individuals lonely. Although mobile phones and the Internet are used as communication tools, excessive use of these technological tools causes individuals to become addicted. Even communication tools may cause non-communication situations. Individuals who are under these circumstances can be supported to receive the help of individual or group counseling in order to make use of such technological tools in accordance with their needs.
